Britain's military allies could not be expected to look favourably on this decision to sacrifice the common security to the Tories' political needs, but the case has special interest for the French. In 1954 Sir Anthony Eden undertook to maintain British troops on the Continent in order to get the French to agree to German re-armament. Otherwise, remilitarisation in West Germany would have given the Germans a majority in the West European army; British troops would, by remaining on the Continent, prevent the Germans attaining this predominance, and it was only on that understanding that the French agreed to the Paris treaties. For Britain to go back on that promise now, even though it is admitted here that she has a good economic case, would leave the French numerically subordinate to the Germans. The question would be academic because recruitment in West Germany is proceeding much more slowly than had been hoped, but the French have withdrawn most of their own troops for the war in Algeria, so they are still anxious to see British troops remain on the Rhine in undiminished numbers. Once again, we see that the root and origin of most French difficulties and hence of many European problems is the continuance of the war in Algeria; if that war were stopped, the whole balance and complexion of European problems would change.

In the face of so much determined opposition from their allies, the British have had to agree to put off their plan for spectacular economies. This might have the beneficial effect of bringing London to consider more favourably the idea put up by M Mendes-France when he negotiated the Paris treaties in 1954: the plan for a common Anglo-French production of classical armaments. In general, one of the best hopes of military economy, both in the manufacture of classical and atomic weapons, for both Britain and France, is to undertake a common and rational programme of co-operation. But this hope is limited by the British belief that they will get more out of the USA if they do not co-operate too closely with the Continent.

The other problem concerns the results of incorporating the overseas territories in the common European market, a question that has been frequently referred to in these despatches. Mr MacMillan at one time passed for one of the most enthusiastic supporters of the common market scheme, but it was a sadly diminished enthusiasm that he displayed in Paris last week. It was obvious from the start that Britain's imperial responsibilities were inconsistent with her full co-operation with Euromarket, and that is why it was suggested here last October that Britain's main interest in Euromarket was to see that it never really came to life. Now that French determination has succeeded in getting the other Continental powers to accept the incorporation of the colonies, British interest has considerably diminished. If the British join a free trade zone that includes the French colonies but does not include British colonies, then the British colonies will be gravely disadvantaged in their trade with Europe. If Britain includes her colonies, then imperial preferences have been scrapped. The only possible explanation for London's sudden and recent discovery of this dilemma is that Britain never really believed that Euromarket would come to much — and that was why she was so ostentatiously in favour of it.

The talks in Paris last week ended in a decision to refer this matter to the experts, and when he got back to London Mr MacMillan said significantly that the experts might be at work for months and months. In other words, British interest in Euromarket has been put on ice, or rather will be limited henceforth to trying to get GATT to scuttle the European common market as an infringement of that international treaty. We have come a long way from last autumn's protestations

(Continued on page 490)

NORTHERN RAILWAY

NOTICE

The important features of the changes in Time Table that will take effect from the 1st April, 1957, are notified below:

(i) Existing trains which will be cancelled.

(a) Nos. 335 Up/336 Dn. between Ludhiana & Amritsar.
(b) Nos. 357 Dn/358 Up between New Delhi and Delhi.
(c) Nos. 1AFA/4AFA between Ayodhya & Faizabad.

(ii) New Trains which will be introduced.

(a) 9AP/12Ap between Patti and Amritsar. (b) 16 BQ/9BQ between Batala and Qadian.
(c) 10JN/9JN between Jullundur City and Nakodar.
(d) 305 Up/306 Dn. (Duplicate Kashmir Mail) between New Delhi and Pathankot and these trains will run from 15-4 to 31-8-1957.

(iii) Existing trains extended.

(a) Nos. 1 BHB/2 BHB Suratgarh — Hanumangarh Passenger extended to and from Bhatinda.
(b) Nos. 63 Up/64 Dn. Toofan Expresses extended to and from Delhi.

(iv) Trains amalgamated to run as through trains.

(a) Nos. 2UC/2SU amalgamated to run as through train between Ambala City & Saharanpur.
(b) Nos. 353/354 Dn. and 339 Up/340 Dn. amalgamated to run as through trains between Lucknow and Amritsar.
(c) Nos. 6JA/2LJU/10 LJ & 9LJ/ILJU/5JA amalgamated to run as through train between Amritsar and Jakhal and renumbered as 5APJ/3ALJ.

(v) New connections secured.

(a) No. 2 MSN with I PL at Sirhind. (b) No. 62 Dn. with 2 LC at Kanpur-Central.

(vi) No. 1 HDK/2HDK will run to summer timings between Hazrat Nizamud-din and Delhi Kishanganj from 1-4-57.

(vii) Nos. 1BDL/2BDL between Delhi Sarai Rohilla and Loharu and 3 BDH/4BDH between Delhi Sarai Rohilla and Hissar have been designated as Express Diesel Rail Car III and Mail fares will be charged by these trains.

(viii) Nos. 1BDF/2BDF are primarily meant for C.O.D. workers and the passengers are booked from various stations as shown herein:

(a) No. I BDF — From Delhi for Farukhnagar only
„ Delhi Sarai Rohilla to Patel Nagar, Delhi Cantt and Farukhnagar, only.
(b) No. 2 BDF — From Farukhnagar to Delhi Sarai Rohilla, Delhi Cantt & Delhi only.
On Gazetted holidays passengers are booked to and from other stations too.

(ix) For details regarding through and Sectional services to be cancelled through and Sectional services to be introduced, reference may be made to the Time Table.

(x) (a) 200 Miles distance restriction for class III passengers on 31/32 Frontier Mails will be imposed on Delhi — Amritsar section instead of on Delhi — Jullundur City section.
(b) The distance restriction of 100 miles in case of class II and 200 miles in case of class III passengers on 73/74 Howrah — Amritsar Mails will not apply on stations between Varanasi Cantt. — Lucknow both inclusive.

(xi) Air-conditioned accommodation will be provided daily instead of tri-weekly on 305/306 and 61/62 trains running between Delhi — Pathankot Delhi & Kalka respectively.

(xii) For other details and timings at intermediate stations reference may be made to April, 1957 Time Table and Guide available for sale at Railway Bookstalls. Hindi & Gurmukhi Time Table will also be available for Sale at the Railway Bookstalls.

CHIEF OPERATING SUPERINTENDENT, NEW DELHI.

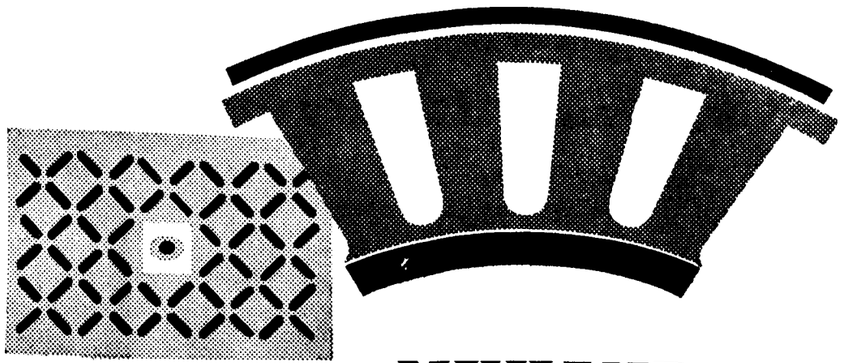
Indian Airlines carry over 500,000 passengers every year

India's highway in the sky... —and it belongs to you!

Servant of modern India, her national airline covers over 20 million miles a year, operates 132 flights each day

EMPLOYING over 9,000 trained personnel, flying over 20 million miles every year and operating 132 daily flights — Indian Airlines Corporation is the largest internal airline in the East . . . and it belongs to the people of India!

Indian Airlines Corporation is a mighty organisation, doing a mighty job — and it is proud of its role in transporting goods and mails, conquering vast distances, bringing the peoples of India ever closer together.



INDIAN AIRLINES CORPORATION

more homes every day...

Today India needs more homes—
better homes—for her millions, calling
for *more* cement and *more* steel.
For the maintenance and expansion of
cement production, components
such as lining plates and grate plates
are essential. Until recently these
tough castings made of manganese steel
were imported, but now they are
made in India—by Mukand.
We are equipped to manufacture,
in increasing quantities, reinforced mild
steel bars and rods, too, so vitally
needed for the construction of buildings.
With our expansion programme
taking shape, we at Mukand, will help
meet the nation's growing needs in
Steel and Steel Castings.

MUKAND
makes *Progress* in Steel

WORLDGRAM

AGRICULTURE

Record Farm Output in E.C.A.F.E. Region: Agricultural production in the ECAFE region (excluding the mainland of China) was at a record level in the crop year 1955-56 exceeding the pre-war average by nearly one-fifth, though still below the pre-war average on a per capita basis, according to a survey conducted by the ECAFE. The increases, however, it says, were mainly confined to a few countries and did not reflect widespread improvement in the food situation. In Japan, the improvement in supplies was reflected in easing of the pressure on prices of cereals, and distribution of rice was liberalised. On the other hand, in India, Indonesia and Pakistan, where the cereal crops harvested towards the close of 1955 or early in 1956 were smaller than in the previous seasons, prices rose appreciably and public attention was keenly focussed on the food situation. This deterioration in the food situation vividly revealed the possibility of sharp increases in the prices of cereals, in response to a relatively small decline in production coupled with factors like hoarding and speculation and indicated the need for remedial action. The survey reveals that most of the crops—cereals, root crops, pulses, sugar, tea—were large: the production of cereals, in particular at over 120 millions tons, was 16 per cent above the pre-war average and even higher than the previous post-war record-achieved in 1953-54. The upward trend in root crops and pulses noticeable in recent years was maintained during 1955-56, the increases over 1954-55 being more than 4 per cent in both cases. On the mainland of China also the output of food grains in 1955-56 officially reported at 184 million tons, was stated to have exceeded that in 1953-54 by 8.5 per cent.

*

Commonwealth Cotton Output: Cotton production in Commonwealth and Sudan fields last year reached a record of 1,279,000 bales, the British Cotton Growing Association announced in its annual report. This was more than 50,000 bales higher than the production of the previous year. The Sudan, Aden and Tanganyika all set new records.

*

Rajasthan Cotton Ginning Factories Amendment Bill: The President has given his assent to the Cotton Ginning and Pressing Factories (Rajasthan Amendment) Bill, 1956. The Bill amends the Cotton Ginning and Pressing Factories Act, 1925, with a view to provide for the licensing of factories and for prohibiting and controlling the admixture of cotton. The Bill has been promoted on the recommendation of the Indian Central Cotton Committee.

*

Cattle and Poultry Development: Several reports and technical programmes relating to various schemes of cattle and poultry development in India were discussed recently by the Animal Breeding Committee of the I.C.A.R. Important among the 94 schemes scrutinized by the Committee was a co-ordinated scheme on investigating the potentiality of cross-breeding indigenous breeds with Jersey bulls. Other schemes discussed by the Committee related to the causes of delayed maturity in Indian cattle, the relative value of selective breeding and grading up and developing the milking capacity of drought animals. Schemes relating to sterility in cattle were also discussed by the Committee. Besides, a number of schemes on the possibilities of developing poultry in India were considered by the Committee. Important among them were the Duck Breeding Scheme in Kerala and Izatnagar, the laying trials carried out in Izatnagar, the chick-hatchery processing plant set up at Katpadi and the influence of different climatic conditions on poultry production.

INDUSTRY

Manufacture of Radio Parts: A model scheme to manufacture radio components, particularly transformers and chokes, has been prepared by the Small Industries Organisation of the Ministry of Commerce and Consumer Industries. The scheme envisages training of the workers for about four to six weeks at a central workshop in the process of manufacture. After training, they can be supplied with tools necessary for coil-winding and assembling in their homes. The radio receiver industry in India is of recent origin. Until recently it was primarily engaged in the assembling of radio sets with imported components. With the adoption of the policy of progressively stopping the imports of these components by the Central Government, the position has changed and most of the parts, except valves, are now manufactured in the country.

*

Industrial Estates: A scheme for the establishment of an industrial estate at Ghaziabad and four other places in U.P. in addition to the two estates already in the process of being set up at Kanpur and Agra, has been proposed by the U.P. Government to the Government of India. The industrial estate at Ghaziabad would cost about Rs. 25 lakhs and is expected to give a fillip to the development of small-scale industries in the district. A minor industrial estate, to cost about Rs. 3 lakhs, in the Community Development block in Ghaziabad's rural area has also been proposed. The schemes have been sent up to the Centre and the State Government is awaiting approval.

*

Revised Standards for Shellac and Bleached Lac: The Indian Standards Institution has just published Indian standard specifications for shellac (revised) and bleached lac (revised). These standards are revisions of Indian standards of shellac and dry bleached lac which were originally published in 1949. In addition to the methods of test given in the draft ISO recommendation for shellac, the Indian standard includes methods of test for determination of rosin, Westinghouse method for flow and non-volatile matter soluble in cold alcohol. The revised Indian standard makes colour index an essential requirement although the draft ISO recommendation has made it optional. The standard deals with terminology and sampling of shellac and prescribes two type of this material, namely hand-made and machine-made. In addition, this standard includes requirements volatile matter (moisture) matter insoluble in hot alcohol, wax, rosin, orpiment, ash, matter soluble in water, flow, heat, polymerization acid value and lead content.

*

D.D.T. Production During February 1957: During February 1957, 48 tons of technical D.D.T. was produced in the D.D.T. Factory at Delhi. This marks the highest average daiiy output of D.D.T. since the starting of the factory. The factory also produced 85.22 tons of formulated D.D.T. during the month. Despatches of technical D.D.T. during the month amounted to 10.4 tons and of formulated D.D.T. to 89.2 tons. In connection with the Alwaye D.D.T. project, a revised offer for the construction of the formulation plant has been received from Messrs. Singmaster and Breyer and is under consideration

*

Draft Standards for Structural Sections: The Indian Standards Institution has circulated, for eliciting comments, two draft Indian standard specifications

covering rolled steel sections. These drafts lay down the nominal dimensions and basic geometrical properties of tee bars and bulb angles in the metric system. The draft Indian Standards bring out briefly the considerations governing the decisions of the ISI committees in the formulation of these standards. Apart from tee bars anad bulb angles covered by these drafts, other structural sections on which standards are under preparation by the Sectional Committee concerned, include cold-formed light-gauge sections, tubes for structural purposes, special sections, etc. Comments on these draft standards may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before April 25, 1957.

TRADE:

Raw Jute Export From East Pakistan: Sales of raw jute for export from East Pakistan in February totalled 280,785 bales, compared with 264,087 bales in the previous month. Larger purchases by countries in the sterling area were responsible for the slight improvement in sales, as sales to other areas recorded a substantial decline during the month under review. Of the total sales during the month under review, the sterling area account for 143,509 bales, dollar area for 27,938 bales, continental area for 78,738 bales and other areas for 30,600 bales. The corresponding figures for January 1957, were 47,723 bales, 34,470 bales, 113,683 bales and 68,211 bales. India topped the list of buyers during the month under review with a purchase of 82,005 bales followed by the U.K. with 32,710 bales.

*

Fish Guano Export: The quota fixed for the export of fish guano from the port of Bombay for the current half-year has been exhausted and no further application for the export of the same will, therefore, be entertained, says a Press note issued by the Joint Chief Controller of Exports.

*

Adverse Trade for Ceylon in December: Ceylon had an adverse trade balance of Rs. 907,000 during December 1956, compared with the favourable balance of Rs. 27.3 million in December 1955, according to customs returns. Ceylon had a favourable trade balance of Rs. 101.6 million last year compared with 479 million in 1955. Value of exports during 1956 amounted to Rs. 1,734.5 million being Rs. 205.5 million less than in 1955. Value of imports during 1956 amounted to Rs. 1,629.3 million being Rs. 170 million more than in 1955.

*

Promoting Exports of Indian Handicrafts: The All-India Handicrafts Board under the Ministry of Production is considering measures for promotion of exports of handicrafts. As a first step, the Board is collecting names and addresses of all exporters of Indian handicrafts with a view to holding discussions with them to understand and assess their problems. These discussions will help the Board to frame concrete measures of assistance and advice to exporters of handicrafts. Handicrafts exporters, who have so far not registered their names with this Board, are requested to send in their names and addresses to the Deputy Director (Marketing), All-India Handicrafts Board, Ministry of Production, Government of India, Janpath, 'A' Barracks, New Delhi.

FINANCE

Grant For Research on Ambar Charkha: The Government of India have sanctioned a grant of Rs. 62,920. of which Rs. 28,000 is for non-recurring expenditure and Rs. 34,920 for recurring expenditure on a scheme of research on Ambar Charkha to be undertaken by the Ahmedabad Textile Industries' Research Association, Ahmedabad. The grant is subject to the condition that the results of the research and experiments conducted out of this grant would be the property of the All-India Khadi and Village Industries Board. The Government of India have also sanctioned the release of a sum of Rs. 66.8 lakhs to the All-India Khadi and Village Industries Board to be utilized as loans for the implementation of Ambar Charkha programme during the current financial year. In respect of Khadi, a sum of Rs. 5 lakhs has been placed at the disposal of the All-India Khadi and Village Industries Board to be utilised during 1956-57 for distribution of implements and accessories at concessional rates for increasing the production of Khadi.

*

Small Urban Loans For D.Ps. From West Pakistan: A sum of Rs. 35.8 lakhs has been allotted by the Central Ministry of Rehabilitation to various Regional Settlement Commissioners and Additional Regional Settlement Commissioners for grant of urban loans to displaced claimants from West Pakistan during the current financial year. The allotments for Regional Settlement Commissioners at New Delhi, Lucknow, Jullundur, Patiala and Jaipur are Rs. 9 lakhs, Rs. 7.50 lakhs, Rs. 6 lakhs, Rs. 3 lakhs and Rs. 3.5 lakhs respectively. A sum of about Rs. 14 lakhs will also be advanced to displaced non-claimants during the current financial year. These allotments during the total expenditure so far on small urban loans to Rs. 14.97 crores. The loans given to displaced claimants are to be ultimately adjusted against the compensation payable to loanees. No interest is charged on these loans. Loans up to Rs. 5,000 in each case are given to displaced persons from West Pakistan under the Small Urban Loan Scheme to enable them to settle in business, trade, industry and other professions in urban areas.

*

Payments in Decimal Coinage: Payments to be made to holders of National Savings Certificates, National Plan Certificates, Defence Savings Certificates, and Post Office Cash Certificates will be calculated in terms of Rupees and Naye Paise instead of Rupees, Annas and Pies with effect from April 1, 1957, simultaniously with the introduction of decimal coinage in the country. The surrender value of these certificates will be converted into the new coinage on the basis of the ready reckoner published by the Government of India. Steps are being taken to bring out a new series of these certificates showing the table of surrender values in the new decimal coinage.

GENERAL

Manufacture of Brass Utensils on Modern Lines: A model scheme for the manufacture of brass utensils has been prepared by the Small Industries Organisation of the Ministry of Commerce and Consumer Industries for the guidance of small industrialists. The scheme has been evolved for helping enterprising small industrialists to break away from old methods of production and to manufacture on modern lines brass utensils for which there is a big demand in the country. With a view to helping small industrial units to produce quality goods and step up their output this model scheme has been prepared and issued in the form of a booklet. It gives basic data regarding the requirements of machinery and equipment, raw materials, capital investment, manufacturing cost etc. Copies of the scheme can be had free of cost from the office of the Development Commissioner, Small Scale Industries, 114, Sunder Nagar, New Delhi, and the Regional Directors of Small Industries Service Institutes in New Delhi, Calcutta, Bombay and Madras.

NEWS IN BRIEF

INDIAN

The Government of India propose to introduce new safety measures for the dock workers against dangers in the transport of explosive ethyl fluids at the ports.

*

The Government of India have decided to extend for a further period up to September 30, 1957, the existing arrangements for payment to displaced Central and Provincial Government pensioners of advances of pensions pending the transfer of their pensions from Pakistan.

*

The Government of India have accepted the detailed Project Report drawn up by Associated Electrical Industries, the consultants for the Heavy Electricals Project sponsored by them, for the establishment of a factory for the manufacture of heavy electrical equipment in India. The factory will be located in Bhopal, Madhya Pradesh; and preliminary steps in that connection are already in progress.

*

A model scheme for the manufacture of activated charcoal, a decolourising agent used in chemical industries, from rice husk has been prepared by the Small Industries Organisation of the Ministry of Commerce and Consumer Industries for the guidance of small industrialists.

*

The Union Ministry of Commerce and Consumer Industries has sanctioned about Rs. 17 lakhs for setting up two production centres in Kerala State, under a programme for setting up a network of production centres throughout the country to absorb matriculates in gainful employment.

*

Nearly 16,000 tons of machinery, equipment and steel structurals have already arrived in Bhilai from the Soviet Union for the one million-ton Bhilai Steel Plant.

*

An occupation-wise analysis of 73,915 scheduled caste applicants registered with the Employment Exchanges at the end of 1956 revealed that 69 per cent were unskilled workers and 9.7 per cent were applicants for clerical jobs. Technicians constituted 4.8 per cent of the number and 1.4 per cent desired to enter teaching profession.

*

The Indian Standards Institution has issued five Indian standards covering methods of test for determination of colour fastness of textile materials to acid spotting, cross-dyeing, (wool), degumming, perspiration, and alkali spotting

*

The Central Geological Department has recommended survey of Garhwal and Almora districts of U.P. for reserves of magnesite deposits in view of its increasing demand under the expansion of iron and steel industry in the country.

*

Several research schemes on fruit growing, floriculture, vegetable production and improvement of spice crops were considered at the four-day session of the Horticulture Committee of the I.C.A.R. recently.

FOREIGN

In the European area of Nyanza Province, the area under tea is increasing at the rate of some 2,000 acres a year. The estimated tea acreage planted in 1956 in Nyanza was Kerich, 1,600 acres, Nandi, 500 acres and Sotik, 200 acres. The estimated production for the same areas are 17,994,450 pounds, 1,345,524 pounds and 643,190 pounds respectively.

*

An order for the supply of "English Electric" Canberra Jet aircraft and spares worth ten million dollars has been signed between the English Electric Company and the Government of Venzuela.

*

It is reported business activity in the U.S. is at a record breaking high, but the sharp upward movement that marked 1956 has ended.

*

New Zealand had a 3.9 million surplus in overseas exchange transactions for the year ended January as compared with a deficit of £26.1 million for the 12 months to January, 1956.

*

The percentage of world crude oil reserves held by the Soviet Union and Eastern Europe nearly doubled during 1956, according to figures issued by the German BP Company.

*

West Germany is to buy 30,000 tons of Egyptian rice for DM 12 million (£.02 million) and in addition, will pay $3 million into Egypts account with the Swiss Bank for 2 million yards of poplin.

*

A new French State Loan, in the form of a prize bond issue which is estimated to yield between Frs. 100,000 million and Fr. 150,000 million (£100-150 million) has been announced.

*

The South African Railways Capital expenditure in the coming financial year is estimated at £72 million against £66 million for the year ending this month.

*

The Federation of Malaya Government has received legislative approval of a five year development plan costing $M. 1,138 million.

*

Exports of cine equipments from the U.K. for 1956 totalled £2,491,252 according to figures issued by the Incorporated Association of Kinematograph Manufactures.

*

Total earnings from East African railway and harbour services in January were approximately £1,859,000 compared with £1,952,000 in the same month in 1956 and £1,908,000 in December last.

*

The Transportation Ministry of Japan estimates new ships laid down in coming fiscal year will total 2,287,000 gross tons and those completed 2,200,000 tons, both of which exceed fiscal 1956.

Special Article

TEN YEARS OF ECAFE

(CONTRIBUTED)

THE Economic Commission for Asia and the Far East, established on March 28, 1947, by the Economic and Social Council under the Charter of the United Nations, has made useful contribution in several directions to the efforts of the countries of the region to accelerate the rate of their economic progress. It would be appropriate at this stage to assess its work in the first decade.

ECAFE's solid activities are best seen in relation to the assistance it has rendered to individual countries. Burma has today one of the most modern iron and steel plants in Asia, and in the world, in the erection of which ECAFE had a share for which it can claim genuine credit. For centuries Burma produced rice, teak and, later, rubber in abundance. Undoubtedly, for this raw-material-producing country, the manufacture of iron and steel was a new venture. Much research had to be done and many important decisions taken before the way was clear for the construction of the first iron and steel plant in Burma. During the planning stage some of the Burmese officials to whom authority for the construction of the new plant had been entrusted joined a group of iron and steel experts from several Asian and non-Asian countries on a study tour of Japan. The trip was organized by two United Nations agencies—ECAFE, which had given the impulse, and the Technical Assistance Administration, which had provided the finances. What the Burmese engineers saw in Japan, and the technical discussions which they had during that study trip among themselves, with their colleagues from other countries, and with ECAFE's iron and steel experts, resulted in radical changes in the plans for Burma's iron and steel plant—changes that proved their value to the Burmese Government and Burmese economy.

In neighbouring Thailand a new large irrigation and navigation dam was ceremoniously opened only a short time ago by the King and the Prime Minister. The water that will flow into Thailand's central plain through a well-controlled and vast network of canals will produce another 500,000 tons of rice for export. The project of the dam is half a century old, for the suggestion was first put forward in the reign of King Chulalongkorn; but it was only since the last war that the Thai Government succeeded in securing, from the World Bank, that bit of financial support that had always been lacking in the past. And when the dedication ceremony of the new dam took place, credit was given to international assistance: to the World Bank that had advanced $18 million toward the total cost of $58 million, to FAO, for having sent an economic agricultural mission to Thailand when the project was being planned, and to ECAFE which, through assisting with hydraulic tests in a scale laboratory, had saved Thailand about a million dollars.

Ten years ago, when ECAFE came into being as a temporary organization to give effective aid to war-devastated countries, it would have required a good deal of imagination to visualize the organization as it exists today. ECAFE, which started as a small research body, has adapted itself to these changes and the Commission has branched out into a multitude of activities affecting almost all aspects of Asian economic life. The handful of ECAFE secretariat staff people who assembled at Shanghai, ECAFE's first headquarters, under the leadership of ECAFE's first executive secretary, Dr. Lokanathan, were doing a pioneering job in collecting reliable data and statistics, and ascertaining the most pressing needs of the various Asian countries. The effects of war were still being felt everywhere in Asia, politically and economically. Politically, the independence movement in Asia had not reached its climax, and not all the new countries of Asia had yet become Members of the United Nations. In fact, Asian countries were heavily outnumbered in ECAFE's original membership, and continued to be a minority for some years. In ECAFE's original membership Asia was represented by China, India, the Philippine Republic and Thailand. The non-regional countries in ECAFE were Australia, France, the Netherlands, the Union of Soviet Socialist Republics, the United Kingdom and the United States of America. Ten countries thus set ECAFE off on its course, under the wider supervision of the Economic and Social Council of the United Nations. But ECAFE's membership, and to some extent also its so-called geographical scope, grew rapidly in course of time. Today the Commission has twenty-four members, of whom seventeen are in the region and seven outside. The Commission's geographical scope, that is, the immediate area of its activities, now embraces a region stretching from Afghanistan to Japan, and from Korea down to Indonesia. To tackle the constitutional problem of getting admitted into ECAFE the Asian countries that were not self-governing or whose constitutional position was in a state of uncertainty or dispute, the device of associate membership was evolved. This proved useful, but by now all associate members have become full members of the Commission, with the exception of Hong Kong, Malaya and British Borneo. ECAFE thus grew into the largest and most important regional agency of the United Nations in Asia.

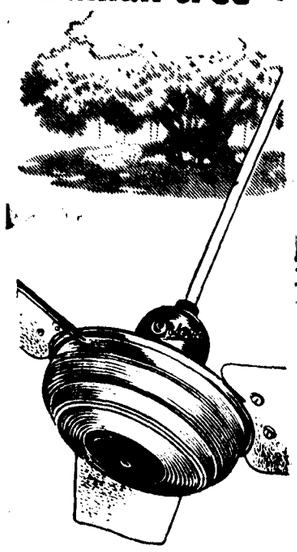
ECAFE, as one of the regional branches of the United Nations, is entrenched, as it should be, in the vast and important region it serves. For centuries Asian countries were oriented outside Asia and there was little intercourse among them. When this situation changed after the war, ECAFE became the first independent regional rallying ground for Asia in the economic field. For ten years now ECAFE has been a forum for Asian economic co-operation and efforts. It is one of the most fascinating episodes in the history of nations to witness how in Asia energetic reconstruction, rehabilitation, and development efforts are made by national governments under the spur of newly won independence, while at the same time this Asian nationalism is blended with the international idea of co-operation and assistance through such agencies as ECAFE. As the quest for independence has by and large been brought to a victorious conclusion, it is realized that political freedom must rest on a sound economic foundation, and that national, regional, and global co-operation is required to ensure a brighter future.

How, it may be asked, has ECAFE furthered economic development? After tentatively probing a multitude of economic problems, the Commission gradually evolved a systematic method of operation which centres around the meetings of the Commission. These meetings, held usually in a different country every year, are ECAFE's highest forum at which senior delegates, many of cabinet rank, meet to discuss their countries' economic situation and problems, review ECAFE's activities and map out a plan of work for the secretariat for the years to come. To provide such a meeting place is one of ECAFE's most important functions. In the first two years of its existence, the Commission met twice a year in full session. The increase in membership and scope of activities soon led to a growth in the structure and status of the Commission.

A committee on industry and trade was established, and in subsequent years there followed the inland transport committee and a large number of sub-committees. These committees and sub-committees meet annually or, in some cases, every other year and, like the Commission, though on a lower but more technical level, they bring together delegates for expert discussions. In addition, ECAFE has during the years arranged many working parties on special topics of importance. Moreover, regional conferences have been held, of which the largest were on trade promotion, flood control and water resources development, mineral resources, statistics, etc. In all these activities, as an organ of inquiry and recommendation, ECAFE has been directed and guided by requests and needs of the governments of its member States. ECAFE's secretariat, which services the Commission, acts as research and statistical bureau, and as a consulting agency for short-term services. During the past ten years ECAFE has prepared some 1,000 studies and reports. The secretariat's 'Economic Survey', published annually since 1948, contains a mine of facts, industriously assembled, carefully analyzed and commented upon.

One of the most important and distinct contributions ECAFE has made to Asian economic life relates to regional co-operation and to the development of regional projects. These projects have assumed an increasing role in ECAFE's activities. In this field, as in others, ECAFE has closely co-operated with other United Nations agencies, especially with the Technical Assistance Administration of the United Nations which has financed several of ECAFE's regional projects. Various types of projects have been developed: training courses and centres, seminars, study groups and group visits. ECAFE has initiated and is closely associated with the United Nations regional railway training centre at Lahore (Pakistan) and it participates with ILO in the establishment of the regional training centre for diesel marine mechanics at Rangoon (Burma). In other instances ECAFE, though not a sponsor, has assisted in various ways. Another type of regional project is study tours, several of which have been organized by ECAFE (and paid for by TAA). Thus, Asian iron and steel experts went to Japan on one of those study tours, railway experts to Europe, lignite experts to Australia, inland waterway experts to Europe and the United States, cottage industry experts to Japan, geologists and mining experts to the USSR and Europe, and electric power engineers to the USSR, Europe and the United States. There are other regional projects of very considerable significance.

One of the most ambitious, a kind of Tennessee Valley project, is the plan for the utilization of the Mekong. The Mekong is one of the largest rivers in Asia, it flows through several countries, and there is great scope for regional co-operation in the field of power, irrigation, and navigation. ECAFE experts first surveyed the potentialities of the Mekong in 1952 and a few months ago a reconnaissance team of senior experts visited the Mekong again to make concrete recommendations. Another instance of ECAFE's work and initiative is the signing of a special convention, drawn up under ECAFE's auspices, for the measurement and registration of inland waterway vessels.



When at an ECAFE meeting in Tokyo somebody suggested that "invisible" exports be also included in trade statistics, another delegate quickly rose to inquire how "invisible" exports could be made visible. Similarly, many of the results of ECAFE's activities are not always tangible enough to become "visible," though their value to the countries concerned and the region as a whole may not be doubted. ECAFE has no executive power; it can only recommend. ECAFE is not a banking or financial institution, and it cannot build factories or dams. However, it has become, as a delegate of an Asian country put it, a "favoured and effective instrument of economic co-operation in Asia and the Far East," and as such it has made its contribution to Asian economic life. And as the economies of Asian countries develop, there is a constantly growing need for economic co-operation, which is the very essence of ECAFE's existence.

of British attachment to the Continent, just as we have come a long way from Sir Anthony Eden's "historic decision" in 1954 to maintain British troops on the Continent in time of peace.

So at the political level the Entente Cordiale has entered a new and fragile phase of its uneven career. But we must not conclude that it is seriously in danger, least of all when the UN and the USA are busy creating the conditions for a new war in the Middle East which may yet require another display of Anglo-French solidarity. Britain and France have always been uneasy friends, but friends withal. Certainly there will be much deep sincerity in the gorgeous demonstrations of amity that are being prepared for next month's visit by the Queen.

OUT-HERODING HEROD

By

CROESUS

OUT-HERODING HEROD is a pastime in which politicians seem particularly to delight especially at election time, but even after the din of elections is over, there are a few who want to persist in this pastime. Since the elections began, it is understandable that the Congress should have staked its all, as it were, on the success of its Five-Year Plan by even going to the extent of calling it as a Plan which has been accepted by the whole country, notwithstanding the serious differences between some sections of the public and the Government on certain aspects of the Plan, although as regards the objectives broadly there can be said to be no two opinions. After this performance of the Congress, it is not surprising that our Government spokesmen should vie with one another in swearing by the Plan and saying that the outlay thereon can only be raised and not reduced. How the Union Finance Minister is going to do this still remains to be seen, though the premonitions about a further stiff dose of taxation next May are there all right. However, Mr. T. T. Krishnamachari's ingenuity could be depended upon fully to rise to the occasion, but some industrialists in Parliament belonging to the Congress seem to feel they can do the thinking in advance of Mr. T. T. Krishnamachari and steal the thunder from the latter. Commendable though the anticipation may be, it has unfortunately all the signs of impatient and immature thinking. Take, for instance, the fantastic proposals of Mr. Chandulal Parikh in the Rajya Sabha on Monday (25-3-1957). I am surprised and shocked that an industrialist of his calibre should have come forward with such suggestions which would not bear even a moment's impartial scrutiny. Not even his desire to excel all others in his party in their consuming passion to speed up India's industrialisation in terms of the second Five-Year Plan can extenuate this impetuosity.

One of the several radical or rather fantastic suggestions that this enthusiastic linetower has put forth for finding the resources to go ahead with the second Plan is the proposal to have a 100 per cent increase in the excise duty on superfine cloth. Before examining to what extent this suggestion is feasible in the existing circumstances, that is, in the context of the steadily declining trend in the production, export and consumption of superfine cloth in the country, it is relevant to recall that the excise duty on superfine cloth already stands raised from 2½ annas per square yard to 4 annas per square yard — this was done only towards the end of August last. While it is not known to what extent the expected additional revenue of Rs. 17.5 crores to the Central Exchequer from the increase in excise duty on all varieties of cloth was actually brought about, the guess can be safely hazarded that, inasmuch as there is very little demand in the country itself for superfine cloth as reflected in the steadily declining trend of production (exports also have fallen ranging as these do, from 0.82 million yards to 1.89 million yards in 1956) and the perceptible accumulation of superfine cloth stocks with the mills, any attempt at further increasing the excise duty, let alone hundred per cent, on this variety of cloth, as proposed by Mr. Chandulal, is deliberately to kill our superfine mills.

Mr. Chandulal is not content merely with proposing this utterly unwarranted impost on the cotton mill industry but he wants to hit the later in yet another way — albeit by implication — that is by making it impossible for the mills to produce superfine cloth by limiting or banning imports of costly Egyptian cotton, on the score that this entails large sums of foreign exchange. One can appreciate this concern of his for our parlous foreign exchange position, but it seems unbelievable that one so closely connected with the mill industry as Chandulal should have asked (by inference) for restricting imports of Egyptian cotton, without pausing to think of the serious consequences. Does Mr. Chandulal think that the Indian mill industry can do without Egyptian cotton, especially after having reportedly entered into an agreement with that country for importing 40,000 bales of Egyptian cotton? Granting, for argument's sake, that this is possible, what will happen to those mills in our country which are equipped to produce superfine cloth? If superfine cloth production were to be restricted, would not a large labour population become superfluous and would not this, in turn, lead to their being thrown out of employment? (The second Plan, let it not be forgotten, has to provide additional employment for 10 million people, excluding the educated classes and the backlog of un employment of 5.3 millions from the first Plan). Perhaps Mr. Chandulal conveniently forgets that, as it is equipped today, the Indian cotton mills could do with out most varieties of foreign cotton but not without a given minimum of long-staple cotton as is grown in Egypt. Moreover, one should not forget that trade is after all bilateral. We cannot expect to increase our exports to Egypt unless we are prepared to import something from that country, and it is common knowledge that cotton is one of the severely limited range of commodities that Egypt is in a position to export. If, therefore, we refuse to take Egyptian cotton or reduce even our normal annual offtake, we must be prepared, **ipso facto** to restrict our exports to that country. Are we in a position to do this when the cry is more of export and not less of it?

It is true that every effort must be made to limit our foreign exchange outlay but, as Mr. T. T. Krishnamachari has categorically stated in Parliament, our foreign exchange position even today is not that bad as to compel us to adopt some desperate measures as a few members like Mr. Chandulal and others have advocated.

Constructive suggestions towards a speedy implementation of the second Five-Year Plan, even on a war basis, would always be well received. And those who come forward with such suggestions could rightly feel proud of their contribution to the successful implementing of the Plan. But, for an industrialist, especially one who hails from Bombay, or rather, who represents Bombay, to say that the excise duty on superfine cloth should be doubled to speed up the Plan implementation tantamounts to nothing short of irresponsibility. If the textile industry, which is already cramped by a restricted production policy, has to suffer suggestions like the one under discussion, and that from one of its own spokesmen, then the industry must be said to have fallen on evil days indeed.

TWO ECONOMIES—A CONTRAST

(CONTRIBUTED)

AT the end of Chou En-lai's visit to Moscow last month, Mr. Khrushchev once again proclaimed his belief in the inevitable ruin of the capitalist economy — that is to say, any economy not closely modelled on Soviet lines. The scarcity of economic information about Communist countries makes it difficult to compare the real development of a totalitarian and a free economy, but to a certain extent, the case of West and East Germany is something of an exception. Here we have a country which since the end of the war has been split in two, and one part has been subjected to the full impact of the strait-jacket of economic and social Sovietisation. Mr. Khrushchev has said that by building Socialism and Communism in the Soviet bloc, the final downfall of capitalism would be hastened because, to quote his words, a good example is a great force. How good has the example been? The publication by the Economic Commission for Europe of a study of economic developments since the end of the war is particularly timely, and it provides some interesting answers.

The secret weapon of the Soviet type of economy is considered to be its high rate of "accumulation", that is that part of the national product which is set aside for capital formation. Yet since 1951, at the beginning of long-term planning in East Germany, the rate of accumulation was 10 to 12 per cent in East Germany and 20 to 25 per cent in West Germany. While West Germany's investment had benefited from the very large volume of external aid, especially from 1948 to 1950, East Germany's investment, up to the end of 1953, was limited by the deadweight of reparations. Moreover, West German investment was spread over almost all sectors of the economy, while by far the greater share of East Germany's investment went into new projects for heavy industry. And their economic foundations were not primarily dictated by the requirements of East German industry but by the general economic policy for the Soviet bloc as enforced by the Soviet Union.

Before the war East Germany exchanged its products, many of them consumer goods, for raw materials and other goods from the West. The increasing integration of the East German economy into the Soviet bloc and the demands of the satellite countries created fresh problems. Satellite orders were concentrated on basic materials and investment goods, and shortage of foreign exchange prohibited them from importing consumer goods. East Germany was driven to a foreign trade programme and a degree of self-sufficiency ill-suited to its highly specialised productive structure. West Germany did not have to contend with problems of this kind. Her exports and her trade surplus were rising and she could freely buy raw materials in foreign markets.

Agriculture offers an even more striking picture of diverging developments. As late as 1950, East Germany was still a net exporter of food to West Germany, as she had been in pre-war years. Yet since 1951 she has been a net importer. In point of fact, agricultural output increased at a much faster rate in the West than in the East. Communist propaganda asserts that it is only through collectivisation that mechanisation of agriculture can really become effective, yet the level of agricultural mechanisation is much less advanced in East Germany with her Machine Tractor Stations than on the farms of West Germany. It is for this reason that East Germany's agricultural output is so seriously affected by the shortage of agricultural manpower. The much lower yields of crops are the direct result of a severe shortage of fertilisers. They have to be imported in part from the West, and the necessary foreign exchange is scarce. For the same reason, the acute shortage of seed potatoes cannot be made good through imports. Before the war, East Germany was one of the most important potato-growing regions of Central Europe.

West Germany, benefiting as she does from the more balanced structure and the external aid which she received at a crucial stage in her economic development, was able at a time of world-wide expansion to adapt herself quickly to the new pattern of demand, both domestic and foreign. But East Germany, despite her undoubted considerable progress in recent years, has been far less successful.

The wide differences in the economic development of West and East Germany lend no support to Mr. Khrushchev's pessimistic forecast about the future of non-Communist economies. But it does provide evidence of the impact of political and social factors on economic action. In East Germany all economic measures are determined by Communist Party policy, as formulated in Moscow. Fixing the share of wages in the national product at a low level is a political decision which workers must accept. They can only express opposition by a fall in the quantity and quality of their products. In West Germany the workers, through their trade unions and political parties, can and do press for wage increases, and in support they can use the strike weapon. Of this freedom of economic and social action, denied to the workers in the Soviet bloc it can be said (to borrow Mr. Khrushchev's phrase) that a good example can be a great force.

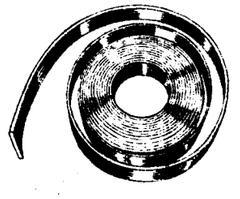
TURNING A NEW ROLL



We have turned a new roll ; and it has cost us three and a half crores of rupees.

To what purpose, pray ?
At the end of the rolling, we get coils of flat, steel strip—skelp, as the steel man calls it. The skelp is passed on to the Indian Tube Company, which welds it into tubes.

So what ?
Merely that steel tubes pipe up water from deep inside the earth to parched fields, helping to grow a rich harvest. In the cities, countless homes receive a protected supply of water through these pipes.

Soon, a new plant will turn out the kind of steel tubes that go into the making of bicycles. Remember also that the locomotive speeding along the track is kept going by steel tubes which hold the steam.

Tata Steel's new Skelp Mill, the first of its kind in India, has a capacity of 200,000 tons. When there is enough steel, this mill will roll all the skelp and strip the country needs.

TATA STEEL
SERVES THE NATION

BUSINESS NOTES

PERSPECTIVE PLANNING FOR SHIPPING

AMONG THE surprises which have given a rude shock to our original anticipations in the second Five-Year Plan, the crisis which has overtaken the programme for the expansion of shipping raises issues of first rate importance. These issues demand early solution which must be found out if the nation is not to be made to pay a heavy price in the form of retarded progress and avoidable expenditure of scarce foreign exchange on freight for shipping. Mr. Dharamsey M. Khatau has uttered a note of caution for timely action in his presidential speech at the last annual general meeting of the Scindia Steam Navigation Company. The gist of his argument is that finance must be provided to prevent the threatened shortfall in the conservative target of expansion of shipping to 9 lakh GRT by March 1961 and more significantly a long-term view must be taken of planning for the development of shipping. This is easy to appreciate. The order books of all the overseas shipping yards are practically full till the end of March 1961 and possibly deliveries of ships to be ordered for the second Plan may be delayed beyond that period. This grave contingency underlines another precaution. We must adopt perspective planning in the case of shipping and draw up the programme for the third Plan right now if we are not to stumble upon the same difficulty for the third Plan as we are experiencing now. This warning has been uttered with deliberate accent by Mr. N. R. Pillai in his address at the last annual meeting of the Hindustan Shipyard.

This crisis of foreign exchange is looming large in the shipping development programme. The allocation of Rs. 37 crores made in the second Plan as the resources to be provided by the Government has been swallowed by the first phase of expansion in which 175,000 GRT only could be acquired. Costs, however, are going up steadily. The market for second-hand tonnage is becoming prohibitive. The price of the American Liberty ships in the moth-ball fleet is usually regarded as an index of the price of second-hand ships. It rose steeply from Rs. 24 lakhs to Rs. 89 lakhs in three years ended December 1956. The price of new ships increased recently by 28 per cent and now no yards are prepared to quote a firm price, while the situation is getting so tight that they decline to quote a price subject to a ceiling on escalation. We need another Rs. 40 crores to complete the target of 9 lakh GRT fixed for the second Plan. Government is not prepared to commit itself to this additional outlay for the simple reason that this expenditure requires foreign currency. The yield from this outlay, however, will be spectacular. The additional tonnage to be acquired with it will raise earnings of shipping in terms of foreign exchange by Rs. 7 to Rs. 8 crores per year pushing up the total earnings of Indian shipping to an annual rate of Rs. 20 crores in foreign exchange by March 1961. The purchase loans can be repaid in a period of seven years. Shipping is among the priority projects which the World Bank is prepared to finance by loan. The case for such a loan should be vigorously pursued with the Bank. What is of fundamental importance, planning should look beyond March 1961 from now onwards.

REASONABLE RETURN FOR ELECTRICITY UNDERTAKINGS

THE ROLE of the private sector in the electricity industry is considerable as can be seen from the fact that some 50 per cent of electricity is still produced and 75 per cent distributed by private undertakings in the country. Being an indispensable public utility, a reasonable rate of return is vital to its healthy functioning and growth because capital will not flow to an undertaking which finds it difficult to pay a fair return to the investor. It is apparently in recognition of this fact that the Electricity (Supply) Amendment Act of 1956 incorporated in it a provision for "automatic adjustment" of the Standard Rate of return to follow fluctuations in the money market so that the industry may not be forced to carry on a hand-to-mouth existence.

But Government's actions are sometimes mysterious and how this legislative intent has been thwarted in effect has been brought out by Mr. K. G. Milne in his forthright address to the annual meeting of the Ahmedabad Electricity Company Limited where he has subjected Government's policies to a searching scrutiny. How the recent decision of the Reserve Bank has affected the electricity industry adversely is best described in the words of Mr. Milne himself. He observes: "Hardly had the ink used in the new legislation dried when the announcement by the Reserve Bank came to the effect that as from February 1, 1957, the rate of interest on advances to scheduled banks against Government and other eligible securities had been raised to 4 per cent while at the same time the official Bank Rate was unchanged at 3½ per cent." He goes on: "For the electricity industry this announcement came as a bolt from the blue for unless upon pressure of circumstances, the Bank Rate itself is officially raised to line up with the Reserve Bank's lending rate for advances to scheduled banks, we are again caught by the necessity to plead for Parliamentary enactment so as to keep in line with the changes in the value of money." In effect the real object behind the amendment is being defeated. Government ought to pay heed to these words and act in time to avoid any injury to this vital industry.

Mr. Milne also devoted a considerable part of his speech to other problems facing the electricity industry. He was particularly critical of the Finance (No. 3) Act, with its provisions for compulsory deposit with the Reserve Bank in respect of depreciation allowances given under Section 10(2) of the Income Tax Act. He pertinently observed that the Electricity (Supply) Act had already made its own provisions towards an identical end, namely, the investment of depreciation allowances in the business or in Government securities and has, therefore, pleaded that consequently the industry must be exempted from the operation of the relevant part of the Finance Act. Yet another serious problem facing the industry is the import of heavy electrical plant and capital goods for future projects in the country. The prevailing foreign exchange crisis has no doubt further added to the difficulties, but Mr. Milne is justified in hoping that in view of its importance in the economy, the industry will receive priority consideration in the allocation of foreign exchange for necessary capital imports.

REVIVING INTERNATIONAL TEA AGREEMENT

THE SUGGESTIONS made by Mr. J. P. H. Benet, Chairman of the Indian Tea Association, at the annual meeting of the Association deserve serious consideration. The reviving of International Tea Agreement has become imperative primarily for two reasons. Firstly, the bulk of teas produced in our country are common teas which are facing harder competition as more producing areas are coming into the field year after year with resultant over-production of this type of teas. Secondly, the inability of Indian tea industry on account of a very rigid cost structure and a high export duty to adjust itself to the necessities of a buyers market except within narrow limits operates as a severe handicap.

Not only that, in recent years, tea production has been started on a commercial scale in many countries.

The People's Republic of China and Formosa which stopped exports of tea during the war have rehabilitated their industry. Africa, though a comparatively newcomer to the tea world is one of the important of the exporting countries competing with India. There is a danger as a result of this ever-increasing output and export of tea from the old and new producing countries of a crisis being brought about in the tea industry of those regions which on account of their climatic and soil conditions could produce only common teas.

In view of these circumstances Mr. Benet has urged that it is essential that "an international tea agreement should be signed if only by India and Ceylon in the first instance. The existence of such an agreement should make it easier for those two countries to come to terms over the regulation of exports in future years and circumstances may later make other countries see the benefits of becoming parties to it also, especially if production increases significantly in Indonesia and Africa, and exports from China and Japan continue to expand." In this context it is most instructive to recall what the Plantation Enquiry Commission has to say on the effect of the international tea agreement which has expired and has not been revived since then. The Commission has demonstrated by statistical proof that the actual acreage under tea has been usually below what was allowed in the agreement. It has, therefore, no restrictive effect on output. Besides it offers a guarantee against wide price fluctuations.

HURDLES AGAINST HIGHER PEPPER EXPORTS

THE ACCENT is now on exports and more exports to help ease our foreign exchange position. Stressing the need for augmenting the country's scarce resources of foreign exchange, Mr. Lakshmipat Singhania, President of the Federation of Indian Chambers of Commerce and Industry, stated, at the 30th annual session of the Federation, on March 23: "It is imperative that export promotion should be looked upon as a joint and national responsibility". While it is true that several Export Promotion Councils have been instituted under the auspices of the Government, it is at the same time indisputable that the benefits accruing therefrom are equally shared by industries in the public and the private sectors alike. Only the actions of some of these Councils often tend to be hidebound, inasmuch as these bodies do not enjoy the same degree of freedom and flexibility that is associated with a private and non-Governmental institution.

That the private interests are quick to take the cue whenever an opportunity presents itself was only recently demonstrated by the promptness with which the Pepper and Ginger Merchants' Association, Ltd., Bombay, apprised the American Trade Mission, who were in Bombay in the first week of this month, to be precise, of the practical difficulties in the way of promoting the export of black pepper, especially to America. Mr. Mariwala, President of the Association, one of the leading pepper merchants in the country, drew pointed attention to the higher freight on pepper and some technical rigidity in the terms and conditions of the American Spice Trade Association's Contract, as the two major hurdles that the pepper exporters in India have to overcome.

Referring to the question of freight on pepper, the P.G.M.A. Chief stated that there had been a tendency for shipping companies to increase freight on the slightest pretext. The move, he recalled, was initiated when pepper prices were around the peak levels, and he conceded that, during the boom period, this upward revision in freight was not unjustified or unfair, wherefore it did not evoke criticism from the trade at the time. However, time has changed since and the price of pepper is now only one-eighth of the boom level. Accordingly, he said, there was urgent need for downgrading the freight. The freight now works out to as much as about 30 per cent of the value of pepper, and, unless this is reduced, as Mr. Mariwala pointed out, the competitive position of Indian pepper will be seriously handicapped. In this connection, he made a very reasonable suggestion when he put it to the American Trade Mission that the original freight rate might be restored, to which could, of course, be added the subsequent increases necessitated by the closure of the Suez Canal.

In regard to the A.S.T.A. Contract, the Association brought to the notice of the U.S. Trade Mission that, despite the Association's several representations, no action has been taken. According to one of the clauses of the Contract, allowance for extraneous matter to the extent of 1 per cent is given, but no allowance is given for an excess of 2 per cent of light pepper. Actually, as per the terms and conditions of the American Spice Trade Association's Contract, 2 per cent of light pepper and 1 per cent of extraneous matter, in all 3 per cent are allowed. But, the Association complained that the U.S. buyers of Indian pepper continue to deduct any excess over 2 per cent from the value of the invoice, even though the total percentage is within the 3 per cent limit.

If the U.S. Trade Mission were to use its good offices to rectify these technical defects, the export trade in pepper, particularly to the U.S.A., which accounts for 60 per cent of India's annual pepper exports, would pick up considerably. Coming in the wake of the beneficial results arising out of the visit of the Indian delegation (sent by the Export Promotion Council for Pepper) to Central European countries towards the end of August last, this should help further to augment our foreign exchange earnings.

PROGRESS OF MYSORE SOAP FACTORY

THE RS. 18-LAKH expansion of the Mysore Government Soap Factory, which is among the premier State-owned units in the country, — thanks to the genius of Sir M. Visvesvaraya who conceived the idea and gave it shape when he was Dewan of Mysore, years ago — and which the Governor of Mysore inaugurated at Rajajinagar, Bangalore, last Monday, is of interest not merely to Mysoreans but to the country as a whole, because this expansion will help to augment the exports of soap, particularly toilet soaps, from this country. According to what the Minister for Industries, Mr. C. M. Poonacha, observed whilst welcoming the Maharaja of Mysore, the prospects of a stable export trade for Mysore toilet soaps seems to be bright, judging from the good reception accorded to the limited quantities of these soaps introduced in the overseas markets. Reports from Malaya, Hong Kong, and East Africa and even Canada and the U.S.A., where Mysore Sandal Soaps are being sold, have shown that these soaps are steadily growing in popularity. This is, indeed, heartening news at a time when the country is facing an acute shortage of foreign exchange.

While not only the Mysore Government Soap Factory — whose total annual output even after the latest expansion is, after all, only 600 tons per year — but every soap factory in India ought to strive and increase the country's soap exports, it is also necessary, at the same time, that soap consumption within the borders of India also should increase considerably. In comparing the **per capita** soap consumption of 23 lbs. in the U.K., 24 lbs. in Japan and 29 lbs. in the U.S.A., with the negligible figure of one lb. in our country, therefore, the Governor of Mysore gave a vivid idea of the enormous leeway that remains to be covered by us in this direction. And he rightly added that cleanliness was not merely a matter of appearance but was essential for one's mental and physical health as well. It is surprising that there should, even to this day, be such a hopelessly inadequate appreciation of this simple thing, and that, in a land where we talk of cleanliness as next only to Godliness. Has cleanliness, by any chance, gone down the priority list after we have chosen to make India a Secular State?

THE INDIAN OVERSEAS BANK LTD. MADRAS

We'll help you solve your trading problems

The Indian Overseas Bank can handle your overseas trading problems 'on the spot' With branches located strategically all over South East Asia, the Bank is in a position to offer Indian businessmen expert personalized service on all matters concerning foreign trade. If you are planning to develop your trade in this area of growing commercial importance you couldn't do better than to consult the Indian Overseas Bank.

More of everything for the common man is the basic objective of the Second Five Year Plan. Rapid industrialisation, with particular emphasis on basic industries, is the key to the fulfilment of this programe. The ever-widening activities of Texmaco are geared to this very objective of national regeneration. In line with the Plan, their factory at Belgharia has been equipped with the most modern machinery. Texmaco's contribution to India's industrial development is a wide variety of products. In technical collaboration with manufacturers of world repute they supply the complete range of spinning machinery for cotton and staple fibre, jute and sugar mill machinery, industrial and locomotive boilers, pressure vessels, railway rolling stock, steel structurals, steel castings, hydraulic dam project equipment, etc.

TEXTILE MACHINERY CORPORATION LIMITED

TXC 4

THE UNITED COMMERCIAL BANK, LIMITED.

(Incorporated on 6th January, 1943.)

FOURTEENTH REPORT
OF THE
BOARD OF DIRECTORS

The Directors submit to the shareholders the Audited Balance Sheet of the Bank as on, and the Profit and Loss Account for the year ended, 31st December, 1956.

The net profit for the year, after providing for all known and anticipated charges and including Rs. 27,761-2-0 brought forward from the previous account, amounts to	Rs.	56,79,419	10	9

The Directors have made the following appropriations out of the net profit:

Transfer to Reserve Fund	Rs.	20,00,000	0	0
Provision for Taxes	„	16,00,000	0	0
Provision for Bonus to Staff	„	6,50,000	0	0
Balance	„	14,29,419	10	9
	Rs.	56,79,419	10	9

Out of the balance of Rs. 14,29,419-10-9 the Directors recommend to the shareholders the payment of a Dividend at Rs. 3-8-0 per share, free of income-tax, which will absorb Rs. 14,00,000, leaving Rs. 29,419-10-9 to be carried forward to the next year's account.

The Bank's business continued to expand during the year and the profit showed a substantial increase as compared to the preceding year.

Demand for money continued unabated throughout the year.

The Bank Rate remained unchanged at 3½% but the rate of interest on both deposits and advances rose steadily throughout the period. After the turn of the year the Reserve Bank of India raised the rate of interest to scheduled banks on advances against Government Securities from 3½% to 4%.

The Bank's investments appear in the balance sheet at below market value.

During the year branches of the Bank were opened at Kuala Lumpur in the Federation of Malaya and Rourkela.

The Directors are thankful to the shareholders and the clients of the Bank for their continued support. They also express their gratitude to the Bank's advisers and advisory committees for their able help and guidance.

Under Article 95 of the Bank's Articles of Association four of your Directors—

Shri G. D. Birla

Shri M. R. Ruia

Shri G. D. Kothari

Shri Yogindra N. Mafatlal

retire by rotation, and being eligible, offer themselves for re-election.

The Shareholders are requested to appoint auditors for the current year and to fix their remuneration.

BY ORDER OF THE BOARD,

G. D. BIRLA

Chairman.

CALCUTTA,

12th March, 1957.

REPORTS OF THE AUDITORS TO THE SHAREHOLDERS

We have audited the foregoing Balance-Sheet of The United Commercial Bank Limited, as at 31st December, 1956 and also the foregoing profit and Loss Account of the Bank for the year ended upon that date, in which are incorporated the Branch returns audited by the Statutory or other Auditors.

In accordance with the provisions of Section 29 of the Banking Companies Act, 1949, read with the provisos to sub-sections (1) and (2) of Section 211 and sub-sections (5) of Sections 211 and 227 of the Companies Act, 1956, the Balance-Sheet and Profit and Loss Account are not required to be and are not drawn up in accordance with the Sixth Schedule to the Companies Act, 1956; they are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Compaines Act, 1949.

We report that:

(a) We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;

(b) The transactions of the Bank which have come to our notice have been within the powers of the Bank;

(c) In our opinion, proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books and proper returns adequate for the purpose of our audit have been received from the Branches of the Bank;

(d) The Bank's Balance-Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account and the returns;

(e) In our opinion and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956, in the manner so required for banking companies and on such basis the said Balance Sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1956, and the Profit and Loss Accouunt gives a true and fair view of the profit for the year ended upon that date.

Calcutta, 12th March, 1957.

COMPANY AFFAIRS

INDUSTRIAL CREDIT AND INVESTMENT CORPORATION

The second annual report of the Industrial Credit and Investment Corporation of India, Ltd., discloses that, by the end of December, 1956, the Corporation had agreed to give financial assistance of as much as Rs. 601 lakhs in one form or the other to industrial undertakings (in respect of 24 applications). In addition to this, fifteen applications, which were under examination at the end of the year, involved a total, we are told, of another Rs. 600 lakhs. Of the Rs. 601 lakhs actually sanctioned, Rs. 295 lakhs were in the form of loans, Rs. 238 lakhs by way of underwriting of ordinary and preference shares, and Rs. 68 lakhs in the form of direct subscription of ordinary and preference shares. Notwithstanding the fact that Rs. 601 lakhs worth of financial assistance was decided to be sanctioned thus, the actual disbursements at the end of the year under review stand at a relatively lower figure. This has, of course, been explained by the Directors in their Report as being due to several factors, such as disbursement of loans not in their entirety, but according to the needs of particular projects, spreading over of instalments over a period, investment of monies in shares only when needed and the difference between the Corporation's eventual subscription to shares 'vis-a-vis' the actual amount of underwriting.

At the rate at which the Corporation has been helping industries, it may not be very long before the entire resources of the Corporation, consisting of paid-up shares and loan from the Central Government, will have been more than accounted for. It is just as well, therefore, that the Directors of the Corporation have already started giving attention to what they should do in the event of such a situation.

Of particular interest to industrialists in the private sector, especially when the foreign exchange position of the country is as parlous as it has turned out to be, is the reference in the report that, up to the end of last year, there was no opportunity for making use of the loan of $10 million or their equivalent in other currencies, made available to the Corporation by the World Bank for purposes of meeting external costs on projects and undertakings assisted by the Corporation. Until recently, the promoters of new projects were in a position more or less to obtain their requirements of foreign exchange in the ordinary course, which explains the absence of any draft on this source of the Corporation's finances. But, now, as a result of the shortage of foreign currency and the consequent revision of import licensing policy, the Directors rightly anticipate that there will be demand for this also, and it is gratifying to note from the Report that the Corporation is ready to assist applicants by making use of these facilities in suitable cases where loans in foreign currency are sought.

The Directors have themselves drawn attention to the fact that the market quotations of a number of the Corporation's investments are lower than the book costs. Explaining the reasons for this, which are nothing unusual in the early years of new companies, the Board gives the assurance that the position would be constantly kept under review, besides providing substantial amounts by way of reserves.

The general reserve of the Corporation, as at the end of December, 1956 was Rs. 10 lakhs. The net earnings of the Corporation before tax amounted to Rs. 36.99 lakhs, which is an improvement over the net earnings for the previous accounting period (ten months only) of Rs. 28.56 lakhs. After providing for all expenses and depreciation and income-tax, the net profit for the year under review amounted to Rs. 21.65 lakhs. The Second Annual Report of the ICICI is not only important because it relates to the first year in which the Corporation has recommended a dividend of 3½ per cent free of income-tax, but also because it is the first Report which gives full particulars of companies in which the Corporation's funds have been invested or to which loans have been disbursed. This is, indeed, a welcome decision on the part of the Board.

Obviously, the increasing activity of the Corporation makes the present premises in which the Corporation is located inadequate, which explains the decision of the Corporation to erect a building of its own. Actually, a plot has been acquired from the Government for this purpose.

THE UNITED COMMERCIAL BANK LTD.

The fourteenth report of the Bank's Board of Directors, and the audited balance sheet and profit and loss account for the year ended December, 1956 (which is published in detail elsewhere in this issue) shows that the Bank conducted satisfactory and expanding operations during the year. This is reflected in a substantial increase in profits over the previous year, from Rs. 36,69,037 to Rs. 56,51,658-8-9, subject to taxation. Together with the balance of Rs. 27,761-2-0 brought forward from the previous year, the profit totals Rs. 56,79,419-10-9. From this amount, the Directors have transferred Rs. 20 lakhs to the Reserve Fund, and have provided Rs. 16 lakhs for taxes and Rs. 6.50 lakhs for bonus to staff. That leaves a balance of Rs. 14,29,419-10-9 available for distribution. Out of this balance, the Directors have recommended payment of a dividend at Rs. 3-8-0 per share, free of income-tax, which absorbs Rs. 14 lakhs, leaving a net balance of Rs. 29,419-10-9 to be carried forward to the next year's accounts.

Throughout the year, the demand for money continued unabated and there is a general feeling of monetary stringency. As a result of increasing demands for accommodation the rate of interest on both deposits and advances rose steadily during the year. The Bank Rate, however, remained unchanged at 3½ per cent. Early this year, the Reserve Bank raised the rate of interest to scheduled banks on advances against Government Securities by ½ per cent from 3½ to 4 per cent.

The Bank expanded its activities to the Federation of Malaya and established a branch in Kuala Lumpur. It also opened a branch at Rourkela during the same year.

Company Meeting

THE AHMEDABAD ELECTRICITY CO., LTD.

Speech of the Chairman, Mr. K. G. Milne

Gentlemen,

I would like to refer first of all to the resignations of Sir Purshotamdas Thakurdas and Mr. Ambalal Sarabhai from your Board of Directors during the year. Since the Company's inception 44 years ago, Sir Purshotamdas Thakurdas has given it his invaluable guidance. So too Mr. Ambalal Sarabhai, with 38 years of active membership on your Board, has been prominent in furtherance of the Company's well-being. With their intimate knowledge of affairs, and of the City of Ahmedabad, they have each rendered untold services to this Company, and I am sure you will wish to associate yourselves with the resolutions which were passed by the Board expressing their high appreciation.

The health of a controlled Industry like Electric Supply is greatly dependent on the regulatory climate in which it functions. We have the Electricity (Supply) Act, 1948, modified by the Electricity (Supply) Amendment Act, 1956, as our chief weather-maker on the stormy shores of the general economy. Shareholders must be anxious to know how far the changes brought about by the 1956 Amendment Act are likely to affect the Company and its equity, and I will therefore attempt an analysis.

Firstly the Standard Rate of return permitted to the Industry will become linked to the Bank Rate as from 1st April, 1957, making at present levels 5½ per cent, instead of the previous fixed figure of 5 per cent. Internal financing has also received a slight fillip from the provision that tax savings accruing from the Development Rebate allowed under the Finance Act are to be taken to a Development Reserve, subject to the earnings of the year not thereby being made to fall short of the Reasonable Return. The Company will be allowed one half of 1 per cent on the annual balances in the Development Reserve as a sort of handling charge or risk money, though no other direct benefit will accrue to shareholders as the Reserve is to be excluded from the Capital Base.

Against these two gains by the Industry must be set off the disallowance of interest on Loan and Debenture Capital as an item of expenditure in arriving at the Clear Profit, evidently on the ground that the Industry could always obtain a return on such monies through the inclusion of the value of the counterpart assets in the Capital Base. It is evident in the final result that the increase in the Standard Rate will not compensate fully for the resultant drop in the permissible Profit in the case of your Company, as approximately one-fifth of the Capital is in the form of Debentures.

However, as things now stand, we may reasonably expect to be able to maintain a dividend of 6½ per cent or thereabouts. The big question is, whether this is going to be enough to restore, in the present climate for investment, the confidence and incentive to the investor which have been so rudely shaken of recent times. The answer to this question, in its widest context, is really vital to India as well as to us.

It is certain that our Government must have prominent before it the problem of carrying the people with it in the raising of extra taxes needed to finance all those tasks it has set itself—River Valley projects, Steel works, the expansion of the Railways and the like. It seems to me however that all these tasks together dwarf in comparison to those which the myriads of ordinary business men have to perform all over the country and in countless different spheres, if real overall progress is to be made. It is a flashing danger sign if finance for worthwhile, and even for essential, projects threatens to dry up in what we may truly call the "People's Sector".

In the case of Electricity, some 50 per cent is still produced, and 75 per cent distributed, by commercial undertakings in this country. It is an absolutely basic commodity whose increase all agree is a "must" for progress. There is really no argument about it. Yet you know that the shares of our Company—the largest and one of the most rapidly expanding single producers of electricity in the State—have been actually standing at a considerable discount most of this year, all because of over-severe controls.

It will be agreed that under such circumstances, we would hardly have been in a suitable position to raise more finance to promote expansion or development. Yet Electric Supply Undertakings have normally a certain stability and position of their own; and others are usually worse placed than us, rather than better. Surely therefore Government will have to evolve policies designed to carry the business people with it to a greater extent if all the people are to flourish.

It seems for these reasons especially unfortunate that Parliament's estimate attempt to encourage the investor in our industry by making a provision for "automatic adjustment" of the Standard Rate of return to follow fluctuations in the money market, has apparently been almost instantly frustrated by executive action. Hardly had the ink used in the new legislation dried, when the announcement by the Reserve Bank came to the effect that as from 1st February, 1957, the rate of interest on advance to Scheduled Banks against Government and other eligible securities had been raised to 4 per cent, while, at the same time, the official Bank Rate was unchanged at 3½ per cent. For the Electricity Industry, this announcement came as a bolt from the blue, for, unless upon pressure of circumstances the Bank Rate itself is officially raised to line up with the Reserve Bank's lending rate for advances to Scheduled Banks, we are again caught by the necessity to plead for Parliamentary enactment so as to keep in line with the changes in the value of money.

The Industry has quickly reacted and approached the authorities for action, if necessary by an Ordinance. It has been pointed out that the World Bank rate of lending against Mortgage Debentures carrying the unconditional guarantee of the Government of India, is now a minimum 5½ per cent, the same as is now available to our Industry to cover any fresh Equity investment. This is clearly absurd.

It may be added that there is still no solution in sight to the discouraging effect of the knowledge that the more rapidly you succeed in expanding Electrical Supply, the more likely the shareholders are to lose, or

continue to be denied, their right to have their dividends credited as income-tax paid.

Reverting to the Electricity (Supply) Amendment Act, I will not try to decode many of the intricacies covering the wide field of regulation and powers and duties of State Electricity Boards that need not normally affect you. I will however refer to a few more points.

First, although the Act still makes no provision for meeting the deferred tax liability arising out of diverse depreciation provisions in the Electricity (Supply) Act and the Income Tax Act, Government are reported to be sympathetically disposed to introducing a clause to cover this need if a suitable formula can be found. In fact a clause permitting appropriation towards a Deferred Taxation Reserve was drafted by the Select Committee when considering the Amending Act. As worded however the clause would actually have caused considerable embarrassment to most undertakings, and at the Industry's request it was dropped for the time being. The Federation of Electricity Undertakings of India is now in correspondence with Government on a revised wording which it is hoped will satisfactorily cover all aspects of this problem.

Another amendment of major importance and interest to you concerns the question of our freedom to adjust our rates for supply to consumers. The 1956 Act has made it clear beyond doubt that the Licensee has the right to adjust his rates within the framework of the Act, including where necessary an enhancement of rates. With this has come to rest an unfortunate legal controversy which had developed, causing much confusion and loss. You will remember how a Rating Committee was formed in the case of your Company in June 1954, when we did not understand how we could have been said to have breached the law. You are not likely to forget the subsequent impasse we had to contend with and which resulted in our being denied a very necessary rate increase for about 18 months, at a cost of about Rs. 25 lakhs in Revenue, necessitating one reduction of the dividend and significant withdrawals from our hardly won Reserves. This was a by-product of the defect in the law which the amending Act has now set right. Hereafter a Licensee must be served with a "show cause" notice, and the authorities must await the results of arbitration before the Central Electricity Authority in respect of any disputes raised, before there can be any question of appointing a Rating Committee. It is a notable step forward that the law now appears to ensure that the penalty of a Rating Committee cannot be inflicted on Licensees hereafter without fully adequate cause.

We have recently been threatened with the effects of some other legislation conflicting with the mandatory provisions of the Electricity (Supply) Act; to our detriment once again. This is the Finance (No. 3) Act, with its provisions for compulsory deposit with the Reserve Bank in respect of depreciation allowances given under Section 10(2) of the Income Tax Act. Under the provisions of the Electricity (Supply) Act, we are not even permitted to earn equivalent allowances. We are hopeful that, in this instance at least, the Rules which are now under consideration by the Central Board of Revenue will recognise the fact that the Electricity (Supply) Act has already made its own provisions towards an identical end, namely the investment of depreciation allowances in the business or in Government Securities, and that consequently the Industry will be exempted from the operation of the relevant part of Finance No. 3 Act.

I have been at some pains to point out that the difficulties incidental to dearer money, problems arising out of deferred tax, and denial of tax concessions, are of even more than usual importance to Companies such as yours which have statutory as well as moral responsibilities for large scale expansion in the national interest. By the very nature of its franchise, an Electric Supply Undertaking must continue to expand, and it will certainly repercuss adversely on the country's economy if such Undertakings have to function in the twilight region between viability and subsistence. The Legislative intent having been firmly expressed in the Electricity (Supply) Amendment Act, 1956, for a return which should provide 'automatic adjustment with variations in the money market' it will certainly be a miscarriage of justice to say the least if the Industry is to be condemned to a further life of hand to mouth existence. I have laboured this point especially because your Company, charged with the task of making power available to the Industries and Citizens of the progressive and expanding Ahmedabad region, has to look forward to greater achievements; and political misunderstandings or legislative lethargy cannot but impede development.

With the commissioning towards the end of 1958 of the 15 MW Turbo Alternator Set ordered last year, the first half of the Company's "C" Power Station will be completed. Future power expansion in Ahmedabad is bound up with the plans of the State Electricity Board for increasing power capacity in their South Gujerat System, possible hydro-generation in the Tapti, Narbada and Mahi river systems, atomic power development, and even the prospect that natural gas might become available. Nevertheless it is not disputed that with offtake developing at an average of over 10 per cent annually — a phenomenon which is general to most of the major power systems in the country — the Company must give serious and now urgent consideration to plans for completion of the second-half of the "C" Station project, involving the installation of an ultimate 60 MW of plant. How best this may be achieved and the manner in which it is to be financed is receiving your Board's earnest consideration.

The completion of this development should take care of the demand in the Ahmedabad area until about 1965. The answer to what is to happen after that must not be delayed for too long either. A modern plant takes anything up to five years from the stage of planning to commissioning. In line with the past traditions of the Company we have already taken preliminary steps to ensure that the future power needs of our area in the mid 1960's are not prejudiced by lack of timely and co-ordinated thought.

The import licence having already been received for the 15 MW plant for completing the first half of "C" Station ordered last year, your Company has so far escaped the import restrictions following the recent Foreign Exchange crisis. How far this crisis will affect the import of Heavy Electrical plant and Capital Goods for future projects in the country, remains to be seen. In the interest of India's proclaimed need for long term credits for the purpose, however, I do hope that official spokesmen will in future find it rather more possible to display a sense of greater confidence in the business community than they have sometimes done in the past few years. Lack of confidence was never conducive to any kind of credit, least of all cheap credit for long periods; and one could hardly blame overseas lenders if they ended to assess their potential clients at the valuation of the latter's own Government. Besides it is the Government itself which has now turned to the business men asking them to obtain the foreign exchange of which the country has run so short.

Another important requirement is that a method should be found whereby borrowers will not be left with the risk of fluctuations in the rates of exchange; a factor which, in the context of long term credit, could be much more serious than even a high rate of loan interest.

It may appear that other things remaining equal, the Electricity Supply Industry, being essential to the general economic uplift of the country, may have reason to hope its requirements of essential plant for power projects will escape drastic import cuts. In fact the need for the Electric Supply Industry to receive priority consideration in allocation of foreign exchange for import of essential plant has been the subject of a Resolution adopted at the All-India Power Engineers' Conference held in Bangalore in January this year.

Coming now to local affairs, the operation of your Company's plant during the year continued satisfactorily, while the peak demand for the year at 110,400 kW recorded an increase of 10,000 kW over that of the previous year. Coal deliveries have been rather irregular mainly due to the shortage of rail transport, but the Company's Coal Agents, through their intensive efforts, have been able to help us maintain stocks at a fairly satisfactory level. The quality of coal received has, however, deteriorated to some extent due to the better qualities of coal being in greater demand.

The constant efforts of the Company to improve the efficiency of operation are being offset by the rise in the prices of materials, especially of plant and of fuel so that in the result the cost of production continues to rise. During the last year we have had to meet an upgrading in the price of coal, which has increased by between Rs. 3 and Rs. 3-8 per ton, together with a rise in freight of one anna in the rupee. It looks as if further rises in the price of coal are to be expected, if the development of this equally essential commodity is not to continue to be thwarted by lack of funds.

The Indian Electricity Rules, 1956, brought into force from the end of June, 1956, have made it obligatory for Electric Supply Undertakings to close their annual accounts as at 31st March. As you know this Company's Accounts were being closed annually as at 30th September and it has now been decided, with the approval of the State Government and the Income-tax Authorities, that the next closing of the Company's Accounts should be for a period of six months ending 31st March, 1957. Thereafter the Company's financial year will be 1st April to 31st March. This will necessitate the compiling of Accounts for the short-term period of six months — October 1956 to March 1957 — which will entail the calling of a General Meeting in November to adopt the Accounts and declare a dividend for that period. With three Electricity Companies under their management, your Agents have drawn up plans to ease the administrative difficulties inherent when all three have a common closing date. These plans envisage the payments of your ad-interim and final dividends in future in April and December respectively.

The All-India Power Engineers' Conference at Bangalore referred to by me earlier has in an important Resolution recognised the necessity of imparting field training to different categories of technical personnel. In this direction your Company has for many years undertaken the training of diploma and graduate apprentices. We have also been sending selected members of the Engineering Staff abroad for training. At the moment we have in the U.K. two Charge Engineers and one Assistant Mains Engineer under training with the Central Electricity Authority. Consideration is also being given to further staff being sent abroad nearer the time when the three Engineers now in the U.K. return to India.

I should also add that the Training Within Industry Scheme initiated by the Company a few years back is progressing well. As required by Government, Unit Production Committees have been constituted in the various Departments of the Company each Committee consisting of about 6 members representing 150 employees. Four of these members are elected representatives of labour and 2 nominated by Management. In general, the functions of these Committees are to ensure proper and efficient use of machinery and adoption of precautionary measures so as to engender safety consciousness against occupational hazards. These Committee have worked well during the year under review.

In keeping with its Staff Welfare policy, the Sabarmati Primary School, which was in the past run by the local District Board, has now been taken over by the Company for the benefit of employees' children. The present strength of the school is 201 children and 6 teachers. It is the intention of the Company to add higher classes to this school in the future. The kindergarten school at Sabarmati which was opened in 1955 continues to provide excellent facilities for the younger children of the employees.

The Accounts, which have been drawn up in conformity with the provisions contained in this behalf in the Companies Act, 1956, are, I believe, fully informative, taken with the explanatory notes appearing on the face of the Balance Sheet. You may, however, like some comment from me concerning appropriations with respect to Reserves. This is an odd matter. In essence we took Rs. 8,44,000 from the Equalisation of Dividends Reserve, and put Rs. 9,38,708 to General Reserve. In the result Reserves gained about Rs. 95,000. It all arises from an undertaking which the Company had to give to the Bombay Electricity Board during the negotiations over the 8¾ per cent Surcharge which was made applicable to sales of energy to High Tension consumers as from October 1955. As the arrangement will come to an end with the enforcement of the amendments to the Electricity (Supply) Act from 1st April, 1957, I trust we will not have cause to bother about it thereafter. The main thing is that against the overall dividend for the year 1954-55 of 5 per cent, it has again been possible to recommend a final dividend of Rs. 4 per share, making 6½ per cent for the year, and to have something over for Reserve.

It now remains for me to record our appreciation of the services rendered by the Resident General Manager and all ranks of the Staff towards achieving the very satisfactory operational results during the year. This Company has always regarded the labourer as worthy of his hire and paid him accordingly — a policy which has been amply justified by the return received from its Staff in the shape of loyal and efficient service. From the consumers' point of view it may be borne in mind that they in turn receive their benefits from progressive policies in the form of minimum production costs and above all continuity of Electric service.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting which will be sent separately to Shareholders.

COMMODITY NEWS AND NOTES

PRODUCTION OF FOOD GRAINS

The production of food grains in 1956-57 is expected to be slightly higher than that in 1955-56 according to the report of the Union Food Ministry for the year 1956. The report says that the all-India first estimate of kharif cereals for 1956-57 indicates an increase in acreage of 6.3 million acres or 0.2 per cent over that of the previous year. The prospects for the rabi crop are encouraging, the report adds. According to the report, the total production of cereals during 1955-56 estimated at 53.4 million tons was lower than the production of 1954-55 by about 2.3 million tons but still it was higher than the first Plan target by 0.9 million tons.

THREE PER CENT INCREASE IN AREA UNDER COTTON

The All-India Third Estimate of Cotton for 1956-57 puts the current year's area and production at 18,084,000 acres and 4,084,000 bales (of 392 lbs. each of cotton lint) as against the Adjusted Third Estimate of 17,553,000 acres and 3,382,000 bales respectively for 1955-56 according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows an increase of 531,000 acres or three per cent in area and 702,000 bales or 20.8 per cent in production over last year. The production of cotton seed is estimated at 1,429,000 tons during 1956-57 as against the corresponding Adjusted Estimate of 1,814,000 tons for 1955-56, thereby showing an increase of 245,000 tons or 20.7 per cent.

The increase in acreage under the current year has been reported mainly by Bombay and to a lesser extent by Punjab, Andhra Pradesh, Madras, Assam and Kerala and has been attributed to favourable weather conditions at the time of sowing during the current year as compared to the previous year. The increase in production has been reported by almost all the cotton growing States except Bihar and Mysore. But this increase has been more marked in the case of Bombay, Madhya Pradesh and Punjab and has been attributed partly to increase in acreage and partly to the favourable weather conditions during the growing period.

EXPORT OF COFFEE

The Coffee Board has released for export 1,500 tons of coffee out of the 1956-57 crop. Tenders have been invited by the Board for registered exporters returnable on April 9, for the quantity which consists of 80.3 tons plantation "A", 433 tons plantation "B" and 264 tons of Plantation triage.

DEPOSITS OF THORIUM IN N.-E. INDIA

What is believed to be probably the world's biggest deposits of radio-active minerals has recently been located "somewhere in N.-E. India" by the Indian Atomic Energy Department, it is stated. Investigations already carried out show that the deposit has over 3.3 million tons of ore containing 300,000 tons of thorium of concentration of about 10 per cent and 10,000 tons of uranium of concentration of 0.3 to 0.4 per cent. The deposit also contains about 80 million tons of ilmenite. It is expected that further investigations would lead to doubling the present estimates.

ART SILK YARN IMPORTS

The Government of India has decided to license import of art silk yarn against actual export, after December 31, 1956, of Indian art silk hosiery goods. This concession was extended in respect of art silk fabrics under the Government's Import Trade Control Policy for January-June 1957. The extension of the concession in the case of art silk hosiery goods was announced on March 18.

WORLD COTTON OUTLOOK BETTER

The International Cotton Advisory Committee has stated that the statistical position of cotton for the free world as a whole "appears to be more favourable than for several seasons past". However, the committee declared that the situation continued "to cause concern in many countries". The Committee, in its review of the world cotton situation for February, said the increase in world stock in August 1, 1956 was the smallest since 1951, production had declined, acreage planted had dropped and disappearance should exceed current output leading to another reduction in stocks on July 31, 1957.

SHELL OIL'S PROGRESS

Shell oil company had another very successful year (1956) in discovering and developing underground reserves of crude oil. Its success in the offshore waters of the Gulf of Mexico again was outstanding. In consequence of this progress, the additions made to the underground reserves substantially exceeded the year's aggregate production. The volume of verified products sales increased and with slightly higher price levels, sales revenues reached another record high.

URANIUM EXPORTS BY S. AFRICA

South African exports of prescribed materials (uranium and thorium) in January totalled £3,268,721 against £2,936,545 in January, 1956, a preliminary estimate by the South African Excise and customs Department shows.

The

QUALITY

that Endures

Three hundred years of history have helped to shape the character of Lloyds Bank. An unwritten charter of confidence has been fashioned from the experience of generations of customers whom it has faithfully served.

In its character is the quality that endures.

Save the Canal

DELHI daily has just carried a radio-photo showing ships of the first convoy to enter the Suez Canal since it was blocked in that dismal November of 1956. This is pleasing to the eye, but one wonders if it is not too early for this country to heave a sigh of relief, for there are yet no signs that President Nasser has awakened fully to the need of placing the economics of the canal—and of Egypt—on stable foundations.

There is no gainsaying that President Nasser's firmness has brought him some dividends and his just stand on Egyptian sovereignty over the canal has been all but completely vindicated. This is on his credit side. But it is also true that his unbending attitude towards Israel has cost him a great deal of principle. If, to make good his role as a champion of extreme nationalism, he continues to be hostile towards Israel, there can be no guarantee that the uneasy peace in the area may not be disturbed and the canal put out of commission again.

This ominous possibility cannot be entirely ruled out, for the canal problem has become too inextricably intertwined with the Israeli-Egyptian relations to lend itself to a lasting solution, in the absence of a peace settlement between the

two countries. And President Nasser's recent moves are not also calculated to win the confidence of Israel in particular or of the canal users in general. His first move, following the Israeli withdrawal from the Gaza strip which was previously held by Egypt under the 1949 Palestine Armistice, has been to name a Governor of Gaza and to run its civil administration. This move has no doubt alarmed Israel, but it is a redeeming circumstance that President Nasser has not attempted to bring Gaza under his military control. As a matter of fact he even seems to be anxious to have the United Nations Emergency Force in Gaza for some more time.

The Egyptian President's other move has been to let it be known unofficially that he intends to resume the naval blockade of the Gulf of Aqaba which leads up from the Red Sea to the Israeli port of Elath. It is claimed in this connection that Egypt has the right of belligerency to blockade Israel in view of the circumstance that there has been no final peace settlement in the Palestine War. With the Israeli withdrawal from the Sharm el Sheik area at the mouth of the Gulf and with its take-over by the U.N.E.F., free passage to the port of Elath has come to be ensured for the present and some ships doing business with Israel have just passed through Aqaba without incident. There is, however, an element of uncertainty here.

Egypt has, again unofficially, taken the stand that she will not open the Suez Canal to passage for ships trading with Israel. As a matter of fact, she had been thus discriminating against Israel long before the nationalisation of the Suez Canal Company. President Nasser's intention to continue to deny passage to Israeli ships is, again, related to the belligerency claim and his contention is stated to be that by doing so he is not violating the Constantinople Convention which has a clause to the effect that Egypt can take measures to "assure.....the defence of Egypt."

These three moves have alarmed Israel, and she has taken the position that if there were a danger of new guerilla raids from Gaza or of blockade of the Gulf of Aqaba, she would feel free to strike out against Egypt within the U.N. Charter provision for self-defence. So long as President Nasser refuses to recognise the existence of Israel he cannot be deemed to recognise the existence of the United Nations itself which has brought that country into being. The Egyptian President may yet appreciate that if, on the strength of the belligerency claim, he takes certain steps by way of self-defence, he will be conceding that right to Israel also with the result that he will be keeping alive a state of war between the two countries. Egypt is afraid of provoking Israeli retaliation at least for the present; this is verily the time for persuading her to come to a final peace settlement with her neighbour.

The most exacting question is, of course, that of the future operation of the Suez Canal. Here the Egyptian case for barring Israeli ships from the canal and interfering with the Israeli-bound vessels is particularly untenable for it violates three provisions of the Constantinople Convention—namely, the promise of free navigation without distinction; the prohibition of blockade; and the guarantee of free transit in time of war as well as peace. It violates the 1951 Security Council resolution which held that the completion of 1949 Armistice rendered null any claim by the parties to belligerency status. It also violates the first and the third among the six principles embodied in the Security Council's resolution of October 13, 1956, and duly accepted by Egypt; these two principles are that there should be free and open transit through the canal without discrimination and that the operation of the canal should be insulated from the politics of any country. If President Nasser can be persuaded to climb down on this issue, the Anglo-French stand for international operation of the canal will become untenable and the expressed or unexpressed fears of the Asian countries trading with Europe will have been allayed.

The acceptability of the latest Egyptian plan for canal operation may then be virtually taken for granted. The main features of this plan are: The Suez Canal Authority, established by the Egyptian Government, would operate the canal in accordance with the Constantinople Convention; tolls should be paid in advance to the Suez Canal Authority at any bank as may be authorised by it; the Egyptian Government will get 5 per cent of the tolls as royalty and 25 per cent of the gross receipts will be deposited in a development fund; tolls would continue to be levied in accordance with the agreement concluded in 1936 and any increase in the current rate of tolls within 12 months shall be limited to one per cent while any increase beyond this level is subject to negotiation; there will be a canal code with provisions for dealing with complaints of discrimination.

This Egyptian plan is more or less in conformity with the second, the fourth, the fifth and the sixth principles embodied in the Security Council resolution of October, 1956. Egypt's contention that the other two principles not honoured in her plan have lapsed with the Anglo-French-Israeli invasion of November last cannot hold water because it is to the United Nations that she is answerable and it was that world body which stopped the aggression and protected her in spite of the fact that it was partly provoked by her own hasty and hostile actions. The plan is otherwise reasonable, being designed to leave control firmly in Egyptian hands. This is understandable for Egyptian sovereignty over the canal is no longer in dispute. The plan has also the merit of conceding the Western position where it lays down that canal tolls could be paid to the Egyptian Government "or its nominee"—a possible opening for the "neutral agency" suggested by Britain, France and the United States.

As President Nasser, in all probability, is afraid of provoking Israeli retaliation or alienating the Soviet and Asian-Arab blocs, whose interests are not wholly in harmony with his views and as he is, by all accounts, anxious to reopen the canal and derive the badly-needed revenue therefrom, his plan may yet be modified to conform fully to the six principles of the Security Council. But negotiations with President Nasser will continue to be laboured, and he will have lost the goodwill of even some Asian nations if he refuses to adjust himself with grace and even some generosity. An apprehensive Eastern World may well appeal to President Nasser: 'Save the canal from a possible second disaster'.

The President of India

EVENTS this week have shown that what should be one of the least controversial political events in the country—the nomination of the President and the Vice-President of the Indian Union—has been loaded with heated and not very dignified debate. In this unhappy debate the Press of Delhi allowed itself to be drawn with results as unhappy to itself as to the candidates concerned. Even if these mistakes had not been made there would be cause for concern. The country cannot be expected to treat the events of last week as being entirely a matter for the Congress Parliamenary Board although its six members had all the authority to make the nomination. As it turned out, it was not even possible for the six members of the Congress Parliamentary Board to think alike on a major issue of policy and thus there has been seen in New Delhi in the last week a conflict of loyalties which should never have been allowed to occur in a matter of this kind.

Briefly, the controversy arose on both a personal and an impersonal issue. The impersonal issue was whether it was appropriate that the President and the Vice-President of the Indian Union should be re-elected after a term of five years or whether a healthy convention should be established to the effect that the President and the Vice-President, like Governors of the States, would normally not be reappointed after a term of five years. Arising out of the impersonal issue there came the question as to whether, whatever the long-period convention, a figure like Dr. Rajendra Prasad should be replaced when he was in fact willing to accept nomination for a second term. Almost certainly the personal consideration, on which it would appear many members of the Congress Parliamentary Party held inflexible views, overrode the impersonal issue which, it would seem, was not even adequately discussed. Both the President and the Vice-President have now accepted nomination for another term.

In this particular case the decision was greatly complicated by the fact that the Vice-President Dr. Radhakrishnan had been led to believe that he might have been nominated to the office of the President. Whether there was justification enough for this belief has been debated in Delhi. Obviously the Prime Minister, whatever his views on the need of a convention, could not, without the authority of the Congress Parliamentary Board, make any commitments to any candidate in regard to a nomination which was beyond the province of the Prime Minister and, indeed, even of the Congress Parliamentary Board, since Congress Party feeling on this issue was strong. It was known that, notwithstanding his ill-health, President Rajendra Prasad had been prevailed upon by a very large number of Congress Party members to accept another term. For a beloved figure, with some claim to the position of a subsidiary hero of the Indian Revolution, this desire for his retention as President was quite understandable; what is surprising is that some members of the Parliamentary Board did not appreciate its force. In the last analysis what has proved to be important has been the fact that the Congress Party has again shown that its somewhat confused personality can be imposed on the Prime Minister on an issue which he will not treat as vital enough for resignation.

What has weakened the Prime Minister's case in the present debate is the fact that the issue of principle which he sought to establish has been conspicuous in its absence by the fact that many high offices particularly in the case of Cabinet Ministers are retained indefinitely even after the period of advantage to the country has passed. It would be claiming far too much for the Congress Party to say that it is free, in the choice of candidates, from intense personal considerations. Why, then, should the impersonal doctrine that the offices of the President and the Vice-President should not be retained for a period of more than five years be applied only in the present case? The Congress Party feeling in this case certainly had force in good logic.

The feeling has certainly been aroused in Delhi that almost no one in this unhappy controversy has come out with distinction. It is clear that the desire to retain or improve office is strong on all sides, and has, to some extent, endangered personal relations to the point when even majority decisions are accepted with bad grace. This has not been an illustrious illustration of the manner in which the will of the majority should be readily accepted by great and small alike.

Now that this unhappy incident has been closed by the acceptance, under powerful persuasion, of re-nomination by Dr. Radhakrishnan of the office of Vice-President, one need only ask that the unseemly events we have seen in the last ten days will not be repeated. The country has as much stake in the dignity of offices of the President and the Vice-President of India as the Congress Party itself, and it seems a pity that differences in the Congress Party and the occupants should have allowed these offices to become so much the creatures of controversy. By the same token, now that a choice has been made by the Congress Party, and circumstances are such that the Congress Party candidates are certain to win with large majorities, it is not appropriate that any other party should contest these elections. Inevitably the result is now fixed, and all that will be underlined will be the weakness and even the negligible weakness of the opposition. The suggestion that Dr. Khare should stand with Hindu Mahasabha support seems, therefore, a puerile one. There is really no point in underlining the fact that in the Central Parliament at any rate Dr. Khare would receive barely a dozen votes; it is wasteful that the whole process of election should be gone through merely to obtain this paltry result.

It has been a good convention — one which still stands out against the absence of all other conventions — that the President or the Vice-President should come from the South. This has been a means of securing unanimity, or at least a substantial majority, on both elections. With this convention accepted by implication there should be no difference on this issue. At any rate one now hopes that for five full years the offices of the President and the Vice-President will continue to be held by their present incumbents, who have added dignity and a high sense of duty to their qualities of heart and mind.

West Germany and India's Plan

TWO events which took place in quick succession since the middle of the last week are expected to make a significant impression on the future relations between the Federal Republic of Germany and India. The visit of the Foreign Minister of Germany has been followed immediately by the arrival in the capital city of a trade delegation from that country. This is no casual development. In fact, the communique issued by Dr. Brentano and Mr. Nehru makes a specific reference to the negotiations between the trade delegation and the Government of India for the purpose of intensifying trade relations as well as industrial and technical co-operation between the two countries. The process of broadening the base of economic collaboration between West Germany and India is being pursued in earnest at least during the last six years. The second Five-Year Plan, however, has given a new complexion to foreign interests in India's economic progress.

This should be quite obvious from the character of the negotiations which were started here four days back. The scope and purpose of these discussions clearly transcend a routine revision of the export-import schedules included in the trade agreement of Mach 1955. In fact, three objectives have already been set before the negotiators—technical co-operation, industrial collaboration and closer trade relations. Schemes of technical co-operation relate to facilities for training in India to be created with German resources in equipment, know-how and teaching staff. Since the announcement was made on the occasion of Mr. Nehru's visit to Bonn in July last year about setting up a technological institute for higher training, considerable progress has been made and its establishment, probably in North India, is now a matter of a few months. The other project, although it is of a small dimension, is of a novel type. The proto-type training workshop whose project is now being finalised is intended for imparting instruction in rationalised techniques for small and medium-scale industries.

Interest in the present negotiations centres essentially round the ways and means which will be devised to put the two-way trade on a comprehensive basis to facilitate an adequate flow of supplies of plant, machinery and industrial goods which this country requires in the immediate future. This is by no means an easy problem; the difficulties which it poses need to be resolved by a sustained effort, nevertheless there is full belief that they need not be considered as altogether insurmountable. Trade between India and West Germany which has been raised to higher levels since 1951 received positive acceleration in 1954 and 1955 on account of the rising tempo in the execution of the first Five-Year Plan and increasing German assistance to industrial projects. While exports from India have more than doubled during this period, her imports from Germany have been very nearly trebled with consequent rapid widening of India's trade deficit. The deficit has shown a rate of increase since 1953 of 100 per cent per year—it has risen from DM 110 million in 1953 to DM 220 million in 1954 and to DM 320 million in 1955.

While a larger import surplus is part of the design of the second Plan, this country is aware that a pragmatic approach to the problem will be expedient from time to time. An erroneous impression appears to have been entertained that this country intends to rely basically on suppliers' credit to tide over the foreign exchange shortage. Deferred payments will necessarily constitute an important form of the accommodation which India will seek in obtaining foreign assistance, but the extent to which it will be attempted must necessarily be left to the individual cases of the major exporting countries. The current trade talks recognise the necessity of assessing the possible extent of imports from Germany on deferred payments; even so they do underline the urgency of a greater balance in Indo-German trade. This implies an intensive export drive on the part of India. One of the earliest results of the talks is the decision to send an exporters' mission from this country to Germany. This mission could very well have been deputed much earlier for one weak link in the chain of trade relations between the two countries is the insufficient direct contact between Indian and German commercial houses. Establishment of such contacts cannot fail to advance the cause of India's exports. A more balanced trade also implies readiness on the part of West Germany to step up her imports from this country. Concrete proposals have been evolved to this end.

The pattern of the post-war reconstruction of West Germany's economy highlights the vital importance of two factors—manufacture of capital goods and a high level of exports. While her general index of industrial production (1936 100) rose to 204 in 1955 and showed an increase of 223 per cent above 1948, the index of capital goods production jumped to 256 and registered a spectacular increase of 400 per cent for the corresponding years. Capital goods constituting more than half the exports had a substantial contribution in pushing up the country's share in world trade from 4.10 per cent in 1950 to 7 per cent in 1955. This is a sound base from which German economy is operating, indicating a stable and long-term market abroad for machinery and equipment. This market is expanding fast in the underdeveloped countries which have entered a phase of vigorous industrialisation. In 1955 when Germany's exports reached a new all-time peak, India was her largest market in South-East Asia. Australia and Indonesia which came next had an offtake of German exports which was half and one-third that of India.

In the immediate context of India's second Plan, co-operation from West Germany will be eagerly sought for participation in industrial projects and exports on credit. The limit of seven years' credit prescribed for import licensing relates to imports whose potential for earning or saving foreign exchange is low. In a wide range of imports, however, whose potential of this type is high, the limit is pitched lower at four years. It conforms to the overall policy adopted by the Export Credit Corporation of West Germany. As the Corporation's financial resources which are invested partly on a revolving basis of two years' credit are replenished as now projected, it should be possible for it to extend accommodation to the requirements of India's second Plan. With improved trade balance and export credit, there is reason to be optimistic about increasing Indo-German co-operation.

THE WEEK'S NOTES

BEVAN ON COMMONWEALTH LINK

MR. ANEURIN BEVAN'S current visit to this country is of more than ordinary significance. He is not only a "good friend of India and a good friend of all good causes" as Mr. Nehru so happily described him. But he is an influential member of the Labour Party (that was responsible for the events leading to the transfer of power to India) and the Foreign Affairs spokesman of its 'Shadow Cabinet'. He is likely to play a considerable role in any Labour Government that may come to power in the event of a general election in Britain. (The General Election may, perhaps, be precipitated in view of the split in the Tory Party and the unpopularity of the Government's policies as reflected in the recent by-elections). Mr. Bevan has come at a time when Indo-British relations are none too happy and there is an insistent demand for the severance of the Commonwealth link. It is in this context that what Mr. Bevan feels on this issue merits earnest consideration.

Mr. Bevan's recent address at a meeting of the members of Parliament came soon after the foreign affairs debate in the Lok Sabha. The depth of feeling in the House over the severance of the link with the Commonwealth was so much that Mr. Nehru had to concede that "I have felt for the first time in these many years that the issue may some time or other require further consideration". Mr. Bevan gave two weighty reasons why the link should be maintained. One was the complete transformation that the Commonwealth was undergoing, thanks to the emergence of parts of Africa into freedom. Thus Ghana had become a member and very soon Nigeria, Uganda, Tanganyika and Kenya may join company which means that the "composition and content" of the Commonwealth will change with the attainment of independence by the colonial peoples. Should not India continue her association at this important phase of the evolution of the Commonwealth and strengthen the process by using her great influence in the right direction? Secondly, the Commonwealth will be an important factor in "creating conditions favourable to the maintenance of peace" if countries in S.-E. Asia including India, which participated in the Commonwealth, tried to exert greater influence on European and Middle East policies and work the 'Nehru Idea' of disinvolvement. The Suez adventure, for example, could have been prevented if there had been frequent consultations at all levels within the Commonwealth. Mr. Nehru himself has expressed the view that the Commonwealth association is good for a variety of reasons, one of which is "at this moment when there are so many disruptive tendencies in the world, it is better to retain every kind of association which is not positively harmful to us than to break it". Here is a question of weighing the advantages and disadvantages. Mr. Bevan's visit would have achieved some good result if it contributes to a sober appraisal of this important issue.

FIRST STEP IN BUDGETARY REFORM

THE FACT that the Union Finance Minister has taken the first significant step towards major budgetary reform has generally gone unnoticed in the Press and Parliament alike. This first step has come by way of a 30-page brochure 'concealed' among the usual budget papers. The new arrival is 'An Economic Classification of the Central Budget for 1957-58' of which "The Eastern Economist" has taken full cognisance in its recent Budget Number. The reclassification which is done in line with the national income and expenditure or social accounting principle will help disclose the share of the Government in the generation of the national product and in national expenditure, the breakdown of Government expenditure into consumption and capital formation and the impact of Government transactions on the level and pattern of expenditure of the rest of the economy.

The economic classification is, however, only supplemental to the traditional classification based on organisational and objective classification. It distinguishes generally payments made for capital formation from payments made for government consumption which measure the direct draft on resources resulting from Government expenditure and from payments such as social security benefits and receipts such as taxation which redistribute the income of the rest of the economy, payments such as loans and advances which make funds available for capital formation by the rest of the economy and receipts such as borrowing which transfer a part of the savings from the rest of the economy to the Government. The loans and grants made for capital formation can be added to direct capital formation of the Government to obtain a measure of the direct and indirect contribution of the Government to gross capital formation.

It is claimed that all this would be useful particularly when reliable estimates of private capital formation are not available. But for a clearer picture of the impact of the Government budgets on the economy as a whole, it is essential not only that the information available in the budgets of State Governments be reclassified along similar lines but also that of the accounts of industrial and commercial undertakings owned and operated by the Government as well as accounts for important sectors of the rest of the economy. The Union Finance Ministry has probably advised the State Governments, to prepare economic classifications of their regular budgets for 1957-58. If, thus, the experimental economic classification comes to cover all the budgets of the Central and State Governments, it may be that the next step towards budgetary reform—namely, functional classification which would give the precise nature of Government expenditure going to various purposes or functions—will be taken in a couple of years.

PROBE INTO POSTS AND TELEGRAPHS

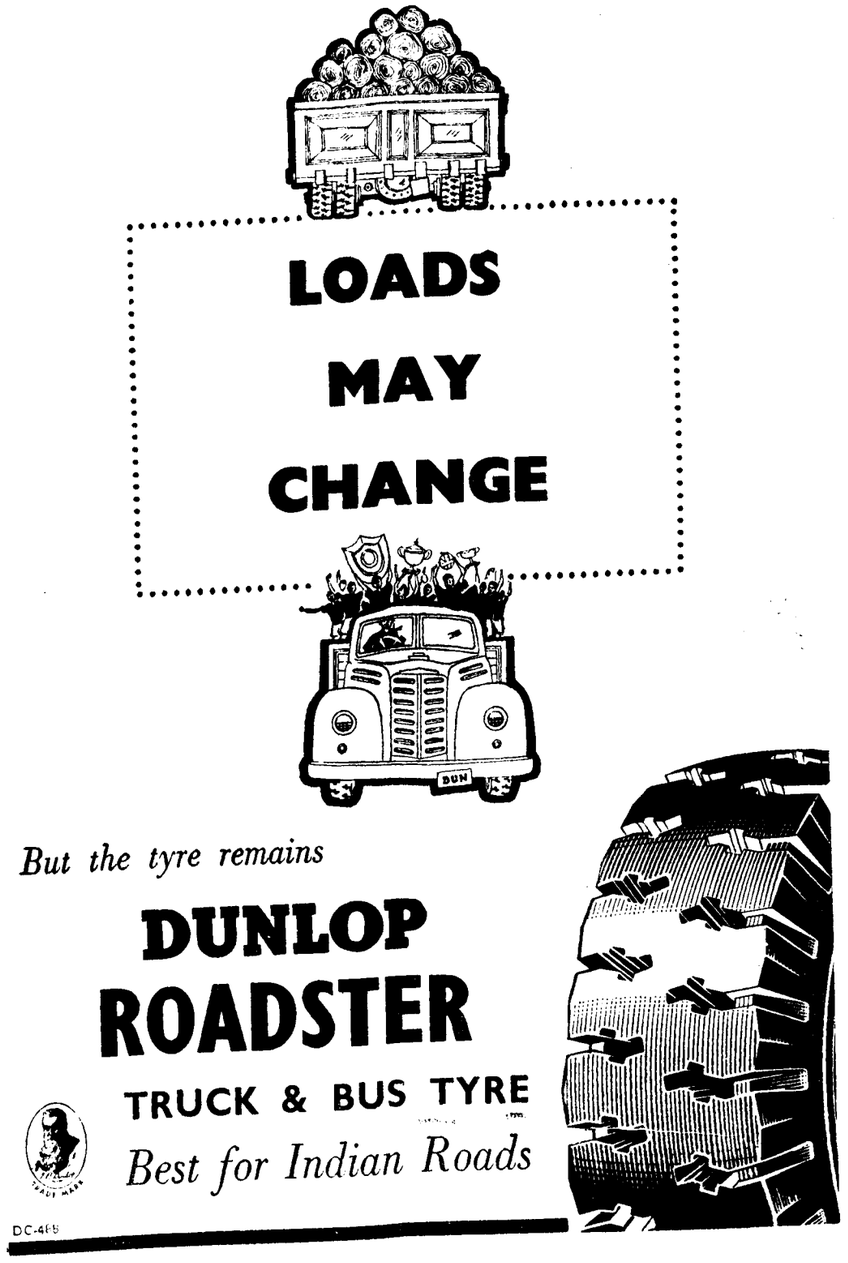
AS WATCH-DOGS of public expenditure, the parliamentary committees are of recent origin in this country. The system of checks and balances, especially by people's elected representatives, is obviously necessary to prevent wastage of public funds and guard against executive lapses. The twenty-second report of the Public Accounts Committee on the working of the Posts and Telegraphs Department draws attention to a number of cases involving losses, frauds and misappropriation of public money. The Committee particularly refers to the large number of cases which are attributable to the negligence or dishonesty of departmental officials. It is noted that the Department has been rather slow in taking disciplinary action and in one case more than nine years elapsed before action against the delinquent officials could be finalised. During the year under review Rs. 3,67,968 was paid as compensation for insured and other articles lost or damaged in transit. The compensation paid on account of negligence or dishonesty of departmental officials amounted to Rs. 1,72,824 or 47 per cent of the total loss suffered by the Department.

The Committee feels that without counter checks, the system of accounting in sub-post offices is open to

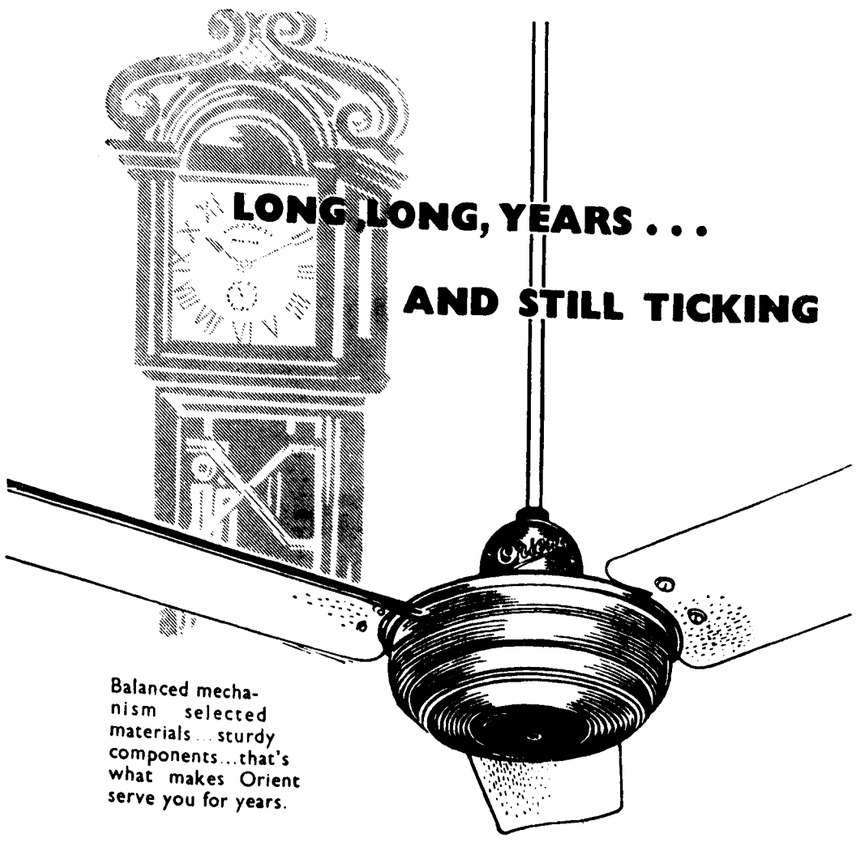
risks and recommends measures to devise a method by which recurrence of such frauds could be prevented. Besides procedural defects there has been no proper supervision and inspection by the authorities who are immediately above. In fact too much reliance is put on routine correspondence with the result that Posts and Telegraphs have lost some of the virtues of a commercial department.

In the opinion of the Committee, the plea that the non-availability of personnel and accommodation hindered the clearance of arrears in stores, is untenable. Maintenance of excessive stocks involves the tax-payer in a four-fold loss. loss of interest on capital locked up; potential loss from the possibility of the stores becoming obsolete or disposable only at a lower price; expenditure on care and maintenance of staff; and storage charges. The present procedure followed by the Posts and Telegraphs Department in the disposal of surplus stores is cumbersome and dilatory. In view of this, it is necessary that the Department should examine the whole procedure in consultation with the Ministries of Finance and Works, Housing and Supply to make it more expeditious and effective.

LABOUR-MANAGEMENT RELATIONS



RATIONALISATION, workers' education and workers' participation in management are some of the important subjects in the field of labour-management relations that have exercised the minds of the administrators as well as trade union leaders for quite a long time. Recently these were the subjects of discussion at the Delhi Session of the International Confederation of Free Trade Unions and the Seventh All-India Conference of the Indian Institute of Personnel Management. The conference of the Indian Institute of Personnel Management was of the opinion that to effect rationalisation the following points were of great practical importance: that for planning schemes of rationalisation in advance a thorough study and investigation was essential; that it was desirable to have proper phasing of schemes to reduce adverse effects of rationalisation to minimise opposition of employees and their organisation and to secure their co-operation and assistance for the successful implementation of the schemes; that prior consultation with employees and their organisations would be useful; that it would be advantageous if an agreement on details of schemes were arrived at with employees and their organisation; that it would be desirable to have in the terms of such an agreement a clause providing for voluntary arbitration to remove doubts and to interpret the agreement if and when necessary; that full and wide publicity of such agreement amongst employees would help in the smooth implementation of schemes; and that, wherever necessary, suitable arrangements should be made for training workers to fit them into changes inherent in rationalisation.



While no one would dispute the soundness of these suggestions, it is necessary to emphasise that due consideration should be given to sharing of gains of rationalisation amongst capital, labour and consumers. Rationalisation is very important from the point of view of future of industry. The only thing that requires major consideration is its planning in such a way as to eliminate retrenchment. In regard to workers' participation in management, it is advisable to go slow. The demand for workers' participation in management would have no significance if sincere and unflinching attachment to the industry with which they are connected is not forthcoming. And to achieve that objective, healthy trade unionism and workers' education are imperative. According to Mr. Millard, the Director of ICFTU, "industrial democracy is impossible without a strong full-fledged democratic trade union movement". At the same time education of workers in trade union philosophy and in constructive and constitutional trade union methods is necessary to invest the movement with a sense of responsibility. It is gratifying to know in this connection that the Union Government's expert committee on workers' education has just submitted its report. In all probability the report might have formulated practicable schemes for workers' education. The report and the Government's action thereon are awaited with interest.

WEST GERMANY'S PROBLEMS

MOST OF what Herr von Brentano, the West German Foreign Minister, expressed in India has remained uppermost in the minds of his countrymen ever since the end of the last war. By and large, he was reflecting the wishes of Germans on either side of the dividing line. Yet what keeps the country partitioned and hampers the setting up of a unified democratic government that could establish good-neighbourly relations with the countries to their east and west, which are the burning desires of the Germans, is the play of East-West politics coupled with the extreme helplessness of the German people in the present circumstances. It is not difficult to see that once the country realised her goal of reunification, the other problems would be far more easy to resolve. But the question of reunification is so much intertwined with the issue of disarmament that each stands in the way of solving the other. It is, therefore, no wonder that being despaired of an early solution that would be acceptable to both the Soviet Union and the Western countries, the Germans are becoming increasingly restive and prepared to pay any price for achieving their aim. This explains, partly at least, the West German reluctance to raise her army to 12 divisions under NATO obligations. The trend is at once understandable and full of grave consequences. If the desire for reunification should become so overwhelming for the Germans as to tear themselves off from Western defence arrangements, and NATO in particular, not only would they be exposed to the Russian might, but the Western defence line would largely retreat to the French borders, and would be rendered almost ineffective.

However, the West German leadership seems to appreciate the danger. Developments over the past few months have shown that even the opposition has veered round to the view that defence is an overriding consideration, notwithstanding that elections are to be held in September and the subject could have lent itself to intense electioneering propaganda. What could conceivably reduce the necessity of defence is the liberation of Eastern European satellites from Soviet control. This was also the burden of a speech of Dr. Brentano here, when he stressed the need for ending imperialist repression in Eastern Europe and permitting those countries to establish a free social order with respect for human rights. Clearly, he was forming a picture of these countries providing a buffer zone between Germany and the Soviet Union. But Hungary is a sad reminder of the real intentions of the Communists. Since that is so, it may well be that West Germany may not be able to give all the necessary attention to productive efforts. This is of some concern to India, inasmuch as this country wants further to expand trade relations with her. The feeling is mutual. Already cordial and friendly relations exist between the two, and India has been the beneficiary of a giant steel plant being set up by the Germans. There is no doubt that scope exists for increased economic co-operation between this country and West Germany.

COAL NATIONALISATION IN THE U.K.: SUCCESS OR FAILURE?

By

ODYSSEUS

TEN years ago the British coal industry was nationalised. Has nationalisation been a success or a failure?

The case for the industry was well put recently by Mr. John Raven, director of a British coal trade association, in a BBC talk (reproduced in "The Listener" of March 7). Mr. Raven admits that the nationalised industry has a poor reputation in the U.K. The average man, he says, sees coal as a major handicap to the rest of British industry. Years ago the U.K. had all the coal she wanted and a surplus for export. Now, the average man complains, the collieries cannot do the job. He believes that the National Coal Board is grossly overstaffed and mainly occupied in seeking subsidies from the tax-payer, the proceeds being spent on large country houses, or cast hopelessly into ruinous holes in the ground. The miners are lazy and the price of coal is excessive. The mines lose millions a year and he looks forward to the day when atomic energy will turn collieries into ancient monuments.

In contrast, Mr. Raven says that an enquiring foreigner would consider the U.K. lucky to possess a full range of fine quality coals produced on a scale exceeded only in the USSR and the USA. Because Soviet coal statistics are ambiguous and because the preponderance of opencast and drift mining in the U.S.A. prevents comparison, a foreign observer might compare the U.K. industry with those of Germany, France, Holland, and Belgium. Their total production and physical conditions of mining are equivalent. Such a comparison shows that the British collieries are superior in price and in productivity. The British miner produces more than the German, French, Dutch, or Belgian, per shift and per year. British coal sells for about Rs. 20 less, quality for quality, than that mined in Europe. This overall superiority has been maintained at a time when the National Coal Board has been raising output from 178,000,000 tons in 1946 to 210,000,000 in 1956.

FAIR PLAY FOR NATIONALISATION

Because British coal is so much cheaper than any other, British industry has an advantage over its European competitors. Our foreign observer might be astonished that the British newspapers, which often praise German industry for its efficiency, overlook the ascendancy which British miners and managers have gained over the Germans. The British Coal Board has a statutory obligation to avoid a loss over a period of years. In its first ten years, five have shown a loss and five a profit. Total losses at the end of 1955 outweighed total profits by £37,000,000, but the Board is, says Mr. Raven, mastering this trend, so that during 1956 the cumulative loss was reduced by over one-third. The Board is incurring heavy investment costs in sinking new pits and in other development schemes essential if the present annual loss of capacity — estimated at 4,000,000 tons — is to be overtaken. Part of this money is being borrowed from the Treasury and will be repaid with interest at the usual rates over the next fifty years. In this way, argues Mr. Raven, all development costs are met out of the sale of coal and any subsidy for current expenditure or investment is avoided. Although Britain is speeding up her development of atomic energy, it will be ten years before any real load is lifted from coal and oil. Atomic energy can only directly replace power-station coal: other uses of coal will persist, many will grow, and a large tonnage of coal will still be required for the numerous conventional coal-burning stations which will remain in use for many years.

Mr. Raven believes that the British coal industry initially got its bad name because of the severe winter of 1947 when, in the second year of the Board's existence, there was a coal crisis. But, he asks, can the avoidance of another 1947 be an adequate long term standard of efficiency and policy for British coal? Is this not tying the reputation of the coal industry to its ability to "execute an arbitrary manoeuvre, a large increase in output every year?"

Supposing the mines had been nationalised in 1929, would the Board then have been thought inefficient if they had refrained from increasing the then excessive production of coal? Or supposing that the present sharp rise in fuel and power demand continues? In a relatively short period, demand will have soared above the maximum production possible. In those circumstances other fuels must be found to meet the extra needs. Will they be used only when the last ounce of coal has been stripped out of the pits each year? Or will the industry be given a chance to consider other objectives for an efficient industry, apart from a temporary spurt for greater output?

COAL'S ATHLETIC FEATS

Mr. Raven contends that during the past few years "coal has managed by standing on tiptoe, to get its finger tips up to the vanishing coat-tails of demand." This is an emergency situation and if the Board's efforts to wring extra production out of "an exhausted and undermanned industry" had been judged in that light all might have been well. But to assume that the coal industry, which had just emerged from the strains of a six years war, following a fifteen-year depression, should have been able to supply all the coal wanted in a new industrial revolution, just because it was wanted, is like "trying to write a permanent coal surplus into the British Constitution." The inevitable disillusionment has made the British public think that the coal industry has let them down and this has undermined the industry's own morale. The material sacrifices made so that "the British people may combine the fuel habits of 1795 with the power needs of 1957" are heavy. Development plans have been delayed, heavy losses incurred on imports of coal, and the industry's valuable export trade has been cut to shreds. All these expedients, whether well or ill-advised, had some reason, but, says Mr. Raven, the sacrifice of reputation and self-confidence was "as pointless as it was inexcusable".

Some of the consequences are apparent already, and may well burden the industry for years ahead. How can the Board recruit the best men to work and manage the industry if it is a constant target for destructive criticism? How many young men, who can go into oil or atomic energy, will go into coal? If, year after year, coal is deprived of potential leaders, what

chance will it have of finding its right level in the complex British three-fuel economy of the future? What chance is there of improving the serious weaknesses which, Mr. Raven says, certainly exist in coal, especially in labour relations? It is just in these vital but intangible relations that *morale* is all-important. If the miners could be given a new enthusiasm extra production might come overnight as a natural result of those sound policies which the crude drive for more and more coal has hindered and postponed. Above all, what encouragement is afforded to the Board to think out and carry through courageous, imaginative policies? How can the Board give proper attention to those broad issues of price, capacity, exports, and utilisation, which it has hitherto considered only against the background of a crushing demand enforced by a misinformed, unfriendly public opinion?

Mr. Raven says that many interests — the political parties, the National Coal Board, the trades unions, the press, and the public — have all contributed to the present psychological plight of British coal miners and managers. There are signs, in his view, that the Board is aware of its errors and of the steps necessary to retrieve them, including a wider and warmer defence of the industry. But, he argues, if the Coal Board makes these moves on its own, and if none of the other interests mentioned above makes any effort to re-consider their attitudes towards coal, then the self-respect that the Board seeks for miners and managers may become mere self-satisfaction. "The community should realise that the Board has been shooting with a worn-out productive bow" at a target of demand that is getting rapidly out of range. On the other hand, the Board should not be tempted to regard the mere avoidance of a coal crisis as a reason for complacency. If the politicians can forget the ideological battle for and against nationalisation and concentrate on the real issues at stake in efficient coal production, and if the public will criticise the coal industry only after having taken the trouble to think about it, then the Coal Board's efforts to lead and to animate will have a fair chance.

No fair-minded person can doubt that Mr. Raven has thrown light on the problems of the nationalised British coal industry and that he makes several valid points.

It is, nevertheless, not the whole story. If we agree with Mr. Raven that the industry is undermanned because young Britons prefer to go into more inspiring jobs, Mr. Raven forgets that thousands of Italians, Hungarians, and other Europeans, are anxious to enter British mines — but the miners' unions persist in refusing to admit them. If these foreigners had been admitted, higher production could have been attained with less effort and consequently the industry, under less pressure to "stand on tiptoe to get its finger tips on the vanishing coat-tails of demand," could have developed in a more orderly fashion. Not least, higher production would have avoided annual threats of crisis and thus helped to disperse the industry's bad reputation with the public.

In the following article we will consider some criticisms of the British coal industry made by responsible observers, which will, I hope, throw further light on the problems of nationalised industries.

YOU CAN'T NATIONALISE HUMAN FEELINGS

By

ODYSSEUS

ON A BLEAK January day in 1946, the late Sir Arthur Street, deputy chairman of the new British National Coal Board said to a morose crowd of miners: "Nationalisation has given you what you wanted. It is up to you to finish the job."

At 11 a.m. the Coal Board's flag was hoisted at the pithead. The Millennium had come. Private ownership in British coal, and the production of British coal for selfish private profit, was ended for ever.

Has nationalisation of coal in Britain failed or succeeded?

In the preceding article, I showed how the nationalised coal industry got off to a sticky start and earned a bad name which was by no means altogether deserved but from which it has never recorded. Fifteen pre-war years of depression, followed by the strains of six years of war in which there had been the minimum of capital expenditure and maintenance, were topped in 1946 by the problems of unifying the working o f1,400 pits — a major operation under the best of conditions — in the midst of an exceptionally severe winter which led to an extraordinary demand for coal, in addition to the normal industrial problems of switching from the war to peace production.

In the 1920's Britain's coal production averaged 250,000,000 tons a year, and 20,000,000 to 70,000,000 tons were sold abroad. Since the war, even with open cast mining, output has only once exceeded 225,000,000 tons, and the UK has become an importer of coal.

In the case for the defence Mr. John Raven argued that the morale of miners and managers was broken by incessant public criticism, that the mines remained undermanned because young men no longer wanted to enter a "dying" industry, and that under constant pressure to raise output every year to stave off a threatened crisis, the industry has never been allowed a fair chance to develop in a planned and orderly way. There is a substantial element of truth in Mr. Raven's views but, as I pointed out, he omitted one all-important fact: if it was true that young Britons were more keen to enter other industries, and if in Welfare conditions of full employment, other industries were competing for their labour, it is not true that nobody wanted to enter the British mines. Thousands of Italians, and recently Hungarians, were and are anxious to do so.

The British miners' unions have stubbornly refused to allow foreign workers in. They remember the terrible interwar years of unemployment. They apparently have no confidence that full employment will last for ever. They fear that wages will be kept down by an influx of foreign workers.

In 1945, average earnings were £5-12-8 a week. In the last quarter of 1956 they were £12-19-7. In 1942, the minimum wage was £3-18. Now, with a new claim pending, it is £9-0-6. As a matter of fact, the coal face worker averages £14 a week today. Many get more. With higher pay have come longer holidays, a five-day week, pensions, houses, and a long list of other concessions, including — it seems — the right to decide the nationality of fellow workers.

These are substantial rewards and one wants to know if the miner has won them fairly, that is, is he making his best contribution to the national welfare?

THE WAGE PRICE SPIRAL

Now, it is obvious nonsense to argue, as some people do, that all inflation is caused by what is called the "wage-price spiral", i.e. prices go up, so more wages are demanded and granted, causing greater spending power to push prices higher and so on. As a general proposition, I think it can be agreed that virtually all inflation is in the first instance caused by government spending more than it is raising in taxation. Therefore, we can dismiss any suggestion that Britain's miners, or any other group of industrial workers, started the inflation. But they certainly become a contributory factor to the inflation created by excessive government spending if they succeed in exacting higher wages without adding to the volume of goods and services in circulation. The internal purchasing power of the £ has fallen by about 30 per cent between 1945 and 1957 and to that depreciation it would seem likely that the miners have contributed their share.

An article in the February issue of "The Director", of London, throws light on my submission. "The Director" says that Mr. Jim Bowman, Chairman of the National Coal Board, claims that the industry has served the nation well. For every 6 tons produced in 1946, it now produces 7 tons with no more men. This is certainly something. Yet since 1949 the production of all British industries as a whole has risen by 31 per cent. Some of those got off to a better post-war start than coal, but the millions poured into the mines cannot be ignored (despite all that Mr. Raven has said).

The 1956 Plan for Coal envisaged an investment of £635,000,000 over the next 15 years. Already £323,000,000 have been spent and 180 major projects begun. Another 150 are planned for the next ten years each costing £250,000. For the next ten years, British coal will be absorbing in these and other schemes an investment of no less than £100,000,000 a year.

Nobody expects results overnight but the 1955 Coal Board report said that 167 major schemes were complete or in progress and that £195,000,000 had been spent on smaller reconsructions. Yet, in spite of this, output has fallen in the last four years. How can this be explained by appeals for patience until schemes in hand yield their results? Uneconomic pits have been closed and their output is no longer available, but other pits have had their production stepped up by cutters, ploughs, and endless new methods. Surely some overall progress should have been made?

In September, 1955, it was stated that the shrinkage in capacity of production was four or five million tons a year, and that the industry could, therefore, be proud that output had risen by 30,000,000 tons since nationalisation. May be, but when even with 12,000,000 tons from open cast sites, the total for 1956 barely topped 222,000,000 tons, one wonders how the target of 240,000,000 tons envisaged by the Plan for 1956 is going to be achieved.

In general, the Board defends itself by saying that the pits are undermanned. In 1951, when total output was almost 223,000,000 tons, there were less than 699,000 miners. In 1956, numbers rose to 703,000 miners and production fell by a million tons. Says "The Director": "Perhaps this is why the Plan looks forward to winning its 240,000,000 tons with 618,000 men!"

NATIONALISED LABOUR RELATIONS

Which brings us to the question of labour relations. Not long ago I had occasion to make a tour of several of Britain's largest engineering factories, belonging to a world famous group. Two points struck me: first, their high degree of efficiency and productivity. Secondly, from the viewpoint of size and complexity of organisation, I wondered how these firms could be distinguished from nationalised industry. The chain of control was departmentalised and seemed to me much like a civil service. I put my question to the chairman: "What is the difference, from the point of view of the individual worker, between private enterprise and nationalisation when you get to enterprises of this scale and size which are virtually managed by a series of committees;" "That's easy," he replied. "In a nationalised industry you can't sack anyone who is not doing his job properly. We can dismiss any administrative or managerial staff at once, and although it is more difficult to dismiss an ordinary factory hand, it is possible eventually to weed out the inefficient."

Looking at the British coal industry, the conclusion seems inescapable, as "The Director" says, that the men are using the new methods to ease their task rather than to increase output. To which I add the rider that the men assume also that the National Coal Board dare not sack anyone, no matter how little work he does.

So far the miners have had the whip hand. The crying need for coal and the monopoly achieved by their union meant that they could ask for the moon and get it. Certainly they had leeway to make up by comparison with conditions in other industries. Certainly when they won the five-day week they surrendered it by agreeing to work at weekends for eight months of the year, thus boosting annual output by 12,000,000 tons. But the additional week's holiday conceded them cost nearly 4,000,000 tons.

At the top, labour relations are excellent. Mr. Jim Bowman was himself a pitman and a miners' leader. When the union chiefs visit the Board's headquarters they are completely at home, just as the chairman of the Board is welcome at the miners' annual conference.

But the British National Coal Board has always been giving and the miners taking. Moreover, the harmony at executive level does not reach all the way down. Last year nearly a quarter of the working days lost by strikes in the UK were lost in more than 2,000 disputes in the mines. No other industry has a tenth of this fantastic number of stoppages. Communist influence is to some extent responsible, particularly in certain areas, but generally speaking the conclusion suggests itself that the men have not been able to enter into the spirit of the socialist experiments. On the human side, nationalisation has failed in the UK.

The men are intent on a new wage demand although the Board has what is likely to be a £20,000,000 deficit and is pledged not to raise its prices for some months. It is, however, just possible the the miners may find Mr. Bowman, their old comrade who has only recently been appointed to the Board, tougher than his predecessors. In the bonus shift negotiations, the union was made to agree that men who go slow, or who take unofficial action, should be prosecuted for breach of contract, and there are various other indications that Mr. Bowman is a man of courage and common sense. It would be odd if the long awaited show-down to prove who's boss came in a nationalised industry.

A NATION'S CONSCIENCE

(From Our Special West European Correspondent)

PARIS, March 29.

ANY student of world affairs in our time, be he journalist or newspaper reader, must pick up the subject of "a nation's conscience" with considerable distrust. So far as this article exists, it has shown itself in recent years to be quite insensitive to the most extraordinary brutalities. The German and Russian national consciences (to begin with the sickliest representatives of the species) have accommodated themselves cheerfully to the most severe strains, and such guilt-feelings as they may have conceived seem to be worn very lightly. Even in Britain and France, where the civilised tradition is older and more secure than anywhere else in the West, the national conscience appears to have suffered some distension since those far-off days when the country could be contorted for the sufferings of the Winslow Boy or the languishment of the Jew Dreyfus. But it exists there still, and has stirred itself to call to justice men who have forgotten it in Kenya, Cyprus or North Africa—or anywhere else where "England's far and honour a name". The French national conscience is currently suffering one of these periodic convulsions, caused in this instance by men who have forgotten their honour in Algeria.

Allegations that the "pacification" in Algeria has been accompanied by barbaric excesses are not new in France, and have been faithfully reported by the French Press. Even when, during the last election campaign, issues of the American magazine "Life" were seized because they contained photographs of a cold-blooded murder of a North African by a French soldier, the photographs were smuggled into the country and printed on the front page of Mendes-France's newspaper. But in recent weeks the volume of incriminating evidence has swollen to disturbing proportions. The increase does not represent a worsening of the situation in Algeria so much as the fact that the Press observed a discreet silence during the UN debate on Algeria, "from a sense of national discipline". That is, reports were held over in order not to provide France's enemies in New York with propaganda material. But they were only held over, not suppressed, and the newspapers are now full of them. They add up to a revolting total and have moved the leading Parisian newspaper to ask in a front page heading "did Hitler really conquer us better than he knew?".

Needless to say, the most circumstantial allegations have so far been met with official attempts at whitewashing. Government committees set up to look into accusations that the rebels and their sympathisers were tortured reported many months later, as Government committees usually do in such cases, that they really could not make up their minds. Minor inaccuracies in serious allegations have been triumphantly demonstrated while the substance of the charge is left unanswered. And of course newspaper editors who publish stories of army brutality have been charged with "undermining the morale of the defence forces". These are the traditional reactions of all democratic governments found guilty of permitting licensed terrorism, and no doubt they have as always provided a useful sedative for those who were determined not to have their conscience disturbed by any evidence. But, unfortunately for Parisian bureaucracy, the French national conscience is not in an elastic mood; threats and assurances have not stayed the tide of revolting news from Algeria, and it is now an acquired certainty that the struggle in Algeria has gone beyond the stage of imperialist repression to the quite peculiar cruelty of a civil war between religious communities.

The French Press has both the right and the duty to report instances of torture and other excesses by the French army, because it has given full publicity (as far as this publicity was compatible with decency) to the outrages of the rebels. Before referring to French crimes in the Indian Press, which has 'not' given publicity to the rebel outrages, it is necessary to emphasise that the rebellion in Algeria has from the start, two years ago, used purely and simply the techniques of the Great Calcutta Killing. The so-called Algerian nationalist movement (this name is highly misleading) has been since 1955 a warring congeries of marauding gangs whose main work has been to terrorise the Muslim majority into a political obedience that could not be obtained spontaneously or by persuasion, and which even today hesitates to accept the offer of free elections because it is uncertain that it could talk, rather than shoot, its way to parliamentary power. These facts are recalled as explanations, not excuses, for what has followed.

What has followed is that the French "pacification" force has sunk to using, in certain cases, the stupid and indiscriminate terrorism of the rebels, and not only against the rebels themselves but against all Muslims who could be suspected of aiding the rebels, which in practice means just any North African at all. This resort to the adversaries' barbaric methods is shrugged off by some Frenchmen as deplorable but inevitable, and anyhow "fair" in some grim sense. But this is absurd. What can be expected of armed gangs which represent nobody (and which are being put down precisely because they do not represent "the Algerian nation") is not what can be expected of an army with a long and famous tradition and which represents a civilised government. Worse, it is a matter of simple political calculation that while terrorism might conceivably encompass the rebels' ends if it got bad enough, counter-terrorism can never encompass the French community's ends, which consist not in trying to drive someone out of the country but in trying to persuade people to live and work together.

Torture and terrorism might serve to maintain Portugal's foothold in Goa, but they cannot possibly sustain the French case in Algeria, for that case rests on the fact (and it is a fact) that Algeria is not just another imperialist colony but a place where settled and permanent communities, millions strong and having no other home, have to learn to live freely and equally. Every peaceable Muslim brutalised, tortured or butchered in Algeria today means ten Muslims who are determined not to work in peace with the French in the future. So just from the viewpoint of political calculation, the excesses now being perpetrated by a section of the French army and police in Algeria constitute the merest stupidity. But some of the cases reported (naturally none of them is fully proven, for official crimes can rarely be proven literally) go well beyond stupidity. People are said to have been third-degreed, kept sleepless, questioned for days together, drugged, given electric shocks in the sexual organs, beaten on the soles of the feet or just coldly murdered as reprisals victims. Though racialism has no doubt played its part, many of the victims of these outrages have

been Europeans, especially Communists, who aid or sympathise with the rebels.

Facts of this sort involve mostly the police force, and admittedly police tactics are none too pretty anywhere, least of all in Latin and Oriental countries. More serious are charges against the Army. It was hoped when a conscript army was sent to North Africa last year that the psychological situation would improve: the conscripts from the metropolitan country were not, after all, colonialists, they did not like the Algerian French and had no wish to defend private interests and outdated institutions. And indeed the Algerian French received them with as much suspiciousness as did the North Africans. But the psychological situation has not improved; it has worsened. This is because the conscript army is necessarily staffed by soldiers who have seen service in Indo-China and who have brought to the totally different conditions of Algeria the bitterness accumulated at Dien Bien Phu. The French army slang today the Algerian rebels are called "Viets", and this small fact shows the tragic confusion that is leading a democratic army to fight the wrong war with the wrong weapons.

When the army heirarchy began to suspect that troops were not being too particular about establishing the rebelliousness of the North Africans they shot down, it was decreed that captured weapons had to be forwarded to headquarters in exact equivalence with the numbers of casualties inflicted on the adversary. It now transpires that units in the field carry with them regular "kitties" of spare weapons which they "save up" when rebel stocks are captured and which they trade among themselves, so that they can always have material 'proof" that unarmed and innocent villagers shot down were really armed desperadoes.

To all such accusations the French Government in Algiers and Paris is replying that even cases that could be proven true would remain exceptions, that the mass of the army and police is not guilty of such outrages and that it is disloyal and unpatriotic to blacken the Army by pinpointing rare instances of savagery. All of which is no doubt quite true, but only means that counter-terrorism is not French official policy in Algeria. The fact stands that the weight of "exceptions" is already too great for the national conscience to bear. The pacification programme, which is nearing a crucial political test in Algeria itself, now faces a scarcely less serious moral test in metropolitan France. Continued use of the tactics mentioned, even if exceptional, will dig France's grave in North Africa. The interests of the French community there are so substantial that it is difficult to imagine them ever being liquidated—but that merely means that the grave when it has been dug will be a very big one.

Economic Report from the U. S.

A WAGES-PROFITS DEBATE

(BY GUY SIMS FITCH)

WASHINGTON, March 9.—Economists, business men, labour leaders and Government officials in the United States have lately been probing the American economy, trying to ascertain not only future trends, but the results of past developments. Their probing has touched off an absorbing debate—most recently on the question of what caused the moderate inflationary movement of 1956.

The weekly publication of the American Federation of Labour Congress of Industrial Organizations (AFL-CIO), the nation's leading labour organization, criticized this week those who regard "excessive" wage gains as the prime move in last year's 3 per cent price rise. The argument that set AFL-CIO Editorial pens into motion goes something like this: wage increases last year exceeded productivity gains, thereby pushing up business costs, depressing profit margins, and necessitating higher prices.

In rebuttal, AFL-CIO leaders contend that wage increases are important to maintain consumer spending, that business profits last year were large enough to absorb most of the increased labour costs, and that in any case productivity now is rising again at a faster pace. As is so often the case, debates of this kind tend to be oversimplified. The fact is, of course, that both profit margins and wage increases last year were part of that general economic development that was—and still is—stimulated by strong demand for goods and services. Inflationary strains resulted primarily from efforts to expend too rapidly at a time when the US economy was running at near-capacity and maximum-employment levels.

In this situation, the US Government has been following the so-called "tight money" policies. These are designed to slow down the rate of economic expansion by discouraging excessive business and consumer borrowing. The Government has been avoiding direct controls over prices and wages. These it considers neither necessary at this time nor desirable in a free economy. But it has called for voluntary, private restraint to supplement its monetary policies. Its call for restraint applies equally to business and labour—to pricing policies as well as wage demands.

At this stage of the current debate, another element moves to the forefront. It is the question of how long and how assiduously restrictive policies and private restraints should be employed if and when they begin to have an appreciable effect on economic activity. At this point, the question remains hypothetical, but one that nevertheless must be considered. One view holds that—as a noted economist has put it—a little inflation is better than a little unemployment. Another school of thought holds that inflation, once started, may become increasingly difficult to stop; and, at any rate, even slight price increases year after year eventually out the purchasing power of Americans, workers included.

These discussions have so far resolved little. But they have had one notable effect: They have pushed into the background some dire warnings heard a few weeks ago about inflationary dangers. It is new evidence of the soundness of the US economy that these warnings have had no dramatic effect on its activity. In fact, the imminence of a serious economic downturn has not only been dismissed by President Eisenhower, but it has also been quickly and decisively discounted by many prominent economists, business men and government-officials, regardless of their economic viewpoints.

Of late, there have been some signs of an easing of inflationary pressures. Thus, the major points of the present debate may disappear in time or be supplanted by other topics. But while the debate is underway, it is generating the kind of thoughtful self-examination that in the end contributes to a better understanding of the free and dynamic American economy. It is no exaggeration to say that such discussions have been the means of resolving many thorny problems as the US Economy has moved on to greater stability and strength.

THE BELSUND SUGAR COMPANY LIMITED

NOTICE

The Annual Ordinary General Meeting of Shareholders will be held at the Registered Office of the Company, 14, Netaji Subhas Road, Calcutta-1, on Monday, the 6th May, 1957 at 11-45 A.M. for the purpose of receiving the Directors' and Auditors' Report for the year ended 30th September, 1956, passing the Accounts, declaring Dividend, electing Directors and Auditors in place of those retiring and transacting any other ordinary business that may be brought forward.

The Share Transfer Books of the Company will remain closed from 22nd April, 1957 to 6th May, 1957, both days inclusive.

The Dividend Warrants will be sent to Registered Shareholders.

By order of the Board,

Per Pro. BANGUR BROTHERS LTD.,

(B. G. BANGUR),

Managing Agents.

14, Netaji Subhas Road,

CALCUTTA.

Dated, 28th March, 1957.

N.B.—A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

WORLDGRAM

AGRICULTURE

U.S. Crop Acreage: The U.S. Department of Agriculture reports that American farmers probably will plant the smallest acreage of crops this year since the World War I. Corn plantings are expected to decline some 4,100,000 acres; spring wheat will decline about 3,500,000 acres, and rice about 2,00,000 acres. Decreases are also expected in peanuts, oats, sweet peas, tobacco, dry peas, hay and flax seed. Increases over 1956 were forecast for barley, sorghums, potatoes, dry beans, soya beans and suger beets. A department survey indicated that about 277 million acres would be planted for 16 major spring crops, about two million acres under that planted to the same crops last year.

*

£50,000,000 Plan to Improve Britain's Farms: Grants of up to £50,000,000 over the next 10 years for farm improvements in Britain will be authorized by a new agriculture Bill now before Parliament. Authority would be sought to increase the amount to not more than £55,000,000. Production grants, had more than doubled over the past five years, and were now running at over £70,000,000 per year.

INDUSTRY

Production of Cables in Hindustan Cable Factory: During the month of February 1957, 48.962 miles of cables were manufactured in Hindustan Cables (Private) Ltd., Chittaranjan, bringing the total length of cables produced during 1956-57 to 556.331 miles. The target for the month which was 46 miles, was thus exceeded by 3 miles of cables. The total value of the cables produced during the year up to the end of February 1957 was Rs. 75,56,024. The total length of cables sold during the month was 39.14 miles, valued at Rs. 8,62,049.

*

Tests For Colour Fastness Of Textile Materials: Five Indian standards covering methods of test for determination of colour fastness of textile materials to acid chlorination, potting, soda boiling, water spotting and carbonizing with sulphuric acid have been published by the Indian Standards Institution. Copies of these standards can be had from the Indian Standards Institution, 19, University, Delhi-8, and its branch offices at 40/40A Cawasji Patel Street, Fort, Bombay and P-11, Mission Row Extension, Calcutta.

*

Cement Packing Charges For Next Quarter: On March 27, 1954, the Government of India announced that packing charges for cement would be fixed every quarter on the basis of the average of the maximum and minimum market price for packing material, during each week of the immediately preceding nine months, plus Rs. 1-4 per ton to cover incidental charges. On this basis, packing charges for the current quarter were fixed at Rs. 13-2 per ton. The packing charges for the next quarter commencing from April 1, 1957, work out to Rs. 13.44 per ton. The Government of India have informed all the State Governments of the revised packing charges. The above packing charges are applicable to cement packed in new bags only. Packing charges for cement packed in old bags will be a matter for settlement between the buyer and the seller subject to the maximum indicated above. There will, however, be no change in the equalised f.o.r. destination price of cement announced in the Cement Control Order dated June 26, 1956, on account of the quarterly revision in the rate of packing charges for cement. Such changes in the rate of packing charges will apply to supplies of loose cement.

Production Of Steel In The Second Five-Year Plan: The production of finished steel in India in 1957-58 would be 1,385,000 tons and 1,200,000 tons of steel would be imported during the year. This compared with the production of 1,335,000 tons of steel in 1956-57 and imports amounting to 1,850,000 tons. In 1958-59 the production of indigenous steel would go up to 1,510,000 tons and imports would be 600,000 tons. The production in 1959-60 will go up to 2,085,000 tons against imports which will be 600,000 tons. In the last year of the Plan the production will be as high as 4,080,000 tons and imports 200,000 tons.

TRADE

No Change In Tea Export Duty: The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty, at Rs. 3-6-1 per pound as against Rs. 3-15 per pound in force from February 1, 1957. There is no change in the existing rate of export duty of annas six per pound.

*

Indo-Iraq Trade Agreement Extended: Letters have been exchanged at Baghdad between Shri R. S. Mani, Ambassador of India to Iraq, and the Minister of Economics, Royal Iraqi Government, further extending the Trade Agreement between the Government of India and the Royal Iraqi Government. The Agreement which was due to have expired on December 31, 1956, will now remain in force without any change for a further period of one year from January 1, 1957. The agreement provides for the export and import of the following commodities in accordance with the import-export regulations in force from time to time:

EXPORTS FROM IRAQ TO INDIA:

Animals, cotton, foodgrains, dates, gallnuts and hides and skins (light weight).

EXPORTS FROM INDIA TO IRAQ:

Food and agriculture products, timber and related products, textiles, fibres and bristles, rubber products, hides and skins and related products, ceramics, pottery, glassware and allied industries, arts, handicrafts, and jewellery, chemicals and related products, minerals and ores, machinery and mineral products; iron and steel and their products, abrasives; belting; birds, films exposed; linoleum and stones, (precious and semi-precious).

*

Exports Risks Insurance Corporation To Be Set Up: The Government of India have decided to set up an Export Risks Insurance Corporation to provide protection to exporters against risks arising in export trade, as a measure for stimulating the country's exports. The Corporation will be registered as a company under the Companies' Act and all its shares will be owned by the Government of India. The necessity or desirability of converting it into a statutory corporation will be examined in due course after adequate experience of its actual working is obtained. The Corporation will cover only those risks which have been recommended by the Committee and will take care not to cover risks where there can be collusion between exporters and importers, fraudulent practices and losses due to the fault of the exporter and/or the foreign buyer.

*

Trade Handled At Cochin Port In 1955-56: The total volume of trade that passed through Cochin Port during 1955-56 was 16,08,687 tons, the highest on record, and showed an increase of 57,068 tons as compared with the volume of trade of the previous year. The increase in trade was due to larger coastal traffic and foreign exports. The working of the port during the

year resulted in a surplus of Rs. 9.10 lakhs as against a surplus of Rs. 10.92 lakhs during the previous year. The traffic dealt with at the wharves during 1955-56 represented 46.9 per cent of the total traffic as against 42.5 per cent in the previous year. Compared with the previous year, the tonnage of cargo carried by sailing vessels showed a slight increase of 7,892 tons. The main imports consisted of mineral oils, rice, paddy, other grains and pulses coal, cashewnuts, sugar, machinery, oil seeds, cotton, oil cakes and salt and the main exports were coir produce, mineral sand, cashewnuts and kernels, tea, rubber and pepper.

FINANCE

Per Capita Income And Tax: In a written answer to a question by Shri S. C. Samanta, the Finance Minister, Shri T. T. Krishnamachari, revealed in the Lok Sabha recently that the estimate of national income in India for 1955-56 was not yet available. For 1954-55, the per capita income worked out at Rs. 262.1 (at current prices). On the basis of 'revised estimates' of tax receipts at the Centre and in the States for 1955-56, per capita taxation in that year worked out at about Rs. 9.7. The percentage of tax this year in comparison with the income could be calculated only after the estimates of national income for 1955-56 was available. The Minister added that information was not available on how the percentage of tax in India compared with those in the United Kingdom, the United States of America, the U.S.S.R. and China.

*

Royalty Paid To Foreign Firms: The Deputy Minister, for Finance, Shri B. R. Bhagat, told the Rajya Sabha recently that information was not readily available about the total amount of royalty paid in 1956 by the Government of India through departmental channels to foreign firms for technical know-how. The amount paid by Indian firms both Government controlled and others in 1956, was Rs. 105.99 lakhs, according to the accounts maintained by the Reserve Bank.

*

French Investments In India: In a written reply to a question from Shri M. Valiulla in the Rajya Sabha recently, the Finance Minister Shri Krishnamachari said that French investments in India on June 30, 1948, amounted to Rs. 49 lakhs. Information subsequent to 1948 was not separately available as figures of French investments had been merged with those of "other countries" in official statistics. The Minister added that Government were not aware as yet of any proposals for the investment of further French funds in this country.

*

Aid For Sericulture Schemes. For the development of sericulture industry, grants totalling Rs. 38,10,011 have been sanctioned by the Government of India up to March 18, 1957. Besides, a sum of Rs. 27,31,651 has been sanctioned as financial assistance in the form of loans to 15 schemes. The total provision for grants and loans to the sericulture industry for the financial year 1956-57 was Rs. 60,00,000.

GENERAL

Chittaranjan Loco Works Sets Up New Record: The Chittaranjan Locomotive Works has set up another record of production when the 500th locomotive rolled out of the factory on March 25, 1957, since it was established seven years ago. 'WG' locomotive is one of the heaviest type of the broad gauge freight locomotive and weighs about 174 tons in working order and has a horse power of 1,300 at 35-45 miles per hour. It may be recalled that production in the shops commenced on January 26, 1950 and the first locomotive, assembled out of imported components steamed off on November 1, 1956. In 1950, three locomotives were turned out. In 1951 — 16, 1952 — 30, 1953 — 54, 1954 — 86, 1955 — 123, 1956 — 150 'WG' locomotives were turned out and at present the shops are manufacturing 14 'WG' locomotives per month. The workshop was set up for a target production of 120 average size locomotives per year which figure was reached as early as May 1954 and since then Chittaranjan Locomotive Works is breaking the old records every month and thus contributing towards India's self-sufficiency in motive power requirements.

*

Progress in Ambar Charkha Programme: At the end of January 1957, the number of Ambar Charkhas manufactured had increased to 50,026 as compared to 37,175 at the end of December 1956. The greater part of the manufacture was done in the 74 decentralised Saranjam Karayalayas established by the All-India Khadi and Village Industries Board. Out of the total number of Ambar Charkhas manufactured so far 20,134 have been distributed to independent spinners for commercial production of yarn. Production of Ambar Charkha yarn up to the end of January 1957 was 3,20,008.85 lbs. as against 2,14,711 lbs. up to the end of December 1956. As regards the production of cloth the total quantity produced at the training centres up to the end of January 1957 was 7,81,687 sq. yards. Estimates which are, however, incomplete, indicate that commercial production of Ambar Cloth till the end of January 1957, is of the order of 4,481 sq. yards. The cloth sold was 1,647 sq. yards, bringing the total sales of Ambar cloth to 15,645 sq. yards.

*

Employment Through Exchanges During First Plan Period: Those given employment through the Exchanges during the first Five Year Plan numbered 12,32,175 stated Shri Khandubhai K. Desai, Union Minister for Labour, in reply to a question by Shri S. C. Samanta in the Lok Sabha recently. The number comprised 1,28,122 (including 80,253 ex-service men) retrenched personnel. The percentage of employment given to the total number registered was 16.7.

*

Industrial Disputes and Relations in India During January, 1957: There was decreased time-loss due to industrial disputes during the month of January, 1957, as compared to the previous month, according to Labour Bureau, Government of India. The total time-loss during the month was of the order of 3 lakh man-days as against over 4 lakhs recorded during the previous month. The time-loss during January, 1957, was also lower than the monthly average time-loss of 591,330 during 1956 by about 52.5 per cent. The number of fresh disputes arising during January, 1957, was 93 and these involved 43,201 workers. The corresponding figures during the previous month were 116 and 46,856 respectively. One hundred and twenty-one disputes were current at any time during the month. These involved about 50,000 workers. In the previous month the number of disputes was 115 and these involved about 66,000 workers. The average duration of disputes current at any time during the month was 5.4 days as against 6.9 days during the previous month.

*

Development of Heavy Chemical Industries: The Government of India have reconstituted the Development Council for Heavy Chemicals (Alkalis). The Council which will function under the Industries (Development and Regulation) Act, will advise Government on the development of the heavy chemical (alkalis) industries. The special functions of the Council will be to recommend targets of production and co-ordinate production programmes. It will suggest norms of efficiency in order to eliminate waste, improve quality and obtain maximum production. Measures for securing the fuller utilisation of the installed capacity and promotion of marketing arrangements and labour welfare measures will be among its other functions.

NEWS IN BRIEF

INDIAN

An increase of 1.21 million tons was recorded in the production of coal in India during 1956 as compared to the production in 1955. The total quantity raised in 1956 was 39.43 million tons as against the total quantity of 38.22 million tons for 1955.

*

An Indian standard specification for size grading of coal and coke for marketing (revised) has just been published by the Indian Standards Institution. The standard prescribes tentative standard sizes of coal and coke for marketing as also the method of sampling for size grading.

*

The Indian Standards Institution has published an Indian standard for bone-meal, steamed. This standard prescribes the requirements for bone-meal used as manure.

*

In view of the increase in the landed cost of imported Ammonium Sulphate and a higher issue price by Sindri, the Government of India have decided to raise the Central Fertiliser Pool issue price of Ammonium Sulphate for cultivators by Rs. 35 per ton.

*

About 11,500 more employees in Uttar Pradesh received benefits under the Employees' State Insurance Act which was extended to Allahabad, Varanasi, Rampur and Kalyanpur (Kanpur District) from the midnight of March 30, 1957. This brings the total number of workers covered by the Act to 11.22 lakhs.

*

India attained self-sufficiency in salt for the first time in hundred years only in 1951. Since 1950 no import of salt is allowed and even though a provision for import of 10 lakh maunds of rock salt was made in the Indo-Pakistan Trade Agreement of August 1955, no import of salt from Pakistan to India took place.

*

The Government of India have released a further quantity of 1.67 lakh tons sugar for free sale. This brings up to the total releases so far made out of 1956-57 production to 5.68 lakh tons which include 0.46 lakh tons released for export.

*

The first meeting of the Board of Directors of the Central Warehousing Corporation which was held recently has decided to issue one lakh shares of Rs. 1,000 each of which, in the first instance, 10 per cent will be called up with share application and 10 per cent on allotment.

*

A peak production of 8.6 crore maunds was attained in 1953, which was in excess of the target of 8.37 crore maunds envisaged under the first Plan. It further improved in 1955 and was about 10 per cent above the 1954 level.

*

The Government of India have sanctioned a loan of Rs. 1 crore to the Bombay Government for the concrete-cum-masonry dam on the Koyna river. This brings the total amount so far given for this project to Rs. 4.10 crores.

*

A provision of Rs. 189 lakhs has been made for the development of existing salt works in the second Plan. Besides, a sum of Rs. 1 crore is likely to be spent on the development of the Mandi Salt Mines — the only source for rock salt in India.

FOREIGN

An energy tax estimated to yield Kr. 525 (£36 million) per annum and primarily aimed at financing a considerable expansion of Sweden's power output, including nuclear plants, and at increasing oil and petrol storage capacity is to be introduced by the middle of this year.

*

It is reported approximately £23 million is to be spent by the Kenya Government during the next three years in expanding Kenya's economy and developing production.

*

Industrial production, personal income, consumer spending and employment were at record or near-record levels in U.S.A. in the first months of 1957.

*

Great Britain received less Canadian newsprint during February and the first two months of this year than in the parallel periods a year ago.

*

U.S. consumption of natural and synthetic rubber —a short working month—was 123,525 tons against 139,228 tons in January and 125,525 tons in February 1956.

*

In spite of a drop of £5.2 million in butter receipts, the export income of New Zealand for the year ended February 28, rose by £11.2 million to £317.8 million and left a surplus of £1.3 million in overseas transactions.

*

The United States concluded recently two 40-year loan agreement with Burma totalling $42.3 million (£15.2 million) for economic development.

*

Nigeria's exports of minerals fell in value by £1,683,764 to £10,040,167 in the year ended March 31, 1956 compared with the previous years.

*

According to the Soviet News Agency, 'Tass', a total of 76 million tons of oil is expected to be contracted this year in the Russian Federation. In 1950 oil production in the whole of the Soviet Union amounted to 70 million tons.

*

Gold and foreign exchange reserves of the Bank of Indonesia have fallen again, the latest figure 2,083 million rupiahs being 84 million rupiahs lower. Advances to Government are 42 million rupiahs up at 7,535 rupiahs and the lower of liabilities is now down to 18.10 per cent.

*

It is reported the European Coal and Steel Community proposes to issue during April $25 million worth of 18-year secured Bonds, due 1975, and $10 million worth of serial secured Notes due 1960-62.

*

Canadian farmers intend reducing their area under wheat this year to 19.8 million acres, the lowest point in 14 years about 1.5 million acres less than a year ago.

*

During February Hong Kong's exports were valued at H.K.$444.1 million or an increase of H.K.$113.8 million over February last year. The value of Hong Kong's exports was H.K.$ 245.2 million an increase of H.K.$3.4 million over February, 1956.

Special Articles:

A REVIEW OF INDIA'S FIRST NATIONAL POLL

(A COMPARISON OF THE GALLUP POLL PREDICTIONS WITH ACTUALS)

(Contributed by The Indian Institute of Public Opinion)

NOW that the results of the elections to the Lok Sabha have been announced for 488 seats, it is possible to compare these results with those predicted on the basis of a pre-election poll conducted by the Indian Institute of Public Opinion and printed in 'The Eastern Economist' Blue Supplement of February 22, 1957. Has the technique of public opinion research been proved in the event in Indian conditions? What has been the margin of error and with what confidence can one view public opinion research conducted on similar lines? These are important questions which are of interest beyond the prediction of the Congress vote in the Lok Sabha which was only a laboratory test of a method that has much larger implications.

Table I gives the prediction of the Indian Institute of Public Opinion as published and the actual results obtained from the elections. It should be remembered that the Congress won 12 seats unopposed and the Party did not put up candidates in four constituencies where contests took place. Also six results are yet to come from Himachal Pradesh and the Punjab. Table II below, therefore, gives the results after corrections for the above-mentioned factors for which no provision was made in the poll.

TABLE I.

SHOWING COMPARATIVE RESULTS OF THE POLL WITH THE ACTUAL ELECTION RESULTS

States (Except Manipur, Tripura* & Jammu and Kashmir)	No. of Seats	As Predicted percentage of Congress Votes	As shown by Actual Election Results: Percentage of Congress	Valid votes polled	Votes polled by Congress
I	II	III	IV	V	VI
Andhra Pradesh	43	59.4	51.2	95,26,605	49,05 153
Assam	12	53.0	57.3	20,67,591	11,84,708
Bihar	55	46.0	45.8	89,31,386	40,87,209
Bombay	66	46.0	48.6	1,65,45,725	80,33,146
Kerala	18	41.7	35.1	59,59,732	20,91,712
Madhya Pradesh	36	57.0	52.1	76,29,233	39,74,347
Madras	41	59.8	47.8	1,16,01,433	55,42,963
Mysore	26	62.0	55.4	58,06,440	32,19,014
Orissa	20	45.0	40.9	43,47,669	17,77,333
Punjab	22	58.4	50.9	61,13,523	31,13,657
Rajasthan	22	46.9	53.6	46,49,093	24,94,094
Uttar Pradesh	86	55.0	46.4	2,28,27,658	1,05,92,594
West Bengal	34	53.3	50.7	1,00,94,998	51,20,857
Delhi	5	55.0	53.7	2,18,092	4,40,875
Himachal Pradesh	4	53.0	(Elections still to be held)		
Total for All India without any correction	490	**53.0**	**48.3**	11,63,19,178	5,61,77,657

* Manipur and Tripura were excluded from the pool, hence credit has not been taken in Columns V, VI. VII and VIII for these two Union territories.

TABLE II.

Showing Results after Correction (i) for the Twelve Unopposed Returns; (ii) Four Seats not Contested by the Congress and (iii) Results still to come.

	Total No. of valid votes polled**	Votes polled by Congress**	Percentage Congress
Actual results without any correction	11,63,19,178	5,61,77,657	48.3
(i) Credit at 48 per cent for four seats which the Congress did not contest	..	4,56,065	..
(ii) Credit for 12 unopposed returns for Congress at 60 per cent	29,69,220	17,83,532	..
(iii) Credit for six seats still to be declared in Punjab and Himachal Pradesh at 51 per cent	14,84,610	7,57,151	..
Results with the above three corrections	12,07,73,008*	5,91,74,405*	49.0*

** Entries in this column against (i), (ii) and (iii) are our estimated corrections.
* As corrected for 12 unopposed returns; four seats not contested by Congress; and six results yet to come.

It will be seen from Table II that after the necessary corrections are made for unopposed returns, seats uncontested by the Congress and the results still pending, the actuals for the Congress vote work out to 49 per cent, against 53 per cent indicated in the pre-election prediction. This happens to be within the margin of error of about four percentage points computed on the assumption that the sample was designed with the chance of failure 1 in 10,000. Statistically speaking this poll was, therefore, a successful illustration of the application of random sampling and public opinion research techniques to Indian political conditions.

Attention might also be directed to the fact that all the incidental predictions of the Indian Institute of Public Opinion have been fulfilled in this case. These were to the effect that the Congress party would poll a substantially larger number of votes than it did in the 1951-52 elections, and that if majorities were of the same order as in the previous elections, Congress would get an additional number of seats. In the present case, as against 354 seats in the last Lok Sabha, Congress has actually obtained 366 seats with six results yet to come and in particular it has a majority large enough to amend the Constitution on its own. The Indian Institute of Public Opinion also correctly estimated the actual poll at near 120 million including the invalid votes, which were polled though they were not fruitful.

Some observations need, however, to be made on the areas where the poll was less successful than elsewhere. It will be seen that almost complete accuracy was obtained in Bihar and substantial accuracy (within about 2.5 per cent) in Bombay and Delhi. Close results, that is, within about five percentage points, were obtained in most States of the Indian Union. The error was largest in Madras and Uttar Pradesh; in both cases beyond the range of error suggested by mathematical sampling error alone. There is 'prima facie' indication here that the quality of interviewing was weaker here than elsewhere. The chances of error in Uttar Pradesh were increased by the fact that the sample chosen for that State in the event was unduly small. Conceivably the error might have been significantly reduced, had a sample as large as that of Bombay (over 500) been taken in the case of Uttar Pradesh. Both the Uttar Pradesh and Madras samples suffered from the omission of certain areas. It seems plausible to assume that, with the additional experience gained, the technique of public opinion research in these States can be developed so as to produce more accurate results.

It may be mentioned that the margin of error in the first of the series of Gallup predictions in the United States was 6.8 per cent against an average error of 3.3 per cent for eleven predictions. The fact that in Indian conditions the margin of error has been about 4 per cent in the first poll of its kind in India (comparing well with Gallup predictions' average error of 3.3 per cent) suggests that the Gallup procedure is appropriate to India though some improvements may be required in designing and training, for both of which there was no adequate opportunity in the present case. Conceivably also part of the error might be due to the fact that the Gallup Poll was taken three weeks before the actual poll and, because of financial and administrative considerations, it could not be repeated a week before the election. There is 'prima facie' indication that non-Congress party election campaigns did influence a significant number of voters, though this does not seem to have affected the broad character of the result.

Assuming that the confirmation obtained in this poll of the value of public opinion research methods indicates that honest and correct opinions can be obtained to certain questions in India and that these reflect the structure of public opinion in the country, one might conclude that just as an event such as the electors' voting intentions can be predicted, so can the reasons which have prompted these intentions. In this particular case, some of the factors which operated in making party preferences are age, religion, income group and other background of the voters and conceivably the influence, on opinions, of the personalities of the candidates.

RATES OF ECONOMIC GROWTH

THE Deutsches Institut fur Wirtschaftsforschung in Berlin (which will hereinafter be referred to as the DIW, so as to leave me room to say something about it) is one of Europe's leading economic research institutes and it has lately published a study of rates of economic expansion in various leading countries. The United Nations and its affiliates attempt this sort of thing from time to time, but a less official agency has the advantage that it can practise the necessary correction of government statistics (especially from Russia) that is required to make these comparisons at all valuable. The DIW's figures are full of interest for the economist, and the few I will give here are equally useful for the layman who wishes to set political news in an economic perspective at a time when political power is increasingly based on economic potential.

The most interesting of the DIW's statistics refer naturally to the balance between Communist and non-Communist economic power. After reducing exaggerated Soviet claims to reasonable proportions, the DIW concludes that Russian industrial output today is just half American, but already exceeds the combined industrial output of Britain, France and West Germany. In fact Russian output, at the latest period for which reliable figures are available, more or less equals the combined output of Britain, France, West Germany, Canada and Japan. The following table, in which the industrial production of various countries is expressed as a percentage of U.S. output, clearly establishes the heirarchy of present, or recent, industrial power:

U.S.A.	100
U.S.S.R.	48
Germany (East and West)	19
Britain	17
France	9
Japan	6
Canada	6
"The West" (without USA)	53

The same figures looked at differently, expressing various countries' output as a percentage of Russian production, give this heirarchy:-

U.S.A.	207
U.S.S.R.	100
Germany (East & West)	40
Britain	36
France	18
Japan	12
Canada	13
"The West" (without USA)	100

But there is a factor that upsets these neat lists and which makes it necessary to emphasise that, although based on the most recent figures, they may already be out of date. That factor is the extraordinarily high rate of expansion now being achieved in the Soviet Union. Russian industrial output is estimated to have

increased by 11 per cent last year, against an increase of 2 per cent in the U.S.A. Where the discrepancy between growth rates is so wide, the balance of economic power can shift very quickly. The Russians indeed claim that their output will equal or exceed American within five years or so, but the DIW, extrapolating with less enthusiasm, puts the overtaking date somewhere between 1985 and 2000 A.D.—so obviously we can disregard this question as beyond the bounds of scientific prevision. What is quite likely is that within 7 or 10 years Russian industrial output will have attained present American levels, but meantime American expansion will have continued and thereafter the rate of Russian growth will begin to fall.

Before drawing any hasty political conclusions from the discrepancy between Russian and American growth rates, it is necessary to notice that the Russian figure is by no means unique in Europe and is in recent years being equalled or exceeded in both France and West Germany; it has been approached in Canada and Japan and was in one recent year much exceeded in the last-named country. So a growth-rate of 10-12 per cent per annum does not necessarily have anything to do with "planning" or any other form of economic dragooning. It has much more to do with the stage of industrialisation — higher figures being achieved in the early stages when the technological innovations of other countries are being exploited quickly — and lower figures being achieved once a plateau of maturity is reached. And there is nothing irrevocable about this latter stage: an old industrial country can become young again after a period of stagnation, and this is happening now in France. Especially high growth rates are recorded in countries where industrialisation begins late, as in Russia and Canada, but there is a slowing up as full employment is approached.

But when all these reservations have been made, the fact stands that between 1929 and 1955 the tempo of industrial expansion in Russia has been sensibly higher than elsewhere. In the post-war reconstruction period, the Russian growth rate was commonly equalled elsewhere, but between 1950 and 1955 Russia maintained an annual rate of increase of more than 10 per cent, while other countries fell well below that figure, save the exceptions noticed above. During this latter period, the Russian industrial growth rate was about three times the American, so that in five years Russian output increased from one-third to one-half of U.S. output. More surprising, it appears from the DIW statistics that the absolute annual increase in output that comes on to the Russian market is already greater than the annual increment in output in the U.S.A., despite the fact that one total is only half the other; between 1950 and 1955 the absolute increase in output in Russia equalled 35 milliard U.S. (1929) dollars, while the corresponding figure for the U.S.A. was 31 milliard (1929) dollars.

It is hardly necessary to mention that the bulk of Russian achievement is concentrated on industrial raw materials: it is only in coal, cement, pig iron and unfinished steel that Russian output is comparable with West European and American. The global figures such as I quote here disguise this, but the DIW analysis of output by commodities shows how far inferior is Russian output of consumer goods such as textiles and artificial fibres. The organisation of Russian industry is not designed to impress consumers, but to impress statisticians and army generals.

With their economy achieving such high growth rates, it is not surprising that the Russians are optimistic about overtaking the U.S.A. within a very few years. The learned Berlin economists whose work I am summarising are much more cautious. It is not that Russians' prophecies are insincere or just propaganda; it is rather that febrile optimism about the future is a natural accompaniment of a period of vast economic expansion. The DIW has calculated the growth rates for half a dozen major countries from 1870 to 1955, and concludes from this review that the Russian growth rate will hereafter begin to fall and within a few decades will be down to the American level. All the time it is falling, of course, it will remain higher than the American figure, so Russian industrial power will constantly be drawing nearer American, but parity will not be achieved much before the end of this century.

Statistical extrapolations apart, there are sound economic reasons for expecting a decline in the rate of Russian expansion. An acute manpower shortage is foreseeable in Russia in the near future, and full employment naturally rules out spectacular growth rates. Moreover, the forced and rapid industrialisation of Siberia and the Russian Far East will also involve a type of investment — in railways, roads and population transfers — that must reduce strictly industrial investment. Nevertheless, Russian potentialities in men, natural resources and in the room for technical improvement are all greater than in the USA, so the DIW's conclusion is that although the date of Russo-American parity is more remote than the Russians imagine, it is still a virtual certainty. A rather different picture emerges if we combine Canadian with U.S. economic potential; the growth rate and economic prospects of such a "North American bloc" would be in no way inferior to the Russian, despite the lower population and smaller area of North America.

The economic progress of the Communist countries apart from Soviet Russia is much less impressive, both in the absolute volume of output and in the rate of growth, than that of the Western countries apart from the U.S.A. Either Britain or France alone outweigh all of Russia's European allies and there is no sign of this position being reversed. The DIW estimates that the industrial power of the West as a whole is twice or thrice that of the Communist world as a whole.

Various political deductions may be drawn from these economic facts, and that part of the question may be left open. It is only necessary to remember that when one moves from economics to politics, what is important is not present absolute achievement but the rate of growth and expansion.

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

THE ROLE OF THE RESERVE BANK

By

CROESUS

IT is axiomatic that credit expansion and economic development go hand in hand. As such the banking structure in general and the Reserve Bank of India — the Central Bank of the country — in particular have a major role to play in the implementation of the Five-Year Plans for economic development in our country. And if this is to be facilitated, the two admittedly essential pre-requisites are healthy banking traditions and complete autonomy in management for the Central Bank, especially, on economic matters. It is often mistaken that complete autonomy for the Central Bank of a country necessarily involves a cat and dog fight with the Government of that country. Autonomy is desired, it should be noted, more to ensure that the Central Bank does not suffer from any inhibitions when it is a matter of expressing its views on the economic health of the country at a given time and the nature of policy most suited to the needs of a given situation. Without these, there would be no curb even on irresponsible or dangerous economic policies that the Government of a country might pursue. It is especially of the essence of a democratic government like India that there should be freedom for the country's Central Bank, if only because of the unique position the latter occupies, to express its views, even if it should happen that the Government of the day might reject these views and insist on following its own policies. But to say that the Central Bank should not even do this, but simply toe the line of its Government is grievously to miss the point of the whole controversy. Unfortunately, this seems to be the impression left on the minds of many who listened to the Union Finance Minister's address to the Annual General Meeting of the Associated Chambers of Commerce of India, held in Calcutta in December last. This explains why the relevant extract was specifically quoted by Mr. C. H. Bhabha, Chairman of the Indian Banks' Association, at the last annual general meeting of that body to drive home the fact that "an autonomous Central Banking Authority built on solid traditions can go a great way in hastening the nation's progress and promoting the welfare of the people."

This leads one on to a consideration of where the Reserve Bank of India stands. By and large, this central banking institution of India has fared all right and, as Mr. Bhabha said, it has so far functioned with goodwill of all. He also added advisedly, if not deliberately, that it has "aimed to pursue an autonomous policy". For, with its nationalisation, the Reserve Bank could at best only aim to pursue but not really assert itself as it is known to, and could have done in the past. Yet there were occasions even after its nationalisation when the Governor of the Reserve Bank could, and did, freely express his realistic views even when these conflicted with the then held official views. But, as the I.B.A. Chief observed, "the risks of interference by, and dependence upon, Government seem to loom large on its horizon at present", judging from the official attitude, as reflected in the speech of the Union Finance Minister referred to earlier. According to Mr. T. T. Krishnamachari, "even the Reserve Bank has to do something which the Government of the country wants to do...." but one hopes that this will be confined only to implementing official policies and not extend to the Reserve Bank's independent thinking on economic issues and policies. In no democratic country with a Central Bank worth its name is the Central Banking institution prevented from free and uninhibited expression of its considered and expert view on any major economic issue, even when there is reason to apprehend that the Central Bank's views may go counter to those of the Government of the day, although the latter's view may ultimately prevail and the Central Bank itself may have to implement it as the official policy. For this reason, I am sure, everyone will wholly endorse the earnest wish of Mr. Bhabha that the Reserve Bank of India should "grow in healthy traditions and maintain its dignity and autonomy and not become a mere Department of the Finance Ministry of the Government of India". It is in the interests of democratic government too that such should not happen; otherwise, the limits of mischief when another political party with more extremist views comes into power are better imagined than indicated.

While on this subject, I might as well refer to another pertinent observation of Mr. Bhabha relating to the Reserve Bank. Here again, public apprehensions have been aroused by a reported statement of the Union Finance Minister in Madras as it appeared in the daily Press. Oftentimes, even well meant observations, if torn out of the context and referred to without an indication of the particular audience to which they were made, may lead to avoidably unpleasant consequences. I regard the treatment meted out to Mr. T. T. Krishnamachari's speech in question at Madras as one of such instances. Having said this, I am bound to add that great caution and restraint are necessary on the part of anyone, and more so on the part of a Union Finance Minister, when any critical things are said about banking generally and the country's Central Bank in particular, even if there be ample justification for these remarks. Mr. Bhabha was not exaggerating, therefore, when he declared that "such attacks expose the nation to the risk of shaking the confidence, not only of its own people but also of other countries, in the banking system of India. If this confidence is shaken, the great need for the success of the second Five-Year Plan, namely securing a further rapid and substantial increase in banking deposits by developing the saving and banking habit among the people of the country, will not be fulfilled. It is easy to destroy the reputation of banks by attacking them, but it would take them a lot of time, trouble, and hard work to rebuild it". Surely a person of Mr. Krishnamachari's calibre cannot be unaware of this and, if my information is correct, what he actually said in Madras was really not of such a nature, although it was stinging enough, in all conscience, to all banks, not excluding the Reserve Bank. All this would appear to have arisen out of the Union Finance Minister's sheer impatience to get things going in a big way, and perhaps he was entitled to say what he did. But my own objection is not so much to whatever he might have said as to his overlooking one fact, namely that the situation confronting our banks and the Reserve Bank is an altogether new one, even as Mr. T. T. Krishnamachari's whole approach has been novel to them. Being doubly unaccustomed thus, it is possible that our banks and the Central Bank seemed to the Union Finance Minister as rather lacking in initiative. Actually, this is not the case, as he will himself soon make out, if he has not already done so.

One of Mr. T. T. Krishnamachari's known criticisms of Indian banks is that they have not done much to

increase their deposits to keep pace with their advances. Mr. Bhabha did well, therefore, in dealing with this aspect of the matter also. The I.B.A. Chief not only conceded that deposits had not kept pace with advances but went further and pointed out an equally abnormal banking feature of the country, namely, that deposits of our banks have also not been rising commensurately with the increase in our note circulation, while, in other countries, a similar trend is not noticeable. In other words, our bankers are also fully seized of the problem and they seem too to know how to overcome it, given the chance and the proper climate. In Mr. Bhabha's opinion, however, not only do suitable conditions not exist, but certain methods adopted by the Government — and he listed these — have resulted in the deposits being literally snatched away from commercial banks. One of these is "the recently reported tendency, which has caused concern to all commercial banks of this country;" "in the overenthusiasm to show large figures for National Savings and Post Office Deposits, a vigorous campaign appears to be afoot to snatch away deposits of commercial banks by pressing all those who have any connection with any of the local bodies or Governmental organisations to convert some of their fixed deposits or savings deposits with banks into Post Office Savings Deposits or National Savings Certificates".

Of a piece with this, not mentioned by Mr. Bhabha though, is the pressure of State Governments, whenever they float loans, on people to go in for these loans. This naturally results to some extent in diversion of bank deposits to investments in Government securities and, to this extent, the growth of deposits is affected adversely. It is, therefore, necessary, and especially if it is the intention of the authorities that banks must play their proper role in fulfilling the large national objectives and in implementing our national plans, that not only should such unhealthy tendencies be curbed, but, as the I.B.A. Chairman himself observed, a farsighted view will also have to be taken and a liberal policy of active help and guidance extended by the Government to all banks.

REQUISITIONING COTTON STOCKS

By
CROESUS

WHILE replying to the debate on the Budget, the Union Finance Minister stated, the other day, that the Plan should be implemented at all costs, even if it had to be put on a war basis. He did not, however, indicate what special characteristics would differentiate the present Plan from the one to be run on a wartime basis, if need be. But this job of differentiation would appear to have been done for the Union Finance Minister by the Textile Commissioner in Bombay.

Restrictions, rationing and regimentation are all concomitants of emergency conditions that prevail when a country is directly or indirectly involved in war. In other words, they presuppose the prevalence of emergency conditions. That these conditions have not yet come to prevail in our country is known to all, except to some officials. Otherwise, there can be no justification for the assumption of more and more regulatory powers by the Government in various fields of economic activity that one has been witnessing for some time now. The latest instance of what looks like a wartime measure is the requisitioning of cotton by the Textile Commissioner.

By a notification issued by the Government on March 29, 1957, the Textile Commissioner was authorised, under the Cotton Control Order, to requisition cotton by directing any person or class of persons such quantities of such description of cotton as he might specify. It was further stated that any manufacturer desiring assistance from the Textile Commissioner for the purpose of obtaining supplies of cotton could make an application to the Textile Commissioner and also that the latter has been authorised to determine the prices of cotton so directed to be sold.

The 'immediate' provocation for such an extreme step by the authorities seems to have been provided by reports alleging that cotton had been transacted at above the ceiling prices. It was only a day prior to the publication of the Press Note in question, that the official "discovery" seems to have been made that there had, in fact, taken place some cotton deals beyond the ceiling levels. Actually, however, there have been current unofficial reports, day in and day out, for well over a month now — almost from the beginning of the third week of February — indicating not only that the futures prices were tending to reach higher and higher levels but that the spot cotton too had started attracting sustained buying at every new high. Indeed, we had ourselves called the attention of the authorities, in these very columns, to the need for investigating the whole question with a view to finding a lasting cure for the cotton malaise. (Vide "The Eastern Economist" dated February 15, 1957).

One thought that the Forward Markets Commission, which has its headquarters in Bombay, thereby enjoying a sort of a ring-side seat, had been watching the cotton futures market at close quarters, especially during the last three or four weeks when spectacular price appreciation had become a pronounced characteristic of the market. Strangely enough, all this while, the F.M.C. did not convey — at any rate there have been no indications — even by as much as the flicker of an eye-lid, that there were happenings transpiring in the cotton market which were out of the ordinary. For aught one cares, therefore, the F.M.C. might well have been located anywhere else and why in Bombay of all places. Further, if a body that has been ostensibly constituted for the specific purpose of ensuring the normal conduct of trading in certain commodities does not enjoy the freedom of action at periods of crises, as seems to be the case, and must needs wait on the approval of New Delhi for every action that it takes, then it might as well not exist at all.

But, be that as it may, what has led to the present rise in the price of cotton, both in the spot and in the futures markets? Even a novice in economics will not find it difficult to answer this poser. It is only the sustained demand for a commodity in scarce supply that has led to these high levels of prices. To argue that all this is due to speculation is nonsense, although it is denied that speculation can and has, to some extent, accentuated the rise in prices; speculation can be completely established only when the statistical position of cotton is quite comfortable and yet there is an abnormal rise in prices. In the present circumstances, on the other hand, it has been proved beyond doubt — what with the steady scaling down of official and trade estimates of cotton crop from 54.20 lakh bales to 49.50 lakh bales and the continued reports of damage to the quality of cotton — that there does exist certain famine of fine cotton, while, at the same time, there has not been a commensurate falling-off in the demand for cotton, in spite of the Government's policy of restricted cloth production, a policy which, in the prevailing circumstances, has, after all, not proved to be an unmixed

(Continued on page 544)

BUSINESS NOTES

HINDUSTAN MACHINE TOOLS

THE COATES MISSION, which recently visited this country to advise the Government on the manufacture of heavy machinery, have commended the work done by the Hindustan Machine Tools in their report which they have submitted to Government. Coming from a team of experts, their observations deserve earnest consideration to revise first reaction about the operations of the factory. It was the criticism of the Colombo Plan expert, Mr. J. D. Scaife in 1955 on the working of this factory as well as the one at Ambernath that drew attention to the whole question of the development of the machine tools industry. The working of the Jalahalli factory was a sad experience for the Government because of various factors and the Estimates Committee itself in one of its reports has focused attention on many of them. It is obvious that there was lack of proper planning and a good deal of delay and wastage in the execution of the project. There was also no co-ordination between the public and private sectors in earmarking spheres of production which led to considerable overlapping and hardship to the latter. All these led to the appointment of the Machine Tool Committee which has now outlined a programme for the development of the industry as a whole.

The team of British experts in their report have now stated that they propose to ignore the background of this project and the length of time it has taken to reach their present-day output. They have no hesitation in asserting if the works "continue to progress as they appear to be doing at the present time, they should be considered to be an asset of considerable national importance". Pointing out that the Indian Government need not be unduly perturbed at the slow start as this was to some extent inevitable due to the very high standards set by the consultants, the report says: "The facts are that India now has a first class machine tool unit in the light/medium range and should turn it to the maximum possible use and now that the fundamentals of accurate machine tool manufacture have been well-established, excessive accuracy should not be demanded on future production on such machine tools as milling machines". A recent report states that the factory registered a production increase of 237 per cent of its original targets laid down for the financial year 1956-57. Taking this fact apparently into account, the British team suggests that "it seems possible that production will outstep the demand for a time, but in view of the rapid expansion of industrial development, Government should be prepared to stockpile these machines against requirements of the second and third Five-Year Plans". The report of the British experts has brought the Jalahalli factory under a new light which may prove of great advantage to its further development.

EXPORT RISKS INSURANCE CORPORATION

WITH A view to stimulating the country's exports, the Government of India have decided to set up an Export Risks Insurance Corporation. The decision is to be welcomed on the score that it would provide protection to exporters against risks arising in export trade. The Corporation will be registered as a Company under the Companies Act and all its shares will be owned by the Government of India. The necessity and desirability of converting it into a statutory corporation will be examined in due course after adequate experience of its actual working is obtained. The Corporation will cover only those risks which have been recommended by the Export Credit Guarantee Committee and will take care not to cover risks where there can be collusion between exporters and importers, fraudulent practices and losses due to the fault of the exporter and/or the foreign buyer. The risks, which, as recommended by the Committee, will be covered are diversion risk, import and export control risks with certain safeguards, insolvency and default risks, war and civil war risks, transfer risks, any other risk which is caused by factors outside the control of the exporter or buyer which arises from events occurring outside the exporters country, C.I.F. risks, and the inability to recoup by sale expenses incurred on market surveys, publicity, stock holding and other promotional measures for the development of a particular market.

The authorised capital of the Corporation will be Rs. 5 crores for the present, the subscribed capital being Rs. 2.5 crores. The subscribed capital will be increased from time to time as the growth of business warrants. The scheme to begin with will be worked on a voluntary basis. But an exporter, who chooses to insure his exports will be required to insure all his exports during a period of 12 months.

It is good to find that the scheme will be worked on voluntary participation. Although compulsory application of the scheme may have certain advantages in reducing the incidence of risk and costs, it has many drawbacks to be set against these gains. This controversy, however, has now been set at rest. So far as risks covered under the scheme are concerned, it is a moot point whether they are the risks which frequently beset export trade. As a matter of fact there should not be much dispute in regard to risks covered as larger and wider risks could always be assumed after a period of successful working of the scheme.

It is a matter for gratification that the Corporation has been set up at long last. It removes one handicap which operated to the detriment of Indian exporters in a highly competitive world market. There is no doubt that such a scheme is a valuable aid to export trade. While providing a cover against reasonable risk, it will secure the simultaneous benefit of adherence to certain essential standards in the export trade.

HINDUSTAN LEVER

THE SPEECH of Mr. A. J. C. Hoskyns-Abrahall, Chairman, at the annual general meeting of Hindustan Lever Limited is an unvarnished account of the problems and prospects of the Company since it got its new form and new name. It is less than five months since the Unilever offered a part of their shares for sale to the public. In the distribution of profits the earlier forecast has turned conservative but now the revised figures have allowed a higher final dividend of 75 naye paise. Though sales have increased in 1956 achieving a tonnage exceeding 121,000 without including the sale of toilet preparations, profits were not of the order they earned in 1955 due to increase in costs of raw materials, of processing and of freight. Apart from raw materials and transport that are some of the problems that continue to cause difficulties, the Company has also to face the recent tightening of import restrictions. Though some 80 to 90 per cent of the raw materials come from the country, certain "key items" are still imported which, unless continued, would not allow in the maintenance of quality. The Chairman pointed out significantly how some of their products like Glycerine, Vanaspati and soap were useful earners of foreign exchange which he estimated at Rs. 76 lakhs in 1956. In the management of the Company the trend of greater Indianisation was more marked and the number of Europeans has already fallen from a peak of 59 in 1952 to 32, the places of 27 having been taken by Indians. The Hindustan Lever has set a model in Indian participation of capital in a foreign concern of which one can take legitimate pride.

The Company earned a net profit of Rs. 104 lakhs for the year after providing Rs. 120 lakhs for taxation. The Chairman has pointed out how the profits were less than what they earned in 1955 and it is difficult to appreciate how in the absence of a proper base for ploughing back of profits and the necessary incentives, foreign capital can continue to take interest in the development of the economy of this country. This consideration applies with equal force to the domestic private sector also. Hindustan Lever is, however, fortunate in having such an experienced and able Chairman as Mr. Hoskyns-Abrahall to guide its destinies and there is little doubt that under his stewardship, the Company will be able to weather the many difficulties that lie ahead.

CENTRAL BANK'S REMARKABLE STRIDE

FOR THE Central Bank of India, 1956 has turned out to be a year of remarkable progress. The all-round improvement in operations witnessed during the year is reflected in the Bank being able to restore, after four years, the cut in dividend and to double the bonus to staff. The net profit for the year has crossed the Rs. 1-crore mark, again after three years. The increase in earnings was mainly in interest and discount, yet a healthy sign has been that commission and exchange earnings have advanced their contribution by some Rs. 20 lakhs, which may be attributed, to a fair extent, to the establishment of a branch of the Bank in London. Also, as a result of the reorganisation, it has succeeded in effecting savings in expenses. Thus, the ratios of total expenses and of establishment charges to gross profits came down by 5 and 4.5 percentage points during the year. On the other side, the ratio of net profit to gross income has gone up by over 2 percentage points, from 13.53 per cent in 1955 to 15.87 per cent in 1956. The total deposits at Rs. 138 crores show a satisfactory improvement of Rs. 10 crores over the previous year. Advances have climbed by a still higher order of Rs. 18.56 crores, to Rs. 90.76 crores, which is the highest ever touched since the Bank came into being. However, its ratio of advances to deposits kept low at 66 per cent as compared to the average of 71 per cent of all scheduled banks.

Read against the background of the generally hard conditions that banking has had to face during the recent past, this performance assumes more than ordinary significance. It is well known that the demand for accommodation from industry has kept a steady increase which the banks have not been able to meet in a full measure. In order to be as accommodating as possible, there ensued an acute competition for attracting deposits, which led to a general increase in interest rates on both time and call deposits. The working funds, including borrowings from other banks thus cost comparatively more; in the case of the Central Bank, interest paid was up by Rs. 57 lakhs. Further, to meet the conditions of stringency and dearness of finance, the Bank had to reduce, like others, its investment portfolio, by a net amount of Rs. 3.74 crores, reducing the ratio of investment to deposits by 6 percentage points to 38 per cent at the end of the year. The magnitude of the stringency can be imagined from the figures of the outstanding advances and inland and foreign bills of scheduled banks which show an extraordinary rise, during 1956, of Rs. 157 crores to Rs. 788 crores. As against this, time and demand liabilities of banks showed a less than commensurate increase of Rs. 81 crores only. Accordingly, the banks had not only to decrease their cash ratio but also to dispose of some of their security holding. In such a situation, the banks can only hope for a lessening of the inflationary pressures as well as look to the Government for providing them with the necessary funds to enable them to perform their normal functions.

HURDLES TO MINERAL EXPORTS

ALTHOUGH THE high level of economic activity in America, the Continent and Japan contributed to the improvement in demand for Indian minerals the picture was not all rosy in 1956. In his speech at the first annual general meeting of the Western India Minerals Association, the Chairman Mr Natwarlal Shamaldas Worah drew pointed attention to the difficulties plaguing the industry. He was particularly critical of the canalisation of the export trade in manganese and iron ores through the State Trading Corporation.

The Government must partly be blamed for any lapses in export promotion of private interests. One of the main handicaps to the expansion of mineral trade has been the chronic shortage of wagons and the lack of stacking facilities at ports. In fact, the quota system in the allocation of wagons has resulted in a certain dislocation in the movement of ores. Although the State Trading Corporation has been functioning since June 1956 its performance has not been spectacular. No doubt it concluded an agreement with Japanese buyers for the sale of seven million tons of iron ore over the next five years, but the position as regards manganese ore is not encouraging. This is despite the fact that the Corporation had an overall quota of more than 25 per cent of the country's export trade.

The quota system and the export duty which have a restricting influence are anomalous particularly at this time when the Government is trying to do everything possible to enhance exports. India is already losing ground in America and the U.K. due to competition by Brazil and Africa in manganese ore. Brazilian ore is generally preferred in the United States on account of cheaper freight charges. Added to all this are the frequent changes in policy by the Government which are likely to shake the confidence of foreign buyers.

BETTER QUALITY FOR HIDES AND SKINS

AMONG THE products that earn foreign exchange for the country, hides and skins, the total value of the exports of which stood at Rs. 34.28 crores in 1954-55 and Rs. 24.70 crores in 1955-56, occupies an important place. It is possible to recover the ground and improve our earnings of foreign exchange under this head by properly processing half-tanned hides and skins into leathers and leather goods for export. With her enormous livestock wealth, India is certainly very well placed in regard to the growth of the leather industry. What is necessary to accomplish this is to explore the field fully, backed by adequate scientific research in the field of processing, curing, and finishing of raw hides and skins. By doing so, not only would our exports be enlarged but the country's internal requirements of finer leather, which are presently being imported, would also be met by our own efforts. Dealing with the state of leather industry in India, only the other day, Prof. M. S. Thacker, Director-General, Scientific and Industrial Research pointed out that the quality of raw hides and skins was deteriorating gradually and that tanners and tanning technologists had to face the challenge of having to produce good quality leather from bad hides. As he observed, such a situation calls for searching of minds, pooling of thoughts, sharing of ideas and chalking out of a clear-cut co-ordinated programme, and specially so because this is an industry which is not only earning considerable valuable foreign exchange already but has great potentialities for earning more of that precious thing. It is to be hoped that a National Hide Bureau or National Hide Association to advise the public and private industry, as well as the Government, regarding the effective steps to be taken in this regard and improve the quality of hides and skins as suggested by Mr. Thacker will soon come into being and help to solve the pressing problems of the industry.

Company Meetings

THE CENTRAL BANK OF INDIA LIMITED

Speech delivered by Sir Homi Mody, Chairman, at the Forty-Sixth Ordinary General Meeting of the Bank on Thursday the 28th March, 1957.

Ladies and Gentlemen,

I have pleasure in presenting the Directors' Report and Statement of Accounts for the year 1956, but before I deal with them I would like to make a few observations on matters of general interest affecting finance and industry.

The year marked the end of the first Five-Year Plan and the inauguration of the second. Economic conditions in India continued to show the buoyant tone in evidence in the last few years under the impact of progressively increasing development outlay. Industrial production, foreign and domestic trade, money supply and prices recorded sizable increases.

The total money supply with the public, comprising currency and bank deposits, amounted to Rs. 2,178 crores at the end of December 1956, showing an increase of Rs. 131 crores over the corresponding date of the previous year. Due to the money supply outpacing the rise in production levels and economic activity, the Index Number of wholesale prices recorded an increase of 61 points and consumer prices also rose substantially.

A feature of our economy which is causing serious concern is the rapid deterioration that has taken place in our foreign exchange resources. During the 11 months ending with February of this year, the fall in our reserves has reached the alarming figure of Rs. 227 crores. This development was largely unforeseen and, for the moment, it has thrown the second Five-Year Plan out of gear. Against a figure of Rs. 783 crores of imports allowed for in the first year of the Plan, imports have been at the annual rate of Rs. 953 crores. As the Reserve Bank Bulletin for December 1956 says "Whereas the Plan expected the phasing of imports to be such as to lead to a hump in the second and third years of the Plan, it seems that the actual course of events has been such as to give rise to a hump even in the first year of the Plan."

That brings me to a consideration of the second Five-Year Plan. Some of us have from the start criticized the unrealistic targets of investment laid down in the Plan and have pleaded for scaling them down. We have also commented on the inadequacy of the provision for agricultural development and production of consumer goods. In the survey of Asia and the Far East published on the 18th March, by the Economic Commission for Asia and the Far East, three questions have been posed: (1) Whether the Plan is not too ambitious in terms of resources; (2) Whether it assigns too great a share of responsibility to the public sector and too little to the private; and (3) Whether it does not emphasise industries (particularly heavy industries) too much at the cost of agriculture. The Commission have also spoken of the risks in attempting too much too quickly.

In mitigation of the hardships which a Plan of this magnitude might impose on the community, spokesmen of Government have been saying that there would be a process of adjustment from time to time which would take care of any material changes in the situation that might take place. I would like to urge that that is not enough and that what is needed is a reappraisal, here and now, of programmes and policies as a whole. I contend that enough is known, even at this stage, of the resources which could be mobilised for planned economic development in India, and the serious difficulties which have already arisen in the first year of the Plan must be taken as an indication that the projected scheme of development goes beyond the country's capacity to carry it out within the stipulated period. No year to year targets of investment were published when the second Five-Year Plan was originally prepared, but the provision of Rs. 915 crores made for 1957-58 as outlay for the Central and State Governments is such as to suggest that the Government is still largely pursuing the schedule of investment under the original assumptions, even though the working of the first year has proved them to be wide of the mark.

In the light of this trend, the urgency of a reappraisal of the whole position cannot be questioned. The extent to which inflationary finance can be resorted to, taxation can be stepped up, and foreign exchange can be secured, is pretty well known, and it would be very unfortunate if fiscal and other measures were taken at this stage in order to live up to an unrealistic programme of investment. In this connection, I cannot but voice my disappointment at the latest pronouncement of the Finance Minister in Parliament. I hope he will realise that the criticisms advanced on certain aspects of the Plan are neither selfish nor obstructive. The business community has repeatedly and unequivocally recognized the necessity of a planned development of the country and has offered its fullest co-operation. That does not mean, however, that it should not have views of its own regarding priorities and methods, nor that its experience and knowledge in such matters should be impatiently set aside.

1956 was a year of stringency and dearness of finance and the resources of banks had to be strained to the utmost to meet the rapidly expanding demand for funds. The loan-portfolio of banks had to be unduly stretched and they had to depend more and more on the Reserve Bank for assistance.

The outstanding portfolio of advances and inland and foreign bills of the scheduled banks amounted to Rs. 788 crores, showing an abnormal increase of Rs. 157 crores since the end of the previous year. The resources of the banking system did not, however, show a corresponding improvement in as much as, over the same period, demand and time liabilities increased by only Rs. 81 crores to Rs. 1114 crores. The banks, therefore, found it necessary to finance the additional credit requirements both by allowing their cash ratio to come down and by disposing of a portion of their security holding. The most remarkable sign of the pressure on the banks was, however, the increase in the scheduled bank's indebtedness to the Reserve Bank from Rs. 30

crores at the end of 1955 to Rs. 79 crores at the end of 1956. In fact, the volume of debt was not much short of the banks' total cash resources, comprising both till-money and balances with the Reserve Bank. In this context, I may refer to a point mentioned in the White Paper on the Budget that the Reserve Bank had lent a limited support to Government securities in order to relieve the extreme stringency in the money market. This is a move forced by the logic of the situation in which bankers have been placed. It is to be hoped that inflationary pressures would be lessened by a reasonable scaling down of the development outlay which has caused them, but given the situation as it is, official policy must obviously be directed towards providing banks with the funds they need for fulfilling their function as suppliers of credit.

Before leaving the subject of the general banking position in the country, I would refer to an improvement in the published statistics which seems to be called for. Although detailed forms have to be sent in every week by all scheduled banks, up-to-date figures of demand and time deposits, as distinguished from other kinds of demand and time liabilities, are not available. Similarly, loans to trade cannot be distinguished in the statistics from loans from one bank to another. A recent issue of the Tata Quarterly discusses some of these questions, and in view of the importance of these data for assessing monetary trends, I hope that steps will be taken to compile them on a regular basis.

There is one other matter to which I would like to refer before closing this review. The statement recently made at the Annual General Meeting of the State Bank of India that, although the statute authorises its operating as a commercial bank, due regard is to be had to the public interest—and this is interpreted by the Bank to include its obligations to the banking structure as a whole—is indeed refreshing. But this pronouncement cannot quite be reconciled with the reported directives to some of the Government and quasi-public institutions, which had hitherto been depositing a part of their funds with commercial banks, to deposit hereafter all their funds exclusively with the State Bank. I would also like to point out that the measures being taken by the State Bank to increase its working funds and the opening by it of branches in areas adequately served by other institutions cannot but affect the interests of commercial banks.

I shall now turn to matters of more personal interest to the Shareholders—the Directors' Report and Statement of Accounts.

The past year was one of further growth in the resources and earnings of the Bank and in an appreciable expansion in its turn-over of business in general. Our gross earnings, which had received a setback in 1953, have since been progressively increasing, and there was a particularly marked improvement during the past year, which recorded a rise of as much as Rs. 86 lakhs. While Interest and Discount accounted for a major portion of the increase, there was a substantial increase of Rs. 20 lakhs under Commission, Exchange, etc. Of this, a no small part was due to the ground gained by us in foreign exchange since the establishment of our own office in London which, for the first time, was able to contribute its quota to the general profits.

The rates of interest on Time and Call Deposits had to be further stepped up during the year, and working funds, including borrowings from other banks, cost comparatively more, resulting in an increase of Rs. 57 lakhs under Interest paid. With regard to Establishment Charges which apparently show a slight recession, the position is not what a comparison of the figures would indicate. The figures for the previous year included a sum of nearly Rs. 13 lakhs on account of arrears paid on adjustment of staff emoluments, as laid down by the Bank Award Commission. If that is taken into consideration, the establishment charges can be said to have been up by nearly Rs. 12 lakhs. The ratio of total expenses to gross profits stood at 75.24 per cent as against 80.28 per cent in the previous year. The ratio of establishment charges to gross profits similarly came down from 66.06 per cent to 61.55 per cent.

As stated in the earlier part of my speech, increase in the resources of banks lagged far behind the increased demand for credit. Scramble for deposits, therefore, continued to be acute and progressively higher rates had to be paid. In view of these conditions, our total deposits which stood at Rs. 138 crores, showing an improvement of Rs. 10 crores over the previous year, may be considered to be satisfactory.

The increase in the Reserve Bank's lending rate against Government Securities from 3½ per cent to 4 per cent and the rise in the cost of borrowings by Banks against Usance Bills from 3½ per cent to 4 per cent, consequent upon an abnormal raising of the Stamp Duty from the 1st of February, has given further momentum to the upward trend in Deposit rates, which has carried the rate for Call and Time Deposits to as high as 4½ per cent. This cannot but have its repercussions on the rates at which banks can afford to lend.

Advances at Rs. 90.76 crores recorded a substantial increase of Rs. 18.56 crores over the previous year, and constituted the highest level touched by the Bank since its inception. Even so, our ratio of Advances to Deposits was 66 per cent only as against the general average of 71 per cent of all Scheduled Banks.

The continuing credit squeeze compelled us more vigorously to pursue our policy of reducing our Investment Portfolio. The reduction would have been more substantial but for the fact that we had to subscribe to the new Central and State Governmental Loans floated during the year. The net reduction amounted to Rs. 3.74 crores, bringing down our ratio of Investment to Deposits from 44 per cent in 1955 to 38 per cent as at the close of 1956.

The sudden decline in market values just towards the end of the year unfortunately widened the gap between the market value and the book value of our Securities, but since the opening of the current year, there has been a revival in values and the position has improved. In this connection, it is worthy of note that nearly 75 per cent of our investments in Government Securities mature within the next ten years, and a further 22 per cent in the following five years. As pointed out in the past, if we can hold on to our Securities up to maturity, not only would the difference appearing at present be wiped out, but there would accrue a substantial surplus.

Shareholders will have noted with satisfaction that, after a lapse of three years, the net profit figure has again crossed the rupee one crore mark. The ratio of net profit to gross income rose to 15.87 per cent as against 13.53 per cent for the previous year. With the reorganisation that has taken place and the further measures we have in view, we hope to keep up the improvement.

Our profit figures would have been better but for some unfortunate experiences we have had in the last two or three years, and which have emphasised the need for doing everything possible to strengthen our position. In the interests of the Bank, it is obviously undesirable to enter into a discussion of the transactions in question. It will suffice to say, every possible step has been taken by the Board to secure the accounts which were not in order and adequate provision has been made where necessary.

It gives me particular pleasure to record that it has been found possible, as a result of the year's working, to implement the assurances I have been giving in the past. I have stated on more than one occasion that as soon as our earnings warranted it, the cut in the distribution, both to the Shareholders and to the Staff, would be restored to the extent the profits permitted. Nothing has, therefore, given greater satisfaction to the Board than to be in a position to restore, after a lapse of four years, the cut in Dividend and to double the Bonus paid to the Staff. Prevailing trends do not at the moment indicate conditions as favourable for Banks as during the past year, but it is to be hoped that, with the improvement that has taken place in our relations with our Staff and with the Management wholeheartedly devoting itself to the interests of the Bank, the institution will be able to maintain, if not improve upon, the progress shown over the past year. In this connection, I must particularly mention the services of our Vice-Chairman, Mr. C. H. Bhabha. His ability and resourcefulness and the keen interest he has been taking in the day to day working of the Bank are beyond all praise, and I would like to extend to him, on behalf of the Board and the Shareholders, our grateful thanks for all he has been doing.

I would conclude by making our acknowledgements to all who are in the service of the Bank. The General Manager, Mr. N. K. Karanjia, has been carrying a heavy burden, which he has been discharging with ability and singleminded devotion to duty. He has done a great deal for the Bank since he has been placed at the head of the administration and he enjoys the fullest confidence of the Board. To him, to Mr. F. C. Cooper, the Deputy Manager, and to all Members of the Staff at the Head Office and at the Branches, as also to the Local Advisory Committees at the various centres, I would like on behalf of the Shareholders and the Board to convey our warmest appreciation.

Note: This does not purport to be a record of the proceedings of the annual general meeting.

THE WESTERN INDIA MINERALS ASSOCIATION

Speech delivered by Mr. N. S. Worah, Chairman, at the First Annual General Meeting held on 18th March, 1957.

Gentlemen,

I have great pleasure in submitting to you the first report and Accounts of the Western India Minerals Association. Although we held a meeting purporting to be our first annual General Meeting on 28th September, 1955, on account of the fact that our Association was Registered only towards the end of February, 1956, that meeting could not be treated as the Annual General Meeting and accordingly our present meeting is the First Annual General Meeting of the Association. For the reason just mentioned, it was found necessary to bifurcate the accounts of the Association for the period 1st July, 1955 to 28th February, 1956 and for the period 29th February, 1956, to 30th June, 1956.

Before dealing briefly with the activities of the Association during the period under review, it would, I think, be appropriate to consider the international situation in so far it affects the Minerals with which most of our Members deal. Although it was hoped some time back that there would be an improvement in the international situation, the recent events have belied this hope and consequently the situation, although by no means dangerous, still continues to be very unsatisfactory. The extremely high level of economic activity in America and on the Continent of Europe as also in Japan, the principal consuming countries for these products, has, I believe, contributed to the improvement in the demand and consequently the price, particularly for Manganese ore which continued to persist not only throughout the period under review but during the latter half of 1956.

Although the sudden decision of the Government of India to canalise progressively exports of Manganese ore through the State Trading Corporation as announced in the Press Note dated the 22nd of June, 1956, was made towards the end of the Association's financial year, and consequently there is very little to comment upon, I think it is my duty to review the present unsatisfactory situation obtaining in the Mineral Trade, which, as all of you know has been brought about on account of this very policy. The argument that has been advanced in justification of the Government's decision to enter the Mineral Trade is that the Mining Industry has not had scope for development along sound lines and that it is necessary for the Government to play a more positive role by reorientating the trade in ores on more rational lines and thus increasing exports and, with this object, to canalise exports through the State Trading Corporation. I am sorry that this argument of Government does not carry any conviction when the only handicap which was proving as an impediment for the expansion of the Mineral Trade, such as Manganese and Iron ore have been the chronic shortage of wagons, the allotment of which is controlled entirely by Government. Despite repeated requests to the Railway Board as well as to the Railway Ministry to allot more wagons to the Manganese ore trade, the actual allotments of wagons have been very unsatisfactory. Hence it will be appreciated that if it was not possible for the exporters to reach the export target, the responsibility for this state of affairs is entirely that of the Railway Ministry.

It is true that the Mining Industry has been experiencing several other handicaps also which have prevented a greater expansion in production and export of Manganese ore but most of these handicaps could be removed only by Government action, such as augmenting the available supply of wagons, improving road

transport from mines to railheads, expanding and improving rail and stacking facilities at the port etc. It would, therefore, have been more appropriate for Government first to remove all these handicaps and find out whether the Industry and Trade still failed to come up to its expectations. Instead of doing so, however, Government, decided to enter the trade itself through the State Trading Corporation. While we have no quarrel with Government, so far as its desire to trade in Manganese and Iron ore is concerned, I think I am voicing the feelings of all of you when I say that on account of the very peculiar and highly technical nature of this trade, coupled with the fact that the fortunes of this trade depend entirely on the degree and tempo of industrialisation taking place in some of the world's foremost Steel making countries, like the U.S.A., the U.K., the Continent and Japan, this trade can be handled more efficiently by Traders in the Private Sector and not by a Government organisation such as the State Trading Corporation. In view of the very wide fluctuation in the prices of Manganese ore, which this material is subject to, I would appeal to Government to be extremely cautious in their dealings with foreign buyers, as whatever policy is ultimately decided upon, the guiding principle should mainly be, that the traditional markets for Indian Manganese ore are not lost to the Country.

The reason which prompted me to make the above remark, as you all know, is the alarming reports which we have been receiving of late about the reported arrivals in America of huge quantities of Manganese ore from the newly found deposits in the Amapa district of Brazil, which is likely to prove itself to be our main competitor in the American Manganese Market. Buyers in America have been complaining lately that on account of the numerous and sudden changes in Government's export Policy, particularly the introduction of Movement and Export Quotas, imposition of an Export duty, etc. they have been finding it difficult to calculate the "all-in" delivered cost of Indian ore at any given time. Consequently, I am sorry to say that the confidence of foreign buyers in the ability of Indian Exporters to fulfil their commitments is considerably shaken. I would, therefore, request Government to take immediate measures to ractify this situation which would no doubt create the necessary atmosphere for increasing the Country's mineral output and subsequent export, resulting in an increase in the earning of the much needed foreign exchange which is so very essential for the success of the second Five-Year Plan.

It was no doubt the intention of Government to help the Industry and Trade to secure enough wagons when they introduced the new movement quota system, which, while regularised the ore traffic in the beginnig to a certain extent on some of the difficult sectors, the same cannot be said on other sectors where wagon position had been easier and where, subsequent to the introduction of this system the situation has deteriorated considerably, i.e., even though wagons could be had just for the asking, the same cannot now be secured for want of movement quotas. In fact, at present the working of the movement quota system has resulted in complete confusion. There has been, on several Railway sectors, over-issue of movement quotas much in excess of the actual rail movement capacity of such sectors. This has affected adversely shipment programmes. Similarly is the case with regard to exports. Even if Exporters have sufficient quantities of ore at the Docks, the same, however, cannot be shipped for want of Export quotas. At a time when Government, through its Export Promotion Council and other Agencies, is out to improve in every respect the export potentiality of the Country with a view to earning more foreign exchange, one fails to understand the logic underlying the continuation of the Quota System in the Mineral Trade, which definitely is having a constructing influence on the Country's Export Trade, particularly at a time when the Indian manganese ore Trade is facing serious competition from producers in Brazil and Africa.

In view of the above and the fact that there is already a tendency for the Manganese price to sag, I would appeal to Government to take immediate and effective remedial steps with a view to meeting the serious situation created by the incursion of Brazilian are into the American market where buyers find this ore to be preferable not only from the defence point of view but also on account of the shorter lead and consequent cheaper steamer freight as compared to ores from India.

On this occasion it is my duty to speak a few words about the activities of the State Trading Corporation in so far as it concerns the country's mineral Trade. Although the State Trading Corporation has, as reported, concluded an agreement with Japanese buyers for the sale of 7 million tons of Iron ore for delivery over the next five years, the position as regards manganese ore is concerned is, I should say, not very encouraging. Although the State Trading Corporation entered the field of the Mineral Trade in June 1956, it is reported that even as late as December 1956, they were not able to ship even a negligible quantity of Manganese ore despite the fact that they secured for themselves an overall quota of more than 25 per cent of the country's Manganese ore export trade. I am constrained to say that no definite policy has been evolved so far and consequently the sales and purchases effected by this body has been on an unscientific basis resulting in a certain amount of uncertainty and anxiety among the Mineowers and the Exporters as they are prevented from planning their future production and development as well as export programmes

In the light of my above remarks, I would request Government to take the following remedial measures in the interests of the Country's Mineral Industry and trade which would assist the Trade to regain its competitive strength, in the world market.

(1) That Government should either abolish the Quota System (both Movement & Export) completely or increase the quantum of Export and movement quotas or the entire quota system should be so altered and liberalised as to permit shipments freely by adopting the policy which was in existence before the introduction of the quota system, when free movement was allowed.

(2) The Export duty which is being levied at present on Manganese ore should be abolished completely, as apart from the irritation which this levy causes to Buyers Overseas, there is also the fact that it acts as a hidden subsidy to other Manganese producing countries.

(3) The ambiguity and uncertainties prevailing in grant of mining leases and Prospecting Licenses for Manganese and Iron ore should be removed forthwith and prospecting licences and Mining leases for these minerals should be granted liberally and expeditiously.

(4) The next export policy which it has been promised would be announced during the course of this month should be for a period of at least three years as against the present one year period which is too short for a trade such as Manganese and Iron ore, as it is customary and incidentally beneficial, for both the exporters and buyers to enter into long term arrangements. This policy is quite essential from the Mineowners' point of view also as it enables them to plan production in advance of actual demand.

You will all be pleased to learn that our popular Commerce & Industry Minister Shri Morarji Desai has very kindly agreed at our request to meet a deputation of All-India Minerals Association's Working Committee at Delhi, on the 21st instant when we expect to put forward our view points and the difficulties confronting the Mineral Trade and Industry which would help Government in formulating their future mineral policy.

HINDUSTAN LEVER LIMITED

Speech of the Chairman at the Annual General Meeting

The Annual General Meeting of Hindustan Lever Limited was held in Bombay on April 4, 1957. The following is the text of the speech made at the meeting by the Chairman, Mr. A. J. C. Hoskyns-Abrahall.

It gives me great pleasure to welcome our new shareholders to this Annual General Meeting of our Company in its new form and under its new name. The report and accounts have been in your hands for some days and by your leave I will take them as read.

Less than five months have passed since we announced Unilever Ltd.'s intention to offer a part of our shares for sale to the public. At that time we made certain forecasts about our business and expressed certain intentions about the distribution of our profits. In the short time that has elapsed since then there has been no sudden boom in our business or any sort of windfall, but our final figures, as you will have seen, have shown our earlier forecast to have been somewhat conservative. We are therefore, recommending to you a higher final dividend of 75 naye paise, at the same time coupling with that recommendation the caution that our outlook and policy have not thereby undergone any essential change. In the light of recent events we would not like you to build up any great expectations that future dividends will be higher than we forecast those few months ago.

In this connection I would remind you that the ink on our Offer for Sale documents was barely dry and the lists had not even been opened, when the Finance Minister sprang his surprise interim Budget on the country, with its capital gains tax, its lengthened scale of supertax on dividends and its compulsory depositing of a large part of companies' reserves. Moreover the Minister has also thought it right to tell us that, in seeking finance for the second Five-Year Plan, he has by no means yet exploited corporate taxation to the full. In this sort of context I feel bound to say that, however, much we may be able to increase our sales turnover in the future, it does not necessarily follow that there will be a commensurate, if indeed any, benefit to our shareholders. The development of this country costs money, a lot of money, and the private investor will continue to be called upon to pay his share by way of taxes. How much that share will eventually be we cannot know, it is not likely to be small.

We did in fact increase our sales in 1956, achieving a tonnage exceeding 121,000 without including the sale of toilet preparations, in which section were tonnage is not a very suitable measure. That our profits were not quite of the order of those we earned in 1955 was mainly due to increases in costs of our raw materials of processing and of freight.

We are far from complacent about this upward trend in costs, which seems to be fairly general among household necessities, or near necessities, into which class our products fall. In a community embracing so many people with very low incomes, our products run the risk of being too highly priced, whether for the consumers' good or our own, and we should greatly like to make reductions, with all the stimulus they would give to increases in consumption. Unfortunately the prerequisites are lacking. We are vitally interested for instance in Government's second Plan target of more than 7½ million tons of oilseeds, representing a 30 per cent increase in production. That oilseeds, and particularly groundnuts, should be freely available at moderate prices is of prime importance to our business, to say nothing of its significance for export and foreign exchange purposes, but we cannot yet detect any great progress being made towards hitting the target.. Transport is another vital sphere where unrestricted availability at moderate prices is essential, but at present its inadequacy is constantly giving rise to costly delays and, on the top of that, freight rates are tending to increase. These are but two indications of what I have said is a general trend.

While the rising national income will generally be absorbing some of the shock of higher prices, we do of course provide what counterblast we can in our own operations. Through nearly all the media we use, we are adding to our normal advertising efforts a steadily mounting educational service, by which habit-forming instruction in better washing and cooking methods is imparted to the public. In the countryside particularly our large and still growing fleet of demonstration, cinema and other vans is carrying this service farther afield every year.

Another matter affecting us is the recent tightening of import restrictions and some of you may well be asking to what extent we rely on imported materials for the pursuit of our business. You will already know that we find between 80 and 90 per cent of our raw materials from within this country, since that fact was stated in our Offer for Sale. That does not mean however that there are not certain key items, some perfume ingredients for instance and certain chemicals imported by us, without which—although they may be small in volume—we should be unable to maintain the quality, or what you might call the personality, of our products. We hope to be allowed to continue to import such items as being actual users of them, but of that we cannot yet be sure. It is hardly necessary to say, that such changes as we are powerless to avoid we shall seek all means to mitigate, and we do not expect to have to ask our consumers to accustom themselves to any serious departure from our normal products. You should know moreover that as exporters we are already useful earners of that scarce and greatly sought after commodity, foreign exchange. In 1956 our exports of Glycerine, Vanaspati and Soap were worth rather more than Rs. 76 lakhs, and they went to places as far apart as New York and Fiji with many destinations in be-

tween. When we seek to make imports, our record as exporters should be allowed to stand to our credit.

It is however, and has long been, our policy to buy Indian materials so far as we possibly can. In the past few years we have been encouraging with some success the local manufacture of items which previously were imported. Bleaching earth, paper and board are recent instances, where we have been able increasingly to switch our buying from foreign to local sources. We are also increasingly relying on Indian sources for the management of the business. It may interest you to know that from a peak of 59 in 1952 the number of Europeans we employ has already fallen to 32, the places of the 27 who have gone having been taken by Indians. This trend extends throughout our business whether it be in the marketing, commercial or technical sections.

Our staff have worked well throughout the year. We are glad to say that we have signed a comprehensive agreement with our Bombay factory employees covering the whole period of the second Five-Year Plan. It embraces wages, bonus and retirement provisions for about half our employees, as well as production incentives. A similar agreement with the rest of our employees all over India is now on the point of being signed and we therefore have good reason to look forward to a period of steady consolidation of the goodwill already existing on both sides.

While on this subject, I might add that we try to look after the welfare of our employees, not only by giving them congenial working conditions, but more particularly by providing them with good medical services and good factory canteens. We have canteens in all our factories except the one at Shamnagar near Calcutta and there a newly built canteen is due to be opened ten days from now. Moreover we are not satisfied with our Bombay Soap Factory in this respect and propose to build there a new canteen at a cost of about Rs. 6 lakhs, as soon as we can finalise our plans and secure the necessary cement and steel. Providing this facility for our office staffs is by no means an easy matter, but we propose to include a modern canteen with recreational facilities in the new Bombay Office building, on which we hope to start work this year. So far as medical services are concerned, we have full-time doctors and nursing sisters on the staff in our Bombay and Calcutta factories, while in our smaller factories we have part-time doctors who attend daily and full-time dispenser-dressers. All factories have consulting rooms and properly equipped dispensaries. Arrangements to deal with medical emergencies occuring outside general duty hours vary from place to place; in Bombay factory we have dispenser-dressers on duty in all shifts; in our other factories we have staff specially trained in first-aid. In our offices we have arrangements for doctors to be on part-time duty or we pay them retainers, so that facilities for free consultation and treatment are available to the employees concerned. In the past few years these medical services have generally, and particularly in Bombay, reduced the time lost through illness and accident.

I would like to end this review by giving you one good reason why this business should continue to expand, lest you should think that I have listed difficulties but little else and hear little but the rattle of chains. We are in fact conducting our operations in a rapidly developing country, inhabited by something approaching 400 million people, who by modern standards consume per head so little of the sort of products we manufacture, that an immeasurably greater consumption is bound to come. Moreover it is entirely for the good of the country that it should come. On this satisfactory base we expect to go on building. As for the difficulties, they are or are likely to be largely of a type common to most consumer industries at the present time, and it is probably fair to say that our business is as well equipped as most others to meet their challenge.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

evil. That there was scarcity of quality cotton was amply demonstrated by the fact that there were only 2,150 bales even when the Jarilla March 1956 delivery Contract went off the board, as against as many as 5,950 bales in the February 1955 Contract. The recent raising of the margin, which sought to prevent the rising trend in cotton prices only brought about a fall in the number of bulls who had a firm grip over the market; such of the bulls as did not feel up to paying higher margins faded out, thereby making the job of rigging up the market easy for those that remained. In other words, the remedy hardly worked, which perhaps explains the more drastic — or is it desperate, — measure adopted since.

Now, it has been decided to requisition cotton from all stockists so that it could be distributed among the needy at fair prices. It must be presumed that such a step applies to all cotton stockists, whether they are in Bombay or elsewhere in the country; otherwise, the charge of discrimination might be laid at the doors of the authorities. In any case, to determine the stock of cotton of every individual or class of individuals all over the country is not a joke; must less so is the determination of a fair price and the equitable distribution of cotton among those who are actually in need of it for the purpose of consumption and not for speculation as understood by the powers that be.

All these clearly point to one thing, namely, that, unless there is a complete reorientation of the Government's cotton policy — with particular reference to the release of export quota only after the crop position is determined fairly accurately, as pointed out by Sir J. C. Burns, the retiring Chief of the Millowners' Association, Bombay, at its last annual meeting and a close watch is maintained of the day-to-day price trend in the market, with a view promptly to taking effective steps and nipping in the bud any unwholesome development, the current Vijay April Contract also will raise a similar problem of undue price appreciation as and when it approaches maturity and perhaps lead the Government once again to take similar despate measures. However, drastic these measures may be, if past experience is any guide, rather lay the axe to the root of the trouble, they only serve to precipitate a crisis.

THE AMALGAMATED ELECTRICITY CO., LTD.

The Registers of Members and Transfer Books of the Company will be closed from 12th to 19th April, 1957, both days inclusive in connection with Interim Dividend for the half year ended 30th September, 1956, payable on or after 20th April, 1957.

By Order of the Board,

THE AMALGAMATED ELECTRICITY CO., LTD.

N. C. JAVERI,

Director.

BOMBAY,

30th March, 1957.

COMMODITY NEWS AND NOTES

KHARIF PRODUCTION OF SMALL MILLETS

The All-India Second Estimate of small millets for 1956-57 puts the current year's area and production at 11,527,000 acres (Kharif and Rabi) and 1,728,000 tons (Kharif only) as against the corresponding adjusted estimate of 11,535,000 acres (Kharif and Rabi) and 1,601,000 tons (Kharif only) respectively for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows a negligible decline of 8,000 acres or 0.1 per cent in area (Kharif and Rabi) and an increase of 127,000 tons or 7.4 per cent in production (Kharif) during the current year as compared to the previous year. There is only a nominal fall in area under Small Millets this year as compared to last year. The decline recorded in Madhya Pradesh, Andhra Pradesh and Mysore has largely been offset by increases in Uttar Pradesh, Bihar and Rajasthan.

EXPORT PRICE OF TEA

The Government of India has issued a notification fixing the price of tea for the purpose of determining the export duty at Rs. 2.74 per pound as against Rs. 3.38 per pound in force from March 1, 1952. There is no change in the existing rate of duty of naya paisa 37.50 per pound, the Ministry of Commerce and Consumer Industries has announced.

EXPORT OF RICE PRODUCTS

A limited quota of rice products, viz. parched rice (murmura) ground parched rice (sattu) parched paddy or puffed rice (khoel) and beaten rice (Chura) will be released for export up to the end of June, 1957 or till the ceiling is reached, whichever is earlier according to an export trade control notice issued recently.

IRON ORE FIELD IN SIBERIA

The Soviet Union has claimed the discovery of the world's largest iron ore field in the Tomsk region of West Siberia. The ore was found during the oil drilling operations. The "Tass" agency quoted Mr. Y. B. Golul—Chief Geologist of the Urals and Siberia, as saying the ore had a 36 per cent iron content and the deposits were "the biggest in the world running into tens of billions of tons."

CEMENT PACKING CHARGES REVISED

The packing charges for cement for the next quarter commencing from April 1, 1957 have been fixed at Rs. 13.44 per ton. The Government of India has informed all the State Governments of the revised packing charges. The packing charges for the current quarter were fixed at Rs. 13.2 per ton

PRODUCTION OF SUGAR

Sugar production in India this year is expected to touch the record figure of 20 lakh tons, according to the annual report of the Indian Central Sugarcane Committee. The report, which covers the period, 1955-56 records an all-round increase during the year; production, acreage and supply of cane to factories showed a rising trend. The total quantity of sugar produced was 18.6 lakh tons—an excess of 0.6 lakh tons over the target fixed in the first Five-Year Plan.

The Government of India has released a further quantity of 1.67 lakh tons sugar for free sale according to a press note issued by the Ministry of Food. This brings up the total releases so far made out of 1956-57 production to 5.88 lakh tons which include 0.46 lakh tons released for export.

DEVELOPMENT OF SUGARCANE

Several schemes for the development of sugarcane were sanctioned at the 23rd meeting of the Indian Central Sugarcane Committee held recently. Important among the schemes sanctioned related to all-India cane crop competitions, campaign against Gurdaspur borer in Punjab and red rot eradication in Bihar. The Committee also sanctioned schemes for the testing of cane crushers in India and for publication of brochures on different methods of manufacture of gur and khandsari.

US MACHINERY EXPORTS UP

Exports of US heavy machinery in 1956 showed an increase of 22 per cent over the previous year. The Machinery Institute has suggested that the principal factor in the increase was the rise in economic activity in Canada and in Australia and other parts of the Far East. The biggest increase was in exports of construction and mining machinery which rose by 47 per cent compared with 1955. After allowing for price increases, exports by physical volume rose by 33 per cent.

PRODUCTION OF NORWEGIAN WHALE OIL

The nine Norwegian expeditions taking part in this year's pelagic whaling season in the Antarctic produced a total of 855,489 barrels of whale oil or 30 per cent more than last year's total production of 654,348 barrels.

UK's PLACE AS COTTON EXPORTER

Lancashire dropped from third to fourth place in the table of the world's major exporters of cotton cloth in 1956. Japan took first place with exports totalling 1,226 million square yards followed by India with 740 million yards, according to an announcement by the Manchester Cotton Board.

SHREE KRISHNA GYANODAY SUGAR LIMITED.

NOTICE is hereby given that the 22nd Annual General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company at Dalmianagar on Tuesday the 30th April, 1957 at 11.30 A.M., to transact the following business:

1. To receive and adopt the Directors' Report and the Audited-Accounts of the Company for the year ended 31st July, 1956.
2. To declare dividends (free of Income-tax) at Rs. 6¼- per share on 'A' Class Preference Shares, Rs. 5¼- per share on 'B' Class Preference Shares and Re. 1¼ per Ordinary Share (existing on the 31st July, 1956) for the year ended July, 1956.
3. To elect a Director in place of the retiring Director. Shri M. R. Sonthalia who retires by rotation under Article 106 of the Articles of Association of the Company, being eligible, offers himself for re-election.
4. To appoint Auditors for the current year and to fix their remuneration. Messrs. Singhi & Co., Chartered Accountants, the retiring Auditors, being eligible, offer themselves for re-appointment.
5. Any other business that under the Articles of Association of the Company may be transacted at an Annual General Meeting.

The share Transfer Books of the Company will remain closed from 24th April, 1957, to 30th April, 1957, both days inclusive.

DALMIANAGAR,
The 4th April, 1957.

N.B. 1. A member entitled to attend and vote at the meeting is entitled to appoint a Proxy to attend and vote instead of himself and a Proxy need not be a member.

2. Payment of dividend when declared will be made only to those members whose names are registered in the books of the Company on the 30th April, 1957, or to the mandatees.

A Letter to the Editor

THE CONGRESS IN KERALA

Sir,

Your leading article on "THE ELECTIONS AND AFTER" in your latest number of March 29 is basically correct, except in the matter of Kerala. The defeat of the Congress in Kerala and the consequent victory of the Communist Party was no surprise to anybody in Kerala, not even the local Congress leadership. In their anxiety to retain power exclusively in their hands, these leaders did not care to view the prospects objectively. It is not so much the error of the Congress strategy as you write, but it is the lack of integrity of the leadership that has been responsible for this great debacle. Nor do I think that Mr. S. K. Patil's preoccupation with Mr V. K. Krishna Menon's election in a Bombay constituency had much to do with this Congress failure in Kerala. As one of the intelligent observers, Mr. S. K. Patil, after his visit to Kerala, is believed to have reported to the Congress High Command that he was quite confident of getting a thumping majority for the Congress if only some of the candidates against whom corruption has been alleged by responsible persons of Kerala, could stand aside and desirable candidates put up in their place. This proposal was turned down as the High Command took the advice from one of their General Secretaries who hails from Kerala who, perhaps, more than anybody else, was responsible for the political neglect and bad administration of the old Travancore-Cochin State. This gentleman, supported by his clever former Chief Minister Panampally, wanted to retain power in his own hands and did not desire to bring in the so-called Congress Rebel Group to the fold, fearing that it might take away power from the present leadership. When Mr Patil's proposal was turned down, he naturally lost all interest in the Kerala Elections and the old clique had the full support of the Congress High Command and the inevitable result was no secret to anybody in that part of India. This fact was clearly presented by the Congress Members of Parliament to the Leader, the Congress President and others at the Party Meetings recently held in the Central Hall of the Lok Sabha. I want to make it abundantly clear that Kerala today is not a Communist State even though the administration has fallen into their hands. The Communists have come to power not only with a minority vote in a State where by far the large majority of the voters are at heart anti-Communists. Even the constituencies which are controlled by Christian votes have returned Communists on account of their disgust with the power politics of the present leaders.

Even though, as you say, the Congress failure has produced results that are likely to have serious psychological consequences abroad, if it brings home to the Congress High Command the real situation in the problem State and makes them wiser, this rude shock can serve as a blessing in disguise. If they would spend sufficient thought on this writing on the wall and take adequate steps to dismiss the present leadership and constitute a new K.P.C.C. where the top qualification for members should be integrity, the Kerala defeat will help to lengthen the Congress Government in India not only in the States, but in the Centre as well.

Yours faithfully,

A Congress M.P. from Kerala.

TRIVANDRUM,
4th April, 1957.

The Politics of the States

FOLLOWING fast on the exhilarating experience of the General Elections comes the sobering knowledge of the factious spirit in which Ministry-making in the States has had to proceed. Faction is no new thing in the Congress Party; that the age-old rivalry between Mr. S. K. Sinha and Mr. A. N. Sinha in Bihar, which had defaced that State's politics since Independence, was still alive was also known. But no friend of the Congress Party in his most

pessimistic moments would have thought that it would be necessary for members of the Congress Assembly Party in Bihar to cast their votes for a leader in ballot boxes which—for fear of disturbance to the public peace—would need to be carried to, and counted in, Delhi. The Congress Party has rebuked itself intensely by this public demonstration of its internal acrimonies. Nor can a ballot-box in Delhi or elsewhere set at rest a deep disease within the soul. The fact that the Chief Minister of Bihar has now been chosen and will presumably include his rival in the Ministry does nothing to detract from the point that the core of the Congress Party in Bihar has a disease far deeper than either its critics or its friends have been willing to claim.

Thus it comes about that, soon after the General Elections when the Congress Party at the Centre could view its ascendancy for another five years with considerable satisfaction, there has descended on many careful observers within the Party the profoundest gloom. It is right that the bitter politics of the States should be seen in their true perspective. In most States of the Indian Union leaders have been chosen unanimously, and there is no indication at present that they will not receive loyal, and even dedicated, support. But what has happened in Rajasthan and Bihar has proved so melancholy that one can reserve doubts even on the indications behind a unanimous election. It is quite clear that the struggle for power in the States is deep even when it is invisible.

This, and no other, is the challenge to the Congress Party in the States at the present time It needs to be protected from within more than from without, in spite of the fact that it has lost one State and is dangerously near losing another. The strength of a political party is often to be found more in invisible bonds, like dedication and character, than in the happy accidents which make success at the polls. It would, of course, be foolish to expect that the passionate dedication of the Indian Revolution should last much beyond a decade after Independence. It is not in the nature of men to remain for this length of time in a state of animation, unless there is a sense of spiritual mission or a deep continuous challenge to the innermost core in heart and mind. The Congress Party, after the passing of Gandhi, has lost its sense of spiritual mission; apparently it is now losing its sense of challenge which, in the age of planning, it might well have found in other terms. How deep the loss has been in the short period it is difficult to say, but almost nobody, who has seen in recent months the scramble for Congress tickets or the petty search for office and power, can be very hopeful. There is justification enough for the growth of gloom in the Congress Party at the moment of its apparently overwhelming victory.

Now that economic pressures are producing this challenge alongside the political strain which has just been experienced, one wonders whether the Governments of the States will be equal to the exacting demands of the second Five-Year Plan in this severely exacting second year of challenge. If the Centre—which is still firmly held under the all-embracing mantle of the Prime Minister—needs to pause for breath, what can be said of the States in which neither character nor cohesion can be measured in like terms? Almost certainly the real test of the Indian nation will be found this year in the States. Will they be willing, now that the hustings have been removed to a distance, to tax themselves for the purpose of the Plan, according to the broad principles which were accepted when the Plan was framed? Should they fail, will the Centre use both its political and economic pressures to insist that the excessive strain which the Centre is bearing at the present time shall not be increased by their acts of timidity or neglect? These are urgent questions; until the budgets of the States are presented in May one will not know whether the unhappy experience of the last fifteen days will be reflected in the courage with which each State Government now faces its own larger economic responsibilities.

Even when the election of a leader has been most unanimous as in Madras one may have some questions as to whether unity is as real as it seems. Mr. Kamaraj Nadar, for all his skilful manipulation of the hustings in his difficult Tamil Nad, is a foreigner in Delhi both by personal outlook and by the sense of "Southness" which he everywhere imparts. It may suit him and the Congress High Command to pretend that they think alike; but no acute political observer will be deceived. There is in fact between Jawaharlal Nehru and Jayaprakash Narayan a deeper communion of spirit than there is between the Prime Minister and the Chief Minister of Madras. The Congress may look a solid block; but it is beginning more and more and in many places to be all things to all men. Thus it is 'weakening' itself, and may one day be broken on the rocks of political doubt. It already has too much of its support in caste and local leadership for it to argue that it is a truly national party.

At the present time all that can be said is that the outlook is not happy, but perhaps the 'residual' character of the Congress Party will provide a silver lining, showing that Mahatma Gandhi built better than the surface indications would lead us to believe. We are now living, by and large, by faith, both in political and economic terms. Faith remains, as it always has been, the substance of things hoped for, the evidence of things not seen. Over the last few years, both our hopes and the evidence of their fulfilment has led us to believe we were building on sound foundations. The sudden halt in buoyancy in the economic system has taken us back to that invisible world in which again we must live by faith. This will do us no harm, for we were beginning to believe that material progress was an almost autonomous thing. Now we have realised that money, and in particular deficit financing alone, will not help us. We will have to think anew and work far harder for success than we have done in the last two years. Nothing but good can come from our thus being forced to take a good look at ourselves in this hour of trial. If we do this in a Gandhian mirror, we will be much abashed; for we have been corroded much by influences Mahatma Gandhi would have scorned. And thus it is that we need not only live contact with the people; we need live contact with ourselves. Perhaps in the ordeal through which we are now due to pass, there will come renewed faith in ourselves. If that should happen because of a new sense of dedication to the country's service, the bitter humiliation through which the country has passed because of its seekers after office, will have proved a blessing in disguise.

India and Suez

PRESIDENT NASSER'S latest memorandum on the operation of the Suez Canal, it is stated, embodies the six principles set out by the Security Council just prior to the Anglo-French attack of November last. This is not wholly correct, for the Egyptian plan differs in some crucial particulars from the Government of India's stand taken at the first London Conference and in the revised Indian plan of October last. This needs to be substantiated if the Government of India is at all to be persuaded to see that it has, knowingly or unknowingly, landed itself in a blind alley. There is ground for hope that the Indian Government may yet modify its Suez policy inasmuch as this country's need for free, safe and secure navigation through the Suez Canal is no less vital than that of Western Europe.

This need was very much in the mind of the Indian delegation to the London Conference in August last. The cautious, though not wholly satisfactory, approach of what was then known as the 'Menon Plan' and that of the revised Indian plan of October last needs to be recalled here in the first instance. The Menon plan of the London Conference urged that consideration be given without prejudice to Egyptian ownership and operation, to association between international interests using the canal and the new Suez Canal Authority. The institutional arrangement for this purpose was to be a body of user interests formed on the basis of geographical representation and charged with advisory, consultative and liaison functions. Under the Menon plan the Constantinople Convention of 1888 could be revised so as to incorporate provisions regarding maximum tolls and canal maintenance. According to the revised Indian plan of October last, the revised convention was to be registered with the United Nations and Egypt to be required to send an annual report to the world body. The function of the users' association was to be limited to 'consultation and liaison'. If the Egyptian Government wished to increase tolls beyond the agreed limit within a period of twelve months, it could do so only with the agreement of the users' association.

The revised Indian plan was worse than the original Menon plan where it contemplated no advisory function for the users' association; it was better where it laid down that tolls could not be increased within 12 months without the prior agreement of the users' association. Otherwise the two plans were virtually identical. The question for consideration here is whether the latest Egyptian plan is in conformity with the two Indian plans. It certainly is not—at least in respect of tolls and canal users' status. The plan lays down that the tolls shall be levied in accordance with the 1936 agreement between the Egyptian Government and the Suez Canal Maritime Company; they can be increased by 1 per cent within 12 months and any increase beyond that level should be the result of negotiation. The snag here is that tolls can well be raised by 1 per cent within every 12 months; there is to be no canal users' body with which any toll increase beyond that level can be negotiated.

Quite apart from the fact that the Government of India has allowed its stand in respect of tolls and canal users' status to be whittled down, there is the consideration that it has not so far firmly stated its position regarding compensation claims arising out of the nationalisation of the Suez Canal Maritime Company. To continue to say (as the latest Egyptian plan also lays down) that these claims should, unless agreed between the parties concerned, be referred to arbitration, is inappropriate for this country which has, to date, a reasonably clean record in the matter of treatment of foreign capital. President Nasser, it may be recalled, promised full compensation at the market value of shares as on the last day prior to the unsuspected take-over of the Suez Canal Maritime Company. This is not a subject for negotiation or for arbitration but one of unilateral obligation on the part of the Egyptian Government. President Nasser has merely to settle the compensation claims in accordance with his promise and to earmark the blocked sterling balances and the frozen foreign assets of the nationalised Company for payment of compensation amounting to about £70 million. As the Company's liquid and near-liquid assets are about £35 million and as Egypt's blocked sterling balances amount to £110 million, *The Eastern Economist* took the view as early as August 10, 1956, that the compensation claims could easily be settled. The Government of India should have no hesitation in telling President Nasser that he should straightway take the necessary steps in the matter.

The leaders of this country should also have the courage to tell President Nasser that while they recognise the right of the new Suez Canal Authority to manage and operate the Canal and to receive the tolls, they also expect that a canal users' body would be recognised by Egypt and that this body's advice particularly in regard to some crucial matters would be respected as a matter of convention. These crucial matters pertain to freedom of navigation for all countries including Israel, to tolls and charges and to the proposed canal development fund. In particular the utilisation of this fund (into which 25 per cent of all gross receipts are to be paid) as of the World Bank's possible loans for the widening and improvement of the canal should be subject to the advice of the users' body. The world's sole interest is in free and improved navigation through the canal, and it is vitally necessary to secure freedom of navigation for all countries at all times and without discrimination on political or other grounds and to ensure cheap and efficient passage for the increasing traffic. A users' body set up to ensure these things cannot, by any stretch of imagination, be deemed repugnant to Egypt's sovereign right to own and operate the canal. While the present Egyptian plan is more or less in conformity with at least four out of the six principles laid down by the Security Council, it would have to be modified to meet fully the letter and spirit of all the six principles. The time has now come for the Government of India to take a forthright stand in the matter, for it is supremely necessary to help allay the just fears of the canal users.

Pakistan's Political Problem

PAKISTAN is once again in the throes of one of its periodical constitutional crises. President Iskander Mirza has resorted to an extreme remedy and imposed Presidential rule in West Pakistan. This was on March 21, 1957. The explanation given for the suspension of the Constitution is that but for it the provincial budget could not be passed in time due to the fluid situation created by the desertion of 30 Republican legislators. Under the President's rule the budget could be—and has, in fact, been—certified by the Governor.

However, if one were to look closely into the matter, the real reason for the dismissal of the Khan Sahib Ministry seems to be different. Had the Ministry been defeated in the House, the Muslim League, the main opposition party in the West Pakistan Assembly, would have to be invited to form a Government in accordance with the normal democratic procedure. The promulgation of the President's rule under Article 193 of the Pakistan Constitution has killed two birds with one stone. It has, on the one hand, kept out of office those who want to scrap the one-unit scheme; on the other, it has made it possible that when President's rule ends, Dr. Khan Sahib may be re-appointed as the Chief Minister. (That is what was done in East Pakistan about two years ago.) It is, therefore, not surprising that President Mirza's action has provoked resentful comments from the opposition leaders.

The Pakistan President's action seems to have been precipitated by the Muslim League's opposition to the one-unit scheme which it had earlier blessed. Mr H. S. Suhrawardy was perhaps preparing the public mind for this action when on the occasion of his country's Republic Day celebrations at Lahore, he asserted that he would not allow such persons or parties to come to power in West Pakistan as might want to wreck the one-unit scheme. Nevertheless, the pertinent question that arises is: How can Mr Suhrawardy attempt such an *a priori* discrimination against his political opponents without doing violence to the accepted canons of democracy? To seek to amend the Constitution is no more than the exercise of a right enshrined in the Constitution itself. Its denial is a repudiation of a basic democratic concept—the sovereignty of the people. Besides, to deny this right is likely to be injurious to the nation as those who deny it generally subordinate national interests to expediency.

The political situation in Pakistan, hardly free from instability, has been further confused by the East Pakistan Assembly's unanimous demand for regional autonomy. This demand also necessitates an amendment of the Constitution. The Central Cabinet Ministers, who ought to be otherwise opposed to this demand, are irreconcilably divided among themselves. While the East Pakistani Ministers of the Suhrawardy cabinet publicly support this demand, the West Pakistani Ministers are opposing it tooth and nail. Mr. Suhrawardy has, of course, ridiculed this demand as "a stunt and not worthy of consideration." But this internal conflict is bound to complicate the task of the Prime Minister to carry the cabinet as a team. He is, moreover, a minority Prime Minister. Thirty-two of the fifty-seven members of his coalition party belong to the Republican Party of West Pakistan; while the remaining twenty-five belong, and are passionately attached, to the demand for regional autonomy for East Pakistan. Doubtless, Mr Suhrawardy seems to have staved off the crisis for the time being by making his supporters agree to the appointment of a committee of nine members, equally divided between East Pakistan, West Pakistan and the Centre, to report on the question of East Pakistan's demand for regional autonomy without impairing or weakening the Centre.

But such devices are not likely to stabilize the political situation in Pakistan. A deep-seated disease needs drastic remedy; and the body politic of Pakistan seems really in ailment. It is probably because of this that President Mirza in his Republic Day broadcast contended that the British Parliamentary system was "unsuited to the genius of the people of Pakistan" and recommended the American system of government: under it there would be no frequent trials of strength in the provincial assemblies. His suggestion ran into heavy weather—even before it could take the shape of a clear-cut proposal—at the hands of the leaders belonging to almost all political parties, including those of the Republican and the Awami League.

In fact, national unity, the country's integration and political stability cannot be achieved through legislative measures or back-stage manoeuvres. Such attempts are, on the other hand, likely to retard their growth by provoking antagonism and suspicion. The best, and perhaps the only possible, way is to develop an industrial economy which will bring in its train, because of consequent operation of centripetal forces, a unity of purpose. This would inevitably engender a feeling of national unity. In this way alone will suspicion be eradicated, the handicap of lack of geographical contiguity and lack of complete cultural unity be overcome and conflicting regional interests be reconciled and resolved.

Political stability is the pre-requisite for the success of such a long-term objective. Effective measures for stability can be undertaken only by a Government which represents the people and enjoys their confidence. Early free and fair general elections are, therefore, a basic necessity for the solution of the political dilemma of Pakistan. Stability in Pakistan is, however, not the exclusive concern of her own people. India, too, has a stake in it. Political instability in Pakistan is harmful not only to India but to all its neighbouring countries, because political adventurers are tempted by such conditions and peace in the entire region is imperative at this time. The solution of the outstanding problems between the two countries—of Kashmir, canal waters, evacuee property—will be facilitated by stable political conditions because a genuinely representative government will be able to take a reasonable stand on these and other similar issues. After all, its continuance in power will not be dependent on the perpetuation of the present conditions of discord between the two countries.

THE WEEK'S NOTES

A WISE DECISION

THE NATIONAL EXECUTIVE of the Praja-Socialist Party has done well in approving the decision of its Kerala branch not to join in a coalition with the Communists. Though its offer was couched in unusually sweet words, the Communists, who had won a working majority, had evidently made it in the certain belief that both its approval and rejection would be to their benefit. In a coalition government as proposed by the Communists the Praja-Socialists would not have been able to take independent decisions. This would have put an end to the only other "Leftist" group in the new State Assembly (as the Revolutionary Socialist Party has not won a single seat). Rejection of the offer by the Praja-Socialist Party, on the other hand, was visualised as no disadvantage because political capital could be made out of the rejection. And this is precisely what the Communists appear intent on doing. No sooner was the offer rejected by the Praja-Socialist Party than the Communists started the expected propaganda barrage: Praja-Socialist Party was accused of being "an auxiliary force of the Indian bourgeoisie"; it was not prepared to join in forming a Government with parties other than the Congress.

These are, however, familiar tactics and cannot deceive those who are acquainted with the Communist wiles of "united front" and "coalition Governments". After 1934, the Congress-Socialist Party, precursor of the Praja-Socialist Party, almost lost its entire cadre and organisation to the Communists in Andhra. In other States the story was not very different, though the results were not so deadly. Masaryk in Czechoslovakia, it cannot be forgotten, was crucified on the cross of a coalition government.

The Communists have come to power in Kerala because the electorate, in all probability, wanted to give them a chance after it had tried out the rule of the Congress and the Praja-Socialist Parties, and found them wanting. The Communists had evidently made the offer to the Praja-Socialist Party in the hope that if, on trial, they were found wanting they could blame it on the coalition government. But now that a coalition is ruled out, the theme-song is that the Constitution of India hinders the implementation of the Communist election manifesto. This is a plea which can pass only with a gullible. For right from the moment when the Kerala elections were announced, the leaders of the Communist Party have been voluble in protesting that they would work within the confines of the Constitution with which they now seek to quarrel.

THE NEW ADMINISTRATOR

PROBLEMS OF administration have been very much in the fore in recent times since the character of Government has changed from that of a police State to a "social service State" in the wake of independence. A number of Government bodies and experts have gone into the question of reforming the machinery of administration to meet the new challenge of economic and social development. The Government of India also sought the services of the American expert, Mr Paul Appleby, whose reports have focussed public attention to many aspects of administration that require overhauling. The Institute of Public Administration was started three years ago to meet a particular need in the field and was intended mainly to make a scientific study of the problems of administration and to provide for necessary training. Mr Nehru in his address this week to the Institute explained the task of the new administration that merits reiteration. The important thing, he said, was that the administration had not only to be good, but had also "to be felt good by the people affected." It meant two things. One was the administration should reflect the wishes of the people. Secondly, it was important to remember that while dealing with large masses of people, "it is the manner that counts more than what you actually do". The proper relationship that should obtain between the administrative apparatus and the people in a democratic set-up thus requires greater study and attention.

Another significant aspect of administration to which Mr Nehru referred was with regard to the avoidance of delay. The machinery of administration should not only be responsive to public needs, but it must get things done quickly. Mr Nehru largely attributed the prevailing corruption to the inordinate delay in the working of the administrative machinery and remarked that fifty to seventy per cent of corruption in the country would go if delays in carrying out things and the power to cause delays were obviated. He pointed out how in the administration of the compensation scheme, for example, there was so much delay that sometimes relief might reach the persons after they were dead! The remedy lies, therefore, in cutting red-tapism and allowing for a good deal of decentralisation. It will be a happy thing if the structure of machinery is so organised that needless consultation is avoided and there is room for taking necessary risks. If local officials were vested with the power for decision, it will be easier to meet local needs locally, and local needs can be heard and redressed locally. Mr Nehru was correct when he said that the experiment of panchayats, though sometimes "most depressing," could not be given up for they form the "base of democracy". The Institute of Public Administration would have rendered a signal service if it could bestir itself to the study of local self-government and devise methods for the successful working of the panchayat as Mr Nehru has suggested.

SOCIO-ECONOMIC SURVEY IN LUCKNOW

ALTHOUGH THE low standard of living in India is a known fact, very little information is available on how people actually live, work and spend their leisure hours and on the type of food they take. The same can be said about housing and clothing. In this respect the socio-economic survey Lucknow conducted in by the Research Programme Committee of the Planning Commission may be considered useful. Though the survey does not give the data on consumption patterns, it fills the lacunae in other ways by providing information about unemployment, sanitation, and the caste structure of society.

The significant feature brought to light is the general superiority of the immigrants over the old residents practically in all essentials including education, earnings, living standards, and incidence of dependency. The average size of a family has been worked out at a little over five persons while dependency is as high as 68 per cent of the total. Class and caste segregation in residential areas particularly of those of the lower ranks has been reported from many localities. It speaks poorly of the State which proclaims itself to be most progressive in the country, when it is found that caste segregation is still rampant and deep-rooted. Again, it is a very sad commentary on the civic administration when it is recorded that in a considerable portion of the city night soil remains lying in the open and only 61 per cent of the streets and 51 per cent of the dust bins are cleaned. Equally

deplorable is the story of workers' bastis which invariably present the sight of slums. So far as the income per household is concerned, the survey works it out at Rs. 135 per month in the case of the immigrants and Rs. 100 per month in the case of old residents. From all that has been said, it appears that some 52 per cent of the households fall below the poverty line, namely, those with an income of less than Rs. 75 per month while another 35 per cent have an income between Rs. 75 and Rs. 250 per month. Only three per cent can be stated to be living in comfort with a monthly income of Rs. 500 or more.

From the humanitarian point of view, it is considered that similar enquiries be conducted in other important towns in the country. The utility of these surveys need hardly be stressed, as it would not only be useful in bringing to light the dismal economic state of affairs prevalent in different parts of the States, but would also be helpful in proper planning.

NIXON'S PLEA FOR AFRICA

AFRICA, THE remote and mysterious continent, known as the paradise of big game hunters, explorers and film producers, has suddenly assumed importance in world politics. This is due partly to the emergence of Ghana as a sovereign State, but largely to Russia's diplomatic and economic offensive in that continent. In practice, both these developments are inter-related. Now that the African people of the various colonies have either won independence or stand on the threshold of political freedom, they want to enjoy the amenities made available by modern science and civilization elsewhere. Russia, as usual, is trying to exploit these aspirations by posing as a disinterested supporter of their demands. According to Mr. Richard Nixon, Vice-President of the United States, who recently undertook a 20,000-mile tour of Africa, "the Communist leaders consider Africa today to be as important to their designs for world conquest as they considered China 25 years ago."

Fortunately, however, their efforts so far do not seem to have been successful. The leaders of the newly-liberated African countries are jealously guarding their hard-won freedom. But it will be wrong to underestimate or become complacent about the danger of Communism. There exists a fruitful breeding ground for its growth in the racial conflict between the Africans on the one hand and the White Settlers and of the peoples of the European colonial powers on the other. While the Africans demand equality some among the latter have not yet given up their imperial notions. Mr. Nixon has, therefore, recommended, and rightly, that the peoples of the free world should not only give priority to economic and technical assistance to the Africans, but also give up racial prejudices. In this connection, he has done well to appeal especially to his countrymen who sometimes do not live up to high ideals they preach, and maltreat Negroes. This gives a chance to Russia and her agents to exploit the incidents and to tarnish the free world in Africa. As we all know they have the knack of making a mountain out of a mole-hill. Mr. Nixon's suggestion to help the independent African States to maintain their ties—analogous to those of the Commonwealth—with Metropolitan European countries is also statesmanlike. It was, after all, the opposite course of American policy which contributed in no mean measure to the collapse of the protective British military canopy over the Middle East, thus unwittingly leading to Communist infiltration.

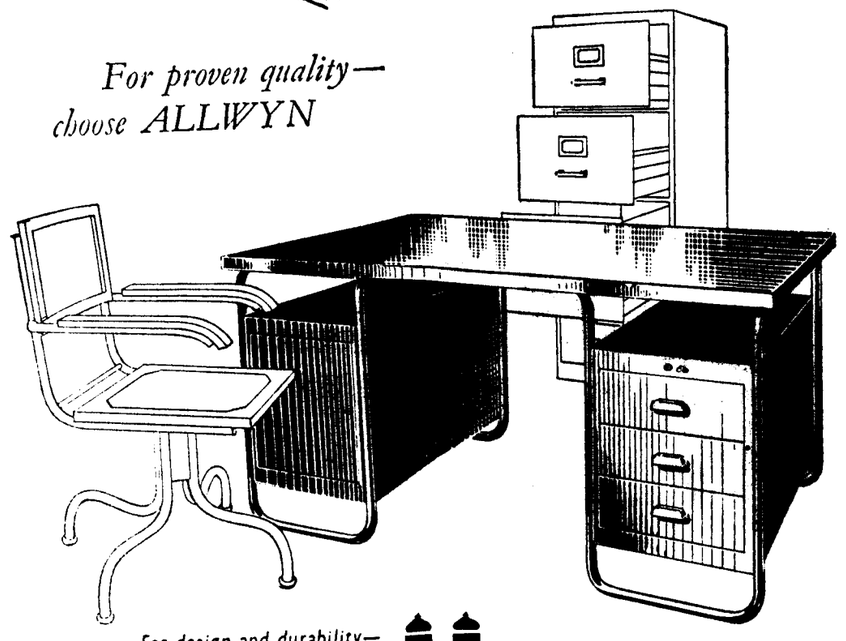
RADICAL REORGANISATION OF U.K. DEFENCE

BRITAIN'S WHITE PAPER on defence, published last Friday, provides for cutting her armed forces by 50 per cent in the next five years, and the call-up for national service is successively to be reduced to end in 1960. In terms of numbers, the strength of the armed forces, by the end of 1962 when all the conscripts will have been released, will be about 375,000—excluding some 60,000 colonial troops and other forces enlisted overseas—as against the present total of 690,000 of both regulars and conscripts. As for the Rhine Army, it will be reduced during the next two years by some 13,000 from the existing 77,000 and may further be cut in consultation with the Allies. The effects of the cut will, however, be offset by increasing the fighting units and equipping them with atomic rocket artillery. Similarly, the introduction of some squadrons with atomic bombs will enable the reduction of the Second Tactical Aircraft in Germany by half in the next twelve months. Among the three wings, the Navy would, perhaps, have to undergo the largest pruning. The financial saving as a result of the reorganisation has been estimated to be £117 million on present prices. The British Defence Secretary, Mr. Duncan Sandys, however, holds that the actual saving is higher at £200 million. In any case, the net defence bill for 1957-58 stands reduced to £1,420 million, after deducting American and German aid.

While the White Paper is not very clear on details of the execution of the five-year reorganisation plan, the reasons that have led to the present decision are obvious. The scars, on the British economy, of the Anglo-French misadventure in Egypt have not, by any means, been entirely healed. It must be remembered that even before the Suez crisis, Britain's economy was facing difficulties and a review of the defence budget had been necessitated to effect economies. An idea of the magnitude of the burden can be formed from the fact that, over the last five years, this unproductive outlay accounted for the absorption of as much as 10 per cent of the country's gross national product. The need for an adjustment between resources and spending was, therefore, obvious.

But that is only a part of the explanation. However strong may be the opposition to atomic and nuclear armament, it is becoming increasingly clear that both sides are convinced of the compulsion to rely mainly on such arms. And the United States has promised to supply the United Kingdom with guided missiles and other nuclear weapons in the production of which the United Kingdom has not made any appreciable progress to depend on her own supplies. For the U.K. this was a necessity dictated by her geography and size. This, in turn, means a lesser emphasis on conventional arms and methods of warfare. The White Paper itself provides a dreadful warning that, in the event of a resort to nuclear attacks and counter-attacks, the effect will be so crippling that such a war may come to an end in a matter of weeks. Apart from rendering huge armies, equipped with conventional arms, largely ineffective, this underlines the need to achieve the highest perfection in speed and accuracy of atomic weapons to wipe out the enemy before he may strike. By and large, that is what the reorganisation seems to seek to achieve. To the extent that the development of nuclear arms in the free world is a deterrent to their possible employment by the other side in a conflict, to that extent their usefulness should be recognised. Nevertheless, the lay man cannot easily get over the grim fear of the effects, direct and indirect, howsoever removed he may be from the theatre of war—and the H-Bomb hardly holds any respect for distances.

Compare Allwyn tubular steel chairs and tables with any you've used so far! Such practical *tested* designs! Comfort that's exceptional! Strength that assures years of faithful service! Only India's



Office Chairs and Tables

foremost furniture stylist, Allwyn, can give *this* dependable value—and yet help you save! See Allwyn before making your choice.

Tubular steel chairs with spring-cushioned seats and padded backs, upholstered in rexine. Also revolving chairs.

Tubular steel tables, with box, drawers, linoleum top-covers, automatic lock.

A Window on the World

"THE TIMES" OR THE "DAILY MUCK RAKER"?

By

ODYSSEUS

MANY MEN of intelligence and culture have a contradictory attitude towards the press. They despise it, dismiss journalists as a scruffy set of interfering snoopers, always putting awkward questions about matters that they do not understand in order to write scandalous columns that upset all "right-thinking people". Yet, if you ask them why, then, they read newspapers at all, they usually have no answer and wax indignant if you suggest that they literally could not perform their duties as professional men, or as citizens, if they failed to keep themselves informed through the newspapers. No civil servant, banker, diplomat, industrialist, or business man, to cite but a few, exists in any country who persistently neglects newspapers (or if he does, it means that he depends on someone else to read them for him).

Genuine democracy is impossible without the constant clash of public debate in the press, and without a press that is not afraid to stand up, when necessary, to criticise any person or organisation in public life, no matter how powerful, and to act as the watch dog of individual liberty. If the press does not do this, nobody else can. To whom, if not to the press, shall a citizen turn, who feels unjustly treated or who has unearthed a public scandal? To his M.P.? But it must be observed that the M.P.'s knowledge that the matter raised will be publicised is an important factor in deciding his attitude towards his constituent. If he thinks that the publicity will be useful to him, he will jump at the chance offered. If he fears that it may create difficulties for him, he must decide whether even worse difficulties may not overtake him if the constituent takes his grievance to the press and reveals that his M.P. was afraid to touch it.

Without a free press a country is on its way to police state abuses and the tyranny of unrestricted bureaucracy—for, make no mistake, what all civil servants in all free countries detest above all else is having matters inconvenient to them revealed in the press. It leads to questions in Parliament which open the door to unpleasant, but democratically healthy, possibilities, such as an exasperated Prime Minister asking the Minister concerned what the blazes is going on behind his back, which sends an aroused Minister charging along to his department, where he has all the secretaries fluttering around him like a flock of pigeons after a gun has been fired. Such embarrassing press vigilance helps to throw light on dark corners and to prevent other corners from becoming dark.

THE PRESS—IN THEORY AND IN PRACTICE

That, no doubt, is the theory of the functions of the press. What of the practice in India, and elsewhere? The press is human and its practice falls short of the ideal in varying degree in various countries.

As far as the dissemination of important information is concerned, the Indian press, by and large, comes out pretty well. The representative Indian newspaper concerns itself with serious affairs. A detailed statistical analysis of a leading Indian Sunday paper's contents that I made here on August 26, 1955, revealed that out of 1,127 column inches, 204 were devoted to politics, 229 to miscellaneous serious news, 223 to finance, industry, markets, etc., 254 to foreign news, and only 41 inches to crime.

On the other hand, as that excellent book "Journalism in Modern India" (Asia Publishing House. 1953) points out, one of the weaknesses of "these admirably solid dailies" is that they are "perhaps a shade timid in dealing with delinquencies in public life. There is a natural feeling against 'letting the side down' and an equally natural aversion to incurring governmental displeasure."

Another reason why some Indian newspapers hesitate to stand up for the rights of individual citizens, or to criticise persons powerful in public life forthrightly, and why some editorial writers and special correspondents are too ready to reflect the official view dictated to them by ministerial spokesmen, is that it is not always easy for those with inadequate financial resources to display all the independence and disregard for consequences that they would like.

The inadequacy of finance arises from the small circulations of Indian papers which, as "Journalism in Modern India" says, "means low advertising rates, and consequent recurrent revenue difficulties." My 1955 statistical analysis also showed that only 31.8 per cent of the Indian Sunday paper's 20 pages carried advertisements, whereas 42 per cent of the 12 pages of the 'Observer' (of London) published on the same date carried advertisements, so that the 'Observer' secured more advertising at higher rates to fill fewer pages.

Nevertheless, with all its imperfections, the Indian press, in its choice of topics and allocation of space, remains the most serious in the free world. 'The Currents' and the 'Blitzes' are the exceptions. The 'Times of India' and the 'Hindustan Times' are the rule.

DANGEROUS ESTATE

When we turn to the British press, we find a different picture. Francis Williams, former editor of the 'Socialist Daily Herald' has just published "Dangerous Estate' (Longmans. 24sh.), which, after giving a first rate outline of the history of the British press (the historical model and inspirer of the press throughout a large section of the free world from Australia to the United States) proceeds to analyse its present-day influence and methods.

In 1956, the British press, daily, weekly, and periodical, published advertising to the value of £350,000,000. It can afford total political independence and is afraid of no one.

Since 1940, the population of the UK has risen by 7 per cent. The sale of national morning papers has risen nine times as fast. It now totals 16,000,000 a day. Since 1940, the sale of Sunday papers has doubled from 15,000,000 to 30,000,000.

The UK press falls into three groups. First, the serious newspapers: The 'Times' (circulation 200,000)

and the 'Manchester Guardian' (160,000). Between them, I consider these to be the two outstanding newspapers in the world: The 'Times' for the variety and quality of its news coverage and the 'Guardian' for its originality, verve, courage, and integrity. Mr. Williams admits the 'Daily Telegraph' (circulation 1,000,000) to this class, but to my mind it is third by several lengths. As Mr. Williams says, it "is the least intellectually demanding of the three" which, no doubt, is why it secures more than two-thirds of the sales of the "quality" press which carries out those functions traditionally belonging to a serious paper.

At the other end of the scale (or shall we say barge pole?) comes the "Daily Mirror", which attracts 4,700,000 readers daily by (says Mr. Williams) "a frenzied gusto in dredging the news for sensational stories of sex and crime," "radical muck raking crusading", "personal invective", and careful avoidance of all that an educated man regards as interesting or important. Next, the 'Daily Express' (4,000,000) whose formula is to create a glamour world of escape in which anything can happen, the world of Walter Mitty, and of the dream of a precocious, badly brought up, 12 year old girl. The readers of these two newspapers are born, live, and die, in ignorance of all but the trivial, the sordid, the emotional, and the pornographic —a solemn thought.

In between, there comes a group of medium circulation popular papers which admit that there is more in the world than sex and crime: the 'News Chronicle', 'Daily Herald', and 'Daily Mail', with circulations between 1,500,000 to 2,000,000 each.

In this picture there is one small bright glint. Even in what are nostalgically recalled as the great days of serious British journalism in the late nineteenth century, no more than 1 per cent of the then population of 38,000,000 bought the serious dailies. Today 3 per cent out of 54,000,000 read them. Twenty-five years ago the circulation of the serious dailies was 6 per cent of all national papers. Today it is 9 per cent. It is consoling that the 'Manchester Guardian' has more than trebled its readers since 1940 and that the circulations of serious weeklies, like the 'Observer', 'Spectator', 'Economist' etc., is in each case several times pre-war. In absolute figures, more intelligent Britons read responsible papers today than ever before. And the leisure of more moronic Britons is spent in reveries of sex, crime, and glamour than ever before.

Francis Williams argues that confusion of thought arises because both the 'Guardian' and the 'Daily Mirror' are described as "newspapers", whereas their functions are distinct. The 'Guardian' seeks to inform and to guide. The 'Mirror' to amuse. He notes that when Britain's eldest Sunday paper, the "News of the World," first appeared in 1843, it concentrated on rape, seduction, violence, and marital infidelity. Whereas there were sufficient literates to buy 100,000 copies in 1843, today compulsory education has raised the number to 7,000,000. It is not, he says, that the papers have depraved the masses but that they supply what the masses want. The taste of the masses today is identical with that of their forefathers.

The mass-circulation papers arose in the UK as literacy came to the millions. As it is but a matter of time before literacy comes to the millions in India, I propose next week to discuss the questions: As Indian literacy rises will Indian Daily Muck Rakers begin to pullulate? If so, would that be harmful or would it not matter? If it matters, what, if anything, can be done to prevent it?

MORE UNREST IN SPAIN

(From Our Special West European Correspondent)

MADRID, April 5.

FOR the past year, unrest, agitation and labour trouble have been constantly simmering in Spain. Coming after 17 years of totalitarian quietude and coinciding with the challenge to dictatorship in East Europe, it is natural that this feverish period should have been taken outside Spain for the harbinger of further and more spectacular trouble to come—specifically, as the forerunner of a direct and open opposition to the Francoist dictatorship. But there are as yet no signs whatsoever of that. Unrest in Spain continues to simmer ominously but never gets any worse; the regime seems powerless to put an end to it, but the population seems equally powerless to carry its discontent any further. This has been especially noticeable in Madrid this past week. Tracts were plentifully distributed here calling on the population to boycott the celebrations for the anniversary of the end of the civil war, and there is no doubt that a majority of Madrilenes substantially agreed with the criticisms of the regime contained in these tracts; the action suggested (staying at home on the regime's birthday, which was a holiday) would have been safe but impressive. In fact, the streets, trams and cinemas thronged with people who gaily abused the government but were not willing to miss an outing for the sake of a political protest. Meantime, the secret police rounded up 14 so-called Communists responsible for printing the pamphlets, and Franco placidly took the salute at an ostentatious and rather comical military parade.

At the same time, a go-slow strike continued in the mines in Asturias. Strikes are of course illegal here and it takes considerable courage for workers to resort to any form of organised protest. But a few minor troop movements toward the mining areas sufficed to break this resolution, and at the time I write it appears that the movement will collapse. In Barcelona, the traditional storm centre of Spanish agitation, there was an echo of the unrest in Madrid and Asturias but a feeble one that came to nothing despite persistent efforts by the regime's enemies. One could understand this failure of generalised discontent to flare up into something hotter if the regime were countering it with firm repression, such as it would meet with in a Communist country; but in fact repression in Spain is as half-hearted as the agitation. One has the feeling—at least one who has the tempo of Indian politics in mind and who has just crossed the Pyrenees from France—that politics is carried on in Spain by people who are half-asleep and who go through the grandiloquent motions of Latin agitation quite absent-mindedly. Neither the occasional bomb-thrower nor the ubiquitous secret police really seem to mean it. Yet the agitation continues.

The way the official censorship deals with the news of this persistent unrest further reveals the political exhaustion and disinterest produced in Spain by three years of civil war and 18 years of Franco's idiotic and incompetent governance. Most of the time, the controlled Press and radio simply ignore the most widespread and visible signs of dissatisfaction, including even events such as took place last year in Catalognia which led foreigners to expect the downfall of the regime. Then suddenly, for no apparent reason, the controlled information services pick out an instance of agitation, such as the current Asturian labour trouble, and not only report it but exaggerate it beyond all bounds, providing blood-curdling accounts of Communist conspiracies and foreign intervention, which are perfectly false. It is as though most of the time the regime relied on political indifference to smother unrest before it becomes dangerous, but every now and then decided to reinforce this indifference by calling up the spectre of the Civil War to suggest where such unrest might lead if too many people took an interest in it.

Paradoxically, the causes of the present discontent redound to the regime's credit—to the credit of its economic ambitions if not of its economic competence. After decades of almost total stagnation, the Spanish economy has at last begun to move and this unaccustomed movement has produced an inflation from which the mass of the population is suffering acutely. Production has been increased more or less as planned in certain branches, but workers' living costs have risen in a year by 33 per cent. The official Press reports only the production increases and permits itself to talk of the "industrial revolution" and the "economic miracle"; the workers, on the other hand, see none of the consequences of the supposed economic miracle but do see the value of money falling.

The conjunction is thoroughly familiar to Indian readers and the interest of the Spanish case is that it reproduces certain characteristics of economic planning and enables us to draw some general conclusions. The main lessons are that planned increases in output can be brought about fairly easily, under any sort of political regime, by planning boards; but that the planners always grossly underestimate the time-lag between planning "successes" and the marketing of goods, with the result that they find themselves with an awkward inflation that exceeds even the dangerous inflation they had cynically allowed for in their plans; and moreover that (this is a lesson emphasised here previously in regard to economic planning in Italy) the planners always grossly underestimate the strain of industrial expansion on the balance of trade. This general picture (varying only the strength of the adjectives) applies to economic planning in Asia, in the Communist countries and now in Spain.

Breaking with its old habits of procrastination and indolence, Franco's government has in the past 12 to 18 months applied itself to encouraging industrial expansion, and has actually succeeded in bringing about increases in the production of basic or "strategic" commodities which on paper and as percentages compare quite favourably with the planning achievements of India and the Communist countries. These include a half-million-ton increase in coal extraction, a 15 per cent rise in electricity production, a quarter-million-ton rise in cement production, a really substantial expansion in heavy chemicals, and exceptional activity in shipbuilding and motor cars. But as usual progress has been uneven, and there has been retrogression in textiles and some sections of agriculture. Worse, this economic "miracle" has been produced almost exclusively by the government's own efforts, and that means by inflationary finance. Native capital is shy of investment in basic industry while foreign capital (already scared by several political nationalisations) is permitted only a minor participation in these industries for nationalist reasons. The government's excessive ambitions in investment have succeeded in weakening

the currency, so that the peseta has lost 25 per cent of its value on foreign exchanges and has simultaneously lost purchasing power within the country.

The foreign exchange element in public investments was much underestimated and there has been a heavy drain on the balance of payments. The cost and quantity of imports required to mitigate the internal inflation brought on by industrial investment were not foreseen, any more than in India or Italy in similar circumstances. Too much attention was given to quantitative increases in output without enough care for quality improvement, so that exports have not risen as much as expected. It has sufficed for one bad agricultural season—in Spain's case, the 85 per cent failure of the orange crop—to bring on an exchange crisis, which American dollar aid has done little to extenuate. Although the workers justly complain of their worsening situation, it is also true that their productivity is far too low, in part because of secular habits of indolence—the Spanish worker has as many religious holidays as his Indian counterpart and probably really only works a 35-hour week. And finally, to complete a familiar picture, the chief economic planner has just admitted that, without actually cutting the plan (planners never confess to doing that), it is now necessary to be more "moderate and selective" and in fact to slow down the rhythm of public investments.

The Spanish economy faces another and peculiar threat, which concerns a matter often referred to here in recent months: the constitution of a European common market. Spain cannot of course afford to join Euromarket because she is developing her industry and cannot permit competition from her more advanced neighbours. But by staying out, she faces the danger that her exports to the rest of West Europe, especially her agricultural products, will run into a customs barrier built by the Six of Messina to protect their infant common market. Thus, after several years of painful effort directed at bringing Spain nearer the economic position of her European neighbours, she may see herself shut out from their common effort and further handicapped in her main market.

As has also happened in certain other developing economies, altogether excessive hopes were placed on American aid, which in the event has been slow to arrive, has preferred military to economic projects and has never (through no fault of the Americans) seemed to reach just the sectors of the economy that most needed it. The American Government is at present putting pressure on Madrid to abandon the system of multiple exchange rates for various exports and imports; the present decline in the value of the peseta may permit the Spanish Government to introduce a uniform system for foreign exchanges, from which it may draw the benefits gained by several Latin American countries which were also obliged to do this under American pressure.

These economic difficulties are sufficient explanation for the simmering unrest that Spain has known for a year past, but in a country where political indifference is so firmly established one cannot assume that this unrest will have serious consequences. Franco is not in full control of the situation, but then he never was, and he will no doubt remain in power, the symbol of Spain's political exhaustion.

WORLDGRAM

AGRICULTURE

Mysore Agricultural Debtors Relief Amending Bill: The President has given his assent to the Hyderabad Agricultural Debtors Relief (Mysore Amendment) Bill, 1956. The Bill seeks to amend the Hyderabad Agricultural Debtors Relief Act, 1956, which applies to certain parts of Mysore, so as to enable the Mysore Government to fix by notification the last date by which applications may be made by debtors to courts for adjustment of their debts. Section 4 of the Hyderabad Act provides that a debtor or his creditor may make an application to the court for adjustment of his debts within three months from October 5, 1956, the date on which the Act came into force. However, the rules for implementing this provision were not framed by the former Hyderabad Government and so no application could be made under this section till now.

*

Villages Covered by Community Development and N.E.S. Programme: The Community Development and National Extension Service Programme covers 222,000 villages with a rural population of approximately 129.9 million, says a Report of the activities of the Ministry of Community Development for 1956-57. Of this coverage, about 36 per cent is under intensive development and the rest under National Extension Service. Families benefited by development activities number 11,140,000. By the end of the second Five-Year Plan, the whole country is to be covered with National Extension Service Blocks. Not less than 40 per cent of the N.E.S. Blocks are to be converted into Community Development Blocks for the purpose of intensive development.

INDUSTRY

Standard for Ethylene Dichloride: An Indian standard specification for ethylene dichloride, technical, has just been published by the Indian Standards Institution. The standard prescribes the requirements and methods of sampling and test for ethylene dichloride, technical. The material is suitable for use in the paint industry and also as an insecticide (fumigant preparations). The standard includes the methods for the determination of specific gravity, distillation range, residue on evaporation, acidity and free chlorine. Copies of this standard, which has been prepared by ISI's Fine Chemicals (Organic and Inorganic) Sectional Committee, are now available from the Indian Standards Institution, 19 University Road, Delhi-8, and its branch offices at 40/40A Cawasji Patel Street, Fort, Bombay-1, and P-11, Mission Row Extension, Calcutta.

*

Graduated Measuring Cylinders: An Indian standard specification for graduated measuring cylinders has just been published by the Indian Standards Institution. The standard prescribes the requirements of a range of graduated measuring cylinders, stoppered, suitable for laboratory uses. The standard also gives a test for neutrality. Five tables, describing tolerance on capacity, over-all height and diameter of the base of the graduated measuring cylinders, length of scale of graduated measuring cylinders, stoppered, and subdivision of graduated measuring cylinders, are provided in the standard.

*

Terms Applicable to Timber Plywood and Joinery: The Indian Standards Institution has issued for eliciting comments, a draft Indian standard glossary of terms applicable to timber plywood and joinery. Several Indian standard specifications covering timber and wood products have been published by the Institution and these include a large number of technical terms relating to timber and wood technology. The glossary includes definition of terms relating to logs, timber and timber products, anatomical features, defects in timber, terms used in regard to plywood and coreboard and also joinery work. An important aspect covered by this draft standard is the definition of terms denoting different sizes of converted timber from the smallest to the largest. Comments on the draft may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before May 25, 1957.

*

Revised Standard for Zinc: The Indian Standards Institution has published a revised Indian standard specification for zinc (IS: 209-1956). This standard was first issued as a tentative standard in 1950. Apart from reduction in the number of grades of zinc from five to three, the revised standard covers requirements with regard to supplier's guarantee, sampling and chemical analysis. Three grades of zinc used for general purposes are included in this standard. Grade Zn. 99.95 may be used for abodes for electro-galvanizing and the manufacture of deep drawing quality non-ferrous alloys. Grade Zn. 98.50 is generally used in the manufacture of pigments for paints and for hot dip galvanising, Grade Zn. 98 is used for general purposes. Copies of this standard can be had from the Indian Standards Institution, 19 University Road, Delhi-8 and its branch offices at 40/40A Cawasji Patel Street, Fort, Bombay and P-11 Mission Row Extension, Calcutta.

*

Revised Standard for Pig Lead: The Indian Standards Institution has published a revised Indian standards specification for pig lead (IS: 27-1956). This standard was first issued as a tentative standard in 1950. Apart from the inclusion of a new grade of pig lead of 99.99 per cent purity, the revised standard covers requirements with regard to supplier's guarantees, sampling and chemical analysis. The limits for the impurities have also been given for all the grades. The standard covers three grades of pig lead. Grades pb. 99.99 and pb. 99.98 are suitable for use in the manufacture of chemical apparatus, and Grade 99.8 is suitable for general purposes. Copies of this standard can be had from the Indian Standards Institution, 19 University Road, Delhi-8, and its branch offices at 40/40A Cawasji Patel Street, Fort, Bombay and P-11 Mission Row Extension, Calcutta.

TRADE

Foreign Trade of India in January, 1957: The provisional figures of foreign trade of India by all routes, sea, air and land, on private and Government accounts, during January 1957, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows:

Merchandise: Excluding transit trade of Pakistan and other overland foreign countries, viz. Nepal, Tibet, Sikkim and Bhutan: Exports Rs. 5498 lakhs, Re-exports Rs. 30 lakhs, Imports Rs. 7876 lakhs; Total trade Rs. 13,404 lakhs.

Treasure: Exports of currency notes Rs. 3 lakhs; Others negligible.

Imports of gold Rs. 1 lakh, currency notes Rs. 389 lakhs, others—nil.

Balance of Trade: The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency, in import figures, the total value of exports (including re-exports) of merchandise and gold fell short of imports by Rs. 2349 lakhs.

*

Trade Handled at Bombay Port: The tonnage handled at Bombay Port during 1955-56 was 10,305,799, setting up a new record in the history of the Port. Imports during the year accounted for 6,707,000 tons and exports 3,599,000 tons. The corresponding imports and exports, during the previous year were 5,630,000 tons and 1,954,000 tons, respectively. Imports of iron and steel showed increase as compared with the previous year, the figures being 140,900 and 281,000 tons, respectively. The number of vessels which entered the Port during 1955-56 was 2,621 of 13.94 million GRT. The number of sailing vessels that used the Port during 1955-56 was 24,191. Amongst important works on which expenditure was incurred during the year was the construction of a new marine oil terminal (Rs. 164.75 lakhs). The Port Trust Board performed another year of useful work and Government viewed with appreciation the work done by the Board during the year under review.

*

Iron Ore Export Earnings Rise: Iron ore export earnings rose to Rs. 6.64 crores during the nine months ended December, 1956, compared with Rs. 4.06 crores in the same period of the previous year, showing a rise more than 50 per cent. In addition to the improvement in the prices of ore, the increase in the quantity from 922,781 tons in April-December, 1955 to 1,262,974 tons during the period under review also contributed to the higher export earnings. Though Japan maintained the position of leading buyer with an offtake of 738,040 tons, shipments to Czechoslovakia at 305,983 tons showed a marked increase of approximately 220,000 tons. While Belgium was out of the Indian market, offtake by West Germany showed a substantial decline at 25,877 tons. Other countries, however, increased their offtake from 75,150 tons in the nine months ended December, 1955, to 193,074 tons during the period under review.

*

Export of Raw Cotton: The Government of India have decided that, with immediate effect, no further sales of Indian raw cotton against the licences issued in terms of Government announcements on February 6 and 7 would be allowed says an Export Trade Control Public Notice issued recently. (Under the announcements made on February 6 and 7, the Government had allowed a total quantity of two lakh bales of Indian raw cotton of all varieties, including Bengal Deshi, for export up to June 30, 1957.) The notice says exporters who have already entered into firm commitments against the licences issued in terms of the February announcements on or before March 30, 1957, are required to produce documentary evidence of (A) firm contract executed, (B) letter of credit opened, and (C) cable offer and acceptance so as to reach the office of Joint Chief Controller of Exports, Bombay, not later than April 6, 1957. No further licences on any ground will be issued, the notice adds.

FINANCE

US Credit to France: At the end of February, 1957, a group of US banks concluded with French banks an agreement under which revolving credit up to $100 million will be granted to finance French purchases of oil in the dollar area. The credit will run until December 31, 1958 and will take the form of bankers' acceptances. The US banks will stamp as "accepted" 90-day sight drafts drawn on them by the French banks, who will pay both the acceptable fee of 1½ per cent per year and the going 3½ per cent rate for discounting 90-day acceptances.

*

Poland's National Income: 1949-55: The national income of Poland, calculated in terms of 1950 prices, increased from 80.3 billion zlotys in 1949 to 146.9 billion zlotys in 1955, or by 83 per cent. Private consumption increased by 60 per cent, from 55.5 billion zlotys, public consumption increased from 6.6 billion zlotys to 12.5 billion zlotys, and nets investment from 18.2 billion zlotys to 45.9 billion zlotys. The share of net investment in the national income varied between 23 per cent in 1949 and 38 per cent in 1953. In 1955 it amounted to 45.9 billion zlotys, or 31.2 per cent of national income.

*

Sales Tax on Inter-State Transactions in Declared Goods: It is stated that Section 15 of the Central Sales Tax Act will come into force on July 1, 1957, together with other sections of the Act, instead of May 1, 1957. This modifies the previous notification issued on the subject. Section 15 declares certain goods to be of special importance in inter-State trade or commerce and lays down that no State is authorised to levy sales tax on 'intra' State sale or purchase of goods at a rate exceeding 2 per cent and at more than one point in the series of successive sales. The goods so declared are coal, including coke and all its forms, cotton, hides and skins, iron and steel, jute and oilseeds.

*

Further Rise in Sterling Area Reserves: The sterling Area's gold and dollar reserves rose by $62,000,000 during March and stood at **$2,209 million** on March 31. Defence aid estimated at $5,000,000 was received from the USA during the month. A sum of $17,000,000 was received in gold or dollars from the European Payments Union in respect of February, and $3,000,000 was paid to creditors of the Union in bilateral settlements. On the provisional figures for the month, the United Kingdom had a deficit of £3,000,000 with the European Payments Union, which will fall to be settled in April, as to 75 per cent. In gold or dollars and as to 25 per cent, by an increase of the debt to the Union. As a result of the further increase in March, there has been a rise of $76,000,000 in the gold and dollar reserves in the first three months of this year.

GENERAL

Electricity Output: During December, 1956, 757 public electricity supply undertakings generated 879.5 million kilowatt hours (kwh.), of which 715.0 million kwh. were sold to ultimate consumers. Power production during November, 1956, was 808.6 million kwh. This shows an increase of 70.9 million kwh. in December. Five purchasing undertakings were the new additions during the month. Those are at Balikuda and Bhulnakhara in Orissa and Ahmedpur, Kaligunj and Basirhat in West Bengal. The output of sale of power during December, 1956 were 784.3 million kwh., and 648.8 million kwh.

NEWS IN BRIEF

INDIAN

The Government of India have reviewed the policy for export of raw wool and have decided to release a further quantity for export during the period April-September, 1957. Exports will be allowed by established shippers and new-comers as in the previous period.

*

Following discussions with the Ministry of Production, the Standard Vacuum Refinery Company has agreed to surrender the duty protection of Annas 2 per gallon on motor spirit produced by them with effect from October 1, 1956, and to refund the money already realised on account of this concession after that date.

*

Sums totalling Rs. 27,86,760 have been sanctioned by the Government of India for road development works in Andhra, Assam, Kerala, Manipur, Madhya Pradesh, North-East Frontier Agency and Tripura.

*

Loans and subsidies totalling Rs. 29,13,287 were sanctioned by the Government of India during January and February, 1957, for the construction of 1,228 tenements under the Subsidised Industrial Housing Scheme.

*

The Government of India are appointing, with effect from April 1, 1957, the Khadi and Village Industries Commission under the provisions of the Khadi and Village Industries Commission Act adopted by Parliament for the purpose.

*

The Open General Licence for Pakistan, which is to expire on March 31, 1957, has been extended, without any change, until June 30, 1957.

*

A total capital expenditure of Rs. 156.83 crores is proposed to be incurred on the three steel projects—Rourkela, Bhilai and Durgapur—during 1957-58.

*

Production of penicillin at the Hindustan Antibiotics (Private) Ltd., at Pimpri, reached a total of 12,49,460 mega units during the month of February, 1957 as against 11,62,000 mega units in January, 1957.

*

The quantity of food grains produced in India during the year 1947, 1952 and 1956 was 425, 429 and 534 lakh tons respectively, while 14.2 lakh tons had been imported during 1956. The total quantity of food grains exported during 1956 was 43,800 tons.

*

The Government of India have approved the placing of an order with Messrs. Oronzio De Nora of Milan, Italy, for the supply of electrolysers for the Nangal Fertilisers and Heavy Water project. Electrolysers form an important constituent of the project. The total cost of the supply to be made by the Italian firm is estimated at Rs. 3½ crores.

*

The Central Sales Tax Act, 1956 (74 of 1956) will come into force on July 1, 1957, instead of May 1, 1957, as previously notified. From July 1, every dealer will be liable to pay tax under the Act on all sales effected by him in the course of inter-State trade or commerce.

*

Under the Colombo Plan, AIR is receiving equipment from Australia, for a number of projects under the first and second Five-Year Plans, for the development of broadcasting in India. Orders for equipment worth about Rs. 87 lakhs, out of the total allocation of Rs. 112 lakhs, have already been placed.

FOREIGN

Industrial production, personal income, consumer spending and employment were at record or new-record levels in the first two months of 1957 in USA.

*

The World Bank has formed a new Far East Department to tackle increased banking operations in Burma, China, Ceylon, Indonesia, Japan, Korea, Philippines, Thailand and Viet-Nam.

*

Canada received a capital inflow of **$6 million** (£2,247,000) in January from international securities trade. In December, there was an outflow of **$9 million** (£3,370,000).

*

It is reported the Australian Government will guarantee prices for butter and cheese for a further five years under the new stabilisation plan for the dairy industry which operates from July 1.

*

Eire's total revenue was £117,663,725 for the year ended on 30th March, compared with £111,675,488 for the preceding 12 months. Expenditure totalled £135,579,479 against £126,281,027.

*

Final figures for the Exchequer 1956-57 show a surplus on ordinary revenue-expenditure account of £290 million. This was £107 million below the 1955-56 level and £107 million short of the Budget estimate.

*

Canada's production of steel ingot and pig-iron in January continued the rising tendency which has been effect for a year or more. Steel ingot output rose 7.4 per cent to 456,440 tons compared with 425,167 the previous January, while pig-iron output rose 7 per cent to 304,896 tons (285,084 tons).

*

A new policy designed to prevent over production in the United States synthetic textile industry has been announced by the Amerotron Corporation division of Textron Inc., a leader in the field.

*

Britain was France's fourth trading partner in the first two months of 1957, statistics published by the French customs and Excise Department show. The trade turn over between the two countries was £33.5 million compared with £29 million in the same period of 1956.

*

It is reported the fall in the United Kingdom's share of world exports of manufactures between 1951 and 1955 continued during 1956, while UK exports of manufactures increased by 11 per cent in value in the first nine months of 1956, world trade increased by 15 per cent. The UK's share of the total consequently fell to 19.3 per cent, compared with 20 per cent in the same period of 1955.

*

The West German production index in February was 215, compared with 207 in January (basis 100 in 1936). This was a rise of 3.9 per cent over the previous month and 12 per cent over February of the previous year.

*

The February trade figures for the Federation of Malaya show for the second consecutive month this year a favourable trade balance. Exports were valued at $M116.2 million and imports at $M153.8 million. These figures compare with exports in January of $M202.3 million and imports of $M160.1 million.

ECONOMIC DEVELOPMENT AND PUBLIC CONTROL IN YUGOSLAVIA

By

SERGEY KRAJGER

(Director of The Institute for Economic Planning)

As the system of social self-government, with the workers' councils and the self-governing communes as its basis, developed in Yugoslavia, the character and methods of public control of economic affairs and the direction of economic and social development have also been gradually changed. The implementation of a determined political line in economic and social development in keeping with prescribed obligations of economic enterprises concerning production and distribution and prices fixed by central organs, was given up and replaced by planning on the basis of the fundamental criterion of the national income and its distribution. Thus, the market and free business contacts of economic enterprises, together with the free operation of the law of values, became the basic instruments in determining production. The economic plan of the Federation, with the unique economic system and financial machinery is the fundamental lever which, in economic matters, ensures the implementation of a uniform economic and political policy of social development. The People's Republics, districts and municipalities, too, have their own economic enterprises.

Economic enterprises in our economic and social system have the status of independent legal persons. The economic plans form a social link between economic enterprises themselves and between the economic enterprises and the community. Enterprises establish business contacts with each other as independent legal persons through the market as laid down by the market laws. We can say that the free market and business contacts established in such a market, without any intervention of the state and its organs, is the measure of general freedom in economic affairs and social relations. The right of the working people to manage the means of production imposes the obligation upon the working collectives of all enterprises to ensure—by marketing their products as best as possible—uninterrupted production, to provide adequate remuneration to all employed workers and office employees according to their work output and to set aside a certain percentage of their profits for social funds of the community, investments and their own funds. Such a status of economic enterprises is irreconcilable with any direct interference in their affairs by the planning and other administrative organs.

All enterprises have the same rights and obligations, no matter whether they belong to the co-operative or the general state sector, whether they are large or small. Since the market activities and goods traffic reflect the extent of economic development and division of labour, we consider that, in our conditions and generally, there is no justification for Stalin's theory, now given in the Soviet text books on political economics on the necessity for the restriction of the market laws and the free operation of the law of values outside the state sector and in the field of personal consumption. Accordingly, his theory, contrary to the Marxist teaching, says that the law of values does not play any role in the traffic of the means of production produced by the "State" enterprises. As this theory states, the reproduction material and the means of production are not market values, nor are they considered as commodities. We on the other hand, consider—and act accordingly in practice—that with social ownership of the means of production it is not only possible but necessary to allow the law of values to operate freely within certain limits. In such limits, the trends of economic movements, which are expressed through the action of the law of values and price fluctuations are the safest indication of the structural deficiencies in economy, of the weaknesses in distribution and the inefficiencies of the economic enterprises. Accordingly, such trends are of great value in determining interventions, as well as in planning.

For some years now, economists of the Western countries and now also commentators in some Eastern countries, have been asking: does not workers' management of economic affairs, i.e. the relative independence of economic enterprises, lead to division of economy and to prevention of concentration of the means of production as necessitated by modern technological process? And further: is not such an organisation suitable for the underdeveloped productive forces of a country in the process of industrialisation, a country with undeveloped division of labour and a poorly developed market?

The experience we gained in the first post-war period of administrative management of economy and during the last six years of social self-government gives a negative answer to these questions. Our successes in overcoming the inherited backwardness, the growing political unity and socialist consciousness of our working people, and, primarily, the expansion of the productive forces, made possible by rapid industrialisation, has made it necessary to abolish the administrative system of economic management. In our case, as always in history, it has proved necessary to go on adjusting social relations to the increasingly higher stage of development of the productive forces. I think that it would be difficult to find any one in Yugoslavia who believes that this problem, which had to be settled in Yugoslavia, does not appear in other countries at the same or even higher stage of development. The important issue in the concentration of production factors is not the question whether enterprises are large or small, but the question of workers' association and co-operation with increasing independence. 'Workers' management of enterprises, and the inter-relations of the productive forces, can in no way retard the process of their growing inter-dependence.

In our conditions workers' management of economic affairs has proved to be the factor which accelerates this process. The indices of industrial production in our country, the ratios of investment and reproduction material and the production of consumer goods, are interesting not merely because they reveal a rapid rate of development. They, first of all, show that the production of many new articles has been mastered, that, with a certain concentration of enterprises, an extensive process of specialisation and division of labour is going on. It is this process in the specialisation and division of labour, together with the increasingly greater variety of products, the necessity of co-operation between enterprises and their growing inter-dependence in expanded production, particularly in timely purchases of reproduction material of corresponding variety and

quality, that made it possible for the enterprises to settle different problems by themselves through the market without any interference from outside. Production orders and detailed central plans of distribution were not able to stimulate a rational use of all the available production possibilities. The dependence of the regular operation of the enterprises on the decisions of the administrative organs was found to check the development of the producers' initiative, and was a source of increasingly greater bureaucracy in business and in sharpening conflicts between the administrative organs and the producers. The transfer of some functions from the Federation to the Republics and districts, carried out in the years before the system of workers' self-government was introduced, was only a partial improvement, primarily in the relations between the administrative organs themselves, but it was not capable of solving the fundamental problems in economic relations and in the business between enterprises.

It is being asked how, under social self-government, it is possible to ensure a harmonised development of the productive forces and the structure of production and distribution as required by the political and economic aims of a socialist society. Since higher wages and larger funds for the development of enterprises depend, as a rule, on a larger volume of production and greater profits, it is evident that the enterprises and producers are interested in expanding production. The problem is to link the increase in wages, in reserve, investment and other funds of the enterprises, with greater productivity of labour, decreased production costs and more successful operation of enterprises on the market through greater variety and better quality of their products.

It is impossible, in the scope of this article, to go into all the elements and methods which enable one to grasp fully the market fluctuations and the subordination of the law of values to the realisation of planned development. I shall, therefore, only point to some of the characteristic trends. The planning organs and the associations of enterprises, together with different chambers, analyse the possibilities of the production and supply of individual groups of articles in relation to expected demands. The study of the structure of supply and demand in the last few years, the available technical equipment, and the realistic appraisal of the production capacities of new enterprises, as well as the volume and structure of imports and exports, serve as a basis to estimate the future volume and structure of production and market demands. These elements are used in assessing the future consumption of equipment, while in the field of personal consumption the expected demand is computed on the basis of consumption in the last few years, in which due attention is paid to changes in personal incomes and in prices. The other element by which society can influence the level and structure of demand and harmonise them with the expected supply is the mechanism of the financial system, which uses various instruments to direct one part of the profits made by economic enterprises to various economic and other funds and budgets and so affects their purchasing power and demand on the market. Another decisive element in the financial system, which affects demand, is the policy of granting credit by the National Bank.

First, the variety and quality of produced goods have been improving throughout the period of workers' self-government; the production of unprofitable goods has been stopped, and the losses of the enterprises thus incurred reduced. With a more rational use of amortization funds and with improved exploitation of the production capacities, the old enterprises, together with new factories, have since 1953 been increasing their production constantly (about 13 per cent a year). In addition to industrial enterprises, transport in particular, agriculture, too, has made some progress, especially in livestock breeding, although there were unfavourable weather conditions in the last few years. The volume of exports, particularly industrial exports, has been increased.

In relation to economic development, some observers have been pointing to certain negative trends, which are being said to be due to the system of social and workers' self-government and to its operation. In this, they most often mention the price increases in 1953, 1954 and 1955, Yugoslavia's deficit in the foreign balance of payment, the stagnation of agriculture and poor progress in advancing socialist relations in the rural areas.

Although it is true that these things have been taking place, and that some of them will persist for some time to come, it is wrong (and probably malicious) to say that they are the consequences of social self-government, of the market conditions and the alleged inability to work with the market law in full operation in Yugoslavia's social and economic system. The trends mentioned were the result of the inherited disproportions in production and the undeveloped productive forces, particularly in agriculture, where the situation was aggravated by a number of poor harvests. Our economy must root out such trends through the process of its development, just as every underdeveloped country has to do, but this process by itself produces new problems. Yugoslavia had to tackle the disproportions in production under exceptionally difficult international conditions. This is particularly true for the period 1948, when she had to stand the blockade of the East European countries and counteract it by a number of measures in the distribution of the national income, by changes in the already started programme of development and by a rapid reorientation of her foreign trade. All this had some negative consequences and produced new disproportions, some of which began to be felt sharply only in the last few years. Due to all this, the prices of commodities had to increase. Another reason for price increases was the fact that—owing to the necessity to concentrate our efforts on the completion of the basic industrial projects—we had to create additional turn-over capital in the economy.

We must mention that the entire mechanism of social self-government extends to the producer and to the working man all the possibilities to control, and to influence effectively, various matters in economic policy, such as personal consumption, budgetary expenditures and accumulations. It is the producer's duty to do this whenever problems of economic development are discussed, whenever the development of his commune, district or enterprise is considered, i.e. whenever problems affecting his own consumption and living standards are involved.

In such social and political relations, there are all the possibilities to settle, not only in theory, but in practice, too, the contradictions between the community as a whole and its individual parts—the Republics, districts and municipalities—without creating any upheavals or political complications. This is for two fundamental reasons: first, because the free operation of the market laws reveals more clearly the existing contradictions which can thus be hardly overlooked, and, secondly, because the working man, as the basic production force and the fundamental pillar of social and political life, tackles all such problems, no matter in what field and at what level of social self-government he encounters them and because he seeks solutions which improve his living standards at once and which create conditions for its constant raising in the future. It was only when the working man became the manager of economic affairs that the last vestiges of state capitalism began to be uprooted and the most important social and economic matter, his place and role in distributing the national income and in determining the use of accumulations, solved.

POLICY FOR SUGAR

THE sugar industry in Independent India made history last year by exporting a substantial quantity. This achievement has two-fold importance. In a phase of acute shortage of foreign exchange, it proves the possibility of devising positive means to mitigate the scarcity. What is, however, of much greater significance, it demonstrates a powerful element of dynamism in the industry.

This performance makes it expedient to change the conventional view in regard to the outlook for the industry in the near future. The conventional view assumes that the sugar industry will have achieved good results if this country attains self-sufficiency in output. A passive attitude of this kind appears to have been generated by the course of domestic production and total supplies over the period of the first Five-Year Plan. The overall position is tabulated below:

	SUGAR SUPPLY	(In lakh tons)
Year	Total Production	Net Imports
1951-52	15.84	Nil
1952-53	14.07	0.60
1953-54	10.40	6.93
1954-55	17.40	5.03
1955-56	19.60	Nil
1960-61	22.50	Nil

Total production includes cane factory production, sugar refined from gur and output of Khandsari. The only year during the first Plan period in which the industry received a great setback was 1953-54 when domestic output touched the low figure of 10.40 lakh tons. Output in 1954-55 jumped to 17.40 lakh tons, exceeding the original target fixed for the first Plan. Nevertheless, it is noteworthy that this impressive improvement had little impact on imports which were only 90,000 tons below the peak volume procured in 1953-54. Per capita consumption in 1951-52 stood at 7.18 lbs., which, although it was exceeded in some years during the war and post-war period, reveals considerable improvement over the pre-war state of consumption. At the present time it is estimated to have risen above 10 lbs., while the target prescribed at the end of the second Plan is 10.92 lbs.

Steady improvement in consumption is not only desirable but inevitable in the wake of an increase in per capita income. It implies the necessity of a fresh angle from which to approach planning for the development of the sugar industry. Rising consumption will make it imperative to ensure a corresponding rise in supplies. This, however, is not a straight function of planning for progressive output from year to year. Fluctuations in production cannot be eliminated in an industry which remains susceptible to the vagaries of nature. A period of depressed cane crop will compel resort to imports. This dismal contingency has created a narrow view that achievement of self-sufficiency over a period represents an optimistic approach. Here precisely lies a great error. Despite the experience of the first Plan period, it should be obvious that years of excess supply of sugar must be taken into account. To take them into account leads to the logical necessity of being armed with a policy for export. In fact a bold and realistic plan for the development of the sugar industry should aim at a programme of export.

Last year's experience is important for this reason. It redounds to the credit of the Indian Sugar Mills' Association that it not only undertook to organize the task of exporting sugar but carried it out on a no-profit basis. Four-fifths of the quota of one lakh tons earmarked for export has been disposed of already. Abnormal world prices have resulted in a profit of Rs. 20 lakhs which have been carried to a special pool to provide cover against possible losses in future. But it needs to be underlined that the Association had expressed its readiness to bear the burden of loss at a rate of Re. 0.25 per maund on its total production, if occasion arose. As a base for a long-term policy for export, for which a market can be developed in the neighbouring countries of South-East Asia, West Asia and East as well as West Africa, a positive set of principles ought to be evolved. Some of the proposals advocated at last week's annual session of the Association by its outgoing President, Mr. S. S. Kanoria, deserve careful attention.

Refund of cess on cane used in quantities of sugar actually exported can certainly improve the competitive strength of Indian sugar in the international market. The Centre will have to exert its good offices to persuade the State Governments to agree to this concession, if the U.P. Government's initial consent to it last year and its subsequent withdrawal on the plea that exports promised to earn a profit is a correct index of their attitude. This issue cannot be considered on an ad hoc basis, but it must take full account of profits and losses which are bound to recur. Sugar exporting countries usually levy a higher price at home or offer subsidies and aids in diverse ways to boost their shipments. An increase of 1 Naya Paisa per seer in the internal price of sugar will make a negligible addition to the retail price ruling above 80 Naye Paise. Mr. A. P. Jain, Minister for Food and Agriculture, seems inclined to consider this proposal in earnest. Other aids to exports are indicated in the direction of ironing out the anomalies of sales tax, simplification of the Central excise procedure and concessional freight rates as also relaxation of route restrictions by the railways for sugar in transit for export.

A dynamic policy for sugar requires clear and early decisions on these and other proposals. It would appear that the planned addition to installed capacity is not fully correlated to the projected expansion of cane output especially in Bombay and Andhra Pradesh. But the grievance voiced on behalf of the Association in respect of lack of balance in allocation of capacity as between expanding existing factories and new factories, or between Northern and Southern regions, is hardly borne out by facts and basic needs of the industry. Individual instances apart, it was a correct principle to adopt, in allocating additional capacity, to apply the test of national interest. The target of production prescribed for 1960-61 is 22.5 lakh tons which leaves an excess of about 4 lakh tons above the output in 1955-56. But installed capacity fixed at 25 lakh tons raises the margin of addition to 6.4 lakh tons. The major problem would be to achieve higher targets of physical output.

As many as 65 out of 143 factories worked for a shorter period than the normal duration of 140 days in the 1955-56 season. Stability in cane prices is highly desirable, but a switch-over to cane prices on the basis of recoverable content has proved a stubborn question. Shifting of uneconomic units from East U.P. and Bihar is partly a financial and partly a political problem. Mr. Jain's emphasis on repercussions of shifting on cane growers explains the Government's embarrassment. But these are difficulties which will have to be faced squarely. To the extent their solution is put off, expansion of output at full speed will also be delayed. The real flaw in the development policy for the second Plan is earmarking of a large share of 15.5 per cent capacity to co-operative sugar factories which have been leaning too heavily on continuous Government assistance from the start. Confidence is unlikely to be created that they can deliver the goods.

Economic Report from the U. S.

THE DEVELOPMENT FUND

(BY GUY SIMS FITCH)

WASHINGTON, April 9.—A new approach to the US Mutual Security Programme has begun to take shape. Testifying this week before the US Senate's special committee on foreign aid, Secretary of State Dulles proposed a special loan fund to finance economic development projects in other lands. This fund, in the Secretary's view, could over the years dispense up to $750 million annually. This will be in addition to limited grants in aid where loans cannot effectively be utilized.

Essentially, loans from the fund would assist specific programmes or projects for which borrowers are unable to obtain financing elsewhere. Thus, the fund would supplement the activities of such other lending institutions as the US Export-Import Bank and the United Nations International Bank for Reconstruction and Development. The loans also would meet certain other criteria: The projects to be financed would have to technically feasible and would have to give reasonable promise of contributing, directly or indirectly, to recipients' increased productivity. Beyond these points, few details on the operation of the proposed fund are now available. It is obvious, however, that the fund would tend to place economic aid on a long-term rather than the current year-by-year basis.

In the end, it might obviate the need for annual Congressional appropriations for this kind of assistance. Some observers believe that the fund, to be workable, would have to be set up for a minimum of three years. No precise estimate has been given as yet of how much money will be sought for the fund for the 1958 fiscal year starting July 1. Mr. Dulles told the Senators, however, that to be effective such a fund would have to start off with enough capital authorized for several years, to be renewed when needed. In a sense, the new US plan would place greater responsibility on borrowing nations by requiring them to work out economic development projects before applying to the fund for loans. But it is expected that US experts, perhaps from the International Co-operation Administration, would be on hand to help them draw up their development programmes if need be.

According to one official here, the proposed fund, by helping to promote viable economies, would enhance the security of all free nations, including the United States. At the same time, he observed, it should demonstrate beyond any question that mutual assistance remains a "reasonably permanent part of US foreign policy." To newly developing nations, and others which have yet to gain their independence, he noted, this holds out the assurance that they do not need to despair. The United States not only is interested in their economic well-being but will continue to do something about it. US economic assistance, he emphasized, would be carried out regardless of any military considerations.

A more detailed plan for the proposed development fund may be incorporated in a special mutual security message which President Eisenhower is expected to send to Congress in another month or so. Congress, if it accepts the new plan, could vote initial capital for the fund through direct appropriation, or it could authorise the fund to draw on the national treasury for a specified period of time. In any case, the consensus here is that the new plan would require a redrafting of existing mutual security legislation. Despite current Congressional efforts to prune the huge US Budget proposed for the 1958 fiscal year, officials are hopeful that the development fund proposal will meet with the approval of most legislators. This new approach to foreign economic aid, they recall, is based on extensive studies by both the executive and legislative branches of the US Government.

STRAINS IN THE TEXTILE INDUSTRY

By

CROESUS

TWO notable events in Bombay's textile industry which took place recently pose issues of deep significance to its future. There is one aspect that stands out as the most outstanding feature of the Phoenix Mills which celebrated its golden jubilee just recently. It is the extent of capital formation that has been achieved within just one industrial unit in the Private Sector, as reflected in the rise in its block account from Rs. 16.69 lakhs in 1905 to Rs. 72.45 lakhs in 1947 and to the more spectacular total of Rs. 155.86 lakhs today. It is noteworthy that, between 1905 and 1947, this increase in block took place without any increase in the capital of the Company; and even when the capital was increased, first in 1947 and then, again, in 1948, it was done not by calling upon the shareholders to bring in fresh money but just by capitalising the sedulously accumulated reserves and issuing bonus shares. If all this could be done without depriving the shareholders of their dividends, except only on two occasions in over two generations, and the workers of their just wages all these years and also after paying taxes to the Government of over Rs. 2 crores during this period, it is not a mean achievement by any means. I wonder whether, in the circumstances prevailing today, even this stalwart company will be able to repeat the performance. It is obvious that it is not so much the unwillingness of the private sector to help the country in capital formation that is responsible for the poor record in this behalf in the corporate sector last year, to which the Union Finance Minister has referred in the White Paper on the Budget 1957-58, as the unhelpful policies of the Government itself.

But to turn now to the next great occasion of interest to the textile industry of Bombay, namely, the annual general meeting of the Millowners' Association. I regard this as a great occasion, especially this year, not from the point of view of the proceedings, which always evoke country-wide interest by reason of this Association being the premier body of millowners in the country representing over 60 per cent. of the cotton mill equipment in the country, but because it marks the retirement of the Association's Secretary Mr. N. S. V. Aiyer after an association extending over 35 years and the appointment of a stipendiary Deputy Chairman, Mr. D. S. Bakhle, I.C.S. (Retd.). Incidentally, the latter office is a recent innovation, which has apparently come to stay, thanks to the increasing interference of the State even in the day-to-day affairs of industry. This development is significant, if only as an indication of the growingly complex nature of the work that industrial and commercial bodies are called upon to shoulder these days.

The two speeches made on the occasion of the annual general meeting of the B.M.A. those of Sir John Burns, the retiring Chairman, and of Mr Ramnath A. Podar, the incoming Chairman, were both thought-provoking, touching, as they did, on a number of problems pertaining to the mill industry—and this number seems to grow with each year. But the two problems which seemed to be uppermost in their minds, for understandable reasons, were finance (dealt with by Sir John and labour dealt with by Mr Podar).

It is not only the Government that is confronted with a financial problem but every unit of the private sector, more so the cotton mill industry. To quote Sir John, "the life blood of development in industry, be it in the public or private sector, is finance." Again, as he declared, "the opportunity of finding finance is going to be strictly limited by virtue of the fact that Government has already absorbed all, or almost all, that is likely to be available." This result is inevitable with parallel ownership of industry under a mixed economy, even in normal times, but, under a socialist structure of society with a planned economy, as we have in India today, it is certain and comes about quite early too. It is just as well, therefore, that the retiring chief of the B.M.A. referred to the remark in the Union Finance Minister's budget speech about "the inadequacy of corporate savings for financing the programme in the private sector" and expatiated on what has brought about this.

Sir John was not very happy either with the Government's proposals for purchase of machinery abroad being allowed only on extended credit. "Long-term credits", he said, "must make a considerable addition to the ultimate cost and ipso facto add, in due course, to the exchange problem." It is estimated that a seven-year credit may increase the cost by as much as 45 per cent. According to him, this is a very difficult exchange problem which everybody appreciates and which Government should tackle properly. For this purpose, the retiring B.M.A. Chairman suggested that the various commercial and industrial interests, bankers, finance corporations and any other interests likely to be helpful might be consulted to see if there are no other approaches to the problem, and possibly also to consider priorities.

How heavy the incidence of the excise duty has been was vividly brought out by the same B.M.A spokesman, according to whom "today excise calculated on the mill price of the variety of representative qualities of cloth varies (according to classification) from 11.5 per cent to 31.9 per cent and averages 24.8 per cent, an average increase of 11.2 per cent over August, 1956." In certain categories of superfine cloth, according to the same source, the incidence is as high as 38 to 39 per cent. But, perhaps the most convincing evidence of the heavy incidence of excise duty on cloth is that the total expected collection of excise on cloth in a year is as much as Rs. 75 crores. This apart, as Sir John pertinently observed, if the index of cotton manufactures in 1956 has increased by only 4.3 per cent, there is hardly any justification for an increase in excise by an average of 11.2 per cent over August 1956 and 14.9 per cent over December, 1955.

The imperative need to ensure industrial peace and higher productivity if the targets under the Second Five-Year Plan have to be reached was underlined by the new B.M.A. Chairman, Mr Ramnath A. Podar. In this context, he prefaced his remarks by saying that one of the many reasons for the produuction target assigned to the cotton mill industry being exceeded under the first Five-Year Plan was the prevalence of industrial peace during that Plan period. But, during the very first year of the second Plan, he pointed out, Bombay had lost a day's production in disputes concerning industrial matters; out of 49 strikes, he added, as many as 30 related to the question of bonus! But one hopes with Mr Podar that there will be no occasion for such stoppages of work in the coming years, in view of the Five-Year Bonus Agreement of March last.

But it is not merely industrial peace that is necessary; as Mr. Podar rightly pointed out, higher productivity also is essential. In fact, the second Plan says so explicitly: "improvement in wages can result mainly from increased productivity". No fairminded person can possibly countenance an outright increase in wages without a corresponding improvement in the effort of labour to give higher production.

It is not sufficiently realised that, even as it is, the gains made by labour far surpass those made by any other sector of the country's population. It is more to bring home this point than to parade the good work done to labour by the millowners of Bombay, I daresay, that Mr Podar referred to the important steps taken in 1956 to promote the social and economic welfare of the working class. No one grudges labour progressive benefits, so long as these are within the capacity of the industry to bear, but, when this is not so, to impose fresh burdens even without consulting the interests that would be effected thereby is, to say the least, unfair in the extreme.

TRADE MISSION FROM DOWN UNDER

By
CROESUS

WHETHER it is due to the successful implementation of the first Five-Year Plan, or the scope for increased imports of heavy machinery provided for in the second Plan, or the triumph of the ruling party in the recent General Elections thereby underlining the stability of the Government and the smooth and unhampered continuance of the overall economic and political policies, some of the advanced countries of the West have begun to evince a somewhat keener interest than hitherto in cementing and furthering the trade and commercial links with this country. This is clearly reflected by the fact, that in the wake of the American Trade Mission, which visited this country early this month, followed close on its heels by the Egyptian Trade Mission, a third Trade Delegation, this time from Australia, has arrived since.

The campaign to explore the possibilities of selling to India, among other things, machinery of a high technical order, which is in great demand in this country at the present time, inasmuch as it is engaged on the implementation of the second Five-Year Plan with a pronounced bias towards heavy industries, is quite understandable. While it cannot be denied that most of the advanced countries have been generally disposed readily to extend a helping hand to this country in its brave efforts to go ahead, as scheduled, with its ambitious Plan, it is becoming increasingly clear to a discerning observer that some at least of these countries are motivated by a more or less common desire to find a new berth in Asia, perhaps as a counter-move to the decision by some of the European countries to set up a European Common Market. An announcement from Rome on March 25, it may be recalled, stated that six West European nations had signed draft treaties establishing a common market. Thanks to these treaties, the six nations—France, West Germany, Italy, Belgium, the Netherlands and Luxembourg—have come under the protective shelter of a common market umbrella. As everyone knows, progressive reduction of the existing tariff and quota barriers is among the main advantages that member-countries of the Common Market hope to derive from this new move.

It is not unnatural for countries outside the orbit of the European Common Market, especially advanced countries like the USA, Japan, and Australia which are in a position to meet the requirements of India's developing economy, to seek for fresh outlets for their exportable goods by adequate preparations in order to be able to meet, on equal terms, a competitive onslaught from economically resuscitated Britain, Germany or France. But what is noteworthy is that the visit to our country of trade missions and delegations from these countries is only one of several indications that give one an idea of the way in which the minds of the more advanced non-E.C.M. countries are working about the probable future trend of world trade generally. True, many of the visits of these trade missions to this country, at any rate in the initial stages, are only of an exploratory character which explains why not much actual business has yet been possible or reported. But, then, a lot of spadework must needs be put in before the conclusion of actual trade agreements between India and the countries in question.

Presently, it has been the turn of Australia to sponsor a trade mission under Government auspices. That there is scope for a much larger volume of business than exists now between the two countries, especially in favour of India, is evidenced by the fact that India has been having a favourable balance of trade with Australia over the past five years, save for the year 1952-53. During the year ended March 31, 1956, for instance, Australia was India's fourth best customer, while, for approximately the same period, India ranked tenth among Australia's overseas markets. The trade balance in favour of India improved from a mere £A0.9 million in 1938-39 to £A11.3 million in 1955-56, while the peak level of trade balance in favour of India was even as high as £A30.9 million, recorded in 1951-52.

For the present, trade with Australia may appear limited in scope in view of the import restrictions currently prevailing, but, as a first step towards promotion of expanded trade between the two countries, when the need for such restrictions disappears, it is necessary to know more about all the goods that Australia could supply to India. Transport and communications, which account for nearly 30 per cent of the total outlay in our second Plan, seem to offer a very important field where there is need, as well as possibility, to import heavy machinery. As it is, Australia has been quite helpful to our country in this behalf, inasmuch as last year it undertook work on an order for 2,000 wagons for the Indian Railways. Australia is in a position, we are told, to make rolling stock of many designs for other industries besides Railways, such as mining, sugar, and timber industries. It would seem that several Australian firms engaged in this line have already marketed their products in India, Ceylon and adjoining countries. These products include, among others, road rollers, pneumatic tyred tractors, bulldozers and road graders.

Although Australia, till only the other day, was considered to be just a supplier of primary products, she has since developed her economy to such an extent that her secondary industry production now represents as much as 70 per cent of Australia's total output of goods. In view of this, it is only reasonable to share the hope which the leader of the Australian Trade Delegation expressed a few days ago, namely, that much value would be gained by an exchange of ideas and an appreciation of India's requirements under the second Plan. Our progress in the field of transportation, increased agricultural production, land utilisation, steel production, and heavy equipment manufacture has been rapid. The progress has been due to the development, through experience and patient endeavour, of special machines and techniques, which, we feel, may be of particular value in meeting India's current needs".

BUSINESS NOTES

ENGINEERING INDUSTRY: HARD TIME AHEAD

A GREAT strain is already being put, and a much severer strain is going to be put, on the capacity of the engineering industry. This is for two reasons. Delivery periods quoted by foreign suppliers are very long—12 to 18 months for fabricated steel and 18 to 24 months for motors and transformers. Drastic restrictions have been imposed on imports. But it is heartening to find that the industry in the private sector is determined to rise to the occasion. At last Friday's annual meeting of the Indian Engineering Association, the Chairman, Mr. K. J. Cleetus, gave unequivocal assurance of maximum effort. It is, however, urgent that Government should take action in certain directions to enable it to bear its onerous burden. Supply of steel has become very uncertain and hurried arrangements made by the Government for imports pose fresh problems. Continental steel, and particularly Russian steel, has created difficulties about specifications, weights, and so forth. Uncertainty has also bred speculation. The Chairman strongly pleads for a longer import policy of at least one year's duration.

The question of technical manpower has taken a grave turn. Scramble for personnel and the morbid practice of "pinching" and "pirating" of staff still goes on. The Chairman urges a balanced and comprehensive plan for technical education and issues a firm warning against the temptation to resort to short-cuts in disregard of quality and adequacy of instruction. The capacity of the private sector of the industry to offer co-operation in the matter of factory apprenticeship and shop training is being strained; but it is prepared to do its utmost to share future burden. The Chairman's attitude to the formula of one price for steel throughout the country on the railhead basis is healthy. He appreciates that it is intended for dispersal of industry and greater equilibrium in regional development. He feels confident, however, that the heavy and technically complex sections will continue to be localised at port towns. But he exhorts his compeers to shift subsidiary units in the interior towns to avoid possible duplication and ruinous competition in the future.

Mr. Cleetus' estimate of the effect of the awards of the Colliery Disputes Tribunal and the Appellate Tribunal on the element of transport cost for coal-consuming industries is based on miscalculation. His estimate is that the coal bill of the railways will rise steeply by Rs. 54 crores as a consequence of the wage increases granted in the two awards. On this assumption he draws the exaggerated conclusion that "when freights and fares are increased, there will be a general and universal rise in costs and prices all round". The Lower Tribunal's award has necessitated an increase of Rs. 3 per ton in the statutory price of coal and the increase due to the Appellate Tribunal's award is placed at Rs. 1-2 per ton. The two together will raise the cost of the 12 million tons of coal consumed by the railways by Rs. 4.95 crores. This is exclusive of the ad hoc increase of As. 6 per ton which will be necessary for two years to cover the cost of retrospective effect to be given to the Appellate award and may be placed a little below half a crore of rupees. This increase will be passed on to the railway users and is to be related to their total bill on account of passenger fares and freight rates at current levels expected to amount to Rs. 340 crores in 1957-58. This discrepancy apart, the Government need to heed the Chairman's warning that the price line must be held firmly to curb inflation.

INDO-US PARTNERSHIP IN PROGRESS

IT HAS been heartening to know from the officially sponsored US Trade Mission to India that not only would American capital be interested in almost all fields of industrial investment in this country, but also that "a very substantial amount might be invested." The investment would mostly be in the private sector, though American business interests would not be averse to joint participation even in the public sector, wherever possible. The leader of the mission, Mr. Forbes, who is also a senior officer in the US Department of Commerce, has further expressed the hope that the volume of Indo-American trade would be considerably increased in the coming years. Such pronouncements are particularly welcome at a time when this country is finding it increasingly difficult to see the second Plan implemented in its entirety and in time. As has been already stressed in these columns, the necessity for India to look more and more to the US for imports of capital equipment is increasing as a result of certain forces at work, not the least of which is the widening gap of balance of payments deficits with the OEEC countries which are our main suppliers of capital goods. Perhaps more important is the relatively lower capacity of the present suppliers to export goods to India under the deferred payments scheme which, under the existing conditions, seems to be inevitable.

The deferred payments scheme, however, has been explained by Indian authorities to be not so severe as was initially understood. The seven-year credit would apply only to such projects as are not expected to yield returns or earn foreign exchange in three or four years —such as power plant and similar other equipment. Where the potential of a project is to earn and save exchange, payments could be made earlier, though the first payments would be low. In the matter of trade, the setting up of the proposed independent organisation for pre-shipment inspection of Indian exports to America like mica, manganese ore and handicrafts, should go a long way in promoting such dollar-earning exports. Also, a wholesale sales organisation in the USA would eliminate delays between the placing of orders and their execution which is so essential for larger and smooth turnovers. It is to be hoped that early action will be taken to put in practice the decisions taken during the mission's tour. It seems that the time has arrived for putting an end to the suspense over a regular treaty for further accelerating the trade between the two countries.

WHY THIS DISCRIMINATION?

IF WHAT is sauce for the goose is also sauce for the gander, the Chairman of the Silk and Art Silk Mills' Association, Ltd., Bombay, Mr. D. N. Shroff, was fully justified in insisting on the rayon weaving industry being placed on an equal footing with the cotton textile industry. Apparently this does not seem to be so. The grievance of the industry would appear to be that, whereas it is placed on an equal footing with the cotton textile industry in the matter of taxation, excise imposts, industrial and development regulations, and social and labour legislations, it is not accorded a like treatment when it is a question of any benefit to the cotton textile industry or when some special provisions are made in respect of cotton yarn and fabrics.

The immediate provocation for Mr. Shroff's reference to this grievance was provided by the statements of Mr. M. C. Shah himself at Ahmedabad. A few days ago, it may be noted, Mr. Shah stated in Ahmedabad that a Bill was likely to be introduced in Parliament seeking to remove sales taxes levied in

States on cotton and jute, mill-made textiles, etc. and replacing them by a surcharge on the Central excise duties on these articles. One can appreciate the anxiety of the interests concerned at the omission of the rayon weaving industry in the list of industries the articles of which were specified as falling within the scope of the Bill in question, because such an omission would not entitle it to a much needed procedural relief, a relief which has been examined and found to be necessary (in the case of mill-made textiles) both by a Select Committee of Parliament and the Taxation Enquiry Commission, quite a while ago. The exclusion of rayon textiles from the proposed relief, as was pointed out by Mr. Shroff, would affect the industry adversely. He indicated how this could happen by referring to the common practice of dealers in textiles. His version was that as most traders deal in 90 per cent of cotton fabrics and only 10 per cent of rayon fabrics, if both the fabrics are not placed on the same footing, the dealers may not care to continue to trade in rayon fabrics undergoing all the hardships involved, and that in return for the poor returns available to them!

Mr Shah remarked that the State Governments could redress any grievances of the business community in respect of this tax. It is noteworthy that he also told them that he felt that the industry had got a good case and that, according to him, at any rate, their demand was just. He further assured that, if the State Governments referred this matter to the Centre and expressed their willingness to include rayon fabrics also along with cotton textiles for the purpose of the proposed procedural relief, the Government of India would have no objection to, or difficulty in, including this commodity also. In short, he seemed to suggest that the industry had first to convince the State Governments of the justness of its demand before expecting the Centre to do anything.

PROBLEMS OF JUTE TRADE

THE TWELVE months of 1956 have been rather disappointing for the jute industry. The main contributory factors to the disappointments of the year have been the lack of solid response from the overseas markets and the abnormal influence exercised on the price structure by the unusually firm jute market witnessed during the year. It was remarked by Mr. N. K. Jalan, Chairman of the Calcutta Jute Fabrics Shippers' Association, at the recent 58th annual general meeting of the Association that the most telling factor in an assessment of the trade during the year was the marked decline in shipments of heavy goods to Australia. For political and other reasons, the Far Eastern market, which once was so important to India now virtually lost. One keen disappointment which was felt was the paucity of eventual offtake by Russia, when it was almost certain that substantial orders would be forthcoming from that quarter. Indeed, it was largely on the understanding that a sizeable business was to be done with Russia, that the industry had agreed at the instance of the Government of India to increase its output in the early part of 1956. Eventually the total business put through amounted to only about 10,000 tons, and with no compensatory revival of demand from other sources, the mills were finally compelled to curtail their production once again, while shippers were left with a feeling of frustration. This need not be considered an entirely depressing picture because, as Mr. Jalan put it, "by sustained negotiation on the part of our Government, a rewarding business connection can still be established on behalf of the Indian jute industry."

Mr. Jalan is right when he says that the real answer to the industry's various problems seems to lie in lower prices for raw jute with finished goods prices stabilised at their present low levels. This seems to be the only way by which the competitive strength of the industry could be preserved. Lower prices for raw jute are essential to maintain the competitive strength, as now the infant jute industry in Pakistan has grown to a very respectable size.

So far as the futures market is concerned, it was pointed out by Mr. Jalan that a misapplication of the rules governing futures trading could well throw out of employment all those gunny dealers and workers, who at present constitute what is known as the "bazar." From that viewpoint, it is thought that the Indian Jute Mills' Association's standard gunny contract form should be excluded from the application of the Forward Contracts (Regulation) Act.

THE COTTON TEXTILES FUND: PROGRESS REVIEW

INDIA'S COTTON textile industry has not only the responsibility of meeting the clothing requirements of nearly 400 crores of people but is also expected to provide 1,000 million yds. for export purposes. The past hundred years' story of the development of this industry reveals that it has made steady progress since its inception and, what is more, that it is capable of much more. The development of the industry was particularly spectacular in the post-war years, when, apart from meeting the country's large textile requirements, both civilian and military, it earned valuable foreign exchange for the country's exchequer. Even now, in the context of our economic development plans, the progress of the textile industry is very vital not just to clothe the teeming millions and thereby help them raise their living standards, but also to earn foreign exchange for financing the Plan. To achieve this, however, requires a progressive outlook, technological improvement and reduction of cost, facilities of research in techniques of production, distribution, marketing, etc. abreast of times.

Among the various problems of the industry, the question of promoting exports is undoubtedly of the utmost importance. The authorities have to be complimented on the various measures that are being adopted by them to stimulate exports. Of these, the creation of the Cotton Textiles Fund Committee, which was established in 1944 by an ordinance, and which has been aiding export promotion, is perhaps the most notable. The ordinance (which was promulgated on July 8, 1944), it may be remembered, provided for the establishment of the Cotton Textiles Fund from the levy of a cess of 3 per cent on the ex-mill prices of all cloth and yarn exported. The activities of the Committee have been recorded in a brochure entitled "the Cotton Textile Fund Committee—its Growth and Development", just brought out by the Fund Committee. According to the brochure, "much work has been done towards achieving the twin objectives of export promotion and textile research". Among the important steps taken by the Committee in the direction of export promotion and textile research, particular mention may be made of the setting up of the Export Promotion Council and the introduction of a scheme of inspection "investing the use of ITEX Mark indicating the hallmark of quality". The quantity inspected in accordance with this scheme till the end of October, 1956 amounted to 11,45,837 yds. Apart from this ITEX scheme of inspection, which is voluntary in character and which is done at the instance of the foreign buyer and the exporter, a scheme of "factual inspection" has also been evolved, which, again, is vountary, and which is conducted at the instance of the exporter or the producer. The total quantity examined under this scheme amounted to 5,61,984 yds. at the end of October, 1956. The publication of the TEXPROCIL, to provide information to the exporters, and the establishment of four research institutes also deserve mention.

COMPANY AFFAIRS

INDIAN ALUMINIUM CO., LTD.

The year 1956 has turned out to be the most successful of all of the Company's working years with sales having gone up by 16 per cent from Rs. 366 lakhs in 1955 to Rs. 425 lakhs in the year under report. In the Company's own products, the percentage increase was still higher at 20 per cent, amounting to Rs. 345 lakhs as against Rs. 239 lakhs in the preceding year. Profits, after making provision for depreciation and taxes, have gone up to Rs. 35,79,225, a rise of close on Rs. 9 lakhs over the previous year's figure. Along with the sales and profits figures, payments to employees have climbed from Rs. 63 lakhs to Rs. 75 lakhs. In the case of taxes and other payments to Government, the amount of Rs. 26 lakhs for the year under review is about double that of 1955.

An interim dividend of 5 per cent on the ordinary share capital was declared during the year, payable in December 1956. With the final dividend of another 5 per cent, as recommended by the Directors, the total dividend amounts to 10 per cent on ordinary shares. On the preference share capital, the Directors have recommended a 5 per cent dividend for 1956, less income-tax.

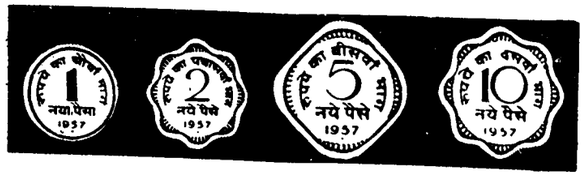
Failure of power supply for a month and a strike lasting nearly two months—caused over a bonus demand—resulted in some loss in production at the Alupuram smelter which was offset by increased imports of aluminium ingots. However, the landed cost, without duty, was greater than the Tariff Commission's estimated price for the Company's ingot production which indicates that its competitive position in the world aluminium industry has improved. The Company has been trying and has achieved some success in promoting a trend towards a more diversified quality market for aluminium.

The first stage of the Company's current expansion programme, comprising the establishment of a new aluminium reduction plant of 10,000 tons annual capacity at Hirakud, and the expansion to 18,000 tons of the existing plant at Muri are expected to be completed by the end of 1958. Thereafter further expansion is scheduled to proceed, raising the Muri capacity to 30,000 tons. The Hirakud plant is also being designed in such a fashion as to permit easy future expansion to 20,000 tons or more. Work is going on to schedule with the co-operation of the authorities. Including additional working capital, the amount required for the current expansion programme is estimated at Rs. 8.63 crores. Of this, Rs. 3.2 crores has been raised by new shares and convertible loan stock issues, and the Company has plans to finance the balance by bank loans, undistributed earnings and depreciation reserves.

THE BUCKINGHAM & CARNATIC CO., LTD.

The accounts and the Directors' report of the Company for the year ended December, 1956, shows that the production of the mills has improved further. But the benefit thus derived has been more than offset by increased costs and reduction in selling prices. The increase in costs was mainly the result of higher dearness allowance to workers, of the order of Rs. 12 lakhs, and increased expenditure on fuel oil, by some Rs. 3.20 lakhs, due to additional excise duty introduced in February, 1956. Excise duty was again responsible for reductions in selling prices in order to offset the increase and maintain sales in overseas markets in which a substantial proportion of the Company's production is generally absorbed.

The financial result of the working has been a profit of Rs. 48,48,883 (some Rs. 7.50 lakhs more than the preceding year) after allowing Rs. 40,96,713 for depreciation, Rs. 21,33,081 for bonus to employees, Rs. 15 lakhs for taxation and Rs. 1,31,666 for contribution to officers' superannuation fund. To the profit has to be added a total of Rs. 9,23,882 from different accounts, making a total of Rs. 57,72,765. From this, payments have been made in regard to dividend on 7½ per cent cumulative preference shares for the year, absorbing Rs. 1,59,765, and interim dividend of Rs. 4 per share on the Ordinary Shares for the half-year ended June, free of income-tax, absorbing Rs. 7,13,912. The balance has been proposed by the Directors to be dealt with as follows: Provision for workpeoples' gratuity Rs. 20 lakhs; debenture redemption fund Rs. 5 lakhs; General reserve Rs. 11 lakhs; final dividend of Rs. 6 per share on the Ordinary Shares, tax-free Rs. 10,70,868. The balance of Rs. 2,28,220 is to be carried forward.



The amount set aside for depreciation has had to be increased in order to cover the charge on capital expenditure on buildings and machinery, and the amount represents the approximate income-tax claim for normal and shift allowances only. The relief from taxation on profits estimated to amount to Rs. 35.50 lakhs has been obtained through the operation of the allowances for development rebate, initial and extra normal depreciation for 1954 and 1955. An amount equivalent to the relief has been directly transferred from taxation reserve to the provision for increased replacement costs of buildings and machinery.

THE BANGALORE WOOLLEN, COTTON & SILK MILLS CO., LTD.

The Company's working for 1956 has been satisfactory inasmuch as both production and sales have registered increases as compared to 1955. Demand for Woollen and Cotswol fabrics of the Company has improved which has enabled it to make greater use of its installed capacity in these sections. Thus, after several years of losses, the woollen section has made some contribution to the Company's profits. In the cotton section, profit margins were slightly lower than in the previous year, which has been attributed to price reductions to offset the increases in excise duty.

The net result has been a profit of Rs. 27,63,582 (a little over Rs. 3 lakhs more than in 1955), after providing Rs. 17,59,884 for depreciation, Rs. 11.48 lakhs for bonus to employees, Rs. 29.75 lakhs for taxation and Rs. 75,000 for contribution to officers' retiring fund. Together with a total of Rs. 5,70,365 being the amount brought forward and provision made previously but no longer required, the profit amounts to Rs 33,33,947. From this, the Directors have made the following payments: Dividend on 6 per cent cumulative preference shares for the year, tax-free Rs. 36,000; interim dividend on Ordinary Shares of Rs. 10 per share, also free of income-tax Rs. 4.05 lakhs. The Directors have recommended the disposal of the balance as follows: General reserve Rs. 11 lakhs; additional provision for depreciation based on replacement costs Rs. 4 lakhs; Workpeoples' housing fund Rs. 3 lakhs; final dividend on the Ordinary Shares of Rs. 20 per share, free of tax Rs. 8.10 lakhs and carry forward Rs. 2,82,947.

The Company has made further progress with the programme for replacement of old machinery and plans are under consideration for the installation of new plant to improve efficiency and production. Finances will be required for this purpose and the Directors have borne this in mind while making proposals for appropriations.

NEW COINS
From 1st APRIL '57

Exact value in existing coins

10 Naye Paise—(1/10th of a rupee)—1 anna 7.2 pies
5 Naye Paise—(1/20th of a rupee)—9.6 pies
2 Naye Paise—(1/50th of a rupee)—3.84 pies
1 Naya Paisa—(1/100th of a rupee)—1.92 pies

The old coins, namely, 1 pice or 1/4 anna, 2 pice or 1/2 anna, 1 anna, 2 annas, 4 annas, and 8 annas, will be in circulation side by side with the new coins shown above. Four anna coins and eight anna coins are exactly equivalent to 25 Naye Paise and 50 Naye Paise respectively and may be used as such for all purposes. Both the old coins and the new coins will be legal tender in payment or on account.

CONVERSION FACILITIES

CONVERSION FACILITIES WILL BE PROVIDED AT THE RESERVE BANK OFFICES, BRANCHES OF THE STATE BANK OF INDIA, OTHER AGENCY BANKS AND TREASURIES AND SUB-TREASURIES.

NEW COINS WILL BE GIVEN ONLY IN EXCHANGE FOR EXISTING COINS OF A TOTAL VALUE OF 4 ANNAS, AND MULTIPLES THEREOF e.g. 4 ANNAS, 8 ANNAS, 12 ANNAS, ONE RUPEE ETC.

CONVERSION TABLE

The conversion table gives the exchange value in Naye Paise (rounded off in the manner prescribed in section 14 (2) of the Indian Coinage Act 1906 as recently amended) for amount tendered in annas/pies coins. The exact Naya Paisa equivalent of the total amount to be converted is rounded off by ignoring fractions of ½ Naya Paisa and below, and treating more than ½ Naya Paisa as 1 Naya Paisa.

EQUIVALENTS IN NAYE PAISE FOR VALUE TENDERED IN ANNAS/PIES IN ANY SINGLE PAYMENT.

4 Annas		25	8 Annas		50	12 Annas		75	16 Annas		100

Rounding off as has been done in the conversion table is necessary only at the end of a transaction when any amount due in annas and pies is to be converted into Naye Paise.

You can make payment either in new coins or in old coins or by a combination of both according to the coins available with you.

The conversion table is, therefore, to be used only at the end of a transaction when payment has to be made or change has to be given as illustrated in the examples below.

EXAMPLES : (Where the amount due is expressed in annas/pies).

For 12 articles, costing 1¼ annas each, the total amount due is 1 Rupee and 2 annas, the purchaser may give the entire amount in old coins,

or

pay 1 Rupee and 12 Nave Paise (the equivalent of 2 annas according to the table is 12 Naye Paise).

In the above example, the purchaser may tender 2 Rupees, all in old coins, and ask for the balance The amount to be given as change is 14 annas. This may be given wholly in anna coins or in new coins, or partly in old and partly in new coins. Let us assume that eight annas is paid in old coins and 6 annas is to be returned in new coins. Use the Conversion table to find the equivalent of 6 annas in new coins which is 37 Naye Paise.

EXAMPLES : (Where the amount due is expressed in Naye Paise).

An article costs 11 Naye Paise. One may pay this amount in new coins or in the form of 1 anna and 9 pies in old coins (the equivalent of 1 anna 9 pies according to the table is 11 Naye Paise).

If a person tenders 20 Naye Paise against 11 Naye Paise due, the change to be returned will be 9 Naye Paise or in old coins, the equivalent thereto namely 1 anna 6 pies.

For a payment of 11 Naye Paise, one may tender a 4 anna coin and ask for change. 4 annas are equivalent to 25 Naye Paise; the balance to be returned is 14 Naye Paise; this can be returned wholly in new coins, or in old coins, 2 annas and 3 pies according to the table are equal to 14 Naye Paise; one may give an anna coin (6 Naye Paise) and 8 Naye Paise in new coins.

It is not necessary to convert rates or unit costs expressed annas/pies into Naye Paise before working out the total amount payable.

EXAMPLES :

If 50 articles are purchased at 3 annas each, first work out the total amount in rupees/annas; You have to pay nine rupees and six annas.

If you have only Naye Paise with you, you find that six annas is equivalent to 37 Naye Paise. You accordingly pay 9 Rupees and 37 Naye Paise.

The result will be the same if you took the exact equivalent of 3 annas (18¾ Naye Paise) and multiplied it by 50 but it would be incorrect if you had taken the rounded off equivalent of 3 annas from the conversion table (19 Naye Paise) and then multiplied it by 50.

Similarly, if you buy from anyone a number of articles at the same time at different rates expressed in annas or pice coins, first calculate the total amount due in rupees, annas and pies. Apply the conversion table to the annas and pies in the total amount, if you want to pay in new coins.

You may simplify conversions by remembering that

4 annas .. .. 25 Naye Paise
8 annas .. .. 50 Naye Paise
12 annas .. .. 75 Naye Paise
1 Rupee .. .. 100 Naye Paise

EXAMPLES :

(1) To make payment of 10½ annas, you may first give 8 annas or 50 Naye Paise; the balance of 2½ annas is equal to 16 Naye Paise;

(2) To make payment of 36 Naye Paise, you first pay four annas or 25 Naye Paise, and then the balance of 11 Naye Paise by tendering 1 anna and nine pies. DA 56/250

The Old Order

THE announcement of India's new Cabinet has failed to raise any substantial interest either at home or abroad. This matters little abroad where the character of India's Cabinet is so firmly identified with the Prime Minister that minor changes in portfolios or an additional member or two cannot suggest a change even in form. What is distressing is [illegible] manner in which the country h[illegible] return of what might be [illegible] respect, the old

brigade. It was widely believed that the Prime Minister would take this opportunity to record his response to the reverses in many States of the Indian Union revealing marked dissatisfaction with things as they are. How it was possible with the men at his command, and Congress Party political imperatives just what they are, to satisfy rebellious elements has nowhere been indicated. Nevertheless, the fact remains that the announcement of the Cabinet last Wednesday has caused deep disappointment. And there is justification for this view, at least in the negative sense, that it shows no added dynamism of any kind.

It is clear that in the senior-most ranks — or should it be pinnacles? — of the Congress Party the old order is not giving place to new. This is not merely because of the rising age, under the ravages of time, of the distinguished old guard. It is because in the younger ranks of the Congress Party talent and enterprise seem to be relatively small. Indeed, there are only two new names in the Ministers of State list which have attracted attention. These are the names of Mr. A. K. Sen and Prof. Humayun Kabir both clearly in time of full Cabinet timbre. But even recording with thanks their arrival, and that of Mr. S. K. Patil, a dynamo of energy on his own, one might record the view that policy, or even its discussion, has not entered on any new or inspiring note. The more Parliaments and Cabinets in Delhi are changed, the more it is underlined that they are the same accustomed thing.

This is merely a reflection of a solid political fact, namely, that all these Cabinets and, in a sense, the entire Congress Party in Parliament is a reflection of the unduly dominating position that the Prime Minister of India occupies in the Congress Party and in the Executive Government. So long as the Prime Minister is subject to the personal loyalties which it would appear he can nowhere abrogate, at least eight members of his Cabinet will have been chosen for him by, so to speak, personal pressures. Four of these — who shall not be named — are obviously essential in the current political or administrative situation in which we find ourselves. On the remaining four differences of opinion are possible. One might certainly hold the view that the Prime Minister would have done well to recognise in some high places that obsolescence of the mind to which he has not infrequently referred in recent months.

One major change which needs comment is the decision to transfer Steel from the Minister of Finance and place it with the new Ministry of Steel, Mines and Fuel. This is, theoretically, a sound decision in the sense that the Finance Minister as a controlling authority should not initiate his own spending. But, on the other hand, administrative niceties can on occasion go too far. If the financial situation had not become critical, there would be everything to be said for leaving Mr. T. T. Krishnamachari, whose great personal dynamism has made the Steel Ministry what it is, in charge of his own creation. It may also well be that, after the Finance Minister has weathered the present financial storm, his best services to the country could be rendered in his capaci Minister of Steel and of Commerce and Indus It was here that he displayed a degree of dyn ism which is notably absent in other econ affairs and, indeed, in a sense in the Governi as a whole. One cannot be too hopeful ab new Ministry of Steel which is obviousl more amateur hands.

What is disturbing is not merely the fac the same personalities figure again and ag different capacities, but that the mental buoy of the Indian Cabinet has tended to fall wit buoyancy in the Indian economic system whole. One notable field of deterioration the planning of economic policy, which sh be, in large part, the responsibility of the P ning Commission. There are rumours that members of the Planning Commission are sh to retire, and one of the vacancies may be unfilled. The problem is not, however, one numbers, but of quality. Recently, the Centr thinking and planning apparatus has fallen int some disuse; in a short while the Planning Com mission may be so enervated that its reason fo existence might even be questioned.

It is vital that the Prime Minister, failed to give a sense of dynamism to his C Government, should try to put the best tale the country into the Planning Commission. at least, he is not bound by political loyal any kind. The mood at the present time country is restive. In some part this restiv is not the fruit of mismanagement of our econo affairs, though of this, too, there can be, justice, some complaint. The real trouble s to be one of haste, pulling scarce resource various directions, some obviously unsound. one can look at the Budget for 1957-58 in d and not be alarmed at the many petty and alm inconceivably vague proposals on which sca rupee resources are to be expended. *The East Economist* will, in due course, and, particula at the time of the introduction of the Budget May, indicate where great economies can be c tained with substantially little effort. This the time to produce the determination and th will to apply the guillotine. There will be th time enough to determine where precisely should fall.

Rightly or wrongly, the impression exists the country that the determination to wrestle w the emergency is not very great; this v be reinforced by the form of the new Cabinet a by the pattern of expenditure in the 'Vote Account' for 1957-58 which is obviously beyo the country's resources at this time. Recentl Estimates Committee reports and Public Account Committee criticisms show a shockingly lax stat in the expenditure of public money in numerou Ministries of the Central Government. This ha done much to create the impression that efficien regulation of expenditure is totally lacking. Th country looks to the Finance Minister for t introduction of financial discipline which h steeply declined. On him depends far more tha appears at first sight. This Cabinet, as well as it predecessor, will be known by its fruit. Th verdict on its predecessor was severely qualif

SECRETARIAT LIBRARY 23 APR 1957 MADRAS

The Decimal: Some Bitter Fr

HE *naya paisa* has been with us these seven days—too short a period for the public derstand and accept the decimal coinage. not also unexpected that a big change of ind from the 64-paisa rupee to the 100-naya rupee would cause some initial confusion. confusion has arisen as much from the official of conversion of the old pice into naye paise tes which necessarily are not exact equiva- s on account of the rounding-off—as from the ultaneous circulation of the old coins in their erent denominations and of the new coins in ir different multiples of the naya paisa. The tinued circulation of both the old and the new ns in the scheduled transitional period of three rs would continue the confusion unless, of e, the period itself is shortened and tens of llions of new coins are minted expeditiously to eplace the old ones.

It is not clear why the Government should have added to this confusion by revising the postal rates in a manner inconsistent with their own version table. The revision has been unfortunate and unwise not for the rate increase in l lines but for the cue that others have from it. The postal authorities could very have stuck to the conversion table, and the ted losses of the Posts and Telegraphs Dent could have been made good by a suitevision of rates at the regular Budget in As they have not chosen to do this, they come to be rightly blamed for setting a bad mple for others to follow. The argument of Postal authorities is that the new rates have fixed under the Indian Post Office Amendt Act of 1956 which has been brought into e with effect from April 1, 1957. It is also lained that if there have been slight increases ome rates, there have been reductions in some ers. But unfortunately the reductions have been as well noticed as the increases, and it hese increases, legal though they be, that have me to affect other prices.

Other instances of price increases which are strictly in accordance with the conversion le are just coming to light in the wake of ised postal rates. The one common increase from 12 naye paise (the official equivalent of nnas) to 13 naye paise wherever the price of commodity or service is 2 annas. The Delhi te Transport Directorate and the Calcutta mway Company have re-fixed their 1, 1½ and nna rates for tickets at 7, 10 and 13 naye paise pectively as against 6, 9 and 12 naye paise of official conversion table. Restaurants are haps the worst sinners in this regard, having t up the prices of drinks and snacks to a greater xtent than the rounding-off justifies. Here in e capital the Annapoorna Cafetaria, to give one ample, has quietly raised the price of the onenna cup of tea to 10 naye paise and of the twonna cup of coffee to 20 naye paise without perotibly improving either quality or quantity. e Annapoorna cup of tea has thus ceased to be e cup that cheers" the poor man. Instances can multiplied to show that there is no disposition the part of retail traders to quote the naye paise ivalents of their usual prices in terms of the official conversion table. Where, according to the conversion table, the conversion of, say, 2 old pice (the exact equivalent of which is 3.125 naye paise) into 3 naye paise involves a loss for the trader, he is naturally inclined to quote 4 naye paise thereby increasing the price by 28 per cent. What is more, he stands to benefit from the official conversion rate itself, where, for example, 3 old pice (the exact equivalent of which is 4.678 naye paise) are to change for 5 naye paise, his gain in this case being nearly 7 per cent. In either case the consumer stands to lose, and that means some addition to his cost of living, for it is the retail end that is of relevance as far as he is concerned.

It is understandable that the retailer, with his small margin of profit, should seek to cut his losses, but obviously there can be no justification for his making a more-than-normal profit under cover of the decimal coinage. If the retail trader is not justified in taking advantage of the situation in this manner, there can be still less justification for the sales tax in some States being collected not in accordance with the rounded-off naye paise equivalents of the old pice but more or less in the manner of the revised postal rates. As the incidence of the sales tax is predominantly on the consumer, there is here another addition to his cost of living.

One wonders if the Government had a measure of the probable price increases well in advance of the latest currency reform. That any reform is, to some extent or other, a costly process, is well known. But it is also equally well known that most reforms affect adversely some sections of society while benefiting some others. The present currency reform, on the other hand, is virtually universal in its adverse effects. Even commercial organisations and business houses have to spend more on their postage. While the majority of people will thus stand to lose something (however small it may be) a minority alone will have gained something in the process.

This situation of initial price increase cannot, of course, be remedied, for it can hardly be expected of the sellers of goods and services to do what Governments at the Centre and in the States are not willing to do. It is inevitable that there will be a rise in the price and cost of living index numbers. The rise may be too small to unbalance the domestic budgets of the larger section of the public, but it may not be too inconsequential to upset the national budget. With the pressing need for holding the price line and reducing the inflationary pressures recognised by the Government, it is hard to see how they can be complacent about the situation. As far as the Central and State Governments are concerned, they should decide to stick to their own conversion table in all their transactions. That is the only obvious remedy, although it can only be a partial remedy in the present situation. For the rest, the possible reduction of the transitional period and the more rapid displacement of the old coins may greatly help in the process of settling down prices to a distinct level in terms of the new coinage.

The Wages of Railwaymen

THE National Federation of Indian Railwaymen celebrated Railway Week by renewing its offensive for an upward revision of the pay scales of railway employees. Its Working Committee which met at Ahmedabad adopted a resolution to this effect in terms that can leave no doubt whatsoever about the pressure it would exert on the Railway Board with this demand. More of it will be heard early next month when the General Council of the Federation meets at Moghalsarai. In sum, the Federation's case is that the problem of pay scales can be solved only by the appointment of a pay commission for the railways.

No one need be taken in by this plea and believe that the pay commission's verdict will act as a talisman. Even that verdict cannot offer a fool-proof solution and wipe out all traces of anomalies in the terms of salaries and wages. The possibility cannot be brushed aside that fresh anomalies will be discovered. The issue of railwaymen's wages has been complicated by various factors among which the integration of ex-princely State railways is one. A pay commission for railways with a specific term of reference for all-round upward revision of pay scales cannot but operate as a signal for wage pressures and set in motion a chain reaction. Trade union leadership at the level of the Railwaymen's Federation has chosen to subordinate national interests to sectional interests in disregard of the crying need for restraint at a critical time when inflation threatens to engulf the economy of the country. If an inflationary spiral is let loose on the railways, where will it be contained?

The Railway Ministry can hardly escape part of the responsibility for providing an impetus to wage pressures. It has chosen sometimes to put expediency above other considerations. There was in fact no justification for the haste with which the new scheme for increased emoluments as well as revised grades and promotion opportunities for certain categories of class III employees was announced on the eve of the last general elections. This reform was no doubt promised by the Railway Minister one year back. But the complications which it involved and the likely repercussions on other categories of employees surely called for a thorough investigation.

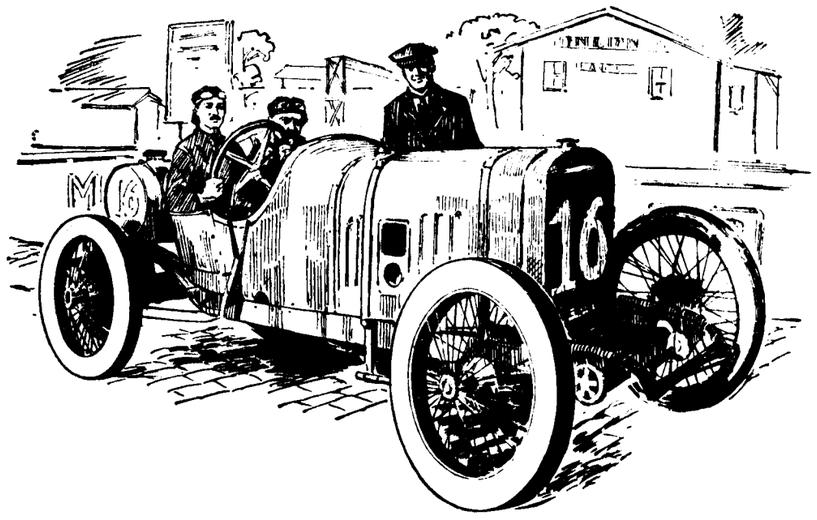
The scheme was declared without full assessment of its financial consequences and even the interim railway budget made only a tentative provision of Rs. 2.2 crores on this count including the element of retrospective effect. Accommodation which was shown to white collar employees invited prompt reaction from class IV employees and the Railway Minister had no alternative but to commit himself to the appointment of a special committee to settle their claims. The Railwaymen's Federation, while it denounces in one breath piecemeal settlement of disputes has adopted a significant strategy to accept and consolidate the gains obtained by this technique without relenting in respect of its pressures. Only in October 1955, having first won by agreement with the Railway Board the claim for retrospective effect to certain revised pay scales from January 1947, it put forward the demand for a pay commission. Its reiteration this week at Ahmedabad is part of the same strategy.

This does not, however, imply that the possibility of the demand for the appointment of a pay commission being pressed hard may be considered as ruled out. It is time the magnitude of overall pressures on railway finances was appreciated fully, not least by those who guide the destinies of the Railwaymen's Federation. The attenuated railway development plan is the minimum that must be executed if the second Five-Year Plan is to be saved from a genuine prospect of deadlock. The railways have been placed under an obligation to contribute Rs. 225 crores during the Plan period from the depreciation reserve fund and Rs. 150 crores from other resources meaning surpluses of current revenues. The first obligation will be met in full out of the appropriations to the reserve fund at an annual rate of Rs. 25 crores. There is not the same degree of assurance about the ability of railway finances to meet the second obligation. While it is true that railway earnings are rising due to the transportation of larger traffic, costs are rising faster.

The net gain or final surplus of the railways which can be applied for development expenditure will decline to Rs. 21 crores in 1957-58 as against Rs. 27 crores in the revised estimates for 1956-57. There is no escape from an increase in freight rates and passenger fares during the Plan period. But development, and not other claims like an overall increase in pay scales, has a legitimate demand on additional earnings. This is a supreme priority dictated by the exigencies of the allocation of resources for the railway development plan.

There is imperative need, therefore, to assert the principle that higher emoluments should be granted where they are earned by improved productivity. There is not only no evidence of an increase in the productivity of railway labour but this crucial criterion is usually overlooked. There is some vague talk about remarkable improvement having taken place in the efficiency of labour. It is unfortunate that this belief should have found acceptance in some high official quarters. Other expert evidence recorded at official inquiries has conclusively established decline. If it is the ambition of the railways to elevate themselves to the position of ideal employers, it will serve no purpose to ignore the essential truth that an ideal employer must have a counterpart in an ideal employee, if the vitality of the enterprise is not to be allowed to deteriorate. The extension of the system of payments by results to railway repair workshops has long been under consideration, but little that is tangible has emerged.

Over wide sections of railway operations, it is quite essential to introduce job analysis. Trade union leadership has no objection in principle to it, but its major embarrassment is that it would be difficult for it to carry labour with it in view of its serious apprehensions of retrenchment following job analysis. An assurance against wholesale retrenchment on this ground can be given since it is clear that railways will require increasing staff (and some of lower calibre) to meet the volume of expansion activity. A machinery for job analysis should not now be delayed to ensure that higher emoluments will be reflected in better operational results. This ought to be the primary test of improved remuneration.



All 6,500 of us in Hindustan Lever, a small army of men and women, have something very important in common. For us, it is not enough to make soaps, toiletries and cooking fats—with each of our products we aim to give you what you need in unvarying quality, so that you—the families of India—may know and trust and use them.

For almost eighty years, we have grown with your growing needs. And, like a flowering plant, we have put forth new and exciting blooms—dynamic pioneering activities behind the actual manufacturing scenes. Our Market Research department—unique in this country—carefully studies your preferences, your habits and opinions, and guides production with its findings. Our Quality Control department carries out strict tests on each product from the raw material stage to the finished article. The Dalda Advisory Service and the Washing Information Service are there to help you make the best use of our products.

And what are these products? You know them well—Sunlight Soap, for instance . . . Lifebuoy . . . Lux . . . Rexona . . . Gibbs S.R. Toothpaste . . . Dalda Vanaspati . . . and others that have become household friends. We are proud that so many of you have chosen to use them every day in your homes. At the same time we realise that your patronage lays upon us a duty, that of keeping steady our common aim, to offer the very best quality and value to our customers . . . to you!

1913 - when 75 miles an hour was sensational!

Way back in 1913, Jules Goux, the racing motorist, won the famous Indianapolis 500-mile race on Firestone Tyres at the then sensational speed of 75 miles per hour. This result helped Firestone to produce better tyres and each successive year, the developments incorporated in Firestone tyres have been tested and proved on the race track for use on the highway.

Now, from Firestone comes a great contribution to safe motoring—the New DeLuxe Champion Tubeless Tyre. It gives you and your family protection never before provided in any tyre at any price. It's the first and only tyre with *built-in peace of mind!*

THE WEEK'S NOTES

COMMUNIST GOVERNMENT IN KERALA

THE COMMUNISTS in India have made history. They have in Kerala, the smallest State of the Indian Union, come to power through democratic process. Their victory is significant in more than one sense. First, the victory repudiates the Marxian assumption that Communists cannot capture power except through a violent revolution; and, secondly, if the Communists succeed in giving Kerala's people stability and prosperity, they will add to their stock in other States, thus making India more vulnerable and exposed to Communism. Kerala is therefore bound to keep on itself attention not only of the rest of the country but of other countries as well.

The Communists have been able to form a government in Kerala in spite of a minority vote. Thanks for this should go to division among the democratic political parties. Democrats now can only hope that the responsibilities of office will instil in the Communists the sense of responsibility which they have not shown hitherto, and prevent them from pursuing reckless policies. Preliminary pronouncements of the leaders of the party do indicate realization of hard facts and consciousness of the new responsibility. The Communist Chief Minister, Mr. E. M. S. Nambudripad, has made no extravagant promises. The programme he has outlined hardly conflicts with the objectives of the Congress and the Praja-Socialist Party. While land reforms are to be undertaken on the lines laid down by the Land Reforms Panel of the Planning Commission, the Government is to be run within the bounds of the Indian Constitution. Mr. Nambudripad has of course promised introduction of agrarian reforms "within a short and definitely fixed time-table". But this promise is more propagandistic than serious, because there is no heavy concentration of land-ownership in Kerala. No scheme of land ceilings is likely to secure even the minimum of what is required to satisfy the needs of the landless.

The problem that may really test the acumen and resources of the Kerala Government most is the problem of middle-class unemployment. To solve this problem, Mr. Nambudripad has evidently considered the possibility of taking over some private industries. Such a measure, though within the provisions of the Indian Constitution, stems from an ideological bias against the private sector, and would probably be taken because of ideological considerations. Otherwise, why should not the capital funds the State may raise for taking over the private enterprises be utilized in supplementing that sector by establishing State-owned industries? Apart from other things, this would relieve unemployment in the State to some extent. Mr. Nambudripad's proposal for nationalization of plantations also does not seem to be in the national interest. It would be unwise to launch upon a policy of "expropriation" of foreign capital when the country is in dire need of it. Besides, India has much better use for her limited exchange resources than the payment to nationalized plantation companies.

It seems doubtful, however, that serious differences will arise between the Kerala and the Union Governments. Mr. Nambudripad has declared that if his Government's plea for nationalization is rejected, it would do no more than protest. Of course, his party will start an all-India campaign against the rejection. Through that device the Communists perhaps hope either to win a concession which would be good for morale, or, failing that, procure an alibi for the failure. This interpretation is reinforced by the fact that the Communists would like to utilize the opportunity which has come their way to build an impressive record rather than lose it through some precipitate action. They know that any success in the economic field, even of a limited nature, coupled with an improvement in the tone of administration, will add to their popularity and prestige throughout the country. And this could be achieved only if they managed to remain in power for a considerable length of time.

OUT-HERODING HEROD

AN IMPORTANT event in the capital this week was the annual conference of the All-India Manufacturers' Organisation. The session was notable for the inaugural address of Prime Minister Nehru who was at pains to explain the magnitude of the task ahead of the country in the implementation of the second Plan. "It is patent" he said "that the Plan puts great burdens upon us — greater than we imagined when we framed the plan". He went on to add that the next two or three years "are likely to be difficult for us and we have to pull ourselves up during these years". After this confession from the Prime Minister, one would have thought that the Presidential address that followed would have dealt with the prospects for the Plan based on unbiassed and objective appraisal taking into account the various difficulties that have cropped up during the year that the Plan has gone through. But Mr. Haji, in his address, however, allowed his enthusiasm to outrun reality. While no one would cavil at the Organisation offering its complete co-operation to the Goverment in the implementation of the Plan, obviously, there is no need to confuse patriotism with conformity to Government's views, when non-conformity in the shape of constructive criticism and dissent may in fact serve the cause of the country's progress with stability.

It is now patent that the difficulties that have faced the Plan even during its very first year have been due to the discrepancy between resources available and the targets set. The financial problem that looms large both on the internal and external components has thus set a considerable section of the intelligentsia to make a reappraisal of the Plan either for scaling down the outlay or for extending the Plan period after a realistic evaluation of the internal and external resources. The financial problem is a stark fact. It requires a practical solution, not platitudes. Mr. Haji was not only confident that the necessary resources could be found, but he took pride in the fact that his organisation had in fact advocated a larger outlay for the Plan. (Apparently this had fallen on deaf ears and one need not be sorry for it!) Whatever it is, Mr. Haji would have considerably strengthened his plea if he had gone to details and had explained how he intended to fill the resources gap. In foreign exchange, the gap is of the order of Rs. 400 crores plus Rs. 500 crores for price increase making a total of Rs. 900 crores. Mr. Haji suggested curtailing of imports, expansion of exports, increasing earnings from invisibles and obtaining foreign aid and foreign capital in a larger measure. These remedies have been recognized on all hands, but it has not been proved to the hilt that the gap is such that it can be filled. On the question of rupee resources again, Mr. Haji was not very helpful. He suggested that new techniques should be devised for tapping small savings, but these, even if they are successful, will only touch partly of the problem. The fact is that the Plan has exceeded its limits with regard to both its foreign and internal resources and it has to be squarely faced.

Mr. Haji in his address did well to deal with the concept of mixed economy. Mr. Nehru's assurance that the private sector "will have not only a very important

place, but a respected place in the context of the broad policies that we pursue" is, of course, heartening. If this assurance is followed by concrete steps to allay many of the fears of the private sector, it will certainly go a long way in the "co-existence" of the two sectors to their mutual advantage. What the private sector needs is sympathetic treatment of its needs and assurance of proper incentives.

IMPORT OF AMERICAN ARMS AID

FOLLOWING fast on the statement of Mr. Chester Bowles made before the U.S. House of Representatives Foreign Affairs Sub-committee that the American arms aid to Pakistan had produced an arms race in the neighbouring countries, Mr. Ellsworth Bunker has come out with a strong refutation of this view. There was, however, not much spectacular in what Mr. Bunker said. By and large, he was corroborating what has often been stressed by the highest authorities in the USA that the aid was essentially of a limited nature, given on the strict understanding that the arms thus received by Pakistan would be used for no purpose other than checking Communist expansion in this area. In the event of Pakistan's misusing them, the supplies would be stopped forthwith. There is no reason to doubt the genuineness of these intentions and this has been admitted on several occasions also by Indian spokesmen. What is, however, not free from doubt is whether the declarations and warnings issued by the American President and the Secretary of State against the possible misuse of arms will be really adequate deterrents. In the main, a cutting out of further supplies can stop an increasing misuse but there is hardly any sufficient guarantee, at least for those who cannot look at the arms from the butt-end, against their being used at all. Is not France, it is being asked, using the NATO arms in her war against the Algerian Nationalists?

Mr. Bunker has no doubt done well to clarify the official position, but the former Ambassador has given his interpretation of the situation as he saw it. There are few people either in America or in India who would not acknowledge Mr. Bowles's intimate understanding of India acquired over a fairly long period of assignment in this country. His recent tour through India, Pakistan, the Soviet Union, etc., must have enabled him to refresh his knowledge and feel the pulse of people in these countries. The essence of his reading of the present position is that the large-scale military aid to Pakistan has created suspicions leading to strained relations between the countries in the area. In turn, this may drive some to devote larger funds to military allocations at the expense of productive outlays; and already there have been such disturbing developments in India. Another former Ambassador to India, Senator Cooper, has also expressed a similar fear. It would be unfortunate if the same instrument, conceived and designed as a strategy against the threatening Soviet expansion, should help in slowing down economic defences against Communism. There is need to arrest the growth of this risk which appears to call for rethinking on the arms aid policy.

A NECESSARY COMPROMISE

AN AGREEMENT has been arrived at between the British Government and Singapore's "Merdeka" delegation, led by the Chief Minister, Mr. Lim Yew Hock, on the future political structure of the island, under which, while external affairs and defence will remain in British hands, a security council will look after Singapore's internal affairs. It was, it may be recalled, on the question of composition of the security council that last year's parleys foundered. Now it has been decided that the security council will consist of seven members—three representatives of Britain, three of Singapore and one of the neighbouring Federation of Malaya. But Britain retains the right to suspend the constitution, on any one of the two following grounds: deterioration of internal situation threatening "the security of Singapore" or "violation of the Constitution by the Singapore Government". Appreciation of whether the situation demands the exercise of this right will be determined exclusively by Britain. The possibility of the suspension of the constitution is not merely academic. In this connection it may be as well to recall the manner in which the Chhedi Jagan Government of British Guiana was summarily dismissed. That Government's "crime" was refusal to subserve the imperial power.

This was evidently not considered sufficient to make mockery of the term "self-government". Britain has also retained supervisory powers over Singapore's trade and cultural relations. The plea put forward for retaining these powers is that so long as Britain remained in charge of external affairs generally, she was responsible for international agreements entered into by the Singaporean Government. But this is not all. The British Government has also laid down the proviso that "subversive persons" should not be elected to the new State's first Parliament. This restriction, which was imposed on the five-man delegation at the final session, is, to put it very mildly, a departure from democratic practice. It would hardly be an exaggeration to say that the constitution offered to Singapore, after a month of discussion, is worse than the Government of India Act of 1935. It will very probably engender numberless frictions, as did the Government of India Act in this country during the days of provincial autonomy.

It must be admitted, however, that in the circumstances of Singapore the dyarchical system may have been inevitable. The island colony is neither economically viable nor sure of its political stability. In Singapore, even more than on the mainland of Malaya Peninsula, Chinese immigrants, who constitute 30 per cent of the island's population, have dubious political affiliations. Many of the trade unions are under the control of pro-Communists. Also, Singapore has been selected as the major base for SEATO; as such it can hardly be left exposed to Communist subversion through infiltration.

Perhaps the most suitable out of the complex situation would be Singapore's merger with the Federation of Malaya. Tengku Abdul Rehman of Malaya has been resisting the idea hitherto, for fear of the large Chinese element in Singapore. In the circumstances, Singapore cannot do more than accept the agreement. On its own, the island cannot provide for continued independent existence. The agreement is perhaps the only way out of Singapore's dilemma for the time being.

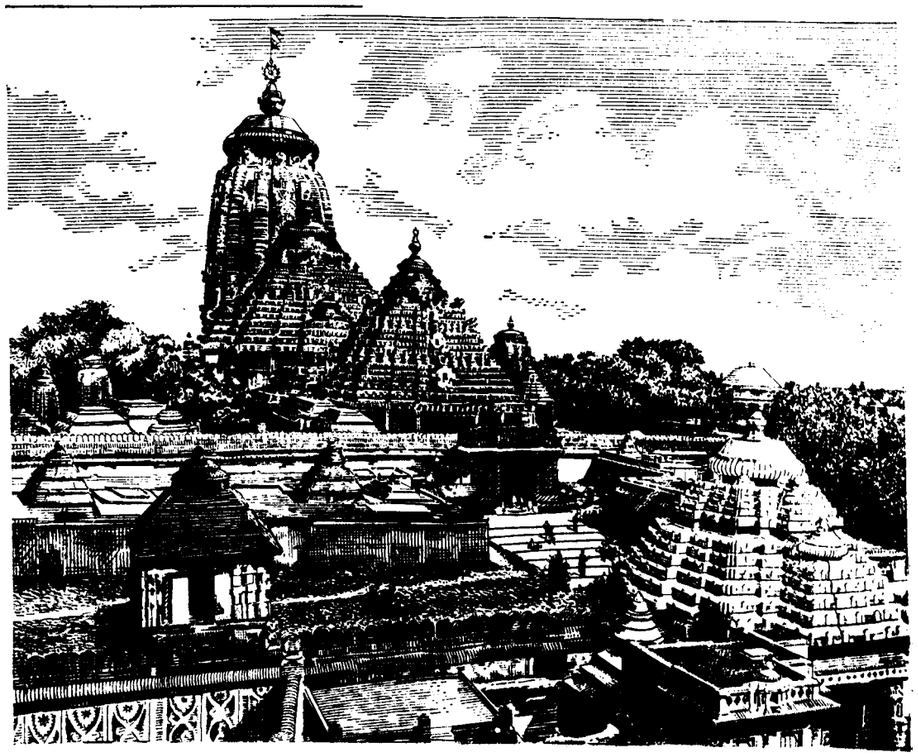
A TOWER OF STRENGTH in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.



Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

Around India with Brooke Bond

The Temple of Jagannath—**Puri**

Puri is famed for the temple of Jagannath—the Lord of the Universe. Built some time in the 12th century A.D., the temple consists of a main shrine—200 ft. high—and a number of accessory temples. Legend has it that the temple is the handiwork of Viswakarma—the divine architect. The Puri temple attracts a stream of pious Hindus throughout the year. But the climax comes in July every year when lakhs of people from all parts of India gather to witness the great chariot festival.

Around here, as everywhere in India, fresh Brooke Bond Tea is made available through a unique system of fast distribution from factory to shop. Brooke Bond is the only tea firm with five blending and packing factories, each serving its own part of the country, from which fresh stocks are rushed to every shop.

A Window on the World

WHAT WILL THE MASSES READ?

By

ODYSSEUS

ONE OF THE ESSENTIALS for preserving individual liberty, warding off bureaucratic abuses and the tyranny of a police state, is a press that is independent, fearless, informative, and responsible.

We considered evidence last week, taken from "Journalism in Modern India" (Asia Publishing House. 1953), that while the Indian press maintains a high average of informative reporting on politics, industry, and other important public affairs, "these admirably solid dailies" (in the words of "Journalism in Modern India") are "perhaps a shade timid in dealing with delinquencies in public life. There is a natural feeling against 'letting the side down' and equally natural aversion to incurring governmental displeasure". Our witness explained this hesitation to criticise powerful figures or bodies in public life by pointing out that it is not always easy for those with inadequate finances to disregard consequences. The inadequacy of the finances of the Indian press arises from their small circulations which mean low advertising rates and revenues.

By way of contrast, we next put in the witness box Francis Williams, former editor of the Socialist 'Daily Herald' of London, whose new book "Dangerous Estate" (Longmans. 24 sh.) is an outstanding study of the British press. Mr. Williams shows that Britain's 54,000,000 people buy 16,000,000 copies of the daily national morning papers and 30,000,000 of the national Sunday papers. Advertising rates are correspondingly high. The British press is financially strong. It is therefore politically independent and fears no man or institution. But the reverse of this medal is that only 3 per cent of Britons buy the serious, responsible national dailies, like the 'Times' and the 'Manchester Guardian', which seek to inform and to give a considered lead to public opinion. The British masses read newspapers which feature sex, crime, and political muck raking.

The mass circulation popular papers grew up as literacy came to the millions. It is but a question of time before this happens to India.

As Indian literacy rises, will Indian Daily Muck Rakers begin to multiply? Would that matter or not? What can be done about it? Is there no alternative between a press seriously informative but too inadequately financed to be courageously independent and a press afraid of no one but irresponsible in its politics and whose main preoccupation is to deprave public morals?

TWO KINDS OF READERS

The first fence to clear out of the way is this: Those who think up these questions are people of education and taste, serious citizens, like you and me. We turn to our 'Hindustan Times' every morning with genuine curiosity, often with anxiety. What, we want to know, is happening to the Five-Year Plan? Will inflation following Egypt's closure of the Suez canal defeat it? What is Pandit Nehru's attitude to Soviet interference in Hungary's internal affairs? Why is so much foreign opinion critical of India about Kashmir? Will the formation of a Communist government in Kerala cause repercussions that could modify India's foreign policy in any way? To us, these are all questions of eager interest.

But put these questions to the man behind the counter in a shop, to a pan wallah, tonga driver, to the policeman on point duty. Go further into villages and put them to all and sundry. The overwhelming majority of people in these walks of life have the most garbled notions of these problems, if indeed they have heard of them at all. They are just not interested in them. No bigger mistake could be made than to suppose that if you were to prohibit the publication of "popular" newspapers, the masses would automatically subscribe to 'The Hindu' or 'The Times of India'. They would simply never look at a paper at all.

The present circulations of India's newspapers are small because only 14 per cent can read. Of that 14 per cent, only a minority reads regularly and with ease. Of the remainder, a still smaller minority are people of sufficient breadth of vision to worry about inflation, or the building up of Chinese power along the Himalayan frontier.

We highbrow university graduates who worry about the universe are too prone to feel condescension or contempt for those who do not share our interests. This is intolerance. I happen to be passionately interested in Bharat Natya but I do not see why anyone else should be compelled to share my enthusiasm, and I would protest if people who spend their leisure watching cricket promoted a law for universal compulsory attendance at Test Matches.

As the Indian literacy rate rises, the number of those who want to read about serious matters will rise slowly (as it has in the UK, where as against 1 per cent of a population of 38,000,000 who read serious papers in the 1890's, today the rate is 3 per cent of 54,000,000), but the numbers of those who can read but who are not interested in life's problems will soar, and enterprising newspaper editors will study the tastes of the masses and achieve huge circulations by publishing what interests them.

FRUSTRATIONS AND DAY-DREAMS

Very well, then, what does interest the masses?

The masses all over the world lead, for the most part, hard, drab lives. Psychologists explain that each individual is equipped with basic instincts, such as hunger, sex, and the assertion of personality. In order that these instincts shall be used in a socially co-operative way, the tribe, clan, caste, or state, sets up a system of social sanctions, rewards and punishments. This works in a rough and ready way but causes innumerable frustrations to the individual. The educated man has many ways in which he can work off (or sublimate) these frustrations—the whole range of intellectual interests, social activities, and the arts.

As we near the average level of the masses, the working off of these frustrations takes less refined and

indirect forms and we get nearer to the actual instincts themselves. One easy way of half satisfying a frustrated instinctive urge is to day-dream of its fulfilment. Now, the two matters on which society sets the strongest and strictest rules are sex and the observance of the current moral code in honesty, truth-telling, and so on. Here the greatest frustrations arise. Which is precisely why the mass circulation papers specialise in day-dreams about sex and crime.

I do not think that we ought to recoil in horror from this without further thought. After all, many educated people enjoy detective stories and thrillers, and as for sex, the highest ranges of literature are concerned with it—Kalidas' "Shakuntala", Shakespeare's "Romeo and Juliet"', Racine's "Phedre". Of course, the bulk of literature does not attain these levels and next to them Elinor Glynn's "Three Weeks" looks the watery soup that it is—but that does not necessarily make it harmful. I do not see why newspapers should not exist to provide the masses with innocent romance and success stories, on levels comprehensible to them.

The root of the problem is where and how do you draw the line between innocent romance and pornography? At the present time, the law on this subject is nonsensical. That is obscene which a magistrate decides would be liable to corrupt the minds of those into whose hands it might fall. This law sends policemen scouring through books to find passages or words which might corrupt, irrespective of their context. But the context is all important. Any ordinarily intelligent person sees at once whether an author is seeking to depict life with such artistic integrity as he has in him or to write up a "slice of life" with intent merely to arouse the senses. Under the existing law, Havelock Ellis' "Studies in the Psychology of Sex" were banned for years, whereas scores of pernicious novelettes could be bought at any bookstall.

The UK is on the way to rectify the law now. A bill making the author's intention the test of obscenity is before the Commons. It is to be hoped that this important Bill will be studied in India.

Another way of half satisfying frustrated desire is by indulging the sense of grievance. This explains why the mass circulation papers devote so much space to stories written in a high scream of indignation. "Radical muck raking", as Francis Williams calls it, helps to make the small man feel that he has a powerful paper campaigning for him and exposing the conspiracies of all the clever ones in established society who are engaged in doing him down. "Journalism in Modern India" makes a relevant distinction here: "The exposure of corruption and the unmasking of fraud is a legitimate and highly praiseworthy activity for a newspaper. It has been done, time and again, with bold efficiency and great effect both in the USA and in Britain, and it would be a purblind optimist who would deny scope for such investigation and writing in India. The danger lies when a new 'revelation' has to be found once, even twice, weekly; when facts are replaced by hearsay and when the same political bias can be seen in every new disclosure".

In a final article next week, we will, taking into account the solutions advocated by the Indian Press Commission of 1953, try to reach conclusions on the several questions that we have raised and left unanswered.

EUROMARKET AND THE OUTSIDERS

(From Our Special West European Correspondent)

PARIS, April 14.

WHEN one writes from within any of the six countries that are destined to form the European common market (Euromarket), one finds it very difficult to take seriously the prospect of an early or extensive fruition for this scheme for a West European free-trade zone. But once one sets foot outside those six countries, one finds that this prospect is taken very seriously indeed, and that the dangers it holds for Euromarket's neighbours and trading partners are regarded with considerable apprehension. This contradiction, I confess, has been reflected in these letters in recent months. When I have written of Euromarket from Paris, it has been with some reserve, not to say cynicism. But last week, writing from Madrid, I reported that in Spain there is much anxiety about the damage that country's exports may suffer from the common market of the Six of Messina. Moreover, Odysseus's faithful readers will recall that, earlier this year, my Parisian doubts about free trade in Europe called forth an optimistic blast from London. Why is it that on the Continent, where people want a free-trade zone, very few believe that Euromarket is going to work—whereas outside, where people are afraid of the consequences for themselves of a European customs union, there is a widespread belief that Euromarket is going to work only too well?

Paradoxically, the answer to both halves of that question is the same: there is a conviction that trading conditions in Europe are going to worsen in the years immediately ahead. This prospect makes the Continentals themselves very dubious about the chances for a reduction of customs barriers between their six countries, for obviously as trading becomes more difficult each country will be less ready to make the concessions to its partners that are required to make Euromarket a living reality. But their neighbours and trading partners (hereinafter referred to as the outsiders) fear that the Six will be obliged to go some way towards union by their treaty commitments, and that, if trading conditions worsen thereafter, they will tend to emphasise the protectionist aspect of Euromarket to preserve their trade from the outsiders' competition. The danger that the six Continental partners will use Euromarket as a grand protective device in a period of poor trade has already sown panic all the way from Scandinavia via Britain and Spain to Latin America—in short in every country where trade with the Continent represents a substantial percentage of exports.

The matter concerns India as one among the many outsiders. True, the Continent does not absorb a major part of India's exports, but still it absorbs enough to matter in a possible period of poor trade. And the inclusion of the overseas territories in Euromarket means that tropical and colonial produce, such as India exports, will henceforth have favoured access to the Continent if it comes from the colonies of France, Belgium and Holland, and to that degree similar produce from elsewhere will be discriminated against. Finally, the question concerns all the members of GATT, who will be called upon to discuss it later in the summer in Geneva, and in particular the dangers Euromarket represents for the outsiders.

Within the territory proposed for Euromarket, one is surely entitled to some cynicism about free trade when the French Finance Minister in the same week holds out before Parliament the advantages of a partial customs union and soon after, in another speech, says the franc is so gravely endangered that he is launching a "Buy French" swadeshi campaign. The German Government describes the multiple benefits of freer trade, while one of its Ministers inadvertently touches off an acrimonious dispute about currency values, in the course of which the German press says the franc is artificially over-valued and the French press returns the compliment. The British sing the praises of a free trade zone based on Euromarket while they concert with the French plans to resist a lowering of tariff barriers that is to be proposed at this month's GATT meeting in Geneva. Meanwhile both the pound sterling and the franc continue their secular decline, which has dipped at a steeper angle since the Suez war.

These circumstances scarcely constitute a favourable background for a grandiose scheme for freer European trade. Admittedly, it is almost certain that all six Parliaments concerned will ratify the Euromarket treaty during this summer. But the proof of the treaty is in the application, and the doubters assume that the many escape clauses and the long period of gradual introduction (15 years) will be fully exploited to put off the birth of Euromarket till doomsday.

This hopeful prospect (hopeful from the point of view of the outsiders) has been enough to cause the outsider opposition in GATT to abandon plans for a veto of Euromarket when the treaty is submitted for approval this year—apart from the fact that such a veto would endanger GATT's own future by losing its support in Continental Europe. The outsider opposition proposes to concentrate its resistance not on the treaty itself, which will probably be approved though with ill grace, but on the modalities of its application. After making the gesture of approving a treaty which is technically an infringement of GATT, the outsiders will seek to obtain from the Six very concrete guarantees and safeguards against a loss of their markets in West Europe. This movement will no doubt be led by the USA, which has yet to get its 'quid pro quo' for the tariff concessions it consented to last year. Japan and Brazil reportedly fear that some of their most vital trading interests are involved and are prepared for a strong resistance to the protectionist elements in the Euromarket scheme. Cuba has lively anxieties about its sugar markets on the Continent and is hoping to organise Latin American opposition.

As for the exporters of tropical produce, who feel that their European markets have been threatened by the inclusion of the overseas dependencies of the colonial powers, they are drafting a scheme whereby Euromarket will concede them guaranteed quotas of imports, to ensure that the European colonies never succeed in wholly supplying the Continent with tropical produce. But the most seriously perturbed group of countries are the Scandinavian powers, who already have on foot a plan for their own customs union—a plan that will be killed in the egg if Euromarket even begins to work moderately well.

Norway, Sweden and Denmark, with their total population of 20 millions, were quietly proceeding with their projected customs union, which is scheduled to come into being at the end of next year, when it became clear that Euromarket was a more serious proposal than had at first appeared. It was then realised

in Northern Europe that internal Scandinavian trade represents only 10-15 per cent of each member's commerce, while trade with the area that would be included in a free trade zone including Britain represents 60-80 per cent. In these circumstances, isolation from the West European experiment is impossible for Scandinavia; it would be crippling for the northern countries to be shut out from an effective Euromarket, while for them to remain outside a free-exchange zone, such as Britain has suggested, would be the ruination of their economies. To join Euromarket, on the other hand, would entail grave economic reorganisation, and in particular would mean that these low-tariff countries would have to suffer a general raising of their import duties to nearer the West European level.

Denmark may yet be willing to meet these dangers and take the plunge of joining the common market of the Six; this is because Denmark, as an exporter of agricultural produce, is more or less obliged to follow her rival and competitor, Holland. The British free-exchange zone is of no interest to Denmark because it is to exclude agricultural goods. Norway and Sweden, on the other hand, must ultimately align their commercial policy on Britain's for Britain is their main trading partner, and the free-exchange zone presents certain attractions for them. Even Finland, which has very little commercial independence but must take orders from the Russians, will have to extort from Moscow permission to associate herself in some way with these projects for Nordic, Continental or European freer trade—unless, as is unlikely, the Communist bloc offers to absorb that 60 per cent of Finnish exports now bought by North and West Europe.

When I recall the case of Spain, which cannot afford to sacrifice her nascent industrialisation by joining Euromarket and yet will see her traditional exports jeopardised by staying out, I will have completed this rough picture of the anxieties aroused among the outsiders by the apparent progress of the common market scheme. There is no need to refer to the anxious dithering of Britain, which cannot yet decide what she should do about Euromarket, for this case is by now well known.

The notable fact is that none of the outsiders has been convinced by the reassuring argument offered by Euromarket's supporters: namely, that the common market will stimulate such a rise of living standards in West Europe that imports from the outside world will, far from falling off, actually increase. This complacent and highly theoretical piece of reasoning cuts no ice because everyone knows that decades of protectionism have produced habits that will not be readily discarded in the new organisation. There is only one form of genuine free trade, and that is global free trade —which is beyond all possibility. Partial free trade areas represent, for those who are not included in them, simply grander and more effective forms of protectionism. How serious this danger really is, or conversely how great the promise of Euromarket really is for its members, cannot yet be judged. The terms of the treaty tell us very little, for everything will depend on how and how quickly it is applied, and that in turn will depend on the level of European trade and on the movement of currency values in the years immediately ahead.

Just Out

INDIAN LABOUR CODE

Just Out

By

S. N. Bose,

Personnel Section, Bata Shoe Company Private Limited, Calcutta.

Third Edition, 1957

Price Rs. 25|-.

An Encyclopaedia of labour laws covering almost the whole field of labour legislations in India with introductory notes and some statements of objects and reasons of the different Acts and Bills. The book has been divided in the following headings: (1) Factory and Establishment Legislations, (2) Plantation Legislation, (3) Mining and Mineral Legislation, (4) Transport Legislation, (5) Child Labour Legislation, (6) Wages Legislation, (7) Social Security Legislation, (8) Industrial Statistics Legislation, (9) Industrial Housing Legislation, (10) Industrial Relations Legislation and (11) Miscellaneous Legislation. The Appendices contain many important labour matters which are not easily accessible except by reference to numerous documents and papers. Apart from the General Index, the book contains Index to Statutory Definitions.

The Book has been recommended as a reference book in M.A. Commerce and M.A. Economics by the Calcutta University and as a text book in the Social Welfare Course of the All-India Institute of Social Welfare and Business Management.

AGRICULTURE

Madras Estates Abolition Amending Bill: The President has given his assent to the Madras Estates (Abolition and Conversion into Ryotwari) (Amendment) Bill, 1956. The Bill seeks to make certain amendments to the Madras Estates (Abolition and Conversion into Ryotwari) Act, 1948, which have been found to be necessary as a result of experience gained in the working of that Act. Among other things the Bill prescribes a limit on the amount that may be deducted on account of rent and excess collections from the interim compensation so as to avoid hardship to the persons or institutions concerned. It also provides that the balance may be recovered from the final compensation amount. The Bill enables the State Government to amend or cancel notifications wrongly issued earlier declaring certain villages as 'inam' estates or under-tenure estates. Certain changes in the procedure relating to appeals preferred under the Act before the Special Tribunal are also made by the Bill so as to remove certain defects and anamolies.

*

Land Allotments to Displaced Land Claimants: Up to February 28, 1957, 2,41,195 displaced families from West Pakistan received permanent rights covering an area of 18,03,277 standard acres in the Punjab. This land is worth Rs. 81.14 crores. During February this year alone, proprietory rights in respect of 15,587 standard acres of land were conferred on 2,645 displaced families now living in the Punjab. The value of this land is Rs. 70 lakhs. The work of allotment of land to unsatisfied or partially satisfied claimants had also been revived. Punjabi land claimants, in addition to those allotted land earlier under the quasi-permanent scheme, were allotted 33,703 standard acres up to the end of 1956. Evacuee lands in the Punjab were allotted on a quasi-permanent basis to 4.77 lakh displaced families and another 33,000 families were settled as tenants-at-will. In addition, 58,000 families were given land on a temporary basis in other states. These land allottees have been given facilities to purchase the land in their occupation on instalments over a period of 15 years after making an initial deposit of 10 per cent of the price of the land. These families were generally given rural loans up to Rs. 1,162 each of which an amount of Rs. 252 is being remitted in consideration of its being a food loan. The total amount thus advanced up to March 31, 1957 was about Rs. 8.9 crores. Rs. 5 lakhs have been set apart for advancing rural loans to displaced families from West Pakistan during 1957-58.

INDUSTRY

Manufacture of Nickel Sulphate from Waste Product: A scheme for the manufacture of nickel sulphate from the catalyst waste of hydrogenation factories has been prepared by the Small Industries Organization of the Ministry of Commerce and Consumer Industries for the guidance of small industrialists. Nickel in the form of nickel formate is used as a catalyst for the hydrogenation of vegetable oils. The manufacturing process is explained elaborately in a booklet issued by the Organisation. From the stage of waste catalyst, up to the stage of packing of finished product, the different stages of manufacture have been described in the booklet with diagrams. The scheme estimates the production of 5,000 pounds of nickel sulphate from 100 cwts of waste catalyst. The booklet also gives the basic data regarding the requirements of plant and machinery, raw materials, capital investment, manufacturing cost and profit etc. Copies of the scheme can be obtained free of cost from the Office of Development Commissioner, Small Scale Industries, 114, Sunder Nagar, New Delhi and the Regional Directors of Small Industries Service Institutes in New Delhi, Calcutta, Bombay and Madras.

*

Draft Standards for Fire Extinguishers: The Indian Standards Institution has issued, for eliciting comments, three draft Indian standards specifications covering three types of extinguishers viz.: foam type, soda acid type, and c.t.c. type. These drafts cover fire extinguishers currently used in the country and lay down requirements for materials, construction chemical charge and performance test. Comments on these specifications may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before June 11, 1957.

*

Ladders for Fire Fighting: The Indian Standards Institution has issued for eliciting comments, three draft Indian standard specifications covering hook-ladders, extension ladders and wheeled fire escape. These specifications form part of a comprehensive series of Indian standards for fire fighting equipment used in the country. Earlier, draft Indian standard specifications for water supply fittings and fire extinguishers have been circulated for comments. The draft standards lay down specifications for material, design, dimensions, construction and acceptance test which includes the deflection test as well as the round test. Comments on these drafts may be sent to the Indian Standards Institution, before June, 11, 1957.

*

Colour Fastness of Textile Materials: An Indian standard method of test for determination of colour fastness of textile materials to steaming has been published by the Indian Standards Institution. Colour fastness of textiles materials is of considerable importance to the consumer. The fastness depends not only upon the nature and depth of shade of the dyestuff used but also upon the nature of the fibre and the method of dyeing or printing employed. Copies of this standard can be had from the Indian Standards Institution, 19, University Road, Delhi and its branch offices at 40/40A, Cawasji Patel Street, Fort, Bombay and P-11, Mission Row Extension, Calcutta.

*

Revised Standard for Brazing Solder: The Indian Standards Institution has published a revised Indian Standard specification for brazing solder (IS: 24-1956). The revised standard covers seven grades of brazing solder, used in brazing steel, copper alloys, nickel, and nickel alloys, designed as Cu. 80, Cu. 60, Cu. 60 Sn., Cu. 54 Sn., Cu. 50 and Cu. 43 Cd. as against four grades provided in the tentative standard issued 1950. The standard includes requirements with regard to manufacture, supplier's guarantee, sampling, chemical analysis and marking. Copies of this standard can be had from the Indian Standards Institution, 19, University Road, Delhi-8, and its branch offices at 40/40A, Cawasji Patel Street, Fort, Bombay and P-11, Mission Row Extension, Calcutta.

*

Draft Standard for Boiling Flasks: The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard specification for boiling flasks (narrow-necked). The draft standard covers three types of boiling flasks, namely, conical, flat-bottomed and round-bottomed and prescribes requirements for capacity, dimensions, construction and workmanship etc. Comments on this draft may be sent to the Indian Standards Institution, 19, University Road, Delhi-8 before June 12, 1957.

TRADE

Traffic Handled at Calcutta Port: Calcutta Port handled the record figure of 41,963 tons of steel during the second half of February, 1957. The highest figure of steel tonnage touched previously was 38,726 in the second half of December, 1956. The total traffic handled during the second half of February, 1957,was 233,241 tons, of which imports alone accounted for 106,634 tons. Imports included 16,204 tons of food grains. Amongst exports, ores amounted to 31,811 tons. The number of vessels which entered the Port during the period was 52.

*

Protection to Machine Screw Industry: The Tariff Commission has taken up for investigation the question of continuance of protection to the machine screw industry beyond December 31, 1957. In this connection, the Commission has prepared special questionnaires for producers, importers and consumers which are now ready for issue. Firms, associations and persons who desire to express their views, may obtain copies of the relevant questionnaires from the Secretary, Tariff Commission, C.G.O. Building, 101, Queen's Road, Bombay-1, specifying the interest they represent. Replies to the questionnaires and representations or memoranda which interested parties may wish to submit should be sent in twelve copies so as to reach the Secretary, Tariff Commission by May 5, 1957.

*

Schedules to Indo-Hungarian Trade Agreement Extended: Letters were exchanged in New Delhi recently between Shri K. B. Lall, Joint Secretary, Ministry of Commerce and Consumer Industries and H.E. Mr Aladar Tamas, Envoy Extraordinary and Minister Plenipotentiary of Hungary in India, extending the Schedules to the Indo-Hungarian Trade Agreement, signed on June 17, 1954, up to December 31, 1957 with the following modifications:—

SCHEDULE 'A': (Import from Hungary into India)—

The following items have been omitted: Canned tomato; cast iron enamel bath tubs.

SCHEDULE 'B': (Exports from India to Hungary)—

The following items have been added: Coffee; jam, chutnies and pickles; cashew nuts and cashew shell oil; tobacco manufactures i.e., cigar and cigarettes; cordage and ropes; paints and lacquers, bristles; tapioca and its products; fruits squashes and sauces; hardware; canned fruit and meat products; silk and rayon textiles and manufacture; light engineering goods; cotton seed oil and pepper.

FINANCE

Customs and Excise Revenue Collected in the Indian Union: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during January, 1957, amounted to Rs. 1,723 lakhs as compared with Rs. 1,423 lakhs in the corresponding month of the previous year.

The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections import duties accounted for Rs. 1,396 lakhs as against Rs. 1,125 lakhs, export duties for Rs. 296 lakhs as against Rs. 261 lakhs and land customs and miscellaneous for Rs. 31 lakhs as against Rs. 25 lakhs. The total gross collection of union excise duties amounted to Rs. 1,797 lakhs as compared with Rs. 1,351 lakhs. During the ten months, April 1956 to January 1957, the grand total of gross customs and union excise revenue realised was Rs. [illegible] lakhs as compared with Rs. 26,032 lakhs during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 11,621 lakhs as against Rs. 10,458 lakhs, export duties for Rs. 2,515 lakhs as against Rs. 3,093 lakhs, land customs and miscellaneous for Rs. 297 lakhs as against Rs. 174 lakhs and union excise duties for Rs. 15,851 lakhs as against Rs. 12,307 lakhs.

GENERAL

Trainin of Village Level Workers: Under the training programme for the various categories of Community Development projects personnel, scheme 27,416 Village Level Workers received training up to February 28, 1957, while 10,034 were receiving training on that date. The number of trained V.L.W.s included 18,091 extension workers and 8,933 basic workers, while the trainees included 5,464 extension workers and 4,093 basic workers. Group Level Workers trained up to the same period numbered 2,265, while those undergoing training numbered 186. The corresponding figures for workshop artisans were 130 and 159, respectively. Figures for Social Education Organisers are available up to March 31, 1957. These show that 2,241 Social Education Organisers received training up to that date, while 515 were receiving training on that date. These included 1,537 men, 634 women and 70 tribal personnel trained, and 360 and 136 women trainees. Eight hundred and ninety Extension Officers had been trained up to March 31, 1957, while 533 were undergoing training. Of these already trained, 605 were on the co-operation side and 285 on the industries side. Among the trainees, 308 were on the co-operation side and 225 on the industries side. As regards the Block Development Officers, 1,357 had been trained up to March 31, 1957. Among the Health personnel, 980 had received orientation training up to the same period and 22 were under training.

*

Lead Deposits Discovered in Almora District: The Geological Survey of India has discovered 1½-mile-long lead belt in Kharahi area in the Almora District of U.P. State. The belt, which is 200 to 500 yards wide, contains deposits the average per cent of which is good for commercial exploitation. The lead ore was found to contain some silver also.

*

Manufacture of Fountain Pen Ink: A scheme for the manufacture of fountain pen ink has been prepared by the Small Industries Organisation of the Ministry of Commerce and Consumer Industries for the guidance of small industrialists. The process of manufacturing fountain pen ink (blue black) is explained elaborately in a booklet issued by the Organisation. The booklet gives the basic data on the requirements of machinery and equipment, raw materials, capital investment and manufacturing cost. Characteristics of quality fountain pen ink, tests for ascertaining the quality, common defects in the manufacture, their probable causes and the ways to remedy them have all been described in detail in the booklet. The booklet contains also lists of firms from whom raw materials and equipment are avilable.

*

Kenya's Development Plan: The Kenya Government plans to spend about £23,000,000 during the next three years in expanding Kenya's economy and developing production, according to an official document published in Nairobi. The plan, which awaits approval by the Legislative Council, covers all aspects of economic and social development, including agriculture, education, medical services, housing, industrial and commercial expansion, roads, aerodromes, community development, and forestry. Kenya's steady progress in the past 10 years is reviewed in the document. Annual income rose from £53,000,000 in 1947 to £150,000,000 in 1955. Imports went up from £14,000,000 to £72,000,000 in the nine years up to 1955, while exports expanded by 260 per cent in the same period.

NEWS IN BRIEF

INDIAN

A reserve of 49 million tons of coal in the South Karanpura Coalfield in Bihar has been estimated by the Geological Survey of India, which carried out the exploratory drilling in the area.

*

The Government of India has authorised the Tea Board to make an interim release of tea export quota for 1957-58 to the extent of 56 per cent of the crop basis of the tea estates, pending final notification of the Indian export allotment of tea for the year.

*

The production and despatches of the indigenous sugar amounted to 15.45 and 8.38 lakh tons up to March 31, 1957, in the current season as against 14.02 and 6.80 lakh tons, respectively, in the corresponding period of last year.

*

The Government of India has sanctioned a loan of Rs. 4.08 crores to the Government of Bihar to cover the expenditure on the Koshi project during 1956-57.

*

It is reported a further loan of Rs. 25,000,000 will be granted during the current financial year to the State Trading Corporation to expand its activities in the export field.

*

From India, a trade team consisting of some Exporters and Importers and an official of State Trading Corporation headed by the Deputy Director of Exhibitions of the Government of India, participated by putting a collective Exhibition of Indian Pavilion and they successfully negotiated business for export of over Rs. 60 lakhs.

*

A provision of Rs. 20 lakhs has been made by the Central Ministry of Rehabilitation for granting small urban loans to displaced persons from West Pakistan during 1957-58.

*

The Government of India have sanctioned loans of Rs. 40 lakhs and Rs. 250 lakhs to Rajasthan and Madhya Pradesh States, respectively, for the Chambal project. This brings the total amount of loans sanctioned for this purpose to Rajasthan to Rs. 227 lakhs and to Madhya Pradesh to Rs. 455 lakhs.

*

It is reported that India imported during 1955-56 goods to the value of Rs. 12 crores from Sudan and exported goods to the value of Rs. 7 crores. Her imports mainly consisted of cotton.

*

The Indian Standards Institution has published a revised Indian standard specification for silver solder (IS: 192-1956).

*

The Government of India have decided in consultation with the Board of Trustees of the Coal Mines Provident Fund to grant interest to the subscribers of the Fund on their accumulations at the rate of 3¾ per cent during the year 1957-58. The rate of interest for the year 1956-57 was 3½ per cent.

*

The Public Companies with an authorised capital of Rs. 15,00,000 and 15 Private Companies with authorised capital of Rs. 48,60,000 were incorporated in the Northern Region in February, 1957. One of the Private Companies was registered in Delhi and its authorised capital is Rs. 10,00,000. It is a subsidiary body of a Government-owned concern.

FOREIGN

It is reported the French bank rate has been raised from 3 to 4 per cent. The rate for advances on securities has also been increased from 4.5 to 6 per cent. Rate on three month and 30-Day Government securities remains at 3 per cent.

*

An agreement for the withdrawal of Egyptian currency still circulating in the Sudan was signed recently. It will be replaced by Sudan's own currency.

*

Iran received over £54.3 million in oil revenues in 1956 as a result of operations carried out in the south of the country by the Consortium of international oil companies.

*

The average price of the British Wool Marketing Board's schedule of prices for the United Kingdom wool clip this year is slightly below the 1956 figure. At 51.35 d. a pound, the new price compares with 52 d. for 1956.

*

With the decontrol of prices of gold, silver, platinum and palladium, announced recently, trade in precious metals in West Germany has now, after an interval of 26 years, again become almost entirely free.

*

The Rhodesian Federation's gross national product rose from about £149 million in 1950 to nearly £356 million in 1956. The annual rate of growth of the Federations national product in recent years has been the highest in the world.

*

France in trading with other members of the European Payments Union in March had an increased deficit of $93,595,000.

*

Three leading French Banks have announced plans for a new company to finance development projects in French overseas territories. The new Company—Campagnie Financeire Pour L' Outre Mer—will have an initial capital of 250 million francs. It is backed by Credit Lyonnais, M. Rothschild Freres and the Banque de Paris et Des Pays Bas.

*

It is reported with the recent signing of trade agreement between Poland and China, China has become Poland's leading non-European customer. The trade agreement is valued at about £28.2 million.

*

Canada received a capital inflow of $6 million (£2,247,000) in January from international securities trade. In December there was an outflow of $9 million (£3,370,000).

*

Britain's exports at £297 million set up a new record last month, exceeding by £2 million the previous peak figure reached last October.

*

It is reported raw jute has been placed on open general license for export purposes in Pakistan with effect from April 3, 1957.

Special Articles:

THE BACKGROUND OF THE U.K. BUDGET

THE budget presented before Parliament recently by Mr. Thorneycroft, the Chancellor of the Exchequer, has to be viewed in the context of Britain's continued economic difficulties during the past two years.

It will be recalled that when the last budget was presented in April, 1956, Britain was in a particularly vulnerable position. The balance of payments position had steadily deteriorated and many people then thought that devaluation of the pound was inescapable. Mr. Macmillan, however, stepped in to stem the rot and adopted a dual policy of economy in governmental expenditure and of credit restrictions (including restrictions on instalment purchases) with a view to curbing the consumer demand. While subsidies on milk and bread were abolished and the first instalment of cuts was imposed on defence expenditure, the Bank rate was raised, certain investment programmes in the public sector were slowed down and Government assumed wide powers to control and regulate the fairly wide field of consumption covered by hire-purchase agreements.

These measures of disinflation helped considerably to correct the imbalance which had resulted from Mr. Butler's earlier policy of "expansion and freedom." The balance of payments position went on improving steadily, (at least until the Suez crisis), the confidence of the world in the stability of the British pound was restored and the galloping inflation which was threatening to get out of control was held in check. Had it not been for the unfortunate Suez adventure, the position would have been better still on the eve of the presentation of the budget for 1957-58.

Nevertheless, the essential problems of today's Britain remain unsolved. The problem is not merely the preservation of the value of the pound, both at home and abroad, but also the maintenance of Britain's position as an exporting country. These can be achieved only if the country's productive capacity increases, while the consumer demand is held in check—at least till such time as productivity and output can outstrip costs.

The Economic Survey report which preceded the presentation of the budget shows that these objectives were not attained in 1956 and that the outlook is rather uncertain for 1957. Although exports rose by some £250 million (in real terms) and the balance of payments improved by more than £300 million in 1956, the gross domestic product rose by just over one per cent between 1955 and 1956, the smallest increase since 1952. Even this increase in production is accounted for by increased output of the distributive and service trades: in other words, industrial production did not expand at all. The increase in exports has also to be viewed against the considerably larger increase in world trade in manufactures: the British share of this world trade did not register a rise, but continued to fall.

It is true that internal consumption was steadier in 1956 (it rose by only ½ per cent over the figure for 1955), but it did not lead to any appreciable increase in 'real' savings. This is rather surprising, particularly in view of the fact that there was a large increase in personal income (total disposable income, after taxes, rose by nearly 8 per cent). The explanation lies in the fact that the potential saver was still being haunted by the spectre of inflation. He did not want to see the real value of his savings go down, if he could help it. He, therefore, preferred to "consume" his extra earnings. As has been pointed out in a recent survey conducted by the Federal Reserve Board of the U.S.A., even restrictions on consumer instalment credit do not affect consumption appreciably over a long period: the money which consumers would have spent on hire-purchase items is merely diverted to other items. The same has been true of Britain—though to a slightly lesser degree.

The real trouble has been that productivity and output have not gone ahead of industrial costs. Plagued by the threat of strikes, both Government and the private employers in Britain have accepted, without murmur, wage increases which cannot be justified in terms of productivity and output. The instinctive and widespread assumption that stoppages must be avoided at any cost, has led to the short-sighted policy of tolerating annual increases in wages far in excess of annual increases in productivity. The lead has been given by the nationalised undertakings (e.g., railways and other transport undertakings) and private employers have merely fallen in line. The resultant increase in labour costs per unit of output has been like a halter round the neck of industries, particularly export industries. During 1956, industrial costs increased by 4 to 5 per cent, but productivity decreased by nearly 2 per cent. The outlook for 1957 is equally uncertain: with the strikes in the shipbuilding and engineering industries temporarily called off after a promised wage increase of 4 to 5 per cent, Britain will be hard put to maintaining economic balance if productivity also does not register a corresponding increase. Here, the position is further complicated by the fact that, in the highly competitive world market of today, countries like the U.S.A., West Germany and Italy are stealing a march over Britain by their superior efficiency and more advanced techniques.

This brings us to the question of the need for expansion of industrial production during 1957. Britain must produce more and cheaply, in order to pay for increased imports—imports not merely of food, but of industrial raw materials and such items as steel and machine tools which have assumed increased importance in the terms of the trade since 1950. Now, besides high wages, there are other factors which hamper production. The very attitude of labour in Britain today acts as a damper. The policy of disinflation pursued in 1956 no doubt produced a balance of payments surplus of about £233 millions, but it did not lead to that frictional unemployment which might have held labour in check. Labour merely worked for a lesser number of days and produced less. As the Economic Survey points out, the output per man-year in manufacturing industries declined by 2 per cent in 1956 from the figure for 1955. The cumulative effect of all this was that the prices of all manufactured goods rose by about 4½ per cent between 1955 and 1956 and retail prices by about 5 per cent.

An important factor for stimulating production is investment. Here also, the situation has been complicated by the fact that the nationalised industries have monopolised the major share of the real savings of the community. Although private industries contribute about 75 per cent of the country's gross domestic product, the nationalised industries appear to have made far greater demands on capital resources in relation to their output. According to "The Economist," since the end of World War II, the four main nationalised industries have obtained two-thirds of their capital expenditure from borrowings, while private industries raised only one-third of their requirements from the market. As contrasted with the nationalised industries, industries in the private sector are directly productive. Yet, these latter—and they provide the bulk of the exports—have been starved of capital.

A contributory cause in the matter of lag in production has been the high rate of taxation on the managerial, professional and entrepreneurial classes. While Britain's tax system cannot perhaps be called the severest in the world (there are countries in which the ratio of taxation to the total national income is greater than in Britain), it is particularly harsh in its incidence on those classes on whose initiative, energy and drive production largely depends.

The dilemma in Britain today is twofold. Firstly, expenditure on social programmes and on the concerns of Government, including defence, does not leave room enough for the necessarily high volume of investment required for industrial production — investment which alone can bring her in line with countries like the U.S.A., West Germany and Italy. If production is not allowed to expand, not only will she lose in the competitive race for world markets, but sufficient safeguards in the shape of more goods and higher productivity will not be generated against threats of renewed inflation and exchange difficulties. Secondly, she cannot afford to let any of her existing factories and shipyards remain idle even for a week, but the only way in which she can ensure against this contingency appears to be by granting higher wages to labour, which, in the absence of higher productivity, must increase industrial costs and once again let loose the inflationary spiral.

Mr. Thorneycroft has announced a £100 million cut in taxes. A portion of the relief would go to the managerial, professional and entrepreneurial classes; purchase tax is being reduced on certain items of consumption, and the extra duty on petrol and light oils imposed last year is being withdrawn; investment allowance for certain types of capital expenditure is being increased. The defence expenditure has already been proposed to be cut by £117 million. These measures are expected to stimulate enterprise, investment and savings, but, as has been stated by Mr. Thorneycroft himself, all these years Britain has been trying to get more out of her economy than she has put into it. The taxation relief and cuts in governmental expenditure, especially defence, will help, but unless expansion can take place "at a pace and in a manner consistent with her responsibilities as a trading nation," the year 1957 may not afford any greater grounds for cheerfulness than the year which has just ended.

WORKERS' COUNCILS IN YUGOSLAVIA

By

IVAN BOZICEVIC

(Vice-President of the Central Council of the Yugoslav Trade Union Federation and member of the Committee for the Preparation of the Congress of Workers Councils).

THE Congress of the Workers' Councils of Yugoslavia will be opened in Belgrade on June 25 this year. This will be the first Congress of its kind in the history of Yugoslavia's social development, combining two basic social functions—the function of producers and the function of managers. The congress is arousing great interest and much significance is attached to it not only in the ranks of Workers' Councils but also among the people in general. The significance of the congress arises above all from the fact that workers' self-management in production constitutes one of the essential bases of our socialist order of society. For the social ownership of the means of production and social management of enterprises, communes, public services and institutions constitute an indivisible whole for the development of the Yugoslav society.

The day when the working collectives in enterprises were entrusted with the management of the economy marked the beginning of a profound, far-reaching process in which inevitable changes took place in different spheres: in regard to the functions and character of the State organs; in increasing the rights and role of the local communities; in the decentralization of administrative functions; in the principles of the economic system; in the methodology of planning; in the role of markets and operation of economic laws; in the democratization of internal relations in the work collectives; in the character of employment; in the consistent introduction of social management into fields outside of the economy—in education, cultural life, social and health institutions, in the social insurance, and housing policy; as well as in many other political and social institutions.

The significance of the forthcoming congress also arises from the fact that this will be the first gathering of the kind of representatives of the workers' organs of management; as well as from the tasks which the Workers Councils have set before their congress. The congress of Workers Councils will be held at a time when great changes are taking place in our economy, on the basis of successes scored in the past. The building of the heavy industry has created conditions for the orientation of our further economic development towards the construction and development of the light industry, that is, towards the production of consumer goods as well as towards raising production in agriculture. At the same time the import of consumer goods is increasing. The policy of raising the living standard has been placed in the forefront. These changes mean at the same time that Workers Councils are on the threshold of a new economic era. The disequilibrium between demand and supply is being rectified, the market is becoming richer and richer which means that in future the enterprises and their organs of management will increasingly be faced with the problems of quality, assortment and prices. This means that in the future they will be confronted ever more sharply with the problems of increasing the productivity of labour, introducing more economical business methods, cutting production costs, and so forth.

The workers' management of enterprises in Yugoslavia started against the background of an underdeveloped economy. The workers' management of enterprises reaffirmed itself in a relatively brief period of its existence as an irreplaceable basis of our socialist system and as an integral factor in production.

Workers' management constituted in that period the basic source of the initiative of the working class and played a decisive role in overcoming a host of difficulties and reaching the present stage of development. The results achieved are of far greater and deeper significance than can be seen from the statistical data on production, on the productivity of labour or on the living standard. They are significant for the creation of new social relations. They mean a definite conquest of new positions of key responsibility in society by the working class. They mark its transformation into the producer-manager. The direct producer ceases to be a mere instrument of another's will, he has finally realized a long-cherished goal; to produce and at the same time control the means of production and decide the distribution of created values. The question who determines distribution policies is of fundamental significant every society. It has a direct bearing on the position of social groups and their mutual relations.

There is no doubt that the achievement of the workers' self-government is accompanied by a series of important problems and difficulties. This is quite understandable, above all because workers' management has been created in an underdeveloped economy with a young working class but more especially because the functions involved call for a high degree of knowledge, technical training and capacity to make imaginative decisions. Besides, the setting up of the Workers' councils called for changes in the economic system which caused certain difficulties to the organs of management. The transformation which took place when the enterprises were handed over to workers for management is so profound and radical that it could not have been realised without obstacles even at a higher level of development and with a more developed working class. One of the most important tasks of the forthcoming congress is to make an assessment of past successes, to analyze the experiences, examine the difficulties and on the basis of all this evaluation visualize the prospect of development and propose measures for the advancement of the system.

The problems which our rapid and exciting social development is daily posing to the working class, its organs of management, the social organizations and other social factors are numerous. Conditions change with development, new needs arise, new solutions are called for with new contents and new forms. The important problems to be examined by the congress extend over a wide range. In addition to these issues, the congress will specially examine some specific problems of various economic fields or branches, for example: workers management in transport, in communal enterprises, in enterprises with a seasonal character of labour, in retail trade, in the catering industry etc. The congress will examine all these questions in the presence of about two thousand delegates, equipped with a fund of experience gained in the past practice and helped by advice, recommendations, requests of nearly two million workers whom they will represent at the congress.

It is expected that the Congress of Workers Councils will be attended by many representatives of workers organizations from foreign countries. They will attend the congress as guests, but they will be able to take part in the work of the congress in a special commission which will deal with the forms of participation of the working class of the world in managing enterprises. Demands for management in economy and the struggle of the working class for the realization of these demands have been arising in the history of the labour movement for over a century. The social-economic development under modern conditions has contributed to making these questions internationally pressing. In some countries this demand has emerged into the forefront. The forms of these organs, as well as the degree of the rights, vested in them are different: they exist in a number of countries and through them is realized the participation of workers in different forms—through consultative, controlling, self-governing management functions. For the world today and for the ideological currents in the contemporary labour movement, it is characteristic that great differences exist in the attitudes of different workers organizations to participate in management.

The realization of the workers' right to the management of the economy is a historical process, a historical inevitability. It is essential for the modern international labour movement to visualize this necessity as well as the inevitability of a series of manifestations in the past and in the world of today. Actually what is involved here is a principle which lives perpetually in the labour movement, which strongly emerges at the time of important social movements and whose realization cannot now be postponed. In view of all this it is understandable why there is a great interest in the world for our experience—for our Workers Councils But there is hardly less interest in our country for the processes which are evolving in other countries on the same plane. The exchange of experiences on these problems of the labour movement and socialism, which will be carried out at the congress of the Workers Councils.

Economic Report from the U. S.

IMF AT WORK

(BY GUY SIMS FITCH)

WASHINGTON, April 16.—When the International Monetary Fund (IMF) this week approved a loan of $75 million for Argentina, it was bringing to a close the most active six months in its 13-year history. Since mid-October, this UN agency has made available to member States more than $1,700 million in loans and standby credits. This is larger than the agency's total transactions from March 1947, when it first began its lending operations, through April 1956.

This recent spurt does not reflect or signal radically new IMF policies. The loan and credit arrangements have been in line with the Fund's major objectives....to help provide emergency reserves for member countries that encounter short-term difficulties in meeting their international payments. Members with genuine balance-of-payments problems have little trouble getting IMF assistance, as long as they take adequate measures to correct the situation without imposing undue trade or exchange restrictions. An example is the $1,300 million credit—$561 million for immediate withdrawal, the rest on a 12-month standby basis—extended to Britain last December to help it meet the strains of the Suez crisis.

In granting Britain the maximum amount allowable—its own full quota in the Fund—the IMF was recognizing not only that sterling is a key international currency but it was also acknowledging that Britain, by not backtracking on its liberalized trade and exchange policies, was living up to the Fund's basic code. Involved, too, was a recognition of the monetary and fiscal measures taken by Britain to keep its internal economy under control. The recent $200 million standby loan to India presented a somewhat different case. It was generally agreed that India was running short of foreign exchange primarily because of high imports associated with its economic development plans. In contrast to its sister organization, the World Bank, the Monetary Fund does not help finance economic development. The Fund's directors decided, however, that the Indian credit could be approved in view of the temporary nature of India's difficulties, and its otherwise sound economic policies.

The short-term credit extended to Argentina this week—half of the Argentine quota in the Fund—will help that country overcome the strain on its foreign reserves while maintaining essential imports, particularly of capital goods. Last September, the US Export-Import Bank loaned Argentina $100 million for "urgent" economic development projects. Approval of this week's loan indicates the Fund's belief that the present Argentine government is making a substantial effort to cure the economic problems left by the Peron regime. A series of stabilizing measures recently were made public in Buenos Aires.

The recent rise in IMF activities may be said to point up a dominant fact of these times: the economic "growing pains" occurring around the world. When the Monetary Fund was set up in 1944, many experts envisaged it largely as a safeguard against international recessions. In practice, however, the Fund has had to deal with exchange problems created by economic expansion rather than contraction. Industrialized and developing nations alike have been undergoing a remarkable economic growth in the past decade. Symbolic of this, perhaps, is a new IMF headquarters building now going up in Washington. The International Monetary Fund, as one observer has put it, "is very much in business."

WHAT PRICE SUPPLIER'S CREDIT ?

By

CROESUS

FROM several recent discussions, in both official and non-official circles, one gets the impression that, while everyone has recognised the gravity of our foreign exchange problem 'vis-a-vis' the second Five-Year Plan, there seems to be a rather facile assumption that much of this problem has well nigh been solved, thanks to the proposals now being made for purchases of plant and machinery abroad on extended credit terms, an arrangement, which, by the way, has had official blessings. But that the problem is not so simple as all that should soon become obvious, if it has not already become so, notwithstanding the seeming eagerness of certain countries to come forward and assist us. An instance to the point is Japan, which has sent the Vice-President of its Import-Export Bank, Mr Kano, on an exploratory mission to have talks with the Government of India officials for supply of machinery on a deferred payment basis. Mr Kano, we are told, feels that the five-year ceiling of the Japanese Import-Export Bank on deferred payments may be relaxed in suitable cases to fit in with our seven-year deferred payment arrangement for import of capital goods. We are even told that the Japanese are now inclined to take a "sympathetic view" of India's growing needs of capital goods which may be bought on deferred payments and, pending the examination of each case on its merits, Mr Kano will even ask his Bank to take a more "liberal view" of the sale of heavy machinery to India.

Notwithstanding all the assurances of relaxation and sympathetic and liberal view of the case, it is suggested, in a very casual way, of course, that a guarantee system by the Indian Government or banks would instil greater confidence in Japanese exporters to conclude deals with private firms in India on a deferred payment basis. This only just falls short of an Import Credit Guarantee Scheme. But we cannot blame Japan, or any country for that matter for being businesslike in these matters or for demanding a relatively high rate of interest on the credit offered whether it be on the ostensible score of the high interest rates prevailing internally in those countries, or it be on the real score of the degree of risk involved. Nor can we tell—or is it dictate to—them that they shall supply us such and such capital goods on such and such terms and charge us interest only at a given rate by invoking our money-lenders' Acts or the 'Damdupat' principle. The long and short of it is that it is not as easy as it is imagined to arrange for imports of capital goods needed by us on terms which are most advantageous to us. On the face of it, it is impracticable, if not impossible, to expect a seller who is our only source, as the deferred payments system would make it, to offer us competitive and attractive terms. The procedure simply reduces a buyers' market to a sellers' market, and a beggar cannot be a chooser, even if the beggar is licensed by his Government! Moreover, as Sir John Burns, who recently retired as Chairman of the Bombay Millowners' Association and who left this country a few days ago to take up a higher assignment at home, said at the last annual meeting of the Association, "long-term credits must make a considerable addition to the ultimate cost and 'ipso facto' add, in due course, to the exchange problem." He referred to an estimate, according to which "the cost of a seven-year credit may increase the cost by as much as 45 per cent." In other words, this seemingly satisfactory solution to our foreign exchange problem is only putting off the evil day, with the evil of the day returning to us later on with a redoubled boomerang effect.

But granting we are able to solve our foreign exchange problem to some extent by resorting to the deferred payment system (which, in younger business circles, has come to be jocularly termed as the "Seven-Year Itch" even without apologies to the famous film of that name!), will it be the end of the financial problems of any one in the private sector wanting to set up a new industry even if that industry happens to have been included in the second Plan? An appropriate answer to this poser, which, I fear, has as yet troubled hardly a few people in this country, was provided by Mr. L. N. Birla when he moved a resolution urging that corrective measures should be taken to relieve the acute stringency in the money market, at the last annual session of the Federation of Indian Chambers of Commerce and Industry in New Delhi. He remarked that the problem of internal finance, which has also to be faced by one who is out to start an industry, is an even bigger one. "Unless internal resources are available, foreign exchange even in plenty is of no use. When we invest a crore of rupees, at least 50 per cent of it is required to be spent in India. Of the remaining 50 per cent with which we bring machinery, we cannot get full credit for the amount; some margin will have to be kept. So nearly 60 to 65 per cent of the capital will be required from internal resources before we can proceed with any new venture."

To find internal resources is proving to be more and more difficult with every day that passes. The capital market, in so far as the individual investor goes, seems to have gone almost dry with even the so-called good foreign propositions ceasing to attract investors readily any more. As for institutional investors, with the disappearance of our life insurance companies, the only institutions that one could approach are either wholly Government-owned or wholly influenced by the Government. In the result, it has become difficult even for those in the private sector who are able to arrange for supply of machinery from foreign countries on a deferred payment basis to make much headway. I know, for example, of quite a sound scheme for a sugar factory in the Bombay State, sponsored by a small public limited company which started with a modest cane farm and began producing only syrup, all but stalled for lack of internal resources, though assured of supply of machinery by a foreign country on the most attractive terms that any Indian firm is believed to have yet succeeded in getting, all because it cannot raise capital from the public even if it increases its capital and issues more shares to the public in the prevailing conditions of our capital market, and, unless this is done, the capital base of the company cannot come up to the expectations of the Industrial Finance Corporation (which to all intents and purposes functions as a glorified bank) to enable it to advance to the company even a small sum of about Rs. 50 lakhs! I may be told this is a stray instance which I do not dispute, but I maintain it is fully illustrative of the enormous difficulties that face industrialists and business men who are out to do something for the country by industrialising it.

COMPULSORY DEPOSITS: A TIMELY STUDY

By
CROESUS

IN order to assess the implications of the Union Finance Minister's "unprecedented" proposal regarding compulsory deposit, with the Government, of corporate reserves, the Association of Indian Trade and Industry, Bombay, recently undertook a study of the finances of some 410 companies. This is a most timely study, although its conclusions, which have now been made public, can at best be of a tentative nature, inasmuch as the relevant rules under the Act to be framed by the Government were not available to the Association. (The rules have been published since this despatch was received.—Ed.) Notwithstanding the ambiguity of some provisions, the Association ventured out, proceeding on the basis of certain available indications, such as the Finance Minister's own reassurances in Parliament, as also his reported assurances to certain commercial bodies. The results in the event of one or all of these assurances materialising have been separately indicated, which is more than anyone has a right to expect within so short a time since the proposal was made. To collect data about 410 companies—although even this number is but a tiny section of over 30,000 companies in India—covering such important industries as cotton textiles, iron and steel, paper, cement and sugar, is no mean task; no less is the labour involved in interpreting them accurately. Hence the interest in, and the significance of, the conclusions of the study in question.

How much depends on whether the rules to be made in this behalf are strict or liberal is clear from the fact that the aggregate liability of the 410 companies studied (on account of both the accumulated reserves and the reserves from current years' profits) would fluctuate as widely as between Rs. 53 crores and Rs. 8 crores. The authors are not unaware of the limitations of their study and have wisely abstained from hazarding any estimate of the deposit liability of the entire corporate sector. Yet the results of the study should leave no one in doubt as to the likely extent of the burden imposed on the corporate sector, thanks to this provision. It would be enough, to quote the findings of the study, "to complicate the ways and means position of the corporate sector and enhance considerably the prevailing financial stringency in the money market." True, the study has disclosed that there are companies which have cash resources in excess of their probable deposit liability, but even such companies may not find it possible to bear the deposit liability without impinging seriously on their requirements of day-to-day working capital. In other words, their position too is not very much more comfortable than that of companies which may not be equally fortunately placed with regard to their cash resources 'vis-a-vis' their deposit liabilities.

An unfortunate effect of the compulsory deposit system, as the study rightly observes, would be to extend the Government's control on the investment of corporate funds. For, unless the Government permits the release of the deposit, the company concerned cannot effect any expansion it may wish to embark upon, and the Government has made it clear that it will allow withdrawal only for "such purpose connected with the business of the company as is approved by the Central Government." It is not improbable that, until it is able to ensure the flow of resources to its own commitments in the public or State sector, the Government will freeze the deposits by merely saying that a given expansion scheme is not acceptable to the Central Government. Thus, no scheme that does not fall within the ambit of the second Five-Year Plan can be normally expected to get the Central Government's approval.

A pertinent poser raised by the study is whether the Government would agree to accept the compulsory deposit in the form of cash or in the form of both cash and Government securities; if the former were to be the rule, it would drive the companies involved to unload their holdings of Government securities on a none-too-willing market which is sure to create more headaches to the powers-that-be. The authorities would then be called upon to support the gilt-edged market by purchases, and, to this extent, the position would be that what the Government takes with one hand, it would have to give back with the other. A second consequence would be a withdrawal of bank deposits by companies that may have excess resources, or a resort to bank loan, or both. Even as it is, our banking system is creaking with the weight of heavy advances, some at least of which are for purposes which the Government itself regards as of paramount importance.

In view of these indisputably undesirable consequences, the study has made the following suggestions, which deserve to be carefully considered.

i) Conditions to be laid down must be as lenient as possible, at least to begin with;
ii) the paid-up capital must be ignored in computing the corresponding amount of fixed assets;
iii) loans and debentures must be allowed to be set off against deposit liability;
iv) reserves used as working capital must be exempted from the deposit scheme;
v) staggered payments must be introduced so as to spread the due dates of payment for various companies instead of concentrating all of them at one and the same period, and
vi) prompt and liberal withdrawal facilities should be allowed for fixed as well as working capital purposes.

MONEY

ITS NATURE AND MANAGEMENT

By B. T. Thakur

How can India guard against diminution in the purchasing power of money? What is deficit financing? What are the functions of Central Banks and the conditions for their healthy existence? What is the purpose of the Reserve Bank of India? These and other questions facing India today are dealt with clearly and comprehensively.

This book is the expanded version of Prof. Benoy Sarkar Memorial Lectures delivered by Mr. Thakur at the Calcutta University in 1956.

Here is a book which will be useful not only to Economists, bankers, administrators and politicians, but also to intelligent readers and students.

BUSINESS NOTES

ENGINEERING GOODS EXPORT

THANKS TO the foreign exchange crisis, a further sense of urgency has been added to the question of export promotion. The Government have no doubt taken a number of measures in this direction like liberalisation of export licensing covering commodities that account for nearly 80 per cent of our export earnings, adjustment of export duties, setting up of export promotion councils, attention to standardisation and so on. But the difficulties in the way of export trade are still many and some of them facing the engineering industries were brought out in the address of Mr. D. N. Jalan to the Engineering Export Promotion Council. While reviewing the activities of the Council since its inception 18 months ago, he pointed out that the problem was not only one of assisting the manufacturers to export their goods, but the more formidable one of making them export-minded, because there was a general reluctance on the part of engineering industries to take risks in foreign markets. Also, since they had already good markets at home enabling them to earn good profits, they were less eager to enter the export trade. This is an undesirable state of affairs from the long-term point of view and Mr. Jalan urged the need for constant propaganda so that the manufacturers may show a greater readiness to participate in the export trade of the country. Mr. Morarji Desai, who also referred to this question, said that the stability of export industries would depend on the quality of their products and the price and suggested that if they were not deterred by the quantum of profits, they would have good markets overseas. It is to be seen how far the Union Minister's appeal will have its desired effect and the manufacturers will take a long-term view of their interests.

It is at the same time necessary for Government to remove the difficulties the industry has to face in its export trade and take positive steps to encourage exports. While welcoming Government's decision to increase the quota of iron and steel to the exporting industries, Mr. Jalan urged the need for early implementation of the decision so that it can give a fillip to the export trade. The Council has also suggested that pig-iron and steel should be made available at prices which were prevailing in the country before the recent increase was effected in order to bring uniform prices at every railhead in the country. Mr. Jalan complained of the cumbersome rules with regard to the grant of rebate of import duty on imported raw materials used in the manufacture of engineering products which were exported and pointed out how so far the member-firms had not been able to secure the benefit intended. Referring to the difficulties with regard to shipping space, he explained how the shipping companies were not inclined to export heavy engineering items which were not so remunerative from the point of view of freight as other items. The apprehension entertained by the industry that the export trade built in Ceylon after considerable labour may be lost to competitive countries if timely action is not taken certainly deserves Government's immediate consideration.

Mr. Jalan in his address also referred to the activities of the Council outside the country where the survey of foreign markets has to be regularly and constantly pursued. The Council has sent two trade missions, one to Burma and the other to British East Africa, Ethiopia and Sudan. The visit of these delegations would naturally have created interest in Indian goods and there is bound to be good scope for developing the exports. However, there can be no room for complacency as markets everywhere tend to be competitive. Manufacturers here have obviously not only to pay attention to quality and price but take every step necessary for meeting the particular requirements of the buyers in the various markets.

FINANCE FOR TEA

APART FROM being one of the largest single earners of foreign exchange, which alone makes the tea industry of considerable significance in the Indian economy, it provides employment to close on a million of people, and makes substantial direct contributions to the exchequer in the form of excise and other taxes. It is, therefore, obviously important to help the industry to overcome its problems which are mainly of finance for meeting working costs in the short period and for rehabilitation, modernization and expansion in the long period. According to the report of the Plantations Inquiry Commission, the total working capital requirements of the industry amount to about Rs. 90 crores on an average. In the case of long-term finance, the Commission has assessed a capital requirement of Rs. 11.12 crores for five years for the 176 companies which contemplate such expenditure and expect to find funds either from their own or from external sources. It may be mentioned that on the basis of the replies received by the Commission, it has arrived at the finding that the Indian-owned companies are in greater need of external funds than non-Indian companies.

Be that as it may, the major consideration that should be taken into view for granting assistance should always be—as explained by Mr. Morarji Desai before a conference of the interests concerned—whether the applicant is deserving. Whether the loan applied for is for the purpose of meeting working costs or making capital expenditures can hardly form the main criterion for a financing institution to reject or grant the loan. All that would appear to be necessary to ascertain before granting a loan would be the extent to which such a loan would improve the production capacity of the particular unit and if the unit would be able to honour the terms of the loan. There is, however, the need of providing finance for repayment of past debts in suitable cases. Strictly speaking, this may not go directly into increasing the production capacity, but indirectly it would bear fruit inasmuch as the estates would be facilitated to work successfully after the redemption of debts. At the present time, however, the country's economy is experiencing a monetary stringency which may render it difficult for banks to meet the requirements of the tea industry in full. It is, therefore, a matter of striking a co-ordination, in the supply of finances, between the State Finance Corporations and other commercial banks in order that the funds that may be available may be utilized to the maximum advantage.

PROGRESS OF HANDLOOM INDUSTRY

THE THIRD Annual Report of the All-India Handloom Board covering the activities of the Board during the financial year 1955-56 makes a relatively more heartening reading than did its predecessor. In view of the important role assigned to the handloom industry in the second Five-Year Plan and the prominent place that the handloom occupies as a means of providing employment in the decentralised sector of the industry, the report acquires added significance. Though the output of the handlooms has been increasing steadily from year to year, one still has doubts about the ability of the handloom fully to meet the increase in demand as also the wisdom of the Government in continuing to freeze cloth output of cotton mills not intended for export. Thus, production of handloom cloth increased from 1,109 million yards in 1952 to only 1,454 million yards in 1955. The position in 1956, however, (judging from the trend in the first three months for which period only figures are available) shows that there has been no further in-

crease. Even the 1955 figure of 1,454 million yards compares with the relatively ambitious target indicated by the Planning Commission, under the second Five-Year Plan, of 3,200 million yards.

An important development, according to the report, is that there has been an enormous increase in the number of Weavers' Societies. It is well known that the Government's intention is to aid weavers through co-operatives as far as possible. According to the report, there are now over a million looms in 8,000 primary Weavers' Co-operative Societies, and efforts are being made to draw more looms into the co-operative fold. The development of housing colonies for weavers with loans and subsidies from the Government of India should go a long way towards ensuring the well-being of the weaving community.

By far the most heartening aspect of the report relates to the vigorous efforts being made by the Board to increase exports of handlooms. It is encouraging to note that exports, particularly those to America, are steadily rising. As the report itself says, "as against 90,000 yards valued at Rs. 2,38,000 exported in 1954, the quantity exported in 1955 amounted to as much as 219,000 yards, valued at Rs. 5,53,000! Exports during January to April, 1956 amounted to 280,000 yards valued at Rs. 5,97,000." The prospects for exporting more of our handloom products to the U.S.A. appear to be quite bright. More and more interest is being evinced by American business men in this behalf and it is left to the handloom interests to make the best use of the opportunity by considerably improving the quality of fabrics and by proper organization.

"INDUSTRIAL DEMOCRACY" IN INDIA

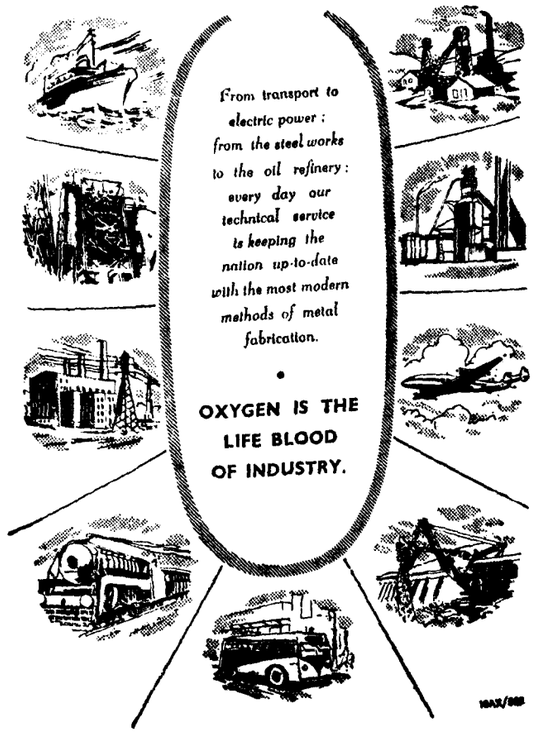
INDIA'S AMBASSADOR in America, Mr. G. L. Mehta, has recently emphasised the importance of the role of foreign assistance in the industrial development of this country. In the context of the enormous outlays in India's Plans, foreign assistance is no doubt marginal; nevertheless, its 'crucial role' cannot be over-estimated. In a world full of suspicion and fear, this country is boldly proceeding on her programme of economic progress against heavy odds of widening gaps between resources and requirements. Since there does not appear to be any inclination, at least for the present, to re-phase the Plan, one solution of the problem would seem to be to obtain savings and investments by 'forcible' measures. This is neither desirable nor easy. The alternative would be to draw on foreign assistance with the twin object of reducing the burden of the people, who are by and large unequal to bearing it, and ensuring a rapid development. And it is America alone that can assist to any significant extent. It is also important to remember that India can benefit greatly by drawing upon the experience, gained over time, in America in the sphere of scientific organisation of production, so necessary for stimulating growth.

It is, therefore, heartening that Mr. Mehta's counterpart in Delhi, Ambassador Ellsworth Bunker, has appreciated the growing need of American participation and assistance to help India obtain higher living standards. He was at great pains to explain and illustrate by his own country's example the important part played by European financial assistance in the expansion of American railways, steel production and coalmining, among others. India, too, over the last ten years or so, has been the beneficiary of large amounts of American aid, totalling around Rs. 430 crores. The largest single component in this has been the US Government aid amounting to a little under Rs. 400 crores and the rest was made up of assistance from either private organisations or other agencies. Again, technical assistance and economic aid have been of the order of well over $325 million. Under the Indo-American Technical Co-operation Programme, some 7.52 lakh long tons of steel and manufactures have been supplied or are being made available to India. The wheat loan of 1951-52 accounts for a total of $190 million with repayment to be spread over a long period at 2¾ per cent interest rate. A good proportion of the amount is expected to be utilised in India itself. In themselves, the figures are impressive. But it is being increasingly realised that they are not altogether sufficient and that America should take a growing interest in helping to make the Indian experiment of an "industrial democracy"—where material resources of the community are so distributed as to serve the common good and where private industry has ample scope — a success.

AUTOMOBILE PRODUCTS

MR. M. A. CHIDAMBARAM in his speech as Chairman of the Automobile Products of India Ltd., gave a heartening account of the work of the company for the year ending July, 1956. The company's effort to extend its activity had met with great success and all the schemes were progressing on sound lines. He pointed out how normal production from the brake lining plant was established from the beginning of the new financial year and the product has been found comparable in every respect with the American products. Of greater interest was the fact that the company was able to establish a steady and rising demand for the Lambretta Motor Scooter and steps have already been taken for their phased manufacture.

Referring to the finances of the company, Mr. Chidambaram said that the Industrial Finance Corporation had in all granted a loan of Rs. 30 lakhs of which the company has so far drawn Rs. 20 lakhs. The turnover of the company had increased from about Rs. 27 lakhs in 1954-55 to about Rs. 134 lakhs in the year under review and it was estimated that on the basis of current sale volume, it may be well over Rs. 2 crores in the year which will close on July 31, 1957. Stressing the need for additional capital, Mr. Chidambaram revealed that it was proposed to approach the existing shareholders and the public shortly for a further capital of Rs. 20 lakhs. During the year under review, the company earned a net profit of Rs. 4.73 lakhs and the Chairman was confident that it would be possible for the company not only to continue payment of dividend on preference shares, but also to resume payment of dividend to the ordinary shareholder. The company can thus congratulate itself on its achievement.



PRODUCTION AND EXPORT OF SALT

THE TOTAL salt production in the country at the present moment is 8 crore maunds annually. Nearly 7 crore maunds of it is produced from sea, and one crore from Sambhar Lake in Rajasthan. The inland consumption is about 6½ crore maunds. Although India is not only self-sufficient but surplus in salt, still it is insufficient for various industries for manufacture of soda carbonate and other bye-products of salt. In order to meet that contingency and to develop sufficient quantities for export, the Government of India have decided to increase the present production to 10 crore maunds under the second Five-Year Plan. Rock salt too is being recovered from rock salt mines in Mandi district of Himachal Pradesh. India is producing 1½ lakh maunds of crude salt annually. Nearly 1,000 maunds of iodide salt is also being manufactured daily by a factory located near Sambhar Lake.

The decision to increase salt exports to East Asia is to be welcomed as it would fetch us more foreign exchange. India exported a record quantity of 75 lakh maunds of salt this year. All exports to Japan and other foreign countries from Madras, Andhra and Bombay ports were allowed to continue on 'free' licensing to encourage export of salt. Exports from West Coast (Saurashtra and Kutch) to Japan and other foreign countries continued under licensing system, though licences were granted liberally to manufacturers as well as recognised general exporters. All exports of salt from India by sea continue to be exempted from the levy of cess.

Company Meeting

AUTOMOBILE PRODUCTS OF INDIA LTD.

Chairman's Speech at the Seventh Annual General Meeting of Automobile Products of India Limited, delivered on 17th April, 1957 at the Registered Office of the Company at Bhandup, Bombay.

It gives me great pleasure to welcome you all to the Seventh Annual General Meeting of the Shareholders of the Company. The Report and Balance Sheet for the year ending 31st July, 1956 have been in your hands for some time and with your permission, I shall take them as read.

During the year under review, your Company earned a net profit of Rs. 4,73,393-1-5. After adding the previous year's profit of Rs. 91,112-9-3 and excess provision for Taxation written back of Rs. 89,681-4-0, a sum of Rs. 6,54,186-14-8 has been carried forward as Profit in the current year. Out of this amount, the Directors have transferred a sum of Rs. 90,000 to Development Reserve and have proposed to pay the balance of the arrears of dividend on Preference Shares for the years 1953, 1954 and 1955. It is also proposed to pay dividend on Preference Shares for the year which has ended on 31st July, 1956. Thus, so preference dividend would be in arrears. This would absorb a sum of Rs. 5,60,000 and a sum of Rs. 4,186-14-8 will be carried forward as balance in the Profit and Loss Account. I hope hereafter it will be possible for the Company not only to continue payment of dividend on Preference Shares, but also to resume payment of dividend to the ordinary shareholder.

Your Company's effort to extend its activity has met with considerable success and all the Schemes are progressing on sound lines. I shall now give you a resume of the various activities in which your Company is engaged.

BRAKE LINING PLANT

The machinery was received towards the end of 1955 and was installed and trial operations commenced towards the close of the financial year. Normal production was established from the beginning of the new financial year and as regards quality, the Product has been found comparable in every respect with the American product. Selling arrangements have been concluded with Messrs. Firestone Tyre & Rubber Co. of India Private Ltd., and our experience in the few months indicates that we will have a rising volume of demand and a substantial share of the market.

LAMBRETTAS

I have indicated in my speech last year that the marketing and distribution of the Lambretta Motor Scooter had been supported by a well-planned advertising and sales promotion programme. This helped us to establish a steady and rising demand for the vehicle, which has now been recognised in India as a very economical and reliable form of transport for the individual, for the small trader and for the large commercial and industrial concerns. We had indicated to the Government that we would proceed to implement our phased manufacture once we establish a steady demand for the new product in the country, at any rate not later than the end of the 1st year. Orders have been placed through our Associates in Milan for all the machine tools, jigs, small, standard and special tools to implement the 1st phase of our approved manufacturing programme. Shipments of the above machine tools etc., have started and all the equipment will be in India in good time. We have also concluded an arrangement with Messrs. Kirloskar Oil Engines Limited to manufacture the Engine and Transmission Unit on a 5-year phased programme period. By this arrangement, a considerable responsibility, which should have normally rested on the Company, has been shared with Messrs. Kirloskar Oil Engines Limited which is a well-known firm with considerable experience in the manufacture of Engines, Machine Tools and other similar products. This arrangement has the Government's concurrence.

MEADOWS DIESEL ENGINES

The Assembly Line and Test House capable of assembling and testing 20 engines per day have been installed during the year. We have been negotiating with two primary manufacturers of commercial vehicles for fitment of Meadows 330 Engines as original equipment. One of them have accepted the engine and vehicles fitted with our engines are currently under test with the other. Agreements will be entered into with the primary manufacturers as soon as the tests are over and the engines approved by them. As the Meadows is a recognised engine and is fitted as original equipment on such well-known vehicles as Guy, Scammel and other vehicles in UK, we believe that the tests will be only a matter of formality since the engine is already a proven one.

Our Director, Mr. P. Matthen, was deputed along with our Chief Planning Engineer, to order the required machinery for the first and second year manufacturing programmes. Orders for machinery for a value of about Rs. 26 lakhs have been placed in consultation with our Associates and we have already received about 40 per cent of the machinery, which is in the course of erection. I am glad to inform you that 19 out of 95 components to be produced in the first year are under manufacture. Your Company is confident of implementing to schedule the phased manufacturing programme it has submitted to Government. In fact, we are currently ahead of schedule.

BORG & BECK CLUTCHES AND LOCKHEED BRAKE SYSTEMS

During the visit to UK of Mr. Matthen, orders were placed for machinery for manufacturing Borg and Beck Clutches. This machinery is expected to be received in the course of the next few months. Meantime, we have started assembly of Borg & Beck Clutches out

of C.K.D. components. Manufacture of Rubber Parts in the Lockheed Brake System was established and samples have already been approved by our Associates in UK. The machine tools for the Master Cylinders, Wheel Cylinders, Hose Sleeves etc., will be received in Bombay before the end of this year.

BUILDING PROGRAMME

It has been decided to expand the main factory building on the northern side to secure covered accommodation of about 20,000 sq. ft. to install the machinery and plant that will be arriving. The building is expected to cost about Rs. 2 lakhs and is expected to be completed before the next monsoon. It will also be necessary to erect warehouses at the Service Parts building to secure further accommodation of 30,000 sq. ft. The construction of this building, which has been sanctioned by the authorities, will be taken up only next year.

FINANCE

As stated in my speech at the last Annual General Meeting, we obtained a loan of Rs. 12½ lakhs initially from the Industrial Finance Corporation of India to cover the Brake Lining Plant. This was reduced to Rs. 9 lakhs to cover the actual cost of the Brake Lining Plant and a second application was submitted to them for a further loan of Rs. 26 lakhs to cover the requirements of the other Programmes. The Corporation has been pleased to grant a further loan of Rs. 21 lakhs making in all Rs. 30 lakhs, and we have drawn Rs. 20 lakhs out of this loan so far. As indicated last year, our annual turnover will go up to Rs. 3 crores and it will, therefore, be very necessary for your Company to augment its liquid resources by another Rs. 25 lakhs to meet the needs of working funds. Our turnover has increased from about Rs. 77 lakhs in 1954-55 to about Rs. 134 lakhs in the year under review and on the basis of current sale volume, will be well over Rs. 2 crores in the year which will close on 31st July, 1957. In order to maintain the progress of the Company, it will be very necessary to bring in the additional capital at an early date. A proposal to issue Second Preference Shares for Rs. 5 lakhs in payment of the arrears of Preference Dividend has already been submitted to you and has elicited favourable response from many of the shareholders, for which I am grateful to them. It is proposed to approach the existing shareholders and the public shortly for a further capital of Rs. 20 lakhs.

TARIFF COMMISSION'S REPORT ON THE AUTOMOBILE INDUSTRY

By a Resolution dated 6th August, 1955, the Government of India, Ministry of Commerce and Industry, had asked the Tariff Commission to enquire into and recommend the fair ex-Works and selling prices of the automobiles under indigenous development. The Commission took the opportunity to make a comprehensive review of the Industry since the time of its first Report in 1953. Your Company submitted a Memorandum to the Tariff Commission and appeared before the Commission at the Public Enquiry. We were also invited to a private hearing at which the programmes of the Company were discussed. We are grateful to the Chairman and the Members of the Tariff Commission for the patient hearing they gave to us and for the sympathetic consideration of our representation.

The Commission submitted its Report on 6th October, 1956. It has estimated that the annual demand for motor vehicles is likely to increase by 1960-61 to 40,000 commercial vehicles and out of this demand about 70 to 80 per cent is expected to be for the diesel-driven type. The Commission has also observed that for the effective implementation of the second Five-Year Plan, the number of additional commercial vehicles required would be much higher, provided the various factors hampering the demand were removed. It has also recommended that priority should be given for the manufacture of commercial vehicles rather than passenger cars and out of the commercial vehicles, the maximum demand would be for diesel vehicles and every effort should be made to meet this demand and that additional capacity required for commercial vehicles should be installed in the existing units rather than new ones.

These recommendations of the Commission were accepted in principle by the Government. The Commission has also emphasised the importance to establish within as short a time as possible the complete manufacture of the Engine, Transmission, Rear Axle, Suspension and Chassis Members. The recommendations of the Tariff Commission should go a long way in establishing the complete manufacture of the commercial vehicle in India within the second Five Year Plan period.

I would like to take this opportunity of tendering our grateful thanks to the Ministry of Commerce and Industry and the Development Wing (Auto.), Government of India, whose help, co-operation and advice have been invaluable.

Our thanks are also due to Mr. F. Matthen, his executives and all members of the staff and factory workers for the whole-hearted efforts that they have put in for the expansion of the activities of the Company.

In conclusion, I earnestly hope that the Company will maintain its progress, and will become a leading manufacturer in the Automobile Industry.

COMPANY AFFAIRS

PROBLEMS OF JUTE MILLS

Over some time in the recent past, jute mills have been experiencing trouble as a result of a combination of various factors. There was expected improved demand from overseas markets which did not materialise with the result that stocks of finished goods increased so rapidly that half-way through the year 1956 they stood at almost double the figure recorded at the end of December, 1955. It will be remembered that it was about this time that the decision to unseal looms was first taken.

As provided in the working time agreements of the Indian Jute Mills' Association, the mills worked 48 hours per week with 12½ per cent of the total looms sealed until January 8, 1956. This was further reduced to 10 per cent from January 9 and to 5 per cent from February 20. Since the middle of 1956, the industry sealed 2½ per cent of the total looms from July 16 and a further 5 per cent on September 17; in other words, the loomage under seal reverted to the original position.

One result has been that stocks have since decreased and prices of finished goods also rose, though subsequently there was a fall. The rise in prices was caused, to an extent, by the uncertain situation in West Asia which induced all consuming markets to improve their stock position. Generally, however, the trading conditions were difficult and almost at no time was it possible to transact business simultaneously in raw jute and goods at a profit.

McLEOD & CO. GROUP OF JUTE COS.

The accounts of the four companies—the Alexandra Jute Mills, Ltd., the Chitavalsah Jute Mills Co., Ltd., the Empire Jute Co., Ltd., and the Kelvin Jute Co., Ltd.—in the group, for the half-year ended June, 1956, show that the working has not been altogether satisfactory and the profits have not been able to maintain the preceding half-year's level. While in the case of Chitavalsah the drop is only marginal, in that of others the decline is disturbing, particularly for Kelvin where profits have sharply slumped from a little over Rs. 3 lakhs to as low as some Rs. 1 lakh.

The financial results of the individual companies are reviewed below:

The Alexandra Jute Mills, Ltd.

The profit for the half-year, after providing for depreciation (Rs. 78,225) and taxation (Rs. 1.30 lakhs) and after taking into account the balance brought forward (Rs. 1,38,329) and dividends forfeited, amounts to Rs. 3,07,207. The Directors have recommended the following distribution: Dividend on 9,000 preference shares at 7 per cent per annum, for the half-year (or Rs. 3-8 per share) Rs. 31,500; dividend on 6,000 ordinary shares at 10 per cent per annum (or Rs. 5 per share) Rs. 30,000. That leaves a balance of Rs. 2,45,707 to be carried forward.

Chitavalsah Jute Mills Co., Ltd.

After making adjustments and providing for depreciation and taxation—Rs. 85,173 and Rs. 3.35 lakhs respectively—and after adding amounts brought forward, including unclaimed dividends, bad debts and the credit balance of Rs. 1,32,949, the profit for the half-year totals Rs. 4,99,785. Of this Rs. 92,820 has been paid as bonus to workers and Rs. 1 lakh transferred to reserve for machinery renewals, leaving Rs. 3,06,965 available for disposal. The Directors' recommendations are payment of a dividend on 5,000 preference shares at 7 per cent per annum (or Rs. 3-8 per share) absorbing Rs. 17,500. Another Rs. 1,88,438 is to be paid as dividend on ordinary shares at 12½ per cent per annum (or Annas 10 per share). The balance of Rs. 1,01,027 is to be carried forward.

The Empire Jute Co., Ltd.

The Company's profit for the half-year totals Rs. 1,36,491 which includes Rs. 78,204 being balance brought forward, as well as Rs. 2,197 and Rs. 5,259 being unclaimed dividend forfeited and over-provision of liability in respect of previous period written back. The profit figure has, however, been arrived at after making provision for depreciation and taxation at Rs. 1,04,900 and Rs. 77,000 respectively. From the available balance, the Directors have recommended payment of a 7 per cent per annum dividend (or Rs. 3-8 per share) on 10,000 preference shares, which absorbs Rs. 35,000. On ordinary shares, the recommended dividend of 10 per cent per annum (or 8 Annas per share) absorbs another Rs. 75,000 which leaves Rs. 1.10 lakhs to be carried forward.

The Kelvin Jute Co., Ltd.

The profit is Rs. 1,09,946 after providing for depreciation (Rs. 2,69,025) and taxation (Rs. 90,000). Together with unclaimed dividend forfeited (Rs. 10,536) and the credit balance brought forward (Rs. 1,10,851), the profit amounts to Rs. 2,31,333. The Directors' recommendations are to pay a 7 per cent per annum dividend (or Rs. 3-8 per share) on 10,000 preference shares, which takes away Rs. 35,000. On the 21,000 ordinary shares a dividend at 10 per cent per annum (or Rs. 5 per share) has been recommended which absorbs Rs. 1,05,000. The balance thus left, amounting to Rs. 91,333, is to be carried forward.

JARDINE HENDERSON GROUP

For the same period of six months, the working results of the two companies in the group, namely Kamarhatty Co., Ltd. and Kanknarrah Co., Ltd. are still more depressing. Kamarhatty has incurred a net loss of Rs. 2,84,936 after taking into account Rs. 86,624 being the credit balance brought forward and after taking credit for Rs. 1,22,999 being Commission waived by the Managing Agents. To the deficit is to be added Rs. 30,000 as provision for depreciation, raising the total to Rs. 3,14,936. This debit balance is to be carried forward.

In the case of Kanknarrah, the loss amounts to Rs. 9,06,331, after taking credit for Rs. 95,409 being Commission waived by the Managing Agents and without making provision for depreciation. The loss stands reduced to Rs. 8,24,216 after deducting the balance of profit brought forward of the order of Rs. 82,115. Together with the provision for depreciation amounting to Rs. 1 lakh, the debit balance amounts to Rs. 9,24,216 which has been carried forward.

NEW JOYRAMPORE COAL CO., LTD.

The profit and loss account of the Company for the half-year ended December 31, 1955, which is available now, discloses a net deficit of Rs. 1,11,096. This is largely made up of the loss of Rs. 1,01,726, representing the difference between the written down value and the sale proceeds of most of the Company's assets. The Company had undergone a loss in the preceding half-year also; the loss brought forward, amounting to Rs. 1,26,182, when added to the loss of the half-year under review, makes a total loss of Rs. 2,37,278. The Directors have recommended this to be carried forward.

In June, 1954, the Company's colliery was inundated and it has not been possible to resume mining operations since then.

COMMODITY NEWS AND NOTES

FINAL ESTIMATE OF CASTORSEED

The all-India final estimate of castorseed, 1956-57, puts the current year's area and production at 1,405,000 acres and 129,000 tons, as against the partially revised estimate of 1,408,000 acres and 124,000 tons, respectively for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Agriculture. This shows a decrease of 5,000 acres or 0.4 per cent in area and an increase of 5,000 tons or 4.0 per cent in production during the current year as compared to last year.

INCREASE IN AREA OF POTATOES

The all-India first estimate of potatoes, 1956-57, puts the current year's area at 573,000 acres as against the corresponding adjusted estimate of 560,000 acres for 1955-56. This shows an increase of 13,000 acres or 2.3 per cent in area during the current year as compared to last year. The increase in acreage during the current year has been shared by Bombay, West Bengal, Punjab, Madhya Pradesh, Madras and Mysore States, and has been attributed generally to favourable climatic conditions at the time of sowing. This increase has, however, been offset to some extent by decreases recorded in Uttar Pradesh, Bihar, and Rajasthan.

NEW MINERAL DEPOSITS IN ORISSA STATE

Deposits of talc, iron ore and Kaolin have been located by the Geological Survey of India in the Keonjhargarh District, Orissa State. Scattered in four areas the talc deposits contain 50 per cent of silica content. The important area where deposits are found lies south of Baliadih in a ¾-mile-long and two-furlong-wide patch. Another patch lies south and west of Keonjhargarh over a distance of 2½ miles. Two other deposits are minor in nature and are distributed in an area of 300 feet by 50 feet in the broad valley and south-west of Dalimpur.

Large deposits of high grade iron ore are noted in south-west of Suakati, north-east of Upar Jagar and Ichanda. The deposits south-west of Suakati are one mile long and three furlongs wide; at Jagar they lie over a length of one mile and a width of two furlongs. At Ichanda the deposit occurs as a thick float over an area of four square furlongs. Good deposits of Kaolin—a kind of clay—are found at several places around Keonjhargarh and several places in a zone extending over one mile west of Keonjhargarh.

INCREASE IN ACREAGE OF TOBACCO

The all-India first estimate of tobacco, 1956-57, puts the current year's area at 826,000 acres as against the corresponding adjusted estimate of 809,000 acres for 1955-56. Thus, the current year's estimate shows an increase of 17,000 acres or 2.1 per cent in area over last year. The increase in acreage during the current year has been shared by almost all the States. This increase has been particularly marked in Andhra Pradesh, Madras, Rajasthan and Bihar, and has been attributed to favourable climatic conditions at the time of sowing. This increase has, however, been offset to some extent by decreases registered in Bombay and Uttar Pradesh.

INCREASE IN SUGAR PRODUCTION

The all-India final estimate of sugar, produced directly from cane in vacuum pan factories puts the current season's production at 20.21 lakh tons against 18.62 lakh tons during the previous season. This shows an increase of 1.59 lakh tons or about 8.5 per cent in production during the current year as compared to last year. The increase in sugar production has been shared mainly by U.P. (78,000 tons), Bombay (51,000 tons), Punjab (33,000 tons) and Madhya Pradesh (11,000 tons). In Bihar, however, a fall of about 11,000 tons is expected.

U.S. IMPORTS LESS TEA

Tea imports into the U.S.A. during 1956 fell to 101,690,000 lbs. the lowest since 1952. Ceylon maintained the position of leading supplier last year with 42,870,000 lbs. while India's share was lower at 31,720,000 lbs. U.S. offtake of tea from Ceylon and India in 1955 was 78,560,000 lbs. and 36,560,000 lbs., respectively.

MANGANESE ORE EXPORT

The outlook for manganese ore exports is grim, according to reports from Calcutta. British Guiana, which started mining operations two years ago, has entered the export field and first shipments in December last year totalled 250 tons. Brazil is another country which had launched upon an ambitious plan to increase manganese ore production. Ghana is also expected to become a potential competitor of India in the export field. Indian manganese ore exports declined to 481,336 tons during the nine months ended December, 1956 from 1,030,000 tons in the same period of the previous year due to increased competition from Russia and South Africa.

PEAK CAR OUTPUT IN CANADA

Output of motor vehicles in Canada in the first three months of this year was a record at 127,023 units according to the Bureau of Statistics. This compared with 106,376 units for the first quarter last year and the previous record of 112,452 units in 1955.

FALL IN WORLD TIN OUTPUT

The International Tin Study Group of the Hague in its synopsis of the world tin position for January and February, 1957 stated that world mined production of tin in concentrates decreased from 1,52,000 tons in December last to 14,300 tons in January. World tin metal consumption during December, is estimated at 13,200 tons compared with 13,900 in November.

INDIAN EXPORT OF WOOL

The Government of India has released a further quantity of raw wool for export during the period April-September, 1957. Exports will be allowed by established shippers and new comers as in the previous period.

ANNEXURE TO THE NOTICE

(Explanatory Statement as required by Section 173 of the Companies Act, 1956)

To,

THE SHAREHOLDERS,

OF THE STANDARD MILLS CO., LTD.

In conformity with the Companies Act, 1956, the following Explanatory Statement as required by Section 173 of the aforesaid Act sets out all material facts relating to the Special business mentioned in the Notice dated 18th March, 1957.

In Respect of Item No. 8 of the Notice:

The Company has rented from Messrs. Mafatlal Gagalbhai & Co. Private, Ltd., a portion of their build-

ing known as Mafatlal House in Back Bay Reclamation, as a monthly tenant at a monthly rent of Rs. 1,736 from 1st January, 1956. The said Messrs. Mafatlal Gagalbhai & Co. Private, Ltd., are an Associate of Messrs. Mafatlal Gagalbhai & Sons, the Managing Agents of the Company. The said premises are suitable for the Company's office and will be required by the Company for a long time even after 1st March, 1958, when the said contract will terminate under Section 361 of the Companies Act, 1956. As the said Mafatlal Gagalbhai & Co. Private, Ltd., are an Associate of the Managing Agents, the said contract requires to be approved under Section 360 of the Act by the Company in General Meeting by a Special Resolution. It is desirable that the Directors be authorised to continue occupation of the said premises after 1st March, 1958, when the said contract will terminate under Section 361 of the Companies Act, 1956, on such terms and for such period as the Directors may deem fit and also to take such additional accommodation in the said premises either before or after 1st March, 1958, for such period and on such terms as they may deem proper.

The following Directors of your Company are partners in Messrs. Mafatlal Gagalbhai & Sons, the Managing Agents of the Company, and they are also Directors and Members of Mafatlal Gagalbhai & Co. Private, Ltd., and hold shares in the said Company as set out below against their respective names and as such they are interested in the said contract of tenancy:

1. Shri Arvind N. Mafatlal—Holds 1,158 Ordinary Shares and 5,250 Preference Shares.
2. Shri Yogindra N. Mafatlal—Holds 1,308 Ordinary Shares and 5,250 Preference Shares.
3. Shri Rasesh N. Mafatlal—Holds 1,458 Ordinary Shares and 5,250 Preference Shares.

Shri Hemant B. Mafatlal is a partner in Messrs. Mafatlal Gagalbhai & Sons, the Managing Agents of the Company. He is also a Director and Member of Mafatlal Gagalbhai & Co. Private, Ltd., and holds 3,650 Ordinary Shares and 1,480 Preference Shares in the said Company and as such he is also interested in the said contract of tenancy.

In Respect of Item No. 9 of the Notice:

The Company has made arrangements with the Sassoon Spinning and & Weaving Co., Ltd., an Associate of Messrs. Mafatlal Gagalbhai & Sons, the Managing Agents of the Company, for supply of air-conditioning facilities to an area of 3,174 sq. feet of the Company's office premises in Mafatlal House, Back Bay Reclamation, Bombay, as from 1st January, 1956, at the rate of Rs. 794 per month, and as such the said arrangement requires to be approved by the Company in General Meeting by a Special Resolution under Section 360 of the Companies Act, 1956. The said arrangement will terminate on 1st March, 1958, under Section 361 of the Companies Act, 1956. It is desiraole that the Directors be authorised to continue the said arrangement after 1st March, 1958, for such period and on such terms as the Directors may deem fit and also to take such further air-conditioning facilities in respect of the Company's office premises either before or after 1st March, 1958, for such period and on such terms as the Directors may deem proper.

The following first four Directors of your Company are interested in the said arrangement inasmuch as they are Directors and Members of the Sassoon Spinning & Weaving Co., Ltd., and holds shares in the said Company as set out below against their respective names, the fifth one is only a Member in the said Sassoon Spinning & Weaving Co., Ltd:

1. Shri Arvind N. Mafatlal—Holds 550 [illegible]
2. Shri Yogindra N. Mafatlal—Holds 55[illegible]
3. Shri Kaushikprasad Chandulal—Holds 55[illegible]
4. Shri Jayantilal D. Vasa—Holds 3,000 shares
5. Shri Chimanlal B. Parikh—Being Member h[illegible] 100 shares.

Shri Hemant B. Mafatlal is a partner in the Messrs. Mafatlal Gagalbhai & Sons, the Ma[illegible] Agents of the Company. He is also a Dire[illegible] Member of the said Sassoon Spinning & Wea[illegible] Ltd., holding 50 shares therein and as such h[illegible] interested in the said arrangement.

In Respect of Item No. 10 of the Notice:

Shri Krishnalal Ratilal Sitwala, who is a[illegible] of Shri Hemant B. Mafatlal, a partner in Mafatlal Gagalbhai & Sons, the Manging Agent[illegible] Company, and who is in the employ of the [illegible] as a Part-time Spinning Consultant on a[illegible] salary of Rs. 200, and as such, the approval of[illegible] pany in General Meeting under Section 3[illegible] Companies Act, 1956, is necessary.

By Order of the Bo[illegible]

For The Standard Mills Co.,

MAFATLAL GAGALBHAI &

Managin[illegible]

The Sassoon Spinning Weaving Company, Limi[illegible]

The State of the Nation

WITH the election of the President and the Vice-President of the Indian Union and the assembly of the new Lok Sabha in the second week of next month, it is hoped that the powerful political current which has operated in the last few months will abate and give place to a sober, and possibly not so cheerful, view of our economic affairs. It has been a misfortune that these three months have been so distracting politically; they have contained a growing pressure on our economic affairs. It is right that the situation should be viewed now in objective terms.

The electorate cannot solve economic problems with the remarkable ease with which it chooses political representatives. And here there will be no agreement on the result. There will be one view of these presented by the Finance Minister in his Budget Speech next month. Almost certainly it will be a far gloomier picture than the one he presented in March, though that was by no means free from concern. What can be said about the state of the nation's economic affairs at this time?

A leader of the Indian business community, Mr. G. D. Birla has chosen a similar theme for his response last week in Bombay to an address of congratulation on the title conferred on him recently by the President of India. Mr. Birla admits that the business world is facing a crisis, but refuses to believe that such a crisis should be a major deterrent to enterprise. He believes that a business man lives in some such world as this with losses and gains essentially intermittent, the results of what should be a continuous operation of enterprise. Mr. Birla does not read into the current economic situation any reason for a loss of heart in the business community. Almost certainly he was not speaking as a typical Indian business man in this situation. If he were, the need for encouraging his colleagues in industry would have been redundant. While, therefore, one needs to record, with the weight which is due to it, Mr. Birla's robust optimism, one need not claim that it represents either the view of the business community or necessarily the kind of assessment that the Finance Minister will produce next month.

It is clear enough that something is wrong with the economic system. Is it that agriculture has paused excessively whilst industry has rushed forward unduly, or that the balance between them has been disturbed by an undue rise in the price of food grains not connected with a shortage of supply. Or is it that monetary stringency, irrespective of the performance in agriculture and industry, has hindered new enterprise; or that expectations have become bearish because of the possibility of heavy taxation in May? Any of these possible explanations might fit a particular situation but it is probable that all together are required to explain the relative suspension of economic optimism at this time. The one fact that is clear is that something is wrong. Therein lies the danger; everyone is conscious of a disease. Nobody has a certain remedy.

A partial remedy would, however, appear to lie in quickly overcoming the food crisis — a crisis that is now developing in much the same way as in the beginning of the first Plan and belying the optimism engendered by the heartening performance of agriculture in the last three years of that Plan. Already 'near famine' conditions are reported in Bihar; and Uttar Pradesh and Bombay, not to speak of Kerala and Rajasthan, are just on the borderline of scarcity. Prices of rice and wheat in the free market have shot up by 50 per cent or more in recent weeks in Bihar alone, and fair price shops with their slender supplies have obviously not been adequate.

In so far as this situation is the result partly of a relative scarcity of supplies — for it is clear that the maximum possible marketable surplus can be had only when production is about 65 million tons — the obvious remedy lies in rushing more supplies to the fair price shops and opening more of such shops. But where are the supplies? Fortunately the planners are not wholly unprepared for this emergency. They have merely to negotiate a revision of the 1956 agreement with the United States under which 3 million and odd tons of surplus wheat are to be imported by the middle of 1959. Already in the first year (1956-57) imports of wheat and rice of the order of 800,000 tons appear to have come in under the agreement. A possible revision of the agreement so as to enable this country to import the entire agreed quantity of wheat by the middle of 1958 is clearly called for. It may be that American wheat alone can save the situation now even as it did in that dismal year of 1951. The only bottleneck here is that of shipping, but this can be partly overcome by possible chartering of ships on special terms. The prospect, for the returning ships, of carrying manganese ores and the like (thanks to the deals put through by the State Trading Corporation) to the United States and elsewhere may well facilitate expeditious deliveries of food grains. Fortunately for this country, the Suez canal is open again, and this would mean a great deal in terms of time and tonnage saved.

The American wheat would come in handy not only for relieving scarcity and holding the price line (which can only be upset by rising food grain prices in the initial stage) but, what is no less important, for making its rupee sale proceeds available on a larger scale for the Government as well as the Refinance Corporation in the current year. The Refinance Corporation, in particular, should go some way in relieving monetary stringency in the private sector. The report that in the Finance Minister's recent discussions in Bombay this question of stringency figured prominently, encourages the hope that something positive will be done soon to arrest the rise in the demand for bullion and quicken the pace with which bank deposits can rise. For, the Finance Ministry is certainly not happy over a situation in which bank deposits have not risen in keeping with the increased notes in circulation. The problem here is how to deal with sources which are not acquainted with banking and productive investment -- sources to which there has undoubtedly been a significant shift of income in recent years.

As we go to the press, the news comes in that the Government are reordering the second Plan's priorities in the light of the critical food situation and the foreign exchange crisis. The annual plan for 1957-58 may well be pruned to a size of Rs. 750 to Rs. 800 crores as against Rs. 915 crores proposed in the Interim Budget. At the same time the report (which quotes authoritative sources) has it that the planners have no intention of cutting down the targets of the second Plan. This, in turn, may mean that the Plan period would be extended.

One might argue that while we wait for the Finance Minister's Budget proposals, one should not add, as is relatively easy on this occasion, one's own despondency to the feeling of psychological defeat which tends to spread. As there is no need for excessive despondency, there is no justification for excessive optimism. A process of consolidation is under way in our economic affairs; necessarily this process will correct errors on both sides. One can look forward to such a process of consolidation without losing hope for a brighter future or without hankering after the unhappy past beyond which we have already moved.

Company Deposits

THERE is reason for the business community to heave a sigh of partial relief that the enforcement of compulsory deposits of company reserves will not be so drastic as it originally threatened to be. When the Finance (No. 3) Bill, 1956, was introduced in Parliament, the business world was treated to a shock. This extraordinary measure of fiscal control caused genuine apprehensions that the corporate sector would be hamstrung in the matter of the use of reserves at a time when stringency in the money market had long put it in hard straits. It appeared as though additional stringency for the private sector did not count for much if only it would ease stringency for the public sector.

The Finance Minister's assurances on the floor of the House as well as outside helped to clear the fears and suspicions. Confidence was steadily created that handicaps to legitimate business activity would be minimised. The Finance Ministry showed no impatience in framing the rules for the administration of the deposits. The rules which have now been framed in a draft form reflect the fruits of preliminary consultation. Comments and suggestions have been invited before the final version of the rules is decided. There is a promise that the administration of the deposits will be informed by practical understanding.

The draft rules which have been released for scrutiny are restricted in their application only to compulsory deposits of a maximum of 75 per cent of the balance, in excess of one lakh of rupees, of current annual profits, after deducting tax and dividends but not depreciation. The second category of deposits provided for relates to a maximum of 25 per cent of the accumulated profits and reserves not represented by fixed assets. Enforcement of this latter provision has been postponed for the time being. This is a significant decision. It saves a large majority of industrial and business concerns from rendering compliance with an obligation which would have caused considerable upsets. It is to be presumed that this dubious experiment will not be launched until the working of the deposits in respect of the relatively small category is watched and observed for its consequences on company finance and legitimate business activity. Here is to be found encouraging assurance that this novel method of financial control is to be put on trial with a cautious approach. If this wise decision is to retain its grace, there must be no hurry to bring accumulated profits and reserves within the clutches of statutory compulsion.

The provisional rules have evoked good reaction in a general way. There are certain saving features which would operate to blunt the rigours of governmental control in a sensitive segment of the corporate sector. The overall intention behind the rules is to temper control with sweet reasonableness. Deposits can be made in the form of government securities at market value in lieu of cash. This option has two-fold advantage. While it facilitates companies which have invested their reserves partly in government paper, it saves such securities from depreciation under pressure of sales and also saves the Reserve Bank from the possible contingency of open market operations.

Representations can be made for relief from the obligation to make the deposit in a lump sum, although the procedure is cumbersome. A Board of Referees is to be set up to entertain appeals against the decisions of the Commissioners of Income-tax in respect of requests for deposits in instalments as well as in claims for refunds. The efficacy of the Board of Referees must obviously depend upon how far it is inclusive of a wide cross-section of interests as well as technical experts in company finance. Banking companies and insurance companies have been granted exemption from the obligation to make deposits. Electricity undertakings engaged in generation or distribution of energy are already subject to a complicated scheme of financial controls under the special Act. They have earned well-merited exemption.

Significant gaps nevertheless remain in the draft rules which ought to be wiped out in the final version. Since the statutory provisions governing compulsory deposits are to be extended in the first instance to current profits, the definition of profits becomes crucial to the nature of the scheme. The definition of income adopted in the rules is the same as that accepted for the purpose of assessment of income-tax, where certain outgoings of monies are included in the income. This process inflates the size of the profits notionally. There is need to modify the definition to take cognizance of such outgoings so that what is brought within the ambit of compulsory deposits is the actual surplus representing the objective position. The only loans allowed to be set off against the deposit liability are those borrowed against the security of fixed assets and no others. Other types of borrowings for the purpose of business cannot be discriminated against, for this is the effect of the rules as now drafted.

The omission in the rules of any time limits for decisions to be taken by Commissioners of Income-tax or the Board of Referees is most certain to cause delays that may add to the strains of financial management of companies. The due date for making deposits is fixed as June 30 and variations admitted in consonance with the accounting years of companies are quite restricted. It coincides with the period of peak expenditure for industries like tea plantations. Apart from these facts, the net effect of a rigid, uniform deadline for making deposits is bound to exert heavy pressure on banks by withdrawal of deposits or demands for loans. Staggering is clearly dictated on grounds of overall convenience.

While some small mercies have been shown in the form of dilution of the scheme of compulsory deposits, the extent to which the rigours of control of reserves can be mitigated will be conditioned entirely by the manner in which the scheme is administered. Determination of the quantum of deposits will undoubtedly entail numerous complicated problems. Refund of deposits forms the real crux of the entire scheme. While it is now reasonable to expect that repatriation will not be difficult, it can hardly be believed with confidence that the operation will be painless for company managements. The official machinery and the Board of Referees have to impart positive helpfulness to the administration of this novel control.

The Future of the Akali Dal

THE Akali Dal, the premier religio-political organization of the Sikhs, is in a crisis. The crisis is caused by the sharp cleavage in its ranks on whether the merger with the Congress should continue. Formally, the Akali Dal has eschewed politics and a large number of its leaders and members have joined the Congress. But the Akali chief, Master Tara Singh, with a substantial following, is again on the war path against the ruling party.

The Akali chief had actually become bellicose before the ink on the Congress-Akali merger agreement was dry. Some at least of his colleagues — Sardar Hukam Singh and Giani Kartar Singh notable among them — had not lately been enthusiastic about their chief's sound and fury. They remain firmly with the Congress, and have professed unflinching loyalty to the party of their adoption. The result is that they are, on the one hand, suspect in the eyes of several local Congressmen, who have lost largely their former positions and influence inside and outside the Congress, and on the other, they are derided by many of their own community who have come to harbour a vague grievance against them for what they consider as a betrayal of the *Panth*. This puts the adherence of the merger in an unenviable position; it also encourages the Akali chief inflexibly to oppose them and the Congress. Since it was he who had brought the merger agreement with the Congress, the situation contains an element of irony. In the din, confusion has become worse confounded.

On second thoughts the Akali chief was apparently assailed by misgivings about the wisdom of the merger. He was bold enough to admit that he had committed a grievous mistake, and that the conflict in his mind did not allow him to reconcile himself to the separation of religion and politics. The mental conflict was evidently accentuated by the post-merger course of events. Master Tara Singh appears to have felt impelled to avenge the attitude towards him of the Congress leaders in the matter of distribution of tickets on the eve of the recent general elections. He contends that, since the Akali nominees won 111 of the 132 seats contested in the elections to the Gurdwara Parbandhak Committee, the distribution of the tickets to the Akalis by the Congress in the recent general elections should have been in similar proportion. But the nationalist Sikhs, who had been routed by the Akali nominees in the Gurdwara Parbandhak Committee elections, were given nearly as many tickets. This, the Akali chief maintains, was grossly unjust and contrary to the promise made by the Congress leaders.

It was on this ground that while he supported some of the Congress candidates, he opposed others and put up his own candidates in 31 constituencies. But far from seeing the wisdom of the Congress choice, reflected in the utter defeat of his nominees -- only two of his candidates managed to scrape through — he has been embittered and has allowed himself to be driven to carry on incessant propaganda against the Congress and against his former colleagues. He is determined to maintain the separate political entity of the Sikhs and is working for the revival of the Akali Dal as a political organization.

According to his former colleagues, now in the Congress, the Congress-Akali merger was a logical culmination of the agreement between the two parties on the Regional Formula for the Punjab. Under that Formula, the Congress had accepted their demand for the recognition of Punjabi as a regional language of the State; and amended the Scheduled Castes Order so as to grant equal treatment to Hindu and Sikh backward classes. The Sikh demand for a Punjabi-speaking State was not conceded. But the Akali Dal had itself willingly given up, in effect, this demand in favour of that for a region inside the Punjab State. Their demands having been conceded, it was incumbent on the Akalis to make a concerted effort along with Congress, to implement the Regional Formula. These efforts could be fruitful only if all the forces pooled their resources and collaborated. This reasoning explains why the general body of the Akali Dal unanimously advised its members to join the Congress. (The advocates of the Hariana Prant –the Hindi-speaking zone of bilingual Punjab — had already joined the Congress once their fears of the rule of the people of the Punjabi zone had been set at rest.)

This merger was, in fact, a reunion of two sister parties estranged in 1945 on the issue of Pakistan. Ever since its inception in 1925, the Akali Dal had been fighting shoulder to shoulder with the Congress in the country's struggle for freedom. Even after 1945, when it fought the general elections as an independent entity, the Akali Dal extended full co-operation to the Congress during the Simla Conference and in the parleys with the Cabinet Mission. Soon after partition, in March 1948, the Akali Dal advised its legislators to join the Congress Legislative Party in the East Punjab Assembly to strengthen the hands of the nationalists against communal forces. It recalled its legislators in July, 1950, when it, especially the Akali chief, felt that the Sikhs were being discriminated against. With the agreement on the Regional Formula, it was but natural that the Akali Dal should have again coalesced with the Congress.

Doubtless, the general public judges the Sikhs by Master Tara Singh's actions and statements. But despite the fact that he is still the most powerful Sikh leader, it would be wrong to equate him with the Sikh community. This is evident from the fact that concrete results of the merger have been heartening despite his relentless campaign against it. The Communists who lost no time in exploiting the Congress-Akali strife to their advantage, witnessed a rise in the stature of some of their leaders, but could not consolidate their position. During the recent general elections all of their stalwarts have been defeated. Only in a few neglected constituencies did the Communists win.

This does not, however, imply that the fires of Communism and communalism have been finally extinguished in the Punjab. There are still many unresolved misunderstandings of the past between the two communities. It would be easy for trouble-makers to exploit these differences. Since many Congressmen still view political and economic problems in a narrow, communal perspective, the Congress organisation may once again be riven with factionalism to the great advantage of the Akali leader. The future of the Akali Dal may thus be said largely to depend on what goes on inside the Congress.

Indian Airlines carry over 500,000 passengers every year

India's highway in the sky...

—and it belongs to you!

Servant of modern India, her national airline covers over 20 million miles a year, operates 132 flights each day

EMPLOYING over 9,000 trained personnel, flying over 20 million miles every year and operating 132 daily flights — Indian Airlines Corporation is the largest internal airline in the East . . . and it belongs to the people of India!

Indian Airlines Corporation is a mighty organisation, doing a mighty job — and it is proud of its role in transporting goods and mails, conquering vast distances, bringing the peoples of India ever closer together.

THE WEEK'S NOTES

SQUARING THE CIRCLE

IT IS a pity that the role of foreign capital is often neglected in current discussions pertaining to the Plan. Mr. K. P. Goenka has, therefore, done well in drawing attention to this aspect in his lucid presidential address at the annual meeting of the Indian Chamber of Commerce this week. He has shown how foreign capital is important not only from the point of view of getting loans to Government projects in the public sector but primarily also for supplementing the resources of the private sector in dire need of additional capital resources. The current financial stringency and the foreign exchange crisis have only added a further sense of urgency to the need for attracting foreign equity capital in a greater measure than hitherto and it is for Government to create the necessary favourable conditions in this respect. Mr. Goenka has here made a number of suggestions which deserve consideration. One is that despite Government's Industrial Policy Resolution, a more positive policy is necessary with regard to nationalisation, which is still causing apprehension in the minds of foreign investors. Unless this is done, more and more of foreign capital is likely to seek outlets in the many under-developed countries in Africa, Latin America and Europe. Secondly, there is the question of double taxation, and unless relief is given in this regard, the foreign investor is not likely to show any excessive interest in the development plans of this country. Allied to this is also the question of giving tax relief to foreign technical personnel who should be given the necessary inducement to make it worth while for them to come to this country.

Another aspect of foreign assistance to which Mr. Goenka has drawn attention relates to the deferred payment plan with regard to the import of capital goods. Here he has pointed out certain snags and expressed doubts whether the main suppliers of our capital goods would be in a position to make them available under the conditions stipulated by Government. For one thing, the period of payment is important and the producers are likely to deal with countries who offer more attractive terms. Already some countries seem to be demanding Government guarantees regarding the payment of outstanding amounts. Secondly, from the point of view of the importers, it is estimated that on the basis of deferred payment, the cost of capital goods may further increase by about 25 per cent. It will be thus hardly surprising if the deferred payment plan leads to a slowing down of imports. In the face of the many difficulties which he himself has shown, it is not known how Mr. Goenka feels that the level of imports of capital goods has to be maintained to fulfil the targets. It is here that one notices a fallacy. Mr. Goenka has correctly diagnosed the current economic malady as arising from shortage of funds for economic activity, deterioration in exports and a rising price level in the agricultural sector. Yet he fights shy of suggesting restrictions in the targets of the Plan as he apprehends that it would tend to slow down the rate of the country's economic development. If the resources are not simply there, how does it avail in clinging to impossible targets? Can one ever square a circle?

US ENVOY ON STATE'S ROLE

MR. ELLSWORTH BUNKER, US Ambassador to India, has made a number of speeches in recent weeks—each important in its own way. But his latest speech at the Indian Junior Chamber of Commerce in Delhi is easily the best of them all in the sense that it displays his sympathetic understanding of the vital basic needs of the Indian economy. The American envoy's view that economic development in India would require greater Government participation than in his country because the rate of capital formation here is relatively lower than in his, is significant. In recognising that India's mixed economy has assigned a crucial role to the State —a role in no way qualitatively different from the one performed by the State in his own country—Mr. Bunker, however, is not unmindful of the quantitative difference. In the United States, the State has all along laid down the rules of the competitive incentive system so as to ensure fair competition. By sponsoring construction projects in which the immediate return would have been too low to attract private capital, it has stimulated private investment in several lines. But this pioneering role of the State has all along been within certain defined limits consistent with the American belief "that wherever private capital finds the incentive to invest, the job will be done more economically and more efficiently than by the Government and, therefore, at a lower cost to the consumer."

While it may be conceded that an under-developed country like India has necessarily to assign a larger role to the State, the supremely relevant question is how much larger it can be. Mr. Bunker's observation that in both India and the United States private investment has a major role to play is no doubt true of the present. What cannct be clearly foreseen is where the State will stop in India. If, as the American Ambassador thinks, India potentially is a much larger mass market than the United States, the logical thing to do would be to continue to maintain the present position of the private sector relative to the public sector, so that competitive private enterprise may cater efficiently and cheaply to the prospective mass market.

ASIAN JURISTS MEET

THE ASIAN JURISTS' CONFERENCE, now in session in New Delhi, is the first of its kind in this continent. Its convening is dictated by an urge to have a fresh approach to international law so far based on European concepts. The Asian Legal Consultative Committee (which has convened the conference) is to examine questions that are under consideration of the International Law Commission, advise the Governments of participating countries on legal problems that may be referred to it and exchange views and information on legal matters of common concern. Participating at the Conference are delegations from six Asian nations—Burma, Ceylon, India, Indonesia, Japan and Syria. Iraq is also a member of the Committee. The absence of Pakistan, Nepal and China from this meet is indeed regrettable, but it is to be hoped that in due course these countries also will come in.

It is well known that international law as we know it has been developed to suit the needs of European colonial powers and protect the metropolitan interests. With the emergence of independent countries in Asia and Africa, the need to adapt and interpret international law in the light of changes in the social and political structure of the contemporary world has become imperative. This point of view was implicit in Prime Minister Nehru's speech at the Conference in the context of the metropolitan powers' use of colonial possessions for nuclear tests. The question posed by the Prime Minister — Can any nation claim a right in international law or moral law to poison the atmosphere of the earth through test explosions by nuclear weapons? — is, therefore, a pertinent one. On the moral aspect of the question there can hardly be two opinions. But the point is, will it carry any weight with Britain, U.S.A., and U.S.S.R.? Even if the World Court were

to give an advisory opinion against the nuclear tests, where is the power to enforce it? The situation as it stands is to be regretted. International law is supposed to guard and protect the international community. But there is an atmosphere of uncertainty and insecurity all round. How international law can be readjusted and enforced is the supreme question. It is for the Asian jurists now to give a lead on the various issues left untouched by the Western Jurists in the matter of international law.

JORDAN IN TRAVAIL

THE EXPLOSIVE situation that has developed in Jordan is an episode in the protracted internal debate —to put it euphemistically—to decide whether she should align with the West. The first rumblings were heard when General Templer unsuccessfully tried to rope Jordan into the Baghdad Pact. During the crisis that followed Sir John Glubb was dismissed. The present development is the outcome of the refusal of Mr. Suleiman Nabulsi, recently the Prime Minister, to support the Eisenhower doctrine or to invite the American President's envoy to Amman, while at the same time taking steps to open diplomatic relations with the Soviet Union.

For the moment King Hussein has the upper hand, having dismissed Mr. Nabulsi and General Abu Nuwar, who was Chief of the Army Staff. But his final victory is far from assured. The new Government under Dr. Hussein Fakhri el Khalidi has every sign of being a temporary expedient. The inclusion of the outgoing Premier as Foreign Minister in the new Cabinet betrays perhaps that its existence will depend on the support of the National Socialist Party. This support may carry with it the obligation to continue the previous Government's policies. The fact that King Hussein has agreed to Mr. Nabulsi's inclusion in the Cabinet could mean that he has reconciled himself to them. Already, he has begun reiterating his belief in "Arab neutralism" and anti-Semitism. He cannot be unaware that aid from Egypt will only come if he toes the Egyptian line in foreign and domestic affairs. And aid from her Arab neighbours is essential for Jordan's continued independent existence, now that she has practically cut adrift from Britain's favours.

However, if Mr. Nabulsi's policy is discarded, and he resigns, it is doubtful if the new Government will be able to command a majority in Parliament. It would thereafter survive, if at all, as a minority Government supported by the King and the army. The future course of the crisis will thus depend to some extent on the attitude of the army, which is uncertain. The army's morale and discipline seem already to have been affected by the resignation of General Ali el Hayari and the reported dismissal and arbitrary transfer of some sixty officers following an unsuccessful coup. But the greatest threat to the King does not come so much from the army; it comes, rather, from the explosive population, made up largely of embittered Arab refugees from Israel, who number more than one-third of Jordan's population. Dr. Khalidi is their acknowledged leader and spokesman. But the wooing of their support will mean adopting a strong anti-West accent; popular opinion blames the West for their present situation.

An issue which may be said to play a part in the conflict is Jordan's relations with Egypt and Syria. There is a reckonable movement in favour of some form of federal union between the three countries. The idea was supported by Mr. Nabulsi and opposed by King Hussein. The King in this matter appears to be counting on Saudi Arabian support; the possible integration of these countries is by no means to the liking of King Ibn Saud. Israel, too, cannot remain indifferent to any development which might affect Jordan's status as an independent country. Should Jordan collapse politically, its neighbours would certainly move in: a vacuum invites power; when there are more than one power, only the strongest will fill it. And Jordan, none of the Arab countries can forget, was created artificially by the British. They cannot also forget, and this Jordan also will not, that it was the only Arab country to gain territorially when Israel was created. Since Arab-Israel relations cannot be insulated from the cold war, the crisis in Jordan has all the makings of a major catastrophe, with implications that reach beyond Jordan's borders. The prospect does not appear very bright.

The hope that King Hussein will yet be able to control the situation as did the Shah of Iran in a not very dissimilar situation is remote. The King of Jordan does not enjoy the same status in the country's social and political life. In addition, the people are not bound by a feeling of nationalism: they do not regard themselves as "Jordanians" but either "displaced Palestinians" or, worse, as "South Syrians". Uncertainty is, therefore, bound to continue. One can only hope that it will not erupt into something worse.

*

Reordering of Plan Priorities: It is learnt that finishing touches are now being given to the annual plan, which will be presented to the first session of the new Parliament. The main interest in the annual plan centres on how the second Five-Year Plan's priorities are proposed to be re-arranged in the light of the deteriorating food situation, difficulties of foreign exchange and other factors not foreseen when the Plan was approved by the last Parliament. The annual plan is expected to reveal to what extent the country is banking on the deferred payment scheme to meet the difficulties of foreign exchange. It is pointed out in this connection that as a result of the visit of British industrial leaders to this country, the Government have already been promised credits to the tune of about Rs. 30 crores.

OUTSTANDING PROGRESS

31st December, 1956

Deposits Exceed ..Rs. 106 Crores

Working Funds Exceed ..Rs. 141 Crores

The P. N. B. secured about 20% of the additional deposits of all scheduled banks in the country during 1956

PROBLEMS OF A FREE PRESS

By

ODYSSEUS

THE FUNDAMENTAL POINT that has emerged from our discussions on the quality of the newspapers that are likely to be aimed at India's masses as they become increasingly literate is that it must be recognised that only a tiny minority in any country wants to read serious news about politics, industry and public affairs. The masses in all countries are not, and are never likely to be, interested in such matters. They want to be entertained. Experience shows that what entertains them most is romantic or thrilling stories, or just plain gossip, about people in public life, ranging from Prime Ministers to film stars. It is a mistake to think that if you ensure that no papers catering for such tastes are allowed to exist, the masses will read serious papers. In fact, they won't read anything at all. They will go to the cinemas. And if a paternal bureaucracy ensures that there is no romance or excitement in films and that only informative, educational, or highbrow films can be seen, the cinemas will soon be empty.

Before Hitler seized power, the German press fulfilled the public demand for variety and entertainment and total circulation was substantial. After Hitler had suppressed all the independent papers and turned the remainder into government propaganda sheets, circulation slumped.

If a newspaper finds that it raises its circulation by curtailing its news columns and increasing the space given to strip cartoons, it is obviously satisfying an unsatisfied demand and I cannot see why it should be prevented from doing so. (You might just as well say that a confectioner's shop must only sell bread and refuse to offer cakes or chocolate). Providing always, that is, that the newspaper engages in honest romance and thrills and does not offend against decency or public order. Experience in other countries shows unfortunately that many newspapers fail to observe this proviso and exploit sex and crime in a socially indefensible way.

It is interesting to note that within a few years of each other, India and Britain have taken similar steps towards the solution of these difficult problems by setting up Press Councils. The Indian Council is a statutory body with the authority of the law and the state behind it. The British Council is a voluntary body seeking to raise standards by strengthening professional self-respect among journalists and newspaper proprietors.

The problems raised in this column were discussed at length in Part I of the Report of the Indian Press Commission of 1953. To all concerned about the future of an independent press in the free countries of the world, I commend this Report for the astonishing breadth and detail of its research and for its obvious honesty of purpose. The Report shows on every page its deep anxiety over the possibility of bias in newspapers. Its own bias is equally obvious: it is suspicious of private enterprise, individual ownership, sees in the profit motive the root of all evil, and in government control the springs of all good. All the more, therefore, to its credit is the way in which it keeps its bias within reasonable control and makes successful efforts to be fair to ideas, practices, and persons of which it disapproves.

HYPNOTISED BY A MYTH

I cannot resist a modest parade of my own bias by pointing out that the Press Commission is hypnotised by its conception of a serious newspaper as an unbiased, public service enterprise. It suffers from the illusion that you can, by thinking up enough rules and regulations, creating enough non-profit-making trusts, diffusing ownership, and limiting profits, free newspapers from all human weaknesses and ensure a production in which all aspects of the serious news are produced in perfect balance with all-wise editorial comment. The Commission was misled into these conclusions partly by the widespread diffusion in India of the myth, refuted by all experience, that private enterprise and individual ownership are inherently sinful, profits proof of depravity, Socialism the cure for all evils, and that once a government department has got control of any activity and inserted the word "Public" in its title, perfect impartiality and freedom from all bias automatically follow; partly, also, by noting that the proprietors of 'The Times' and the 'Observer' of London have, in the public interest, limited their sovereign controls over their papers by transfering their ownership to Trusts. The object of these Trusts is to prevent the sale of a paper like 'The Times' to a new Northcliff who might change its traditions and character.

But the Indian Commission is mistaken in thinking, because 'The Times' owners have surrendered the right to sell their paper without the approval of the trustees, that they have rid themselves of the obligation to make as big a profit as they can. The day that 'The Times' and the 'Manchester Guardian' cease to satisfy a public demand, they will cease publication, and the only test by which they can know if they are satisfying demand is whether they are making a profit or not. The Socialist can never see this point because he assumes that an institution of which he happens to approve (e.g. a particular serious newspaper) has a God-given right of eternal survival, irrespective of public demand for it, and if it fails to make a profit, he insists that the state must meet the loss. This process (known as getting away from the evils of the profit motive) can, however, continue only so long as other industrial or commercial enterprises in the state are making enough profits to meet the loss.

DEPARTMENTAL SECRET REVEALED

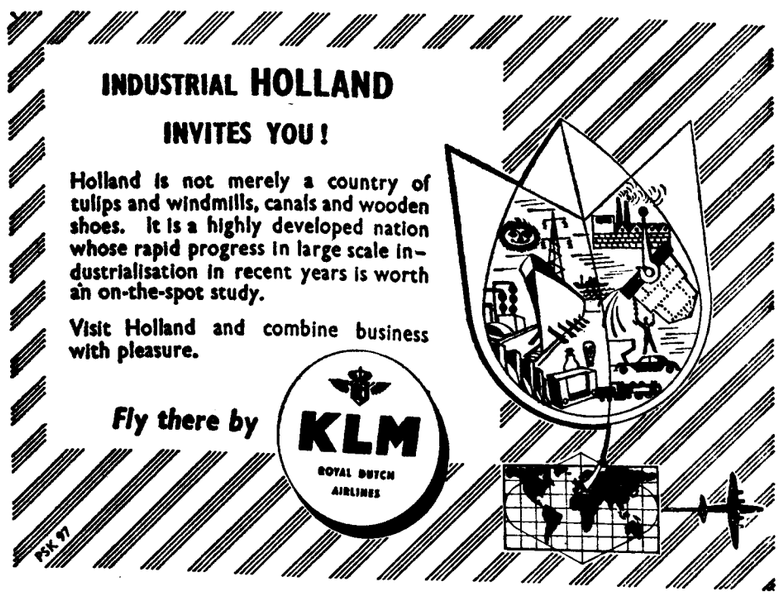
The Press Commission Report analyses the problems of the press with insight and authority and has many comments and recommendations to offer, but its weakness, I repeat, is its tendency to think that you can enforce moral conduct if only you can think up rules of procedure to meet all contingencies. If the Report's rules for conditions of work, employment, and dismissal, are really going to be enforced, journalists will be enmeshed in all the red tape that strangles civil servants, and newspaper offices instead of humming with activity, will move at the moribund pace of a government department. It will become impossible to promote a good reporter unless he is of the right seniority, and the only way to dismiss a bad one will be to secure his transfer to another department of the newspaper, or to another newspaper. I speak of this

from first-hand experience because when, years ago, I joined the Government of India for a spell and found that it was easier to be first up Mount Everest than to dismiss an incompetent, I evolved a highly successful technique of writing glowing chits which unloaded my incompetents onto other departments.

It is another of the weaknesses of this admirably solid Report that it is essentially concerned with the promotion of the interests of serious newspapers. These constitute a majority of the Indian press today only because literacy is 14 per cent, but as it rises it is in the nature of things that the serious press will eventually account for a minute percentage of total readership (although it may rise in absolute numbers, as it has in the UK).

There will always be a modest demand for serious papers of information and opinion. The real problem is how to ensure that mass circulation papers stick to the supply of innocent romance, and refrain from depraving the masses by indulging in pornography or dishonest sensationalism.

To a limited extent the problem can be met by sensible legislation against pornographic writings (particularly, as I said last week, if the Indian law is revised in accordance with a recent bill introduced in the UK which makes the author's intention the test of obscenity), and to a greater extent by making legal proceeding for libel easier and more effective.



In this connection, I commend to your attention Randolph Churchill's first-rate book "What I Said About the Press", (Weidenfeld and Nicolson. London. 1957. 7sh. 6d.), which reveals Mr. Churchill as a fearless and victorious campaigner against the sex and sensationalism purveyed by the 'Daily Mirror', 'The People', 'News of the World', and other mass circulation irresponsibles. My adjectives are mild compared with those employed by Mr. Churchill, who has just won £5,000 in a libel action (against 'The People') in which he stood up in the witness box and delivered himself of a spate of witty home truths about Lord Rothermere and other British newspaper proprietors.

Since I am not one of these do-gooder, Welfare state perfectionists, but am content to take our poor struggling human nature as I find it, a mixture of splendid ideals and sordid failures, I do not believe that you can hope ever to eliminate all bias, distortion, and symptomatic vulgarity from the press, for the same reason that you can never be wholly rid of murder, dacoity, fraud, theft, or adultery, at any rate in the present ratio of incarnations.

Which does not mean that you should not work to raise standards. This is a twofold task—that of raising standards of public education, so that more people come to see how boring sex is compared with a verbatim report of Mr. Krishna Menon's 7½-hour UNO speech, and of raising standards of professional ethics among journalists and proprietors.

Morality only exists where the individual is free to choose between good and evil. Prohibition, whether of alcholic drinks or of "yellow" newspapers, solves no problems. On the contrary, by treating human beings as irresponsible children, it prevents them from growing up. It creates an unhealthy atmosphere which promotes interest in the very practices that it seeks to prohibit. That is why people drink more in prohibition than in free states and why pornographic books are two a naye paise wherever censorship exists.

If the Indian and British Press Councils bear in mind that there is no quick and easy way of ensuring that mass circulation papers avoid all harmful matter, and if they concentrate on education and persuasion rather than on regulations and compulsions, we shall inch our way steadily towards the Millennium.

THE SAHARA WAITS

(From Our Special West European Correspondent)

PARIS, April 20.

THE wave of indignation that swept France after the revelations of army brutality in Algeria has borne fruit in that the Government, while protesting its perfect confidence in the unsullied honour of the army, has decided to constitute "a committee for the safeguard of human rights" in the war-torn North African departments. The committee is non-official and its composition is judged satisfactory by the liberals, considering that it had necessarily to be chosen from among men not so far involved in the public controversy about brutality in Algeria—a circumstance that excluded most respected notables, for these had lost no time in condemning publicly alleged departures from normal procedure. Nevertheless, the committee begins work in a curious atmosphere, for it has been charged not simply with reporting actual cases of illegal proceedings but also with pursuing the authors of baseless allegations of such proceedings. This means in practice that any complainant making charges before the committee faces the prospect of finding himself in trouble if his charges cannot be proven. This is expected to limit the supply of witnesses. The technique will no doubt be admiringly noted by governments everywhere; as usual, the patent for this method of intimidation belongs to those arch-inventors of machiavellian shifts—socialist democrats in power.

The Mollet government could scarcely ignore the outburst of indignation about brutality in Algeria when, in addition to the socialist and Mendes-France press, there were added the voices of a French army general, the conclave of French cardinals and the Pope himself. These latter parties could hardly be dismissed with the customary observations about a Communist demoralisation campaign. The Pope's message was addressed "to all the police forces in the world", but there was no mistake made in Paris about the relevance of his views to conditions in Algeria. Mention of the uncompromising stand taken by the leaders of all the religious communities of France on this issue makes it permissible to recall that we are still waiting for the religious leaders of the North African Islamic community to reprove the ghastly terrorist methods of the Algerian rebels which have led to the present degeneration of the struggle into a long communal riot. Reports of French troops encouraging suspected terrorists to talk by means of electric shocks need to be set against the fact that after a recent terrorist bomb explosion at a football match eight legs had to be amputated, including the legs of two girls aged three and five.

So the "dirty war" in Algeria drags on. Official communiques list an uninterrupted series of French victories, which are no doubt true for the French are militarily in control of the situation. This is not surprising for 400,000 French troops are fighting an estimated 30,000 rebels. But the rebellion continues withal. According to the official French figures, the rebels have been losing 2,000 to 3,000 men a month, but nevertheless they seem to have no recruitment problem. Rather, they have an armament problem. The French capture 2,000 weapons a month, but then 3,000 modern weapons are smuggled across the Tunisian border each month. Tunisian and Moroccan aid is a major factor in the continuance of the struggle, because as well as supplying smuggled arms these territories provide training camps for the rebel movement and in general a "privileged sanctuary". The French have succeeded in sealing 70 miles of the Moroccan frontier but the Tunisian border remains largely open, and while the French Finance Minister is demanding the repatriation of 100,000 soldiers for excellent economic reasons the generals are demanding an extra contingent to seal these borders for excellent military reasons.

More important than these military successes which never seem to mean anything, the French can claim several substantial gains in the struggle against the rebellion. Urban terrorism in Algiers itself has sharply declined and the rebels' demand (backed by terror) that Muslim parents keep their children away from the State schools is now being generally defied: school attendance has risen in a month from 70 only to 33,000. But the decline in terrorism in Algiers has been accomplished only with the aid of 10,000 parachutists (the parachutists are now the French corps d'elite), not to mention the aid of precisely the brutal methods that are now the subject of outcry in metropolitan France. The failure of the school strike remains a major victory although it has economic reasons: the French pay lavish child allowances to the North Africans as to metropolitan Frenchmen (not only lavish but absurd for a people whose population increase is phenomenal) but only if the children are sent to school. The school strike was limiting family incomes intolerably and the rebel leaders, whose whole supposed "national movement" rests on terror and intimidation, had to agree to its suspension.

These French victories bring no nearer a conclusion to the struggle, and indeed the prospects for peace in Algeria are bleaker now than before the United Nations debate. I meet many French people who believe that the struggle must be continued indefinitely; one even meets a fair number who believe that it should be continued with the use of every possible means; including the illegal and inhuman methods that have been adopted in order to meet terrorism on its own ground. But one meets absolutely none who believes that an end is in sight. Not even the toughest dieheards think that the rebellion is going to cave in; the best they seem to hope for is that a condition of superficial quietude can be attained, and thereafter maintained by prolonging the military siege of the territory indefinitely. This happens to be economically impossible, even supposing it were militarily feasible. But if the French have no idea of how the Algerian war can be brought to an end, no more have the Algerian rebels. None of them can seriously believe that, if terrorism continues, one day the French will pack up and go away, or accord Algeria "national independence". This is one of those peculiarly idiotic wars where neither side has any idea of what it is fighting for, because the two proclaimed objectives of pacification and independence are equally unattainable.

It is a commonplace of liberal opinion here that there is no solution of a military kind possible in Algeria, but that an egress from the present hopeless situation has to be sought in the political and social field. But just how far the French settled in Algeria are from considering such a solution was brought home to me this week in reading the French Governor-General's directive to troops and civilians in which, among other things, he requested "all Europeans in this country to cease using 'tu' systematically in speaking to Muslims"—in Indian terms, to stop calling all Muslims 'tum' and to use an occasional 'aap'. That it is only in the year 1957 and after two years of civil war that

the French in Algeria discover that it is wounding to a community's dignity to be addressed systematically with the familiar pronoun is no promising augury for plans for "a new social deal" for Muslims in Algeria.

While the terrorists and the parachutists continue to fight it out in Algeria, a constant casualty of the struggle is the native Algerian bourgeoisie, the very class that might be looked to to provide some hope of political leadership in the country's doubtful future. The terrorists assassinate any bourgeois suspected of sympathising with the French, and the latter intern any suspected of pro-nationalist feeling. The result is that the class most politically competent and most likely to take up a political position short of extremism is being decimated. For instance, of 30 Algerian barristers in Algiers, none today remains in practice in the city; 15 are interned and the rest have left the town or just withdrawn from active life. Notably, of the bourgeois leaders only one, Ferhat Abbas, has chosen "the road to Cairo" and joined the rebels; most of the rest have migrated to France itself. Whether or not this indicates the direction of their sympathies, the fact remains that the leadership of the rebel movement necessarily falls exclusively to the extremists. When at last the French can, and consent to, negotiate in Algeria, they will discover that they have prepared themselves a most intractable bunch of adversaries.

And while the war drags on in Algeria, the world and the Sahara Desert wait. World opinion, which was brought so narrowly to extend French credit at the last UN debate, waits the next session of that body where a different sentiment may well prevail if the situation does not improve during this summer. And behind Algeria waits the Sahara, concealing beneath its sands the resources that can assure the future not only of both the Algerian communities but possibly of all North Africa and Europe, resources that cannot begin to be tapped until the war stops in the gateway to the heart of Africa.

WORLDGRAM

AGRICULTURE

Punjab Consolidation Proceedings Validation Bill: The President has given his assent to the Punjab Consolidation of Land Proceedings (Validation) Bill, 1957. The Bill seeks to replace an ordinance which validated certain consolidation proceedings, in respect of land allotted to displaced persons in the Punjab, declared null and void by the Punjab High Court.

*

Bombay Tenancy Law Amending Bill: The President has given the assent to the Bombay Tenancy and Agricultural Lands (Amendment) Bill, 1957. The Bill, replaces an ordinance promulgated by the Government of Bombay this year to remove doubts regarding interpretation of certain sections of the Bombay Tenancy and Agricultural Lands (Amendment) Act, 1955.

*

Cultivation of Extra-Long-Staple Cotton: About 1,260 lbs. of seed of the "Andrews" variety of Sea-Island Cotton—the world's finest cotton, having as high staple length as 1.3/4" to 2" and capable of spinning 150s. counts—were grown in Malabar in 1956-57, under a scheme for growing this cotton, at present almost wholly imported from foreign countries. In 1954-55, India imported 3.8 lakh bales of cotton of staple length 1.1/16" to 1.1/8" and 2.3 lakh bales of cotton of staple length 1.3/16" and above at a total cost of over Rs. 53 crores. The object of the present scheme, estimated to cost Rs. 6 lakhs, is to spread this variety of cotton in India, and by 1960-61 produce 2.25 lakh bales, valued at over Rs. 30 crores, thereby reducing the import of long-staple cotton by a similar quantity. The seed grown in 1956-57 is considered adequate for covering an area of about 126 acres. In 1958-59, the area under "Andrews" cotton will be extended to 5,000 acres, in 1959-60 to 2½ lakh acres, and in 1960-61 to 3 lakh acres. A supervisory committee has also been constituted to review the progress of this scheme from month to month.

*

Utilization of Farm and Food Wastes: A Committee to draw up a plan of research with priorities for utilization of waste food products and farm wastes, has been constituted by the Council of Scientific and Industrial Research. The committee will make a survey of agricultural and food wastes and suggest ways and means for their utilization. It will examine how far the facilities available at the existing research institutes in the country can be effectively made use of and whether there was a necessity for setting up a new technological institute for this purpose.

INDUSTRY

Brass Ingots and Brass Gravity Dye Castings: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for brass ingots and brass gravity die castings (including naval brass). The draft standard covers the requirements for two grades of brass used in the manufacture of bearings, gears, pump parts, parts for electrical industry, steam valves and general engineering fittings. Brass gravity die castings possess high strength, toughness and resistance to corrosion and wear, and find application where accuracy, intricacy, stability, economy and a clean surface, inherent with die castings, is desired. Comments on this draft may be sent before June 30, 1957 to the Indian Standards Institution, 19 University Road, Delhi-8.

*

Petroleum Fuels and Solvents: The Indian Standards Institution has issued, for eliciting comments, five draft Indian standard methods of test for petroleum fuels and solvents. They are for the determination of total ash and water soluble ash, carbon residue (Ramsbottom method), freezing point, hard asphalt content and kauri butanol value of hydrocarbon solvents. These draft test methods would form part of a series of Indian standards now under formulation on this subject. As the methods of the test devised by the American Society for Testing Materials and the Institute of Petroleum (UK) are widely used in the industry and in the laboratories, and are being considered by the International Organisation for standardization in formulating draft international recommendations, the committee decided to base these draft standards mainly on the standards issued by these two organizations, although certain additional details have been included.

*

Draft Revision of Specification for Copper: The Indian Standards Institution has circulated, for eliciting comments, a draft revision of specification for Copper (IS: 191-1950). This standard specifies the requirements for four grades of cast copper, viz. electrolytic high conductivity copper, cathode copper, fire-refined high conductivity copper and fire-refined ordinary copper. This standard was first issued in 1950. The main modifications made in this revision relate to inclusion of clauses on chemical analysis; resistivity test in case of copper used for electrical purposes; and sizes of wire bars, billets, cakes, slabs, ingots and ingots bars—the shapes in which copper is normally supplied. Comments on this draft standard may be sent before June 20, 1957 to the Indian Standards Institution, 19, University Road, Delhi-8.

*

Steel Economy Through Standards: The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard code of practice for the use of steel tubes in general building construction. This standard is one of a series of Indian standards being published under the Steel Economy Programme. In preparing this draft standards, the manufacturing and trade practices, followed in the country, have been taken into consideration. Comments on this draft Indian standard may be sent before June 11, 1957 to the Indian Standards Institution, 19, University Road, Delhi-8.

*

Electrically Welded Mild Steel Boiler: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for electrically welded mild steel boiler and superheater tubes (for design steam temperatures not exceeding 455°C). The introduction of electrically welded steel boiler and superheater tubes into boiler practice in India has made necessary the preparation of this draft Indian standards. The draft has been divided in two parts. Part I covers clauses on general requirements while part II includes specific requirements with regard to manufacture, chemical composition, workmanship, testing etc.

TRADE

Trade Handled at Vaisakhapatnam Port: The Vaisakhapatnam Port handled 55,432 tons of traffic

during the fortnight ended March 15, 1957. Mineral ore exports during the period amounted to 26,409 tons. Imports totalled 21,544 tons, including 4,910 tons of food grains and 1,532 tons of Bhilai Steel Project material. Twenty-three steamers entered the Port during the period.

*

Export Promotion Committee to Visit Commercial Centres: The Export Promotion Committee, appointed by the Government of India to recommend measures to stimulate India's exports, will leave on a three-week tour of the country shortly. During its tour, the Committee will meet commercial and industrial associations and discuss with them matters relating to the promotion of exports. The Committee, which was appointed in February this year, has been asked to report on the nature of fiscal and other concessions to be granted for promoting exports, the nature and extent of credit facilities required for export trade and the lines on which the export promotion bodies should function. The Committee has also been asked to recommend measures for transport facilities and simplification of commercial transactions.

FINANCE

New Rate of Interest on Coal Mines Provident Fund Accumulations: The Government of India have decided in consultation with the Board of Trustees of the Coal Mines Provident Fund to grant interest to the subscribers of the Fund on their accumulations at the rate of 3¾ per cent during the year 1957-58. The rate of interest for the year 1956-57 was 3½ per cent. The Act which came into effect in 1948 covers 3.17 lakh workers in 753 coal mines. Accumulations in the Fund up to January, 1957 exceeded Rs. 8 crores.

*

Compulsory Deposit by Companies: The Central Government has fixed the percentage for computing the deposit to be made by a company with reference to the amount by which the statutory surplus exceeds Rs. 1 lakh. These deposits relate to the assessment to income-tax of any Company for the year commencing on the first day of April, 1957. No deposits will be required to be made in the following cases:

(a) A Company in which not less than forty per cent of the share capital is held by the Central Government or by any State Government or Governments, or partly by the Central Government and partly by one or more State Governments;
(b) A Company incorporated under any special Act of Parliament;
(c) A banking Company as defined in the Banking Companies Act, 1949 (10 of 1949);
(d) A Company, being an insurer as defined in the Insurance Act, 1938 (4 of 1938); and
(e) A Company engaged in the generation or supply of electricity.

In the case of all other companies, the figure fixed for computing the deposit to be made is 50 per cent. A notification to this effect has been published in a Gazette Extraordinary dated April 16, 1957.

*

Bombay Sales Tax Laws Amending Bill: The President has given his assent to the Bombay Sales Tax Laws (Amendment) Bill, 1957. The object of the present Bill is to amend the various sales tax acts in force in Bombay so as to make them conform to the restrictions laid down in Articles 269 and 286 of the Constitution and bring them in line with the Central Sales Tax Act, 1956. Certain other amendments to the Acts necessitated by the imposition of inter-State sales tax have also been made and the opportunity has been taken to express the taxation rates in terms of decimal coinage.

*

Funds for Housing Accommodation for D.Ps.: An allotment of Rs. 12.56 lakhs was placed at the disposal of various State Governments by the Central Rehabilitation Ministry during March for construction of cheap tenements for displaced squatters. The Ministry has made a provision of Rs. 5.78 crores for construction of houses for displaced persons from West Pakistan during the second Plan period. Funds have also been provided for the completion of housing schemes carried over from 1955-56 and for the development of refugee colonies and townships to the standards prevailing in the neighbouring areas. During 1954-55, a sum of Rs. 60,00,000 was advanced in the shape of house building loans to displaced persons against their verified claims. A further sum of Rs. 77,70,000 was advanced during 1955-56. Displaced persons living in 'Dharamshalas', temples etc. were allotted cheap tenements.

GENERAL

Saurashtra Barkhali Abolition Amending Bill: The President has given his assent to the Saurashtra Barkhali Abolition (Amendment) Bill, 1957. The Bill seeks to clarify certain provisions of the Saurashtra Barkhali Abolition Act, 1951, which provides for the levy at concessional rates of assessment of Gharkhed lands and lands allotted to Barkhalidars for personal cultivation. Under the 1951 Act the intention was that this concession should be granted only in respect of lands allotted under certain sections of the Act for which applications were to be made within a prescribed period. The Bill seeks to make this intention quite clear.

*

India's Largest Rail Yard Creates a Record: India's largest railway marshalling yard at Moghalsarai, near Banaras, last month set up a record of operating performance which has never before been achieved in its long history. Daily during March, an average of 2,082 wagons were despatched to a multitude of destinations on the Northern, Central and Western Railway, marking a 17 per cent increase over the performance in March last year, and a 24 per cent increase over March 1955. In the opposite direction, to the Eastern Railway an average of 2,101 wagons left Moghalsarai daily during March, an increase of nearly 20 per cent over the daily average for March last year. During the last 11 days of March, an average of one wagon left Moghalsarai every 20 seconds. This process continued all round the clock.

*

Membership of Employees' Provident Fund: The Government of India have decided to raise the limit of eligibility to the membership of the Employees' Provident Funds to Rs. 500 per mensem inclusive of dearness allowance and cash value of food concessions. The decision will take effect from May 31, 1957. Under the existing provisions of the Employees' Provident Funds Scheme, 1952, an employee drawing more than Rs. 300 per month as basic wage is ineligible to become a member of the Fund, although such employees, who became members on getting a lower wage, continue as members even when the basic wage exceeds the limit of Rs. 300 per mensem. The Employees' Provident Funds Act, 1952, which applied only to factory industries, was amended by Parliament in December, 1956 to empower Government to extend it to non-factory establishments. The Act has since been extended to cover plantations' employees. The schemes cover over 20 lakh workers employed in 4500 factories in India.

NEWS IN BRIEF

INDIAN

Draft rules issued by the Central Government regarding the deposits required to be made out of current profits by companies have been published for general information in a Gazette Extraordinary issued on April 15.

*

The Union Government has suggested to the authorities in U.P. to pay a special monthly allowance of Rs. 5 to all their low-paid employees as well as to those engaged by local bodies.

*

It is reported that either a departmental committee or the Tariff Commission will shortly undertake a comprehensive enquiry into the cost structure of coal production.

*

The Government of India has decided to continue the scheme of granting rebate of excise duty at the rate of six pies per square yard on all cloth produced by a textile mill and cleared for home consumption, in excess of its average monthly packed production of cloth during the eight months January to August, 1956.

*

It is reported that the Government of India is ready to allow the import into India of larger quantities of Sudanese cotton.

*

The Working Committee of the National Federation of Indian Railwaymen, has demanded the immediate setting up of a Pay Commission to revise and raise pay scales of railwaymen and eradicate all the existing anomalies.

*

A work and orientation centre has been set up in Delhi under a pilot scheme to help the educated unemployed enter into avenues of employment other than white collar jobs.

*

The Government of India has decided to allow freely for export apparel made of mineral khaki cloth till the end of June, 1957.

*

Imports of capital good during the last quarter of 1956 recorded a substantial rise of Rs. 474,000,000 over a year, according to the Reserve Bank of India.

*

The Central Cotton Advisory Board has recommended to the Government of India that in order to meet a shortage of cotton in the country they should permit the import of 1,75,000 bales of cotton of various saplings from both sterling and dollar areas.

*

The Government of India has decided to release 2,000 tons of linseed oil-cake for export outside India during the period April-June, 1957.

*

Production of Jute goods during March, 1957 rose to 84,700 tons from 80,200 tons in the previous month, according to the Indian Jute Mills Association.

*

It is reported fifteen scheduled banks have been invited to participate in the proposed refinance corporation which will shortly come into being.

FOREIGN

The World Bank announced recently that during the three months January 1 to March 31, 1957, it made three loans totalling 8,56,00,000 dollars to India, Iran and Peru.

*

South Africa's gold and foreign assets in the week ended April 5, totalled £131,880,000 compared with £135,550,000 a week earlier.

*

Oil consumption on Sweden rose, by 19 per cent to 10 million cubic metres in 1956. This compares with a rate of increase of 24 per cent in 1955 and 22 per cent in 1954.

*

Dutch unemployment at the end of March totalled 44,000 against 55,000 at the end of February and 50,000 a year ago.

*

It is reported of the two forthcoming South African Government loans, one will bear 4¾ per cent interest and mature on April 15, 1977, and the other 4 per cent and mature on April 15, 1962.

*

Japan had a balance of payments surplus of $38 million in the financial year ended March 31, compared with a surplus of $535 million in the previous year.

*

Air France carried 2-1/3 million passengers in 1956, 27 per cent more than 1955. Ton-mileage increased by 22 per cent to 225 ton-miles.

*

A New York firm W. R. Grab & Co., has decided to erect a £4 million chemical fertiliser plant in Trinidad,, provided it can make satisfactory tax arrangements with the Government. The proposed plant would use natural gas from Trinidad oil fields to produce ammonia and ammonium sulphate.

*

Philippine gold production for 1956 was 406,163 ounces — 12,949 ounces less than the 1955 output of 419,112 ounces. The 1956 production earned 44,580,451 pisos as compared with 43,860,071 pisos in 1955.

*

A Frs. 23 million company to study investment possibilities for economic development in Algeria has been set up in Algeirs on the initiative of a number of banks.

*

The Iraqi Government received £5,810,281 in oil revenues for the first quarter of 1957. The Iraq Petroleum Company exported through a Mediterranean sea port 529,237 tons of oil from the Kirkuk field and 25,596 from the Mosul field in the period March 12 to March 31.

*

The Anglo-Dutch trade balance in the first two months of the year showed a marked change compared with the corresponding period of 1956.

*

It is reported Persia and the Soviet Union have signed a barter trade agreement for three years.

For every hour in the air, a Clipper receives two hours of maintenance on the ground.

Every day Clippers must pass the world's toughest fitness test

Before and after each flight, a rigorous inspection is made of all operating parts. Even in flight, the state of a Clipper's* health is under constant scrutiny—through the electronic eyes of Pan Am's Engine Analyzer.

Every 11 weeks engines are taken down with critical interest. Instruments probe vital parts. From nose to tail each square inch is thoroughly inspected, every part replaced at the slightest drop from peak efficiency.

How banking serves the SPICES INDUSTRY

There is tremendous demand throughout the world for pepper and cardamoms and South India produces the bulk of these spices. One-third of the entire world demand for pepper is grown between Karwar and Cape Comorin; and in 1951-52, India's exports earned more than Rs. 27 crores.

Within the last ten years there has been a remarkable increase in cardamom growing, particularly in the South Indian states of Mysore and Coorg, and the districts of Madura, Tinnevelly, Malabar and Coimbatore.

The Indian spices industry has a happy future, and banking will naturally help to expand and improve it. The facilities and guidance of a good bank, such as the availability of ready funds when needed and the collection of dues from any part of the country, have become part of efficient organisation in every industry.

We at Palai are proud that many spice growers of South India employ the *complete* banking service we offer:

Current Accounts—Demand Drafts—Telegraphic Transfers—Investments—Letters of Credit—Bill Collection—Deposits—Loans & Overdrafts—Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

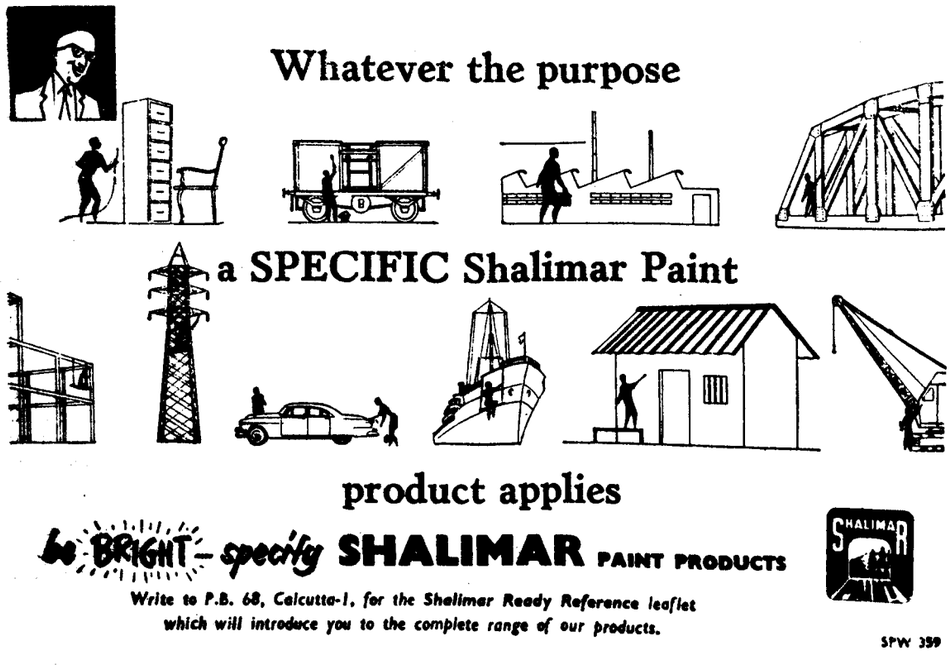
Economic Report from the U. S.

THE FEDERAL BUDGET



(By GUY SIMS FITCH)

WASHINGTON, April 23.—It has been said of the US governmental system that the President proposes and Congress disposes. Like all generalisations this one, too, has its exceptions—but not in the matter of the Federal Budget. In the final analysis it is the legislative branch of the Congress that holds the Government's purse strings. Two months ago, President Eisenhower proposed to Congress a budget involving outlays of $71,800 million for the 1958 fiscal year beginning next July 1. Since then, Congress has been going about the task of examining these budget proposals, and appropriating the money to carry out Federal functions. Its general tendency so far has been to prune President's request for funds. Much of this emphasis on budget cutting can be traced to the belief that the 1958 budget is "too big." It is, in fact, the largest peacetime, exceeded only by three years of World War II and one year of Korean fighting. But does this mean that the proposed budget is beyond the financial strength of the US? Virtually all economists, whether defenders or critics of the budget, would answer in the negative. For one thing, the budget has been in balance for several years, and expected to be in balance again next year. With the economy expanding and incomes rising, government receipts from taxes of all types for fiscal 1958 are estimated at $73,600 million, indicating a surplus of $1,800 million.

Many experts also point out that the proposed budget places no greater strain on the economy than have budgets of previous years. In 1946, for instance, budget outlays equalled 23 per cent of the total national income. In 1956, they were about twenty per cent. If national income estimates prove accurate, they would again be about 20 per cent in the coming year. Indeed, per capita, they would amount to less than in many other years, when Federal spending was considerably lower. It would appear then that the US economy surely could afford a budget of the proposed size. But the question does not end there. More than a few experts believe that continued large budgets, whether or not in balance, could intensify inflationary pressures. Moreover, they say, such budgets require the kind of huge tax "take" that eats up private savings needed to finance industrial growth. And the very existence of high tax rates is seen by some as tending to diminish business incentive.

These arguments have not been disregarded. The President himself has suggested last week to Congress ways in which his 1958 budget could be trimmed by some $1,300 million. But the legislators apparently are looking for deeper cuts than that. Obviously, neither the Administration nor Congress wants to cripple essential government functions. Some spending, moreover, is virtually untouchable—including expenditures resulting from previous legislation on such fixed charges as interest on the public debt. This means that Congress must look primarily to trimming what it considers the "frills"—elements within otherwise desirable programmes that it feels are not absolutely necessary. This is a difficult task at best. And it has not been made simpler by the widespread desire to reduce the tax burden imposed by a large budget. Thus, it is almost certain that the final appropriations will not match the President's budget proposals. But it is safe to say, if past experience is any criterion, that they still will make adequate and effective provision for the nation's national security, its international responsibilities, and its public welfare.

The Business World

THE OPTIMISM OF AN ELDER STATESMAN

By

CROESUS

FOR robust optimism there is hardly any one amongst our leading business men today who can rival Mr. G. D. Birla. And this optimism has its roots in realism as well, which characteristic, again, is something that distinguishes him from most others. It is not surprising, therefore, that, when Mr. B. M. Chinai, President, Federation of the Indian Chambers of Commerce and Industry (who held a reception in his honour on the conferment, by the Government of India, of the title of "Padma Vibushan" on Mr. Birla) requested Mr. Birla to give guidance to the business community, by virtue of his rich and varied experience over the past so many years, he exhorted them not to lose heart, not to be down-hearted, but to go ahead and work for the progress and prosperity of the country, unmindful of occasional irritations, sometimes real, sometimes imaginary. In a rather casual way, Mr. Birla dismissed what he called the one common shortcoming of business men as being something like the constant complaint of the husband by an Indian wife, who, despite all her complaints, would never drop him. In other words, what he sought to convey to the powers-that-be was that however much business men might complain against the Government, it was far from their intention to discredit the Government or even to embarrass it, and much less to remove it from office. Old habits die hard, he said, and reminded his hearers that Indian business men had perhaps not yet shaken off completely their attitude towards, and their manner of approach of, an alien Government, and that some relic of the ruler-and-the-ruled psychology still continued to cling behind. It is a reflex action of this pre-Independence psychology legacy that erupts in the form of unduly severe criticism of the Government at times, he seemed to suggest.

After doing this in a subtle and ingenious manner, Mr. Birla proceeded to warn business men not to get themselves lost inextricably in what has come to be called the-private-sector-versus-the-public-sector controversy. There seems to be a growing feeling lately that this public and private sector controversy has gone rather too far and that, unless something is done to arrest it and take stock of the position, catastrophic consequences to the country may follow. This doubtless explains why both Government spokesmen right from the prime Minister downwards and leading business men like Mr. Birla have deemed it necessary to appeal to the public to cry a halt to this unending and, at times, even unseemly controversy. Addressing the All-India Manufacturers' Organisation in New Delhi, the other day, it will be recalled, Mr. Nehru said: "The public sector must inevitably expand, but I do not want people to think as if the public sector and the private sector are mutually contradictory or come in the way of each other, pulling each other back". The same sentiment was echoed by Mr. Birla when he declared: "It was a bad day when these words 'Private Sector' and 'Public Sector' were coined. I do not know why we started talking of public and private sectors. To me there is no such thing as public and private sector. It is a national sector in which we are called upon to play our part". Mr. K. M. Munshi, Governor of Uttar Pradesh, who presided over the function, also expressed similar views and said: "There should be no conflict between the public and the private sectors. The more progress the country makes through the public sector, the greater will the private sector gain. The other way about, the more strength the private sector gains, the greater will be the strength of this country".

In short, all are thus agreed that the two sectors ought not to be, and are not, in fact, mutually contradictory but must be mutually complementary; that is, it is a game in which both the parties stand to gain or lose, but if both have to gain, both must play the game. But he would be a bold man, indeed, who could say that this happens always. More often than not, it does not happen. What is the cause of this? As Mr. Birla rightly diagnosed it, it is the absence of contact between the business men, who are mostly in Bombay or Calcutta, and our rulers who are safely ensconced in New Delhi. There is, therefore, need for closer contact between the two and also for either to 'talk to' and not 'talk at' the other, as Mr. Munshi observed.

In exhorting business men not to be down-hearted, Mr. Birla, again in his characteristic way, said he simply could not think of business men keeping idle. "They have got enterprise. They work. They like to create not for the purpose of making money. It (working) is a second habit with them. They cannot live without work and, therefore, they will continue to create". Pausing at this point perhaps deliberately and feeling himself quite reassured that this had gone home, Mr. Birla pointedly drew the attention of business men to the difficult times through which the country has been passing, what with an ambitious plan to raise the living standards of millions of people, difficulties such as those of foreign exchange in financing it, the Kashmir issue and the Kerala experiment, and appealed to them not to do anything to weaken the Government. Very meaningfully, he added: "In a democracy, you cannot have everything your own way. The virtue of democracy is that you can do neither too much good nor too much bad. Therefore, watch the progress of democracy in this country and everything will be all right". This is a sage counsel to business men, but, if I may say so, Mr. Birla should, at the same time, also tell the Government not to misunderstand the attempts, at times, of those who come out in the open to criticise the Government, even if it be in the strongest language—although, I concede, this is not at all necessary — when they genuinely feel that a certain policy or action of the Government threatens to cut at the very roots of democracy. He is in a position to do this, both by reason of his eminence as a business man and by the degree of confidence he enjoys with the highest authorities of the realm.

PLASTIC INDUSTRY'S SPECTACULAR PROGRESS

IN very few fields of industrial activity has there been such tangible evidence of progress as in the case of the plastics industry. Maybe, the increasing importance given to large-scale production of consumer goods is responsible for making it possible even for the layman to 'feel' the spectacular progress that the plastics industry has made in the last decade. The industry has taken such sustained and confident strides that it enjoys

the unique distinction of being the only industry wherein a ten-fold increase of production during the second Plan has been confidently predicted.

Inaugurating the tenth All-Indiaa Plastics Manufacturers' Conference in Bombay, Mr. Morarji Desai, Union Minister for Commerce and Industry, envisaged a great future for the plastic industry and profferred all governmental aid and assistance towards helping the industry in extending its activity to numerous fields of production. Admitting the need for modernising the machinery and equipment employed in the industry, Mr. Desai declared that the progress of the industry depended, to a great extent, on the close co-operation between the producers of raw materials for the industry and processors, who should utilise indigenous raw materials and maintain the prices of the finished products.

According to the President of All India Plastics Manufacturers' Association, with the exception of p.f. moulding powder, which is manufactured in the country, the rest of the raw materials are imported. While no official figures are available as to the exact progress in the production within the country of these raw materials during the past nine months it is comforting to see that some new plants for the production of raw materials are in the process of being installed in the country. Thus, under the auspices of Messrs. Polychem Ltd. in collaboration with Messrs. Dow Chemicals Co., U.S.A., a plant is being installed in Goregaon, a suburb of Bombay, for the manufacture of Polystyrene. While the capacity of the plant, due to go into production shortly, is six million lbs. per annum, the estimated current demand of this raw material is 2,500 tons (5.6 million lbs.) while the anticipated requirements are of the order of 3,500 tons (7.8 million lbs.).

The production of Polythene within the country is expected to be made possible by the Imperial Chemical Industries (India) Private Ltd., who are expected to instal a plant in Calcutta involving a total investment of about Rs. 3 crores. Another plant, to be established in Bombay again, will take care of the production of Polyethylene. Messrs. National Carbon Company (India) Ltd. are expected to undertake this venture. The total capacity of these two plants will be 5,100 tons per annum. Besides these, plans are also under way for the manufacture of Urea Formaldehyde moulding powder in India in collaboration with a British firm. There are also other projects contemplated for the manufacture of Cellulose Acetate moulding powder and P.V.C. compositions and P.V.C. resins. All these projects are expected to materialise in the second Plan period.

The current import policy, dictated as it is by the strain on our balance of payments position, is characterised by restriction of imports of even industrial raw materials. The plastics industry has also had to suffer some limitations on this score. Thus, in the case of the import of Polystyrene moulding powder, the quota to established importers has been reduced to 15 per cent while actual users' licences are not granted. The industry is rather agitated over this and has been pressing the Government for necessary redress. The situation, however, is bound to improve when the new plants mentioned above actually go into active production. Even otherwise, as has already been stated, earnest efforts should be made for the industry to become more and more independent of imported raw material.

With the increasing emphasis on rapid industrialisation in the second and successive Plans, the plastics industry may well nigh become one of the major industries in the country. To what extent the industry can be depended upon to contribute to the expansion schemes of the Government, particularly in the fields of rural water supply, community projects, agriculture and farming and also domestic water supply in new or growing townships, is evidenced by the fact that it can supply plastic pipes to meet the shortage of metal pipes. The use of this plastic pipe, which has been in vogue in the U.S.A., has now provoked other countries to explore the possibilities of incorporating this method of transporting water. Plastic pipes are now available in India and it is significant to note that very shortly two new plants—one with British and the other with American technical assistance — will be set up for the manufacture of basic polyethylene which will make the plastic pipe industry almost completely self-sufficient. It is gratifying to note that the Central Government is taking active interest as also the States of Bombay, Rajasthan, Orissa and Madras, in considering the possibilities of the plastic pipe. The completion of the second Five-Year Plan will, it is to be hoped, enable the industry to display its achievement in a better perspective.

BUSINESS NOTES

A REALISTIC REVIEW

FROM TIME to time the Chairman's reports of the United Commercial Bank have been noted for providing lucid analyses of the Indian economy as well as useful suggestions. Mr. G. D. Birla's latest speech, however, is of more than normal importance inasmuch as it has come at a time when the country has entered in the second year of the second Plan under conditions not entirely encouraging for the implementation of the Plan, either in the private or the public sector. It is known that in the first Plan the private sector gave a remarkably good account of itself and contributed substantially towards increasing the industrial production of the country by mobilising resources for an investment outlay of the order of Rs. 340 crores as against a considerably smaller figure of Rs. 148 crores in the public sector, in large and medium industries. While it may be admitted that there exists wide scope for private enterprise in the second Plan, and that, in financial terms, the private sector is supposed to play an equally important role in industrial development as the public sector, it cannot be stated with certainty that it would be enabled to achieve the same success as in the first Plan.

The reasons for this are not of the private sector's own making. The largest single difficulty being faced by almost all organisations is the disturbance caused by the acute monetary stringency that has been present over the last six months or more. Both short and long term factors have combined to produce the prevailing tightness, among the more important being the deflationary effects of adverse balance of payments and the growing demand for money by industries for developmental purposes. The result has been that even though all borrowing is becoming dearer, the banks have not been able to obtain deposits and other funds sufficient for the full accommodation of the increasing demands. The Government has, however, taken a few measures to provide relief, but a positive solution of the problem is the need for stepping up real savings and domestic capital formation, for which effective incentives are necessary.

What calls for attention before anything else is the problem of medium-term credit ranging from five to seven years. Given the credit base of the banks — 60 per cent being demand deposits, 30 per cent payable within six months and the remaining 10 per cent in a year or so — coupled with the fact that the ratio of advances to deposits is already as high as 70 per cent, and in some cases has even touched the 80 per cent mark, it is extremely unlikely that they will be able to undertake the responsibility. In this connection Mr. Birla has given a positive suggestion for the issuance, by banks, of bonds with a maturity of three to six years on the Swiss model. If such bonds are exempted from stamp duty as in the case of debentures issued by the Industrial Finance Corporation, etc., and if interest is payable after deduction of income-tax at source, the result may be fruitful in that a base for medium-term credit to industry may be established in the long period. Immediately, however, the scheme to make available to commercial banks the sale proceeds of the American wheat loan, which are earmarked for the assistance of the private sector, is sound and practicable, and if executed in a well organised fashion, may go a long way in relieving the tightness in the money market.

The country's foreign exchange position being what it is, and the necessity now being recognised for obtaining long-term credits from abroad, have made it increasingly clear that private foreign investment in India should be encouraged. This can prove to be useful in the same way as it was in, for example, the U.S.A. in the initial stages of her development when large investment funds flowed there from Europe to develop her transport and some major industries. Foreign investment is essentially a means of improving the distribution and use of the world's productive resources. In an underdeveloped country like India, where considerable imbalance exists between the supply of capital and other factors of production, the need is obvious and pressing. It would not be a day too early for the Government to do hard rethinking on the current policies so that they may be suitably modified and adapted to the changing economic conditions in the country.

TRAINING FOR INDIAN STEEL ENGINEERS

ONE OF the difficult problems in the setting up of the ambitious steel projects in the public sector from the beginning has been connected with the requirements of technical personnel. It was estimated that the supervisory staff from Foreman upwards that would be needed would be 2,100 and about 120 of the supervisory staff had to be highly qualified engineers. The bulk of these had obviously to be trained abroad and the agreements with the German combine and the Soviet authorities themselves provided for part of such training facilities. Thus nearly 100 engineers are undergoing training in Russia and about 70 in West Germany. Apart from these, similar facilities have been secured on a large scale from the U.K. and the U.S.A. and on a smaller scale from Australia and Canada. It is in this context that it is heartening to find that plans have been finalised to send 200 Indian engineers to the U.S.A. for receiving training for a year. On return, the engineers are expected to be absorbed in the steel projects at Rourkela, Bhilai and Durgapur.

An outstanding feature of this training programme is the grant of 1.5 million dollars by the Ford Foundation which will meet the trainees' living expenses in the United States and their academic fees. The Ford Foundation's work in India since 1951 has been quite substantial and more than 16 million dollars have been spent on rural welfare, education, etc., and this latest grant is certainly timely and is a notable contribution in an important field of the country's development activity. It is stated that in addition to production and manufacturing procedures, the trainees to be sent to the U.S. will be instructed in such management techniques as accounting, quality control, safety and job analysis. The American steel industry has offered its full co-operation and will bear the cost of instruction and training in their plants. The entire programme is to be evaluated in the spring of 1958 to consider whether it should be modified or extended. The Government of India have expressed the hope that the experience of the initial group of trainees will be successful and the U.S. steel industry will extend the programme and train an additional 700 to 800 engineers. There seems to be little doubt that the U.S. would extend its hand of co-operation to close a vital gap in resources to implement the steel segment of the second Plan.

EUROMARKET AND THE FREE TRADE AREA

TOWARDS THE end of the last month, the outlines of the European common market were given formal shape with the signing of the treaty by the six 'Messina' countries. When it comes into full operation — and

that will take some 12 to 15 years of uninterrupted process — it will have abolished tariff, quota and other trade restrictions between France, Germany, Italy, Holland, Belgium and Luxembourg. Whatever the reasons that have speeded up the signing of the treaty, it is the feeling of some, at least, in the group that not much economic purpose would be solved if the U.K. and some other European countries were to remain outside. Accordingly, the idea is being extended to evolve what has been termed the free trade area which would include the U.K., the Scandinavian countries and other OEEC countries that would be willing to join. The main distinction between the European common market and the free trade area would be that while the countries in the former will have common tariffs with the other countries of the world, those in the free trade zone would be at liberty to maintain their own tariffs with all countries outside the zone boundaries.

It is difficult at the present time to measure accurately the impact of the free trade area on the composition of India's export and import trade. Much the best part of India's exports to the U.K. comprises cotton manufactures and tea, coffee and similar other agricultural products. Both in the case of cotton manufactures and agricultural products, India appears to stand to benefit in some respects. In agricultural products the existing preference will continue which should be helpful. Japan is India's greatest competitor in the U.K. market for cotton and the preferential treatment in favour of this country may reduce the severity of the Japanese competition. However, Indian exports to other countries of the area may receive a setback even though it could be possible for Britain to import from India and re-export to such countries without having to cross the tariff barriers. But such a development is not altogether desirable in so far as India has been attempting to increase direct trade with the continental countries which are largely her suppliers of capital goods.

For capital equipment imports into India, the possibility cannot be ruled out that the supplies may be diverted to other countries within Europe, at the expense of this country, making it difficult for India to meet her growing needs of machinery and scarce industrial products. It may be argued that this can be only a short-term effect and that such transfers may increase the production capacity of the European countries in the long run. While this may be good for those countries as such, for India it would mean dislocation and delay in the execution of its development projects, which she cannot afford.

INDO-GERMAN TRADE

IT IS a matter of great satisfaction that the Governments of India and West Germany have agreed to give all possible facilities, consistent with their respective import and export regulations, to enlarge the scope of trade and to promote commercial contacts between the two countries. Under three sets of letters exchanged recently between the West German delegation and the Government of India, quotas have been fixed for a number of items of Indian exports which are still subject to quantitative restrictions in West Germany.

Under the circumstances, it seems doubtful if the imports from West Germany would continue to run at a high pitch unless deferred payment facilities are agreed upon to mutual benefit. In this connection it would not be out of place to mention that recently the Government of India proposed to regulate imports of capital goods according to the availability of the foreign credits for financing purchases by Indian importers. The details of this scheme were discussed with the West German delegation and the delegation seems to have appreciated the difficulties the Government of India was placed in. How far suppliers' credit will be available from German manufacturers is a matter whose outcome must depend on further negotiations. But the propects of such accommodation is there.

The German delegation have invited a team of business men from India to visit Germany in order to explore the possibilities of export trade entering into deferred payments arrangements. The move is to be welcomed as it would not only afford an opportunity for our importers to establish close relations with German exporters, but it would also help in the sphere of technical assistance so very essential for the successful execution of the Plan.

At present India exports only a few agricultural products like tea and vegetable oilseeds and oils. There is scope for increasing exports of ores, of hides and skins and leather goods, of textiles, jute and coir manufactures and various handicraft products. It is up to Indian exporters and industrialists to give concrete shape to it. The most effective field for economic cooperation is in the sphere of technical assistance. There are so many projects in which West German collaboration has been offered and is possible. In addition to the scholarships and technical apprenticeships, there is the offer from West Germany to assist in the setting up of a prototype training workshop for the development of small and medium scale industries in India. Last year's agreement provides that the supply of equipment as well as senior staff for a higher technological institute to be set up shortly in the North should be made by West Germany. This project is now taking concrete shape. As a result of the measures that have now been agreed upon trade and economic relations between the two countries will be further strengthened.

SELF-SUFFICIENCY IN JUTE

THE GOVERNMENT OF INDIA have decided to set up a Central supervisory body with the Jute Controller as Chairman to review periodically the progress of achievement of the jute production target of 55.4 lakh bales fixed for the second Five-Year Plan. Announcing this at a high-level conference on promotion of jute production here recently, Dr. M. S. Randhawa, Vice-President of the Indian Council of Agricultural Research, stated that the step had been taken by the Government in view of the national importance of achieving self-sufficiency in jute. Similar bodies would also be set up at the State level in the jute-growing States, he said.

The Central supervisory body will consist of: the Jute Controller (Chairman), representatives of the Planning Commission and the Indian Jute Mills' Association, Directors of Agriculture of West Bengal, Assam, Bihar, Orissa and U.P., the Chief Jute Development Officer, the Director of Railway Movements, Calcutta, and the Secretary of the Indian Central Jute Committee. Dr. Randhawa asked representatives of the States to treat the problem of jute production in India on an emergency footing in view of the difficult foreign exchange position. The conference decided to speed up the distribution of fertilizers to jute growers in view of the short time available before the next sowing season. It was emphasized that more depots should be opened so that the fertilizer could reach the cultivators in about six to eight weeks' time from now.

Company Meeting

THE UNITED COMMERCIAL BANK LIMITED

Statement of Shri G. D. Birla, Chairman of The United Commercial Bank Ltd., circulated to the shareholders at the Fourteenth Ordinary General Meeting of the Bank held on 18th April, 1957.

Gentlemen,

The Balance Sheet and Profit and Loss Account for the year ended 31st December, 1956, have been in your hands for some time and they bear testimony to the brisk activity of the bank's business in the past year.

PROFIT AND LOSS ACCOUNT

We have been able to show the substantially increased profit of Rs. 56,51,658-6-9 in respect of last year's working This resullt is naturally a matter of considerable gratification to the Board as it would be to you and the Directors would like to see that it is maintained, and if possible, improved upon. It is, however, necessary, in view of the uncertainties of the monetary outlook and of trade, to sound a note of caution. The resources of banks are not expanding as fast as we would wish with the result that competition for deposits is very keen, and the rate of interest allowed on deposits has risen. But the rise in the rate of interest charged on advances is not adequate to offset the higher cost of deposit money. Borrowings from the Reserve Bank of India are progressively costing more. Operating costs, of which salaries are the largest item, continue to rise. In these conditions the maintenance of future profits at the higher level now atttained is dependent on increase in business, greater volume of deposits and prevention of rise in working expenses through the achievement of greater efficiency.

Shareholders will observe that we have considered it prudent in these circumstances to utilise a substantial part of our additional profit to increase our allocation to the Reserve Fund which now stands at Rs. 1.15 crores. At the same time we have been mindful of the shareholders and the staff in that we have increased the dividend payable to shareholders and the bonus disbursed to staff.

DEPOSITS

Turning now to the main features of the Balance Sheet, you will notice that the total of current, savings and fixed deposits and other accounts at the end of 1956 stood at Rs. 52.15 crores as compared with Rs. 47.69 crores at the end of 1955. The increase in deposits of Rs. 4.46 crores represents a rise of 9.3 per cent in 1956 against 17.9 per cent in 1955 and compares with the rise of 7.8 per cent in the deposits of scheduled banks as a whole for the year 1956.

CASH

Cash on hand and with banks was Rs. 7.51 crores and represented 14.4 per cent of our deposit liabilities.

INVESTMENTS

The investments of the bank in Government and other approved securities stood at Rs. 19.43 crores which is a reduction of Rs. 2.74 crores from our holding at the end of 1955. In that year we invested in Government securities the bulk of our increase in deposits but we have now corrected that position and have effected a more even spread over advances and bills. The cash resources and unencumbered investments, together amounting in the aggregate to Rs. 22.03 crores, give a ratio of 42.2 per cent to total deposits.

In view of the bill market scheme of the Reserve Bank of India our liquid assets are not confined merely to cash and government securities but also include eligible bills which augment our liquidity.

BILLS

The amount of bills discounted and purchased increased during the year from Rs. 9.74 crores to Rs. 15.92 crores. A good percentage of these are sight bills which are continually falling due while usance bills are available as collateral for advances from the Reserve Bank of India. You will be gratified to note that this self-liquidating asset forms 30.5 per cent of the deposits of the Bank.

LIQUIDITY RATIO

The total of our liquid assets — cash on hand and with banks, unencumbered investments and bills — represents 66 per cent of our deposits liabilities, which you will agree is a very satisfactory liquidity ratio.

ADVANCES

Our advances have risen from Rs. 17.85 crores to Rs. 22.54 crores and they form 43.2 per cent of our deposits. We have endeavoured to meet all legitimate demands of our customers for increased accommodation and, for this purpose, have freely drawn upon the facilities available with the Reserve Bank of India for advances against bills and government securities.

FOREIGN EXCHANGE BUSINESS

The foreign exchange business of our Indian and Overseas Branches has shown a gratifying expansion. Owing to the increase in its activity our London branch was moved to more spacious premises at No. 12, Nicholas Lane, E. C. 4.

The credit for the excellent results of the working of the Bank goes primarily to the General Manager, Mr. S. T. Sadasivan and his able deputies and assistants, to whom I take this opportunity to record the thanks of myself and of the Board of Directors. I wish also to record our thanks to the other members of the staff of the Bank for their contribution in achieving these results. I also look forward to greater co-operation from them in the current year and the years to come.

BANK RATE

The official bank rate of the Reserve Bank of India remained unchanged at 3½ per cent but the cost to commercial banks of borrowing from the central banking institution has been progressively increased. In the first place the rate of interest chargeable to commercial banks for loans against usance promissory notes under the bill market scheme was put up in two stages from 3 per cent to 3½ per cent and the concession that the Reserve Bank of India would bear half the stamp duty on usance promissory notes was withdrawn. Early this year, the stamp duty on bills of exchange and usance promissory notes was raised ten-fold to two annas per cent for three months or part thereof. This has enhanced the cost of borrowing against usance bills by a minimum of half per cent and when allowance is made for the fluctuations in the debit balances of customers over a period and of the bank's borrowings against bills, the rise in the real cost is very much more than half per cent per annum. At the same time the Reserve Bank rate for advances to scheduled banks against Government securities was put up to 4 per cent. For all practical purposes, therefore, the bank rate has effectively been raised from 3½ per cent to 4 per cent. The working of the bill market scheme will, however, be much facilitated if the Government would annul the recent enhancement of the stamp duties on bills of exchange and usance promissory notes, leaving it to the Reserve Bank to charge the same rate of interest to scheduled banks for loans against bills as against Government Securities.

While money rates in India are hardening there is a retreat from dear money in other international money markets. The Bank of England rate has gone down from 5½ per cent to 5 per cent while open market rates in London are more akin to a still lower bank rate. The bank rate in West Germany has been brought down in two successive stages from 5½ per cent to 4½ per cent.

MONETARY CONDITIONS

For the past six months conditions in the money market have been very stringent and the demand for funds has continued unabated. Short and long-term factors have been at work in creating these conditions. Among the short-term factors may be mentioned the deflationary effects of adverse balance of payments caused by excessive imports. Imports of machinery have imposed a heavy drain on bank finance and import of iron and steel, which has been exceptionally heavy, has been a new factor in the demand for funds. There has been a basic alteration in the pattern of bank advances, the seasonal character of which has been largely blurred on account of financial requirements of industry being spread evenly throughout the year. Secondly, inventories of trading, manufacturing and engineering companies stood at a very high level. The long-term trend has been the rising demand for money from industries to meet the increased needs of a developing economy. The resources of commercial banks have not risen proportionately to the increased demand. There has been a further tightening of money during the conventional busy season as a result of the requirements of crop finance and of the sugar industry being superimposed on the more stable pattern of industrial demand.

The problem for the monetary authorities is, therefore, how to meet the legitimate demands for accommodation while at the same time keep inflation in check during a period of substantial development expenditure under the second Five-Year Plan.

It is gratifying to note that the Finance Ministry and the Reserve Bank of India have taken measures to remedy the situation in good time and liberalised the bill market scheme so as to make Central Bank credit freely available to scheduled banks for the legitimate purposes of credit expansion during the current busy season. Another welcome step is the change in the policy of the Reserve Bank as regards open market operations in Government securities. The sale of banks of Government securities during the busy season was a normal method of providing themselves with funds during periods of stringency but the Reserve Bank discontinued buying securities since the middle of 1951 save in exceptional cases and banks had therefore to put themselves in funds by borrowing from the Reserve Bank. During the current busy season the Reserve Bank has changed its policy and has bought securities freely from banks. The only unsatisfactory feature is that bank deposits have not registered a growth commensurate with the growth of economy. Conditions have to be created under which there may be a revival of real savings and encouragement to domestic capital formation.

MEDIUM-TERM CREDIT

The problem of medium-term credit has to be tackled urgently. What should be the organisation or institution that should disburse medium-term credit to private industry and how should the large resources required for the purpose be raised? There is already an appreciable element of medium-term financing included in the advances of scheduled banks and their investments. There is an increase in investments by banks in ordinary and preference shares of industrial companies and in their debentures. The banks have also subscribed to the capital of institutions like Industrial Finance Corporation, Industrial Credit and Investment Corporation of India and State Finance Corporation, which have been organised to extend long term credit to industry. Advances have been made by banks against stocks and other approved securities but in reality the money so raised has been utilised for the purpose of expansion of block.

With the ratio of advances to deposits well over 70 per cent and, in individual cases, topping even the 80 per cent mark, it is clear that commercial banks now lack the credit base to carry the load of medium-term finance to Industry. 60 per cent of bank deposits are repayable on demand, another 30 per cent are, probably, repayable within three to six months and a bare 10 per cent of deposits have a year to run. The idea that commercial banks should grant medium-term loans ranging from five to seven years out of the resources of this nature conflicts with principles of sound banking. Whether medium-term financing should be the responsibilty of special institutions or whether commercial banks should undertake this additional responsibility, and if the latter is considered the better course, to what extent the well established rules of practice of commercial banks should, at the present stage of development of banking, be modified and what protection should be given in the event of the loans getting frozen, are all matters which have to be carefully enquired into. Banks may legitimately employ a part of their capital and resources not represented by fixed assets in such loans and this they have already done.

A wider incursion in the field of medium-term loans to industry would require the previous development of long-term deposits from the public. Swiss banks are known to have raised funds through the issue of bonds with a maturity of three to six years and if Indian banks could issue such bonds successfully, a base for medium-term credit to industry would have been established. In Switzerland the stamp duty on such bonds is a nominal 1.2 per mile per annum, whereas by virtue of the recent Finance Act, the stamp duty in India has been stepped up to 1 per cent. If on the analogy of the debentures issued by Industrial Finance Corporation of India and the Co-operative Central Land Mortgage Banks, the Bonds to be issued by Commercial banks are exempted from stamp duty, and the interest thereon is made payable after deduction of income-tax at source, as in the case of Government Securities, the ground would be well prepared for an interesting experiment.

Such an experiment would, however, take a long time to produce results whereas the medium-term credit needs of industry are urgent. In view of this, the U.S.A. funds arising from the sale of wheat which are ear-marked for assistance to the private sector of industry, could well be handed over to the Commercial Banks and utilised for medium-term loans to existing industries for the purpose of expansion, such loans to be repaid out of subsequent earnings of the borrowing companies.

Finance for starting new industries and permanent capital required by existing industries should be left to be raised by issue of new capital to the public through the normal channels and it is here that the Stock Exchange comes into the picture. The Stock Exchange does not create or destroy the prosperity of the country. But it does act as the barometer of the conditions obtaining in industry and, as such, the present low level of activity in the Stock Exchange clearly indicates how confidence in the stability of industry has been shaken among the investors, and how impossible it is for companies, now, to raise any new capital. It is, therefore, necessary to bring about an amelioration in the condition of the middle classes and a revival of the confidence of investors in order that companies might be able to raise new capital through the customary channels.

SUCCESS OF THE FIRST FIVE-YEAR PLAN

The execution of the first Five-Year Plan has been acclaimed as a success on all hands and the targets of development and production have been fully achieved and in some cases surpassed. In the field of agricultural production the output of foodgrains rose from about 54 million tons to 65 million tons; cotton from 2.9 million bales to 4.9 million bales; jute from 3.3 million bales to 4 million bales; oilseeds from 5.1 million tons to 5.5 million tons. In the field of industrial manufactures the production of cotton textiles increased from 4,618 million yards to 6,850 million yards; sugar from 1.1 million tons to 1.7 million tons, paper from 114 thousand tons to 200 thousand tons; cement from 2.7 million tons to 4.3 million tons; fertilisers from 46 thousand tons to 380 thousand tons and automobiles from 16,500 units to 25,000 units. The first Plan was a modest one which did not strain the available resources. The total investment was very roughly Rs. 3,100 crores of which the investment in the private sector accounted for a little more than half the total. The net borrowing from the Central Banking Institution, which is the extent of deficit financing, was only Rs. 350 crores. As a result of the financial operations during the first Plan period and the economic development during the period bank deposits went up from Rs. 882 crores to Rs. 1,042 crores and the currency Notes in circulation from Rs. 1,247 crores to Rs. 1,467 crores. Thus the total money supply during the first Plan period increased by Rs. 380 crores.

ACHIEVEMENT OF THE PRIVATE SECTOR IN THE FIRST PLAN

Another factor to be noticed during the execution of the first Plan is the very substantial contribution made by the private sector for the success of the Plan. In the first Plan period, though the overall investments by the public and the private sectors were about equal, the investment outlay in the large and medium industries by the public sector was Rs. 148 crores as compared with Rs. 340 crores by the private sector. The private sector was able to mobilise the resources required and contributed in such a spectacular manner to the rise of industrial production during the first Plan period.

WIDE SCOPE FOR PRIVATE ENTERPRISE IN THE SECOND PLAN

Turning to the second Five-Year Plan the industrial development by the public sector in the field of large and medium industries and minerals envisages an investment of the order of Rs. 700 crores whereas the investment allocated to the private sector is Rs. 575 crores over new projects and Rs. 150 crores on replacement and modernisation. It will thus be seen that from the financial point of view, the private sector is invited to play as important a part as the public sector in the field of industrial development. In this connection it should be borne in mind that the bulk of the investment in the public sector relates to the three steel projects, heavy electrical machinery, machine tools and fertilisers, all of which, in any case, could not be developed by private enterprise without a very substantial backing from the Government. The wide range of industries awaiting development and expansion on a big scale in the private sector are the iron and steel, ferro-manganese, refractories, aluminium, cables, heavy and light engineering industries, automobiles, railway wagons and rolling stock, casting, industrial machinery, bicycles, motors, transformers, chemicals, industrial explosives, dyestuffs rayon, sugar, cement, plastics, paper and a host of medium-sized industries too numerous to mention. It is, therefore, on the private sector that the responsibility of normal expansion of industries is placed and the private sector has, therefore, plenty of scope for its initiative and resourcefulness. There is, therefore, no need to emphasize the demarcation between the public and private sectors or to harp upon any imaginary conflict between the two.

FOREIGN EXCHANGE GAP

We are, however, faced with the most serious problems when we turn to examine the resources available to both the public and private sectors for the execution of the various tasks allotted to them. In my speech last year, I drew your attention to the seriousness of the inadequacy of foreign exchange resources to carry through the Plan. I, then, estimated that the foreign exchange required would be anything between Rs. 1,600 and Rs. 2,000 crores and that, even on the basis of the lower figure, there would be a deficit of Rs. 800 crores to be found. This gap has turned out to be wider than anticipated. But if I had foreseen serious difficulties in respect of foreign exchange, I admit I had not expected similar difficulties in the availability of internal capital which has now suddenly become so scarce. Even if we had adequate external finance, without its rupee counterpart, obviously, no industry could be built up. Internal finance has, at present, become so dear that even the best industrial scrips are selling on 8 to 10 per cent yield basis. With the interest rates so high, who would invest his savings in a new venture with all its concomitant uncertainties? If none, then how is the Plan to be implemented? The external and internal finances are the two main rocks on which the Plan may wreck and, therefore, we cannot afford to ignore the danger.

VOLUNTARY SAVINGS

The plain truth of the matter is that the resources for the Plan can come only from savings, whether forced or voluntary. Forced savings can be affected through direct and indirect taxation and such measures as compulsory deposit of reserves. Voluntary savings emerge from the profits of companies and personal savings,

and it is these that from the sources of funds for capital investment in new companies in the private sector. With individual taxation at a very high level, there is very little money with the private investor to subscribe to new issues, and the middle class investor, who formed the backbone of every floatation of capital in the past, has ceased to exist. Since the advent of independence, we have looked after the rural and industrial areas very well, but have neglected the middle class, a fact which is perhaps reflected in the recent elections. We must henceforward lay greater emphasis on the prosperity of the urban area — the cities — if the middle classes are to be rehabilitated and reconstituted as a source of support for industrial floatations.

INDUSTRIAL PROFITS

As regards corporate savings, there has, unfortunately, been a sudden change in the pattern of industrial profits in recent months. The Jute industry is in a bad way and had a record of disastrous losses during 1956. The Textile industry, which was doing well a few months back and was expanding production enormously, is now finding it difficult to sell its products. I venture to hope that this is only a passing phase. If not, it is a real danger to production. Tea prices have gone down and the profits of tea companies and the foreign exchange earnings arising out of the export of tea have declined. The coal industry has its own special problems. It is only cement, steel, paper, engineering and a few other miscellaneous industries, which are really enjoying prosperous conditions. I do not mean to say that there is anything in the nature of an industrial crisis brewing but I certainly feel that the present net earnings of industry are not conducive to large-scale investments and quick expansion of production.

The Finance Minister has rightly remarked in some of his speeches that he was not against earnings but that he desired these earnings to be utilised for the benefit of society. This objective is undoubtedly one which will find echo from every quarter but rather than have the earnings put to good use through compulsion, it would be better to achieve the desired result through methods of persuasion.

INCENTIVE FOR SAVINGS

The experience in all democracies has been that without a friendly climate and expectation of reward, there has been no industrial expansion either in the private or in the public sector. Even the public sector can only thrive upon profits. It appears to me that for development of internal finance, the first and foremost action that we have to take is to revive confidence and create conditions conducive to the greater earnings by industrial concerns to be ploughed back for expansion schemes.

PRIVATE FOREIGN INVESTMENTS SHOULD BE ENCOURAGED

As for external finance, the search for foreign credits and extended terms of payment goes on and may afford some relief and so also the borrowing from the International Monetary Fund and the World Bank. The time has now, however, come to revise our attitude toward private foreign investment which, if freely encouraged,could go a long way to solve our problem of the exchange gap. History teaches us that all backward countries have been built up with the help of foreign capital and, we cannot afford to ignore the lessons of history. We must appreciate the fact that we can build up India quickly only through the help of foreign capital and, since we are an independent nation, I do not see why we should be afraid of it. I feel, therefore, that not only should we allow foreign investment without any restriction but we should welcome it, improve the climate for it and make the investor feel that the opportunities for profitable utilisation of caiptal here compare favourably with those available anywhere else in the world. Sometime ago the Finance Minister stated that he was not against foreign capital but that it had to make peace with Indian capitalists. I hope Indian industrialists will not take narrow view of the situation but, in the higher interests of the country, make it absolutely clear that they welcome foreign capital.

I have tried to deal at some length with the question of internal and external finance required for the second Five-Year Plan and have also suggested measures which may lead to the establishment of a better atmosphere. I am sure the Hon'ble Finance Minister is already aware of these considerations. Mr. T. T. Krishnamachari is no novice in the field of finance. As Minister for Commerce and Industry, he gave a great fillip to production and left the Ministry with a brilliant record of achievement. He may, therefore, be trusted to apply his talents to the financial problems of the second Five-Year Plan and achieve greater success in his new sphere of responsibility. The Commerce Ministry is now presided over by an equally able Minister, but like the Finance Minister he is also faced with great problems. I am, however, confident that he would solve the difficulties in such a way that production and trade expand during his stewardship. With these two key portfolios in the hands of such distinguished ministers, I look to the future with faith and optimism.

RECORDS & STATISTICS

(QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

COMPANY AFFAIRS

INDUSTRIAL INVESTMENT TRUST, LTD.

The Directors' Report of Industrial Investment Trust, Ltd., for the year ended December 31, 1956, makes a better showing than that for the previous accounting period. The balance carried to Revenue Appropriation Account, or net revenue for 1956, is higher at Rs. 5,99,627, as compared to Rs. 5,81,908 for the year 1955. The improved result thus and the saving of income-tax (nil for the assessed years 1950-51 to 1953-54 as against Rs. 1,02,764 in respect of 1955) has doubtless enabled the management to double the provision for investment reserve from Rs. 25,000 to Rs. 50,000, as also to recommend a higher dividend — 5 per cent free of income-tax, compared to 4½ per cent paid for the year 1955. At Rs. 3,23,875, the Company has, besides, a sufficiently high free balance, pending the tax assessment for the years 1953 to 1956.

Industrial Investment Trust Ltd., is among the leading Trust companies in India and has consistently followed a conservative but prudent policy in regard to its investments. The result is that the shareholders of the Company have been receiving an assured, though somewhat modest, return year after year. This year, however, the dividend has been stepped up by a half per cent. The care with which the management selects the investments of this Trust company is reflected in the approximate valuation of the Company's investments which, at market quotations, stood higher than the total book value by 3.1 per cent on the day of closing the accounts.

MAHINDRA AND MAHINDRA LTD.

The Company has recorded remarkable progress in its working for the year ended October, 1956. While total sales at Rs. 14 crores are almost 2½ times that of the previous year's Rs. 5.74 crores, the steel sales have multiplied by 3½ from Rs. 2.72 crores in 1954-55 to Rs. 9.62 crores in the year under review. Among other items, jeeps have climbed by a crore of rupees, trailors by Rs. 5½ lakhs and tractors by a little under Rs. 25 lakhs.

The profit for the year, after providing Rs. 2,15,340 for depreciation, amounts to Rs. 46,47,231, which together with the balance brought forward of Rs. 86,831, totals Rs. 47,34,062. From this amount, the Directors have appropriated Rs. 16 lakhs to provision for taxes, Rs. 6.91 lakhs to bonus to employees, Rs. 1.75 lakhs to Directors' Commission and a little over Rs. 66,000 to bad and doubtful debts. That leaves a balance of Rs. 22,01,871 for disposal. The recommendations of the Directors are to pay a tax-free dividend of 12½ per cent per annum on ordinary shares absorbing Rs. 6,87,500. On preference shares, a dividend of 6 per cent per annum, also free of tax, absorbs another Rs. 1.50 lakhs. An allocation of Rs. 1,52,276 has been recommended for reserve for additional taxation and contingencies, and Rs. 10 lakhs are to be transferred to general reserve. The balance of Rs. 2,12,095 is to be carried forward.

The Company's application for relief under Section 23A of the Indian Income-Tax Act was granted and the dividends paid by the Company in the preceding year were declared to be adequate. The Directors propose to submit a similar application for relief this year.

Trading for the first five months of the current year is reported to be satisfactory.

THE STANDARD MILLS CO., LTD.

The Company's working for the year ended December 1956 has been satisfactory and the profit stands at Rs. 47,99,772 after providing Rs. 28,10,063 for depreciation, Rs. 10,26,477 for Managing Agents' Commission and remuneration and Rs. 35,15,000 for taxation. Together with the previous year's balance brought forward (Rs. 12,833), the profit totals Rs. 48,12,605. From this amount, the Directors have appropriated Rs. 17,85,073 to rehabilitation and development reserve and Rs. 7,10,973 to development rebate reserve. The dividends recommended by the Directors are: on 6,000 — 4 per cent cumulative redeemable 1st preference and second preference shares each — Rs. 4 per share, free of income-tax, Rs. 24,000 under each head (or Rs. 48,000 for both); on 87,000 ordinary shares — Rs. 20 per share also free of income-tax, Rs. 17.56 lakhs; and a bonus of Rs. 2½ per ordinary share, again free of income-tax, Rs. 2,19,500. That leaves a balance of Rs. 2,93,059 to be carried forward to the next year's account.

The modernisation scheme of the Mills was continued during the year and Rs. 1,76,202 was spent on construction of new buildings and another Rs. 26,84,364 on installation of new machinery which is reported to be working satisfactorily. Also, the Company has been granted a certificate of approval for acquiring prospecting licences and mining leases in Bombay. Already the Company has obtained a licence for establishing a cement factory in Saurashtra.

SWAN MILLS LTD.

The year 1956 has been one of satisfactory operations and substantially advanced profits, as compared to the preceding year, for the Company. After allowing Rs. 10.50 lakhs for depreciation and Rs. 3.40 lakhs for taxation, the profit for the year amounts to Rs. 14,00,845 as compared to Rs. 9,46,266 in 1955. Including the balance brought forward (Rs. 1,51,030), the profit totals Rs. 15,51,875. From this amount the Directors have appropriated Rs. 1 lakh to general reserve account, Rs. 2.25 lakhs to development rebate reserve and an equivalent amount to retiring gratuity reserve. A sum of Rs. 9 lakhs is absorbed in paying the proposed dividend on 36,000 shares, free of income-tax, at Rs. 25 per share. The balance of Rs. 1,01,875 is to be carried forward.

According to the Directors, prices and deliveries of cloth were satisfactory for the first eight months of the year but declined in the latter part. With this coincided the increase in excise in September, which means an additional amount of excise of the order of Rs. 12 lakhs a year.

THE MODERN MILLS, LTD.

After allowing for bonus to staff for 1956 and gratuity in accordance with the Award of the Industrial Court, Bombay, (both aggregating Rs. 10,55,056) and after providing for depreciation (Rs. 4,68,595) and taxation (Rs. 44,261) —both of which the Company used to provide in previous years by appropriation of profits — the profit for the year ended October, 1956, stands at Rs. 5,77,527. Together with the balance brought forward, it totals Rs. 6,09,197. From this Rs. 2 lakhs has been allocated to machinery rehabilitation reserve. The balance of Rs. 4,09,197 has been recommended to be disposed of by paying a dividend of Rs. 5 and a bonus of Rs. 3 per ordinary share of Rs. 50 absorbing Rs. 3,54,088. The balance of Rs. 55,109 is to be carried forward.

In line with others, the Company had to bear the effects of the enhanced excise duty in addition to the credit restrictions which disturbed the cloth trade.

COMMODITY NEWS AND NOTES

IMPORT QUOTA FOR RAW COTTON

The Government of India has decided to issue with immediate effect, licences for the import of raw cotton of staple length 1-1/32 inches up to 1-3/16 inches from soft currency areas. The varieties qualifying under the staple lengths are Jinja, Bukhedi, West Nile, Budama, Busoga and B.P. 52 Licensing will be done on a ceiling of 50,000 bales and the licences will be valid for shipment up to June 30.

JUTE PRODUCTION TARGET

The Government of India has decided to set up a central supervisory body with the Jute Controller as Chairman to review periodically the progress of achievement of the jute production target of 5.54 million bales fixed for the second Five-Year Plan.

COFFEE EXPORT QUOTA

The Coffee Board has released for export 1,500 tons of coffee out of the 1956-57 crop. The quantity consists of 921 tons of plantation "A" 372 tons of plantation "B" and 207 tons of plantation triage.

CAPITAL GOODS IMPORTS

Imports of capital goods during the last quarter of 1956 recorded a substantial rise of Rs. 474,000,000 over a year, according to the Reserve Bank of India. This was mainly responsible for the sharp increase in the value of total imports which rose from Rs. 1,858,000,000 in October-December, 1955 to Rs. 2,940,000,000 during the period under review, a rise of Rs. 1,082,000,000. The expenditure on machinery, metals and vehicles, the main components under capital goods totalled Rs. 943,000,000 in the last quarter showing a rise of 60 per cent over the corresponding quarter of a year ago.

TRANSPORTATION OF COAL

The Union Government has accepted the recommendations of the sub-committee of the Coal Transport Advisory Committee for giving top priority to proposals for increasing siding and loading accommodation to the collieries to enable them to move their increased output during the second Plan period. The Coal Board has granted permission to ten collieries for opening or reopening of mines.

US COTTON FOR PAKISTAN

The US Agriculture Department has announced issuance of an authorisation to Pakistan to buy 21,000 bales of US cotton. Contracts might be made April 19 to June 29 with deliveries for April 19 to December, 31.

AUSTRALIAN GOLD RESERVES UP

Gold balances held abroad by the Commonwealth Bank jumped £A13,404,736 to £A422,666,798 in the week ending April 10. The level is the highest for 2½ years.

PEAK GERMAN EXPORTS

German exports last month showed a marked rise at £274.9 million or 37.8 per cent more than in March, 1956 and over 50 per cent more than in March, 1955. Exports last February amounted to £230.7 million. Imports at £229.3 million also reached a new peak—an increase of 24.2 per cent over March last year. The export surplus totalled £59.5 million in January-March period as against £34 million in the comparable period of last year.

CANADIAN NICKEL OUTPUT UP

Canadian production of nickel in all forms was advanced in January to 16,554 tons from 14,985 in January, 1956. Output of new primary copper eased to 26,053 tons from 30,075 a year before.

CHEMICAL SALES IN US

The chemical industry in US is selling more of its products this year than a year ago, it is indicated by reports from two leaders in the field, 'du pont' and 'Union Carbide'. 'Du Pont' reports that sales were up by 9 per cent in the first quarter of this year and 'Union Carbide' by 6 per cent, compared with a year ago. 'Du Pont' sales for the latest quarter represented a record for any similar period in Company history.

NAURU PHOSPHATES RECORD

The British Phosphate Commission shipped 1,771,353 tons of phosphates—a record—from Nauru and Ocean Islands in the Pacific during the year ended June 30, 1956 states the annual report of the Commission. The UK, Australia and New Zealand acquired the phosphates rights in the island in 1920, for £3.5 million.

HIGH COTTON STOCKS IN EGYPT

With the reopening of the Suez Canal, Egypt expects to dispose of her accumulated cotton stocks and thus relieve her balance of payments position. Despite exports to East Europe, sales of Egyptian cotton this season up to the end of February reached only £40 million as against £60 million for the corresponding 1956 period.

Before the Budget

MAY 15 is another 'D-day': the second Budget day in the calendar year 1957 because of the accident that India has had two different Lok Sabhas in this year. A belief has been sedulously created that in some remarkable, but undefined, sense the new Lok Sabha has a different outlook and a different capacity to operate on the Central Government's policies than the old. This, of course, is nothing more than a superstition, or at best a gesture to a political convention. The tiresome repetition of many observations made on the March 'Vote on Account' will now have to be endured; again, it is extremely unlikely that the observations on any taxation proposals that the Finance Minister will place before the Lok Sabha will affect the current of economic policy. In part, the Finance Minister has been responsible for the strait-jacket in which the country now finds itself with virtually no capacity of manoeuvre either in the foreign, or domestic, financial field. But it would be quite erroneous to place on him the major responsibility for things as they are. There is no doubt that it is the size of the Plan, and almost nothing else, which has decreed our present financial crisis. The Finance Minister is the creature of the Plan; he can no longer create his environment. He is the servant of events, not their master.

What seems to be irrational, both in the view of the public and private sectors, is the continued belief that the Finance Minister of India can by his Budget policy provide a solvent for the current crisis. Political currents have decreed a rate of

advance which it has been found economically impossible to sustain at least in this calendar year. Instead of recognising the damage which has been done to the economy by ceaseless overstrain, particularly with the pause in agriculture — for reasons which the Ministry of Food and Agriculture is still quite unable to explain — we are pretending to ourselves that the Finance Minister of India can invoke financial wizardry at his command to right the situation. And thus both hopes and fears are excessive. One should remember that both are unwise; intelligent analysis of a crisis should be free from both. Equally the Finance Minister should not strive to satisfy the extravagant expectations that are being raised. His last two Finance Bills bore the mark of haste and inadequate forethought, largely, it seems, because of unwarranted pressures. But haste, like anger, is a bad counsellor, most of all, perhaps, in finance.

While one can suggest moderation to the Finance Minister, one must recognise the tremendous political pressure that exists to increase taxation at the present time. The belief that inflation is the result of an uncovered revenue deficit on revenue account dies hard. Of course, this is the wildest nonsense. It is the overall deficit that matters, and not the nice distinction which official accounts make between our capital and revenue accounts. Political currents, it seems, have decreed that the overall deficit shall run at a figure of nearly Rs. 300 crores. Thus these political currents have decreed inflation, whatever the Finance Minister might choose to do on his taxation proposals. The current unsophisticated opinion that taxation can do the trick is thus hopelessly misplaced.

On the other hand, the capacity to tax even in relatively small quantities in the wrong places will do serious damage. The covering of the revenue gap can do us no substantial good; but it might do us significant harm. Will the Finance Minister in these circumstances choose this erroneous course? If he does, his difficulties next year will not be merely great; they will be insurmountable; for confidence is now at a low ebb. It may respond by a crash. Thus, on the eve of the new Budget, one arrives, paradoxically, at the conclusion that the Finance Minister had better not have a new Budget. The 'Vote on Account' has given the Government of India plenty of opportunity to cut items without proclaiming its intentions to the whole world. Politically, the country would be satisfied that the Plan is still under way even if in practice much of the expenditure is held back — much more than could possibly be raised by taxation. What should be important in the mid-May budget is its preamble and not its text—that is, the assessment which the Finance Minister gives before his precise proposals. The kernel of the preamble should be that taxation is held in suspense, and the expenditure pattern pruned drastically even if, for good political reasons, the act of pruning is not widely advertised.

This would not be to practise deceit upon the Indian people. The Finance Minister can easily convince the country that the only manner in which real incomes can be maintained for the lower income brackets is to maintain the value of the rupee both at home and abroad. This, without a period of intense consolidation, will be nearly an impossible task. For one thing, a seasonal factor will operate on food grain prices for the next six months, raising the general index of food grain prices by between 10 and 15 per cent even if moderate imports are thrown into the scales. With this seasonal pressure, it will certainly be impossible to hold a free line with new development expenditure; it will be impossible to hold the price line even if substantial new excise duties add to the present cost of living. Surely this can be explained to the people with all the facts and they will respond with understanding and even generosity. It is not in the public interest that a mistaken level of Government expenditure should be persisted in merely to save the Government's face.

In the last analysis, the strength of the Indian Union lies in the maturity of its people. Those who can recall the Great Depression of the thirties will remember thousands of acts of personal heroism particularly in the countryside, when dire hardship visited literally millions of our people, but was quietly and cheerfully taken. Only a political party which had no vision of those tremendous days—when sacrifice and hardship were sought out as opportunities for dedication—will hesitate to tell the Indian people the blunt truth on the present occasion. The blunt truth is that we have arrived at a situation at which there is no solution except to adjust our major determination to proceed with the Plan at the level contemplated. This does not mean that we cannot take up the thread some time, perhaps in a year or two. We may or we may not; but we must tell the people that it is not in the national interest at the present time to run the risk of inflation—the full impact of which will fall undeservedly on the poorest in the country. If pushing back the price level is impossible—and so, it seems, it is for the short period—Government must take the responsibility at least of arresting as much of the rise as is humanly possible. The country will not expect miracles even from its heroes. They remain men for all that. And the Opposition should not choose what is truly a national crisis for scoring petty debating points to illustrate the fact that the Congress Party has seriously erred.

Because this is a truly national crisis, it should be met by a supreme national effort to abandon anger and recrimination until the crisis has passed. There are deep divisions in the country between political parties, between employers and employed, between urban and rural areas, and between those wielding power and those suffering by its excesses. There are genuine grievances as well as imaginary ones, but the essence, and even the grandeur, of a great national crisis is that it gives us an opportunity to surrender good, as well as bad, grievances in a cause which is greater than ourselves. That cause is, as it always must be, India. That is the whole which is always greater than the sum of its parts. A sacrifice for the nation can enrich us more than the sum of individual sacrifices leaves us in want. In this sense the leading note in this crisis is not social, political or economic; in its highest sense, it is moral. It is a challenge to dedicate ourselves anew to the service of all. When the trumpet sounded forty years ago, it found us ready. Does the trumpet itself now give forth an uncertain sound?

Community Projects Disappoint?

THE Fourth Evaluation Report on the working of Community Projects and National Extension Service Blocks, which was presented at the sixth conference of Development Commissioners held at Mussoorie a few days ago, is important from more than one point of view. It was the first really independent evaluation made of the performance of these projects and blocks. All the previous evaluation reports had been made either by the paid staff of the Planning Commission or by persons directly associated with the working of the scheme. The present Evaluation Report is the product of detailed studies undertaken under the auspices of the Programme Evaluation Board set up by the Planning Commission in December, 1956, and headed by a distinguished non-official, Dr. V. K. R. V. Rao of the Delhi School of Economics. And Dr. Rao is not an official of the Government. The second important point about this report is that it covers the period up to the last year of the operation of the first series of community projects started in 1952-53. It was, therefore, possible for Dr. Rao's team to make an overall appraisal of achievements in these areas, both in physical terms and in terms of behaviours and attitudes — an assessment which was not feasible in the three earlier Evaluation Reports. As a matter of fact, work in most of these areas came to an end in September, 1956, when they entered into what is called the "post-intensive phase". After a period of "intensive development of 3½ to 4 years, these areas are supposed to have been fully developed and placed on a "post-intensive" pattern, which is expected to continue indefinitely into the future.

The Report makes very disquieting reading. While it admits that almost all villages have been covered by one or more items in the programme, it points out that the achievement has been neither uniform nor co-extensive with the accepted programme. Not only it is; the performance has been singularly unsatisfactory in certain sectors and also in terms of behaviour and attitudes of the village people. Thus, while improved agricultural practices were more or less widespread, only 57 per cent of the villages covered by the enquiry had resorted to all three of the most important of such practices, *viz.*, use of improved seed, use of manures and fertilizers and improved methods of cultivation. In other items relating to agriculture, such as irrigation, land reclamation, soil conservation and consolidation of holdings, the performance was even less satisfactory — less than 25 per cent of the villages covered having adopted any of these practices.

In the sphere of cottage industries, the performance was exceedingly poor. The production-cum-training centres were a total failure and whatever money has been spent in the community project areas on such schemes may be deemed to have literally gone down the drain. The performance in the sector of institutional programmes, *i.e.*, in respect of schools, co-operatives and panchayats, was also unsatisfactory. While free primary schools had been set up in almost all villages, the same could not be said of co-operatives and panchayats. Even when these latter institutions had been set up, they were on the ground more with "official" backing than as spontaneous expressions of the community spirit. The achievement was particularly poor in the sphere of social education, *i.e.*, in the setting up of youth clubs, women's organisations, community centres and adult literacy centres.

Much more significant, according to Dr. Rao, is the fact that the attitude of the people has not undergone that amount of change which one would be inclined to expect from the numerous publicity literature issued by Government — both at the Centre and in the States. "While there has been considerable increase in rural consciousness of economic and, to a smaller extent, of social needs, the objective of stimulating continuous and positive effort based on self-help for promoting economic or social development has been comparatively unsuccessful. Too much dependence on Government initiative and assistance is still being exhibited by the vast majority of the rural population affected by the programme". Speaking on the wide disparity in the distribution of the achievement and, therefore, of the benefits of community project programmes, the Report points to another interesting aspect of this disparity. There was disparity not merely between different blocks in the project areas, but between villages within the same block. Within the blocks, it existed as between the headquarters villages of the Gram Sevaks, the villages easily accessible to them, and the villages not so easily accessible. Within the villages, it existed as between cultivators and non-cultivators; and within the cultivating classes, it existed as between cultivators of bigger holdings and larger financial resources and those of smaller holdings and lesser financial resources. "This is a matter of serious concern not only in terms of regional and social justice but also in terms of the political consequences that may ensue in the context of the increasing awakening among the people."

The Report does not rest content merely with stating facts. It also analyses the probable causes of the present state of affairs and makes valuable suggestions towards remedying them. The causes, according to the Report, are three-fold in character: administrative, financial and sociological. On the administrative side, it is stated that there is still too much regimentation and too little decentralisation. There is also lack of co-ordination at many levels. Some States (at least the officers of various technical departments in these States) have not yet realised that the Community Projects and N.E.S. agency should be regarded as the permanent and normal field development arm of the State Government in the rural areas. Others have not been able to transmit this knowledge to the staff at the block or village level.

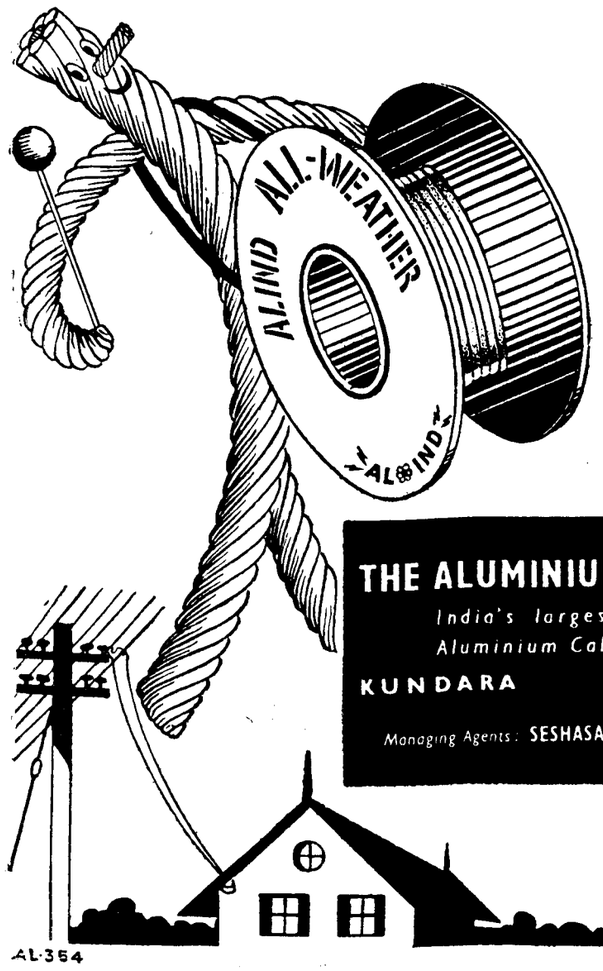
On the financial side, the Report hints that the money allotted for rural development in the second Five-Year Plan is far too inadequate. Although he does not specifically say so, Dr. Rao is evidently of the view with which *The Eastern Economist* is in agreement, that it would have been far better if all the villages were not sought to be covered during the second Plan period: instead, more intensive development should have been attempted in, say, 50 per cent of those proposed to be covered.

There is another important aspect of the financial problem to which Dr. Rao has invited the attention of the Government. The transition from the "intensive" to the "post-intensive" stage

has been too sharp and sudden. The last year of the project period, which was also the year immediately preceding the transformation of a project area into the "post-intensive" pattern, had been a period of great spending. No sooner had great hopes been aroused in the minds of the villagers than came the "post-intensive" period: the latter were told that they could not expect anything special from Government and that they must look to the normal agencies thereof for the necessary financial support. Unfortunately, the "normal agencies" (of State Governments) do not have the funds to provide such support.

It may be argued that Dr. Rao's Report is not representative in character, as it is based on a sample survey. This, however, is not correct. The assessment is based, firstly, on evaluation reports on some 702 villages from 17 evaluation centres covering the entire country, and, secondly, on two special studies conducted by the Programme Evaluation Organisation. Of these two special studies, the first involved a quick survey of a large sample of villages (15 to 20 per cent) in all the project areas — a survey designed (a) to observe the physical accomplishments of the programmes in these villages and (b) to determine their current status. The second study was based on a much smaller number of villages (three in each project area), but involved intensive and qualitative observations on social attitude and behaviour resulting from the programme. The statistical tables appended to the Report (more detailed tables are promised in Part II of the Report still under scrutiny) show conclusively that a very objective analysis has been made by a very competent economist of the social and economic changes which are said to have taken place in rural India and their impact on different sections of the rural population.

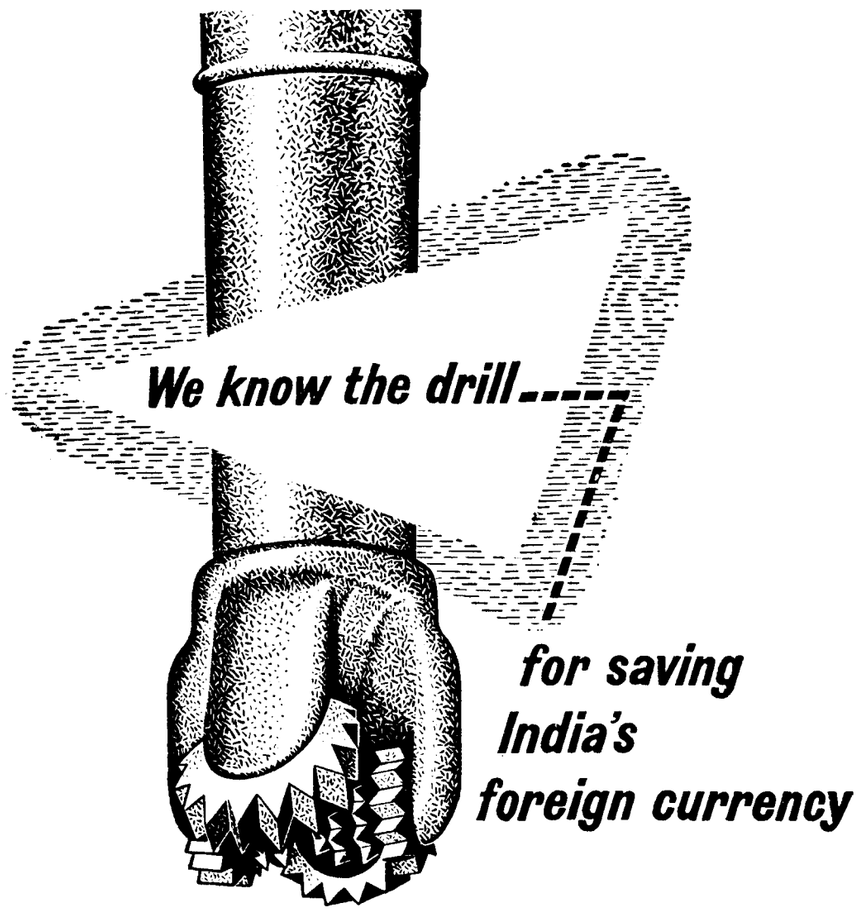
This fourth Report of the Programme Evaluation Board should be an eye-opener to all who are interested in the orderly evolution of a socialist pattern of society. There is no doubt whatsoever that the community projects movement is essentially sound, but like many other institutions, programmes and projects which are essentially sound, this movement must be channelled along right lines. If only those in authority would think less in terms of publicity and collecting laurels from foreign visitors and more in terms of giving silent service to the community, the next Evaluation Report may tell a happier and less disquieting story.



ANNOUNCING ...

ALIND 'ALL-WEATHER'

—the polythene-insulated, weather-proof aluminium conductor for H.S.O.S. (House Service Overhead Systems) applications!



Representing an entirely new phase of electric cable manufacturing, ALIND 'ALL-WEATHER' will embody in itself accepted, modern materials and modern techniques.

It is the ideal cable for low-voltage, overhead service lines. You'll save on first cost and save on installation by specifying ALIND 'ALL-WEATHER.'

Manufacturing range in standard sizes. ALIND 'ALL-WEATHER' *conforms to BSS. 1557 for polythene insulation and BSS. 7 for braiding and compounding.*

THE ALUMINIUM INDUSTRIES LTD.
India's largest manufacturers of Aluminium Cables and Accessories
KUNDARA KERALA STATE
Managing Agents: SESHASAYEE BROS. (TRAV) PRIVATE LTD.

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

THE WEEK'S NOTES

BEGINNINGS IN KERALA

THE COMMUNIST MINISTRY in Kerala began its tenure of office last month with some spectacular first measures. It released political prisoners and commuted death sentences; it issued an ordinance unconditionally staying eviction proceedings against all types of occupiers of land and house-sites; and it has recently passed orders more than doubling the emoluments of village officers in the Malabar area of the State. There is a disposition in some quarters to dismiss these first measures of the Communist Government in Kerala as so many stunts. Any such interpretation of at least the last two measures would be wide of the mark, for it ignores their crucial significance in terms of social psychology and in the context of conditions in two other southern States, Andhra and Madras.

The need for staying eviction proceedings has been questioned on the ground that there is protective tenancy legislation already on the statute book. The Communists' answer to this objection is that "there is not one law which 'unconditionally' and 'effectively' bans evictions". They point to the flaws and loopholes in the Malabar Tenancy Amendment Act "which gives protection to only tenants who have been in possession for six years. There are similar flaws in the laws which were enacted for the Travancore-Cochin State". There is a large element of truth in this contention for it has been a sorry experience practically throughout the country that tenant-protection laws have virtually turned out to be tenant-eviction laws. In particular Madras (of which the district of Malabar formed part before the recent States' reorganisation) and Andhra have been the worst sinners in this regard, and there has all along prevailed some very acute agrarian discontent in these two southern States in which the tenant-cultivated sector (accounting for just under 40 per cent of all cultivated lands before 1949) is now only a ghost of its former self. The possible psychological impact of the Kerala ordinance on the rural areas of Madras and Andhra may be inferred.

The generous increase ordered in the emoluments of village headmen, Karnams (accountants) etc., has implications even greater (or graver?) than those of the total ban on all tenant-evictions. The new salaries will be Rs. 20 for the village headman, Rs. 20 for the Karnam and Rs. 15 for the Kolkaran and a dearness allowance of Rs. 25 and a special allowance of Rs. 7 for all. The increased salaries and allowances (which will entail an additional expenditure of Rs. 7.1 lakhs) will be confined to Malabar district where they will henceforward be at the same level as those in Travancore-Cochin. The salary increase is, of course, justified because there cannot possibly be two different scales in the two areas of the new State. As far as Kerala is concerned, the significance of this measure lies in this that it will logically lead to the demand for increases in the emoluments of elementary school teachers and police constables. The Communist Ministry will most likely do the needful and thereby lay a firm foundation for their next electoral victory. As for Andhra and Madras where the emoluments of village officials are about the same as in Malabar (prior to their recent increase), a wave of discontent among those officials is bound to manifest itself sooner or later. If the emoluments of school teachers and police constables also come to be raised in Kerala, the added psychological impact on Andhra and Madras may also be inferred. The Communists mean business, and this means discredit to the Congress Ministries which have so far refused to deal sympathetically with the just prayers of the low-paid but most essential and basic services.

ZONAL COUNCILS

THREE OF the Zonal Councils—the Northern, Eastern and Central—among the five that have been proposed under the States' Reorganisation Act have been set on their career recently. The Councils have been conceived mainly as an antidote to the fissiparous tendencies that began to show their ugly head during the course of the reorganisation of States. The acerbities caused by linguistic rivalries and regional chauvinism led to an apprehension that unless these were checked in time, any talk of the unity of the country will remain a mirage. It was felt, therefore, that the formation of Zonal Councils will serve to attain a certain measure of inter-State co-operation that will gradually outgrow narrow regional loyalties. Perhaps the intention was that these Councils will in course of time pave the way for larger units through the experience gained in co-operative working. How far this hope will materialise remains to be seen but it requires no prophet to say that this consummation is very far off as things stand at present.

The main objectives behind the formation of those Councils seem to be three. One is to arrest the growth of separatism and linguism. Secondly, to deal with border disputes, linguistic minorities and other matters arising out of the reorganisation of States. And lastly, which is by far the most important, to deal with matters of common interest in the field of economic and social planning. Already in the matter of river valley and development projects, there is some kind of 'ad hoc' machinery for purposes of planning and co-ordination. But the Zonal Councils will accelerate the process and embrace wider spheres of inter-State co-operation like road development, pooling of service and technical personnel and development of educational and research institutions that would be complementary in their role. Perhaps the Zonal Councils may also serve a useful role in the settlement of claims and counter-claims by various States in the location of industrial plants. Though they are only advisory bodies, the constitution of the councils is such that their recommendations are bound to be treated with respect by the Centre. But the real snag in this new experiment is how far the States will subordinate their particular interests and reconcile their conflicting viewpoints to bring about inter-State accord. Placed as they are it will be idle to pretend that the Zonal Councils will have a smooth sailing and produce spectacular results. But at the same time it is conceivable that frequent consultations and confabulations among the States may lead in time to some measure of inter-State co-operation.

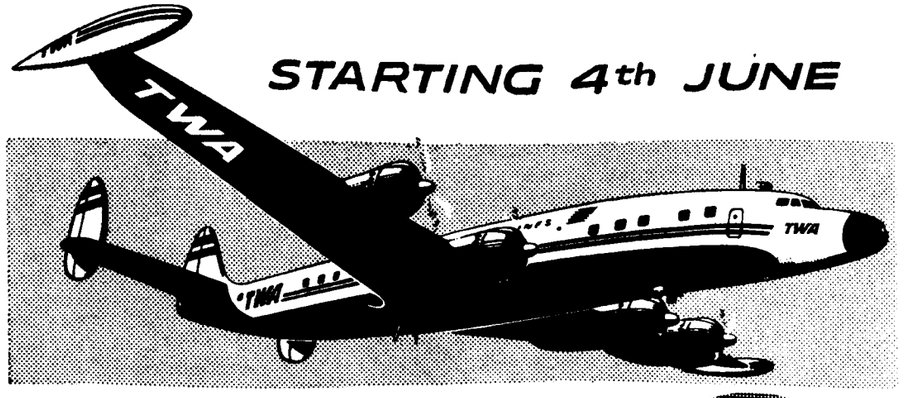
BURRA DHEMO ENQUIRY

THE REPORT of the Committee appointed by the Government of India to enquire into the Burra Dhemo Colliery disaster reveals a sorry state of affairs in the management of coal mines. The Committee has held the manager responsible for this ghastly tragedy in which 28 miners lost their lives. According to the Committee the main cause of the accident was the presence of a huge quantity of water on surface and subsidence causing sudden flooding of the mines. The subsidence is ascribed to the existence of a great bulk of water on surface for a considerable time; weakness of the strata in the outcrop regions of the mine where the cover was thin; and presence of a geological disturbance in the from of a squeeze in the strata.

The manager's fault is that he ignored the danger signal when a large number of mines got flooded. Had he acted in the same way as the other managers had done by withdrawing their men, the tragedy would not have taken place. The main mistake of the manage-

ment lies in not obtaining any record of the previous history of the mine which had changed hands several times. The worst aspect was the delay in starting the dewatering operation. It was extremely callous that both the mining authorities and those in charge of rescue operations should have gone about on the assumption that none could be alive. If the pumping operations had started earlier, the 11 survivors who were trapped inside the mine under the most dreary circumstances could have been brought out earlier.

It is strange that the Inquiry Committee has given a clean bill of health to the Inspectorate of Mines. The question arises, why did not the Mine Inspectorate force the management in time to strengthen the stock of its pumps. It surely was the duty of the Inspectorate to warn the managers of changes in the conditions of topography and underground working and to supply the necessary equipment for dewatering the mine. It is to be hoped that this will not be repeated again. The Enquiry Committee has recommended that the mines rescue stations should have suitable equipment for dewatering a mine. Another important recommendation is that mines which have a similar topography and shallow workings should be examined with a view to the improvement of all safety precautions. The recommendations need to be implemented at the earliest not only because of the big increase in coal production envisaged under the second Plan but also because of the fact that hazardous operations are involved in mining.



TOWARDS SETTLEMENT

THE NEW Egyptian statement of policy on the administration of the Suez Canal is fair and reasonable. It promises the Canal users efficient and economical administration of the Canal and its development in accordance with the needs of modern shipping. The statement announces that any dispute over the Canal Code would be submitted to an arbitration tribunal composed of one nominee of the complainant, one of the Egyptian Suez Canal Authority, and one chosen by mutual agreement between them.

Under the Egyptian scheme the tolls will have to be paid in advance to the Suez Canal Authority. The declaration promises, however, that the tolls will be charged in accordance with the last agreement (of April 29, 1936) between the Egyptian Government and the former Suez Canal Company. Increase in tolls would not in any case be more than one per cent in 12 months except through negotiations; and, failing agreement, will be settled by arbitration. Egypt has also promised to set aside 25 per cent of the tolls for development of the Canal and 5 per cent in royalties for the Egyptian Government.

Though Egypt has given every reasonable assurance and offered every reasonable safeguard to ensure that the rights of the Canal users do not suffer, Britain and France, the two principal users, continue to be critical of her plan. They have described it as 'vague and nebulous'. But their objections seem to be puerile — perhaps because they are prompted by irrational fear and are based on unfounded suspicion. Egypt cannot, surely, within reason, be expected to go further than she has in her concessions to them. What the users now are entitled to ask for is the right of innocent passage for ships of all nations — which means settlement of the question whether Egypt has the right to discriminate against Israeli ships. The exercise of this belligerent right by Egypt is uncalled for now that Israel has unconditionally withdrawn from the Gaza strip and the Gulf of Aqaba. In any case, Egypt should have no hesitation in referring this matter to the International Court of Justice.

Meanwhile, the United States has done well in deciding to give the Egyptian plan a "trial", even though under "protest". Instead of quibbling about the nature and character of the Egyptian declaration, Britain and France would do well to follow the American lead. After all, the success of the plan will depend on co-operation and the manner in which it is executed.

How banking serves the COIR INDUSTRY

INDIA is the world's chief producer of coir and coir products, her yearly output being around 130,000 tons. More than half this output is exported, earning about ten crores of rupees in foreign exchange. The coir industry, which is exclusively South Indian, is concentrated in Malabar and Travancore-Cochin, and employs over six lakhs of workers.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the coir industry.

We at Palai are proud that so many leading coir goods manufacturers of South India employ the complete banking service we offer.

Current Accounts – Demand Drafts –
Telegraphic Transfers – Investments –
Letters of Credit – Bill Collection –
Deposits – Loans and Overdrafts –
Confidential Credit Reports, etc.

* * *

If you have business interests in the South... it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

A LEADING BANK IN SOUTH INDIA

THE ITALIAN LEFT

(From Our Special West European Correspondent)

PARIS, April 26.

LAST November's violence in Hungary and the Middle East caused in West Europe a series of political convulsions nowhere more severely felt than in the ranks of the Left, from the Communists to the social democrats. The butchery in Budapest totally isolated the Communists, paralysed their militant membership, lost them much of their fellow-travelling support and alienated all their left-socialist allies of the Nenni type in Italy. At the same time the Egyptian war rent the socialist international, whose two main constituents, the French and British socialist parties, found themselves bitterly opposed. Moreover, the worsening of the Algerian repression conducted by the socialist Robert Lacoste further disheartened and divided the non-Communist Left, as well as producing serious cracks in the Leftish liberal parties of the Mendes-France type. From all this confusion and disgust it was hoped that a new European Left might emerge; the mass support seemed to be ready and waiting, requiring only a new leadership that would disown both the neo-Stalinism of Khruschev, Togliatti and Thorez, and the Rightist pseudo-socialism of Mollet and Saragat. For those that held such a hope, it was plain that the first test would be in the reorganisation of the Italian Left.

The Italian Left was important because it contained all the colours of the socialist prism, from the biggest Communist Party outside the Iron Curtain, through the fellow-travelling Nenni socialists, to the Atlantic Fact socialists led by Saragat who now form part of a coalition government with the Christians and Liberals. A reorganisation and reunification of this vast Leftist movement would have immediate and extensive consequences. It would produce the downfall of a European Government, for the coalition in office in Rome depends for its existence on the co-operation of the Saragat socialists. It would heal a long-standing and painful division in the socialist international caused by the Nenni-Saragat split, which has had the embarrassing result that the international recognises as its Italian member not the larger Nenni Party but the much smaller Saragat Party. Further, it would strike a major blow at Communism in the West, for Togliatti's Party and person are Moscow's strongest representatives outside the Soviet glacis. A new and stronger Left in Italy could serve as the signal for a reorganisation of all the "progressive" forces in West Europe.

For a time, a realignment of the Italian Left seemed not only possible but imminent. The Italian Communist Party was sorely hit first by the Khruschev report and then by events in Hungary, so much so that even Togliatti himself wavered and spoke, in a reckless moment, of an Italian "national" Communism. The Nenni socialists suspended their working agreement with the Communists and appeared to be ready at their Venice conference to consummate the break entirely. Nenni opened parleys with Saragat for a reunification of their forces, and several of Saragat's lieutenants openly favoured quitting the coalition government in order to facilitate the renewed alliance of the non-Communist Left. No wonder then that socialist leaders from the rest of Europe suddenly began taking their holidays in Italy, hoping to influence the reorganisation of forces that seemed to have begun. Messrs Aneurin Bevan and Morgan Phillips went to Venice for the meeting of the Nenni clan, and Bevan made an excursion to Rome to meet Saragat; from Paris, Pierre Commin, the secretary of the French socialist party, and Thorez, the unregenerate Stalinist boss, went south for talks with their colleagues; and last week Hugh Gaitskell took a Roman holiday over Easter as the guest of Saragat but taking time off to meet Nenni.

To date, from all these meetings and discussions nothing substantial has resulted. Paradoxically, the reunification that seemed imminent in the autumn has not transpired but has produced a further fragmentation in the spring. Far from coalescing, the three main tendencies in Italian Left politics, represented by Togliatti, Nenni and Saragat, have split into at least six tendencies, each party producing a new internal Left and Right. The most important part of the operation, the reconciliation of the Nenni and Saragat clans, has not been effected. Nenni himself has broken with the Communists but his own rank and file will not permit him to isolate his party sufficiently from the Communists to facilitate the socialist reunion. On the other hand, Saragat is not willing to break with the Right-wing government coalition until Nenni's party has completed the divorce. The benevolent intervention of the British Labourites has so far had only unhappy results, Aneurin Bevan in particular incurring charges from many quarters of discourtesy, interference and abuse of hospitality; the more suave Hugh Gaitskell had very thin ice to skate on when he repeated the attempt at mediation last week.

The divisions of the Italian Left have always seemed confusing to outsiders who do not follow the intricate meanderings of Italian politics, and the further fragmentation of Leftist forces referred to above is designed to increase this confusion to discouraging proportions. But I suggest that there is an evident pattern in these reshufflings, which is all the more interesting because it is not confined to Italy but is reproduced in several other European countries. This common feature is the revolt of the rank and file against its own leadership, a revolt that in most cases does not go to the extent of a shift of political allegiance but is limited to disaffection, sulking and political disinterest. Aware of their isolation from their mass support, the recognised political leaders are restricted in their movements and are unable to carry through the reorganisation of the Left that events demand.

This is quite obvious in the case of the Italian Communist Party. Togliatti's iron grip over the party machine appears, but only appears, to have been restored. The recent party conference was carefully stage-managed under the eyes of an imposing delegation from Moscow, but even then could not smother dramatic denunciations of Soviet policy in Hungary. Defections from the party continue, and involve eminent and long-faithful revolutionaries. Since I began to write this despatch I have received a startling pamphlet by a leading Communist deputy, Antonio Giolitti, called "Riforme e Rivoluzione" which ferociously attacks Togliatti's leadership and his total subservience to Moscow. Maybe by the time this appears in print, Signor Giolitti will have been expelled from the party (as has happened with those French Communists who have published identical protests against the Thorez clique) but that will not have destroyed the powerful rebellion within the party.

At the other extreme of the socialist spectrum, Saragat is in no better position. He had to accept a

few days ago the resignation of his party's secretary, Matteo Matteoti, who had violently urged quitting the coalition government and going at least half way to meeting the Nenni faction's terms for a reconciliation. Getting rid of Matteoti settles nothing, for it is certain that the same thesis will be presented at the Saragat party's congress in June and it is quite probable that thereupon there will be a split. Saragat in fact finds himself in a position very similar to Mollet in France, holding on to an alliance with the extreme Right in order to stay in office, while the mass of his party drifts Leftward and loses all contact with its supposed leadership.

Nenni is in no better case. His party is being wooed from both sides; that is nothing new, but what is new is that the leadership and the mass of the party want to move in different directions. Nenni found himself faced with rebellion in Venice when he sought to hasten the reconciliation with Saragat by completing the break with the Communists, and to this day he cannot break free of his old Stalinist allies because the rank and file of his party is refusing to sever connections with the Communists in the trade unions. It is not at all that the ordinary Nenni socialists want to go on co-operating with Togliatti and all he stands for—Russian tanks in Budapest and the rest. It is precisely because the Nenni socialists at the lower levels (and especially in the trade unions) know that the Communist movement is split and is out of sympathy with its leadership that they want to maintain contact with their Communist fellow-workers. They see in that a better hope of Leftist reunification than in any theatrical reunion between socialist politicians who have lost their following, like Saragat and Nenni.

So the European Left today, and not only the Italian Left, presents the spectacle of many generals without armies. Some of these lonely generals must feel a measure of sympathy with Kadar, the Hungarian "people's leader" who can probably count the people he leads on his fingers and toes. In France, Guy Mollet cannot reasonably be compared with Kadar but there must be precious few French socialists who would be willing to swear that Mollet and Lacoste are implementing a specifically socialist or Left policy. Were it not for Bevan's political flair, Hugh Gaitskell would possibly be in the same situation in Britain today. The fading of hopes for a reunion of the Italian Left demonstrates that these leaders without a following are incapable of carrying through the reorganisation of "progressive" forces that the majority of the working class demands. But the West European working classes are so thoroughly "politicalised", boss-led and unused to democratic action that it is unlikely that they will be able to put through the reorganisation they hope for, against the will of the leaders in whom they have lost confidence.

WORLDGRAM

AGRICULTURE

Grow More Food Programme for Madras: A total amount of Rs. 81.46 lakhs has been provided for the Grow More Food schemes for Madras State for the year 1957-58. Of this, Central aid in the form of loan and grant amounts to Rs. 68.60 lakhs, and the State Government will contribute Rs. 9.64 lakhs. The balance of Rs. 3.22 lakhs will be available to the State Government from the Centre when it submits new minor irrigation schemes. In addition, the Centre has agreed to give a short-term loan of Rs. 330.75 lakhs for purchase and distribution of 1.05 lakh tons of a fertilizer in the State. It is anticipated that, as a result of these schemes, there will be additional food production to the extent of 1,53,968 tons. The overall target for the current year is 3,20,235 tons of additional food grains, including 25,058 tons from major irrigation schemes, for Madras State.

*

Measures to Develop Sheep and Wool Production: For development of sheep and wool production in India, 396 extension centres will have been set up by March 31, 1959, at a total cost of Rs. 150 lakhs. The object is to improve sheep breeding and utilisation of wool, and conduct research on cross-breeding and selective breeding with a view to upgrading local sheep with the higher species. Already 24 such centres have been established—8 each in Uttar Pradesh and Punjab and 4 each in Bombay and Andhra Pradesh in 1956-57. During the year 1957-58, 166 additional centres will be established—39 in Rajasthan, 25 each in U.P. and Bombay, 16 each in Punjab, Mysore and Jammu and Kashmir, 14 in Madhya Pradesh, 8 in Madras and 7 in Andhra Pradesh. It is also planned to establish in 1957-58, 3 wool utilisation centres—one each in Uttar Pradesh, Bombay and Rajasthan. A similar number of sheep breeding farms will be set up in Bombay, Himachal Pradesh and Madhya Pradesh, each farm having a wool analysis laboratory as well. The Government of India have sanctioned a total grant of Rs. 10 lakhs and Rs. 4 lakhs as loan to States for 1957-58 for this purpose.

INDUSTRY

Specification for Caustic Soda Technical: The Indian Standards Institution has issued, for eliciting comments, draft amendment No. 2 to the specification for caustic soda, technical (IS: 252-1950). The draft amendment modifies the requirements of caustic soda, technical, so as to bring the specification in line with the quality of the product manufactured in the country. Comments on the draft amendment may be sent before July 10, 1957 to the Indian Standards Institution, 19, University Road, Delhi-8.

*

Draft Standard for Suji: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for semolina which is commonly known as Suji or Rava. Requirements, both physical and chemical are specified in this draft standard. These requirements are for particle size, microscopic appearance, moisture, total ash, acid insoluble ash, fat, acidity, etc. This draft standard has been prepared by ISI's Edible Starches, Confectionary and Cereal Products Sectional Committee. The Committee has taken into consideration the data on the composition of 'Suji' as manufactured from different varieties of wheat produced in the country and imported from abroad. Due weight has also been given to the relevant rules issued by the Government of India under the Prevention of Food Adulteration Act, 1954. Comments on the draft standard may be sent before June 13, 1957 to the Indian Standards Institution, 19, University Road, Delhi-8.

*

China Clay for Rubber Industry: The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard specification for China clay for rubber industry. This draft standard prescribes the requirements for China clay used in rubber industry as a reinforcing material, and as a filler divided into two grades. The material for the former use has been designated as Grade 1 and that for the latter use as Grade 2. Comments on the draft may be sent before July 10, 1957 to the Indian Standards Institution, 19, University Road, Delhi-8.

TRADE

New Trading Corporations in Burma: The Government of the Union of Burma has announced the forthcoming establishment of five joint-venture trading corporations, in which private enterprises and persons will be allowed to purchase shares up to a maximum of K. 10,000 (K.1 = US $0.21). Each corporation will have a share capital of K. 5 million, of which the Government will subscribe K. 2.6 million and the public K. 2.4 million, each share having a par value of K. 100. These firms will import and distribute industrial raw materials; machinery and equipment; such consumer goods as textiles, foodstuffs, and general hardware, including building materials; and tires and tubes.

*

French Trade in 1956: France's deficit in its trade with countries outside the Franc area rose from the equivalent US $248 million in 1955 to US $1,101 million in 1956. Imports (c.i.f.) increased by 21 per cent, to $4,326 milion, while exports (f.o.b.) declined by 6 per cent, to $3,145 million. These figures include trade in industrial gold, which was small in 1956. Also, the trade figures for 1955 are not exactly comparable with those for 1956 because of a change in the period of coverage, which had the effect of lengthening the 1955 period covered by 3 per cent for exports and by 1 per cent for imports.

FINANCE

Purchases from the IMF by Egypt and India: The Government of Egypt has purchased from the International Monetary Fund US $15 million with Egyptian pounds. This is the second Egyptian transaction with the Fund in recent months. Last September, Egypt purchased Canadian dollars equivalent to US $15 million. The Government of India has entered into an exchange transaction and stand-by arrangement with the International Monetary Fund in a total amount of $200 million. The transaction provides for the purchase of $127.5 million from the Fund with Indian rupees. The Fund will transfer $60 million of this amount immediately and $67.5 million after 30 days. A stand-by arrangement which will become effective on the date of the second transfer, will permit India to purchase from the Fund during the following 12 months currencies equivalent to an additional $72.5 million. India purchased a total of $99,980,000 from the Fund in 1948 and 1949, and has since made repurchases which restored the original position. The recent arrangements permit each country to draw up to 50 per cent of its Fund quota.

*

Personal Income Record in US: Personal income in March rose to a record annual rate of $337,500 million, the US Commerce Department reports. The rate level was $1,000 million over the preceding month. Personal income—a major indicator of the economy—includes wages and salaries, and net income of proprietorships,

as well as dividends and interest, net rents received by landlords, and other types of individual income.

*

Financial Assistance to Educational Institutions: A further sum of Rs. 12.50 lakhs was sanctioned by the Central Ministry of Rehabilitation last month as grant-in-aid to educational institutions, catering to the needs of displaced students from West Pakistan, for construction of buildings and purchase of equipment. A sum of about Rs. 37,00,000 was allotted during the last financial year to disrupted as well as non-disrupted educational institutions. This allotment was in addition to the allocations of Rs. 95,00,000 made up to the end of 1955-56. The Central Ministry of Rehabilitation has made a provision of Rs. 3.74 crores in the second Plan for expenditure on the education of displaced students from West Pakistan. Under the educational schemes of the Ministry, displaced students are helped in the prosecution of their studies through financial assistance in the shape of exemption from tuition fees, grants for purchase of books and stipends.

*

10-Year Treasury Savings Deposit Certificates: The Government of India have decided to allow the holders of 10-year Treasury Savings Deposit Certificates to pledge them with scheduled banks and co-operative banks and societies for the purpose of securing advance against them. At present, these certificates can be transferred for the purpose of being deposited as security only to a Gazetted Government Officer, an executive officer or local authority defined in the General Clauses Act, 1897 in his official capacity or the Reserve Bank of India. Details of procedure to be followed in this regard may be had from the Government treasuries and the Public Debt offices of the Reserve Bank of India.

*

Special Rebate on Handloom Cloth Sales: A special rebate of three Naye Paise per rupee will be granted on all the retail sales of handloom cloth during the Fourth All-India Handloom Week to be celebrated throughout the country from May 5 to May 11, 1957. This special rebate will be in addition to the rebate now being granted at the rate of 12 Naye Paise per rupee in Bombay State and nine Naye Paise per rupee in all other States. Also during the week a special rebate of nine Naye Paise will be granted on such sales where the present rate of rebate is six Naye Paise only.

GENERAL

Industrial Disputes and Relations in India: There was decreased time-loss due to industrial disputes during the month of February 1957, as compared to the previous month, according to Labour Bureau, Government of India. The total time-loss during the month was 205,196 man-days as against 390,852 recorded during the previous month. The time-loss during February 1957 was also lower than the monthly average time-loss of 592,437 during 1956 by about 65.4 per cent. The number of fresh disputes arising during February 1957 was 74 and these involved 35,540 workers. The corresponding figures during the previous month were 119 and 115,059 respectively.

*

American Lend Lease Silver Being Returned: During the war the United States Government lent/leased 226 million fine ounces of silver to the Government of India to be returned five years after the duration of the emergency. The liability for the return of this silver was divided between India and Pakistan, India's share being approximately 172 million ounces. For the return of this silver, the following arrangements have been agreed to between the Government of India and the U.S. Government. The Government of India will make immediate arrangements for the shipment of approximately 50 million fine oz. of silver of the requisite fineness in the form of bars to the U.S. Government. The balance of the silver amounting to approximately 122 million fine oz. will be made available in the form of quarternary alloy coins to the Government of the United States of America through the American Embassy in New Delhi. The alloy silver will be taken over by the U.S. Government through their Embassy in New Delhi and all cost of handling, transportation and refining will be on the account of the U.S. Government. The U.S. Government will retain all the metals recovered in the refining process.

*

Research Programme for the Plan: The Research Programme Committee of the Planning Commission has now finalised the main lines of research to be sponsored in the fields of Politics and Public Administration. The following three broad categories of subjects have been chosen by the Committee.

1. Machinery for Planning and Implementation.
2. Working of Village Agencies with special reference to Public Co-operation.
3. Problems of Public Administration and Parliamentary control of Public enterprise.

According to its usual procedure the Committee will receive and examine research schemes on subjects coming under any one of the above categories. This is in addition to the following subjects in Economics and Sociology which have been earlier chosen by the Committee viz. analytical studies of macro-economic aspects of Indian Economy, studies in decentralisation and industrial dispersal including problems of planning regional development, resources of development and problems of social dynamics such as those relating to cultural change in rural and tribal life, changes in family structure and studies in social hierarchy and leadership.

*

Oil Production in the Middle East: Crude oil production in the principal Middle East countries during the first three quarters of 1956 was 21.2 million tons greater than in the first three quarters of 1955. The increase was due mainly to a sharp rise in Saudi Arabian and Iranian production:

	Jan-Sept. 1955	Jan.-Sept. 1956
	(In millions of metric tons)	
Kuwait	41.09	44.48
Saudi Arabia	34.46	42.46
Iraq	24.60	26.30
Iran	11.39	19.10
Qatar	4.03	4.45
TOTAL	115.57	136.79

After the outbreak of hostilities and the closing of the Suez Canal, however, production was cut back sharply. In Saudi Arabia, crude oil production during November totalled only 21.6 million barrels, compared with 31.2 million in November, 1955. Production in Iraq fell from 3.1 million tons in October, 1956 to only 729,000 tons in November. In Iran, production in the entire year 1956 amounted to 25.9 million tons, of which 11 million tons were refined; comparable figures for 1955 were 15.7 million tons and 7.2 million tons, respectively. The total 1956 production in Iran exceeded the amount agreed to in the original oil agreement by 2.9 million tons; it is estimated that without the Suez crisis it would have reached 27 million tons. On a daily basis, Iranian output in November and December was 8,000 barrels less than in September.

NEWS IN BRIEF

INDIAN

India has constituted a special rupee account to be utilised for purchasing cotton and cement from Egypt.

*

The Government of India has decided to allow re-export of imported cotton piecegoods, according to export control trade notice issued recently by the Joint Chief Controller of Exports, Bombay.

*

It is reported the Government of India will continue to issue wheat at the rate of 15,000 tons a month each to the State Governments of Uttar Pradesh and Bihar to meet the needs of fair price shops.

*

Twenty small industrial estates are to be set up at Community Development Block Headquarters. State Governments have been asked to select the location of these estates in consultation with the Ministry of Commerce and Industry, the Joint Development Commissioners for Small-Scale Industries for the Regions and the Directors of Industries for the States.

*

The Employees' State Insurance Corporation which met on April 25, considered the capitation fee payable to panel doctors for the insured person and his family, and the arrangements for sharing the cost of medical care with the State Governments on inclusion of families.

*

The Indian Standards Institution has published an Indian standard code of practice for the use of structural steel in general building construction.

*

It is reported quarternary alloy coins of the value of one rupee, half a rupee and quarter rupee of the King George VI issue will form part of the return of lend-lease silver by India to the United States Government.

*

A total sum of Rs. 279.83 lakhs has been provided for the Grow More Food schemes of Uttar Pradesh for the year 1957-58.

*

The estimated total output of iron ore in India increased to 365,168 tons in February 1957 from 354,405 tons in January, 1957, according to official statistics released by the Chief Inspector of Mines.

*

Shri K. C. Reddy, Union Minister of Works, Housing and Supply, has disclosed that the Government of India had decided to continue to operate the Hindustan Housing Factory.

*

For the Manufacturing Industry group the index of industrial relations (base 1939=100) for the month of February, 1957 was 652.8 as compared to 386.0 (revised) for the previous month and 93.6 for the corresponding month of the previous year.

*

According to the lists received from Pakistan in pursuance of the Indo-Pakistan Movable Property Agreement, India will receive a sum of Rs. 16 lakhs from Pakistan on account of sale proceeds of movable property of displaced persons.

FOREIGN

Foreign Governments last year paid $700 million (about £250 million) of the debts to the United States Government. Britain paid the biggest sum—$118 million (over £42 million), including $58 million on early post-war credits and $48 million in lend-lease silver returned on an ounce-for-ounce basis.

*

The Bank of Finland has placed a ceiling on rediscounting by the financial institutions with effect from August 1. The limit is equal to double the amount of the bank's own funds plus the credit balance in its cheque account with the Central Bank.

*

World wheat production for 1956-57 is likely to be about 121 million metric tons, some two million tons below production for 1955-56, according to the latest reports received from abroad. The figures do not include production in Eastern Europe, the Soviet Union and China.

*

The value of West German permits issued between 1952 and the end of 1956 for private investments abroad totalled a little over DM1.3 billion.

*

New Zealand had a surplus of £0.8 million in overseas transactions during the year ended March 31. This compared with a deficit of £16.5 million last time.

*

South Africa's gold and foreign assets in the week ended April 12 totalled £131,880,000 a week earlier. The latest total comprised £83,222,000 in gold coin and bullion, £37,025,000 in foreign bills, £6,687,000 in foreign securities and £4,596,000 in other foreign assets.

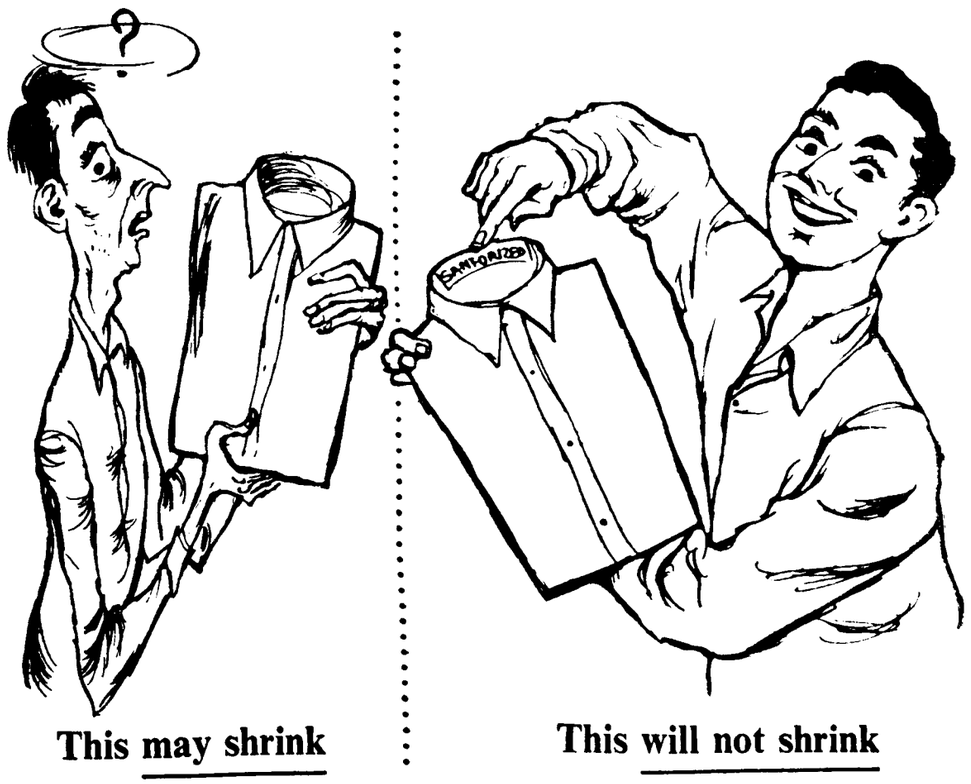
*

Soviet oil production this year is expected to be 97 million tons with more than 70 per cent of it coming from the newly developed area between the River Volga and the Ural Mountains.

*

Western Europe's share in the world's steel production is growing, states the High Authority of Coal and Steel Pool in its fifth annual report to the Common Assembly.

*



Direct investment in Australian companies by overseas interests during 1955-56 at £A103 million showed a 20 per cent increase on the 1954-55 figures (£A86 million).

*

According to proposals published by the Commission of Inquiry into income-tax in East Africa, companies would pay more income-tax and individuals less.

*

Canada's official holdings of gold and U.S. dollars increased by $3.9 million in March to $1,923.6 million. This was an increase of $52.2 million on the $1,871.4 million reported in March last year, according to the Bank of Canada.

This may shrink

This will not shrink

That's why people look for 'Sanforized' on the label!

The 'Sanforized' trade mark inspires such confidence that people all over the world pick 'Sanforized' trade marked fabrics —knowing they bear this assurance: *This garment will not shrink out of fit— even after many, many washings!*

It adds value and prestige to your own label—enables you to sell with confidence—and assures the public that you take trouble to give them value.

People rely on you to serve them well—so serve them 'Sanforized' labelled cloth.

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For Information: 'Sanforized' Service, 95, Marine Drive, Bombay 2

CO-OPERATIVE MOVEMENT IN BIHAR

By RAMAN K. DESAI

K. G. SIVASWAMY, a member of the Servants of India Society, passed away in January last after he had completed yet another valuable service in the Plantation Enquiry Committee. His survey of the co-operative movement in Bihar was undertaken in the early months of 1954; the report published last year is unofficial but considerable assistance seems to have been received from various sources. The second volume containing statistics would be looked forward to with interest. The Delhi School of Economics which sponsored the survey deserves credit for this piece of field research.

The principal fact about rural India is the unbalanced economy in which, in a rural population of 30 crores, four out of every five self-supporting persons derive their income from agriculture. Among cultivators, the largest sector consists of small cultivators with small plots of land, subsisting on the margin of starvation. The agriculturist avails himself of credit mainly from moneylenders and relatives. He sells his produce in the village, rather than in a market town, because he cannot afford to wait and there are no facilities for storage. In these two vital aspects of his business, credit for the purchase of raw materials on the one hand and economics of storage, processing and marketing on the other, he is dependant on the trader, the miller and the moneylender. For the last 50 years, administrators and social reformers have hoped that the tyrannical burden of the trader and the moneylender will be replaced by the methods of self-help and mutual benefit enshrined in the Co-operative Movement.

The Movement itself is the result of a philosophy which was put into practice by Robert Owen and his followers in the middle of the nineteenth century. The basis of co-operation was the assumption that competition and profit motive were inimical to social progress. A new society was envisaged in which with the help of sound education, human nature could be transformed, and in the field of economic enterprise, this Movement would assist change in character, by abolishing this motive. The mutual aid and common holdings eliminated interference from the State, because it was feared that partnership with the State would evolve a regimented society, as opposed to unfettered society where men would develop gradually into higher citizens. It was also felt that "for the government to subsidise and spoonfeed co-operative societies means usually the kiss of death."

In India for the last 10 years Government have assisted this Movement in a signal manner. At the same time, Government have enacted that the inhibitions of laws relating to companies, partnerships, and banking companies would not prevail in the case of Co-operative Societies, which were regarded as 'sui generis'. The public when they realised that the Movement was not progressing well, blamed the British Government on the ground that the officials did not permit public participation. Strangely enough, after independence, the Government have inclined to take the view that in the absence of education and civic consciousness among the people, this defect of the British should be further accentuated in the shape of a vast official control over the Movement. Side by side, it may be noted that during the last four decades, commercial bankers and insurance companies, without Government assistance, in fact often in the face of foreign competition, public prejudice, and Government neglect, have enabled the build-up of vast industrial organisations in India, with marked integrity. If, therefore, the agriculturist is not benefited to the same extent as an industrialist, in spite of Government's strong support of this Movement, some fundamental questions regarding the validity of the premiss which relates to the quality of the Movement, and its organisation must be raised.

There are two aspects of the Movement which must be examined. Firstly, the extent to which the element of self-help, arising out of a gradual awakening of civic consciousness, has progressed, and secondly whether the Movement has led to any appreciable betterment of the lot of the beneficiaries, in fact if it has served its purpose. With regard to the first item, it can be stated that far from any awakening, there has been a growing reliance on government agencies, not merely in terms of finance but even in the matter of management, thus vitiating the avowed purpose of transforming the acquisitive character of human nature.

After so many decades of solid support from all sides, it has been found that without active government participation and control, for an indefinite period, the Movement must fail. Instead of self-help, the Movement has become one wing of the agencies mobilised by government for the purpose of fulfilling a series in a planned economy. No other agencies such as obtained in other countries, nor the banks which have proved valuable in other fields have been approved as substitutes for this moribund institution. The Reserve Bank of India, which has played a considerable part in the guidance of opinion on the subject, is inclined to the view that multi-purpose co-operative societies at all levels would be adequate for an integrated economy in the rural area.

The recent survey report under the auspices of the Reserve Bank has formulated a scheme by which the commercial banks, the Reserve Bank, the State Bank and the co-operative societies at the higher level, along with some States banks, would be co-ordinated into a powerful drive to supply rural credit. At the same time, a plan has been formulated for storage and warehousing. More than that, the suggestion has been made that except at primary stages, at higher levels, there should be a very active organisation, in fact a partnership between the State and the Movement in which the State would be the dominant partner in financing, in supervision and in management. The survey report aims to pump State credit and State management into this movement, a movement which the Survey itself condemns as a piece of failure.

On the second aspect, the Survey under review throws considerable light. The recent survey of the Reserve Bank relied on a vast and diffused survey of villages in India. But we have before us a Report on a select area by a competent and sympathetic observer. The author subscribes to the view, along with the Reserve Bank, that there is no alternative to the Co-operative Movement and actually the facts that he has found are all the more damning in their import. Apart from the general inadequacy in the scope and action of the Movement in relation to rural economy. Bihar suffers from a gross mismanagement at all levels of the Co-operative Movement. The State Co-operative Bank started in 1914, earned in 1949 a strange comment from an observer: "The Provincial Bank had not the will or

the staff to satisfy itself about the security of a loan sanctioned by it and the directors generally busied themselves in canvassing favours from the departmental heads at such meetings." The Co-operative Department has very wide powers, of policing, judicial powers of a Civil Court and authority to surcharge members of management. The Registrar is the Head of this Department. He sanctions loans made by bankers, he arbitrates disputes for which he holds a monopoly, believe it or not, even against the Civil Court. He appoints personnel and transfers or discharges them. Obviously, this Grand Moghul must be a super-man. The Maclagan Committee recommended that the Registrar should have intimate knowledge of rural life and economics, knowledge of law, banking and trade. Obviously, now that the Movement is no longer confined to a few citizens combining in a voluntary organisation, it is a State-organised activity for mobilising the people, and the Registrar's qualifications must be that of the super-man. But no heed has ever been paid to the necessity of employing qualified men. The Hubback Committee in 1932 recommended that the managing director of the State Co-operative Bank should be a business man or a trained banker, not to be appointed by Government. Such advice has been consistently ignored. But we can hardly blame Bihar when now the belief that any administrative officer in any secretariat can run anything, technical concerns, plants, even banking business, is the accepted dogma of bureaucracy.

The State Co-operative Bank is a mercantile firm rather than a bank. Its substantial business is trade and only a small part banking. It commenced business in fertilizers in 1945, sale of cloth in 1949, iron in 1950, coal and textbooks in 1951. Central Banks undertake all kinds of business in addition to commodities, such as loans to business men, investment in transport, contract for sawai grass and bamboos. Naturally, the banks lost heavily when cloth and commodities generally were decontrolled. To recoup the losses they have dabbled all the more in the supply of commodities. In 1951, the Reserve Bank warned Bihar against trade activities by the State Co-operative Bank and the recent Survey Report against emphasises the necessity of separating trade and banking functions in such banks. Yet in 1952, the State Bank lent to societies Rs. 25 lakhs only, but the sale of cloth amounted to Rs. 146 lakhs, fertilizers Rs. 59 lakhs, oilcakes Rs. 13 lakhs. As was expected, corruption rapidly seeped in; some Central Banks sub-let cloth licenses to private dealers, profits mainly going to the traders, "favouritism became rampant in fixing the dealers for sale, bank clerks were responsible for credit sales to individuals whose names and addresses could not be traced". In the name of development programme, huge sums have been wasted.

What about audit? The present method about audit dates from the time when co-operatives were merely mutual teams of agriculturists and if the audit staff worked under the Registrar, there seemed to be no particular harm. But now when the Registrar is the head of an almighty department, it is strange that he can smother audit through a staff dependent upon him. There is objection, and no wonder, to audit even by the Reserve Bank. The Grand Moghul is monarch absolute. A delightful phrase has been invented by Bihar for presentation to the Dictionary of Banking, a "Bullock Loan". Loans can be taken for the purchase of a single bullock returnable in 3 years and for 2 bullocks returnable in 5 years. The author writes — "if only all the members against whom such loans stood really purchased bullocks, there should be too many unwanted bullocks in villages". May I suggest "Bullock Loan" as a synonym for bogus loans?

Knowing all this, the State and the Reserve Bank and in their ignorance, the public, have been doped with the slogan, "co-operation has failed but co-operation must succeed". Vast sums of money continue to be poured without even an enquiry into the purpose and the management. A colleague of mine joined the State Bank as Managing Director on a Monday morning, resigned on Thursday and left for Calcutta on Saturday: those of us who thought him hasty learnt to appreciate his courage when we knew the facts. And yet even in this book an idea is mooted whether the decision of a majority of members of primary societies should be enforced on the whole village including non-members. In support of this idea, legislation in those enlightened and democratic countries, Bulgaria, Rumania and Yugoslavia is cited; this is the best possible way by which people may be acclimatised to the practices of a Communist Party Dictatorship, elimination of other opinions and parties.

If this were a report on Company management or private enterprise, there would have been a howl of rage in the Press and the Legislature. On the contrary, neither the administration nor the public seem to be worried about these findings and yet if this be the standard set by public institutions, people like myself must wonder whether we were not unduly severe on bank directors in the past. Those who are not blindly prejudiced in favour of co-operation as the one sovereign remedy for rural poverty, must question the validity of the fundamental assumption on which the Movement rests. If organisation, or methods or indeed our national character suffer from inherent defects, those must first be remedied before an experiment based on slogans can be thrust upon the country. With what face we shall celebrate the Centenary of the death of Robert Owen next year, I do not know. We must recognise that there are no absolutes and no eternal verities in economics and pragmatic methods must be the safest guide at our present state of progress. In Communist Poland, Gomulka in a recent defence of private enterprise, has already started talking of parasitical capitalism as distinguished from productive capitalism. Such is the revenge of the science of economics on charlatans, a lesson we may not ignore.

THE INDIAN OVERSEAS BANK LTD.
MADRAS

The South East Asian market — a problem ?

Businessmen interested in trade with South East Asia couldn't do better than to consult the Indian Overseas Bank. The bank has extensive experience in trade with South East Asian countries through its chain of branches strategically located all over South East Asia. Before you invest in trade in this area it would be wise to consult the Indian Overseas Bank.

BUSINESS NOTES

EXPANSION OF BANK CREDIT

MR. S. P. JAIN has discussed two important issues relating to the expansion of credit facilities through banks in his presidential speech at this year's annual meeting of the Punjab National Bank. He argues a strong case for the penetration of commercial banks in the country-side and also pleads for raising the limits of loans to be granted by the Industrial Finance Corporation and the State Financial Corporations. He emphasizes that commercial banks should make a determined effort to augment their resources by tapping funds available in the rural areas. High cost of branch offices in rural areas is a serious handicap to the development of banking there. One effective remedy suggested by Mr. Jain to reduce costs is to allow banks to fix wage scales in alignment with the cost of living in those areas and not according to notional standards prescribed in the Bank Award. Government has shown no inclination to take kindly to this suggestion. A year and a half of the existence of the State Bank of India has shown that in spite of concession in the form of financial reliefs little encouraging progress could be made in branch office expansion in the country-side. The Chairman has suggested that commercial banks should be enabled to take an energetic and forceful part in rural banking activity by linking their operations with the Reserve Bank in its function of expanding rural credit as well as with industrial organisations like sugar factories, ginning presses, and so forth. There need not be any doubt that such a conscious direction of policy will accelerate the process of monetisation of the non-menetised sector. Agricultural and industrial activity in the rural areas will be fortified by larger facilities of credit.

Mr. Jain's proposals are helpful in so far as they go and they merit close consideration by the Reserve Bank and the Finance Ministry. But there are other urgent problems of bank credit which demand prompt solution. The main criticism against the working of the State Financial Corporations is their failure to serve the requirements of small and medium industrial units, although it must be recognised that some of them have to face competition from other State-aided financial agencies. The major problem of the Industrial Finance Corporations is inadequacy of funds for the second Plan. Their difficulties are not going to be solved by raising the ceilings on loans they are allowed to grant. But above all the burning problem which needs to be tackled immediately is one of overcoming the tightness in the money market for providing adequate credit for business activity in the urban and industrial sectors.

INDUSTRIAL CREDIT AND INVESTMENT CORPORATION

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION, which was launched in January 1955 for giving assistance to industrial enterprises falling within the private sector, has completed two years and the total assistance it has authorised has now reached over Rs. 8 crores covering 28 projects. Mr. A. Ramaswami Mudaliar in his address as Chairman at the annual general meeting referred to two main criticisms levelled against the Corporation. One was that it was too slow in its working and it took a long time to scrutinise the projects presented to it. The Chairman was perhaps correct when he explained that it took some time for a Company starting from scratch to get going and gain experience. But with regard to scrutiny of projects, it is obvious that consistent with its responsibility, the Corporation should take steps to expedite them without undue delay.

Mr. Ramaswami Mudaliar referred to the other criticism that the Bank had so far failed to make use of the $10 million of credit granted to it by the World Bank. He explained that so long as industrialists and promoters of schemes presented to them were in a position to get their foreign currency needs in the normal way, they were not willing to take loans in foreign currency from the Corporation. But now the situation had changed as a result of the foreign exchange crisis and since the Government's deferred payment plan for capital imports had been announced, a number of enquiries for loans in foreign currency had been received by the Corporation. The Corporation has thus now come to acquire an increasing importance in the assistance it can lend to the private enterprises and in the coming months it will utilise more and more the line of credit open to it from the World Bank. The potentialities of the Corporation in industrial development will be thus felt in increasing degree in the months to come.

DUNLOP'S ACCELERATED PROGRESS

The rapid strides which Dunlop Rubber Company (India) is making are well reflected in its vigorous programme of development. Planned expansion of the Sahaganj factory will be completed in a couple of years' time and in the meantime work will be started for the erection of another factory at Madras. A comprehensive account of the financial and physical operations of the company during the calendar year 1956 will be found elsewhere in this issue in the annual review made by the incoming Managing Director, Mr. John Luckham. It is significant that the company's ratio of profit to turnover was reduced from 3.6 per cent to 3.2 per cent after taxation in the last two years. The Chairman rightly claims credit that this should be considered as a yardstick of the services rendered by the company to the country in this strategic industry. Continuous expansion of demand for tyres in particular and for other rubber products will be necessitated for developmental activity under the current Plan. The new Dunlop Roadster Giant Tyre is making rapid headway since ideal suitability under different conditions is its strong point. Demand for a variety of products, especially bicycle tyres, has outstripped output. The scooter is fast winning popularity with the urban rider. The Chairman has given the assurance that the company will strive its utmost to catch up with the demand. Imports were necessary under high pressure from the buyer and some time-lag would be required before domestic output will be able to cut down overseas purchases.

Mr. Luckham does not strike a note of complaint, but he urges that certain aspects of raw material supply should be taken into account. World prices for crude rubber declined last year below the prices of Indian rubber and to restore parity a cess was imposed after August 1956 on imports equivalent to the difference between the home rubber price and the landed cost of imported rubber. The cess is to go to assist rehabilitation of rubber plantations. This is a sacrifice which is demanded of the manufacturing industry since obviously there will be no compensatory relief if world prices rise above prices of Indian crude rubber. One factor contributing to higher production costs was the increase in import duty on items in which the industry is interested, for instance rayon yarn, in the case of which the duty was put up by 25 per cent. The company's experience on distribution of finished products was far from satisfactory, the chief bottleneck being wagon supply by the railways. This fact needs to be noticed as a reminder that the Railway Ministry's publicity of efficiency performance presents one side of the picture.

INDIAN BANK'S EVENTFUL YEAR

THIS PREMIER bank of South India is celebrating its Golden Jubilee this year. The concrete fruit of fifty years of sustained service and forward policy is seen in the new peaks achieved by the Bank during the calendar year 1956. The gross profit of the Bank reached another high of Rs. 2.04 crores in 1956 which compares with a gross profit of Rs. 1.46 crores in 1955. In terms of net profit, the record attained is the highest in the Bank's history of half a century. Net profit during 1956 rose to Rs. 45.71 lakhs at which level it was more than double the amount in the previous year. This performance speaks for the success of the working of the Bank. The reserve and other funds now add up to Rs. 1.01 crores as against the paid-up capital of Rs. 63.83 lakhs. The working funds have shown an impressive increase to Rs. 48 crores, or Rs. 6.10 crores more than in 1955. The foreign exchange business is expanding steadily. In the year of Golden Jubilee, the shareholders have been presented with the happy announcement of a dividend of 13.1 per cent.

The Chairman Kumararajah Shri M. A. M. Muthia Chettiar of Chettinad, has drawn pointed attention to the paradoxical situation which has arisen in respect of the official Bank Rate. Formally, the Bank Rate remains unchanged. Only the Reserve Bank's rate of interest on advances to scheduled banks against Government securities has been increased from 3½ per cent to 4 per cent. The status quo in regard to rate of interest on usance bills is more nominal than real. Actually, the abnormal increase in the stamp duty has raised the effective rate of interest on trade bills to 4 per cent. Scheduled banks are required to pay in practice 4 per cent, or a little more, on call and short-term deposits. Their lending rate has gone up by 1 per cent to 1½ per cent These manipulations of the interest rate have added to the strained situation which scheduled banks had to undergo during 1956 for a variety of reasons not least important of which was the official policy of credit restraint and squeeze.

EAST INDIA DISTILLERIES

THE STATEMENT of the Chairman, East India Distilleries and Sugar Factories Limited, Madras, made at the recent Annual General Meeting conveys an account of progress in each direction including the organisational set-up. The scheme of merger of Parry's with East India Distilleries has been fully implemented without any mentionable dislocation and the Company in its post-merger form has fully consolidated its position. A significant change in the Company's organisation is its transformation into a Director-managed concern. The majority of the members of the Board of Directors are now Indian nationals. It is happy to be told that this policy is going to be pursued progressively in the coming years with specific reference to the service cadres.

Programmes of expanded production of sugar, fertilisers, chemicals and other products are proceeding according to schedule. The Chairman has pointed out that export of sugar will in future become an integral part of the sugar industry of this country. Although the Company and the concerns allied to its group did not participate in the export trade because of lack of surplus production in South India, the Company's Deputy Managing Director made considerable contribution to formulating last year's export policy and programme in his capacity as Vice-President of the Indian Sugar Mills Association. The Indian agriculturist is fast becoming fertiliser-minded. The Company's turn-over in fertilisers nearly reached the two-crore rupees mark, while imports of chemicals went up to Rs. 61 lakhs. The transfer of Parry's interests in the fertiliser business to the Company and reorganisation of the group's factory at Ranipet have been completed. The resources position is under review to meet the increasing requirements of this business. It is sound proof of the dynamic state of the Company's structure that another factory is contemplated to be set up at Bezwada.

Company Meeting

The East India Distilleries and Sugar Factories, Ltd.

Statement by the Chairman at the Annual General Meeting of the East India Distilleries and Sugar Factories, Limited, Madras, on Tuesday, April 30, 1957.

"Last year, when I had the privilege of addressing you for the first time, as Chairman of the Company, I indicated to you in broad outline the shape of things to come, following the merger of Parrys with E.I.D. Now that I have the opportunity of addressing you again, you will no doubt be interested to know what progress we have made in the objectives set out. The E.I.D. is now a director-managed concern, with a majority of Indians on the Board. You will remember that at the time the merger proposals were placed before you, only myself and Sri V. Ramakrishna were on a Board of five, the other three being Messrs. Wonfor, Noel-Tod and Hadfield. The Board invited two distinguished Indians Dr. U. Krishna Rau and Sri R. Venkataswamy Naidu to join the Board and I may take this opportunity to record how much we valued their co-operation and goodwill, their knowledge and understanding of the problems that came for assessment at the Board level. May I also take this opportunity of recording my appreciation of the spirit of loyalty and sense of duty that uniformly characterised my British colleagues on the Board who were all in executive charge and entrusted with the responsibility of implementing the decisions of the Board. I have nothing but praise for the way the Directors on Parry Board also responded to their call. The Parry Board all along has been a close preserve of senior British Executives but today we have two Indian nationals on the Board and I have no doubt that in due course more Indians will find their place on it. It is the accepted policy of the Company that other things being equal, Indian nationals will have preference and priority in recruitment to the service cadre of the Company. It is also the policy of the Company to have these recruitments to the covenanted ranks by open competition. For the first time posts were advertised and applications invited towards the close of last year and I may confess I was amazed at the thousands of applications that came pouring in. From a study of these applications two things emerge viz. that there is plenty of qualified talent in this country waiting for openings and opportunities and that service in Parrys set-up is greatly coveted even by men already in service elsewhere. My only regret is that we are not in a position yet to make fuller use of the abundant talent available. Of those who are in the service of the Company today it is but right that I should record that I have found them in good fettle, eager and willing to give of their best, especially in the new set-up.

And now let me turn to the Report and the Accounts for the year ending 30th September, 1956. These

THE NEW SHORROCK SPINNING & MANUFACTURING COMPANY LTD.

NOTICE

NOTICE is hereby given that the 45th Ordinary General Meeting of the Shareholders of the Company will be held on Wednesday the 8th day of May, 1957 at 11-0 A.M. at the Registered Office of the Company situated in the Mill Compound of the Shorrock Spg. & Mfg., Co., Ltd., at Asarwa Road, Ahmedabad to transact the following business:

(1) To receive and adopt Directors' Report and the Audited Balance Sheet and the Statement of Profit & Loss Account for the year ended 31st December, 1956.

(2) To declare Dividend.

(3) To elect a Director in place of Shri Yogindra N. Mafatlal who retires by rotation, but being eligible, offers himself for re-election.

(4) To elect a Director in place of Shri Pramukhalal M. Patel who retires by rotation, but being eligible, offers himself for re-election.

(5) To elect a Director in place of Shri Ratilal Nathalal who holds office up to the General Meeting, but being eligible, offers himself for re-election.

(6) To appoint Auditors for the year 1957 and to fix their remuneration.

(7) To consider and if thought fit to pass the following Special Resolutions with or without modifications, if any.

Special Resolutions

1. 'RESOLVED THAT this Company hereby accords its consent to Shri Krishnalal R. Sitwala, the Spg. Master of the Company, who now becomes a relative of Shri Hemant B. Mafatlal, a Director of the Company, under Section 6 of the Companies Act, 1956, drawing a monthly salary of Rs. 1,800 from the Company and thereby holding the office or place of profit under it as defined in Section 314 of the Act'.

2. 'RESOLVED THAT in accordance with the provisions of Section 360 of the Companies Act, 1956 the Company hereby consents to the continuance of services from March 1, 1958 of the following persons who are the Associates of M/s. Mafatlal Chandulal & Co., Ltd., the Managing Agents of the Company, by virtue of their being relatives of the Directors of the said Managing Agents mentioned against their respective names hereunder:—

Name of Directors of M/s. Mafatlal Chandulal & Co. Ltd. whose relative he is	Name of persons who are in service of the Company	Designation	Present Salary	Remarks
Shri Laxmanprasad D. Vasa	Shri Jayantilal D. Vasa	Purchasing Officer	500.00	Entitled to get all other benefits as other employees of the Company.
Shri Kaushikprasad Chandulal	Shri Vinodchandra T. Patel	Spg. Supervisor	160.00	
— do —	Shri Jayendra T. Patel	Wvg. Supervisor	75.00	— do —
Shri Bhagubhai Chandulal and Shri Hemant B. Mafatlal	Shri Krishnalal R. Sitwala	Spg. Master	1,800.00	— do —

(8) To transact such other business as may be placed before the Meeting by the Chairman.

The Share Transfer Books of the Company will be closed from 16th day of April, 1957 to 6th day of May, 1957, both days inclusive.

By Order of the Board of Directors,
For Mafatlal Chandulal & Co., Ltd.
ARVIND N. MAFATLAL
Director,
Managing Agents

BOMBAY,
Dated March 18, 1957.

N.B. 1. **Proxy:**—A Member entitled to attend and vote at the above Meeting is entitled to appoint a Proxy or Proxies to attend and vote instead of himself and that a Proxy need not be a Member of the Company.
2. The Dividend, if any, as sanctioned at the General Meeting will be paid to those Shareholders whose names stand on the Register of the Company on 16th day of April, 1957. The payment will be made from Thursday the 23rd day of May, 1957 between 12-0 Noon and 4-0 P.M. at the Registered office of the Company situated in the Mill compound of the Shorrock Spg. & Mfg. Co., Ltd., at Asarwa Road, Ahmedabad, on working days.
3. Dividend Warrants will be sent to the Registered Addresses of the Shareholders.

Explanatory Statement under Sec. 173 of the Act has been sent to the Shareholders.

THE SHORROCK SPINNING AND MANUFACTURING COMPANY LIMITED

NOTICE

NOTICE is hereby given that the 53rd Ordinary General Meeting of the Shareholders of the Company will be held on Wednesday the 8th day of May, 1957 at 10-30 A.M. at the Registered Office of the Company in the Mill Compound at Asarwa Road, Ahmedabad to transact the following business:

(1) To receive and adopt Directors' Report and the Audited Balance Sheet and the Statement of Profit & Loss Account for the year ended 31st December, 1956.

(2) To declare Dividend.

(3) To elect a Director in place of Shri Yogindra N. Mafatlal who retires by rotation, but being eligible, offers himself for re-election.

(4) To elect a Director in place of Shri Pramukhalal M. Patel who retires by rotation, but being eligible, offers himself for re-election.

(5) To elect a Director in place of Shri Bhagubhai Chandulal who holds office up to the General Meeting, but being eligible, offers himself for re-election.

(6) To appoint Auditors for the year 1957 and to fix their remuneration.

(7) To consider and if thought fit to pass the following Special Resolution with or without modifications, if any.

SPECIAL RESOLUTION

1. RESOLVED THAT in accordance with the provisions of Section 360 of the Companies Act, 1956 the Company hereby consents to the continuance of services from March 1, 1958, of the following persons who are the Associates of M/s. Mafatlal Chandulal & Co. (Ahmedabad) Ltd., the Managing Agents of the Company, by virtue of their being relatives of the Directors of the said Managing Agents mentioned against their respective names hereunder:-

Names of Directors of M/s. Mafatlal Chandulal & Co. (Ahmedabad) Ltd. who relative he is	Names of persons who are in service of this Company	Designation	Present salary	Remarks
Shri Arvind N. Mafatlal	Shri Bapalal P. Desai	Stores Clerk	115/-	Entitled to get all other benefits as other employees of the Company.
Shri Laxmanprasad D. Vasa	Shri Jayantilal D. Vasa	Purchasing Officer	500/-	
— do —	Shri Rasiklal R. Patel	Cotton Clerk	138/-	— do —
— do —	Shri Harkant N. Sitwala	Sales Clerk	80/-	— do —
Shri Pramukhalal M. Patel	Shri Atmaram R. Patel	Pay Clerk	146/-	— do —

(8) To transact such other business as may be placed before the Meeting by the Chairman.

The Share Transfer Books of the Company will be closed from 16th day of April, 1957, to 6th day of May, 1957, both days inclusive.

BOMBAY,
Dated 18-3-1957

By Order of the Board of Directors,

For Mafatlal Chandulal & Co. (Ahmedabad)

ARVIND N. MAFATLAL

Director,

Managing Agents.

N.B. 1. **Proxy:**—A Member entitled to attend and vote at the above Meeting is entitled to appoint a Proxy or Proxies to attend and vote instead of himself and that a Proxy need not be a Member of the Company.

2. The Dividend, if any, as sanctioned at the General Meeting will be paid to those Shareholders whose names stand on the Register of the Company on 16th April, 1957. The payment will be made from Thursday the 23rd day of May, 1957 between 12-0 Noon and 4-0 P.M. at the Registered Office of the Company in the Mill Compound on working days.

3. Dividend Warrants will be sent to the Registered addresses of the Shareholders.

Explanatory Statement under Sec. 173 of the Act has been sent to the Shareholders.

have been in your hands for the statutory period and with your permission I shall take them as read. I regret very much that these Accounts are submitted to you later in the year than has been done in the past. The delay however has been quite unavoidable. It has been largely occasioned by this being the first time that consolidated Group Accounts have been furnished and the preparation of Accounts in this form has necessarily had to be done with great care. Also, the provisions of the Indian Companies Act, 1956, regarding the charging of expenses by a Managing Agent to Managed Companies, have delayed the finalisation of the accounts of our subsidiary, Parry and Company Ltd. To enable the Directors of Parry and Company, Ltd., to formulate an equitable assessment of the amounts of overheads etc. that should correctly be charged to the Managed Companies, an elaborate system of recording through Time Sheets, the time spent by each member of the staff on the affairs of each Company in the Group was introduced. The consolidation of the information made available by these Time Sheets took some time to complete but in order to comply with the spirit and the letter of the Indian Companies Act it was quite essential that this additional work should be undertaken. Having now accumulated reliable statistics, I expect, it will not be necessary in succeeding years to undertake this work in such detail and I therefore hope that it will be possible to issue the Accounts for the current year well before this time next year. You are of course aware that in order to ensure that dividends were paid within the fiscal year ended 31st March, 1957 your Directors declared a second interim dividend of 10 per cent in anticipation of these Accounts being adopted and thereby shareholders have been saved the embarrassment of the final dividend being paid the next fiscal year.

The operations of the year have been fully reviewed in the Directors' Report and there are only one or two points I should like to refer in this context. You would have noticed with interest that the sugar industry has developed a new facet with the emergence of an export market due to fortuitous circumstances. Part failure of the best crop in Europe and the closure of the Suez Canal created a shortage of sugar supply in the Middle East which it was possible for India to cover at remunerative prices. Exports are being handled through the agency of the Indian Sugar Mills' Association, on a non-profit basis. Such profits as are made are carried over to a Reserve with a view to balance any loss that may be incurred in the future in the maintenance of the export market. So far, firm orders to the extent of about 86,550 tons have been booked and shipments in substantial measure have already commenced according to an agreed schedule. Further orders are expected and the Government of India, I understand, are agreeable to release stocks for export and they had no idea of imposing any rigid limits in this respect. In hammering out the export scheme and giving it dynamic expression you will be glad to know that Mr. P. Hadfield, Deputy Managing Director of this Company played a notable part as Vice-President of the Indian Sugar Mills' Association. Our Group has not yet sold any sugar for export. This is understandable against the background that South India is still deficient in sugar and it is easier to negotiate freight at the two ports Bombay and Calcutta, from which exports are now made. But the value of this offtake by means of exports cannot be overlooked or underestimated in sugar economy. Today there is an all-India surplus in production, supply outpacing demand. This no doubt is a heartening reversal of the position three years back when sugar had to be imported to relieve shortage in the country. In 1954-55 the total production of sugar in the country was 15.89 lakhs of tons; in 1955-56 it moved up to 18.56 lakhs of tons; in 1956-57 it is estimated production will touch 20.2 lakhs of tons. Besides expanding production, we have also a carry over of well over 5 lakhs of tons. The present pace of consumption is rated at 19 lakhs of tons and at the end of the Planning period it is expected this may move up to 22.5 lakhs of tons. At the same time, with new sugar mills progressively coming into production during the Plan period and several of the old ones expanding their crushing capacity the total production in the country is expected to reach up to 25 lakhs of tons at the end of the second Planning Period. If sugar economy is to be protected, obviously, apart from expanding internal consumption a regular outlet by way of export has to be created, developed and maintained. By good luck we have made a promising beginning and if only Government will take note of the export potential and the need to build it up in all possible ways, I believe the sugar industry apart from safeguarding its own economy is destined also to play an important part in the balance of payments position of the country. Before leaving this subject, may I crave your indulgence to correct a misstatement in the Directors' Report. In the last para under the heading "Sugar" in page 6 of the Report the closing sentence says that the export target at the end of the second Five-Year Plan has been fixed at 2,500,000 tons. This is obviously a mistake, the figure refers to the total production target.

You will also have observed that in the Report mention is made of the substantial increase in Fertiliser turnover. The turnover in fertilisers during the period under review amounts to just under two crores of rupees equivalent to £1½ million sterling and that of chemical imports to 61 lakhs of rupees equivalent to 457,000 pounds sterling. Business in these lines bids fair to increases in the coming years as people in the agricultural sector are getting fertiliser minded and it is the policy of the Government to increase food production by extensive as well as intensive cultivation. With a view to simplify and streamline operation and control of the Group's factory at Ranipet where the major part of our fertiliser manufacture is carried on, the transfer of Parry's interests in the fertiliser business to East India Distilleries and Sugar Factories Ltd., has just been completed and in addition it is proposed to set up another factory at Bezwada to which I shall refer in greater detail presently. It is obvious that a turnover of this magnitude running into millions of pounds will require careful consideration of our cash and credit resources. On the basis of our present capital and reserves it seems to me our credit resources are fully extended and it would be unwise to base our further expansion programme on such additional banking facilities as may be available to us. Your Directors are now exploring various alternatives by which further capital can be introduced into the Group and we shall come forward presently with proposals to this end. In this context it may be just as well to correct a possible misapprehension arising from the acquisition of Parry's equity shares. Although the total cost of cash for the purchase of the Parry ordinary shares amounted to £558,000, the actual net outgoing of cash from the Group on this account is £.204,000 only. This is because £.225,000 of the outgoing amount was immediately used by the main sellers the Coromandel Investment Trust Ltd., to purchase the E.I.D. shares then held by Parry and Co., Itd., and they also agreed to accept deferred payment in respect of £.144,000, balance of the purchase price. Of this amount of £.144,000 for which deferred payment over 5 years was agreed, a first instalment of £.15,000 only has just been paid.

Turning to the results of the year, I would like to stress that the Accounts of our two main subsidiary Companies, Messrs. Parry and Co., Ltd., and Messrs. Parry, Murray and Co., Ltd., are for 9 months only, but it is most satisfactory to note that for these 9 months they have recorded profits on a par with their results for the previous 12 months which confirms the view taken by your Directors 18 months ago on the

profitability of acquiring the ordinary capital of these Companies. If we convert these figures to a basis of twelve months and if we reduce the taxation charge by the sum applying to previous years, we find that the net profit after taxation would have been increased by some £.60,000 and that our present dividends would be covered three times by earnings. On the basis of a full year's income, the figures for 1956 show that the purchase price of ordinary shares in Parry and Co, Ltd. (on an annual basis of 22.4 per cent) works out to less than five years' yield on these shares. I may also make a reference to the amount of taxation paid on the Group profits for the year under review, as set out in note 3 of page 18 of the Report and Accounts. The total amount of tax represents the very high figure of about 56 per cent of the profit and of the total amount of taxation, £.66,223 consists of additional taxation imposed by the Indian Finance Act, 1956 and the Indian Finance (No. 3) Act, 1956. This sum represents 13 per cent of the profit or, viewed in another way, 12 per cent on the Ordinary Capital. I feel therefore that it may be recorded as a matter for satisfaction that in spite of the burden of this upsurging in taxation your Directors have been able to maintain a total dividend of 15 per cent on the Ordinary Share Capital. To what extent the burden of taxation may be varied during the current year is of course dependent on the contents of next month's budget and I cannot, therefore, venture on any forecast but the figures I have quoted will establish beyond doubt or dispute that private enterprise, rightly directed, will prove a bulwark to our national economy.

Turning to the prospects for the current year I am glad to say that progress is well maintained in all directions. It is common knowledge that import restrictions have progressively been tightened in recent months. To the extent that the policy is dictated by a desire to protect indigenous industries we may take comfort that the trading activities of Parry and Co., Ltd., will not be seriously affected, as in Parrys sales agency portfolio we hold a high proportion of goods of Indian manufacture. The major items in the import agencies that we hold are essential commodities such as sulphur, phosphates and plant for generation of electricity in respect of which, I expect, restrictions will be relaxed. Incidentally Shareholders will be interested to learn in connection with the last item that over the past eighteen months Parrys have obtained orders for the Diesel generating equipment manufactured by Messrs. Mirless Bickerton and Dey Ltd., of Stockport to a total contract value of just under two crores of rupees or very nearly £.1½ million. These orders include about 6,000 kilowatts of power for the Koyna Project in Bombay, 6,000 kilowatts of power for the construction of the Russian Steel Plant at Bhilai in Madhya Pradesh, and over 20,000 kilowatts for the Delhi State Electricity Board. It must however be recognised that the general exchange position has sadly deteriorated and its shadows have begun to fall even in respect of capital goods. Unless long-term credit facilities from overseas manufacturers are forthcoming, exchange restrictions, I am afraid, will effect the flow of orders in respect of capital goods. It may be possible to arrange medium if not long-term credit if Government can find ways and means to guarantee exchange rates. I understand Government are considering at the moment representations to this effect from concerned interests and I hope that the problem posed will be resolved soon.

Apart from the direct activities I have so far referred to, you are aware that Parry and Co., Ltd. perform the duties of the Managing Agents for three Companies. The Deccan Sugar and Abkhari Co., Ltd., the Travancore Sugars and Chemicals Ltd., and Parrys Confectionary Ltd. You will be glad to hear that all these companies are in good shape and have maintained their dividends. In respect of the Deccan Sugar Abkhari Co., Ltd., you will be interested to know that the Company is at the moment engaged in a programme of modernisation and reorganisation of its factories at Samalkot and Pugalur which will considerably improve the efficiency of both units. The Company is issuing 3,96,400 shares at par totalling approximately twenty lakhs of rupees which I expect will easily be taken up by the shareholders having regard to the record of the Company in the past and current market quotations for these shares.

Last year the Cauvery Sugars and Chemicals Ltd., was promoted with the goodwill and co-operation of the East India Distilleries and Sugar Factories Ltd., and Parry and Co., Ltd. Capital issued was of the order of 49 lakhs and the entire issue was underwritten. Orders have been placed for the requisite machinery and the factory is now under construction. The factory is well located at Pettavathalai in Kulittalai Taluk, Tiruchirapalli District, as good quality cane in sufficient supply is confidently expected to be available. The capacity of the factory is 300 tons of cane per day. The East India Distilleries and Sugar Factories Ltd. have been appointed Technical Consultants and Parry Co., Ltd. are the Secretaries and Treasurers. The main reason which prompted our association with this new Company is the desire to have a common selling organisation which will not only operate economically but also ensure a fair margin for the production of Nellikuppam Factory, Pugalur Factory and Cauvery Factory. The new factory is expected to go into production in June-July next year.

Earlier, I referred in another context to our intention to set up a factory at Bezwada for Fertilisers to cover the needs of the Krishna and Godavari Delta. This Company (Andhra Fertilisers Private Ltd.) in which the East India Distilleries and Sugar Factories Ltd. will be equal partners with Messrs. K. C. P. Ltd., will shortly be formed. It is proposed to establish a super-phosphate manufacturing unit, for which Government approval has already been obtained. The sales franchise of this new Company will be exercised by the East India Distilleries and Sugar Factories Ltd. I don't think I need say anything more about the value or importance of this unit intended as it is to enable us to improve our coverage in Andhra in respect of fertilisers.

One other Company that we propose to interest ourselves in is the Pamba River Starch Co. Private Ltd. in which the East India Distilleries and Sugar Factories Ltd. will be an equal partner with Messrs. Corn Products Ltd. and Messrs. Travancore Sugars and Chemicals Ltd. The object of the Company is to manufacture from Tapioca roots a high grade starch principally for the export markets. We are holding up the integration of the Company pending clarification of the condition under which companies may be required to deposit a part of their Reserves with the Government, pending also the issue of an import licence for the plant required and finally pending a clarification of the policy of the present Government of Kerala on the issue of nationalisation.

I shall now revert to the Report and Accounts placed before you; before proposing the adoption of the Report and Accounts for the year ending 30th September, 1956, I shall be glad to answer to the best of my ability any questions which any shareholder may wish to put to me concerning the Report and Accounts."

The Directors' Report and the Accounts for the year ended 30th September, 1956 were unanimously adopted. Mr. R. Venkataswamy Naidu and Mr. P. Hadfield were re-elected to the Board, and the Auditors, Messrs. Lovelock and Lewes, were re-appointed.

N.B.—This does not purport to be a Report of the Proceedings of the General Meeting.

A Letter to the Editor

A SOMEWHAT DIFFERENT CASE

Sir,

In the "Economic Report from the U.S.", entitled "I.M.F. at Work" by Guy Sims Fitch (vide your issue dated April 19, 1957), it is stated: "The recent $200 million standby loan to India presented 'a somewhat different case' ..... economic policies." By itself, this observation is not such as to make any Indian take exception to it. But following, as it does, a reference to the maximum allowable credit to the U.K. and preceding another reference to the short-term credit to Argentina, it does not, in my opinion, establish that any special concession has been made in the case of our country as your comment seems to suggest. For, notwithstanding all the explanations that Guy Sims Fitch offers to justify the maximum credit extended to the U.K., it is clear that part at least of that country's troubles has been the outcome of the Suez escapade. Fortunately for Britain, her economy has not been very adversely hit even by this, as her Chancellor of the Exchequer has only recently admitted. Nor is her external balances position so bad as was made out to be, especially when this country was obliged to draw heavily on her sterling balances. True experience reveals that even relatively small movements in the sterling balances can create havoc with the slender balances on overall trade account. Yet, as the London correspondent of "Commerce" has rightly observed in his despatch dated April 6, 1957 to that journal (vide issue dated April 13, 1957) "if one is seeking to indict the holders of sterling balances for having embarrassed the U.K. by their drawings, one must also appreciate that, at the end of 1952, the sterling balances of all the countries stood at £3,219 million and at the end of 1956 at £3,425 million, showing over the five years an increase of £200 millions!" All these only go to show that the U.K.'s economic condition has not been, and is not, so hopeless as some have sought to establish, presumably to evoke the sympathy of the U.S.A. and international financial agencies; at any rate, it cannot be as bad as that of India; judging by the 100 million tax relief that the British Chancellor of the Exchequer has given in the last budget, on the one hand, and the threat of several hundred crores of additional taxation that his Indian counterpart has been holding out, on the other.

In the case of Argentina, even according to your correspondent himself, the economic problems of the country are a legacy of the Peron regime and yet to relieve the strain on her external reserves, we are told, the I.M.F. extended the latest short-term credit to Argentina. In the light of such self-evident facts — more political than economic — I thought it rather intriguing that Guy Sims Fitch should have regarded the credit to India as presenting "a somewhat different case." If, as your correspondent pertinently remarks, in practice, the I.M.F. has had to deal with exchange problems created by economic expansion rather than contraction (when the Monetary Fund was started in 1944, it will be recalled, the experts connected with it envisaged it largely as a safeguard against international recession), it has done nothing exceptional to India, although one must appreciate the dynamism of the I.M.F. machinery. I believe India is entitled to take some credit at least for this reorientation in outlook of the I.M.F. This country cannot be too grateful, therefore, to those who represented it so ably on the I.M.F. and to no less a degree, to our present Ambassador in America, who has pulled the strings from behind in true diplomatic style that seems so naturally to come to him.

Yours sincerely,

ORVY

UDAIPUR,

April 22, 1957.

MAHINDRA & MAHINDRA LIMITED

NOTICE

THE Eleventh Annual General Meeting of the Shareholders of Mahindra & Mahindra Ltd. will be held at the Green's Hotel, Apollo Bunder, Bombay 1, on Wednesday, 22nd May, 1957 at 4-00 p.m. to transact the following business:—

(1) To receive and adopt the Directors' Report, the audited balance-sheet and profit and loss account for the year ended 31st October, 1956.

(2) To declare dividend on Preference and Ordinary Shares.

(3) To appoint a Director in place of Mr. A. K. Mitra who retires under Article 110 of the Articles of Association but is eligible for re-election.

(4) To appoint a Director in place of Mr. Keshub Mahindra who retires by rotation under Article 110 of the Articles of Association but is eligible for re-election.

(5) To appoint a Director in place of Mr. Jal H. Mehta who retires by rotation under Article 110 of the Articles of Association but is eligible for re-election.

(6) To appoint Auditors for the current year and to fix their remuneration.

A member entitled to attend and vote at a Meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

By Order of the Board,

KESHUB MAHINDRA,

11th April, 1957. DIRECTOR.

The Transfer Books of the Company will be closed from the 8th May, 1957 to 22nd May, 1957 both days inclusive.

The Dividend when sanctioned will be payable to those shareholders whose names stand on the Register of the Company on 22nd May, 1957, and the Dividend Warrants will be posted to them on or after 23rd May, 1957. Shareholders are requested to immediately notify any change of address.

Company Meetings

DUNLOP RUBBER CO., (INDIA) LTD.

Mr. John Luckham's Review

The 31st Annual General Meeting of the Dunlop Rubber Co. (India) Ltd., was held in Calcutta on the 29th April. Mr. John Luckham, Managing Director, said:

Gentlemen,

The Directors' Report and Accounts for the year 1956 have been in your hands for some time and with your permission I will take them as read.

I should like to preface my remarks this year by referring to changes in your Board of Directors. Mr Cecil Stack, who had been a Director of the Company since 1942 and Managing Director for the last six years, resigned at the end of last month. During the last year Mr. Stack had been in indifferent health and since he had served for 33 years in this country he decided to accept an appointment offered to him by the Dunlop Rubber Co., Ltd. in London. It was with great regret that the Board accepted his decision and I am sure you will wish to join me in expressing our appreciation of Mr. Stack's long and valuable services.

You will have seen from the notice convening the meeting that it is proposed to appoint Sardar H. S. Malik to the Board. Sardar Malik, as I am sure you are all aware, has recently retired from a long and distinguished career in the service of the Government of India and latterly as Indian Ambassador to France. I am confident that Sardar Malik's wise counsel and great knowledge of affairs will be of the utmost assistance to your Board and I commend this appointment for your approval.

THE YEAR'S TRADING

The factory was working to full capacity throughout the year and new records of output were achieved. Nevertheless, we were unable to meet the demand for all of our products and a shortage of Giant and Cycle Tyres and Cycle Rims necessitated the Government granting import licences for these products to alleviate the situation. We have plans for increasing our production and I will deal with these later on in this review.

Once again distribution of the Company's products was adversely affected due to the shortage of railway wagons. Many pleas have been made from both the public and private sectors for serious actions to be taken to improve the situation, and it is to be hoped that this important problem will receive the attention it deserves.

Total sales in value were 12½ per cent higher than in 1955, but with the lower level of selling prices prevailing throughout 1956, the ratio of profit to turnover declined from 3.6 per cent to 3.2 per cent after taxation. This exceedingly modest profit percentage provides, I think, a good measure of our service to the community.

PRODUCTS

We have continued to receive the full benefits of the Dunlop worldwide research activities and many improvements have been put into effect during the year.

Last year my predecessor announced the introduction of the new Dunlop Roadster Giant Tyre, and it is with great pleasure that I am able to tell you that this has been extremely successful and has proved ideal for most conditions. This new tyre, combined with the ever popular Dunlop Trakmaster Giant Tyre, provides users with an ideal selection to choose from to cover the different types of service conditions which are found in this country.

Car Tyre performance continues to be excellent and we have retained our premier position in the market.

I must make mention here of the very rapid growth in the development of the Scooter and to say that your Company have prepared themselves to meet the demand for the special type of tyre required.

The Bicycle Industry continues to develop very rapidly and so far we have been unable to keep pace with the demand for our Cycle Tyres and Rims, and, as already stated, imports were necessary to help fill the gap.

Substantial increases in sales were also achieved in our Industrial Rubber Products range. The second Five-Year Plan has already increased the demand for Conveyor Belting and we are taking steps to ensure that we can play our part in meeting this. Further great strides were made in Dunlopillo Latex Foam Cushioning and demand remains ahead of production.

Our work in chemical plant lining made considerable progress during 1956, and we now have orders in hand which fully justify our decision to undertake this work.

NEW FACTORY

I am happy to be able to tell you that in addition to the expansion which has taken place and will continue at least for the next two years at your Sahaganj factory, the Company has obtained Government approval for the establishment of another tyre factory in Madras. The Chairman stated at this time last year that we as a Company hoped to play our full part in meeting the very considerable increase in demand for rubber products which would arise under India's second Five-Year Plan. The new factory in South India will, it is hoped, give us sufficient overall capacity to meet the demands for our products for some time to come. A substantial amount of additional capital will be required to finance this new project and as soon as our plans have been finalised you will be advised of the Board's proposals. An issue of further share capital will form the basis of these plans.

RAW MATERIALS

The raw material supply position, with the exception of crude rubber, was generally satisfactory and we were fortunate that at the time of the Suez Canal crisis we had adequate stocks of imported materials.

As in the previous year, consumption of raw rubber by manufacturers at 31,405 tons far exceeded production at 23,444 tons and substantial imports were made.

Since the world market price of rubber had fallen below the Indian controlled price, Government introduced a cess on imported rubber equal to the difference between the landed cost of the imported rubber and the local price, applicable to all imports after August, 1956. The amount collected under this price equalisation policy is payable to the Rubber Board as a contribution to the rehabilitation of rubber plantations. We are happy to co-operate with Government in this scheme, but have been unable to get any indication of how the importer will stand in the event of the world rubber price again rising above the local price.

Generally costs tended to rise during the latter half of the year, chiefly due to increases in freight rates and import duties. For instance, the duty on rayon yarn, one of our chief raw materials, was increased by 25 per cent and to a lesser extent carbon black and tyre valves were also affected.

PROFIT & LOSS ACCOUNT

The net profit for the year after providing for depreciation, interest and taxation was Rs. 55,09,909 and after taking into account the balance of profit carried forward the amount available for disposal is Rs. 66,81,594 compared with Rs. 61,28,686 for 1955. The Directors are recommending the same rate of Ordinary Dividend as for 1955, that is 15 per cent, which will absorb Rs. 24 lakhs. The Directors also propose the transfer of Rs. 26 lakhs to General Reserve as against Rs. 22 lakhs last year. This will increase the General Reserve to Rs. 216 lakhs and you will see from the Balance Sheet that the Ordinary Share Capital is covered more than twice by the total Reserves and Surplus. These reserves are, of course, fully employed in the business and the continued availability of profits for appropriation to reserves is very necessary to assist in providing the funds for development and expansion.

BALANCE SHEET

The additions to Fixed Assets during the year amounted to Rs. 42,22,000, consisting mainly of Plant and Machinery for expansion and modernisation. The amount of depreciation written off in 1956 was Rs. 30,55,000 as against Rs. 27,51,000 in 1955.

Stock inventories at Rs. 455,47,000 were Rs. 63,84,000 higher than at the close of the previous year. This was partly due to increased production but also to the fact that some raw material stocks were abnormally low at the end of 1955. Sundry Debtors were up by Rs. 28,79,000, due to the greater sales turnover. Cash, Bank and Current Balances were also higher, making the total increase in Current Assets Rs. 107,15,000. Deducting the increase of Rs. 17,96,000 in Sundry Creditors and other current liabilities there is shown a net increase in working capital during the year of approximately Rs. 39 lakhs, which is reflected in the combined rise in the bank overdraft (including the usance promissory notes) and unsecured loans.

EMPLOYEE RELATIONS

During the past year we have continued our efforts to maintain and improve our high reputation for congenial working conditions and welfare facilities. At our Sahaganj factory we now house, at low rents, a community of 4,600 employees and their families. The standard of housing is very high and excellent medical services including a modern hospital are available to all. Canteens have been provided in which good meals are available at subsidised prices. The existing educational facilities for children are now proving inadequate and a new school building is under construction. A market building is also being provided to improve shopping conditions for the residents in the Company's housing estate. The construction of 65 additional houses, to which the Chairman referred on this occasion last year, is now well advanced and improved street lighting is being installed. All forms of sport are encouraged, for which the Company provides the necessary grounds and buildings. Thus we strive to look after the welfare of our employees and extend their social amenities. General labour relations remained consistently good throughout the year. Staff and operatives have given us their loyal support and contributed greatly towards the successful outcome of the year's activities. I am sure you will wish to join with the Directors in thanking them for their faithful service.

Note:—This does not purport to be a record of the proceedings of the annual general meeting..

THE INDIAN BANK LTD.

Extracts from the speech delivered by Kumararajah Shri M. A. M. Muthiah Chettiar of Chettinad, B. A., who presided over the Fiftieth Ordinary Annual General Meeting of the Shareholders of the Bank held on 20th April, 1957 at "The Indian Bank Buildings", North Beach Road, Madras.

Gentlemen,

The year 1956 was a most significant landmark in the economic development of our country. It marked the end of the first phase of our development plan viz. the first Five-Year Programme and ushered in, the second phase of our plan, viz., the second Five-Year Programme. While the emphasis in the first Five-Year Programme was on agricultural development, the main feature of our present programme is on rapid industrialisation. The second Plan envisages a rapid increase in the tempo of industrial activity. The Plan, has among other objectives, an increase in the national income by 25 per cent and the per-capita income by 18 per cent, additional employment for 5 million persons, an increase in the output of finished steel to 4.3 million tons as against 1.3 million tons, in that of aluminium to 25,000 tons as against 7,500 tons and in that of cement to 4.80 million tons as against 2.70 million tons.

For effectively reaching the Plan targets, plan estimates indicate an investment of about Rs. 5,300 crores

in the public sector alone covering the Central and State Governments. But the need for reappraisal of the position is becoming more apparent as the strains and stresses of the very first year of the Plan are beginning to be felt. There are enough indications to show that the present scheme of development is too ambitious to be carried out successfully without serious damage to the economy of the country. Further, if an additional Rs. 2,400 crores are needed in the private sector, the plan will mean double the expenditure of the first five year plan. It will be wisdom, therefore, that the Plan should not leave out of sight the resources available for it and should not also be allowed to dominate the economy to the point of breaking it. It is the view of many of our leading economists and industrialists that a re-examination of the resources is vitally necessary. The increase in the rate of investment in the plan projects should also be in proportion to the rate of increase in consumption. But an under-developed economy can never keep pace with the rate of increase of investment which is out of proportion to its capacity for consumption.

The working of the second Five-Year Plan will naturally have its impact on the banking system. The banks are called upon to extend credits to meet the needs of an expanding economy. In 1956, Bank credit registered such a sharp rise as to act as a regular squeeze on the resources of banks. Money became so dear that the banks had to restrict even normal advances and had to depend more and more on the assistance of the Reserve Bank.

The advances of scheduled banks during 1956 amounted to Rs. 788 crores showing an increase of Rs. 157 crores over the previous year. There were no proportionate increases in the deposits of the Banks. During 1956, the deposits increased only by Rs. 81 crores to Rs. 1,114 crores. The percentage of advances to deposits shot up by about 11 per cent i.e. from 60.37 per cent to 71.11 per cent. The Banks had, therefore, to dispose off a portion of their security holdings and they were also obliged to bring down their cash ratio. This resulted in the increase of the indebtedness of scheduled banks to Reserve Bank of India from Rs. 30 crores at the end of 1955 to Rs. 79 crores at the end of 1956. The demand for money was so acute that rates of interest had to be raised for time and call deposits resulting in an increase in interest paid by scheduled banks.

Although the bank rate of 3½ per cent remained unchanged, the Reserve Bank, from 1st February, 1957, raised the rate of interest on advances to scheduled banks against Government securities from 3½ per cent to 4 per cent. Though the rate of interest was not raised on usance bills, the abnormal increase in the stamp duty resulted in an actual 4 per cent interest rate on trade bills. The result is that although the Reserve Bank rate is 3½ per cent, scheduled banks are paying on call and short-term deposits 4 per cent and a little over sometimes. The lending rate of scheduled banks has in consequence increased by 1 to 1½ per cent. The scheduled banks during 1956 witnessed and continue to witness a period of high bank rate, credit restraint and credit squeeze and security selling continues to be a part of normal banking operations.

Another important feature of our economy during the first year of the second Plan which has caused anxiety in financial circles, has been the rapid deterioration of our foreign exchange position. Our foreign exchange reserves have fallen by Rs. 229 crores during the last year which leaves very little margin for safety. Large purchases of steel and machinery for Plan purposes have resulted in a great increase of imports over exports. The total money supply with the public at the end of December, 1956 comprising of currency and bank deposits amounted to Rs. 2178 crores showing an increase of Rs. 131 crores over the figure at the end of December, 1955. Due to money supply outpacing the rise in production levels and economic activity, the index number of wholesale prices recorded an increase of sixty-one points and consumer prices rose substantially. As I pointed out earlier, unless the national output is increased proportionately with the rate of consumption, the gap will usher in conditions of rising prices.

Another important event in 1956 was the emergency budget of the Finance Minister in November 1956. The main features of the budget were enhanced taxation of dividends of Joint Stock Companies, compulsory deposit of the Reserves and Profits of Companies with the Reserve Bank and the re-introduction of the Capital Gains Tax. Several cuts in imports of consumer goods covering a large number of items were made to conserve Foreign Exchange resources. Mention must be made of the additional excise duties on textiles imposed in October, 1956.

The policy of the Government has been one of more taxation and the Private Sector has almost been frightened off by these measures. There has been a spectacular drop in Stock Exchange values and between November 1956 and April of this year there has been a landslide resulting in a loss of about 40 per cent of the values. This is regrettable as the country's record of industrial production reached a new high level in 1956. Production statistics and financial results of companies were extraordinarily good. The tempo was steadily kept up and there was an industrial 'buoyancy'. The general index of industrial production (base 1951: 100) improved from 122.9 for January, 1956 to 197.9 in June 1956—an all time high in the industrial production of the country. Uncertainty in regard to Government's policies on the foreign exchange and domestic price fronts has created fear and anxiety in the private sector and the tempo of industrial activity has shown signs of slowing down.

The assurance of the Prime Minister on 13th April, 1957 that the private sector has not only a very important but also a respectable place in the context of the broad policies of the Government is to be specially welcomed at this juncture.

Now I have great pleasure in referring you to the salient features of the Balance Sheet and Profit and Loss Account of the Bank. The gross profit of the Bank has reached a new high figure of Rs. 204.33 lakhs for the year ended 31st December, 1956 as against Rs. 146.28 lakhs for the corresponding period in 1955. The net profit is the highest reached since the inception of the Bank. The net profit for 1956 amounted to Rs. 45.71 lakhs as against Rs. 20.28 lakhs in 1955. Your directors have recommended a dividend of 13 per cent for the year.

The Bank's financial strength is reflected in its Reserve Funds. As against a paid-up capital of Rs. 63.83 lakhs, the Reserve and other funds stand at Rs. 90.50 lakhs inclusive of the appropriation of Rs. 10.75 lakhs from the profits of 1956.

The working funds improved to Rs. 48.00 crores as against Rs. 41.90 crores in 1955. It will also be of interest to you to learn that our foreign exchange department is steadily making progress.

THE INDUSTRIAL CREDIT & INVESTMENT CORPORATION OF INDIA LIMITED

Speech of the Chairman, Sir Ramaswami Mudaliar at the Second Annual General Meeting of the Industrial Credit & Investment Corporation of India Ltd. held on Monday, 22nd April, 1957, at 4 p.m. at the Offices of the Associated Cement Companies Limited, Bombay.

Gentlemen:

I welcome you to this the Second Annual General Meeting of the Shareholders of this Company. The Directors' Report and the audited accounts have been in your hands for some time and with your permission I shall take them as read.

Before we proceed to the consideration of the accounts and the adoption of the Directors' Report, I should like to make a few observations of a general character.

From the Directors' Report it will be seen that at the end of 1956 your Company had agreed to give assistance in respect of 24 projects and others were under examination. The total of assistance authorised has now reached over Rs. 8 crores in respect of 28 projects. For the reasons brought out in the Report the present total of our actual investments is, of course, substantially less.

You will be aware that there has been some criticism in certain quarters regarding our activities. We have been accused of being too slow and too cautious in our lending and investing policy. Your Directors have had these criticisms very much in mind and from time to time have reviewed past activities to see whether these criticisms were justified. They reached the conclusion that they were not. When a Company such as ours is started from scratch it inevitably takes some considerable time to get organised and to gain experience. The record of other companies doing similar business both in India and elsewhere is very much the same as ours in their earlier stages. We set out to do something wider in scope than has ever been attempted in India. We are not a purely lending company concerned mainly with the security offered against our loans. We have done a substantial amount of underwriting of shares and have indeed invested in the share capital of a number of companies, an activity which requires very close consideration of the proposals advanced. At our inception there was a great urge to move forward as rapidly as possible with the development of industries in the private sector and it is only natural that those concerned with these plans, both in Government and outside it, should wish to see our activities expand as rapidly as possible.

You will of course realise that your Board of Directors are not only the custodians of the shareholders' funds but have also entrusted to them a substantial amount by way of loan from Government which has to be repaid in due course. The aims and objects of your Company have been clearly defined and it is realised that these cannot be achieved by being overcautious. Certain risks have necessarily to be taken in all such ventures but these risks must be carefully calculated risks and not risks incurred blindly.

The detailed investigation involved in examining fully all aspects of a project presented to the Company before the Directors are asked to take a decision has also been the subject of criticism on the part of some industrialists who thought that because they had investigated matters to their satisfaction there was no need for further scrutiny on the part of your management and technical advisers and ultimately by the Board. I believe this is not a correct appreciation of the responsibility which we have in coming to a decision.

There has also been recently some criticism that we have so far failed to make use of the $10 million of credit granted to us by the International Bank for Reconstruction and Development--the World Bank as it is commonly known. I have always been of the opinion that this source must be availed of at the earliest possible opportunity and in fact the talks that some of the promoters of this Company had with the officials of the World Bank at the highest level gave us the optimistic hope that further credits will be forthcoming from the World Bank once this amount was fully availed of. The fact, however, remained that so long as industrialists and promoters of schemes presented to us were in a position to get their foreign currency needs in the normal way they were not willing to take loans in foreign currency from us. In fact there was no application before the Board for foreign currency facilities and the resources of local currency not having been exhausted there was no need to turn to the World Bank and utilise the line of credit open to us.

The situation has now altered as the result of shortage of foreign exchange. Since the announcement by Government of the new policy regarding the provision of exchange for imports of capital goods we have received a number of enquiries for loans in foreign currency and we expect to present some of these proposals to the World Bank in coming months.

Your Company has been established to promote the development of industries in the private sector and I feel it would not be inappropriate if I were shortly to refer to the position which the private sector occupies today in the economy of the country and what its future is likely to be. The position of and the prospects for industrial development in the private sector has undergone substantial change since 1954 when the establishment of your Company was decided upon. In my Speech at the last Annual Meeting I stated it will be evident to everyone that if the establishment of new industries and the expansion and modernisation of old ones in the private sector is to be successfully undertaken it is necessary that all interested in the economic and social progress of the country should avoid a continuing series of shocks to the investing public. I referred to a feeling of uncertainty among

the investing public caused by a series of measures that had been adopted. Anyone conversant with the establishment of industries in the private sector would realise that the very high level of taxation has had a dampening effect on such enterprises. The Budgets of 1955 and 1956 and the supplementary Budget have raised rates of Income-tax, Corporation-tax and Super-tax, have imposed dividend, bonus issue and capital gains taxes and have introduced the much debated deposit scheme covering both past and current profits. It has also been freely stated that more rigorous measures of taxation are in the offing and may be introduced in the coming Budget.

Observations about the effects of high taxation on enterprise have been answered by reference to the substantial amount of development which is currently taking place in the private sector. I would like, however, to point out that the current development in the private sector represents in the main the consummation of earlier plans.

Both the Government and the public realise that it is absolutely necessary if the standard of living of the people should be raised that greater industrialisation should take place in the country, that funds should be available for such industrialisation whether in the public or the private sector and that both sectors should function in a complimentary manner if the purpose which Government has in view has to be fulfilled. I hold the view, however, unorthodox it may be, that proper development of industries in the private sector would lead to a snow-ball effect gathering more and more momentum by the utilisation of resources saved so as to make further industriaiisation possible, whereas there is not the same result or even the same incentive in public enterprises promoted by the State. A very high level of taxation which may produce more money to the State partly for promoting social amenities and partly for investing in public enterprise will have an atrophying effect on private savings and thus on the development of industries in the private sector. There seems to be a realisation on the part of the authorities that their taxation policy has seriously crippled the resources of Indian capital. The change in the policy of the Government regarding the extent to which foreign collaboration in the capital structure of a company can be permitted is a recognition of the shortage both of Indian capital and of foreign exchange. This more flexible attitude of Government towards foreign capital is a welcome sign, which will be appreciated by all who are interested in the industrial development of the country.

I do not want to elaborate any further on the many aspects of industrialisation in the private sector with which we are mainly concerned. The chairman of various industrial companies have made observations on the present situation and I venture to think that some at least of these gentlemen have done so not merely with a view to criticising Government policy or questioning the accepted social pattern of society but have done so with the genuine desire of bringing to the notice of the Government the considerations which they believe may jeopardise the very objectives of the Government.

Turning now to our own Accounts you will see that after meeting the heavy demands of Income-tax which require over Rs. 15 lakhs out of our net income of nearly Rs. 37 lakhs, we have for disposal, including the balance of Rs. 7 lakhs and odd brought forward from last year, a total of Rs. 23.31 lakhs. From this your Directors have appropriated Rs. 5 lakhs to General Reserve making, with the Rs. 5 lakhs provided last year, a total of Rs. 10 lakhs. A Dividend at the rate of 3-1/2 per cent free of income-tax for the year is recommended absorbing Rs. 17-1/2 lakhs and leaving a little over Rs. 6 lakhs to be carried forward to next year.

In recommending this first Dividend your Directors have had in mind that many of those who invested in our shares have looked for an early return and I would remind you that this Dividend represents a gross return of over 4-1/2 per cent on the share capital. I need not repeat what I said last year about the necessity of building up a substantial Reserve. As our profits grow we must constantly bear this need in mind. However careful we may be we shall not always succeed in avoiding losses, for which due provision must be made.

Our position remains very liquid but, provided the projects we have agreed to assist by way of Rupee loans or Investments are not held up as the result of the shortage of foreign exchange, the figures at the end of the current year are likely to show a very different picture and we shall be continuing our thoughts, to which reference is made in the Directors' Report, of the means by which our Rupee resources can be augmented when the need arises.

You will see that we have adopted the unusual course of giving full details of investments actually made and loans actually disbursed. The reasons for this change are set out in the Directors' Report. It seemed undesirable to confine ourselves to the minimum requirements of the Companies Act since this would have given an unbalanced view of our activities. Before I pass to the normal business I should say something about our prospects. Given reasonable opportunities and reasonable operating conditions I see no reason why this Company should not continue to expand on the sound basis which I believe we have established but much will depend on Government policies and the availability of foreign exchange in the provision of which we shall, with the help of the World Bank, play our part.

Before concluding I have to inform you that two senior officers have been appointed in the course of the year, Mr. Parekh who has been appointed Deputy General Manager and Mr. Johnson who has been appointed Technical Adviser. The addition of these two officers has somewhat strengthened the administrative organisation of the Company but I am bound to state that we still need additional senior officers if the work of the Company is to proceed in the way desired by the General Manager and your Board.

I would like to thank the officers and staff of the Company who have done hard and strenous work during the year under review. The nature and extent of that work is not reflected by the number of applications which the Board has ultimately sanctioned but by the number of applications received and examined. In respect of many of these constant advice has been sought and freely given; several are undergoing further scrutiny before final consideration by the Board. I would like to pay special tribute to the General Manager and the Deputy General Manager who have both devoted themselves with great earnestness to the onerous duties that they have to discharge.

COMPANY AFFAIRS

THE CENTURY SPINNING AND MANUFACTURING CO., LTD.

It redounds to the credit of the Century Spinning and Manufacturing Company that it has been able to disclose excellent results during the year 1956 although it had to contend with disturbances, following the publication of the States Reorganisation Committee's Report, even occasioning, in some cases, the closure of mills. Thanks to the smooth and efficient working of the Company, it has been able, subject to donations, depreciation, managing agents' commission and taxation, to show a gross profit during the year 1956, of Rs. 99,88,834 as against Rs. 88,71,711 in 1955. It is significant to note here that this has been possible even against heavy odds, like the increase in excise duty on cloth from March 1, 1956 and a further additional increase in September 1956, which adversely affected the offtake of cloth.

Provisions have been made higher as compared to the previous year. Thus, donations claimed Rs. 3,24,410 against only Rs. 1,06,830. Depreciation has been more than doubled at Rs. 30,80,600, while Managing Agents' Commission had gone down to Rs. 6,15,511 as against Rs. 7,55,123. Provision for taxation is only Rs. 3,11,538 against Rs. 31,00,000. No special provision has been made for reserves, but Rs. 55,00,000 has been taken to the Development Reserve.

The total dividend was maintained at Rs. 22 per share which absorbs Rs. 24,07,416.

The Company's sales during the year, including rayon yarn, fetched Rs. 7,90,31,805 as compared to Rs. 8,25,73,163 in the previous year. Stocks at the close of the year have been valued at only Rs. 1,82,21,899 as compared to Rs. 2,00,96,451.

The Rayon Factory at Kalyan (near Bombay), started production in September 1956. The work on the expansion of the Rayon Plant to a capacity of 12 tons per day is fast progressing. Meanwhile, a large part of the necessary machinery ordered out for the expansion has already arrived.

THE GOLD MOHUR MILLS, LTD.

The Company's trading profit for 1956, after allowing for depreciation and taxation at Rs. 6.25 lakhs and Rs. 4.70 lakhs respectively, amounts to Rs. 12,49,421. Together with the preceding year's credit balance of Rs. 36,368 brought forward, it totals Rs. 12,85,789. From this amount, the Directors have appropriated Rs. 1 lakh to general reserve account. A sum of Rs. 43,000 has been appropriated to development rebate reserve and another Rs. 2.35 lakhs to retiring gratuity reserve. From the balance, a dividend of Rs. 15 per share, free of income-tax, has been proposed which absorbs Rs. 7.50 lakhs, leaving Rs. 1,57,789 as net balance to be carried forward.

According to the Directors, prices and deliveries of cloth, for the first eight months of the period under review, were satisfactory. In the latter part of the year, however, these declined, coincident with the increase in excise effective from September last. For the Company, the additional amount of excise as a result of the increase has been estimated at Rs. 23 lakhs a year.

BRAITHWAITE AND CO., LTD.

After providing for depreciation and sundry charges, the Company's trading profit for 1956 stands at Rs. 30,43,096, a little over Rs. 3 lakhs more than in 1955. The net profit, after providing for taxation at Rs. 15.70 lakhs (against Rs. 13 lakhs in 1955) is Rs. 14,78,096, again a little more than in the previous year. After adding the credit balance brought forward, etc., and after charging Rs. 2,12,242 for super-tax payable on the issue of bonus shares, the balance available for distribution is Rs. 25,29,194.

The dividend for the year has been stepped up to Rs. 2 (Rs. 1-12 in 1955) absorbing Rs. 11,31,958. An amount of Rs. 11,97,937 has been recommended to be transferred to general reserve, leaving Rs. 1,99,299 to be carried forward.

THE PUNJAB NATIONAL BANK, LTD.

For the Bank, the year 1956 was one of an expanding banking service through its 341 offices in India and abroad. The working results are highly satisfactory inasmuch as the year's profit at Rs. 87,85,164 is substantially more than the previous year's figure of Rs. 64,41,068. Adding to the profit Rs. 2,35,108, being the amount brought forward from the preceding year, it totals Rs. 90,20,272. From this, the Directors have transferred Rs. 27.50 lakhs to provision for income-tax and an equivalent amount to reserve fund (statutory). For bonus to staff, Rs. 13 lakhs has been transferred to that account. Charity account and gratuity to staff have got Rs. 1 lakh each. Towards the payment of an ad-i interim dividend at Rs. 2 per share, free of income-tax, Rs. 7 lakhs was appropriated.

From the balance of Rs. 13,20,272, a dividend at Rs. 2 per share, free of income-tax, making the total at 16 per cent per annum has been recommended by the Directors, absorbing Rs. 7 lakhs. The balance of Rs. 6,20,272 has been recommended to be carried forward.

THE PODAR MILLS LIMITED

The working of the Podar Mills Ltd., for the year ended December, 1956, has resulted in a profit of Rs. 10 lakhs after providing Rs. 3,52,500 for payment of Bonus to the employees for 1956, Rs. 1,25,000 for Depreciation on Plant and Machinery and Rs. 1,07,000 for Managing Agents' commission.

Out of the profits, the Directors have provided Rs. 4 lakhs for taxation. The dividend has been maintained at the previous year's figure of Rs. 4 on Preference Shares and Rs. 12 (including Bonus) on Ordinary Shares. A sum of Rs. 4,72,683 has been carried forward against Rs. 3,92,677 brought in.

Sales of cloth and yarn amounted to Rs. 1,40,78,971 and Rs. 20,92,475 respectively during the year. Stocks of cloth and yarn at the end of the year stood at Rs. 15,20,240 and Rs. 3,18,011 respectively.

COMMODITY NEWS AND NOTES

RAGI PRODUCTION GOES UP

The All-India Final Estimate of Ragi for 1956-57 puts the current year's area and production of the crop at 5,674,000 acres and 1,914,000 tons respectively, as against the Partially Revised Estimate of 5,693,000 acres and 1,820,000 tons for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows an increase of 94,000 tons or 5.2 per cent in production during the current year as compared to last year, despite a small fall of 19,000 acres or 0.3 per cent in area. Despite the decrease in area, there has been increase in production of Ragi during the current year. This increase in production has been attributed to favourable seasonal conditions during the growing period of the crop.

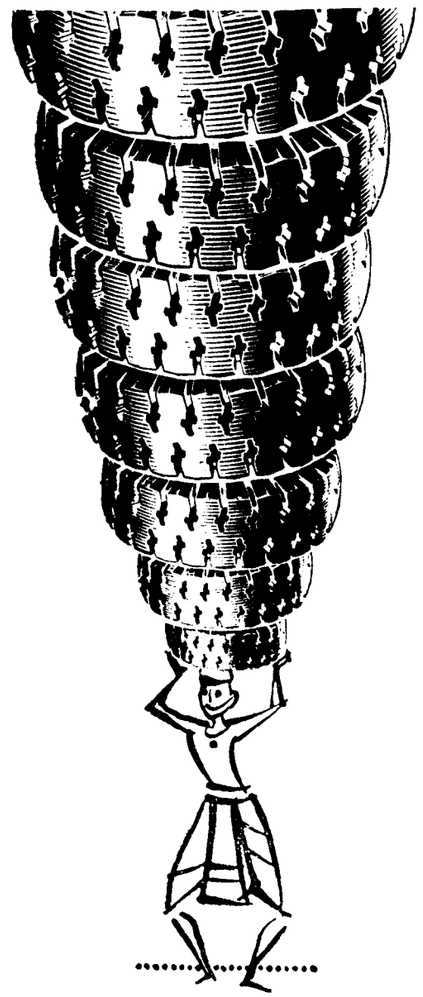
MORE PRODUCTION IN KHARIF JOWAR

The All-India Second Estimate of Jowar for 1956-57 puts the current year's area and production at 39,839,000 acres (kharif and rabi crops both) and 4,516,000 tons (kharif crop only), respectively, as against the corresponding Adjusted Estimates of 41,174,000 acres and 4,312,000 tons for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows a decrease of 1,335,000 acres or 3.2 per cent in area under Kharif and Rabi Jowar and an increase of 204,000 tons or 4.7 per cent in production of Kharif Jowar only during the current year as compared to last year.

MORE ACREAGE UNDER LINSEED

The All-India Second Estimate of Linseed puts the current year's area at 3,052,000 acres as against the adjusted Second Estimate of 2,765,000 acres for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows an increase of 287,000 acres or 10.4 per cent in area over last year. The increase in acreage during the current year has been reported by all the Linseed Growing States except West Bengal and Punjab. This increase has been more marked in the case of Bombay, Madhya Pradesh and Bihar and has been attributed generally to favourable weather at the sowing time.

MORE ACREAGE UNDER RABI PULSES



The All-India First Estimate of Rabi Pulses other than Gram and Tur for 1956-57 puts the current year's area at 9,827,000 acres as against the corresponding Adjusted Estimate of 9,237,000 acres for 1955-56 according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows an increase of 590,000 acres or 6.3 per cent in area during the current year as compared to last year. The increase in acreage during the current year has been shared by Bihar, Madhya Pradesh, Uttar Pradesh, Punjab, Bombay, Rajasthan and Delhi and has been attributed generally to favourable weather conditions at the time of sowing.

INCREASE IN RAPE AND MUSTARD PRODUCTION

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of rape and mustard for the year 1956-57 puts the current year's area at 2,682,000 acres, as against the adjusted second estimate of 2,564,000 acres for 1955-56. This shows an increase of 118,000 acres or 4.6 per cent in area over last year. The increase in acreage during the current year has been shared by Punjab, U.P., Bihar, Madhya Pradesh and Bombay and has been attributed to favourable climatic conditions at the sowing time. This increase has, however, been offset to some extent by the decreases reported mainly by Rajasthan and West Bengal.

SYNTHETIC DIAMONDS PRODUCED IN THE U.S.

A man-made material that is just as hard as diamonds, if not harder, has been produced in the United States by the General Electric Company. Called borazon, the new material is said to be the hardest substance ever made by man. It is created by the use of tremendous pressure and heat. It can scratch a diamond and is able to stand heat that will burn up a diamond. If borazon can be produced in adequate quantities at a reasonable cost, it may take the place of diamonds as a cutting material in industrial processes. Diamonds are limited in quantity, expensive ($6,000 a pound), and virtually all of them are found in Africa.

Chairman's Speech

THE PUNJAB NATIONAL BANK LIMITED

110th Ordinary General Meeting held on Saturday, 27th April, 1957.

Shri S. P. Jain Reviews Economy

Commercial Banks to Collect Rural Savings and Extend Credit to Cultivator.

Gentlemen,

I extend to you all a hearty welcome to the 110th Ordinary General Meeting of the Bank.

The past year has been one of outstanding progress for your Bank with profits, deposits, advances and foreign exchange business touching new peaks.

BALANCE SHEET, 1956

The Accounts show a profit of Rs. 80.20 lakhs including Rs. 2.35 lakhs brought forward as against a profit of Rs. 69.40 lakhs in 1955. This profit has been arrived at after provision for contingencies. After transfers—Rs. 27.5 lakhs to taxation, Rs. 27.5 lakhs to Reserves, Rs. 13 lakhs for bonus to staff, Rs. 2 lakhs for gratuity to staff and charity—the Board has proposed a final dividend of Rs. 2 per share in addition to the interim dividend of Rs. 2 per share. This raises the rate of dividend to 16 per cent per annum. It has been proposed to form a Trust under which a fund will be built up by annual appropriations from profits for gratuity benefits to employees.

DEPOSITS

The working capital has risen by Rs. 28 crores to Rs. 141 crores registering 2½ times increase over 1950. Against our paid-up capital of Rs. 87.5 lakhs, our reserves stand at Rs. 1.25 crores including the share premia amount of Rs. 37.5 lakhs. Deposits rose to Rs. 106 crores registering an increase of Rs. 16 crores during the year against Rs. 14 crores in 1955. It will be noted that the quantum of increase in the total deposits of all scheduled banks in 1956 declined as compared with 1955. The growing confidence of the public in your Bank is reflected by the fact that of the increase in the deposits of all scheduled banks in 1956, 20 per cent was gained by the Punjab National Bank. Your Bank did not make any general increase in the interest rates and the cost of money remained, therefore, steady in the year under review.

LIQUIDITY

The figures on the assets side indicate a strong liquid position. Cash in hand, bank balances, money at call and short notice and investments aggregate Rs. 59.3 crores constituting 55.7 per cent of the deposits. If the bills discounted and purchased amounting to Rs. 8.77 crores are added, we have a total of Rs. 68 crores raising the ratio of our liquid assets to deposits to 64 per cent.

LOANS

Our loans and advances show an increase of Rs. 12.84 crores from Rs. 42.02 crores in 1955 to Rs. 54.86 crores in 1956. There has been 31 per cent increase in our advances. Our efforts to step up advances to meet the developmental needs are continuing and we are strengthening our organisation to that effect both in the Head Office and in the field.

FOREIGN EXCHANGE BUSINESS

You will be glad to know that there has been rapid increase in our Letter of Credit business. "Acceptances, endorsements, and other obligations" which are mainly in connection with foreign exchange business amounted to Rs. 13.4 crores in 1956 as compared with Rs. 6.53 crores in 1955 registering 100 per cent increase.

BONUS SHARES

Your Bank's application for issue of bonus shares about which I had mentioned in my review at the last meeting is still pending with the Finance Ministry. The required permission should be obtained before long, because your Bank's issue is against share premia which are but receipts of capital from the shareholders themselves.

BRANCH OFFICES

Our network of branches continues to expand. With the opening of 14 branches during the year, we have 340 offices including one office in Rangoon and two in Pakistan. The demand for lockers was well sustained and we are continuing to develop this business. You will be glad to know that the Head Office building in New Delhi is coming up and will be complete in about a year for occupation. The removal of the Head Office to New Delhi will meet the convenience and wishes of a large number of the Bank's customers. With regard to branch offices also, we are trying to improve the premises and follow a policy of progressive extension of service to the public. In this connection, our expansion programme is also receiving careful consideration.

TIGHT MONEY

The problems of the banks during the last year were the consequences of the problems that faced the country. What have agitated all minds are the acuteness of finance for domestic needs as well as to pay for imports and the rising trend of prices. There were the large needs for development, imports of steel, capital machinery etc. There was an increase of Rs. 158 crores in advances and bills against an increase of Rs. 77 crores in deposits. The banks had to resort to increased borrowings from the Reserve Bank, liquidate a small part of their investments and reduce cash balances to meet the demand. Shri T. T. Krishnamachari, the Commerce Minister, on taking over the Finance portfolio was confronted with the serious problem of credit for trade and industry and the limited capacity of the commercial banks to meet the same. Living up to his

reputation for prompt and dynamic action, the Finance Minister had consultations with banks and representatives of industry along with the Governor of the Reserve Bank and liberalised the bill market. This very largely assisted the commercial banks to meet the demand for funds from industry and commerce and Shri T. T. Krishnamachari rightly earns the credit for the easening in the otherwise tight situation. The higher money cost aimed at curbing inflation in India has had no significant effect. Similar is the experience in the UK and they are in the process of reversing gears. The gilt-edged market has been adversely affected and but for the open market operations which induced confidence, there would have been a greater drop in prices. The stamp charges and higher interest rates raised the cost of money to banks. The banks had to incur the stamp charges on bills even when the bills were not ultimately fully utilised. The stamp charges could have been covered if at all necessary in the interest rates. The cost of money from the Reserve Bank induced the banks to raise their interest rates. This affected money already with the banks and pushed up its cost in large commercial centres. New money was not attracted to banks from small investors and mofussil areas.

RISE IN PRICES AND DECLINE IN AGRICULTURAL PRODUCTION

The second significant economic trend as regards rise in price levels was characterised as inflationary arising from large developmental expenditure. In the White Paper published in March, the Finance Minister has analysed that the rise in prices has been basically due to declining agricultural production. There has been some complacency in this respect due to the comparatively comfortable position in regard to agricultural supplies at the end of the first Plan. The White Paper states: "The success of the Plan, it is apparent, would turn largely on the realisation of the targets of agricultural production. Apart from the obvious effect of agricultural production on prices and on the balance of payments, the flow of savings in the economy also depends to a significant extent on production in this sector. Scarcity of food grains and agricultural products in India often leads to relatively sharper increases in agricultural prices than in the prices of manufactures and this in turn leads to a redistribution of national income away from both the fixed income groups and the investing classes". This has been the crux of our problem.

FOREIGN EXCHANGE SCARCITY & DEFERRED PAYMENT TERMS

The foreign exchange scarcity is another serious problem to be effectively tackled. The difficult foreign exchange position arising from developmental activities is being understood and appreciated the world over. The appearance of this scarcity condition earlier than expected only confirms that the rate of development has been faster and larger than planned. The position was also aggravated by higher prices of capital equipment and increased transport cost due to Suez crisis. The deferred payment system that has been evolved is of course very costly but it is a screening process by itself. Projects which are not adequately remunerative will not be proceeded with immediately and foreign exchange expenditure to that extent will be automatically curtailed. Representatives of capital exporting countries abroad who have visited our country after the announcement of deferred payment scheme have understood and appreciated the value and desirability of such a scheme. Our efforts in the direction of rapid economic and industrial development are also appreciated. In order, however, that import of necessary equipment in line with the policy enunciated by the Government takes place, certain institutional facilities have to be arranged for. They are (i) the coverage of fluctuations in foreign exchange beyond normal trade risk by Government or any Government agency, (ii) underwriting the risk or giving some acceptable guarantee to the overseas seller (iii) association or institution formed by a combination of manufacturers in industries of national importance should be able to obtain financial assistance for development from institutions like the World Bank, International Finance Corporation etc. It will be necessary for the Finance Ministry and the Reserve Bank to work out details.

MAGNITUDE OF SECOND PLAN AND STANDARD OF LIVING

The second Plan aims at increasing the national income by 1961 to Rs. 13,480 crores from Rs. 10,800 crores. The rise in the national income at the end of the Plan is of the order of Rs. 2,680 crores. Against the present saving of Rs. 800 crores, we have to save Rs. 1,482 crores. The increase in our savings for reinvestment and development will be Rs. 682 crores against a national income increase of Rs. 2,680 crores. Thus three-fourths of the additional income viz., Rs. 2,000 crores, will be available for sustaining a higher standard of living. If our effort is not of the magnitude planned, our national income will not go up as envisaged. If our national income does not go up as targeted, the quantum available for consumption will be curtailed with its consequence on the standard of living. What we have to fulfil is no doubt a big task but we have to gear ourselves to the best effort.

RURAL SAVINGS AND BANKS

More funds are needed by both the public and private sectors. There has to be a proper apportionment of the available resources if the overall economic activity has to be stepped up. The tax policy of the Government has to be such as to leave savings in the hands of that class of society which has the habit of saving for investment. While there has been more expenditure in the rural sector, the burden on the urban sector has been increasing. As the Taxation Enquiry Commission has stated: "The per capita tax is uniformly and distinctly higher in urban than in rural areas. The per capita Central taxation in the urban sector is a little over two and a half times the rural estimate while the State taxes come to nearly three times". Vast sums of money are thus diffused and not drawn into the money stream.

The Commercial banks have to organise themselves to collect money from the unorganised sectors and supplement their deposits through other facilities. In large towns there is already keen, rather unhealthy, competition. The current deposits are being converted to Call deposits which were paid higher interest rates. This does not create any additional money but only makes the money dearer. The commercial banks have, therefore, to expand their activities in the rural areas either directly or through the agency of subsidiary or small banks. To a large extent, the success of this effort will depend on the policy and support of the Government of India and the Reserve Bank. Fortunately, we have at our helm a Finance Minister who is bold and who has ideas and vision. The greater the difficulty of a problem the greater appears to be his resourcefulness and courage. The new Reserve Bank Governor, Shri H. V. R. Iyengar has intimate knowledge of the problems relating to the development of our economy and is aware of the needs of industry and trade. This knowledge and experience will help him to have a practical outlook in his new task.

In the banks' expansion in the country-side, there are certain factors of primary importance. The Government should provide facilities for security of cash and other assets so that banks may be saved of large expenditure on employment of chowkidars, which forms an appreciable percentage of expenditure in small branches. This may be done by giving instructions to the police authorities to take special care for the safety of the property of banks. Some scheme of co-operative insurance may also be evolved by the banks themselves or through Insurance Companies. Secondly, to enable large banks to open branches, the wage structure for the new offices should be in consonance with the prevailing living conditions in the rural areas concerned and not according to the bank classification.

CREDIT TO CULTIVATOR

The third factor is that the banks should be in a position to cater to the credit needs of the rural areas. It is difficult for the banks to make available such credit from their existing resources. The Reserve Bank is not finding a proper agency in the Co-operative banks to make available the entire money that they have apportioned for supplementing credit to the rural areas. The Co-operative banks are only confining their activities to co-operative societies and, knowing as we do, the weak structure of the co-operative societies, in certain States especially, we should not insist on credit being made available only through them. By commercial banks expanding in the countryside, rural credit will be augmented. The commercial banks may also in turn take the help of agencies which have commercial dealings with agriculturists at present such as sugar factories, ginning presses, rice mills, oil mills etc. The Reserve Bank may lay down a condition at the time of discounting the bills of commercial banks for rural credit that the cost of money to the cultivator should not be higher than what he will have to pay when he obtains credit through co-operative societies. We are under the impression at present that credit through co-operative societies is cheaper. What we find today in many parts of the country is that the ultimate cost of money to the cultivator is 3½ to 4 per cent higher than the rate at which the Reserve Bank makes available the money. When we are keen on increased agricultural production we should use all agencies to make available to him necessary credit at reasonable cost. The utilisation of the commercial banks in this sphere will achieve a dual purpose. The non-monetised sector of the country will be monetised through savings of the rural sector coming into banks. The agriculturist will get organised credit in his effort to increase food production which is admittedly the key to the success of the second Plan. I hope the Reserve Bank will find this proposal worth pursuing.

FINANCIAL INSTITUTIONS

In the growth of new industries, a great handicap is sluggishness in the Stock Exchange. It is difficult for any new enterprise or even the existing ones to raise additional finance through the stock exchange. Therefore, it is important that the financial institutions in the country should carry on a more positive and active role. The Industrial Finance Corporation, the State Finance Corporations and also the Industrial Credit and Investment Corporation have done satisfactorily during the last year. But for meeting the tempo of development in this country they have to do very much more. The present limit of advances at the State level should be increased considerably. It should be brought up to something of the order of Rs. 25 lakhs. All small and medium needs should be met by the State institutions. The State Corporations should be strengthened by additional resources through the Reserve Bank. The Industrial Finance Corporation of India should increase their limit from 1 crore to 2½ crores of rupees. Most of the large industrial organisations today cost us anything between 3 and 8 crores. Money should be advanced when the Corporation is satisfied that the undertaking or project in question is in line with the general policy and pattern of the National Plan. The Industrial Credit and Investment Corporation should also, in my opinion, be more active and finance large industries like non-ferrous metals, chemicals and large engineering workshops are of very great importance. These industries have been left under the second Plan to be developed by the private sector. In this connection, it is heartening that a Refinance Corporation is being formed to utilise the USA Wheat Sales Fund for extending medium term credit. The terms that have been announced are very sound and I am confident that banks will take advantage. It will greatly improve money market conditions and the requirements of industry for expansion will be met considerably.

BETTER CLIMATE AND INVESTMENT PROSPECTS

The industries in this country are, by and large, making reasonable profits and I am confident that with the better atmosphere that may now be created with the removal of the uncertainties when the new budget will come, the share market will improve and the investor will come forward to invest his savings in the industrial projects of this country. The process will be greatly aided if the investors find it convenient to borrow money against their industrial securities whenever money is needed and the advances against industrial shares could be rediscounted by the Reserve Bank. The Finance Minister should come out with a clear cut policy and a four-year budget that will give him the resources that he requires and enable the people to budget as he does and fulfil their responsibilities under the Plan with the resources that they require. I am confident that with the boldness and imagination that he possesses, Shri T. T. Krishnamachari will see that he gets what he requires for carrying on the responsibilities of Government and at the same time creates conditions and an atmosphere under which the people will have the enthusiasm and resources to fulfil a difficult but essential task.

PEOPLE'S GOLD FOR DEVELOPMENT

A suggestion that I would like to refer here is that of the Prime Minister in one of his speeches that the people should give their gold to the Government so that hoarded wealth may be put to use. The Finance Minister should evolve a policy that will induce the people to part with their gold. Even if the Government buys gold at a price higher than the world price the gold stock with the Government will help to strengthen our currency considerably and will enable Government to get money from abroad at more reasonable cost. What the exchequer will lose in the purchase price will be adequately compensated by the large financial resources that could be obtained and by the early development of our country.

Before I conclude, I must express my thanks to all our worthy constituents for their continued co-operation and confidence. I owe more than formal thanks to my colleagues on the Board and the Local Advisory Committees. I would also like to welcome our new General Manager, Mr. A. M. Walker, whose experience with the erstwhile Imperial Bank of India should prove of real value to our institution under the present fastly developing conditions in the country. I must also record my appreciation for Shri R. L. Tuli who has carried on with diligence and ability, the responsible and onerous duties of General Manager till Mr. Walker's taking over. I have also to thank other officers and staff at all levels at the Head Office and elsewhere for their loyalty and sense of devotion to the interests of the Institution.

Food: An Exercise in Statistics?

THE accent this week has been on food. In some respects, it has been a frightening emphasis. The most recent reports from West Bengal and Bihar are deeply disturbing. In West Bengal acute food distress has been heightened by the sight of prices, in some areas between Rs. 22 and Rs. 27 per maund with no indication of a fall. It has been noticed, too, that some "surplus" districts have been affected. The West Bengal Government has introduced "test relief" works and has already put about 350,000 people on a modified rationing system. In Bihar there have been what are described as "harrowing" tales of hunger and misery to which much publicity was given at a conference of Thana and Anchal Panchayat executives of Purnea district held at Katihar. These

conditions were described by a Congress M.L.A., Mr. Basudeo Prasad Sinha, who presided over the conference. He explicitely stated that a Congress worker of Zabe-Kusha in Rupauli Thana had informed him that two men had died of starvation. When the cry that men are dying of starvation is raised, it is often difficult to produce chapter and verse; but here is a statement by a responsible Congress member of a legislature, which can be scrutinised by those in authority. In any case, it cannot now be denied, in view of the reports from West Bengal and Bihar, that the food situation is acute and, indeed, has already gone out of control.

It is the more surprising that the Minister of Food and Agriculture, Mr. A. P. Jain, should have chosen Monday this week to produce what has been described as a "cautiously optimistic" assessment of the food situation. There can be few more unsatisfactory conferences than that held by the Food Minister this week. He chose to assert over and over again that the situation was under control, the argument being that he had made substantial "commitments" to Bihar, Uttar Pradesh and Bombay and presumably those "commitments" would be sufficient for the purpose. Meanwhile, figures of production on final forecasts have been released in abundance. If statistics could console and convince, these should have been adequate. Whether or not these statistics belong to that small group of reliable figures on which sound policy can be based, or to that much larger group which misleads more than it instructs, it is clear that the whole of the food picture presented by the Minister must be entertained with very serious misgivings. If the production front was anything like as satisfactory as Mr. Jain's statistics suggest, the rise in rice and wheat prices cannot be substantiated. As between the statistical theory woven by the Ministry of Food and Agriculture and the hard facts in the field, one might be excused for repeating the cynical observation that an ounce of fact is worth a ton of theory.

In this particular case one can also be permitted the observation that this year our agricultural forecast statistics have varied so much as to indicate that one or other of recent forecasts must be in error. In a Special Article in this issue an analysis is made on the basis of the latest official statistics. It will be seen that, even on the official rendering, there is cause for concern. The availability of food grains per capita does not show any rise, and the presumption must, therefore, be that the supply position is not better than last year, while demand per capita is probably rising with increased purchasing power all over the country. Irrespective of the official statistics the situation cannot be treated except as one of relative shortage. On the other hand, one can certainly choose to be pessimistic on the statistics. Consider, for example, the second forecast for rice for 1956-57. This forecast places rice production at 24 million tons; to be precise at 23.9 million tons. The final forecast which has just been released estimates it at 28.1 million tons or a rise of 4.2 million tons or over 16 per cent of the original figure. It is not known whether this rise is based on another method of computation or on village reports. Whether it is or whether it is not, the two forecasts placed so close to one another should not differ by as much as 16 per cent if they are both to carry conviction. Again if the method is the same, why should the final forecast always be statistically superior? There are also non-statistical factors operating against an improved final forecast. Some crops, though perhaps not rice in large measure, were injured by the hailstorms in April. One might have expected the final forecast to take account of this fact. If it does not, surely the statistical sample for crop-cutting has been inadequate. So, in respect of wheat, it seems to have been.

Whether this view or that on the statistical front is credit-worthy, surely one can claim that the evidence on prices has to be marshalled with the same care as the evidence on production. It might be indicated that a "surplus" of 3 to 4 million tons of rice in the monetised sector would be absolutely decisive on prices. By all experience based on 1953-54 and 1954-55 events, if the rice crop was of the order of 28 million tons, we would have had a collapse in all forward rice prices. The fact that prices continue to harden and desperate scarcity has been seen both in Bihar and West Bengal makes one wonder whether or not the engines of statistics which the official authorities employ for production, but not for pricing, are not heavily biassed one way. If random sampling is good for production estimates, why is it not used equally elaborately to measure price changes? The new metaphysic is invoked, it seems, on a highly selective basis.

The situation is full of gravity. In the first place, a seasonal factor operates in food grains between April and September which may raise the level at its peak about 10 or 15 per cent above the figure at the last week of April. Secondly, the deficit financing contained in the Budget for 1957-58 will certainly involve a heightening of all prices, at the time the deficit financing is actually invoked. Thirdly, with the transport system heavily overloaded, it seems almost impossible to move food grains freely in quantities adequate to relieve growing distress. Fourthly, and not least of all, the Food and Agriculture Ministry has fallen on evil days, losing at once both the capacity to inspire confidence and the technical skill in manipulation which distinguished this Ministry in the great days of Rafi Ahmed Kidwai.

It would be good for the Ministry of Food and Agriculture to recall both the precept and example of its departed Minister. Rafi Ahmed Kidwai would reject his own agricultural statistics and go into the fields to find his facts. He would then initiate a policy which confounded his statistics; he was big enough to prove himself wrong. It is this unselfish pragmatism which we need; not statistical niceties. Let there be no foolish worship of the idols of the statistical world which five years ago were proved to be unworthy, and, indeed, the heavy instrument of ignorance. We need again something like the imaginative touch of Rafi Ahmed Kidwai. One of the great tragedies of the Indian situation today is that Delhi cannot find his like. Of course, genius is not for everyday and Providence, in its wisdom, has made genius mortal. But surely, when genius departs it leaves its footprints on the sands of time. Unhappily there is no mark of Rafi Ahmed Kidwai in the Ministry of Food and Agriculture. Who will now deliver us from the bondage from which he gave us, for three fitful years, happy release?

SECRETARIAT LIBRARY 14 MAY 1957 GOVERNMENT OF MADRAS

Jordan and India

PERHAPS realizing that national self-interest is more important than nebulous pan-Arabism, King Hussein of Jordan has moved swiftly to put his country's affairs on a realistic basis. His summary dismissal of Mr. Nabulsi's Government followed by an abortive expedient of a coalition, including the head of the former Government, has led to a Government of Independents headed by a well-known veteran liberal, Mr. Hashmi. To give a breathing space to the new Government martial law was enforced.

Swift action may, however, look, but actually not be, conclusive. Nothing has been resolved and nothing substantially has changed in the situation. The political situation continues to be highly volatile and uncertain. In the circumstances, King Hussein may have to hold the reins tight for quite a long time. His main pre-occupation is to keep the Arab Legion loyal to the throne, for which he needs money. The Arab Legion's pay has been overdue since the beginning of the last month. Perhaps it is financial stringency which has induced the King to seek shelter under the American canopy to qualify himself for aid under the Eisenhower doctrine. It was for "pan-Arab" solidarity that King Hussein did not join the Baghdad Pact, dismissed Sir John Glubb, terminated the Anglo-Jordan treaty in January this year, and sacrificed the British subsidy of £12,000,000 per annum. True, Egypt, Syria and Saudi Arabia did promise to make good Jordan's financial loss. Of the three States, however, only Saudi Arabia has so far met its commitment. Syria has not only refused its share but has also sent a bill for the maintenance of Syrian troops in Jordan. Egypt has offered useless credits in blocked sterling balances. This has naturally led to a financial crisis in Jordan which it is believed her two defaulting "allies" would not find unwelcome. When on top of this, the pro-Egyptian and pro-Syrian elements in Jordan began pressing for what they called a federal union with Syria and Egypt, the King could not help being abrupt, which explains his brusque method in sending away the Nabulsi Government. Had the so-called federalists been allowed, Jordan might have ceased to exist as an independent entity.

Jordan is a small kingdom, having been created somewhat artificially by the British without full regard to geographical and economic viability. By its very nature it must depend for its survival on foreign help, at least for some years more, and on the forbearance of its neighbours. With the inclusion of 750,000 Palestinians, 450,000 of them Arab refugees, from Israel in 1948, Jordan came to have in its body politic a highly explosive element. More sophisticated and more powerful than the original inhabitants, the vociferous Palestinians dominate Jordan's politics. Their hero is President Nasser. It is to him that they look for vengeance on Israel and its creators. President Nasser, therefore, could have destroyed Jordan without firing a shot. The disquieting possibility still exists. What has evidently restrained him so far is the attitude of King Saud, who himself is apprehensive of a reduction in reverence for Kings. Syria, Jordan's other neighbour, which might have intervened against King Hussein, could not move for fear of an almost certain counter-move by Iraq. Israel, the Middle East's dark horse, was too pre-occupied with the Gulf of Aqaba to involve itself on its eastern front. Thus Jordan has survived, in the main, because of the peculiar political stalemate that induces hesitation, for different reasons in Jordan's neighbours. But the pattern of circumstances that has helped Jordan may not be repeated and its neighbours may find an opportunity to pounce upon it and pick it to pieces.

Whatever the future of Jordan, however, the fortnight's kaleidoscopic events have brought into relief certain important facts, the most important being the inadequacy of the Eisenhower doctrine. The near-crisis has shown how difficult it is to apply its military provisions. A factional fight, even if it is fomented and led by the Communists, would leave the doctrine unused, since no external aggression will have taken place. In view of the fact that the Kremlin is using pan-Arab sentiment as a means of internal subversion, the Eisenhower doctrine has been shown to be without much value. This makes it necessary for the policy planners in Washington to reorientate the doctrine if the Russian challenge is to be met. Aggression will have to be countered with measures appropriate to this cunning and resourcefulness. Today, when the Middle East has assumed the world's "powder keg" role formerly played by the Balkans, it is essential for India to appreciate the reality: Soviet expansion in this area would neutralize the British base in Cyprus, render the Eastern Mediterranean insecure for the Sixth Fleet, endanger the security of the Suez Canal and expose the area spreading from Turkey to Pakistan. It would be useful also to remember that two-thirds of the world's proved oil reserves are situated in this area.

The most hopeful sign for the free world has been the recent tendency of the Arab leaders, headed by King Saud, and now also by King Hussein to stem the tide of enthusiasm for Russia among their peoples. Indeed, most of the Arab States are aligned against President Nasser on the Communist issue. These States include, besides Saudi Arabia and Jordan, Iraq, the Lebonon, Lybia, Tunisia and Morocco. But it cannot be denied that the problem which opened floodgates for the Communist penetration still remains unsolved: the problem of Israeli-Arab relations.

Does Jordan have a lesson for India? The answer to the question is bound to be influenced by predilections. There is, however, one thing which emerges clearly. It is that no country, small or big, can afford to ignore the realities of its socio-economic as well as political life. When neutrality enlarges into co-existence with a sinister political partner, seeds of strife are sown. And Communism is both an external as well as internal threat. To humour its patrons and promoters abroad while pretending to contain it at home is to bring about the very situation which many neutralists seek to avoid. They become involved, howsoever indirectly, in the actual struggle for world power. It was no accident that the recent general elections in India revealed Communism even in its domestic guise a highly respectable creed; true, India is economically not as weak as Jordan or any other country in the Middle East. But we are yet far from economic and emotional stability, which makes co-existence an explosive ingredient in our body politic. Perhaps India really has an appropriate lesson to learn from Jordan's experience. We may one day like Jordan be facing a real Communist threat; it will be all the worse if it comes from within.

The Refinance Corporation

THE Refinance Corporation promises to make a positive addition to institutional agencies for the provision of industrial finance. Considering the growing volume of demand for credit, their resources are patently too inadequate. It is not on this ground alone that the proposal for the formation of the Corporation is to be welcomed. For a country which is embarking on a vigorous programme of industrial expansion, the absence of an organised agency for the supply of medium term credit is certainly a vital gap. The main significance of the Corporation lies in the role which is to be assigned to it to cater to this type of accommodation. It will be presumptuous to assume that the Corporation will close the gap. But it will surely not be unrealistic to expect that it will lay a sound and broadening base to cope with this expanding demand.

The Corporation ought not to be viewed from a narrow angle as an entrant going to swell the number of industrial credit institutions. It claims a distinctive character of its own, seeking to provide a special channel for rediscounting of industrial bills. Its purpose is thus to extend cover to credit agencies dealing directly with industrial borrowers on a medium term basis. The choice of the lending agencies is yet to be finalised, but the Government as sponsor of the Corporation has left no doubt whatsoever that its preference in the first instance is clearly for the commercial banks. The second five-year Plan has placed new obligations on commercial banks to reorientate their credit policies and there is now a growing volume of opinion among leaders of banking in this country that commercial banks ought to make a start in accepting responsibility for medium industrial credit in a limited measure. Such a bias would not constitute a radical departure from their recent policies. Participation in the provision of industrial finance in a modest degree in the form of direct investment or credit has now become an integral part of their normal business. This participation is obviously restricted to short periods by virture of the character of the resources of commercial banks.

A definite change in the nature of credit extended by commercial banks to industry is thus establishing itself. It cannot, however, be interpreted as a deliberate switch-over of part of lending resources to medium industrial requirements. A conscious choice in this direction, for which commercial banking is now psychologically prepared, will need as an absolute precondition a solid base of long-term deposits. Hardly 10 per cent of their deposits are repayable after a period of one year or above. Nevertheless, ways and means have to be devised to enable them to face up to the new responsibility which the pressure of industrial credit is imposing on them partially at least. The Chairman of the United Commercial Bank has put in a cogently argued plea for facility for banks to issue bonds with a maturity extending up to six or seven years. The funds to be raised by this technique will form a base for medium term industrial credit. Creation of such a base is a long-term function. In the meantime, the funds of the Refinance Corporation can provide operating ground for the change in lending policies.

In a phase of acute stringency in the capital market, the resources of the Corporation offer some relief. These resources are being augmented and fortified by the proceeds of the counterpart fund to be raised out of part sales of American farm surpluses under the Indo-US Agricultural Commodities Agreement concluded in August last year. In fact, Rs. 26 crores of the fund, which constitute a loan to be utilised for the needs of the private sector in pursurance of the terms of the agreement, have made the establishment of the Corporation feasible. Its share capital of the order of Rs. 12.5 crores is to be divided in fixed ratios, two-fifths being subscribed by the Reserve Bank of India, one-fifth by the State Bank of India and the Life Insurance Corporation each, with the balance of one-fifth being offered at the present time to fifteen Indian scheduled banks and exchange banks. The total resources of Rs. 38.5 crores are to be applied to the provision of lending facilities against loans advanced by the member banks to medium-sized industrial units for medium periods.

The criteria to be applied in granting the cover of refinance have very nearly been settled. The purpose of the loans must be specifically related to selected industries in the private sector in the second Plan. A medium-sized unit with total resources not exceeding Rs. 2.5 crores and a loan to an individual concern with a ceiling of Rs. 50 lakhs for a period ranging between three and seven years are the principal conditions prescribed for eligibility for the rediscounting facility. Member banks will be entitled to use the facility within the limits of quotas varying from Rs. 1 crore to Rs. 3 crores fixed for each on the basis of their share capital. The counterpart fund contribution of Rs. 26 crores will be available to the Corporation for thirty years. Loans from the Corporation will carry interest at the rate of 5 per cent with a margin of 1.5 per cent allowed to the primary lending banks.

The resources of this exclusive rediscounting agency under State ownership are of a modest size which underlines the need for caution against the errors into which most of the industrial finance institutions have lapsed. These errors relate primarily to lack of flexibility in lending operations and of maximum use of funds. The Corporation must be allowed to function with a reasonable degree of freedom and initiative and the danger of relegating it to the status of a State department must be guarded against. It is on this basic issue of vital importance that a major divergence of views has emerged in the current negotiations between the Reserve Bank and the commercial banks for joint participation. In the absence of a positive share in the formulation and direction of policy, the banks are likely to be faced with a situation in which borrowing from the Corporation will introduce an added element of inflexibility in their working. Since the Corporation's dealings will be confined exclusively to the banks, all liability for risks will devolve upon them. Industrial credit is a specialised field in banking which calls for a technical apparatus to investigate the soundness of loan propositions. Commercial banks have to acquire that apparatus. The costs and risks involved can hardly be covered by the margin now offered to them. Nevertheless, the strongest point in favour of the proposed set-up of the Corporation is the solid opportunity it creates for institutional provision of medium-term credit. It must be carried to fruition.

THE WEEK'S NOTES

CONGRESS AND THE MASSES

HOW KEENLY concerned Mr. Nehru is at the declining popularity of his party, revealed by the last General Elections, is no more a secret. In a letter to his colleagues he has dwelt at length on what he believes to have tended to alienate the people from the ruling party. Ostentatious pomp and show generally indulged in by the Congress Ministers and dignitaries have been mentioned by him as some of the causes of the decline in Congress hold on the people of the country. He has, therefore, advised them to take to austerity and to develop "public contact and public approach" to the problems of the country's development.

This is not the first time that Mr. Nehru has warned Congress leaders against shutting themselves in ivory tower offices far removed from the mass of the people. True, when austerity is demanded from the people for the success of the Plan, conspicuous living in high places is inexcusable. But this is not the only — and perhaps even a major — cause of the slump in the stock of the Congress. After all, this diagnosis of the disease fails to answer certain pertinent questions: why is it that the Congress is losing its hold on the masses when they generally support its national and international policies? Why is it that the students and workers are getting increasingly alienated from the Congress? How can the Congress attract young men when older people refuse to accept the corollary to make room for them in legislatures and ministries? It is perhaps because of the partial and superficial nature of Mr. Nehru's diagnosis that his repeated advice and warnings have gone unheeded by his partymen.

The real reason for the decline of Congress popularity is that its members, especially in the middle rung, have deviated from the Gandhian path and ideals. Instead of selfless service of the people, they are indulging in self-aggrandizement and self-advancement. The reputation for integrity that Congressmen enjoyed during the struggle for independence has tended to give place to notoriety for its opposite "quality" (?). It is also an undeniable fact that Congressmen have tended to neglect the masses in their increasing involvement with the Parliamentary activities of the party. It is, therefore, high time that the Congress High Command banned members of Parliament and State Legislatures from holding offices in State or District Congress Committees. Freed from Parliamentary duties, the middle leadership of the party will begin devoting its energy to the popularization of the party programme, cultivation of mass contact and execution of the country's development plans. It will, in consequence, revitalise the party and bridge the gulf between the leadership and the masses.

ECONOMIC CADRE

ECONOMIC AFFAIRS are now in such a state of confusion that it is now being increasingly realised that without foresight and understanding they cannot be tackled in an orderly way. With the extension of State activity in the economic sphere and the continually changing and extensive functions the State is called upon to undertake, the politician and the average civil servant are faced with tasks where mere intuition or rule of the thumb will be of no avail. It is in these circumstances that one finds the demand for the services of those who have the necessary technical knowledge to furnish advice and assistance on many of the contemporary problems requiring a good deal of economic reasoning. This trend is already seen in the incursion into the charmed circle of the higher strata of the civil service, persons with special designations of Economic Adviser, Chief Economic Adviser and so on. A recent report that the Government of India are considering a proposal for the establishment of a regular service cadre of economists and statisticians to facilitate the implementation of the Five-Year Plan seems only to be a logical extension of the process already in evidence.

Some recent experiences of the Planning Commission seem to have underlined the need for a service of this kind which would be of great help in obviating misdirection of efforts and avoiding wastage owing to inaccurate assessment of needs from statistical data. This is a timely move and a step in the right direction because the economic civil servant can make a valuable contribution in policy-making though, of course, the final decisions will lie with the man who takes them. Policy-making can be made easier by first-rate analysis, statistics and the experience the economist can bring to bear and, above all, by his capacity to see the interrelations of different things instead of following a rigid approach of compartmentalism. This, of course, implies that the economic civil servant will have the necessary freedom to advocate and press what he considers to be the best lines of policy on matters in which he is responsible. Policy-making in the context of the Five-Year Plan requires a great understanding of the dimensions of the problems to be solved and the main task of the economist and the statistician will be to provide the essential orders of magnitude of the things at issue — why one objective should be given priority over another and whether available resources are adequate to achieve the particular objective and so on. To fulfil this role an economic civil servant unlike the ordinary civil servant requires greater initiative and latitude and provided these are vouchsafed, there is no reason why the contemplated cadre should not fulfil a lacuna in the economic apparatus of the Government.

WRITER AND THE STATE

MR. TARA SHANKAR BANERJEE, in his presidential address at the Writers' Seminar at Allahabad last week has reflected faithfully the fear and concern of Indian litterateurs about the relationship between the writer and the State. True, there is no immediate danger in this country of encroachment by the State on the writer's work. But at a time when the Government of India is engaged in planned economic development on a gigantic scale, and has, in consequence, begun to impinge upon the life of the citizen, it is necessary for the writer to guard against undue limitation on his freedom. He must also guard against succumbing to the bait of material comfort and yielding up his convictions. The experience of writers in "Socialist Camp" and frequently deplorable standard of their writings should warn the unwary. In such conditions, the writer tends to degenerate into a publicity man for the monolithic State.

The suggestion of the Seminar that All-India Radio and the various Akadamies should not buy outright the copy-right of any work is commendable. Such a measure will not only limit corruption by forcing the writer into the market; it will also allow the work to find its own qualitative level, and enable the writer to reap the fruits of his creation if it happens to be good or popular. In fact, since the various Akadamies are being run as adjuncts more or less of one or the other Government department, it would be desirable to define their activities. The Seminar has realistically concluded that State publishing should be limited to classics, reference books and translations.

Apart from these is the consideration of printing and get-up. Experience in State publication is not encouraging. The States where text book have been nationalised offer evidence of this. In Uttar Pradesh, a good number of Hindi books for secondary schools are incredibly poor, both in printing and in subject-matter. Things are no better in the Punjab, where nationalised books are extremely shoddy in nine cases out of ten. All said, the best way in which the Government could ameliorate the conditions of writers would be by speeding up literacy. This would create a sizable reading public among the country's 390 million people.

CHANGES IN PAKISTAN

THE PAKISTAN NATIONAL ASSEMBLY'S decision to introduce joint electorate in West Pakistan also is commendable. Besides removing the anamoly resulting from joint electorate in East Pakistan and separate electorate in West Pakistan, the measure will help in integrating the various communities into a compact nation, to have two systems in the two wings of the country was, as Mr. Suhrawardy pointed out, a bad advertisement of the country—it proclaimed irreconcilable differences among the people. He rightly asserted that separate electorate was contrived by the Muslims of pre-partition India merely to indicate their rights, for the Muslims formed a quarter of the Indian population, and in certain regions were in the majority. After the establishment of Pakistan the issue of joint electorate versus separate electorate was only of academic interest. Whatever the arrangement it would hardly change the complexion and composition of the West Pakistan Legislature or the National Assembly. Practically all the Sikhs and Hindus have migrated to India from that part of Pakistan.

It may also be mentioned that introduction of joint electorate fulfils Mr. Jinnah's dream of a nationalism based on non-religious factors. When his demand for Pakistan had been conceded, he had declared that Hindus and Sikhs of Pakistan were as good Pakistani citizens as their Muslim brothers. It seems strange, therefore, that the present leadership of Mr. Jinnah's party should stand for separate electorate. They cannot be unaware that their stand can only serve to discredit their country abroad; the implication of their stand is that the Muslims, who are in an overwhelming majority, are either apprehensive of the minority communities in their midst, or intolerant of them. The fact cannot be overlooked that the Hindus of Pakistan, about a fourth of the population, support joint electorate.

SENATOR McCARTHY

DEATH CLAIMED on May 2 the stormy Senator Joseph R. McCarthy, one of the century's most controversial figures. Though a junior member of the American Senate, he suddenly leapt into the limelight in February, 1950, with the allegation that his country's State Department was infested with Communists and fellow-travellers. The mood of the country, profoundly disturbed by the revelations of spying activities of Dr. Fuchs and Mr. Alger Hiss, Presidential aide at Yalta, inclined even sober citizens to get alarmed at the state of the nation's security. Four years later, he became the chairman of the Senate's Permanent Sub-Committee on Anti-American Activities, and thus came to enjoy unprecedented power without responsibility.

In his investigation of alleged Communist infiltration in Government departments and armed forces, Senator McCarthy clashed with President Eisenhower's administration. His career came to a climax in the televised Senate hearings in the row between Senator McCarthy and high army officials and the then Secretary of State of the Army, Mr. Roberts Stevens. Millions followed the controversy during which the Senator charged his opponents with "coddling Communists" and was counter-charged with "black mailing" the army officers into soft-handling his wealthy, young aide, Private David Schine. Following lengthy hearings, Senator McCarthy was brought before the Senate and censured for "obstructing the constitutional processes of the Senate" and for "violation of Senatorial ethics". Politically, this verdict was well nigh a fatal blow to the sardonically witty and sometimes sentimental Senator. By then, even die-hard anti-Communists had come to realize that McCarthyism, too, represented as much a danger to the United States as Communism itself; it not only resorted to kindred methods of investigation but also damaged the country's reputation for a liberal democracy.

It cannot, however, be denied that the Senator from Wisconsin did a great service to his country and the free world by focussing their attention on the danger of internal subversion inherent in the extra-territorial loyalty of a group of men in any country. There can be perhaps no better tribute to the late Senator McCarthy than that he is bound to live as long as the English language will be read and spoken. McCarthyism is now synonymous with intolerance and witch-hunting.

INTELLECTUALS' REVOLT AGAINST COMMUNISM

THE RECENT Congress of the Communist Party of Great Britain has turned out to be one more indication that Communism as practised under Soviet aegis is losing its hold over the intellectuals. Professor Hyman Levy, mathematician and philosopher, referred to the "terrible things" that had happened in the Soviet Union and resigned his membership of the Party as a protest against the "hush hush" policy of its leaders about the situation in Russia. Noted historian, Mr. Christopher Hill, criticised a trend toward authoritarianism, distrust of the rank and file and a fear of discussion even inside the Party. Mr. Brian Behan, a member of Central Committee, described this trend as "witch-hunt". Historical novelist, Mr. Jack Lindsay, accused the Party leaders of living in "a smug little world of their own invention".

Besides this "revolt" of the intellectuals, about 7,900 of the 33,900 members have left the Party since the last Party Congress. This is probably the lowest mark which the Party membership has touched since the Nazi-Soviet Pact of 1939. The main cause for this decline is the Soviet armed intervention in Hungary and the unreserved acceptance of the Soviet version by the Party in defiance of truth as revealed by Mr. Peter Fryer, for a number of years the British Communist Party's ace correspondent, who was in Budapest at the time of the Hungarian revolution.

This disillusionment of the intellectuals of Communism is not confined to Britain alone. In France, the painter, Pablo Picasso, and the Existentialist philosopher-novelist, Jean-Paul Sartre, are reported to be as deeply disaffected. In Italy the disenchantment is even greater. The intellectuals, who had refused to accept the cult of the individual as the cause of Stalin's crimes, have now treated with icy disdain the Soviet version of the Hungarian revolt. They regard both these developments as "part of Socialism". These developments auger well. For it was these intellectuals who had lent a social respectability to the brutal creed of Communism.

What Forum of Free Enterprise Stands for

SINCE the Forum of Free Enterprise came into being with the object of educating public opinion on the values of Free Enterprise and the significant contribution which it can make to the rapid progress of economic development, a great deal of enthusiasm for its cause, and interest in its work has been generated. Along with this, controversy has been provoked as to whether the tenets of Free Enterprise are consistent with the social and economic ends which the country seeks to attain. The Forum is convinced that they are; and in this statement reiterates its attitude towards some of the basic issues which have been raised so that no misconception or doubt on its point of view can be left in the public mind.

Free Enterprise not "Laissez Faire"

We consider that "Laissez Faire" or Nineteenth Century Capitalism has no place in contemporary Indian life. These systems, whatever their usefulness might have been, have outlived it. Today they are as dead as the dodo and can make no contribution to the industrial, social and economic advancement we seek. Equally do we hold that the Marxist approach to socialism through State ownership of the means of production is outmoded in time and thoroughly discredited in practice.

Capitalism of today, or as we prefer to call it "Free Enterprise", operating within a planned economy, is the most alive and the most vigorous economic system in the world. Its motive power is rooted in the fulfilment of the individual, controlled and bounded always by the values and principles of the society in which he lives. Thus, Free Enterprise contributes to the moral and material betterment of society by the voluntarily harnessed efforts of the people which compose it. From this must spring a happier and a richer life for all. Reverse the process by introducing authoritarian planning, which places the State above the individual, and the result will inevitably be confusion, frustration and the loss of liberties.

"The Socialist Pattern of Society"

As far as we know, this phrase has not yet been defined in specific terms. The Forum unreservedly accepts the concept of a fuller and better life for all, equality of opportunity, eradication of unjust privilege; in fine, the establishment of a Welfare State. Indeed we hold that these objectives will be attained more rapidly, more effectively, and with a greater degree of enthusiastic co-operation of the people, through Free Enterprise, than through any other system. Inherent in our acceptance of these social aims is also that of a planned economy, and the common existence and mutual interdependence of a State-controlled and Free Enterprise Sector. What we do not accept is the theory that this State-owned sector should continuously expand until it dominates the national economy, for then, as night follows day, will there be a regimentation of life, totally at variance with India's outlook and traditions, which have always recognised the place and worth of the individual in society.

The Bhakra-Nangal Dam, the Fertiliser Factory at Sindri, the Aarey Milk Colony in Bombay, to take only a few examples, are State achievements which are matters of pride not only to their authors but to the whole country. On the other hand, the Nationalisation of Life Insurance, the introduction of State Trading and the acquisition of the Kolar Gold Fields are equally in our opinion examples of unwarranted State intervention. It is this trend which must be curbed and halted if the free way of life in our country is to be preserved and its economic progress through the democratic processes assured.

The first Convention of the Forum of Free Enterprise was held in Bombay, on April 25, '57 at which many leading industrialists, professionals, and businessmen were present. Write for copies of speeches made by Mr. A. D. Shroff & Mr. M. A. Sreenivasan at the Convention.

Free Enterprise and Scientific Advancement

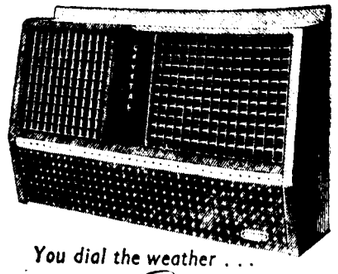
A good deal has been said recently on the need to avoid obsolescent thinking in this age of atomic power and of breathtaking scientific advancement. It is important that we define our stand on this issue. We believe that the challenge of our times is to evolve a synthesis of these techniques and their effective use by free members of a democratic society. In many ways our country is blessed by the fact that she is embarking on her plans of industrialisation at a time when superb scientific aids are available to her. Possibly for the first time in history conditions prevail when the question of Bread *or* Freedom need not even be asked. For, today, science offers us not only Bread *and* Freedom, but also Speed of attainment thrown in for good measure. It would be a tragedy indeed if this bountiful opportunity were distorted and misconstrued to impose Centralised State Control as the instrument of applying the benefits of science to a regimented society. This and not our approach would be a demonstration of obsolete thinking.

Conclusion

For the reasons which we have given we claim that socially responsible private initiative, or Free Enterprise as we term it, is the most dynamic and effective system available to attain the moral and material ends which all of us so ardently hope for That is why the Forum has pledged itself to the task it has undertaken, and that is why it will continue its effort in the certainty that in our good country the values of Free Enterprise will ultimately prevail.

FE-57-2

Forum of Free Enterprise
235, DR. DADABHAI NAOROJI ROAD, BOMBAY 1.



A non-political organisation to educate public opinion on Free Enterprise

A cool, calculated investment —the 'Crystal' room air conditioner!

FRESH, quiet, free from dust and outside noises—your 'Crystal'-cooled office invites good work, impresses clients and visitors. You can calculate for yourself how many dividends it earns you in better business, more goodwill . . . and cool comfort!

The 'Crystal' is made *in* India *for* India, by Voltas Limited—the people who know air conditioning best. Its smart appearance adds distinction to your office . . . its low installation and running costs recommend it to every astute businessman! And remember the 'Crystal' is backed by Voltas' unrivalled after-sales service.

You dial the weather . . . the Crystal supplies it

VOLTAS the people who know air conditioning best!

A Window on the World

INTRODUCTION TO INDIA—1

By

ODYSSEUS

CONFUCIUS (one of my more distinguished predecessors in this commentating business) once said: "The superior man is distressed by the limitations of his ability; he is not distressed by the fact that men do not recognise the ability that he has." True, but this need not mean that a man is compelled to be distressed when someone nods appreciatively in his direction, and since no less an authority than Aristotle lays it down that "Modesty is hardly to be described as a virtue", I hesitate no longer to reveal that in the spate of studies on Indian affairs now being published, the number of quotations from this column, or references to it as a source, causes me no Confucian distress.

A recent example is "Jobs and Workers in India", a handbook on labour problems for students, business men, trades union leaders, and others, preparing to study, invest, or work in India, written by Professor Oscar Ornati, and published by the Institute of International Industrial and Labour Relations of Cornell. (Since this university is situated at Ithaca, I was completely at home when in the course of my Odyssey I was invited there to lecture to a study group on Indian affairs). Professor Ornati concludes a wide-ranging analysis of Indian industrial relations with a chapter in which, offering suggestions for further reading about India, he says "a very interesting listing compiled in India is that of Odysseus in 'The Eastern Economist'. Departing from the premiss that the 'average Briton, and indeed the average foreigner of any nationality in India, knows little of India's history and social background', Odysseus published 'Introduction to India', a series of articles on May 23 and December 12, 1952, and January 9 and 16, 1953". Professor Ornati's friendly reference having caused me to look up my "Introduction to India", I thought that it might usefully be brought up to date. Before doing so, I offer two suggestions and two warnings.

The first suggestion is that although intended as a guide to Indian affairs for the foreigner of good will, it cannot be denied that the average national is often little better informed on the history, politics, economics, arts, and culture of his own country and that he suffers from the additional handicap that whereas the foreigner may feel a certain humility because he knows that he knows nothing, the national may display an abounding complacency because he thinks that he knows all that there is to be known about his own country. The second suggestion is that the enquiring foreigner (or the earnest national) who wishes to learn more of India should not approach the matter as a duty to be conscientiously performed, but as a means of adding to his enjoyment and appreciation of life. The more that you know about the significance of the men, women, institutions, and customs around you, the more significant life becomes to you, the richer your inner resources, and the less dependent you are on such extraneous devices for "taking you out of yourself" as drink and the devil. (If Confucius did not say this, I am profiting by the occasion to fill the gap).

The first warning is that the list of books that I am going to discuss does not pretend to be exhaustive: it is confined to those for which I can vouch from personal acquaintance. The second is that, apart from mentioning three standard works that should be on the book shelf of anyone who claims the least knowledge of India, this is not a repetition but a supplementary list to bring my original "Introduction" up to date.

Repeated from my old list, then, are what I regard as the three best introductory histories: "India From the Earliest Times to Independence and After" by Moreland and Chatterji (Longmans). "The Rise and Fulfilment of British Rule in India" by Thompson and Garratt (Macmillan), and "A Short Cultural History of India" by H. G. Rawlinson.

INDIA WITHOUT TEARS

The newcomer to India who starts off by plunging into serious advanced level stuff, like the Oxford University Press' (excellent) "Legacy of India" edited by G. T. Garratt, will come up gasping for air. He had far better start on something undemanding like "Just Half a World Away" (Hutchison. 1955) by Jean Lyon. This is a well-observed travelogue about people met and places seen on a long tour "in search of the New India". Miss Lyon was ready to accept picturesque local conditions, no matter how primitive, and her anxiety to understand and to enjoy all that she encountered has produced an unpretentious but informative book.

"From the Back Streets of Bengal" (Allen and Unwin. 1955). The first 140 pages offer a worm's eye view of life in the slums of Dacca and constitute a first-class piece of on-the-spot reporting. This is how the poor of Bengal really live. The second half of the book, describing a hasty tour round India, is superficial.

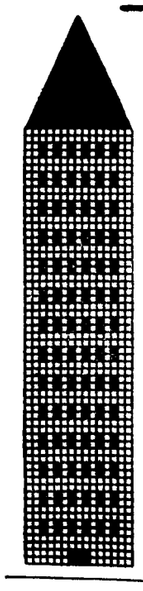
The American Miss Lyon and the British Mr. Llewellyn are fluent professional writers, but they were transients in India. The late Lady Hartog who published "India: New Pattern" (Allen and Unwin) in 1955 lacked their ease of expression but she had the advantage of having spent a life-time in India and of really knowing the country and the people. Her book is a tightly packed guide to independent India covering, at American women's club lecture level, the constitutional background, the parliamentary scene, democracy in action, corruption, the Five-Year Plans, public and private enterprise, food and the population, social life and change, the future of the English language, the refugee problem, and the discreetest chapter on Kashmir that I have ever read. This would be the ideal book to slip at the last moment into the hands of a friend just off to India.

Upgrading ourselves (but not too much as yet), we might next tackle another smooth professional job: "As I See India" (Cassell. 1957) by Robert Trumbull, 'New York Times' correspondent in India 1947-54. Mr. Trumbull offers admirable reporting of scenes that he witnessed and some penetrating profiles of prominent Indian personalities whom he met. His chapters on the civil disturbances of 1947, on the Kashmir quarrel, on his journey into the land of the Nagas with Pandit Nehru at a critical moment, and not least on Pandit Nehru's character, are genuine and original contributions to contemporary history. Unfortunately, Mr. Trumbull's knowledge of Indian history and politicial and social background is patchy, so that his views and

interpretations are often inaccurate or naive. Trust him when he is describing what he saw, not when he is telling you what he can only have acquired at second hand.

"Ambassador's Report" (Gollancz. 1954) by Chester Bowles, US ambassador in India 1951-53, offers (1) a clear and sympathetic explanation of Pandit Nehru's "neutralist" foreign policy which is not always easy for the non-neutralist to understand; (2) a vivid account of things seen and people met, but, again, distrust him when he is telling you what he learnt at second hand from an unsystematic and haphazard reading of books; (3) a frank revelation of the thinking processes of that section of Americans who believe that the best way to ingratitate themselves with Indians is to smear the British. What such Americans need to grasp is that Indo-British relations are a family affair, the intruder into which is likely to attract to himself the resentment of both parties. A foreigner who offered sympathy to a Virginian for the way "those dam-Yankees" had treated his people since the civil war would provoke similar resentment. It is sad to have to pass strictures on one who (on page 303) quotes with approval from this column of April 3, 1953, and shows himself a diligent student of our mellower moments.

ONWARD AND UPWARD WITH NEHRU



Anyone who has read all the books so far listed can regard himself as qualified for advanced, post-graduate study. My first choice for him now is Frank Moraes' biography of Jawaharlal Nehru (Macmillan. 1956). Mr. Moraes does two things extremely well: (1) As a patriotic Indian, he explains India's domestic and foreign policies with persuasive moderation. He offers an ABC of the Indian viewpoint which should be invaluable to the puzzled Westerner. (2) He provides an interesting and well-documented study of the working of Pandit Nehru's mind.

Candidates pondering a thesis on Pandit Nehru's more obscure vagaries will find Tibor Mende's "Conversations with Nehru" (Secker and Warburg. 1956) a collector's piece, illustrating exactly what 'The Times of India' had in mind when it described the Prime Minister's "flexible" approach with its "distaste for details and penchant for soaring well above the earth, if not into the clouds."

From Pandit Nehru it is a natural step to Gandhiji. The eight volumes of Tendulkar's biography, and the two of Pyarelal's, must be regarded as source material for the historian and as pious monuments rather than as bedside reading for the beginner. For him, I suggest (to be tackled in the order listed): "Mahatma Gandhi," by Polak, Brailsford, and Pethwick-Lawrence (Odhams. 1949). From their different standpoints these three, who knew him well at different periods of his life, make the Mahatma's apparent contradictions comprehensible to the ordinary Westerner. "My Experiments with Truth", Gandhiji's own autobiography, a wonderful document, unfortunately ends with the year 1924. Mahatma Gandhi's writings cover several thousand scattered pages. The best guide to his thought for the non-specialist is "Selected Writings" (Faber. 1951) edited by R. Duncan. To be browsed over, rather than read solidly through, is "Mahatma Gandhi: Essays and Reflections on His Life and Work", contributed by 83 friends, edited by S. Radhakrishnan (Allen and Unwin. 1949).

Next week, we will list some new books covering Indian art, literature, history, and culture generally.

However big or small

—every **NEW INDIA** policy guarantees security and service!

PROFIT from NEW INDIA's years of experience, guidance and assistance. NEW INDIA ASSURANCE covers every kind of general insurance from marine and fire to accident and burglary, settles your claims promptly, ensures you security and service! NEW FORMS OF FOREIGN INVESTMENT

(From Our Special West European Correspondent)

PARIS, May 5.

PROJECTS for European unity and economic co-operation usually get a skeptical reception on this page, so it is good to be able to point to one form of international co-operation on this Continent that is working and promises to have considerable extension in the future. This is the formation by private firms in various European countries of consortiums or even new super-national companies for the purpose of investment in overseas countries. The progress of plans for a European common market has given this new development in the private sector further impetus, because it should make easier the resolution of the intricate taxation and customs problems set by the establishment of super-national companies. In fact, this new line of thinking in the private sector is closely connected with the governmental plans for Euromarket, Euratom, etc., in that it is based on the same argument: that only by pooling her economic resources can West Europe meet the competition of the bigger powers. Since the competition in question is for the supply of capital equipment to Africa, Asia and Latin America, any new ideas in this field are of importance.

Quite apart from the question of pooling European resources to match Russian and American, these new forms of co-operation have interesting economic and political features. Economically, they may offer the best way of reviving the flow of private capital toward overseas investment, because a consortium or international company that draws its membership from five or six Continental countries has a much more hopeful prospect as a borrower, either in the open markets or in the international financial institutions, than any single enterprise. Politically, moreover, such a combine receives a less suspicious reception in sensitive underdeveloped nations. Even the recent unhappy fate of the "Universal" Suez Canal Company does not testify against this latter assertion since the new combines are seeking to retain a more private, and less governmental, character than earlier essays in this direction.

A typical example of these new ventures (although not purely Continental in constitution) is the International Contractors and Suppliers Association, which hides under its anonymous label the greatest industrial consortium ever formed in history. Last month it submitted to the Argentine Government a programme for oil installations that will cost 250 million dollars and which it proposes to carry out on the basis of a simple service contract conceived on purely commercial and technical lines. Argentine public opinion is highly sensitive to the political character of foreign investment, which is not surprising for it has suffered from many contracts of the lion-and-donkey variety; the political disturbances caused by Peron's proposed concession to Standard Oil illustrate this sensitivity. But the international and strictly business character of the ISCA and the terms it has offered have disarmed criticism. French initiative led to the constitution of this giant combine, which has grouped around the original nucleus of the Parisian Schneider group and the American firm Williams Brothers a list of companies which is too long to detail here but which draws members from Britain, the USA, France, Holland, Italy, Belgium and, of course Argentina itself.

But the field in which this type of co-operation promises to develop most is in the exploitation of the mineral resources of Africa, especially within the French colonial empire there. These territories have substantial deposits of oil, iron ore, copper and aluminium. France does not have the capital to exploit them alone. Furthermore, all these areas are making steady progress toward political autonomy and so it is necessary to devise forms of long-term investment that will not be called in question later when they are self-governing. The French have felt that international companies grouping all the countries of Euromarket (including the "non-imperialist" nations) and having a clearly private character offered the best hope, and this was one of the reasons Paris fought successfully to have the overseas territories included in the European common market. When her Continental partners agreed to this (reluctantly, it must be admitted), Paris arranged a tour of the African territories by representatives of the Euromarket countries. That they have returned convinced of the economic possibilities of joint exploitation of Africa is no more important than the fact that during their tour they were well received by African leaders who assured them that they regarded joint private investment as an important step forward from their present colonial economy.

The interest of Continental firms in these areas is of course that they can obtain there supplies of raw materials from sources much nearer Europe than their present suppliers. Iron ore is an example. European resources are already inadequate and alternative sources are distant: India, Venezuela, Brazil or Canada. Ore with a content of 63-67 per cent is available in Mauritania, in French West Africa, but requires for its extraction and transport capital investment beyond the means of France. So an international company, Miferma, has been formed which groups all the West European countries; Italy last week bought her way into it by taking over the shares held by a Canadian Company. It is interesting to notice that the Italian shares will be taken up by a steel corporation which is actually a subsidiary of the State, but this does not alter the private character of Miferma for the Italian corporation participates as one Company among others. Miferma will have to build a 300-mile railway line to get its ore to the sea, and the total investment will be of the order of £45 millions, but it is reasonably expected that, given its constitution, it will have no difficulty in raising a large loan from the international financial organisations.

A similar project is under way for the manufacture of aluminium in French West Africa by a Company that groups French, German, Swiss, Italian and possibly Canadian capital, and African copper deposits are proposed to be exploited in the same way, combining private European capital in a Company that can then approach international lenders for assistance with the construction of transport facilities. Even if the European common market treaty does not produce the degree of economic unity forecast officially, we can expect to see private co-operation of this sort much extended, for West European industry is today thinking "Continentally" more than ever before and can demand from its various governments assistance in resolving the complicated legal and exchange difficulties that beset such forms of joint investment. Even the

West Germans, who are very short of capital (as their dealings with the Indian Government over steel showed), are keenly interested because they are disadvantaged in the supply of raw materials and hope that joint investment in Africa will mitigate their difficulties; but the Germans perhaps more than others have been scared by recent arbitrary treatment of foreign capital by such as Nasser, and would like to see some secure international conventions for the protection of private investments abroad.

The most important element in joint European investment would of course be the co-operation of French and German industry, and it is here that most progress is being made. The legal question of forming companies of mixed nationality is receiving close attention, and it is healthy that the Germans are especially anxious to avoid any appearance of "neo-imperialism" or new East India Companies, and wish to keep Government aid and participation down to a minimum. This growing co-operation at the private level between French and German industry is in fact being duplicated at the official level, for co-operation between the Governments of Paris and Bonn in the matter of research and production of armaments has already gone very far—much farther than is yet realised by public opinion in those two countries.

For those who are skeptical about the formation of a genuine free-trade area on the Continent, it will appear that Britain and other overseas opinion has reacted too timorously to the supposed threats of Euro-market. But in this matter of Continental co-operation for investment in under-developed territories, the danger to British and American capital equipment suppliers cannot be mistaken. Consortiums or companies of mixed nationality that combine the industrial resources of the Continent will be able to make offers to developing countries that cannot easily be equalled by the biggest single nations. For the moment, this Continental effort is directed mainly to Africa, but if it succeeds there it will seek new fields elsewhere—and the recent Italian irruption into the closed Anglo-American preserve of oil production in Iran suggests how disturbing such competition can be when it offers terms considerably more attractive for the borrower than have been the rule to date in foreign overseas investment.

Second Plan Irrigation Projects in Orissa: Eight irrigation and multi-purpose schemes, which will benefit an area of about 4.64 lakh acres in Orissa State, have been included in the second Five-Year Plan. The total cost of the schemes, some of which will be completed in the third Plan period, is estimated at about Rs. 6.61 crores. Of this amount, Rs. 6 crores will be spent during the second Plan period. Nearly 2.04 lakh acres will receive irrigation benefits during the period. A sum of Rs. 0.10 crores has been earmarked for investigations during the second Plan. The Rs. 4.45 crore Salandi irrigation project in Balasore and Keonjhar is expected to irrigate 1.76 lakh acres during the second Plan period. Expected to be completed by 1961-62 the project will ultimately benefit 3.53 lakh acres. The Salki irrigation project, which will cost about Rs. 0.53 crores, will irrigate 0.45 lakh acres in Baudh-Phulbani district. The project is likely to be completed by 1962-63. Thirteen thousand acres will be irrigated in Puri district when the Rs. 0.43 crore Budhibudhiani project is completed by 1961-62. The Salia project is expected to irrigate 0.26 lakh acres which will include parts of the Puri district. It is estimated to cost Rs. 0.47 crores. About 0.13 lakh acres will be irrigated during the second Plan period. The project is scheduled to be completed by 1961-62.

*

Grow More Food Programme for Delhi: A sum of Rs. 8.68 lakhs has been agreed to for the Grow More Food schemes of Union Territory of Delhi. Out of this sum, Central aid, in the form of recoverable expenditure, will amount to Rs. 6 lakhs and subsidy equal to Rs. 2.68 lakhs. Besides this a short-term loan of Rs. 8.89 lakhs has been approved. There are in all 11 development schemes for which Central subsidy has been sanctioned. These relate to plant protection, fishery development, development of jheel fisheries and co-operative fish marketing and cold storage. Other schemes relate to sludge and manure distribution and schemes for distribution of chemical fertilizers and for the development of local manurial resources. There are also schemes for improvement of village tanks and for sinking new wells besides those dealing with seed distribution and development of seed farms.

INDUSTRY

Draft Standard for Aluminium Shot: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for aluminium shot for use in iron and steel manufacture. The draft standard specifies, amongst others, requirements for chemical composition, sampling for chemical analysis, freedom from defect, sizes, etc., Comments on this draft standard may be sent before July 15, 1957, to the Indian Standard Institution, 19, University Road, Delhi-8.

*

Draft Standard for Biscuits: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for biscuits. This draft standard, therefore, lays down requirements which are applicable to all types of biscuits and which would act as the basis for determining the wholesomeness of these products and their freedom from likely deleterious contaminations. The draft standard specifies that biscuits shall be well-baked but shall not bear signs of scorching. They shall be crisp and of uniform texture. Designs on them, if any shall be clear. They shall have an agreeable odour, typical of well-baked biscuits and shall be free from off odour, soapy or other off taste, and free from insect and fungus infestation. In addition to such physical characteristics, there are certain chemical requirements which have also been prescribed in the draft standard. These chemical requirements are for maximum percentage limits for moisture, acid insoluble ash, etc., and minimum limit for fat content.

*

Dimension of Three Phase Induction Motors: The Indian Standard Institution has circulated, for eliciting comments, a draft standard on dimensions of three-phase induction motors. The Indian draft has, to a very large extent, succeeded in reducing to a minimum the differences between two groups of countries. In doing this, the Institution has also been able to keep to the essential requirements of the metric system which has been adopted by the Government of India. The draft represents the agreed views of the manufacturing industries and organized users like Government departments. Comments on the draft may be sent before July 12, 1957, to the Indian Standards Institution, 19, University Road, Delhi-8.

*

Draft Standards for Industrial Windows: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for industrial windows. This specification supplements the draft specification for steel doors, windows and ventilators which covers requirements for domestic buildings including offices and schools. The range of sizes included in the earlier standard did not meet the needs of industrial buildings, specially factories and warehouses, where large single units are required to be installed. This standard covers those ranges and provides for sizes varying from 97.5 cm x 97.5 cm or (3'—2-3/8" x 3'—2-3/8") to 197.5 cm x 217.5 cm or (6'—5¾" x 7—1-5/8"). As in the case of domestic windows, the sizes of industrial windows have been fixed so as to fit into modular openings based on a 10 centimetre module. The specification includes sizes, tolerances, quality of the material to be used, constructional requirements and fitting and fixing of materials. Comments on the draft may be sent to the Indian Standards Institution, 19, University Road, Delhi-8 before July 10, 1957.

TRADE

Protection to Cocoa and Chocolate Industry Extended: The Government of India's Resolution on the Tariff Commission's report (1956) on the continuance of protection to the Cocoa Powder and Chocolate Industry has been published in a Gazette of India Extraordinary.

The Commission's main recommendations are:

(a) that protection to this industry should be continued for a further period of one year i.e. up to December, 31, 1958;

(b) that the protective duty on cocoa powder should be maintained at the existing rate of 31¼ per cent ad valorem (including surcharge), and,

(c) that the protective duty on covering chocolate should be 50 per cent ad valorem or Rs. 1 per lb., (including surcharge), whichever is higher (as against the existing rate of 50 per cent ad valorem),

Government have accepted these recommendations and the revised rate of duty on covering chocolate as in (c) above is being brought into force with immediate effect.

The Commission has also made certain ancillary recommendations and suggestions for general assistance to this industry.

Foreign Trade of India in February 1957: The provisional figures of foreign trade of India by all routes sea, air and land—on private and Government accounts, during February 1957, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta are as follows: Merchandise, excluding transit trade of Pakistan and other overland foreign countries viz. Nepal, Tibet, Sikkim and Bhutan: Exports Rs. 54.25 crores, re-exports Rs. 30 lakhs, imports Rs. 71.32 crores; Total trade Rs. 125.87 crores. Treasure: Exports of currency notes Rs. 5 lakhs, others negligible. Imports of gold Rs. 2 lakhs, currency notes Rs. 5.10 crores, other—nil. Balance of trade: The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures, the total value of exports (including re-exports) of merchandise and gold fell short of imports by Rs. 16.79 crores.

*

Trade Handled at Vishakhapatnam Port: The Visakhapatnam Port handled 92,145 tons of traffic during the first half of April, 1957. This included 33,405 tons of mineral ores. The imports which totalled 51,034 tons included 4,036 tons of shipyard material, 4,859 tons of food grains and 481 tons of Bhilai Steel Project material. Twenty four vessells entered the Harbour during the period as compared with sixteen during the previous fortnight.

FINANCE

Loan for Madras Projects: The Government of India have sanctioned a loan of Rs. 1 crore and 93 lakhs to the Madras Government for meeting the expenditure during 1956-57 on three schemes under the programme of permanent improvement in the scarcity areas. This brings the total amount of loans sanctioned for these schemes to Rs. 4 crores and 86 lakhs. The three schemes are the vaigai project, the Amaravathi Reservoir project and the Mettur Canal scheme. The Vaigai Project, estimated to cost Rs. 330 lakhs, will ultimately irrigate 20,000 acres in the districts of Madurai and Ramnad. The project comprises the construction of a dam, 11,675 ft. long across the vaigai river to store the surplus waters of the Periyar. About Rs. 226 lakhs will be spent on the project during the second Plan period. The Rs. 296.71 lakh Amaravathi Reservoir project will irrigate 15,000 acres in the Coimbatore district. The scheme comprises the construction of a dam 3,594 ft. long and 133 ft. high above the river-bed across the Amaravathi river. About Rs. 147 lakhs have been allocated to this project during the second Five-Year Plan. The Mettur Canal Scheme will benefit an area of 45,000 acres in Salem and Coimbatore districts. The Total cost of the scheme will be Rs. 183 lakhs. The project envisages excavation of canal from the Mettur reservoir for utilising the end rents of the high and low level luices. About Rs. 10 lakhs are provided for this scheme under the second Five-Year Plan.

*

More Loans to Displaced Persons: Sixty one loans totalling Rs. 3.42 lakhs are the latest to be sanctioned by the Rehabilitation Finance Administration to displaced persons from East Pakistan. Ten supplementary loans amounting to Rs. 65,000 were sanctioned for improving the business or industrial undertakings started by displaced persons with earlier R.F.A. loans. Till the end of January 1957, the Administration disbursed loans amounting to Rs. 1037.5 lakhs out of a total of Rs. 1235.22 lakhs sanctioned. Up to the end of 1956, the Administration disposed of 74,947 out of 87,508 application for loans received by it.

*

Customs and Excise Revenue Collected in Indian Union for February 1957: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during the month of February, 1957, amounted to Rs. 14.49 crores as compared with Rs. 14.74 crores in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 11.47 crores as against Rs. 11.97 crores, export duties for Rs. 2.57 crores as against Rs. 2.63 crores and land customs and miscellaneous for Rs. 35 lakhs as against Rs. 14 lakhs. The Total gross collection of Union excise duties amounted to Rs. 15.64 crores as compared with Rs. 14.21 crores. During the eleven months, April 1956 to February 1957, the grand total of gross customs and Union excise revenue realised was Rs. 530.27 crores as compared with Rs. 289.26 crores during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 127.68 crores as against Rs. 116.56 crores, export duties for 28.14 crores as against Rs. 33.85 crores, land customs and miscellaneous for Rs. 3.31 crores as against Rs. 1.88 crores and Union excise duties for Rs. 171.14 crores as against Rs. 136.97 crores.

*

Rebate of Excise Duty: The Government of India have decided to extend the rebate of duty on excisable goods to cotton fabrics used for the manufacture of bags which are exported out of the country. The rebate is at present applicable only to ready-made apparel, tents and sugar products including biscuits and preserved fruit. Manufacturers of cotton bags who wish to export them from India should contact the Collector, Central Excise, in whose jurisdiction their factory is situated in order to avail themselves of the benefit of the procedure subjects to observance by them of the formalities required under Rule 191-A of the Central Excise Rules, 1944.

GENERAL

American Assistance for Indian Railway and Community Development Programmes: The Governments of India and United States of America have signed two supplementary project agreements providing for $10.5 million in Development Assistance Funds for the Indian Railways and $.2 million for the Community Development programme. This total of $12.5 million is part of the $.55 million in development funds available to India during the current fiscal year under the Indo-American programme and is in addition to Technical Assistance Funds. The sum of $10.5 million will be used by the Railway Board for purchasing approximately 56,400 tons of steel rails and 1900 tons of fish plates. $.2 million is intended to continue assistance to the Community Development programme by providing necessary funds for the purpose of procuring equipment required for opening 200 new community development blocks.

*

Employment Assistance to Scheduled Castes: The employment exchanges procured jobs for 1,819 registered scheduled castes unemployed during February, 1957. Of those placed in employment, 932 were placed under the Central Government, 550 under State Governments, 196 under Quasi-Government establishments and local bodies and the remaining 181 with other employers. During the month, 848 vacancies were notified as specifically reserved for Scheduled Caste applicants, of which 705 were provided by the Central Government, 136 by State Governments and the remaining 7 by other employers. Out of 401 reserved vacancies filled, 349 were under the Central Government, 51 under State Governments, and 1 with a private employer. At the end of the month under review 76,901 such applicants were borne on the Live Register as against 76,073 at the end of the previous month.

NEWS IN BRIEF

INDIAN

The Government of India has extended the provision of Section 39 of the Insurance Act, 1938 to postal life insurance policies thereby making it possible for a holder of a postal life insurance policy to nominate a person to whom the assured sum may be paid in the event of his death.

*

A number of industrial schemes for the manufacture of machinery, machine tools and equipment are understood to have recently received the approval of the Government of India.

*

The Government of India has extended free licensing of all varieties of cotton piecegoods (mill-made and powerloom) and cotton manufactures including cotton waste blankets other than restricted varieties for export up to December 31, 1957.

*

The Punjab Government has decided to set up a modern well-equipped milk plant at Chandigarh at a cost of Rs. 6 lakhs 75 thousands to improve the milk supply, butter, ghee and milch products in the town.

*

The Government of India has decided to raise the limit of oil content of de-oiled groundnut meal (solvent extraction variety) tendered for export from less than one per cent to less than 1.5 per cent.

*

Final negotiations between the Government of India and the World Bank on the quantum of aid for the railway development programme in the current Plan will begin in New York about the middle of May.

*

The Formation of co-operative societies in rural areas for the manufacture of building material like bricks, lime, tiles etc. was recommended by the Sixth Development Commissioners' Conference as one of the important measures for a speedy implementation of the Rural Housing Programme.

*

Over 54,000 tenements were built in India by State Governments private enterprises and corporations under the subsidised industrial housing scheme up to March 31, 1957.

*

The Okhla Industrial Estate, the site of a township for small industries seven miles South of Delhi is fast taking shape. Out of 35 factories being constructed on this 40-acre estate, 29 have already been allotted to small enterpreneurs from Delhi. The remaining six factories are expected to be allotted shortly.

*

An analysis of the age distribution of the applicants registered with the Employment Exchanges at the end of December 1956 revealed that out of 7,58,503 applicants, 3,05,104 (40.2 per cent) were between 18 to 22 years of age.

*

About 9,500 patients on an average went daily to the dispensaries run under the Contributory Health Service Scheme for Central Government Servants in Delhi, according to an official report on the working of the scheme for the period July 1955 to December 1956.

*

A big expansion of technical studies in eastern region comprising West Bengal, Bihar, Assam and Orissa has been recommended by a special Expert Body appointed by the Eastern Regional Committee of the All India Council for Technical Education.

FOREIGN

Persia and Russia have signed a transit agreement by which they will both be able to use trade routes through each others territory for three years.

*

Brazil has signed a $2,750,000 loan agreement with the US Export-Import Bank to pay for reconditioning of twelve cargo ships brought last year. The loan bearing 5½ per cent interest would be repaid in semi-annual instalments over eight years.

*

US exports advanced $3,440 million (£1,228.5) last year as American traders increased their shipments to all major free world trade areas. The gain was larger than the $1,206 million rise in imports, the surplus increasing sharply to $6,397 million from $4,163 million in 1955.

*

The US and Pakistan have reached an understanding by which 54,000 five ounces of US silver loaned for coinage purposes during the war will be repaid to the US Treasury.

*

The European Coal and Steel Community is assisting in the financing of housing in the Netherlands. It will grant credits for Fls. 4 million at nearly one per cent with the General Mineworkers Fund of Holland providing Fls. 16 million at 4¾ per cent.

*

Royal Dutch Petrolium is seriously contemplating the establishment of a large synthetic rubber factory at Pirnis, near Rotterdam, where the Company's big refinery is situated.

*

The Federation of Malaya's trade in March revealed a favourable balance of $M154.5 million (£18.2 million) and exports $M210.2 million (£24.7 million). The Federation had a favourable balance for the first three months of this year of $M108 million (£12.7 million).

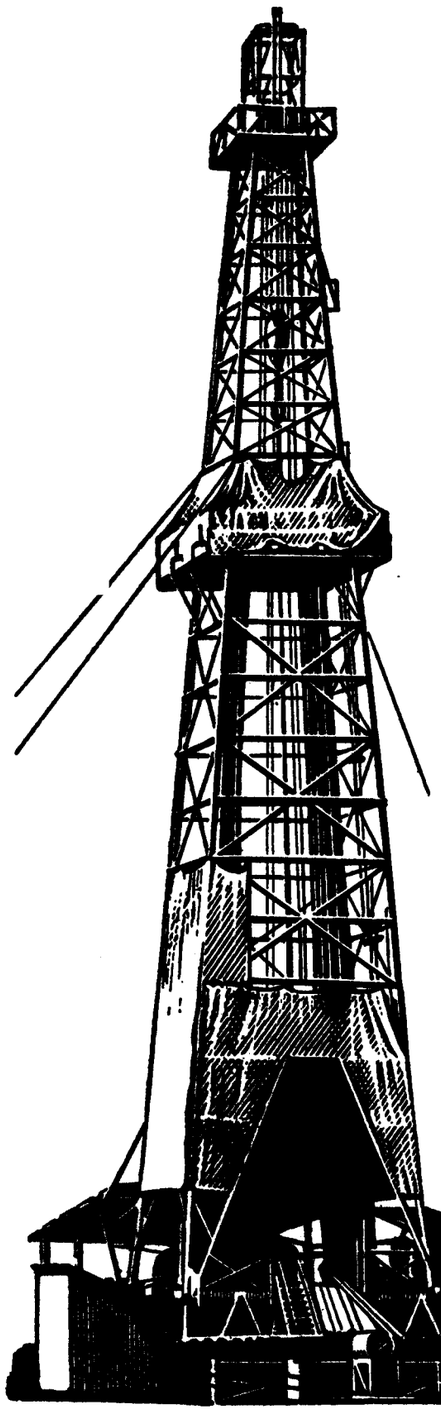
*

A Ministry of Trade spokesman has announced that the open account between Japan and the Netherlands is likely to be abolished from July 1 as a result of talks at the Hague between delegates of the two countries. Trade between the two nations will hereafter be settled in sterling or Dutch guilders.

*

The meeting of F.A.O. Co-ordinating Committee will be held at Rome from May 6 to 17, 1957. The Committee will discuss, among other things, F.A.O.'s programme of work and budget for 1958-59, F.A.O. documentation organisation and co-ordination of meetings, seminars and training centres.

*



Accounts published in the Kenya "Official Gazette" show that the colony's revenue for the year ending June 30, 1956 totalled £33,389,131 about £8,000,000 more than the sum estimated.

*

It has been reported that the Pakistan Government has asked Montecatini, the biggest Italian mining and chemical corporation, to participate in designing and financing the construction of a plant for the production of fertilizers to be built in that country.

It is reported United States newspapers will need 8 million tons of newsprint by 1965 to meet ever increasing demands, according to a study by the American Newspaper Publishers' Association.

A TOWER OF STRENGTH in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

FOOD GRAINS PRODUCTION IN 1956-57

IT is now claimed that the food scarcity that has manifested itself in recent weeks in several parts of the country cannot have been due to any fall in production in the agricultural year 1956-57. Though the final position regarding the year's production of food grains has not yet clearly emerged, it is still possible to have a rough general picture. The final estimate of the dominant staple food grain crop — rice — shows that its output has set up an all-time record of 28.14 million tons as against the partially revised estimate of 26.85 million tons in 1955-56. The final estimate of the next important food grain crop — wheat — is, however, not yet available; but it is confidently stated that its output has reached the level of 8.78 million tons which was the figure for 1954-55. Among the coarse food grains, maize and ragi alone appear to have so far come in for final estimates. The output of maize in the year is of the order of 3.02 million tons (as against the partially revised estimate of 2.55 million tons in 1955-56), while ragi production is 1.91 million tons (as against the partially revised estimate of 1.82 million tons in 1955-56). Provisional official figures for all coarse food grains, according to a press note of the Union Ministry of Food and Agriculture, represent an increase of about 0.4 million tons on the figures of 1955-56.

This rough final picture for 1956-57 may now be compared with the output figures since the first year of the first Plan. The following table gives the relevant figures for food grains other than pulses:

(Production in million tons)

Year	Rice (cleaned)	Wheat	Coarse food grains	Total
1951-52 . .	20.96	6.09	15.84	42.89
1952-53 . .	22.54	7.38	19.30	49.22
1953-54 . .	27.77	7.89	22.61	58.27
1954-55 . .	24.53	8.78	22.42	55.73
1955-56 . .	26.85	8.35	20.15	55.35
1956-57 . .	28.14	8.78	20.55	57.47

It is seen from the table that food grains production in 1956-57 has nearly reached the record level of 1953-54. Four good or fairly good years in succession have maintained annual production above 55 million tons. In particular rice has set up an all-time record in 1956-57 with an output of 28.14 million tons. The increase in production of rice is partly due to the increase in acreage which has been attributed to favourable seasonal conditions at the time of sowing; and it is also partly due to favourable seasonal conditions during the growing period in all the States except Uttar Pradesh. The table at the end gives a State-wise breakdown of rice production in 1956-57 and 1955-56:

The rather intriguing question is why, in spite of the increase in production of rice (which accounts for very nearly 50 per cent of the entire production of food grains) and of wheat, scarcity has begun to manifest itself in several parts of the country. The uneven increase in production of rice and, perhaps, of other food grains in different States may partly explain local scarcity conditions for the time being. The prseent scarcity, however, does not appear to affect the primary producers for the simple reason that production has increased — and not decreased as in 1950-51. As consumption of food grains by producers has always had a tendency to increase with increased production, the marketable surplus available now for the non-producers both in the urban and in the rural areas may be taken to be relatively the same as in former years — that is, a third of the total production.

On the above basis, food grain supplies in the monetised sector may be estimated at 19.16 million tons (or 15.4 oz. daily per head of the non-agricultural population) in 1956-57 as against 19.43 million tons (or 16.5 oz. daily per head) in 1953-54 and 18.54 million tons (or 15.1 oz. daily per head) in 1955-56. The index number of food grains in the monetised sector (compiled by the 'Economic Intelligence Unit' of the Indian Institute of Public Opinion) was 129 in 1953-54 as against 110 in 1955-56. This relative scarcity of supplies in 1955-56 should have largely caused an increase in prices which, since April 1956, have risen by 12½ per cent up till April, 1957. This price increase also appears to accentuate the relative scarcity of supplies which in 1956-57 are about the same as in 1955-56.

The present scarcity, however, may be largely confined to low-income groups whose purchasing power is not adequate for purchasing food grains in the usual quantities at the prevailing level of prices. In other words, there is a fall in effective demand on the part of vulnerable low-income groups, and hence the loud cry that food grains are not adequately available. The inadequacy is, of couse, there to some extent. But it is also true that this inadequacy is partly related to the prices. Some more supplies and somewhat lower prices may relieve scarcity. Here the 'Economic Intelligence Unit' of the "Indian Institute of Public Opinion" has suggested that 2.5 million tons of imported food grains should be put into the monetised sector this year not only to overcome the relative scarcity but to bring down wheat prices by about 15 per cent. This is not a recommendation on the food front only; its purpose is to build in some insurance against inflation which the heavy development expenditure proposed in the year makes certain.

(In million tons)

State	1956-57	1955-56	Percentage increase over 1955-56

FACTS ABOUT KORBA

ONE day recently, at the very end of April, 1957, a wagon load of rather poor coal rolled southwards down the branch line from Korba to Champa Junction and thence to Bilaspur, fifty-six miles distant from Korba station. It was not a very dramatic shipment. Yet it was a historic moment. For that was the first delivery of coal from the pilot quarry, sunk by the National Coal Corporation of India into the Thick Seam, at Manikpur, near Korba railhead. In those same days, two miles or so further north, near the ford across the river Hasdeo — the Charpara Ghat — the first incline of the first colliery was being sunk to win the good coal of the 'Ghordewa' seam. Yet press reports earlier in April had written of 30,000 tons per month already being mined at Korba. In the same optimistic vein, other press notices, last autumn, had foretold a production of four million tons a year from the field by 1960. In truth it will be many months, perhaps a year, before the 30,000 tons per month can be achieved, and the figure of four million tons per annum lies far ahead. Yet the gap between over-optimistic assumption and stern reality should not be allowed to decry the fundamental importance to India's industrial development of the Korba field. All that is now needed is clear understanding and fair judgment by the public, press and all concerned.

The geographical advantages of the field are beyond question. It lies at the south-western corner of the great parallelogram of the main coal bearing lands of India. Markets to the west and the south-west can be supplied from Korba and the long haul from the older fields of Bengal and Orissa can be saved and wagon space economised. It is a big field, about two hundred square miles in extent. The coal of the Ghordewa seam is good and it has been tested in quantity, on many occasions and in many ways. It does not do everything. It is not a gas coal. It does not, by itself, produce metallurgical coke. It is an honest, clean burning, steam raising coal, of good calorific value. Two to four miles to the south, depending on the location in the field, is the other, and so different, asset the Korba Thick Seam. Thick it undoubtedly is. The quantity is enormous. Only part of the gap between Jatraj and Binjra has been closed by drilling at Durpa and Kusmunda. Yet it is highly probable that beneath the fields of the villages of Geora and Naraibod, and perhaps far beyond Binjra to the west, this huge mass of fuel lies just below the surface. The figure of reserves must run to hundreds of millions of tons. On the east side of the Hasdeo, in rather thinner beds, the seam has been proved on a frontage of more than four miles. But it is poor stuff. Perhaps it is better not to use the word 'coal' at all! Rather one should say 'a huge mass of low grade fuel'. It is a thick bed of shale and shaly coal, with an ash content of 30 per cent to 45 per cent. The many boreholes which have so far been sunk through the Thick Seam have failed to establish the existance therein of any band of good coal that could be mined for its own virtues out of the surrounding mass.

Not surprisingly the Ghordewa Seam of wood coal and the Korba Thick Seam, a mass of low grade fuel have been confused in reports and press articles. It has been said that experiments showed that coal from the Korba field could be blended with coal from Jharia to give a metallurgical coke. True enough, that was coal from the Rajgamar extension of the Ghordewa Seam. It has been said that coal in the Korba field exists in enormous mass suitable for open cast quarry mining by highly mechanised methods. But that is the poor stuff of the Thick Seam. It is fatally easy to indulge in day-dreams about the industrial use of the Thick Seam. Quite obviously the immediate and entirely correct use is to burn it on the specially designed grates of the Korba Power Station which will provide the electricity for the Bhilai Steel Plant. But that will only absorb about 20,000 tons per month, say a quarter of a million tons a year. In the case of the Thick Seam the problem is not to raise coal, it is to dispose of it to willing customers. At present there are but few furnaces and fireboxes in all-India that can burn fuel of this low calorific value. The time may well come when the whole plateau west of Jatraj will be a great industrial area deriving its energy and its raw material from the great beds of the Thick Seam. But that time is not yet. There have been forecasts of synthetic oil production, of a new steel plant. But the production of synthetic oil demands, as the Germans well know, complicated machinery and heavy expenditure in capital equipment. Another steel plant lies far in the future. There have been optimistic reports that the run of mine from the Thick Seam can be washed to produce marketable coal. That may be. Now that the pilot quarry has been sunk, trials can be carried out on hundreds and indeed thousands of tons to prove whether this washing project is a practical solution. For the moment it looks as if a very great deal of poor material would have to be quarried to produce a proportion of useable washed coal.

For the Ghordewa Seam the problem is entirely different. The market exists, is, indeed, clamouring for good, burning, coal. But there has been a disappointment east of the Hasdeo. North and north-east of the town of Korba the seam exists in workable thickness. The first colliery, due north of the town is due to produce 20,000 tons per month. A second sunk a little further east will produce the same quantity. But then the seam seems to fade out till it reappears in five foot thickness at Rajgamar, a good distance away from railhead. So now it looks as if the 'Ghordewa Seam' must be sought on its native soil, so to speak, those classic villages of Ghordewa and Dangania, where Dr. Cyril Fox, Superintendent of the Geological Survey of India, visited John Dunlop in 1926 and whence came the report in the Memoirs of the Geological Survey. Perhaps, in the light of our present knowledge, the railway was sent up the wrong side of the Hasdeo. The energetic teams of the Bureau of mines have carried out a tremendous programme of drilling on the eastern side of the field, 56,000 feet drilled in slightly over a year. But they have not found anything startlingly new. The Thick Seam is as disappointingly mediocre on the east as it was on the west. The Ghordewa Seam is rather thinner and indeed seems to fade away in places. And no new seam has been found. 'There is more and better coal on the west of the Hasdeo' was recently said. Fortunately, just above the Durpa Ghat, by Korba town, there is an ideal crossing place; the river narrows and there are sandstone bluffs on either bank. The bridge and siding to Ghordewa are even now being planned. The commercial project of 1953, envisaged an aerial ropeway to bring coal across the Hasdeo, from the colliery at Dangania to railhead at Korba. Now the plan is for a bridge, perhaps a combined road and rail bridge. On the long view that is far better than a ropeway. But the years are going by and even two million tons a year from the Ghordewa Seam will need a lot of energetic work.

So, for Korba, the programme seems to be first, that the public of India, the owners of the enterprise, should understand what is possible and what is not possible; then, for the Korba Thick Seam a long term study of the manner in which this great potential asset can best be used; for the Ghordewa Seam, an energetic programme of early development on both sides of the Hasdeo. Already, by the end of April, three of the Government drilling machines have moved across the river to the western side, an interesting sign of the times.

Finally, for the whole field, there clearly exists the need for an act of statemanship. In large measure by reason of three changes of government policy in ten years, the psychology of the Korba field is clouded by litigation and disputes. It would be a happy augury for this great new enterprise in the public sector if it could be launched on its way in a happy atmosphere of national and international good-will.

BOOK REVIEWS

LAND REFORM

Progress in Land Reform: Second Report, released by United Nations, 1956: Copies can be had from Orient Longmans, Calcutta, Bombay, Madras and New Delhi: Oxford Book & Stationery Co., New Delhi and Calcutta; and P. Varadachary & Co., Madras: Pages 190: Price US $2.00 or equivalent in other currencies.

The book under review is a sequel to 'Progress in Land Reform' which was published for the first time in 1954. It contains an analysis of replies, to a U.N. questionnaire issued in 1955, by governments of more than 40 countries representing a total population of 1,188 million and a total agricultural area of 1,730 million hectares out of 2,434 million and 3,695 million hectares respectively in the world as a whole. As Communist China is not a member of the United Nations, there is here no authoritative account of the progress in land reform in that country. Among the other Communist countries, Albania, Czechoslovakia, Eastern Germany, Hungary, Poland and Yugoslavia alone have responded to the questionnaire. It is sad to reflect that a number of countries have not co-operated with the United Nations in an enquiry covering land reform which is crucial to the communist and non-communist worlds alike.

A brief report such as this, however, can give only a bird's eye-view of the situation in the countries covered. Even here the account is inevitably scrappy, being based on perfunctory official replies. A paragraph from the chapter on Land Settlement and Secure Tenure is quoted in this connection by way of illustration:

"The Indian reply supplies information on schemes of settlement for landless farmers and labourers which have been carried out during the period 1951-1953, mostly by State Governments on waste and fallow lands. In the State of Andhra, 7,951 acres of Government land has been allotted to landless farmers, either on an individual or co-operative basis, the normal grant being two and one-half acres of irrigated land per family or five acres of unirrigated. In Bombay the respective figures have been five and ten acres. In Madras, blocks of 50 or 100 acres have been given — free of lease or against nominal rent — to co-operative societies. In Uttar Pradesh, where collective farming is being encouraged, over 80,000 acres of reclaimed land have been allotted to 6,000 families. It is reported that similar settlement programmes are being carried out in other States".

An account of this kind can only be called scrappy, for it is not possible to figure out how much land and how many families have been covered by land settlement schemes in the entire country. The economic analysts of the Department of Economic and Social Affairs of the United Nations cannot, of course, be held responsible for this superficial treatment. The officers at this end who answered the questionnaire should have taken greater pains to assemble facts and figures. This line of criticism is, of course, not applicable to all the chapters and to the replies of all the governments. One gets a rapid account, within a short compass, of what is being done in the world to tackle the problems of land and agriculture in their multifarious aspects. And that is worth having.

LAW FOR PRACTICAL REFERENCE

Company Law: By Messrs. N. C. Chatterjee and N. Krishnamurthi: Federation of Indian Chambers of Commerce and Industry, 29, Ferozshah Road, New Delhi: 1957: Pages 862: Price Rs. 25.

Radical amendments incorporated in the Companies Act, 1956, have not only changed the content of the law beyond recognition in material parts but made it a cumbrous and bulky piece of legislation, by no means easy to digest and certainly difficult to comply with, particularly in regard to the mass of technical requirements it stipulates. Persons at different levels, who come in direct contact with company management, whether as office-bearers or otherwise, will now find that acquaintance with the major provisions of Company Law is an obligation which they cannot ignore. Messrs. Chatterjee and Krishnamurthi have rendered valuable service not only to the legal profession but to the business world in bringing out a lucid commentary on the Companies Act, 1956. They have made a departure from the conventional treatment of comment and interpretation of the law section by section in the serial order. The basis of treatment which they have chosen deliberately — and it ought to be added, wisely — makes their work a highly useful volume of practical reference to a variety of persons according to their respective interests. The company promoter, shareholder, director, managing agent, secretary and treasurer, manager, accountant and auditor will each find provisions of the law relevant to the proper discharge of his duties analysed and explained in separate chapters. In spite of this distinctive treatment, this book retains its value as a commentary on the text of the law. No important judicial decisions have been left out and, on the other hand, the latest ones, including two important rulings, of the Bombay High Court, have been included.

How political, economic and social currents in thought have coloured the Companies Act in its final form is best illustrated in the chapter on Managing Agents. The eventual trend of policy on Managing Agents aiming at its abolition was the result of later pressures, particularly dating from the deliberations of the Joint Select Committee to the discussion on the Bill in the two Houses. It reversed the earlier con-

sensus that the malpractices in the system could be eliminated by amendment of law and there was no need to seek extinction of what had proved to be a great aid to company management. The institution of Secretaries and Treasurers which is being elevated as a total successor to Managing Agents will have no right to appoint or nominate any Director to the Board of Directors and as regards their remuneration it will be restricted to a maximum of seven and a half per cent of net annual profit as against a maximum of 10 per cent for Managing Agents. Excepting for this major distinction the authors feel that the two institutions will have almost identical functions and duties. If this interpretation is borne out in substance, the mountain of effort that has gone into giving Company Law the form of an intricate and complex piece of legislation will achieve the purpose of imposing several rigid restrictions on legitimate freedom of management and depressing the initiative of the entrepreneur.

MAURYAN EMPIRE

The Mauryas and the Mauryan Empire: By Rama Krishna, M.A.,: Indian Postal Service: Published by Atma Ram & Sons, Delhi, 1957: Pages 68: Price Rs. 2/-.

This small book deals with the age of the Mauryas in ancient India. The history of the Mauryan Empire, the system of Government which prevailed then, and the cultural, moral and religious aspects of social life in that period are succinctly and ably narrated. The author is rightly of the view that the age of the Mauryas was as great as the golden age of the Guptas. This greatness of the Maurya Age was, in large measure, due to the towering personality of Asoka. This essay in history is marked by brevity, clarity and lucidity of style. It should come in handy for reading by the general reader.

THE BULLETIN OF THE BOMBAY SHAREHOLDERS' ASSOCIATION

AT A time when the confidence of the Indian Investor, especially the average middle class man, is shattered by a plethora of measures sponsored by the Government of India, there is undoubtedly great need for some publication periodically to pin-point the various problems confronting him and to offer him "constructive suggestions". The Bombay Shareholders' Association has done well, therefore, to bring out such a publication entitled the "Shareholders' Bulletin". The first issue which has just reached us contains, apart from articles pertaining to the activities of the Association, two other contributions — Cloth Excise and Government policy by Mr. S. K. S. and Reminiscences of Company Meetings by Mr. M. H. Enginner — which should be of interest to the investor. Summing up the purpose and objective of the bulletin, the Editorial Board, consisting of Mr. C. H. Diwanji, Mr. S. M. Shah, Mr. M. H. Enginner, Mr. B. A. Trivedi and Mr. Chokshi, all of whom are good business men with the requisite competence to undertake this venture, declare (in the first editorial of the Bulletin) that "so long as free enterprise has a role to fulfil in the economic structure, risk capital will be the pivot around which its wheels will revolve. All that the Association demands of the authorities is that the Indian shareholder be given the rightful place that he is entitled to in the economic set-up of the country today and he be assured of the basic environment and conditions necessary for a free flow of risk capital. The Bulletin pledges itself to present the case of the Indian investor "honestly and fearlessly". No one can do this better than an accredited body of shareholders such as the B.S.A. and the sponsors accordingly deserve to be congratulated on embarking upon this laudable venture.

SALES TAX

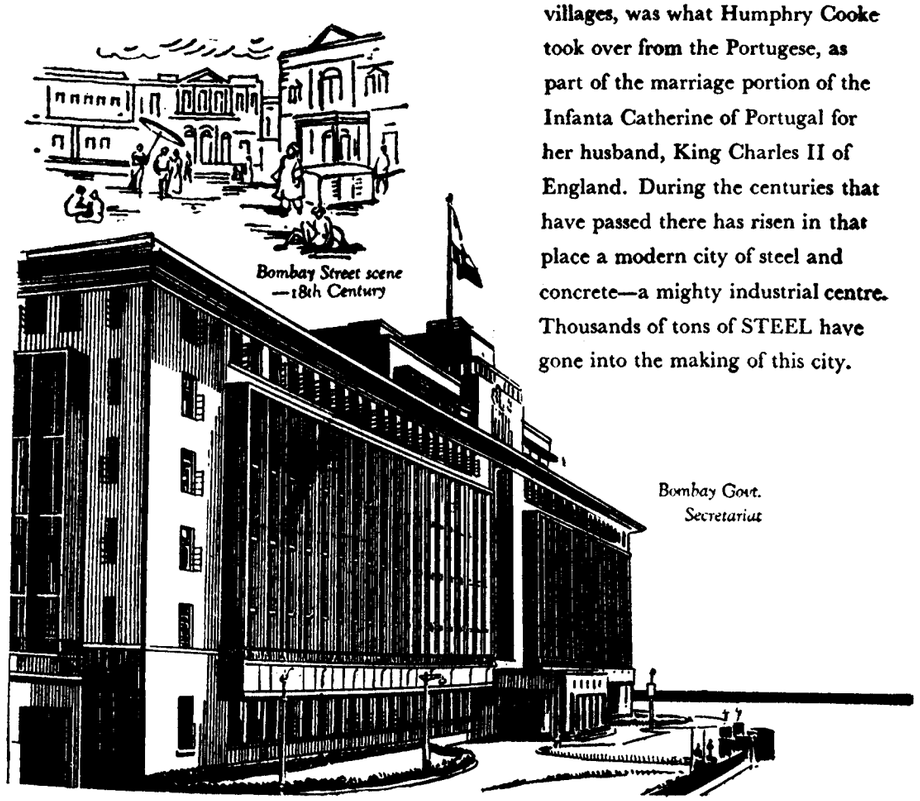
The Central Sales Tax Law with Notes: By C. M. Mehta and M. H. Patel: Publishers: Chimanlal M. Mehta & Co., Bombay 9: Price Rs. 1-8.

With the exception of Section 15, the Central Sales Tax Act has been in force since January 5, 1957. This legislation, it will be recalled, was enacted by Parliament in order to remove certain anomalies, as also a good deal of confusion, created by two important judgments of the Supreme Court of India regarding the validity of inter-State Sales-tax levy. The authors of the publication under review have endeavoured to explain the Act, both in English and in Gujerati, supplemented by appropriate illustrations, within about a hundred pages. Although the presentation and treatment of the subject leave much to be desired, the contents of the book as such should prove of considerable help to the commercial community in comprehending this new and undoubtedly complicated piece of legislation. One notices that there have crept in a number of avoidable errors which mar an otherwise well got-up publication, and it is to be hoped, therefore, that the authors will thoroughly revise it atleast when they happen to bring out a second edition.

New Subscription Rates for
THE EASTERN ECONOMIST
and
RECORDS AND STATISTICS

'The Eastern Economist' greatly regrets that it has become necessary, owing to the steep rise in costs, to raise its subscription rates both for the weekly and for 'Records and Statistics', the Quarterly Bulletin.

WITH EFFECT FROM THE 1ST MAY, 1957, ALL NEW SUBSCRIPTIONS WILL BE ENTERED AT RS. 57.50 FOR A YEAR AND RS. 30 FOR A HALF YEAR. THERE WILL BE NO SUBSCRIPTIONS FOR A SHORTER PERIOD.



IN THE CASE OF 'RECORDS AND STATISTICS' THE ANNUAL SUBSCRIPTION WILL BE RS. 16. FOR SUBSCRIBERS OF 'THE EASTERN ECONOMIST', THE RATE WILL BE RS. 14.

The present rise is not a charge for the Blue Supplements and additional coverage given in larger Special Numbers. No increase was made in the subscription of Rs. 50 when the Blue Supplements (annual subscription Rs. 5) and the Annual and Budget Numbers were enlarged. It is proposed to continue these Supplements without additional charge. The new subscription rates are, therefore, inclusive of Blue Supplements and all Special Numbers, the total individual value of the issues supplied in a year being Rs. 65.50.

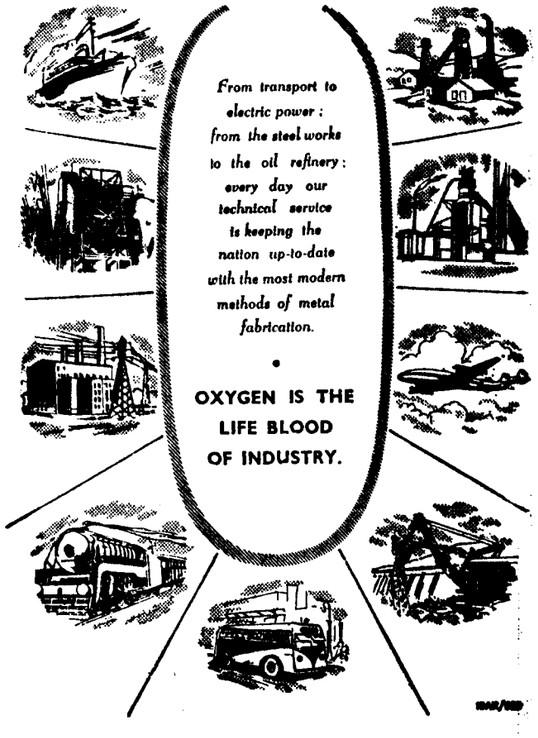
Economic Report from the U. S.

WORLD TRADE FAIR

(By GUY SIMS FITCH)

NEW YORK, April 30.—The largest world Trade Fair ever held in the US ended here last Saturday after two busy weeks. And according to its President, Charles Snitow, it was a "fabulous success." All four floors of New York's huge coliseum were jammed to capacity with more than 3,000 displays from 59 countries throughout the world. Many of the exhibits emphasized travel and investment as well as trade opportunities. Among the thousands of products on view were handicrafts from India, Indonesia, Thailand and Morocco; textiles from the United Kingdom, Greece and France; cameras and electronic equipment from Germany and Japan; housewares from Brazil and Italy; foods from the Netherlands, Israel, Poland and Yugoslavia.



It took about three years for US World Trade Fair, Incorporated, the organization Snitow heads, to complete arrangements for a private show of this magnitude. Snitow estimated that approximately 700,000 persons visited the show. But more significant, commercially, was the presence of more than 100,000 buyers representing every important purchasing and retail organization in the United States, to say nothing of hundreds of purchasing officials from Latin America and Canada. There even were buyers from such more distant places as Europe, Japan and Australia.

According to Snitow well over $1,000 million in "actual" orders was placed with exhibitors of foreign merchandise. Enough general interest was shown, moreover, to indicate that many of these were "test" orders, probably paving the way for larger sales in the future. Judging from conversations he has had with participating business men and government officials, Snitow confidently expects that virtually all of this year's exhibitors will return next year, for a repeat performance he is scheduling in May 1958. So much enthusiasm has been evidenced that he is looking forward to the participation of even more companies and governments than were represented at this year's show.

In every real sense, the Fair's success reaffirms the growing receptivity of the US market to goods from other lands. Last year, US imports were a record of $13,000 million, and they may well exceed that figure this year. Chances for the successful penetration of the US market are enhanced, of course, by adapting products, merchandising methods and pricing policies to US requirements. Among the Fair's significant results, says Snitow, were the valuable lessons learned by foreign exhibitors in these matters—lessons that should be reflected in their future exports to the US. Supporting this view are the innumerable instances in which foreign products have been winning a market in the United States. It was only a few years ago, for example, that an Italian sewing machine first "cracked" the US with new features that gained the favour of American housewives. Today, it is an established item in US stores.

US automobile imports from such countries as Germany and the United Kingdom, France, Italy, Sweden and Japan have been rising spectacularly; in 1956, they were twice the 1955 total. Also growing in American favour are such items as Japanese crockery, Indian rugs and Italian vases—all of them on display at the Fair. Imports of these and other speciality products by no means eliminate opportunities for other countries; Brazilian crockery exhibitors, for instance, picked up more than a million dollars in new orders at the Fair. A most revealing comment was made by a trade official from Ceylon. With many of its attractive handicraft wares already being sold in stores throughout the United States, Ceylon put on a new display of a variety of items. "We exhibited our products for the first time in New York in 1954," this official recalled. "Orders were small at first, but they grew. Now we are introducing several new items.... and we are hopeful that our exports to the US will continue to thrive."

RE-THINKING ON FREE ENTERPRISE

WITH the tempo of planning gaining momentum, it is perhaps natural that the controversy over the respective roles of the private and public sectors should also gain in intensity. Free enterprise is, however, a vital part of the mixed economy or the pattern of society we are trying to build and the Industrial Policy Resolution of 1956 has clearly recognised this fact. If, nevertheless one should still be bedevilled by this theme from time to time, it should be attributed to two reasons. One is the contradictory ministerial pronouncements on this controversy and the other the schizophrenia — to borrow a familiar term in psychology — that seems to characterise the mind of a considerable section of Indian business today.

It is, therefore, necessary to clear certain cobwebs that surround discussions over the concept of mixed economy. A mixed economy is inevitably part private and part public and it comprises private enterprise as well as public enterprise. It follows that the private sector is not to be allowed to function by sufferance with constant threats of extinction, but has to be conceded that it has a necessary and legitimate role to play. It assumes that the people should be provided with opportunities to own, invest, initiate, experiment and to form associations and in certain well-defined areas they have freedom to act without the State using its influence against them in any way. It further assumes that a substantial amount of individual freedom is basic for the functioning of the private sector; this cannot legitimately be curbed by arbitrary legislative and administrative restrictions.

It is to this basic fact that Mr. M. A. Sreenivasan turned his attention while inaugurating the first convention of the Forum of Free Enterprise. Pointing out how the private and public sectors are two distinct wings of the country's economy, he argued that the difference between the two is fundamental. "It is the difference", he said, "between private ownership and ownership by the State. It goes to the root of the concept of property. It is closely related to the question whether the State exists for the citizen or the citizen for the State".

The idea of a welfare State has gained ground since World War II and planning has now become part of normal thinking everywhere. The only relevant question is whether it should be authoritarian or be related to our proclaimed professions for democracy. If it were to be the latter, it is necessary that free enterprise should be given a square deal and the forces that come in its way resisted. The drive towards conformity, the impatience shown to dissent of any kind and the enormous powers that the State has augmented for itself, all these are trends that will inevitably tend towards totalitarianism and the ultimate destruction of individual liberty.

A recent document of the Forum of Free Enterprise has cogently argued how 'Free enterprise' can operate within a planned economy and consistent with the social and economic ends which the country seeks to attain. What is objectionable is not planned economy and the common existence and mutual inter-dependence of a State-controlled and Free Enterprise sector. What is to be resisted is the continuous extension of the State-owned sector till it dominates the national economy leading to regimentation and the suppression of the individual. Mr. A. D. Shroff, speaking at the convention, put the case of the Forum clearly when he explained that what they stand for is "Free Enterprise with a social purpose" which means that "within the framework of planned development, every individual in this country should have the largest possible scope for making his or her contribution towards the development of the country by the use of his or her initiative and enterprise".

The last few months have seen the impact of a tremendous pressure on the private sector of the economy and various types of burdens have been imposed on it, such as the company deposit proposal. In the absence of personal savings or available ploughed-back profits, opportunities for investment are bound to be crippled. At the same time one has also to take note of the limitations of an over-burdened public sector. The Forum document referred to earlier significantly points out that the Bhakra-Nangal Dam, the Sindri factory etc., are all achievements of the public sector of which the entire country can be proud. By the same token, the nationalisation of insurance and the introduction of State Trading are examples which show where the State can legitimately refrain from intervention. This is the trend that should be arrested if free enterprise and the democratic process are to survive.

An expanding economy provides the background to individuals as well as the people as a whole to seize every available opportunity for material improvement and there is no denying that a target of material improvement can serve as a great stimulus. Having accepted mixed economy as the goal, it is necessary to assign the proper place to free enterprise and thus ensure adequate flexibility as well as dynamism to the system. Correspondingly on the political plane, the acceptance of democracy makes it necessary to underline its prime significance as marking the difference between freedom and authoritarianism. Recent trends in the shaping of economic policy have a strong authoritarian thread. The public sector is becoming judge and jury in its own case; sometimes it does not submit its case to judicial processes at all.

WHY HIGH DIVIDENDS ?

By

CROESUS

THE second Five-Year Plan, which envisages an outlay of Rs. 720 crores on industrial development in the private sector (excluding mining, electricity generation and distribution, plantations and small-scale industries) makes provision for an amount of Rs. 300 crores by way of internal resources, which, in the main, must come from profits ploughed back into industry. This, by the way, is twice as much as the amount envisaged under this head in the first Plan. Wherefore, it follows that the exhortation of Dr. B. C. Roy, West Bengal's Chief Minister, to the tea industry, the other day, to build up reserves, even if it should mean some sacrifice on the part of shareholders, is, to all intents and purposes, timely, besides being both appropriate to, and in line with, the Socialist Structure of Society that this country has opted to evolve. But

this presupposes that the Government of this country also should follow a policy actively to encourage this practice. Indeed, the Matthai Commission regarded ploughing back of profits as the major source of capital for private industries and favoured the encouraging of it. Yet the last budget of Mr. Chintaman Deshmukh did away with the rebate given to companies on undistributed profits, thus taking away a positive incentive to capital formation in the private industrial sector. Probably he feared this would lead to dissipation of profits by way of inordinately high dividends and, with a view to countering it, perhaps, he, at the same time, also introduced a graduated penal tax on payment of dividends in excess of 6 per cent. While the logic of this patently contradictory policy is difficult to appreciate, it has certainly affected adversely a time-honoured incentive for retained profits. Even earlier, this incentive had suffered somewhat, thanks to the tendency of some industrial courts prompted by extremist labour demands no doubt to extend the claim of labour for a share in reserves built out of undistributed profits of previous years.

Be that as it may, it is not clear, from the reported proceedings of the annual general meeting of the Tea Association of India, whether Dr. Roy wanted the rate of dividend itself to be not more than 6 per cent. This, however, is of crucial importance, for the rate of dividend is one thing and the actual return to the shareholder on his investment (that is, the price paid by him for acquiring his holdings) quite another. More often than not, especially in the case of shares of old and established concerns which pay dividends regularly, the cost of the share to the investor is not just the face value (or the amount actually paid up per share) but the market value, and, on this basis, even a 40 or 50 per cent dividend may, in fact, yield no more than a 6 to 7 per cent return to the investor. So, whilst talking of limitation of dividends, be it statutory, as, in fact, we already have, or voluntary, it is of the utmost importance to bear this aspect in mind.

There is yet another aspect to this question. It is true that several companies, in particular tea companies, have paid, and continue to pay, dividends of 40 to 45 per cent. Apart from the fact that this should be judged in relation to the market price of the shares in the case of listed shares, as stated above, this seemingly high dividend rate may, in fact, have been forced upon the company concerned by reason of its being a private limited company or a Section 23A Company under the Indian Income-tax Act. Such a company has no option but to distribute the major portion of its profits, which naturally raises the percentage figure, the more so if the number of shareholders is few and far between.

While on this point, one feels constrained to question the very thesis that one of the ways to promote capital formation in industries is to impose a limitation on dividends. Take the case of West Germany where several big industrial undertakings, which had been literally raised to the ground, have again come up during the past few years. It is noteworthy that this remarkable achievement has been realised without any restriction on dividends. A restriction on dividends would have proved fatal to West Germany's industrial recuperation, what with the fantastically high interest rates that industrialists there have had to pay to raise finance for their business. Presumably, because we in this country seem to be terrified by any suggestion to increase interest rates, notwithstanding the clear signs crying out for such an increase, we have developed a psychological aversion to high dividends as well.

BUSINESS NOTES

STEEL FOR ENGINEERING INDUSTRIES

THE ENGINEERING industries, which demonstrated their dynamism in a striking manner after their emergence from the crisis of idle capacity, seem threatened with the prospect of stagnation in the immediate future. The situation is in no sense of their own making and precisely because it is beyond their control and also because it seems intractable the end of the interlude of stagnation seems hard to forecast. Shortage of steel is the acute problem. For a couple of years now there does not appear to be an assured outlook of improvement in the supply of steel, for this is the period which will have to elapse before the second plan programmes of expansion of steel production begin to yield concrete results. Meantime, the inexorable necessity to clamp strict rationing on import on account of the state of foreign exchange removes reasonable expectation of any appreciable improvement. Whatever adjustments can possibly be made by way of conservation or ad hoc redistribution are unlikely to change the complexion of the problem in any marked degree.

It is not absolutely necessary to cite statistical evidence to substantiate the hard prospect that lies ahead in respect of steel supply for these industries. At the recent annual meeting of the Engineering Association of India, the Chairman, Mr. B .R. Bagri, set out the problem of steel shortage with reference to the comparative statistical position. He emphasised that as against total supplies of 3.18 million tons in 1956-57, including home production and imports, supplies in 1957-58 are assumed to decline to 2.58 million tons and they are apprehended to decline still further to 2.1 million tons in 1958-59. The snag in this comparison lies in the fact that availability in the base year 1956-57 was very high as a result of heavy imports. Nevertheless, the fact remains that considering the development programme chalked out for these industries, inadequacy of the basic material will be a great handicap difficult to surmount. The Chairman has suggested that supplies of steel should be planned on a basis of steady flow for which purpose the budget for steel should be prepared for two years. This suggestion ignores the fact that unless resources are first provided the budget will have little chance of being implemented. The short-term stop-gap arrangement that he has pleaded, however, deserves close attention and sympathetic action by the Government. He has suggested that steel stocks lying with the public sector projects which are not needed for immediate use should be diverted to steel processing factories for distribution on a basis of borrowing to meet pressing needs. This arrangement will be considered obviously where there is clear proof that the public sector projects themselves will not be landed in a deadlock when they require steel for their consumption. His second remedy is to put a ban on export of scrap estimated at 2 lakh tons and melt it inside the country. This proposition has something intrinsic to argue for itself. A number of suggestions which he has made to rationalise the administration of steel allocation will go to liberalise the procedure and mitigate practical difficulties on this score.

OUTLOOK FOR TEA INDUSTRY

IN HIS presidential address at the first annual general meeting of the Tea Association of India (a body recently started to promote the interests of indigenous tea planters), Mr. H. B. Kanoi has drawn attention to certain problems facing the industry that merit consideration. The past year has been a good year for the industry with record tea exports, no large surpluses and more or less satisfactory prices. The improvement in the export position was mainly due to the entry of the USSR in the Calcutta market and the large increase in the Egyptian off-take due to her exchange difficulties with Ceylon. However, there is no ground for undue optimism in this respect since Indian 'common teas' have to face severe competition in the UK (the largest market for this type of tea) from East African and other countries and unless suitable measures are taken to improve the competitive position of India tea, the prospects will remain far from rosy for its exports. In this connection, it is necessary to examine carefully the proposal to revive the International Tea Agreement which expired in 1955, and what effect it will have on the Indian tea industry. Mr. Kanoi has pointed out that any regulation, if introduced, should cover all producers, old and new, because if the agreement is signed without the participation of other countries which have growing surpluses for exports to world markets, it is bound to affect adversely India's interests.

Connected with the question of export is the effect of the export duty on Indian tea which affects its competitive position. Mr. Kanoi has argued cogently that the export duty not only undermines the producers' financial strength especially at a time when the producer is confronted with strained liquid resources, but the variations in export duty prove harmful to Indian exports as overseas buyers alter their buying programme whenever the duty is increased in India and resort to alternative sources. This is an aspect that deserves close examination. Mr. Kanoi has also pleaded for more vigorous and extensive propaganda to increase external and internal consumption and has pointed out how it is odd that an industry paying for its own propaganda should spend only a small sum out of the annual collection of about Rs. 2 crores from the Tea cess. While it is true that ultimately it is the quality that will weigh in the success of India's exports, the propaganda aspect should also be given its due and rightful place. Mr. Kanoi has also drawn attention to the problem of warehousing and has pointed out how the Government itself has accepted the suggestion of the Tea Auction Committee to increase accommodation expeditiously to store about 1 million chests a time. Since the problem of storage capacity in Calcutta is urgent, Mr. Kanoi's suggestion that private parties should be allowed to build warehouses with an attempt to decentralise tea warehousing seems sound and calculated to remove the prevailing difficulties.

THE ROLE OF MANAGERS

IN THE giant joint-stock enterprises, the owners, that is, the share-holders, are so large in number and scattered so far that it is hardly possible for the owners themselves to meet and take policy decisions. In other words, a sort of divorce between ownership and management has become a conspicuous feature of organised industry today. It is this feature which has given birth to a new type of administrators known as the managerial class whose functions, in the main, are to run the organisation efficiently, to look ahead, plan and produce, and to take decisions. In the western countries, some industries have even created special departments whose main function is to look as far ahead as, say even, 2000 A.D., and to tackle problems that may be expected to arise then. In India, the need for such managers and technicians is very urgent, the more so in the context of the second Five-Year Plan. Dearth of personnel, who can man key industrial enterprises, particularly in the Public Sector, is a great inhibiting factor in the way of rapid industrialisation of the country. Both Mr. Wankhede, Bombay's Minister for Planning and

Development, and Mr. P. L. Tandan, Co-ordinating Director of Hindustan-Lever, therefore, felt impelled to stress the need for qualified business managers in India, whilst addressing the industrial management group recently in Bombay.

Referring to the present position in India, Mr. Tandan maintained how, since the second World War, both the public and the private sectors have begun to make serious attempts to train managers, as, happily, the awareness is there now that efficient management contributes very much towards increased production. As regards the functions of management, he said, that the management's skill or ability lay not only in breaking all problems and tackling them according to a given order of priority, but in keeping an eye on their proper and efficient implementation. Digressing at this point to say something about the meaning of the term "efficiency", Mr. Tandan, very rightly underlined that efficiency in the past had been a more or less static conception but that it had since come to acquire a relative meaning, that is, relative to the cost of operation and to the cost of the human factor. Gone are the days when the human factor received scant or no attention, and it is this reorientation in outlook that makes the industrial revolution of the twentieth century so redeemingly and refreshingly different from that of the preceding century.

LAMP INDUSTRY'S PROBLEMS

THE LAMP industry has made phenomenal progress during the last ten years. From the production of 3.11 million Pcs. of G.L.S. and other types of lamps in 1946, the industry has steadily raised its production of similar lamps to 29.78 million Pcs. In addition, the industry has diversified its production in many other respects. In particular, the flourescent tubes and miniature bulbs which were produced within the country for the first time in 1952, are now being increasingly manufactured from year to year to meet an appreciable portion of the country's requirements.

It is the contention of the Indian Lamp Factories' Association that the main problem of the lamp industry has been the lack of balance amongst the different operating units within the industry, which the Association's chairman Mr. H. Sinha has explained in his annual speech. The result has been a lop-sided development of the industry. Since this industry is one of the scheduled industries under the Industries (Development and Regulation Act), the chairman stated, it is necessary that the Development Council for Light Electrical Industries should give very careful consideration to the problem of lack of balance within the industry. He has urged that it is essential to regulate production, marketing and future expansion of the industry as would enable the factories manufacturing products of less popular brands to also raise their production to a reasonable extent and thus derive real advantages of a developmental economy. He has, however, not explained how production of different units could be regulated within the framework of the official policy on industry. In this context the suggestions made by Mr. H. Sinha at the recent meet of the Indian Lamp Factories' Association are worthy of consideration. Mr. Sinha has touched upon several aspects of this industry and has made some valuable suggestions. It is essential to reduce the country's dependence on imported lamps as well as raw materials required for the industry. It is important from the point of view of saving our foreign exchange. As regards the delay in the issue of licenses for import of machinery pointed out by Mr. Sinha, the opinion is that the Government should grant the required licenses within the limitations of the availability of foreign exchange.

INDUSTRIAL MEDICINE

THERE IS no gainsaying that, for higher industrial production, industrial peace is of paramount importance. The loss of working days, whether it be due to industrial strife resulting in strikes and lock-outs or for health reasons, retards the industrial development of a country even as it affects industrial production. The most important factor which ensures industrial peace, apart from a proper understanding, especially by our Trade Union leaders, of the various problems of industry, such as capacity to pay, productivity of labour, etc. before demanding wage increases, is industrial medical service. In Western countries, unlike in our country where it has hardly received attention, this subject is not only studied in detail but is considered to be a vital one. Very rightly, therefore, whilst inaugurating the Fifth Annual Convention of the Society for the Study of Industrial Medicine, Bombay's Chief Minister, Mr. Y. B. Chavan, emphasised the need for co-ordinated research on problems connected with industrial hygiene. As he said, such efforts will not only bring about industrial peace but also help raise our industrial production. Industrialisation, as he pointed out, leads to urbanisation and concentration of population, thereby endangering public health, and in such circumstances, the need to provide hospitalisation and proper medical care becomes all the more imperative.

Speaking on the same occasion, Dr. V. V. Kulkarni, President of the Society, charged a section of industrial employers of evading their responsibility for providing adequate medical service to their workers and complained that the introduction of the Employees' State Insurance Scheme seemed to have created the impression (in the minds of at least some of them) that the health and safety of the industrial worker was no longer their responsibility. This would appear to be a rather sweeping summing up of the case. Yet, the fact remains that the need to improve the health of the industrial population is as great as it is vital and demands concerted efforts on the part of the employees and employers alike, of both the private and the public sectors. It needs to be mentioned, that the Society for the Study of Industrial Medicine seeks to provide training courses on industrial psychology, industrial hygiene and sanitation, factory-first-aid service and safety services.

NATIONAL PRODUCTIVITY COUNCIL?

THE CREATION of a National Productivity Council, to launch an effective national movement for increased productivity in India, has been recommended by a delegation of officials and non-officials which visited Japan last October. The delegation, sponsored by the then Ministry of Heavy Industries, was asked to study the productivity movement in Japan and recommend measures for propagating a productivity programme in India. In its report, which has just been released, the delegation says that, in the context of the ambitious industrial programme in the second Five-Year Plan, increase of productivity could play an important role by stimulating operations and by motivating industrial personnel to produce more goods of better quality. The report emphasises that in a rapidly increasing economy, the increase of productivity could be a powerful element of national policy for increase of national wealth and the raising of the standard of living without creating unemployment. The delegation warns that productivity should not be confused with rationalisation and the retrenchment of surplus labour. The National Productivity Council, the delegation has recommended, should be an autonomous organisation at the Centre which should create productivity consciousness in the country. It should stimulate the establishment of local productivity councils at places of concentration of industries.

COMPANY AFFAIRS

THE TATA MILLS LTD.

The net profit per loom of the Tata Mills Ltd., rose from Rs. 433.87 in 1955 to Rs. 1,039.46 in 1956, thanks to the short rise in the total amount available for disposal, after providing for Managing Agents' remuneration, depreciation and bonus, from Rs. 7,80,967 to Rs. 18,71,028. There was a fractional rise in the Managing Agents remuneration from Rs. 1,57,386 to Rs. 1,68,985, but the provision for depreciation fell sizably from Rs. 20 lakhs to Rs. 11.87 lakhs and that for taxation from Rs. 55,800 to nil. Bonus, amounting to Rs. 9,70,000 for the four years 1952, 1953, 1954 (at 4.8 per cent of basic wage) and 1955 (at 10.9 per cent of basic wage) under the Five-Year Bonus Agreement between the Bombay Millowners' Association and the Rashtriya Mill Mazdoor Sangh became payable during the year (1956) under review. Labour also got the benefit, with retrospective effect from November 22, 1954, of gratuities which entailed a payment of Rs. 26,500 to those who retired prior to the publication of the Award. With the extension to Bombay of the Employees' State Insurance Act, the insurance carried on by the Millowners' Mutual Insurance Association Ltd. was taken over by the E.S.I. Corporation and the Company's share of Rs. 68,325 out of the M.M.I.A.S. total Reserve Fund Account of Rs. 16.85 lakhs was made over to the Bombay Millowners Association for acquiring an immoveable property in Bombay for its use.

Out of the profits for the year under review, General Reserves got Rs. 8 lakhs, as against nil in the previous year and Gratuity Reserve Rs. 1.35 lakhs as against Rs. 85,000, while Dividend Reserve received nil, as compared to Rs. 6.52 lakhs in 1955. The Directors have recommended payment of a dividend of Rs. 3 per ordinary share and a bonus of 50 Naye Paise per share for the year, as against Rs. 4 per ordinary share for 1955, but then the latest dividend is on an increased paid-up capital consequent on the issue of new ordinary shares (at the rate of one share per share held) in November, 1955.

The Directors report that "the Company's plan for the reorganisation of the mills is making very satisfactory progress and machinery of the value of Rs. 23.33 lakhs was installed during 1956". At the end of the year, they add, "machinery of the value of Rs. 2,71,000 was awaiting installation". Gross block depreciation and net block of the Company at the end of December, 1956 stood at Rs. 2,01,67,222, Rs. 80,31,256 and Rs. 1,21,35,966, respectively.

SWADESHI MILLS COMPANY LIMITED

The trading conditions in the Textile industry were rather stale after September 1956 due to an increase in the excise duties and the credit restrictions imposed by banks under Government directions. The directors of the Swadeshi Mills Company Limited feel that the cloth markets are still languishing with poor demand at unremunerative prices. The sales of the company in respect of cloth, yarn and wastes have declined to Rs. 356.2 lakhs during the year ended December 31, 1956 as against Rs. 373.6 lakhs during the previous year. The audited accounts of the company, however, show higher profits during the current year at Rs. 31.8 lakhs (after providing for Managing Agents' remuneration, depreciation and bonus) against Rs. 15.5 lakhs during the year ended December 31, 1955.

A sum of Rs. 16.0 lakhs has been transferred to General Reserve and Rs. 1.4 lakhs to Gratuity Reserve. The directors have recommended a dividend on Ordinary Shares at Rs. 12 and a bonus at Rs. 2 per share (without deduction of income-tax) to which account Rs. 14.0 lakhs have been appropriated.

The Company, while implementing the plan for the reorganisation and renovation of the mills, has installed machinery of the value of about Rs. 6.56 lakhs during 1956. Machinery for Rs. 10.8 lakhs has been received and orders for machinery worth Rs. 34.0 lakhs have still to be placed by the Company.

THE ELGIN MILLS COMPANY LTD.

In spite of the difficult trading conditions and uncertainty prevailing in the Cotton Textile Industry, the Company, during its working in year ended September 30, 1956, has shown profit of Rs. 25.8 lakhs (after providing for Depreciation and adjustments).

From the profits of the current year deductions for General Reserve and Rehabilitation Reserve have been made to the extent of Rs. 2.0 lakhs and 15.0 lakhs respectively. A sum of Rs. 10.0 lakhs, being amount of Provision for Taxation no longer required, has also been transferred to Rehabilitation Reserve, making a total transfer of Rs. 25.0 lakhs in that account. This reserve is substantial in order to conserve the financial resources of the Company to meet the cost of an extensive capital Replacement programme.

The directors have recommended the payment of dividend of Rs. 1-4 per share (12½ per cent) an Ordinary and Vendors shares. Total amount appropriated to Dividends (preference, vendors and ordinary) is Rs. 7,87,500 and an amount of Rs. 78,754 has been proposed to be carried forward.

COMMODITY NEWS AND NOTES

IRON ORE DEPOSITS IN INDIA

There was a record production of 4.65 million tons of iron ore in India during 1955. The value in terms of money was Rs. 3.24 crores. Two States of the Indian Union — Bihar and Orissa between them, accounted for 85 per cent of the total production. A mineral of world importance, extensive deposits of good quality iron ore are scattered in several areas in Bihar, Orissa, Madhya Pradesh, Andhra and Mysore. The approximate estimates of reserves of iron ore in the country are 21,000 million tons. The statewise figures are:— Bihar and Orissa — 8,000; Madhya Pradesh — 7,000; Mysore — 2,500; Madras — 1,000; Bombay — 300; Andhra — 54 and others — 2,100. Out of the estimate, the proved and indicated reserves are 6,400 million tons. The total iron content in all classes of ore may be put at 12,000 million tons. Nearly three-fourths of the output is being smelted in the country for reduction to pig-iron and for making steel. The rest is exported. Japan is the principal consumer of iron-ore from India. There was a record export in 1955 of 1.2 million tons which fetched foreign exchange worth Rs. 5.3 crores.

INDIGENOUS PRODUCTION OF SUGAR

The production and despatches of indigenous sugar amounted to 17.01 and 9.44 lakh tons up to April 15, 1957, in the current season, as against 15.46 and 7.55 lakh tons respectively in the corresponding period of the last year. The stock with the factories on this date stood at 12.85 lakh tons, as compared with 12.21 lakh tons last year.

TEA EXPORT DUTY REDUCED

The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty at Rs. 2.41 per lb. as against Rs. 2.74 per lb. in force from April 1, 1957. The export duty at this price will be Naye Paise 25 per lb. as against Naiye Paise 37.50 per lb. in force hitherto.

RICE PRODUCTION

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of rice for 1956-57 puts the current year's area and production of the crop at 78,174,000 acres and 28,142,000 tons respectively as against the partially revised estimate of 76,864,000 acres and 26,846,000 tons for 1955-56. This shows an increase of 1,310,000 acres or1. 7 per cent in area and 1,296,000 tons or 4.8 per cent in production during the current year as compared to the previous year.

Both area and production of rice during the current year touched all time records at 78.2 million acres and 28.1 million tons. The next best year for rice crop was 1953-54, when area and production were 77.3 million acres and 27.8 million tons respectively.

All the principal rice producing States except West Bengal and Orissa share the increase in acreage during the current year. The increase in acreage has been attributed generally to favourable seasonal conditions at the time of sowing. The increase in area is more marked in the case of Andhra Pradesh, Bihar, Uttar Pradesh, Bombay, Madhya Pradesh, Punjab and Rajasthan States.

Increase in production has been reported by all the States except Uttar Pradesh and is partly due to increase in acreage and partly to favourable climatic conditions during the growing period. Notable increases in production have been reported by Bihar, Madhya Pradesh, West Bengal, Andhra Pradesh, Madras, Assam and Punjab. Decrease in production has only been reported by Uttar Pradesh despite the increase recorded in area and have been attributed to adverse seasonal conditions and damage caused to the crop by floods.

INCREASED PRODUCTION OF MINERALS: MORE EMPLOYMENT IN MINES

There was increased production of minerals and more employment in mines in India during 1955, according to the Indian Bureau of Mines. The production in terms of rupees was 105.6 crores as against 102.6 crores during the preceding year. The average daily employment in mines was 591,000 as against 568,000 during 1954. The value of minerals production was very nearly 1 per cent of the total national product. The increase in the value of mineral production in 1955 was mainly accounted for by coal and mica of which the latter commanded a good export market during the year.

IMPORT OF COTTON

The Government of India have decided to permit the import of a further quantity of cotton, of 1956-57 crop, over 1-3/16" staple length against a special payment procedure. These imports will be permitted only against contracts approved by the Textile commissioner, Government of India, Bombay.

Intending importers may contact the Cotton Adviser, Office of the Textile Commissioner, Bombay or the Joint Chief Controller of Imports and Exports, Bombay for details regarding the grant of these licences.

EXPORT OF COTTON PIECEGOODS

The Government of India has extended free licensing of all varieties of cotton piecegoods (mill-made and power-loom) and cotton manufactures including cotton waste blankets, other than restricted varieties for export up to December 31, 1957. The existing procedure and other conditions would continue, it has been announced.

BURLAP FEED BAG FOR U.S. MARKETS

Plans for the introduction of 50 lb. burlap feed bags in the U.S. market were announced at the open industry meeting of the National Burlap Bag Dealers Association's 24th annual convention held in New York recently, according to a report in the Jute Bulletin of the Indian Central Jute Committee. The 50-lb feed bag, it was emphasised, would find favour in the industry leading to a substantial increase in American consumption of burlap, as not all feed manufactures were satisfied with the bulk method of shipment. It has also been reported that prospects for increased Argentine purchases of burlap were good since the indications were that there would be little burlap on hand by the end of the year.

U.K.'S DOLLAR RESERVES

The British gold and dollar reserves increased by $111 million in April and at the end of the month amounted to a total of $2,320 million, the U.K. Treasury has announced. According to provisional figures, Britain last month had a credit balance of $16 million with the European Payments Union.

MAIZE PRODUCTION HITS NEW HIGH

The all-India final estimate of maize for 1956-57 puts the current year's area and production of the crop at 9,224,000 acres and 3,020,000 tons respectively as against the partially revised estimates of 9,116,000 acres and 2,554,000 tons for 1955-56 says a Food and Agriculture Ministry Press Note. This shows an increase of 128,000 acres or 1.4 per cent in acre and 466,000 tons or 18.2 per cent in production of maize during the current year as compared to last year. Production of maize during the current year is the highest on record.

† Preliminary. * Index numbers refer to calendar years 1952, 1953, 1954 and 1955.

Note: Tre Food Production index relates to the production of crops and livestock products for human consumption. Crops and milk used as food in livestock production are deducted to avoid double counting. The Total Agricultural Production index includes, in addition to the item in the Food Production index, fibres, tobacco, industrial oilseeds and rubber. These indev number base period is 1934-38 for most countries. Exceptions are: Western Germany and Greece, 1935-38; Spain 1931-35; South Korea, an average of 1930, 1934, and 1936; India Pakistan, 1936-38; Australia, 1936-39; and Canada, Madagascar, New Zealand, Union of South Africd, United States, and the South American countries, 1935-39.

These indices may differ from national indices produced by the countries themselves of differences in coverage, weights, and methods of calculation.

An Icy Blast

THE Budget proposals introduced by the Finance Minister last Wednesday provide for commerce and industry in the country an icy blast. It may possibly be that, when these proposals are more happily digested, the shock which the Stock Exchanges have recorded will tend to be reduced and possibly, to some extent, reversed. But it is quite clear that the cheerful pre-Budget anticipations that the Finance Minister's bark would be worse than his bite were fundamentally mistaken. If the Stock Exchanges had assumed that current levels before the Budget had discounted the worst that the Finance Minister had in mind, they must be very sorry guides to the structure of the Finance Ministry's mind. The first observation that can be made on the Budget is the marked element of surprise which has been visited on many financial institutions in the country. The Finance Minister's armoury and his will to use it recklessly are still, it seems, far from exhausted.

The Stock Exchanges need not by themselves be taken too seriously. They are, indeed, good barometers of both the speculative and investment mind. But they are not necessarily good barometers of the national interest or of that vast amorphous mass of Indian opinion which has no measure or stake in the operations of buying and selling which dominate the lives of the business community. It may conceivably be that in the present case the national interest differs markedly from the interest of the business community;

that seemed to be the Finance Minister's case in a notably eloquent and, in parts, passionate speech. On the other hand, one must enquire seriously whether the Finance Minister has provided the essential link by which the national interest can be advanced by what the business community believes it has lost. If we gained enough on the swings to offset our losses on the roundabouts all would have been well. That seems by no means to be the case.

The link by which the national interest can be advanced must be production, and production only. In the last analysis it does not matter whether substantial transfers are made from one section, even if it be an active section, to another, even if it should be, for the most part, a passive one. The crucial test is whether the operations on the whole will lead to a fulfilment of the Plan or even an opportunity for higher activity outside it. *The Eastern Economist* does not believe that this will be the case.

To the extent that higher taxation will contain inflation it is obviously to be welcomed. To the extent that it promotes inflation by the reduction of production of consumer goods, it is obviously to be deprecated. On the face of it, the taxation component is likely to be more deflationary than the operation of new taxes is inflationary by reducing production. In a Special Article elsewhere in this issue it is shown that the general index of wholesale prices might conceivably rise between 6 and 7 points at the most and, on the face of it, there is no reason why consumer goods production as a whole should be lower as a result of the Budget. In other words, *prima facie* the large element of excise duties amounting to Rs. 49 crores is deflationary rather than otherwise, since it greatly reduces the volume of deficit financing without affecting current production.

But while current prices and current production have not been markedly affected, it is quite otherwise with future production, necessarily important in a development plan. Quite apart from the deep psychological blow struck at confidence, there is the problem of how much of the new excise duties will be taken by the consumer and how much they will be forced back on industry. In the case of the cotton excise added last year, broadly the incidence was shared fifty : fifty. If one assumed this would happen in all the industries affected, one might claim that Rs. 25 crores would be the direct incidence on industry apart from the higher Corporation tax. Rs. 12½ crores of this reduction in profits would be taken by the Government, which seems cheerfully to have ignored the incidence on itself of a squeeze on profits. But the shareholder has naturally reacted bearishly to the other half. A reduction of dividends or reserves of this order cannot be lightly contemplated.

This is why the Stock Exchanges have responded in a markedly panicky way. Obviously, the Budget has created the impression that opportunities for Capital Gains, whether by Bonus Shares or otherwise, have been for all time abandoned. And dividends must be lower notwithstanding some trivial relief on distribution. Thus it comes about that the investor, who has not in the last twelve months received any encouragement, has been further injured. If enhanced private investment was a vital element in the Plan, this would be to strike a deadly blow at the Plan itself. To the extent that corporate savings can replace the private investor, one need not take too gloomy a view of his discomfiture. But, of course, corporate savings alone cannot do the trick. For where are they higher than before?

In the last analysis, this Budget must be described in invisible terms. It has impressed on the Indian people the determination of the Government of India to go socialistic in more than its taxation measure. Relief on personal taxation amounting to Rs. 7.5 crores is no departure from this determination, since the tax on wealth and, in time to come, the expenditure tax will absorb a substantial amount of the increased incentive which lower personal taxation rates have induced. The private sector, apart from a gesture, here and there, is being forced to give ground. There is thus evidence that the determination to proceed with the Plan is not merely great, but it is also heavily loaded against the instruments of private incentive which are, broadly speaking, the investor and the corporation in which his assets are framed. If this should be the pattern of all future Budgets, one might argue that the private sector in this country has been served with notice that its operations will be conducted in an atmosphere of such onerous financial pressure that, in the last analysis, it will be dependent on the Government for all new capital. Thus socialism will be established by making all economic activity dependent on the Government's pleasure. That is both a politically dangerous, and an economically unwise, end of public policy.

The Eastern Economist considers that the Finance Minister has erred greatly in assuming that this is the solution for India's current problems, even if, for a short period, he should obtain the finance he needs for the Plan. For, in the process of obtaining finance from the private sector, which provides his main suppliers, he will be hampering their and, therefore, his own operations. Robbing Peter to pay Paul is no solution of the Indian planning dilemma. The national interest requires that both the public and private sectors should move hand in hand in the production programme in the Plan. If the public sector should have all its resources and the private sector deprived of all initiative, the net effect may be worse, but certainly no better, than it is now. It is greatly to be feared that this heavy dose of socialist political ideology will recoil on both the Congress Party and the Government of India when it is shown, as it will be in a short time, that these measures are no solution to the basic weaknesses of the economy. For an economy short of private incentive and sound public organisation the Finance Minister has decreed less private incentive and no greater public efficiency.

In the result this Budget is a mistake; how great a mistake will depend on the capacity of the public sector to perform adequately the tasks which it has taken on itself by withdrawing elementary resources from its private counterpart. Those who know the operation of the public sector in this country cannot be hopeful that it will measure itself up to its self-appointed task. Even if the Finance Minister gave to the public sector all the rupees it required it would fail to do its job, for, notoriously, finance alone cannot save an unwieldly and wasteful organisation. To the extent that it fails the Finance Minister and the Central Government will have forfeited the confidence of the nation. One wonders why they have chosen so desperate a risk at this critical time.

GOVERNMENT OF MADRAS

Railway Finances

THE Railway Budget introduced by Mr. Jagjivan Ram on Tuesday this week contained no surprises, and seemed designed to spread complacency. If anything, what should cause surprise is the naive manner in which estimates have been made of working expenses. In spite of the fact that substantial rises in labour costs have been displayed elsewhere, the Railway Minister has chosen to take no account of this inflationary factor. This is certainly strange because only recently a special committee was appointed by the Railway Minister himself to report on the revision of the emoluments of Class IV employees in the railways. These employees constitute the majority of the labour force and the increases in their wage bill will not be negligible. Why then has he kept the working expenses for the current financial year at the March figure of Rs. 244.16 crores? This is to fly in the face of evidence and to introduce an element of doubt in the statistics bordering on the misgivings which attend statistics on food production. Almost all, if not all and more, of the increase in gross traffic receipts of Rs. 9.4 crores will be absorbed in the increased working expenses. It might encourage the unwary to see an enhanced surplus from Rs. 21.43 crores in the interim budget estimates to Rs. 30.83 crores. But no deep student of the railways will accept this easy solution of the exacting problems of Indian railway financial planning.

The answer is certainly not to cut expenditure on railway development. The whole of the additional Rs. 200 crores now suggested, and perhaps more, is required. What is important is that one should recognise that this must mean a substantial cut in the Plan elsewhere even though where it is to fall cannot yet be indicated. Secondly, there should be recognition of the fact that a rising paper net surplus is no answer to the yawning real financial gap. The Railway Minister has left all basic financial problems on railway development unanswered. It is all very well to plan greater movement, which is certainly essential from the point of view of the traffic offering. What seems to be a major error is the failure to accept the logic of this decision in terms of the new financial burdens it imposes on the country at large. If railway working expenses chase gross traffic receipts—as they certainly will—how can the surpluses increase substantially and assist net capital formation on the railways?

This budget assumes importance, however, by reason of the fact that it marks the end of vascillation on the size of the railway plan. It was recognised from the start that an increase of 50 per cent, or 60.8 million originating tons, in railway freight transport capacity, raising it to 180.8 million tons during the second Plan period, was the minimum which must be achieved. Financial allocation, however, was made for a capacity of 162 million tons, or extra 42 million tons. Developments subsequent to the formulation of the second Five-Year Plan, including specifically the steep upward revision of the agricultural target, gave unmistakable indication that the original estimate of transport capacity of 180.8 million tons would prove conservative. The present additional allocation of 42 million tons in capacity provides a mere 7 million tons for general industrial and agricultural production. The balance, representing the bulk, has been reserved for the movements required for the steel plants, coal and cement. This is a prospect which could not be faced with equanimity and a pious proviso that capacity would be increased as resources became available was in no sense helpful. The resources have to be found and planned sufficiently in advance for the procurement of the equipment. From where, is the unanswered question.

The allocation of responsibility for the outlay of Rs. 1,125 crores required for the attenuated railway plan, intended to create additional carrying capacity of 42 million tons, should make it clear that a redistribution in the shares of the Central Exchequer and the railways themselves must be decided upon if the target of capacity is to be raised. The financial problem of the railways has proved difficult to tackle in its foreign exchange component during the last few months and as a result there has been a considerable slowing down in the tempo of expenditure. The Exchequer has undertaken responsibility to allot Rs. 375 crores for the rupee component of the railway expenditure programme. To raise the residue, which was originally estimated at Rs. 375 crores is the liability of the railways. Meantime, the cost of the railway plan is steadily going up. On present reckoning, it will be inflated by not less than Rs. 100 crores. This is not the end of the chapter on additional cost for the railway expansion programme. Once a decision has been made that the uncovered gap of 18.8 million tons in the requisite transport capacity must be covered it becomes incumbent to fix responsibility for providing the outlay that it involves. The Railway Ministry places the cost of bridging this gap in capacity at Rs. 100 crores. It is far from clear how this estimate was arrived at and the overwhelming probabilities are that in course of time this estimate too will entail an added element of inflation.

Only a fraction of the additional outlay of Rs. 200 crores now envisaged can come from the higher traffic which the railways will carry with their expanded capacity. By and large, a definite source must be found outside the railway earnings to defray that outlay. In his speech introducing the interim budget in March last, Mr. Jagjivan Ram announced that it would be possible for him to take definite decisions on the recommendations of the Freight Structure Enquiry Committee and incorporate them in the regular budget. This has been deferred for the time being although the Committee's report was tendered a few days back. An elaborate technical investigation is being carried out for the purpose of a revised schedule of goods tariffs. The Railway Minister seems to have made up his mind that the extra cost of the railway plan should be met out of the current earnings. It must be recognised, and recognised quite categorically, that the consequences of imposing the burden of the extra outlay on development on freight rates in particular is bound to spell inflation all over. This prospect must be avoided. In the result, the responsibility for the provision of the additional finance ought to be accepted by the Central Exchequer.

The Challenge of the Wages Bill

THE recent spate of upward revisions in the emoluments of the employees in the fixed income groups, both in the public and the private sectors, has raised the fear that a policy of wage appeasement may lead the economy straight into a wage inflation. The Indian economy is already poised dangerously for an inflationary spell and if great care is not taken, bouts of wage and price inflations may succeed each other. What is the order of present commitments and the irresistible consequences of current policies on relief to low-income and other groups?

Let the last come first. Last week Mr. T. T. Krishnamachari upgraded the pay scales of about 21,000 employees of the Life Insurance Corporation, including 16,000 persons belonging to the clerical cadre and 5,000 of the subordinate service. The revised emoluments have enhanced the expenditure of the Corporation by about Rs. 60 lakhs per annum. This additional burden has not been necessitated by the rising prices alone. The employees of the Corporation who were brought under one banner by the nationalisation of all the Life offices in this country were not satisfied with the pay scales which were announced some time ago. No doubt, the integration of several units with widely divergent scales of pay poses an intractable problem: the tussle between the disgruntled employees and the Corporation had, therefore, an evil effect on the working of the Corporation, so much so that the new business in 1956 dropped by Rs. 68 crores to Rs. 200 crores only. The fresh burden has, in fact, been imposed on the Corporation in order to buy the active co-operation of the employees. The new scales are similar to those of the Oriental Insurance Company — the premier Life office in the pre-nationalisation era — and wherever the scales deviate from that of Oriental, the benefit goes to the employees.

Within three days of the announcement of a revision in the pay scales of the insurance employees, the report of the Wage Board set up under the Working Journalists Act for fixing the minimum basic wages, rates of dearness allowance and local allowances for different categories of journalists was released. The Wage Board sought to classify newspapers and weeklies on the basis of their gross annual revenue and to fix the minimum salaries of journalists in the various categories. The dearness allowance has been linked with the all-India cost of living index published by the Labour Bureau of the Government of India. It will be some time before a clear idea of the burden of the higher wage bill on newspapers and periodicals can be formed. Considering the number of journalists involved, it can however, tentatively be hazarded that the new impost will be nearly Rs. 1 crore, if not more.

In the second week of February, the Railway Minister revised the grades, promotion opportunities and salary scales of non-gazetted officials. This decision was made on the eve of the elections and involved an extra burden on the Railways which is estimated to be a little above Rs. 2 crores. In the same month, the decision of the Labour Appellate Tribunal raised the total emoluments of all the categories of workers in the coal industry, imposing an additional expenditure of Rs. 4 crores per annum. Since the appellate decision will take effect retrospectively from the enforcement of the scales awarded by the lower tribunal, the industry may possibly be required to bear the burden of the arrears for one year, depending, however, upon the decision of the Supreme Court.

Recently, the Government of India has decided to extend the scheme of Central assistance to the State Governments for bettering the emoluments of teachers up to the secondary level. The Central Government has shown its willingness to foot half the bill for financing this scheme, and it is estimated that the Central commitment will amount to nearly Rs. 4 crores per year.

The Eastern Economist believes that the claims for revisions in the salaries of the fixed income groups could not all be resisted because of the rising cost of living. Whereas no reliable indices of consumer prices are available for the middle classes, those of the working classes show the nature as well as the extent of the rise. The all-India cost of living index (Base: 1944 = 100) has recorded a rise of 15 points; it stood at 148 in January, 1957 as against 133 in January 1956. It is estimated that in the month of May, the index may rise to 158. If this estimate turns out to be correct, the cost of living will have risen by 15 points over May 1956 and 31 points over May 1955. It means that the internal purchasing power of the rupee will have dwindled by nearly 25 per cent between May 1955 and May 1957. The planners had envisaged a fall of this magnitude only at the end of the plan and not at the outset of the second year of the plan. The greatest single contributory factor to this alarming rise in the cost of living index is undoubtedly the disproportionate rise in the food component. Food prices which always drop at this time of the year, have either remained stable (perhaps in wheat-growing areas only) or have risen. Reports of scarcity in Bihar have created great concern. The crux of the whole problem of price inflation or wage inflation is the paucity of consumer goods, especially food. It seems that despite a "record" food crop this year (as revealed by official statistics?) the available surplus, coupled with imports, has fallen short of demand which has increased due to a rising population and increased per capita consumption.

A policy for curbs on inflation necessitates a readjustment in the priorities of the development programmes in the plan. The making of a policy for food prices is a condition of price stabilisation. If such a policy is not implemented without delay, the dangerous trend which has already exhibited itself will not be contained. There is justice in the raising of both salaries and dearness allowance; but justice will not be enough. If income rises generate price rises which in turn generate income rises, where and to whom will justice be done? To seek a solution merely by augmenting the wages bill is, therefore, to start at the wrong end. There is only one end at which to start; it is to increase the availability of food supplies, by imports first and thereafter a policy of real, instead of imaginary, production. If this is not done, social justice will be impossible to work however good it may look on the surface.

THE WEEK'S NOTES

"DECENTRALIZATION" IN RUSSIA

MR. NIKITA KHRUSHCHEV has announced what is described as sweeping "decentralization" of the Soviet Union's economic administrative apparatus; a "transfer of the centre of gravity" to territorial and local management is believed to have been effected. Of more than 30 Soviet Ministries concerned with industrial production and the processing of raw materials, only eight are to be retained though the functions of the abolished Ministries would now be handled by as many as 92 National Economic Councils. These would plan, co-ordinate and control the industrial complex in their respective regions, henceforth to be known as "economic districts". On the political plane, Mr. Khrushchev has recommended that 15 Prime Ministers of the constituent republics should take the place of the Central Ministers, now found redundant.

The Khrushchev Plan will directly or indirectly affect 300,000 State enterprises and 40 million workers. Besides, as the plan unfolds itself over the next fifteen years it will involve wholesale movements of population from European Russia into the Siberian waste land. This re-shaping of the world's biggest planned economy is due to be accomplished before the end of the next months. In effect this may well mean reconstruction of the monolithic structure of the Soviet State which the Kremlin has been rearing for the last 40 years.

The declared objective underlying this "reform" is to reduce rigidity, eliminate cumbersome processes inherent in a totally planned economy, and to move some ministries from Moscow and bring them closer to centres of production. What exactly is the political motive behind this widely heralded new industrial policy we cannot know for certain for some time yet. But the dichotomy between a totalitarian State and workers' welfare which the Soviet economic experiment has revealed should be clear to all. As an instance we can only refer to the fact that the number of bureaucrats in the Soviet Union approximates to .6 per cent of the total population, which is evidently excessive by all standards. But even more astounding is their share of national income. According to a rough reckoning the Soviet bureaucrats, excluding perhaps Mr. Khrushchev and his comrades, eat away 6.2 per cent of the total national income.

Reorganization may therefore contribute to the elimination of existing bureaucracy, thus helping, on the one hand, the struggle against, what Mr. Khrushchev calls, "bureaucratism", and bringing about much needed economy in State spending on the other. Whether or not this is decentralization of economy, as say Vinoba Bhave understands it, should be left to time to decide. The inescapable fact at the moment is that while the proposed "decentralization" would doubtless enable local managers and other officials to take certain decisions on the spot, all major issues will still have to be settled within the prohibitive confines of the Gosplan. Thus, in reality, the changes may turn out to be more formal than real. The proposed "decentralization" seems, therefore, to have been necessitated by strategic considerations. It is obviously in Russia's interests to disperse its industrial and administrative potential as a precaution against the possibility of a knock-out blow in the event of a war.

The lesson from the recent developments in Russia for countries like India, which have only recently launched on planning, is that however strong the case for it, planning always runs the risk of bureaucratization, political patronage, departmentalism and conformism. These in the long run become "fetters" on the development of production. "Democratic Centralism" tends to produce greater centralization and less democracy in the sense of local and regional initiative, and of course individual freedom.

DEVELOPMENTS IN THE MIDDLE EAST

THE RULING National Front, a Left-Centre coalition, has won the recent bye-elections in Syria expected by many to provide the test of the regime's popularity. This "victory" came a few weeks after the Left-wing in the Army had successfully resisted the transfer of its leader, Col. Abdul Hamid Serraj, from the head of the Deumieme Bureau to that of a military attache in Cairo. The situation in Syria would thus appear to remain as disquieting as it has been for some years now. But there are certain countervailing factors which minimise to some extent the gravity of the situation. Although the regime has proved capable of winning at the polls it cannot be said to command the adherence of the majority of the Syrian population. For instance, at recent bye-elections nearly 60 per cent of the voters abstained. Moreover, while Col. Serraj and his friends in the army have shown their power to resist moves designed to weaken their stranglehold, they have not yet the strength to destroy wholesale all opposition to their regime. The posture of the Syrian armed forces, too, on which the regime chiefly relies, is rather defensive. The Soviet bloc arms and equipment, including aircraft armour and artillery, though too much for Syrian economy to sustain, are just enough to permit the re-equipment of the Syrian army. There is hardly any evidence yet of a surplus to be set aside for any "Liberation" assignment.

On the other hand, the recent events in Jordan have alerted the Kings of Saudi Arabia, Iraq and, of course, Jordan. These monarchs are apparently having second thoughts about so-called Arab solidarity so much talked about and canvassed by the Syrian rulers and President Nasser of Egypt. The events in Jordan have helped them forget their age-old dynastic rivalries and disputes. Their meeting this week-end may lead to a common defensive alliance against the danger of subversion by international Communism masquerading as anti-imperialist Arab nationalism. If this development takes place, it would reduce the chances of any mischief brewing in Syria. For, surrounded by pro-West States, Syria may be presumed to be stewing in its own juice. America will, of course, besides providing these natural leaders of the Arabs with means to ameliorate the conditions of the people of their Kingdoms, provide them shelter under the Eisenhower Doctrine. This is, however, not to say that the Middle East as a whole has turned the corner. In any case it would be unwise to be complacent. For in Syria there are elements still in key positions who can any day set the Middle East aflame, even at the risk of their own extinction.

NUCLEAR WEAPONS FOR NATO

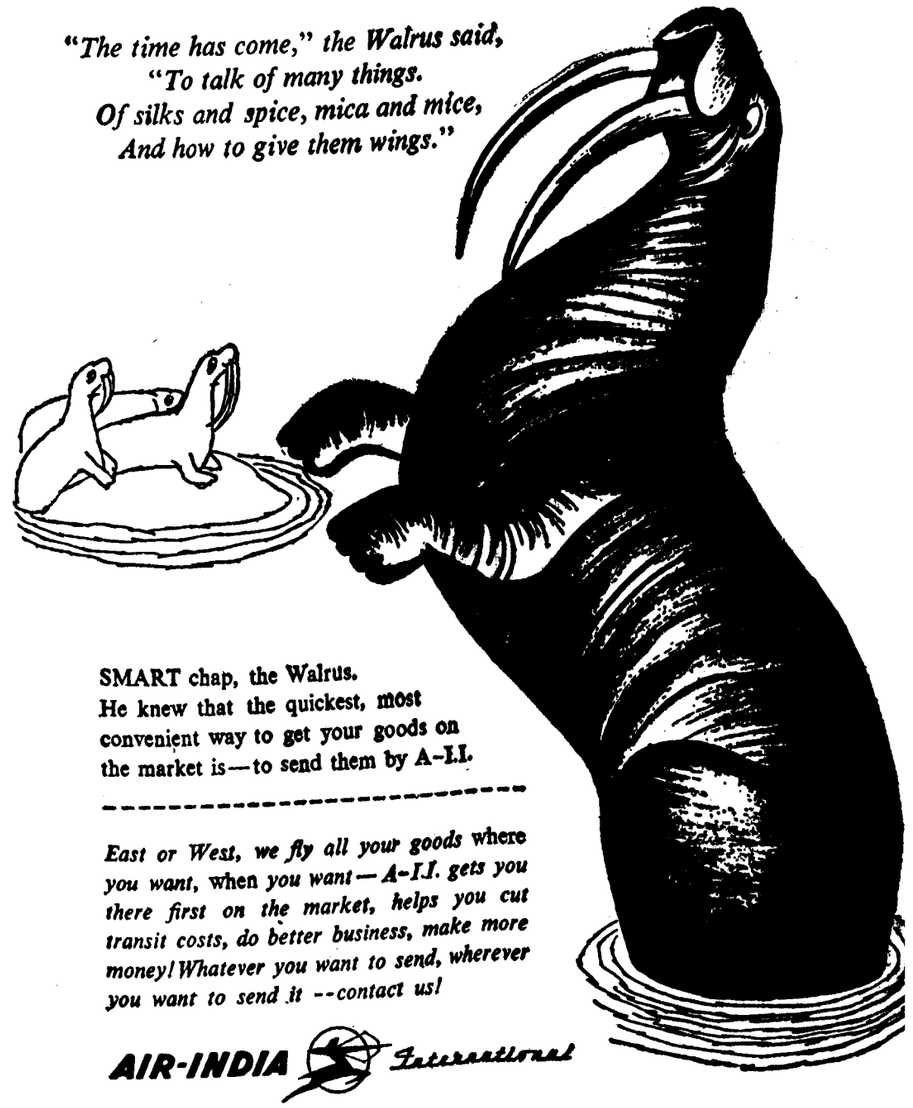
THE MOST outstanding development emerging from the recent deliberations in Bonn of NATO Foreign Ministers' two-day conference is the decision to equip NATO troops with atomic and nuclear weapons. This choice has been forced upon the NATO Powers because they could not for economic, or would not for political, reasons maintain conventional forces comparable to those of the Russian empire. Britain has drastically reduced the level of its forces due to economic difficulties; the pace of German re-armament has been extremely slow; internal tensions created by Britain's differences with Greece and Turkey over Cyprus have reduced the NATO Powers' conventional resistance; and a substan-

tial number of French troops from NATO have been transferred to Algeria. All these factors put together make for an appalling reduction in the NATO Powers' resistance in conventional terms. They had, therefore, no alternative to reliance on atomic and nuclear deterrents, which is what the Bonn meeting only confirms. Russia's repeated atomic tests have perhaps been the answer to the NATO Powers' decision.

This may prove intriguing to some in view of the talks now going on at the Disarmament Sub-Committee in London, the main emphasis of which seem to be control of nuclear weapons. But if we recall that the basic purpose of NATO is containment of Communism from a position of strength we may really find no incompatibility between the NATO Powers' decision and the deliberations in London. Moreover, pending an acceptable agreement on disarmament the NATO Powers cannot logically be denied the possession of modern arms needed for their defence. For all we know the Russian armies in the satellite countries are already armed with nuclear weapons. And would it not also be illogical for the NATO Powers, particularly Britain and America, unilaterally to accept ban on atomic test explosions as suggested by some statesmen, including the British Labour Party leader. Mr. Hugh Gaitskel? Atomic stock-piles, it is useful to remember, are the only deterrent to Stalin's heirs.

POPULATION CONTROL

WITH THE population growing at the rate of at least five million a year, the economic future of the country is a matter that should cause one genuine concern, notwithstanding the ambitious development plans in progress and in the process of incubation. There is no denying that such a growth, if unchecked, would become a liability to the country. The Government's active and direct interest in family planning as an essential ingredient in the programme of regulating the population of the country is thus an encouraging factor in the situation. The second Five-Year Plan has allotted Rs. 5 crores for family planning programmes and the constitution of a Family Planning Board as an autonomous body last September thus underlines Government's anxiety to go ahead with further development of the family planning programmes on a systematic basis. Mr. Nehru's claim in the course of his preface to a recent Health Ministry Publication that the India Government is one of the few Governments that have undertaken family planning in a scientific way is, therefore, justified.



Mr. Nehru has also significantly referred to the new interest evinced in China over family planning schemes. This seems to be a remarkable development, since, all along, the theory of the Communists has been that a large population is no problem in a Communist society (which, according to them, releases the forces of production from their capitalist fetters) and the Malthusian doctrine is a fiction meant to cover the sins of the capitalist class. The Chinese Premier's great interest in family planning is evident in the interview he gave to the Indian delegation which visited China last year to study agricultural planning and techniques. Mr. Chou En-lai is reported to have told the delegation that a sense of apparent complacency, which is wrong, has been engendered by the fact that the net increase of population in China is about 2 per cent while the net increase in agricultural output is currently 4 to 5 per cent per annum. It is obvious that freedom from poverty will be impossible so long as the increase in production is consumed by a population growing unchecked. It is, therefore, understandable that the Chinese Premier should have shown great interest in Indian experiments on family planning. He is reported to have told the delegation that as soon as a good method of contraception was discovered, the Government of China would undertake a countrywide campaign for the adoption of family planning by the Chinese people. (That the Chinese would carry out a possible family planning programme with their wonted determination, may be taken for granted). Here then is the crux of the problem that faces India as well as China and in fact all the Asian countries which are over-populated in relation to their current and prospective levels of production. Real success in family planning cannot be achieved by mere propaganda or the starting of clinics all over the country. It can be achieved only by discovering an ideal contraceptive that will be cheap, harmless and easily accessible to the poorer classes. This is a challenge to the planners as well as to the scientific talents of the country.

SARVODAYA AT KALADI

EVERY YEAR a Sarvodaya Sammelan is held somewhere in India but never at the same place and time as the annual session of the Congress. This is somewhat surprising although both Mr. Nehru and Acharya Vinoba Bhave are the acknowledged heirs of Mahatma Gandhi, but it is even more surprising in the context of the Congress Party's professed love for Sarvodaya. Why is the high-priest of Sarvodaya so very anxious to keep his movement at a respectable distance from the Congress in spite of the latter's anxiety to be identified with it? It is certainly not a case of making a distinction without a difference, for there is a clear ideological cleavage between Sarvodaya and Nehruvian Socialism. It is not also possible to interpret that Nehru is the political heir of the Mahatma and Vinoba his spiritual heir, for the latter's work appears to have as much a political import as the former's a spiritual one. Perhaps it is a case of personality clash between two dynamic leaders. While Nehru's achievement is largely that of a leader wielding the instruments of political and administrative power, Vinoba's is largely that of a leader operating on the plane of moral persuasion. Surely the achievement of a person who has collected, on behalf of the landless poor, free gifts of land conservatively valued at Rs. 1,250 million, cannot be dismissed lightly although his success todate falls far short of his ambitious target. As the Sarvodaya spirit and the moral power of a not inconsiderable army of Sarvodaya workers are thus factors to be reckoned with, one wonders if the two leaders would come closer together if the Gandhians who constitute a species of Advaitins are not to slide imperceptibly, in their evident bitterness, into the materialist monism of Marx. For be it remembered here that Gandhism has a firm materialist base in spite of all its idealist trappings. And Gandhism, as a rare ideology of social action, may well metamorphose into the very thing it currently opposes if the men who sustain it by their fanatical dedication are not themselves sustained by its continuing success. The latest Sarvodaya Sammelan at Kaladi in Kerala has provided no key which could unlock the mysteries of the Congress —Sarvodaya or of the Nehru-Vinoba politics.

ECONOMIC SET BACKS IN CHINA

AN EXPLANATION of the reasons for Communist China's wide-spread economic difficulties is given by Mr. Chia To-Fu, Vice-Chairman of the National Economic Commission, in a recent address in Peking, now available in translation. Mr. Chia admits that targets for industrialisation had been set too high, that planning was inefficient and wasteful and the labour calling up, in particular, excessive. Some enterprises, including "cultural and educational activities," had been promoted too hastily. Serious shortages of coal, iron and steel are freely admitted. Iron and steel, Mr. Chia warns, can be made available only for "essential manufactures" and there must be vigorous nation-wide collection of scrap metal.

INTRODUCTION TO INDIA—II

By

ODYSSEUS

MOST COUNTRIES contain groups of foreigners who remain in their midst for business or other professional purposes over long stretches of years. The bigger these foreign colonies—there are, for instance, over 6,000 Americans in India—the easier it is for them to lead self-contained lives, never learning the language of the country, knowing nothing of its history, social life, literature, classical dances, or theatre. In an effort to help out the foreigner of good will anxious to learn something of India but bewildered and daunted by the array of books confronting him on the innumerable facets of Indian civilisation available in any reputable book shop, I published here a series entitled "Introduction to India" on May 23 and December 12, 1952, and January 9 and 16, 1953, discussing the merits of some selected books. I am now engaged not in repeating my old list but in bringing it up to date. Last week, I offered suggestions to the newly arrived in India. This week I am for the most part discussing books which assume that you are acquainted with the background.

My 1952-53 "Introduction to India" brought me a number of letters regretting that some of the books recommended had gone out of print or seemed otherwise unobtainable in India. It may therefore be worth pointing out to foreign residents that all India's leading cities have, concealed somewhere or other about themselves, fine public libraries. It is, for example, easy and worth while to get yourself listed as a reader in the Secretariat Library in New Delhi and the National Library in Calcutta, which for completeness of titles on India are rivalled only by the India Office Library in London and by the Indian section of the Library of Congress in Washington DC. For those who want to buy second-hand books, among book sellers who specialise on books on India are: Kumars, Antiquarian Book Sellers, 79-23 Lower Circular Road, Calcutta 14; and the Select Book Shop, K. B. K. Rao, 21-A Mahatma Gandhi Road, Bangalore 1. Specialists who pride themselves on being able to track you down within a reasonable time a copy of any book ever published on India are Luzac and Co., 46 Great Russel Street, London. WC. 1.

We might start off this week with Sardar K. M. Panikkar's "Survey of India" (Asia Publishing House, Bombay, 1954). I cannot praise too highly this superb little book of 306 pages. The trouble with most books on Indian history written in the half century ending on August 15, 1957, is that they are littered with the propaganda debris of the struggle for independence. It is one of Sardar Panikkar's many merits that, although of the generation most mixed up with the struggle, and although seeing Indian history through the eyes of a proud, sensitive patriot, he maintains the highest standards of scholarly respect for evidence. If I must record some hesitation in accepting one or two of his interesting theories, I must trumpet my approval of the way in which he follows an argument wherever it leads if the evidence will not allow him to do anything else. The result is an imaginative, poetical, living history, which does full justice to Hinduism and yet sees the problems of the British steadily and as a whole. Sardar Panikkar's history stops at the turn of this century. Can we hope that he will now focus the powerful beam of his historical search-light on the years 1900-1950?

A moderate statement of the British viewpoint is to be found in Sir Percival Griffiths "British Impact on India" (Macdonald. London. 1952) which shows evidence of wide research and reflection.

INDIA'S FORGOTTEN STATESMAN

Most Indian histories of the nationalist struggle have been written by Congress Party members or sympathisers. An interesting third party view is to be found in "Indian Politics Since the Mutiny" (Allen and Unwin. 1940) by the late C. Y. Chintamini, a disciple of one of India's greatest statesmen of a former generation, G. K. Gokhale, whose biography was written by J. S. Hoyland (YMCA Publishing House, Calcutta) as far back as 1933. D. V. Tahmankar has just published a forthright justification of Lokamanya Tilak (J. Murry. 1956), the "father of Indian unrest". I throw out the suggestion that it is time someone undertook a re-appraisal of Gokhale as "the father of Indian reason and democracy". Tilak's new biography was sponsored by the Kesari Mahratta Trust. Does Mr. A. D. Mani not think that he should galvanise the "Servants of India Society" into literary action to revive the memory of their great founder for a generation which has forgotten his name? (Or am I revealing my ignorance and has a re-assessment of Gokhale appeared in recent years?).

To those who are fond of wandering among the byways of history, I commend H. Tinker's "Foundations of Local Self-Government in India, Pakistan, and Burma" (London Univ. 1954) which despite its arid academic title is interesting, especially in these days when everyone is glorifying the village panchayat system. This book should be compulsory reading for Jayaprakash Narayan and all his Sarvodaya followers who (reasonably and rightly) want our villagers to govern themselves and pray that New Delhi's bureaucrats will wither away. I could not agree more. Tinker's book will, however, throw light on many of the practical problems involved.

Working our way towards the present, we might next tackle "The Transfer of Power in India (Allen and Unwin. 1954) which describes events in India after January, 1945, which led to the hand-over and to the partition of the country. Compact and lucid, this is the only piecing together of these dramatic events that exists (at least with any pretensions to historical objectivity).

"The Integration of the Indian States" by V. P. Menon (Longmans. 1956) is the account rendered by the late Sardar Patel's principal aide of the liquidation of the princes. I can think of no serious argument in favour of their retention, but Mr. Menon's zestful display of Machiavellianism fills me with indefensible nostalgia for one of the most colourful chapters in India's history. You may see better what I mean if you read Thompson's "Making of the Indian Princes" (Oxf. Univ. Press. 1943).

TO BE READ IN SECRET

The enquiring foreigner is bound to ask what he should read in order to understand the Kashmir quarrel. The short answer is that if he lives and works in India,

he had better stick to the Indian government's White Paper, and if in Pakistan confine himself to that of the Pakistan government. Thus will he avoid the stress of living in a state of unresolved mental conflict that will overtake him and poison his relations with his Indian (or Pakistani) friends if he reads "Danger in Kashmir" (Princeton Univ. Press. 1954) by J. Korbel (chairman of the UNO Commission sent out in 1948 to arbitrate in the quarrel) and "Two Nations and Kashmir" (Hale. 1956) by Birdwood who, whatever one's reactions to his diagnosis, has written a closely documented volume. A contemporary eyewitness account of the origins of the quarrel appeared in Jossleyn Hennessy's little book "India and Pakistan in World Politics" (King-Hall News Letter Reports. 1950). These three books should be read in secret behind closed doors, preferably with a bearer on duty to give timely warning of the approach of strangers.

As we have mentioned Pakistan, it may be useful to list three books which look at contemporary affairs from the viewpoint of Karachi: "The Making of Pakistan" (Faber. 1950) by R. Symonds, who includes a useful bibliography for further reading. "The Cultural Heritage of Pakistan" (Oxf. Univ. Press. 1955), a collection of essays edited by S. M. Ikram and Percy Spear. "Crescent and Green" (Cassell. 1955) essays by 16 authors including Arnold Toynbee and Sir Mortimer Wheeler.

A vast polemical literature has grown up round Hindu-Muslim relations. An attempt made to approach the problem from a scientific viewpoint is that made by Unesco at the request of the Indian government in 1949. I have not seen the Unesco reports but I have read "In the Minds of Men" (Basic Books. New York. 1953) by the American social psychologist, Gardner Murphy, who collaborated with Indian scientists in the Unesco survey. Dr. Murphy's book makes the reader a participant with Unesco's teams in refugee camps, textile mills, caste and religious groups, and areas of high and low tensions in cities and villages. Typical is the story told of the work of the late Professor Pars Ram of Gujerat university in tracking down how an obscure scuffle between some boys grew into a rumour that a major riot was being planned. An important point that emerges from Dr. Murphy's book is that Hindu-Muslim difficulties are not a problem unique to India but conform to the pattern of relations between majorities and minorities found in all countries where friction exists. Dr. Murphy also throws light on the contemporary working and likely future fate of the caste system and shows that although it may be fashionable nowadays to condemn it without qualification, the system has (stripped of the excrescence of untouchability) a reasonable social justification.

Which reminds me that on the historical, anthropological and descriptive sides, the most fascinating, as it is authoritative, study of the caste system is "Caste in India" (Camb. Univ. Press. 1946) by J. H. Hutton. A foreigner who digests this will, from the mere mention of such caste names as Agarwala, Ayar, Bhatia, Lohar, Panikkar, Prabhu, Reddi, etc., etc., be able to tell a great deal about the origin and background of those whom he meets.

This Introduction to India will be continued next week.

THE END OF MENDES-FRANCE

(From Our Special West European Correspondent)

PARIS, May 11.

THE congress of the Radical Party in Paris this month confirmed not only the inability of that party to influence the coalition government to which it belongs, but also the inability of Mendes-France to influence the policies of the party he supposedly leads. The gradual decline of Mendes's authority since January 1956, when he emerged from the elections as joint leader with Guy Mollet of the victorious coalition, has now reached the point where Mendes would probably be defeated within his own party if he pressed any vital issue to a showdown. Yet this is the party that he has broken, splintered and ruled dictatorially in an effort to get a political instrument subservient to his will. The masses of young people that Mendes attracted to the party over the past three years now see that he is unable to overcome its traditional opportunism and that he fears to force a showdown; so they are losing faith in him and drifting away from Radicalism. The hopeful experiment of Mendesism must now be held to have failed.

The hopefulness of that experiment consisted not simply in that Mendes-France offered the Fourth Republic a more honest, efficient and realistic government than any other politician since the war, but above all in this: that he offered a break with Micawberism, he offered policies that went ahead of events instead of waiting and procrastinating until it was too late to do anything but acquiesce in the inevitable. Micawberism, waiting for something to turn up, is the political disease of the Fourth Republic, as we saw in Indo-China and as we are now seeing in Algeria. Mendes proposed to break with this habit and his ten months in power were sufficient to demonstrate that if you go half-way to meet the inevitable you can usually get better terms than if you wait for it to corner you. That the mass of the French electorate was unwilling to accept the risks and the short-term sacrifices that such a policy entails is no explanation for the failure of Mendesism, because it is nothing unusual for democratic governments to go ahead of the people and to impose wise decisions which are, on a head-counting basis, unpopular at the time. Almost all great political decisions are temporarily unpopular but that is no handicap to a political leader supported by an adequate party machine and expert in the art of public relations. (The careers of Nehru, Roosevelt and Truman are full of examples).

So the failure of Mendesism is not accounted for by saying that France is not (not yet) Mendesist. The immediate causes are the inadequacy of the Radical Party which Mendes chose as the vehicle for his policies, and the betrayal of the French Socialist Party after the 1956 victory at the polls. The Radical Party (Radical-Socialist, to give it its full but misleading name), the party of Clemenceau, Herriot and Daladier, has been traditionally the political movement of the educated, liberal middle-classes and above all of the professional men and women who rebel against the firm discipline of the monolithic doctrinaire parties of Right and Left. It has a tradition of indiscipline that equals that of the Indian Congress Party, but being on the contrary a small party it has relied for its power on loose and shifting alliances with the larger and more determined groups of Right and Left. In so far as it has stood for anything other than the vague liberalism of the professional classes, it has represented firm central government, strong nationalism, an opposition to all sectional privileges, economic progress and sound money. But it has never had enough power of its own or enough internal discipline to represent any of these things with passionate tenacity (save perhaps under Clemenceau) and has drifted from one ambiguous compromise to another; its present embarrassed marriage with the Socialists is typical.

This was the party that Mendes-France chose as the vehicle for his policies. The wise-after-the-event now say this was his original mistake and that he should have sought to found a new party that would have represented modern Jacobinism in a purer and less ambiguous form. Perhaps, but that course would have had risks of its own, especially in the confused multiplicity of French politics. The effort of moulding the Radical Party to a firmer purpose was worth trying — but it has failed. Mendes drove from the party one group of dissidents and opportunists after another, relying for support on the masses of young people who were attracted to Radicalism in greater numbers after each purification. But the need to maintain some political continuity and above all to present known figures at the 1956 elections obliged him to compromise with anti-Mendesist elements, and it is these men who, today holding seats in parliament and portfolios in the government, have checkmated the drive for renovation from the less organised new members of the party. In turn, the inability or the unwillingness of Mendes-France to break finally with these conservative elements is alienating the "young Turks". Mendes-France is today in a minority in the parliamentary Radical party and could easily be put in a minority at the general congress in Toulouse later this year.

No less damaging was the betrayal of the Socialists in the coalition government. The Radicals and Socialists fought the 1956 elections together in the Republican Front, of which the main policy was an early conclusion to the Algerian war. The Socialists are the senior partners of this alliance, being by far the bigger party, so it was natural that their leader, Guy Mollet, should form the government. But the Radicals are no less important because only they can swing that 5 per cent of middle class votes that makes a non-Communist Leftish government possible in France, so it would have been natural that their leader, Mendes-France, be offered the second post in the coalition, Foreign Affairs. Under Right-wing pressure, Mollet declined to offer this portfolio to Mendes — and the collapse of the Republican Front had begun. Mendes accepted a ministership without portfolio but the surrender of Mollet to the Algerian settlers after his visit to Algiers in February last year initiated the long and painful drift of the coalition toward defence of reactionary interests in Algeria, and this eventually made Mendes's continued membership of the government impossible.

But having resigned himself, he permitted his Radical fellow-ministers to remain in the Government. Even after three years of Mendesist "dictatorship", the Radical Party lacks the internal discipline to force unity of policy on its own ministers, and the result today is

that Mendes-France is the most violent critic of a government which consists in part of ministers drawn from a party he himself leads! When he exclaimed last week at the Radical meeting "It is Fascism that reigns in Algeria" he was condemning the actions of men who sat beside him on the rostrum. A few hours after this exclamation he had to restrain the "young Turks" who, drawing the logical conclusions from his own attack, demanded the resignation from the Ministry of its Radical members. Instead he presented a black-and-white motion that instructed the Radicals in the Cabinet to insist on a liberalisation of Socialist policy, but without setting any time-limit for this liberalisation and without threatening any sanctions if it does not transpire — as it almost certainly will not.

Mendes's calculation in this matter is plain enough. To withdraw the Radical ministers from the coalition at this stage would certainly produce the downfall of the Government, and since the Socialists could say that it was the Radicals that brought on this crisis, all further co-operation between Radicals and Socialists would be impossible for years to come, and the Radicals are too small a party by themselves to aspire to power without Socialist support or consent. Worse, the present parliament is so constituted that no government can be formed without the Socialists, so the next ministry would be a coalition of the Socialists and some party even further to the Right, pursuing no doubt even more reactionary policies in Algeria. Mendes is evidently banking on a ministerial crisis that will be produced without Radical intervention (as could occur if the Right seriously objected to Socialist taxation increases), or alternatively on a rebellion within the Socialist party against the Right-wing leadership of Mollet and Lacoste — whereupon the Radicals could hope to resume co-operation with a new Socialist leadership. But neither of these events is probable, for the Right is willing to pay heavily for the pleasure of leaving the dirty work in Algeria to the Socialists, and the Socialist Party is governed by an iron discipline that makes rebellion impossible.

So Mendes-France finds himself today at the head of a party that is almost useless to him as a political instrument, while he incurs the hatred of the Right for his criticism of the Government's Algerian policy and the disgust of the Left for his inability to do anything about it. The vast enthusiasm that Mendesism aroused in 1954 is being dissipated in recrimination and disappointment while France goes on waiting for something to turn up. This is the end of Mendes-France — or at least if ever he comes to power again it will only be after disasters so severe that neither he nor his followers would wish them on their country.

WORLDGRAM

AGRICULTURE

Mysore Land Reform Bills: The President has given his assent to four Bills concerning tenancy legislation in Mysore State. The Bills are the Mysore Tenancy (Amendment and Continuance of Tenancies Bill, 1957, Bombay Tenancy (Suspensions of Provisions and Amendment) Bill, 1957, Hyderabad and Madras Areas Tenancy (Suspension of Provisions and Amendment) Bill, 1957, and Coorg Tenants Bill, 1957. These Bills replace ordinances promulgated earlier to maintain the 'status quo' in regard to different tenancy laws in force in specified areas of Mysore State pending introduction of a uniform law. At present there are different laws in force in the areas which formed part of the former States of Madras, Bombay, Hyderabad and Mysore. Coorg has no tenancy law at all.

*

The Development of Fisheries in Indo-Pacific Region: The development of inland and marine fisheries in the Indo-Pacific region is one of the subjects to be discussed at the seventh session of the Indo-Pacific Fisheries Council to be held at Bandung (Indonesia) from May 13, to 27. The Council will transact its work through two technical committees — one for inland, sea and miscellaneous fisheries, and the other for craft, gear, food technology, statistics, socio-economics and marketing. Set up in 1949, the Council mainly formulates schemes for development and utilisation of fisheries resources in the Indo-Pacific region. It also encourages and co-ordinates research and its application, compiles and publishes information, recommends projects to Governments, undertakes co-operative schemes, and proposes and adopts standardisation measures.

INDUSTRY

UK Steel Output: UK steel output in April again declined slightly from the record level achieved in February. Production was at an annual rate of 22.36 million ingot tons, compared to 22.47 million tons in February and 22.41 million tons in March. Pig-iron output continued to advance last month. A new record annual rate of 14.42 million tons was reached, passing by 10,000 tons the figure for March, the previous highest month. It compares with an output rate of 13.23 million tons in April, 1956 representing an increase of 9.1 per cent.

*

Handloom Mill for Bihar: It is reported a Rs. 50 lakh handloom spinning mill with an annual production capacity of 2,56,000 yards of yarn will be set up at Mokamah, 45 miles east of Patna. The mill, which is expected to go into production by the end of 1959, will feed over two lakh looms operating in Bihar. A plot of 30 acres has been acquired at the site and a part of the machinery has already arrived. The handloom industry in this State has fixed a target of producing 220 million yards of cloth between 1956 and 1959 out of 1,000 million yards of additional cloth scheduled to be turned out by the industry in India during the second plan period. Of it 165 million yards are to be produced in the co-operative sector of the industry in Bihar.

*

Four Regional Design Centres for Handlooms Being Set Up: The All-India Handloom Board under the Union Ministry of Commerce and Industry, is to set up four Regional Design Centres in the country to evolve new designs, new colour harmonies and textures in the production of handloom cloth. The Central Design Centre, which has been established at Bombay, is expected to function by the end of this month. The other three centres are to be established at Madras, Varanasi and Calcutta. Besides these Regional Centres, a number of sub-centres are likely to be set up in specialised areas of handloom weaving. One of the sub-centres will be set up at Kancheepuram in Madras State. The Government of India have sanctioned a sum of about Rs. 1.27 lakhs to the Bombay Centre and an equal amount for establishing a Regional Centre at Madras. For the sub-centre at Kancheepuram a sum of Rs. 35,000 has been sanctioned.

*

Thailand's Industrial Promotion: The Cabinet Council of Thailand has decided, on a recommendation of the Ministry of Industry, to establish flour, milk, and rubber goods industries under the Industrial Promotion Act of 1954, so that foreign exchange used for imports of the products of these industries may be saved, and assistance given to economic progress by the provision of employment and the utilization of domestically produced raw materials. It is intended that the flour industry should produce about 3,000 tons of flour annually and the milk industry about 150 tons annually. The rubber goods industry would produce annually 150,000 pairs of rubber or rubber-soled shoes, 150,000 sets of rubber soles and heels, and for bicycles, 50,000 tyres, 100,000 inner tubes, and 35,000 sets of tyres and tubes.

*

Japanese Whaling Industry: Japan is expected to send seven whaling expeditions to the Antarctic during the 1957-58 season; the number dispatched in 1956-57 was five and in 1955-56 three. This increase will place Japan second only to Norway among the participating nations; at present Norway has nine expeditions. The expansion of the Japanese whaling industry is taking place largely through purchases of whaling companies which had been operating in the Antarctic under the flags of other nations, e.g., Panama, the United Kingdom, and the Union of South Africa. In the 1955-56 season, Japan, with three expeditions and one land station, produced 17 per cent of the total oil output; Norway, with nine expeditions and one land station, produced 36 per cent.

*

ISI Certification Mark for Lead-Acid Storage Batteries: The Indian Standards Institution has granted a licence to Messrs. Associated Battery Makers (Eastern) Private Limited, Calcutta, for the use of the Standard Certification Mark of ISI on lead-acid storage batteries (dry separators) for motor vehicles, conforming to (IS: 395-1952). The Standard Mark consists of the monogram of the Indian Standards Institution and the number of designation of the Indian standard being inscribed in the top side of the monogram. It will certify that the lead-acid storage batteries conform to all the requirements given in the relevant Indian Standard, viz., IS: 395-1952.

TRADE

Protection to Calcium Lactate Industry Extended: The Government of India's resolution on the Tariff Commission's Report (1957) on the continuance of protection to the Calcium Lactate Industry has been published in a Gazette of India Extraordinary. Government have accepted the Tariff Commission's main recommendation that protection to the industry should be continued at the existing rates of duty — 37.8 per cent 'ad valorem' (Standard) and 27.3 per cent 'ad valorem' (Preferential) — for a period of three years, i.e. up to December 31, 1960. Government have also accepted certain ancillary recommendations of the Commission for assistance to the industry and will take suitable steps to implement them as far as possible. The attention of the industry is drawn to the Commission's suggestion that if at any time the industry finds that

its competitive position in the domestic market is seriously threatened by abnormally cheap imports, it may apply for a review of the existing scheme of protection.

*

Tariff Commission Questionnaire: The Tariff Commission has taken up for investigation the question of continuance of protection to the automobile leaf spring industry beyond December 31, 1957. In this connection, the Commission has prepared special questionnaires for producers, importers and consumers which are now ready for issue. Firms, associations and persons who desire that their views should be considered by the Commission may obtain copies of the relevant questionnaires from the Secretary to the Commission, Central Government Offices Buildings, (3rd floor), Queen's Road, Bombay-1, specifying the interest they represent. Replies to the questionnaires and representations or memoranda should be sent in 12 copies so as to reach the Secretary, Tariff Commission, by May 27, 1957.

*

Trade Handled at Calcutta Port: Calcutta Port handled the record figure of 42,200 tons of steel during the second-half of March, 1957. The highest figure of steel tonnage touched previously was 41,963 tons in the second-half of February, 1957. The total traffic handled by Calcutta Port during the second-half of March, 1957, amounted to 317,178 tons, of which imports were 159,290 tons. Amongst exports, ores accounted for 39,249 tons. Imports of food grains totalled 48,729 tons. The number of vessels which entered Calcutta Port during the period was sixty.

*

Increased Exports of Handloom Cloth in 1956: The export of Indian handloom cloth in 1956 increased considerably both in terms of quantity and the foreign exchange earned. The exports during the year totalled 59,786,000 yards valued at over Rs. 8.66 crores. In 1955, the handloom cloth exports totalled 55,827,000 yards, the value of which was nearly Rs. 7.77 crores. The principal buyers of handloom fabrics are Ceylon, Nigeria, the Federation of Malaya, Aden, the Sudan, Singapore, Kenya, Tanganyika and Kuwait. Exports to the United States, although comparatively smaller, had been steadily increasing. In 1956, 835,000 yards of handloom cloth was exports to that country as against 219,000 yards in 1955 and 76,000 yards in 1954. An external marketing scheme to promote the export of handloom cloth has been in operation for some time. Marketing officers have been posted at Singapore and Baghdad and provision has been made under the scheme for appointing Marketing Officers at Colombo and Rangoon also. Handloom Fabrics Emporia have been opened at Colombo, Aden, Singapore, Bangkok and Kuala lumpur.

FINANCE

Financial Statements of International Bank: The International Bank for Reconstruction and Development have reported a net income of $25.7 million for the nine-month period ending March 31, 1957, compared with $21.2 million for the corresponding period in 1956. This income was placed in the Supplemental Reserve against losses on loans and guarantees, and raised the Reserve to $176.4 million. Loan commissions amounted to $12.3 million and were credited to the Bank's Special Reserve, increasing that Reserve to $89.3 million. Total Reserves on March 31, 1957 were $265.7 million. Gross income, exclusive of loan commissions, was $53.6 million compared with $47.3 million in 1956. Expenses, which included $22.2 million for interest on Bank bonds and other financial expenses, totalled $27.9 million for the period. During the third quarter of this fiscal year, the Bank made three loans totalling $85.6 million in India, Iran and Peru. This brought the total number of loans to 166 in 44 countries and raised the gross total of commitments to $3,063.4 million. Disbursements on loans for the nine-month period were $247.6 million, bringing total disbursements to $2,211.2 million. During the period the Bank sold or agreed to sell $43.5 million principal amount of loans without its guarantee. On March 31, 1957 the total sales of loans amounted to $319.7 million, of which $250.7 million was without the Bank's guarantee. Principal repayments and prepayments received by the bank amounted to $20.4 million. Total principal repayments to the Bank, including repayments, were $184.7 million on March 31. In addition, a total of $112.7 million of borrowers' obligations which had been sold by the Bank had been paid on or before maturity.

*

National Income of India: National income of India increased from Rs. 9,110 crores at the beginning of the first Five-Year Plan to Rs. 10,800 crores in 1955-56, representing an increase of 18 per cent. At constant prices the national income will increase to about Rs. 13,480 crores at the end of the second Plan period, recording an increase by about 25 per cent. Per capita income has stepped up from Rs. 254 in 1950-51 to Rs. 281 in 1955-56; and in 1960-61 it will increase to Rs. 330. The share of agriculture and allied pursuits in total national income will decline from 48 per cent in 1955-56 to 46 per cent in 1960-61, while that of mining and factory establishments will increase correspondingly from 9 to 11 per cent. Despite substantial increase in net output of mining and factory establishments, the structure of economy will change only marginally over the plan period. The programme of investment envisaged for the second Plan period -- Rs. 6,200 crores — requires, broadly speaking, a step-up in the rate of domestic saving from the present level of some 7 per cent of national income to about 10 per cent of national income in 1960-61.

*

New Companies in the Northern Region: Sixteen companies were registered during the month of March, 1957, in the Northern Region. Of these, two were public companies with an authorised capital of Rs. 2,05,00,000 and 14 were private companies with an authorised capital of Rs. 29,70,000. Fifteen public companies increased their authorised capital to Rs. 3,00,000, subscribed capital to Rs. 6,99,600 and paid-up capital to Rs. 5,92,080. During the same period, 49 private companies increased their authorised capital to Rs. 44,00,000, subscribed capital to Rs. 1,18,91,700 and paid-up capital to Rs. 1,20,26,434. Five public and five private companies went into liquidation during the month. The names of 14 public and 20 private companies were struck off the register under Section 560 of the Companies Act, 1956. Prosecution was launched against 23 public and three private companies during the month for default in filling returns with the Registrars. Of the 4 cases already pending, court decisions were taken in respect of two public and two private companies.

GENERAL

Progress of Employees' State Insurance Scheme: Over 10 lakh employees — about half of the total insurable population of factory workers in the country — were covered by the Employees' State Insurance Scheme, according to the annual report of the Employees' State Insurance Corporation for 1955-56. During the year, the Scheme was extended to Madras City and its suburbs, the Hyderabad-Secunderabad area, Calcutta city and Howrah District, seven industrial centres in Andhra and Lucknow, Saharanpur and Agra in Uttar Pradesh. As a result, an additional 3,19,000 employees were brought under the purview of the Scheme.

NEWS IN BRIEF

INDIAN

The Government of India have decided in consultation with the Board of Trustees of the Employees' Provident Fund to grant interest to the subscribers of the Fund on their accumulations at the rate of 3.3¾ per cent during the year 1957-58. The rate of interest for the year 1956-57 was 3½ per cent.

*

Messrs. Tata Industries Private Ltd., managing agents for the Tata Iron and Steel Company Ltd., report that the total approximate production of iron and steel at the steelworks at Jamshedpur during the month of April 1957, as (in tons) pig-iron 92,300; steel ingots 89,300; saleable steel Semis 14,700; Finished 47,800.

*

The Rajasthan Government has announced revised rates of sales tax, increasing the tax on certain articles, removing exemption on certain others and providing exemption on the sale of allopathic and homeopathic medicines and drugs.

*

The Government of India have announced that the shipment period of raw cotton from the U.S.A. under the Indo-Burma-USA tripartite agreement 1956 has been extended up to June 30, 1957.

*

It is reported the Government of India proposes to set up a corporation to handle the export of handloom products and to assess their demand in foreign countries.

*

The Government of India have decided to extend free licensing of all varieties of cotton piece goods (mill-made and power-loom) and cotton manufactures including cotton waste blankets other than restricted varieties, to all permissible destinations except Nepal, Tibet, Bhutan, Sikkim and Portuguese possessions in India for shipping up to December 31, 1957, according to a notification.

*

The Government of India has set up a six-member Committee to investigate the prices of coal. The Committee will recommend the changes necessary in the price-structure of coal and report on the impact of the price changes recommended by the Committee on the economy of the country and on industry generally.

*

The reserves of manganese ore in India have been estimated at about 112 million tons by the Indian Bureau of Mines. The reserves, which are of all grades are chiefly found in Madhya Pradesh — 100 million tons. The remaining 12 million are scattered in other areas.

*

The Indian Standards Institution has circulated a draft Indian Standard glossary of terms relating to paints with a view to eliciting comments.

*

The birth and the death rates in towns with a population of 30,000 or over in India during the month of March 1957 were of the order of 27.0 and 12.7 respectively per thousand of population. Corresponding figures for March 1956 were 27.9 and 11.8 respectively.

*

A grant of Rs. 14,040 has been given to the Government of Madras for opening and maintenance of family planning clinics. For the same purpose grants of Rs. 10,100, Rs. 5,190 and Rs. 5,500 have been sanctioned to the Bombay municipality, the Family Planning Association of India, Bengal branch, Calcutta and the Philadelphia Hospital, Ambala, respectively.

FOREIGN

France had a deficit in April with the E.P.U. of $108, 206,000, the worst adverse balance since 1952. This compared with $93,696,000 in March and $33.8 million in April, 1956.

*

Figures issued by the Straits Trading Company at Singapore give total Malayan tin shipments in April as 6,427 tons compared with 7,694 tons in March. For the first four months of this year, estimated Malayan tin exports have been 25,039 tons, compared with 24,033 tons in the previous year.

*

The sterling area gold and dollar reserves rose by $111 million during April to $2,320 million, their highest level since last September.

*

The U.S. has granted Indonesia a $15 million loan and promised $77 million more for development purposes. Indonesia agreed to repay the $15 million over 40 years, with interest at 4 per cent, if the repayment is in Indonesian currency and 3 per cent if in dollars.

*

The Tunisian Government is considering setting up a national bank of issue. At present bank notes for both Tunisia and Algeria are issued by the Banque de L'Algerie et de la Tunisie, which was nationalised by the French Government in May 1946.

*

The total trade of sterling area countries with the rest of the world reached a new record during 1956. Exports by the area to non-sterling countries expanded by 13 per cent, compared with 1955, while imports into all sterling countries last year were the highest on record, exceeding slightly those in the previous peak year 1951.

*

It is reported work is likely to begin in the late summer or autumn of this year on the new £10 million oil refinery at Whitegate, Cork. The refinery will produce about 2 million tons a year including motor spirit, diesel oils and industrial fuels consumed in Eire and is expected to be completed in 1959.

*

It is reported that the new trade agreement between Australia and Britain has been ratified. The agreement replaces the 1932 Ottawa Agreement.

*

South Africa's total gold and foreign assets in the week ended April 26 totalled £132,034,000 compared with £131,182,000 a week earlier.

*

Changes in export taxes for cotton, coffee and cottonseed were announced recently in Uganda. The coffee export duty will in future be calculated at one-third of the export price above £120 per ton for Robusta and £195 for Arabica, while the non-African coffee producer's present rebate against export duty will be withdrawn.

*

British aero exports for the first quarter of the year totalled just under £25 million representing an annual rate of about £100 million, states the Society of British Aircraft Constructors.

*

East African Railways and Harbours income in March 1957 was £1.82 million compared with £1.7 million in February and £1.9 million in March last year. Rail earnings were £106,000 below the level estimated for March and harbour earnings were £45,000 below estimates.

Eyes that see around the world

The look of experience is something all Clipper* pilots have.

It comes from watching the weather through all the Seven Skies over all the Seven Seas—year in and year out.

It's the look you want in your pilot when you fly. And it's one great reason why more people choose Pan American when they fly—anywhere.

For on every Clipper flight deck there are as many as three qualified over-ocean pilots—trained to the most rigid and exacting standards in the world.

And beneath every Flying Clipper, all around the world, there extends the great supporting force of watchful experts—the vast ground forces of Pan American, 17,600 strong.

In the skies or on the ground, these are the people who make possible the fastest, most frequent service to the United States or to any of the 81 lands on our world-wide system—over 600 offices throughout the world.

Remember, when you fly Pan American, you're on the only airline with over 60,000 trans-Atlantic crossings.

Master Pilot John Mattis, one of the Clipper Captains who have logged over 500 trans-Atlantic flights.

Let your Travel Agent arrange your trip—his services are free. Or call Pan American in:

Calcutta : 42 Chowringhee, Tel. 44-2651, 2652, 2653

WAGE BOARD AWARD FOR JOURNALISTS

BEING an award, the reaction among those affected by the decisions of the Wage Board for Journalists is bound to be mixed. This is hardly surprising. While the employees as a class may feel that the Board has not gone far enough but belied certain high expectations entertained, the industry may take the view that the award has imposed certain severe burdens which it cannot bear in its present stage of development. The task of the Wage Board had not, however, been enviable. It was a formidable one and with practically no precedents, the Board had to be its own path-finder. Confronted with the question of fixing suitable scales of pay (including allowances) to a class of employees engaged in a profession with an astonishing and bewildering variety in its ranks and working in units of different sizes of varied fortunes — from the marginal to the prosperous and the not-so-prosperous —the Board had to arrive at certain workable criteria for a rational classification of the different newspaper establishments, the areas in which they are located and the designations of the different categories of employees.

It is on the basis of these criteria that the Board has given its decisions while 'apparently' taking into account in the process various factors like the cost of living, the prevalent rates of wages for comparable employments, the circumstances relating to the newspaper industry in different regions of the country and so on. This qualification 'apparently' is necessary because in its report, the Board has refrained from giving reasons for arriving at each one of its decisions. The result is that one is not only left guessing as to why it came to a particular decision but there is also a certain ambiguity in some of the provisions which might lead to differences in interpretation. There are, however, two factors that might operate to minimise the hardships that may be caused in the implementation of the decisions. One is the provision that in no case should the present emoluments of the employees be reduced as a result of the operation of the award. The other is that another Wage Board should be constituted under the Working Journalists' Act to review the effects of the decisions of the Board on the newspaper establishments and the working journalists after the expiry of three years but not later than five years from the date of publication of the decisions of the Board.

However, it is necessary to draw attention here to certain doubts that arise on a reading of the Wage Board's report. While for the purpose of fixation of wages, the Board takes into account 'gross revenue' for the classification of newspaper establishments (which includes dailies as well as weeklies published by them) it adopts a different criterion viz. 'circulation' in the case of classification of other weeklies and periodicals. In the absence of any explanation vouchsafed, it is difficult to understand the reasoning behind this distinction. The result is that the Board has been confronted with a dilemma, as it were, while dealing with certain categories of weeklies; for example, the financial journals which may come under a low category if circulation is the criterion but whose gross revenue may not warrant them to be placed in such a category. The Board has, therefore, suggested that pay scales in these cases may be fixed on the basis of collective bargaining subject to the minimum prescribed. This seems like circumventing the issue due to the difficulty arising from the different criteria it has adopted.

Again on the classification of working journalists, the Board has been presented with a searching problem. For example, the distinction made between an Assistant Editor and a Leader-Writer seems to be a distinction without a difference. Similarly, the clubbing together of Assistant Editor, Chief Sub-Editor, Commercial Editor, Sports Editor and so on seems to be rather odd. Though any solution in this regard will be far from ideal, it would have been better if Group II included Assistant Editor, News Editor and Chief Reporter and the rest in the group placed under a separate category. This would have perhaps provided a more equitable basis for the fixation of the pay scales governing these categories of employees. Apart from this, there are one or two provisions in the report that may lead to some confusion in the absence of clarification. The provision with regard to the splitting of the consolidated pay and dearness allowance is an instance in point, as it might raise the question whether the pay hitherto drawn by an employee was only basic pay or included dearness allowance also. Similarly the 'modus operandi' suggested for the calculation of the dearness allowance is also a little vague since the adjustment of the rate of dearness allowance to the cost of living index requires further elucidation.

In the absence of relevant data, it is premature to analyse the effects of the award on different sections of the newspaper industry. The Board in its labours seems to have gone on the basis that as many as possible of those engaged in the profession should be assured of a reasonable minimum wage and a pay scale fixed that would help to know where one stands. It is, however, a moot point whether the award would help in attracting enough talent to a profession that is becoming increasingly specialised and more and more technical. The Press Commission in its Report has pointed out that though the salary scales offered in 1952 might have been higher than in 1939 the real wages of the working journalists have actually gone down as the rise in the wages has not been commensurate with the rise in the cost of living. The Commission has, however, conceded that in regard to individual cases, there has been improvement in the matter of emoluments but has stated that quite often this improvement is noticeable only in the highest and more senior posts, which has only served to emphasise the disparity in the maximum and the minimum salaries. The Wage Board's approach in the fixation of pay scales seems to have been governed by this observation of the Press Commission.

In an analysis of 36 English newspapers, the Press Commission has found that they employ 684 junior journalists (defined as to include sub-editors, reporters, special representatives, news photographers and so on) and 67 senior journalists (defined to include joint editors, assistant editors and news editors). It found that in only one paper the average monthly emoluments paid per journalist was below Rs. 100. In most of the cases, average monthly emoluments fell within the range of Rs. 201-300 and the overall average was in the neighbourhood of Rs. 350. Table A on next page analyses the position in seven English newspapers having a circulation of over 35,000 employing 286 junior journalists and 35 senior journalists. Out of the 286 junior journalists, nearly half fall into the category of those getting Rs. 201-350 whereas of the 35 senior journalists 23 get a salary of over Rs. 750.

The senior journalists referred to by the Press Commission fall in category II and the junior journalists in category III of the Wage Board's classification. The

Board has classified Editors in category I and proof readers in category IV. It may be roughly taken that papers with a circulation of over 35,000 fall under class "A" of the Wage Board's classification and the award has fixed the following scales for this class:

CLASS A

Group of Employees	Starting Pay	Scale
I ..	1,000	1000-30-1300 (6 years) -75-1600 (4 years)
II ..	500	500-40-820 (8 years) E.B. 50-920 (2 years)
III ..	175	175-20-415 (12 years) E.B. 25-515 (4 years) 42½-600 (2 years)
IV ..	125	125-7½-215 (12 years) E.B. 10-275 (6 years)

From a rough comparison of Table "A" with the scales of pay for class "A" the view can be safely hazarded that the overall wage bill for an "A" class paper after implementing the Wage Board's decisions is not likely to show a considerable difference if they are strictly adhered to. But the provision that the existing emoluments could not be reduced, the fact that those belonging to the category of senior jouranlists may at present be drawing salaries likely to be in excess of those recommended by the Board and the adjustments necessitated by the fitment of the present employees to the new scale—all these may in fact throw a severe burden on particular papers falling in this class. The Press Commission has found that it is those papers that paid their journalists better that were also employing more journalists on their staff It may be, in fact therefore that the burden is increased on what may be the most efficient newspaper managements. Perhaps this is no more than the usual injustice involved in all welfare policies; they generally tax those that have, since they can get nothing out of the have-nots. But who will say that this is not sometimes a tax on efficiency and hard work? The Wage Board for Journalists can no more escape the charge that it hurts some of the best than can the canons of progressive taxation which provide the accepted vehicle of social justice in our impatient time.

TABLE A.

Emoluments	No. of papers	Junior journalists
Rs. 101-200	1	40
Rs. 201-350	3	137
Rs. 351-500	1	42
Rs. 501-750	1	50
Over Rs. 750	1	17
TOTAL	7	286

Emoluments	No. of papers	Senior journalists
Rs. 351-500	1	8
Rs. 501-750	1	4
Over Rs. 750	5	23
TOTAL	7	35

THE IMPACT OF EXCISE DUTIES ON PRICES

THE Budget proposals of indirect taxation have provoked first reaction of great resentment. The burden of criticism has been that they will impose a severe strain on the common man by causing considerable increase in the prices of daily necessities of life and therefore in the cost of living. The wide range of commodities which has been selected for indirect taxation and the fact that the total additional revenue from indirect taxes during the remaining period of the current financial year will be of the order of Rs. 55 crores have lent colour to the view that the effect of the taxes will be very heavy on the middle and lower classes. Out of this increase, the Union Excise accounts for Rs. 49 crores. Table I below recapitulates the Budget estimates of the probable additional yields from the new levies of excise duties. No less than thirteen commodities have been selected for additional levy of excise duties. On a superficial view there appears to be much force in this contention. It is essential, however, to assess statistically the approximate impact of the excise duties in order to gauge the real burden that is going to be imposed. The Research Section of 'The Eastern Economist' has attempted to assess this burden with reference to the likely rise in the general indices of wholesale prices immediately after enforcement of the duties. It will be obvious from the analysis here attempted that the popular belief has little basis. The increase in the wholesale prices index will not be higher than 1½ per cent as compared to the latest published index for April 20 last.

TABLE I.

INDIRECT TAXATION

	(Rs. Crores)
I) Sugar	18.55
II) Cement	6.70
III) Motor Spirit	6.65
IV) Matches	6.20
V) Un-MANUFACTURED TOBACCO	6.15
VI) Steel Ingots	5.70
VII) Vegetable non-essential oils	3.15
VIII) Tea	2.45
IX) Paper	2.00
X) Refined Diesel oil ..	1.90
XI) Coffee	0.80
XII) Diesel oil, not otherwise classified	0.35
XIII) Kerosene	0.20

Table II on next page sets out the importance of the thirteen commodities as represented by their weights in the wholesale price index (base year ended August 1939=100) and their indices before and after the Budget proposals. As has been stated earlier, the indices for the pre-Budget week refer to the week ended April 20, 1957. The post-Budget indices have been computed by adding the full impost of excise duties on the wholesale prices. When the post-Budget indices are fitted into the general scheme of the overall index of wholesale prices, it is found that the final effect of these duties is to push up the price index by 6 to 7 points, 6.64 to be precise. This is equivalent to an increase of 1½ per cent in the wholesale index immediately in the wake of the Budget proposals. The thirteen commodities show varying degrees of impact on the index. The greatest contribution to the rise in the index comes from three commodities, namely, unmanufactured tobacco, sugar and tea in the order of their importance. This order of importance in the contribution to the

increase in the general index has been arrived at not merely by calculating the absolute increases in the individual indices but by taking full account of the weightages assigned to these commodities in the general index. The combined effect of these three leading commodities is to raise the index by 5 points while the rest of the ten commodities put together give an increase of only 1.6 points.

TABLE II.

GENERAL INDEX OF WHOLESALE PRICES

(Base: Year Ended August, 1939=100)

Commodity	Weight (Per cent)	Index Numbers (Pre-Budget)	Index Numbers (Post-Budget)
Motor Spirit ..	1.02	213	234
Diesel oils	Not included

TABLE III.

GENERAL INDEX OF WHOLESALE PRICES

(Base: 1952-53=100)

Commodity	Weight (Per cent)	Index Numbers (Pre-Budget)	Index Numbers (Post-Budget)
Motor Spirit ..	0.74	100	110
Diesel Oil ..	0.17	99	101
Kerosene ..	0.26	91	93
Cement ..	0.35	113	130
Iron and Steel Manufactures ..	0.11	132	138
Sugar ..	1.76	95	109
Vegetable Oils ..	4.69	121	124
Tea ..	1.92	143	157
Coffee ..	0.15	85	93
Un-manufactured Tobacco ..	1.60	84	97
Matches ..	0.35	100	141
Paper ..	0.61	101	102

Table III above gives the same composition on the basis of the new series with base 1952-53=100. The total effect of the Budget excise proposals on the wholesale prices index is to raise it by 1.24 per cent above the pre-Budget index of April 13 last. Here also the three leading contributors to the rise in the index are the same commodities as in the case of the index based on the 1939 series but with slight difference in the order of their importance. The pride of place goes to tea, sugar retains its second rank, while unmanufactured tobacco comes third. These three commodities between them push up the general index by 0.73 per cent, the remaining increase of 0.51 per cent coming from the rest of the ten commodities.

A significant point that emerges from a study of the three tables needs to be highlighted. The commodities which are the prime contributors in pushing up the general index of wholesale prices are not necessarily the commodities whose yields to the Exchequer are the maximum. Sugar alone is an exception to this conclusion. Cement, motor spirit and matches which between them bring an additional revenue of Rs. 20 crores out of the total of Rs. 49 crores due to excise have little inflationary effect as evidence by their shares in raising the general index. Whereas the combined contribution of sugar, unmanufactured tobacco and tea to the additional yield from excise is one-half their share in raising the general index is a little more than two-thirds.

Economic Report from the U. S.

THE STEEL OUTLOOK

(By GUY SIMS FITCH)

HOBOKEN (New Jersey), May 7.—The past few weeks have been marked by new expressions of confidence in the United States economy—confidence extending beyond the coming months to the years ahead. It is based primarily on the need for greater industrial capacity and the never-ending search for new products. Indicative of the current thinking was a statement this week by Roger M. Blough, Chairman of United States Steel Corporation, the nation's largest company in this basic industry. Echoing the sentiments of virtually all steel officials, Blough told a stockholders' meeting here that their company's most difficult problem is not any "temporary drop" in operations, but keeping pace with the "relentless demand."

By 1975, he said, the nation's steel-making capacity will have to be expanded another 50 million short tons —some 37.5 per cent—over the present 133.5 million tons. Not the least of the factors behind this expansion will be continuing population growth accompanied by increasing consumer purchasing power. Scientific research and product development play an important part in the steel outlook, according to Blough and other industry leaders. Metallurgists, for example, are now working on new types of steel that promise to be "more than twice as strong as any commercial metal known today, in Blough's words.

Industrial emphasis on growth and research is also pointed up in a recent report by the Mcgraw-Hill Company. This publishing firm's annual assessments of business plans for expansion and modernization of production facilities have by now become accepted barometers of economic sentiment in the United States. They are not mere forecasts, but reflections by fairly firm programmes. Mcgraw-Hill' latest report puts the 1957 total for capital spending at a record $41,000 million, up 12 per cent from 1956. What is more, business men already have scheduled an annual outlay of $35,000 million for as far ahead as 1960. The actual total undoubtedly will be higher than that, as new programmes are drawn up. But even at the rate now planned, US industrial capacity will be 74 per cent greater in 1960 than it was in 1950, and 15 per cent greater than it is today. The larger outlays on new plant and equipment go hand in hand with heavy investments in research and development. The survey shows that spending for these purposes will come to nearly $7,400 million this year—some 20 per cent more than last year, and about double the 1953 total. By 1960, industry expects to be spending more than $9,000 million—a figure that may well turn out to be an underestimate. Such programmes are fully in line with industry's sales expectations, manufacturers see their sales rising 26 per cent in the next three years. And 10 per cent of their 1960 volume bids fair to be in new products—products not made at all in 1956, or so improved as to be virtually new.

Reflecting the anticipated introduction of new equipment and processes in American industry, the nation's machinery makers expect some 20 per cent of their 1960 sales to be in wholly new types. The extent to which industrial expansion and research have in the past been transforming the American economy is revealed in a recent report by the US Department of Commerce. After studying long-term trends, the Department concludes that new products have been a major stimulus to economic growth. The fastest growing product, its reports show, have all been introduced in the past 25 years, many of them within the past decade. Their variety ranges all the way from titanium to antibiotics, from clothes dryers and foam rubber mattresses to insecticides,—all of them obscure or totally unknown in the recent past, but widely used today.

New Subscription Rates for
THE EASTERN ECONOMIST
and
RECORDS AND STATISTICS

'The Eastern Economist' greatly regrets that it has become necessary, owing to the steep rise in costs, to raise its subscription rates both for the weekly and for 'Records and Statistics', the Quarterly Bulletin.

WITH EFFECT FROM THE 1ST MAY, 1957, ALL NEW SUBSCRIPTIONS WILL BE ENTERED AT RS. 57.50 FOR A YEAR AND RS. 30 FOR A HALF YEAR. THERE WILL BE NO SUBSCRIPTIONS FOR A SHORTER PERIOD.

IN THE CASE OF 'RECORDS AND STATISTICS' THE ANNUAL SUBSCRIPTION WILL BE RS. 16. FOR SUBSCRIBERS OF 'THE EASTERN ECONOMIST', THE RATE WILL BE RS. 14.

The present rise is not a charge for the Blue Supplements and additional coverage given in larger Special Numbers. No increase was made in the subscription of Rs. 50 when the Blue Supplements (annual subscription Rs. 5) and the Annual and Budget Numbers were enlarged. It is proposed to continue these Supplements without additional charge. The new subscription rates are, therefore, inclusive of Blue Supplements and all Special Numbers, the total individual value of the issues supplied in a year being Rs. 65.50.

The Business World

MUDDLING IN MANGANESE

By CROESUS

IN the context of the country's urgent need for augmenting its foreign exchange earnings which every official spokesmen—right from the President and the Prime Minister downwards—has been stressing so often, one has a right to expect the correct lead from the officials of the State Trading Corporation. But, unfortunately, this does not appear to be forthcoming; instead, the S.T.C is fast becoming the laughing stock of the people being openly dubbed as "an asylum of orphans" and so on. I have not the least doubt that those connected with the S.T.C. would have endeavoured to divert attention by dismissing all such criticism as "interested propaganda" had it come from the business community, but, happily for the country, they are denied this chance, inasmuch as reports about the unsatisfactory state of affairs inside the S.T.C. organisation have emanated from the headquarters of the Government of India and prominently featured in sections of the daily Press known to be at once fair and friendly to the powers-that-be. That something is rotten in the State of Denmark (S.T.C.) is thus clear. In any case, one need not labour the point except perhaps to illustrate it by reference to the handling by the S.T.C. of any one commodity. No other commodity has attracted so much attention lately as manganese has done, presumably because there is still "co-existence" in manganese trading and the S.T.C.'s performance stands in glaring contrast to that of the private sector. Manganese interests—miners, traders and shippers all—have certainly rendered a better account of themselves than the S.T.C. even since the latter chose to enter the field. Instead of toning up the export trade in manganese which the S.T.C. set out to do ostensibly, it has only created near chaotic conditions. Thus, although there are enquiries from foreign buyers to the tune of some 3 to 4 lakh tons, private interests are not in a position to conclude any business on a firm basis in the absence of a decisive policy by the Government. It is but natural for the Government to favour the S.T.C., but, in this process, it seems to have forgotten that it is only the country's interests that are being held to ransom thereby. For, since the entry of the S.T.C., it has become almost impossible, it is stated, for miners and shippers to enter into any fairly long-term deals as they could do before. Needless to say such long-term deals not only ensure a given quantum of exports for the country but also serve as an effective insurance against undue or wild fluctuations in prices.

Again, although the authorities may not accept, it is contestible that the S.T.C. is not able to hold its own against foreign buyers, who have not been slow to take advantage of the amateur officers of the S.T.C., as witness the fact that the bulk of the S.T.C. shipments of manganese so far consisted mainly, if not wholly, of high grade ores. Normal trade practice used to be to send properly blended consignments consisting partly of the higher and partly of the lower ore, which meant more exports and, therefore, more foreign exchange for the country. Brow-beaten by skilled and veteran representatives of foreign buyers, and feeling elated at having got a slightly higher price, the S.T.C. officials seem to be blissfully ignorant of the harm they have thus unwittingly done to the country's manganese export business.

Even before the S.T.C. has found its feet, it is wanting to embark on an ambitious scheme of procurement and sales in which all shippers are asked to act as a "homogeneous organisation", and the irony of it is that, by agreeing to the scheme, they will have to allow the S.T.C. a discount ranging from 6 per cent to 23 per cent (and more if prices go above Rs. 230) on the F.O.B. price, excluding duty, realised by the S.T.C. If a Government-sponsored body like the S.T.C. itself were to demand this price for the job of finding a buyer abroad, which manganese interests are certainly not incapable of doing, if left to themselves, how can it lie in the mouth of the Government to say that it is its avowed objective to do away with as many middlemen as possible. Evidently this is a precept meant for others and not one for the Government to practise itself.

It is most unfortunate that the authorities are still not aware that the ground is being cut under their feet imperceptibly all the time, as a result of their unhelpful and ill-advised policy in regard to exports of manganese. And the tragedy is that this is happening just at a time when India is beginning to have fresh and more powerful rivals in the field. True, America has for long been our best customer for manganese, but it is feared, this fortunate position may not last. (That country's import of Indian manganese out of a total of 31.28 lakh short tons, according to the latest published figures, was 12.28 lakh short tons, as against her import of only 4 lakh short tons from South Africa, 1.4 lakh short tons from Cuba, and 1.6 lakh tons from Brazil). Apart from other causes, a very important factor that may reduce the US offtake of Indian manganese is that America has begun to turn more and more to South American countries, which is certainly not an unnatural development. Besides being nearer and, therefore, less costly, purchase of the South American ore will also make for increased popularity of the USA—a great political gain—in the South American countries. Accordingly America has underwritten extensive exploratory work now going in Brazil ond elsewhere. The Bethlahem Steel Company, for example, has reportedly entered into a deal with Brazil to extract some six lakh tons of manganese ore annually. Similarly, the National Tungsten Corporation also is shortly to exploit manganese ore in Chile. At least to some extent, this is the result of part of the trade going into the hands of the S.T.C. and of the export duty.

While India is in the process of slowly losing an importont customer like the USA, thus, there is the alarming prospect, at the same time, of our having fresh rivals from the African continent. In addition to South Africa, French Morocco, Ghana, Egypt, Mozambigue and Tunisia bid fair to figure as serious rival to India in regard to manganese exports to America, Russia too is a serious rival, although for the time being, her competition is being felt by India only in the European continent. This may extend to Japan also ere-long.

In the highly competitive market that is thus developing, if any country has to make headway in pushing its exports, it must offer better quality goods at relatively cheaper prices, and according to a fixed time schedule. Since the advent of the S.T.C. and the recently revied export duty, none of these important pre-requisities can be guaranteed, as was possible when the export trade in manganese was wholly in the hands of miners and private traders. It is not surprising, therefore, that there has already started a decline in our exports of manganese.

As against this undoubtedly dismal picture, there is, however, one redeeming feature about the S.T.C. which must go on record. It is the admittedly valiant efforts of the Managing Director of that body "to tidy up procedures in this rather untidy organisation (vide

'Hindustan Times' weekly of 21-4-1957) and bring about a drastic reorganisation of both personnel and administration". I am not concerned with this aspect of the S.T.C., nor do I claim to have made an investigation into it, but I know from enquiries in manganese circles and from reputed firms engaged in the export of this ore that, notwithstanding the alleged organisational difficulties no effort is being spared by this official to secure the wholehearted co-operation of all exporters in India irrespective of whether they are private exporters sponsored by the S.T.C. or those doing export on their own account. Whatever the outcome, it is reassuring to learn that at least the approoch is along sound lines.

In so far as private manganese interests are concerned, they say that, if this country's manganese exports have not only to be maintained but improved upon, as the authorities want, the latter must at once reconsider the question of the export duty, especially on lower grade ores, and allow exports freely. Of course, they take it for granted that the Government of India would evolve and declare its future export policy in unequivocal terms so as to make-possible the conclusion of long-term contracts, at least such contracts as are indisputably in the longer interests of the country.

BANKS AND INDUSTRIAL CREDITS

By CROESUS

IT is now fairly generally accepted that a solution to the problem of medium term credit in this country brooks no further delay, but there does not seem to be the same degree of public acceptance in respect of the method and manner of tackling it. From time to time, various suggestions were made, but the latest one and the one that has taken concrete shape is the suggestion to start an altogether separate institution — Refinance Corporation—for the purpose.

As Mr. G. D. Birla pointed out recently, (in his statement circulated to the shareholders of the United Commercial Bank Ltd., on the occasion of the 14th Annual Meeting of the Bank), "there is already an appreciable element of medium term financing included in the advances of scheduled banks and other investments." Even in the UK, where liquidity has been claimed to be and is, in fact, the dominant feature, by and large, there are known to be exceptions. Again, as in our country, in England too, commercial banks have been providing medium-term, nay even long-term credit, albeit in an indirect way, to their clients. There also, banks have contributed to specialised credit institutions like the Industrial and Commercial Finance Corporations. The recently released report of the European Productivity Agency of the O.E.E.C.—"The Supply of Capital Funds for Industrial Development in Europe" —throws light on the latest trend among banks in other countries of Europe and points out that, while not abandoning their customary role as suppliers of short-term credit, they are not averse to shouldering the responsibility of medium term credit.

Some of the banking trends in Europe which have paved the way for this incursion of banks into the field of medium-term credit are also noticeable in our country, as, for example, the relatively greater rate in the growth of time deposits vis-a-vis demand deposits. But conditions in this country differ from those in European countries in one important respect, namely, in regard to the saving and the banking habit. Both of these require to be greatly accelerated if they have to keep pace with the rapid growth of our economy. To quote Mr. Birla on this point, "the only unsatisfactory feature is that bank deposits have not registered a growth commensurate with the growth of our economy. Conditions have to be created under which there may be a revival of real savings and encouragement to domestic capital formation."

An important pre-requisite to our banks launching on any medium term credit experiment is that they should have an adequate credit base. With the ratio of advances of our commercial banks to their deposits being what it is today, it is clear, again, as Mr. Birla pointed out, that they lack the credit base to carry the additional burden of providing medium-term finance to our industries. In view of this, two splendid suggestions were made by Mr. Birla, one to promote long-term deposits from the public and the other to use the counterpart funds of the US wheat loan to India for assistance to industries in the private sector as, in fact, these are required to be used under our agreement with the US Government. Because the first will take some time and as the problem requires to be urgently tackled, he wanted a beginning to be made with his second suggestion. Herein lies the nucleas of the newly blossomed Refinance Corporation, and it is just as well that it took this form. For, according to an earlier proposal which fortunately received short shrift, it would appear, these counterpart funds were to have been entrusted to the State Bank of India and distributed to industries in the private sector through selected commercial banks.

It is against this background that one has to view the structure of the newly created Refinance Corporation and its future scope. By creating an altogether new body, the Government of India must be said to have blunted the edge of the controversy that, as between the State Bank of India and the Finance Corporations, the latter should have received preference. In the event, the controversy proved to be a case of a quarrel between the two benefiting the third but, in this case, it so happens that the third is the deserving third. The structure of the R.C. is such as to ensure the co-operation of all that matter and the participating banks in particular which have had their problem of finding finance for giving medium term credit all but solved for them. The R.C. starts with a bang as it were, having as much as Rs. 38.5 crores even to begin with, and, out of this total, all that the participating banks have had to find is no more than Rs. 2.5 crores. Each of these banks will have a quota related presumably to its subscription to the R.C.'s initial capital and, out of this quota, the bank concerned can satisfy the demand for medium term credit of any of its clients subject to the maximum loan for a borrower of Rs. 50 lakhs. Normally, for the smaller industries which are the ones generally that are most handicapped for medium term finance, this amount should be enough to tide them over a temporary crisis. To the banks, the R.C. provides an additional source of business and the 1½ per cent they are allowed to charge over and above the rate they have to pay to the R.C. should satisfy them, inasmuch as it is more than the servicing charges for such transactions which co-operative institutions are permitted to receive. It is true that the participating banks have to hold themselves responsible for their respective clients, but this is of the very essence of the scheme, for, if banks cannot take the risk in respect of their own clients, who will do it? In this respect, they are any day better placed than Finance Corporations. There is no reason, therefore why they (banks) should not assume the risk and think in terms of asking the Government to share the risk. It is like Oliver Twist asking for more of the Government.

BUSINESS NOTES

INDO-JAPANESE CO-OPERATION

THE POST-WAR reconstruction of Japan and the unprecedented progress it has made in the field of industry and commerce in recent years is a source of inspiration and guidance to many Asian and African countries, which are now engaged in economic development, after decades of foreign rule. Their achievements are a proof of, and a testimony to, their patience, initiative, courage and entrepreneurial zeal. India too has much to learn from Japan, especially in the development of cottage industries, which have been assigned an important place in our second Five-Year Plan. Indo-Japanese friendship, particularly in the field of commerce and trade, has its roots in very olden times. Both Mr. F. Hayshi, the outgoing Consul-General for Japan, and Mr. D. N Shroff, Chairman of the Silk and Art-Silk Mills Association, very pertinently stressed this point — Indo-Japanese friendship and co-operation — on the eve of the former's departure and a send-off to him at the "Resham Bhavan", in Bombay, last week.

Mr. Shroff expressed the view that the Indian Rayon industry owes its inception to Japan, for, during the thirties of this century, he said, there was a tremendous flow of Japanese Art Silk fabrics to India which attracted the business minds of this country, and providing an initiative to try their hands in this line. Though there are certain similarities in the conditions prevailing in both the countries there is one striking disparity, namely, the shortage of raw material in India; also labour is not as cheap or skilled as in Japan. The shortage of raw materials is, as Mr. Shroff said, due to stringency of foreign exchange, on the one hand and the inadequecy of indigenous production on the door. Continuing, the Silk and Art-Silk Mills' Association's chief expressed the hope that the business relationship between the members of his Association with the Japanese manufacturers would increase in the years to come, as mutual business has been progressively increasing. He further hoped that both the countries "will join hands and explore every possibility of increasing the volume of intra-regional trade in Asia and the Far East as desired by the Economic Commission for Asia and the Far East."

STRAINS IN TEXTILE INDUSTRY

IN HIS speech at the annual general meeting of the shareholders of the Buckingham and Carnatic Company, Mr. R. E. Castell, Chairman, pointed out how the last year had not been an easy one for the textile industry. It was characterised by the accumulation of stocks and this may look odd when the total production of mill and handloom cloth minus the quantity exported provided only 16 yards 'per capita'. The explanation seems to lie in the fact that it is due to the restrictive effect on purchases by the higher costs and the diversion of spending by the people to other essentials. The demand for cloth, however, is bound to grow in the coming years and Mr. Castell's view that the official estimate that the 'per capita' demand for cloth would be 18½ yards by 1960-61 errs on the conservative side accords with a realistic appraisal. Mr. Castell has also pointed out that the circumstances in which the excise duties were imposed gave rise to a widespread belief that they were of a temporary nature and that cloth would be available later on at cheap rates. Though this has not materialised, there is no reason why Government should delay the implementation of their plans for increasing cloth production when demand is bound to outstrip supply in the future.

However, here again the mill industry is faced with obstacles. Mr. Castell has explained how the conditions attached by Government to the scheme for expansion of the mill industry are most exacting, especially the obligation that all the production of the new looms must be exported in addition to almost all the production previously exported. Government have also stipulated that for every yard of the guaranteed quantity not exported, a penal duty will be levied on the mill concerned. This condition would certainly involve a serious risk for the industry in view of the increasing competition in overseas markets. Mr. Castell has, however, told the meeting that so far as the company is concerned they have decided that in spite of the risks they should not miss the opportunity of increasing the productive installation of their mills. Hence they had agreed to the allocation of 144 new automatic looms. (The Government's plan in this regard, for the mill sector, it may be mentioned, is to instal 14,600 additional automatic looms to produce 350 million yards of cloth for export). The export sales of the company last year has been creditable in spite of keen foreign competition and it earned foreign exchange to the value of nearly Rs. 1,90,00,000. Whether it would be able to maintain the same level would depend on their success in getting essential machines, components, etc., for their modernisation programme, which seems by no means easy in view of the foreign exchange difficulties.

EXPORT PROMOTION: A.I.M.O.'S MEMORANDUM

THE PATTERN of India's foreign trade, particularly since the implementation of the first Five-Year Plan, has been undergoing significant changes to suit the requirements of the country's developmental programme. One such change is the shift from raw materials to semi-manufactured goods in the composition of exports and to capital goods in that of imports. This shift, which is clearly reflected in the large deficits of our balance of payments, almost from the commencement of our second Five-Year Plan, has led to a foreign exchange crisis. Export Promotion, one of the main ways of bridging the yawning gap in our foreign exchange budget, has accordingly been receiving increasing attention lately. An Export Promotion Committee has been appointed which is even now examining the ways and means of promoting exports. In a comprehensive memorandum which the All-India Manufacturers' Organisation has submitted to the Committee, the Organisation deals with various aspects of this vital problem. The Memorandum while appreciating the anxiety of the Government to augment its foreign exchange resources, urges, among other things, creation of Export Promotion Councils for various commodities, setting up of Commodity Boards, diversification of exports, vigorous drive to increase tourist traffic intensification of publicity abroad, expanding and strengthening trade commissioners' and commercial secretaries' institutions etc; and lays particular stress on four important facets of this problem, namely, the "Price factor," the quality factor, the transport problem and the "invisible items".

Regarding the price factor, the memorandum says that as the Indian exporter has to offer competitive prices in foreign markets, the Government should, by various fiscal measures, enable him to face competition from other countries in the market abroad. The second factor — the quality factor — is perhaps still more important to safeguard the interests of Indian exporters in the international markets. "Constant endeavour", as the memorandum says, "to improve the quality of our products to meet the demand and taste of discriminating foreign consumer" is imperative. This improvement of quality must be sustained so as to maintain the reputation once attained. With regard to transport — a

vital link in the chain of economic development — the memorandum suggests that the freight rate structure of goods meant for export should be so revised as to help the exporter in increasing his competitive capacity in foreign markets. Finally, the AIMO contends that there is considerable scope for augmenting our foreign exchange earnings through the three "invisible export items" namely, banking, insurance, and shipping. It is well known that the foreign exchange banks are better placed than their Indian counterparts in regard to providing credit facilities to their customers. As our exchange banks are still relatively new to foreign exchange and as the financial resources of our banks are severely limited vis-a-vis those of their foreign counterparts, they are not in a position to serve our export trade to the extent necessary. Besides, it is the AIMO's view that a considerable amount of foreign exchange could be earned through insurance, which is given "little direct or indirect encouragement by the Government." It suggests for instance, that by giving every possible encouragement, such as giving exemption from taxation on profits earned by the insurance companies on their operations abroad, the scope for earning foreign exchange could be increased. The memorandum also urges the Government to increase the tonnage of Indian shipping by providing assistance, such as loans on liberal terms to private companies for acquisition of ships. It also pleads for more direct shipping services with various parts of the world, particularly with those countries with which India has greater trade relations. As it is, the AIMO fears that even the modest target of 0.5 million tons, fixed by the Planning Commission for overseas tonnage may be difficult to reach due to financial stringency. It, therefore, makes the bold suggestion "that the World Bank should be approached for a loan of foreign currency against the mortgage of ships to be purchased". Inasmuch as the foreign currency borrowed thus will start earning foreign exchange almost immediately, the Organisation adds, it will not be a burden at all.

SCOPE OF CHEMICAL INDUSTRIES

IT IS heartening to learn from the speech of Mr. Manubhai Shah, delivered at the first meeting of the reconstituted Development Council for Heavy Chemicals, that the Chemical and Alkali industries in the country had now reached a stage of development when not only quick expansion could take place, but a growing export market for their exports could also be developed. The Minister disclosed that the Government had decided to set up an Export Promotion Cell in the Development Wing of the Ministry of Commerce and Industry. The Cell, which would cover heavy industries, engineering industries, chemical industries and consumer and light industries, would try to co-ordinate the work of the Development Councils on the one hand and the export promotion bodies on the other.

One salutary aspect of the reconstitution is that it may be possible to evolve a National Fertiliser Policy in close collaboration with the Ministry of Food and Agriculture and other Government agencies concerned. There is no doubt that dependence on the production of one type of fertiliser alone, namely, nitrogenous fertilizer is out of the question. Modern agricultural practices, of course, do require a balanced development of nitrogenous as well as phosphatic and potassium fertilizers. It is on account of this that a proper development of phosphoric acid and phosphatic industries is to be struck. India at present exports 1.5 to 2 lakh tons of bones every year. It is felt that if bone utilization plants of economic sizes were set up in the North, South, West and Central Regions of India, near the caustic soda chlorine factories, the country could gain valuable products like bone meal, ossein for high grade gelatin and glue and phosphates which may also enable us to earn more foreign exchange.

It was revealed by Mr. Shah that a joint meeting of Development Council for Alkalis, Acids and Fertilizers, Drugs and Pharmaceuticals and representatives of other Ministries would be held next month in Bombay. A joint meeting of the Development Council is to be welcomed as it may help in evolving soon a national drug policy, based on the indigenous manufacture of primary intermediates, synthetic drugs, vitamins, antibiotics, alkaloids and other drugs and heavy alkalis and acids.

BANGALORE WOOLLEN

Mr. R. E. CASTELL, Chairman of the Bangalore Woollen, Cotton and Silk Mills Company in his address to the annual general meeting of the Company, drew pointed attention to one aspect of the company finances that is causing some genuine concern to those connected with business, viz., the compulsory deposit scheme. The draft rules recently published have not made it clear whether the reserves employed as working capital would be exempt from making such deposits. Referring to this aspect, Mr. Castell has pertinently observed "Your Directors view with grave concern the implications of the provisions relating to the compulsory deposit with the Central Government of certain proportions of accumulated and current reserves. This company, which has consistently followed the conservative finance policy of a reasonable allocation of profits between dividends and reserves is all the more adversely affected by this recent legislation and I can only hope that the draft rules, which have recently been published for general information, will finally make it clear beyond all doubt that those companies where the reserves are being fully used for the purpose of the business will be exempt from making such deposits".

For the rest, the Chairman dealt with the progress of the company. In spite of intense competition in overseas markets, the company's export sales of cloth in 1956 were considerably more than in the previous year. After several years of losses, the company's woollen section made a modest profit in 1956. Production and sales in the company's silk section also exceeded all previous records. The company has also decided not to miss the opportunity to expand their existing installation and has accepted an allocation of 96 new automatic looms and its further plans of expansion would depend on the policy Government is to announce regarding the other looms which they have to buy from abroad.

Company Meetings

THE BUCKINGHAM & CARNATIC CO. LTD.

CHAIRMAN'S SPEECH

Presiding at the Thirty-sixth Annual General Meeting of the Shareholders held at the Company's Office, 7, Armenian Street, Madras, on Friday, 26th April, 1957, Mr. R. E. Castell said:

Gentlemen,

The Report of the Directors and the Accounts for the year ended 31st December, 1956, having been in your hands for the requisite time, I propose with your permission to take them as read, but I will be glad to reply to questions later.

The delay in publishing the accounts and the holding of the Annual Meeting is regretted, but is due to the many complications which arose in preparing the accounts in accordance with the new Companies Act and because of the additional notice to shareholders which it is now necessary to give under that Act.

The year under review was not an easy one for the Indian textile industry and the present trading results of your Company for 1956 owe much to the progress made with modernisation of machinery and manufacturing methods and to the continuing popularity of the Company's products. That this process of modernisation should be continued is essential for maintaining the Company's high standard of quality and to mitigate the effect of higher wages, heavy sales taxes and excise duties, by every possible economy in production methods. There are obstacles now in prospect which are likely to impede our further efforts with the general programme of modernisation, and I think it right that you should be informed of your Directors' present anxiety on this matter. The obstacles before us arise from India's present shortage of foreign exchange, which has caused Government to adopt a most stringent import licensing policy. The effect on your Company seems likely to be serious as much of our programme of modernisation depends on our obtaining machinery and components which at present can only be secured abroad, and which may not for many years yet be made in India, whereas our needs are urgent.

Our first new Weaving Shed reached the stage of full operation in 1956 and has made a substantial contribution to the increase in the Company's productivity. The completion of our second new Weaving Shed, the building of which is already well advanced, forms an important part of our modernisation programme and to make this second new Weaving Shed as efficient as the first, we require a range of foreign precision-made components for rehabilitating the existing automatic looms to be transferred to it from the old buildings. The issue of import licences to cover these components is of vital importance.

Yet another cause of anxiety is the prospect of drastic cuts in imports of dyestuffs, textile auxiliaries and other essential stores not now made in India, but which are so vital for our present standards of quality and variety. As you know, almost every yard of your Company's production is either bleached or dyed, and much of it is specially finished by one process or another. Unless we have the materials necessary to supply a range of well woven and properly finished cloths in pleasing and lasting colours, we cannot hope to continue to satisfy the Indian public or our customers overseas, who can afford to be fastidious and exacting, as there are other manufacturing countries eager and well equipped to supply all their needs.

The textile industry as a whole was embarrassed last year by accumulation stock and this difficulty generally continues. Your Company was not much inconvenienced in this way, but in spite of the widespread popularity of their products, it was found necessary to reduce prices in order to compete overseas and internally to absorb some part of the heavy increases in excise duties during the year, particularly those from 1st September, 1956.

The final official estimate was that by 1960-61 the per capita demand for cloth would be 18½ yards: other authorities, including representatives of the textile industry, and I share their opinion, consider the official estimate too low. At first sight it seems strange that stocks should have accumulated in 1956 when the total production of mill and handloom cloth, less the quantity exported, provided only 16 yards per capita. While there is no doubt that the higher cost to the consumer had in itself a restrictive effect on purchases, the circumstances in which the latest excise duties were imposed gave rise to a widespread belief that they were of a temporary nature and that cloth would be available later on at cheaper rates. There also seems to have been some diversion of spending by the masses to other essentials and to luxuries also.

I am still convinced, however, that within the next year or two the demand for cloth is likely to exceed supply, and I hope, therefore, that Government will not unduly prolong the implementation of their plans, announced in June 1956, for increasing cloth production.

As you will remember, these plans included the handloom industry and the mills, not to mention the powerlooms and the Ambar Charkha: for the Mills the plan was to instal 14,600 additional automatic looms to produce 350 million yards of cloth for export. The conditions attached by Government to the scheme for expansion of the mill industry are most exacting, particularly in the obligation that all the production of the new looms must be exported in addition to almost all the production previously exported. For every yard of the guaranteed quantity not exported, it is intended that a penal duty will be levied on the mill concerned. This condition involves a serious business risk for the industry, in view of the ever increasing competition in overseas markets, which has been reflected in the progressive decline in India's exports of cloth for the past three years.

However, after very careful consideration of all the circumstances, your Directors decided that in spite of the risks, it would be wrong to miss the opportunity

of increasing the productive installation of your mills, for which we have all waited so long. We, therefore, accepted an allocation of 144 new automatic looms, but I am sorry to say that we cannot proceed with the procurement of the additional machinery until Government have announced their policy regarding the looms and other machinery which it will be necessary to import in order to expand our unit with proper efficiency. Even if Government make a decision soon, it is unlikely that the new machinery can be installed and in operation before the end of 1958 at the earliest.

I am glad to tell you that by strenuous effort we succeeded in increasing our export sales last year in the face of keen foreign competition with the result that in 1956 your Company earned foreign exchange to the value of nearly Rs. 1,90,00,000. We shall strive to improve on this performance, but it will be difficult even to maintain it unless we continue to be supplied with those essential machines, components, dyestuffs and other materials which we can as yet only obtain from abroad.

In 1956 nearly 10,000 bales of yarn were supplied by your Mills to the handloom industry against 8,500 bales in the previous year. It is possible that in the next year or two. with so many new spinning mills coming into production, and the spindleage of existing mills being increased, our statutory obligation to supply in quantities which are large for a composite mill such as ours, will be reduced or even removed.

When I addressed you last year, I mentioned that certain disputes which had been raised by labour were to be the subject of arbitration by the Hon'ble Mr. justice Ramaswamy Gownder.

In all, thirteen major issues were referred to the Arbitrator including such important ones as wages, leave facilities, bonus, shift timings, dearness allowance and gratuity.

The Award was recently published and by it Labour was granted an increased minimum basic wage, a short term Gratuity Scheme and certain other benefits. The rate of dearness allowance, the system of bonus, the leave facilities and shift timings were left unaltered, but in all, the Award has placed a considerable additional financial burden on the Company.

During the year there were one or two stoppages by sections of labour but fortunately work was resumed before interruption of the production of the Mills as a whole assumed serious proportions.

For reasons which are difficult for us to understand, the Madras Labour Union withdrew from the Mill Labour Advisory Organisation.

There is little to comment, I think, on the published Accounts which are now shown in much greater detail than has been the practice in the past. It was unfortunate that the improvement in production was offset by increased costs and reductions in selling prices.

It has been necessary to allocate Rs. 20 lakhs from Profit and Loss Account in respect of the short-term Gratuity Scheme, to which I have already referred, this being the estimated liability on this account as at the date of the Balance Sheet.

You will note that an amount of Rs. 35,50,000 has been transferred from Taxation Reserve to the Provision for Increased Replacement Costs of Buildings and Machinery and, as this represents relief from taxation on our profits for 1954 and 1955 through the operation of allowances for initial and extra normal depreciation and development rebate, it is but logical to utilise it for the purpose for which it was intended by the Government of India, that is, to finance the expansion of our reconstruction programme.

Debentures to the face value of Rs. 8,50,000 were redeemed and cancelled during the year and, in accordance with our practice, a similar amount has been transferred from the Debenture Redemption Fund to the Provision for Increased Replacement Costs of Buildings and Machinery.

Since the introduction of the Interim Budget in December, 1956, your Directors have been perturbed by the implication of the provisions relating to the compulsory deposit with the Central Government of certain proportions of accumulated and current reserves. It is obvious from our published accounts that the effect of this legislation could be extremely serious for your Company and it is, therefore, sincerely to be hoped that the draft rules which have recently been published for general information will finally make it clear beyond all doubt that those Companies whose reserves are being fully used for the purpose of the business will be exempt from making such deposits.

The liabilities of the Workpeoples' and Employees' Provident Funds, the accounts of which are now maintained by the Trustees, amounted at the 31st December 1956 to Rs. 1,50,47,590 and Rs. 13,32,355 respectively, and corresponding amounts have been invested in Trustee Securities.

In 1956, the Company made a donation of Rs. 75,000 to the University of Madras on the special occasion of its Centenary. This sum combined with donations from the Bangalore Woollen, Cotton & Silk Mills Co., Ltd. and Binny & Co. (Madras) Ltd., has been earmarked to provide a hostel for accommodating research students in chemical engineering, textile technology and allied subjects.

Nowadays there is little if anything which is either private or free in that sector of enterprise in which we are engaged but in spite of all new problems and difficulties your Company has made further progress. I would like once again to ask you to join me in a word of praise for the executive and supervisory staff of the Management and the Mills. By their conscientiousness and zeal, they are helping your Company to make a valuable contribution towards the second Five-Year Plan and I only wish that their efforts could be rewarded and further inspired by some mitigation of the present harsh personal taxation.

I deeply regret the untimely death last year of two former Directors of the Company, Mr. B. W. Batchelor, C.B.E. and Mr. D. V. Bulloch, whose energy, foresight and enterprise during their many years of service achieved so much for the lasting benefit of your Mills.

Note:—This document does not purport to be a report of the proceedings of the General Meeting.

THE BANGALORE WOOLLEN, COTTON & SILK MILLS CO., LTD.

CHAIRMAN'S SPEECH

Presiding at the Seventy-Fourth Annual General Meeting of the Shareholders held at the Registered Office of the Company, Agraharam Road, Bangalore City, on Saturday, 27th April 1957, Mr. R. E. Castell said:

Gentlemen,

The Directors' Report and Accounts for the year ended 31st December 1956 having been with you for the requisite time, I propose with your permission to take them as read, but after my speech I shall be glad to attend to any questions members may wish to ask.

The delay in publishing the accounts and the holding of the Annual Meeting is regretted. It is due to complications arising from the introduction of the new Companies Act and because of the additional notice to shareholders which it is now necessary to give.

As you will see from the accounts, your Company has concluded another successful trading year, the results of which have been assisted by the continuing programme of rehabilitation and replacement of machinery and the further improvement of processing methods. In spite of all that has already been accomplished, we still have a long way to go before we can complete our plans for modernisation and for this purpose more machinery and components are required, some of which must of necessity be imported, and we trust that our further progress in this direction will not be retarded by the present stringency in Import licensing arising from the shortage of foreign exchange.

As you know, your Company manufactures an unusually wide range of textile fabrics, including cotton, woollen, union and silk goods, and to maintain our reputation for quality and variety, it is impossible to rely wholly on equipment and materials made in India. Apart from the matter of machinery, therefore, your Directors are perturbed by the prospect of severe cuts in imports of those dyestuffs and other essential stores which can only be obtained abroad.

Last year, the Indian textile industry as a whole experienced an accumulation of stocks, and these conditions still obtain. I think it must be accepted that the heavy increases in excise duties during 1956 were largely responsible for the decline in offtake. Traders have developed the habit of buying cautiously partly because of the general impression that the last increases in excise duties on 1st September, 1956 were a temporary measure, and also because of the uncertainty about Government's intentions for replacing existing sales taxes on cotton textiles by excise duties. The consumer is also being cautious or maybe he is spending more of his money otherwise.

There was no serious accumulation of stocks in your Mills during the year, but it was found necessary to reduce prices for cotton cloth in order to keep goods moving despite the increases in excise duties already mentioned. It seems strange that the supply of cloth should be more than enough when only 16 yards of mill and handloom cloth is presently available for internal consumption and one could reasonably expect demand to be rising towards the official estimate of 18½ yards as at the end of the second Five-Year Plan, an estimate which many of us consider to be too low.

I do not think, however, that we should be misled by the present apparent adequacy of supply as within a year or so there is more likely to be a shortage. I hope, therefore, that Government will proceed with their plans announced last year for the expansion of the textile industry. For the most part these plans depend on expansion by the handloom industry assisted by Spinning Mills and Ambar Charkhas, and on conversion of handlooms to powerlooms. The expansion of composite mills has in fact been linked to the export trade.

The conditions laid down by Government for the installation of additional automatic looms were difficult in several respects, particularly in their insistence that all the production of the new looms be exported, as well as almost all the production previously exported. However, after carefully considering every aspect of the matter, your Directors decided that the Company should not miss the opportunity to expand their existing installation. We have, therefore, accepted an allocation of 96 new automatic looms, of which we have agreed to buy 24 from Indian manufacturers. We are waiting for Government to announce their policy regarding the other looms which we need to buy abroad.

In spite of intense competition in overseas markets, the Company's export sales of cloth in 1956 were considerably more than in the previous year, and we shall continue to exert ourselves to secure foreign exchange for India by further developing our export trade.

It is pleasing to record that after several years of losses, the Company's woollen section made a modest profit in 1956. This change of fortune was the result of sustained efforts by our technical ,administrative and sales staff to increase production and to introduce new qualities and designs. Every further effort will be made to ensure that the woollen section continues to pay its way, but a fair reward is unlikely to come to us or any other unit of the Indian woollen industry so long as the present heavy excise duties and cesses apply to woollen goods. Also, for some time now we have had to pay higher prices for wool, both indigenous and imported.

The year brought a further increase in production and sales of our popular Union fabric "Cotswol" and of the heavier cloth "Angola" which although mainly supplied to the Armed Forces is also in general demand.

Production and sales in the Company's silk section exceeded all previous records, but we now face a new problem in that we specialise in the manufacture of superior quality silk sarees and other fabrics, and although we use considerable quantities of raw silk produced in Mysore State, we must rely on importing a proportion of our requirements of filature silk and most of our needs of spun silk to maintain our reputation for the quality of our silk fabrics until such time as the indigenous materials are further improved. Unfortunately supplies of the imported materials have lately been severely cut and unless we can find some remedy for this, our production and trade in silk fabrics is likely to be seriously disturbed.

The imposition of a heavy octroi duty on raw materials and other essential items entering the City limits, announced by the Bangalore Corporation in 1954 is still a matter serious in its implications. The Company lost its case in the Mysore High Court, but has decided to appeal to the Supreme Court, for if this

duty prevails, the local industry will be handicapped by an increase in costs which will not affect other manufacturing centres.

Towards the end of 1956, the Company was asked to reduce consumption of Corporation water supply by 40 per cent. So heavy a reduction would have seriously disturbed the Company's manufacturing activities, but fortunately the Authorities later agreed to reduce the cut to about 20 per cent. Within this limit we have so far managed to avoid any serious dislocation of our output, but although we shall continue to do everything we can to offset the reduced water-supply by economies in consumption and use of bore well water, we hope that the former full supply of Corporation water will be restored shortly.

Although during the year we were involved in long discussions and negotiations with the Labour Association on a number of issues, I am glad to say that there were no stoppages of work causing loss of production.

Your Directors have set aside Rs. 3 lakhs to cover the estimated cost of Workpeople's housing during 1957, including the electrification of all the houses in Binnypet Village.

The published accounts, particularly the Profit and Loss Account, have this year been shown in much greater detail and I think, give you all the information you require regarding the financial position and the trading results of the Company.

Although there was a slight reduction in the profits of the Cotton Section, satisfactory trading in all other sections was responsible for the improvement in the profits when compared with the previous year.

You will observe from the comparative figures given in the Directors' Report that the allocations for Depreciation, Bonus, Officers Retiring Fund and Dividends remain approximately the same, but that it has been necessary to increase the Provision for Taxation by Rs. 9½ lakhs in order to cover the liability on the higher profits and also that arising from the additional burdens placed on companies by the Finance Acts of 1956.

In this regard I refer to the incidence of the increased Dividend Tax which is particularly severe on Companies where the ordinary capital represents a relatively small proportion of the total effective capital. In the case of your Company, for example, the ordinary dividend represents a modest distribution of profits of slightly over 4 per cent on the ordinary capital plus the reserves and it seems to me inequitable that we should be called upon to pay the excess Dividend Tax. However, merely because this tax is assessed arbitrarily on the rate of dividend on the ordinary capital, we are liable to an additional tax of Rs. 2,83,500.

Your Directors view with grave concern the implications of the provisions relating to the compulsory deposit with the Central Government of certain proportions of accumulated and current reserves. This Company, which has consistently followed the conservative financial policy of a reasonable allocation of profits between dividends and reserves is all the more adversely affected by this recent legislation and I can only hope that the draft rules, which have recently been published for general information will finally make it clear beyond all doubt that those Companies where the reserves are being fully used for the purposes of the business will be exempt from making such deposits.

At an Extraordinary General Meeting of the Company held on the 29th March, 1957, the necessary resolutions authorising the capitalisation of Rs. 81 lakhs from reserves and the issue to shareholders of two ordinary shares for each ordinary share held by them on that date were unanimously passed and the new share certificates are now being prepared and will shortly be issued to shareholders.

You have already received notice of an Extraordinary General Meeting which is to be held later this morning for the purpose of passing certain resolutions regarding the re-appointment of Binny & Co. (Madras) Ltd. as Managing Agents of the Company for a period of 10 years with effect from 1st January, 1957. The results of their management over a long period of years are well known to you. I am happy to inform you that the Central Government have approved of their re-appointment and your Directors recommend these resolutions for your approval.

The Workpeoples' and Employees' Provident Funds do not appear in the published accounts of the Company as they are vested in Trustees. The liabilities of these Funds as at 31st December, 1956, amounted to Rs. 64,12,070 and Rs. 4,58,264 respectively and corresponding amounts are invested in Trustee Securities.

I feel you will wish to join me once again in expressing appreciation of the valuable work done by the executive and supervisory staff of the Management and the Mills.

I deeply regret the untimely death last year of two former Directors of the Company. Mr. B. W. Batchelor, C.B.E., and Mr. D. V. Bulloch, who worked in Bangalore for several years and whose endeavours over a long period contributed much to the present efficiency and prosperity of these mills.

COMPANY AFFAIRS

TEXTILES AT AHMEDABAD

Some Ahmedabad Textile Mills show impressive working results during the year ending December 31, 1956. This has been in spite of increases in excise duty on cloth in March and September 1956. The present excise duty works out at 4 annas on Superfine, 3 annas on Fine, 2 annas on Medium and 1½ annas on Coarse Cloth (other than coarse dhoties and sarees on which the duty continues at ½ anna) all on a sq. yard basis. The directors of these companies feel that owing to the increase in the scale of excise duties and other disturbing features of Finance Bill proposals, all markets have received a shock from which they have not yet recovered.

As clear from the table below the sales have remained steady and profits and dividends are higher than those of the year before. Even the provisions for Depreciation and Taxation are substantially higher.

The programme for Reorganisation, Renovation and extension is common to all the four mills under review.

THE ARVIND MILLS LTD.

The rise in profits in the case of the Company under review is encouraging in view of the unfavourable conditions stated above. The dividend has, therefore, been paid at Rs. 17-8 and a bonus of Rs. 10 per ordinary share, income-tax free, for the second half of the year ending December 31, 1956. Provision for Depreciation, Development and Rehabilitation has been raised to Rs. 24.45 lakhs during the year under review against Rs. 13.52 lakhs last year. Provision for Taxation is also higher at Rs. 37.0 lakhs against Rs. 19.5 lakhs during the previous year.

The Company has spent Rs. 29.8 lakhs on the extension of buildings and installation of new machinery and equipment.

A sum of Rs. 13.75 lakhs, which was a part of the undivided profits of the Company standing to the credit of the Reserve Fund was capitalised and 13,750 ordinary shares of Rs. 100 each were issued and were entitled to dividend from January 1, 1956.

THE ASOKA MILLS LTD.

The sales (cloth, yarn and waste) of the Company during the year ending December 31, 1956, have improved to Rs. 217.7 lakhs against Rs. 207.3 during the previous year. This improvement is in spite of the hardships being faced by the Textile Industry. The profits too have improved to Rs. 16.0 lakhs against Rs. 14.2 lakhs during the last year. The amount appropriated for Depreciation, Development and Rehabilitation is also higher at Rs. 5.97 lakhs against Rs. 3.1 lakhs during the previous year. Similarly provisions for taxation are also higher at Rs. 14.0 lakhs against Rs. 13.25 lakhs.

The directors have decided to maintain the last year's dividend rate of Rs. 30 per cent per ordinary share, income-tax free.

The extension of building and new machinery installation programme of the Company has progressed very well and a sum of Rs. 10.94 lakhs was spent on this account during the year under review.

The installed capacity of the mills is 37,368 Ring Spindles and 914 looms with complete Dyeing and Bleaching plants.

THE SARASPUR MILLS LTD.

The profits of the Company during the year under review, before providing for depreciation and taxation, are higher at Rs. 25.6 lakhs against Rs. 24.4 lakhs during the previous year. The profit transferred to appropriation account, however, is lower at Rs. 9.19 lakhs, because the provisions for depreciation and taxation are higher at Rs. 5.42 lakhs and Rs. 11.00 lakhs respectively against Rs. 4.10 lakhs and Rs. 9.35 lakhs for the same items last year

The directors have decided to maintain last year's rate of Dividend at Rs. 20 per ordinary share, income-tax free.

The Company has spent Rs. 7.99 lakhs on extension of buildings and installation of new machinery and equipment during the year under review. A sum of Rs. 8.00 lakhs, a part of undivided profits standing to the credit of the Reserve Fund was capitalised and 8,000 ordinary shares were issued.

THE AHMEDABAD NEW COTTON MILLS. CO., LTD.

The gross profits (including provisions for taxation and depreciation) of the Company for the year under review stand at Rs. 14.3 lakhs against the previous year's Rs. 13.9 lakhs. The Company has transferred Rs. 6.35 lakhs and Rs. 4.50 lakhs towards depreciation and taxation against last year's Rs. 5.00 lakhs and Rs. 3.58 lakhs respectively.

Of Rs. 3.46 lakhs transferred to appropriation account, a sum of Rs. one lakh has been taken over to Reserve Fund and Dividend Equalisation Fund. The directors have recommended the payment of Rs. 20 per share on 10,000 ordinary shares. Last year's dividend of Rs. 30 per share was on 6,000 ordinary shares. 4,000 shares were issued this year by capitalising a part of the undivided profits (Rs. 4.0 lakhs) standing to the credit of the Reserve Fund.

The Company has spent Rs. 8.78 lakhs on reorganisation and renovation programme during the year under review.

WORKING RESULTS OF AHMEDABAD TEXTILE MILLS

(Rs. lakhs)

		Sales	Salaries and Wages†	Depreciation	Provision for Taxation	Profit	Dividend (Percentage)
Arvind	1955	348.9	67.9	13.5	19.5	25.2	27.5
	1956	348.3	67.6	24.5	37.0	26.4	27.5
Saraspur	1955	200.0	40.3	4.1	9.4	10.9	20
	1956	202.1	46.0	5.4	11.0	9.2	20
Asoka	1955	207.3	40.9	3.1	13.2	14.2	30
	1956	217.7	47.1	6.0	14.0	16.0	30
Ahmedabad	1955	122.6	22.8	5.0	3.9	5.1	30
	1956	121.7	27.5	6.3	4.5	3.5	20

Note: Salaries and wages include Bonus and other welfare expenses. Depreciation includes provision for Development and Rehabilitation. Profit here is indicated after taking out provisions for taxation and depreciation. The Dividend for Arvind Mills is for the second half year and includes a bonus of Rs. 10 each share. The dividend is on ordinary shares only.

COMMODITY NEWS AND NOTES

COTTON ESTIMATE FOR AFRO-ASIAN COUNTRIES

According to an estimate of the American Cynamide Company the 15 biggest Afro-Asian Cotton Growing countries will be able to produce as much as 17 million bales of cotton a year by 1960. This means an increase of about 20 per cent over the present total cotton crop of the 15 countries which is around 14.7 million bales. This will be about 20 to 25 per cent more than the usual yearly cotton crop of the U.S.A., the world's biggest producer. It is said that main cotton crop losses result from insects and are for the most part due to lack of newly discovered insecticides. It is claimed that the use of latest insect controls could lead to the following cotton production figures by 1960. India 5 million bales, Pakistan 1.7 million bales, Turkey 750,000, Syria 600,000, Iran 330,000, Burma 120,000, South Korea 87,000, China 4.8 million, Egypt 1.9 million, Sudan 540,000, Uganda 360,000, Belgian Congo 300,000, Nigeria 200,000, Mozambique 200,000 and Tanganyika 120,000.

JAPAN IMPORTS MORE SALT FROM INDIA

It is reported, Indian salt has gained considerable ground in the Japanese markets. India's share in total salt imports into Japan is estimated to have risen to 12 per cent last year from 8 per cent in 1955. During January-November, 1956, Japan imported 2,038,838 tons of salt, out of which India supplied 252,138 tons. The corresponding figures for the previous year were 1,748,276 tons and 145,675 tons respectively.

COAL RAISINGS AND DISPATCHES

Raisings and dispatches of coal recorded on all-round increase in March this year. According to official figures, production from all fields in India during the month under review was higher at 3,652,375 tons in February, 1957. Dispatches, however, showed a rise of nearly 400,000 tons from 2,850,781 tons in February, 1957, to 3,250,689 tons in the next month. Total raisings and dispatches of coal during the first quarter of 1957 were also higher at 10,798,207 tons and 9,237,998 tons compared with 9,902,934 tons and 8,314,566 tons respectively in the same quarter of last year.

TEA EXPORTS

Tea exports from major tea producing countries — India, Pakistan, Ceylon and Indonesia — rose to the record level of 989.6 million lbs. in 1956 from 834.4 million lbs. in previous year. Out of an increase of 155 million lbs. in total exports, India alone accounted for 148.5 million lbs., with exports rising from 365.6 million lbs. in 1955 to 514.1 million lbs. last year. Exports from Pakistan and Indonesia at 51.4 million lbs. and 75.9 million lbs. also showed a rise of 9.3 million lbs. and 11.5 million lbs. respectively. Shipments from Ceylon, second only to India as an exporter of tea declined to 348.1 million lbs. from 362.2 million lbs. in 1955. This is, however, no reason to be over-optimistic about the welcome upward trend in exports from India because the large increase was mainly accounted for by the carry-over of the previous season's teas and the 17 million lbs. of tea purchased by Russia during 1956-57.

KANKAR DEPOSITS IN ANDHRA STATE

Nearly 300,200 tons of kankar deposits in Bhadrachalam Taluk, East Godavari District of Andhra State has been traced by the Geological Survey of India. The deposits which occur in three areas east and south of Maduvayi, occupy a total area of about 32 acres. The analysis of the samples collected from the deposits reveal that it is of high grade and is suitable for the manufacture of cement. The Geological Survey of India, however, have advised that the question of utilising the kankar deposits in the area alone should not be considered in the manufacture of cement even to serve the local needs as the quantity available is very much limited. The question of manufacture of cement, it is stated, is linked with the scheme of exploiting the limestone at Cherla and Sudibaka where the deposits have been estimated to contain 185,000 and 160,000 tons of limestone respectively within a depth of 10 feet.

RESERVES OF MANGANESE ORE IN INDIA

The reserves of manganese ore in India have been estimated at about 112 million tons by the Indian Bureau of Mines. The reserves which are of all grades, are chiefly found in Madhya Pradesh — 100 million tons. The remaining 12 million tons are scattered in other areas. Out of the total reserves, about 60 million tons are of high grade containing 45 per cent and above of manganese. Manganese ore, which holds the second place in India's mineral production, occupies the first place in the list of minerals exported from India. The quantity of ore exported during 1955 was 837,000 tons. Of the total annual exports nearly three-fourths consists of high grade ore containing 48 per cent manganese. Exports of manganese, however, have been falling since 1953 when a maximum of 1.65 million tons were exported, earning foreign exchange worth Rs. 25.7 crores. The declining trend is attributable to lack of adequate enquiries from the U.S.A. which is the biggest purchaser of manganese ore in the world accounting for nearly 40 per cent of our annual exports. Competition from other producing countries, especially the re-entry of Russia's manganese ore in the European markets, has also been responsible. The production of the ore in 1955 which was 1,583,538 tons was higher as compared to the figure for 1954 namely, 1,413,068 tons. Under the second Plan, a production target of 2 million tons and an export target of 1.5 million tons has been proposed for manganese ore. The output of ferro-manganese is also to be stepped up from 28,000 tons to 160,000 tons by the end of the second Plan.

INCREASE IN RAPE AND MUSTARD PRODUCTION

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of rape and mustard for the year 1956-57 puts the current year's area at 2,682,000 acres, as against the adjusted second estimate of 2,564,000 acres for 1955-56. This shows an increase of 118,000 acres or 4.6 per cent in area over last year. The increase in acreage during the current year has been shared by Punjab, U.P., Bihar, Madhya Pradesh and Bombay and has been attributed to favourable climatic conditions at the sowing time. This increase has, however, been offset to some extent by the decreases reported mainly by Rajasthan and West Bengal. The information given in this estimate generally relates to the period up to the end of February 1957. Till then, the condition of the crop was reported to be generally satisfactory. This estimate relates to the area sown exclusively to pure crop. Information regarding the crop sown mixed with other crops will be given in the final estimate only. Past experience has shown that the area given in this estimate forms roughly 40 per cent of the area under the crop finally reported.

The Apotheosis of the Plan?

)N and reaction on the Budget have been st equal and opposite. The harsh blows d by the Finance Minister in his taxation ls on May 15 have raised throughout the country a powerful political current which, it would appear, cannot now be stayed. Some indication of the force of this current was seen in the meeting of the Congress Parliamentary Party

held last Saturday. That meeting at least technically was *in camera;* more significant is the open attack on these proposals delivered by Rajkumari Amrit Kaur, a Congress Member of the Rajya Sabha and an ex-Minister of the Central Cabinet. The extent to which various parties are vying with one another to protect the "common man" seems to indicate that concessions to public feeling cannot now be withheld. Again, if, as the Finance Minister stated, the taxation that he has imposed is "the least that could be done to save the Plan" it may be taken for granted that the Plan will not be saved.

While public feeling is unanimous that the existing proposals cannot go through, the Prime Minister and the Finance Minister alone have chosen to take a determined line on the fulfilment of the Plan. Since no major modification of the Plan can be made without the Prime Minister's approval, the question has naturally been asked how far the Prime Minister can resist the powerful pressure to reduce expenditure at least this year. It is to be noted that this Plan was not the original Rs. 4,800 crores project which *The Eastern Economist,* in common with many other leading journals in the country, supported as an appropriate follow-on of the first Plan which, in its last three years, seems to have provided a rate of growth of total national income of 3.5 per cent per year. It would appear in the first year of the second Five-Year Plan we have fallen back not a little in this rate of advance. And thus it is appropriate, both by reason of the fact that the original Plan has been substantially changed in financial terms, and its environmet, has for a variety of reasons, not lived up to expectations, that one should recognise that the fulfilment of the Plan today is different, both in substance and in perspective, from what it was twelve months ago. To insist that any Plan, whatever its size, shall be fulfilled whatever the circumstances implies an apotheosis of the Plan which can find no rational explanation.

Over the whole country today, there is growing the belief that the Government has lost its sense of proportion on the Plan. The Plan exists for the people; not the people for the Plan. There is something bordering on religious fanaticism in the Prime Minister's assertion that the Plan must be proceeded with at almost any price. It would appear that in People's China, which theoretically should be more rigid, there is now, as the following article will indicate, greater flexibility in the face of problems akin to our own. The expansion of the public sector at any price in the pursuit of ideas which a monolithic executive Government considers essential has a history as old as the Pyramids of Egypt and as new as Eastern Europe. The Pyramids, too, were great public works executed by Governments with a single mind. For a time they operated to the benefit of the people to whom substantial employment was given. But when the Pharaohs drove the Pyramids beyond the endurance of their people, and the capacity of the economy, they became instruments of terrible tyranny; in the end they demolished themselves and thus ended even Pyramid building, the supreme urge of their mistaken lives.

No Government with the need for accommodating its people dare ignore the lessons of ancient Egypt any more than the lessons of modern Eastern Europe. If, in a totalitarian administration of a kind of which there has been no parallel in the Communist World, excessive Pyramids could not be indefinitely imposed it surely is a great mistake to assume that in a democratic country similar excesses will be permitted. Nor should a cynical future historian ever be allowed to draw a comparison between first Indian dynasty after Independence and the rise and fall of the great Egyptian dynasties; or between the passion for Pyramids and the rapacious appetite we seem to have found for Plans of any and every size.

The Eastern Economist holds the view, which is argued more fully in the Blue Supplement in this issue, that it is a fundamental error to assume that, having conceived a Plan of any given size, one can impose at will any level of taxation required for its fulfilment. It believes that the Finance Minister has erred substantially in not cutting down expenditure as a partial alternative to his drastic taxation proposals. For one thing he will be unable, because of the political opposition that he has raised, to see the taxation proposals through. But even if he could, the disorganisation in the economy, particularly in the corporate sector, would be so great that future production would be substantially affected. If this should happen in respect of consumer goods, the inflationary factors in the economy which remain — and are even to be extended with deficit financing at an all-time peak of Rs. 275 crores — will bring us to a domestic crisis within the calendar year at the same time that we shall be facing a severe foreign exchange crisis from without.

This prospect makes the last week in May critical week in India's history. If the Prime Minister and the Central Government should choose, contrary to all wisdom and public feeling, to persist in their obstinate course, they will be undermining the place of the Congress Party in the political life of the country and will be producing a long-period economic crisis which, in the opinion of *The Eastern Economist,* will be nearly unmanageable. We are poised at this time at a point of no return. It is vital that the country should be warned that there are serious political, as well as economic, dangers that are being run by a level of forced expenditure which cannot now be sustained. For there are limits to human endurance as well as there are to heights of human daring. There may be a few misguided people who are always attracted by the daring of others, having none of their own. But there are multitudes who, even if attracted, will not or cannot share a dire risk. This does not mean that fearful risks should not be run. They must continue to be run in the small area where the daring few can pay almost all the price. The Indian people live too close to the lower limits of endurance to share in the heavy price which the Finance Minister's daring must entail. An appetite for heady wine cannot be created in a day. Perhaps the appetite for a grander Plan at an indefinitely greater cost in human suffering will grow. But it is now not there; we ignore this fact at our peril.

Pause in the People's Republic

THE news this month from the People's Republic of China has a strange, and almost incredible, ring. It would appear that, both on the political and economic front, some cracks have appeared in the smooth and all-too-deceptive surface of Chinese unity. When all was going well — and almost right through 1956 things looked good, particularly in industrial production — the growing tempo of what has now come to be called the "antagonism between popular masses and the leaders" seems to have been held in check. Since January this year, partly as the result of adverse economic circumstances to which reference is made later, events, here and there, suggest that the splendid unity of the People's Republic is giving way to many querulous and, possibly, revolutionary trends. Many party leaders have been seriously disturbed. The Head of the Propaganda Department, Lu Ting-yi, actually wrote last March about "some having fallen into pessimism and despair". If all was going well, as official publications abundantly distributed in India suggest, where was the need for this pessimism and this despair?

Those who have gone carefully through local political and economic reports have chapter and verse to prove that there has been a deep pause in the People's Republic's progress both in political and economic terms. In some areas repression has been redoubled. One report suggests that since 1956 "corrective labour camps have been erected everywhere for vagabonds, as part of the high-tide of socialisation. In the region of Shanghai alone 60,000 people were confined in 1956". On this basis those detained in the whole country might be estimated at about a million. It has been expressly stated that no criminal charge has been made in these cases but the persons are held in detention as "their behaviour might have an unfortunate influence on public security". This is indication enough that a system of forced labour is now in operation on a grand scale.

Strikes and "similar actions" have been frequent recently. Chou Yang, Deputy Head of the Party Central Committee Propaganda Department, recently told foreign correspondents "strikes, demonstrations or similar actions — which were rare in China — can be regarded as a manner where people oppose bureaucracy. No suppression could be permitted in dealing with such action by the people. The Chinese people had the right to demonstrate and strike just as they had the right to free speech and meeting". He failed, however, to explain, why when things were supposed to be going so well and real wages in particuular rising so fast, "the opposition to the bureaucracy" should be growing so rapidly. In this connection a report of a conversation between President Voroshilov and Mr. Chou En-lai has significance. The Chinese Premier is reported to have said: "Forty years ago (May 4, 1919) Peking students broke through the old walls in hostility to the bureaucratic warlords of the time. If we do not amend our bureaucratism, they may break through the walls again."

More complete evidence, perhaps, than any other is contained in a letter from a student, Sun Yu-Shan to Tung Pi-wu, Congress delegate for Hupei, member of the Politbureau and President of the Supreme Court. This is an authenticated document since it was published in April in the *Chinese Youth Daily.* The third, fourth and fifth paragraphs read as follows:

"Since you, Aged One, are the representative of the people of Hupei, I want to talk to you about the problems affecting the lives of the worker and the farmer masses. As all know, living conditions are better than before the Liberation; but even now differentiation is still too marked. In a southern district of Tayeh country one of the better farm workers may get only 250 yuan a year, whereas the higher kanpu (government agents) get a monthly salary of 200-300 yuan, or more. To the kanpu, this difference may not seem great, but to the workers and farmers it seems unreasonable. Last year I spent two days in the workers' residential district at Tayeh Steel Works. The dormitories were cramped and dark, and the roofs were leaking — in Peking and other large cities theatres and movie houses are built in luxurious style. The contrast is painful.

"Last year a worker in Tayeh committed suicide because of the bureaucratic treatment he received from a responsible comrade. In my own village I myself have known many sick people going without medical aid. In one family all the members were sick and there was nobody to open the door.

"We have to take a stand against the principle of equality (of wages) *but now we have lowered unduly the life of ninety per cent of the people and we have raised the life of less than ten per cent too high."*

It would appear that there are some misgivings about the character of political progress, but it would appear that much of the discontent is fundamentally economic. Some details are available in regard to the manner in which cloth production and consumption have recently fallen. So far as consumption per head is concerned it rose steeply from 7.61 Chinese feet per head to 22.14 feet in 1953. In 1954 and 1955 it dropped below 22, though in 1956 it rose to a peak of 29 feet. But there has now been a drop of about 15 per cent. The rationing system which was based on a larger assignment has broken down. Even the peak figure of consumption must be considered inadequate and a leading paper in Peking had this observation to make. "On the basis of present production cotton cloth per man available is inadequate; it is below the 30 Chinese feet per head just enough to make one cotton padded suit or two non-padded suits. It is obviously insufficient to satisfy the clothing needs of the people". It might be added that this is significantly below the average per capita consumption in the Indian Union.

What is true of cloth seems increasingly true about food though, here, the reports are so conflicting that it is very difficult to determine whe-

ther, in point of fact, India is better off than China at the present time. In China there are two sets of figures, one based on targets or estimates quite unrelated to performance, and another — for the most part unofficially compiled -- of total figures by addition of actual performance in each district. Some foreign scholars working on the latter figures have come to the conclusion that Chinese agriculture in the current year has stayed still. It is curious that this is similar to our Indian experience. It may be that seasonal factors both in China and India have overcome the fruit of investment in the last few years. But at any rate the belief that Chinese co-operative farming has already worked wonders is without any adequate proof.

It would seem that both the Indian and the Chinese economic systems have entered on a difficult phase; the period of quick returns, following both on initial enthusiasm and favourable monsoons, has ended. Both systems — and it would appear that totalitarianism has here no advantage over democracy — are encountering some internal resistance. Whereas India has the advantage of free debate between the Government and its critics, China has the extreme difficulty of carrying on a discussion in involved Marxist terms, with peasants who are not, and never will be, interested in Marxism. Even though the character of this artificial intellectual process is different from what it is in the Soviet Union, Chinese persuasion is meeting no better fate.

The situation is full of interest for political, economic and social observers. But for us it should have a ring of tragedy. Have things come to a stage when the two poorest countries in per capita terms are encountering greater difficulties than any other? Let the grand debate on systems wander where it likes. The tragedy is that the hardships of the poorest in the world continue to grow while the hollow debate goes tirelessly on.

Fly home for vacations...

Special 25% concession on fares for students

IT'S SUCH A THRILL to be up in an aeroplane, such fun to travel alone like a grown-up! Fly home this summer and be with your family on the 'first' day of your holidays!

IAC has a wonderful offer for students— a special 25% concession on fares to any part of India! Here is your chance to fly—home for the holidays, on sight-seeing trips or educational tours. You'll enjoy every single moment of your trip.

So make sure you fly home this time.

THE WEEK'S NOTES

POINTERS FROM BOMBAY

THE SAMYUKTA MAHARASHTRA SAMITI has won 68 seats against 54 won by the Congress in the recent elections to the 131-member Bombay Municipal Corporation. Obviously, the results indicate that the Congress is losing its hold on the two biggest cities in the country. In Calcutta, earlier the Congress managed to keep its precarious hold over the Corporation due largely to restrictive electorate. In a city of 3,344,839 souls only 194,000 people are eligible to vote. The result must be surely painful to the Congress. Its leadership has emphatically been denying that the linguistic issue has anything to do with its electoral misfortune. No doubt if linguistic passions had been as dominant as the critics maintain, a higher percentage of the voters would have participated in the elections. But it would be obviously wrong for them to presume that most of those who abstained from voting were Congress supporters. However interpreted, the election results show that the Congress has become vulnerable. Now its chief strength seems to lie in the disunity and weakness of its opponents. Where the Opposition has shown even a semblance of unity, the Congress has been reduced to a secondary position.

The Congress defeat does not, however, mean that it has finally been beaten. The municipal elections in 1952, too, had failed to return it in an absolute majority. With only 55 members out of 124, it was able to provide a stable civic administration with the help of a large number of Independents and the Fourth Party. Actually the position of the Congress this time also is not very different. The Samiti, technically the party enjoying an absolute majority, is a strange conglomeration. It consists of Communists, Praja Socialists, Socialists, Hindu Sabhaites and Jan Sanghists. The haggling for seats which marked its pre-election politics, tends to strengthen the belief that the motley crowd may not be able to prove a cohesive team. In the event of not an unlikely split, it will not be surprising if the Congress succeeds in recapturing the reins of office which it has now been forced to yield to the Samiti.

For the country, it may not however be very helpful if the Congress is forced to depend on such artifices. For this will only add to the moral deterioration in the country's politics. The Congress leadership will, therefore, do well to probe into the causes of increasing isolation of its party from the masses and try to reorganize it in such a way as to become once again the embodiment of the wishes, desires and needs of the people. Complacency on its part is bound to be corrosive in effect. Already, the Government of India's crushing texation policy has strained the loyalty of the middle classes, the lynchpin of stability.

POSTPONE IMPLEMENTATION

THE DESHMUKH COMMITTEE has recommended "a phased programme of introduction of the three-year degree course in the country from the 1957-58 academic year" with 50 intermediate and 100 degree colleges. The target of 180 intermediate and 360 degree colleges will be achieved by the end of the period of the second Plan. The Committee has also suggested the upgrading of at least 250 intermediate colleges and re-orientation of 500 degree colleges during the third Plan. The estimated cost of total reconstruction of the Indian educational system will be Rs. 25 crores of which 15 crores will be spent during the second Plan. Of this amount while Rs. 9.9 crores is non-recurring and Rs. 5.1 crores recurring, Rs. 7.5 crores will be contributed by the Union Government and the University Grants Commission, the other half would be made available from the State Governments and private agencies.

The Committee has prepared its report obviously without discussing the merits or the principles underlying the three-year degree course. Influenced by the prevalent fetish which changing the educational system has become with Congress men, it has apparently taken it for granted that its recommendations would be above question. The Committee has also found it expedient to remain silent about the future of those colleges which are neither to be upgraded nor re-oriented. Apparently, they will continue with the old four-year course. The co-existence of two systems and two structural patterns will, thus, be another confusing innovation in the already confused academic situation. Moreover, it is difficult to divine what reasons have prompted the Committee to recommend "gradual reduction of enrolment to 800 to 1,000 students per college". It is hard to believe that the college education has lost its charm for the youth of the country. On the contrary, the number of college-going students is on the increase. The artificial restriction now proposed would seem to have originated in non-academic considerations. The more one thinks about it the more confused one is likely to be.

But even more pertinent objection to reconstruction of the Indian educational system is whether this is at all called for. To waste Rs. 25 crores on a project whose merits are not beyond question is nothing short of a crime when India is in the throes of an acute economic crisis. As it is, the country's economy cannot provide employment to the educated youth. The Planning Commission has estimated that "the size of the problem will remain substantially unchanged during the period of the second Plan" and will continue touching 1.45 million figure. It would, therefore, be wiser and more useful to postpone the implementation of the recommendations of the Deshmukh Committee for the next five years when the question should be examined afresh.

A POINTLESS PROTEST

ON MIDNIGHT of May 14-15, the telegraphists of the Post and Telegraph Department in many parts of the country launched a go-slow strike, which was hurriedly withdrawn five days later. The dislocation of telegraphic communication caused by the strike can be judged from the fact that in some places it reduced the clearance of telegrams to nearly a third, necessitating the disposal of ordinary telegrams by airmail. The various statements issued by the union officials in defence of the strike cannot for a moment obscure the basic fact that the strike was as pointless as it was improper. It was patently wrong on the part of the telegraphists to resort to pressure tactics when their demand for the appointment of a committee to inquire into the working of the telegraph department had already been conceded; the Union Minister for Communications had besides promised to consider their other demands sympathetically, "within the Government's financial limits".

These demands pertained to an increase in dearness allowance, its merger into the basic pay and revision of pension rules in consonance with the increased cost of

living. Obviously, the acceptance of these demands cannot but force the Government to extend the benefits claimed by other public servants also. Such a course will inevitably have deeper repurcussions forcing the Government either to increase the volume and rate of taxation or resort to deficit financing. The former course will be unwise politically, being intolerable to the people at large, the latter will be disastrous for the country's already strained economy.

As for the strikers' demand for cancellation of the results of a test held by the Government it is clear that it is unreasonable, if not absurd. Equally absurd is their ingenious justification for the strike, that they were working in accordance with the "rules laid down by the Posts and Telegraphs Department itself". Correct though this may be technically, it cannot convincingly explain the extreme course resorted to by the telegraphists totally unmindful of the inconvenience caused to the public. The real reason for the go-slow strike, it would seem, as a spokesman of their Federation himself admitted, was "to make sure that their pending demands would be met". In other words, having won their demand for the appointment of an inquiry committee, the strikers wanted to influence its deliberations and findings also.

At the same time it is to be regretted that the Ministry concerned had not cared to settle the long-standing dispute, until its employees forced its hands by the present demonstration of their strength and determination. This is a serious administrative failure.

THINKING IN A CIRCLE

THOSE WHO had expected that with the formation of a Communist Government in Kerala the Party would eschew recklessness and become realistic in its thinking are likely to be disappointed over the resolutions of the Central Committee of the Party which met recently in New Delhi for the first time after the last General Elections. A week's deliberations behind closed doors carried the Committee to the conclusion that the Indian taxation system was "unjust, extortionate and reprehensible in the economic conditions of today". But at the same time it demanded "the speediest fulfilment of all targets of the second Plan" and expansion of the public sector. The Central Committee evidently did not see any connection between a hard taxation policy and the fulfilment of the targets. The Committee has also demanded the "immediate nationalization of certain foreign-owned industries". It does not seem, again, to have entered the minds of the members of that august body that these funds would have to be raised by an even more ruthless recourse to "unjust and extortionate taxes"—or to deficit financing which in actual practice means the same thing. In short, the Communists have condemned the very measures which are essential for the implementation of the policy they advocate. It is only common sense, that if the funds could be raised, it would be better to raise them and utilize them for narrowing the gap in the resources and financial needs of the Plan.

The same curious pattern of thinking is discernible in the Central Committee's approach to the problem of nuclear tests. While expressing "grave concern", it has not uttered a single syllable in criticism of Russia which has exploded the maximum number of atomic bombs in recent months. On the contrary, the Committee has welcomed Russia's "efforts" in trying to reach an agreement with Western Powers to ban the nuclear weapons and suspend the atomic tests.

More significant than all this is, however, the decision of the Central Committee to "double" the Party's membership of 125,000 before the year runs out. To achieve this objective it has decided to scrap the conspiratorial organization of the Party based on "cells". The cell, "based upon the factory or place of work", will give place to "a ward or a number of wards in the urban areas, or to a village or group of villages in rural areas, or to a factory or mine". The upper limit of cell's membership of 15 will remain; the present structure of the Party will remain, and "democratic centralism" will continue to determine its working. Thus, only the "cell" will be known as a "branch" from now onward. As Shakespeare so pertinently asked, What's in a name....?

TRADE WITH CHINA

THE RIFT between the two Atlantic Powers, Britain and the United States, over trade with China has been partly bridged. The differences between the two arose out of Britain's desire and America's opposition to lifting the embargo on it. The embargo was imposed during the Korean war and was relaxed after it ended. Those half-hearted measures have however given rise to a somewhat flourishing clandestine trade with Red China. While some of the British goods are routed to Communist China through Hong Kong, a large volume of American goods finds its way there through Japan which has recently concluded a trade treaty with Peking in a bid to capture the Chinese market. The position of Britain and of the United States, though diametrically opposed, is understandable. While the former wants to secure a relatively less competitive market for its goods, the United States does not want to give any succour to Communist China which is passing through severe crisis due to the economic consequences of re-Stalinization in Russia. The relaxation of embargo will, the United States rightly feels, run counter to its policy of strengthening the free world's defences. Only recently it had decided to arm Nationalist China's forces in Formosa with guided missiles capable of carrying atomic war-heads. The Nationalist Chinese, with the help of these missiles, now can, if necessary, penetrate 500 miles into the Chinese mainland.

The only possible solution of the differences was what has now been agreed upon by the two allies. According to the new understanding Britain has been allowed to relax trade embargo against Communist China in such non-strategic items in which it is already dealing with other Communist countries. This relaxation, though not to the extent it would like, should satisfy Britain. In the struggle against the forces of totalitarianism, the interest of no country can be precedent to that of the free world. The news of understanding between the two leading most members of the democratic alliance is particularly welcome. It should go some way to promote conviction that it is not America's cussedness but plain duty of all free countries that demands circumspection in dealings with the Communist world.

BRITISH OVERSEAS AIRWAYS CORPORATION

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

A Window on the World

INTRODUCTION TO INDIA—III

By

ODYSSEUS

SARVODAYA, the word used by Mahatma Gandhi to describe his ideal social order, is usually dismissed by foreigners as too mystical and impractical to need bothering about. Like most social movements, it is made up of many strands, some of which are contradictory and others of which, I concede, do not seem practical, but that does not mean that the movement can be disregarded as having nothing to contribute. The basic point to realise about Sarvodaya is that it offers the only reasoned, progressive Left-wing criticism of the socialist welfare state. Whereas the orthodox socialist envisages a state in which the citizen is looked after from birth to death, making him in K. G. Mashruwala's memorable words "an A, B, or C class prisoner of the state under the outward semblance of democracy (and the USSR also regards itself as a democracy of its own type), it is much better to live as we have lived from the birth of humanity until now, in some sort of hard struggle for existence than be just comfortable well kept animals". Sarvodaya is unique among political philosophies in the world today in that it is preaching self-help to the masses, warning them that they cannot hope to get something for nothing.

A popular and sympathetic outline of the Bhoodan (land-gift) aspect of Sarvodaya is to be found in Hallam Tennyson's "Saint on the March" (Gollancz. 1955), an excellent piece of descriptive writing and reporting, if a largely uncritical presentation of Bhoodan ethics and economics. For a critical appreciation of these, see this column: "The Economics of Bhoodan" (June 3, 1955), "Saint on the March" (June 10, 1955), and "My Economics and Vinobaji's Ethics" (June 17, 1955). But far and away the best analysis of Sarvodaya occurs in the pages of "Indian Approaches to a Socialist Society", published by the Institute of International Studies, Berkely University, California, in 1956, edited by M. W. Fisher and J. V. Bondurant, who bring out well the contrast in methods and aims between orthodox and Gandhian socialism.

THE COMMUNISTS AND THE R.S.S.

From the anti-totalitarian, anti-bureaucratic Sarvodayans, we may turn to totalitarians of the Left and Right. If there are any who still think that there would be no harm in forming a Popular Front with the Communists, they had better read M. R. Masani's well-documented, factual reporting in "The Communist Party of India" (Verschoyle. London. 1954). Whether the R.S.S. (Rashtriya Swayamsewak Sangh) have any political future, I do not know, but J. A. Curran's study of the rise of the movement—"Militant Hinduism in Indian Politics: A Study of the R.S.S."—is a collector's piece for those who like plumbing the obscurer by-ways of politics.

That we need have no serious fears lest the R.S.S. capture power in India is the moral that seems to emerge from "Parliament in India" (Longmans. 1947) by W. H. Morris-Jones. This book is what its publishers claim that it is, a major contribution to the literature on contemporary India, as well as to the study of political processes. I need not elaborate on this since I wrote about it at length on March 15 and 29 of this year.

Parliamentary government calls to mind democracy and education, and I call attention to "India, Democracy and Education" (Orient Longmans, 1955) by Jossleyn Hennessy. This is a study of the work of the Birla Education Trust, but the third chapter, which sets the Trust's work in the perspective of India's educational problems as a whole, analyses the causes of student indiscipline and shows the relation between education, good citizenship, and a smoothly working democratic regime, explains why so many teachers, responsible for the future generation in India, have Communist inclinations, and suggests what could be done about this.

What with the technical experts of the Colombo Plan and foreign aid generally, there is a stream of foreigners anxious to help India to lift herself up by her chupli-straps. All of them are welcome, but some would find their life in India easier and more profitable if they were to read "Fifty Years of Technical Assistance" (Public Administration Clearing House, Chicago. 1954) which collates the accumulated wisdom of some veteran field workers on how to carry out technical assistance programmes effectively without harming psychologically the people assisted.

The best expositions of India's foreign policy are to be found in the speeches of Pandit Nehru. The usefulness of the bound volumes of the Prime Minister's collected speeches, which the Publications Division of the Government of India's Ministry of Information and Broadcasting publishes periodically, is unfortunately seriously diminished by the absence of a comprehensive and detailed subjects index.

A sympathetic, stimulating, and valuable outside observer's exposition and assessment of India's foreign policy is to be found in "Free India in Asia" by Professor Werner Levi (Minneapolis University, 1952) the index to which is, incidentally, a model of its kind which could be studied with profit by the New Delhi Publications Division.

INDIA'S SPIRITUAL TREASURES

And now let us turn away from the crowding problems of the contemporary world and seek consolation among India's spiritual treasures.

As the old hands who have frequented this column over the years are aware, I am interested in Bharata Natya, Tanjore's great classical dance, and in Kathakali the wonderful dance drama of Malabar. But you do not need to be an addict to enjoy Beryl de Zoete's "The Other Mind" (Gollancz. 1953), with its 120 beautiful photographs, because it is as much a fascinating study of South Indian life and folk-lore and a sensitively written travelogue around Madras and Kerala, as it is of dancing. I add that many Indians could read it with profit as well as pleasure, because the degree of popular understanding of Indian classical dancing may be guaged by the fact that when the topic crops up, most people mention Uday Shankar. I yield to none in my enjoyment of this modern master but I insist that his art has but the echo of a connexion with India's classical dances. Miss de Zoete, who is the

glossiest of Blue-stockings, carries her learning modestly and conveys her own joy in out of the way discoveries. "Kathakali" (Luzac. 1956) by K. Bharatha Iyer, amplifies and extends Miss de Zoete's book. With the breaking down of the traditional modes of life in Kerala, Kathakali is ceasing to be a living art. These two books will help you to enjoy the art while yet dancers remain who dance it as part of their lives. For the connoisseur, I cite "Tanda-Laksanam" (G.S. Press. Madras. 1936) by Naidu and Pantulu. This contains photographs of the 108 karanas sculptured on the pillars of Holy Chidambaram, which establish that Bharata Natya is at least 1,300 years old. But this book is hardly for a beginner. A charming book which may sometimes still be found in second hand shops is G. Venkatachalam's "Dance in India" (Nalanda Publications. Bombay).

For an introduction to Indian painting, try G. W. Archer's "Indian Painting in the Punjab Hills' (H.M. Stationary Office. 1952).

In the course of an interesting review of "The Principal Upanishads" edited by S. Radhakrishnan, (Allen and Unwin. 1954) 'The Times' (of London) Literary Supplement of June 25, 1954, observed that there are two reasons why the meaning of the Upanishads is difficult for Western readers to grasp. They are the world's earliest known philosophical compositions, flowering in the minds of their anonymous authors between 800 and 300 BC. But their philosophy is that of seers, not of thinkers in the specialised Western sense of the word. They are the fruit of contemplation, though a speculative element is to be found in some of them, and they are meant for contemplation. To regard them as a branch of philosophical idealism is to miss the reality which they reveal. That reality was not merely a problem of thought but was grounded in spiritual experience at all levels, from simple prayer to ultimate illumination. We are, in fact, in the presence of metaphysical poets rather than of logical thinkers, poets for whom the Real was not abstract but eternally alive in the human heart.

The second barrier for Western readers is that of translation. A sensitive translator, Mr. John Mascaro, says: "If Sanskrit could find a group of translators with the same feeling for beauty of language and love for the sacred texts in the original as the Bible found in England, eternal treasures of old wisdom and poetry would enrich the times of today." Unfortunately, the possibility seems unlikely and is in any case almost prohibited by the difficulty of communicating in English the sensitive subtlety of the Sanskrit. But at least in the avoidance of gross distortions there has been a great advance. How, then, does S. Radhakrishnan's edition meet these two difficulties? He would seem ideally qualified to expound and to render this bible of India. His own philosophy is rooted in it and has at the same time critically assimilated Western thought. That this, however, is not wholly an advantage is felt at times in his long expository introduction, when his own fluent philosophical disposition tends to overlay the immediate truths which he is interpreting. But he is informative about the historical background and about the various out-workings over the centuries of the fundamental conceptions which form their essential teaching. More valuable are the copious notes which draw upon such commentaries as Sankara's or, for comparison, on Western and Christian sources.

I conclude by reminding you that these three articles are not offered as an exhaustive reading list but as a supplement to my original Introduction to India series published here on May 23 and December 12, 1952, and January 8 and 16, 1953.

SOVIET POLICY IN EUROPE

(From Our Special West European Correspondent)

PARIS, May 18.

SIX months ago Soviet Russia was very much on the diplomatic defensive in Europe, having suffered one reverse after another from Poznan to Budapest, while she was on the offensive in the Middle East, consolidating her influence in Egypt, Syria and Jordan. Today the situation is the opposite. In the Middle East, where she now faces not the divided and discredited imperialism of Britain and France but the united power of the USA's Sixth Fleet and Mr. Richards' bag of dollars, Soviet influence has been limited and isolated. Russia cannot meet this opposition, as she did with the British and French, by threatening to sprinkle her adversary with atomic missiles. Threats of that sort cannot be offered to the USA. So M. Gromyko has simply had to put in reverse gear the machine constructed by M. Shepilov for the first major Russian venture into the Middle East. Admittedly, the retreat can be regarded in Moscow as temporary, for the USA is still backing the same unpopular ruling forces as the French and British supported so long in this region, and it is not only Communists who think that in the long run the West has chosen the losing side.

But this retreat in the Middle East has been compensated for by a return to the diplomatic offensive in Europe. Here the main objectives of Russian policy have been first to repair the cracks in the East European alliance, second to live down the disgrace of Hungary, and third to intimidate the USA's West European allies into "atomic neutrality". It is the latter campaign that has been most developed and we can expect to see it much intensified between now and September, when the West German elections are to be held.

The first aim has been fully encompassed. The repression in Hungary has been total, the example of Budapest has found no imitators, the Warsaw Pact has suffered no defections, not even Poland's, and with the aid of Mr. Chou En-lai the Communist bloc has been able to restore a semblance of unity. Western commentators make much of the fact that it is now proven that this apparent unity would be worth nothing in the event of a European war, because it is clear that the Soviet outposts in East Europe would be a liability rather than an asset in an open struggle with the West. That is no doubt true but it would be of importance only in the actual event of war — and one of the lessons of Hungary is precisely that the West is not prepared to make war in order to liberate East Europe. Meantime, a half-hearted semblance of unity during peacetime is more important diplomatically to Russia than probable defections in an improbable war.

The second aim, living down the moral defeat in Hungary, has so far met with no success in Europe. Though Soviet leaders can tour India, Indonesia, Indo-China and China, they cannot set foot in West Europe. Apart from a trip to Helsinki and an exchange of formal amenities with neutral Austria, the Russian diplomatic isolation in Europe remains complete, and this is no doubt galling for Messrs Bulganin and Khrushchev who had hoped to continue and extend the series of triumphal tours and receptions that began with the London visit and Guy Mollet's trip to Moscow. But by quietly serving their time in quarantine, the Soviet leaders can reasonably hope to emerge from this isolation sooner or later. Only time can heal the damage done in the West by the intervention in Budapest, but time will surely heal it, at least to the extent of permitting a resumption of superficially polite relations such as ruled at the time of the London visit. Moscow seems willing to assist this process by allowing some freedom of expression in Russia itself and considerable freedom of movement to the new regime in Poland, hoping thus to prove that Hungary was simply an accident in the work of destalinisation rather than a return to Stalinist methods. It is difficult to get any non-Communist delegations or notables to make the visit to Moscow just yet, but it is remarkable that those few who have consented to go have been permitted to discuss Hungary freely with non-official Russians and that these latter have been permitted to express frankly the opinions that Budapest was a much dirtier business than Suez, that the Hungarian revolt was not a fascist plot, that it was not organised by the West, that the Russians had to shoot down workers and children and that the Russians are generally hated in Communist East Europe — but that the repression was nevertheless a painful necessity for Russian security. This frankness has been widely and favourably noticed in West Europe and may be a first step to "living down Budapest".

Finally, there is the Russian campaign of combined intimidation and blandishment directed at the NATO powers in West Europe, consisting of notes pointing out the advantages of neutrality of the Austrian or Finnish variety and concluding with the threat that the Continent would be transformed into a vast cemetery in the event of atomic war. The pretext for these notes is the supposed intention of the USA to equip its West European allies with atomic weapons. But this is mere pretext, for Moscow knows quite well that American atomic weapons have been stored in West Europe for some years past; current NATO plans entail no new or sudden increase in the danger for Russia. What is new is the growing anxiety in Europe about the dangers of atomic radiations, and it is this that the Russians are seeking to exploit; hence the theatrical and propagandist tone of Russian references to the subject. Outside of West Germany, this campaign has so far made very little impression; indeed at the recent NATO conference in Bonn it was evident that the Russian threats had had the contrary effect of reinforcing the solidarity of the alliance, especially among the smaller Nordic nations.

West Germany is a special case, and would be even if elections were not scheduled for the autumn. As it is, Russia is willing to devote much energy to securing the defeat of Konrad Adenauer,. Not that the West German social-democrats, who might replace Adenauer's coalition, are in the least pro-Communist; on the contrary, their antipathy for the East German Communist regime could

not be exceeded by the Right. But they would oppose the conversion of the West German army into an atomic force, and since armies today are necessarily equipped with atomic weapons if they are to matter at all, this would be the first serious breach in the Atlantic alliance. Determined Russian diplomatic intervention can be expected throughout this summer with the aim of influencing the elections to the Bundestag, and in fact whatever the ostensible subject of Russian demarches henceforth, they should be evaluated in terms of their possible effect in West Germany.

The Russian campaign against the Adenauer coalition is assisted, curiously enough, from Washington, and the most serious threats to Dr. Adenauer come from circles close to President Eisenhower, particularly from Mr. Stassen. This is because Dr. Adenauer's whole policy is founded on using the powerful NATO alliance as a bargaining counter in negotiations for the reunification of Germany, and any suggestion that the least measure of disarmament can be negotiated with the Russians before Germany is reunited necessarily knocks the bottom out of his programme. Such suggestions do repeatedly arise in Washington and though they are disavowed by the Administration it is no secret that some variation of the Radford, Eden or Stassen plans is constantly under scrutiny there. The latest is the suggestion for a trial zone of disarmament in Central Europe, which naturally means mainly Germany, and reports of this proposal have just caused another crisis in U.S.-German relations.

It is in this context that Mr. Khrushchev is an interview with the "New York Times", has just made an offer that that newspaper interprets as a direct suggestion to the USA for a new two-power Yalta, a division of the world between Russia and America such as was foreseen as a danger in West Europe just one year ago. This danger has been largely forgotten in Europe since the events in Egypt and Hungary, because it was felt that even if American and Russian strategists were inclining to some such view last year, the renewal of antagonism between the power blocs has made its materialisation impossible. That Mr. Khrushchev should seek to rehabilitate it now can only mean that he has in mind the particular case of Germany and that he is suggesting a continuation of the division of that country combined with its neutralisation, i.e. that Washington should leave Dr. Adenauer in the lurch. No more general application of the doctrine could possibly be acceptable to American opinion so soon after the demonstration that Russian hegemony over "its" half of the world is not something to be accepted fatalistically but something that could collapse at any time, as it collapsed temporarily last autumn in Hungary.

WORLDGRAM

AGRICULTURE

Agricultural Credit Co-operative Societies: In the three years 1953-54 to 1955-56, the number of agricultural credit co-operative societies rose from 1,11,623 to 1,59,939 (increase of 43 per cent); the number of members rose from 5.13 million to 7.79 million (increase of 52 per cent); working capital rose from Rs. 49.18 crores to Rs. 79.1 crores (increase of 61 per cent); paid up share Capital from Rs. 9.9 crores to Rs. 16.8 crores (increase of 70 per cent), and investments and assets from Rs. 8.9 crores to Rs. 16.9 crores (increase of 90 per cent). Increase in share capital, working capital and investments and assets were proportionately larger than increases in membership. A large proportion of the societies, members etc., added in the years 1953-54 to 1955-56 were in N.E.S. and Community Project areas. These results have been secured though the N.E.S. movement which had covered only 83,300 villages by October 1955 and it had not devoted in the early years the concentrated attention to agricultural production and co-operation which it is now devoting.

*

Study of Plant and Animal Breeding: Plant and animal breeding will be the main topic of discussion at a two-day Research Workers' Conference, opening in New Delhi shortly. The Conference will have three committees—each committee discussing plant breeding and genetics, animal breeding and genetics, and problems of common interest to plant and animal geneticsts respectively. The meetings have been so arranged as to enable research workers of one committee to have the opportunity of taking part in the discussions of the other committees. Delegates nominated by State Government and representatives of Central commodity committees and research and educational institutions have been invited to attend the Conference. In plant breeding, evolution of improved strains of major crop plants, such as cereals, fibre crops, oilseeds, vegetables and sugarcane, will be discussed. Animal breeding and genetics will include a study of the influence of climate on the health and productivity of livestock. In addition, a survey will be made of the present position regarding fodder resources and the scope for improvement of fodder grasses and legumes. The relative utility of some modern techniques, such as exploitation of hybrid varieties and scope for co-operation between plant and animal geneticists, will also be discussed.

INDUSTRY

Industrial Production in Yugoslavia: According to data released by the Federal Statistical Office, industrial production in the first quarter of this year was 21 per cent greater than in the same period of last year. The volume of production in this period was 15 per cent greater than the average monthly output last year. The greatest increases were recorded in the production of electric appliances—45 per cent, crude oil—44 per cent, heavy engineering—36 per cent, electric power and rubber goods—28 per cent, chemicals—25 per cent, timber and printed matter—23 per cent, textiles and non-ferrous metals—22 per cent, etc. Very important for the balancing of supply and demand and for the raising of the standard of living were the increases made in consumer goods production, including, as shown above, textiles, electric appliances and metal goods.

*

Consultancy Services for Neiveli Lignite Project: An agreement for expert consultancy services in respect of the mining scheme of the integrated Neiveli Lignite Project with a British firm was executed recently. The cost of consultancy services over a period of 3½ years would amount to about Rs. 40 lakhs. The integrated Neiveli Lignite Project comprises among other schemes the mechanised open-cast mining of about 3.5 million tons of lignite per annum at an estimated cost of Rs. 16.90 crores. The services of Messrs. Powell Defferyn were originally obtained as technical consultants under the Colombo Plan in 1954 for drawing up proposals for the mining, utilisation and processing of South Arcot lignite.

*

Standard for Valve Grinding Paste: The Indian Standards Institution has published an Indian standard specification for valve grinding paste. The standard, which covers the usual type of silicon carbide suspended in a mineral base, prescribes the requirements for three grades of the material, namely coarse, medium and fine, used for grinding internal combustion engine valves. The standard specifies the grain size for the different grades and also the quality of the vehicles used for suspending the abrasive. Copies of this standard can be had from the Indian Standards Institution, 19, University Road, Delhi-8 and its branch offices at 40/40A Cawasji Patel St., Fort, Bombay and P-11 Mission Row Extension, Calcutta-1.

*

Optical Glass Plant: A preliminary project report on the manufacture of optical and ophthalmic glass in India, prepared by a Soviet team of experts, is being examined by the Government of India. The team recently visited this country at the invitation of the Government of India and made an extensive tour.

*

Small Industries in Okhla Industrial Estate: Twenty-five different types of industries, ranging from bicycles to safety razor blades and machine tools to pins and clips, are being established in the Okhla Industrial Estate near the Capital. With the establishment of these industries, it is expected that about 1,200 people will find employment. Effort has been made to include a large variety of industries in this 40-acre estate. The National Small Industries Corporation received about 145 applications from small entrepreneurs for setting up industries in the estate. The largest number wanted to manufacture bicycles and bicycle parts and electrical goods—an indication of their great demand in the country. The second largest number of applications were for making machine tools and machine parts, castings and foundry works, agricultural implements, sewing machine parts, buttons and fastners, umbrellas and electrical wiring. In the selection of applicants the Corporation gave due emphasis to the establishment of light engineering industries. Care was taken to avoid concentration of any particular type of industry which would result in wasteful competition. In the 35 factories constructed in the estate about 25 different types of industries will thus be established. In some cases, however, more than one factory has been permitted to set up the same type of manufacture although the components to be produced will be different. For example, three factories will manufacture electric wires, four bicycles and bicycle parts and two each automobile accessories, buttons and castings. Some of the other items that will be manufactured in the Estate will be sanitary fittings and surgical instruments, fire extinguishers and electrical machines, umbrella ribs and steel doors and windows, steel furniture and blowers and furnaces.

TRADE

Trade with Soviet Union: In a written reply to a question by Shri D. C. Sharma in the Lok Sabha, Shri Morarji Desai, Minister for Commerce and Industry,

revealed recently that the total value of India's exports to the Soviet Union during the first nine months of 1956-57 was Rs. 10.94 crores. During the same period India imported goods worth Rs. 10.80 crores from the USSR. Replying to another question by the same Member, Shri Desai said that the State Trading Corporation of India had entered into an agreement with the Soviet Union for the supply of tobacco. The exports were being arranged through the Tobacco Export Promotion Council.

*

Three More Export Promotion Councils: Replying to a question by Shri M. Valiulla in the Rajya Sabha, the Minister for Commerce, Shri Nityanand Kanungo, said that Government proposed to sponsor the formation of three more Export Promotion Councils—for Shellac, Sports Goods and Chemical and Allied Products. Shri Kanungo said that already eight Export Promotion Councils had been formed. These were for Cotton Textiles, Silk and Rayon Textiles, Plastics, Engineering Goods, Cashew and Pepper, Tobacco, Mica and Leather.

*

Traffic Handled By Calcutta Port: The total traffic handled by Calcutta Port during the first half of April, 1957, amounted to 309,783 tons of which imports were 139,210 tons. Amongst exports, ores accounted for 41,873 tons. The imports of food grains at the Port during the period totalled 50,187 tons and steel 26,046 tons. The number of vessels which entered the Port during the first half of April, 1957, was fifty-nine.

*

Protection for Stearic Acid Industry: The Tariff Commission has prepared questionnaires for producers, importers and consumers in connection with its inquiry into the question of continuance of protection to the stearic acid, and oleic acid industry beyond December 31, 1957. Copies of the questionnaires may be obtained from the Secretary, Tariff Commission, Central Government Office Building, 3rd Floor, Queen's Road, Bombay-1. When requests for copies of questionnaires are made, the interest represented, i.e. whether the party is a producer, importer or consumer should be specified.

FINANCE

Technical Aid Programme: The funds for the Technical Aid Programme of the United Nations and its specialised agencies are contributed every year by the participating countries on a voluntary basis. For the year 1957, the highest amounts were given by the United States of America: $15,500,000; the United Kingdom: $2,240,000; and canada: $2,000,000.

A calculation in dollar cents per capita shows however the following comparison:

Canada	13.2 cents
Denmark	13.0 ,,
Norway	11.2 ,,
Sweden	9.6 ,,
United States	9.5 ,,
Netherlands	8.2 ,,
New Zealand	8.0 ,,
Switzerland	7.1 ,,

*

Compensation to Displaced Claimants: Over Rs. 53.72 crores were paid as compensation to displaced claimants from West Pakistan up to the end of March, 1957. Out of this sum, over Rs. 33.76 crores were paid in cash, Rs. 11.65 crores by transfer of property and Rs. 8.31 crores by adjustment of public dues. During the month of March alone, about Rs. 3.20 crores were paid in compensation — over Rs. 2 crores in cash, over Rs. 70 lakhs by transfer of property and about Rs. 41.63 lakhs by adjustment of public dues. During the same month, over Rs. 1 crore were paid in compensation by the Central Ministry of Rehabilitation in the Lucknow region. Out of this sum, Rs. 78.52 lakhs were paid in cash, Rs. 18.81 lakhs by transfer of property and Rs. 6.60 lakhs by adjustment of public dues.

*

World Bank Loans to Private Industrial Concerns: In a written reply to Shri Valiulla in the Rajya Sabha Shri T. T. Krishnamachari, the Minister for Finance stated that the World Bank had so far granted loans to four private industrial concerns in India. The amount of the loans given to each concern was:

i) Tata Iron and Steel Company Ltd. ..	$75 million
ii) Tata Hydro Agencies Ltd.	$16.2 million
iii) Indian Iron & Steel Company Ltd. .. (Comprising of two loans of $31.5 million and $20 million respectively).	$51.5 million
iv) Industrial Credit and Investment Corporation of India	$10 million

GENERAL

Optimum Handling Capacity of Madras Port: The optimum handling capacity of the Port of Madras was of the order of 1.75 million tons per year, but the Port had been required to handle as much as 2 to 2½ million tons per year ever since 1950. Though the Port had been working on three shifts to handle this additional cargo beyond its capacity, certain amount of delay to ships had been inevitable. A project for increasing the number of quay berths from 9 to 17 had been sanctioned. The construction of two of these berths is in progress.

*

Houses for Colliery Workers: The Union Deputy Minister for Labour, Shri Abid Ali, said in reply to a question by Shri T. B. Vittal Rao in Lok Sabha recently that 4,724 houses for colliery workers had been constructed till the end of April 1957. These were built either directly by the Coal Mines Labour Welfare Fund Organisation or under the Subsidy and Subsidy-cum-loan schemes.

*

Supply of Turbo Drilling Equipment from U.S.S.R.: A supplementary agreement for the supply of turbo drilling equipment from the U.S.S.R. has been signed. The agreement modifies an earlier agreement executed in May 1956 for the supply of conventional rotary type drills along with geophysical and seismic equipment at a cost of Rs. 1 crore and 34 lakhs. Under the present agreement, the U.S.S.R. will supply drilling rigs designed for forced turbine and rotary drilling of oil and gas prospecting up to a depth of nearly 16,000 feet. The modification involves an additional expenditure of Rs. 20 lakhs and covers the supply of cementing and additional workshop units also. The first consignment of equipment is expected to be delivered this month, the second by October 1957, and the third by December this year.

*

Machinery Used on River Valley Projects: The Government of India have decided to standardise certain categories of machinery used on river valley projects on the recommendations of the Standing Committee constituted for the purpose. The categories of the machines and the number of makes standardised respectively are: Crawler Tractors (above 60 H.P.), 3; Rubber-tyred Tractor Dozers, 1; Scrapers Motorised, 4; Scrappers towed (above 6 cubic yards capacity), 3; Bottom Dumpers (above 12 cubic yards capacity), 3; Rear or side Dumpers (above 6½ cubic yards capacity), 2; Rear or side Dumpers (small — up to 6½ cubic yards capacity), 4; Excavators, 5; Graders (above 75 H.P.), 3; and Loaders, 1.

NEWS IN BRIEF

INDIAN

The Union Government have decided to set up a high powered Committee to investigate fully into the causes for rise in food grain prices.

*

The Indian Standards Institution has circulated for eliciting comments, a draft Indian standard specification for swage blocks and stands which are generally used for heading bolts and swaging bars.

*

The Railway Board has given its approval to a scheme for the re-modelling of the railway yard at Jaipur, on the Western Railway, at estimated cost of nearly Rs. 55 lakhs.

*

The Government of India have set up an 'ad hoc' Committee to consider such amendments to the Companies Act, 1956, as may be found essential to remove defects or deficiencies in its working.

*

The Government of India have suggested a large industrial unit, registered under the Industries (Development and Regulation Act), to foster collaboration with small-scale industries so that small units can grow up as ancillaries to large factories.

*

The Government of India has approved the establishment of regional laboratories in Madras, Kerala, and Bihar States under the scheme for the development of Public Health Laboratory Services formulated by the State governments.

*

The Railway Board has authorised the South Eastern Railway to carry out the preliminary engineering and final location survey for a railway siding from Birmitrapur to Hathibari with an alternative route from Kumaramunda to Hathibari.

*

The Railway Minister, Mr. Jagjivan Ram has announced that supplementary charge on goods and parcels traffic would be doubled from July 1.

*

The Government of India have released a further quantity of 1.64 lakh tons sugar for free sale in the country, the Ministry of Food and Agriculture announced.

*

The Joint Chief Controller of Imports, Bombay, has announced that inter-mill sales of imported cotton will not be allowed except with the permission of the Central Government.

*

To regulate supply of chemical fertilizers of the prescribed standard to the cultivators at fair prices, the Government of India have promulgated the Fertilizer (Control) Order, 1957.

*

The Minister for Industry, Shri Manubhai Shah, revealed in the Rajya Sabha that the Government of India had earmarked Rs. 4.3 lakhs to be spent by the Coir Board during 1957-58 for promoting the sales of coir goods within the country and abroad.

FOREIGN

The external assets of Ceylon fell by a further Rs. 26.8 million and stood at Rs. 1,126.3 million at the end of March. This is the fifth successive month in which the external assets have declined. Over the first quarter of 1957 they fell by Rs. 53 million.

*

South Africa's total gold and foreign assets in the week ended May 3 totalled £128,108,000 compared with £132,034,000 a week earlier. The latest total comprised £83,068,000 in gold coin and bullion, £33,865,000 in foreign bills, £6,707,000 in foreign securities and £4,463,000 in other foreign assets.

*

It is reported Japanese industrialists have launched a five year research and development programme, subsidised by the Government, leading to the production of commercial aircraft.

*

The World Bank has granted a loan of $4,200,000 (about Rs. 2,00,00,000) to the Pakistan Industrial Credit Investment Corporation and the agreement in this regard is to be signed in a few days.

*

The number of employed persons in the US will rise to a record 68 millions this year, half a million more than the present record set last year. Employment reached 64.3 million in mid-April. This exceeds the employment total in mid-April last year by more than 300,000.

*

World Jute production in 1956 is estimated at 4,651 million lbs., as compared with 4,477 million lbs. in 1955, according to 'Foreign Agriculture' a monthly publication of the US Department of Agriculture.

*

The International Committee of the National Planning Association of the US, a non-political organisation devoted to planning in economic and other fields, has recommended the establishment of a new Government Corporation with an initial capital of at least $1,000 million to handle economic aid.

*

According to the Cotton Board figures, production of cotton and mixture clothes by the Lancashire weaving industry improved by about 80,000 yards per week during March.

*

It is reported the United Nations Economic Commission for Europe will in future act as a "clearing house" for interested Governments to arrange multilateral compensation of balances arising under their East-West trade and payments agreements.

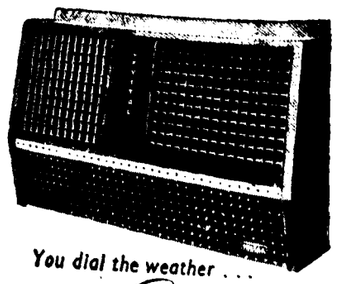
*

The Ghana Government has granted permission to an American group to make a rapid survey of the Volta River Hydro Project.

*

It is reported Australian exports to India and Ceylon are expected to rise by £A3 million in 1958-59.

*



The Government of Argentina has purchased $75,000,000 from the International Monetary Fund with Argentine pesos. Argentina's quota in the Fund is $150,000,000 of which the member paid $37,500,000 to the Fund in gold.

A cool, calculated investment —the 'Crystal' room air conditioner!

FRESH, quiet, free from dust and outside noises—your 'Crystal'-cooled office invites good work, impresses clients and visitors. You can calculate for yourself how many dividends it earns you in better business, more goodwill . . . and cool comfort!

The 'Crystal' is made *in* India *for* India, by Voltas Limited—the people who know air conditioning best. Its smart appearance adds distinction to your office . . . its low installation and running costs recommend it to every astute businessman! And remember the 'Crystal' is backed by Voltas' unrivalled after-sales service.

You dial the weather . . . the Crystal supplies it

... and YOU!

All 6,500 of us in Hindustan Lever, a small army of men and women, have something very important in common. For us, it is not enough to make soaps, toiletries and cooking fats—with each of our products we aim to give you what you need in unvarying quality, so that you—the families of India—may know and trust and use them.

For almost eighty years, we have grown with your growing needs. And, like a flowering plant, we have put forth new and exciting blooms—dynamic pioneering activities behind the actual manufacturing scenes. Our Market Research department—unique in this country—carefully studies your preferences, your habits and opinions, and guides production with its findings. Our Quality Control department carries out strict tests on each product from the raw material stage to the finished article. The Dalda Advisory Service and the Washing Information Service are there to help you make the best use of our products.

And what are these products? You know them well—Sunlight Soap, for instance . . . Lifebuoy . . . Lux . . . Rexona . . . Gibbs S.R. Toothpaste . . . Dalda Vanaspati . . . and others that have become household friends. We are proud that so many of you have chosen to use them every day in your homes. At the same time we realise that your patronage lays upon us a duty, that of keeping steady our common aim, to offer the very best quality and value to our customers . . . to you!

Economic Report from the U. S.

FOREIGN AID PROPOSALS

(BY GUY SIMS FITCH)

WASHINGTON, May 14.—So many reports on foreign aid have now been issued, they need to be put in context as background to both President Eisenhower's forthcoming specific proposals to Congress and his broad campaign on behalf of his Budget.

What are some of the principles on which Presidential, Congressional and private groups have agreed in their foreign aid studies?

The Best way to approach this inquiry is to take a look at the latest and highly important report, just published by the Senate Special Committee on foreign aid.

The Committee was created last July during an intense Congressional struggle over mutual aid. As the report itself states, the Committee sprang from the realization that Congressional votes in favour of mutual assistance had suffered from atropy ever since all but seven legislators approved of the Marshall Plan ten years ago.

Composed of the full Foreign Relations Committee and ranking members of the Appropriations and Armed Services Committees, the foreign aid group brings together the views of some of the most influential men on Capitol Hill.

It is then of consequence that these men after exhaustive study and in the midst of a strong Congressional economy drive, recommend that foreign aid be continued. Their report flatly states that there can be only one answer to the fundamental question: "Foreign aid is necessary". On that issue all reports agree.

Another characteristic the reports have in common is a shift of emphasis. No report recommends specifically that the programme on which close to $58,000 million has been spent for, should go on without change.

The proposals for shifting gears range all the way from abroad and general preference for loans (as opposed to grants) in the Presidential Committee's reports, to Secretary of State, Mr. Dulles' far more specific suggestion for the establishment of a revolving fund.

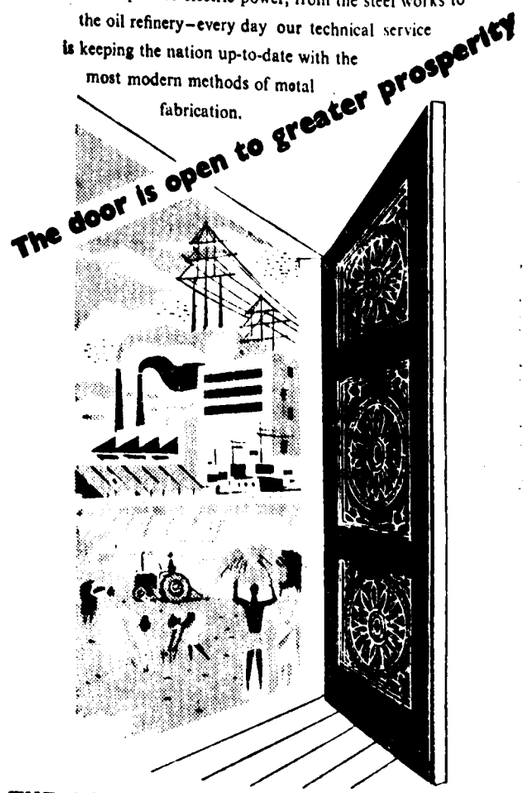
Such a fund, to be built up in yearly installments of about $500 million to $600 million would free foreign Aid planning from the limitation of annual budget appropriations and particularly benefit economic-project aid in newly developing countries.

Agreeing with Mr. Dulles' idea, the Senate Committee, too, recommends a revolving fund but for reasons that go well beyond budgetary procedures. It proposes that the fund be established wholly apart from other types of aid, such as military assistance, defence support (a special type of economic aid) and technical assistance, for which, incidentally, the Senate group is full of praise.

The revolving fund would be under the control of a new government corporation with State Department, Commerce Department and Export-Import Bank officials among its directors. It would supplement Export-Import Bank lending, promote private American investment abroad and encourage the development of private enterprise. It could enter into joint investment with private capital and acquire debentures in national or regional development banks in recipient countries.

Under the Committee's recommendations, foreign aid would receive several new slants: Military aid would come under domestic defence; defence-support aid, specifically to peoples under critical threat of Communist aggression, would be under the State Department's direction; technical assistance would continue in its present form; and the fund would handle pure economic-development aid.

It would give assistance in the form of repayable loans, with distinctly lower interest rates and longer repayment schedules than those customary for private loans, but with a 'reasonable expectation of repayment".



The fund thus would allow a "discriminating reduction" of grant and of the overall costs of the programme.

The Committee feels strongly about the purity of economic aid: 'The economic development of other independent nations is in the interest of the United States," the report declares, and its purposes are better fulfilled if they are not confused with defence against the threat of Communist aggression.

The Committee's approach would give each type of aid a clear and distinct purpose. It would, in effect, make economic development aid part and parcel of U.S. long-range foreign economic policy, a concept in which the State Department itself has shown considerable interest of late.

INDIAN OXYGEN is playing a vital role in building a more powerful and self-sufficient India in the Second Five-Year Plan.

From transport to electric power, from the steel works to the oil refinery—every day our technical service is keeping the nation up-to-date with the most modern methods of metal fabrication.

THE BUDGET IN BOMBAY

By CROESUS

NO official position today is more unenviable than that of the Finance Minister of India. Given the mandate to find funds for financing a plan—the second Five-Year Plan.—the size of which does not appear yet to have been finalised, and this at a time when the balance of payments position, on the one hand, and the internal price situation, on the other, are anything but satisfactory, it is difficult to say whether anyone else in the position of Mr. T. T. Krishnamachari would have acted differently; possibly, one might have done worse. But the question is repeatedly asked—and it will continue to be asked, notwithstanding our Prime Minister's remark in Neiveli that those who do so lack the quality of audacity—whether it is at all worth while to force the pace thus. It is not that those who argue in this strain are averse to the raising of the standard of living of our people, because they realise only too well that it is low enough in all conscience. But what they genuinely apprehend is the likely frustration if the second Plan falls short of the targets. I am positive these are not Jeremiahs or Iagos out to create a scare for the simple fun of it or the sheer mischief of it. They too are men of great calibre and varied experience who are not lacking in any way in the love of this great and beloved land either. Nothing has brought this home to the people more pointedly than the Union Finance Minister's latest assessment of the economic health of this country and his formidable budget proposals. Epithets like "Flecee-All" budget or "Save-the-Plan" budget only partly describe the development. Individual proposals have been justified by some and condemned by others, but persons with penetration are prone more to view the budget proposals as a whole from the point of view of the effects—not just the plupical, but the psychological—they are likely to have. Even to say these would be disastrous would be to put it very mildly. Far from fulfilling all the four objectives underlying them, Mr. Krishnamachari's budget proposals would or rather might achieve just one objective, that is the first objective of producing a sizeable addition to public revenues, but whether this will be a continuing process or just a passing phase is more than one can say at this stage. The danger is not altogether absent that the tax yields might fail to respond to increased incomes, at any rate to the extent expected.

Several commentators have described Mr. Krishnamachari as courageous. Courageous he undoubtedly is; but he might have been courageous and also considerate had he implemented 'in toto' all the proposals of Professor Nicholas Kaldor, for whom he has unconcealed admiration. I go a step further; Mr. Krishnamachari should have, with all the tax changes he has brought about, also made a bid for a triennial budget, if not a budget for the rest of the Plan period, and then asked the public to judge his performance. That is what Roosevelt asked for in his Fair Deal.

To turn now to the reactions to the budget proposals of the business world. If there is one new tax proposal that has been almost universally condemned, by the business world, and also by the discerning public, it is the wealth tax on companies. The Union Finance Minister has justified this levy by reference to certain peculiar circumstances of this country. By that beautifully vague phrase he presumably means the structure of companies in India as it has developed, under which the managing agents or the people who manage point-stock companies under other appellation hold—or rather used to hold—a major interest. But has not enough been done already to sound the death-knell of this structure? That apart, can anyone challenge the correctness of the charge against this impost that it amounts to double taxation pure and simple? Moreover, at a time when the country needs more savings, more capital formation and more production, this threat of a sure levy right from inception can hardly conduce to the growth of more concerns. The low rates with which the Wealth Tax has been ushered in have not succeeded in making it acceptable, for the certain fear is there that, once introduced, its behaviour would not be very different to the small ripple that a stone thrown into a pond initially produces. The ripple widens.

Next in the order of the hated new levies comes the Expenditure Tax. In having brought in this tax also, along with the Wealth Tax (and the Capital Gains Tax earlier) without giving effect to Kaldor's suggestion to reduce the level of taxes to 45 per cent at the same time, Mr. Krishnamachari has allowed himself to be chastised by Kaldor, although the former can quote the latter to justify this piece-meal implementation of his (Kaldor's) proposals. However, in doing this, the Finance Minister has not belied the worst expectations of some people that he might import the worst features of the Kaldor Report without most of its severely few redeeming ones. Whatever may be the theoretical justification for the Expenditure Tax—even here, there are few bar Kaldor who approve of it—the difficulty of giving effect to it in practice and the avoidable fears about one's "sacred secrets" being exposed ought to have deterred our Finance Minister.

As regards the other levies, in particular the excise duties and the import duties, there is no other or further angle that the Business World has provided than what is by now familiar to all. But one point that deserves to be stressed, even if it may be called a repetition, is the combined inflationary effect of both of these. It has been admitted that the object of the excise duties, on some of the consumer goods is to discourage their consumption by making them dear and thus taking them beyond the reach of most people. The increased import duties and the further tightening of imports also are aimed at achieving a similar end. The creation of this "artificial" shortage will lead to surplus or idle purchasing power, the quantum of which will go on increasing with the steady flow of development outlay, and this could be diverted into other channels, unless effectively dammed or mopped up, bringing about an imbalance therein and also lead to embitterment among those sections of the population which are only lately being drawn into the money economy.

Even more serious than this is the certain effect on our export prices due to the all-round rise in costs. The Finance Minister may deny the exchequer any excise duty on goods produced in this country for export, but he cannot prevent the cost of these goods going up as a result of the price-wage spiral that the gathering inflationary conditions will soon set in motion. India can compete with her rivals in whatever foreign markets she has entered more on the count of attractive price than on that of superior quality, although the quality is fast improving.

These criticisms are not frivolously made. As I said at the outset, the position of any Finance Minister today is unenviable and most people sympathise with him and go even so far as to say that, in the context of our impossible second Five-Year Plan, what he has done is perhaps inevitable. But would it not be prudent to bow to the logic of facts and cut down the size of the Plan to manageable proportions or extend its period.

BUSINESS NOTES

SHARP DECLINE IN LIFE INSURANCE BUSINESS

THE STATEMENT laid on the table of the Lok Sabha by Mr. B. R. Bhagat, Deputy Minister for Finance, makes the disturbing disclosure that there was a sharp decline in the new life insurance business written in 1956 under the auspices of the nationalised set-up. Life insurance business in 1956 stood low at Rs. 200 crores in telling contrast with business of the order of Rs. 268 crores in 1955 and Rs. 247 crores in 1954. It is the contention of the Minister that these figures cannot be taken at face value and proper allowance must be made for certain special factors. The special factors to which more than normal business is attributed in the years 1954 and 1955 are: (a) Business under Staff Assurance Scheme and (b) business due to Estate duty policies and Married Women's Property Act policies and (c) conversion business. Staff Assurance Schemes were prohibited in October 1955 as they led to unhealthy and cut-throat competition. As for Estate Duty policies and Married Women's Property Act policies, the initial spate of business subsided and only marginal business that may be available from year to year was left in 1956. Consequent on the steep reduction in the rates of premiums, there was a great rush for abandoning existing policies and buying new ones at the attractive low rates. Business so written was in no sense genuine new business but mere conversion business. The scope for such conversion business was exhausted by the end of 1955. This in brief is the official explanation of the special factors which contributed to an unusual volume of business in the two years preceding nationalisation.

There is no doubt some force in the contention of Mr. Bhagat. However, even if full allowance is made for the operation of these special factors, the conclusion remains unaltered that business in 1956 did record a significant fall. As the statement shows, in the year 1954 business worth Rs. 36 crores was attributable to the conversion factor, Rs. 10 crores to the Staff Assurance Schemes and Rs. 7.5 crores to Estate Duty and Married Women's Property Act policies. This adds up to Rs. 53.5 crores. The respective figures for 1956 were Rs. 36 crores, Rs. 18 crores and Rs. 7.5 crores, aggregating to Rs. 61.5 crores. If this volume of special business is excluded, the comparative position of new business written emerges as follows: 1953 — Rs. 168 crores, 1954 — Rs. 193.5 crores, 1955 — Rs. 206.5 crores and 1956 — Rs. 200 crores. These figures disclose that whereas in the years 1954 and 1955 there was a substantial increase in business of the order of Rs. 25.5 crores and Rs. 13 crores as compared to the previous year, in the year 1956 there was a trend in the reverse direction showing a shortfall of Rs. 6.5 crores below the preceding year. This short-fall comes ill at a time when higher incomes and the desire to save ought to have given impetus to the life business.

Mr. Bhagat's statement contains a significant admission. He says that during January to September 1956, when, after nationalisation, life business was managed by the erstwhile insurance companies functioning under custodians as separate units, business of Rs. 145.61 crores was completed. This was in excess of the business done in the corresponding period of 1955. The implication of this admission is clear. It is that conditions in 1956 were far more propitious for new business than in the previous two years, so much so that even the effect of the three special factors would have been more than wiped out. After the Life Insurance Corporation was launched, that is, between September and December 1956, monthly average business suddenly shrunk to Rs. 13.7 crores as against the monthly average of Rs. 18.2 crores under the custodians. The dislocation which followed movements of staff and the dispute over pay scales as well as the uncertain and unsettled conditions of work for agents are matters of common knowledge. The staff has been appeased now at a cost of Rs. 60 lakhs per year in terms of higher emoluments. The difficulties of the agents remain to be resolved. Certain new schemes of insurance have been proposed to be introduced. Time alone can show whether present optimism about their potentialities is justified. But so long as the Corporation does not set its house in order in respect of conditions of employment for field workers, it is unlikely that any mentionable progress will be made in life insurance.

ONCE BITTEN, TWICE SHY

LAST WEEK'S raising of the Bank rate (from 3½ per cent to 4 per cent with effect from May 16, 1957) has set right at least one anomoly, namely of the official Bank Rate lagging behind the Usance Bill Rate. But the problems of the Electricity Industry do not appear to have been solved thereby. The Industry is still agitated by two allied problems in the context of the Electricity (Supply) Act. The first of these is that, although the De Facto Rate—the Usance Bill Rate—was raised to 4 per cent from February 1, 1957, the Electricity undertakings will not be able to adjust the returns automatically with the money market, until April, 1958, as matters stand, because the Bank rate as such was raised only from May 16, 1957 or, in other words, after April 1, 1957, the date relevant as per paragraph XVII (10) of the Sixth Schedule to the Electricity (Supply) Act. Thus, despite the effective rise in money rates because of the delay in the DE JURE recognition of a DE FACTO state of affairs, the industry is made to suffer avoidably for no fault of its own. The second is the possible repetition, by the Reserve Bank, of the increase in the Usance Bill Rate without a simultaneous and corresponding rise in the Bank rate. The industry cannot certainly be blamed for entertaining such an apprehension. Once bitten; twice shy, it has not forgotten its bitter experience when the Usance rate was raised in February last without also raising the Bank rate at the same time. In these circumstances, the industry has again approached the Government with two specific prayers, which require not only sympathetic but prompt consideration at the hands of the authorities.

First, the industry wants the Reserve Bank rate to be made effective retrospectively from April 1, 1957, notwithstanding the fact that the increase in the Bank rate came later; secondly, it has asked the Government to push through at least a brief bill during the current session of Parliament, in order to meet the more pressing needs of the electricity industry. The bill need deal with only two consequential amendments namely that relating to paragraph 3(b) of the Fifth Schedule and that relating to paragraph 2(b) (ii) of the Eighth Schedule.

In this connection, the Federation of Electricity undertakings of India has actually suggested a draft text of the amendments to paragraph XVII (10) of the sixth Schedule to the Act. This reads as follows:

Explanation "for purpose of this paragraph, the Reserve Bank rate means the Bank rate under Section 49 of the Reserve Bank Act 1934 or the rate of interest on advances to scheduled banks against Government and other eligible securities under Section 17 of the Reserve Bank Act, 1934, whichever is higher.

The above only crystalises the position as it ought to be. Inasmuch as even the Union Finance Minister has accepted the views of the Federation on the point, it is to be hoped that there will be very little delay in giving a legislative form thereto.

NIEVELI LIGNITE PROJECT

THE OPENING of Nieveli Lignite Project by the Prime Minister this week marks a significant stage in the development of industries in South India. So far development of industries in the south could not be speeded up on account of the lack of coal and power supply. Coal supplies are obtained from West Bengal and Bihar and entail high transport and freight charges.

The mining of lignite of brown coal, is the core of this multi-purpose project which envisages an annual output of 3.5 million tons of lignite by 1960, production of 70,000 tons of nitrogenous fertilizers and generation of 200,000 kilowatts of thermal power. The total cost is estimated at Rs. 70 crores. The Nieveli scheme will not only generate power and make possible the setting up of a 10,000-ton aluminium plant in Salem during the current Plan period, but will also give rise to a host of other industries. As there are no known deposits of good coal in the South, the region's only chance of an assured supply of cheap fuel lies in the exploitation of the large deposits of lignite in the South Arcot. The present project is expected to achieve that and relieve to a considerable extent the present shortage of fuel in the area.

The Government of India who are anxious to have the project pushed through without delay have sanctioned the errection of the Mining Scheme as the first step. Te management of the project has been entrusted to the Nieveli Lignite Corporation, a Government-owned company. The biggest prospect opened up by Nieveli is the manufacture of steel using lignite as fuel. There have appeared in the Press reports about the setting up of the third public sector steel plant in the South, the reason assigned being that the lignite fuel will greatly assist this plant. This is an exaggerated estimate of the potentiality of the Nieveli project. The report is now contradicted.

There is also a proposal to manufacture synthetic petroleum from lignite. The setting of these industries is expected to correct the present imbalance in the country's industrial development. While the steel and aluminium plants would put the southern region on the road to faster industrialization, the functioning of the fertilizer plant in the neighbourhood of the Neiveli Project, would help in stepping up the food production drive in the South.

ENQUIRY INTO COTTON MILL CLOSURES

PERHAPS THERE is no other industry which has been so severely affected as a result of the recent formidable burdens as the cotton textile industry. This industry, which is already reeling under such heavy burdens as increased excise duties, hgher interest rates and compulsory deposits — not to speak of the recent imposts on Joint-stock enterprises —is now confronted with the prospect of closure of a number of its units and of investigation into the causes for such closure by the Government. Save for an infinitesimally small number of those who may have skeletons in their cup-boards to hide, this is, indeed, a blessing in disguise It is not surprising, therefore, that many have welcomed investigation. It is desirable not only from the point of view of the workers, who will be thrown out of employment—an aspect in which the Government is primarily interested but also from the industry's point of view. For, such should serve as an eye-opener to the Government and enable it to find how they have become victims, due to causes beyond their control, of unrealistic economic policies. Mr. N. H. Tata, Chairman of the Svadeshi Mills Co. rightly pin-pointed this, while addressing the annual general meeting of the shareholders the other day.

After making a passing reference to policies and executive actions of the Government, which are doing a lot of damage to the industry and to Mr. Krishnamachari's "all-out" budget efforts to produce Rs. 93 crores of tax revenue, the Svadeshi Chairman expressed his view on the reported closure of a number of textile units. Mr. Tata had no doubt that investigations into this matter "would be interesting and thought-provoking" even for the Government. He said, "it would be sheer folly on the part of any manufacturing unit today, with burdens of heavy standing charges, in the form of heavy interest charges, insurance and salaries, to seek relief through the expedient of a closure, involving under our labour laws staggering statutory liabilities in the shape of retrenchment compensation or benefits of involuntary unemployment of its labour force. Consequently, he opined, it was as much suicide for the employer as it was calamity for the worker.

HEAVY MACHINERY MANUFACTURE

WITH THE selective acceptance by the Government of India of the recommendations of U.K. Heavy Engineering Mission and the Soviet team of experts, the path has been set for establishing the manufacture of heavy machinery so needed for strengthening the industrial base. It may be recalled here that during the last twelve months foreign experts made surveys of the resources and sites for starting heavy machine industries. Two high power teams came from Britain and the Soviet Union; a Japanese trade mission came later. Government of India had also invited experts from Germany and Czechoslovakia to make on-the-spot studies.

The scheme for the development of heavy manufacture, the broad pattern of which is now available, provides for the setting up of a heavy machine building shop, a foundry forge shop to meet the requirements of the machine shop and other industries, a heavy structural shop, a plate and vessel shop, a machine tool plant, a mining machinery and equipment plant and an alloy and tool steel plant. In regard to the setting up of a Central heavy machine building plant, a capacity to manufacture 80,000 tons of machinery equipment annually is envisaged. It is to be concluded in two stages. At the end of the first stage the annual capacity will be 45,000 tons and this would correspond with the second Plan period. The Soviet Government's offer of credit of Rs. 60 crores will be utilised for the setting up of this plant and also the mining machinery and equipment plant. A heavy structural fabricating workshop, a plate and vessel shop and a heavy machine tool plant will be established on the lines proposed by the U.K. mission. Assistance for technical consultative services is likely to be available under the Colombo Plan in regard to these projects. For the heavy machine tool plant offers of collaboration are forthcoming from the Continent also. As regards foundry forge shop discussions are going on with Czechoslovak, Russian, British and German interests. Although the details of these projects have still to be worked out, it is estimated that the entire development will cost Rs. 80 to Rs. 90 crores of which Rs. 50 crores will be the foreign exchange component.

The latest development in the field is the appointment of a special negotiating Committee set up under the Chairmanship of Mr. Y. N. Sukhtanker to negotiate the various projects that will form part of the heavy machine building plant with Russian, British, German and Czech interests. Along with the speeding up of the heavy machinery projects there is also the need of the technical personnel to man the foundries and forges, the factories and machine shops. Provision for training facilities of these personnel forms part of the overall programme of expansion of technical institutes which is now being taken up on an appreciable scale.

COMPANY AFFAIRS

THE NATIONAL RAYON CORPN. LTD.

The National Rayon Corpn. Ltd. reports a net profit of Rs. 58.33 lakhs after providing Rs. 60 lakhs for depreciation and Rs. 26.61 lakhs for taxation. The provision out of the year's profits are Rs. 7 lakhs for general reserve, Rs. 10 lakhs for deferred taxation reserve and Rs. 2 lakhs for gratuity reserve. The debenture redumption fund also gets a credit of Rs. 10 lakhs. The carry-forward at 5.52 lakhs compares with Rs. 51.12 lakhs brought forward from the preceding year.

The balance sheet shows that the paid-up share capital of the Company now stands at 334.92 lakhs as against 331.90 lakhs last year; representing an increase of 3.03 lakhs. The Company's funds also benefited to the tune of Rs. 6.15 lakhs by way of premium and share account; being the value of forfeited shares sold during the year. It is significant that for the first time provision has been made for payment of taxes to the extent of Rs. 26.61 lakhs as already stated as it is expected that the Company's profits for the year 1956 may became liable to assessment for income-tax. From the point of view of the shareholders this means that the dividends on preference shares will be subjected to deduction of income-tax at source while those on ordinary shares will have to be grossed up by the shareholders in their returns for purposes of income-tax.

It is not clear from the Directors' report, and pending the finalisation of the relevant rules, whether or no the Company will be required to make any compulsory deposits.

The Company has been making satisfactory progress in regard to its expansion programme. The second stage of the expansion was completed in December last, while the 3rd and the fourth stages are due to be completed very soon, when the total installed capacity of the complete plant will be 24 tons per day (on the basis of 114 diniar). Alongside of the expansion of the main plant work has also been going on in connection with the erection of the caustic soda chlorine plant which is expected to go into production about third quarter of this year. Normally the plant should have gone into operation by now but the Suez crisis delayed the arrival of machinery by quite a few months. This up selling the original time schedule of the management.

Another activity of the N.R.C. is the proposed connection of a four million pounds capacity tier curd plant. This is expected to cost the Company about three crores of rupees and the erection of the plant may be expected to be completed in about 2 years time from the date of placing the order. This venture will naturally require additional finance besides securing of the required plant on a deferred payments basis as required by the Government of India. Accordingly, the Directors have decided to increase the ordinary capital of the Company by a further issue of 80,500 ordinary shares to the existing shareholders in the proportion of one share for every two shares held. Subject to the sanction of the government it is proposed to ask a premium of Rs. 25 per share. As regards arranging for deferred payments as also for negotiating terms for the purchase of necessary equipment and know-how arrangements have been made to depute representatives of the Company to explore possibilities.

The accounts for the year under review do not reflect fully the incidence of the new excise duty on Rayon Yarn; which became effective only from December 1, 1956. But as the directors state in future years the incidence of this burden will be for the full twelve-month period and at the present rate will cost to Company more than Rs. 35 lakhs every year.

The N.R.C. is a unit of one more industry which has been the victim of the unsatisfactory position regarding supply of wagons.

THE TATA IRON AND STEEL COMPANY LIMITED

NOTICE.

The Transfer Books of the Company will be closed from Monday, the 24th June, to Saturday, the 20th July, 1957, both days inclusive.

The dividends for the year ending 31st March, 1957, when sanctioned, will be made payable to those shareholders whose names stand on the Share Registers of the Company on Saturday, the 20th July, 1957.

BY ORDER OF THE DIRECTORS,

Tata Industries Private Ltd., Managing Agents,

J. D. Choksi,

DIRECTOR.

BOMBAY, 17th May, 1957.

COMMODITY NEWS AND NOTES

PRODUCTION OF INDIGENOUS SUGAR

The production and despatches of indigenous sugar amounted to 18.22 and 10.35 lakh tons up to April 30, 1957, in the current season, as against 16.53 and 8.06 lakh tons respectively in the corresponding period of the last year.

The stocks with the factories on April 30, 1957, stood at 13.14 lakh tons, as compared with 12.58 lakh tons last year.

ESTIMATE OF MESTA FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate a mesta for 1956-57 puts the current year's area and production at 738,000 acres and 1,474,000 bales (of 400 lbs. each), as against the partially revised estimate of 572,000 acres and 1,159,000 bales respectively for 1955-56. This shows an increase of 166,000 acres or 29.0 per cent in area, and 315,000 bales or 27.2 per cent in production over last year.

The increase in area during the current year has been shared mainly by West Bengal, Bombay and Bihar, and has been attributed to favourable climatic conditions at the time of sowing. Some minor decrease in acreage during the current year has, however, been reported from Mysore and Madhya Pradesh.

The overall increase in the current year's production has been shared by almost all the States except Andhra Pradesh and Madhya Pradesh. The increase is marked in the case of West Bengal, Bihar and Bombay and has been attributed partly to increase in acreage, and partly to favourable climatic conditions at the growing period of the crop.

PRODUCTION OF COMPLEX FERTILIZERS

The production of 200,000 tons of "complex" fertilizers annually at the new fertilizer plant, to be set up in the country soon, has been recommended by the Standing Committee on Manures and Fertilizers of the Ministry of Food and Agriculture. The 'complex' fertilizers, containing principal plant nutrients, will cost about 40 per cent less than the prevalent price of fertilizers. The Committee reaffirmed its original recommendation to the Government of India that 40,000 tons of diammonium phosphate should be manufactured at the Sindri Fertilizer Factory. In view of the upward revision of the consumption target of potassic fertilizers for 1960-61, from 30,000 tons to 48,000 tons per year, the Committee suggested that the additional quantity could be produced by stepping up the production of potassium chloride (muriate of potash) at the existing salt manufacturing centres in the country.

MARKETING OF CHILLIES

A report on the marketing of chillies in India, published by the Directorate of Marketing and Inspection of the Union Ministry of Food and Agriculture, estimates that the annual production of chillies is about 18 million maunds—8 million maunds green and 10 million maunds dry, covering an area of about 12 lakh acres. Important chilli producing States are Madras, Andhra, Bombay, Madhya Pradesh, Mysore and Bihar, which together account for 88.9 per cent of the total area under the crop. Of these, Madras has the largest acreage, followed by Andhra and Bombay in that order. There is hardly any import of chillies into India. On the other hand, India exports on an average about 187,000 maunds per annum, the largest importer being Ceylon. There are many varieties of chillies in India, differing in size, shape and pungency. They are grown both as a garden and a field crop and also as a rain-fed or an irrigated crop. The report emphasises the need for improving market intelligence and the methods of storing, grading and packing. It says that co-operative societies should be developed for gathering and distributing chillies and State Governments should enact legislation for regulating markets. The report lays stress on the necessity of improving the financial resources of the producers and of adopting effective measures to fight pests and diseases as also of introducing improved methods of cultivation.

RICE ACREAGE IN PUNJAB

The final forecast for rice crop in Punjab has placed the total area sown in 1956-57 at 7,32,800 acres as against 6,74,000 acres in the corresponding forecast for the last year. This includes an irrigated area of 5,11,400 acres—70 per cent of the total rice-fields in the State.

The total out-turn of husked rice according to the Random Sampling Method of crop cutting experiments is estimated at 2,77,000 tons and according to the official estimate is 2,22,600 tons against 2,02,000 tons in the last year. The average per acre yield estimated comes to 876 lbs.

The total area under maize crop in Punjab during the year 1956-57 has been estimated in the final forecast at 10,09,000 acres as against 9,85,000 acres in the corresponding forecast of the last year. The average yield per acre comes to 1,445 lbs. according to the Random Sampling Method of crop cutting.

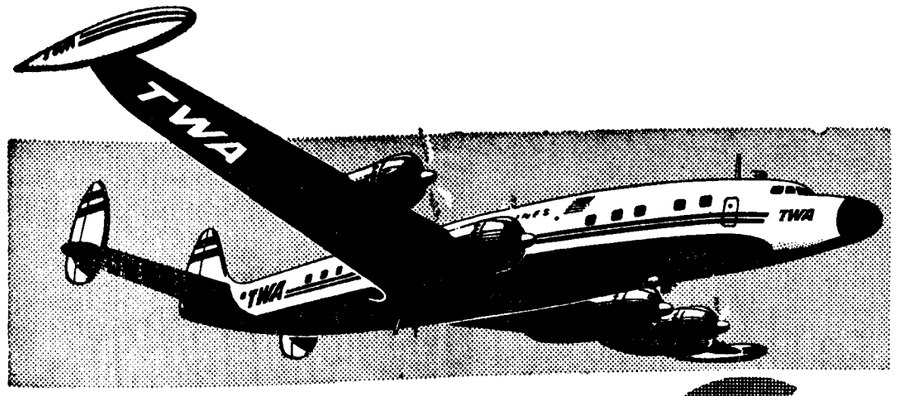
The total area under jowar this year, according to the final forecast, is 7,06,000 acres as against 7,00,000 acres in the last year.

WORLD CONSUMPTION OF TIN

World consumption of tin is expected to rise by over 8,000 tons this year.

Japan is one of the countries which is taking more from the world supply and her offtake from Malaya is expected to be around 8,500 tons during 1957, against just over 6,500 tons last year.

However, despite the optimistic outlook, there are developments afoot which could change this. Estimates of the year's production in Indonesia and Bolivia show that both countries may not turn out as much this year as they did last year, and it may be that the extra supplies will have to be drawn from either Russia or Brazil. Russia, however, is holding back large quantities for stock-piling.



SUGAR PRODUCTION IN U.P.

The production of sugar in U.P. this season is estimated at 10.4 lakh tons as against the country's production of about 20 lakh tons.

The State, which has half the number of the country's total of 134 sugar factories, has almost doubled its production during the last five years. The sugar factories in U.P. crushed 16.44 maunds of sugarcane, producing 5.92 lakh tons of sugar in 1950-51.

SOUTH AFRICAN GOLD PRODUCTION

Gold production in the Union of South Africa amounted to 15.89 million fine ounces in 1956, a new record figure. It was 8.8 per cent greater than in 1955, and more than 20 per cent greater than in 1954. The declared value of the 1956 gold output was £198.5 million, compared with £182.8 million in 1955 and £164.6 million in 1954. Most of the increase in output during 1956 was attributable to the expanding operations of the mines in the Orange Free State, whose production rose to 3.17 million fine ounces, from 2.19 million fine ounces in 1955. There was, however, also a slight increase in the production of the Witwatersrand Mines, to 12.21 million fine ounces in 1956 from 11.91 million fine ounces in the previous year. Production of miscellaneous mines amounted to 0.52 million fine ounces in 1956, compared with 0.51 million fine ounces in 1955.

Company Meeting

MAHINDRA & MAHINDRA LIMITED

The following is an abbreviated version of the Speech delivered by the Chairman Mr. K. C. Mahindra at the eleventh Annual General Meeting held in Bombay on May 22, 1957.

This is the first occasion on which the Chairman of your Company is addressing the Shareholders. It is a matter of satisfaction and a little pride that the report which has been presented to the shareholders reflects the conclusion of an exceedingly successful year of operations for the Company. It has been a year where high levels of sales and earnings have been reached. This achievement was possible principally because of your organisation keeping pace with the demands of an expanding economy. Illustratively, for instance, Government put through a programme of heavy purchasing of Steel from abroad. As one of the principal importers of steel, your Company was in a position to service this demand for additional steel and thereby continue to occupy a dominating position in imports. It should be mentioned that under the very rigid regulations governing steel business, the profit margins are extremely low and importers and dealers usually depend upon large volume in order to meet the substantial expenditures of such an operation.

The turnover in Jeeps and allied vehicles was about 20 per cent more than the previous year, but a very satisfactory improvement was made by the Spare Parts Division. Tractors achieved a remarkable advance in sales, almost tripling the record of the previous year. With the commissioning of your new Trailer factory at Pimpri the Company is now in a position to embark on the manufacture of heavy Trailers, and several steps are at present being taken to improve upon the techniques of production, and equip ourselves to service the demands for heavy Trailers in the country.

The problem of manufacture of Jeep components has been our foremost concern, and while the progress so far made is in accordance with the progressive phases of manufacture presented to Government in 1955, it is early to say whether the restrictions now enforced in respect of import of capital goods and tooling would seriously disturb the schedule of timing. Every effort is being made to overcome the difficulties of foreign exchange, and I have hopes that no serious set-back will be experienced during the current year in maintaining our progress.

Shareholders will appreciate that although it was the original design to gradually build and concentrate the Jeep operations at Pimpri, a major decision in this respect became inevitable last year when owing to scarcity of steel and cement it was found that the requisite building operations would not be completed within the time available to us. Accordingly, decision was taken to re-locate the Jeep programme. For this purpose we were fortunate in acquiring certain built-up factory areas in Worli and in Ghatkopar and accordingly the manufacturing operations did not suffer too much of a lag in time.

I will not be doing my duty to the shareholders if I were to gloss over the great difficulties which the manufacturing organisation is facing today: difficulties principally in the matter of foreign exchange but also connected with scarcity of steel and cement, shortages of appropriate raw materials of industry and the continuously rising costs. Problems of this nature will surely retard, if not bring to a halt, our expansion programmes.

There is, besides, the great problem of financing the operations, which are now at a high level. You will have noticed in the Directors' Report a reference to the line of credit of approximately one million dollars which the Willys Overland Export Corporation extended to the Company. This credit is in itself an evidence of faith and confidence which our Principals have shown in your organisation, and I should like to place on record on your behalf our appreciation of this gesture from the Kaiser interests, who now own the Willys organisation.

During the year, the Tariff Commission rendered a great service to the automobile industry by presenting a very able report to the Government, and it is encouraging to know that the industry has now been placed in the category of protected industries eligible for receiving the favours and the bounties attached to such developments. Nevertheless, the industry, in order to become strong and self sustaining, must proceed to develop sound and healthy lines. It is imperative that during the ten years' period recommended by the Tariff Commission and accepted by the Government, the ten years of protectiveness, the industry should shape its course in a manner that it relieves the country and the consumers of such burdens as will naturally be suffered during the protection stage. I do not see this happy consummation being reached unless a considerable degree of common exploration and research is carried out in order that we develop an automotive vehicle which will suit not merely the conditions of locomotion and transport in the country, but which will also suit the pockets of the millions of this land where purchasing power is so low and where the roads are scanty and undeveloped. Your Company is engaged in developing a vehicle ideally suited to the road conditions of India but I must confess it does not qualify as a peoples' car because of its high cost today. Cost can only be brought down by sheer weight of volume turnover. There is no other way in the automobile industry. It is incumbent upon the operators of the automobile business in India to explore the operational uses of a vehicle like the Jeep, to develop and build on its functional structure and evolve the multitypes suitable for what people need, suitable for the roads and available within the purchasing power of an ever increasing number of users.

The Tariff Commission also laid considerable stress on the necessity for common production programmes for auxiliary components like forgings, castings, chassis members, etc. No one need quarrel with the general proposition. It is, however, doubtful whether such an object will be achieved when the types and models of vehicles being produced are so disparate in characteristic and so few in number.

In another place I called attention to the inflationary pressures which have begun to weigh rather oppressively on our economy. The Finance Minister has devised some bold measures to curb the inflationary potential and to keep down domestic consumption

through a series of heavy excise duties. In the Budget presented last week to the Lok Sabha an unequivocal affirmation has been made that sustained increased productivity and savings are the only true key to progress. This statement will be welcomed, particularly in the light of the heavy sacrifices he has called for from the organised business section of the country. I draw attention, however, to a serious omission — the continual inflation of wage demands aided and abetted by Industrial Tribunals and Ordinances has not received the rebuke it deserves, for be it not ignored that the wage leverage upwards is the most potent and powerful threats to the success of any disinflationary measures. A wage freeze, a moratorium for 5 years on wholesale increases in wage demands, would be amply justified under the existing competitive urges when prohibitive restraints are being imposed on payments to shareholders and wealth, qua wealth, is being taxed to satisfy socio economic purposes. The promise to hold prices in the agricultural sector will require a reorientation of transport operations and methods, for it is my belief that mal-distribution of food grains stock is mainly responsible for the scarcity conditions which have developed in various odd spots in the country.

One important sphere of inflationary pressure has not come within the broad sweep of Mr. T. T. Krishnamachari's measures — the positive influence of rising public expenditure. No amount of restraint on consumption or on credit would be of avail if the magnitude and the pace of Governmental spending is not diminished. The volatile spenders, both State and Central, need to be kept in check under a strong leash if the delicate balance of stability is to be achieved. The distinguished Governor of the Bank of England stated recently that "the economic machine could not be driven with one foot on the accelerator of public expenditure and the other on the brake of credit restriction". Mr. Cobbold went on to add that it was not for the Bank to suggest where public expenditure should be cut. That was a political judgment, but it was his prime duty to "sound warning bells when Government and near Government spending is putting too heavy a burden on the country's resources". How true it is of our preset economy. We look to the Finance Minister to exercise enough persuasion with his colleagues so that political judgments conform to dire economic necessity of the moment.

For the success of our ambitious plan of development the co-operation and enthusiasm of the people must be marshalled; a feeling of commonness of responsibility must be generated; likewise a sense of sacrifice must filter down to the people. From this angle, a deliberate increase in costs of living may provide the feeling and the background of obligations and responsibility. Our able Finance Minister is a realist; he should have risen above the historical emotions respecting salt, as also the moralising sanctions respecting prohibition. Rajkumari Amrit Kaur, a devoted follower of Gandhiji, and erstwhile Minister of Health has urged the abandonment of symbolic attachment to salt and has also advocated the scrapping of prohibition laws: these two can provide him immediately with substantial revenues and at the same time incite a large number of the low income category of our population to participate in the grand venture.

Another aspect of the economics of disinflation which has not engaged the attention of our Finance Minister is the imperative need for providing incentives for greater production all round. Mrs. Joan Robinson, the eminent Cambridge economist who has studied deeply the Indian plans and made several visits to India for the purpose, stated a few months ago that "to support any large scheme of investment with a long gestation period there must be an appropriate amount of quick-yielding investment to get the consumption sector (including food production) into the posture to meet the demand that will fall on it — if the threat of inflation hangs over the Plan, it must surely mean, not that the Plan is too large but that the balance is wrong".

When I come, however, to the tax measures affecting Joint Stock Companies, I cannot but help regard the new burdens as indicative of the "certain ambivalence" in economic thinking to which the Finance Minister has himself drawn attention. The increase in Corporation taxes, compulsory deposits and tax on wealth are positive disincentives to capital formation, which by itself has not presented a promising picture over the last five years. A recent survey by the Indian Institute of public Opinion arrived at the depressing conclusion that "there was no significant rise in the rate of capital formation between the years 1952-53 and 1955-56. The second Five-Year Plan assumed that the rate of saving in the economy would be stepped up from 7 per cent to between 10 and 11 per cent, and this assumption was made in the belief that the capital formation in the last years of the first Plan was undergoing some change in an upward direction, possibly of the order of 1 to 2 per cent a year. It now appears that so far as 1955-56 is concerned there is no justification for this assumption and that it may be that capital formation in 1956-57 has even fallen back below 7 per cent."

External dis-savings are huge and consumption expenditure is steadily mounting up. Yet in addition to heavier corporation taxes, a fresh tax on the "wealth" of a company has been imposed, because of "the peculiar economic structure" in India. The Finance Minister has said that "companies were being brought within the wealth tax because in India a very large number of companies were owned by a group of individuals, that company shares were not broadbased." Surely, it is not only being unrealistic but a little disingenuous to place heavy burdens on the source and the instrument of capital formation — a role which hardly fits the credentials and the personality of Mr. Krishnamachari. The egalitarian crucible appears to have consumed the promising yeast of change which the Finance Minister wishes to introduce in the fundamental bases of tax policies of the country. Assuming that a tax on wealth were demanded by the political judgment of the majority of the people, and that wealth was being concentrated in few hands, surely tax on the assets of a productive instrument is not the best method of divesting individuals of a portion of their holdings, for you are thereby hurting the most the very organs which should stand four square in the battle for fighting inflation, for sustaining stability and for furthering industrial growth. On the contrary, the effects of the proposed taxation measures will be far-reaching in respect of disincentives, in respect of capital formation, in respect of savings apart from the incongruous and unjustifiable levy of multiple taxation on the same quantum of income and now wealth. Perhaps the Finance Minister is of the opinion that such disincentives are demanded by the existing strains in the economy. But one should have thought that the most important aspect of a rational policy of taxation is to create incentives and add to the national income so that resources available for taxation are continuously being augmented.

While Mr. Kaldor recommended a tax on personal expenditure, tax on gifts and a tax on 'annual' wealth, he simultaneously recommended a reduction in rates of income and super tax to 45 per cent — all to form a harmonious basis of taxation, a self-checking system which will provide incentives for savings and discourage evasion. This portrait of a new taxing system is missing from the proposed measures. Delhi perhaps has not learned that policy cannot be processed from

(Continued from page 792)

haphazardly collected and oddly assorted recommendations. The complex difficulties of administering the new taxation measures in an equitable manner have not been fully realised, nor serious note taken of the inevitable harassment and corruption which will be entailed in evaluating personal expenditure and wealth.

Perhaps it is the view of the Finance Minister that a halt should be called to development and expansion particularly in the private sector. The most significant sentence in his Budget Speech is a sentence of five negatives: "These measures are not intended to curtail genuine investment in the private sector, though it would not be unreasonable to assume that a slight slowing down for a short a period will not, in present circumstances, be undesirable." If disincentives are really what are being aimed at, business men should frankly be told to go slow but we should not be asked to accept the sort of Alice-in-Wonderland economy in which the more the Government spends and the higher the taxes went, the more would be left for investment and spending!

In conclusion, I should like to express on behalf of the shareholders their appreciation of the commendable efforts of the staff and the workers of the Company in achieving such remarkable results in the past year, which give promise of a good future for the organisation.

Facing the Facts

THE general debate on the Budget in the Lok Sabha this week has shown that many members of the new Parliament, whether on the Congress side or on the Opposition, have far more determination to say what they think than members in the Parliament replaced. This should be a good thing except to addicts to party discipline at any price. It promises, however, as this Parliament's life extends, to be increasingly embarrassing to the Executive. Not the least of the comments which have been made in Delhi this week is on the surprisingly small effect the Prime Minister's speech on Thursday had on the structure of Congress criticism within the House. Immediately after the Prime Minister had concluded his address last Thursday it was found there were Congress Members who were both for a drastic cut in the tax proposals and for a severe economy drive inside and outside the Plan.

This reflects a political fact of which both the Prime Minister and the Finance Minister have taken insufficient notice. It is obvious to almost everyone in Delhi that Congress Members of Parliament have been deeply shaken; they remain fairly disciplined for all that. But there is no enthusiasm of any kind for official policy. Outside there is growing restiveness. The

hartal organised in Calcutta on Thursday showed powerful unanimity with the Leftist Parties which should never have been allowed to capitalise on the situation in this manner. The Central Government's action is bound to encounter difficulties as the Prime Minister proceeds from persuasion to performance. The acts of persuasion have been very inadequately done both by the Prime Minister and the Finance Minister this week. The task of performance—including spending planned outlays — will be impossible, although it is theoretically conceivable that any volume of finance can be raised by measures provided they are stringent enough. Thus, though the volume of taxation in the current Budget is by no means impossible, the disorganisation and resentment it will cause will defeat the performance of the Plan, and may let loose, by the process of a shortage of consumer goods production, a strong inflationary spiral. In the end it is this inflationary spiral and the foreign exchange gap that will defeat the Government. A vote of confidence—with the Whips firmly put on—will not, of course, be in doubt. But this is not a true democratic victory in that the Government's policy is probably contrary to majority opinion in the country. Such an enforced policy can never be worked with democratic zest.

The argument that the Plan can now go through substantially without change, with the current financial proposals ignores two major elements of the situation. The first is that deficit financing is already in heavy use, the Central Government's deposits being as low as Rs. 54 crores in the current week. Secondly, if the Plan outlay runs its course and if the food supply position is not substantially improved in the course of the next two months, the cry for dearness allowance raised both in Calcutta and at the very door of the Finance Minister by a crowd of 5,000 members of the Confederation of the Central Government Employees on Thursday will be irresistible. The Government, having prescribed a liberal dearness allowance for everyone, including working journalists, cannot fail to apply to itself the logic of its own righteous policy of social betterment. Thus every price, and not only those of taxed articles, will sooner or later rise. If we are caught in an inflationary swing within six months, the Budget which should have been a corrective for this situation must be deemed, at least in a negative sense, the cause.

There are two and only two methods by which further deterioration can be stayed. The first (as has been frequently advocated by *The Eastern Economist*) is that the Government should import substantially more food grains under another agreement with the US Commodity Credit Corporation. Imports under this agreement should be of the order of 2 million tons with as much rice as possible and can be kept as an emergency Central reserve, while the 2.5 million tons to be imported this year under the previous P.L. 480 agreement can be sold at a price of 10 per cent below the current market price. To the extent deficit financing is employed for food subsidies to the tune of Rs. 25 crores or even Rs. 50 crores it is on balance deflationary, and so deficit financing for this purpose need not be a source of anxiety. What is essential is that instead of requisitioning stocks of food grains at arbitrary prices, under the proposed Essential Commodities (Amendment) Bill which might cause extreme disorganisation and harassment, quick action should be taken to distribute food imports rapidly and arrange for further reserves without delay.

The second method is no other than the one which formed the central theme in *The Eastern Economist* Blue Supplements on the Budget last week as well as in March last. This is the pruning or rephasing of the Plan so as to reduce the budget year outlay on the Plan projects by anything from Rs. 150 crores to Rs. 190 crores both at the Centre and in the States. If both these measures are adopted at once, there is just hope that the inflationary spiral may be held in check until consumer production presents a healthier picture to face a new bout of deficit financing.

Whether the Prime Minister who, for the first time since Independence, appears to have lost majority support on the pattern of current expenditure will be able by the unique position he occupies to gather all the threads together again or not, it is becoming increasingly clear that substantially more is involved in the current serious economic situation than appears at first sight. One small, though significant, point is the vehemence with which Mr. Shriman Narayan, General Secretary of the All-India Congress Committee, has just written in the A.-I.C.C. Economic Review against Government extravagance. Mr. Shriman Narayan says: 'The people in general have a feeling that while the Government is imposing heavier burdens on the common man, the Government expenditure shows no signs of economy. The people naturally ask: Why is the Government erecting palatial buildings in New Delhi and spending crores of rupees when a large number of buildings are lying empty in other cities?..... The Government of India cannot expect to create the necessary enthusiasm for additional taxation in the general public when its own expenditure cannot be regarded reasonable or equitable". The Congress Secretary is particularly severe in his criticism of the lowering of the taxable minimum from Rs. 4,200 to Rs. 3,000. "We do not think", he says, "that the Finance Minister has done the right thing in this respect. Psychologically the lowering of the taxable minimum will greatly disturb a large number of middle class and lower middle class persons in the country who can hardly afford to bear the additional burdens at a time when the prices of essential goods are showing an upward trend".

These strong words of criticism, coming as they do from the Congress Secretary, have fallen on deaf ears for the tax concessions (announced by the Finance Minister as we go to the Press) look so inadequate that one is led to think that the original tax proposals and the revised ones will not be separated in the public mind. The net effect of the changes and marginal adjustments in the original proposals would be to reduce the estimated revenue from them by just under Rs. 6 crores in a full year or about Rs. 5 crores in the remaining part of the year. These concessions are by no means generous and make little difference to the inflationary situation. Thus the democratic brake has failed in this case to work. But the car cannot race for ever; events are forming their own block to executive intransigence. They always win in the end.

SECRETARIAT LIBRARY 1957 GOVT. OF CANADA

Postscript to the Ike Doctrine

THE Eisenhower doctrine for the Middle East was criticised and condemned by most of the Arab and Asian Governments when it was propounded in December last. None of its critics—or supporters—at that time knew that it would be put to the test so soon, and prove the statesmanship of its initiators. In truth, this should not be surprising. For it has been demonstrated repeatedly—as it was in this instance—that Asian assessment of Western moves in the Orient is often coloured by lingering colonial memories and consequently tends to lack objectivity. This anti-colonial neurosis has led Governments this side of Suez to deny, ostrich-like, the existence of both a "power vacuum" in the Middle East after the ignominious Anglo-French adventure and the danger of internal subversion by international Communism. President Kuwaitly of Syria, during his visit to this country, for instance, denied that there was a "power vacuum" in the Middle East and termed the idea as a "fantastic proposition". Mr. Nehru, who could not obviously afford to be as unrealistic, suggested that the peoples of the region themselves should fill that vacuum "by their own inherent strength and power".

Doubtless, an ideal solution of the problems of the Middle East would have been what Mr. Nehru has advocated if only the peoples of that area were really in a position to develop in accordance with their genius and traditions. But, as the Syrian President himself admitted, even "Syria has to look for help from other sources". The question thus is not whether the "power vaccum" is to be filled by outsiders or the peoples of the region themselves but whether the latter really are in their present condition and circumstances—now vitiated by growing Soviet influence —capable of fending for themselves. The unpleasant truth is that if the Middle East countries were left to their own meagre material and human resources, they may not remain free for long. After all, the Soviet Union, whose frontier extends into the Middle East and which, following ancient Russian tradition, looks avidly at the small countries just beyond the periphery, is not likely to move from its recently-found foothold in that region, howsoever precarious it may otherwise be. It would thus be futile to expect platonic disinterestedness on the part of the Soviet Union in regard to the Middle East generally.

After what the world has already seen in Eastern Europe, it would be naive to imagine that in the Middle East Russia would not like to walk away with the tent, like the proverbial camel. Like the nations of Eastern Europe, these nations would be able to exercise their newly-won sovereignties only so long as they are not absorbed in the Soviet orbit. Economically too successful Communist infiltration would be ruinous. The principal asset of the area is oil, for which Western Europe alone offers an adequate market. Astride the Middle East, the Soviet Union can not only strangle the economy of Western Europe by cutting off vital oil supplies, which would be bad enough; but it may also acquire thereby power of life and death over these countries. And indeed if the Soviet Union comes to control the Middle East, it would be able to dictate terms to practically whole of South and South-East Asia also. With its bases in close proximity to Middle East capitals, Russia would be able to occupy [illegible] country almost at will, if it does not have to face the mighty countervailing force of the country it alternatively fears and admires. America alone can induce from it a healthy respect for the independence and sovereignty of the Middle East nations. One can only hope that this is a factor in the calculations of over-zealous Arab nationalists. In their own interest they would do well to remember that the best way to safeguard their independence is to keep away from Russian blandishments and influence as far as possible.

The recent near-crisis in Jordan has shown how serious and genuine is the danger of Communist infiltration and subversion. It was fortunate that the United States had formulated the doctrine at a time when there was uncertainty in the Soviet Empire itself and when there was robust confidence among the Arab countries in America's anti-imperialist policy. The doctrine not only deterred Syria from an imperialist adventure, but also pro-Soviet internal forces from subverting and undermining the sovereignty of Jordan. It is no exaggeration to say that through the Eisenhower Doctrine, the United States has underwritten the continued freedom of these countries. A similar policy by America in respect of Formosa and Western Europe through SEATO and NATO respectively has not been challenged by the Soviet Union so far.

The only weakness that one can suspect in the doctrine is its seeming inadequacy in rooting out the endemic cause of instability in the region — Arab-Israeli relations. It is this instability which offers Russia an unprecedented opportunity to manoeuvre in the Middle East; at no cost to itself it can easily parade as a champion of Arab nationalism. Also, the kaleidoscopic events in Jordan have shown how difficult it can be to apply the military provisions of the Doctrine though fortunately no such contingency arose there. The Eisenhower Doctrine does not also seem to have any answer for the Kremlin's change of strategy for world domination. From a nuclear open war it has switched over to internal subversion through economic aid. During the last two years, Russia has granted to nine countries a total of 800 million dollars worth of credits on easy terms. To meet this challenge, it is necessary that Washington should reorientate its strategic as well as economic thinking. A generous offer of economic aid without political strings to help the Middle East countries in their developmental plans is an obvious necessity and sooner Washington announces it the better for all concerned.

While offering economic aid and technical assistance, the United States would do well to avoid the pitfalls of British policy in its dealings with the Arab States. The British mistake chiefly lay in its allowing itself to be identified with the reactionary forces in the resurgent society and thwarting the economic development of the region. True, there is no cause for America to commit any such mistake. As a champion of functioning democracy, it is but natural, proper and necessary that America should show through friendly help and guidance that the area of freedom as of prosperity goes on enlarging from precedent to precedent. If some of the Arab monarchs are helpful allies today, that should be no reason for America to think of popular aspirations only in terms of their convenience for ever.

THE WEEK'S NOTES

AMBAR CHARKHA AND THE PLAN

APROPOS THE Finance Minister's statement that barring the projects in the hard 'core' covering steel, coal, transport and ancillary power, some rephasing of the second Plan is inevitable, a fundamental revision in thinking seems to be necessary in some of the Government's socio-economic experiments. The Prohibition policy of the Government has already come in for severe criticism at the hands of Rajkumari Amrit Kaur, a former member of the Central cabinet. Whatever may be its relative merits, a considerable volume of opinion in this country has always held that Prohibition need not be given any high priority when the Government's coffers are strained to meet even the crying needs of the people like food and clothing. A similar socio-economic experiment of doubtful validity in the present context is the Ambar charkha programme, which is governed by sentiment rather than by any economic reasoning. It is a pity that this item in the Budget speech of the Finance Minister has not drawn much public attention as it shows how Government's intentions to concentrate on the essentials are not translated into practice.

The economic and social implications of the Ambar charkha programme are still in the region of controversy. The heavy subsidy involved in the matter of production and distribution of Ambar yarn certainly does not make it an economic proposition while it is not quite clear whether the elimination of the traditional charkha by the Ambar charkha will provide any additional employment of a substantial nature. Assuming on both these counts that the Ambar charkha can hold its own, it is open to doubt whether the present is the opportune moment for pushing ahead with this programme. When the supply of cloth is not able to catch up with demand, it is a great error on the part of the Government to have put a ceiling on mill production hoping that this would enable the decentralised sector to fill the gap. Under the second Plan, 300 million yards of cloth have been earmarked for production from Ambar yarn out of the total additional production of 1,700 million yards at the end of the Plan. Accordingly 75,000 Ambar charkhas were put into operation during 1956-57. The Ambar cloth production during the year totalled about 1.53 million yards as against the target of 2.25 million yards. At this rate, it is not known how the target of 300 million yards at the end of the Plan will be reached.

In the face of this, it does not seem appropriate that a provision of Rs. 10 crores (Rs. 3 crores by way of grant and the balance as loan) should have been made in the budget for the current year to extend this programme and introduce 1,80,000 more charkhas. It is patent that despite generous State aid and patronage, the decentralised sector will not be able to increase its output. The need for more cloth which is bound to be accentuated in the coming years can only be met by permitting the mill sector to expand and not hindering it. It is nothing short of misuse of resources to throw away Rs. 10 crores in the current year on a programme that has little to commend itself except sentiment. It is also worth examining what it would mean in increasing cloth production in the immediate future if this money were diverted to the mill sector. This is not mere idle speculation since this would provide some relief to the mill industry which is now confronted with the prospect of closure of a number of its units. There seems to be a clear case for postponing the Ambar charkha programme till times are more propitious.

A TIMELY WARNING

SPEAKING ON "Democracy and the Rule of Law" at the Bombay Branch of the Indian Council of World Affairs, Mr. M. C. Chagla, Chief Justice of the Bombay High Court, has recently emphasized that the judiciary should be completely free from any political influence. The wisdom of the advice cannot be over-emphasized. Indeed, several provisions in the Indian Constitution were designed primarily to ensure it in the conduct of our country's public affairs. Without the independence of the judiciary democratic institutions cannot function. But when Mr. Chagla contends that these provisions have not been of much avail, he invites attention to a weakness in our public life which should immediately be remedied. The Chief Justice of Bombay obviously spoke from knowledge, and perhaps experience.

He makes the disconcerting revelation that the appointments to the High Court Bench in some States have been made against the wishes of the Chief Justice concerned. This is an unfortunate development because democracy is not merely a government of for and by the people; it must also be carried on through free institutions, with the sure backing of truly independent judiciary. It is to counteract these sinister tendencies that Mr. Chagla calls for amendment of the constitutional provisions governing appointments to the High Courts (and, presumably, also to the Supreme Court). The Chief Justice of a High Court, he suggests, should not merely be 'consulted'; his 'concurrence' should be made a prior condition of appointment of the puisne judges.

While making this suggestion the Chief Justice of Bombay does not rule out the possibility of an "unholy alliance" between the Chief Justice and the Chief Minister of a State. To safeguard against this possibility he further recommends that there must be a provision for securing the concurrence of the Chief Justice of the Supreme Court in all appointments initiated by the Chief Justice of a High Court. One recommendation of the States Reorganisation Commission is worth recalling in this context, namely, that a portion of the puisne judges of every High Court should be appointed from among those belonging to other States. Implementation of this recommendation would go a long way to minimize, if not completely obviate, the danger of "political appointments" to which Mr. Chagla has drawn attention. It cannot be too highly emphasized that the earlier these suggestions are implemented the securer will be the future of the nascent Indian democracy.

KISHI'S VISIT TO INDIA

INDIA HAS just had the privilege of receiving the distinguished Prime Minister of Japan, Mr. Nobusuke Kishi, who is on his way to the United States. The diplomatic significance of the visit to this country and to South-East Asia stems from Japan's anxiety to identify herself more closely with most other Asian countries barring China. The reasons are obvious: they are economic and commercial. This is as it should be, for even in the case of China mutually beneficial trade relations have been considered necessary to some extent by Japan. However, Japan appears to have succeeded to a great extent in making up the lack of full-fledged economic and commercial relations with China by further promoting her trade relations with the other countries of Asia. It is in this context that Indo-Japanese economic collaboration acquires particular significance.

This is naturally reflected in the diplomatic relations between the two countries. The Prime Minister of India and the Prime Minister of Japan have had cordial discussions and appealed to the Big Powers to suspend immediately nuclear and thermonuclear test explosions and to reach an agreement on the ultimate abandonment of these tests. This is an appeal made

in all seriousness for both India and Japan are most exercised over the radioactive effects of atomic and hydrogen bomb tests—India because of the nearness of her land frontiers to Asiatic Russia and Japan because of her nearness to the Pacific Islands. The radioactive effects may go on increasing if the tests are not immediately suspended. Indo-Japanese accord in this connection may well pave the way for an agreement between the Big Powers to stop the tests. India's relations both with Russia and the United States and Japan's standing with the latter in particular encourage the hope that the world would soon be partly relieved of its worries on the score of the nuclear genii.

ANOTHER FALL IN PARIS

MR. GUY MOLLET's Government has been defeated in the French National Assembly on a vote of confidence. It was a singular achievement of his Government that it contrived to stay in office for nearly 16 months, a record among the 22 Ministries of the Fourth Republic. This is about all there is to its credit. During his Prime Ministership, French committeed naked aggression against Egypt in collusion with England and Israel. Again, Mr. Mollet came to power with the slogan of ending the Algerian war. But as soon as he was in office, he stepped up the struggle, doubtless, being afraid of the catcalls of the French settlers in Algeria and the jeers of the French people who have apparently not reconciled themselves to their country's shrunken stature. Strangely enough, it were the representatives of these very sections whom Mr. Mollet had tried to placate who have now voted him out of office—by refusing to pay the price of the Algerian war in the form of increased taxation. They, on the other hand, demanded that the Socialist Prime Minister should cut the allocations on social and public services in return for their continued support. While his Government was prepared to cut down these services it insisted on raising the levy on petrol, the rate of purchase tax and the tax on dividends and impounding special depreciation allowance and enhancing postal and telephone charges in order to secure 150 billion francs of extra revenue to meet the cost of military operations in Algeria. The crisis has once again proved—if at all proof were needed—that France has failed to solve the dichotomy between its political ambition and economic reality. The lesson of these repeated political crises unmistakably is that France cannot prosper until the Algerian issue is settled.

Political instability has thwarted the economic progress of France. This becomes crystal clear on comparing the post-war development of victorious France and defeated Germany. Twelve years after the Second World War while truncated Germany has overcome war weariness, France remains caught in its aftermath. Inflation is marked within the country, and could be dangerous in a state of endemic political instability.

The fall of Mr. Mollet's Government will, no doubt, result in the usual rounds of consultations among the "Centre" groups. The policy of these groups being less rigid, is more easily adjustable than that of either the Communists or the De Gaullists. But whichever party may succeed in mustering sufficient strength to form a Government, the new expedient will be hardly different from its predecessor. The new Government will in all probability pursue old policies under a familiar though reshuffled team, with minor alterations and replacements.

PROPOSALS ON DISARMAMENT

PROPOSALS AND discussions on disarmament have followed a tortuous course since 1945. While much time has been spent over determining the size of the armed forces in numerical terms, it does not seem to have been realized that the heart of the problem lay elsewhere. The stumbling blocks were the deferred reunification of Germany; the question of priorities in the steps towards disarmament; the proportion of nuclear weapons vis-a-vis conventional weapons; and the central issue of international inspection and control. In point of fact, more recently world opinion has been alarmed at the idea of the probable use of nuclear weapons in a future, perhaps inevitable, war. The tests that are being carried on have evoked concern from various quarters about their effect on the future of humanity.

In the absence of any known method of detecting hidden stock-piles of nuclear weapons, proposals and counter-proposals for their control and ultimate ban have been of no effect. It is, perhaps, in recognition of the intractability of the problem that the latest American proposals on disarmament are reported to have by-passed this aspect of the problem. Achievement of success in the "first step" cuts in man-power, conventional weapons and defence budgets is a prior necessity. There can be no two opinions about the intentions of the United States to find a solution. The hope is that if an agreement, however limited, is achieved, it will, in course of time, brighten the chances of a nuclear disarmament also.

The other new suggestion that the American proposals are said to contain is that those countries, which do not possess atomic weapons at present, should not make any effort to develop them. Doubtless, this is a laudable suggestion inasmuch as there already exist enough atomic stockpiles to wipe out perhaps our civilization itself. But it is, at the same time, doubtful if the proposal would be acceptable to countries like France and West Germany, at least so long as those powers which possess these weapons continue their test detonations and piling up programmes. But it may as well be tragic if the new proposals do not receive calm consideration on all sides. The prevailing atmosphere seems to be encouraging.

ESTIMATES OF NATIONAL INCOME

THE NATIONAL income of India at 1948-49 prices was Rs. 10,420 crores in 1955-56 and Rs. 10,280 crores in 1954-55 as compared to Rs. 10,030 crores in 1953-54. The 'per capita' income at 1948-49 prices correspondingly rose from Rs. 268.7 in 1953-54 to Rs. 271.9 in 1954-55 and Rs. 272.1 in 1955-56. This is revealed by the fourth issue of the annual paper on national income just released by the Central Statistical Organisation. The estimates for 1954-55 included in this paper are based on the detailed method of estimation followed for the earlier years and show an upward revision over the preliminary estimates published last year. The estimates for 1955-56 are, however, based on partial material and are subject to revision.

On the whole, during the first Five-Year Plan period (1951-52 to 1955-56) the national income in real terms increased by 17.7 per cent as against the original Plan target of 11 per cent. The corresponding rise in the per capita income was 10.5 per cent. The absence of any pronounced rise in 1955-56 over 1954-55 was mainly due to the fall in agricultural production revealed by the latest available crop figures. The total contribution to national income at 1948-49 prices by 'agriculture' showed a decline of Rs. 50 crores in 1955-56 over 1954-55 as compared to a rise of similar magnitude in 1954-55 over 1953-54. There was no appreciable change in the yearly increase in the overall contribution by other sectors.

A Window on the World

UNDER-EMPLOYMENT IN RURAL WALES

By

ODYSSEUS

CARDIFF, South Wales.

THROUGHOUT TEN DAYS in Wales, I found myself constantly reminded of India's rural problems. An area in South Wales centred on this city of Cardiff, about 75 miles east and west and 36 miles north and south, is industrialised without, however, being in any way a "black country" of continuous streets and grime. The rest of Wales is agricultural or forest land and suffers from under-employment. The land is in fact tending towards depopulation because there is a steady drift of the young, the enterprising, and the more intelligent, into the industrial areas of Wales and England.

In 1954, there was formed by private, non-official initiative the Welsh Economic Development Council, "as a central body representing industrial and commercial concerns, farmers, trades unions, local authorities and others interested in promoting the economic development of Wales." One of the main objects of the W.E.D.C. is to draw the attention of English firms considering the erection of new factories to the advantages of putting them in the rural areas of Wales.

In other words, the W.E.D.C.'s argument is that industry should go where the workers are — which is in direct contradiction of the view expounded by the old school of economic historians who explained that the location of industry was dictated by hard economic facts, such as nearness to power. Industrial South Wales illustrates the classical theory. Here the iron, steel, tinplate, and coal industries grew up in the nineteenth century because of the location of coal and iron ore. To this previously scantily populated rural area a large labour force was attracted. Sixtyfive out of every hundred workers were dependent on these four traditional industries, which were dangerously concentrated on a narrow range of export markets. The inter-war years of bitter depression hit South Wales. In the pre-Keynes era, no one knew how to cope with deflation (any more than today we seem able to cope with inflation), and some 400,000 workers left South Wales for more prosperous parts. These were naturally the younger and more enterprising, and their departure disrupted homes and weakened the social structure. It was not until 1934 that the government hit on the daring idea of alleviating unemployment by trying to bring new industries to the workers.

PLANNING INDUSTRIAL LOCATION

As Peter Self points out in his booklet, "The Planning of Industrial Location" (Univ. of London, 1953, 2sh. 6d.), industry had become much more mobile in the course of the twentieth century. Naturally some industries, such as mining, are tied to given places. Also service industries, such as bakeries, shops, etc. are bound to a local market. Between these two extremes, however, there is a wide range of industries in which there is room for manoeuvre and the choice of location will depend on what balance is struck between such factors as location of (1) raw material supplies, (2) industrial techniques, skills, and equipment, and (3) distance from markets. Obviously if a raw material such as coal is bulky and costly to transport, it is cheaper to site industries near it. Other determinants are access to ports or railway or road networks. Coal has hitherto been the basis of U.K.'s wealth and all the main urban areas, except for the big ports, are built on coalfields. But power from gas and electricity grids, and road transport, have substantially modified the picture.

Once an industrial agglomeration of towns — a "conurbation" — has come into existence, it perpetuates its own growth, as we have seen notably in Bombay and Calcutta. The existing industries attract to themselves related industries. The accumulation of skill in one area, the economies of concentration, and good transport, all act as magnets to continuous expansion. As the size of the local market grows, it brings in a widening range of consumer industries. "The snowball effect of industrialisation," says Mr. Self, "has been responsible for piling up over 40 per cent of the population of England in six densely packed conurbations," which together contain 16.9 million people compared with 24.2 millions in the rest of England.

It has only been seen since efforts were first made in the late 1930's to inject new industries into the depressed areas to relieve unemployment that it has gradually begun to be realised that it is not inevitable that vast, amorphous conurbations of factories, suburbs, and slums should continue to be piled up. It is beginning to be realised that the advantages of economic concentration and of reservoirs of skilled labour may be more than counter-balanced by the staggering social and economic costs of congestion, which slows down production by transport or other bottle-necks, which decreases potential working hours by making millions of people spend hours travelling to and from work every day, which decreases efficiency by the pollution of the atmosphere and by causing avoidable fatigue to the population, and which piles up a huge individual, industrial, and national bill for ill-health. Moreover, the greater the city, the less social integration, the less community life there is. The individual's tendencies to irresponsible or anti-social conduct are strengthened because he is made to feel an obscure nonentity, of no importance to anyone but himself.

What brings out responsible, social, and patriotic behaviour is the individual's feeling of being needed by, or of belonging to, a family, caste, clan, civic centre, or other community with common interests and purposes. The smaller the city, the greater the opportunities for personal loyalties and for neighbourliness.

Hitherto, most people, and especially industrialists, while admitting the force of the arguments against conurbations, have shrugged their shoulders and said in effect "They already exist. Nothing can stop them from growing bigger. What can you do about it?"

BRINGING INDUSTRY TO THE WORKERS

The success, however, of Britain's efforts to bring industry to the workers wherever they are, by means of the Distribution of Industry Act of 1945, has thrown new light on these problems. The 1945 Act enabled

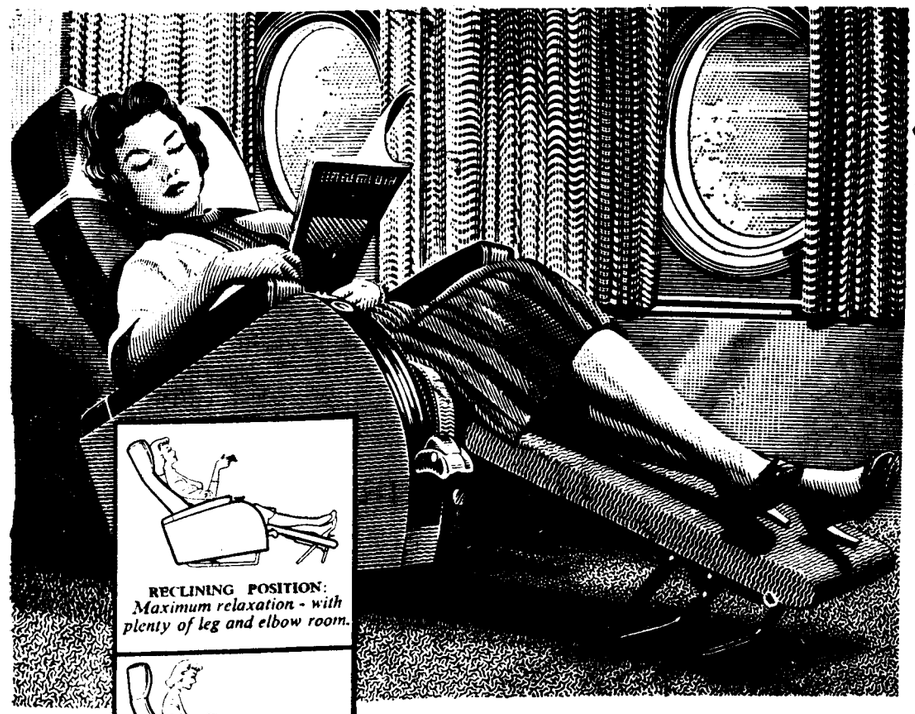
the Board of Trade to build factories and to lease them on advantageous terms, and even to advance funds to firms with insufficient capital but considered to have good long-term prospects. The Board was empowered, in certain circumstances, to refuse a building licence in an area held to be congested. In 1945, the Board of Trade estimated that the employment target for the Welsh Development Area should be 125,000 new factory jobs above the pre-war level. Since then, some 400 new firms have been persuaded into the area and the employment target achieved.

In the course of the experiment, the local officials of the Board of Trade have accumulated detailed knowledge of the special requirements in sites, power, labour supply, tool making, etc. etc., of innumerable industries, so that they have been of the greatest practical assistance in helping new firms to settle in smoothly, speedily, and with the least expenditure.

Firms employing skilled labour were reluctant to move to Wales, away from the congested areas where there existed a reservoir of labour with their particular skill, and perhaps the most interesting outcome of the 1945 Act has been to demonstrate that labour skills are not innate qualities among particular sections of the community but can be taught anyone, providing the teaching is done by trained teachers (that a man may be a skilled worker does not necessarily make him a good teacher). This point hardly needs elaboration in India now that it has been demonstrated that skilled fighting is not the monopoly of the "martial races".

Employers also find that their new-trained skilled labour is often more stable than the members of the reservoir of skilled workers in the old urban centres who are apt to wander from factory to factory, giving rise to absentee and turnover problems. Skilled workers, living in a small, integrated community of neighbours, will, if properly led by an enlightened management using modern personnel techniques, develop into a loyal team, indentifying their personal ambitions with the success of the factory.

Now that the Development Area of South Wales has been "comfortably industrialised", the Board of Trade and the Welsh Economic Development Council are beginning to divert new enterprises to the entirely rural areas of the west, centre, and north of Wales. For example, a £100,000 engineering factory is to be erected in rural Anglesey. Apart from an ample supply of healthy workers, other attractions are plentiful water, important for many industrial purposes, and the problem of power is solved by the electricity grid. In this last respect rural India is at a disadvantage, but a beginning could be made by pushing grids out in special areas designated as Rural Development Areas.



The British experiment in Wales proves that the vision of those who founded the Vallabh Vidyanagar — the rural university to promote industries in the Kaira district of Gujerat — and the hopes of those who are propounding Sarvodaya — with its emphasis on rural industries and rural self-help — are based on solid realities. The Sarvodayans and the directors of the Vidyanagar should send a study group to the U.K. to see what is actually being done to ruralise industry here.

The World Abroad:

LABOUR PRODUCTIVITY: A LESSON FROM JAPAN

THE Indian Productivity Delegation to Japan, led by Dr. Vikram A. Sarabhai, has carried out its assignment in a systematic and conscientious manner. This is the first impression one gets of the Delegation's report which bids fair to be more valuable for Indian Industry than the report of either the Krishnappa Delegation to China on Agricultural Planning and Techniques or the Patil Delegation on Chinese Co-operative Farming can ever be for Indian Agriculture. The substantive portions of the Sarabhai Report deal with the productivity movement in private industry in Japan against a relevant economic-industrial background.

This background highlights at the outset the industrial situation in Japan. The striking features of this situation are: 16 million out of a total labour force of 42 million (as of 1955) are employed in manufacturing industry, and of these 16 million industrial workers, 22 per cent are self-employed, 11 per cent are family workers and 67 per cent are employees; the category of small-scale industries in manufacturing industry employs 42 per cent of the total industrial workers and accounts for 22 per cent of the value of all industrial goods and the category of medium-scale industries employs 17 per cent of the total industrial workers and accounts for 16 per cent of the value of all industrial goods, while the category of large-scale industries employs 41 per cent of the total industrial workers and accounts for 62 per cent of the value of all industrial goods. The category of small-scale industries (covering firms employing less than 30 people) accounts for 94.4 per cent of the total number of industrial firms, the category of medium-scale industries (covering firms employing between 30 and 99 people) for 4.3 per cent and the category of large-scale industries (covering firms employing 100 or more people) for 1.3 per cent.

An idea of the high rate of industrial development in Japan may be obtained from the following table of manufacturing production index:

(1934-36 average = 100)

Year	Production Index
1951	115.1
1952	128.2
1953	159.7
1954	171 9
1955	190.0

Alongside of this increase in industrial production there has been a steady increase in productivity (that is, average production per worker). The following productivity index (based on 1934-36 = 100) bears this out:

	1949	1950	1951	1952	1953	1954	1955
Mining	46	53	64	64	73	77	—
Manufacture	54	68	90	101	125	133	153

This productivity index based on 1934-36 shows that there has come about a 50 per cent increase in labour productivity since those pre-war years. But an index based on 1947 (given elsewhere in this article) shows that there has come about a four-fold increase in labour productivity since that year.

This is something of an achievement which is attributed to the productivity movement in Japan. Industrial productivity in that country is thus high in comparison with other Asian countries although it is still low compared to that in advanced Western countries. The comparative position in respect of productivity, wages and per capita national income is brought out in the following table:

Country	Productivity or average production per worker in manufacturing industries (England = 100)	Wages per hour in 1953 in U.S. $ in manufacturing industries.	National Income per capita (1954 in U.S. $)	Rate of productivity in 1953. (Productivity index 1937 = 100)
Japan	34	0.21	193	123
U.S.	250	1.77	1,845	155
Canada	165	1.36	1,301	112
England	100	0.55	849	124
West Germany	81	0.39	567	114
Italy	—	0.27	324	166

It may be noted here that a rapid advance is being achieved in Japan in increasing productivity but that the increase over pre-war levels in still lower (as of 1953) than in the U.S.A.

What is of particular interest to India is not that productivity in Japan is still less than in Western countries but that the increase in productivity in that country has contributed, more or less 'pari passu,' to a continuous rise in real wages and to a striking improvement in the standard of living of the average industrial worker. The close relationship between labour productivity, real wages and standard of living is borne out by the following figures:

Year	Labour Productivity	Real Wage	Standard of living-consumption level
1947	100	100	100
1948	145	167	110
1949	186	212	120
1950	231	273	130
1951	294	300	139
1952	316	342	159
1953	370	368	178
1954	376	375	181
1955	428	398	187

The real wage index (based on 1934-36 = 100) in respect of the cotton spinning industry and of all manufacturing industries is given below to convey the extent of improvement since the pre-war years:

Year	Cotton Spinning Industry	All Manufacturing Industries
1934-36	100	100
1948	75	49
1949	84	66
1950	125	85
1951	128	92
1952	157	102
1953	164	107
1954	168	108
1955	181	115

This all-round improvement is largely the result of a productivity movement which was given concrete shape in the latter half of 1953 when the Federation of Economic Organisations, the Japan Federation of Employers' Association, the Japan Chamber of Commerce and Industry and the Japan Management Association jointly sponsored a round table conference of 19 different organisations of trade and industry. The "Japan Productivity Council" was set up following the conference. The movement acquired an official and national character when the increase of productivity in industry was adopted by the Japanese Government as a major policy in September 1954. Thereafter, the "Japan Productivity Council" was dissolved, and the "Japan Productivity Centre" was set up as a statutory body in March 1955. With the founding of this Centre an integrated productivity movement has come to function in Japan. The character of this movement, the lessons it holds for this country and are examined below.

The character of this movement may be judged from the basic difference between it and the pre-war movements of rationalisation and efficiency increase in Japan. The guiding principles of the movement are that it should be an instrument of betterment of the national economy and the national standard of living and thus be developed as a national movement with full understanding and support of every citizen; that although increased productivity would ultimately increase employment, pertinent measures should be taken to prevent transitional unemployment, if any; that the actual system for the increase of productivity based on each industry should be concerted by the joint efforts of management and labour; and that the results of productivity increase should be fairly distributed among capital, labour and consumers. In accepting the productivity movement and associating with the Japan Productivity Centre, representative organisations of the larger sections of Japanese labour have enunciated some more guiding principles which have come to be accepted by the Centre as supplementing its own principles.

These supplementary principles are: (i) The productivity movement does not aim at increasing the profits of industry by intensification of labour's burden, but on the contrary, it aims at improving labour conditions and real wages; (ii) the productivity drive is not such as to bring about the accumulation of capital but aims at the stabilisation of small and medium industry; (iii) all the results achieved through the productivity drive should be properly used for the reduction of prices, the improvement of labour conditions and the renewal of equipment; (iv) it is indispensable for the success of the productivity drive that industrial democracy and rational labour relations should be established; (v) as for the actual activities for the increase of productivity, labour agreements should be concluded between labour and management; (vi) the Japan Productivity Centre, in promoting the productivity movement, should adopt the opinions of labour unions interested; (vii) in order to obviate the possibility of unemployment and of changes in working places as the result of reorganisation of enterprises, Government and managements should take measures for all-round employment stabilisation, and in each individual enterprise employment should be maintained by shortening working hours and without lowering labour conditions.

The Japan Productivity Centre at the apex, the National Industry-wise Productivity Council, the Regional Productivity Centres, the Prefectural Productivity Council and other related organisations have been promoting the productivity movement within the broad framework of the aforesaid principles. The practical working of the movement in the context of management and labour problems is examined next.

On the practical side, the J.P.C. is carrying out, by stages, a number of projects for spreading the productivity movement. These projects are: Sending overseas productivity study groups; inviting foreign specialists on productivity; studying, investigating and disseminating information on scientific administration regarding production, sales, labour and management problems; implementing training programmes in respect of production, sales, labour and management; diagnosing and practical guidance of enterprise practices for the purpose of increasing productivity; studying and disseminating information on advanced foreign techniques; carrying out publicity for the purpose of increasing productivity; and collecting materials and data concerning productivity.

The J.P.C.'s Productivity Research Section which has been functioning since 1956 carries out research through various Committees, 'Situation Surveys', sponsored research and 'Model Factory'. Research through committees has only recently been started and reports are yet to be prepared. The methods of productivity increase, the method of sharing profits, the problems of productivity increase in relation to unemployment and over-population, all problems relating to processes intermediate between the manufacturer and the consumer, the relationship between Japanese export markets and future export possibilities, methods for improving the standard of machines and of precision machine-tools particularly in relation to medium and small-scale industry, the preparation of a standard form of labour agreement, the three S's (simplification, standardisation and specialisation) in relation to the iron and steel industry, automobiles, ship-building and architecture—all these are the subjects of study by the respective committees. A. 'Situation Survey' has also been conducted by the Research Section for collecting information from foremen by questionnaire in 1,700 enterprises to date and by interview in 18 factories in the Tokyo area. Sponsored research at various institutes and universities has included analysis of fluctuating elements of labour productivity and its effects, and study of relationship between productivity and labour and management. The research section is also taking up two factories as models for preparation of a draft code of practices.

With such a wide range of activities to its credit, the J.P.C. has already spread the productivity consciousness in Japan to a great extent. This consciousness is growing among both employers and employees, and the productivity movement is rapidly gaining momentum. The success to date is not a little due to the active co-operation of the larger sections of labour. That labour's co-operation can be easily had if it is enabled to see the benefits of the productivity drive, is the supreme lesson from Japan. There is every reason to believe that Indian labour will take to it kindly if politics (which is a consuming passion with people generally in this country) can somehow be restrained in the field of trade unionism.

YUGOSLAVIA'S STAND AGAINST SELF-SUFFICIENCY

WHAT follows is the account of an interview with Dr. Vladimir Valebit, State Under-Secretary in the Yugoslav Foreign Office. Dr. Valebit, it may be recalled, was Deputy Foreign Minister till his appointment as Yugoslav Ambassador to Rome and London. The interview in the form of questions and answers has been sent us by a Yugoslav correspondent.

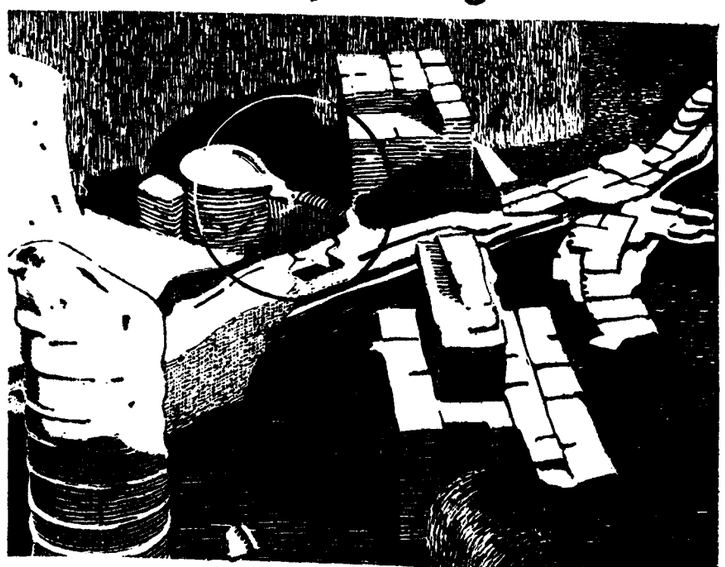
Q: What are the principles underlying Yugoslavia's economic relations with foreign countries?

A: Relations between nations, whether political or economic, have their root in the recognition that the gradual progress of mankind is possible only on the basis of co-operation the forms content and intensity of which are determined by the degree of historical development. In our era the conviction has prevailed that wider economic relations among nations are desirable and even necessary, but I would not venture to say that an agreement has been reached as to the principles on which such relations should be founded. As a founder member of UNO, Yugoslavia naturally accepts in the first place the basic principles underlying the UNO charter, and the Statutes and Regulations of the Organisation and Agencies arising from and pertaining to it. It seems to me that in this conjunction the foremost principle is the equality of rights of all nations. Yugoslavia, however, goes beyond this and proclaims the necessity of recognising the principle of aid to poor and undeveloped countries by the international community. In trade relations, which are a part of economic relations, Yugoslavia has for her starting point the recognition of international division of labour and the necessity of exchanging the products of such labour to the mutual advantage of the partners concerned. Accordingly, we accept and treat the principle of free exchanges of goods and refute the opposite principle of self-sufficiency and economic isolation.

Starting from the view-point that the scientific and technical achievements should benefit all people, we defend and implement the principle of scientific and technical collaboration among nations.

Q: Yugoslavia has so far based her trade with foreign countries primarily on a bilateral system of payments. What is Yugoslavia's present attitude in respect of multilateralism in international payments?

A: The last war, a rapid industrialisation of our country and some other reasons and circumstances have caused some disturbances and difficulties in our economy. In order to overcome these difficulties more rapidly and with greater ease we resorted to the system of bilateral payments agreements. I consider it is unnecessary to mention that for the same or similar reasons many other countries adopted the same course. Ever since this bilateral system was introduced we had considered that this was a temporary measure. We did not adopt it as the realisation of an objective to which we are aspiring, but as a necessary means by which we should be able to efficiently overcome the obstacles in the way of a greater impetus to international trade. As soon as it is possible to waive the bilateral system without impairing the achieved volume and pattern of foreign trade, we are ready to do so. Because of the differences in trade with different countries, the abolition of the bilateral system and the introduction of a multilateral system of payments can only take place gradually and with caution in order to avoid unnecessary damage. In my opinion this method of approaching the problem of gradual transition to the multilateral system best suits the interests of our foreign trade, and I believe we shall adhere to this method in the future, too.



Q: What importance does Yugoslavia attach to the liberalised regime granted her by some OEEC countries? How much has this contributed to the expansion of trade and what are the prospects in this respect?

A: The liberalised regime proposed by some OEEC country-members to be applied to Yugoslavia has had a considerable effect and has undoubtedly contributed to the expansion of trade with such countries. In addition to the immediate effects of abolishing some administrative restrictions and complications which had an unfavourable effect on the rate and volume of traffic, this has had an important psychological effect, which, however, has not yet been generally realised. The very fact that some countries liberalised their trade controls in respect of Yugoslavia seems to indicate their friendly attentions and their interest in trading with us. Yugoslav business circles received this with satisfaction, and it will encourage them to increase trade with such countries.

Q: In addition to Europe which has always been Yugoslavia's largest foreign trade partner the year 1956 has shown a pronounced strengthening of economic relations with the Far and Near East countries. Could you please explain in more detail these developments and their future prospects?

A. Our country's comparatively weak economic relations with the Far and Near East countries are a reflection of the heritage from the past or the economic under-development of our country. Naturally, before the last war non-industrial and agriculturally backward Yugoslavia could not be an economic partner of the Asian countries who, because of their own economic pattern, sought to trade with industrially developed countries who could offer them the goods they needed. With the gradual strengthening of our industry in the direction of producing industrial goods for the export market this position has started changing. The lack of tradition in our country's trade with Asian countries, the lack of mutual knowledge of the markets, unfamiliarity with our possibilities and equality, continue to be a negative element in these relations. However, I wish to stress with pleasure that our economic connections with the Asian countries show a definite tendency of strengthening and increase. On the basis of results already obtained I consider that optimism is justified and there is no doubt that there are favourable prospects of a further intensification and increase of our trade with Asia.

Brahmanabad

Inside a house excavated at Brahmanabad in Sind, has been found an interesting piece of earthenware tubing. A basin like altar which probably served as the seat for bathing some household deity, is connected by this tubing to a covered drain. This tubing unlike other pipework found at various sites of the Indus Civilisation, has a corrugated outer surface, obviously as a safety measure against breakage.

THE THREAT TO THE FRANC

(From Our Special West European Correspondent)

PARIS, May 25.

FRANCE's holdings of gold and foreign currencies fell heavily during 1956 (a balance of payments deficit for the year of $840 millions), and have continued to fall even more spectacularly in the first few months of this year. The Bank of France holds 765 tons of gold. In addition the country now has only $200 million, which at the present rate of expenditure equals only two months' deficit. Obviously, France is perilously close to international brankruptcy. In the face of such figures, one would be entitled to forecast an early devaluation of the currency but the franc has performed the balancing trick so long that the most pessimistic observer hesitates to announce that the hour of reckoning has at last arrived. The most one can say is that a devaluation is unlikely to intervene before September of this year, but that herculean efforts will be needed to postpone it much beyond that date.

Everyone knows that the French franc is chronically overvalued and that the difference between French and foreign prices is roughly 20 per cent. But this has been the case for some years past, and it is not that that has brought the currency to its present parlous straits. The causes of the recent exhaustion of gold and dollar reserves were accidental or at least temporary: the 1956 frosts, Suez, reduction of U.S. military expenditure in France and the continued boom in France's industry. These factors are either not likely to repeat themselves or will in time bring compensating benefits to the trade balance. So the temptation is naturally to hang out as long as possible, eating well into the gold reserves, rather than admit the defeat of devaluation. This is all the more true because France is now playing a gigantic gamble, both politically and economically: the gamble on the Sahara petrol. This should begin to pay off around 1961, and all the country's problems are conceived in terms of holding out till then. But the recent strain on the reserves has been so severe that one must doubt whether the franc can retain its present value so long; certainly it cannot without substantial foreign aid.

The mechanism by which the franc has been held at its unreal value despite the wide difference in French and foreign prices makes devaluation to some extent less likely. This mechanism consists in a complicated combination of export subsidies financed by import taxes and this system has many of the effects of a devaluation without the inconvenience of admitting that the franc is overvalued. Naturally, this trickery arouses the anger of France's commercial competitors, for it is an infringement of at least the spirit of several international treaties; for instance, it is only the unfair export subsidies that enable the French jute mill industry to underquote Calcutta from time to time in dollar markets. It is quite unlikely that these offended parties would tolerate both a devaluation of the franc and a continuance of this system, but if she had to abandon the latter in order to devalue, France would gain so little from the operation that she recoils from a devaluation that other countries would accept as inevitable. Moreover, most of the imports whose prices would be increased by a devaluation are raw materials for booming French industry, so on that side of the account a devaluation would have very doubtful benefits.

The factors that are imposing a strain on the franc can readily be listed in order of importance. The first, by far and away, is the increase in imports of raw materials for industry. This is due to the fact that the volume of French industrial production rose by 8½ per cent in 1954, by 9.2 per cent in 1955, by 11 per cent in 1956 and will probably rise this year by a further 10-11 per cent. The administration is, of course, reluctant to do anything to put the brakes on this expansion, for it took so much effort to get it going that if it were stopped no one could say when it would begin again. The domestic inflation has led producers who are achieving these output increases to be satisfied with the home market rather than to make the unaccustomed effort of promoting exports; at the best of times, the French industrialist is notably less export-conscious than his British or West German counterpart.

The next most important strain, until recent months, has been food imports. These were increased by the cruel winter of 1956 and their adverse effects are by now probably spent. The very mild winter of 1957 has meant bigger crops (100 million quintals of wheat this year against only 56 million last year), so with resumed wheat exports to Germany, the food account will this year be favourable rather than deficit. But the strain eased on this head has been more than replaced by the cost of fuel imports as a consequence of Suez — a cost not diminished by France's stubborn refusal to bend her neck to Nasser's yoke with the same willingness as Britain. Another substantial burden on the franc is the importation of military equipment for the war in Algeria; these purchases, mostly in dollars, increased last year and promise a further big rise this year. Here again stubbornness in pursuing a war that cannot be won appears as a threat to the currency. Alongside these "political" factors, the element of consumer imports, which one might expect to find as the main factor in a currency unbalance, are virtually negligible. In any case, consumer imports cannot be cut without infringing commercial agreements (remember that France is supposed to be promoting a common European market!) and thus further limiting exports.

Apart from the balance of trade, there are tourism, US military expenditure and the repayment of foreign debts. Tourism, which is France's biggest "export" industry, will probably bring in the usual quantities of foreign exchange this summer, for the petrol shortage has by now passed its peak. Incidentally, it is the importance of the tourist trade that makes it sure that even an inevitable devaluation would be postponed until the autumn so as not to lose the benefit of the country's biggest currency-earning season. "Involuntary tourism", or the expenditure of U.S. troops stationed in the country, is as important for France as for Britain (it is Britain's biggest dollar-earner), but US outlays are to be reduced heavily this year. Finally, France has to repay $300 million of foreign debts this year and will have to make equal payments in each of the next few years.

So although it is a chapter of accidents that has brought the franc to the brink, the fact remains that reserves are now so exiguous that there is very little room to manoeuvre, even if the gold stocks are eaten into. The commitment to repay $300 million in foreign debts each year will absorb, by itself, any savings that can be made by undertaking a cautious deflation at home. Yet it is precisely now that France needs a little room to manoeuvre for, as I have said, she is playing the Sahara petrol gamble which should come off by 1961. The French steel industry is making great efforts to hasten the production of pipelines and it is not too optimistic to forecast that within four years French North Africa will be supplying 10 million tons of fuel. And 10 million tons of fuel will take 200 million dollars off the trade deficit. If the Algerian and West African iron deposits are producing by then, the French balance of payments will be assured. But what is to sustain the franc between now and 1961?

Surely not American aid. Algeria is not the dollar-mine that Indo-China was, and besides, Congress has just reduced President Eisenhower's foreign aid programme. But France has a neighbour who could very well afford to supply the limited-term credit in foreign currencies she needs. This is West Germany, whose currency reserves now stand at $3,600 million and they are increasing by $100 million each month. West Germany, moreover, is a creditor in the European Payments Union to the extent of $755 million; and she is France's biggest customer as well as her second supplier after the USA. But it would be a bitter blow to French pride, bitterer even than those lately administered by Nasser, to have to beg a loan in West Germany to support the franc — quite apart from the fact that Bonn makes no secret of its irritation at the continuing overvaluation of the French currency. Yet a foreign loan has to come from somewhere soon if the booming, prosperous and expanding French economy is not to be declared internationally bankrupt just when it is in sight of resolving its balance of payments problems once and for all.

Government of India

4 per cent Ten-Year Treasury Savings Deposit Certificates

(FREE OF INCOME-TAX)

Interest at the rate of 4 per cent will be payable free of income-tax annually from the date of deposit and will not be taken into account in calculating the total income of the Depositor for the purpose of income-tax.

The maximum amount that may held in these deposits including the amount invested in 3½% Ten-Year Treasury Savings Deposits in terms of Government of India, Ministry of Finance Notification No. 7(1)-B/51 dated January 22, 1951, will be —

For an individual	Rs. 25,000
For an individual jointly with another	Rs. 50,000
For Charitable Institutions	Rs. 1,00,000
For other Institutions	Rs. 50,000

Deposits in cash/cheque will be received from June 1, 1957, and until further notice in multiples of Rs. 100.

Deposits will be refundable at any time after expiry of one year from the date of deposit at certain discount.

Applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras and Bangalore, branches of the State Bank of India, State Bank of Hyderabad and Bank of Mysore Ltd. conducting Government treasury business and treasuries and sub-treasuries in India at places where there is no such office of Reserve Bank of India or branch of State Bank of India, State Bank of Hyderabad or Bank of Mysore Ltd.

Deposit Certificates will be accepted for safe custody by Public Debt Offices and interest remitted to holders, if so desired.

For full particulars apply to any of these offices, branches of treasuries.

WORLDGRAM

AGRICULTURE

Sea-Island Cotton Scheme: The Government of India have sanctioned a co-ordinated scheme for the production of Sea-Island Cotton in the States of Kerala, Mysore and Assam for a period of 5 years, beginning May 1957. The objects of the scheme which will cost Rs. 6 lakhs are:

1. To survey areas suitable for cultivation of Sea-Island cotton in the three States;
2. To cultivate Sea-Island variety "Andrews" in an area of 3 lakh acres to produce about 2.25 lakh bales of staple cotton;
3. To improve the fibre strength and ginning percentage of "Andrews" by selection and make the cotton more remunerative and suitable for spinning 80's counts;
4. To conduct agronomic research to improve the yield and quality of "Andrews" in all the three States;
5. To arrange for ginning and marketing of the produce.

*

Indo-US Agricultural Commodities Agreement: In a written reply to a question in the Lok Sabha recently regarding commodities so far received under the Agricultural Commodities Agreement which India had entered into with the United States last year, Shri Ajit Prasad Jain, Minister for Food and Agriculture, laid the following statement on the Table of the Sabha: "Commodities received up to 30-4-57 with their quantities and values:

	Quantity	Value (C & F) (Lakhs of Rs.)
Wheat	7,41,000 tons	3,079
Rice	1,33,000 tons	1,038
Cotton	88,149 bales of 480 lbs. each	7,44

GRANTS AND LOANS Nil so far. Out of the rupee proceeds of the commodities to be received under the Agreement, namely wheat, rice, cotton, tobacco and dairy products a grant of $54 million and a loan of $234.1 million will be given to India after the Loan Agreement has been signed and the projects on which it is to be utilised are mutually agreed upon by the Government of India and the Government of USA.

*

G.M.F. Schemes in Andhra Pradesh for 1957-58: A total amount of Rs. 165.19 lakhs has been sanctioned by the Centre for grow more food schemes in Andhra Pradesh as loan and subsidy for the year 1957-58. In addition, a short-term loan of Rs. 531.5 lakhs has been approved, of which Rs. 404.00 lakhs are earmarked for distribution of 1.08 lakh tons of ammonium sulphate, 10,000 tons of urea and 1,000 tons of ammonium sulphate, nitrate to the cultivators. For supply of paddy fertilizer mixture, ammonium sulphate and superphosphate, a short-term loan of Rs. 127.50 lakhs and a subsidy of Rs. 1 lakh was also accepted. The schemes for manure and compost include purchase of capital equipment for collection of urban compost and production of compost from night soil through 500 panchayats, for which a loan of Rs. 13 lakhs has been approved. A subsidy of Rs. 1,77,646 has also been approved for a model scheme for exploiting local manurial resources in 61 blocks in the State. Other schemes included in the grow more food programme generally relate to land reclamation, irrigation, distribution of improved seeds, control of pests and diseases and supply of manure and compost to cultivators.

Central Grant for G.M.F. Schemes in Manipur: A sum of Rs. 4,500 has been sanctioned by the Government of India for grow more food schemes in Manipur State for 1957-58.

The grant for subsidised sale of improved seeds and crops amounts to Rs. 500—the Central subsidy being Rs. 2.50 per maund for 200 maunds of improved seeds required by the State. For plant protection work, the Centre has allocated Rs. 3,250, and for supply of phosphatic fertilizers Rs. 750.

A Centrally administered territory, Manipur has a cultivated area of about 2 lakh acres mostly under cereals.

*

Community Projects in Punjab: The total outlay incurred in the Community Project in Gurdaspur district, Punjab, up to January 31, 1957, amounted to about Rs. 53 lakhs. The outlay incurred in connection with the establishment in the Project up to the same date, was Rs. 6,08,435. The following are figures in respect of other Projects in Punjab: Jagadhri in Ambala District, Rs. 5,47,486 up to September, 1956; Nawanshahr in Jullundur District, Rs. 5,78,088 up to January, 1957; Sonepat in Rohtak District, Rs. 5,72,774 up to December, 1956; and Dhuri in Sangrur District, 6,65,506 up to September, 1956.

INDUSTRY

DDT Factories in Delhi and Kerala: The second DDT factory, being set up by the Government of India in Kerala, is expected to go into production by the middle of 1958. The contract for the supply and installation of the plant and machinery for this factory, including the construction of the requisite buildings and structures, had been awarded on a turn-key basis to an American firm. The first consignment of the machinery and equipment had arrived at Cochin Port and was under clearance. Construction of the main factory building and other subsidiary buildings was in progress. Regarding the expansion of the DDT factory in Delhi, it is reported a substantial part of the equipment required for expansion had arrived at the site. The installation of the equipment and construction of the requisite building was in progress. The entire project was expected to be completed by the end of this year.

*

Coal Washing Plant at Kargali: Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, revealed recently, the progress made in regard to the installation of coal washing plant at Kargali. It was pointed out that the plant and equipment required for the washery had been fabricated in Japan. "One-fourth of the plant and equipment has so far been received at the site, and the remaining portion is expected to be received within the next few months, in time for the timely completion of the project. Fifty per cent of the structural work has been completed at the site." No delay was anticipated in the receipt of the plant and equipment in time, said the Minister and added that the plant was likely to be commissioned by about January 1958.

*

Hindustan Housing Factory: Shri Anil K. Chanda, Deputy Minister, Works, Housing and Supply, stated in Rajya Sabha recently that the Union Government proposed to continue to run the Hindustan Housing Factory Ltd. He added that Government took over complete control of the Factory on August 16, 1955. From that day to the close of the Company's financial year on July 31, 1956, the Factory made a net profit of Rs. 5,813-13-0 which, however, had gone to reduce the losses of Rs. 5 lakhs incurred by Government during

its partnership with Messrs. Basakha Singh-Wallenberg Ltd.

*

Manufacture of Railway Wagons in India: Questioned in the Rajya Sabha by Dr. Raghubir Singh, whether Government have any proposal to license engineering firms for manufacturing railway wagons, the Deputy Minister for Railways, Shri Shah Nawaz Khan, replied in the affirmative. He further stated that in all 15 factories would be set up--8 in the Northern, 3 in the Western, 2 in the Southern and 2 in the Eastern areas of the country. Each of these factories is to develop capacity up to 1000 wagons annually, except one which has to develop annual capacity up to 400 wagons only.

TRADE

Indo-Tibetan Trade: The total exports from India to Tibet in 1956-57 were valued at Rs. 3,17,60,000. The value of imports from Tibet during the same period was Rs. 72,94,000. As for the special steps being taken to encourage Indo-Tibetan trade, it is stated that the Indian Trade Agent and his staff continued to lend a helping hand to the Indian traders. The question of solving payment and other difficulties had been taken up at the inter-governmental level.

*

Export of Madras and Mysore Silk Waste: The Government of India have decided to release a quota of 2,84,000 lbs. of Madras/Mysore silkwaste for export up to the end of September, 1957. Details of the licensing procedure are being notified by the Joint Chief Controller of Imports and Exports, Madras.

*

Import of Cotton Against Special Payment Procedure: Replying to a question by Shri M. Valiulla in the Rajya Sabha, the Minister for Commerce, Shri Nityanand Kanungo, said that Government had decided to issue permits for the import of cotton against a special payment procedure. Explaining the broad outlines of the procedure, Shri Kanungo said that it provided for import of cotton against contracts approved by the Textile Commissioner and registered with the State Trading Corporation. Payments against such contracts, he said, would be made in Indian Rupees into a special account of the S.T.C. and the sale proceeds would be used to finance Egyptian purchases from India.

*

Export of Vegetable Non-essential Oils: In February 1957, a simplified procedure for export of Vegetable Non-essential Oils ex-India was put into Operation. With the enhancement of the rate of excise duty on such oils, the amount of rebate of excise duty payable to the exporters shall with effect from May 16, 1957, be five-seventh of the duty actually paid.

Imports and Exports at Calcutta Port: The total tonnage of imports and exports which passed through the port of Calcutta during 1955-56 and 1956-57 were, 8,030,735 tons and 8,869,210 tons, respectively, Shri Raj Bahadur, Minister of Shipping, stated in a written reply to Shri D. C. Sharma in Lok Sabha, recently.

Important commodities imported and exported from Calcutta during the same period were:

IMPORTS: Cement, chemicals, salt, grain, iron and steel and other metals, machinery, railway plant and materials, and oils and oilman stores.

EXPORTS: Coal,: gunnies, ores, tea, scrap, and lac.

FINANCE

India's Foreign Exchange Reserves: The Finance Minister, Shri T. T. Krishnamachari, told Shri D. C. Sharma at question time in the Lok Sabha recently that at the beginning of April this year, India's net foreign exchange reserves stood at Rs. 563.27 crores. At the beginning of May this year, sterling balances, which constituted the major portion of these reserves, amounted to Rs. 496.42 crores. This included a drawal of Rs. 60.7 crores from the International Monetary Fund during last February-March. The Finance Minister added that at the beginning of May last year, the net foreign exchange reserves stood at Rs. 751.36 crores. Of this the sterling balances amounted to Rs. 721.50 crores.

*

I.F.C. Loans: The Industrial Finance Corporation disbursed loans amounting to Rs. 24,75,32,259 since its inception up to May 10, this year. The disbursement was made to 113 industrial concerns in 15 States. This information was given in the Rajya Sabha by the Finance Minister, Shri T. T. Krishnamachari, in a written reply to a question by Shri Nawab Singh Chauhan. The Minister added that the Corporation sanctioned loans only to industrial concerns as defined in the I.F.C. Act and not to State Governments.

*

UN Technical Assistance for India: A sum of $2,344,500 has been allotted to India for 1957 under the UN Expanded Technical Assistance Programme. The assistance is by way of the services of exports, equipment ancillary to their services and training facilities in foreign countries.

*

NIDC Loans for Jute and Cotton Mills: In a written reply to a question by Shri M. Govinda Reddy in the Rajya Sabha recently, the Minister for Commerce and Industry, Shri Morarji Desai, said that the National Industrial Development Corporation had approved in principle loans to four jute mills and a cotton mill. Formalities had been completed in respect of two jute loans and about Rs. 46 lakhs had been paid in instalments. Explaining the terms under which such loans are granted, Shri Morarji Desai said that the loans carried an interest at 4½ per cent per year and were repayable in 15 annual instalments. The loans were secured by a mortgage of the assets of the borrowing company. The NIDC retained the right to have a nominee on the Board of Directors of the borrowing company.

*

Central Loans to States: The amount of outstanding interest-bearing central loans against the various states, as on March 31, 1957 was Rs. 1030 crores. The amount outstanding against others on the same date was Rs. 157 crores. The rates of interest varied in each case, depending upon the period of the loan and the market rates prevailing at the time it was sanctioned.

GENERAL

Oil and Petrol Production in India: The import of petrol has decreased considerably as a result of the setting up of refineries in the country, said Shri K. D. Malaviya, Union Minister for Mines and Oil, in reply to a question by Shri Bishwa Nath Roy in the Lok Sabha recently.

The comparative import figures in gallons, as given by the Minister are: 269,674,238 in 1953-54; 215,764,975 in 1954-55; 75,387,825 in 1955-56; and 28,571,613 in 1956-57 (April to December 1956). Crude oil was being imported, for the refineries as there was no increase in the production of indigenous crude.

*

Filaria Control Measures: Sixty-five Filaria Control units are proposed to be set up during the second Five-Year Plan and 20 of these have already been allotted to the participating States. Thirty-three Filaria Control units and 22 Survey units had already been set up in eleven States. The population surveyed was 1,49,53,626, the number of persons treated 8,62,934 and the number of houses sprayed with insecticides 2,72,406.

NEWS IN BRIEF

INDIAN

India's sterling balances on May 3, 1957, amounted to Rs. 496.42 crores. Since May 1956, the sterling balances were being withdrawn on an average of about Rs. 24 crores a month.

*

It is reported an order for a textile mill of 12,000 spindles will be placed with the Soviet Union on a deferred payment basis.

*

The French and Indian Governments have reached agreement in principle on French participation in India's Five-Year Plan.

*

The Minister for Commerce, Shri Nityanand Kanungo, stated in the Rajya Sabha that by the end of March 1957, 8,92,940 handlooms had been registered. Of these 4,32,603 had been registered in Madras 2,32,475 in Uttar Pradesh, 68,485 in Bihar, and 50,120 in Bombay.

*

According to the Finance Bill introduced in Parliament the excise duty on cement has been increased from Rs. 5 per ton to Rs. 20 per ton.

*

The Government of India have increased the prices of various controlled categories of steel by Rs. 70 uniformally. The increase has been necessitated following the announcement of increase in the rate of excise duty leviable on steel ingots.

*

The Indian Standard Institution has circulated for eliciting comments, a draft Indian standard specification for pressed steel tanks.

*

Shri S. K. Dey, Union Minister for community Development revealed in the Lok Sabha recently that the approximate amount to be spent for each of the 20 small Industrial Estates proposed to be set up at Community Development Block Headquarters was Rs. 2 to 3 lakhs.

*

The goods India bought from Britain last month were worth over £1,000,000 more than in April, 1956. Her purchases this April totalled in value £14,822,764 as against £13,171,931 in the same month last year.

*

Loans amounting to Rs. 533.215 lakhs in 1955-56 and Rs. 369.14 lakhs in 1956-57 were sanctioned to 15 states in connection with national water supply and sanitation programmes in the urban areas.

*

Thirty-two thousand two hundred and sixty one workers obtained refund of their provident fund accumulations, amounting to Rs. 74.90 lakhs, under the Employees Provident Fund Scheme during 1956-57.

*

A new record of concrete placement was achieved at the Bhakra Dam during April this year. About 1,63,820 cubic yards of concrete were placed, bringing the total up to the end of the month to 13,46,566 cubic yards.

*

The total Life Insurance business transacted in 1956 amounted to about Rs. 200 crores. The figures from January 1, 1956 to August 31, 1956 were Rs. 145.1 crores and those from September 1, 1956 to December 31, 1956 were Rs. 54.76 crores.

FOREIGN

The Dutch Chemical Industry is maintaining a high rate of investment, following a big rise in output last year. The increase in production in 1956 was chiefly the result of higher domestic sales which gained by 15 per cent as against a rise in export of 6 per cent.

*

The Greek Government has announced a major five-year electrification programme. The plan will be carried out by the Public Power Corporation, which at present serves continental Greece with the exception of the Athens-Piraeus area.

WAGE BOARD FOR THE TEXTILE INDUSTRY

(By a Special Correspondent)

A FEW weeks ago, the Government of India announced the appointment of a seven-member Central Wage Board for cotton textiles with a view to working out a wage structure for the industry based on principles of "Fair Wages". The Government's action is in consonance with the general recommendations of the Planning Commission for the establishment of such bodies to undertake wage investigations in the industrial sector. At its annual session in 1956, the Indian National Trade Union Congress demanded a general increase in wages and called for the appointment of Wage Boards for the purpose. The reactions of employers in the cotton mill industry to the Union's demand were clear and positive. They were willing to co-operate in the investigation and are prepared to do so now.

The point for consideration, however, is not so much the volition of employers as the appropriateness or otherwise of appointing such a body at this juncture. In the first place, the Government of India has not yet evolved a well-considered and comprehensive wage policy for the industrial sector as a whole and, unless this is done, any piecemeal attacks on the problem by singling out a few industries for wage revision will only create more complications.

Secondly, the present does not appear to be a propitious moment for undertaking such a far-reaching reform. There is universal appreciation of the need for creating a wider scope and more favourable conditions for investment in the economy in order to ensure the country's rapid progress. The industrial sector, which has an outstanding part to play in the realisation of this goal, will not be able to function effectively if it is faced with a continual depletion of its resources. In the present state of India's economy, wage restraint is among the indispensable pre-conditions to its speedy development.

Thirdly, it is not clear why, of all industries, the cotton mill industry has been selected for purposes of wage investigation. It certainly cannot be argued that the persons employed in this industry are being inadequately remunerated. In fact, since independence, there has been a considerable advance in their social and economic well-being. The various welfare measures adopted in recent years are designed to give adequate economic security to the worker in the event of unemployment, sickness and disablement and when he becomes old. The achievement of generations in other countries has been telescoped into a few years in India.

Besides far-reaching social legislation, there has been a steady rise in the level of the workers' wages. For instance, the average monthly basic wage of the cotton mill worker of Bombay has increased from Rs 44 to Rs. 49-1 since 1947. Together with dearness allowance, bonus and other emoluments, his total annual earnings amount approximately to Rs. 1,600, which is much higher than the 'per capita' income in the country.

In these circumstances, it is difficult to appreciate the propriety of appointing a wage board for cotton textiles. It may be that, sooner or later, similar bodies will be set up for a few more organised industries, but such a course of action cannot obviate the need for a comprehensive examination of the wage question in the entire organised industrial sector at the appropriate time. Such an investigation concerning the living standards and earnings of some twenty-seven lakh persons cannot be completed in haste. Nor can the issue of higher wages be isolated from such considerations as the capacity of industry to pay and the level of income in the other sectors of the economy.

It will not be in the best interests of the country to ignore these considerations or to give cause for the feeling that the Government responds only to pressure. **The industrial workers represent but an infinitesimal fraction of the country's population of 380 million and yet they receive a disproportionately bigger share of the Government's attention, while the plight of the vast numbers of agricultural labourers has remained almost unchanged.** Surely, it cannot be the intention of the Government to accord preferential treatment to any one section of the community merely because it is better organised than the other elements of the population.

Moreover, it is wrong to suppose that the size of the pay packet always truly reflects its buying capacity. If prices play truant and cannot be stabilized, the benefits accruing from increased wages will only be nominal and may even turn out to be illusory. Indeed, it will be possible to attain the "plateau of stability", so ardently desired by planners, only when the price index remains steady over a period of years. Such stable conditions can, however, be brought into existence by a rise in national income accompanied by a substantial increase in production.

Unfortunately, we have not yet reached that happy position. Shortages threaten us from almost all directions. At the present moment, there is food scarcity in the country and the Government is hard put to it to ensure adequate supplies at economic prices. Food constitutes a major item in the working class family budget and it is inconceivable how a mere increase in money income will benefit its recipients materially, unless food prices are kept at reasonable levels. Similarly, there is need for a bigger volume of cloth production in order to meet the growing demand for this essential commodity. So, unless there is an adequate increase in the output of consumer goods, a sudden rise in the buying power of the people is likely to create an imbalance in the economy. Great pressure will be exerted on available supplies, resulting in prices being pushed up. Such a development will touch off new wage claims on the part of dissatisfied labour.

These are broad considerations, and we may now examine the possible bases on which a wage board might seek to reconstruct the wage structure of an industry. The criteria for an upward revision of wages are (1) whether the work effort in a given industry is at a level to warrant an increase in the earnings of its workers and (2) whether an industry can afford to pay increased wages.

Before dealing with these points, we may usefully make a few preliminary observations. Competent persons have held the view that it is not easy to define with precision what constitute "fair prices". Moreover, as the Committee of Fair Wages, in its report of 1949, rightly says: "any attempt to evolve principles for governing the fixation of wages must be made against the background of the general economic con-

dition of the country and the level of the national income". It further holds that the state of national income is "highly relevant" to the problem of wages, because "no wage policy can be regarded as just or even economically sound unless it encourages increase of the national income and secures to the wage-earner a legitimate share in that increase." We have already discussed the manifest futility of striving for the greater prosperity of one small section of the community before raising the living standards of the population as a whole.

To turn now to the first point. There is a facile belief that it is easy to relate wages to productivity. The task of measuring output, especially when there is a paucity of statistics, presents almost insuperable difficulties. Even in countries that are statistically well-served, the assessment of productivity is no better than studied guesses. The difficulty is much greater in India, especially when measurement of productivity is attempted in the cotton mill industry where we are confronted with so many variable factors. Higher output is attained if the raw material used is of superior quality, if the working conditions are good, if the machinery is modern and if its operation is efficient. There is no ready method by which it is possible to determine in what proportion each of these factors contributes to increased production. It certainly is not as simple as separating the sheep from the goats. In any case, it would not be correct to attribute the resulting increase in production entirely to labour.

Again, higher productivity is not attained in all the units of an industry and definitely not in the same proportion. And since productivity is bound to vary from unit to unit, we must be prepared to establish wide and varying wage differentials between units in the same industry. It is, of course, impossible to do this. Further, we would be landing ourselves in great difficulties if it is urged that wage increases should be granted only in those units and industries which have achieved higher production. This, in effect, would mean that the employees of static or declining undertakings should be left high and dry — a proposition that would never gain the acceptance of workers. If, on the other hand, the benefits of increased productivity are proposed to be given to all the workers of an industry, then the wage increase granted to non-progressive units would, as a well-known economist points out, constitute additional purchasing power without any corresponding increase in the volume of goods available for purchase. To quote the authority: "In other words, the application of the principle that workers in each industry are entitled to the full benefit of higher productivity would necessarily mean inflation."

Mr. C. D. Deshmukh, former Union Minister for Finance, holds even more emphatic views on the subject. In a series of lectures delivered recently, he declared that one of the instances where the needs of the nation were somewhat ignored was seen in the idea that the wages of organised labour should move up in line with the increase in national income. Mr. Deshmukh thought that this was bad economics and that some counsel for restraint seemed necessary.

At any rate, no wage-fixing machinery can possibly determine a fair wage without relating it to a fair load of work. If this is done, as, indeed, it must be, it would be extremely difficult to establish a convincing case for any increase in wages in the near future. The fact that the present work effort in the Indian cotton mill industry is below normal is proved by the comparative figures given at the end of this article.

Lastly, the assumption that the industry has been enjoying abounding prosperity and that it can afford to increase the wages of its workers continually is based on a misunderstanding of the real position. Apart from the fact that large profits attract heavy taxes, the worker receives his due share in the shape of bonus and other direct and indirect benefits. In any case, what with the increasing burdens on the industry and the heavy demands upon its resources, the days when windfall profits could be made are over and are not likely to recur.

There is, therefore, a good case for wage restraint in the present transitional period. The second Five-Year Plan has laid great emphasis on the attainment of a higher level of output and on the expansion of India's export trade with a view to earning bigger amounts of foreign exchange. If the private enterprise industry is to play its part in making Indian goods competitive in world markets, it stands to reason that nothing should be done that would inflate costs and prices. It must be remembered that the cotton mill industry is required to earn for the country external resources totalling Rs. 375 crores by the end of the current Plan. It may be able to accomplish this task if it succeeds in raising the volume of cloth exports to 1,000 million yards per annum — a very difficult undertaking indeed in a keenly competitive and steadily declining world market.

To conclude, there is no enormity in labour's demand for higher emoluments, but it cannot expect to march ahead independentiy of the country. A far more equitable way would be that it should seek to earn higher wages through greater work effort. For example, labour should co-operate in the standardisation of workloads in the cotton mill industry on the basis of, say, four sides to a spinner and four looms to a weaver, where the equipment is of the conventional type, and agree to a carefully-considered programme of plant modernisation and rehabilitation. By adopting such a helpful attitude it will not only benefit itself but will be making a valuable contribution to the stability and progress of the industry as a whole. The country will also be a beneficiary of the resulting prosperity.

It is earnestly to be hoped that the Wage Board for cotton textiles will take the facts discussed here into consideration before formulating its proposals for any revision of the existing wage structure in the cotton mill industry.

THE JANATA POLICY SCHEME

By

CROESUS

THE Janata Policy Scheme, inaugurated last Sunday by Mr. Morarji Desai, Union Minister for Commerce and Industry, has undoubtedly begun under happy auspices. It has had not only official blessings — which is only to be expected after the nationalisation of life insurance — but also those of all sections and shades of labour leaders, which is quite significant. It is significant, because, hereafter at least, these quarters may be expected not to oppose diversion of a portion at least of such additional benefits as bonuses that may be awarded to workers towards insurance policies and national savings. By and large, the industrial workers seem to be well disposed towards the scheme, judging from the reported initial response from about a thousand Bombay workers already. This must be reckoned as a very good augury, indeed, for, if the scheme is thus patronised by the industrial workers of Bombay, what with the progressive outlook they are credited with, as Mr. G. R. Kamat, Deputy Chairman of the Life Insurance Corporation, remarked at the inaugural function, the chances of about five million people, who are supposed to avail themselves of the scheme, also taking to it kindly are reasonably assured. From the point of view of the workers themselves and the Life Insurance Corporation, as also of the country as a whole, this is a thing that is to be devoutly wished and worked for. Mr. Morarji Desai said as much when he expressed the hope that the labour and the rural population, for whose special benefit the scheme is intended, would take full advantage of it.

Mr. Morarji Desai also claimed that the Janata scheme was a striking evidence of the fruits of nationalisation and that no individual company could have undertaken such a gigantic scheme. There is a good reason for this, though the idea itself is by no means novel. In a way, albeit very small, a number of Provident Societies, mostly from Bengal, had explored this field, but these companies neither operated extensively nor did they seek to reach the industrial workers and the rural people specifically as the Life Insurance Corporation has now set out to do. These societies used to issue policies for sums below Rs. 1,000 and, invariably, their premium rates were in one rupee or multiples thereof, according as the policies were for Rs. 250, Rs. 500, Rs. 750 or Rs. 1,000 and for 10, 15 or 20 years. Nearly all over the country these companies had their agents for collection of premiums and apparently to make the small commission they gave attractive enough, they allowed the agents to deduct the commission due to them out of these collections and remit only the balance to the head office. Although, prima facie, the schemes were fairly well devised, they could not make much headway for the following reasons: (i) the narrow coverage, (ii) lack of effective inspection arrangements, (iii) indifference of agents who did not take to this business seriously, and (iv) the unscrupulousness of some management themselves. All these reasons obviously stem from one and the same factor, namely the uneconomical nature of the proposition, if I may say so. Fortunately for the Life Insurance Corporation, it has not only the sole monopoly of this business for the whole country but a network of both readily available and prospective organisations to canvass business for it, besides. In this sense, perhaps, Mr. Desai is entitled to claim that only nationalied insurance could undertake such a gigantic project.

But it is not enough if the Life Insurance Corporation has an extensixe organisation; it must be able to make the new experiment an economical proposition as well. Of course, in the beginning itself, the project cannot be expected to meet its way and must perhaps entail losses, but the losses may be expected to decrease steadily and disappear altogether over a period, if all the circumstances prove favourable. The question, however, is: who will bear the cost of the losses meanwhile, that is until this stage is reached? Will it be the State or the policyholders falling under other schemes? If the Life Insurance Corporation itself were to bear the losses, it is obvious, this would only be at the cost of the other policyholders, for, in such event, the benefits that would have accrued to them otherwise (that is if the Janata scheme had not been there) would have to be curtailed to a corresponding extent. But even this could be countenanced, if the scheme held out promise of turning out to be an economical proposition. eventually. There is no reason why this should not happen, given the wholehearted co-operation of our labour leaders in the urban areas and our Sarvodaya workers in the rural areas.

If success is to be assured to the scheme, our labour leaders must energise all the trade unions in the country and ask them to take to this constructive work of popularising the Janata scheme and thereby raising the savings of the country as a labour of love, as a mission of their life. The Union Finance Minister is convinced — as most people, indeed, are — that the bulk of the additional purchasing power generated by the large developmental outlays of the Government has percolated to industrial workers, workers in the project areas and the rural people. There cannot be a more appealing and effective method of tapping this idle or surplus purchasing power than that offered by the Janata scheme, which is, in a way, a challenge to the labour leaders and the Sarvodaya workers to prove their bona fides as regards their concern for the man-in-the-street and to demonstrate that their heart, in fact, pulsates for the common man.

I would have very much liked to end this story here but I feel I ought not to deny myseylf this opportunity to say that Mr. Morarji Desai cannot explain away — Mr. B. R. Bhagat, Deputy Minister for Finance, be it noted, tried and failed to do it in the Lok Sabha — the fall in life insurance business from Rs. 268 crores in 1955 to Rs. 200 crores in 1956 ('The Insurance Year Book' 1956 puts the 1955 business at Rs. 238.29 crores and one hopes this has not been deliberately done to minimise the extent of the fall in business in the first year of nationalisation!) to the several factors mentioned by Mr. Bhagat and to the teething troubles of transition as he himself summed up. These factors did operate, no doubt, but why, may one ask, have the Government spokesmen not made even a passing mention of the increase in the limit up to which abatment was made available for income-tax purposes on payment of life insurance premia? Is it because this operated to the advantage of the Corporation? Again, Mr. Desai's pointed attention must be drawn to the difference in the performance of the nationalised insurance itself as between the regime of the custodian, and that of its successor, the Corporation.

As "The Eastern Economist" has already pointed out (vide P. 765 of the issue dated May 24, 1957),

whereas, during January-September, 1956, when the business was managed by the erstwhile insurance companies under custodians, a total business of Rs. 145.61 crores was completed (this, by the way, was more than for the corresponding period of 1955), thus giving a monthly average of Rs. 18.2 crores, between October and December, 1956, that is after the Corporation was launched, the monthly average suddenly shrank to Rs. 13.7 crores. It is not that the reasons for this fall are unknown to the powers-that-be who seem content to refer to staff unrest as the main villain of the piece. The Corporation has yet to make it up with the agents and the medical men and not until at least this is done, let alone the elimination of such vagaries as the ordeal of medical examination of big cases by as many as half a dozen specialists differently, can the work of the Corporation proceed unhampered. However, to be fair, the time for comparing the performance of the Life Insurance Corporation with that of private insurers prior to nationalisation is not yet. Meanwhile, one only hopes that the Corporation keeps separate records in respect of its new experiments so as to facilitate an objective and dispassionate comparison at a suitable time.

DEVALUATION—WHY ?

By

CROESUS

WHETHER or no there was a case for devaluation of the Indian rupee, it is a fact that the question has been debated in this country even before "Lombard" chose to give the Government of India his gratuitous advice (in the columns of "The Financial Times," London) that the wisest course for the Government of India is "to make it clear that they intend to maintain the rupee at its existing level and to demonstrate that they are following economic policies that will enable them to do so." The advice follows his rather casual conclusion that the rupee is tending to fall under suspicion, because gold prices in Bombay went up a few days ago to Rs. 111 per tola and to Rs. 72 per sovereign. He also suggested that "the tendency for money to move out of Indian currency into other currencies is finding no reflection in movements in exchange rates, because the rupee is linked to sterling".

There is no gainsaying the fact that the rupee has suffered in value, both internally and externally, but the situation is certainly not as serious as Lombard seems to suggest. To quote his own words, "it is, as it happens, not unlikely that the danger in which the rupee stands as a result of the deterioration in India's external and internal economic circumstances is being exaggerated". The extraordinary efforts to correct the adverse balance of payments position and to maintain the stability of prices internally that the Government of India has made, and is continuing to make, should satisfy even the most meticulous critic that no stone is being left unturned to maintain the value of the rupee.

Lombard's conclusion seems to us casual, as we have noted above, because the sharp rise in gold prices since the beginning of this year is not wholly related to the deterioration of the rupee. Ever since the wealth tax idea was mooted, thanks to Professor Nicholas Kaldor, the demand for gold has been steadily going up, and the peak would appear to have been reached already, as, since the past few days, gold prices have started showing signs of decline. Moreover, gold prices in India even normally tend to rise in the early months of the year, by reason of the certain demand occasioned by the annual marriage season. In any case, the prices reached this month (May, 1957) are by no means the peak levels. They are only the highest since the first week of September, 1951; in April, 1951, gold prices in India touched the all-time peak level of Rs. 115-12. Incidentally, India's foreign balances were standing at much higher levels at both these points of time; in April, 1951, our foreign assets stood at Rs. 876.68 crores, while, in September, 1951, these were of the order of Rs. 811.24 crores.

It is true the internal price structure has been such as to cause concern. The relentless march of inflationary forces has begun to tell and, if anything, the tempo of this march has only been further accelerated by the latest budget proposals of the Union Finance Minister. Yet the Herculean efforts being made and proposed should at least stem further rise, though they may not succeed in reversing the trend, unless the supply of food and other essential consumer goods suddenly rises so substantially as to make an impression on the price level. Since, in any case, there cannot be an overnight increase in food production and more imports of food grains require additional foreign exchange, it might appear that we have verily reached a blind alley. Actually, the position is not that bad. If the American P.L. 480 is pressed into service fully, as seems not improbable, the present food shortage may well be tided over at least until the coming monsoon brings in the next harvest, and if Providence were to favour India, this monsoon should be favourable.

So the danger which the Indian rupee is alleged to be facing today is really not too grave. Even if it were, would devaluation be the right solution? A few weeks ago, perhaps, one might have toyed with the idea, but it would be foolish to entertain any such notion after the back-breaking budget of Mr. Krishnamachari.

That apart, in what way is devaluation going to help us? To say that it will lower our export prices, which it certainly will, is one thing, but to argue that it will increase our exports is rather to overrate India's ability to export, especially in the growingly highly competitive markets abroad. Our Finance Minister has admitted that there, are severe limits even to our staple exports. Again, devaluation will undoubtedly raise the cost of our imports, and do we want this? It would be mid-summer madness to do anything of this sort when we have already reached a stage where we cannot curtail our imports any further. In such an event, the result would be avoidably to put up our import bill without the saving advantage of any increase in supplies of consumer goods that might at least help fight the presently developing inflationary forces. Both these consequences must be averted not only to prevent the size of the second Plan from bulging any further but to leave the door open for imports of consumer goods whenever the imperative need for such a course might arise, which is not unlikely. Should this happen, the Government of India would be perfectly justified even to draw upon the country's sterling balances to a figure below Rs. 400 crores, as there is no sanctity as such about that figure. India can also draw to the fullest extent permissible her quota from the I.M.F., even as Britain has done, for here is a proved imbalance in our economy, a solution to which does not brook any delay.

There is one other consideration — and this is very important — why India should not countenance devaluation at this stage. It is that the Indian rupee has become quite popular in the Middle East countries and there is developing imperceptibly a Rupee Bloc, as it were. Would it not be suicidal to resort to any such thing as devaluation at this stage and thereby shake the steadily growing confidence in the Indian currency in these areas?

But saying all these is not to rule out devaluation for all times. If the Government of India were to continue to think and act in terms of the inviolability of the size and the duration of the second Plan and if it should persist in pushing it through at any cost, which is clearly beyond the savings and investment capacity of this country, it will not be out of our volition that devaluation will come; on the contrary, devaluation will force itself on us. Unfortunately, this warning, which has ere now been sounded in the clearest terms seems to be going unheeded.

INVESTMENT, INFLATION AND EMPLOYMENT

(CONTRIBUTED)

THE problem of employment is a crucial one in the economic development of those countries which are over-populated in relation to their resources, assessed in the context of the current techniques of production and productive organisation prevalent in those societies. Such is, in fact, the situation of most of the countries in Asia which face an unemployment problem of the greatest magnitude in the background of a system of production which is extremely primitive in character. This, it should be noted, is unlike the unemployment problem in the Western countries which face it in the background of a vast productive apparatus that happens to be idle for some reasons.

One of the imperatives of planning in such countries has, therefore, inevitably to be concerned with the problem of employment. An almost absolute limit to the process of economic development is, however, set by what may be called the Inflation Barrier. The Barrier, of course, is a function of many factors and varies over the time-period. But still it can never be ignored with impunity, specially by countries which are and aspire to remain democratic in character.

The pattern of investment varies with the pattern of economic development that a country wishes to follow for itself. It may be geared to the ends of power or the ends of welfare, though the two may coincide for some moments in the case of some countries. The variation in the pattern, however, is not supposed to affect inflation. It is only the absolute amount of investment that is supposed to have the relevant consequences. There are, of course, other factors such as the capital-output ratio and the time-schedules of investment-fruition that are also relevant for assessing the inflationary effects of an investment policy. Still, in the short run, it is the absolute amount alone that is supposed to matter.

It is, however, not merely the amount of investment but also the pattern that seems to matter even in the short run. And, in a certain sense, the type of investment that may promise most employment in the short run may also result in setting up inflationary tendencies of the utmost intensity. The wider disbursement of funds to a larger number of people creates obviously a greater demand-pressure on available consumer goods and services than a more concentrated disbursement to a lesser number of people. In case a larger amount of investment flows into the hands of a limited number of people, it facilitates the anti-inflationary process of autonomous saving flowing back into the investment-process and thus creating the cycle once again. The demand-pressures in the latter case are generated more on the luxury goods which perhaps can be met more easily than the increased demand for basic consumer goods generated by an employment-oriented pattern of investment. The relative ease would, of course, depend on the pattern of luxury-consumption prevalent in a particular society. If, for example, the pattern is determined in terms of a feudal style of living, it should at least be theoretically possible of easier attainment than if it consists largely of prestige-goods industrially manufactured outside the country, even though it be a moot question whether a feudal style of living can go with the capitalistic entrepreneurial spirit without which economic development can hardly take place.

Further even in cases where the pattern of luxury-consumption creates pressures on the foreign exchange position, it can be checked and controlled far more easily than the demand-pressures generated on the basic consumer goods front. And, in any case, a strain on the foreign exchange position is bound to take place if the pattern of investment takes a capital-intensive form as, in most cases, the required technical skill and equipment will have to be imported from abroad. Whether the luxury-imports induced by the investment process add significantly to the strain shall remain an undecided question. It can perhaps be settled only for specific cases: a generalised solution, I suspect, may not be possible in the matter.

The employment-oriented pattern of investment may have one anti-inflationary consequence in the sense that the time-period of investment-fruition is relatively shorter and that the employees are set on producing the things that they as a whole have more or less directly to consume. The cottage-industries and handicrafts which give large employment to people produce almost directly the goods that the newly employed would need to consume. This, however, meets a serious limitation in the fact that in countries living on the margins of subsistence the increased demand-pressure would, in the first stage, be felt primarily on the food front. The increase in agricultural production, however, can neither be so quick nor easy as in the case of other consumer-products in general. If this be coupled with the fact of rising population, as is the case with most countries of Asia, the difficulty becomes still more acute. The anti-inflationary force of investment in consumer goods produced by cottage industries and handicrafts is, thus, considerably reduced. The primary barrier in the realm of agricultural productivity does not let this force function as it normally would have done if the limiting factor had been absent.

This, it should be clear, is not a plea for an investment-pattern unoriented to employment ends. It merely seeks to focus attention on the incompatible effects of a pattern of investment with regard to its consequences in terms of employment and inflation in a particular economy. The break-through can perhaps be made by raising agricultural yields all through — a problem that, in any case, is central to all economic development geared to the ends of welfare rather than power in a particular society. Unless a concentrated effort is made to break through this foundational barrier, a country may industrialise itself in terms of power and be reckoned among the polities of the world but lose in terms of economic welfare and political freedom for which alone perhaps it set itself on the path to economic development.

Economic Report from the U. S.

MUTUAL ASSISTANCE PROGRAMMES

(By GUY SIMS FITCH)

WASHINGTON, May 21.—It has been recognized for some years now that the mutual assistance programmes of the United States have become an integral part of U.S. foreign policy. Now, as expected President Eisenhower has asked the U.S. Congress to enact legislation that would give these programmes a new shape, one more in keeping with the stature they have in fact attained. In his long-awaited mutual aid message, sent to Congress today, the President has emphasized the general agreement among Congressional committees, the Administration, and informed private citizens on the proposition that US economic and military aid to other countries promotes world peace, security and well being, and therefore should be continued and strengthened.

In essence, the President's legislative recommendations would separate clearly the economic from the military aspects of US aid, identifying each with its real purpose and giving it its own place in the federal budget. This, it is believed, would help remove any uncertainties or misunderstandings regarding the nature of this aid. Military aid thus would include both outright defence assistance, such as weapons and training for allies, and so-called defence support — aid which is superficially economic but which actually enables friendly nations to maintain military forces and facilities they otherwise could not maintain. Outlays for defence support and direct military aid would be made part of the regular US defence budget.

To give greater continuity as well as balance to collective security efforts, the President also recommends that appropriations for these interrelated defence items be subject to continuing Congressional authorization, rather than having to be reapproved periodically, as at present. For the 1958 fiscal year starting next July 1, Mr. Eisenhower is asking for a $2,000 million appropriation for military assistance—$1,900 million for equipment and services, $900 for defence support. Also in the interest of greater continuity and efficiency, the President recommends that economic development assistance be placed on a new and clearly defined basis. This would entail creation of a development loan fund to finance specific projects and programmes in other lands which give promise of contributing to their sound economic development. These loans would not replace or compete with such existing sources of credit as private investors, the US Export-Import Bank or the United Nations World Bank. But they would tend to be somewhat "softer" in many instances, with the prospects of repayment, either in dollars or local currencies, based on confidence in the long-range development of the borrowing countries. Thus, the proposed fund would tend to promote, rather than impede, the flow of needed capital from other credit and investment sources.

Since the fund will be dealing with long-term projects, the President recommends that it be set up initially with suficient resources to finance its operation for the coming three fiscal years. The appropriation asked by the President for the first year is a sum described as "not less than $500 million." As development programmes move forward, he anticipates substantial increases in the following two years, possibly through borrowing from the US Treasury, up to $750 million annually.

While the shape of the mutual assistance programme would be changed substantially its overall magnitude would not. The total request for new aid funds for the 1958 fiscal year adds up to $3,865 million. This is over $535 million less than was estimated in the President's budget message to Congress last January, but nearly all of the contemplated reduction would be made through a $500 million savings in the military programme. Moreover, the total being requested for fiscal 1958 is slightly larger than the new aid obligations voted for the present fiscal year, and some 45 per cent larger than those voted for fiscal 1956. These proposals of the President now must be translated into law by Congress. A number of Legislators, mindful of the demands for reductions in government spending, have indicated their intention to seek substantial cuts in the aid funds requested by the President. How deep these cuts will be, and whether or not they will affect Mr. Eisenhower's proposed changes in the mutual security set-up, can only be matters of conjecture at present. But on one matter there is virtually complete agreement in and out of Congress: US aid to other countries is properly a matter of continuing concern to the United States, regardless of the size or shape it may ultimately take.

THE DUNLOP RUBBER CO., (INDIA) LTD.

The Directors of The Dunlop Rubber Company (India) Limited announce the following decisions:

1. A Rights offer of 14,00,000 new Ordinary Shares of Rs. 10 each at a premium of Rs. 5 per share for cash payable in full on application will be made to the members whose names appear on the Register of Members in respect of the existing Ordinary Shares on 11th June, 1957, in the proportion of seven new Ordinary Shares for every eight Ordinary Shares then held.
2. An interim dividend at the rate of 7½ per cent free of tax for the year ending 31st December, 1957 will be paid on 19th June, 1957 to the members whose names appear on the Register of Members in respect of the existing Ordinary Shares on 11th June, 1957.

For the foregoing purposes notice is hereby given that the Share Transfer Books and Register of Members holding Ordinary Shares in the capital of the Company will be closed from 4th June, 1957 to 11th June, 1957, both days inclusive.

Holders of Ordinary Shares under blank transfers are particularly reminded that it is necessary to register the transfers prior to 4th June, 1957 in order to be entitled to the Rights offer. Legal representatives of deceased shareholders should get their legal representations immediately registered with the Company to enable them to receive and deal with the Letters of Rights on behalf of the estate of the deceased.

BUSINESS NOTES

THE BUDGET AND THE PRIVATE SECTOR

IN A provocative speech delivered at the annual general meeting of Mahindra and Mahindra Limited, Mr. K. C. Mahindra, Chairman, has turned the searchlight of scrutiny on some aspects of the budget that require careful examination. While one of the cardinal objectives of the Plan is to curb the inflationary potential, he has pertinently asked why the Finance Minister has done nothing to reduce the positive influence of rising public expenditure. All the measures of Government to put restraint on consumption or credit, would, it is obvious, be of little avail in the absence of a curb on Government spending. "The volatile spenders both the Centre and the States", he observed, "need to be kept in check under a strong leash if the delicate balance of stability is to be achieved". He has cited appositely in this connection what the Governor of the Bank of England recently stated that "the economic machine could not be driven with one foot on the accelerator of public expenditure and the other on the brake of credit restriction." Another aspect to which Mr. Mahindra has drawn attention is the imperative need for providing incentives for greater production all round. In support of his contention he has quoted approvingly such a high authority as Mrs. Joan Robinson who has stated that "to support any large scheme of investment with a long gestation period, there must be an appropriate amount of quick-yielding investment to get the consumption sector into the posture to meet the demand that will fall on it". But current economic policies unfortunately do not seem to lay much store on this aspect. Mr. Mahindra's basic criticism of the Plan on the score of a lack of balance is thus unanswerable.

Mr. Mahindra's criticism of the taxation proposals as affecting the private sector are equally devastating. When capital formation is of paramount importance for furthering industrial growth, the proposals for compulsory desposits, increase in corporation taxes and tax on wealth on companies are positive disincentives (He has here referred to the recent survey by the Indian Institute of Public Opinion showing that there was no significant rise in the rate of capital formation between 1952-53 and 1955-56). In a trenchant criticism of the effects of the proposed taxation measures he observes that they "will be far-reaching in respect of disincentives, in respect of capital formation and in respect of savings apart from the incongruous and unjustifiable levy of multiple taxation on the same quantum of income and now wealth." No less pertinent is his arresting conclusion about New Delhi getting its inspiration from Kaldor and yet not going the whole hog with it. It is nothing but 'Heads I win, and tails you lose' when Government hurries to adopt the Kaldor devices without adopting the safeguard he has recommended, viz., reduction in rates of income tax and super-tax to 45 per cent which is the core of Kaldor's harmonious basis of taxation. If what Government aims at is disincentives and a halt to development of the private sector, why should it not place all its cards on the table? What else is the construction one should put, as Mr. Mahindra has justifiably raised, on this statement of the Finance Minister in his Budget speech?; "These measures are not intended to curtail genuine investment in the private sector, though it would not be unreasonable to assume that a slight slowing down for a short period will not, in present circumstances, be undesirable".

A WAGE POLICY FOR LABOUR

THE QUESTION of formulating a sound industrial wage policy has been in the fore quite for some time now, but it has gained added importance in the context of the inflationary spell that threatens the Indian economy. In his cogently argued presidential address to the annual session of the All-India Organisation of Industrial Employers, Mr. G. D. Somani has made a constructive approach to the whole question. The I.N.T.U.C.'s demand for an outright increase of 25 per cent in the level of industrial wages has evidently produced no favourable reaction in the country. The Government's proposal, therefore, to set up Wage Boards for different industries seems to be a step in the right direction since the constitution of a Wage Commission is not feasible at present as it may take many years to complete its labours in the absence of a wage census. Mr. Somani has referred in this connection to the construction of a Wage Board for the cotton textile industry and one of its terms of reference, viz. that in evolving a wage structure, the Board should, in addition to the considerations relating to fair wages, also take into account the needs of the industry in a developing economy. "A sound wage policy", he said, "must be judged in the context of earnings of workers in different sectors, such as agriculture, tertiary and domestic, the national income, its effects on costs and exports, inflationary potential etc." Thus Mr. Somani has put the entire question in the proper perspective. Manufacturing costs, it must be remembered, have to be kept down not only to promote exports in the competitive international markets but also to keep the internal prices under check so as not to add to the inflationary potential. The argument, therefore, that the employers can easily pass on the increase in price consequent on the wage increase to the consumer is thus not quite correct.

Mr. Somani has pleaded that any increase in the standard of living of the industrial workers should be aimed only through the scientific process of increased productivity, which has assumed considerable importance recently. Productivity, he pointed out, should not be confused with just rationalisation but should include the entire gamut that goes to build up the climate of productivity. Here the recommendation of the Industrial Productivity Delegation which recently visited Japan to form a National Productivity Council in this country has come not a day too soon, since it would make available to everyone the benefits of the research work and experience gained by different industrial units and organisations in this direction. It needs no particular emphasis that it would be difficult to halt the inflationary pressure without relating the whole question of wages to productivity. The several trade unions in this country should realise that the best way of protecting the workers' interest is through a more ordered system of wage increases and not by mere competitive claims by taking advantage of a particular bargaining position in a particular context. It is here that the question of workers' education is of great relevance since there is urgent need for paying greater attention to the training of labour and make them imbibe a proper outlook. There is no reason why trade union leaders should not awaken themselves to the realities of the present situation and try to work out a method that would assure their members gradually increased wages in return for co-operation over productivity.

MEDIUM-TERM FINANCE FOR INDUSTRY

WITH THE passing by the Lok Sabha this week of the Reserve Bank (Amendment) Bill and the State Bank of India (Amendment) Bill, a significant step has been taken to provide medium-term credit to industries. The providing of medium-term credit to the industry has received so far very little attention with the result that the current needs of the urban industrial sector have remained unfulfilled. In actual practice it was observed that institutions like the Industrial Finance Corporation catered mainly to long-term finance. Even bodies like the State Financial Corporations and the Industrial Credit and Investment Corporation could not give adequate medium-term finance facilities in the private sector of industry. With the rising tempo of industrial development, it was felt that one institution was not adequate for offering credit facilities. It was to remove this lacuna in the industrial credit structure that the necessary legislation was thought of.

The Reserve Bank (Amendment) Bill as passed would enable the Reserve Bank to contribute to the capital of institutions that would be set up to provide medium-term loans to industries. The State Bank of India (Amendment) Bill would remove some of the restrictions in the State Bank of India Act relating to the grant of loans and advances for periods in excess of six months and against the primary security of immovable property. Under the new set-up, the Directors of business houses would be excluded and only the bankers would be associated with the proposed institutions. The granting of loans would solely be a matter for the bankers to decide.

It is rather unfortunate that the Directors of business houses who could assess the needs of industry better are to be excluded in the proposed institutions, but it is to be hoped that the bankers with their long experience of lending to industries would be able to take their place effectively and discharge their duty fairly. The main advantage of these institutions would be that they would go a long way in meeting the needs of a particular type of credit and help in the rapid industrialisation of the country.

STEEL FOR RAILWAYS

SHORTAGE of steel is the main impediment in the speedy execution of certain projects in the public sector. This shortage is quite marked in the case of Indian Railways. A number of line and other development works on the timely completion of which depends the creation of the additional transport capacity are being held up as a result of that. The steel requirements of the railways during 1957-58 total about 1.6 million tons, but present indications are that they may not receive even 45 per cent of this quantity. In the last year only 50 per cent of the requirements of steel were received.

Since much depends on the additional transport capacity needed to meet the mounting demands of traffic under the impact of the second Plan, it is apprehended that a continuation of this shortage may not only be very harmful to the railways but may even prove a great handicap for the plan as a whole. The situation in the supply of steel is not likely to improve till the second plan programme of expansion of steel production begins to yield concrete results. Meanwhile, the Government of India has taken two steps to improve the situation. With effect from April 1, 1957, the responsibility for the procurement of the more important categories of steel has been transferred from the Ministry of Commerce and Industry to the Railway Ministry. A small steel procurement unit has been set up in the Railway Board's Office in New Delhi charged with the responsibility of procurement of various categories of rails, steel sleepers, fish plates and bearing plates. This arrangement has been made with a view to make the railways get in touch directly with the sources of supply thereby enabling it to acquire speedy steel supplies.

The second step taken is the decision to send a railway steel procurement mission to the UK and other steel-producing countries of Europe. It is expected that the mission would succeed in its effort at least in some measure to bring early relief. In the meantime, will it not be a worthy arrangement if steel stocks lying with the public sector not needed for immediate use are diverted to the railways on a basis of borrowing to meet pressing needs?

A SALES TAX MUDDLE

TRADERS AND industrialists in this country have been receiving a series of blows, almost in continuous succession, in one form or other. Of these, it is undoubtedly the fiscal measures of governments, both Central and States, which have created the most uncertain and confused atmosphere in market circles—stock, bullion, cotton and commoditics—so much so that even the boldest 'entreprenuer' now hesitates to venture. The morale of the market has been completely shaken on account of the increased uncertainty. In Bombay for example, business in almost all the commodity markets, particularly in Vadgadi, the hub of the city's wholesale trade activity is practically at a stand-still, since last week, as a result of the complications created by a circular recently issued by the Collector of Sales Tax, Bombay, making it obligatory on the part of the commission agent to bear the sales tax, as though he were the dealer himself. Such a position did not prevail until the enactment of Bombay Sales Tax (Amendment) Act of April 1957. The commission agents, who are severely hit as a result, have withheld their purchases as a protest. As a large portion of Bombay's business -- this is estimated roughly at about 80 per cent--consists of transactions by these commission agents, almost the entire trade has been paralysed.

The present crisis, according to business circles, has been created by the Sales Tax circular dated April 30, 1957, asking commission agents not to issue certificates in forms J, K or N to the vendor, if the effect of the transaction is that there is no resale by him to his Principal of the goods purchased by him. If they are not allowed to issue certificates, as per this circular, the commission agents apprehend they may have themselves to bear, on pain of punishment, the burden of the sales tax, amounting anywhere from 2 to 5 per cent. It is not clear how such an interpretation could be given. For all that can be said about the circular in question is that it would give the Sales Tax Collectors more opportunities of harassing the commission agents. In view of this, possibly the present trouble could be ended, one feels, if the Government of Bombay were to be content itself with just an undertaking in writing by the commission agent concerned that he acted in that capacity in respect of a given number of transactions.

Meanwhile the decision of the commission agents to stay away has affected adversely the wholesale trade of both Bombay and Ahmedabad in cotton textiles, kariana, spices, colour and chemicals, dried fruits, betel nuts and a host of other commodities, resulting in heavy losses to the traders as well as to the Government. To subject to sales tax a commission agent who only acts for, and renders some service, to his upcountry Principal or client is neither just nor equitable.

COMPANY AFFAIRS

JAY SHREE TEXTILES LIMITED

The report and the audited accounts for the year ended December 31, 1956, show a profit of Rs. 6,69,630. after making provisions for depreciation (Rs. 5,67,169) and doubtful debts (Rs. 32,412). As this year's working was considered good, an amount of Rs. 2,82,610 has been deducted from profits against last year's debit balance. The directors have recommended a payment of dividend on 4,91,700 Equity shares of Rs. 10 each at As. 6 per share, which will absorbs Rs. 1,84,388. A balance of Rs. 2,652 has been proposed to be carried forward to next year's account.

An approximate amount of Rs. 40,70,000 is outstanding as unabsorbed depreciation allowance on 31-12-56. This includes initial depreciation, extra depreciation, extra shift allowance and also the development rebate as worked out by the Company according to the provisions of the Indian Income Tax Act, 1922. As indicated in last year's report, the working of the Company has shown considerable improvements during the year under review. It is hoped that this improvement will be maintained. Sales (including processing charges) during the year have increased from Rs. 54.21 lakhs in 1955 to Rs. 62.30 lakhs during the year under review. The company's main items of manufacture are: Flax Hosepipes for Fire-Fighting; Linen Threads and Twines; Flax Canvas and Paulins; Staple Yarn and Fabrics; Hair Belting Yarn; Knitting Wool, etc.

The Company's products have become very popular — specially Hosepipes, Threads, Twines and Belting Yarn. In the past the country used to import these essential items from foreign manufacturers, but now the Company is able to meet almost the entire demand of the country, cutting down imports to the minimum possible and thus affecting a saving of vital foreign exchange. Some of the departments of the company have been expanded, by adding new machineries, during the year under review. Plans are being finalised to make further expansions to meet rising demand for the Company's goods. The Directors are glad that the Company has also ben given permission to work 152 of its existing looms on Cotton Canvas. Some of the looms have already been started for the production of this item. The Company has received permission from the Government of India for establishing a new Staple Fibre Spinning Plant. The Directors are now giving the necessary consideration to the scheme.

The relations of the management and the workers have been very cordial throughout the year, and the Directors have recorded their appreciation for the loyal co-operation extended to them by all members of the staff and workers.

THE INDORE MALWA UNITED MILLS, LIMITED

The Audited Balance Sheet and Profit and Loss Account of the Company for the year ended December 31, 1956, show Profits for the year, after providing Rs. 6,59,256 for Depreciation and Rs. 3,57,615 for Development Rebate, at Rs. 12,50,745.

Adding thereto the balance brought forward from the accounts of the previous year amounting to Rs. 9,550 and Rs. 16,421, being the balance of the bonus amount provided for the year 1955, the total is Rs. 12,76,716.

Deducting therefrom the amouunt paid on November 12, 1956 as ad-interim dividend at Rs. 5 per share, free of income-tax Rs. 2,50,000. The balance is Rs. 10,26,716.

From this sum, the Directors have recommended: Provision for Taxation Rs. 7,20,000; Payment of 60th (Final) Dividend at Rs. 6 per share, free of income-tax Rs. 3,00,000.

A balance of Rs. 6,716 is proposed to be carried forward.

The estimated amount of Development Rebate as per the Indian Income-tax Act for the year 1954 and 1955 which was formerly credited to Depreciation on Plant and Machinery Account has now been taken to Development Reserve Accounts. However, Initial Depreciation has been included in the amounts charged in the respective Depreciation Accounts. Further, the credit balance of Rs. 36,657 of Reserve for Bad and Doubtful Debts has been transferred to General Reserve Account.

During the year under Report, the Mill output of Cloth in the country registered a further improvement, the striking feature being the rise in the rate of output although there has been some setback from the month of September. The maintenance of the high level of Mills output has followed the expansion of the installed capacity of the Mill sector during the first Five-Year Plan period and by the perceptible rise in the domestic demand for Cloth. Despite the marked improvement in Cloth supplies the prices of Cloth ruled distinctly firm till August, 1956, mainly due to general increase in the standard of living following the implementation of various development schemes and lower stocks with the Mills in the beginning of the year. But due to the uncertainty caused by increase in Excise Duty imposed from September 1, 1956, and various official statements, the Cloth Market became weak and this factor coupled with stringency in money market day by day, resulted in the poor off-take of cloth and consequently the Mills had to carry larger stocks. This affected the working of the Mills in the latter part of the year.

During the year under report, as per five years bonus agreement entered into by the Company with the Indore Mill Mazdoor Sangh, a sum of Rs. 1,40,000 has been provided for the bonus for the year 1956.

THE ELPHISTONE SPG. & WVG. MILLS CO. LTD.

The Report for the year ended December 31, 1956, together with the audited Balance Sheet and Profit and Loss Account shows profit on the working of the Company at Rs. 16,27,614. Which after provision for depreciation of Rs. 1,88,376, for Gratuity Rs. 3,50,000 and setting aside as provision for taxation Rs. 5,50,000 leaves a Balance of Rs. 5,39,238 to the credit of Profit and Loss account.

To this should be added, being the amount brought forward from previous year, Rs. 1,31,354.

The total amount available for appropriation is Rs. 6,70,592. Out of which the Directors have appropriated Rs. 1,00,000 to Development Reserve. Leaving a balance of Rs. 5,70,592.

The Directors have recommended the Dividend as follows:

(a) Payment of a Dividend of Rs. 7 per share (subject to Inocme-tax) on 25,000 7 per cent Cumulative Preference shares of Rs. 100 each for the year 1956 is Rs. 1,75,000.

(b) Payment of a Dividend of Rs. 5 per share (free of income tax) on 59,961 Ordinary shares of of Rs. 50 each for the year 1956 is Rs. 2,99,805.

A Balance of Rs. 95,787 is to be carried forward to the next year's account.

The cloth market was in a healthy state up to August, 1956, when both off-take and prices were at a satisfactory level. These conditions were, however, reversed by the sudden increase in the excise duty on cloth of all varieties to a very high level effective from September 1, 1956, in addition to the increases effected earlier along with the Budget Proposals for 1956-57.

Gratuity to workers became payable for the first time during the year as a result of an Award given by the Industrial Court in November, 1956. The Award was given retrospective effect from 22-11-1954 and a sum of Rs. 3,50,000 has been provided in the accounts for the purpose.

COMMODITY NEWS AND NOTES

FINAL ESTIMATE OF KHARIF PULSES

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of 'kharif' pulses other than tur for 1956-57 puts the current year's area and production at 16,166,000 acres and 1,664,000 tons, as against the partially revised estimate of 15,567,000 acres and 1,632,000 tons for 1955-56. This shows an increase of 599,000 acres or 3.8 per cent in area, and 32,000 tons or 2.0 per cent in production over last year. The increase in acreage has been shared mainly by Bombay, Rajasthan, Punjab and Andhra Pradesh and has been attributed generally to favourable climatic conditions at the time of sowing. This increase has, however, been offset to some extent by the decreases, registered in Bihar, Madhya Pradesh, Mysore, Uttar Pradesh and Himachal Pradesh. The increase in production has occurred in Andhra Pradesh, Bombay, Bihar, Madras, Punjab, Rajasthan and West Bengal and has been attributed partly to increase in acreage and partly to favourable climatic conditions during the growing period of the crops. As between various pulses, the increase in production has occurred in the case of mung, moth and kulthi. Some of the pulses included in this estimate are also grown during rabi season in some States. Kharif pulses reported in this estimate, however, cover about 62 per cent of the total area under pulses other than gram and tur.

INCREASE IN PRODUCTION AND ACREAGE OF GRAM

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of gram 1956-57 puts the current year's area and production at 23,354,000 acres and 5,350,000 tons as against the adjusted second estimate of 22,333,000 acres and 4,636,000 tons for 1955-56. This shows an increase of 1,021,000 acres or 4.6 per cent in area and 714,000 tons or 5.4 per cent in production over 1955-56. The increase in area during the current year has been shared by Madhya Pradesh, Punjab, Rajasthan and Delhi. This increase is generally attributed to the favourable climatic conditions at the time of sowing. The increases recorded in these States have, however, been offset to some extent by decreases registered mainly in Bihar and Bombay States. The increase in production has been shared by Punjab, Rajasthan, Madhya Pradesh and Uttar Pradesh, and has been attributed partly to increase in area and partly to favourable weather conditions during the growing period.

PRODUCTION OF MICA IN INDIA

The production and export of mica had increased in recent years, said Shri K. D. Malaviya, Union Minister for Mines and Oil, in reply to a question by Shrimati Ila Pal Choudhury in the Lok Sabha recently. The Minister further added that an Export Promotion Council for mica had been set up to maintain and develop mica export trade. Shri Malaviya also placed a statement on the table of the House giving the comparative figures of production and export of mica from 1953 to 1956.

Year	Production (Quantity in '000 Cwts)	Exports (Quantity in '000 Cwts)
1953	245	245
1954	335	335
1955	419	419
1956	437	426

Only from 1956 the reliable statistics of mica in the country were made available under the Mineral Conservation and Development Rules. Prior to this, the statistics of production of mica were mainly based on the export figures which were more or less a true index of mica production in India as the bulk of production is exported.

IMPORT OF WHEAT AND RICE IN 1956-57

The cost of wheat and rice purchased from abroad in 1956 amounted to about Rs. 40 crores, besides the wheat obtained from the USA with aid funds. Food imports, it is reported, were arranged on a calendar year basis. The quantity of wheat imported from the USA during January-April 1957, amounted to 6 lakh tons. The import programme was reviewed from time to time in the light of requirements and availability of shipping. The present intention, is to import about 2½ lakh tons of wheat every month.

FINAL ESTIMATE OF DRY GINGER, 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of dry ginger, 1956-57, puts the current year's area and production at 39,700 acres and 14,900 tons as against the partially revised estimate of 39,800 acres and 15,300 tons for 1955-56. Thus, the current year's estimate shows a nominal decrease of 100 acres or 0.3 per cent in area and 400 tons or 2.6 per cent in production over last year. The decrease in area and production of ginger during the current year occurred in the major ginger-growing States of Kerala and Andhra Pradesh. The decrease in area has been offset to a large extent by increases recorded in all other States. The decrease in production has occurred in Himachal Pradesh, Kerala and Andhra Pradesh, and has been attributed to decrease in area and adverse seasonal conditions during the growing period in these States.

FINAL ESTIMATE OF BLACK PEPPER FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of black pepper, 1956-57, puts the current year's area and production at 233,600 acres and 31,600 tons, as against the partially revised estimate of 232,500 acres and 32,100 tons for 1955-56. This shows an increase of 1,100 acres or 0.5 per cent in area and a decline of 500 tons or 1.6 per cent in production over last year. The increase in area during the current year has been reported mainly by Kerala State. Despite an increase in area, there has been an overall decline in the production of black pepper. The decrease in production occurred in Kerala and Mysore States, and has been attributed generally to the unfavourable weather conditions during the flowering and growing period of the crop.

MORE EXPORT OF MINERALS

India earned nearly Rs. 7 crores more on exports of minerals during 1956 as compared to the preceding year. The total value of exports during the year was Rs. 38.7 crores as against Rs. 31.9 crores during 1955. Mineral exports which fetched foreign exchange worth nearly Rs. 200 crores during the first Plan period showed a significant improvement in 1956. The improvement in the export position was brought about by a large export of iron ore which accounted for an increase of Rs. 3.5 crores in the total foreign exchange earnings through mineral exports. The amount of iron ore exported during 1956 was 1,692,626 tons: in 1955 it was 1,198,458 tons. The increase in foreign demand for iron ore is mostly attributable to the larger output and higher prices of steel in producing countries. The quantum of manganese ore exported decreased by 1.4 lakh tons from 837,283 tons. But the value of exports increased by Rs. 1.2 crores. The shipment of mica was higher in 1956, contributing an increase of Rs. 0.8 crores to the value of exports. Exports of ilmenite registered an all time record of 283,000 tons consistent with the peak production of 334,000 tons during the year.

Back to the Wall

E meeting of the Import Advisory Council ld in New Delhi yesterday was significant ne profoundly new light it has thrown on Government's immediate economic policy. rary to the stubborn adherence to the Plan h seemed to be—perhaps mistakenly—the pub- ppreciation of the Finance Minister's speeches the Budget debate, the tone yesterday was to the point of suggesting that the Go- ment has gone the whole way to meet its s. Mr. Morarji Desai's opening address was del of sombre realism, different certainly in from the militant Government pronounce- s on the Plan. Now, at least, it is certain the foreign exchange crisis is upon us. Not certain is that the cutting back of many ns in the Plan will occur as a consequence of inability to meet the foreign exchange com- ment in this case. Mr. Desai said at one stage t if it was necessary to cut back capital goods s would also have to be done. The Govern- nt of India had, he said, no intention of creat- liabilities which it was unable punctually to charge.

Policy is thus no longer hesitant; it has ac- ired a fine edge and is going to work with a will. This clear statement of policy has done much to clear the air of growing uncertainty. There is no doubt that the foreign exchange crisis, notwithstanding the very drastic measures which are to be taken in the next half year, will last well into 1958. At the same time the Finance Minister has not been slow to gather to himself the control of rupee expenditure which was threatening in the hands of many irresponsible Ministries to go completely out of hand. Two circulars have recently been issued by the Ministry of Finance; one practically decrees cessation of new building, and another stringent priority in regard to current expenditure, which will be more heavily scrutinised by the Financial Advisers of the Ministries. This will give fresh heart to those who believed, sometimes hesitatingly, that the Ministry of Finance still had the power to stay the rot in terms of wasteful expenditure which the Ministries have incurred. There is almost no Ministry free from blame, and perhaps the mention of one or two would tend to be misleading. Nevertheless, in the Ministry of Education and the Social Welfare Board and in the Ministry of Information and Broadcasting one could point to great areas of economy, which needs now to be enforced by the Ministry of Finance since the

Ministries themselves have been incapable of realising the extent to which they were out of tune with the state of the Indian economy.

In the end the rupee outlay position this year is likely to be almost exactly what *The Eastern Economist* has advocated, namely a reduction of about Rs. 80 crores of outlay at the Centre and conceivably Rs. 70 crores in the States. If this is written into the current decisions (which in the last fortnight have shown the capacity for facing unpleasantness greater than in the previous twelve months) one can look on to an intensely difficult economic situation with much more satisfaction than before. At long last the Government of India has shown its basic resilience in economic affairs. It has actually, though unobtrusively, accepted the main basis of the criticism that has been levelled against its wasteful expenditure in the Budget debate. A wise Government accepts the criticisms of its friends even more than plaudits of the masses. The plaudits of the masses have recently been scarce. Perhaps that is one of the reasons why the Government of India is readier to accept the criticism of its friends. But one need not place upon their current action this uncharitable interpretation. The truth seems to be that the Government of India's socialism is subordinate to its healthy pragmatic cast of mind. That, at any rate, one must believe to be the interpretation to be placed on Mr. Morarji Desai's address at the Import Advisory Council and the recent circulars of the Ministry of Finance.

Mr. Morarji Desai issued a warning to the business community that the Government of India would deal severely with those who exploited the situation of shortages following the restriction of imports. It is unlikely that the Government of India has appreciated fully the limitations to which the business community is subject in decreeing restraint through the length and breadth of a country of this size and with millions of unorganised traders. It would be a miracle if decrees of established importers were in fact effective. It is wholly academic to expect the business community to run a system of price restraint, when the Government with all its armoury is unable to work a system of price control. Nor, indeed is this a risk which should be properly run. High prices mean not merely discomfort for the consumer; they involve, if higher profits accrue to non-rupee companies, an additional remittance of foreign exchange which we cannot at this moment afford. A minimum series of price ceilings must, therefore, be enforced by the Government and this should be enforced as soon as restrictions are introduced. There is no point in waiting to see how free markets work. Everyone knows they will work, to a greater or less extent, by equalising demand and supply at a significantly higher price. This method of working is not in the national interest at the present time.

One can look upon the present crisis when India truly has her back to the wall, and feel not merely calm but even exhilarated. The country was living beyond its means and was encouraging itself foolishly to think that the economic progress could be grandly designed on paper and then equally implemented by grandiose talk. All these foolish dreams have ended; now we see ourselves face to face with a crisis which calls for much harder work and far more austerity—greater, indeed, than in the hard days of 1951. This is not the time for recrimination or, indeed, for anger. The Government of India deserves, by the very fact that it takes the main responsibility for seeing us through the crisis, the support of every patriotic citizen of India. It is right that this co-operation should have been sought from the business community but it is not the business community alone that is involved. Much will depend on the character of want under pressure than on the dealer in search of profit. It is sincerely to be hoped that in this testing time we shall show ourselves greater in stature than in the last three or four years when things have been easy enough to corrupt the morale and to hinder dedication. We might lose in material terms by the pushing back of certain schemes in the Plan, but we will be more ready for the next stage in our journey with a clearer mind and a stouter heart. There will thus be a spiritual gain to set against our material losses. And of dedication it can be said that it is a commodity always in short supply; perhaps, that is why it is always beyond price.

Behind the Congress Scenes

AS usual the All-India Congress Committee has put its seal of approval on the Government's economic policies. This it has done after a deal of rank and file grumbling on the score of Budget proposals. The grumbling by itself has not amounted to much, for the fact remains that the Committee has after all approved unanimously the two official resolutions on the current economic situation and the contemplated food production drive. The rank and file discontent, however, has found its vent in an unsuccessful non-official resolution urging reduction of Ministers' salaries to Rs. 1,000 a month. That the resolution could muster 32 supporters out of 70 members present, has its own lesson which looks differently in two different contexts.

In one context it looks as though the Congress rank and file has within it the power to restrain or reverse the monolithic trends inside the Party. In this context it would only be a matter of time before the opposing section finds itself led by a determined section of the liberal intelligentsia. This may as well turn out to be a flight of the fancy, for in another context (familiar to close observers of the inner working of the Congress party machine) it looks as though the monolithic trends only get confirmed when periodically some sort of an opposition to the leadership is allowed to manifest itself in the manner of Her Majesty's Opposition. In this context discontented rank and file members are merely allowed to let off steam, which is deemed to be in their own interests. What usually happens in this context, again, is that the members who have been most vociferous in their 'opposition' to some of the policies of the leadership are the first to draw themselves closer to them (the leaders). In either context, however, the defeated non-official resolution cannot be invested with any very great significance, for the monolithic trends inside the Congress do not stem so much

from the political as from the economic factors which are largely extraneous to the organisation

If anything, greater significance attaches to the two key resolutions approved by the Committee. Basically this significance lies in the fact that the Congress leaders, as Government leaders, are too powerful to be seriously challenged on their policy planks from within the Party which, after all, is only a junior partner in the enterprise of ruling India. As a rubber-stamping machine it is hard to beat and one cannot, therefore, confidently look up to the Party for bringing about a reversal of unsound or unrealistic official policies. Currently the need for realism is underlined by what are turning out to be over-ambitious investment targets under the second Plan in relation to mobilisable reserves both in real and money terms. As facts and realities have a way of bringing round the intractable, they may be depended upon to do their silent work.

Already the Finance Minister who has made prestige of the size of the second Plan has come down to the extent of telling the latest session of the National Development Council that he would not stick to the revised public sector outlay of Rs. 5,200 crores, but only try to keep the original target of Rs. 4,800 crores intact. It may be recalled here that it was only at the previous session of the Council that the Prime Minister announced that the over-all investment target was being put up by Rs. 400 crores or Rs. 450 crores largely to provide for the increase in prices of capital goods and machinery. If, after all, the target of outlay is not to exceed Rs. 4,800 crores now, it only means that the size of the Plan has been cut back by a twelfth in real terms. If this is so, surely the Government has been protesting too much!

This is not the whole story, for there are indications that in-as-much as the 'core' of the Plan (in respect of coal, steel, transport and ancillary power) cannot be implemented fully in view of foreign exchange difficulties, the investment targets will get automatically reduced in actual practice. If, on the other hand, the 'core' of the Plan is pushed through by getting foreign exchange through a vigorous export drive (which, the Finance Minister thinks, will be facilitated by the expected restraints on domestic consumption following the additional excise levies) the rupee resources needed for that 'core' may only be just sufficient. In which case, projects and schemes outside the 'core' will automatically come in for pruning or for postponement. This way, again, the size of the Plan in relation to the Five-Year period will have been further cut down. This journal which, along with the Planners, was enthusiastic about the original size of the second Plan has done some re-thinking and abated its former enthusiasm to some degree. But men in power who were for a bigger Plan can hardly be expected to tone down their original enthusiasm all too suddenly. The obvious reasons for their slow stepping down are political and psychological, and this is understandable.

In a sense the meeting of the National Development Council, more or less synchronising with the A.-I.C.C. meeting, has greater significance for the simple reason that the Council is a high-level body which is more administrative than political in character. The State Chief Ministers on this body have been frankly told that if their respective Plans are not to be curtailed, they should raise further resources of their own. But the Centre has been told, in reply, that the States would not be in a position to raise more than Rs. 20 crores in all by additional taxation this year after the large tax efforts by the Centre. This means that there will be an inevitable shortfall in expenditure under the State Plans this year even as there was a shortfall to the tune of Rs. 45 crores in their first-year outlay. This year the shortfall is likely to be larger, for the Centre is determined not to exceed the figure of Rs. 275 crores for deficit financing. It may be noted that if the Centre is not to contribute to the State Plans by way of grants, loans and advances to the tune of around Rs. 275 crores, the need for deficit financing in respect of the Central projects would not be there.

In other words, deficit financing is largely intended for the State Plans. If the practical consequences of deficit financing should, by any chance, become alarming, its possible curtailment might involve a further pruning of the State Plans. As the States will be most reluctant to forgo the sales tax on food grains, their prices (which may continue to be higher to the extent of the tax) alongside of deficit financing would only keep the inflationary situation intact. Whether the sales tax on food grains is removed or deficit financing is curtailed the result would be the same as far as the States are concerned, and that is their money resources would be less to that extent and there would be inevitable shortfalls in their proposed outlays for the second year of the Plan. Thus, from the States' side also the second Plan will come to be pruned in actual practice. After all, realism may dawn on the State Governments also which, it may be recalled, went to the Planning Commission with their Draft Plans for a fantastic aggregate expenditure of about Rs. 11,000 crores. The Centre is now shifting the unpleasant task of pruning the State Plans to the States themselves. And the State Plans will be inevitably curtailed by reason of the fact that they have been forbidden additional foreign exchange for six months. To those who have argued that an uncurtailed plan would be impossible, this is satisfaction for what it is worth.

The Debate on Co-operative Farming

THE long-awaited report of the Patil delegation, which visited China last year, has at last seen the light of day. Thus, a further impetus has now been given to the current debate on co-operative farming, its suitability or otherwise for this country. In a way, the report has not come as a surprise. It was common knowledge even from the beginning that the delegation, with its predilection for the Chinese experiment, was bound to be 'conquered' and return truly impressed. This expectation has not been belied. What was a bit unexpected was the minute of dissent by two members of the team which, thanks to some journalistic enterprise, has become common property. It is good that this happened as this dissent note gave a clue to the general tenor of the report to come and also in a way prepared the ground for studying it in the proper perspective.

To be fair to the (majority of the) delegation, it must be conceded that in spite of its convictions about the merits of co-operative farming and its

feasibility in this country, it is not blind to the genuine fears, doubts and objections entertained on the other side. In fact, it goes to the farthest extent in discussing these frankly though how far it succeeds here is quite a different thing. Thus its zeal is tempered by realism and it does not fall into the trap of suggesting any general programme for acceptance by the country since it is conscious of the "danger of a divided leadership on an issue which involves a radical change in an age-old outlook on the part of a naturally conservative class as the farmers". This realistic and tolerant attitude is reflected in two of its recommendations. One is that it does not visualise any compulsion in bringing about the agrarian transformation on co-operative lines and hence the "principle of voluntariness should be scrupulously adhered to". Secondly, it is content for the time being with suggesting a "well-laid demonstration programme" leaving the future of co-operative farming on the success of such a programme. So, it lays down a modest target of about 10,000 co-operatives at the rate of one society for every group of 50 villages in the next four years. By this cautious approach, it indicates that it is aware of the enormity of the task in the transformation of an age-old practice and the numerous difficulties involved in bringing about a peaceful and smooth transition from family farming to co-operative farming.

The delegation pleads that there must be a positive view about the goodness or badness of the programme of agrarian co-operatives. If it is good, it says, it is the duty of the Government to sponsor it. If it is bad, it should be excluded. It is here that one finds a fallacy in reasoning. A thing may be good in theory with the various safeguards and qualifications governing it, but the trouble just arises when it is brought into the realm of practice. In a mass programme involving tens of thousands of human beings, the subtle distinctions that look so plausible in theory, for example, between voluntariness and coercion, wear thin. In a programme actively sponsored by the State, in the temptation to produce quick results, voluntariness may easily slide into coercion and once this trend finds its way, there are no means of checking it.

Even assuming that co-operative farming has many virtues and it is a panacea for all our agrarian problems (which is not quite the case as will be argued later) the fears expressed by the dissenting members cannot be dismissed lightly. Though these members would welcome the development of co-operative farming in places where farmers undertake farming operations in common "under *exceptionally* favourable and psychological conditions and where good leadership is available", they have no hesitation in considering that "it would be dangerous for Government to launch a programme of general co-operativisation, as launching of such a programme would ultimately mean use of coercion in one way or another." The majority of the delegation themselves do not deny the existence of mass violence in the Chinese land reform programme but in the co-operative movement, they somehow persuade themselves to believe that the elements of violence and fear are absent and there is only enthusiasm and activity. This seems contrary to facts as the different stages in the history of the formation of the Chinese co-operatives, as Vice-Premier Tang-tsu Hui himself has admitted, are based on "class struggle, first the landlords versus all peasants and then the rich peasants versus the poor peasants". To believe that this "complete proletarianism" of the peasantry, which is the basic tenet of the Marxist-Leninist thesis, could be brought about without the coercive element is to fly against facts. The theoretical freedom of the peasants to keep out of the co-operatives in this context is meaningless since it is impossible for them to function independently. It is quite unnecessary to labour the point further that collectivisation in China has been achieved through great stress and violence. To expect that such a programme can be adopted here without in the process giving room to the ideology governing it to make it a success will be nothing short of naivete.

The dissenting members have rightly contended the claim of the majority that co-operativisation of agricultural production will be the remedy for all our agrarian problems. "According to them (the majority)", the minority members point out "it would solve at once stroke the problem of small holdings, the problem of unemployment, the problem of poor technique, the problem of low productivity and income, the problem of diversification of agriculture, the problem of casteism and the problem of the landless." This certainly is a tall claim and is not borne by past experience of even the few co-operative farms in this country. The report of the Programme Evaluation organisation of the Planning Commission in regard to the working of these societies must be an eye-opener. As for the growth of co-operative endeavour in the community project areas, there is again the testimony of the latest report of the Programme Evaluation Organisation. It says "Except for a few project areas....., the movement is still largely official in initiative and support, and has not evoked that sense of identification and member responsibility without which there can be no real or lasting progress in the co-operative movement." If that were to be the position in regard to co-operative effort in general, what is the chance of generating enthusiasm for co-operative farming in the peasant when it will be known that he will be deprived of individual ownership of land ultimately?

If voluntariness is to be the basis of co-operative farming, one has to seriously consider whether the cultivators can be *persuaded* to give that high degree of co-operation that will be required to make a success of this experiment. Can it not be also that in the long run personal attachment to the soil will prove the most efficient way of using he land? The majority in the delegation have contended that co-operatives can raise production. The minority members have, however, shown how in China the increase in production is to be attributed more to the provision of technical advice, improved techniques, better seeds and so on rather than to co-operative farming as such. There is considerable substance in their view that since, in the system of family farming, the peasant benefits directly, favourable institutional arrangements to help the peasant through Government agencies will help considerably in augmenting production. Surely there seems to be enough area to extend the co-operative principle without denying the [illegible]t the incentives and pride of ownership of [illegible]and. It will be unfortunate if co-operative farming were made an ideological creed to make up for the failures in land reforms.

THE WEEK'S NOTES

RIOTING IN FORMOSA

THE ANTI-AMERICAN rioting in Formosa, following on the heals of similar riots in South Korea and Japan, is noteworthy for its explosiveness and virulence. According to the official version of the American State Department, the inside of the Embassy was "totally wrecked" and the building of the United States Information Service was "completely destroyed". All Embassy cars were either burnt down or were otherwise rendered unserviceable. How such a serious situation could develop so suddenly is not easy to understand unless one looks beyond the immediate cause which sparked the situation. After all, the mere acquittal of the American Master Sergeant Robert Reynolds could hardly have driven the people to such excesses. A single case of the failure of what must have looked to the Formosan mobs justice could not have possibly caused such an emotional disturbance as to lead the mobs to violence on such a scale. That basic provocation perhaps came from the extra-territorial rights enjoyed by the Americans in Formosa. What aroused the wrath of the Formosans was not therefore so much the manslaughter committed by an American serviceman as his immunity from the normal processes of Formosan law courts. It was, after all, not on the day Master Sergeant Reynolds committed the dastardly deed that the riots broke out; it was only when the American court martial acquitted him that the mass fury exploded into widespread attacks against American property and personnel. The extra-territorial rights seem to have been the prime source of trouble.

The subsequent developments in Formosa seem to confirm this impression. Chiang Kai-shek's countermeasures are of a nature and magnitude as to be unwarranted by a single unsavoury incident. The dismissal of as many as three high-ranking army commanders, arrest of 70 "ring-leaders" and the proclamation of Martial Law are actions too sweeping by any standards, assuming that the cause of the rioting was what it has been stated to have been.

Not only the extra-territorial rights enjoyed by the Americans are incompatible with national sovereignty but they are doubly obnoxious to the Chinese, thanks to their past history. The Western domination of China in the 19th century and in the first three decades of the present century was achieved through imposition of unequal treaties and the principle of extra-territoriality. The abhorence has become more pronounced due to the comparison that is provided by the defiant attitude of Red China and comparatively the abject behaviour of the Nationalist regime vis-a-vis America, a Western power. Herein lie the real cause and the future danger. If the feeling of domination, and consequent frustration gains ground in Formosa, as it threatens to do at the moment, a whole series of embarrassing problems may be created for the free world. Peking's siren song of "liquidation of American slavery in Formosa" may then lead many a Chinese on the island into a mood and behaviour that may easily undo what America has done to defend and help the island fortress of the Chinese Nationalists.

The Philippine soldier-diplomat, General Romulo is right in his diagnosis of the malaise in South Korea, Japan and Formosa. The riots in these countries, he asserts, were not an expression of anti-American sentiment but were due to violation of the national sovereignty of those countries. General Romulo's frank appraisal will perhaps help the United States to realize the need for greater delicacy and subtlety in its dealings with its Asian friends.

SOCIALISM WITHOUT MORALITY

THE WELL-KNOWN Communist novelist of America, Mr. Howard Fast, has resigned his membership of the Communist Party of the United States. In a recent issue of "Masses and Mainstream," the American Communist cultural magazine, he has explained why he has taken that step — "with distaste and soul-sickness." The document is worth pursuing. It is a scathing indictment of the Soviet Union at the hands of an intellectual who had lent decency and respectability to the callous creed of Communism. Mr. Fast's resignation is "a protest against the course of events in the Communist world" and against the Party which, "mostly through events beyond its control, is compromised to a point where it can no longer make any contribution to the continuing struggle for democracy and social justice". He had, like many others within the Communist Party, realized long before Mr. Khrushchev's "secret speech" appeared in the Press that "something was tragically wrong" in the world Communist movement. But he was not prepared for "the explosive and hellish revelations" contained therein. 'The dimensions of this horror were not only beyond anything we could have dreamed of — but also beyond, far beyond, the worst accusations of the worst enemies of the Soviet Union", he remarks.

On reading the "unspeakable document", Mr. Fast writes, he "felt a sense of unmitigated mental nausea" at the realization that he had "supported and defended this murderous bloodbath". He also felt that he had been a "victim of the most incredible swindle in modern times". He has described Mr. Khrushchev's explanation of these tragic happenings — the "cult of the individual" — as "not only empty, but almost facetious in the unrelatedness to the event it describes". Mr. Fast remarks that "the contrast of a socialist state claiming to be the highest type of social organization on earth, yet lacking the rudimentary legal rights and protections which both the United States and England grant their citizens is thought-provoking, to say the least". Thereafter, Mr. Fast sums up the Soviet system so succinctly that a longish quotation seems excusable: "In Russia, we have socialism without democracy. We have socialism without trial by jury, habeas corpus, or the right against self-incrimination, which is no more or less than protection against the abuse of confession by torture. We have socialism without civil liberty. We have socialism without public avenues to protest. We have socialism without any right of free artistic creation. In so many words, we have socialism without morality".

Mr. Fast also considers the post-Stalin era in which the world has been treated to a new kind of diplomacy — "diplomacy by insult and vulgarity". Anti-semitism has been "elevated" to foreign policy, and a new kind of socialism has been demonstrated in Hungary — "socialism by slaughter and terror". He asserts, however, that there exists within the Soviet Union, due to "the brutalized and dehumanized practice of power", an increasing contradiction between Communist leadership and the Soviet people. "It is the very lack of any operative channel for either free elections or free recall in the Soviet Union that has so far prevented the change of Government that the society is ready", he contends. Mr. Fast appeals, therefore, to both Communist and Socialists to combat "the cruelest and strangest development of history", if they want to end "the present agony of mankind".

NEPAL: WHAT NEXT?

IN NEPAL, India's next door neighbour, the political situation seems to have deteriorated once again. The

Nepali Congress Party has demanded the establishment of an elected sovereign Constituent Assembly before the year runs out and has threatened with "direct action" if its demand is not conceded. Mr. Tanka Prasad Acharya, the Nepali Prime Minister, has opposed this demand on the ground that such a constituent assembly might take into its head to dispense with the monarchy itself. He has, therefore, suggested that the King should himself give the country its draft constitution which should be discussed and approved by the constituent assembly.

Apparently though the suggestion seems to be anti-democratic, in the situation as it pertains these days in Nepal, it will be wrong to make a fetish of democracy and sovereignty of the people. Nepal lacks political cohesiveness, being riven by feuds of as many as 25 political parties. Of the half a dozen parties, which are really noteworthy, besides the Nepali Congress and the Praja Parishad, the Rana-led Gurkha Parishad and the Communist Party, are reckonable factors in Nepal's politics—the last two parties are, for different reasons, interested in disorder and instability. Only recently, the Nepal Government had to rush its army and police to restore peace and order in southern Nepal where Communist-led armed peasants had established a "Telangana". Moreover, Nepal lacks administrative machinery so essential to run a modern democratic State. The only person, who has been able to ensure cohesiveness to the country's politics and who, unlike most of the political leaders is modern and progressive in his outlook, is the King.

Thus, what is needed in Nepal today is progressive enlargement of the participation of the people in the Government of Nepal culminating ultimately in the establishment of a constitutional monarchy and full-fledged democratic institutions. Such an arrangement will among other things be a guarantee of continuity with the past, the virtue and value of which cannot be overemphasized in a backward country like Nepal.

INDIA AND THE BAGHDAD PACT

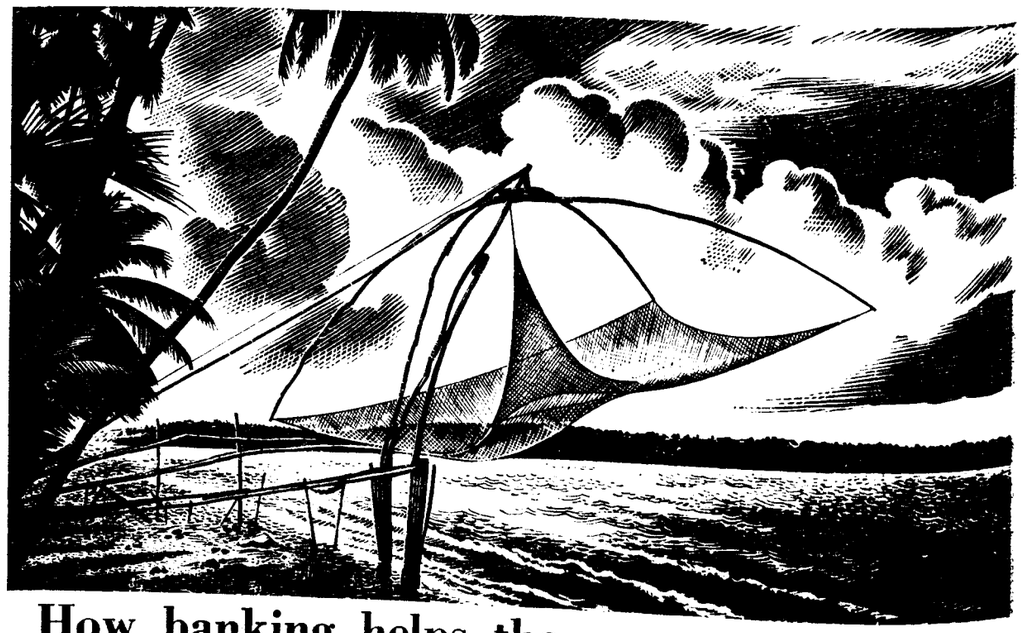
FROM THE public guarantee of territorial integrity of the Baghdad Pact powers to membership of the military committee of the five-nation Baghdad Pact was for America but a short step. This step was perhaps even inevitable as a part of its policy of increasing association with the Baghdad Pact, especially after the weakening of the Anglo-French influence in the Middle East and the spectacular growth of Russian influence there. This development is, however, bound to raise apprehensions in the minds of many Indians whose thinking is inevitably conditioned by what happens in or to Pakistan. The United States has, therefore, done well to declare publicly that its membership of the military committee and its participation in the planning of defence of the area will be limited to combating the Communist menace and that it carries no commitment in regard to any other matter. This is obviously intended to allay Indian fears.

It is, however, a pity that no serious attempt has apparently been made by America to help solve those problems which have been bedevilling the political situation in the Middle East. On this sub-continent, too, the same forces at work. It was, after all, the strained Israeli-Arab relations which opened the floodgates for Communist penetration and forced Egypt to buy arms from Russia and its satellites. In India this danger arises from the fear — real or imaginary — of the military strength of Pakistan. The delay in arm deliveries by the Western Powers, notably Britain, is already creating a predisposition to accepting Soviet intentions on face value and an arms offer, hitherto dangled about, may now be seriously made by Russia. It is an open secret that there are persons in important positions in India who will see herein an opportunity to push the country closer to the Soviet Union. Thus, in the absence of the solution of the problems which vitiate the political situation from the banks of Nile to those of Brahmputra, there is a danger that this policy of defence pacts to contain Communism may become self-defeating.

N.D.C., FOOD AND REFUGEES

ONE OF the problems that confronted the National Development Council at its session in New Delhi this week was to find ways and means for increasing agricultural production. Towards this end, it has suggested the fixation of minimum prices for food grains, though what they should be and whether they should be different for different regions has not finally been decided. It may look odd that the Council should have suggested the fixation of floor prices when what is more necessary is to fix a ceiling in the present phase of rising food grain prices. The idea seems to be to provide an incentive for the agriculturist to produce more which would help in easing the price situation. The contention that floor prices are required to provide incentives for greater production cannot hold water at this juncture because the prevailing prices which are fairly high are good enough incentives if any such are required. The Deputy Chairman of the Planning Commission has proposed to take steps for increasing production by three million tons each year. It would have been better if the public had been made aware what those steps would be.

Another problem that dominated the deliberations of the Council on the first day was the disturbing state of displaced persons from East Pakistan. Over a million of them are still awaiting rehabilitation. This is an enormous task, particularly because of the unending stream of refugees from East Pakistan, on the one hand, and their reluctance, in general, to move out of West Bengal, on the other. A high-powered committee, with the Union Home Minister as chairman, has been set up to tackle this problem. Large areas falling within the States of Madhya Pradesh, Orissa, and Andhra have been earmarked for the rehabilitation of these displaced persons and an autonomous body has been created for the achievement of this objective. The rehabilitation of about a million refugees can be successfully accomplished only if the refugees from East Pakistan agree to settle down in States other than West Bengal.



INDIA'S FOREIGN EXCHANGE NEEDS

IN A note on the country's economic situation, the Planning Commission has disclosed that foreign exchange to the extent of Rs. 600 crores more than what has been promised is necessary to meet the commitments under the second Five-Year Plan. The note reveals that foreign holdings of the Reserve Bank which were being depeleted at the rate of Rs. 5 crores to Rs. 6 crores a week in February, March and April, 1957, were going down at the rate of Rs. 9 crores a week in May. Steps had, however, been taken to arrest the fall and may have effect shortly.

The present level of India's foreign exchange reserves was Rs. 470 crores. The statutory minimum prescribed as currency reserve was Rs. 400 crores. Leaving a working balance of Rs. 40 crores, the reserves were negligible. The unutilised standby credit of Rs. 1.5 crores obtained from the International Monetary Fund, may, however, give a brief respite. The total draft on foreign holdings of the Reserve Bank during the 14 months ending May 1957, was Rs. 335 crores. A credit of Rs. 60.7 crores was obtained from the International Monetary Fund. The actual fall in the bank's holdings was thus Rs. 275 crores.

Prospects of bridging the foreign exchange gap are not held as very hopeful. On the other hand, the importance of cutting imports, stepping up exports, even at the cost of curtailing domestic supplies, and other remedial measures have been stressed.

How banking helps the
FISHING INDUSTRY

THE seas around India's 2,900 miles of coastline are rich in fish. In the South of India, particularly, fishing is an important industry. It supplies food and many valuable by-products, some of which are exported.

In South India alone, the fishing industry employs over 1½ lakhs of people, and its catches are worth about Rs. 3½ crores every year.

Banking has greatly helped the growth of the fishing industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the fishing industry.

We at Palai are proud that so many leading fishing firms, and indeed important firms in every field of business and industry in South India, employ the *complete* banking service we offer:

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans and Overdrafts — Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

RURAL INDUSTRY

By

ODYSSEUS

THE MORE THAT experience of nationalisation and direct executive action in commerce, industry, and agriculture accumulates, the clearer does it become that government executive action is not more efficient than Free Enterprise and in many cases less efficient, and in its social and psychological effects less desirable.

I agree that in this mid-twentieth century, it is the responsibility of governments to maintain (to the extent that it is within their power) the economic climate in which the national economy is to evolve. This is not the role of the industrial leaders of Free Enterprise because they have not the information at their disposal to see the national economy as a whole and because they might be biased in favour of their sectional interests.

Every government should have properly organised economic research services to provide data on which decisions of national policy can be taken. While we should not be deceived by the world-wide myth that bureaucrats are above all human prejudices, superbly impartial, blind to all save the national interest, we can concede that in certain circumstances their own bias may not clash with the national interest, and that in a democracy the voters have at least the periodical right to throw out ministries whose policies they have found wanting.

How can the bias of government departments be minimised so that their decisions coincide more closely with the national interest? Anyone who has ever worked in a responsible position in a government department knows that the civil servant's first pre-occupation must be to conserve and enlarge the importance and sphere of influence of his own department. All cases that come up for decision, which do not raise problems concerning the department itself, will be decided on merits as far as is humanly possible. Otherwise not.

The problem, then, is to find a system which will, by setting an automatic limit to the growth of a department's sphere of influence, minimise the departmental urge to condition decisions in such a way as to preserve departmental rights, and set civil servants free to judge cases on their merits.

Now, as long as Socialism is interpreted to mean executive implementation by government of policies, the continuous extension of the executive power of civil servants (as in the control of nationalised railways, mines, banks, engineering plants, and so on) will spread. Clearly the more that a state enlarges its entrepreneurial economic activities, the more diffuse must control over detail become, the more minutely must its administrative or industrial problems be solved according to fool-proof rules laid down in a code book from on high. I do not suggest that a wholly Socialist economy must grind itself to a halt, but that it must be slower, less efficient, conducted with less enterprise, elasticity, and resourcefulness.

The ideal would be a system in which the state, backed by economic research services formulates national policies but leaves executive implementation to industrialists, remembering that whereas losses are rarely even noticed by civil servants and merely passed on to the taxpayer, business men are expected to demonstrate efficiency by making profits, failing which they are liquidated — in the traditional and unsinister sense of the word — by going bankrupt. By removing executive duties from civil servants, you would automatically limit the potential sphere for departmental expansion and increase the margin for judging cases on their own merits. In other words, the ever continuing spread of government control over civilian life and enterprise would be halted.

CONCRETE EXAMPLES

From these generalisations let us descend to concrete examples, prompted by my recent investigations into the economy of Wales. In the inter-war years, 40 per cent of the workers of South Wales were employed in the coal mining, iron, steel and tinplate industries. When the depression came these industries were hit and South Wales became listless with a million despairing unemployed. Today, South Wales enjoys full employment. Only 25 per cent are in the traditional industries, while 29 per cent are now in others. The doctrinaire Socialist credits this to state action, and doctrinaire individualist to Free Enterprise. The truth is that both systems share the honours which neither could have achieved alone with equally satisfactory present results and future prospects.

The state it was which decided in 1934 that to insist that because sufficient work in the traditional industries of South Wales no longer existed, therefore all the workers must be made to migrate to other parts of the UK, would be nationally disastrous for two reasons:

(1) It would deal a death blow at the life of South Wales by disintegrating hundreds of communities, tens of thousands of families and dispersing them around the UK to spread anti-social feelings, and behaviour, arising from the sense of injury and victimisation which they would naturally feel.

(2) These hundreds of thousands of people would naturally drift to the great industrial conurbations — Greater London, Greater Manchester, Birmingham and the Black Country of the West Midlands, Leeds-Bradford, Merseyside and Tyneside, in which are huddled together in grime, 17 million people.

It was against this background that the problems of industrial location, and its corollary town-planning, began to be studied intensively in the U.K. As described here last week, the upshot was that the government took powers to prevent any factory from being expanded, or a new one built, without licence from the Board of Trade, which tried to direct industry towards those areas where unemployment existed. The Board did not act as a dictator. If it refused to sanction a firm's choice of site, the firm might decide, or threaten, not to build its factory at all. The Socialist, no less than the Conservative, governments of the UK have had the sense to realise that public controls should not be applied in such a way as to dampen or extinguish the individual initiative which is the foundation of all progress.

SOCIALISM AND FREE ENTERPRISE CO-OPERATE

In the event, three factors brought prosperity back to South Wales: (1) The government choice of its remote valleys as sites for war production factories, all of which have now been leased to private enterprise and converted to peace production; (2) the Distribution of Industry and other Acts, which strengthened the Board of Trade's powers of persuasion in relocating industry, giving it funds to build factories to be leased on advantageous terms. The Board has since 1945 spent Rs. 26,00,00,000 in building factories in South Wales. The foregoing two factors were undoubtedly responsible for reversing the trend, but if (3) Free Enterprise, had not followed in the official wake and poured its millions into investment in South Wales, the overall result would have been meagre. This is easily grasped when you consider that one company alone spent Rs. 15,60,00,000 (or more than half the Board of Trade's expenditure) in putting up a vast plant in South Wales, which today employs 5,000 men and women.

The requirements of factory location have changed since the 19th century when they were largely dictated by proximity to the coal fields as a source of power. In the UK, electricity and oil are now widely available and road transport, powered by economical diesel engines, renders the railway unnecessary, even for heavy products. All this sets firms free to choose unconcongested areas. For let it not be overlooked that although conurbations like Calcutta have certain advantages in economic concentration, the disadvantages (listed here last week) are enormous and have to be weighed before it can be decided that they can be ignored.

I am far from suggesting that the UK has solved all the problems of planning for the economically and socially most advantageous relocation of industry. These studies are in their embryonic stages. What still lacks in the UK is a ministry able (a) to advise an industrialist impartially on the relative merits of alternative regions and (b) responsible for considering the location of industry from the viewpoint of national rather than of regional prosperity. The Board of Trade's control over industrial location is decentralised among its regional offices and only cases involving outstanding national projects are referred to London. Moreover, the Board's attitude is affected by its natural anxiety to avoid unemployment in particular areas. But economic growth, indispensable to progress, must involve some shifts in the location of industry and while the one extreme is to uproot a million people because certain traditional industries have been hit, the other is to insist that people must be born, live, and die in the same community. The first leads to social disintegration; the second to stagnation.

A whole literature on industrial re-location and an association to promote it — Town and Country Planning, 28, King Street, London, WC 2 — has grown up in the UK. The broad object is to contract the conurbations and to ruralise industry without wrecking the countryside.

India is so vast that its conurbations seem negligible, until one recalls that UNESCO calculates that the ideal social and economic size for a city is 300,000, and that there are in India no fewer than 18 agglomerations above 300,000; Bombay, 3,000,000; Ahmedabad 800,000; Poona 500,000; Nagpur 450,000; Madras 1,500,000; Madurai 361,000; Amritsar 330,000; Kanpur 800,000; Lucknow 500,000; Agra 400,000; Banaras 360,000; Allahabad 335,000; Calcutta and Howrah 3,000,000; Hyderabad 1,100,000; Indore 320,000; Bangalore 800,000; and Delhi city and environs 1,250,000.

India's problem is the over-population and underemployment of the mofussil. This is the problem with which the UK is beginning to grapple; how to ruralise industry without urbanising the country. It is on this that the Five-Year Planners of Delhi and the Sarvodayans, Vinobaji and J. P. Narayan, should be getting together with those practical idealists, the Patels of the Vallabh Vidyanagar rural university in Gujerat, in order to digest what is being done in the UK and to prepare the way for a rurally industrialised India in which the economic climate is maintained by the state and the wealth created by the enterprise of individuals.

WORLDGRAM

AGRICULTURE

Development of Local Manurial Resources: For development of local manurial resources, three schemes had been prepared by the Government of India and forwarded to the State Governments for implementation during the year 1957-58. These schemes were for larger and better utilisation of local manurial resources for the production of manure in villages; production of compost manure in village Panchayats from the night soil; and popularisation of green manurial practices. State Government officers were also given training by the Compost and Sewage Development Officer of the Government of India for a fortnight in January-February, 1957.

*

Food Consumption: In a written reply to a question put by Shri V. P. Nayar, Shri A. P. Jain, Union Minister for Food and Agriculture, stated in the Lok Sabha recently that the estimated 'per capita' availability of food for consumption in terms of calories per day for 1955-56 amounted to 1,257 for cereals, 219 for pulses, 154 for sugar (gur), 78 for vegetable oils and 226 for other protective foods, such as milk and milk products, meat, eggs, fish, fruits, vegetables and nuts. The corresponding figures for calories 'per capita' per day for 1950-51 for these commodities were 1,118, 156, 141,71, and 202 respectively. The figures for vegetable oils and protective foods for 1955-56, it was indicated, were provisional.

*

Sone River Barrage Scheme: In reply to a question by Shri Kamal Singh and Dr. Ram Subhag Singh, the Minister of Irrigation and Power, Shri S. K. Patil, said in Lok Sabha that a project report on the Sone River Barrage scheme had been received from the Bihar Government.

The salient features of the scheme were:

(i) A new Barrage, combined with 24 ft. wide road bridge 4,752 ft. long, five miles upstream of the present Sone anicut;
(ii) New reaches of the left and right bank main canal with a capacity of 8,000 and 3,000 cusecs respectively;
(iii) High level canals from both the main canals to bring under command new areas;
(iv) Total area to be irrigated is 17.11 lakh acres;
(v) Power benefits to the extent of 13,775 kw. for 5 months and 6,570 kw. for 7 months; and
(vi) Estimated cost, excluding power portion and remodelling of existing distribution system is Rs. 13.09 crores.

Shri Patil added that the project report was under technical examination and no decision to undertake the work had yet been taken.

*

Allotment of Agricultural Land to D.P.s from West Pakistan: Shri Mehr Chand Khanna, Minister for Rehabilitation and Minority Affairs told Shri Valiulla in the Rajya Sabha recently that all evacuee agricultural land had not been allotted to the displaced persons. Shri Khanna added that up to January 31, 1957, 30,012 standard acres, 2,19,953 acres and groves worth Rs. 36.51 lakhs had been allotted to 17,310 non-Punjabi land claimants. He said that the total number of quasi-permanent allottees in the Punjab including PEPSU was estimated at 4,75,000. Up to March 31, 1957 'sanads' conferring permanent rights had been issued to 2,24,373 claimants. The area transferred permanently was 18,10,029 standard acres. The evacuee land which was still available was being allotted to the displaced persons who have verified claims for agricultural land.

INDUSTRY

Industrial Co-operative for Handlooms Centre's Loan to Madras: An Industrial Co-operative Society of handloom weavers is being set up at Manavasi, in Tiruchi district of Madras State, with the help of the Central Government. The Co-operative will have 77 members. Of these 60 will be male weavers each having a share of Rs. 50. The rest will be women each of whom will pay a nominal membership fee of one rupee only. The women members of the Co-operative will carry out winding and spooling operations. For executing the scheme the Union Government have sanctioned to the Madras Government an interest-free loan of Rs. 13,800 and a grant of Rs. 4,100. While the loan will be spent on contributing three-fourths of the share capital of the male members and for purchasing looms and accessories, the grant will be used for acquiring accessories for a dye-house and for paying the rent of the premises. The Co-operative will obtain its working capital, which is estimated at Rs. 20,000, as a loan from the Reserve Bank. This is the seventh industrial co-operative in the handloom industry to be set up with the assistance of the Central Government. The object of forming industrial co-operatives is to enable the producer to enjoy the fruits of his labour.

*

Draft Standard for Gold Alloys: The Indian Standards Institution has circulated for eliciting comments a draft specification for Indian standard gold alloys. The draft specifies the purity of five grades of gold alloys. The purity is expressed as a ratio between the weight of pure gold in the gold alloy to its total weight expressed in parts per thousand. The purity of the five standard grades has been specified as 970, 916, 750, 625 and 375. Comments on this draft may be sent before August 15, 1957, to the Indian Standards Institution, 19, University Road, Delhi-8, or its branch offices at Bombay and Calcutta.

*

Yarn Produced by Ambar Charkhas: Shri Nityanand Kanungo, Minister for Commerce stated in the Rajya Sabha recently that the quantity of yarn produced by Ambar charkhas up to May 1, 1957, was 1,052,522 lbs. Out of this a quantity of 474,909 lbs. was utilised for the manufacture of 1,899,635 sq. yards of cloth. He added that arrangements had already been made for weaving another quantity of 404,000 lbs. of yarn. The balance in stock on May 1, 1957, was 173,613 lbs.

*

Cotton Textile Industry for Ceylon: Plans are being developed for the establishment of large-scale textile factories in Ceylon, with an annual production capacity of 85 million yards of cotton textiles, the amount now imported each year. The plan is to establish within five years five spinning mills with 25,000 spindles each. Also, power loom and hand loom units will be established. At first, cotton will be imported from Egypt and other countries. Eventually, about 100,000 acres of land will be brought under cultivation to produce the required 30 million pounds of cotton.

*

Industrial Finance Corporation in South Africa: Dr. de Kock, Governor of the South African Reserve Bank, has announced that a new industrial finance corporation is being set up in South Africa, with the Reserve Bank taking a leading part in the project. Participation has been offered to commercial banks, insurance companies, mining houses, and other financial institutions. In a speech to the Association of Trust Companies in South Africa, Dr. de Kock said that the country's economy appeared to warrant a change of emphasis from restriction to encouragement of private initiative and

enterprise. At present, South Africa's internal and external economic situation would appear to be sound and more stable than it has been for some time but, after a period of exceptionally rapid development, there is as always the danger that the pendulum may swing too much in the other direction, if not checked in time. The change of emphasis in the Reserve Bank's attitude has taken place, not because a stimulus to private capital outlays is considered an immediate necessity, since the economy is still fully extended, but because it takes considerable time to plan new projects and complete preparations. The Governor drew attention to the fact that the Reserve Bank's gold and foreign exchange holdings had increased by £12.5 million between the end of April 1956 and April 1957, against a decrease of £15.5 million in the preceding 12 months. The improvement in the reserve position was not derived from any increase in the net inflow of foreign capital but from any increase in the net inflow of foreign capital but from a surplus on current account, notwithstanding a further relaxation of import control and a continued increase in imports. The surplus was achieved through increased production of gold and increased exports of uranium, wool, and other products.

TRADE

Trade Agreement Between Egypt And India: Shri Morarji Desai, Minister for Commerce and Industry said, in a written reply to a question by Shri Moulana M. Faruqi in the Rajya Sabha recently, that a trade agreement had been concluded between the Governments of India and Egypt recently. Describing the terms of agreement the minister said that in pursuance of the understanding reached, a special Rupee Account had been opened by the State Trading Corporation of India (Private) Limited to provide easy payment facilities to exporters and importers. The Special Account would be used for purchasing cotton and cement from Egypt and the sale proceeds would be used to promote the export of jute goods, tea, pepper, tobacco, electric fans, diesel engines, centrifugal pumps, dry batteries and other engineering, chemical and pharmaceutical products to Egypt.

*

Export of Scrap Metal: Replying to a question by Dr. Raghu Vira about the export of scrap metal, the Minister for Commerce, Shri Nityanand Kanungo, said in the Rajya Sabha recently that scrap metal was being collected in increasing quantities for the use of domestic industries, and the quantities and categories surplus to domestic requirements were allowed for export. The Minister said that it was not true that a number of persons engaged in collecting scrap metal had been rendered jobless and the machines engaged for pressing the metal for export had been rendered idle.

*

Import of Capital Goods on Deferred Payment: The Minister for Industry, Shri Manubhai Shah, said that the Government of India had so far approved arrangements by importers for deferred payment for the import of capital goods in 27 cases. The break-up of these cases according to industry was as follows: Sugar industry 16; chemicals and pharmaceuticals 4; cement 2; paper 2; textile 1; automobiles 1 and glass 1.

*

Export of Manganese Ore: The Minister for Commerce, Shri Nityanand Kanungo, said in the Rajya Sabha that there was no decline in the export of manganese ore during the period April to December 1956. He said the actual exports during this period were 10,44,460 tons as against 10,33,417 tons during the corresponding period of 1955.

FINANCE

Low-Income Group Housing Scheme Loans: Shri Anil K. Chanda, Deputy Minister for Works, Housing and Supply, laid the following statement on the Table of the Rajya Sabha recently in a written reply to a question by Shri Maheswar Naik on the loans sanctioned to the various State Governments up to the end of 1956-57 under the Low-Income Group Housing Scheme: Andhra Pradesh — Rs. 98.44 lakhs; Assam — Rs. 30.92 lakhs; Bihar — Rs. 35.00 lakhs; Bombay — Rs. 126.25 lakhs; Jammu and Kashmir — Rs. 24.50 lakhs; Kerala — Rs. 5.00 lakhs; Madhya Pradesh — Rs. 198.25 lakhs; Madras — Rs. 87.29 lakhs; Mysore — Rs. 104.00 lakhs; Orissa — Rs. 18.00 lakhs; Punjab Rs. 426.50 lakhs; Rajasthan — Rs. 97.40 lakhs; West Bengal — Rs. 58.80 lakhs; Uttar Pradesh — Rs. 310.00 lakhs; Delhi — Rs. 110.22 lakhs; Himachal Pradesh — Rs. 8.20 lakhs; Manipur — Rs. 0.70 lakhs; Pondicherry — Rs. 2.00 lakhs and Tripura — Rs. 1.25 lakhs. Total: Rs. 1,742.82 lakhs.

*

Financial Aid to Andhra: A total sum of Rs. 704.29 lakhs had been sanctioned by the Government of India as loan and grant to Andhra Pradesh for soil conservation and grow more food schemes during 1957-58 The loan for grow more food schemes amounted to Rs. 152.68 lakhs and grant Rs. 12.51 lakhs. In addition, a short-term loan of Rs. 531.50 lakhs was sanctioned for these schemes. For soil conservation schemes, the Government of India sanctioned Rs. 4.58 lakhs as loan and Rs. 3.02 lakhs as grant for the year 1957-58.

*

Exchange Control Between the Sudan and Egypt: The Sudanese Ministry of Finance and Economics has announced exchange control in respect of all transactions with Egypt, effective April 7. The transfer of money to Egypt, which previously had been permitted quite freely, will now be allowed only after permission has been obtained from the Ministry of Finance and Economics. Only money orders of up to LSd 10 may be sent through any post office without formality. Imports to and exports from Egypt will be subject to the same regulations that have previously existed in trade with other countries. The Egyptian Ministry of Finance has restricted imports into Egypt from the Sudan, and instructions have been issued to all Egyptian customs stations that consignments are not to be released except against licences.

*

Polish Exchange Rate: The Polish Press Agency has announced that the Polish zloty has been devalued by one-third in relation to the Soviet ruble, effective May 1. The new exchange rate is Zl 1.50 per ruble, whereas previously the zloty and the ruble had been at par. If this devaluation is in relation to the ruble alone, and applies only to certain service transactions, particularly tourism, it is comparable to the introduction, as of February 11, 1957, of a special exchange rate of Zl 24 per U.S. dollar, applicable to almost all current transactions, other than merchandise trade and connected services, with countries outside the Soviet bloc.

GENERAL

Coal Mines Provident Fund Scheme: The number of subscribers to the Coal Mines Provident Fund till the end of the financial year 1956-57 was 3.33 lakhs. The total accumulation in the fund was Rs. 8.74 crores, of which contributions of subscribers amounted to Rs. 4.13 crores. A sum of Rs. 44 lakhs had so far been distributed amongst subscribers since the introduction of the Provident Fund Scheme.

*

International Tea Agreement: In a written reply to a question by Shri M. Valiulla in the Rajya Sabha, Shri Morarji Desai, Minister for Commerce and Industry, said that difficulty was being experienced in the renewal of the International Tea Agreement. Asked to state the reasons for this, Shri Desai said that it had not been possible for the participating countries to agree on the manner in which the export of tea was to be regulated, should such regulation become necessary in the future.

NEWS IN BRIEF

INDIA

The Government of India has decided to canalise the exports of iron ore through the State Trading Corporation with effect from July 1 this year.

*

A ten-year scheme has been prepared and approved by the Government of India for survey and settlement operation for Tripura. The expenditure sanctioned for the year 1956-57 amounts to Rs. 3,59,840.

*

It is reported an agreement between the International Bank and the Government of India for a loan of 9.8 million dollars for the Tata Trombay Thermal Station Project has been signed.

*

The approximate gross earnings of Indian Railways during the month of March 1957, amounted to Rs. 31.01 crores. They showed a decrease of Rs. 2.44 crores as compared with actuals for March 1956. The approximate coaching earnings for the month amounted to Rs. 11.10 crores and goods earnings to Rs. 18.41 crores. Other earnings amounted to Rs. 1.50 crores.

*

With effect from April 1, 1957, the Ministry of Railways has taken over from the Ministry of Commerce and Industry the work relating to the procurement of the more important categories of steel requirements for the Indian railways.

*

A model co-operation societies bill and rules and by-laws for various types of co-operatives, such as credit, marketing; labour housing, small-scale industries and dairy, have been drafted by the Committee on Co-operative Laws, appointed by the Government of India.

*

The Indian Standards Institution has published an Indian Standard (IS: 886-1957) which relates to basic profile of screw threads as well as design or profiles of nuts and bolts with nominal major diameter 0.25 to 5.00 mm (0.01 to 0.1969 in).

*

Loans and subsidies totalling Rs. 47,91,189 were sanctioned by the Government of India during March, 1957, for the construction of 1,176 tenements under subsidised industrial housing scheme.

*

A sum of Rs. 4.75 lakhs was sanctioned last year for seven multi-purpose development blocks in the tribal areas of former Madhya Pradesh, Rs. 2.25 lakhs for two singular blocks in former Madhya Bharat and Rs. 87,000 for one block in former Vindhya Pradesh.

*

It has been decided to construct a marshalling yard at Tughlakabad, near Delhi, at an estimated cost of Rs. 1.03 crores.

*

In a written reply to Shri V. P. Nayar, in the Lok Sabha, recently, the Finance Minister Shri T. T. Krishnamachari stated that 20,308 private limited companies were at work in India as on March 31, 1957. The total paid-up capital of these companies was Rs. 334 crores.

*

In the first Plan a grant of Rs. 4,86,18,571 was sanctioned to the Punjab Government. Of this Rs. 24,26,968 was disbursed to non-government institutions selected under the scheme.

FOREIGN

Trans World Airlines' world famed Super-G Constellations will start linking India with Ceylon and the US, and other major international capitals of the world, effective June 4th, according to Jules C. Gindraux, TWA's District Sales Chief in India.

*

Kenya's exports increased in 1956 by over £3,000,000 or 13 per cent, while the estimated volume exported showed an increase of some 7 per cent over the previous year.

*

In the first four months of this year total exports of iron and steel from Britain were valued at £72.1 million over 23 per cent more than in the same period of 1956. The increases have been spread over a wide range of products, but the biggest advances have been in sheet and tinplate.

*

It is reported a special Committee appointed by the Japanese Ministry of Trade is working on a plan for establishing an Asian trade area which may take advantage of the Development Loan Fund proposed by President Eisenhower.

*

South Africa's total gold and foreign assets in the week ended May 17 totalled £125,431,000 compared with £24,317,000 a week earlier.

*

In the last year, minerals to the value of £34.8 million were exported from South-West Africa—an increase of £6.5 million compared with 1955.

*

New Zealand's overseas transactions for the 12 months ended April 30, showed a surplus of £4.6 million compared with a deficit of £12.9 million for the previous year.

*

The International Fund has approved an application by Israel for a loan of $3,750,000 for the strengthening of Israel's monetary reserves.

*

World exports of manufactures were $38,545 in 1956 or 14 per cent more than in 1955, according to provisional estimates published in the Board of Trade Journal.

*

It is reported private United States investment in Australia is now higher than in any other country except Britain and about six Latin American nations.

*

It is reported Australian exports would be a record £A1,000 million worth this financial year.

*

World population of some 2,700 million is rising by about 120,000 a day or 43 million a year, according to the UN Demographic Yearbook, just published.

*

In her first Five-Year Plan People's China had increased her steel production as fast as Britain did in the 23 years between 1880 and 1903. The output had been boosted from 1,350,000 tons in 1952 to almost 5,000,000 tons this year.

Announcing the opening of the

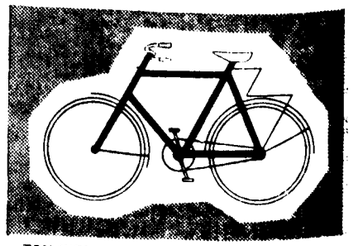
TUBE PRODUCTS OF INDIA LTD.

factory at Avadi, Madras

Production has begun of the world famous TRU-WEL Electric Resistance Welded steel tubes

Promoted as a joint venture between Messrs Murugappa and Sons, Madras, and Tube Investments Limited, Birmingham, U.K. (through their subsidiary, Tube Products Limited, Oldbury, Birmingham), Tube Products of India's factory marks an important milestone in the progressive industrialisation of our country.

Planned and developed as a specialised unit to produce ERW steel tubes, Tube Products of India Limited have commenced production of the world famous TRU-WEL Electric Resistance Welded steel tubes.

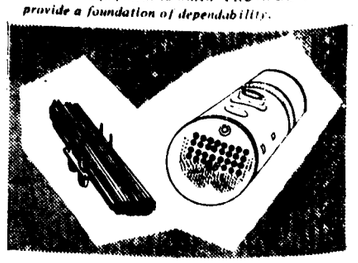


TRU-WEL—a familiar name: TRU-WEL is a familiar name in India. For nearly thirty years Tube Products Limited, Oldbury, our associates, have been the principal suppliers of ERW steel tubes to India. TRU-WEL tubes therefore, enjoy an established reputation for high quality and unrivalled service.

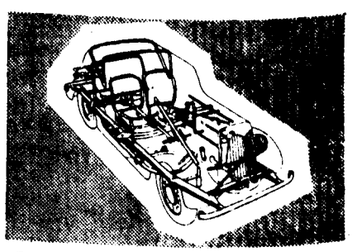
A versatile tube: TRU-WEL tubes combine great strength with exceptional lightness. By skilful manipulation TRU-WEL steel tubes can be made to serve a variety of our developing needs in the home and in industry. The bicycle industry is entirely dependent on it. Motor cars, locomotive boilers and transformers are some of the highly specialised industries which require ERW steel tubes in large quantities.

Tubular seat frames, handrails, struts, support and guard rails, which are in extensive use in body-building and interior furnishings in buses, trains and ships, are other familiar uses. Its use in home and office furniture is becoming increasingly popular.

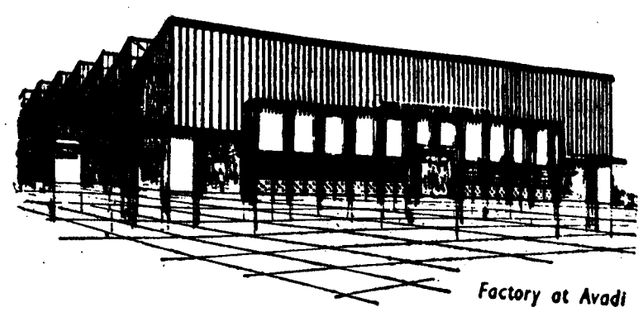
We are happy that Tube Products of India Ltd. will play a complementary role in Indian industry in that it will serve many of our existing engineering industries and also help to promote many more in the years to come.



Board of Directors: Sir A. Ramaswamy Mudaliar is the Chairman. The other directors include: Sir Ivan A. R. Stedeford, K.B.E., Chairman of Tube Investments Limited, Birmingham, Mr. A. M. M. Murugappa Chettiar, and Mr. A. M. M. Arunachalam, Partners, Murugappa & Sons, F. W. Martin, Managing Director, Tube Products Limited, Oldbury, Birmingham and Hon'ble Mr. G. R. Macdonald, Director of T. I. (Export) Limited.



TRU-WEL steel tubes have played a decisive part in the evolution of the slim, light and immensely strong cycle of today.



Cooling tubes for transformers - an example of electrical equipment to which TRU-WEL tubes provide a foundation of dependability.

Flawless accuracy and uniform finish make TRU-WEL tubes ideal for locomotive boilers

TRU-WEL tubes are as essential as tyres to the modern motor vehicle. Their applications range from small tubes for radiator overflow pipes to outsize tubes for rear axle casings.

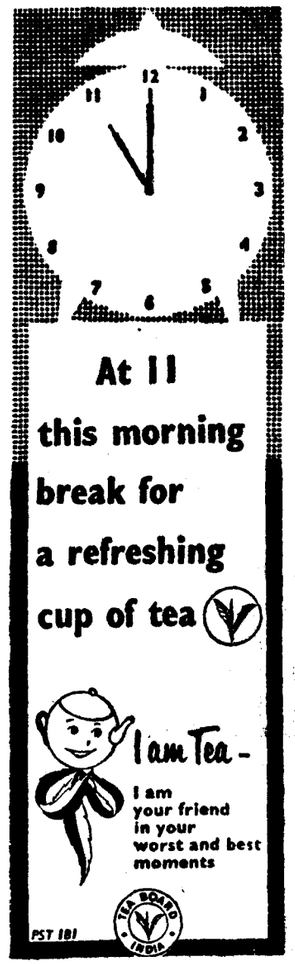
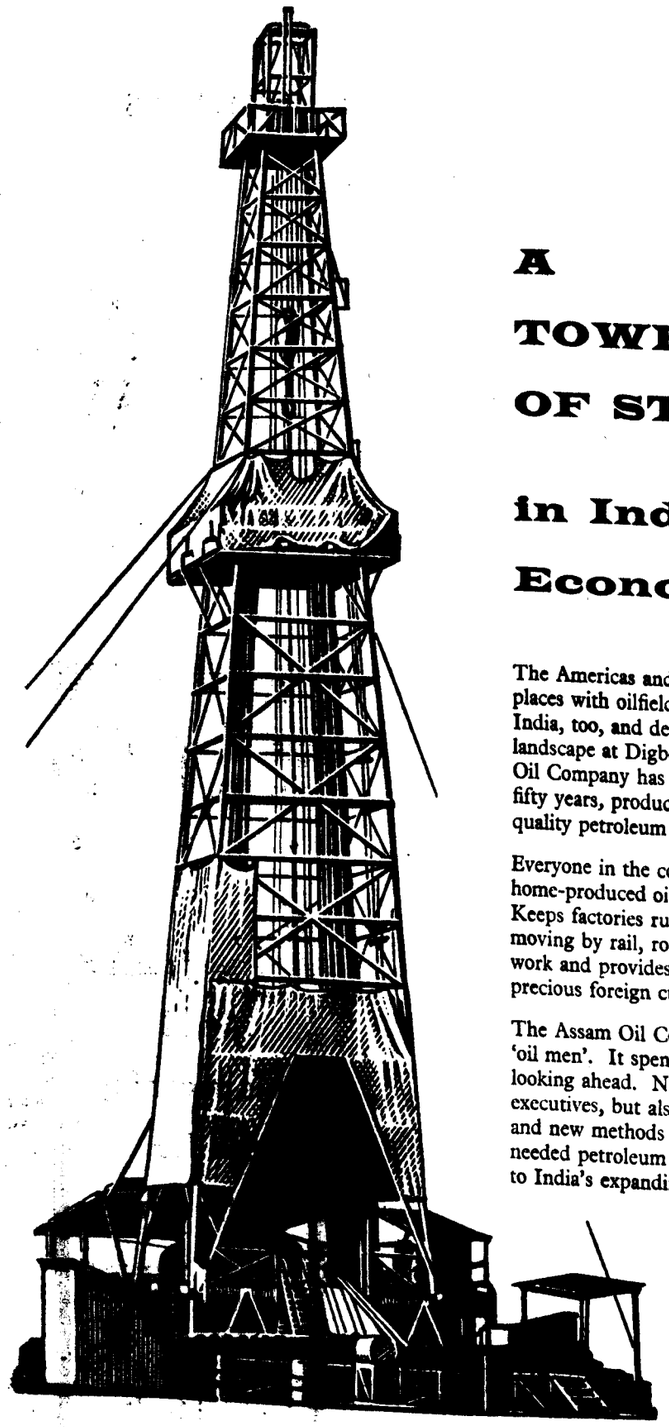
Economic Report from the U. S.

PORT DEVELOPMENT PROGRAMMES



(By GUY SIMS FITCH)



NEW YORK, May 28.—If last week's celebration of World Trade Week—an annual event in the United States—aroused little more than a ripple of excitement, it can be attributed to a simple fact. Expanding international trade has been accepted by the public as a normal accompaniment to the steady economic growth of the United States and other countries.

US trade with the rest of the world set new highs in 1955 and 1956 and may be on its way to another record in 1957. In fact, the value of goods imported into the United States in March, the latest period for which reliable figures are available, set a month high of $130 million. But this trade expansion has brought with it some new problems especially those affecting the nation's ports—its gateways to the world. Since the end of world war II, there has not been an American port that has not enjoyed an increased volume of overseas cargo. With world population and living standards on the rise, the outlook is that this volume will continue to grow. More and more, the nation's port cities are becoming aware of the challenge they face if they are to fulfil the role for which they have been cast. Involved primarily are the improvement of port facilitaties and the widening and deepening of channels. In the past 10 years, US port administrators have poured more than $630 million into new facilities and the rehabilitation of old ones. More than 70 ports, large and small, on every US coast including the great lakes, have participated in this expansion and modernization. Yet even with these vast expenditures, ports have barely kept pace with the rising requirements of international commerce. Despite the progress that has been made, facilities at a number of key ports are still not fully geared to the larger cargoes of today and tomorrow.

Expanding trade opportunities, moreover, are leading not only to more cargo, but also to larger merchant ships and these require deeper and wider port channels. Ocean-going giants already range up to 106,000 deadweight tons, and even bigger ones are in the planning or construction stage. Only a relatively small number of sea ports in the United States, such as New York and San Francisco, now are equipped to handle ships of this size. It is small wonder, then that US port cities are girding as never before to tackle a gigantic building job. To do this, many of them have been reorganizing the methods of administrating port facilities. The majority of US ports now function under some form of public authority. Each port has its own type of operation, of course, but most of these authorities are empowered to build facilities that are needed and to issue bonds to finance them. Ports are no longer being looked on simply as a gonglomeration of wharves and piers over which exports and imports move, but rather as integral parts of community and industrial development. More and more, public authorities are co-operating in community planning to make ports more efficient and more attractive links between sea and land transportation.

The US maritime board also has taken an active interest in port improvement. Recognizing that healthy harbors are indispensable to an enlarged flow of trade, the board has been helping them evaluate both their present and their future needs. As one board official has noted, "commerce and the ships that carry it have a common meeting ground; the terminals at which the ships dock and to which the shippers can bring their goods and in turn get their imports". It is this broad concept from which port development programmes now proceed.

A TOWER OF STRENGTH in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

B.O.C. A member of the British Group of Oil Companies

ASSAM OIL COMPANY

Special Articles

ESTIMATES OF NATIONAL INCOME: 1948-49—1955-56

THE latest White Paper on "Estimates of National Income: 1948-49 — 1955-56" released by the Central Statistical Organisation last week will be read with great interest for two reasons. In the first place, it sets out the national income figures for the last eight years in a concise form. The Indian economy in these figures moved at an average rate of 3.75 per cent per annum during 1952-53 — 1955-56 as against a hesitant rate of only 1.25 per cent per year during 1948-49 — 1951-52. In the second place, it gives revised estimates of national income for 1954-55. Great interest attaches to the estimates of this year in view of the heated controversy which C.S.O.'s preliminary estimates created last year. The preliminary estimates did some damage to the national interest because they suggested that in one year 1954-55 India had fallen back after its encouraging spurts in 1952-53 and 1953-54.

In a series of articles at the time "The Eastern Economist" called in question the preliminary estimates showing them to be under-estimates and needing revision. It is good that the National Income Unit in the C.S.O. has re-examined them and has rectified its mistake.

The history of economic growth in India during the last eight years as shown in Table I below may be divided into two parts of four years each The first period starting with 1948-49 and ending with 1951-52 may be described as static one which showed a total rise of nearly 5 per cent in national income or a rise of about 1.5 per cent per annum. In per capita terms, therefore, the growth was negligible. The economy took a turn in 1952-53 and during the second period ending in 1955-56, the national income rose by 15 per cent in four years, recording a rise of 3.75 per cent per annum. The rate of growth, in per capita terms, during this period was 2 per cent per annum. It was this impulse in the economy which encouraged the planners to have a target of 5 per cent per year (3.6 per cent in per capita value) in the second Plan.

It will also be seen from this table that the total net output at 1948-49 prices rose by 2.8 per cent in 1954-55 over 1953-54 and not by 1.5 per cent only as shown in the preliminary estimates. "The Eastern Economist" needs to draw the attention of the C.S.O. to a new paradox created by the revised estimates. Table II on the next page compares the preliminary and final estimates of C.S.O. for 1953-54 and 1954-55. It shows that final estimates on constant prices have been under-estimates for both these years while those at current prices have been over-estimates. This needs explanation. The upward revision of preliminary estimates on constant prices shows that the physical output of goods and services is higher in the final estimates. One may wonder why the final estimates at current prices, instead of at best rising at a lower rate, should decline. This is a matter which needs some close scrutiny.

Agricultural production in the years 1953-54, 1954-55 and 1955-56 has almost been the same with marginal differences from year to year. This is clear from Table III on the next page which shows the net national output at 1948-49 prices. In current prices, however, there has been a significant fall in 1954-55 and 1955-56. As against total agricultural income of Rs. 5,200 crores at current prices in 1953-54, the income accruing from agriculture in 1954-55 fell to Rs. 4,230 crores and in 1955-56 to Rs. 4,100 crores. This fall of about Rs. 1,100 crores in the agricultural sector in the last two years shows the magnitude of the swing which the terms of trade took against the agriculturist. The year 1956-57, however, will tell a different story. It is known that the prices in the last year in the agricultural sector have shown a steady upward trend and the terms of trade have once again moved in favour of the agriculturist, at the expense of the non-agriculturist population.

A close examination of the sectors, especially Commerce, Transport and Communications and other services shows that the figures are nothing more than broad estimates. These sectors form the weakest link in national income computations. More fundamental research needs to be done in these sectors in order to make them reliable and useful.

ENERGY, INDIA AND OIL—I

(CONTRIBUTED)

THERE is a growing sense of realisation that for a country such as India, in the process of dynamic development, one of the key basic commodities which requires close and anxious examination of availability is the supply of Energy. Furthermore it is a commodity which has never been treated effectively in the past as an entity but always separated into its component sources without planned study of the substitutability between the components, and the economics of the most suitable source for the anticipated use.

The components of the energy pattern are well known; the main commercial sources of supply are coal, oil and the power of falling water; part of the output of these various sources is routed to the consumer in varying proportions through the medium of electricity. The non-commercial sources of supply lie in the winds, the tides and solar radiation and, in India by far the greatest source of supply of all, the burning of agricultural and animal wastes.

Of all these forms of energy supply it is apparent that there is only one which moves internationally on a very large scale to fill the vacuum of demand for energy in scores of countries across the earth, and that is oil. It will be self-evident that the ability to meet this demand has not taken place solely by chance, and that the art of forecasting has to be developed most effectively to track demand far ahead for the facilities to be in a position in time to avoid a series of crises and extempore measures.

The world is now at a very interesting stage in economic development. World progress in the last 10 years has been extremely impressive. Exclusive of the Soviet sphere, industrial production has been increasing at an average of about 5 per cent per annum and there would seem to be reasonable hope that future increases will be sustained at a rate approaching this figure.

Of the three basic essentials for industrial advance —material resources, education and capital—it would appear that in general the latter is the principal bottleneck at the present time, though it is arguable that for India at this moment shortage of managerial and technical ability may be running it a very close second. Though the highly industrialised countries have the greatest ability to produce capital they also have a correspondingly large appetite for it, and it is interesting to note that capital formation in Europe has been going at a percentage rate rather higher than before the war. Broadly speaking, the major European countries are investing in capital a proportion of their gross national product which is approaching 20 per cent.

The sums that are becoming available for risk ventures are larger than may be generally thought. A striking example of this is afforded by the amount of money being expended on the building of tankers. The tonnage of tankers now building or planned amounts to a total of no less than 38 million deadweight tons. This compares with the tonnage of the world tanker fleet now afloat of about 45 million deadweight tons. These additions to the world fleets range from medium to the new very large super-tanker and the capital investment required may be of the order of Rs. 3,800 crores. The Oil Companies themselves are only able to provide a small part of this investment and virtually all the remainder is coming from the risk capital markets.

There can be no progress in world development without an abundance of cheap energy and it is anticipated, on a conservative estimate, that the world energy requirements will increase at a rate of about 3½ per cent per annum. World coal production, providing now about 40 per cent of world energy supplies, is hardly more than stationary. Water power is increasing but it is unlikely to advance materially from its present contribution of 3 to 4 per cent of the total. It is important in the long run that atomic energy should be progressed to the maximum economic extent, but it must be remembered that the capital cost of nuclear plant is very heavy in relation to its probable operating expenses. Europe is beginning to move fast in the setting up of nuclear power plants, and many countries are awaiting the practical experience of prototype plants before placing their orders for plants of more advanced design. In the East, India is well advanced in making provision for her atomic future and it is fortunate that atomic minerals are evidently available here in large quantities; but in general even if the most rapid progress is made in the provision of nuclear plants it is unlikely that they will be able to provide more than 5 per cent at most of world energy supplies by 1980.

It is therefore going to be Oil, and only Oil, that will meet the greater part of the world's added energy requirements in the foreseeable future.

Last year the consumption of oil for the world exclusive of the USA and the Soviet sphere, increased by 12½ per cent. This year it seems likely to increase by about 9 or 10 per cent. Leaving the USA apart, it looks as though world oil consumption will have to be at about double the present rate between 1965 and 1970 if the improving trend of living standards is to be maintained. In addition to consumption doubling within this relatively short time, there will be the need to satisfy the increased import requirements of the United States.

To illustrate what this means, the production of oil in the Persian Gulf area, now 160 million tons a year, will have to be doubled some time before 1965. This matter is of some significance to India as it means that there will be a very marked accretion of income to the main producing countries in that area with the probability in sight of a rapidly increasing export market developing for Indian made consumer goods and eventually, capital goods exports.

The problem of the expansion of the demand for energy and the economics of the various sectors of supply, if of great significance on a world scale, are now of vital importance to the planned expansion of the Indian economy. There is one consistent fact that has emerged out of recent history and that is the general tendency to underestimate the forces at work, particularly in the context of the demand for power.

In a highly developed industrial economy it is now proving practical to establish correlations between the projected increases in realisable industrial expansion and also that of the Gross National Product, to yield a projection in the demand for energy.

Inside the total increases of energy the contribution from the sources available—coal, oil, water and the atom—can be established within limits to develop a plan on which the problem can be attacked. This is an exercise which has recently been carried out in detail by the O.E.E.C. for Europe.

In India it is apparent that a study of this nature is urgently required and though it will inevitably be complex the urgency may well be considered to be very great. The complexity arises firstly from the fact

that the demand for commercial energy is rising from a very low base, particularly when considered per capita, and in a situation where the ground is rapidly shifting as entirely new sectors of industrial expansion are developing with different speeds and intensities. The second, and probably greatest element of complexity, arises from the fact that by far the greatest amount of energy consumed in the country is non-industrial and historically has been satisfied by the domestic burning of wood and farm and animal wastes. Even superficial study shows that this is now becoming a situation of great potential difficulty. The burning of farm and animal wastes has an important side effect in the devitalising effect on the land, with correspondingly low crop yields, but it is evident that as the population and prosperity continues to rise demand may rapidly outstrip availability. The availability of these supplies is largely unrelated to increases of population or purchasing power, particularly the animal wastes, and the timber resources are of slow regenerative strength; therefore it is possible that a stage in time is reached when availability moves from surplus to a balance.

From balance the situation would move to an inability to regenerate supplies fast enough and in such a situation, which may well have been reached in India, the gap between demand and supply would widen with increasing rapidity.

It has now become virtually axiomatic in current thought that one of the key bottlenecks that may develop in the 2nd Plan is that of transport, but it must be realised that transport itself depends absolutely on the supply of energy whether in the form of coal, oil or electricity. It is indeed arguable that the most anxious examination should be directed towards the supply of power without which all else fails. It is therefore of great importance that the availability of energy is not squandered.

In this stage of India's development it has been said that the big projects with a long period of gestation must be accompanied by an amount of quick yielding investment, otherwise the process of development will stall. The key to quick yielding investment is the rapid utilisation of power in manufacture or agriculture and it is here that doubts may well arise as to the foresight that has gone into the projected pattern of utilisation of the electric power available from the big projects. History is emphatic in recording that there is a general tendency to underestimate the rate of demand for electric power in an area previously ineffectively supplied. Once the hard won electric power is diverted to transportation on the railways or the more sophisticated manufacturing processes which require unusually high power consumption, then there is no retracing the steps taken, and if the quick yielding industries go short there is no alternative but to adopt expensive emergency additional generating capacity or fail in the objectives.

Parallel with a study of the growth of demand for energy, and measurement of the potential availability, it is evident from what has been said that considerable thought should be given to the substitutability of various sources of energy one with another. It is indeed arguable that it is not enough to consider one big consuming industry and a particular source of supply of energy in isolation, but real study is required first of the economics of substitutability of this energy from other sources to yield the most prosperous economic solution over the widest area.

The Business World

YUGOSLAVIA'S FOREIGN TRADE

ACCORDING to the preliminary data at present available, 1956 was a record year in Yugoslavia's foreign trade. On the whole the general industrial production index, compared with 1955, increased by 10 per cent, the goods exports index rose by 25 per cent and imports by only 7 per cent. In absolute figures the two-way trade amounted to 238,193 billion dinars or $793,976,000 (at the official rate of exchange of 300 dinars to $1). This amount consisted of 96,439 billion dinars worth of exports and 141,754 billion dinars worth of imports, while the actual adverse balance was reduced to only 13,268 billion dinars (last year—21,112) due to the tripartite economic aid which in 1956 amounted to 32,047 billion dinars. In addition to the considerable increase in production, the favourable development of exports was influenced by the consolidation of the home market, improved quality and particularly by the larger range of export goods which included new articles of the Yugoslav processing industry.

In addition, the exports of agricultural produce, particularly those of livestock breeding and grain farming, were increased. The new trade agreements, signed at the beginning of 1956 with some Asian countries, established the basis for the expansion of trade with new areas in addition to the intensification of goods traffic with our most important trade partner—the European countries. On the whole the pattern of trade shows no substantial changes as compared with that of 1955. Thus, in the overall increase of exports, industry and agriculture participated equally, namely, the industrial products exports increased from 50,692 to 60,171 billion dinars, and those of agricultural produce from 26,284 to 36,268 billion dinars; in percentages the ratio of industry to agriculture was 62.4 to 37.6.

The following figures show the dynamics of exports and imports by production branches in 1955 and 1956. With the exception of the timber industry and non-ferrous metals, all branches show a greater or a smaller increase of exports. The substantial increase of the exports in iron and steel industry products from 1,333 to 6,087 billion dinars deserves most attention. In the electrical industry exports were trebled, mainly due to the large increase in exports of cables, electric motors, etc. The exports of coal and crude oil derivatives were doubled: the most important items, in addition to the traditional but limited exports of coal to Austria and Italy, were gas oil and fuel oil together with bitumen. Exports of textile fabrics were more than doubled with about 40 million metres, exports of footwear were doubled while exports of raw skins were reduced as they are now processed in the country. There was a further increase in tobacco exports with a record figure of about 20,000 tons in the value of 6,217 million dinars as compared with 5,103 in 1955.

As compared with 1955, total imports in 1956 were increased by 9,466 billion dinars and rose from 132,288 to 141,754 billion dinars. If one considers the pattern of the imports it will be found that the entire difference was made up of increased imports of wheat, as imports in this branch rose from 25,285 to 34,331 billion dinars.

In regard to the area pattern of the Yugoslav foreign trade in 1956, the general characteristic of this period is a considerable extension of the circle of countries with which trade was maintained viz., about 75 countries in exports and 60 countries in imports. In conformity with the existing tradition and the geographic position this year, again Europe constituted Yugoslavia's most important foreign trade partner. Its participation was 78.9 per cent in the aggregate exports and 61.2 per cent in the imports or in value 76,088 and 88,761 billion dinars respectively. The further normalisation and intensification of trade relations with East European countries, with which trade was carried on within a mutually satisfactory pattern, contributed to a further affirmation of these countries. At the same time exports to Western Europe grew on parallel lines, the trade with the entire EPU area having been brought into a balance which caused a slight decrease of imports, as compared with 1955. The increase of imports from over and above exports to East European countries comprises the import of goods under the investment credit arrangements concluded with some countries. The participation of Western Europe in exports and imports in percentages amounted to 56.2 and 39 per cent respectively, and of Eastern Europe to 22.7 and 22.2 per cent respectively.

Exports to North America remained practically at the same level. The steady expansion of the number of articles in the Yugoslav exports asserting themselves on this important market in the face of a keen competition of other countries is growing steadily so that it is fully justified to optimistically view further developments. In imports, in view of the economic aid granted, USA continues to be the leading country with their supply of food, raw materials and other goods. Trade development with Asian countries turned out to be very favourable, particularly with the Far East where 1955 exports amounted to only 282, and in 1956 to 3,279 million dinars or, by countries, China 1,333, India 1,069 and Burma 485 million dinars. In 1957 a further increase is expected with these countries whose development programmes and market absorption power, as well as the favourable reception of Yugoslav consignment in the past, ensure further sales. Increased trade is also expected in the case of Indonesia, as well as with the Near East countries and particularly with Egypt with whom trade relations have been considerably augmented. In South America trade has suffered a considerable setback as various countries have adopted a new policy of a multilateral payments system for goods and due to the expiration of the existing trade agreements and the need of regulating the relations by new instruments. It is hoped, however, that before long a satisfactory basis will be found for strengthening trade with these countries which are traditional partners and suppliers of Yugoslavia with their products and buyers of Yugoslav goods.

RE-THINKING ON NATIONALISATION IN U.K.

By

CROESUS

EVIDENTLY nationalisation is losing its charm even to its most ardent advocates in the U.K. The pragmatic Britisher, even if he be a Labourite, has found that instead of being the sovereign remedy, nationalisation could operate not only to the disadvantage of workers but of the nation as well. It is this latter consideration that prompted Sir Hartley Shawcross, Attorney-General in the last Labour Government, openly to denounce nationalisation, especially of industries which have been doing well. "Leave such industries alone for the nation's prosperity" has become the slogan of this veteran Parliamentarian.

Hardly have a few weeks passed since the above statement was made, when yet another top-ranking Labour leader — this time Mr. Richard Stokes, a Minister of Works and Lord Privy Seal in the Attlee Government—has come out to tell his supporters that "it would be silly to nationalise anything for purely doctrinaire reasons". If Sir Hartley made particular mention of the I.C.I. and the Uniliver for his 'hands off' signal, Mr. Stokes had in mind not only the I.C.I. but also the cement and the engineering industries. This reference to engineering industries as not being suited for nationalisation must have been the severest blow to the doctrinaire elements in the Labour Party, especially as this happens to be slated as one of the industries scheduled for rapid nationalisation after the Party comes into power again. But it now looks that, save for a few rabid left-wingers, whose counterparts are not lacking in our own country, socialist opinion in Great Britain will be generally opposed to any further experiments in nationalisation.

It is worthwhile examining why eminent labourites like Sir Hartley and Mr. Stokes have become such staunch opponents of further nationalisation. They are men of such integrity that no one dares to impute motives to them for this seeming "somersault" in their views, or to suggest that they have been corrupted by the rightists in the U.K. But let the reasons given by Sir Hartley and Mr. Stokes speak for them. According to the former, it would be best for the State to leave these industries which have been really faring well severely alone. To nationalise these would lead the country to disaster, he is reported to have declared. Sir Hartley is also concerned that industries in Britain are not progressing as well as they ought to. Although he did not say in as many words that fear of nationalisation was probably one of the main reasons, there can be no gainsaying that he meant it. The other reasons that he listed for the halting progress of industries in his country — although these may not be strictly germane to a discussion on nationalisation of industries — are also noteworthy, and these include taxation policy which is not helpful to investment and modernisation, inefficiency of managements which are indifferent to the needs of competitive production, and lack of interest in their own industry on the part of workers engaged in a given industry. If there is reason to complain of these shortcomings in a country like the U.K. where the workers are reputed to be remarkably conscientious and also duty-conscious, one can unhesitatingly state that these reasons are to be found in Indian industries in an even more glaring or pronounced form.

In this context, what Sir Hartley said about the workers and trade unions in the U.K. applies to workers and trade unions in our country also with equal, if not greater, force. As he observed, it is only natural that the workers and their trade unions should be mainly concerned about their own welfare, but then don't they also owe a duty to their country as nationals of the country? Sir Hartley, it is noteworthy, did not stress this aspect; on the other hand, the shrewd observer of human nature that he is, he put it in a way that could not have failed to go home straight. It is essential, he said, that the workers should realise that their welfare depends upon the welfare of the industry in which they are engaged. He might have added "on the welfare of their country", for, if the health of their country is not all right, how can they themselves be happy?

To turn now to Mr. Stokes's views. These were even more specific than those of Sir Hartley, and Mr. Stokes even went so far as to tell his friends that, if the workers wanted to set things right in any existing industry, the best solution would be for their Government to start a fresh unit of that industry and run it on lines on which they would like the existing units in the private sector to do. Obviously, like Gandhiji, Mr. Stokes is a greater believer in practice than in precept. The reasons he gave for not nationalising the I.C.I. were at once realistic and sound. He categorically stated that it was not practicable to think of nationalising the I.C.I. because their present arrangements with other chemical concerns were so involved. Mr. Stokes is one of those who rightly holds that a mere transfer of ownership of big firms to the State would in itself achieve nothing. To him, even the question of ownership does not matter, provided the Government can control these big firms as was being done during the War.

The reason that Mr. Stokes gave for not wanting to nationalise engineering industries, a pet plank in the Labour platform, was equally realistic. Realising what a great contribution these industries are making to the country's export trade, Mr. Stokes had the courage of his conviction to admit that the engineering industry was particularly active in the export field and that it would be impossible to conduct its affairs successfully if it were ever nationalised.

Anyone would have thought that the powers-that-be in our country would have the wisdom to benefit from this experience of another member, and that a senior member, of the Commonwealth. But, far from doing so, it seems, those at the helm of affairs here would want to go through the experience all over again before becoming disillusioned and retracing their steps. In their new-found enthusiasm for nationalisation, our administrators are out to nationalise not only industries but even trade, conveniently forgetting the clear warning of even the Father of the Nation against the State turning out to be a trader. Apparently they don't believe that seeing is believing, unless it be that they refuse to see. If it pleases them individually to undergo the travail, they are free to do so, provided the sphere of their experiments do not go beyond the confines of their own lives, but they should not forget that, in persisting in the way in which they have been doing to go through the ordeal themselves and thereby landing their country and countrymen also in difficult waters, they are taking a far greater risk than they really need to.

BUSINESS NOTES

THE THIN END OF THE WEDGE?

THE ANNOUNCEMENT last week that the State Trading corporation has been entrusted with the entire export trade of iron ore from July 1 next has come as a veritable bolt from the blue. Sometimes facts can be stranger than fiction and nothing in the contemporary economic scene illustrates this adage better than the history of the State Trading Corporation. The Corporation was set up last year with the ostentatious object of developing trade with Communist countries, since it was felt that a Government agency will be more successful in pushing through barter deals with the totalitarian countries and arranging for imports on Government account. Several sections of the mercantile community were even then apprehensive of this new development. This was deemed quite unnecessary and with justification because a country like the United Kingdom, which carries on a large trade with the Communist countries both of Europe and Asia, is able to develop her trade without the aid of any Government agency. But Government's solemn assurances that they had no intention of ousting private trade out of business to some extent mollified opposition.

But subsequent developments have confirmed the worst fears of the business community when the Corporation entered fields of trade other than those of dealing with the Communist countries. First began the State trading in iron ore and manganese ore and apart from the Communist countries, the S.T.C. extended its operations to non-Communist countries which are the traditional markets like the U.S.A., England and France, thus ousting exporters from the trade. Perhaps whetted by the profits made the S.T.C. began to make incursions in the domestic field also and thus took over the entire business of distribution of cement. Now comes the attempt to monopolise the export of iron ore. Soon it is possible that the list might expand and Government might find some plausible excuse or other every time to justify its action.

To revert to the question of iron ore export, it is the contention of the Government that the S.T.C has certain advantages over the small miners and shippers in respect of the completion of contracts and it would enable better utilisation of transport facilities. No doubt there has been an increase in the export of iron ore and the Corporation has already been able to conclude contracts for 2.1 million tons of iron ore and hopes to step up exports to 2.5 million tons in 1957-58. But is the success of the Corporation not mainly due to the fact that it has been able to get over the transport bottleneck because of the support given by the Government? By the same token, can it not legitimately be asked that if similar facilities were given to private trade, it would have fared equally well? The spreading of the tentacles by the S.T.C. raises two fundamental issues. Is the Government justified in denying private trade its legitimate share contrary to its earlier solemn assurances? Secondly, what is no less important, is the S.T.C. in such an exceptionally sound position from the point of view of organisation to do full justice to the ambitious tasks it has undertaken? An answer must be found for both, sooner or later. Of course, the sooner the better.

EXPORT PROMOTION

ANOTHER IMPORTANT organisation of the business community—the Indian Merchants' Chamber, Bombay, (IMC)—has made a few notable suggestions to augment the much-needed foreign exchange of the country in a memorandum submitted by it to the Export Promotion Committee. While conceding the necessity of the country availing itself of all possible sources of external finance to meet the foreign exchange requirements of the second Plan, the IMC says that, in the ultimate analysis, the problem has to be solved by one's own efforts, that is, to quote the memorandum, "by a careful husbanding of our foreign exchange resources, on the one hand, and by making efforts to increase them on the other". This requires both the maintenance of a minimum level of imports and the maximisation of exports. As the scope for further reduction of imports, in the immediate future, appears very dim, the only alternative left is, as the memorandum says, to increase our exports by creating greater export-mindedness in the country.

As both this Chamber and also other trade bodies, such as the mill interests, have pointed out, the price factor is even more important than export-mindedness; nay, it is of paramount importance to the exporter, for he has to countenance very keen competition in the international markets. This calls for sizeable cuts in the costs of production of our exportable goods, apart from resorting to the well-known devices of export promotion, such as, diversification of export both commodity-wise and country-wise, intensification of propaganda, setting up of special organisations on the lines of the British Trade Research Organisation (BETRO) and the Japan Export Trade Recovery Organisation,—all intended to foster greater export-mindedness. The Chamber suggests, in addition, introduction of some measures to provide special incentives to exporters as are adopted elsewhere. Many fiscal incentives, such as remission of direct taxation, export subsidies, advances to exporters on easy and favourable terms, and preferential rates for conversion of export earnings into domestic currency are provided by other countries. Among these, the IMC lays particular stress on the scheme of remission of income-tax on exporters and urges that this should be conceded and implemented straightway, at least on an experimental basis with a view to finding out its potentialities as a measure of export promotion. It may be recalled that the Gorwala Committee too was in favour of such a scheme. While this would not cost the Government much, that Committee observed, it would provide a "real incentive to exporters".

Another suggestion of the IMC relates to the setting up of a special organisation called an "Export Promotion Cell" with a Deputy Minister at its head in the Ministry of Commerce and Industry to prepare a comprehensive plan for export promotion and to be in charge of the day-to-day work connected with export promotion. The entry of the State Trading Corporation in the sphere of foreign trade, the Chamber points out, "has dampened the initiative of the private enterprise, as the traders fear that the Corporation might enter their business at any time". It urges the Government, therefore, to reiterate its assurance that the S.T.C. will carry on its trading operations only in respect of certain commodities or with only specific countries. Such an assurance would go a long way in removing uncertainties in the minds of the business community which, in turn, should stimulate it to work for export promotion vigorously.

COMPANY AFFAIRS

OPTIMISM FOR SUGAR

Sugar industry has given an outstanding account of itself during the last few years. The production during 1955-56 (1.86 million tons) has exceeded even the revised target (1.80 million tons) for the first Plan. During the last year alone the rise in production was to the tune of 20 per cent. The average recovery of sugar is, however, low and there is enough scope for its improvement by a judicious choice of the sugar-cane quality and the sowing season. Almost all the companies are going ahead with the rehabilitation and modernisation of the plant and machinery and it seems that the sugar industry is capable of maintaining its present rate of growth for some more years to come.

BEGG SUTHERLAND GROUP OF MILLS

The production of sugar in most of the mills in the group was higher than ever. But, it seems that, instead of adding to profits, it has, inflated the stocks of sugar carried forward by the mills. Even the prices remained low because the despatches over the railways were rather disappointing.

Cawnpore Sugar Works, Ltd.: The working results for the year ending October 31, 1956 show a surplus of Rs. 6.65 lakhs after providing for all charges including provisions for Taxation and Depreciation and having written back earlier provisions no longer required. A sum of Rs. 3.50 lakhs has been transferred to Rehabilitation Reserve. The balance is to be disposed of as follows: only a sum of Rs. 80,000 in payment of a dividend on the Preference Shares of 8 per cent per annum free of Income Tax and another sum of Rs. 2,25,000 in payment of a dividend of as. 12 per share an Ordinary Shares free of Income Tax.

The Purtabpore Company, Limited: The results for the year ended October 31, 1956, after making the usual provisions, charging Depreciation, and adjustments, show a profit of Rs. 3,91,334. A sum of Rs 2,50,000 has been transferred to the Rehabilitation Reserve. The balance has been recommend, to be disposed of as follows: A sum of Rs. 60,000 in payment of a dividend of 10 per cent on the Preference Shares, free of Income Tax, for the year ended 31st October, 1956 and another sum of Rs. 67,500 in payment of a dividend of as. 12 per share, free of Income Tax, on the Ordinary Shares for the year ended 31st October, 1956. The balance of Rs. 20,705 will be carried forward.

The quantity of cane crushed by the factory during season 1955-56, was very similar to that in the previous season namely 25,97,018 maunds but the extraction improved from 10.15 per cent in the previous season to 10.22 per cent in the season under review. The factory commenced crushing on the 1st December, 1955 and completed the season on the 14th April, 1956.

The cane price remained at the high rate of Rs. 1-7-0 per maund for Factory gate and Rs. 1-5-0 per maund out-stations, and while the factory did not receive any increase in the quantity of cane crushed, in other parts of India that high cane price produced a very high quantity of cane and a corresponding increase in the quantity of sugar produced in the country. The result of this high production of sugar tended to reduce the market price for sugar and also to increase the quantity of sugar carried over from the season under review to the next season. This carry over of stocks was also aggravated by a shortage of Railway Wagons on the N.E. Railway in the earlier part of the year and this also had its effect in depressing the market price of sugar.

The efficiency of factory operation continued at a very high level while the Company's estates continued to supply cane to the factory and seed cane to growers to assist in improving both the quantity and the quality of the cane offered for crushing.

Champarun Sugar Company, Limited: The results for the year ended 30th June, 1956 after making the usual provisions, charging Depreciation, and adjustments, show a profit of Rs. 5,50,484. After deducting Contingencies Reserve of Rs. 1,10,000 for stock realisation and Rs. 2,55,000 for Rehabilitation Reserve, the amount left at credit of Profit and Loss Account is Rs. 2,09,503. This balance, has been recommend, to be disposed of as follows: A sum of Rs. 1,80,000 in payment of a dividend of Re. 1 per share, free of Income Tax, for the year ended 30th June, 1956 and a carry forward to next account to the extent of Rs. 29,503.

The quantity of cane crushed at the Barrah Factory had improved considerably over previous years and was indeed the highest crush ever taken off at that factory during the last 20 years. The crop taken off at the Chanpatia Factory was disappointing both in quantity and in quality. Barrah Factory crushed 35,52,767 maunds of cane with an extraction of 9.54 per cent while Chanpatia Factory crushed 20,69,019 maunds of cane with an extraction of 9.89 per cent.

Barah Factory commenced crushing operations on the 24th November, 1955 and completed the season on the 5th May, 1956 while Chanpatia Factory commenced crushing on the 12th December, 1955 and completed the season on the 6th April, 1956.

The Balrampur Sugar Company Limited: The results for the year ended 30th June, 1956 after making the usual provisions, charging Depreciation, and adjustments, and after providing a Contingencies Reserve for Stock Realisation of Rs. 70,000 show a loss of Rs. 69,251. From this a sum of Rs. 20,880 has been deducted against the carry forward from the previous year. The Debit balance to be carried forward is Rs. 48,371.

The crops taken off by the Factories in the crushing season covered by this report are disappointing as compared with other factories in the U.P. and Bihar. Balrampur crushed 18,65,905 maunds of cane with an extraction of 9.57 per cent, while Tulsipur crushed 22,00,961 maunds of cane with an extraction of 9.97 per cent. There was an improvement in the quality of the cane supplied to the Tulsipur Factory, but at the Balrampur Factory there was a deterioration in the quality of cane supplied. Balrampur Factory started crushing on the 12th December, 1955 and finished on 16th March, 1956; Tulsipur Factory started crushing on 1st December, 1955 and finished on the 6th April, 1956.

COMMODITY NEWS AND NOTES

EXPORT OF RICE BRAN

The Government of India have decided to release limited quotas for export of rice bran, paddy bran and rice meal of West Bengal-Madras region from all the ports under the jurisdiction of the States of West Bengal, Madras to all permissible destinations up to the end of June 1957 or till the ceiling is reached whichever is earlier.

COAL RAISINGS AND DISPATCHES

The Indian Coal Board has granted permission for the opening and re-opening of mines and seams to nine collieries last month. The raisings and dispatches of coal during March, 1957, from the coal fields of India were 3,652,777 tons and 3,248,399 tons respectively. The daily average loading for April, 1957 from the Bengal Bihar coalfields was 3,780 wagons as against 3,726 wagons in March, 1957.

WORLD COTTON PRODUCTION

The US Agriculture Department estimated world cotton production in 1956-57 at 38,185,000 bales. The Department said this output would be a decline of 1,540,000 bales from the record high 1955-56 production of 39,725,000 bales, and would be the smallest since 1952-53. It was 700,000 bales less than the estimate made by the Department last January.

RUBBER PRODUCTION AND CONSUMPTION

Production of Rubber in India has gone up by 852 tons in April compared with the previous month. Consumption has also increased by 321 tons during the same period. The month by statement issued by the Rubber Board showed production and consumption figures for April at 2,072 tons and 2,907 tons, respectively. The relative figures for the previous month were 1,220 tons and 2,586 tons. The quantity of imported rubber during the month was 649 tons. Stocks with estates and dealers and stocks with manufacturers as on April 30, 1957 were 3,657 tons and 2,532 tons respectively.

FINAL ESTIMATE OF SESAMUM (TIL OR GINGELLY), 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of sesamum, 1956-57, puts the current year's area and production at 5,433,000 acres and 451,000 tons, as against the partially revised estimates of 5,653,000 acres and 457,000 tons respectively for 1955-56. This shows a decline of 220,000 acres or 3.9 per cent in area and 6,000 tons or 1.3 per cent in production over the last year. The decline in acreage during the current year has been reported mainly by Madhya Pradesh, Bombay, Mysore, U.P., and Bihar and has been attributed generally to unfavourable climatic conditions at the sowing time. Some increase in acreage has, however, been reported by Rajasthan and Andhra Pradesh. The decline in production has been shared mainly by Madhya Pradesh, Bombay, Bihar and Mysore and has been attributed partly to decrease in area and partly to heavy rains during the growing period of the crop. The decrease in production has, however, been offset to some extent by small increases reported mainly by U.P., Rajasthan and Andhra Pradesh.

NEW PEAK OF MINERAL PRODUCTION DURING 1956

Mineral production in India reached a new peak in 1956, according to the Indian Bureau of Mines who have just published the estimate of mineral production during the year. The total valuation of mineral production was Rs. 116.4 crores which was 10.8 crores more (10 per cent) as compared to the previous year. Coal with an output of 39.4 million tons was the leading commodity that added to the rise in the value of mineral production. It was valued at Rs. 57.6 crores and represented an increase of 1.2 million tons over last year; the share of the State collieries was at about 1 lakh tons. Other minerals that came in order of importance were manganese ore (Rs. 24.7 crores), mica (Rs. 7.7 crores), gold (Rs. 5.8 crores), salt (Rs. 5.5 crores) iron ore (Rs. 3.9 crores) limestone (Rs. 3.3 crores) and copper ore (Rs. 3 crores). Production of metallic minerals valued at Rs. 40 crores in 1956 was higher compared with Rs. 31.8 crores in the preceding year.

SURVEY OF MINERAL TALC IN RAJASTHAN

Dr. M. M. Das, Deputy Minister of Education and Scientific Research, told Shri Raghunath Singh in the Lok Sabha recently that a survey of mineral Talc in Rajasthan had been conducted. In a statement laid on the table of the Sabha in this connection, the Deputy Minister said that Talc or steatite occurrences at the following localities in Rajasthan were examined by the Geological Survey of India during recent years:

(1) The working at Ghevoria in Mewar was examined and steatite from the old pit was found to be of excellent quality.

(2) The following localities in the former Idar State, Rajasthan were examined in 1945-46 field season:

i) Bhanmer
ii) Kundal
iii) Thuravas
iv) Vartha
v) Ghanta

(3) In Bhilwara district, Udaipur, the following localities were examined during the field season 1950-51:

i) Two miles South of Geuria
ii) Two miles North-East of Chandpura
iii) Bugwasa
iv) Kishengarh

In these localities steatite occurs in massive dolomite. The steatite bodies are from 60 to 70 feet to over 250 feet long and 20 feet to about 100 feet in vertical extent, the width varying from 5 to 50 feet. The reserves have not been calculated but are expected to be large.

TIN ORE DEPOSITS IN BIHAR

Shri K. D. Malaviya, Union Minister for Mines and Oil, gave out the areas where occurrences of tin ore were known to exist in Bihar in reply to a question by Shri Kishori Ram in the Rajya Sabha recently. The areas were: Paharsingh hill in Ranchi district; Nurgo, Simratanri, Pihra and Chappatand in Hazaribagh district; and Dhanras Pahar and Chhakarband in Gaya district.

The Minister added that the Geological Survey of India was investigating Paharsingh area for tin ore deposits. The Minister, however, added that no tin mine had been discovered by Government in Bihar.

NO CHANGE IN TEA EXPORT DUTY

The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty, at Rs. 2.47 per lb. as against Rs. 2.41 per lb. in force from May 1, 1957. There is no change in the existing rate of duty of Naye Paise 25 per lb.

The Force of Example

TODAY, Friday, June 14, the Prime Minister took off on a tour of many European countries which will keep him away from India for a month. There has been criticism that this is the wrong time for him to be away. In a sense he remains, particularly in times of crisis, the central figure without whom final decisions cannot be taken. But it is good, both for him and for India that (after the decisions announced this week on a salary freeze and a new plan of austerity in the Central Administration) he should be able to think calmly and without distraction of our problems pressing at this time. It is good for us, too, not to depend solely on one man, however eminent and however central to our life and affections he may be. It is necessary for India to know that it can function without the Prime Minister for a month; we should prepare ourselves to do without a particular person for an indefinite period. Thus alone can the strength of democracy be demonstrated; for democracy is essentially an impersonal creed. It rests upon not men but on events, and upon their wise understanding by a sovereign people that never dies. Thus only can we gather immortality to ourselves, for there is no person who has been vouchsafed eternal life. It is a necessary step for an intensely personal administration to put on the garments of impersonal democracy.

It is good, however, that the Prime Minister should have chosen in this decisive week of June to alter the outlook under which the Central Government shall function both in his absence and in the remaining period of the Plan. To those who do not appreciate the symbolic character of

living, a cut in the salaries of the Central Ministers which will give an annual saving of only Rs. 1 lakh may look a little comic. But one must look behind the figure to the solid gain beneath. The Prime Minister's mind has been forced partly by the critical debate in Parliament and by events in the A.I.C.C. to bring a new sense of proportion into all the Central Government's expenditure. But the popular mind wanted dramatic proof. It is a great tribute to the Prime Minister that he has shown so swift a recognition of popular feeling, and even of popular indignation, as to have even rebuked himself for the size of the house in which he was living. In this sense he has shown an example which will deeply stir the conscience of the country. He has awakened the devotion of Congressmen and, as he has often done in crises before, the affection of many of his political opponents. There is also the ring of greatness in his admission that his speeches a month ago were in error.

It is right that tributes should be paid, too, to the Ministers of the Central Government and particularly the Finance Minister, whose work has been vital in this matter, in bringing about this uncomfortable admission that the critics who were repulsed last month on the floor of the House were after all substantially right. Thus the stone which the builders rejected has again become the key-stone of the arch. To suggest, however, that the cuts in the Plan and the great gestures which have been made by the Ministers in the Central Administration are complete solutions to the problem would be to misjudge the demands of the economy in the short period. Apart from the foreign exchange crisis—of which we have been reminded again this week by the utilisation of a further I.M.F. stand-by credit of 72.5 million dollars — there is the current inflationary situation. A terse official pronouncement issued on Wednesday said the official Wholesale Price Index (with the year ended August 1939 as 100) advanced by 0.5 per cent to 449.0 and was higher by 4.1 and 12.4 per cent respectively when compared with the corresponding week of the last month and that of a year ago. But it did not say the index had risen 15 points in two weeks. It must be recognised that if prices cannot be halted, the cut in salaries proposed will be physically impossible to work, nor will it be possible to avert or reject a series of demands for dearness allowance whether by salaried workers or by organised labour. Thus the situation is fraught with considerable danger. If cuts are being imposed, those affected can certainly reasonably ask for a stabilisation of prices. The natural corollary to a policy of cuts in salaries is a freezing of the price level. Unhappily, on this point the Central Government is markedly silent. No one will take seriously its appeal for a cut in salaries, until it gives an assurance that its policy will stop inflation.

For many months *The Eastern Economist* has argued that the freezing of the price level is impossible unless the Government institutes a deflationary policy on foodgrains. At long last, the Government of India has opened new negotiations with the United States for another P.L. 480 Commodity Loan. The delay in opening these negotiations was a serious error for which the Indian Cabinet must take its responsibility; but, now that the error has been remedied, everything depends on hastening imports and on the sale of these imports at a price which will guarantee a stable price level. This cannot be done without an element of rapidly rising food subsidy; but as has been argued previously, deficit financing in the Central Budget for the limited purpose of showing in the accounts a loss on foodgrain sales will reduce the level of foodgrain prices in the country and the cost of living, and thus be deflationary. What is required at the present time is that foodgrain prices should be pegged at a level 10 per cent below their present value, which, we need to remind ourselves, has touched a peak of 566 for Cereals in the General Index. If a further rise in the price level should occur in the next three months (and with the new import restrictions and the absence of adequate foodgrain stocks, further rise seems certain), the level at which foodgrains will need to be sold when they arrive may need to be lower. One might argue that the level should be fixed in such a manner that the Wholesale Index is pegged at a level of 430.

Thus the decks can be cleared for action. The lines of economic policy should be reasonably clear in the next twelve months. There will certainly be the most drastic curtailment of all imports. Delegations (of which some hundreds have gone abroad in the last five years) are now being screened by a business-like group in the Ministry of Finance which is likely to separate the abundant chaff from the all-too-inadequate grain. First things are at last coming first. We should now be able, having cleared our minds of ostentation and grandeur, to see more clearly the things that are of intrinsic worth. Perhaps we will begin to see with a blinding light that our salvation lies in production, and in production only. All the rest is good only to the point of holding a line. But holding a line in India will never do; let us stabilise prices as a first defence. But we need rapidly to proceed from defence to attack. How else can poverty be beaten back from its deadly hold on the life and thought of the weakest, and some of the best, human material that it is our privilege to have and to hold?

The Kerala Budget

THE first Budget, for 1957-58, of the Communist Government of Kerala has naturally attracted countrywide attention. More than ordinary significance attaches to it not so much for the Communists' capacity for bold experiments as for its revenue surplus at a time when other State Governments are budgeting, in some cases recklessly, for deficits. The new taxation measures have the only merit that they convert what would have been a revenue deficit of Rs. 2.25 crores in the Rs. 30-crore Budget into a surplus of Rs. 7 lakhs. Otherwise these proposals which are, for the most part, in the nature of robbing Peter to pay Paul ignore the basic need for increasing production all round and for attracting capital to a State like Kerala which is markedly underdeveloped in relation to the neighbouring States of Madras and Mysore.

The proposed levy of a tax on agricultural wealth can be considered proper and inevitable only if the tax proposed by the Centre in respect of non-agricultural wealth were to stay. The proposed additional super-tax (besides the existing super-tax of four annas) ranging from one anna to four annas on the agricultural incomes of plantation companies between Rs. 25,000 and Rs. 10 lakhs would eat further (to the tune of about Rs. 65 lakhs per year) into the profits of companies which already have to pay a whole series of taxes from the basic land tax and sales tax to the Central income-tax. It is no wonder, therefore, that plantation scrips have heavily slumped in the southern stock markets. One wonders if the Communists who were unable to secure Central approval for nationalising the foreign-owned estates have come to think in terms of forcing them out indirectly by further heavy taxation. As the investment climate for foreign capital and that for indigenous capital are not two different things, the Communists will not succeed in attracting Indian capital while driving out British capital. The apparent bias in favour of Indian capital is not convincing; indeed, it cannot last.

A surcharge of 5 per cent on agricultural income-tax and super-tax, a surcharge of 2.5 per cent on the sales tax paid by traders with a turnover of Rs. 30,000 or over, and a surcharge on the profession tax of those with an income of Rs. 250 or over per month are all expected to yield Rs. 13 lakhs which, according to the State's Finance Minister, is intended to meet the increase in expenditure on education. These surcharges are not inconsequential for, whatever be the purpose for which they are intended, they add to the existing tax burden on persons and companies. In any case, surcharges on existing taxes are meant to be used sparingly and removed in due course. Their continuance as permanent additions to taxes has unfortunately come to prevail in many of the States. As social services have always constituted a charge on the tax revenue as a whole, surcharges for additional expenditure on education and the like are hard to justify.

As there is so much valid objection to these taxation measures, the proposals in respect of additional expenditure cannot extenuate them for economies in other lines could well have been explored with some success. The reasonableness of these proposals may not, however, be seriously questioned. One of these proposals is to revise upward the salaries of all primary school teachers on the scale of Rs. 40 to Rs. 120. Another proposal is to grant fee concessions in high school classes (education in the State is already free up to the upper primary stage) to all poor students whose parents' annual income is below Rs. 1,200. Yet another proposal is to grant interim concessions to sections of low-ranking Government servants, besides raising the allowances of police constables, while there is now to be an upper limit of Rs. 1,000 in the salaries of officers in State Service. These proposals are typical though they may look rather trivial. Actually they are anything but trivial in the context of the Congress Governments' grudging performance or lack of performance in the spheres concerned. They may have to follow suit sooner or later, and in this sense the Kerala Government will have given a healthy lead to the other State Governments particularly in the South although the latter will have been discredited to some extent.

These, however, are not the only things which invest the Kerala Budget with more than ordinary significance. The Government's decision to set up a State Trading Corporation for dealing in agricultural products exported from the State is particularly noteworthy in this connection. What this will mean (by way of trading profits to the Government) may be inferred from the fact that the value of commercial crops (in some of which Kerala has a near-monopoly) raised annually is of the order of Rs. 125 crores. This step, however, may not be a substitute for the claim advanced by the State Government for a share in the export duties collected by the Centre on the products concerned. Surely their aim must be to profit from the export-products both ways, but it is open to doubt whether reasonable prices can be ensured for the agriculturists without putting up the export-prices of some products.

The State Finance Minister's reiteration of the Government's determination (which is unlike the 'firm' promises repeatedly made in the last few years by the Governments of Madras and Andhra) to take speedy steps for comprehensive land reforms, is even more significant in the context of Prime Minister Nehru's bitter criticism of the snail's pace in this regard in several States. Here, as elsewhere, the Kerala Communists mean business althought their task is by no means easy in view of the complex character of land tenures in their State. If even the extremely complex land tenures in the State come to be reformed, it will only bring out all the more glaringly the bankruptcy of the Congress in other States where the land tenures are less complex but where the bigger landowners in particular have greater influence with the ruling party and the administration alike. As ill-conceived land reforms, however, can easily disintegrate the existing agrarian order and set in train forces of disruption, it remains to be seen whether the Kerala Communists will be informed by constructive wisdom or impelled by 'class war' considerations in this crucial sphere. Although the proportion of landless agriculturists in Kerala as in Madras and Andhra—being 75 for every 100 landowing agriculturists—is the highest in all India, the land problem can be solved smoothly, if at all, only on the basis of a programme of maximum justice to tillers with minimum injustice to owners. This will necessarily mean moderation, compromise and adjustment which cannot be easily derided for there is no particular virtue in disruptive radicalism, although it may be perfectly constitutional and in strict accord with the Planning Commission's proposals which are formidable on paper but most difficult to implement.

Another noteworthy decision of the Kerala Government is to give greater encouragement to private enterprise for nurturing medium industries in the best traditions of the former T. C. State. It is just possible that the State Government's proposed industrial policy statement may contain some guarantees to allay the fears of entrepreneurs on the score of possible nationalisation. The professions, present and prospective, of the Communists in respect of private enterprise are laudable. But business men are practical men who will be influenced in their decisions more by the tax, wage and labour policies of the Communist Government than by any prospect of nationalisation. For, it is these policies that are relevant to the day-to-day running of industrial units. The studied omission of any talk of nationalisation from the Finance Minister's speech may be intended as a bait for private capital. This can by no means be attractive to entrepreneurs who, in any case, know that compensation in the event of nationalisation is ordained by the Constitution within whose limits the Communists will have to work. The Communists would need to establish their *bona fides* beyond the shadow of a doubt and give convincing proof of their realisation that production, rather than the pursuit of egalitarian visions, is the paramount need of the hour. They have made a pretty initial showing; but the gilt will wear off the gingerbread and we are in the oven baking new.

"Metamorphosis" of Marxism

SINCE Stalin's death in March 1953, Marxism has, it is claimed, been undergoing a "metamorphosis". The widespread impression, forstered sedulously by the Communists themselves, is that this represents an evolution of Marxist thinking. Actually, however, the position is quite the contrary. The "heart-searchings" and re-evaluation current in the Communist world are in point of fact the concomitants of compulsions it has come up against. Stalin's heirs have, for instance, neither his ability nor his prestige to combat internal pressures for better conditions of living and less State control. They cannot also play upon the fears of the Russian masses with the cry of the danger of "capitalist encirclement of the Socialist fatherland" now that, according to their own statements, a socialist world has emerged which can successfully compete with and challenge the capitalist world in almost all spheres of life. They can also no longer find scapegoats like the Kulaks and capitalists to explain away their failings in economic and political fields and for the continued servitude and destitution of the masses. Moreover, the generation which had experienced Czarist tyranny and feudal exploitation has passed away, giving place to a new one whose hatred of these is limited and less fierce because its knowledge of these is distant or bookish. The atomic stalemate has at the same time provided the born slaves an opportunity to demand more freedom of thought and action.

These internal pressures led to the revolt of the courtiers against their late mentor and master, Stalin. The Twentieth Congress of the Communist Party of the Soviet Union postulated the theses of de-Stalinization, collective leadership and different roads to socialism. But the ruling party in Russia, while denigrating Stalin, propounded the theory of the growth of the cult of the individual to explain Stalin's crimes. The explanation was as un-Marxist, if not more, as the development of the Stalinist cult of the individual was a violation of Marxism. For, if an individual is, as Marx asserts, the creature and not the creator of circumstances, Stalin was the creation of Marxian Communism; he and his cult of the individual followed from it.

And, now, Mao Tse-tung has come out with another heresy. Addressing a secret meeting of the Central Committee of the Chinese Communist Party, he observed that "in the course of the development of a socialist society, incompatibilities and contradictions can still arise between the masses of the people and their leaders". This conflict, he added, cannot be resolved by methods of power, but by democratic means — that is by free discussion and persuasion. He even asserted that if democratic means had been employed by Russia, there would not have been any violent outbreak of last autumn in Hungary. Giving the slogan: "Let all flowers bloom together; Let diverse schools of thought contend", Mao Tse-tung in point of fact goes so far as to say that strikes, being a form of protest against bureaucracy, should not be suppressed and its leaders should not be penalised. Indeed capitalists and intellectuals should, he suggests, be "re-educated and their bourgeois mentality combated by mild, persuasive methods". "Criticism should not be imposed," remarks Mao, "upon a person who does not accept it .... those found to have committed mistakes, big or small, except for serious offences against the law or discipline, are all to be exempted from disciplinary measures."

To "popularise" this new policy of *Cheng feng* ("correct the winds"), the press and radio in Communist China have launched a campaign against the "roughshod interventions", "indulgence in the bad habits of the old society" and "the pushing beyond reason of their (party members and bureaucrats) claiming privileges and high pay". Mr. Peng, who runs the party machine, has even warned the party officials "to stop treating ordinary people as the enemy, or the people will turn into the Party's enemy".

Apparently Mao's "startling" theory recognises that conflicts can and do arise between the people and leaders of a socialist State. This is indeed a radical departure from the orthodox Communist theory. Had not Karl Marx fondly hoped and confidently asserted that class struggle would disappear in a socialist society? Had not Lenin maintained that the Communist Party, being supreme, should lead and not follow the masses? Mao's thesis not only runs counter to these assertions; it also destroys the basis on which a Communist totalitarian State is founded. A totalitarian State after all rests upon the pretension that the ruling party alone possesses the truth about the ultimate destiny of mankind and that it alone knows what is good for the community.

Mao's present thesis, however, loses much of its importance when we recall his servile approval of the Russian armed intervention in Hungary. Nor has Mao discarded the other hoary Communist slogan, "Unity — Discussion — Unity". Even in the "revolutionary" speech Mao has more than once reiterated this slogan; he has redoubled the emphasis on "Unity". There is, therefore, every reason to believe that the Chinese Reds would tolerate criticism only to the extent that did not impair the Communist State. An open revolt against — even a turning away from — Communism would involve something more than gentle persuasion. Hungary remains a stern example.

Two reasons suggest themselves for the apparent "metamorphosis" of Marxism at Mao's hands. Appeasement of the masses has become urgent and necessary due to the failure of the Communist Government, in spite of its claims about overfulfilment of the Plan targets, to ease the economic situation in the country. The Government has, on the other hand, asked the people once again to tighten their belts. But the Chinese Communists know too well that they are skating on thin ice. Their methods of raising the "people's enthusiasm" through threats of "imprisonment and extermination" and through "schooling" at the "corrective labour camps" have produced opposite results. Absenteeism, go-slow and partial strikes have become more frequent. It is in deference to the new situation that Mao has suggested resort to peaceful methods of persuasion and has contended that the time has come to "dismount the horse"— in other words, to slacken the pace of economic development in view of various shortages and difficulties. His present thesis, if put into practice, may provide a safety-valve for the grievances and the discontent born out of an over-ambitious plan of industrialisation and collectivisation. It might also help in bringing into the open all those who are not well disposed towards the regime, thus providing useful dossiers when there is a return to terror and persecution. Such a return is inevitable because the gardener will have to remove the weeds even if he allows for the time being "all flowers to bloom together".

THE WEEK'S NOTES

HAPPY KALDOR?

DR. NICHOLAS KALDOR, the Originator of the concept of a tax on expenditure, is reported to be happy — perhaps happier than the Indian Finance Minister who has chosen to experiment with it. He has every reason to be happy over the fact that the Government of India have already accepted three major tax proposals made in his Report on Indian Tax Reform. Of these, the tax on capital gains has already come into force and the taxes on expenditure and wealth are awaiting approval by Parliament. While Dr. Kaldor may justly feel a sense of personal pride that his novel tax concepts — still under debate in the United Kingdom where he is like a prophet who is not honoured in his own land — have found favour with the Government of India, his pride and happiness are probably not unmingled with regret and sorrow on at least two counts. One of these is that the Indian Finance Minister has not adopted the Kaldor scheme of tax reform in its entirety but has chosen to implement some proposals to the exclusion of others. And the other is that he has varied such proposals as he has adopted. Dr. Kaldor has not, of course, expressed his regret or sorrow openly on these two counts but has only stated that he is in no position to evaluate the factors that have weighed with the Finance Minister.

Even if Dr. Kaldor has no regret over it all, he should be knowing, more than anybody else, that his scheme of tax reform was designed as an organic whole of which his crucial proposal to bring down the maximum rate of income-taxation to 45 per cent was an inseparable part. His scheme was such that it should have been accepted or rejected in toto. The entire scheme was based on a certain estimate of the magnitude of tax evasion in the country. When the Central Board of Revenue disproved Dr. Kaldor's estimate of tax evasion, it had virtually knocked the bottom out of his scheme of tax reform. If the Finance Ministry has chosen to maintain the maximum rate of income and super taxes at a high level even after introducing three major Kaldor devices, it must be because that it believes in the Board of Revenue's view that there is not as much tax evasion as he has estimated. It is clear that the Finance Ministry thinks that the Kaldor taxes are a boon promising additional tax revenue besides the revenue from income-taxation at more or less the usual level. If the Government of India should, by any chance, decide to implement the remaining Kaldor devices but not to reduce the maximum rate of income-taxation to 45 per cent, their additional tax revenue might exceed the figure estimated by him. In which case the judgment on the distinguished Cambridge economist may well be that he has played into the hands of the tax-hungry Finance Ministry. And then his sorrow may be all the greater.

STATE INCOME OF WEST BENGAL

THE STATISTICAL BUREAU of the Government of West Bengal released last week provisional estimates of income for the State of West Bengal. The estimates cover a period of four years, starting with 1948-49 and ending with 1951-52. West Bengal is not the first State to make these regional estimates of income. The States of U.P., Madras and Bombay have already published similar estimates, though every one of them, like the West Bengal Statistical Bureau, has not followed the method adopted in the final report of the National Income Committee Report. Efforts of computing income at the State level need to be encouraged as they may constitute a reasonably good check on the estimates of the National Income Unit. Is it not an axiom in arithmetic that the sum of the parts equals the whole?

The total income of the State has been estimated at Rs. 759.77 crores in 1951-52. This works out to be 8 per cent of the total national income of the Indian Union. The primary sector (i.e., agriculture, animal husbandry, forestry, etc.) generates 38.42 per cent of the total State income as against the secondary sector (i.e., mining industry, construction) which is responsible for 20.53 per cent only. The balance, i.e., 41.05 comes from the tertiary sector. No attempt has been made by the Statistical Bureau to indicate, on the lines of the National Income Report, the margin of error to which each one of these sectors is susceptible. Independent estimates made by the Indian Institute of Public Opinion for 1950-51, however, put the figure at Rs. 927 crores—nearly 22 per cent above the Bureau's estimate for 1951-52. It is perhaps premature to say which of these estimates gives the true picture of the State of West Bengal. Let us hope that the results of the various surveys which the Bureau is still analysing will throw more light on the subject.

The rate of growth in income at current prices in West Bengal during the period under review was slower than that of the Indian Union. The income of the State of West Bengal rose by nearly 12.7 per cent as against a rise of 15.3 per cent in the case of the Indian Union. What complicated the situation further in West Bengal was the influx of refugees from East Pakistan which increased the population from 231.07 lakhs in 1948-49 to 249.86 lakhs in 1951-52—a rise of more than eight per cent in three years. This unexpected rise in population was instrumental in reducing the per capita income. The net increase in income per head was, therefore, of the order of 4.2 per cent in three years. On the other hand, the per capita growth in income in India at current prices was, in 1951-52, 11.0 per cent above 1948-49.

In absolute terms, the per capita income of West Bengal in 1951-52 is estimated at Rs. 303.9 which stands 11 per cent above the corresponding estimate for the Indian Union. This naturally leads to the conclusion that the average Bengali is significantly better off than the average Indian. That, however, is an erroneous impression as, according to the State Bureau, a large portion of the fruits of the labour of those engaged in big industries, big trade, mining etc., is not disbursed within the state. What does get distributed completely within the State is the income generated in the agricultural sector. The underlying cause for a poor show in the agricultural sector is that whereas nearly 57 per cent of the total population draw their sustenance from it, the net contribution to income stands at 38.42 per cent only. The key to the prosperity of the state, especially the indigenous population, lies to a great extent on the level of output of agriculture and agricultural prices.

REVISION OF THE UN CHARTER

THE UNITED NATIONS GENERAL ASSEMBLY by 67 votes to none (with the Soviet bloc countries absenting) has decided to postpone till 1959 a review of the United Nations Charter. By that time, it is hoped, circumstances would be more propitious. The decision is welcome. As Mr. Krishna Menon pointed out, the world situation imposed on members the responsibility "not to rock the boat any more we need to". Besides, the revision of the Charter is futile unless there is the will to uphold its provisions, existing or amended.

There are two reasons for the demand for the revision of the Charter. First, the existence of veto power for the Big Five, which, in the opinion of some members, violates the principle of equality between nations; and, secondly, the lack of effective punitive power of the United Nations to punish violators of international law. Equality of nations is, doubtless, a laudable objective. But can it be denied that

nations are unequal in 'real politik'? The provision of veto in the Charter is merely a formal acknowledgment of the realities of the power situation as it stood immediately after the second world war. The United Nations may be given certain powers in respect of enforcement of peace, but neither the Security Council nor the General Assembly can be made effective against an aggressor unless the United States and the Soviet Union act in unison. One reason why the efforts of the United Nations were successful in stopping the Anglo-French aggression in Egypt and not the Soviet armed intervention in Hungary is that in the latter case America and Russia were ranged against each other. Moreover, to consider a practical point, it is doubtful if any of the Big Powers would be willing to give up the veto; without their unanimous approval the Charter cannot be amended. The question of Communist China's claim to replace Nationalist China in the Security Council also looms large; without settlement of this point, it will be idle to expect Russia to endorse any revision of the Charter.

One cannot, however, ignore the fact that the "uniting for peace procedure" adopted in 1950 at Mr. Dean Acheson's suggestion, whereby the General Assembly could be seized of matters at issue before the United Nations, has blunted to a great extent the edge of the power to veto. Also, the fact that none of the two power blocs has a ready-made majority in the United Nations has worked in the same direction. Apart from the Soviet satellites, there are no rigid divisions in the United Nations now, and a majority decision has assumed some meaning. An overriding difficulty is, however, that, under the Charter, the decisions of the General Assembly, unlike those of the Security Council, have no legal existence. It is true, of course, that in practice the majority decision of the Assembly cannot be brushed aside.

The demand for more teeth for the United Nations is also unrealistic. It ignores the fact that punitive action against a Great Power will mean a world war—which it is the fundamental precept of the United Nations Charter to banish. The fact that the Powers which possess Atomic or Hydrogen Bombs are not prepared to suspend even their thermonuclear tests, despite the knowledge of risks to the existence of human race, indicates the extent of ill that can accrue should the present precarious balance be disturbed.

What shakes world peace is not the veto power of the Big Five or the inadequacy of the Charter, but subjugation of peoples, racial inequality and the insecurity of existence in the under-developed regions. There is nothing in the Charter which stands in the way of the eradication of these conditions. The weakness lies, indeed, not in the provisions of the Charter, but in the lack of morality and sense of justice among those who, blinded by ambition, seek to curb human freedom and aspiration.

KHRUSHCHEV'S TELEVISION BROADCAST

THE VIRULENT vituperation of Mr. Vyshinsky during the early days of the cold war seems to have given place to comparative amiableness in these days of atomic stalemate. In his television broadcast to the Americans recently, Mr. Khrushchev talked in terms of sweet reasonableness, and with apparent sincerity. He referred to the mortal danger to mankind from the repeated atomic and H-bomb tests and the extinction of humanity should there be another war. One must remember, however, that it is not necessary to be a paragon of virtue to quote from scriptures. Who can forget the aid given by Mr. Khrushchev and his comrades in perpetrating the atrocities now credited to Stalin? And who can help seeing that the "collective leadership" has used and is using those very methods which they condemn in Stalin—to "liquidate Beria and his gang of imperialist hirelings", to suppress in blood and terror the Hungarian revolution in the autumn of last year? And has not Mr. Khrushchev's Russia tested atomic bombs—which he holds are harmful to mankind—more frequently than any of the Western Powers? It is difficult, then, not to suspect that Mr. Khrushchev's television broadcast is a new propaganda technique, and not much more.

Mr. Khrushchev has again offered to withdraw troops from East Germany, Poland, Hungary, Czechoslavakia and Rumania—if the United States withdraws its forces from Western Europe, Greece and Turkey. In order to emphasize, as it were, that his offer is genuine, the Communist Party chief has asserted that he had made this offer in the certain belief that the Communist regimes in Eastern Europe enjoyed the support of the people and could not, therefore, be subverted by "capitalists or their agents". To believe that the Kadar Government in Hungary "is based on the will of the people" is next to impossible, with recent happenings in that country fresh in memory. Indeed, recent events in Hungary and Poland have shown, on the other hand, that Communist regimes can only be maintained with the help of Russian troops. Moreover, if Moscow were really as zealous an advocate of co-existence as Mr. Khrushchev has claimed, some evidence for it would surely have been found in Soviet foreign policy. The reversal of the policy of de-Stalinization has countered effectively the co-existence so much bruited.

Mr. Khrushchev has as usual praised the Communist ideal which is, according to him, essentially democratic and which is sure to triumph in an ideological struggle over capitalism—a system based on "wage-slavery" and "violence". Like a true Communist, Mr. Khrushchev has misrepresented issues. The conflict, it is hardly worth repeating, is not between a socialist and a capitalist economy, but between regimentation and freedom to choose. There is nothing in the history of Man to suggest that he will prefer regimentation to freedom. It might be said, and said with a grain of truth even, that during the last few years conversion to Communism has increased. But if the condition under which Communism spreads are carefully studied, it would be found that it was accepted only where the alternative was not freedom but submission to political tyranny and economic servitude, and where neither security nor stability existed. In many cases Communism was imposed by the Red army.

UNITED STEEL DOES NOT STAND STILL

THE UNITED STEEL COMPANIES LTD

During the past few years The United Steel Companies, by research and full-scale experiment, have introduced and sponsored several completely new products and improvements in existing products; by so doing they have made a significant contribution to the progress of steel consuming industries all over the world.

The United Steel Companies (India) Private Ltd.

A Window on the World

WHERE POLICE POWERS ARE GREATEST

By

ODYSSEUS

MR. BANARASI DAS, former Parliamentary Secretary to the U.P., seeks to persuade the All-India Congress Committee that the highest salary receivable by a Congress man in office should not exceed ten times the lowest and that the highest itself should in any case not exceed Rs. 1,000. This sort of muddled thinking acts like a red ribbon on a typewriter to this column, making us gnash our newsprint, and tear out out italics.

The obvious questions that Mr. Das' resolution raises are: Why should the Congress party take steps to make it more difficult for it to secure the services of men who are capable and ambitious? Why this self-denying ordinance? But these questions are really the froth on the surface. What Mr. Das is really implying is that inequality of incomes is incompatible with the Socialist ideal.

In going back to fundamentals to consider the Socialist ideal, I shall be drawing extensively on the facts established in Bertrand de Jouvencl's masterly little book of 90 pages, "The Ethics of Redistribution" (Camb. Univ. Press. 1951) to which I direct your attention. Anyone who has asimilated this, and Walter Eucken's 96 paged "This Unsuccessful Age" (W. Hodge. London. 1951), should have a well-grounded working knowledge of the major fallacies that impede progress in this mid-twentieth century.

Whence did the practice of redistribution of income by the state originate? As J. E. Meade says in his "Planning and Price Mechanism," complex state machinery has grown up piecemeal to provide money benefits, free medical and other services, and goods and services below cost, by which money is distributed to the poorer from the richer, whose incomes besides being diminished by direct taxation are eroded by rent control, dividend limitation, and other extractive devices.

In the course of the next week or two, I propose to try to show that Redistributionism is descended neither from Socialism nor from ideas about redistribution of land.

EQUALITY IN LAND DISTRIBUTION

The idea of land redistribution in the name of social justice begins with the dawn of history itself when agriculture was the major industry throughout the world. In the Christian world, its respectability is vouched for in the Bible, where in the first instance land was to be apportioned by lots (Cf. Numbers xxxviii. 54). But note the difference between (a) the ancient tradition that the land needs to be re-distributed periodically to ensure holdings of equal size and (b) the idea that incomes should be equal. Tradition does not advocate the equalisation of the produce of the land but only of the source of the produce. Tradition does not visualise Mr. Das' world in which no Congress man would enjoy more than Rs. 1,000 a month. On the contrary, the traditional view is that, providing all men have started with an equal endowment of land, it is just that inequalities of reward should arise which reflect harder and better work on the part of some owners. The aim is not to equalise incomes but the original capital endowment.

Socialists and traditional agrarian reformers thus have one aim in common: the elimination of the effects of unequal distribution of property. This ideal accords with that of the American ideal of free universal education (up to post-graduate levels for those capable of benefiting by it) which gives everyone the same start but says nothing about preventing them from exploiting their individual talents thereafter, and going on to becoming millionaires if they can—a logical conclusion which upsets Socialists.

The Socialist ideal is a new society based on brotherly love. Socialists do not merely consider that rewards are not proportionate to effort, they are in emotional revolt "against the antagonisms within society, against the ugliness of men's behaviour to each other." The embryo of this doctrine is traceable to Rousseau, who thought that social progress increased strife by arousing man's desires and the competitive spirit. He held that the cure was to re-educate men into substituting love of fellow-men, love of society, for love of oneself. This is the basis of all genuinely Socialist thought. Secondly, Rousseau held that social antagonism arose from "objective situations," the removal of which would remove strife. Socialists single out private property as the basic "situation" creating antagonisms, first, between those with and those without property; secondly, between those with property.

The true Socialist solution is by extinguishing private property to extinguish all antagonisms, thereby rendering unnecessary the whole of the state's machinery of repression and police power, and enabling the state itself to wither away.

Now, at this point there may be some Socialist in the audience who will rise in wrath and say that all that stuff about the state withering away is out of date and is not fundamental to Socialist doctrine. Anyone who argues thus is unacquainted with the history of Socialism, from which the plain fact emerges that the promise that the state will wither away is fundamental to Socialist doctrine, because the disappearance of antagonisms and the achievement of brotherly love is Socialism's fundamental ideal.

SOCIALISM IN RUSSIA

It is, however, easy to see why many contemporary Socialists forget, or refuse to recognise, this fact. It is because actual experience has now overtaken and disproved the theories of Rousseau and his nineteenth and early twentieth century followers. The years since October, 1917, when Socialism was inaugurated in the U.S.S.R. have shown that police powers are at their greatest (and judging by the rampant "treason" purges, brotherly trust and love at its lowest) everywhere that private property has been eliminated. Not only has this failed to end antagonism, but what spirit of solidarity has been achieved "seems to have as a necessary ingredient the distrust and hatred of another society." The most typical sermons preached by the leaders of the U.S.S.R., China, and the satellite countries, are denunciations of the warlike intentions of foreign powers (including other Socialist states, like Yugoslavia).

And the curious fact is that in such a completely socialised state as the U.S.S.R. so far from the radiance of brotherly love dissolving all antagonisms, traitorous friends of the capitalist classes are frequently discovered (or alleged) to be in league with aggressive foreign capitalist states. "Thus," Bertrand de Jouvenel shrewdly points out, "the solidarity obtained is not, as intended, a solidarity of love but, at least in part, a solidarity in strife"—which must make Rousseau, Marx and all their disciples wonder where they went wrong.

They went wrong by leaving religion out of it. A community based not on the economic independence of the individual but on a brotherly sharing of the common produce, inspired by a deep feeling of unity (not aroused by, or directed against, foreign enemies) is not Utopian. Such communities have existed for centuries in monasteries. Is it not significant that the first objective of the Chinese Socialists on "liberating" Tibet was to liquidate those communities which come nearest to achieving Socialist material equality and spiritual brotherliness?

If we examine monastic ideals, we see why monks succeed where Socialists fail. The inmates of monasteries are handpicked, dedicated individuals, bound together by solemn spiritual vows and by one objective: the love of God. Material goods can be shared without difficulty because they are spurned. Monks are working to raise their spiritual, not their material, standards of living. There is no antagonistic competition among individual monks because they are not out to increase production at all. They live in harmony because they constitute not a social but a mystical body.

Socialist writing and preaching is full of this mystical brotherly love, but what the authors and orators do not realise is that they seek to create an economic peace among brothers who are all out, and indeed egged on by the state, to produce more material goods, and a mystical harmony among men who are constantly reminded either that they live in a secular state in which any religion is held to be as good as any other, or in an atheistic state which dismisses all religion as superstition.

Here, I think, we lay our finger on the basic contradiction of Socialism. On the one hand, it holds out a mystical appeal — the ideal of brotherly love and repudiation of production for the profit of the individual producer that exists in unreconstructed capitalist societies. On the other, it has, with its Five-Year Plans and its Heroic Worker medals, endorsed the capitalist societies' pursuit of ever increasing consumption.

But if all society's efforts are directed towards the production of more goods, why should the individual citizen be denied more goods? If, as Bertrand de Jouvenel says, the good of society lies in greater riches, why not the good of the individual? If the appetite for more possessions, more riches, is disgraceful in the individual, why not in society?

The Socialist is undaunted by these questions. He replies that it is not more production that is disgraceful but, like Mr. Das, unequal distribution. This reply opens new horizons for which we have no space this week. Suffice it to suggest a train of thought by observing that (a) the supporter of free enterprise is entitled to hold that justice demands that individual rewards should be proportionate to individual endeavours, and (b) the Socialist is entitled to hold that justice demands that individual rewards should be proportionate to services rendered to the community. We may provisionally agree that existing society does not achieve the free enterprise conception of justice and that the Socialist conception does not mean that justice is achieved by equalising all incomes, or by arbitrarily limiting them to multiples of Rs. 100 with a maximum of Rs. 1,000. We will struggle afresh with these matters next week.

P. N. B.

WORKING RESULTS AT A GLANCE

STATEMENT OF ACCOUNTS AS ON 31-12-1956

LIABILITIES

i.	Paid up capital	Rs.	87,50,000
ii.	Reserve Fund and other Reserves	Rs.	1,25,00,000
iii.	Deposits	Rs.	1,06,38,58,201
iv.	Other Liabilities (including contra items such as Bills for collection and acceptances, endorsements and other obligations)	Rs.	32,52,11,363
	Total ..	Rs.	1,41,03,19,564

ASSETS

i.	Cash and balances with Bankers		
ii.	Investments	Rs.	12,39,23,611
	(a) Investment in G. P. Notes, Municipal Loans and shares guaranteed by the Central and State Govts. 46,89,66,671		
	(b) Other investments		
iii.	Loans and advances 1,40,42,990		48,30,09,661
iv.	Other assets (including contra items such as Bills Receivable being Bills for collection and constituent liabilities for acceptances, endorsements and other obligations)		54,86,00,526
			25,47,85,766
	Total ..	Rs.	1,41,03,19,564

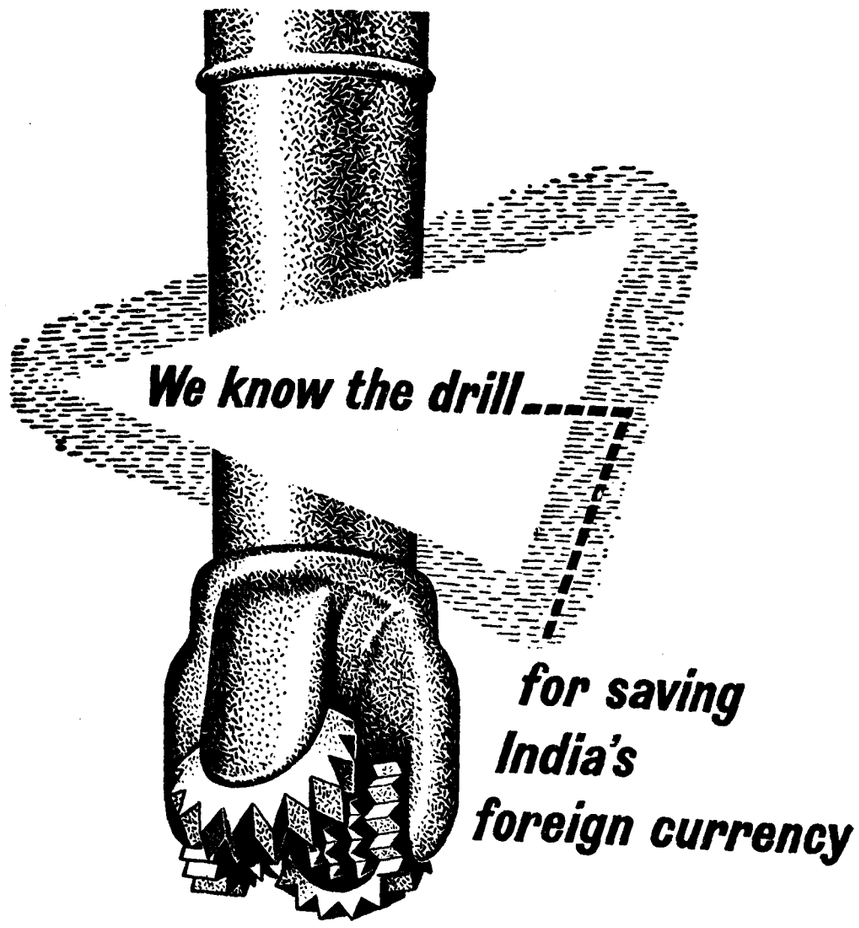
Around India with Brooke Bond

The Murias of Madhya Pradesh

The Murias, a charming, industrious tribal people, live in Bastar in Madhya Pradesh, a land of undulating plains, Sal forests and hills. The Murias are fond of wearing feathers, glass beads and colourful clothes. A unique feature of the Murias is their Ghotul—a kind of village dormitory of which all unmarried boys and girls are members. The boy members of the Ghotul help in festivals while the girls work as bridesmaids in weddings. Their games and dances help to bring joy and gaiety into the lives of the Murias.



Around here, as everywhere in India, fresh Brooke Bond Tea is made available through a unique system of fast distribution from factory to shop. Brooke Bond is the only tea firm with five blending and packing factories, each serving its own part of the country, from which fresh stocks are rushed to every shop.

FRESH and GOOD

96 139

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

WHY BOURGUIBA ISN'T NASSER

(From Our Special West European Correspondent)

PARIS, June 8.

RELATIONS between France and her former North African protectorate, Tunisia, now governed by the Neo-Destour party of Habib Bourguiba, are again near breaking point. This new crisis has supervened soon after the delicate repair of the breach caused last autumn when the French kidnapped the Algerian leaders who were on their way to Tunis for the talks between Bourguiba and the Sultan of Morocco. The harmony restored by negotiations that lasted most of the winter was fragile, and could not survive the sudden decision of the Mollet Government, at the very moment of its defeat, to suspend the £12 million of economic aid which had already been promised, signed, sealed and approved by Paris. The surprise in the new crisis is not that Bourguiba has permitted himself some gestures of extreme irritation and has called in question the whole future of Franco-Tunisian relations, but that he has not allowed himself to be carried further into the sort of disastrous vindictiveness that Nasser practised in the face of similar provocation last summer.

For the provocation Tunisia has just received from France is not only comparable to, but much more direct than, that offered Egypt in the refusal to finance the Aswan barrage. Worse, the French decision in this case was not even the outcome of the type of "calculated risk" that Mr. Dulles has boasted of in the Aswan affair; it was simply part of a desperate and absurd parliamentary manoeuvre by the falling Mollet Government, which was seeking to convince the Right (whose votes it needed to avoid defeat) that it could "get tough" with the North Africans. The sample of toughness it chose to provide was to break the solemn promises it had given Bourguiba to furnish economic aid for the country's development, on the grounds that Bourguiba's Tunisia was actively supporting the Algerian rebellion.

In fact, of course, Bourguiba's Tunisia is indeed supporting the Algerian rebellion. It is improbable that the Government in Tunis is directly involved in gun-running across the Algerian border and nor is there any centrally directed policy of aid and shelter for the terrorists who take refuge in Tunisia. But if Bourguiba's officials are not positively doing these things, they are certainly doing nothing to stop them; and at the lower levels of administration, along the border of Tunisia and Algeria, Tunisian officials are evidently directly implicated and are receiving no orders from higher levels to desist. To that extent, the French are quite justified in saying, "Here is a country to which we have just given complete independence and to whom we are expected to supply all sorts of economic and other aid, but which is blatantly abetting the terrorists who are marauding and murdering throughout neighbouring Algeria". But if that much is true, it does not follow (though the Right in Paris and Algiers affects to believe this) that if Tunisian support were discontinued, the terrorism in Algeria would cease. A much probable result, Bourguiba could reply, would be that terrorism would continue in Algeria and furthermore extremists would take control in Tunisia itself — because no Muslim Government anywhere in the world and least of all at Algeria's doorstep can afford to appear to be co-operating in the French work of putting down terrorism in Algeria.

It is quite plain that such assistance as Bourguiba is giving — or suffering to be given — to Algerian terrorism is given against his will and because he has very little choice in the matter. He has made it clear, moreover, that no one wishes more heartily than he to see an end to the Algerian struggle, and not necessarily on the extreme terms put up by the rebel leaders. Still, his position would not be very honourable if it were limited to that: it would be no credit that he acquiesced in the continuance of terrorism from a feeling of well-intentioned helplessness and in order to perpetuate his own moderate regime in Tunisia. But he has gone much beyond that. He has repeatedly offered his assistance in bringing about an end to the fighting, and has matched his castigations of French repression with admonishments to the terrorists to accept a reasonable compromise. Though the French have snubbed him and the terrorists ignored him it is clear that for both parties Bourguiba still represents the best way out of a bloody and hopeless tangle, as soon as each side recognises that prolongation of the conflict is useless.

There are reasons to doubt the argument of the French Right that because Bourguiba subsidises assassins, France should cut off economic aid. And in fact most members of the late Socialist Government realised this, especially the Foreign Minister, Christian Pineau; the aid agreement had been drawn up and approved despite Right-wing objections. Nothing had changed at the end of last month, except that Pineau was absent in New York at a U.N. meeting, and Mollet's Government badly needed Right-wing votes to stay in office. So Mollet dramatically announced suspension of the aid pact. His Government fell anyhow, because the Right was too much concerned about the new taxes required to finance the Algerian war, and about the pig-headed refusal to resume use of the Suez Canal, to be placated by the last-minute sacrifice of Habib Bourguiba. It is a damning commentary on French political morality (and also an explanation of why France will never build a Commonwealth on the British model) that the connection between France and a former colony (a connection which in this case includes a customs union) can be thrown away for the sake of a parliamentary debating flourish.

If Bourguiba had been Nasser a variety of catastrophic responses would have been open to him in the face of this senseless insult. He could have nationalised the phosphate mines in Tunisia, sequestered the goods of some of the 130,000 Frenchmen that live in his country, done something foolish about the vital naval base at Bizerta, quit the franc zone, wound up the customs union with France, broken off all relations with France or just set mobs loose on the 40,000 French troops stationed along the Algerian border of his country. In fact, it was widely expected in his own entourage that he would do some of these things; the danger of reprisal seemed small for France was at the time without a Government.

On the contrary, Habib Bourguiba made a firm and angry speech that concluded: "We shall liberate ourselves economically as we did politically. But we will

do it by means of the reason, patience and moderation we have always shown. No adventures. No surgery". That this comparative moderation did not cover weakness he made plain by serving notice on Paris that he henceforth counted as void all the economic treaties between the two countries, and adding that a mere later agreement by Paris to resume its economic aid would not alter this situation. This denunciation of what he claimed were unequal treaties was not to be final, but would clear the way for negotiation of new and fairer agreements as soon as France had given herself a new government. Meantime, he signified revision of the customs union by beginning direct negotiations about trade agreements with a number of third countries.

Of course, it can be pointed out that Tunisia's moral and material position is too weak reasonably to allow her any further reprisals. She is, how willingly does not matter, morally implicated with the Algerian terrorism, and Bourguiba made his speech the very day the fellagas brutally massacred 302 Muslims as part of their war not with France but with the rival MNA terrorists. There are 40,000 French troops in the country, presumably in a state to defend themselves and other French nationals. The country is poor and nearly bankrupt and depends for its existence on French aid, and would even be severely hit economically by the withdrawal of the French garrison which Bourguiba nevertheless demands. Bourguiba's first attempts, after suspension of French aid, to obtain ready support elsewhere, by calling in the American, West German and British representatives, showed him that the nations able to assist him were much concerned to avoid offending their French ally. Russian and Arab-Egyptian offers of help, though supposedly unconditional, obviously carried with them dangers too great to be run by the moderate Neo-Destour regime. All of these facts add up to a sound case for declining to enter upon adventurous courses, but recent displays of Islamic "diplomacy" in Egypt and further east were notable precisely in that they did not reckon with similar realities. So although it is no great praise of the Tunisian Government that in the face of deliberate provocation it did not respond with passionate recklessness, the fact is nonetheless unusual enough in the charged atmosphere of the Middle East to be worth recording.

Franco-Tunisian relations, then, go back to where they were last autumn after the kidnapping of the Algerian rebel leaders. (That event is now sufficiently remote for us to point out that it has had absolutely no effect on terrorism in Algeria, which has worsened since; so there too France ruined her connection with Morocco and Tunisia without gaining anything in the Algerian struggle.) This time Bourguiba has shown that he is not so anxious to keep his differences with France "in the family", by appealing to the U.N. to do something about the refugees entering Tunisia from war-torn Algeria. It will take a long time and much goodwill for the new French Government to restore cordial relations with its only friend in all Islam, Habib Bourguiba. Yet, every day the Algerian war drags on makes it more evident that it is only through the intercession of Bourguiba (along with, perhaps, the Sultan of Morocco and the leaders of French tropical Africa) that any solution of that struggle can be obtained within the family of nations that look to Paris, as distinct from a solution imposed by the U.N. — i.e. by the Big Powers.

The Hindu

FOR NIGH EIGHTY YEARS THE LEADER

WORLDGRAM

AGRICULTURE

All-India Agricultural Labour Enquiry: A second all-India agricultural labour enquiry is now being undertaken by the Union Ministry of Labour and Employment to bring upto-date the data collected during the first enquiry in 1950-51. Data on all essential aspects such as size of family, occupational structure, employment and unemployment, wages and earnings and indebtedness of agricultural labour was collected during the first enquiry.

*

Soil Testing Laboratories: Out of the 24 soil testing laboratories, 14 have already been set up in the country. The 14 laboratories are at Nagpur (Bombay), Calcutta (West Bengal), Poona (Bombay), Coimbatore (Madras), Sabour (Bihar), Ludhiana (Punjab), Cuttack (Orissa), Hyderabad (Rajender Nagar Farm) Andhra Pradesh), Bangalore (Mysore), Nabha (Punjab), Trivandrum (Kerala State), Gwalior (Madhya Pradesh), Simla (Himachal Pradesh), and Indian Agricultural Research Institute, New Delhi. It was proposed to open the remaining 10 laboratories at the following places: Damodar Valley Corporation, Hazaribagh (Bihar), Agartala (Tripura), Kotah (Rajasthan), Bapatla (Andhra Pradesh), Rajkot (Bombay), Jabalpur (Madhya Pradesh), Central Tobacco Research Institute (Rajamundry), Coffee Research Board (Bollihanur) (Mysore), Kanpur (Uttar Pradesh), and Jorhat (Assam). The statement stated that the idea at the time of selection of the sites was to give at least one laboratory to each State and it was to be done in stages. Preference was given to States where the work could be started readily. Each of these centres would cost Rs. 31,500. Out of this, a sum of Rs. 19,500 would be recurring every year. The statement also said that the Government of India would finance the schemes for three years and then the laboratories would be handed over along with equipment, to the respective States and agencies free of cost.

INDUSTRY

Record Production at Machine Tools Factory: The Hindustan Machine Tools Factory surpassed all previous production records by turning out a record number of 36 machine tools during May 1957. These machines includes

i) 29 standard 1000 MM lathes,
ii) Two lathes of 1500 MM produced for the first time in the factory, and
iii) Five horizontal milling machines also produced for the first time in the factory.

The previous best performance of the factory was 25 lathes in January 1957. With the factory touching the production rate of 36 machine tools per month, it has not only achieved, but far surpassed its target production rate, envisaged under the original programme, four years ahead of schedule. Under its original production programme, the factory was scheduled to reach an output of 400 machine tools per annum by 1960-61.

*

Co-operative Sugar Mills: Thirty-eight licences had so far been issued for opening co-operative sugar mills—16 in Bombay, 5 each in Punjab and Andhra Pradesh, 3 each in U.P., Madras and Mysore, and 1 each in Bihar, Assam and Orissa. Four applications were under consideration, two for establishment of sugar factories in Uttar Pradesh and one each in Punjab and Andhra Pradesh. The statement further stated that a total amount of Rs. 279.1 lakhs had been sanctioned as loan—Rs. 158.0 lakhs to Bombay, Rs. 86.1 lakhs to Punjab, Rs. 25.0 lakhs to Madras and Rs. 10.0 lakhs to Assam—for this purpose.

Draft Standard for Fountain Pen Inks: The Indian Standards Institution has circulated, for a period of three months, a draft Indian standard specification for coloured fountain pen inks, (Blue, Green, Violet and Red) for eliciting comments. This draft standard gives instructions about collecting samples and prescribes requirements for sediment, dye content, keeping quality and performance. Comments on this draft standard may be sent by August 10, 1957, to the Indian Standards Institution, 19 University Road, Delhi-8 or to its branch offices in Bombay and Calcutta.

TRADE

Foreign Trade of India during March 1957: The provisional figures of foreign trade of India by all routes, i.e., sea, air and land, on private and Government accounts, during March 1957, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows:

MERCHANDISE: Excluding transit trade of Pakistan and other overland foreign countries, viz., Nepal, Tibet, Sikkim and Bhutan:

Exports	Rs.	5060 lakhs
Re-exports	Rs.	41 lakhs
Imports	Rs.	7951 lakhs
Total Trade	Rs.	13052 lakhs
TREASURE		
Exports (including Re-exports) of currency notes	Rs.	36 lakhs
Current coins (excluding gold coins)	Rs.	1 lakh
Others	Nil	
IMPORTS		
Gold	Rs.	4 lakhs
Currency notes	Rs.	453 lakhs
Others	Nil	

The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures, the total value of exports (including re-exports) of merchandise and gold fell short of imports by Rs. 2854 lakhs.

*

Export Promotion Council for Shellac: An export Promotion Council for shellac has been set up to maintain and promote the exports of Indian shellac. This is the nineth Council sponsored by Government to maintain and develop export markets for Indian products. The Export Promotion Council for shellac, which will have its headquarters in Calcutta, will undertake market studies in foreign countries, send trade missions abroad and appoint representatives or agents for purposes of collecting and disseminating among exporters statistical and other information about the export trade. The other functions of the Council are publicity for shellac abroad and publicity at home of samples of goods in demand in foreign markets. India's total exports of shellac in 1953-54 were valued at Rs. 3.6 crores, at Rs. 6.27 crores in 1954-55 and Rs. 7.28 crores in 1955-56. The exports in the period April to December 1956-57, were worth Rs. 5.12 crores. The principal markets for Indian shellac are the United States of America, the United Kingdom, West Germany, Italy and other continental countries and lately the Soviet Union.

*

Indo-Czechoslovak Trade Agreement: Letters were exchanged in New Delhi recently between Shri K. B. Lall, Joint Secretary, Ministry of Commerce and Industry and H. E. Mr. Jiri Nosek, Ambassador Extraordinary and Plenipotentiary of Czechoslovakia in India, extending the Trade Agreement concluded between the two countries on November 17, 1953, up to September

30, 1957, pending negotiations for modification of the Agreement. The trade between the two countries has been on the increase since the signing of the agreement. Exports during the period April to December 1956 from India to Czechoslovakia were valued at Rs. 209 lakhs as compared to Rs. 133 lakhs during the whole of 1955-56. Imports from Czechoslovakia during April-December 1956 amounted to Rs. 517 lakhs against Rs. 289 lakhs during 1955-56. The main items of Indian exports to Czechoslovakia are iron ore, mica and skins. The main items of imports from that country are chemicals, machinery and mill work, iron and steel and paper.

FINANCE

Customs and Excise Revenue for March 1957: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross Sea and Land Customs Revenue collected in the Indian Union during the month of March, 1957, amounted to Rs. 17.67 crores as compared with Rs. 17.42 crores in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year.

Of the total customs revenue collections, import duties accounted for Rs. 15.50 crores against Rs. 14.27 crores, export duties for Rs. 1.69 crores as against Rs. 3.03 crores and land customs and miscellaneous for Rs. 48 lakhs as against Rs. 12 lakhs.

The total gross collection of Union Excise duties amounted to Rs. 17.65 crores as compared with Rs. 12.54 crores.

During the twelve months, April, 1956, to March, 1957, the grand total of gross Customs and Union Excise Revenue realised was Rs. 365.60 crores as compared with Rs. 320.19 crores during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 143.18 crores as against Rs. 130.83 crores; export duties for Rs. 30.07 crores as against Rs. 37.50 crores; land customs and miscellaneous for Rs. 3.79 crores as against Rs. 2 crores and the Union Excise duties for Rs. 188.56 crores as against Rs. 149.86 crores.

*

Excise Duty on Tea and Coffee: The Government of India have decided to restore on and from the 1st June, 1957, the 'status quo ante' in respect of the excise duties on tea and coffee. These duties had recently been enhanced through the Finance (No. 2) Bill of 1957. The procedure introduced by the Government on the 25th May, 1957, in regard to export of tea, not otherwise specified, and package tea by manufacturers and exporters other than manufacturers, has been cancelled, and the procedure for export of tea which existed before will now again be in force.

*

Loan for Bhakra-Nangal Project: In a written reply to a question by Shri D. C. Sharma, Shri S. K. Patil, Union Minister of Irrigation and Power, said in Lok Sabha, that an amount of Rs. 14.55 crores was advanced by the Central Government as loan to the Governments of Punjab (including PEPSU) and Rajasthan during 1956-57 for irrigation and power works. The main development works undertaken were:

(i) Construction of roads in the areas served by the Bhakra canals;

(ii) Establishment of mandies to facilitate the marketing of exportable surplus commodities produced in the areas irrigated by the project; and

(iii) Development of factory and residential areas.

*

Rural Housing Grants: Shri K. C. Reddy, Minister of Works, Housing and Supply, in a written reply to a question by Shri Onkar Lal stated in the Lok Sabha, that the sum of Rs. 10 crores available for rural housing in the second Five-Year Plan had not so far been allocated to States, as the rural housing programme had not yet been finalised. The programme was likely to be finalised soon. In the meantime, allocations of a token character had been made to States in the current financial year. A sum of Rs. 2.30 lakhs had been allocated to Rajasthan.

*

UNICEF Grants for Health Programmes in India: An amount of $38,000 has been allocated to India by the 30-nation Executive Board of the UNICEF for a programme to improve, expand and integrate the training of physicians in chemical and social paediatrics. The UNICEF Board has also made allocation of $2,045,500 for programmes of tuberculosis control, goitre control, pre-school and school feeding programmes and for maternal and child welfare services in the Community Development areas. The allocation for tuberculosis control is $1,31,000, for goitre control $16,500, for feeding programmes $3,83,000 (which is the cost of freight only) and $1,515,000 for maternal and child health services.

*

Funds for Nagarjunasagar Project: A sum of Rs. 396 lakhs was advanced as loan by the Government of India to the Andhra Pradesh Government for the execution of the Nagarjunasagar project during the year 1956-57. A provision of Rs. 550 lakhs had been made in the Central Government budget for 1957-58 for the purpose of advancing loans to the Andhra Pradesh Government in connection with the execution of the Nagarjunasagar Project.

GENERAL

Goitre Control Scheme: A scheme for the control of goitre in the sub-Himalayan region extending from Kashmir up to Himachal Pradesh and NEFA where goitre is known to be prevalent has been sanctioned by the Government of India. Under this scheme a rapid survey of the whole region will be undertaken and an assessment made of the problem of goitre in areas where it is not clearly defined. Arrangements to distribute iodised salt in areas affected by endemic goitre are also contemplated. To begin with, it is proposed to supply iodised salt in some of the endemic areas selected from the States of Punjab, U.P., Bihar and Assam and the Union territories of Himachal Pradesh and NEFA.

*

Eastern Shipping Corporation: The working of the Eastern Shipping Corporation Limited in 1955-56 has shown a net profit of Rs. 31,71,038. Out of this, the Corporation has repaid to Government of India a sum of Rs. 17.11 lakhs which it has received from them during the previous year to cover the loss incurred by it under the term of the Indemnity Agreement between it and the Government. One of the two vessels, for which the Corporation had placed orders with the Hindustan Shipyard, has been delivered during 1955-56 bringing the total number of the vessels of the Corporation's fleet to seven. This vessel, "the State of Kutch", is the largest ship built in the shipyard so far. It has an overall length of 488 feet, a gross tonnage of 5,296 tons and a trial speed of 14.9 knots. "The State of Kutch" has been put on the India-East Asia-Japan route. The Eastern Shipping Corporation has also placed orders with the Hindustan Shipyard for three overseas vessels of 9,500 DWT each and one cargo-cum-passenger vessel of about 4,000 DWT. The management of the second-hand passenger-cum-cargo ship MV "Nicobar", acquired by the Ministry of Home Affairs, has been entrusted with the Eastern Shipping Corporation. The ship is employed on the India-Andamans route.

NEWS IN BRIEF

INDIAN

Industrial production in India maintained during 1956 the annual rate of increase of 7 to 8 per cent, achieved towards the end of the first Plan, although the developments contemplated in the second Plan have yet to take shape.

*

Provident Fund benefits were provided to 3.17 lakhs of colliery workers by the end of the financial year 1955-56.

*

The Indian Telephone Industries (Private) Limited, Bangalore, proposes to increase its manufacturing capacity progressively to 65,000 telephone instruments and 45,000 exchange lines per annum during the second Plan period.

*

The Government of India have decided that the procedure for export out of India of articles under claim of rebate of duty on exciseable goods used in their manufacture should be extended to umbrella cloth as well.

*

The Indian Standards Institution has circulated for eliciting comments, a draft Indian standard specification for wrought aluminium and aluminium alloys, bolt and screw stock (for general engineering purposes).

*

The President has given his assent to the Uttar Pradesh Consolidation of Holdings (Amendment) Bill, 1957. The Bill provides for the payment of compensation to tenure holders whose lands are utilised for public utility purposes.

*

The President has given his assent to the Essential Commodities (Amendment) Act. The object of the amending legislation is to discourage hoarding and to prevent undue profiteering by traders in food grains.

*

It has been estimated that the services of about 2,500 persons trained in chemical engineering and technology will be required in the country during the next five years.

*

The Government of India have issued a notification prohibiting the export of rice, including paddy, from Greater Bombay to any outside area except under permits by the Bombay Government.

*

A number of schemes for the development of handicrafts have been approved by the Government of India. Grants and loans totalling Rs. 1 lakh have been sanctioned by the Union Ministry of Commerce and Industry for the purpose.

*

The Government of India have increased the prices of wire and wire products. The prices which have on an average been increased by approximately Rs. 84 came into effect from May, 1957.

FOREIGN

Economic experts from Saudi Arabia, Jordan, Syria and the Yemen have signed an agreement setting up an Arab financial organisation with a capital of £20 million for Arab economic development.

*

Britains import duties on iron and steel products may be reduced as a result of negotiations in London at the meeting of the Council of Association between the UK Government and the High Authority of the European Coal and Steel community.

*

A plan for issuing life insurance policies linked in a value either to the official cost of living index or to the official rate of exchange of the Israeli pound to the dollar has been put forward by nine local insurance companies in Tel Aviv.

*

The Norwegian Government's long-term economic development programme for the four year period 1958-61 foresees an average annual increase in total production of some three per cent.

*

Under a new Japanese-Swedish one year trade agreement, which has recently been signed, sweden will adopt a trade liberalisation policy towards Japan's exports, while Japan will give import from Sweden non-differential treatment similar to that given to imports from the sterling area.

*

An agreement has been signed in Geneva under which Israel will benefit from the multilateral payments arrangements of the Economic Commission for Europe.

*

The Swiss Government has agreed to an Austrian request for a loan to enlarge and modernise railway stations on the Austrian-Swiss border. The loan requested was understood to amount to some Swiss Frs. 50 million (about £4,166,000).

*

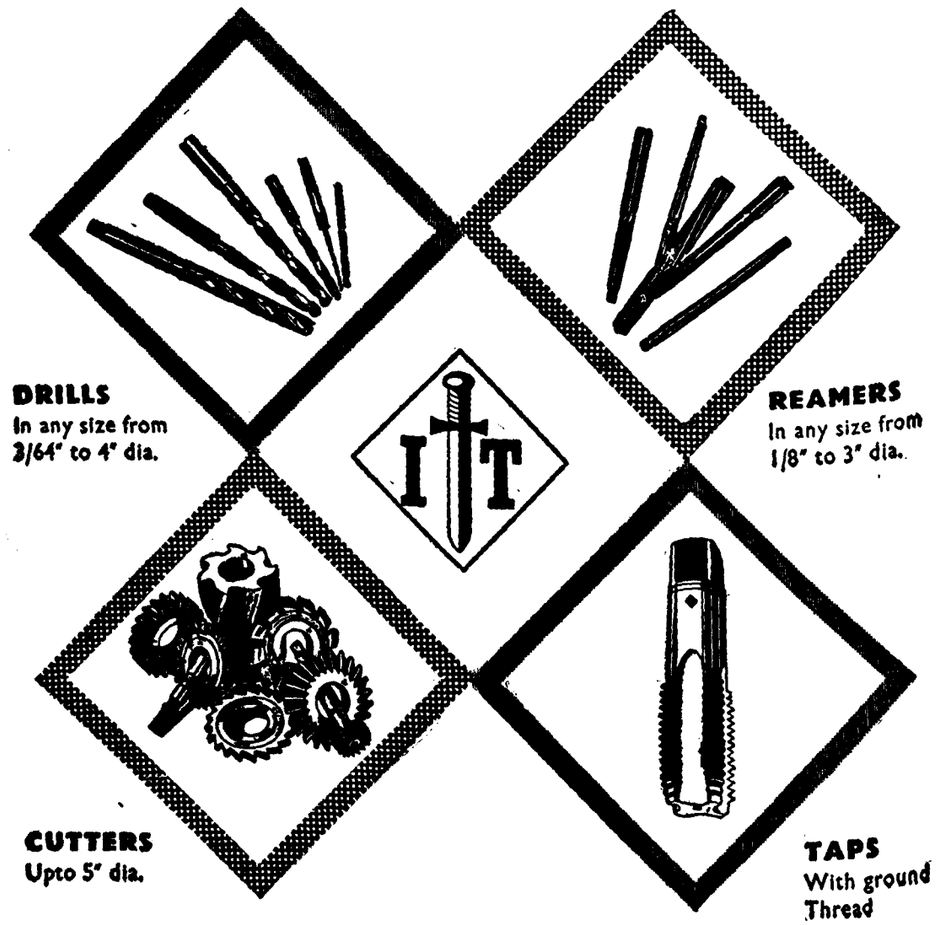
The cost of operating airlines into the UK has been increased by an additional $1.4 million (£500,000) a year from June 1 as a result of a new scale of landing charges introduced by the British Government.

*

The Egyptian Finance Ministry has announced an immediate issue of import licenses for £6 million worth of sterling goods which were ordered before Egypt's sterling balances were frozen last July 28.

*

Production in the US has falttened out at a record height, but the output of a number of individual industries is declining. Overall production is stable despite these individual declines, which are being offset by advances in other industries.



*

The Board of Trade in England has prolonged the suspension of import duties on blast furnace ferromanganese and on a wide range of iron and steel products until March 18, 1958.

*

It is reported Krupp has booked a firm £2 million Turkish order for the construction of a blast furnace at Karaburk.

Economic Report from the U. S.

PEOPLE'S CAPITALISM

(By GUY SIMS FITCH)

WASHINGTON, June 4.—From the nation's capital, and from New Haven, Connecticut, seat of Yale University came this week, wholly independent of each other, two decisions that throw considerable light on the workings of the United States economy. The Washington decision involved a suit brought by the U.S. Government against two of America's corporate giants—E. I. Dupont De Memours and Company, known for its leading role in chemicals and a variety of other industries, and General Motors Corporation, largest automotive firm in the country. It was the finding of the U.S. Supreme Court that a 23 per cent stock interest held by Du Pont in General Motors violates the nation's anti-trust laws. These laws, dating back to 1890 and strengthened since, are designed to protect the public against industrial monopoly.

No one — and that includes the Supreme Court justices who handed down the decision—had questioned the integrity or honesty of the officials of either company. Nor has anyone cited any serious evidence of conspiracy between the companies to restrict trade or manipulate markets. But it is the sense of the verdict that the mere existence of this stock interest is undesirable in principle, that it could lead to monopoly situations which might restrict opportunities of competitive concerns. This far-reaching interpretation of the anti-trust laws can be construed as one way in which American capitalism is made to work for the benefit of the nation as a whole. It was precisely this concept of widely shared opportunities and rewards that was exhaustively examined at Yale University last November by a panel of economists, college professors, business men and labour leaders. This week their findings and decisions were made public in a pamphlet issued by the advertising council. The essence of it is that people's capitalism — a term popularized by the council — is an apt description of the American economic system. The pamphlet itself bears this title of "people's capitalism".

In accepting this term, these analysts agreed on one basic conclusion. It is this: in human history, the U.S. economic system has come closest to the goal of providing abundance for all in an essentially classless and free society. Inherent in this view, of course, is the wide spread of ownership either through the holdings of corporate stock or the ownership of farms and businesses. Fully one-third of American families can be said to have in this way a direct share in the nation's productive assets. This does not take into account the even broader ownership of insurance and pension policies, land and residential property. These types of ownerships, coupled with the Government's vigilance — as in this week's Supreme Court decision — to maintain the integrity of free and competitive enterprise, provide effective safeguards against undue concentration of wealth and power.

But ownership by itself is by far not the only, or perhaps even the most important, element in the American system. There is, most obviously, the broad popular sharing of this economic system's benefits in the form of high and rising standards of living. Beyond that, there is the fact that consumer preferences, based on high incomes and an abundance of goods, dominate the workings of the free market. And underlying all these aspects is the recognition by all groups, including business and labour, that economic enterprise must, in the final analysis, be conducted with due regard for the public welfare. This does not mean that the United States has found the perfect system. The Yale panelists would be the last ones to make any such arrogant assertion. Trained analysts who are careful to document their conclusions at every turn, point to a number of problems that still face the American economy. But they find these problems arising not from the imminent threat of stagnation or decline, but from a possible excess of the very dynamism that has characterized American life. In the long run, these are problems of maintaining stability and balance in an atmosphere of growth and change, where no central authority imposes all the answers and gives all the orders. In meeting this challenge lie the responsibilities, the opportunities and the rewards of freedom.

THE INDIAN OVERSEAS BANK LTD., MADRAS

Bring us your trading problems

If you are looking for a potential market in South East Asia, you couldn't do better than to come to the Indian Overseas Bank. It has several strategically located branches in this area of growing commercial importance. Its experts from over years of experience have a mass of information which could be of very great help to you. Consult the Indian Overseas Bank before you decide.

CAPTAIN ANDRE LESIEUR

PILOT WITH A PAST
AND A FUTURE

Captain Lesieur's past 10,000 hours of flight figure importantly in the future of Air France. His experience flying Super Constellations over the Atlantic (120 crossings) will smooth the integration of the new Lockheed Super Starliner into the Air France fleet. His hours at the controls of Comets and Carvelles will be indispensable in the coming changeover to jets. His well-rounded operational background is typical of the men of Air France. It is men like Captain Lesieur who will make it possible to carry on Air France's record of dependable service to the peoples of 73 countries in the generation ahead.

INDUSTRY IN BLACK AFRICA

FOR the last 200 years, in one part or another of the globe the Industrial Revolution has been making a new beginning. We do not mean an industrial revolution in the sense that term is abusively applied to every major technological innovation, be it atomic power or electronics; we mean it in the original sense: the first move away from a purely agricultural and handicrafts economy toward large-scale production in powered factories. In this sense of the term, India and many other parts of Asia knew the first impact of the Industrial Revolution very many decades ago, and the changes now in train there are mostly an intensification and extension of that process. In Black Africa, on the other hand, industrialisation is at this moment in its veriest infancy — yet it is beginning with projects of a size that dwarf corresponding industries in Europe or North America. Each time it makes a new start, the Industrial Revolution is a new thing, for the newcomer chimes in at the existing level of technology elsewhere. Thus darkest Africa is beginning not with coal, canals and railways but with electricity, aluminium, telepherics and pipelines. The scope of these changes will emerge from a rapid survey of industrialisation now under way in those parts of tropical Africa that used to constitute French colonies but which are now making measured progress toward autonomy.

The limited variety of resources, the virtual absence of domestic demand for industrial consumer goods and the total lack of a native bourgeoisie combine to give African industrialisation some curious features. But it is nothing new that industrialisation should be brought to a region entirely by outside initiative and capital, should be limited to a small number of products and designed for the needs of international markets. What is more distinctive in Africa's industrialisation is that it occurs at a time when industry in general is migrating toward its sources of supply, so that a backward country becomes not just a source of raw materials but a place where those materials can be processed. But above all, it is the shift to electric, from coal, power that dictates the large scale and modern conception of French tropical Africa's first essays in industrialisation. The upshot is the planning from Paris (though drawing on multi-national capital) of a number of substantial industrial ensembles dotted about that vague region that was marked green on our school atlases.

French Guinea. In this region, on the Konkoure River, will be situated one of the biggest of African industries: a combined barrage, hydro-electric station and aluminium factory financed by French, German, Swiss and Italian capital. The barrage, at Kaleta, will be 100 metres high and 1,200 metres long, forming a reservoir of 5,000 million cubic metres. At the base of the barrage, 40 metres underground, will be built the power house which will generate 2,000 million kwh annually. Two lines of 220,000 volts will carry power 50 miles away to the bauxite fields at Kindia where the aluminium factory will produce, in the first phase, one million tons of aluminium. Power will also be supplied to another aluminium plant at Boke, formed by a French firm and Alcan, of Canada.

Gabun and Middle Congo. The electric power that will permit exploitation of this region's mineral deposits will come from a 100-metre high barrage on the Kouilou River. Attached to the dam will be a power plant producing 7,000 million kwh annually and supplying current to another gigantic aluminium factory on the coast. Tropical Africa is betting heavily on this metal, of which world consumption doubles every 10 years. But the region also has manganese deposits estimated at 150 million tons, of a content of 48-50 per cent, making them the second richest in the world. A company in which American and French capital are combined, Comilog, will exploit these mines and transport the metal 50 miles by telepheric to a railhead; the preliminary surveys are now complete. The barrage will also serve to open up the territory to navigation, will irrigate country producing vegetable oils and will permit industrialisation in the coastal towns.

Cameroons. Aluminium has already begun to be produced here, the first ingots being cast a few weeks ago. A barrage has been built on the Sanaga River, serving a hydro-electric plant that generates 1,300 million kwh a year. This power is supplied to an aluminium plant that will be producing 45,000 tons annually by 1959.

French Somaliland. This desert region opposite Aden has been found to be exceptionally rich in magnesium chloride. Conveniently, it also has a lake, Lake Assal, six miles from the sea and 500 feet higher than sea-level. This difference in levels will be exploited by a power plant that will then permit development of the magnesium chloride deposits.

Madagascar. This island contains one of Africa's rare coalfields, situated along the Onilahy River, in the south-west. Confirmed resources approach 40 million tons, which are to be exploited at the rate of 2 million tons a year. The coal is not of a quality to permit steel-making without further treatment, and may either be used in thermal power stations at La Rochelle or transported to France, where it can be landed cheaper than equivalent coal from the USA or the Ruhr.

Senegal and Mauritania: A barrage on the Senegal River will produce 2,000 million kwh annually as well as irrigating the fertile Senegal Valley. The power will be used in the treatment of copper at Akoujt and of iron ore deposits at Fort-Gouraud.

The existing industrial base on to which these substantial enterprises are to be grafted is exiguous, especially outside the favoured regions of Senegal, Cameroons and the Ivory Coast. It can be summarised in these few and scattered industries: groundnut oil in Senegal, sugar and rice in Madagascar and Middle Congo, leather and meat in Chad and the Cameroons, cocoa and coffee in the Ivory Coast, a very big frozen fish industry along the coasts of Senegal and Mauritania, cement in Senegal and textile factories in Dakar, Brazzaville and Bouali. These few exceptions to the tribal and agricultural economy of the continent do not generate sufficient capital to contribute notably to the ambitious ventures listed above. Nor is there available sufficient skilled manpower, French technical education centres having had disappointing results to date. The want of native initiative and economic enterprise has already been referred to. Plainly, in these circumstances, most of the enterprise has to come from Paris and this gives the birth of capitalism in tropical Africa an unusually administrative and planned character. But this has its advantages in that the French four-year plans are framed for balanced regional development, such as is only possible when industrialisation begins in truly virgin territory. Each region sees the simultaneous growth of mining, electric power, transport,

basic industry, consumer goods production and education.

But if Paris can supply the plans, it cannot supply all the capital and it is because of this that the French have been so anxious to obtain general European co-operation by including these territories within the Common Market scheme. The response from the West Germans has been encouraging, especially since French colonial policy in Black Africa, by contrast with the sorry mess in North Africa, is enlightened and has the consent of the native populations. However, a curious development since the Suez war has been the wish to "keep the Americans out" by limiting the sources of capital and technical help to the Continental area to be covered by the Common Market. This is much more marked as regards the oil deposits of the Sahara Desert which are France's main hope in her African possessions but which are not referred to in this survey which is limited to Black Africa; French public opinion is as sensitive to the political implications of American participation in this work as could be the xenophobe peoples of the Middle East and Latin America. This coldness is even extended to Canadian participation in the big aluminium projects, to which Italian and other West European help is preferred. It remains to be seen whether this exclusiveness is justified in a great work which consists essentially in exchanging French imperial domination (and inactivity) in Black Africa for gradual political autonomy combined with large-scale multinational industrial investment.

ENERGY, INDIA AND OIL—II

(CONTRIBUTED)

IN the long run the basic fact will remain that India is not blessed with really great resources of hydro power, particularly in relation to her population, and therefore the study of the economics of utilisation should be most scrupulous and far-sighted.

The targets for expansion of coal raising are well-known, but it is more than evident that India will be no exception to the rates of growth of the demand for oil that have been forecast for the rest of the world outside the U.S.A. and the U.S.S.R.

Indeed quite moderate but careful estimation would show that the increased demand in India for oil may be such that demand will increase three times in the next 12 to 15 years to about 15 million tons, and again this may prove to be a cautious estimate.

One method of checking these rather startling conclusions is to establish the projected annual increases in the national demand for commercial energy, and establish with exactitude the contribution that can be expected from hydro power and coal supplies. The former should be relatively easy as the completion dates of the projects are known well in advance and it should not prove impossible to establish realistic probabilities for coal production.

The balance, by deduction, must be supplied by oil unless there is to be a failure in certain sectors of the national effort. This is an entirely legitimate method which is now in wide use and does, in the process, pay recognition to the fact that oil and the oil industry has proved capable of the flexibility necessary to meet virtually any increase in demand, no matter how unusual. It also recognises that oil by its nature and ability to be processed to controlled products for particular purposes possesses an unusually high factor of substitutability with other sources, greater in fact than any of the other forms of commercial energy.

It is the difficulty of establishing the true demand for energy in India, and the inter-relationship between supply and demand on the vast domestic fuel sector, that points the need for scientific study on a large scale. If the growth of total energy demand has been underestimated then the effect on the growth of the balancing supply item, oil, is very much greater and the demand for oil would increase even faster than postulated above. In any event increases in the demand for oil of the magnitude foreseen will demand organisation of a high order for those engaged in making the long term arrangements to provide supplies.

The oil industry should be quite capable of meeting the great expansion of world-wide demand that is probable — and it clearly represents the biggest industrial expansion of its kind the world has yet seen — if the conditions are right. It must of course remain virile, competitive and healthy, and it also must make reasonable profits; adequately large enough to plough back earnings for expanding capital commitments.

In the world excluding the U.S.A. and the U.S.S.R. these commitments in the next ten years are likely to total the equivalent of some Rs. 20,000 crores in many currencies.

This compares with the equivalent of about Rs. 9,000 crores in the previous ten years.

Many things have changed in recent years for both internal and international financing, and this question of ploughing back earnings has become an important feature of modern industry, as the pace of big industry continues to outgrow the capital market of the world.

There are now only too many instances of the serious difficulties that arise in particular industries in countries where the ability to generate finance for expansion for one cause or another has been curtailed. The steel industry is a notable example and as a case in point the predicament of the U.K. steel industry is worth study.

Vast as the capital requirements of the oil industry may be, they would be far greater if full recourse to every new advance in technology was not energetically pursued. For example the technical advance which permits the construction of tankers of giant size has been put to practical use with great speed. Out of the orders placed for new ships no less than 300 of these vessels will be too large to transit loaded through the Suez Canal in its present form. Quite a number of these vessels will be around 80,000 deadweight tons and there will be some in excess of 100,000 tons.

Generally speaking the economies of scale in the bulk movement of oil have restrained the pressures on costs arising from other causes. On the other hand, the cost of finding and producing oil is increasing with rising equipment costs and the fact that the search has to proceed deeper and further afield. It is, however, reasonably apparent that these costs may not rise at a rate comparable with the costs of mining new resources of coal.

Out of the pattern of investment of the industry one important point emerges and that is the cost of exploration, drilling and production facilities exceeds the cost of all the rest of the industry's commitments put together — the refineries, tankers, pipelines, marketing facilities, etc.

This outlay on production has very important implications for India in the context of the possible increases in her demand for oil, bearing in mind that this oil is a necessity without which economic expansion slows down.

The prospects of developing oil in new areas involve two kinds of risk. The physical risk—that of spending much money and finding no oil, and the commercial risk — that of not gaining a sound and viable operation.

Looking at the financial risk the costs can be very considerable; there are numerous cases where large sums have been expended in search in new territories for years without success. But even where success is eventually achieved the costs continue at a very high rate. An example of this is Canada where large sums were expended for many years with virtually no success. Since success was achieved $1,500 million have been expended since 1946 in oil development and yet this has so far resulted in a current production that is considerably less than that of Kuwait. The very large production and reserves of oil that have been discovered in the Persian Gulf area naturally influence the viewpoint of enterprises which may be considering participating in the search for oil in contiguous areas. It is self-evident that to any commercial enterprise the situation would be considered marginal where the prospects are distinctly speculative and the terms noticeably less advantageous.

But if the climate is right the inflow of capital produces remarkable results of which the recent case history of Canada is an excellent example. Canada has been running a current account deficit which has been widening rapidly. In 1956 it jumped from $800 million to $1,400 million and indications are that the gap is continuing to widen. And yet the Canadian dollar, one of the few currencies that are allowed to "float", is steadily appreciating in terms of other leading currencies.

This apparent anomaly is accounted for by the fact that foreign money, in the form of capital and investment money, is moving in so fast that it is covering the current account deficit and still leaving a surplus for reinvestment abroad and additions to the reserves. An important element in the inflow of capital is that on the Oil Industry Development account.

India's appetite for oil is such that the sheer risk capital and effort that must be devoted to search and development, perhaps for years, presents a very heavy load for which the alternative is external oil purchases to an extent which the exchange reserves are unlikely to stand.

The efforts that are being exerted by the Government and others to discover oil in the country are admirable indeed, but the problem is evidently growing to such a magnitude that it may well be in the country's interest to attract the maximum amount of external assistance if serious strain on the economy is to be avoided.

INDUSTRIAL FINANCE: LESSON FROM EUROPE

TWO Bills recently passed by Parliament to amend the Reserve Bank and State Bank Acts can be said to have more than ordinary significance. Not only have they brought into focus the entire problem of industrial finance, but, what is more, they also seem to be the precursor of some major reforms in banking in the offing. A hint to this effect was given by the Finance Minister while speaking on his bills in the Lok Sabha. He observed that it was his intention to make the Reserve Bank "the supreme adviser to Government in all matters of money, credit and banking" and also to enlarge the functions of the State Bank by transferring to it some of the functions of the Reserve Bank which are in the nature of "pure commercial or co-operative banking". It may be that it is Government's intention that a rationalised credit structure should soon be evolved to cope with the needs of an expanding economy. If that were so, there is nothing to cavil at.

However, the problem immediately posed is with regard to industrial finance. The Reserve Bank and the State Bank Acts have been amended as a prelude to providing an institutional set-up that will make available medium-term finance to the private sector of the industry. This has been considered necessary because Government have felt that the Industrial Finance Corporation, the Industrial Credit and Investment Corporation and the State Financial Corporations have not been of much avail in this regard. Thus the constitution of the Refinance Corporation will be followed by other institutions (to the capital of which the Reserve Bank will contribute) to meet the increasing demands in the field of industrial finance. Here the Government seems to have taken the cue from certain recent trends in Europe and the valuable report of the Productive Agency of the O.E.E.C. (Organisation for European Economic Co-operation) might have provided some inspiration.

A significant development in banking in the post-war period in many countries on the continent has been the rather active association of banks with industry. The O.E.E.C. Report says "It would be no overstatement to say that the banking systems are fairly generally expected to do more for financing the capital formation of industry than orthodox views on deposit banking would allow". In view of this it goes on to say "It might be advisable to concentrate on devising newer techniques for the problems involved than to go on fighting a rearguard action against the trend of developments". It is true that Indian banks are essentially commercial banks supplying short-term capital to trade and industry and they do not have the tradition of mixed banking, that is, also supplying long-term capital requirements. This has been largely the result of emulating the practice of British banks. But recently commercial banks here also have become involved in medium or long-term industrial finance. For example, they have been indirectly supplying long-term capital to industry by subscribing to the share capital of the Industrial Finance Corporation and the Industrial Credit and Investment Corporation. A few banks, it may also be mentioned, have been directly underwriting new issues on a small scale. Further, with the nationalisation of insurance and the stepping up of the taxation rates, banks have been indirectly forced to play an increasing role in financing industrialisation.

However, opinion in this country has not crystallised over the exact role of commercial banks vis-a-vis industry. For example, the Shroff Committee, which examined the problem of credit supply to the industrial sector, discountenanced suggestions that commercial banks should play a more active role in regard to the supply of industrial finance. On the other hand, it suggested a number of new organisational arrangements through which more credit could be made available to the private sector. The establishment of the National Industrial Development Corporation and the Industrial Investment and Credit Corporation seems to be a logical corollary to this suggestion.

While analysing the trends in industrial finance in Europe the O.E.E.C. report pertinently observes that any extensive development that would make commercial banks use part of their deposits for long-term loans to industry would "in effect be reversing the continental banking reforms of the 1930's." Perhaps the report is more impressed with the developments in Britain where in the system obtaining there, there is little scope for long-term lending to industry. It observes, "Apart from the reluctance on grounds of policy to tying up reserves and taking risks incompatible with their responsibilities to the depositors, the joint stock banks are not technically organised for providing long-term finance to industry". Therefore the report has no hesitation in suggesting that "a safer and convenient method of using the commercial banks' resources to the proposed end is to form specialised technically well-equipped institutions whose share capital is jointly held by banks and to supply them with sufficient loan capital for long-term investment." It goes on to emphasise that "the loan capital provided should be really earmarked for long-term lending and not withdrawable whenever the shareholding banks have liquidity troubles".

This recommendation that specialised institutions are necessary for supplying medium or long-term finance seems to have found favour with the Government of India. The formation of the Refinance Corporation and the Finance Minister's statement that other new agencies will be started to meet the needs of the industry stem from the acceptance of this suggestion. But doubts have been expressed in certain quarters that the constitution of the Refinance Corporation more or less as a department of the Reserve Bank indicates signs of direct participation by banks in industrial finance. The O.E.E.C. report seems to take exception to this kind of development. In fact it goes to the extent of suggesting that even the specialised institutions should not depend on bank advance at all. It says, "A technically safer solution is for any such institutions to raise their operating funds by issue of bonds and debentures instead of relying on bank advances".

The report examines the position in Great Britain and points out that the I.C.F.C. (Industrial and Commercial Finance Corporation) and the F.C.I. (Finance Corporation for Industry) offer significant examples of a method whereby a part of the commercial banks' resources can be harnessed to long-term lending through agencies technically equipped for this specialised work and able to devote their full attention to doing it consistently. Even here it suggests "On a long view of the prospects of this relatively new departure in industrial financing it may be in the best interests of all concerned that the loan capital used by such institutions should not be dependent upon bank advances. It could be raised by issue and sale to the capital market of

"...and an aluminium house we'll build"

Aluminium houses are so light and easy to erect...no wonder our young friends feel that even they could do it.

Prefabricated aluminium houses and aluminium building materials are rapidly gaining popularity in India because they are light, strong, durable and require no maintenance.

At Hirakud in Orissa, close to large resources of hydro-electric power and bauxite, Indian Aluminium Company is installing a new 10,000-ton smelter which will make more aluminium available for our homes, farms and factories.

I am Adipocere

Pronounced 'adi-po-saire'

how d'you do?

You have never heard of me—well,
I don't blame you as I have been very shy
of tom-tomming my existence. Let me tell you
a story about myself, my trials and tribulations.

I was born millions and millions of years ago.
My origin was from sources which are not socially
acceptable ... in fact, I cannot wear a dinner jacket!
Lots and lots of animal and tiny plant matter decayed
in stagnant water where there was no oxygen ..
these were my ancestors, who eventually turned into
the waxy residium that I am—ADIPOCERE.
I have no ancestral wealth, and I could never own a
castle—but I am fabulously rich in fatty acids,
and I don't think you could do without me.
I am flabby, shapeless and ungainly—
all the same I am quite happy.

That's me—ADIPOCERE, the ancestor
of that Prime Mover—Oil.

STANVAC—*the name that stands for progress*

bonds and debentures. Bank advances would then be used more appropriately to meet marginal fluctuations in requirements and to provide temporary finance between bond issues".

Although it is possible that as in other fields there is considerable scope for innovations in the field of credit also, the suggestions in the O.E.E.C. report are certainly worth study. However one thing needs reiteration. The problem of finance and credit arises on account of a deficiency of overall availability of resources as well as an inadequacy in organisational arrangements in regard to mobilisation. There is no use emphasising the latter to the exclusion of the former. The basic problem still remains that of more saving without which more investment is not possible.

EXPORT TRADE PROMOTION

(CONTRIBUTED)

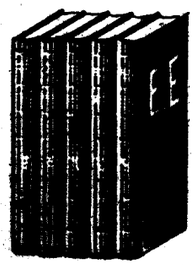
THE need of the hour in India is to find more and more money to finance an ambitious plan. If the heavy taxation measures of the recent Central Budget are one means of finding the wherewithal, another orthodox means lies in stimulation of exports. The questions that immediately strike us are: What are our export potentialities in regard to commodities? What is the volume of export surplus available? What is the level of internal consumption? In all these cases, unfortunately the answers are negative to varying degrees. In the first place, limitations are imposed by the basically agrarian character of the country's economy and, secondly, the apparent neglect in developing a new series of export industries which may act as our second line of defence. Admittedly the industrial pace has not been rapid enough. Therefore at the moment our foreign exchange earners are to be drawn from the traditional list of agricultural commodities and semi-manufactures and these are few. To this can be added the products of the cottage industry, but here also a saturation point has already been reached in productivity.

To begin with production, two requirements are at once obvious—increase in volume and improvement in quality, with austerity in consumption, where warranted. In this connection, incentives might step up production, such as grant of State subsidies in the shape of cash or certificates, provision of technical know-how and offer of materials at cheaper rates than their current selling prices, to equalise the competitive advantage enjoyed by foreign manufactures. A distinction might be made between the materials used in the manufacture of articles for export and those for home consumption. As the quality of the finished product depends on the quality of the materials used, machinery installed and methods employed, modernisation and rationalisation of these is immediately desirable.

Quality can only be ensured through a regimented standardisation of methods from production to marketing stage. At present, the work and functions of standardisation in India are well looked after by the Indian Standards Institution, but it has been observed that many of its standards tend to be too general and as such touch only the fringe of the problem. The real problem is that no standardised machinery has been devised to enforce the standards. The Indian Standards Institution has evolved an impressive standard for packaging of textiles for export, but experience shows that complaints are still made on packages, which could be avoided to a certain extent by instituting a system of affixing stamps on every exported bale or package that the package conforms to the official standards. To check whether questionable use of the stamp is made, test checks of bales should be undertaken. It appears that a scheme of certification marking is in operation in Mysore under which druggets made according to the ISI on the subject are only allowed to be exported. The principles of this scheme might be extended and applied suitably to cover many items of our exports.

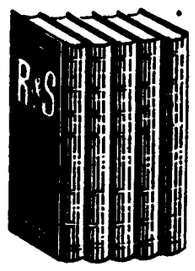
There is need for organising immediately a Central Export Trade Board composed of representatives of trade and industry and the Government, with headquarters in New Dlehi and branches in four main centres. As a matter of fact, there are in existence several committees and councils and boards, such as the export trade promotion councils for various commodities, the Coir Board, Handloom Board, etc., but due to their large and increasing number, they only tend to duplicate matters. Even the constitution of a new Foreign Trade Board announced by the Minister for Commerce and Industry in his recent address to the Export Advisory Council is not a solution as it will only group the existing personnel into a different mould with an enlarged secretariat. On the other hand the constitution of a Central Export Trade Board would help in the execution of policies in close conjunction with trade. If it is endowed with the necessary powers and functions directly under the Minister of Commerce and Industry, it could take the responsibility for the entire management of exports and all the existing councils and boards would become unnecessary. Its immediate task should be to prepare a list of exporters and this list might be enlarged from time to time to enable a wider section of business to participate in export trade. Overseas importers should be asked to deal with only the exporters who have been included in the list through the Central Export Trade Board. On receipt of an enquiry, the Board should select an exporter, according to the magnitude of the contract and the ability of the exporter to undertake the transaction, from the list of exporters for dealing with it. The marketing of dairy products by the Dairy Products Marketing Commission in New Zealand operates on this principle to great advantage. To ensure equality of opportunity, a system of rotation and division of exporters on a destinational basis might be employed, while selecting exporters to work out export contracts.

The next task of the proposed Central Export Trade Board should be to set up a nucleus of research organisations such as a design school, council of fashion and idea scouts, colour council and advertising council. The design school, composed of members of the manufacturing industry, should conduct research in designs, train designers, collect and collate design data and its recommendations should govern all design activity. The idea scouts should similarly engage in the research of new ideas, fashions and trends for incorporation in production. As a further aid to manufacturing industry, a museum might be opened, where samples of articles from different manufacturing centres of the world are exhibited to focus production trends. The organisation of a colour council preferably on the lines of the one in the United Kingdom should take care of another fundamental aspect of manufacture.



Complementary to these research organisations, which are mainly designed to improve production, should be an organisation to conduct regularly market

research and analysis. It should be recognised that different markets need different goods and different techniques to exploit the demand. Consumer research and product research, conducted systematically by actual salesmen in the consuming centres, are essential. The functions of such field market analysts are now performed by the Trade Commissioners who are not quite experienced in this field. The present method of selecting Trade Commissioners from the restricted field of the Indian Foreign Service personnel or from the Ministry of Commerce and Industry should be replaced by forming a new service called Foreign Trade Service manned by persons with a minimum period of 10 years' experience in trade and industry. The staff also should be drawn from the field of trade and industry.



Competitive prices, appointment of agents and sole distributors abroad, improved salesmanship methods, extension of sight draft facilities as opposed to irrevocable letters of credit, removal of double taxation, prompt payment of commissions are all methods that can be adopted to boost exports. Competitive prices can be ensured by the removal of all export duties and cess, inter-State taxes, sales tax and other charges which raise the source price. The manner in which our trade samples are presented confirms lack of salesmanship and it is time that minimum standards for trade samples were prescribed. Publicity and propaganda are also necessary for high quality salesmanship. A central advertising organisation for export, functioning under the proposed Central Export Trade Board, may be formed on a national level, to assist and advise the trade in regard to advertisement either in the national or international press. The next step would be to publish attractive handbooks well illustrated and incorporating all information on the commodity concerned which may act as a buyer's guide. To cover day-to-day trends, a monthly journal should be brought out on the lines of "Czechoslavakian Foreign Trade", "German Export", "Rumanain Foreign Trade", and "Hungarian Foreign Trade". In the sphere of visual publicity, exhibitions, fairs and displays are no doubt an effective media, but only when properly laid out. Another method of salesmanship that should be employed in a greater measure is by the use of trade brands and marks, fixing of labels and stamps and directions for use. Branded goods not only signify quality but increase sales and turnover.

Of the various factors hampering expansion of our exports the most serious is the unethical business methods resulting in trade disputes. The most common complaint is that the goods exported never conform to the sample on the basis of which the contract is entered into. Secondly, attention is not paid to the instructions and wishes of the overseas importer. Thirdly commissions are not promptly paid and fourthly, the settlement of the trade dispute is delayed. A preventive step would be to establish a court of arbitration or a tribunal, as an integral part of the proposed Central Export Trade Board, armed with full judicial powers to deal with any defaulter punitively. Every export contract should stipulate that any disputes arising in the performance of the contract would be governed by the rulings of this court. The format of the contract itself should be standardised. In so far as the foreign importer is concerned, this would ensure that in future he would have recourse to a high tribunal.

We are on the threshold of great changes where conservatism and doctrinaire approaches are powerless to deal with situations. There is no reason why some boldness and imaginativeness should not be brought to bear in the promotion of our export trade.

BOUND VOLUMES
of
THE EASTERN ECONOMIST
and
RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

THE EASTERN ECONOMIST .. .. .. Rs. 75.00

RECORDS & STATISTICS .. .. .. Rs. 18.00

(We regret above prices were wrongly quoted as Rs. 50/- and Rs. 12/-, in our last issue.)

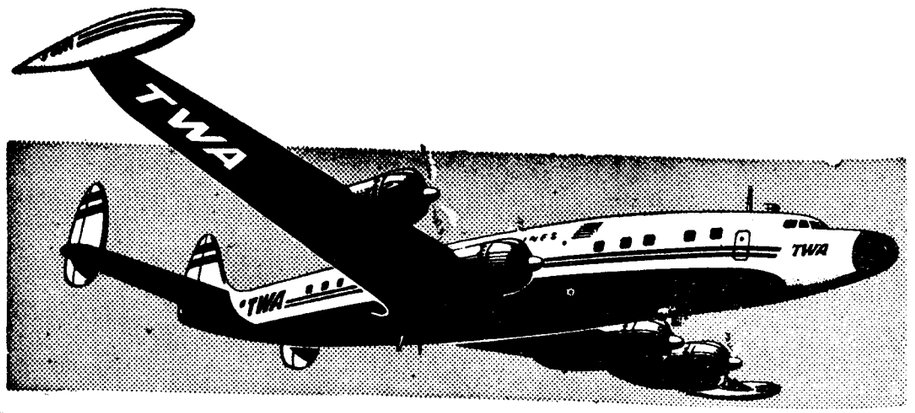
BUSINESS NOTES

COAL AND THE PLAN

RECENT DISCUSSIONS in Parliament over the Coal-Bearing Areas (Acquisition and Development) Bill served to focus attention once again on Government's policy over the coal industry. The bill, which has been passed by both houses of Parliament, arms the Government with powers to establish greater public control over the coal mining industry and its development. There is nothing to cavil at this, provided Government has a definite policy that can deliver the goods since pious hopes alone can lead the country nowhere. Now what are the facts about this industry which the Finance Minister has significantly included in the hard 'core' which he is determined to implement at all costs? The target of coal production by the end of the second Plan has been raised to 60 million tons per annum from the existing production of 38 million tons and out of this increase of 22 million tons, the public sector has been assigned 12 million tons while the private sector has been given the balance of 10 million tons. The division of the target between the private and public sectors has apparently been based on the consideration that the Industrial Policy Resolution of 1956 places coal in schedule A which means that all new units in this industry, save where their establishment in the private sector has already been approved, will be set up only by the State.

But if past performance were to be any guide, there are enough reasons to hold that the Government is trying to bite more than it can chew. So much so, an ardent advocate of nationalisation like Mr. R. P. Sinha was forced to utter some home truths in the Rajya Sabha during the discussions on the Bill which should make Government shed some of its complacency. The fact was, he reminded, that the achievement of the public sector during the first Five-Year Plan was not very creditable. Out of 38 million tons, the production from the public sector was only 4 million tons while the balance came from the private sector. Further, the monies that were allotted to the public sector were not fully utilised by them. They were allotted about Rs. 110.95 lakhs against which they could only utilise to the tune of Rs. 38.66 lakhs during the first four years of the Plan. The surveys of areas where coal production could be developed could not be completed and the monies that were allotted for surveys were not utilised. In the face of these, there was no wonder that he should have asked Government to place all the cards on the table and frankly tell the country how they proposed to fulfil the additional 12 million tons which had been allotted to the public sector in the light of the progress that had been made so far and what areas they proposed to work in the public sector. It would appear, Mr. Sinha said, that Government had made tentative allotments with regard to six million tons but no decisions had been taken with regard to the rest of the six millions, though the first year of the second Plan had already gone.



It would, therefore, be hardly surprising if genuine doubts are entertained about the Government's capacity to fulfil the targets under the Plan. The path of wisdom will be that instead of being doctrinaire, all energies must be bent on developing this national asset, so important for industrial development, at its optimum efficiency by all available means instead of indulging in futile controversy as to targets of production between the public and private sectors. It is with this end in view that Mr. Sinha uttered a warning that "if the Damocles' sword is hanging over the head of the private sector that the coal industry is going to be nationalised, it will have neither the mind nor the incentive to invest money and go ahead". The fact is that the responsibility of the private sector under the second Plan is very great since it has to fulfil about 75 per cent of the total requirements under the Plan, and it will be a short sighted policy to hamper its progress on dogmatic grounds which will only end in killing the goose that lays the golden eggs.

In the ultimate analysis, the country's interests are paramount and if the public sector cannot fulfil the target, then the private sector must be enabled to do it. Thus any discrimination against the private sector will be injurious to national interest and Government should see to it that it uses the powers in its hands with care and with the larger end in view. There are various ways of helping the private sector. Mr. Sinha, for example, suggested that the contiguous areas that have to be worked by private collieries should not be taken up by the Government. This is indeed only fair. Government should also extend all reasonable facilities in the matter of transport and in meeting shortage in materials like iron, steel, cement and machinery. Above all, the time has come for the revision of coal prices which will be fair and at the same time help the expansion of the industry by facilitating capital investment. This would also avoid wastage in mining and encourage efficiency in utilisation.

CO-OPERATIVE MOVEMENT IN INDIA

THE STATISTICAL statements, just released by the Reserve Bank of India, on the progress of the co-operative movement in 1955-56 highlight the considerable expansion that has taken place during the year. There has not been only an advance in agricultural credit societies, but there has been a significant expansion in non-credit structure too. The number of Central non-credit societies increased from 2,599 to 2,764 and their membership from 1.8 million to 1.9 million. At the primary level non-credit societies in both agricultural and non-agricultural sectors recorded a general rise in their number, membership and business. The number of State non-credit societies went up by 22 to 82 and their business almost doubled. Again, primary non-agricultural, non-credit societies retained their position and showed profits of as much as Rs. 71.51 lakhs in 1955-56 as against a loss of Rs. 89.53 lakhs in 1954-55. The profits of the State and Central and non-credit societies went up from Rs. 49.23 lakhs to Rs. 123.63 lakhs. Agricultural credit societies numbering 159.939, however, recorded a larger increase compared with other types of societies and represented numerically the most important single class of co-operative institutions, forming 67.6 per cent of the primary societies and 80.5 per cent of the primary agricultural societies. Assuming that an average family consists of five persons, it may be estimated that 22.8 per cent of the population has been brought into the co-operative fold as against 21 per cent at the end of the preceding year.

Although not stupendous, this may be deemed fairly satisfactory achievement. The disparity in the development as between agricultural credit societies and non-credit societies is, of course, understandable as such a trend is inevitable in a country which is predominantly agricultural and where lack of credit facilities for cultivators has for long been considered hopelessly inadequate. While giving credit to the movement it has to be stressed that the emphasis should be not merely on quantitative expansion, but on qualitative development as well.

Branch Office at : **Connaught House, Connaught Place, New Delhi.**

COMPANY AFFAIRS

THE NEW INDIA ASSURANCE CO. LTD.

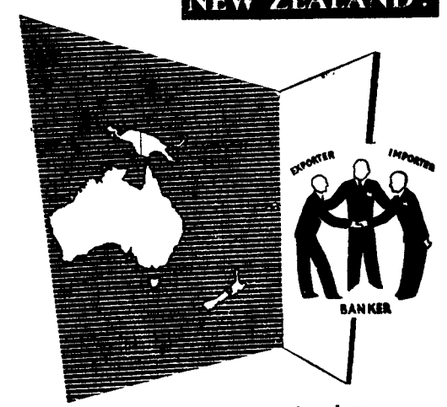
The annual report of the New India Assurance Co., Ltd., for the year 1956 is the first report of the Company which does not incorporate the accounts of the life branch, thanks to the Life Insurance Corporation Act, 1956, and the consequent transfer of the life business and the life departments' assets and liabilities to the Corporation. Although the taking over of the life business has meant a considerable curtailment in the activities, and that too in one of the most paying branches of the company, it is gratifying to find that New India was able to maintain the rate of its growth. This is doubtless because the New India was not only practically the first Indian enterprise in the field of General Insurance but also the first company to attain an eminent status outside India. As a result of this tradition and wide experience the company's business has gone on expanding all the time. It is noteworthy that, despite a downward revisions in rates of premiums in both 1955 and 1956 and the nationalisation of its life assurance business, which had the effect of completely disrupting and disorganising the company's administrative set up, New India registered further progress in the year 1956. The Premium income of the company, amounting to Rs. 564 lakhs represented an advance of Rs. 66.3 lakhs over that of the preceding year. While all the three departments contributed towards this improvement, the major share of the credit must go to the miscellaneous department, which recorded an increase of Rs. 35 lakhs. The increases in both fire and marine businesses were of the order of Rs. 15 lakhs in each case.

It is not only in regard to increase in business but in regard to commission and expense of management percentage as well that the miscellaneous department scored over the other two departments. Thus, as against 43 per cent, 22.3 per cent and 35.3 per cent in fire, marine and miscellaneous departments in 1955, the percentages of commission and expenses of management in 1956 were 44.8, 24.2 and 33.3, respectively. But the claims experience of the miscellaneous department was not as satisfactory as that of the fire and the marine departments. Whereas in the latter departments, the percentage of claims ratio was either the same or only slightly higher, that is by just one point, that in respect of the miscellaneous department increased by 3.4 per cent in 1956.

As regards the contribution to the earnings of the Company during the year under review, the share of the fire department was the largest, having gone up from Rs. 43.1 lakhs in 1955 to Rs. 47.7 lakhs. Indeed, it is this department which accounted for the bulk of the credit to the profit and loss account the exact figure being Rs. 46.1 lakhs. The miscellaneous department accounted for a credit to the Profit and Loss account of Rs. 4.1 lakhs, whereon the marine department actually showed a deficit of Rs. 5.3 lakhs, after the required transfer from additional reserves to maintain the Reserve Unexpired Risks, at hundred per cent. In the result, the total profits from all departments transferred to the Profit and Loss account aggregated Rs. 44.8 lakhs, that is an improvement of nearly Rs. 7 lakhs over the previous year. It must be noted here that, unlike in 1955, there was no credit from Shareholder's Life Profit account in 1956. The only other important source of income was from investments, which amounted to Rs. 9.2 lakhs. The net result was that the total amount available was Rs. 54.4 lakhs, as against Rs. 55.3 lakhs in 1955. After providing for taxation to the extent of Rs. 12.6 lakhs, there was left a balance for appropriation a sum of Rs. 41.8 lakhs. The various appropriations recommended by the board of directors, including Rs. 13 lakhs for investments reserves and Rs. 21.4 lakhs for the slightly increased dividend at the rate of Rs. 3 per share, left a balance of Rs. 1.4 lakhs to be carried forward, as against a little over Rs. 1 lakh brought in. In passing, it may be mentioned that, although the amount to be distributed as dividend to the Shareholders shows an increase from Rs. 17.8 lakhs in the previous year to Rs. 21.4 lakhs, the latter amount is more than covered by the total interest earnings which improved to Rs. 23.9 lakhs in 1956.

The total funds of the Company here further augmented as a result of the year's operatons and, at Rs. 759.8 lakhs, they are higher by Rs. 52.9 lakhs over the previous year.

The progress of the Company for the last five years is summarised below:



(In lakhs of Rupees)

	1956	1955	1954	1953	1952
Premium Income:					
Fire Department .	289.7	274.1	250.3	233.3	229.3
Marine Department .	130.0	114.5	100.7	84.0	91.1
Miscellaneous Dept. .	144.1	108.9	85.5	72.3	65.5
Total of all Depts. .	563.8	497.5	436.5	389.6	385.9
Funds:					
Fire Department .	188.0	181.0	168.0	159.0	155.0
Marine Department .	165.0	156.0	141.8	125.0	132.0
Miscellaneous Dept. .	92.0	74.0	62.0	55.0	51.0
Total of all Depts. .	445.0	411.0	371.8	339.0	336.0
Free Reserves:					
General Reserve . .	100.0	100.0	85.0	75.0	66.0
Premium on Shares .	36.2	36.2	36.2	36.2	36.2
Dividend Equalisation Reserve . .	22.0	20.0	20.0	17.0	16.0
Exchange Reserve .	5.0	5.0	9.9	11.1	11.1
Investment Reserve .	12.0	9.0	9.0	—	—
TOTAL . . .	175.2	170.2	160.1	139.3	129.3

As on December 31, 1956, besides the Free Reserves of Rs. 175 lakhs, Additional Reserves held in the Underwriting Departments amounted to Rs. 137 lakhs.

Under the Life Insurance Corporation Act, 1956, a sum of Rs. 48.7 lakhs and under the Life Insurance (Emergency Provisions) Act, 1956, a sum of Rs. 1.51 lakhs have been offered to the Company as Compensation. But the Company considers these amounts as inadequate in terms of the Acts and has, therefore, not accepted it.

COMMODITY NEWS AND NOTES

INCREASED COAL OUTPUT DURING MARCH

Output as well as despatches of coal from pitheads in the country showed an increase in March 1957. During the month, according to information received from the Chief Inspector of Mines in India, production was 3,652,777 tons and despatches 3,248,899 tons. The figures for the previous month were 3,520,645 tons and 2,850,074 tons respectively. Coal stocks at pitheads at the end of March were 3,000,133 tons as compared with 3,033,961 tons at the beginning of the month. During the month, 833 collieries were reported to be working with an average daily employment of 360,572 workers. Output per man-shift was estimated at 1.13 tons for miners and loaders, 0.61 ton for all workers underground and in open-workings and 0.41 ton for all persons employed including surface workers. The percentage of absenteeism was 13.06. Nine coke plants at collieries and elsewhere produced 396,086 tons of hard, soft and other kinds of coke during the month, and despatched 228,253 tons.

TOBACCO ESTIMATE FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of tobacco, 1956-57, puts the current year's area at 900,000 acres, as against the adjusted second estimate of 847,000 acres for 1955-56. This shows an increase of 53,000 acres or 6.3 per cent in area during the current year as compared to last year. The increase in area during the current year has been shared by Andhra Pradesh, Bombay, Bihar, Madras, Uttar Pradesh and Rajasthan and has been attributed generally to favourable climatic conditions at the time of sowing. The information given in this estimate generally relates to the period up to the end of February 1957. Till then, the condition of the crop was reported to be generally satisfactory. This estimate does not cover the entire area sown to tobacco crop during 1956-57. Past experience has shown that the area at the second estimate stage forms roughly 95 per cent of the area under the crop finally reported.

AGRICULTURAL PRODUCTION IN 1956-57 AND 1955-56

Replying to a written question by Shri Nawab Singh Chauhan, Shri A. P. Jain, Minister for Food and Agriculture, said in the Rajya Sabha that the total increase in the production of food grains (cereals and pulses) during 1956-57 over 1955-56 was likely to be over 1.4 million tons.

The Minister added that the final estimate of production of rice in India during 1956-57—the first year of the second Plan—showed an increase of 1.3 million tons over 1955-56. Provisional advance estimates for wheat, other cereals and pulses for 1956-57 indicated that the additional production will be over 1 lakh tons. The target of additional production of food grains, the Minister further stated, was fixed at 1 million tons for the grow more food schemes for 1956-57.

STANDARD FOR ANTIMONY

The Indian Standards Institution has circulated, for eliciting comments, a revised draft of the Indian standard specification for antimony (IS: 211-1950). The specification was first issued as a tentative standard in 1950. The main modifications made in this revision relate to the inclusion of limits for silver and tin in the chemical composition of the three grades of antimony covered in this specification. Comments on this draft standard may be sent before August 10 to the Indian Standards Institution, 19, University Road, Delhi-8 or its branch offices in Bombay and Calcutta.

PRODUCTION AND DESPATCHES OF INDIGENOUS SUGAR

The production and despatches of indigenous sugar amounted to 19.13 and 11.70 lakh tons up to May 15, 1957, in the current season, as against 17.28 and 9.77 lakh tons respectively in the corresponding period of the last year. The stocks with the factories on May 15, 1957, stood at 12.70 lakh tons, as compared with 12.61 lakh tons last year.

PRODUCTION OF MINERAL WOOL

A new process for the production of mineral wool has been developed at the Shri Ram Institute for Industrial Research, Delhi. The new process developed has been evolved with the aid of "press mud" from carbonation sugar factories—a waste material, the disposal of which entails considerable expense to sugar manufacturers. A sugar factory crushing 1,000 tons of cane, discards 10 tons of "press mud" daily and accumulates 1,200 tons in a working season of 120 days. Substantial quantities of mineral wool from "press mud" have been prepared at the pilot plant, and supplied to user industries. Know-how for the production of loose mineral wool on a large-scale has also been perfected. Parties desirous of undertaking the commercial development of the process are invited to correspond with Secretary, National Research Development Corporation of India, Mandi-House, Lytton Road, New Delhi-1.

COAL DEPOSITS IN GARO HILLS

The Union Minister for Steel, Mines and Fuel, Sardar Swaran Singh, said in Lok Sabha that considerable reserves of coal were estimated in Garo Hills in Assam, but these were yet to be proved by detailed prospecting. Replying to a question by Liladhar Kataki, the Minister said that drilling operations had been started by the Geological Survey of India to find out the potentiality of the coal deposits. The question of exploitation of the deposits could be considered after the results of drilling were known.

MINERAL DEPOSITS IN HIMACHAL PRADESH

Replying in the affirmative to a question by Shri Bahadur Singh whether Government contemplated taking up geological investigations in respect of mineral deposits in Himachal Pradesh, the Minister of Education and Scientific Research, stated in the Lok Sabha that Geological Survey of India had been carrying out investigations in the past and would continue to do so in future as part of their annual field programme. Replying to another part of the question, he said, the following minerals were reported to occur in the territory:

Asbestos, Beryl, Barytes, China Clay, Coal, Copper, Galena, Gold, Gypsum, Iron ore, Lead, Limestone, Magnetite, Mica, Pyrites, Salt, Slate and Sulphur.

Your Income tax affairs need not worry you

Preparation of Income tax returns is a complicated matter these days. This need not, however, worry you.

You will find it to your advantage to place your Income tax affairs in the hands of your bank.

The State Bank of India will be pleased to undertake the preparation of returns, the checking of assessments and the submission of claims for refund of tax at moderate charges. The Bank will ensure that you obtain all the refunds to which you are entitled.

Why not talk things over with your nearest Bank Agent or write for information?

The State Bank's branch at Delhi, one of more than 555 offices waiting to serve you throughout India.

STATE BANK OF INDIA

Largest of the Indian Joint Stock Banks

SISTA'S-SB-9

YOU SHOULD KNOW

HOW THE RECENT INCREASES IN EXCISE DUTIES AFFECT YOU

When you buy SUGAR, remember that the increase in duty is 5 nP per lb. or 10 nP per seer.

VEGETABLE OILS produced by ghanis or by small producers are exempt from duty and should not, therefore, cost more. Even for vegetable oils from large mills the increase in duty is only 2 nP per lb. This small increase may very well be absorbed by the trade in view of the 10 to 20 nP per lb. rise in price during the last year.

If you smoke, please note that you need not pay more on any brand of cigarettes other than those manufactured exclusively from Indian TOBACCO such as "Char Minar" or "Shah-i-Deccan." On these the effect of the rise is between ½ to 1 nP per packet of 10. 100 biris will cost only 1 nP more. The price of hukka tobacco should not in any case increase by more than 13 nP per lb.

For your MATCHES, do not pay more than 4 nP per box of 40 sticks and 6 nP per box of 60 sticks. This includes reasonable profit for trade as well as increase in duty.

A quire of Ordinary Writing PAPER (8 lbs.) should, if at all, cost only 1½ nP more.

PAY ONLY WHAT IS FAIR

IT BENEFITS YOU AND THE COUNTRY

The Finance Minister

the Prime Minister absent abroad, it is ural that the spotlight, if only because of nomic crisis, should rest firmly on the Minister. Mr. T. T. Krishnamachari has himself responsive to the feeling widely the business community that he should at some length—and appropriately with rce of his strong personal equation—the ter of the rude economic changes which he itiated with the Budget and his proposed and monetary policy. During this week there have been long and, on the whole cordial, discussions at Calcutta with a group of business men drawn together by the Federation of Indian Chambers of Commerce and Industry. On Saturday and early next week Mr. Krishnamachari is meeting business men of Bombay who, perhaps, even more than the business men whom he met in Calcutta, believe themselves to have felt the rigour of his measures. It is difficult to say whether the Bombay atmosphere will be as favourable to the production of a good psychology as

was the Calcutta meeting. Broadly, it might be said, however, that a meeting can do no harm even if it fails to do any significant good.

Two views are possible in regard to the character of the psychological change which these meetings are to induce. The business community is in many minds at the present time. At one end is the somewhat inflexible group represented by the Forum of Free Enterprise. At another there is the group of extremely flexible business men, who believe that political power has passed entirely from the business community and all that is left for them is to accept with good grace any decisions of the representatives of a sovereign people, in which inevitably a radical element must reside. Betwixt and between, there are a number of business men who feel that they can come to terms with the people's political representatives even though a strong radical have-not element rests lower down. There is some foundation for this faith; for these political representatives need the business community as much at least as the business community needs the politicians. For if the politician gives the business man political stability, the business man by organising production gives the politician resources without which he cannot function. There exists, therefore, a basis for compromise. It is likely that the middle element which is ready to play with the Government but at the same time to make clear the limits within which co-operation is possible will command in time the largest section of the community. Whether this growing section will record more with the Finance Minister than any other is one of the questions which is currently being asked.

In making economic policy in the last twelve months the Finance Minister has been notoriously indifferent to the advice tendered to him by the business community. His last Budget has done violence to some of the elements of enterprise which the business community feels essential. In particular, the tax on wealth applied to companies has a direct disincentive effect on the expansion of business, the full significance of which the Finance Minister has been still unwilling to realise. In a sense the Finance Ninister in accommodating himself entirely to the strong political current initiated by the socialistic pattern of society has tended to lose touch with the business community. Nobody need pretend that the meetings in Calcutta this week and those proposed in Bombay next week have abolished the points of difference. The most one can expect is that they are narrowing down the issues on which fundamental differences exist, and inducing a sense of realism in the business community that what cannot be cured is not so terrible that it cannot be endured.

There were other happy indications. Broadly, one might say that the Finance Minister's discussion in Calcutta was helpful in indicating the limits to which additional taxation might go. He certainly gave the impression that the pattern of future taxation in the Plan will not differ substantially from that of the current Budget. What this precisely means in rates of taxes is still in question, but the range of new taxes is now happily restricted. That, in itself, is some consolation for those who have not been able to digest the rapid and novel ideas which have already marked the Finance Minister's short term of office.

The Finance Minister has also shown himself alive to the major problems at the present time particularly the severe stringency in the money market in respect of the provisions of working capital and even some fixed capital required by the private sector to implement its part of the Plan. He gave the assurance in Calcutta that it was the Government's intention that the private sector should perform fully its section of the Plan, and that Government's assistance, to the extent that it was possible, would be available for this purpose. Certainly private sector order books on the Plan items will be full, even if the Plan is cut substantially, as is now inevitable. It is also arguable that the Plan contains proposals for additional taxation which have not yet been exceeded by the Finance Minister; the business community cannot very well claim that he has sprung a surprise on them when the printed Plan contained provision for additional taxation of Rs. 800 crores which has been far from exceeded. In other words, the Finance Minister can claim consistency with the Plan, even though the measures which he has taken have rudely shaken the private sector. It is arguable that the private sector should have been in a more prepared mood for these onslaughts, which were underwritten by the country in the halcyon days before the Plan was seen in its hard exacting guise. The private sector has full order books and at least past acceptance of the volume of taxation to sustain its broken morale. The Finance Minister can claim now that he is only being as good or as bad as the written word.

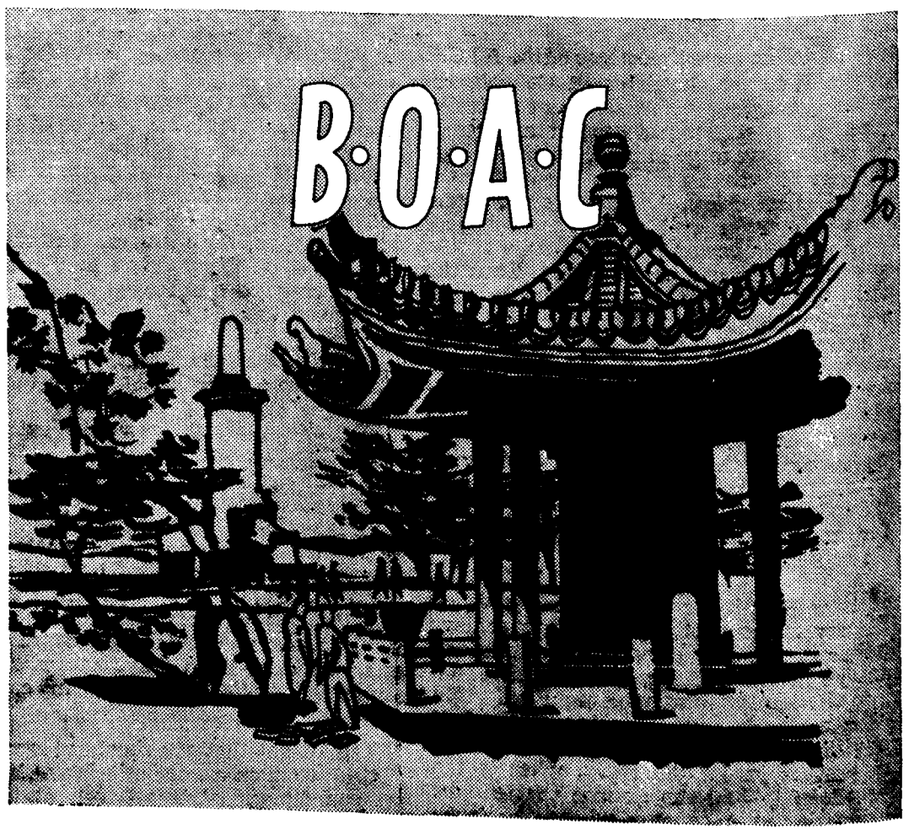
When all is said and done the fact remains that the conversations at Calcutta and Bombay are not likely to reconcile the prevailing philosophy of the private sector and the socialistic pattern of society in which both the public and the private sectors are supposed to operate. If the private sector believes that substantial concessions will be made by the Central Government as at present constituted, it is living on false hopes. If, on the other hand, it should choose—and for this purpose the metings in Calcutta and Bombay were arranged—to ascertain the areas of adjustment, the possibility of smoother co-operation between the sectors, than has existed in the last twelve months, is real.

There is at least one good reason why unstinted co-operation at this time should be extended to the Government. India is facing a severe external and internal crisis almost at the same time. The problem of foreign exchange and the problem of inflation are too close for us to indulge in a philosophical debate which will merely hinder action and aggravate our difficulties. Until the crisis at the door is resolved, every business man must be first a citizen of India and, therefore, a servant of the national, and no sectional, interest. In that sense and for a limited period the Finance Minister, unpopular as he now is in business circles, should receive in the framing of current economic policy the support of every element in the country. One may hope he will, when the Select Committee on the Finance Bill frames its report, remember some of the requests, which have been made of him. That will be the time for him to show by the appropriate gestures that he values the counsel and assistance that active agents in the business community render to the national interest in this hour of trial.

The Limits to Austerity

As a sequel to the recent meetings of the A.I.C.C. and the National Development Council, the country has been given a new slogan of austerity. The Prime Minister himself has set a personal example by deciding to go in for a smaller habitation. A voluntary cut in salaries has been made by the Central ministers. Some State Governments have followed suit and reports appear everyday about the varied and spectacular moves made to avoid pomp and ostentation. Thus the construction of the new Raj Bhavan for the Punjab Governor costing Rs. 58 lakhs has been postponed. Many State Chief Ministers have decided to dispense with their security guards. There will be restriction in the presentation of civic addresses to ministers and many more things of this kind may still come about. All these are apparently meant to create the necessary psychology in the country for austerity and "the tightening of the belt" at various levels very unequally prepared for an operation which is comparatively agreeable at the top.

It is time to ask the inconvenient question what this cry for austerity is meant to achieve and whether it will ever provide a real solution. The country's economy is faced with a crisis consequent on the implementation of the Plan. Will appeals for austerity and tightening of the belt help in saving the Plan and make the country tide over the present crisis? Secondly, what is the scope for austerity and the savings that can be effected thereby in a country where the large majority are living on the margin of subsistence? A frank answer must be found for these if the new drive for austerity is not to confuse and distract rather than assist solution.



The Ministers are a class apart in that if they forgo a part of their salaries (even this is in part doubtful as there are quite a number to whom this may mean a real sacrifice) there is at least a political gain. Any cut in the salaries of the other classes will have no compensation. So far as the Indian Civil Service is concerned, its members have been guaranteed certain salaries in the Constitution; it is wrong to treat these solemn guarantees lightly. So far as other services are concerned, cuts will sap morale and will bring about demoralisation. This certainly will not be conducive to efficiency or hard work on which so much of the utility of administration depends. The demand for another Pay Commission has already been made by other classes of Government servants. Though the Prime Minister has stoutly discountenanced this demand, it cannot be bypassed if prices rise. Similarly the cry for an upward revision of salaries has also been heard from several other services. The claims of labour have been no less insistent and the constitution of Wage Boards for several industries is thus inescapable. In the face of these, the pursuit of a cut in the salaries of any class at this juncture is likely to be a vain stand against an overwhelming current.

The other method of enforcing austerity is to restrict consumption. Appeals have been made for avoidance of waste and extravagance and to curtail consumption. With food prices soaring and prices of cloth showing no marked tendency to come down, the consumption of the two primary necessities has already been limited to the margin. What scope is there for any considerable saving on this score? The fact is that in the majoriy of consumption goods, there is severe limitation in the practice of austerity. Mr. Morarji Desai has expressed the view that "imported drugs and medicines are not essential consumer goods". It may be that only about ten per cent of the population resort to them. Does it mean then, for instance, that they should go without these drugs when they can be effective in reducing grave suffering. Surely this austerity is doomed to failure.

These being the limits to austerity, its current value can be safely relegated to the background instead of making a fetish of it. The real remedy for the disease in the body-economic obviously lies in other directions. These are firstly, whatever tenable economy that is possible must be effected by drastic cuts in Government expenditure; secondly, it must be realised that production is the only remedy and whatever comes in its way either on ideological or doctrinaire grounds must be scrupulously eschewed, and lastly, it is high time it was realised that the Plan outlay must be related to available resources. Austerity is no remedy for a situation in which we are recklessly beyond our investment capacity.

It is right that one should recognise that in a critical situation a war outlook and even a "blood-sweat-and-tears" approach can at times greatly assist the task in hand. The danger, however, is always in attempting, in the name of a war psychology, a demand far beyond human endurance. What constitutes human endurance in this case is itself a variable thing, being a function of the degree of insecurity felt and, therefore, of the readiness to make sacrifices in the public mind. It is fairly clear already that our current economic crisis has not induced a passionate war outlook. In other words psychologically, too, there are limits on the demand which a programme of austerity can command.

There is obvious danger, when the willingness to sacrifice is not there, in imposing by any monolithic and non-democratic means a measure of sacrifice which will raise rebellion and not response. There is enough indication in the present case — as the response to the Central Budget made it clear — that the people of India are not prepared for all the sacrifices which the Government of India deems to be necessary. It is obviously advisable for the Government to take note of the indignation which the taxation proposals have raised amongst the vocal public. Civil servants and those subject to public service conduct rules cannot raise a similar cry, but this does not imply that their feelings in the matter are very different. There are many civil servants who are anxious to share in the sacrifice which the Prime Minister believes to be necessary. But there are many more in whom the proposed cut in salaries, with the inflationary situation still growing, will induce anger and resistance. On balance the result for the public sector is not likely to be favourable. In this psychological field, even more perhaps than in the tangible material things, there rests the supreme limit to a call for ideological sacrifice. It is easy to overdo the austerity cry; indeed it has already been overdone.

THE WEEK'S NOTES

CANAL WATER DISPUTE

MR. W. A. B. ILIFF, Vice-President of the World Bank, is at present engaged in a fresh round of talks with the Government of India and Pakistan for the solution of the long-standing dispute over the utilization of the water of the Indus basin rivers. It is unfortunate that Mr. H. S. Suhrawardy, the Pakistan Prime Minister, should have chosen this occasion, when hope of a settlement is ascendant, to tell an American news agency correspondent in Karachi that Pakistan would be within its rights to fight for water supply if it should be cut off by India. The statement was not only inopportune; it was also unfair to India which had agreed to refer the canal water dispute for settlement to the World Bank despite the Standstill Agreement of 1948. Under that Agreement, Pakistan was to deposit with the Reserve Bank of India certain 'ad hoc' amounts for the flow of water from India to Pakistan. Though for the last nine years it has not deposited the money, India has not diminished the supply of canal water, which it could do under the Agreement, in order to meet the requirements of the Punjab and the arid areas of Rajasthan.

When due to Indo-Pakistan differences, it was felt that the dispute was becoming intractable, the World Bank offered its good offices to help find a solution. In 1954, the World Bank suggested a scheme under which the waters of the three rivers — Indus, Jhelum and Chenab — were "allotted" to Pakistan and the waters of Ravi, Beas and Sutlej to India. It also suggested that India should bear the cost of construction of the link canals in Pakistan which would replace the water supply Pakistan now gets from this country. India accepted the proposals, with the qualification that Kashmir should get a share of the waters of three rivers allotted to Pakistan. The latter raised, however, a number of objections in regard to the principles on which the scheme was based. In the beginning its opposition was due more or less to sincere doubts about its own capacity to execute the work of constructing the link canals during a specified period. But lately Pakistan seems to have been impelled by a desire to hold up indefinitely India's own schemes for utilization of the rivers allotted to it: it has kept alive the problem by demanding an omnibus solution of all Indo-Pakistan disputes. The aim of this policy of Pakistan seems two-fold: first, to buttress its case for Kashmir, on the ground that India's control over the disputed State might prejudice supplies from the rivers allotted to it as they have their source there; and, secondly, to force India to finance not only the link canals but also some gigantic irrigation projects by threatening to thwart India's progress by indefinitely prolonging the dispute. If Pakistan were keen on a settlement, it would have commenced the construction of the link canals during the last three years. After all, it has already constructed the Balloki-Suleimanki link canal, which has more than replaced the water Pakistan would lose after the completion of the Bhakra Dam.

RAJAJI AND THE PEACE COUNCIL

MR. C. RAJAGOPALACHARI, one of the elder statesmen of the country, is generally known and widely respected for his sagacity and political acumen. It was he who, as the Union Home Minister, refused to be taken in by the "non-Communist" character of the then newly-founded World Peace Council and banned holding of its inaugural meeting in New Delhi. Later, when the Communists offered a potent threat to the minority Congress Government in Madras, Rajaji emerged from retirement to save the State from falling a prey to Communist machinations. During one of his fighting speeches in the Madras legislature, he described himself as "Enemy Number One of the Communists".

It is strange, therefore, that he should now associate, and that so closely, with those very people whom he designated as his enemies. Indeed, it has become difficult to distinguish between his stand and that of the Communists on almost every burning topic — be it outlawry of the Atom and Hydrogen Bombs, the Suez issue, the Hungarian revolt or the Eisenhower doctrine. Recently, he inaugurated a conference of the All-India Peace Council in Madras State, and also sent a long message to the Colombo session of the World Peace Council. His message can well be described as the epitome of the Commuunist peace policy.

Rajaji's somersault — it is no less — is difficult to understand. Unlike Dr. Saifuddin Kitchlew, Pandit Sunder Lal and a host of fellow-travellers, he still commands the nation's attention and respect. Unlike them he is not a back-number in Indian politics, nor does he have to depend on the Communist platform for an audience, like so many who were considered eminent once. But the difficulty of understanding the association does not make it less excusable. Indeed, on scrutinizing the "policy" and the "performance" of the World Peace Council, it is difficult to refrain from condemning his association. Even after alleged "transformation" in the wake of de-Stalinization, the World Peace Council remains a wing of the Kremlin's foreign policy makers. It has not yet made known its stand on any issue independent of or at variance with Moscow. While it vehemently condemned the Anglo-French aggression in Egypt, it vociferously applauded and approved Russia's armed intervention in Hungary. This was obviously in tune with the policy of the Soviet Ministry of Defence. In a pamphlet issued on March 20, 1954, it was declared that "Communists are against imperialist wars as being counter-revolutionary wars, but they are in favour of liberating, anti-imperialist, revoluntionary wars". The same sentiments were echoed by Professor Joliot-Curie, President of the Council at Helsinki in June, 1955. While talking to the celebrated Swedish writer, Mr. Erik Blomberg, he said that "revolutionary wars of liberation are not counted as wars from the point of view of the World Peace Council". In plain words, this is an unequivocal admission that the executive core of the Council is exploiting the worthy sentiments for peace of the people to serve the purposes of Soviet Communism. One is inclined to ask Rajaji to share with the public any good that he may have seen in Commuunist profession and practice, for what can be better than sharing the greatest good with the greatest number?

U.S. AID TO POLAND

AFTER MORE than three months of negotiations, the United States has extended $95 million worth of economic aid to Poland. Of the aid, nearly $48 million will cover surplus farm commodities and mining machinery; $30 million would be in the form of a line of credit to be administered by the United States Government's Export-Import Bank; and about $19 million have been provided for the sale of cotton and fats and oils. The State Department also announced that Poland and the United States have agreed to begin negotiations soon on the American property claims against Poland resulting from nationalization measures after the Second World War, and on the releasing of pre-war Polish assets in America. The United States has also agreed "to broaden commercial and financial relations with Poland" by permitting the dispatch of certain private dollar funds to Poland and to simplify licensing procedures for export to Poland. The aid being made available immediately will enable Poland to make the following purchases in the United States: 100,000 metric tons of wheat, 26,000 metric tons of cotton, 60,000 metric tons of fats and oils and $4 million worth of mining

machinery. The credit for these purchases will be repayable in dollars, for a period of 20 years beginning in 1962, at 4.5 per cent interest.

This is the second time that the United States has given economic aid to any of the Communist countries, since the Second World War. This aid was demanded by the prevailing situation. The Polish people have been displaying increasing evidence of a determination to follow a course independent of the Soviet Union. In response to that popular sentiment, the leaders and the Polish Government have been trying to soften the features of Communism which do violence to human nature. If the United States Government had decided to act otherwise, it would have driven the Polish people and Government back to the Russian orbit. America's acting otherwise was feasible on a technical consideration that it would have, in the long run, become an unbearable economic burden on the Soviet Union. That would also have meant incidentally acceptance of the oft-repeated theory that there was no evolutionary road to independence for a people dominated by Communism and that their salvation lay either in their own successful violent revolution or through the victory of the free world over the Communist empire which could come about only in the event of a war. And war is unthinkable.

Economic aid to Poland will help that country progress towards greater independence of the Soviet Union. Mr. Richard Nixon, the United States Vice-President, remarked that "the explosive power of freedom is great enough to destroy Communism once it is given a chance to flourish." The Eisenhower Administration's decision to give economic aid will prove the correctness of this. It is, therefore, not "merely a gamble worth taking" as some short-sighted politicians will have us believe.

MALTHUS, MARX AND MAO

FOR SOME time past a heated controversy has been going on in Communist China on the advisability or otherwise of restricting the growth of population through what Malthus would describe as "preventive checks". Professor Ma Ying-chu, a leading economist of the country, has predicted that unless drastic steps are taken to restrict it, the Chinese population will surely increase to 2,600 millions in the next 50 years, almost equalling the present known population of the world which is about 2,636,600,000. Professor Ma is against the legalization of abortion or sterilization — which is "bad for health of women". He has, however, suggested that parents should limit their children to two. He has also recommended rewards for those who have only two children, and taxing of those who have more than two. These suggestions have provoked a barrage of criticism in newspapers, which allege that it would lead to ill-treatment of the third child at the hands of parents and possibly even lead to infanticide on a mass scale. Mrs. Teh-chaun, Minister for Health, has also opposed Professor Ma's suggestions, but has advocated "the popularization of the preventive checks". Chairman Mao Tse-tung recently rung the curtain over the controversy by observing that birth control is "something more than just regard for the health of mothers and children; it is the only solution of the population problem which has haunted the Government for some years". The birth control campaign has now been launched on a "war footing".

It is obvious that Malthus could not hope for a better compliance with his prescription. Gone are the days — at least in Red China — when advocacy of birth control was termed " capitalist cannibalism" by dyed-in-the-wool Marxists. These Communist critics of Malthus took their cue from Marx and Engels, the co-founders of "scientific socialism". Malthus will now perhaps be no longer "a bought advocate and a shameless sycophant of the ruling class", and his theory of population no more a "sin against science" and a "libel against the human race"'. The pressure of population is now at last recognized as something more than a problem of "the means of employment". One wonders how the faithful will reconcile with Mao's view their own belief that "it is capitalistic accumulation itself that constantly produces, and produces in the direct ratio of its own energy and extent, a relatively redundant population of labourers, i.e., a population of greater extent than suffices for the average needs of the self-expansion of capital, and, therefore, a surplus population". Malthus should now chuckle in his grave that the law associated with his name is after all not "peculiar to the capitalist mode of production."

In spite of its gigantic plans of development and socialistic economy, China has failed to make a mockery of the Malthusian Theory of Population. On the contrary, there is a grave danger of the ghost of Malthus stalking the land under the shadows of an acute famine. Lenin's well-known dictum, that even "critical flirtation with Malthusianism inevitably results in a descent to the most vulgar bourgeois apologetics", has not prevented Mao from accepting the theory of Malthus both as an explanation and a solution to the growth of population in China. History has strange ways of taking revenge.

A NEW VENTURE

THE EARLY part of this month saw the inauguration at Avadi in Madras State of yet another unique venture based on Indo-British partnership. Indeed, it can be stated without any exaggeration that the opening of the Tube Products of India's factory in collaboration with Tube Investments Limited, Birmingham, marks a mile-stone in the progressive industrialisation of South India. Estimated to cost over Rs. 1.5 crores eventually, the factory will be initially engaged in the production of tubing for the cycle industry, but there is no doubt that this industry will have a much wider field to cater to, the precision steel tube being a basic product for industry and having a multitude of uses. It is also not a little significant that the factory is a pioneer unit engaged in the production of a commodity not ventured before.

The Governor of Mysore, who spoke at the function, drew attention to the fact—which may look at first sight as rather odd—that a private industry should be started at the very place from where "inspiration went out for remodelling our society on a socialist pattern." But in truth, this is really not odd since the concept of a mixed economy is basic to the socialist pattern of society envisaged for this country. Recently, the Prime Minister and the Finance Minister have reiterated the vital role that the private sector has to play in taking the country forward in a co-operative spirit. Nothing can provide a more striking testimony, if any proof were necessary, than the setting up of the new factory which should show convincingly how the responsible section of the business community has understood the implications of the goal towards which this country is to move and how it is willing to play its legitimate part. It is for Government to respond in an equally generous measure to assist this section in all possible ways in the rapid industrialisation of the country without leaning heavily on doctrinaire policies.

A Window on the World

IS WEALTH BADLY DISTRIBUTED?

By

ODYSSEUS

IS THE REDISTRIBUTION of incomes part of Socialism? Does Socialism imply that all incomes should be equal?

These questions first began to agitate the minds of men in the nineteenth century when, after the Industrial Revolution, consciences were disturbed by the plight of the working classes. It was felt to be wrong that their human needs were so little satisfied. By a natural sequence it soon began to be felt that if it was wrong that some should have so little, it must also be wrong that some should have so much more.

The Industrial Revolution initiated not merely a material but a spiritual revolution. All over India most people identify poverty with holiness. This attitude shows how relatively little as yet the Industrial Revolution has penetrated India because the association of poverty with holiness is not peculiar to India: it was common to all countries before the Industrial Revolution when the impact of poverty, plus the belief that it was an eternal feature of the landscape, tended to create a revulsion against riches. But the techniques that caused the Industrial Revolution, by enabling mass production to multiply goods, created (1) a deep appreciation of worldly possessions and (2) a sense of the new material power that could eventually end poverty. Hence the characteristic Victorian philosophy of Samuel Smiles (author of the "Self-Help" and "Thrift" series of best sellers). Riches had been a scandal in the face of poverty. Smiles made poverty a scandal in the face of riches: an attitude which orthodox Socialists denounce, but which our Sarvodayans are sensibly propagating when they urge villagers not to wait for the state to build new roads and wells for them but to do the job themselves.

But if the Industrial Revolution focussed attention on the problems of poverty and redistribution, the idea of redistribution was not new. It is inherent in the concept of any society that those in direct need must be looked after. The family, the clan, the caste, the village have always looked after their needy. The practice broke down in Europe, and in local areas of India, when small communities were disrupted by the assembling of workers higgledy-piggledy into new cities that grew ever more vast and more impersonal. It is fashionable nowadays to sneer at feudalism, but the feudal concept "Every man hath his lord" meant that every man had someone whose recognised social obligation it was to protect him.

It took time before the gap left by the break-up of feudal traditions by the Industrial Revolution was recognised and filled. It was assumed that the standard of living of the masses would rise as free enterprise, competition, and mass production made goods cheaper and cheaper. By and large this faith was justified, as the free enterprise economy of the USA has demonstrated. Nowhere is the common man better off (or, as some unkindly add, more common).

HELP THE UNFORTUNATE OR RAISE THE AVERAGE?

Bertrand de Jouvenel offers the interesting suggestion in his remarkable booklet "The Ethics of Redistribution" (Camb. Univ. Press. 1951) that two different notions were confused: (1) that the situation of the average worker is best improved by the play of productive forces and (2) that there is no need to take care of an unfortunate "rearguard". As long as emphasis was laid on raising the average by the processes of profit-making competition, there was reluctance to intervene on behalf of the unfortunate. On the other hand, as soon as attention became focussed on the rearguard, it was a natural conclusion that the condition of the average could also be raised by state intervention.

Let us re-read that last paragraph and reflect about it. Does it not suggest that while (1) relief of the unfortunate is a clear social obligation which the destruction of village neighbourliness, of responsible aristocracics, and (in the West) of Church wealth, has laid on the state for want of a better agency, it remains to be seen whether (2) taxation and other redistributive policies are the best means of raising average incomes and the standard of living, and whether they do not conflict with other social aims?

Bertrand de Jouvenel distinguishes the two cases thus: (1) when through the working of the social services, a man in actual want is provided with the means of subsistence, whether it be a minimum income when unemployed or medical care which he could not have afforded, this is a case of social obligation for relief of the unfortunate. But (2) redistribution occurs whenever the individual is relieved of an expenditure that he could have afforded. By freeing a proportion of his income for expenditure on other things this therefore amounts to raising his income. A family which would have bought the same quantity of food at non-subsidised prices and gets it that much cheaper, and an individual who would have paid for the doctor whose care he gets for nothing, have had their incomes raised by redistribution.

SCANDALOUS EXPENDITURE

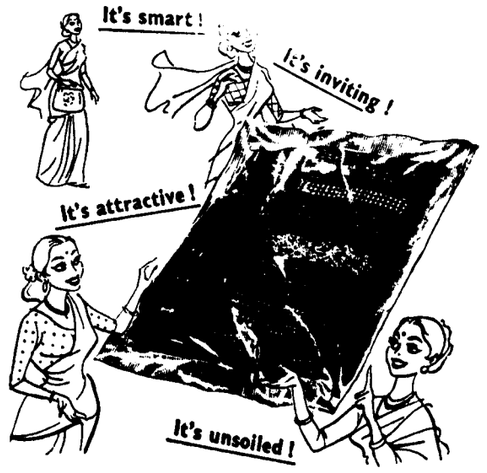
The urge to redistribute arises because it is felt to be scandalous that so many should be inadequately provided when a minority have more than they need.

But judgments on what is, or is not, sensible and legitimate consumption are relative and vary enormously. While the sight of an alleged millionaire dashing by in a Rolls arouses condemnation for "wasteful" expenditure in Bombay, the same sight in New York, far from arousing disapproval, provokes emulation: "If I work hard enough, I'll be able to afford a car like that!" And remembering that the poorest people in New York enjoy a standard of living fantastically higher than most ordinary middle class people in India, the "obvious" merits of redistribution seem to need consideration.

The first basic fact to grasp is that whatever is felt to be (a) scandalous, or (b) reasonable, consumption reflects the subjective judgment of the state's policy-controlling classes—which in virtually every democracy has now come to mean the lower middle class. The views of this class as to what is indecent low-living or indecent high-living vary from country to country, from decade to decade, and from century to century.

An incidental fact to which I have drawn attention before is that the masses of "the people", are far less critical of conspicuously high-living than the petty bourgeois or lower middle class. The people who love spectacular durbars, aristocracies, and film stars are "the people".

The second basic fact is that it is the popular belief that most countries are wealthy and that what is wrong is that the wealth is badly distributed—too much going into the hands of too few. A simple calculation made from the income-tax statistics of any country will show that if you took all the income away from those whom the lower middle class controllers of opinion agree to call "rich", you would add only a decimal fraction to the incomes of those whom they agree are "poor".



Unfortunately, I do not, as I write, have the latest Indian statistics at hand, and the best I can do is to quote from the 1947-48 report on the British Inland Revenue which showed that 58,500 Britons received incomes between £2,000 and £4,000 a year, giving them a total net income of £156,000,000; 3,430, received between £4,000 and £6,000 giving them a total net income of £14,000,000; and 70 received over £6,000, giving them £400,000. Thus, 62,000 "rich" were in net receipt of a total of £171,000,000 net. Supposing that it were possible to take this sum away without affecting production disastrously, and to distribute it to the 20,000,000 "poor" Britons in receipt of incomes of less than £1,000 a year, each would have an additional £8/10/0 to spend! You obtain similar rediculously disappointing results whatever country's figures you analyse. Before you could begin to raise the lowest income group to any noticeable extent, you would have to include lower middle class incomes among the "rich", and all that you might achieve would be slightly to raise the lowest group at the cost of debasing the whole range of middle class incomes from top to bottom. This is a theoretical possibility because if you attempted redistribution of existing wealth on that scale, you would bring the process of production to a dead stop.

From this, it emerges that the aim of all political parties in all states should be to promote policies which stimulate everyone to greater productive effort, as opposed to policies which hold out hopes (that must inevitably be illusory) of a bigger share of the existing cake.

The lower middle class intellectual (I use the term descriptively, not abusively) is naturally out of sympathy with the gaudier displays of wealth of the very rich. He therefore considers that redistribution involves no social loss. But if redistribution were carried out wholesale in hopes of adding a noticeable mite to the very poor, the lower middle class individual would take a different view of the resulting noticeable decrease in his own income. What he would consider sensible patterns of life would be destroyed, affecting standards which the intellectual considers necessary for the performance of social obligations of which he approves. It is easy to lay down that the Maharaja of Blankipore must do without his fleet of Rolls, but when teachers, clerks, public servants, trades unions officials, intellectuals, and artists, are to be deprived of their "modest" competencies, their "intelligent" pleasures, and their ability to spend money in "socially desirable" ways—that's "quite different".

But this raises many questions: Who is to decide what is "socially sensible" spending? How many ounces of caviare is "gracious living", how many "sheer gluttony?" Is it wrong to want to buy a valuable painting or even a book on economics, when you can look at either in a public library? Must the painter and the writer look solely to the state for patronage? Can you ensure that the recipient of redistributed income will have the good taste to refrain from "worthless" spending on worthless film shows in favour of "culturally valuable" activities like a Kathakali recital? We will attempt these questions next week.

[This is the second of five articles on "The Ethics of Inequality". Last week's was "Where Police Powers Are Greatest". Those to come are: "James—You Must Not Support The Painter"; "Bhanging Up The 5-Year Plan"; and "A Point for Mr. T. T. Krishnamachari".—Ed.]

EUROPE, OR LITTLE BY LITTLE

(From Our Special West European Correspondent)

PARIS, June 15.

DESPITE political crises in Italy and France, and despite the pre-electoral atmosphere in Italy and West Germany, plans for the unification of Little Europe are assured of making paper progress this summer, because even the unstable and uncertain ministries now in office will probably be able to negotiate the Euromarket and Euratom treaties through their parliaments before the August holidays. The Bourges-Maunoury ministry in France, which in fact differs hardly at all from the Mollet Government it succeeds, is as thoroughly "European" as its predecessor, and in fact the elimination of Mendes-France from the leadership of the Radical Party leaves the new Prime Minister (who belongs to the right wing of that same party) a freer hand to hasten ratification of the treaties. The present Government is admittedly a stop-gap affair which Guy Mollet himself has manoeuvred into office to tide over until he is ready and able to resume power, probably later in the year. But its successor will almost certainly be another Mollet cabinet, so on European questions there will be uninterrupted continuity of policy. The retention of Pineau, and more important of his aide Maurice Faure, at the Quai d'Orsay underlines this continuity and recalls that throughout her post-war ministerial instability France has managed to go through fewer Foreign Ministers than most of her allies, the USA for instance.

In Italy, similarly, the fall of the Segni and then of the Zoli cabinets has had no effect on the progress of the treaties. Though, as I write, the succession is undecided, it is assured that no matter whether this fall to a minority Christian Democrat cabinet or to a neutral "current affairs" ministry holding office until the forthcoming elections, the European treaties will be ratified this summer in Rome. In West Germany, the treaties are not at the centre of the gathering electoral debate, and their ratification by the outgoing parliament is certain.

From the fact that the three main members of Six-Power Europe can thus ratify unification of their economic and power policies even in the midst of domestic political turmoil one might draw the conclusion that the Continentals are so passionately determined on unity that they are allowing nothing to stand in the way of the treaties. Or, alternatively, one might draw the conclusion that these paper plans are being pushed through by their enthusiastic advocates in an atmosphere of general indifference because all their numerous opponents know that there will be plenty of time later to undo the "progress" that is to be achieved this summer. This latter conclusion would perhaps be too cynical, but one is entitled to a measure of cynicism when theoretical unification is being hastened while economic unbalance grows, particularly between France and West Germany, while the deepening of the Algerian war puts a widening gulf between France and her partners, and while the policies of the coal-and-steel community are floundering in uncertainty.

Let us take the last-named institution first, because it is the only existing example of unification in Little Europe and its fortunes are a test of the European idea. The six Governments will have to undertake in a few months' time negotiations for the revision of the coal-and-steel pool treaty and this will be the occasion for a review of its utility to date. Meantime we have the evidence provided by the congress this month in Stresa (North Italy) of 300 economists and lawyers from the six countries, which studied the working of the pool. At the theoretical level, these experts were split sharply into planners and liberals: those who want the High Authority of the pool to follow a vigorously interventionist policy by really taking to itself the attributes of supra-national sovereignty in matters of prices and investments, and those who want the High Authority to remain a guardian of economic liberalism, a simple market policeman who leaves to the national parliaments all questions of prices, wages and the like. That years after the pool has been at work, the best-informed part of Continental opinion should thus be still totally at loggerheads on its functions is significant because the self-same question will arise for every other form of European unification, and the same divisions of opinion will repeat themselves. In other words, "European unity" covers radically different things for various people.

More important than what the experts say, is how the pool has in fact functioned, and the main fact that came out at Stresa was that the pool has not functioned except when it absolutely had to. The High Authority has made no attempt fully to exercise the powers the treaty gives it, let alone extend those powers. In the matters of selling zones, distribution of scrap iron and investments the High Authority has pushed passivity to the limit, while it has suffered concentrations and amalgamations to occur freely. (I am not arguing that so far concentration has reached dangerous or undesirable proportions, but the point is it has just occurred without the High Authority so much as offering its opinion on a policy for competition and monopoly.) Notably, it has been of no use in the controversy about decartellisation in West Germany—the break-up of the Rhineland cartels to which West Germany is committed by treaty but which is just not happening, far from it.

The explanation for this passivity is evident. It is not the outcome of liberal policy, but an absence of policy. The High Authority is powerless against the six member governments, and these governments have not supported it in any supra-national experiment, but on the contrary have taken back in practice the shreds of national sovereignty that they surrendered to it in the original pool treaty. Silently, and under the cover of a specious supra-nationality, the six countries have been drifting back toward the traditional practice of multilateral international agreements. Admittedly, at that level they have some useful achievements to their credit in coal and steel: an international agreement on labour migration and the preparation of a convention on social security. But, unless the word has lost its meaning, multilateral agreements of this sort, however desirable, are not "unification" and it is unification that Little Europe is supposed to be about. A test for the utility of the steel-and-coal pool lies just ahead: the Continental steel industry has increased its output by 50 per cent between 1951 and 1956 and is still booming, so that by 1960 it will need to import 30 million tons of coal, much of it from the USA. If the

High Authority can impose a common import and distribution policy for American coal, then it will be time to talk of a progress of supra-nationality in West Europe.

The unity mystique, however, seems to be proof against mere facts of the sort that were discussed in Stresa last week. The President of the Italian Republic, Signor Gronchi, who is a confirmed European, pronounced the closing speech at Stresa and then went straight to Rome to pronounce the opening speech at the Congress of Europe this week. At the Congress were repeated all the arguments about the economic power and political influence Europe can regain by uniting, about the necessity for a common policy on major world problems, etc., etc. Politicians have short memories, so we must assume they had already forgotten Suez but presumably they were aware that in the senior member-country of Little Europe, France, the dominating problem is Algeria, and on Algeria none of France's partners (save perhaps Belgium) would be willing to endorse present French policy. This is important because the Algerian situation has worsened considerably and the French now face a choice between capitulating and making total war. A capitulation would produce grave political strife within France itself such as to endanger the existence of the Fourth Republic; an all-out war, complete with state of siege in Algeria and wartime austerity in France, would mean extensive reorganisation of the French economy such as to make impossible further progress toward economic unification. In either case, the future of Little Europe will be gravely compromised.

Already the West European economy, which it is proposed to unify, is in a state of acute unbalance, with West Germany heavily in surplus in EPU and France heavily in deficit. Some of the features of this situation were discussed here recently in an article called Threat to the Franc. Since then, and as a direct result of the loss of confidence caused by the ministerial crisis in Paris, the French Government had to take draconian measures against imports, demanding a 50 per cent cash deposit with all applications for import licences. On this measure, the Gazette de Lausanne commented: "Once again France has disappointed us....France has just rendered a very poor service first to her own reputation and then to the European unity cause which she has defended so vigorously this year. She must recognise this undeniable fact: the new measure which seeks to discourage foreign imports is in total contradiction with her whole European policy". The contradiction is indeed total, but it is typical. Seeking a vote of confidence in Parliament this week, M. Bourges-Maunoury promised both active measures to limit imports and hasty action on the ratification of the common market treaty.

Naturally, in this atmosphere of uncertainty plans for the creation of the free-trade zone in Europe, which would include Britain, have fallen behind schedule. The ministerial committee of OEEC which was to hear Mr. Peter Thorneycroft's report on the progress of these plans next month will now not meet until the end of October. There is of course no hurry; it took the Continentals two years to devise the Euromarket pact and the first customs tariff reductions under that scheme are not due to be introduced until the beginning of 1959. The free-trade zone is a much more complex business and presupposes firm progress on the Continent with Euromarket, progress which it is the purpose of this article to suggest is much less certain in fact than on paper.

WOODWORK NEEDS PROTECTION

Whatever the wood and the condition of its surface, there is a specific **Shalimar Paint Product** which will make it wear better, last longer and look more attractive.

... That's because, only Shalimar Paint Products are backed by over 55 years of manufacturing experience in India. The extensive paint research, constant progress, and development carried out is a guarantee that Shalimar Paint Products will stand up to the difficult and extreme climatic conditions in India.

Whatever the need, specify the purpose when you order

SHALIMAR PAINT PRODUCTS

*Write to P.B. 68, Calcutta-1, for the **Shalimar Ready Reference** leaflet which will introduce you to the complete range of our products.*

WORLDGRAM

AGRICULTURE

Soil Testing Service for Delhi Farmers: A Soil Testing Laboratory has been established at the Indian Agricultural Research Institute, where the farmers of Delhi can send their soil samples for analysis and obtain free advice on the use of fertilizers and other soil corrective measures for the increase of crop yields.

This Laboratory is one of the 24 State Soil Testing Services Laboratories proposed to be set up by the Government of India throughout the country under an Indo-US Agreement. So far 14 such laboratories have been established in different States.

The Delhi Laboratory has already started functioning and farmers from the villages lying close to the Delhi urban area have started taking advantage of this free service and quite a few farmers have begun to use fertilizers on the basis of soil tests conducted by the Laboratory staff. More than 500 Soil samples have been collected from the 19 villages covered by the scheme for the introduction of Intensive Cultivation Methods which the Indian Agricultural Research Institute had initiated in Delhi a few years ago.

*

Export Sale of US Cotton: The US Agriculture Department has announced the export sale of 35,930 bales of 1954 crop Government-owned cotton as well as the sale of 295,321 bales of 1955-crop cotton.

The 1954 crop sales were made at an average price of 27.73 cents per lb. basis middling inch cotton while the average price of the 1955 crop cotton was 27.33 cents.

With this sale the total sale of 1954-cotton crop under the 1956-57 Disposal Programme amounts to a net of 7,703,177 bales, the department said. The net total included adjustments. This cotton is to be exported before August 15, 1957.

The amount sold up of 1955-cotton crop under the 1957-58 disposal amounts to a net of 3,203,287 bales. It was the sixth sale of this cotton which cannot be exported until August 15 of this year.

INDUSTRY

Punjab Plans for Leather Industry: To modernise the tanning industry and to organise tanners' Co-operatives, the Punjab Government has decided to establish 10 Co-operative village tanneries in the State with a cost of Rs. 1,70,000 during the current financial year. The Central Government will meet the entire cost and will provide Rs. 8,250 as interest-free loan and Rs. 8,250 as grant for the construction of tanning sheds and pits to each tannery. At present the leather workers and tanners in Punjab are doing tanning work mostly in their houses on primitive methods using bark of trees as tanning material. There is a vast market for high class tanned leather in Punjab from where hides and skins are at present, exported and tanned leather imported from outside.

The State Government also proposes to organise 271 new Co-operatives of shoe-makers at a cost of Rs. 2,85,000 during 1957-58. The whole of this amount will be provided by the Central Government out of which half will be advanced in the form of loans and the remaining half as grants. Each leather goods society will have on an average, 15 workers.

*

Cement Factory For Srinagar: The Kashmir Government will shortly set up a cement manufacturing plant near Srinagar at an estimated cost of Rs. 15 lakhs.

The cement factory, which will manufacture between 30 and 60 tons of cement per day, forms part of the State's second Five-Year Plan for developing the industrial potential of Kashmir, involving an outlay of Rs. 3.41 crores.

The Planning Commission has, under the second Plan, approved the schemes submitted by the State for the establishment of cement, pottery, brick and tiles factories.

Among other things, the Planning Commission has also approved the expansion and renovation of some of the existing industries, such as silk and woollen textiles, and increase in the local production of raw materials required for these factories.

The State Government is, however, facing some difficulties in the matter of foreign exchange and technical personnel to implement these schemes speedily. The State Government has already sent out over 50 persons to receive technical training in other States and abroad.

*

Industrial Output Improves. Industrial production in India showed slight improvement in January, 1957, when the general index (base 1951—100) stood at 138.9, compared with 136.4 for December last year.

This minor improvement in the index was mainly due to increased production of textiles during the month under review. Output of cloth and yarn rose under review. Output of cloth and yarn rose to 483,700,000 yards and 156,400,000 lb. during the month under review from 479,300,000 yards and 155,200,000 lb. in December last year. In January this year 88,800 tons of jute goods were manufactured compared with 84,900 tons in the previous month. Among other industries, production of automobiles and matches was also higher at 3,025 and 50,700 cases, compared with 2,882 and 48,100 cases, respectively, in December last year. Output of paper and cement was nominally lower at 17,493 tons and 459,000 tons. Raisings of coal also fell to 3,627,000 tons from 3,678,000 tons in December, 1956.

*

Standard for Caustic Soda Issued: An Indian standard specification for Caustic Soda, Pure, (IS: 1021-1956) has been published by the Indian Standards Institution. Caustic soda, pure, is a basic raw material for a variety of chemical industries and is of particular importance in the production of rayon fibres where it is used as a coagulant. Rayon production is very sensitive to the impurities in the alkali which affect the quality of the final fibre produced. This grade of caustic soda will be suitable for rayon industry. Copies of this standard can be had from the ISI Office, 19 University Road, Delhi-8, or its branch offices in Calcutta and Bombay.

FINANCE

India Avails of I.M.F. Standby Credit: Under an agreement arrived at with the International Monetary Fund in February 1957, the Government of India have so far drawn an amount of $127.5 million. The same agreement also provided for a standby credit of $72.5 million which India could draw on at any time in the next twelve months. The Government of India have availed of this standby credit and drawn a sum of $72.5 million.

*

Pakistan-UK Agreement: The Pakistan Government has announced conclusion of an agreement with the United Kingdom for avoidance of double taxation and prevention of fiscal evasion with respect to duties on estates of deceased persons.

*

Andhra Pradesh Sales Tax Bill: The President has given his assent to the Andhra Pradesh General Sales Tax Bill, 1957. The Bill seeks to introduce

throughout Andhra Pradesh a uniform law relating to sales tax. Hitherto, the Hyderabad Sales tax law was in force in the Telengana area and the law of the old Andhra State in the rest of Andhra Pradesh. The provisions of the Bill generally follow the provisions in the Sales Tax Laws which were in force in the two areas. Besides, the rates of tax are expressed in terms of naye paise and the taxation of sales of "declared goods" is made to conform to the provisions of the Central Sales Tax Act, 1956.

*

Foreign Capital for Heavy Industries in India: The Deputy Minister for Finance, Shri B. R. Bhagat, had laid recently a statement on the Table of the Rajya Sabha showing all remittances made from abroad for investment in Indian business or industry in the four months between December 1956 and March 1957. According to the statement a total of Rs. 73.16 lakhs was received for investment in India from the United Kingdom, British East Africa and Germany. The amount from the UK was Rs. 65.97 lakhs in respect of manufacturing industries such as asbesto goods, tube mills, metallic and non-metallic gaskets, pharmaceuticals, sewing thread, automobiles, spindle tapes, v. belts etc. From British East Africa, a sum of Rs. 0.25 lakhs was received for cement and chemical manufacturing industries. Germany's contribution was Rs. 6.94 lakhs for diesel fuel injection equipment and dam construction.

TRADE

Export of Unutilised Quotas of Yarn to be Permitted: Cotton textile mills are at present allotted quarterly yarn export quotas from out of their production of yarn in excess of their production in 1955. This incentive is given with a view to encouraging mills to produce more yarn for the handloom industry. Quotas thus allotted under the present procedure are to be exported by the mills themselves or through their nominees. It has been noticed that some of the yarn export quotas remain unutilised and are not exported because the mills are not interested in export, the internal prices of yarn being sufficiently attractive. In view of the foreign exchange position, Government have decided that the quota remaining unutilised in the preceding quarter will be freely licensed to exporters on first-cum first-served basis in the following quarter.

*

Indian Owned Tonnage in Overseas Trade: Indian owned tonnage employed in various overseas trades consisted of 43 vessels of a total GRT of 2,89,273 on March 31, 1957, as against 36 vessels with an aggregate of 239,953 as on March 31, 1956. The freight and passenger earnings of Indian Shipping Companies in the overseas trade showed an increase in 1955-56, the figures being Rs. 10.49 crores in 1954-55 and Rs. 13.41 crores in 1955-56. On the India-UK-Continental trade, Scindias and India Steamships employed by the end of March, 1957, 30 ships of about 208,329 GRT as against 25 ships of about 1,73,000 GRT employed by the end of March, 1956. The Eastern Shipping Corporation were able to ply two ships in the India-East-Asia-Japan trade as against one ship employed by them during the previous year. The Indian owned tonnage employed on the coast as on March 31, 1957, consisted of 81 vessels of a total GRT of 2,32,167. The net provision for shipping in the second Plan is only Rs. 37 crores, of which a sum of Rs. 20 crores is intended for expenditure in the public sector. Almost the entire provision of Rs. 37 crores made in the second Plan for shipping has been utilised by March 31, 1957 by way of grant of loans to private shipping companies or investment in the Government shipping corporations, and this has enabled the shipping companies, both in the private and public sectors, to acquire or order construction of extra tonnage.

*

UK Dollar Exports Continue to Rise: The value of British exports in April was £272,200,000, according to the final trade figures for the month issued by the Board of Trade in London. Re-exports were valued at £8,600,000, and imports at £349,700,000. The value of the exports was £25,000,000 less than in March, and that of the imports £12,000,000 less, and the visible trade deficit rose to nearly £69,000,000. Allowing for the carry-over of delayed imports, the average trade gap this year of £62,500,000 a month is of much the same dimension as the visible deficit of £56,000,000 a month for the period January-April 1956. The commodity pattern of trade remained comparatively unaltered in April compared with the first quarter of this year. Exports of engineering products were up by one per cent and the recovery in motor-car exports continued, while exports of steel also showed a marked upward rise. Petroleum imports, for the first time since the closing of the Suez Canal, reached the average level for the first 10 months of 1956, their value—at £43,000,000—being nearly two-fifths greater. Seasonal movements accounted for the other changes in the April import pattern.

GENERAL

Improvement in Employment Situation: The overall employment situation in the country showed improvement during April 1957. There was increase in the number of employers utilising the services of Employment Exchanges, the vacancies notified by them and placements. Twenty seven thousand four hundred and sixty nine vacancies were notified by 5,827 employers during the month. The figures for March were 22,646 and 5,126 respectively. The number of placements secured by Employment Exchanges in April was 15,814. This was 2,743 more than the placements in March. The increase in placements was recorded mostly in the States of Uttar Pradesh, West Bengal, Bihar, Bombay, Rajasthan and Madhya Pradesh. Of the placements secured 5,827 were in the Central Government, 5,533 in State Governments and 2,221 in quasi-Government establishments. The remaining 2,463 placements were in the private sector. The Live Register showed that there were 7,53,537 applicants awaiting employment assistance at the end of April as compared with 7,47,341 at the end of the previous month.

*

Railway Lines in India: During the first Plan period 430 miles of railway lines dismantled during the war were restored, 380 miles of new lines constructed and 46 miles of narrow gauge line converted into metre gauge. By the end of the Plan, ten new lines totalling 453 miles were under construction, 52 miles of lines were under conversion into broad gauge and surveys for 2,000 miles of new lines were in progress. Of the nineteen new lines totalling 758.92 miles opened to traffic since independence, twelve were executed during the first Plan period. The most important of these new lines was the Assam Rail Link measuring 142 miles. In spite of adverse conditions, the project was completed well ahead of schedule. The main features of the programme of development under the second Plan are: doubling of 1,607 miles of track; conversion of 265 miles of metre gauge lines into broad gauge; electrification of certain sections totalling 825 miles; dieselisation of 1,293 miles; construction of 842 miles of new lines, and renewal of 8,000 miles of obsolete track.

NEWS IN BRIEF

INDIAN

It is reported that the Government of India is contemplating on the establishment of a metals refinery with a capacity of 10,000 tons.

*

There was an improvement in the supply position of petroleum products in India during 1956. The country was able to export 80,785 tons of motor spirit and 2,48,552 tons of fuel oil during the year.

*

The Joint Chief Controller of Exports, Bombay has announced that as the ceiling fixed for the export of copra cake has been reached, no further shipping documents will be entertained with immediate effect.

*

It is reported that cotton waste soft, including silvers, rovings, ends and bondas, will continue to be licensed freely for export till December 31, 1957.

*

Twenty four private companies with an authorised capital of Rs. 70,95,000 were incorporated in the Northern Region in April, 1957. During this period, no public company was registered in the Northern Region.

*

The Government of India have decided to extend the shipment period in respect of licences for cotton textiles issued under the Indo-Burma agreement under the U.S.P.L. 480 programme up to June 30, 1957 in respect of the quantity which has remained unshipped as on March 31, 1957.

*

The Indian Standards Institution has circulated for eliciting comments, a revised draft of the standard specification for antimony. The specification was first issued as a tentative standard in 1950.

*

The coal washery to be set up at Kargali at an estimated cost of Rs. 2.5 crores is expected to produce 350 tons of coal per hour.

*

The value of the output of cottage and small-scale industry products under different schemes implemented in nine of the 26 pilot projects for intensive development of such industries in the C.D. and N.E.S. areas for the period ending December 31, 1956 totals Rs. 58,55,000.

*

Messrs. Tata Industries Private Ltd., Managing Agents for the Tata Iron and Steel Company Limited, report that the total approximate production of iron and steel at the Steel Works at Jamshedpur during the month of May 1957 was, pig-iron 91,300 tons, steel ingots 86,600 tons.

*

To milk factories, two rural creameries and five milk unions will be established in the State during the second Five-Year Plan period by the Co-operative Department of Uttar Pradesh. The cost of these schemes is estimated at Rs. 112.69 lakhs.

*

Negotiations between the National Industrial Development Corporation and several foreign firms for their collaboration in the execution of major industrial projects have reached an advanced stage.

*

Industrial production in India showed slight improvement in January, 1957 when the general index (Base 1951=100) stood at 138.9 compared with 136.4 for December last year.

FOREIGN

The World Bank, in participation with other investors, on 15th May made a loan equivalent to $15 million to the Finance Corporation for National Reconstruction (Herstelbank) of the Netherlands. The loan will provide the Herstelbank with additional capital for lending to the enterprises for industry, transport and commerce.

*

The International Labour Organisation has announced in Geneva that Ghana has become a member.

*

It is reported Pakistan Government has banned export of food grains from the country.

*

Most of Japan's textile industries are planning to curtail their operations because prices are falling with increasing rapidity in many markets.

*

The US Export-Import Bank has announced a $23 million loan to Iran to strengthen her economy and help her to maintain adequate defence forces.

*

The sterling area's gold and dollar reserves rose by $25 million during May. The total reserves—an indication of Britain's economic health—stood at $2,345 million on May 31.

*

The United States has announced it was extending $95 million (£33.9 million) worth of economic aid to Poland.

*

Two more major US international oil companies have raised their prices for crude oil in the Persian Gulf.

*

Australia is expected to finish her financial year this month with a favourable balance of trade of £A275 million, compared with a deficit of more than £A39 million in the last financial year. This would represent an improvement of £A314 million.

*

Europe's production of steel in 1956 reached record proportions and the rise continued in the first quarter of this year.

*

Personal spending in the first quarter of 1957 on main items other than food and fuel in England rose by 7 per cent to £1,232 million or 4 per cent at constant (1948) prices.

*

A new tariff now in force for all zones of Morocco, including Tangier, will impose high duties on imports of shoes, clothes, soaps and carpets. Although mainly protectionist, it will also apply to luxury goods such as automobiles, refrigerators and radios.

*

A new Dutch-Chechoslovak trade treaty has been concluded providing for an increase in mutual trade of about 10 per cent. More Czechoslovak goods will in future be carried in Dutch ships.

NEW TRENDS IN POLAND'S ECONOMIC POLICY

By PROFESSOR OSKAR LANGE

["The Eastern Economist" is glad to present this analysis of Poland's recent developments by Oskar Lange. His views being those of a leading international authority need careful consideration, but they are not necessarily those of 'The Eastern Economist'].

THE economic development of Poland after World War II can be divided into three stages: the first was the stage of post-war reconstruction; the second may be briefly labelled as the stage of socialist industrialisation. The third stage, which is just beginning, may be properly described as that of balancing the national economy and of developing workable forms of socialist democracy.

During the war and in the course of the Nazi occupation, the country was terribly devastated. Six million people, i.e., one-sixth of Poland's pre-war population, perished under the physical extermination policy of the Nazis. About one-third of the nation's wealth was destroyed. The repair of the damage and the restoration of conditions of normal life were very difficult tasks. They were achieved more or less by 1948-49, with industrial production exceeding the pre-war level at that time by 60 per cent.

In 1950, a Six-Year Plan of socialist industrialisation was started. The experience of the pre-war period showed that industrialisation based on private capital investment was impossible. The Polish middle class was economically too weak. It did not have sufficient resources to develop large-scale industrialisation of the country. There was much foreign capital in Poland, controlling from 50 to 90 per cent of the major industries. The attitude of this foreign capital, however, was semi-colonial. It was interested in quick profits which were exported and not reinvested in the development of Poland's national economy. Under these conditions, only socialist industrialisation, carried out by means of public investment could do the job.

The programme of socialist industrialisation proved to be a success. During the years 1950-55, industrial production increased by 270 per cent. Output of steel almost doubled reaching 4.4 million tons per annum. An entire set of new industries was created particularly in the field of machine tools and chemicals. Among these, mention might be made of aircraft (jet planes), motor cars and shipbuilding. The output of textile industry increased during the period by 230 per cent. This rapid industrialisation was achieved at great national effort. The amount of national income devoted to capital accumulation amounted, during some years of the Six-Year Plan, to as much as one-third. The resulting increase in national income during the six-year period amounted to 82 per cent.

It is clear that such an intensive and huge effort of industrialisation could not take place without difficulties. It created a certain lack of balance in the national economy. One of the unbalancing factors was the failure to develop a sufficient raw material base, either through the development of production of domestic raw materials or through developing sufficient foreign trade to import the necessary raw materials. The latter was hampered by foreign exchange difficulties. The other, more important, unbalancing factor is agriculture. Agricultural output increased during the Six-Year Plan only by 19 per cent. This was partly due to insufficient resources devoted to agriculture and partly a consequence of errors in agricultural policy which did not sufficiently take account of the need to develop proper incentives among the peasants.

The main objective of the economic policy during the next few years consists in assuring a more balanced development of the national economy. The rate of capital accumulation is reduced to 20 per cent of the national income. Industrial output is expected to increase during the period 1956-60 by about 55 per cent, special attention being given to assuring a balanced industrial structure. This implies specially increased output of raw materials and of export goods in exchange for which raw materials may be purchased. Greater attention will also be given to consumer goods industries, partly through encouragement of the development of private handicraft and other forms of small private and co-operative enterprise.

A special effort is going to be made in the field of agriculture. The objective is to increase agricultural output by at least 25 per cent during the period 1956-60. This implies not only the direction of greater amounts of resources towards agricultural development but, more important still, a new economic policy designed to develop the peasants' economic incentives. This implies a substantial reduction of the compulsory deliveries made by the peasants to the State with the prospect of abolishing them altogether in the future. The intention is to arrange relations between the State and the nationalised industries on the one side and the peasants (most of whom are private producers) on the other entirely on the basis of the market. The State will continue in principle to encourage the development of co-operative agriculture. However, any attempt to enforce co-operative production has been definitely given up. Such co-operative farms as were organised under conditions which did not ensure free choice to the peasants, are being liquidated. Only those remain which have definitely proved that they are economically sound. In this way the development of co-operative agriculture is being put on a new basis.

During the period of intensive industrialisation, planning and management of the national economy was highly centralised. This was necessary to marshal all resources for the objective of industrialisation and to prevent leakage of resources into uses which are not essential from the point of view of the industrialisation programme. The rapid industrialisation was also done with cadres which had no experience in industrial management. This too necessitated centralisation of management of the national economy.

The centralised methods of planning and management were useful during the period of intensive industrialisation, but they cannot be a permanent feature of the economy. One may say that these were essentially methods similar to those used in a war economy like centralised control and allocation on the basis of priority. Indeed, the country was waging a war against centuries of economic backwardness and once the war has been won, it is possible and even necessary to adopt

new and more flexible methods of economic planning and management.

The new methods consist in decentralisation and democratisation of the management of the national economy. Smaller industries of local significance and the whole State retail trading system are passing under the management of local government. At the same time small private handicraft and other forms of small private enterprise are being encouraged. The main feature of the decentralisation of management is the attribution of greater independence to socialist enterprises. The central economic plan will set only the basic objectives for the enterprises, leaving them free to choose ways and means of implementing the plan and also to decide upon the detailed aspects of their production plan.

The management of the national economy is being democratised. The top-heavy bureaucracy, which developed during the period of centralised management, is replaced by a system of self-government of the workers. One of the consequences of industrialisation was a doubling of the number of industrial workers in Poland. This has led to a great increase in the political activity of the working class and in particular to a great movement for workers' self-government in industry. Workers' councils are being formed in the factories and the workers demand to be masters in their plants. New legislation was passed recently giving the workers' councils the right of participation in the management of the plants and in the appointment and dismissal of directors.

A great democratic upsurge is taking place among all classes of Polish society. Peasants, intellectuals, the lower middle class — all are forming associations designed to express their interests and points of view. The workers' councils, co-operative societies and the associations just mentioned will be the instruments of democratic management of national economy.

The new stage of development which Poland's economic policy enters upon can be briefly described as the stage of maturation of socialist democracy. Pre-war Poland was one of the most backward countries in Europe, underdeveloped and dominated by foreign capital. With great and tremendous efforts the Polish People's Republic took the road of planned, socialist economic development. The road was difficult, fraught with errors and distortions of over-centralised bureaucracy. Through all these difficulties, the road led ultimately to success. Now it has opened new vistas of greater economic balance and true socialist democracy, of an economy managed by the people and for the people.

AN ALL-INDIA PRICE OF COAL

(CONTRIBUTED)

RECENTLY there have been proposals for the equalization of the price of coal on an all-India basis. The purpose is to make coal — like iron, steel and cement — available at an equal price, at all rail-heads, to industries (existing or probable) in various regions of the country, and thus eliminate the handicap created by the localized occurrence of a basic raw material.

The objective of an equal price for a basic source of energy such as coal is probably a sound one, as it may give equal chances for industrialization to all parts of the country and to a certain extent help in the dispersal of industries. How can the objective of equalized price of energy be achieved with the concurrent achievement of the objectives of:

(i) utilization of the poorer quality of coal resources which form by far the major resources (90 per cent) of the country;

(ii) minimizing transport of coal and conserving haulage capacity;

(iii) producing basic industrial raw materials and services, such as iron and steel, cement, power and heavy chemicals at the lowest cost for distribution, and

(iv) encouraging dispersal and economy in production of consumer goods without upsetting the present industries and particularly basic industries?

The only way to achieve these objectives is by production of the basic commodities such as iron, steel, and cement at the cheapest possible cost and by equalizing the price of these intermediates and raw materials for manufacturing and consumer industries on an all-India basis at all rail heads; and at the same time establishing a price structure and distribution policy for coal, so that in effect the policy of distribution results in equalization — at least in the different zones — of the effective useful "heat value" of coal. The mathematical treatment given below shows the general conditions for establishing equality in the effective price of useful heat value of coals through control over distribution of the different qualities of coal.

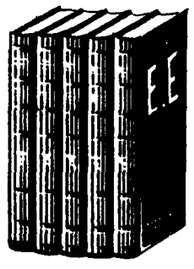
Let the effective price of a superior grade of coal with useful heat units H1 be P1; and the effective price of the useful heat units in the inferior variety of coal H2 be P2. Then P1/P2 is greater than or equal to H1/H2....(1). When equality holds; prices are proportional to the heat units so that it does not matter to the consumer whether the coal is of higher or inferior quality. There will be a greater demand for the superior quality coal if P1/P2 is less than H1/H2....(2) and the result will be that in equation (2) consumers will insist on superior qualities of coal even when they can consume efficiently inferior qualities. The stoppage of misuse of superior varieties of coal and their conservation can be effected only if P1/P2 is greater than H1/H2....(3). Equation (3) suggests that the price per useful heat unit should be greater for superior coals.

It will be clear from equation (3) and the useful heat values of coal given in the table below that in the existing system of effective price, viz., pit-head price plus transport cost, the requirements of equation (3) can only be satisfied by restricting the supply of superior quality coals to areas of longer haulage. It is true that the above equation (3) is only of use when a consumer can utilize inferior varieties of coal. But, for industries such as iron and steel, which cannot do without superior varieties of coal, the equality to be achieved by equation (3) may not be applicable. On the other hand, in effect this equity is achieved by equalizing the effective price of iron and steel at all rail heads so that any benefit or weightage to manufacturing or consumer industries by virtue of their location near the iron and steel plant will be largely eliminated and the principle of equity for manufacturing

The Increased Cost of Coal for Steel for the Second and Third Plans

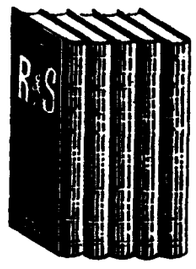
Year	Demand of coal Estimated in million tons	Cost of Coal (Rs. Crores) Present Price (a)	Equalized Price (b)	Difference (b) — (a)
1957-58	3.81	9.14	17.15	+ 8.01
1960-61	11.00	26.40	49.50	+23.10
1965-66	35.00	84.00	157.50	+73.50

and consumer industries for the country in general will be established. The principle of equalization of the useful value of energy will thus be achieved by following a policy of control on distribution of qualities of coal on a zonal basis and on the basis of unavoidability or inescapability for basic or heavy industries.



A zonal distribution scheme which will result in creation of iso-price distribution zones through controlled distribution of grades of coal is given below:

Class of Coal	Range of distribution from source of origin
Coal above 35% (ash and moisture)	(At or near pit head).
Grade III	Up to 75 miles
Grade II	75 — 200 miles
Grade I	200 — 400 miles
Selected Grades	Above 400 miles
Domestic Coke	Equalized price on 150 miles and 250 miles zonal basis
Coking coals	Restricted only to metallurgical industries.



From the proposed policy of distribution of coal under the existing structure of effective price, it seems, therefore, that distant consumers will, in fact, have an advantage if they are supplied with the proper quality of coal. The equalization of coal price at all rail heads will have an opposite effect.

This policy also fits in with the principle of maximum utilization of the coal resources of the poorer qualities which form the bulk of our resources in fossil fuel. It will also result in providing an incentive to develop power resources on a regional basis (and from sources other than coal) and avoid inflation in the cost of heavy as well as consumer goods and minimize [illegible] port of bulky raw materials.

Adjustments in price structure of pit-head values of coal will, however, be necessary in order to provide an incentive to produce higher qualities through scientific techniques of betterment. Similarly, the price of by-product or waste fuels (e.g., middlings and rejects) have to be subsidised so that it may be economic to consume or convert them into higher grades of energy such as power, gas, or oil near their centres of production on an economic basis. In the cleaning of Indian coals, nearly 30 per cent to 40 per cent of the coals will become by-product, low grade fuels for which avenues of utilization must be found. This is necessary in any case, as the transport of the naturally occurring or "by-product" poor quality coals is uneconomic and wasteful. Unfortunately, the inferior qualities form the bulk of our resources of coal. Clear thinking and technology both have to be utilized if we are to solve our coal problems in future.

BOUND VOLUMES
of
THE EASTERN ECONOMIST
and
RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

THE EASTERN ECONOMIST .. .. .. Rs. 75.00

Economic Report from the U. S.

AN ATOMIC VENTURE

(By GUY SIMS FITCH)

CHICAGO, June 18. — About 50 miles (80 kilometers) south-west of this metropolis, in the little town of Dresden, Illinois, major construction work began last week on the largest nuclear power plant in the U.S. It will have a capacity of 180,000 kilowatts, sufficient to provide electricity for a city of 250,000 persons, and will connect with transmission lines now serving a good part of northern Illinois. But the size alone does not measure the significance of this venture, which is scheduled to begin commercial power generation sometime in 1960. The salient point is that the Dresden plant is entirely the product of private enterprise and is designed to supply power on a competitive basis.

This new plant lies in the heart of a coal mining area. Yet officials of Commonwealth Edison Company, operators of the plant, believe that power generating costs will be on a par with those in their efficient coal-burning plants. This means the atomic production of electrical power at a cost of about 0.75 cents per kilowatt hour. There is one proviso in this figuring, however. This type of efficiency may be possible because the Dresden station will function also as a laboratory and training centre for seven other firms participating with Commonwealth in its construction. Some $15 million of the estimated $55 million construction cost will be charged to research. Thus, only $40 million enters into the calculation of generating costs.

The eight participants, plus General Electric Company, which is building the plant, apparently expect to recover any possible excess of costs in the form of technical know-how. This know-how, they emphasize, is an important intangible which later can pay off in tangible dollars and cents in this and future plants. In a sense, then, both Commonwealth and General Electric are putting massive risk capital into an atomic venture which they are confident, will be successful in the end. This step not only proved rewarding, but it helped revolutionize the electrical power industry.

This does not mean that anyone here predicts that a large-scale nuclear power industry will actually operate economically within the next few years. After all, the atom is still in the infancy as a source of power, and many U.S. generating stations can produce electricity for as little as 0.4 cent a kilowatt-hour using conventional fuels — coal, oil, gas and water. What is more, the U.S. still has abundant reserves of these power sources. In the face of such facts it seems startling to learn that more than 80 companies are now participating in the building of 14 nuclear plants in the U.S. at an aggregate cost of $400 million. There also is the likelihood that as nuclear costs are reduced, the atom will prove an economic power source in those areas — such as north-eastern United States — where fuel transported over long distances substantially increases generating costs. It is noteworthy that the Dresden plant will be filled with 60 tons of uranium which should last for six years — the equivalent of 3 million tons of coal.

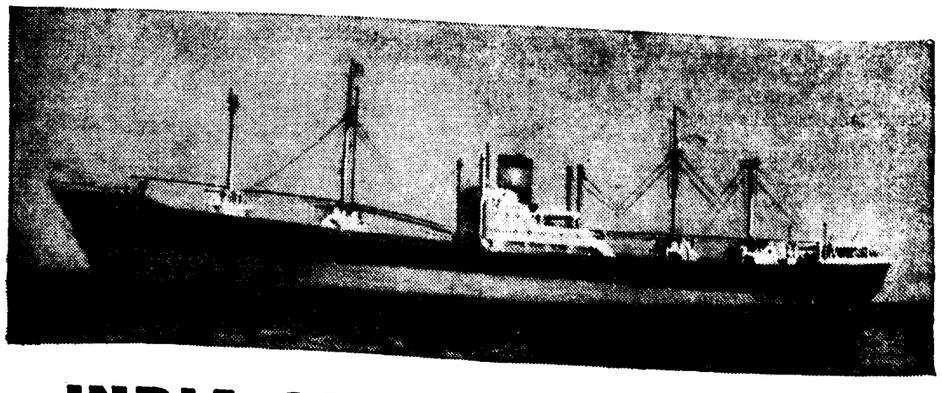
The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete *reliability* of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for *you!*



Look for 'SANFORIZED' REGD TD MK on the label

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

BUSINESS NOTES

ROLE OF ADVERTISING

IT IS true that among the generality of the people, there is an inadequate appreciation of the value of advertising. For one thing, most people seem to take the view that advertising is a wasteful form of expenditure which the country cannot afford at present. Secondly, there is the objection from the social side that advertising debases morals and lowers popular taste and sometimes even leads to committing fraud on the public. The speeches of Mr. Morarji Desai and Mr. Dharamsey M. Khatau at the annual meeting of the Indian Society of Advertisers last week have helped not only to remove a good deal of misconceptions on this subject, but what is more important, have highlighted the important role that advertising plays in the economy of the country.

Mr. Khatau, referring to the progressive role of advertising in encouraging economies of scale, pointed out how "since advertising enables the manufacturers to expand the market, it makes it possible for them to cut down costs and pass on the benefits of lower production costs to the consumer". He cited the example of the West where the increase in national advertising expenditure has kept pace with decline in production cost per unit and expansion of markets and pointed out that the U.K. spent some 2 per cent of its national income on advertising while the proportion in U.S. was about 2½ per cent. There is no wonder, therefore, that the importance of advertising should have been recognised by manufacturers in India also since, as Morarji Desai put it, "it is not only a necessary expenditure but also a good and vital investment". The Indian Society of Advertisers, which represents nearly 60 per cent of the national advertisers, has been formed to "maintain and uphold sound economic principles of advertising" and also "to promote scientific standards and practices in advertising and publicity". Mr. Khatau has also underlined that since misdirection of advertising is a national waste, "it is both necessary and desirable that the cost of advertising should bear a reasonable relationship to the cost of production and cost of selling." This should go a long way in allaying any misapprehension of advertising being a wasteful form of expenditure.

From the point of view of the country, advertising can be of great value if it can promote the country's exports and bring valuable foreign exchange. Here Mr. Khatau has offered the co-operation of the Society to the Government and has made a number of suggestions which deserve great consideration. He has pointed out how only two countries account for nearly 50 per cent of India's export trade and only three commodities — tea, jute goods and textiles — account for 50 per cent of India's export earnings. There is thus need for both country-wise and goods-wise diversification of our export trade and hence publicity at expert level can play a large part. To be effective, advertising should not only be sustained, but it should be regarded as an investment and therefore in export market, there should not be any parsimony in expenditure. Since many members of the Society have acquired valuable experience by engaging themselves in export-advertising, there is no reason why Government should not take kindly to the suggestion of Mr. Khatau that the Society should be given adequate representation in export promotion councils and similar bodies that are being set up.

Lastly, with regard to the social aspect, Mr. Khatau has pointed out how the Society stands for the highest ethical standards and it has done its best in the formation of the Advertising Council. Mr. Desai rightly urged advertisers that they should not do anything that might harm society instead of benefiting it. "Advertisements" he said, "must not be something which attracts people to buy things which are really those which they should not buy". This is sound advice. Advertisers should also realise that much of the current prejudices against them are due to the rather preposterous claims that are sometimes made on behalf of their activities. This temptation should be guarded against if they want the public to repose more trust in them.

BUDGET AND CORPORATE INVESTMENT

THE UNREALISTIC nature of the Government's economic policy in general and that of the fiscal measures adopted by it in particular is clearly reflected in the stresses and strains which the economy has been experiencing ever since the commencement of the second Five-Year Plan. This situation, which has assumed serious proportions lately, calls for a practical approach which means a reorientation in the matter of implementation of the second Five-Year Plan. A dispassionate analysis of the prevailing economic situation of the country reveals that the root of all the trouble now facing our country lies in the unduly, bold and ambitious nature of the second Plan vis-a-vis the available resources. A sure remedy to the present economic malaise, therefore, consists in pruning the plan to a relatively more manageable size and re-adjusting its outlay accordingly. Mr. G. P. Kapadia, Vice-President of the Indian Merchants' Chamber, Bombay, very rightly pin-pointed this while addressing a Special General Meeting of the members of the Chamber held last week to consider the mid-May budget proposals of the Union Finance Minister. This was also the view expressed by Prof. B. R. Shenoy a few days later.

After reviewing the present economic situation and the overall resources position for the implementation of the second Five-Year Plan, Mr. Kapadia said that there would be a "substantial gap" of more than Rs. 500 crores, even after making due allowances for the possible increase in revenues and the fulfilment by the States of their respective contributions. If our defence expenditure was to increase substantially for national reasons, further resources might have to be found. This coupled with the serious foreign exchange position and the difficult agricultural situation, naturally calls, as Mr. Kapadia said, for a "re-adjustment of the lay-out of the Plan, confining the same to more essential projects."

Referring to the adverse effects on the capital market of the taxation proposals of the Union Finance Minister, which are beyond the capacity of the country to bear, Mr. Kapadia pointed out that, at a time when corporate enterprise needs nursing and encouragement, proposals of this nature would dry up the very springs of capital formation. Dealing with certain specific proposals in the budget, he said that a wealth tax on companies was a tax on productive capital and the imposition of such a tax would not only divert productive resources from the citizens' sector to the State sector, but would also act as a damper on corporate investment as well. With regard to the Expenditure tax, he expressed the view that a revolutionary measure of this nature should not be attempted, especially during the planning period. In conclusion, Mr. Kapadia hoped, with the other speakers who also gave unequivocal expression to the feelings of the commercial community, that there would be substantial modifications in the present proposals. In view of the expressed wish of the Union Finance Minister to retain the bias in favour of corporate investment, Mr. Kapadia had sufficiently good reason to hope for some modifications in the present proposals, such as dropping of the Expenditure Tax Bill and the wealth tax on companies, the elimination of the tax on bonus issues, and treatment of dividends as earned income. Even so the hoped for relief sounds too good to turn out to be true.

MYSORE'S FINANCES

YET ANOTHER State Government has come out with a deficit budget. This time, it is the first budget of the reorganised State of Mysore and, if only for this reason, it is difficult to make any comparative study. The only comparison that can be made is between the interim budget deficit figure of Rs. 1,197.96 lakhs and the present deficit of Rs. 935.99 lakhs. As against a total revenue of Rs. 5,092.95 lakhs, total expenditure for 1957-58 amounts to Rs. 6,028.51 lakhs, thus leaving a deficit of Rs. 935.99 lakhs. One would have expected that, at least in response to the repeated exhortations of the Union Government, the Planning Commission and the Prime Minister, Mr. Mariappa, the Finance Minister of Mysore would have come forward with proposals to cover this big revenue deficit. On the contrary, Mr. Mariappa has chosen not to announce any new taxation measures to cover the deficit and is content with reducing it by only about Rs. 2 crores, being the proceeds (during the current year) of the uniform taxation laws yet to be enacted by the State Government. The balance is proposed to be made from existing cash resources or borrowings. In the absence of details about the cash resources available with the State, it is not possible to indicate what portion of the remaining gap is likely to be accounted for by these cash resources. And, as regards borrowings, it is a moot point whether the State could afford to go on adding to its already heavy debt, as indicated by the sum of Rs. 505.37 lakhs towards debt services charges mentioned by Mr. Mariappa himself. In fact, it is these debt service charges and the total outlay on the second Five-Year Plan of the State during the year under review of Rs. 823.32 lakhs that together account for the deficit. Looked at from this point of view, i.e. the fact that at least in respect of the Plan expenditure, this may not continue indefinitely, there might appear to be same justification to leave the deficit practically uncovered.

Mr. Mariappa seems to think that there is no danger in adding to the public debt of the State because the money is spent in building up assets and on welfare measures. While it is no doubt true that productive expenditure which adds to the assets of the State is to be welcomed and the welfare of the people of the State ought to engage the primary and immediate attention of the Government, there is something like a safe limit beyond which the public debt of any State Government ought not to go. But in the circumstances in which he finds himself, Mysore's Finance Minister has probably no other alternative but to seek adequate assistance from the Central Government. It is to be hoped that the Finance Commission, which has already carefully gone into the financial position of the reorganised Mysore State, will make a suitable recommendation to the Government of India so as to place the finances of the new State on an even keel. Not only is there need for it, but the State Government fully merits such a gesture by reason of the measures it has promptly taken to effect economies as suggested by the Finance Commission. Even so, on a careful reading of the full text of the Mysore's Finance Minister's budget speech, one cannot help getting the impression that there is still sufficient scope for further economy. The redeeming feature of Mr. Mariappa's speech is that this has been accepted by him in as many words. One can appreciate, as Mr. Mariappa has said in this speech, that this could only be effected either by an expert or a person of considerable administrative experience appointed for this purpose. It is however a pity that he has not followed this observation with an announcement that the Mysore Government would shortly appoint such an expert for this purpose.

NATIONAL RAYON CORPORATION

THE PARAMOUNT need of the hour being a drastic cut in imports, every suggestion facilitating this merits serious attention. In his address as Chairman to the annual general meeting of the shareholders of the National Rayon Corporation, Mr. Kasturbhai Lalbhai drew attention to the increase in the quantity of foreign rayon yarn imported. He pointed out that during the nine months April to December, the imports of rayon yarn amounted to 47.62 million lbs. and he calculated that if the flow of imports continued at the same rate during the remaining three months of the financial year, the total imports together with the indigenous production of 30 million lbs. would raise the quantum of available supplies to about 93 million lbs. This, he said, would obviously be considerably in excess of the normal requirements of the weaving industry now estimated at around 45.50 million lbs. He also revealed that the landed cost of the foreign yarn was higher than the selling prices of indigenous products. It may be mentioned that imports of rayon yarn in India amounted to an average of over 36 million lbs. during the post-war years involving foreign exchange to the tune of around Rs. 15 crores per annum. Here is a field to which Government may turn its immediate attention and effect the necessary cuts in imports and see that the available stocks in the country are utilised properly.

The Chairman in the course of his address referred to the progress of the Corporation and pointed out how this included the further expansion of the main plant and the putting up of the caustic soda plant. The considerable experience gained in the working of the plant enabled them to open a special Designing and Engineering Department which had been responsible for the entire designing and engineering of the new expansion. Recently they had broadened the activities of this department and had obtained a licence from the Central Government for the manufacture of machinery for rayon, sulphuric acid, carbon-di-sulphide and caustic soda as well as water filtration and softening plants and auxiliary equipments. The Corporation had already made a beginning with the sulphuric acid plant and were in a position to offer a complete contact process unit on a turn-key-job basis. The Chairman also referred to the proposal to instal a rayon tire cord plant with an annual capacity of four million lbs. One of their Directors was already in the States exploring possibilities of obtaining credit under the deferred payments scheme of the Government. But indications so far seemed to be that it would be difficult to obtain credit for a period of seven years. This may involve perhaps persuading Government to make some changes in the conditions which would facilitate the obtaining of credit.

COMPANY AFFAIRS

THE BRITISH INDIA CORPORATION, LIMITED

The Audited Accounts for the year ending December 31, 1956 show that including income from Investments, and after making all the usual allowances, including the sum of Rs. 11,52,222 for depreciation, the profit for the year amounts to Rs. 28,05,105. To this has been added the sum of Rs. 50,00,000, previously reserved for taxation, which sum is not now required for that purpose.

As a result, the sum available, after providing Rs. 20,00,000 for future taxation and deducting the debit balance on the Profit and Loss Account brought forward from last year amounting to Rs. 27,36,584, is Rs. 30,68,521, which has been recommended to be disposed of in the following manner:

1. Transfer to Reserve for Bad and Doubtful Debts	Rs.	5,00,000
2. Transfer to Rehabilitation Reserve ..	„	5,00,000
3. Dividend for the year to 31st December, 1955, on the 8 per cent Cumulative Preference Shares,free of Income Tax ..	„	6,48,000
4. Dividend for the year to 31st December, 1956, on the 8 per cent Cumulative Preference Shares, free of Income Tax ..	„	6,48,000
5. Dividend for the year to 31st December, 1956, on the Ordinary Shares at 10 Naye Paise per share, free of Income Tax	„	6,50,000
6. Carry Forward to next Account ..	„	1,22,521
TOTAL	Rs.	30,68,521

A profit of Rs. 5,85,025 was realised on the sale of investments and this amount has been carried to Investments Reserve Account. The results for the year show an improvement on those of the two preceding years, when losses were sustained. Output and sales of the Corporation's Woollen Branches, and the trading results achieved, were satisfactory. The traditionally high quality of Lalimli and Dhariwal Woollen Goods was maintained and improved upon wherever possible, and the reception accorded by the market continued to be favourable.

BARAREE COKE COMPANY, LIMITED

The audited accounts of the Company for the half-year ended September 30, 1956, show, after changing depreciation of Rs. 18,000, a profit of Rs. 1,50,738. The balance of Rs. 45,399 brought forward from the previous half-year is added alongwith the transfer from Provision for Doubtful Debts of 20,136. The Adjustment in respect of Material in Processes as at 31st March, 1956 is Rs. 14,963. A sum of Rs. 866 has been written off for claims considered irrecoverable. Another sum of Rs. 80,000 has been provided for Taxation. The Directors have recommended a Dividend on the Share Capital of 5 per cent without any deduction for Income-tax payable by the Company, absorbing Rs. 6,000 and leaving a balance at credit of Rs. 90,370 to be carried forward to the next account.

Manufacture and despatches during the half-year were as follows:

		Manufactured		Despatched
Coke	Tons	29,481	Tons	30,058
Tar and Pitch . . .	„	1,365	„	1,338
Sulphate of Ammonia .	„	164	„	1,338
Benzol	Galls.	3,045	Galls.	6,995

BENGAL FLOUR MILLS CO. LTD.

The Directors of the Company submit the audited accounts of the Company for the year ended December 31, 1956. The profit for the year, including items relating to previous years, after providing for taxation and depreciation, was Rs. 5,13,605 to which is added provision for taxation in excess of ascertained liability Rs. 1,46,444 and balance brought forward from 1955 Rs. 76,830 making a total of Rs. 7,36,879. Out of this total, the Board paid an interim dividend of 11¼ per cent on October 22, 1956, amounting to Rs. 1,35,000. The Board has transferred Rs. 1,46,000 to tax contingency reserve and Rs. 2,00,000 to general reserve, leaving a balance of Rs. 2,55,879 available for distribution, which it is recommended be dealt with as follows:

To final dividend of 13¾ per cent absorbing Rs. 1,65,000 and leaving balance to be carried forward of Rs. 90,879. The tax contingency reserve has been strengthened to increase the provision for the future tax liability which will arise as a result of the special depreciation allowances on new plant.

From September 1956 onwards, Mills in Calcutta were not permitted to use indigenous wheat and were solely dependent on allocations of imported wheat by Government. Towards the end of the year measures of restricted flour milling were introduced to overcome the scarcity and high price of residual 'atta' in the Calcutta market. In an endeavour to assist the West Bengal Government the Company increased substantially the extraction of residual 'atta' resulting in an almost equal reduction of flour. This action contributed greatly towards making 'atta' available to the public at reasonable prices.

Considerable new milling plant was installed during the year which has not only improved the quality of the finished products and increased the overall capacity of the mills, but has enabled the mills to run much more economically and with greater flexibility.

RESERVE BANK OF INDIA

APPLICATIONS are invited for the posts of Research Officers in the Bank's Department of Research and Statistics at Bombay.

SCALE OF PAY: Rs. 375-55-815 E.B. 55-925-60-1045. In addition to pay, the selected candidates will be eligible to draw Local Pay, House Rent Allowance and Dearness Allowance at the rates prescribed by the Bank from time to time.

Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scale.

Appointments to the above posts will be made on a temporary basis in the first instance but are likely to be made permanent.

Candidates should not ordinarily be over 30 years of age as on 1st June 1957. The age limit may be extended up to 35 years in the case of candidates with exceptionally good qualifications and/or research experience of value to the Bank.

QUALIFICATIONS: First or high second class Master's degree in Economics or Commerce of an Indian or Foreign University of a Doctorate degree in Economics of an Indian or Foreign University, and a period of research work in one or more of the following subjects: (a) Monetary Economics, (b) Banking theory and practice, (c) International Finance and (d) Agricultural Economics. A period of practical banking training will be an additional qualification in respect of applicants with specialisation in (a) and (b) above.

Applications should be in a special form obtainable from any office of the Reserve Bank of India. All the applications should be accompanied by copies of certificates regarding age and educational qualifications and two testimonials (originals should not be sent, the Bank does **NOT** accept responsibility for returning the originals if sent through oversight) and should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay, so as to reach him on or before Saturday the 13th July 1957. **Candidates already in service must submit their applications through their employers.** Candidates belonging to the Scheduled Castes/Scheduled Tribes should mention this fact prominently on their applications and also enclose a copy of certificate to that effect from a competent authority.

Applicants must remit along with their applications an application fee of Rs 7.50 (Rs 1.75 in the case of Scheduled Castes' Scheduled Tribes' Candidates) by Postal Order, **Cheque or Bank Draft on a Scheduled Bank payable at Bombay.** The application fee is in no case refundable. Bonafide **unemployed** Refugee candidates applying through any of the Government Employment Exchanges are exempted from payment of the application fee.

Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded as a disqualification.

All 6,500 of us in Hindustan Lever, a small army of men and women, have something very important in common. For us, it is not enough to make soaps, toiletries and cooking fats—with each of our products we aim to give you what you need in unvarying quality, so that you—the families of India—may know and trust and use them.

For almost eighty years, we have grown with your growing needs. And, like a flowering plant, we have put forth new and exciting blooms—dynamic pioneering activities behind the actual manufacturing scenes. Our Market Research department—unique in this country—carefully studies your preferences, your habits and opinions, and guides production with its findings. Our Quality Control department carries out strict tests on each product from the raw material stage to the finished article. The Dalda Advisory Service and the Washing Information Service are there to help you make the best use of our products.

And what are these products? You know them well—Sunlight Soap, for instance . . . Lifebuoy . . . Lux . . . Rexona . . . Gibbs S.R. Toothpaste . . . Dalda Vanaspati . . . and others that have become household friends. We are proud that so many of you have chosen to use them every day in your homes. At the same time we realise that your patronage lays upon us a duty, that of keeping steady our common aim, to offer the very best quality and value to our customers . . . to you!

Company Meeting

THE NATIONAL RAYON CORPORATION LTD.

Speech of the Chairman, Shri Kasturbhai Lalbhai

The following is the speech delivered by Shri Kasturbhai Lalbhai at the Tenth Annual General Meeting of the Company held on 13th June, 1957.

Gentlemen,

I have great pleasure to welcome you here this afternoon and to present to you for adoption the Tenth Annual Report and the audited Statement of Accounts of your Company. The Report and the Statement of Accounts for the year ended the 31st December, 1956, have been in your hands for over a month now, and so I hope, with your permission, I can take them as read. The Report covers fairly fully all the salient points with regard to the working of the Company during the year under review, and I do not, therefore, propose to traverse the same ground again. I would, however, like to make a few observations on some items in the Statement of Accounts.

You must have noticed from the Balance Sheet that the net block has increased by Rs. 201.50 lakhs to Rs. 681.21 lakhs. This increase is accounted for, in the main, by the further expansion of the main plant and the putting up of the Caustic Soda Plant. The sales effected by your Company during the year of Report were of the order of Rs. 422.38 lakhs, while the gross profits amounted to Rs. 144.94 lakhs, as against Rs. 342.50 lakhs and Rs. 103.29 lakhs, respectively, in the preceding year.

The amount of Excise Duty of Rs. 80,221 shown in the Profit and Loss Account needs explaining. It represents the difference between the Excise Duty paid to the Government for the month of December 1956, and that recovered from the customers. The amount of Rs. 1,32,529 shown in the Profit and Loss Account under the head of "Miscellaneous Income in respect of previous years" is the refund of insurance premium which became due to the Company following the fixing up of these rates by the Fire Insurance Association, with retrospective effect.

Since the publication of the Report, the Government of India have published draft Rules with regard to the new provision made in the Income Tax Act for deposits with the Reserve Bank of India of a portion of the Company's reserves not represented by assets and undistributed profits. Certain provisions thereof need still further clarifications, but as far as we can make out of the proposed Rules and Amendment of the relevant section of the Income Tax Act, your Company may not, in fact, be required to deposit any amount with the Reserve Bank of India this year. You must also have noted that the Government have proposed to increase the rates of Income Tax and Corporation Tax. I believe, the provision made in the accounts for payment of taxes is adequate to take care of this increase in incidence. However, the proposed increase will affect your Preference shareholders, inasmuch as it will reduce the net amount of dividend payable on the taxable Preference shares of the Company. This would necessitate a slight change in some items of appropriations. I am, accordingly, amending suitably the usual Resolution for the adoption of the Report and the Statement of Accounts.

The new taxation proposals announced on the 15th May last have evoked considerable criticism throughout the country. I will only refer to those proposals which affect our Company along with other industries. It is a recognised fact that for some years past industrial enterprise in India has been handicapped by lack of adequate capital, and whatever expansion has taken place in recent years has been made possible by prudent and conservative ploughing back of the annual profits. The increased Income Tax and Corporation Tax, the imposition of Wealth Tax on companies and the substantial addition to the tax on bonus issues, will have the cumulative effect of causing a heavy drain, year by year, on the resources of companies. I take this opportunity of earnestly appealing the Government that in order to maintain the tempo of industrial development in the country, they should reconsider these proposals with a view to ensuring adequate financial resources for companies and to stimulate further fresh investments in industry.

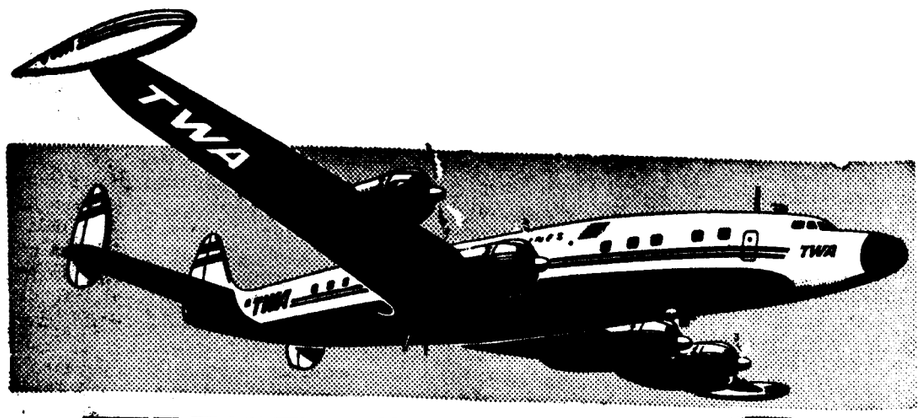
You might have noticed in the Report that it is proposed to install a Rayon Tire Cord Plant with an annual capacity of four million lbs. In this connection, I am happy to inform you that one of your Directors Shri R. J. Chinai, is already in the States, exploring possibilities of obtaining credit, of course, within the framework of the Government's new policy of deferred payments, as also acquiring the equally important 'know-how'. His negotiations, both in the States and on the Continent, indicate that it is difficult to obtain credit for a period of seven years.

Our application for additional capital to partly finance the new project by the issue of equity shares, in the proportion of one for every two of such shares held by the shareholders, is pending with the Controller of Capital Issues, New Delhi.

On account of the closure of the Suez Canal for steamer traffic for about six months since October last year, many of the shipments were delayed thereby upsetting to some extent the installation work and the production schedule of our expansion programmes. As a result of the Suez episode, the freight bill on capital goods and on imported raw materials went up.

It is evident that there has been an increase in the quantity of foreign yarn imported. During the nine months. April to December, the imports of Rayon Yarn amounted to 47.62 million lbs. If the flow of imports continues at the same rate during the remaining three months of the financial year, the total imports, together with the indigenous production of 30 million lbs. would raise the quantum of available supplies to about 93 million lbs. which is considerably in excess of the normal requirements of the Weaving Industry in the country, now estimated at around 45-50 million lbs. The landed cost in the case of 150 deniers, on the basis of the present quotations of foreign manufacturers, comes to Rs. 3-11-0 as against the price for NRC, namely, Rs. 3-6-0 per lb. The Indian Units, which have been concentrating on the production of the most popular deniers of 150 and 120, are in a position to meet the entire demand in these deniers estimated at over 50 per cent of the total requirements of the Weaving Industry.

As hitherto, the coal position continues to be unsatisfactory, and wagons for transport from the coal pits are still not being made available in sufficient numbers. The authorities both at Calcutta and at Bombay, are being constantly requested to make satisfactory arrangements in this connection.



The increased requirements of electric power for our expansions were met when the Trombay Plant went into commission. We are now not drawing any electric energy from the Power Pool at the higher rate. Our additional requirements, consequent upon the launching of further frames and Caustic Soda Plant, have already been applied for, and it is hoped, they would be met by the Power Companies in full.

It will interest you to know that the considerable experience gained in the working of our Plant has enabled the management to open a special Designing and Engineering department, which has been responsible for the entire designing and engineering of the new expansions. In the result, we have been able to get quite a few items locally fabricated, thereby effecting considerable saving on the total equipment, using our own materials, training our own engineers in the process, and, lastly, conserving some valuable foreign exchange. Recently, we have broadened the activities of this department, and have obtained a licence from the Central Government for the manufacture of machinery for Rayon, Sulphuric Acid, Carbon-di-sulphide and Caustic Soda as well as Water Filtration and Softening Plants and Auxiliary Equipments. We have already made a beginning with the Sulphuric Acid Plant, and are in a position to offer a complete Contact Process Unit on a turn-key-job basis.

You will agree with me that in an organisation of our type, it is necessary to have a well-equipped Research Department to keep in line with the changing techniques. This department will be mainly concerned with manufacture of Viscose Yarn and Rayon Tire Cord on a Pilot Plant scale. Again, as our Caustic Soda Plant, which will go into operation shortly, will release a fairly large quantity of Chlorine, research work is proceeding apace, with a view to its practical use, and this may lead to the production of such Chlorine compounds as can be readily and profitably marketed. Laboratory experiments carried on in this respect are quite successful, and Pilot Plants are being put up to carry on further research in this direction also.

The Employees' State Insurance Act, as you may be aware, confers on workers, among other benefits, medical and maternity benefits, and these are proposed to be made available to the members of workers' families. The Government propose to meet the additional cost by increasing the rate of employer's contribution from 1¼ to 3½ per cent. While higher and higher charges are levied from Industrial concerns, as far as workers are concerned, they do not get the services which Companies like ours have been rendering to them. Efforts, legislative and otherwise,towards the creation of sound industrial relations and a due recognition of the human factor in industry are, no doubt, welcome.

Before I conclude, may I express my sincere appreciation of the very good work put in by the workers and staff, technical and non-technical alike, but for whose efficiency, loyalty and co-operation, it would not have been possible to make the progress that we have already achieved.

COMMODITY NEWS AND NOTES

FINAL ESTIMATES OF MAJOR MILLETS (JOWAR AND BAJRA) FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimates of major millets, viz., 'jowar' and 'bajra' for 1956-57, put the total area and production at 68,856,000 acres and 10,353,000 tons respectively, as against the partially revised estimates of 70,928,000 acres and 9,981,000 tons for 1955-56. This shows a decrease of 2.9 per cent in area and in increase of 3.7 per cent in production during the current year as compared to the previous year. The decrease in acreage under 'jowar' during the current year has occurred mainly in Rajasthan, Madhya Pradesh, Mysore, Andhra Pradesh and Bombay, and decrease in area under 'bajra' mainly in Bombay, Punjab and Rajasthan. Despite the decrease in area, there is an increase in the production of 'jowar' during the current year. The increase in the production of 'jowar' has occurred mainly in Bombay, Madhya Pradesh and Uttar Pradesh. There has, however, been a decline in the production of 'bajra' during 1956-57. This decline has occurred mainly in Rajasthan, Punjab and Uttar Pradesh.

RICE EXPORT FROM BOMBAY PROHIBITED

The Government of India has issued a notification prohibiting the export of rice, including paddy, from Greater Bombay to any outside area except under permits by the Bombay Government.

The import of rice from outside into Bombay city will still be permissible. This is intended to safeguard the supply position of rice in Bombay city and stabilise the prices at a reasonable level.

By another notification the Government of India has prohibited the export of wheat products (maida, suji, rawa, whole-meal atta and resultant atta) from Greater Bombay to any place outside it, except under permits to be issued by the Bombay Government.

This would ensure larger supplies of wheat products in Bombay city. The areas which have been traditional recipients of wheat products from Bombay city will, however, be supplied reasonable quantities on export permits.

COFFEE EXPORTS

The latest revised estimate of 1956-57 season's crop stands at 41,565 tons made up of 21,845 tons Arabica Plantation, 7,010 tons Arabica Cherry and 12,710 tons Robusta. The preliminary estimate of next season's crop is placed at 35,750 tons made up of 23,170 tons Arabica and 12,580 tons Robusta. The deliveries of Robusta to the pool so far have established a surplus for export of 1,450 tons. It was decided to recommend for export a further quantity of 1500 tons comprising o 1,000 tons Plantation and 500 tons Arabica Cherry provided the anticipated pool receipts were realised in full.

PULP OUTPUT RISES

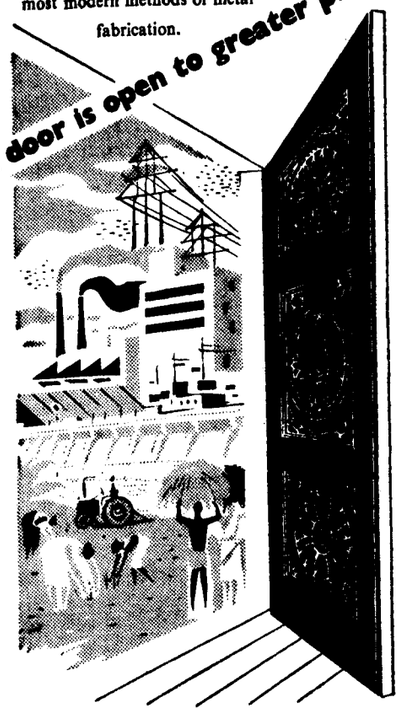
Woodpulp production in Canada in April and in the first four months of this year gained marginally over 1956. Domestic consumption was also ahead, but exports declined slightly.

April output totalled 831,493 tons this year and 849,794 tons in 1956. Domestic consumption was 634,267 tons, compared with 657,301 tons last year, and exports were 187,253 tons, against 187,574 tons in 1956.

Production in the first four months totalled 3,522,321 tons and included 1,586,172 tons of chemical pulp and 1,908,621 tons of mechanical pulp. This compares with last year's total of 3,430,593 tons, which included 1,553,382 tons of chemical and 1,844,618 tons of mechanical.

Domestic consumption to the end of April was 2,726,203 tons, against 2,637,122 tons for the corresponding period last year. At the same time, exports were off slightly at 747,294 tons, compared with 765,705 tons in 1956.

CEYLON TEA AND RUBBER



The Tea Controller states that during April, Ceylon's tea production amounted to 37,198,848 lbs.

Production for the period January to April, amounted to 143,134,607 lbs. compared with 134,241,361 lbs. produced in the corresponding period of 1956.

According to statistics released by the Rubber Controller, Ceylon produced 7,317 tons of rubber in April, which brings production for the period January to April, 1957, to 26,408 tons.

Exports for the period January to April totalled 35,767 tons.

Stocks of rubber at the end of April amounted to 22,298 tons and were comprised of 11,525 tons with producers, 3,495 tons with dealers. 629 tons with manufacturers, 1,101 tons with shippers and 87 tons under Customs.

INDIAN OXYGEN is playing
a vital role in building a more powerful and self-sufficient India in the Second Five-Year Plan.
From transport to electric power, from the steel works to the oil refinery—every day our technical service is keeping the nation up-to-date with the most modern methods of metal fabrication.
The door is open to greater prosperity

Searchlight on Hungary

THE report of the United Nations General Assembly's five-nation Committee on Hungary released on June 20 is a grim narration of the brutal suppression of the Hungarian revolt last autumn by the Soviet Union. The Committee has come to the conclusion that Russia resorted to "massive armed intervention" for crushing "a spontaneous national uprising" in Hungary and for "overthrowing a legally established Hungarian Government". The Committee has further unequivocally observed that "there has been no evidence of popular support for Mr. Janos Kadar's Government" which "has preceded step by step to destroy the power of the workers and their councils". The report registers the Committee's conviction that there was no legal basis for the Soviet intervention on November 4, or at any time prior to that. Nor was Soviet intervention undertaken at the invitation of any legally constituted Hungarian Government. At that time Mr. Imre Nagy was the Prime Minister. Mr. Janos Kadar's Government did not take its oath of office until three days after and there is evidence which strongly suggests that he and his colleagues were actually in Moscow, and not in Hungary, at the time of the Soviet aggression. In addition, Mr. Nagy himself appealed, at a time when he demonstrably enjoyed real support of the Hungarian people, to the United

Nations to address itself to the needs of Hungary. The Soviet abduction of Mr. Nagy from Yugoslav protection also illustrates the degree of Mr. Kadar's "subordination to the Soviet forces". "Having taken over Hungary by armed intervention, the Soviet authorities were compelled by reason of the administrative vacuum to administer a country whose popularly supported Government they had overthrown".

The Committee has also incontrovertibly refuted the Russian thesis that the uprising was "fomented by reactionary circles in Hungary" and was "aided and abetted by Western imperialists". From start to finish the uprising was, the Committee has observed, led by students, workers, soldiers and intellectuals, many of them Communists or ex-Communists. Their main political demands "included a stipulation that democratic socialism should be the basis of the Hungarian political structure" and that such "social achievements" as land reforms should be safeguarded. "At no time was the proposal made for the return to power, or to the Government, of any figure associated with the pre-war days". What did take place in Hungary in the fateful autumn of 1956 was a spontaneous national uprising, fanned by long-standing grievances such as Hungary's satellite status, Russian exploitation and the unlimited power of the political police. The Committee is convinced that the numerous accounts of inhuman treatment and torture by the political police "are to be accepted as true". On the evidence placed before it, the Committee is also convinced that numerous Hungarians, including women, had been deported to the Soviet Union.

There is also "no evidence of advance planning of the uprising", its entire course bearing the "hallmark of continuous improvisation". On the contrary, the Soviet authorities had taken steps as early as October 20 to resort to armed intervention. The Committee records that "evidence exists of troop movements from that date on", though no clause of the Warsaw Pact, which was later invoked by Russia in self-justification, provides for intervention by armed forces of the Soviet Union to control political developments within the frontiers of any of its signatories. Moreover, three days earlier, Mr. Imre Nagy, the Prime Minister, had renounced the Pact and appealed to the United Nations to safeguard Hungarian neutrality. The Soviet "reponse" was immediate, decisive and brutal: its tanks and armoured divisions thundered into the beleaguered capital of Hungary. The free world stood gaping. As has been aptly put, it thought only of sharing in the triumphs, and not the trials, of the Hungarian people. Vacillating and hesitant, it showed itself lacking in moral courage and amazingly inactive. Hungary was battered and re-Sovietized in a few days. Thus ended its short-lived, though glorious, struggle to escape the Russian bear's embrace. The Committee's record of the events from October 23 to November 4 and after is the ghastly tale of a rape committed in the presence of those who could prevent it, and did not.

The Committee has made a signal contribution to the cause of justice by its impartial and exhaustive investigations and penetrating analysis. For sources of its information, the Committee examined copious documents, and in several languages. It recorded voluminous testimony from over a hundred witnesses who were in a position to render first-hand account. They represented a wide cross-section. Among persons examined were both Communist and non-Communist intellectuals; professors of law, medicine, philosophy and history; high school students; members of the Hungarian armed forces; and both skilled and unskilled workers. Eight of these witnesses had themselves been deported to the Soviet Union, but had escaped or been returned; other witnesses had been liberated from deportation trains. The witnesses were, according to Mr. R. S. S. Gunwardene, a trained jurist and a Ceylonese member of the Committee, subjected to so close a scrutiny and such a severe cross-examination that some of them accused the members of the Committee of being Communists.

The Kremlin has in accordance with its set policy, and not unexpectedly, described the Committee's report as "a collection of lies" prepared from the testimony of "political adventurers, common criminals, and traitorous refugees". Its propagandists have also challenged the validity of the very existence of the Committee which they assert was "illegally constituted" and trained for months for "fabricating and drafting various slanders". The Soviet Government would have the world believe that the Committee's activity constitutes "interference into the domestic affairs of Hungary"!

Russia's reason for indulging in these diatribes is obvious. It would have the Hungarian tragedy categorized as but another sordid incident in the cold war. It is not necessary to be a student of Soviet affairs to wonder why, if the Russian Government was so sure of its "innocence", it did not allow enquiry and investigation on the spot. It is on record that the Committee was constituted only *after* the Soviet Union had ignored the United Nations resolutions calling for withdrawal of Soviet troops from Hungary and *after* Mr. Janos Kardar's regime had refused to permit Mr. Hammerskjeold to visit that unfortunate country. Again, in line with this pose of innocence, the puppet Hungarian Government of Mr. Kadar felt shy of meeting the Committee. Is more circumstantial evidence required to suggest skeletons in the Russian cupboard?

The composition of the Committee provided the fullest guarantee of an impartial and objective investigation. The chairman was a Dane, coming from a country forcibly occupied in World War II by the Nazis and, to that extent, least likely to be prejudiced in favour of Fascism. It included one representative of Ceylon, an uncommitted country, and another of Tunisia, generally held above bias against Russia. Uruguay, from Latin America, known for its consistently democratic traditions, was also represented, and its rapporteur was an Australian. Assuming that Denmark, Uruguay and Australia were susceptible to influences of the cold war, Mr. Banderanaike's Ceylon, and Mr. Bourguiba's Tunisia can certainly not be tarred with the brush of partisanship. To accuse them of lack of independence and impartiality, as Russia has done, would be to insult these small but proud nations. These countries are not, and have not been, involved in power politics.

The report needs and deserves to be read by all who feel concerned for truth. It is more than a record of the fate of the people. An unmitigated condemnation of Soviet Russia, the report also constitutes a severe indictment of inadequacy, unpreparedness and grave hesitation of those from whom Hungary had every right to expect help. Denied help, and with their backs to the wall, the Hungarians went down fighting, blazing a new trail for freedom-fighters for all times to come.

Problems of Rural Credit

A RECENT statement of the Finance Minister in the Lok Sabha that he proposes to transfer to the State Bank some of the functions of the Reserve Bank which are in the nature of "pure commercial or co-operative banking" has lent a freshness to the whole question of rural credit. This statement, seen in the context of a report that a high-power committee is now investigating a proposal that the State Bank should take over the function of supplying agricultural credit, seems to indicate that certain far-reaching changes are in the offing in the banking structure in this field. There is no doubt that this will be the signal to raise a first-class controversy as to the relative roles of the Reserve Bank and the State Bank vis-a-vis rural credit.

By a coincidence, this week saw the release of Part II of the Survey Report of the Committee of Direction of the Rural Credit Survey. It appears to have come as a timely reminder of the tardy progress made in the improvement of the agricultural sector though the Government had accepted already the main recommendations of the Gorwala Committee for rejuvenating the rural economy. An integrated credit scheme that would answer the needs of the villages was an important aspect of the Committee's recommendations which is now in the process of implementation. Whatever may be the changes now contemplated, the present report of the Committee has come at an opportune moment, which will help kindle greater interest in the problem and provide a better understanding of the operation of the various credit agencies in the rural areas.

The report highlights the fact that the private creditor—the professional money-lender, the agriculturist money-lender and the trader—still reigns supreme in the field of rural credit supplying 70 per cent or more of the total requirements. As against this is the fact that the Government supplied as little as 3.3 per cent and the co-operatives the equally insignificant proportion of 3.1 per cent. This phenomenon is explained mainly by the way private agencies operate which in general are not keen about laying down terms and conditions of loans in specific detail. By contrast, one finds that Government finance is ordinarily available only to defined categories of people for defined purposes. Similarly co-operative finance for various purposes and under various conditions is also limited as to amounts and periods. The primary objective being maximum gain (compatible with security of repayment) it is small wonder that the private credit agency is not really interested in ensuring that a loan is used for a specific purpose.

Yet another fact that emerges out of the report is that whatever regulations exist to regulate money lending, the devices adopted by moneylenders to obtain extra gains are usually illegal. In very few States is there a separate administrative machinery to ensure proper enforcement of the Acts. The data on rates of interest by themselves are sufficient to show the extent of evasion of legal regulations relating to private moneylending and thus the authors of the report exclaim "That the legal rates of interest should be so universally ignored and that their disregard should occasion little comment is itself of very considerable importance in relation to the study of existing conditions of rural credit and the possibility in future of regulating or organising it in private hands."

Here then is the crux of the problem. There cannot be two opinions that this usurious lending deserves the strongest condemnation. What, however, is the alternative? It is obvious that most of the agriculturists will not satisfy the conventional requirements of commercial banks and other credit agencies in regard to credit worthiness and thus there is a pathetic dependence on the money-lender. The report points out how both Government and the co-operatives supply relatively a large proportion of the credit obtained by the big cultivators. The real snag is that in the case of the small farmers, the productive as well as the consumption needs get mixed up and they are not in a position to offer the required types of security to the commercial banks or other credit agencies necessary to obtain loan. Thus, in the present circumstances, it so happens that private moneylending seems to play necessarily a complementary role to the other credit agencies. But the root question is how far, despite the constitution of a number of new agencies, the various credit needs of the farmer can be adequately met.

The primary fact that should, however, be remembered is that the problem of credit supply cannot be dismissed in terms of organisational set-up alone. As in the case of industrial finance, where there is need for creating an appropriate investment climate, in regard to rural credit also there is need to take into account the potential availability of productive opportunities. It cannot be forgotten that the paramount need is to raise agricultural productivity to meet the needs of an expanding economy and the best results can be obtained only when all available productive opportunities are utilised. Thus the problem of finance or credit must be related to the question of the various fields in which the financial resources will be utilised.

Another important question relates to the need for exploring ways and means by which established banking and credit agencies would undertake to look after the consumption needs of the farmer also which are now mainly attended to by the private moneylender. The Survey Report, while discussing co-operative finance, points out that there are many gaps in the co-operative structure and defects in co-operative coverage. "To remedy the defects" it says "a development programme must aim at multiplying the number of societies, and at making finance adequate and fully available to members." The dependence on the moneylender can be considerably reduced if the credit agencies sponsored by the State undertake the responsibility for providing consumption loans at relatively lower rates. This would not only help the rural consumers but prove of benefit to the credit agencies who will be substantial gainers thereby. Ultimately this will not only lead to the elimination of the moneylender, but the effect on the economy will also be great since by the operation of the relative high interest rates, some substantial savings will be forced on the unorganised sector. If the Survey Report can lead to some fundamental thinking on the problem of tackling private moneylending, it would have done some distinct service.

Kerala's Industrial Policy

THERE can be no doubt that Kerala is more advantageously placed for rapid industrialisation, but she is less developed than the neighbouring States of Madras and Mysore. The fact that this West Coast State has considerable natural advantages for the establishment of a wide range of industries is well brought out in the statement of industrial policy just issued by the State Government. Kerala produces almost the entire quantity of rubber in India. There are ample resources of straw, bamboos, soft woods, hard woods, mineral sands, lemon grass oil, tapioca starch, china clay, etc., which are suitable raw materials for different kinds of industries. Cheap hydro-electric power is available, and more hydro-electric projects are under execution. Besides a network of good roads, which already exist, the State will see the completion, this year, of the last link of the railway line connecting its northern and southern parts to Cochin harbour. Above all, skilled and unskilled labour available is some of the best in India from the point of view of intelligence, manual ability and adaptability.

It may be straightway conceded that all this is true and there is no exaggeration in this official account of industrial possibilities. There is no particular merit in this preamble of the Communist Ministry to its industrial policy statement for, if there had been a Congress Ministry, it would have said the same thing. What is more relevant is not the listing of locational advantages which are probably well known to entrepreneurs elsewhere in India but the soundness or otherwise of Communist policies in respect of nationalisation and labour. Here unfortunately there is no ground for excessive optimism.

For one thing, the Kerala industrial policy, which purports to follow broadly the Central Government's industrial policy resolution of April 1956, is significantly different from the latter in one respect. The Kerala statement says: "As is laid down in the industrial policy resolution of the Government of India, the industrial units not included in Schedules A and B thereof will not be nationalised unless, in the case of a particular unit, there is gross mismanagement leading to loss of national wealth or deliberate and continuous refusal on the part of the management to abide by Government's policies with regard to the living and working conditions of the employees. In the case of those industries which, for any reason, are proposed to be nationalised, reasonable compensation will be paid. This will also apply to foreign owned plantations when they are nationalised with the concurrence of the Central Government."

What the Central Industrial Policy Resolution, on the other hand, states is merely that "all new units in these industries (listed in Schedule A), save where their establishment in the private sector has already been approved, will be set up only by the State" and that "this does not preclude the expansion of the existing privately owned units, or the possibility of the State securing the co-operation of private enterprise in the establishment of new units when the national interests so require." With regard to industries in Schedule B the resolution lays down that "with a view to accelerating their future development, the State will increasingly establish new undertakings in these industries" and that "at the same time private enterprise will also have the opportunity to develop in this field, either on its own or with State participation." "All the remaining industries", according to the resolution, "will fall in the third category, and it is expected that their development will be undertaken ordinarily through the initiative and enterprise of the private sector, though it will be open to the State to start any industry even in this category."

The crucial difference between the Kerala industrial policy and the Central industrial policy should be plain as pikestaff. Whereas the latter nowhere lays down positively the principle that the existing privately-owned industrial units coming under Schedules A and B are liable to be nationalised as a rule, the former threatens, by implication, that such units in the private sector would be nationalised. What is worse, the Kerala policy statement holds out the threat that even the privately-owned units in the third category might be nationalised under certain conditions. Again, whereas the Central Industrial Policy Resolution makes no distinction between Indian-owned and foreign-owned private enterprises in any connection, the Kerala statement singles out foreign-owned plantations for possible nationalisation. And, to cap it all, the Kerala industrial policy promises only 'reasonable' compensation in the event of nationalisation. How 'reasonable' compensation can be under Communist dispensation, nobody can know; it may mean anything or nothing.

One wonders how private enterprise can be attracted to Kerala where the Communist Government keeps the Damocles' sword of nationalisation hanging over the existing privately-owned industrial units, foreign as well as Indian. It is one thing for the State to start new enterprises of its own, but quite another to nationalise the existing ones in the private sector. If existing units themselves are subjected to insecurity, is there any reason to suppose that new units will be started by entrepreneurs with any sense of security? In the circumstances, the appeal of the Communist Government to private enterprise to start new industries in their State rings hollow. The hope engendered by the Kerala Finance Minister's Budget speech which made no reference to nationalisation is now belied. It thus turns out that the State's industrial policy is vitally different from the Central Government's policy even which has left much to be desired.

The outwardly sweet reasonableness of the Kerala Communists towards private enterprise is just not enough to carry conviction. The facile view that their control of or influence with industrial labour in the State would ensure its reasonable attitude towards management has to be set against the just fear that such control could any time create complications. The Kerala Government's emphasis on collective bargaining agreements providing for reasonable wages, allowances, bonus, etc., and on joint consultative committees is hard to justify in the case of enterprises which are just incipient or to be newly started and which may not naturally be in a position to figure out their future prosperity. By all accounts, therefore, the Kerala industrial policy, which hints at onerous conditions in respect of wages and labour and at nationalisation at every turn, is not calculated to evoke prompt enthusiasm.

BRITISH OVERSEAS AIRWAYS CORPORATION

A TOWER OF STRENGTH in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

THE WEEK'S NOTES

PROBE BODY ON FOOD

IN THE matter of food this country is not out of the wood, agricultural plans notwithstanding. And the pretty serious situation in respect of both production and prices certainly calls for an expert inquiry. Such an inquiry cannot, by its very nature, be time-consuming but would have to be carried out with the utmost possible expedition. The news is, therefore, heartening that a high-powered committee with Mr. Asoka Mehta as Chairman, Dr. S. R. Sen as Member-Secretary and Dr. B. K. Madan and four other members has just been set up by the Government of India and charged with the task of reporting within three months. It is most appropriate that Mr. Asoka Mehta who has a deserved reputation for balanced and constructive criticism is to have, as Chairman, yet another opportunity to render some outstanding public service. The inclusion of Dr. B. K. Madan, Economic Adviser to the Reserve Bank of India and Dr. S. R. Sen, Economic and Statistical Adviser, Ministry of Food and Agriculture, is equally appropriate and probably intended to ensure a high quality of research which is particularly required in respect of supplies, prices and effective demand according to income levels in the monetised sector of the economy.

The terms of reference of the committee encourage the hope that the inquiry may well be more scientific than the usual ones. In the first instance, the present food situation is to be reviewed and the causes for the rise in food prices since the middle of 1955 are to be examined. Secondly, the likely trends in demand and supply of food grains over the next few years are to be assessed. This assessment is to take into account the likely increase in production from the second Plan schemes; the impact of growing development expenditure, increase in population and urbanisation on the demand for marketable surpluses; and the availability of food grains from abroad in relation to requirements and in the light of the foreign exchange position. The findings of the inquiry regarding these relevant factors will be awaited with great interest. In the meanwhile it is good to find now a refreshing lack of complacency in the Union Food and Agriculture Ministry which has rightly decided to negotiate with the US Commodity Credit Corporation for another food grains deal covering probably some 2 million tons.

As it is all a question of more supplies in the monetised sector if food grain prices are to be brought down by, say, 15 per cent, 'The Eastern Economist' hopes that the Asoka Mehta Committee may find that this reduced level of prices would be consistent with the necessary incentive to the producer, with the interest of the consumer and with the maintenance of a reasonable cost structure in the economy. The statistical estimates already made by the Economic Intelligence Unit of the Indian Institute of Public Opinion in this connection, though by no means exhaustive, should none the less be useful to the committee in its inquiries.

AN INEXCUSABLE DELAY

THE UNCONSCIONABLE delay in the publication of the Planning Commission's review of the results of the first Five-Year Plan seems to follow a familiar pattern. That does not, however, make it the less objectionable. To observers, the technique followed in the case of reports not convenient to Government would seem to go along one or the other of these lines; either to suppress the report altogether or publish only such portions of it that will not be 'embarrassing' for Government or delay its publication unduly so that by the time the report sees the light of day, it loses its main purport and perhaps its sting. Just to illustrate, the fate of the report of the Official Language Commission belongs to the first category and it is remarkable that the product of a Commission that went into a controversial issue should be so pitilessly consigned to the archives without allowing the public even to have a look at it. In the second category comes the report of the Wage Board Award for Journalists where the Government have not thought it fit to publish so far the minority dissent in spite of persistent demand.

The case of the Planning Commission's report on the working of the first Plan apparently fits in the last category. Even with the huge apparatus at its command, the Government has taken about fifteen months to prepare the review. What is more intriguing is even after the report has been made ready, its release has been further delayed. According to reports available—due to journalistic enterprise—the document does not seem to be very creditable to the Public Sector over its performance and it is possible it may explode some of the assumptions of the second Five-Year Plan. After all, the main plank of the Congress election manifesto was the second Five-Year Plan. While seeking its endorsement from the electorate, it should have gone with its own published record of the first Plan's achievements. Since Government have not chosen to do so, they cannot escape the charge that the public were not given all the relevant data before seeking their approval for the second Plan. However, the presentation of the recent Budget has imparted a freshness to the demand for the publication of the report which Government cannot hold back for long.

It would appear from what reports that are available that the shortfall in the outlay in the public sector is of the order of about Rs. 400 crores. In fact as against the aggregate provision of Rs. 2,386 crores made, it is considered not likely that more than Rs. 1,960 crores had been actually utilised. It is, however, not known how much of the Rs. 94 crores allotted for the public sector for industrial development has been utilised. But so far as the private sector is concerned, as against an anticipated investment of Rs. 233 crores in industrial expansion, the actual capital expenditure is estimated to have amounted to Rs. 231 crores in the five-year period. Here is a fact that any student of contemporary economic affairs cannot afford to miss. If the private sector was able to fulfil its target and come out creditably in the first Plan there is no justification on doctrinaire grounds alone to come in its way in the field allotted to it in the second Plan. Why should anyone think of killing the goose that lays the golden eggs?

THE BLOOMING FLOWERS

ON JUNE 19, Peking and Moscow simultaneously revealed to the world the text (or most of it) of the major doctrinal formulation which Chairman Mao Tse-tung had made at a meeting of his colleagues on February 27. In this speech he is reported to have pleaded for allowing "a hundred flowers to bloom together". A day later, on June 20, however, the five-nation UN Committee released its 150,000-word report on Hungary which showed that the Kremlin had brutally suppressed the national uprising in Hungary. Though the irony is overpowering, Mr. Mao's speech is important for its "liberal" tone. To brush it aside as "of no consequence" will be wrong. The speech may rank in importance with Mr. Khrushchev's now-famous secret speech on the cult of the individual.

It is useful to recall that many observers of Communist goings-on tended to minimize, at that time, the importance of the policy of de-Stalinization. "The leopard cannot change his spots", these pundits asserted. They warned the free world not to be taken in

by the new Communist tactics. Some of them even tended, in their cocksureness, to turn the Nelson eye to the significance of that major development in the history of Communism, especially for the Communists outside the Kremlin oligarchy and the subjugated nations of the Russian empire. They overlooked that just as farmers and sports-lovers read the evidence of the advent of rain in different signs and with different sentiments, the Communists outside Russia might interpret the Khrushchev performance in a manner and for a purpose altogether different from that of the author or authors. The Poznan riots and even the Hungarian uprising were, in parts at any rate, attributable to the atmosphere generated by de-Stalinization.

Doubtless, Chairman Mao's formulation has less of the element of surprise, and one should not really run to any drastic conclusion from it. But the speech calls for a serious study, especially against the background of events like the Hungarian national revolt coming in the wake of the denigration of Stalin. While it may not at all seem likely that there will be another Hungary, those responsible for laying down policy for the free world could be alert to all signs of popular assertion in China, particularly among its minorities and non-Han nationalities. If once again opportunity is missed, then once again the non-Communist world may have only to eulogise the brave deeds of martyrs without being able to live up to their expectations and without being able to offer anything more than the cold comfort of words for the living.

ASSAM'S INTRANSIGENCE

THE "TRUCE" arrived at between Maulana Azad and Mr. Bishnuram Mehdi, Chief Minister of Assam, on the question of locating the oil refinery sends one between tears and laughter. It is heartening because it has, for the time being, averted a political crisis in a State which is already threatened with instability on account of the Naga disturbances. But the fact that the "truce" has been achieved at the cost of a major principle — that important national questions should be decided by the experts and not by politicians -- is a little dismaying. If the precedent is followed in the future, politics will begin to make encroachments in the sphere of economics and technology. This will have a deleterious effect on the country's development. Planning will cease to have any meaning and confusion may well prevail everywhere. If the planners are to make a success of their job, politics — more correctly "politicking" — must not be permitted to foil their efforts and befog their vision. This is a basic principle of planning which India can afford to ignore only at peril to its economic salvation.

This is, however, not to underestimate or deny Assam's financial worries or its claims for generous financial assistance from the Central exchequer. A strong and contented Assam, with a tenuous land link with India, is the best guarantee for the security of the country's north-east frontier and the establishment of the refinery will mean much larger scope for industrialization and for employment. It is, therefore, easy to sympathize with and appreciate the strength of feeling engendered in Assam on being denied location of an oil refinery. But no one can, surely, sympathize with or appreciate the manner in which the adverse decision of the expert committee on the matter was made an excuse for releasing a political whirlwind.

The expert committee which went into the matter viewed things from many angles other than merely those which appear relevant or important to Assam. It favoured Barauni, in Bihar as against Calcutta and Gauhati, because of strategic and other reasons. Calcutta was found unsuitable because the setting up of the refinery there would require a much longer pipeline and because of its close proximity to the Indo-Pakistan frontier and its susceptibility to labour troubles. Gauhati was rejected as a possible site because of the unstable political conditions resulting from the Naga trouble and also because it would have been more difficult to transport oil to consuming centres from there. In short, Assam's claim was rejected because of national considerations. Much as every State would like to promote its individual interests, these have to be subordinated to those of the country as a whole. We feel, therefore, that both the manner in which Assam has reacted to the expert committee's verdict and the manner in which Maulana Azad has tackled should not be repeated.

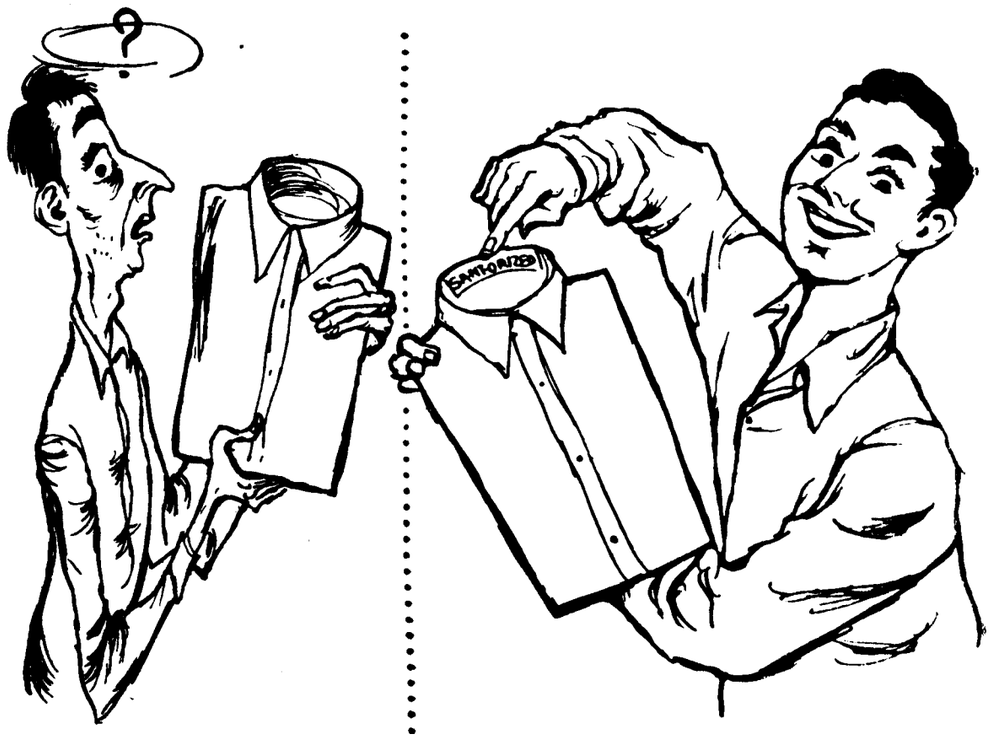
TOWARDS BRIGHTER RADIO PLAYS

NEXT TO sweet strains of music, perhaps what attracts the twiddling tuner most often is drama. The listener is induced to hear the exciting denouement. But there are also the plays from which the listener turns in disappointment. Dr. Keskar, inaugurating recently a seminar of playwrights and feature writers in South Indian languages in Bangalore, suggested that they might find ways of making the short ten or fifteen minute feature more interesting for the listener. This is timely advice. However, the fact is there is a scarcity of themes for original writing, and this means the canvas must be spread widely for attracting the proper talent. Another difficulty to be contended with is the perhaps inevitable restriction of time. This can be obviated by using only a limited number of characters, dialogue that is quick, lively and meaningful, and a concise plot. Adaptations and translations from classics unfailingly produce exactly what is necessary, if original compositions cannot turn from hackneyed themes. There is the excellent example of the B.B.C. which often takes a scene from a famous novel or play, and re-writes it to suit a broadcast.

My life *by Adipocere*

Pronounced 'adi-po-saire'

What a life I have had. To add to my troubles, I keep being attacked by little microscopic things which you call bacteria, but which I call a curse. Little do they know that I am immortal, as in spite of this terrific onslaught I continue to live, albeit in different forms.



When the bacteria attack me, my body releases hydrocarbons—light, medium and heavy. The corresponding physical states of these are gas, liquid petroleum and wax. The petroleum part of me is squeezed into any contiguous porous material, usually sand or limestone, where it remains until some crazy geologist from an oil company decides to look for me.

STANVAC — *the name that stands for progress*

STANDARD-VACUUM OIL COMPANY INCORPORATED IN THE U.S.A., WITH LIMITED LIABILITY

PSSVOC-44/57

This may shrink | **This will not shrink**

That's why people look for 'Sanforized' on the label!

The Trade Mark 'Sanforized' inspires such confidence that people all over the world pick fabrics trade marked 'Sanforized' —knowing they bear this assurance: *This garment will not shrink out of fit— even after many, many washings!*

It adds value and prestige to your own label—enables you to sell with confidence—and assures the public that you take trouble to give them value.

People rely on you to serve them well—so serve them cloth labelled 'Sanforized'.

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements

JAMES, YOU MUST NOT SUPPORT THE PAINTER!

By

ODYSSEUS

INCOME TAXES, subsidies, rent restriction, and dividend limitation, are among the means used in Socialist and welfare states to extract wealth from the "rich" to redistribute to the "poor". The object of this redistribution is to curb or eliminate "ostentatious, wasteful, anti-social, or scandalous" expenditure by the "rich". But this, as we saw last week, raises the questions: When does expenditure on caviare pass from "gracious living" to "gluttony"? How can you ensure that the "poor" recipient of redistributed income will have the good taste, or the sense, to refrain from "worthless" in favour of "socially desirable" spending?

One often hears it said that while those who enjoyed "riches" before welfare states waded in and substantially reduced their spending power must continue to miss what they can no longer afford to buy, their children, brought up without these tastes, will no longer miss them and will be happy and contented citizens. This implies that differences in tastes are merely due to social habits and that they can be eliminated by taxing such habits out of existence. But granting this, as Bertrand de Jouvenel points out in his stimulating "Ethics of Redistribution" (Camb. Univ. Press, 1951), men will, even so, remain different in character and therefore some differences in tastes must always persist. But with heavy equalising taxation, economic demand will be controlled solely by numbers, no longer by the varied tastes of purses of varying spending power.

One effect will be that those goods and services demanded by larger groups of individuals will be supplied more cheaply than other goods and services demanded by smaller groups will be supplied to the latter. "The satisfaction of minority wants will be more expensive than the satisfaction of majority wants." The state will thus discriminate against the minority.

There is nothing startling in this discovery. People of uncommon tastes in all economic systems always have to pay more for their unusual wants. And, by the same token, this is one of society's most powerful incentives to secure harder work, higher productivity, and greater volume of production. It is an incentive of which welfare and Socialist states increasingly deprive themselves. In a competitive society, open to individual enterprise, there is no end to the variety of specialised wants that individuals develop and no limits on incentive and variety of production.

L.C.M. OF THE COMMON MAN

The Socialist says, however, that in the interests of the majority, no individuals can be allowed to earn more than certain limited incomes. In other words, in the interests of "equality", the whole society must be reduced, materially and culturally, to the level of the Lowest Common Multiple. Because in all countries at all times, the average man has led a dull, drab life, therefore no man at any time shall be allowed to extricate himself from the sticky mess of mediocrity. It is fortunate that Plato, Shakespeare, Racine, Kalidas, James Watt, George Stephenson, Thomas Edison, Shankaracharya, Tirunvalluvar, and Rabindranath Tagore, flourished before the age of egalitarian Socialism, for they were individualists whose tastes were as original as their effects have subsequently been powerful. But if they had all had to keep expense accounts, and be levelled down by steeply progressive income tax to an average income considered acceptable by bureaucrats, we should never have heard of them. All these great men had free play given to their geniuses by the patronage of wealthy courts and rich men. The average man was no more their patron in those various centuries than he is today. How many tens of millions visit the cinema theatres today in India? How often are the plays of Kalidas given? How many hundreds go to them? You can make a fortune out of a successful film. Can you make a fortune by publishing Tagore?

Bertrand de Jouvenel points out four important consequences:

(1) Personal hardship for individuals of original tastes.

(2) The loss to society of the special effort such people make in order to satisfy their special needs.

(3) The loss to society of variety in the ways of life resulting from successful efforts to satisfy special wants.

4) The loss to society of those activities which are supported by minority wants.

Remember that innumerable items now supplied cheaply to the masses were originally luxuries (like spices and newspapers) which could only be produced because a few were willing, and able, to buy them at high prices. Such "luxury" expenditure would have been severely condemned by our equalisers who insist that the nation's productive efforts must be directed first towards necessities for all, rather than towards luxuries for the few.

If the equalisers have their way, they risk bringing material progress to a dead stop because it is one of the most glaring facts of history that each successive enlargement of opportunities to consume arose because the means to consume were unequally distributed.

HOW TO INCREASE WEALTH

Judging by the constant reappearance in public life of recommendations either that taxes should be further increased to take "superfluous" wealth from the "rich" to be redistributed to the "poor", or that nobody should be allowed an income above a given maximum, it cannot be repeated too often that such proposals imply that a plethora of wealth already exists, and that what's wrong is its bad distribution. In fact, however, the object of all thinking citizens should be to advocate ways and means of adding to the wealth of a poverty-stricken world.

The more opportunities there are for individuals to raise themselves above the national average of wealth, the quicker will that average rise.

Those who call for equalisation of incomes and for radical redistribution have never tried to visualise what the nation would look like if they had their way. In the first place it would materially debase the present modes of life of the nation's leaders in every sphere,

whether statesmen, public servants, business men, industrialists, engineers, trades unionists, intellectuals, or artists. The "fair and equal" redistribution of the national income would cause a great shift in activities. The demand for some goods and services would increase, for others vanish. Certainly some of what P. H. Wickstead called (in "Common Sense in Political Economy", London. 1933) the "misdirection of productive activities" would be eliminated, i.e. the buying power of rich men to divert to their use resources that would be better employed in satisfying the needs of poorer men. But how great a proportion of economic resources, was in fact so diverted in pre-war India or Britain?

Nor would most thinking people rejoice at the disappearance of all the activities which find their market in the classes earning above average incomes. The production of all fine quality goods would cease — as it has already diminished substantially. The skills that they demand would be lost and the taste that commands them would be coarsened. Who could buy paintings? Who could buy books other than cheap, paper-backed novels? If the Rs. 60,000 spent by the 2,000 buyers of an original piece of historical or philosophical research are henceforth spent by 60,000 buyers of novels at Re. 1 each, then 60,000 individuals may have their satisfactions increased, but is the nation richer? Is it the Socialist case that spiritual values no longer count?

The Socialist has his answer ready. It is true that individuals will no longer be able to buy pictures or books but the state will provide bigger and better public libraries. Artists, authors, historians, scientists, fine craftsmen in silk, glass, and marble, will be maintained by the state.

Here we reach the heart of our discussion. The redistribution of incomes, whether considered from the economic or from the cultural viewpoints, involves diminution of the freedom of the individual and enhancement of the power of the state. The loss of investment capital which arises from punitive taxation has to be made good by state saving, state planning, and state investment of funds. Likewise if heavy taxation makes it impossible for individuals to support the arts, the state becomes the sole, powerful manipulator and monopolist of spiritual values.

Everywhere throughout the civilised world, the state is slowly, or rapidly, extinguishing the individual as an individual, with all his possibilities of imagination, variety, change, and growth, and substituting the Common Man — housed, fed, employed, exercised, entertained, by the state. In such circumstances, the Common Man cannot fail to be one whose ideas and behaviour conform strictly to normality — as defined by the state.

But the cream of Socialist redistributionist illogicality is, as Bertrand de Jouvenel points out, this: By redistribution, the Socialist wants to maximise the satisfactions of the masses. When all incomes are equal, says the Socialist, all satisfactions are equal and maximised. The object is to prevent the "'rich" from "diverting" to themselves by force of their superior buying power the allocation of productive resources. If, then, the "rich" are eliminated, are not market values set by the mass of buyers, and is not the resulting allocation of resources ex hypothesi, the best, free from all distortion? Apparently not, because in direct contradiction with this whole line of reasoning, the state steps in to resume production of items of art and other cultural activities that are no longer in demand! Q.E.D. — which may be roughly translated as "Was that what was to be demonstrated?"

If we say that although people would be better satisfied by spending a certain sum on ice cream and detective stories (the need for which they feel more keenly than buying of a painting), nevertheless "in their interests" the state must tax them sufficiently to deprive them of these pleasures in order to support the painter, "we obviously", delightfully suggests Bertrand de Jouvenel, "lose the right to argue that James's income must go to the mass of the people because satisfaction will thereby be increased. For all we know, James may be supporting the painter. We cannot accept the criterion of maximising satisfaction when we are destroying private incomes, and then reject it when we are planning state expenditure."

Of course... it's wrapped in

TR 1041

SPAIN AND MOROCCO

(From Our Special West European Correspondent)

PARIS, June 21.

THE negotiations between the Governments of Franco and the Sultan which have just ended in Madrid have carried a stage further the piecemeal restoration of Moroccan unity and sovereignty. Progress was made on the intricate problem of withdrawing from circulation the Spanish peseta which still forms the currency of the northern part of Morocco, and replacing it with the Moroccan franc. But less progress was made with regard to the enclave of Ifni, in southern Morocco, which Spain wants to hold on to, as Portugal is still holding on to Goa. The importance the Government in Rabat attached to these negotiations can be seen from the fact that the Moroccan Foreign Minister, M. Balafrej, spent 15 days in Madrid at the head of his delegation, trying to get matters out of the stalemate they had fallen into last December. Naturally, it is the Moroccans who are making the pace and the Spanish who are dragging their feet, but the new Government that has emerged from Franco's energetic political spring-cleaning seems a little more willing to reach agreement, given time and adequate compensation.

The Hispano-Cherifian negotiations are part of the long task of nation-building that the regime in Rabat has had to undertake since Morocco attained independence. Elsewhere in the world, imperialism had built colonial nations which, on becoming free, had at hand all the administrative and economic framework of nationality, but in Morocco the various imperialist powers had consecrated the bizarre fragmentation of the old sultanate. On the morrow of independence, Morocco was politically split into the French and Spanish zones, plus the international zone of Tangiers, plus various enclaves such as Ifni. Moreover, the southern and inland borders of the country were quite undetermined and there is no clear international agreement about where Morocco ends; it just fades off vaguely into Mauretania and the French Sahara. On top of this political fragmentation but by no means exactly coinciding with it, there was an economic fragmentation, of which the dual franc and peseta currency was only one example. The existence of the totally "free" economic zone of Tangiers and of other duty-free ports was further complicated by treaties with Britain and Spain prohibiting the imposition of customs tariffs on imports from those countries. Moreover there was a fragmentation of legal powers, as in treaties granting extra-territoriality to certain foreign nationals, as for instance Americans.

The unification of the country required abrogation of all these multifarious privileges, which could only be obtained by complex international negotiations. So far, Morocco has met with considerable goodwill in this matter; Britain and the USA, for example, have made no difficulties about surrendering their rights. Economic unification is particularly difficult and is taking more time. Thus, the Spanish currency cannot be replaced without agreement on the rate of exchange and, apart from the fact that the Spanish peseta has no one international value, this is intricate because the French Government wants to have its say in the matter for it is the guarantor of the Moroccan franc. Economic unity is urgent not only for reasons of national prestige and convenience but because the conclusion of financial assistance treaties with other countries (France, the USA and the international lending institutions) is impossible until the government in Rabat has control of its currency and tariffs.

The international aspect of restoring unity and sovereignty in Morocco has to be attended to at the same time as the Sultan seeks to ensure that his writ runs throughout the territory, against the opposition of the regional powers of Islamic feudalism and against the extremist forces represented by the Army of Liberation. The struggles between these disruptive elements and their quarrel with the infant central power are considerably complicating the international negotiations, for the terrorists or a regional chieftain will choose to abduct French citizens just when the Rabat administration is in the midst of concluding a treaty with Paris. The Sultan is none too sure of himself in such situations; sometimes he disowns the extremists but sometimes he has to take their misdeeds on to his own account for internal political reasons.

The Moroccans have obtained in Madrid abrogation of the Hispano Coerifian commercial treaty of 1861, which was modelled on the treaty with Britain signed in 1858. This will enable them to enforce a uniform customs tariff regime for the whole country, including the former international zone of Tangiers. Thus they can begin to frame an industrial policy by offering protection to local enterprise. In return the Spanish have demanded concessions in the shape of a new trade treaty that will guarantee increased imports of Spanish goods into Morocco; this will not be easy to achieve, for the Spanish and Moroccan economies are competitive rather than complementary. Progress in the currency negotiations removes another obstacle to closer economic co-operation with France, from which country Morocco still has to expect the major part of its foreign aid. There is yet to be settled the question of the status of Spanish officials who will remain as servants of the new government in the northern zone. Agreement on this question has been reached with the French in the south. The issue is important because Morocco has no native technical or administrative cadres and must continue to rely on the tens of thousands of European officials that ran the old protectorates. Both parties are anxious to have their status and loyalties firmly fixed, the Europeans because they feel insecure in the troubled conditions of the new state and the Moroccans because they remember the way a French pilot nominally in the Sultan's service took orders from the French Government last autumn when he kidnapped the Algerian rebel leaders who were then the Sultan's guests.

The question of the employment of its officials in the former protectorate is of special importance to the Spanish Government because Morocco was traditionally a place for employing the eternal excess in the overstaffed Spanish bureaucracy. This is particularly true of the Spanish Army, for whom Morocco served as a vast barracks and training ground. This matter will be settled along with (or perhaps disguised as) a "technical assistance" treaty. The grant by Madrid of such technical aid will also help absorb some

part of the Moroccan Government's substantial credits in Madrid.

While progress is being made in these directions, the Spanish have hardened their attitude on Ifni, which Madrid considers as Spanish territory. The Spanish claim is based on the 1860 treaty of Tetouan by which Morocco (in a lion-and-donkey pact) ceded this Atlantic territory to Spain in perpetuity, for the purpose of founding a fishing station. It was occupied and garrisoned by the Spanish as late as 1934 but they have no wish to give it up today, having consolidated it administratively with their colony of Rio d'Oro, in Spanish West Africa. The position of Rabat in these discussions is embarrassed because Ifni lies in a part of southern Morocco where the Sultan's writ does not run; local bands make the law there and practise occasional sorties into neighbouring Spanish and French territory, presenting the Sultan with the choice of spoiling his relations with his European allies by supporting the wild men, or of giving his domestic extremists ammunition by condemning them. The irredentist party in Morocco has fantastic ambitions, laying claim to vast tracts of the French Sahara and to the Atlantic coast down as far as Senegal. After this week's negotiations in Madrid, both sides seem willing to leave the thorny question of Ifni (and hence the exaggerated irredentist campaign of which it is the first step) for resolution at a later and quieter time.

It should be noticed that there is one theoretical abatement of Moroccan unity and sovereignty that the present Government does not intend to remove: this is the presence of important American military and aviation bases. These are an essential link in American world strategy and Rabat is aware that in return Morocco can obtain considerable American aid and support. In any case, the Sultan's government is not neutralist but resolutely anti-Communist and is in general thoroughly well disposed to co-operating with Western defence policies. (The same considerations apply to the vital naval base of Bizerta in Tunisia.)

But while this piecemeal reconstitution of Morocco as a political entity proceeds, the main threat to peace and unity in the country persists: the continuation of the war in neighbouring Algeria. This requires the continued presence of French troops in the country, with the frequent causes for dispute and violence that this provides. Worse, it also requires continued support of the terrorist bands that take refuge over the border in Morocco before returning to resume the bloody struggle in Algeria. Morocco is still the home of several hundred thousand French people who constitute not only the mass of the administration but also the framework of the country's economic structure, its best hope of economic and industrial advance and the best guarantee of continued assistance from metropolitan France. Their departure would be the country's ruination, but as long as the war persists — indeed worsens — in Algeria, their security cannot be fully guaranteed by the new, inexperienced and insecure regime, as was demonstrated in the massacre at Meknes a few months ago. Like Tunisia, Morocco ardently desires an end to the Algerian conflict, and, again like Tunisia, not necessarily on the extreme terms set by the terrorists. But French policy is apparently still a long way from using its two best hopes for a peaceful settlement in North Africa, the moderate governments in Rabat and Tunis.

WORLDGRAM

AGRICULTURE

G.M.F. Programme for Himachal Pradesh for 1957-58: Thirteen schemes relating to distribution of fertilizers and improved seeds, development of local manurial resources, purchase of agricultural implements, propagation of fisheries, extension of irrigation and raising of paddy nurseries have been sanctioned by the Government of India for the grow more food programme in Himachal Pradesh for 1957-58. A total sum of Rs. 35.99 lakhs has been approved by the Centre for these schemes. Out of this, recoverable expenditure amounts to Rs. 18.46 lakhs and grants Rs. 17.53 lakhs. A sum of Rs. 14.88 lakhs has been sanctioned as subsidy for 45 minor irrigation projects.

*

Scheme for Development of Sericulture: The Government of India have sanctioned grants totalling over Rs. 4 lakhs to six States to promote silk-worm rearing and to provide disease-free good quality silk-worm eggs to the rearers in these States. Uttar Pradesh which has received about Rs. 1.5 lakhs will have two grainages, a station for foreign race univoltine seeds and a farm for univoltine and bivoltine seed cocoons ond another for multivoltine seed cocoons. Orissa has been sanctioned Rs. 50,000 for a station for tassar seeds and another for eri seeds being set up there. Collective chawki rearing units are being set up in Mysore also for which the State has received over ten thousand rupees. A Basic Muga Seed Farm is being established at North Lakhimpur in Assam for which a grant of about Rs. 22,000 has been given. An univoltine seed farm and grainage and multivoltine seed farm are being set up in Madhya Pradesh too for which the State has been sanctioned a grant of Rs. 36,000.

*

Irrigation Schemes in Punjab: Five new irrigation and multi-purpose projects, which will benefit an area of about 6.24 lakh acres in Punjab, have been included in the second Five-Year Plan. The total cost of the projects, some of which will be completed in the third Plan period, is estimated to be Rs. 7.87 crores. Of this amount, Rs. 4.04 crores will be spent during the second Plan period. A sum of Rs. 0.14 crores has also been earmarked for investigations. Nearly 1.78 lakh acres will receive irrigation benefits during the period. The Gurgaon canal project, which will cost Rs. 2.45 crores, will irrigate 1.064 lakh acres in Gurgaon district. About 0.54 lakh acres will be given canal supplies during the second Plan period. The scheme provides for the construction of a canal which will take off from Okhla on the Jamuna river. The Rs. 0.75 crore scheme to increase the capacity of channels in Karnal and Delhi will benefit 0.75 lakh acres. Of this, 0.45 lakh acres will be irrigated during the second Plan period. The scheme is expected to be started some time this year or next year and will be completed by 1960-61. The scheme for the extension of flood irrigation (lift) from the Western Jamuna canal to Rewari and adjoining areas is expected to irrigate 0.40 lakh acres in the second Plan period. Costing Rs. 0.56 crores, the scheme is likely to be completed by 1960-61. Amongst the important continuing schemes from the first Plan to the second Plan is the Bhakra-Nangal Project. A sum of Rs. 1,778 lakhs has been earmarked for the irrigation from this project in the second Plan. Nearly 2,347,000 acres will receive irrigation benefits during the period.

*

G.M.F. Schemes for Assam: Twelve schemes relating to irrigation, plant protection, mechanised cultivation, distribution of seeds, and development of fisheries and compost and manurial resources have been sanctioned by the Government of India for the grow more food programme for Assam in 1957-58. The Central aid for the schemes amounts to a total of Rs. 61.46 lakhs — Rs. 53.98 lakhs as loan and Rs. 7.48 lakhs as grant. Important among the schemes are development of forest, hill and natural fisheries and distribution of fish seed. The Central share of assistance to these schemes amounts to Rs. 2 lakhs as loan and Rs. 1.45 lakhs as grant.

INDUSTRY

Industry and Research: In order to bring about a living and intimate contact between industry and research, the Council of Scientific and Industrial Research has appointed special staff consisting of an Industrial Liaison Officer at the Centre and three Regional Liaison Officers, one each at Calcutta, Bombay and Madras.

This Industrial Liaison Staff will render every assistance to industry to fully utilise and exploit, for its growth and development, the results of researches completed in these national Laboratories under the C.S.I.R. It will also study specific problems facing the industry — both in the public and private sectors — with particular reference to process of manufacture, cost of production and quality of product, and arrange to solve them by experimental and research work in the national Laboratories. A special information cell has been set up at Delhi for the convenience of the industrialists.

*

Brick and Block Making Machine: A hand-operated brick and block making machine has been developed at the Central Building Research Institute, Roorkee. The machine presses two bricks at a time, with four men working on the machine two for turning the lever, one for filling the mould and one for removing and stacking the bricks. The output per man/hour is about 62 which means an output of about 2,000 bricks per day. The machine allows bricks to be produced on a cottage industry basis and is likely to find considerable use in community project areas. Parties interested in undertaking the commercial development of the process may write to the Secretary, National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi-1.

*

Progress of Cottage Industries in 1956-57: Steady progress was maintained in the implementation of scheme for the development of khadi and village industries, handicrafts and sericulture during 1956-57. According to the Report for Cottage Industries, during the year the Centre sanctioned over Rs. 6.35 crores as grants and about Rs. 4.82 crores as loans for the khadi industry including ambar charkha. These figures compare with about Rs. 5.14 crores given as grants and Rs. 1.87 crores given as loans during the preceding year. The production of traditional khadi (i.e. non ambar khadi) during 1956-57 was slightly over 24 million yards valued at 4.93 crores of rupees. The total sales of khadi amount to Rs. 5.95 crores as against Rs. 4.26 crores in the previous year. In addition khadi cloth worth Rs. 1.26 crores was produced by those who spin for their own consumption. The number of such people has grown from 38,000 in 1953-54 to 5,87,000 in 1956-57.

*

Carbon Dioxide and Compressed Oxygen Gas: The Indian Standards Institution has published Indian standard specifications for carbon dioxide (Industrial) (IS: 307-1956) and for compressed oxygen gas (Technical) (IS: 309-1956). The standards not only prescribe requirements but also the methods of test for the material used in the manufacture of aerated waters, as fire extinguishers and in the manufacture of solid carbon dioxide, and for the material commercially

known as 'compared oxygen gas' used for welding and cutting operation. The standards can be had from the ISI Office at 19, University Road, Delhi, or its branches at Bombay or Calcutta.

*

Insulation Boards from Waste Products: A new process to make insulating material from waste products like ground-nut or paddy husk, banana stem, coir or bagasse has been evolved at the Central Food and Techonological Research Institute, Mysore. This insulating material has been found to possess properties similar to cork at present being imported. The Mysore laboratory is now engaged in standardising conditions for the production of this insulating material. It is also conducting tests to study performance of the product. This experiment was undertaken at the Institute with a view to manufacturing heat insulation boards, cushion pads and sound-proof boards from waste material.

TRADE

Development of Indo-Afghan Trade: The negotiations between representatives of the Government of India and the Trade Delegation from Afghanistan concluded in New Delhi recently. Under the arrangements which have been agreed upon the two Governments have reaffirmed their desire to promote the trade between their respective countries on the basis of mutual advantage and in a manner so as to achieve a balance in their trade. Further, transit facilities have been provided for Indo-Afghan trade in terms of Article 15 of the Treaty of Friendship and Commerce concluded between the two countries in 1952. It has been agreed that subject to a ceiling of Rs. 3.35 crores for the first year, facilities will be afforded to the registered traders in Afghanistan and approved parties in India, who have participated in Indo-Afghan trade during the 4 years ending June 30, 1956, to supply fruits, both dry and fresh, and asafoetida to India. These supplies will be paid for in Indian rupees. The Government of Afghanistan will on their part afford facilities for the import from India of goods such as cotton textiles, green and black tea, bidi and tobacco manufactures, spices, jute manufactures, art silk piece-goods and woollen manufactures, leather and leather goods, including footwear, films, machinery and building materials, chemicals, rubber goods, bicycles and motor cycles, paper and stationery, aluminium goods, iron and steel products and sugar. The two Governments will consult each other periodically to review these arrangements with a view to improving upon them to their mutual advantage.

*

Quota for Export of Cotton Rags: The Government of India have decided to release a small quota of cotton rags and hosiery cuttings for export during the period July-December 1957, from the port of Calcutta and Bombay. Details of the licensing procedure are being notified by the port officers.

*

Indo-Bulgarian Trade Agreement: Letters were exchanged in New Delhi recently between Shri K. B. Lall, I.C.S., Joint Secretary, Ministry of Commerce and Industry and His Excellency Mr. Ivan Petrov Daskalov, Envoy Extraordinary and Minister Plenipotentiary of the People's Republic of Bulgaria in India extending up to December 31, 1957, the Schedules of the Indo-Bulgarian Trade Agreement signed on April 18, 1956, with certain modifications. The volume of trade between India and Bulgaria, though not very large, has been steadily growing since the Trade Agreement between two countries was signed. The balance of trade is unfavourable to India. The imports from Bulgaria rose from Rs. 81,000 in 1954-55 to Rs. 3,50,000 in 1955-56 and to Rs. 22,24,000 in 1956 (April to December). Exports from India to Bulgaria have also gone up, but the increase has been comparatively smaller. The corresponding figures for exports stood at Rs. 79,000; Rs. 2,05,000 and Rs. 4,77,000 in the three years. The principal items of import from Bulgaria to India have been metals and ores, chemicals and electrical goods. India, on the other hand, has been exporting to Bulgaria mostly spices and shellac.

FINANCE

New Provision of Central Sales Tax Act: Section 15 of the Central Sales Tox Act, 1956 was replaced by a new section by the Central Sales Tax (Amendment) Act, 1957 passed by Parliament in its May Session. The new provision seeks to restrict the powers of the State Governments to levy tax on declared goods of special importance to inter-State trade or commerce only at the stage of last sale or purchase in a State and at a rate not exceeding 2 per cent of the sale or purchase price thereof. It also provides that no tax under the State Law shall be levied on such goods if they are intended for despatch to another State. In order to allow sufficient time to the State Governments to amend, where necessary, their Sales Tax Laws to accord with the new provision of Section 15, the Central Government has decided to postpone further the date of enforcement of the Section to October 1, 1957. A notification has been issued in this connection. This postponement will not in any way alter the enforcement of levy of tax under the Act with effect from July 1, 1957 as already notified.

*

Deposit Scheme for Companies: Under the Income-Tax Act, 1957, a company will not be entitled to the allowonces in respect of depreciation and development rebate in the computation of its profits and gains for purposes of assessment, unless it deposits with the Central Government before June 30 of the relevant assessment year a prescribed amount out of its undistributed current profits and reserves computed at a certain percentage thereof as notified by the Government. For the financial year 1957-58, the Government have already notified the percentage for deposits out of current profits, which is nil in the case of government companies, statutory corporations, and banks and insurance companies, and is 50 per cent for all other companies. A draft of the rules providing for the manner and the procedure for the making of deposits and refunds and other incidental matters proposed to be made has already been notified and these will be finalized shortly. For the current year, the completion of assessments will have to be deferred until the Finance Bill, now before will have to be deferred until the Finance Bill, now before Parliament, becomes law. It has, therefore, been decided that this year, the last date for making deposits should be extended to August 31, 1957, or within 6 months of the relevant accounting year whichever is later.

GENERAL

Employees' Provident Fund Act: About 3,600 more workers will get provident fund benefits from July 31, 1957 when the Employees' Provident Fund Act is extended to employees of the oxygen, acetylene and carbon-dioxide gases industry. The contributions of these workers to the fund, along with the employers' share are estimated at over Rs. 97,000. The Employees' Provident Funds Act, which came into force in November 1952, initially applied to six industries. At present the Act applies to 30 industries and establishments. In December 1956, the Act was amended to empower Government to extend it to non-factory establishments. Accordingly tea, coffee, rubber, cardamom and pepper plantations were brought under the purview of the Act. The Act applies to factories and establishments, which employ 50 persons or more and have been in existence for at least 3 years. About 5,475 factories and establishments have so far been covered by the Act. The number of subscribers is about 24 lakhs. The average monthly collection of provident fund contributions is about Rs. 1.82 crores. The total contributions up to March 1957 amounted to about Rs. 80.26 crores.

NEWS IN BRIEF

INDIAN

The Government of India has created three wheat zones. These are Punjab, Himachal Pradesh and Delhi; (ii) U.P.; and (iii) Rajasthan, Madhya Pradesh and Bombay (including the City of Bombay).

*

The Union Labour Ministry is taking a lead in finding a way out of the current difficulties between management and labour, particularly in the cotton textile and jute industries, over introduction of rationalization schemes.

*

The Government of India has accorded approval to the programme of establishing one principal laboratory at Calcutta and 14 regional laboratories in different districts of West Bengal during the second Five-Year Plan period.

*

Work has started on the Rihand Dam, which when completed, will provide power and irrigation facilities to three States—Uttar Pradesh, Bihar and Madhya Pradesh—and the shipbuilding activity at Visakhapatnam.

*

The Bihar Government has sanctioned the creation of a Directorate of Geological Survey on a temporary basis during the second Plan period to make a thorough and intensive survey of the mineral-bearing areas of the State.

*

Automobile production in India in the current year is likely to exceed the record output achieved last year. According to official statistics, the number of automobiles produced in the first quarter of 1957 amounted to 9,340 compared with 8,374 in the preceding quarter and 7,545 in the first three months of 1956.

*

The Government of India have decided to allow export of cotton yarn up to 78 counts freely within a ceiling of 5,000 bales on "first-come-first served" basis to all permissible destinations except Portuguese possessions in India.

*

Production and dispatches of indigenous sugar amounted to 19.75 and 12.27 lakh tons up to May 31, in the current season, as against 17.86 and 9.54 lakh tons respectively in the corresponding period of last year.

*

Textile exports from Japan to India generally recorded an increase in 1956 from the level of the previous year. In the period January to November 1956, Japan exported to India 6,075,487 lbs. of rayon filament yarn, compared to 4,112,567 lbs. in the same period of the preceding year.

*

The Indian Standards Institution has issued, for eliciting comments, a draft standard specification for logs for matches.

*

Small exports of food grains were possible only in the last three years of 1954, 1955, and 1956. The total quantity exported comes to 165,000 tons which earned us Rs. 878,00,000.

*

As against the average production of 51.8 million tons of food grains (rice, wheat, millets, other cereals, gram and pulses) per annum, during the first quinquennium ending 1951-52, the average has gone up to 64.9 million tons per annum during the last quinquennium ending 1956-57.

FOREIGN

Dr. Van Rhijn, Minister of Economic Affairs, announced recently that import control would be finally lifted some time next year, and South African industries would then have to face free competition from overseas for the first time since the outbreak of the war.

*

The Dutch Government has decided to adapt the embargo on trade with China, Northern Korea and North Viet-Nam to the control system ruling for trade with some East European countries.

*

Work has started on the construction of a new potash fertiliser plant in Sicily, which will meet all of Italy's requirements of potash fertilisers. Hitherto Italy has been dependent on imports for this type of fertiliser.

*

Net farm income fell by 18½ per cent in 1954-55 compared with the preceding year, according to a "Blue Book Farm Incomes" in England and Wales, 1954-55 prepared by the Ministry of Agriculture.

*

Steel production reached a new record in UK last month, the annual rate of output exceeding 23 million tons for the first time. May output of crude steel averaged 443,200 tons a week, equivalent to an annual rate of 23.05 million tons which was 2.6 per cent higher than the previous record rate of 22.47 million tons established in February of this year.

*

Legislation is to be introduced in the Ceylon Parliament to set up State Corporations for the manufacture of salt, sugar, cotton, yarn, textiles, cement, fertilizers and for ilmenite refining. Iron-ore resources are to be studied with a view to establishing a steel industry.

*

Total exports in May, including £11.8 million reexports reached a new record of £314.7 million. It was the first month in which UK goods shipped overseas had exceeded £300 million—the May figure was £302.9 million, and nearly £6 million above the previous best figure, last March.

*

The Dutch cost of living index for 1957 is expected to rise by 4½-5½ per cent, compared with last year, according to the official Central Planning Bureau.

*

The West German Ministry of Economics has announced a simplification of procedure in making imports of non-liberalised goods from countries within the payments area of marks of limited convertibility.

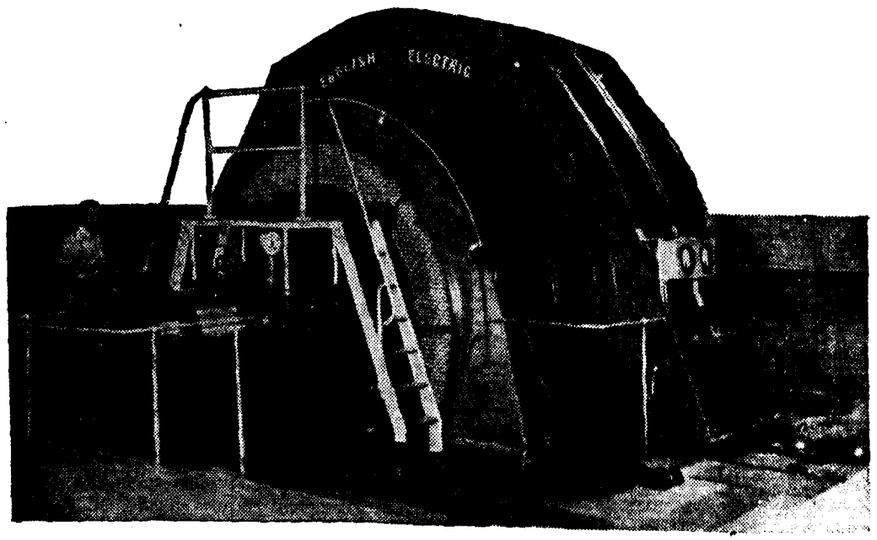
*

European and Chinese companies in the past three years have invested nearly $M10 million (about £1.2 million) in mining high grade iron ore deposits in the vicinity of Ipoh, in the heart of Malaya's rich tin bearing Kitna Valley.

*

A draft agreement on the exploitation of the Water power of the Pasvik River, on the Soviet-Norwegian border, has been produced by a Committee of Russian and Norwegian experts and Russian and Norwegian Governments for approval.

*



An increase of over 25 per cent in Israel's export trade was recorded during the first five months of this year.

*

Current expansion plans in the Dutch iron and steel industry are due for completion early in 1959.

'ENGLISH ELECTRIC'

EQUIPMENT FOR THE STEEL INDUSTRY

The illustration shows the 6650 H.P. Motor for the 40" Blooming Mill at the Indian Iron & Steel Works, Burnpur. In addition, the Company has supplied over 100 motors of various ratings to these Works.

The English Electric Co. Ltd. has specialized for many years in the design and manufacture of electrical distribution equipment and motors for every type of duty in the Steel Industry.

Economic Report from the U. S.

U.S. TRADE WITH EUROPEAN REDS

(By GUY SIMS FITCH)

WASHINGTON, June 25.—Almost unnoticed, the US Government last week added 200 commodities to its lengthening list of items that can be exported to the Soviet Union and other East European Communist countries under general licence, without the need for individual licenses for each shipment.

The US Department of Commerce, which is in charge of export licensing, emphasises that this new step represents no change in the Government's trade control policy. All commodities now on the general license (GLSA) list are of types that would normally be approved for export under existing licensing policy, even if individual shipment approval were required.

But the new move does serve to make it easier for European Communist countries to expand their peaceful trade with the US if they are willing or able to do so.

Past experience on this score is rather revealing. General licences have been in effect for about a year now. They cover a wide range of industrial and agricultural products. Yet GLSA shipments totalled only $165,000 in the last half of 1956, a period during which $4.2 million invalidated individual licenses were issued. This substantiates the view that US export license policies have not been important obstacles in the peaceful trade with Eastern Europe.

The only areas to which US permits no exports are Communist China and North Korea, held to be international aggressors by the United Nations. On the other hand, the only goods barred from the European Communist bloc are those relatively few, which are considered strategic or war-making commodities. Yet in 1956, all Eastern European countries together, including the Soviet Union, imported only $11.5 million worth of goods from the United States, out of total US exports of $15,000 million. US trade with the USSR and Eastern Europe has been picking up somewhat in 1957. But even so US exports to these areas are hardly likely to exceed $20-25 million this year.

The list of US commodities embargoed to Eastern Europe has been fairly stable for several years and leaves plenty of room for expanded peaceful business —in consumer items, agricultural products, manufacturing equipment and raw materials of all types. But business men have generally found the Communist countries to be erratic and limited markets. One reason, of course, is the political motivation that underlies much of the trading activity of these countries.

In addition, these countries have demonstrated a lack both of dollars and of exportable items. This means they have used the US and other free markets chiefly to relieve their own shortages and to obtain products of advanced design. According to Commerce Department officials, Soviet and other Eastern European purchasing agents seem particularly interested in taking a good look at what American industry has to offer. Recent license inquiries, for instance, concern the latest of such US goods as agricultural equipment, woodworking machinery and industrial chemicals.

As a general rule, the US Government does not object to business with the Communist bloc—except for Communist China and North Korea—as long as it remains within accepted non-strategic licensing procedures. Each American company, as a private trader, is free to make its own decision on whether the market is worth the sales effort and the abnormal hazards involved. In making this decision, of course, the company tends to consider the usually more advantageous commercial opportunities that abound in the rest of the world. But the Commerce Department emphasises that it is ready to act promptly and speedily on any inquiries or license applications it receives for non-strategic trade with the Communist countries.

Call it what you will—a kutcha track, a cattle-path. It is a *road*. It leads somewhere. It is a vital line of communication. Perhaps, where you live, roads stretch out straight and firm on every hand. Perhaps you take roads for granted. But it is not so everywhere. Over large tracts of India, there is a crying need for more roads, safer roads, faster roads. Roads are the arteries of civilised life. Without roads, the modern world couldn't tick. And without *bitumen* the road engineer of to-day would lose a tough ally. *Bitumen*, a petroleum product, is of immense value in road-making. It provides a smooth but tremendously durable surface. Water rolls off it. Scorching sun and biting cold have little effect on it. Under the increasing loads and speeds of modern vehicles, *bitumen* flexes invisibly and recovers itself time after time after time. It is one of the world's most economical and practical construction materials. We make available many tons of *bitumen* each year to P.W.D. authorities and contractors up and down the country. We also make available the skill and experience of our *bitumen* engineers. Wherever you travel in India, you are pretty sure to be travelling at some time or other on *bitumen* supplied by Burmah-Shell.

BURMAH-SHELL... *in India's life and part of it.*

The Business World

A GREAT SON OF INDIA

By

(CROESUS)

By a curious coincidence, glowing tributes were paid on the same day last April (18-4-1957) to two of India's most outstanding men, who have between them contributed to the economic and constitutional progress of this country in a measure that few other two living contemporaries have done—Padma Vibhushan Sri G. D. Birla and Sir Purshotamdas Thakurdas. The occasions were a public meeting at the Vallabhbhai Stadium to felicitate the former on the conferment of Padma Vibhushan by the Government of India and a largely attended function at the Taj Mahal Hotel to celebrate the publication of the biography of Sir Purshotamdas Thakurdas by Mr. Frank Moraes, Editor of the 'Times of India'. Almost three generations of Indians have had occasion to see these stalwarts at work, sometimes behind the scenes but more often in public, that is inside the legislature, in committees or on commissions. Their enormous industry, their persistence of a stand chosen after mature deliberation and the able manner in which they were able to win over even opponents to their ways of thinking are well-known. But these should be shared by a wider audience and especially the younger generation, and it is because of this that, at the Taj Mahal function, the need for more and more biographies, of our eminent men, was stressed by Mr. M. C. Chagla, Chief Justice of Bombay. Writing a biography is not like writing a story; the author must have intimate knowledge of, and also genuine respect for, the subject of his biography. Mr. Moraes can lay claim to both these which explains why his biography of Sir Purshotamdas Thakurdas has turned out to be such an eminently readable book.

As one skips through the pages of this publication, one's estimation of, and admiration for, Sir P. T. goes on visibly rising. There are woven into the fabric of the narration some striking incidents in the life of Sir P. T. which not only make the hero familiar to the reader but take him intimately near to an admittedly awe-inspiring personality. Who would not be impressed, for example, with Sir P. T.'s valiant fight for the 1sh. 4d. rupee against the determined stand of the Government of the day to maintain it at 1sh. 6d.? Could any Indian afford to forget the services of Sir P. T. to the country on the food front? And can any Indian trader in cotton be over-grateful to Sir P. T. for the great edifice of the E.I.C.A. that he built up and nurtured. By taking the reader into confidence in regard to the background to all these and other great achievements of Sir P. T., perhaps for the first time, the author enables the reader to see Sir P. T. rise to his full stature slowly, steadily and surely.

Although mainly engrossed in business activities, which is only quite natural considering that Sir P. T. is a firm believer in Private Enterprise it must be admitted that his is a versatile career with many an interesting and diversified facet. As has been aptly observed by the publishers, it (Sir P. T.'s career) "stretches across an important latter-day span of the story of India's political and economic life and, in both spheres, he was to play a constructive, often a definitive, role." Surely not many could have known all the contribution of Sir P. T. to the political progress that one finds recorded in these pages. There is in this biography something that not only gives an insight into the patriotic side of Sir P. T. but also demonstrates that, even among those who may not have courted imprisonment during the days of our political struggle, there are genuine nationalists. No greater proof is necessary to establish the claim of Sir P. T. to being as great a nationalist as any of the tallest politician among us today than the respect he used to receive at the hands of the Father of the Nation. Though distantly related to Sir P. T., it is significant that Gandhiji never took any liberty with Sir P. T.—only once did he ever demand money from Sir P. T. for a cause, and that too indirectly through C. F. Andrews—knowing only too well, as he did, Sir P. T.'s strong and highly individualistic, views on any given issue.

The biography is indeed a highly satisfying publication, but, after one has finished reading it, one cannot help feeling that it is like the story of the hero in a Shakesperean tragedy who suffers not because of any serious flaw but because of a common human failing. The episodes leading to Sir P. T.'s exit from the "Oriental" and the E.I.C.A. organisations with which he had been connected so long and so intimately, give a rather tragic touch, as it were, to an otherwise flawless story. One—at any rate this writer—is not competent to say whether there was anything like the Bradlerjan "tragic flaw" in the hero of Moraes' biography, but one cannot but wish that these two episodes had not taken place. This writer cannot but express the view that even the existence of any tragic flaw in Sir P. T. is not a good enough justification for the admittedly cavalier, if not almost ungrateful, way in which this great son of India was allowed to retire from the two organisations so near and dear to his heart.

BUSINESS NOTES

FROM COAL WAGES TO COAL PRICES

THIS WEEK'S high level tripartite negotiations for the settlement of the dispute over the Labour Appellate Tribunal's award on coal wages have put an end to a vexed controversy. Since wages form a major ingredient in the cost of coal production, the settlement of the question of wages must be treated as only the first main step in the settlement of the larger issue of the price of coal.

In brief, the out-of-court settlement provides that the increases which were granted by the Labour Appellate Tribunal over and above the increases awarded by the Original Tribunal should be accepted as binding by employers and employees and furthermore the retrospective effect given to the Appellate Tribunal's decision from the date on which the Original Tribunal's award became effective, namely, May 26, 1956, should be operative. It ought to be recalled here that the minimum wage for coal miners granted by the Original Tribunal was Rs. 69-1 which was raised to Rs. 78-4-4 by the Appellate Tribunal with a stipulation added as regards equal pay for both the sexes.

In effect, the settlement puts the seal of final confirmation on the Appellate Tribunal's decision. The employers, of course, undertake to withdraw the appeal which they have preferred to the Supreme Court against the decision of the Appellate Tribunal. Obligation to pay higher wages in terms of the settlement will become effective after the Government announces the interim increase in the price of coal which it is expected to do this week-end. Arrears of higher wages arising out of the retrospective effect are to be paid in nine quarterly instalments commencing in mid-October next. The Original Tribunal's award necessitated an increase of Rs. 3-8 per ton of coal and it is obvious that the forthcoming additional increase would be based on the same principle. While the question of a second dose of increase in coal price was being discussed in New Delhi before employers preferred their appeal to the Supreme Court, it was taken for granted that an extra interim increase in price would be awarded for a period sufficient to cover the liability in respect of arrears of higher wages. It will be inequitable if this element of increase is not taken into account in the interim higher price to be announced shortly.

This settlement does not terminate the issue of coal prices — a fact which is patent from the description of the forthcoming wage increase as an interim measure. A committee of enquiry is now seized of the larger question of the fixation of the overall price of coal. By a turn of events, settlement of coal wages has received first priority not as a matter of deliberate choice of preferences but because the coal wage dispute was pending for quite a long time. The question of revision of coal prices is of supreme importance in the context of the ambiticus scale on which expansion of coal production has become inescapable in the second Five-Year Plan. Expansion on the projected scale is hardly possible unless a definite developmental element is included in the price of coal. Colliery owners have clarified their demand for an increase in price for the specific purpose of financing development and undertaken to credit the proceeds of this category of increase to a separate reserve. No clue is so far available to Government's policy on this important aspect of coal price. But it is to be trusted that the enquiry committee will take full cognizance of it on merit.

BOMBAY'S UNCOVERED DEFICIT

IN THE matter of Prudent financial management the State of Bombay undoubtedly ranks high. The past record of the State, particularly, in the first Plan period, bears ample testimony to this.

The budget, for the year 1957-58, presented this week, by the State's Finance Minister, Dr. Jivraj Mehta, is no doubt one more deficit budget, but like the deficit budget of Mysore, it does not contain any new proposals of taxation. Taking a realistic view of the situation, the Finance Minister has studiously refrained from imposing any new taxes for the second year in succession. In view of the increasing cost of living and the heavy share of the additional taxation proposed recently by the Central Government that the people of this State have been called upon to bear, Dr. Mehta's gesture to leave the deficit of Rs. 3.17 crores uncovered by any new tax levies may find justification. But it is also a statesmanlike policy, what with the Finance Commission's recommendations in the offing. Rather than resort to any further tax measure at this stage and court unpopularity, Bombay's Finance Minister has perhaps preferred to keep his fiscal weapons in reserve until after the Commission has reported.

To turn to some important details of the budget. All the figures of revenue, expenditure and deficit, have gone up in the revised estimates presented now, as compared to those found in the interim budget presented in March last. Thus, the receipts on revenue account estimated then were Rs. 106.32 crores, whereas they have now been revised to Rs. 109.44 crores. The revised estimate for expenditure also has gone up to Rs. 112.61 crores from the March figure of Rs. 108.69 crores. In consequence, the March deficit of Rs. 2.37 crores has risen to Rs. 3.17 crores.

Dr. Mehta has stressed two important issues, in the course of his budget speech, which merit consideration. These are the problem of increasing food production and the question of intensifying the small savings drive in the State. As he rightly emphasised, every effort should be made to make the vast rural surpluses available for productive investment. These surpluses have long remained uninvested in a manner contrary to the demands of the economic conditions in the country. If earnest efforts are made to sell National Savings Certificates to the rural masses, the results should not be disappointing. As regards the State's intention to float a loan, Dr. Mehta has not indicated anything clearly. Nor could he be expected to say anything definite, when, while he was preparing his budget speech, the States' Finance Ministers' conference had not yet concluded its deliberations. Since then, the Finance Ministers of all State Governments have met and heard the views of not only their compeers but also those of the Union Finance Minister. The latter has made it clear to the States' Finance Ministers that they have better chances of success if they rely more on national savings than on loan floatations. Taking the air, evidently, Dr. Mehta has chosen to be content with the State's share of the collections from savings, following the Madras Government's footsteps.

MINERAL PRODUCTION

THE PRESS summary of the address of Mr. K. D. Malaviya before the Mineral Advisory Board's meeting on June 26 at Simla does not encourage optimism that the Government has formulated a positive policy for a minimum programme of expansion in mineral production during the second Five-Year Plan. It is undoubtedly good news that the aeromagnetic survey, conducted by the team of Canadian experts has revealed the existence of large deposits of iron ore to the north-east of Jaisalmer. The findings of this survey however, will have to be followed by intensive investigations and prospecting. It is also somewhat hearten-

ing to learn that mineral production went up from Rs. 102 crores in 1954 to Rs. 117 crores in 1956. This progress in itself gives no cause for any sense of pride, but considered in the context of transport difficulties which persisted throughout the period in question it is encouraging.

Adverting to the transport bottleneck, Mr. Malaviya was altogether non-committal in what he said. It served no purpose to reiterate that there was universal awareness of transport shortages which, therefore, did not require any reference. But this next assertion to the effect that, even if there was cause for any anxiety on this score, there was no need to get "unnecessarily" depressed about it, shows, to say the least, reluctance to face a problem which may prove to be a real handicap to the development of mineral output. Some mercies have been shown to the private sector and it has been assured that there would be room left for its participation in the exploitation and export of minerals by reason of the existence of small mining areas scattered in different regions. An attitude of this kind shows less than adequate appreciation of the capacity of the public sector to undertake onerous tasks of mineral expansion as in the case of coal and of the vital role which ought to be assigned to private enterprise. The difficulty regarding shortages of technical manpower is to be tided over by resort to short-term training courses of two years' duration. Taking into account the possibilities for the provision of such courses, it is problematical whether cadres trained at this level will be available in sufficient numbers during the period of the second Plan.

CONGESTION IN BOMBAY DOCKS

HOW A bottleneck in transport can lead to a stalemate and make even a Union Minister run up from Delhi to Bombay is illustrated by the congestion that is prevailing in the docks of Bombay today and the avoidable delay in distribution of food grains that it has given rise to. Today (23-6-57) as many as eight foodships carrying 51,000 tons of food grains and one ship carrying 9,000 tons of fertilisers are waiting in mid-stream for berths to become vacant in the docks. There is not only resulting delay in distribution that this gives rise to, but there is also the question of the heavy demurrage charges that the Government of India has to pay to shipping companies. It is estimated that the Government of India pays something like Rs. 5 lakhs per month on this account alone.

Perhaps the congestion in the Bombay docks today is something that could not be prevented, although it cannot be said that it could not have been foreseen. Surely, if a Port that is allotted to handle only 7.5 million tons a year is asked to handle over 12 million tons, the Port authorities are not to blame, whether this abnormal increase in tonnage it is asked to handle is the outcome of the Suez episode or of the steadily swelling volume of imports under the second Five-Year Plan or, for that matter, of the unexpectedly large quantities of food grains that it has suddenly become necessary for this country to import. The simple fact of the matter is that the Bombay Port cannot handle all this tonnage and must have relief. Relief can come only in two ways, namely, by diverting some ships to other ports and by expediting unloading of goods from ships.

Now, it has been found that the prospects of diverting ships from Bombay to other ports are severely limited. It is stated, for instance, that Kandla Port cannot take more than one ship per week for the reason that only 800 tons of food grains can be lifted by the Railways from that Port. The only other way left then is to expedite unloading so as to meet the abnormal situation prevailing at present. Normally, the Bombay dock workers can unload and handle 5,000 tons per day, but they are now required to handle 8,000 tons, that is an increase of more than 50 per cent, and this in the present inclement weather which normally reduces output by about 20 per cent. It must, however, be said to the credit of the Food Ministry that it got installed two electric elevators capable of handling 3,000 tons per day, exactly the additional quantum of food grains that workers have to handle now, about 18 months ago. One would have thought here was a readily available solution, but the dock workers and the contractors deem these elevators as labour-saving intruders which affect their living and have, therefore, prevented their being put into commission till now. The daily worsening food situation prompted the powers-that-be to appeal to Mr. Gulzarilal Nanda, Union Minister for Labour, to go over to Bombay and persuade the workers either to increase their daily turnover by over 50 per cent or to accept the use of elevators. He has been able to prevail upon, and get an assurance from, the dock workers that they would increase their daily turnover to the extent needed, subject to certain reasonable facilities being extended to them. It now remains to be seen how this undertaking of the workers will be translated into action without any hitch.

One is not certain that this will be the end of the present trouble, even assuming that all sections of workers and contractors co-operate to redeem their pledge to Mr. Nanda. For there is the problem of wagons to move the food grains. Perhaps, as Railway wagons do not fall within the direct purview of Mr. Nanda, he did not throw light on how far the railways are equipped to meet this additional and urgent haulage problem, but one hopes that the good work of the Union Labour Minister and the willing co-operation promised by the dock workers, notwithstanding their objection to the use of elevators, will not be allowed to be undone by any failure on the part of the railways to rise to the occasion.

WHO said cats can't fly?
Why only last week, I flew all the way from Bombay to London and enjoyed every minute of it.
My exclusive berth was most comfortable; the attendants extremely courteous and helpful; the food excellent.
I arrived feeling fresh and happy.
I only had one complaint — there wasn't a mouse in sight! A-I.I. will have to do something about that if they want more cats to fly.
When you have cargo for Europe or U.K., send it by A-I.I.

COMPANY AFFAIRS

SHRI GOPAL PAPER MILLS

The working results of the Company for the half-year ended December 31, 1956, show a gross profit of Rs. 28,00,814. After providing for interest on Debentures and other interest, Managing Agents remuneration, Depreciation, Contribution to Staff Welfare Fund etc. the account shows a net profit of Rs. 20,03,605, against Rs. 19,67,055 during the previous half-year. A sum of Rs. 9,75,000 has been set aside for Income-tax etc. and Rs. 13,985 has been provided by way of Development Rebate leaving a balance of Rs. 11,32,355 in the profit and loss account including Rs. 1,17,735 being surplus brought forward from the last Balance Sheet.

The Directors have proposed to a dividend on Preference Shares at the sale of 8 per cent per annum, which will consume a sum of Rs. 30,000. Another sum of Rs. 7,34,316 will be consumed towards the payment of a dividend on Ordinary Shares at the rate of 12½ per cent per annum, for the period under review. A balance of Rs. 3,18,038 has been proposed to be carried forward.

The production of paper during the period under review was 7041.4 tons against 6358.0 tons produced during the previous half-year. Due to the enhancement of excise duty, prices were increased slightly. The Company has placed orders for the machinery required for the expansion of the Power House and the Steam Generating Unit.

The Vanaspati Section of the Company did not fare well because most of the time factory was closed. The trend of oil and vanaspati prices was extremely erratic and the Company did not find it advisable to carry on production. The entire quantity produced and brought forward from the last half-year was disposed of; the sales amounting to 687 tons.

THE INDO-BURMA PETROLEUM COMPANY, LTD.

The income of the Company for the year ended December 31, 1956, was at Rs. 3,52,89,946 against last year's Rs. 3,37,90,493 but the gross profits for the year were lower at Rs. 50,71,823 against previous year's Rs. 57,85,972. Depreciation on Building, Roads, Plant, Motors and Vehicles was Rs. 3,90,797. The provision for Taxation at Rs. 28,92,557 was at last year's level (Rs. 28,90,000).

Dividend on Ordinary Shares has been proposed to be paid at 20 per cent against last year's 40 per cent which has absorbed Rs. 20,00,000 (Rs. 40,00,000). A sum of Rs. 56,48,935 has been decided to be carried forward.

During the year, with the consent of Government, the Company entered into a joint venture with Messrs. Steel Brothers and Co., Ltd., in prospecting the Oil in England. Two wells have been drilled in Lancashire which failed to prove oil or gas in commercial quantities and were abandoned. The Company's share of expenditure on this account was Rs. 5,93,030. Preparations are now in hand to test another structure which is considered to have reasonable prospects.

ALLIANCE JUTE MILLS COMPANY, LTD.

The working results of the Company show a loss of Rs. 65,330 after taking into account the sums of Rs. 85,000 for provision to write down jute stock and in transit to estimated realisable value, and Rs. 65,000 for Depreciation. The Credit Balance brought forward from the previous half-year is Rs. 23,103 and the amount overprovided in Liability in respect of previous period written back is Rs. 21,343. An amount of Rs. 1,00,000 has been transferred from General Reserve Account.

The Directors have recommended a Dividend on 15,000 Preference Shares at Rs. 3 per Share for the half-year ended 30th June, 1956, absorbing Rs. 45,000 and leaving Rs. 34,402 to be carried forward.

In accordance with the Main and Supplementary Working Time Agreements of the Indian Jute Mills' Association, the mills worked 48 hours per week with 12½ per cent of the total looms sealed until January 8, 1956. This figure was reduced to 10 per cent from January 9, 1956 and to 5 per cent from February 20, 1956. Since the close of the period the Industry sealed 2½ per cent of the total looms from July 16, 1956 and a further 5 per cent on September 17, 1956, again making a total of 12½ per cent of the total looms sealed. Trading conditions throughout the half-year continued to be difficult, and with the increase in produition due to unsealing of looms prices fell rapidly and at no time was it possible to transact business simultaneously in raw jute and goods at a profit. Labour relations have been satisfactory.

COMMODITY NEWS AND NOTES

INCREASED PRODUCTION OF IRON ORE IN INDIA

There was increased production of iron ore in India during the first quarter of 1957. The output, according to the Indian Bureau of Mines, rose to 1,305,000 tons from 1,302,000 tons in the previous quarter. The principal producing States are Orissa and Bihar which recorded an output of 528,000 tons and 479,000 tons respectively in this quarter. The opening stocks of iron ore in January, 1957 were reported to be 1,625,000 tons which show an increase of 300,000 tons over the opening stocks at the beginning of last year.

PRODUCTION OF MANGANESE ORE IN INDIA

India produced 430,000 tons of manganese ore during the first quarter of 1957. This represented an increase over the output of the quarter—October-December, 1956. Compared with the corresponding quarter of the preceding year, the production has registered a fall of 69,000 tons. The opening stocks in January 1957 were reported to be 1,309,000 tons as against 1,034,000 tons in January, 1956. Among the States, Orissa accounted for 108,000 tons of production, Bombay 88,000 tons, Madhya Pradesh 85,000 tons and Andhra Pradesh and Mysore 65,000 tons each.

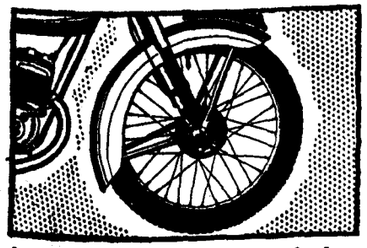
HIGH-CALCIUM LIMESTONES OF INDIA

The National Chemical Laboratory, Poona, undertook a survey of high grade limestone deposits in terms of their physical and chemical properties. The results of the survey carried out so far have been recorded by Drs. H. C. Bijawat and S. L. Sastry in the form of an interim report, just published, under the title "High-Calcium Limestones of India". It gives a detailed account of the characteristics of 50 samples of limestones (and limes derived therefrom) obtained from the various States of India, specifications for limestones and limes for use in different chemical industries and an assessment of the quality of the limestones and limes in respect of their suitability for various chemical applications. The report for the first time makes available data on the porosity, compressive strength, physical change on calcination and nature of limestone. The inclusion of manufacturers' data relating to limestones and limes consumed in different chemical industries in India makes the publication very useful to the chemical industry for making a suitable selection of limestones for particular needs.

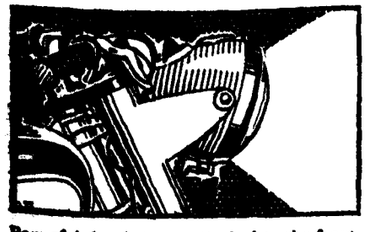
COPPER DEPOSITS IN RAJASTHAN STATE

The Geological Survey of India has recommended geochemical prospecting to assess the copper mineral content in the Khoh-Dariba area of Alwar District, Rajasthan State. The department investigated the area during the last two field seasons for determining the nature and extent of mineralisation and to prepare a scheme for exploration. There are old abandoned copper mines in the Khoh-Dariba area, about 40 miles south of Alwar town. A very rough estimate based on the stoped area of the Dariba mine shows that about 400,000 cubic feet or 30,000 tons of copper ore were removed from the mine. The calculation has, however, been made on guess-estimates of the total height of the stopes which in places are more or less filled with waste or are inaccessible.

INCREASING EXPORTS OF SALT TO JAPAN



There is scope for increasing salt exports to Japan, provided India is able to meet competition from China, Egypt, Spain and Formosa, the other main suppliers of salt to Japan. India was the second largest salt supplier to Japan during 1956, whereas in the previous year she occupied the fifth position. During January to November, 1956, India supplied 252,133 tons of salt to Japan out of a total of 2,038,838 tons imported into that country. The corresponding figures for 1955 were 145,675 tons and 1,748,276 tons, respectively. China continued to be the leading supplier, meeting 35 per cent of Japan's salt requirements. Salt is one of the items in respect of which the Japanese Government exercises monopoly control and all imports are effected on behalf of the Japan Monopoly Corporation, a Government organization.



Instructing here, supervising there, checking everywhere — the engineer needs a Royal Enfield Motor-cycle to travel quickly between sites and office.

For men who must be on the spot
—there's nothing like a ROYAL ENFIELD ENSIGN 150

Large wheels help you go fast, safe. Less wear and tear because of fewer revolutions per mile

Powerful head lamp attached to the front fork floods light along the way you turn. Makes night riding safe

TRAVEL AROUND on your own ROYAL ENFIELD Motor-cycle! It's *the* way to save time—no delays waiting for crowded trains and buses, no fear of missed appointments. You save money, too ... ROYAL ENFIELD ENSIGN 150 gives you as much as 130 miles to the gallon!

And look at all the advantages a real, full-sized motor-cycle brings you: greater sturdiness, smoother pick-up, better shock absorption, higher road clearance, larger wheels for better stability, better traction, more efficient braking ... and a far, far higher resale value!

You'll agree that for a man who must go places, there's nothing like a ROYAL ENFIELD ENSIGN 150.

ROYAL ENFIELD takes fatigue out of travel

We do business with the nicest people...

And we are deeply interested in these nice people: in *you*! That's why we have a special Market Research Department that devotes itself to finding out what you like and don't like, why you buy—or don't buy.

Our teams of interviewers travel all over the country, calling on families in city, town and village, and noting your growing needs and changing preferences. This fact-finding process enables us to introduce new products like Rinso, or change a familiar one in some way—the perfume of Lux Toilet Soap, for instance.

Many of our products are, perhaps, already your household friends, and you appear on the charts and reports compiled by our interviewers. But you are more, much more, to us than facts and figures . . . you are the very people we do business with. We spare no trouble in trying to meet your needs, in offering you the very best value for your money.

Emergence of Finance Corporations

THE establishment of credit corporations for the provision of finance for industry immediately in the wake of Independence is in no sense a casual development. It is the result of a conscious policy adopted by the Government to stimulate the growth of new industries and expansion of existing ones. The problem of provision of finance inevitably came to the fore-front. Commercial banks have built a highly developed credit structure in this country. To the extent it is possible within the limits of their commitments on deposits, they have always been prepared to accommodate industry in respect of its requirements of working capital. It was, however, outside their normal jurisdiction to invest in long-term industrial stock. Whether commercial banks should or should not change their traditional policy and switch over to long-term investment in industry has always been debated. The answer to this question was seldom in doubt. It was finally given by the Shroff Committee, which, while exhorting them to extend their investment portfolio in securities of industrial concerns of proved competence, cautioned them not to change the essential pattern of their lending operations.

No time was lost by the Government in coming to the conclusion that if provision for industrial finance is to be met consistently with the rapidly increasing pressure of demand for it, one effective way to do it was to encourage the establishment of industrial finance corporations sponsored and encouraged by the Government. Within less than two years of Independence, the Industrial Finance Corporation of India came into existence. In retrospect it would appear that rather ambitious hopes were entertained about its role as a supplier of credit for industry. The full implications involved in this novel field of credit were perhaps not fully appreciated. Considering the under-estimation of the requisite time for its activity to gather tempo, it can fairly be said that the Industrial Finance Corporation has rendered a good account of itself.

At the State level it was found essential to start the counterparts of the Industrial Finance Corporation for the provision of credit to medium and small-scale industries. With the passage of the State Financial Corporations Act the way was cleared for the establishment of these institutions. Most of them started their business operations recently while the earliest ones did not do so more than three years before. State Financial Corporations have not been able to come up to the expected standards of performance. It would, however, be premature to come to any judgment on their potentialities. Nevertheless, a good deal of drive and businesslike management will have to go into their operations if they are to achieve their object.

The National Industrial Development Corporation marks an important phase in the development of industrial banking in this country. An ambitious role has been assigned to it in the public as well as in the private sectors of industry. Its main purpose would be formulation of projects for establishing new industries or developing new lines of production. Sizeable funds have been placed at the disposal of this Corporation and it has already embarked upon a programme of financing the rehabilitation of cotton and jute textile units which have received priority by reason of their export potential. This Corporation in its first stage has also undertaken programmes of development of newsprint, aluminium and foundry projects. In the context of the near future the limiting factor on the expansion of its activities will be the availability of technical personnel.

Next in the chronological order comes the Industrial Credit and Investment Corporation. The most

outstanding feature of this Corporation is that it represents collaboration of foreign and domestic private enterprise for the promotion of industrial credit. American and British participation in investment has given it a solid basis. Its resources have been strengthened by the proceeds of the U.S. steel counterpart fund and Rs. 7.5 crores have been placed at its disposal. The essential purpose of this Corporation is to render assistance to industries in the private sector by grant of loans or participation in equity shares or by underwriting the issues of new shares. Paper, electrical equipment, chemicals and textile machinery have received the first priority in its programme of assistance.

The latest in the field, but essentially in the global sphere, is the International Finance Corporation. India has acquired original membership of this Corporation and she expects her due share of assistance from the Corporation's resources. A benefit of great value which underdeveloped countries stand to gain from participation in the activities of this Corporation is the supply of managerial skills — an aspect of industrial organisation which has not received the attention it imperatively demands in all these countries.

This Blue Supplement seeks to give an integrated picture of the operations and potential benefits of these Corporations in the advancement of industries at all levels. During the brief period of their working one handicap has already been disclosed. That is the overlap in functions. The Industrial Finance Corporation is bound to feel the impact of the parallel working of the National Industrial Development Coporation and the Industrial Credit and Investment Corporation. At the State level, some of the State Finance Corporations have found considerable difficulty in exploring means for employing their funds to the full. This is because of credit provided by State-aided agencies on liberal and attractive terms. Difficulties of this kind were not unexpected, but they cannot in any sense be regarded as a threat to the growth of these institutions. The demand for industrial finance is growing at such a rapid rate that the multiplicity of supplying institutions would be not only no hindrance to smooth functioning but a positive aid. Competition should prove in the long run to be an incentive for the adoption of progressive management policies and efficient methods of business.

Industrial Finance Corporation

THE Industrial Finance Corporation of India, which is the first industrial banking institution to be established in this country on a comprehensive nation-wide basis with government participation in share capital and active assistance in diverse ways, is running the ninth year of its existence. Its financial operations during the eight years completed on June 30, 1956, disclose that its role as a supplier of loan finance for industry has been modest. It is possible to argue that the initial difficulties inherent in this sphere of banking in this country were not fully assessed in raising the expectations about its progress. This argument is valid in a partial sense. With the element of risk in its business operations having been held within reasonable dimensions due to government assistance and guidance, its actual performance could have been imporved upon. Now that the National Industrial Development Corporation and the Industrial Credit and Investment Corporation have emerged in this field the IFC may be deemed to assume the status of a junior partner.

NATURE OF LENDING

The magnitude of its lending operations over the eight years can be fairly assessed in terms of annual averages. It sanctioned loans at an annual average rate of Rs. 5.4 crores, whereas disbursement of loan amounts worked at an annual average of Rs. 2.09 crores. The actual amounts under the two heads are tabulated below:

Year (Ending June 30)	Loans sanctioned (Rs. Crores)	Loans Distributed (Rs. Crores)
1949	3.42	1.33
1950	3.77	2.08
1951	2.39	2.38
1952	4.45	1.78
1953	1.44	2.50
1954	5.27	2.82
1955	7.34	1.64
1956	15.13	2.20
TOTAL	43.21	16.73

An important trend which the above figures establish is the absence of any correlation between loan sanctions and disbursements of amounts. The gross disparities between these two factors of lending operations are strikingly brought out by the figures for two years. In 1952-53 sanctions were the lowest ever at Rs. 1.44 crores while disbursements stood at Rs. 2.5 crores exceeding the average for the entire period. In the eighth year 1955-56 sanctions attained an impressive new peak of Rs. 15.13 crores but disbursements stood marginally above the average at Rs. 2.20 crores. It is undoubtedly true that sanctions constitute the index of the readiness of the Corporation to supply credit and disbursements are determined by the estimates of the borrowing enterprises of their requirements of finance from time to time as well as their desire to reduce liability on account of payment of interest. The outstanding commitments, after deducting the disbursements actually made, amount to Rs. 20.25 crores by reason of the fact that out of the total sanctions Rs. 6.22 crores represent loans subsequently declined or not made available on grounds which do not necessarily cast reflection on the credit-worthiness of the borrowers.

DISTRIBUTION OF BENEFIT OF RESOURCES

The benefit of IFC's total sanctions of Rs. 43.21 crores was extended to eleven categories of industries according to the classification which it adopted as late as 1954-55. This classification has been referred to here for convenience of assessment over the whole eight-year period. Categories of industries which were granted loans in excess of Rs. 1 crore have been tabulated below in the order of the loan amounts they were sanctioned:

Category of Industry	Amount of sanctioned loans (Rs. Crores)
Sugar	11.59
Cotton Textiles	6.10
Chemicals	5.87
Paper	4.22
Cement	3.40
Mechanical Engineering	1.68
Electrical Engineering	1.56
Ceramics and Glasses	1.50
Automobile and Tractors	1.34
Light Engineering	1.34
Rayon	1.10

The assistance given to the sugar industry rests on special considerations. Rs. 5.50 crores or about half the total sanctions during the eight years for the industry were granted in 1955-56. There is a deliberate bias in favour of financial help to the sugar industry because of the policy which the Government is following to promote co-operative sugar factories. They are now the major recipients of assistance. Certain conditions are prescribed which require the co-operatives to subscribe a definite share of the capital. Furthermore, the Central and Union Governments guarantee payment of interest and repayment of principal fifty per cent each. IFC has been instructed to be liberal in its tests of eligibility of the co-operatives for loans on the gorund that the production target of the industry has been raised.

In the statistical tables of the Supplement will be found a comprehensive table explaining the break-down of the aggregate sanctioned loans according to industries as also according to States. The position relates, of course, to the States before reorganisation in October last. Bombay, West Bengal, Madras, Bihar and Travancore-Cochin represent in the order set out the major beneficiaries. Madhya Pradesh, Delhi, Madhya Bharat and Assam represent the reverse order. In recent years the attitude of the IFC has been to provide larger accommodation to States which had not before drawn upon its resources. Thus Andhra, Punjab and Uttar Pradesh are receiving larger amounts of aid. This attitude has been prompted by a desire to meet the contention that the industrially less developed States should be accorded special consideration. The Corporation cannot go very far in meeting this claim for the obvious reason that a credit institution can come into the picture at the proper stage and it is not an agency to take initiative in promoting industrialisation of less developed regions. The margin of relaxation which it can exercise is narrow inasmuch as it is under an obligation to adhere to normal principles of sound banking.

SOUND MANAGEMENT POLICY

An examination of the schedule of repayment of principal discloses that the borrowing enterprises in general have honoured their obligations. Out of the aggregate amounts due on this account of the order of Rs. 2.25 crores the amount of default is Rs. 56 lakhs or 24.9 per cent. If the Sodepur Glass Works is excluded, this amount would be considerably reduced and account for five cases of default. Assets of one enterprise have been sold and those of another have been leased. Since IFC's basic objective is to promote industrialisation and not to function as a full-fledged profit-earning bank, its policy is to explore all practicable means to restore financial viability to the borrowing concern. Sale is resorted to as the last measure but here again the object is to safeguard the existence of the enterprise. This was exemplified by its handling of Sodepur Glass Works which were handed over to a Japanese manufacturing company on forming the Indo-Asahi Glass Company with a rupee capital. An amendment made in the Industrial Finance Corporation Act in September 1955 empowers the IFC to lease a defaulting concern instead of selling it. Reference is made earlier to one case of lease. No sale can be effected now without prior reference to the Government. The IFC's record of recoveries of interest is worthy of appreciation and speaks as much for its prudence in approving loans as for the earnestness of the borrowers to discharge their obligation in this behalf. Out of the total amount due on interest to the tune of Rs. 2.81 crores, Rs. 2.73 crores were received, disclosing defaults of the order of 6.4 per cent. The major share of defaul is due to enterprises which have defaulted in payment of principal.

The capital structure is being maintained on an expanding basis and the assets and liabilities position is sound as shown by the published balance sheet from year to year.

The IFC has exercised its statutory power to borrow from the Reserve Bank cautiously. Last year Rs. 66 lakhs out of Rs. 1.48 crores which it borrowed from the Reserve Bank was repaid. It has so far not taken up any debentures or underwritten any issues of capital or guaranteed any loans of industrial concerns.

PARLIAMENTARY CONTROL

By and large, the management of the IFC has been scrupulous in applying appropriate tests to sanctions of loans and in prescribing conditions for their grant. Nevertheless, it became the object of a heated controversy in Parliament which resulted in the appointment of the Sucheta Kripalani Committee for investigation into the conduct of certain of its operations. One major case showed a large error of judgment. In fairness, however, it must be stated that it did not incur a verdict showing want of bona fides or positive or gross negligence of the interests of shareholders. The Committee's recommendations have resulted in the amendment of the Industrial Finance Corporation Act, the main change being the appointment of a full time Chairman to be in top charge in place of the erstwhile Managing Director. The irregularities disclosed in the Committee's enquiry were again the subject of the audit report for 1953-54.

The issue of principle involved in the enquiry as well as the auditor's report really was whether or not discretion should be granted to the managing authority in the conduct of loan operations. Where mala fides are not attributed but the objections rest essentially on irregularities of procedure, this issue becomes relatively simple for a practicable answer. Exercise of discertion pertains to the varying conditions on which loans are granted. It should not be difficult to appreciate that reasonably varying creteria ought to be appplied to different applicant enterprises, depending primarily on their creditworthiness, the soundness of the enterprise which is to be financed and in certain cases its key importance to the economy. On the one hand, the objection is raised that loans are granted to companies which could float debentures or issue fresh capital and, on the other, criticism is levelled for keeping funds idle. The fair conclusion to draw would be that so long as management policies do not deviate from principles and practices of sound industrial banking and the Corporation's interests are not jeopardised, there should be no intervention from Parliament. Discretion is essential where cases of loan requests represent a range of diversity. Unless flexibility is maintained in management, the purpose of special government-sponsored credit institutions like the IFC cannot be advanced.

It is difficult to be dogmatic that this episode of intervention has not produced adverse repercussions on IFC's flexibility of approach in its dealings.

FACING THE FUTURE WITH OPTIMISM

The IFC had to call upon the Government to give subventions for payment of the entire guaranteed dividend of Rs. 11.25 lakhs in 1955-56 in spite of earning a net profit of Rs. 22.5 lakhs. This was because of appropriation of the total net profit to the reserve for bad and doubtful debts which is now built to an adequate size. Total subventions from the Government for this purpose have amounted to Rs. 53.45 lakhs. On the anticipation of reduction in the tax liability, consequent on the amount that will be allowed to be written off, it is believed that no subvention will be required in the current year.

The rate of interest charged at 6½ per cent per annum (minus rebate of ½ per cent when interest and instalments of principal are punctually paid) has been a handicap in expanding the base of operations. In view of the advisability of retaining the guarantee on dividend, there seems little room for lowering the rate. The real solution lies in making a vigorous drive for attracting a large number of loan applications by more business-like management. This is also the solution to the problem, which, according to the Chairman, has been raised by the appearance of the National Investment and Development Corporation as well as the Industrial Credit and Investment Corporation. Overlap of functions is unavoidable in a certain measure. But given a large volume of business, it should not prove a handicap. There are healthy indications that the IFC is undeterred by the prospect of competition and takes an optimistic view of the period lying immediatley ahead. Its Chairman has emphasized that the allocation of Rs. 15 crores to the IFC during the second Plan would prove inadequate and negotiations are in progress to obtain an increased amount. The procedure in investigating applications for loans is being rationalised mainly as regards legal scrutiny of title deeds and standardisation of conditions of mortgage bonds. This should go some way towards reducing vexatious delays. The Corporation is now getting tuned up to face the challenge of a phase of rapid expansion.

State Financial Corporations

THERE is a consensus of opinion that the State Financial Corporations in general have not rendered a good account of themselves in the brief period of their existence. This feeling was expressed freely during the debate in Parliament on the State Financial Corporations (Amendment) Bill, 1956. Criticism is directed against the shortcomings in the discharge of their obligations, the inadequate supply of credit for medium and small-scale industries and the rate of interest on loans. Before reorganisation of States there were 13 State Financial Corporations with paid-up resources of Rs. 11 crores and authorised capital of Rs. 25 crores. The post-reorganisation position is not relevant here as the accounts and operations relate to the prior situation. These Corporations are meant to cater to medium and small-scale industries, since the large-scale industries are provided for by the Industrial Finance Corporation, the National Industrial Development Corporation and the Industrial Credit and Investment Corporation. But it is a recurring complaint that some of the State Corporations are giving accommodation to comparatively large industrial concerns on a rather disproportionate scale, not fully consistent with their fundamental function. Cotton textile, engineering and electric supply industries in Bombay and tea and rubber plantations with factories in Travancore-Cochin are major recipients of loans. Specifically, the Corporations are presumed to allocate a substantial portion of their funds to satisfy the needs of smaller units which have difficulties in securing risk capital. The results of working during the last three years, however, do not justify the conclusion that the assistance which they have rendered is substantial.

Some extenuating circumstances may be found in the fact that the State Financial Corporations Act does not permit any accommodation unless it is sufficiently secured by pledge, mortgage, hypothecation or assignment of assets in the manner prescribed by regulations. As a purveyor of long term credit, the Corporations have to satisfy themselves that the proposal placed before them is sound, that it is backed by adequate and readily marketable security of tangible assets, that the management of the applicant industrial concern is efficient and prudent, that the profit earning capacity of the intending borrower is sufficient and that there are reasonable chances of the loan being repaid within the stipulated period. Often, considerable delay is experienced in getting applicants to deliver all the documents required to establish their title to the mortgaged property, to submit plans and estimates for the buildings put up or proposed to be put up and audited accounts for three years immediately preceding the date of application, income-tax assessment orders, etc. One of the peculiarities of the management of small industrial concerns, especially of the non-corporate type, is that they do not have their accounts audited by qualified accountants nor do they follow the accepted practices of accounting in industrial undertakings. In the absence of properly audited accounts it is difficult for lending institutions to assess the financial soundness of borrowing concerns or to calculate the net value of the assets offered in security. In fact, one of the purposes of the 1956 Amending Bill has been to reduce the rigours of the law so that loans can be given on slightly less onerous terms. Section 25 of the Act has been amended so that industrial concerns engaged in small-scale and cottage industries, not having sufficient tangible assets may avail themselves of financial accommodation from State Financial Corporations.

OPERATIONAL TRENDS

With the exception of Madhya Bharat, all the State Financial Corporations have shown profits for 1955-56 — even the Andhra Corporation which operated for only six months. Travancore-Cochin Corporation stands significantly above others in operational efficiency. Next come those of Bombay, Saurashtra and Punjab, which along with that of Travancore, had the advantage of an earlier start. Last year's trends indicate that the funds of the Corporations are being utilised on a much larger scale than before in advances of loans for capital investment, and with the exception of the Hyderabad Coroporation, they have achieved a fair record of progressive assistance to industry. The Hyderabad Corporation has explained the fall in the number of applications for loans last year by the fact that the Small-Scale Industries Board offers loans on more attractive terms. A similar difficulty is faced by the Andhra Corporation due to the recent liberalisaton of the terms of credit under the State Aid to Industries Act and the consequent expansion of activities of the State Industries Department for such assistance. The raising of the limit for advances under the State Aid to Industries Act from Rs. 20,000 to Rs. 1 lakh will doubtless curtail the field of activity of the Corporation. It is necessary to evolve a scheme of integrated credit so that the activities of the various credit agencies may be clearly demarcated and co-ordinated. The State Bank of India has recently evolved such a scheme as an experimental measure.

As yet, the Coroporations are not self-sufficient and they have to depend on government subventions to pay the guaranteed rate of dividend. Income-tax and Corporation tax, to which State Financial Corporations are subject, now absorb about 43 per cent of their income. The Central Government has rejected the demand for a tax holiday for five years. But it is apparent that even if the exemption were granted, subventions would be necessary for some years to come.

Self-sufficiency will be possible only as the scale of operations expands. There is scope for reducing the administrative expenses of almost all the Corporations. The percentage of administrative expenditure to gross profits is as high as 66.1 and 59.1 in the case of the Andhra and Bihar Financial Corporations respectively whereas it is the lowest in the case of the Travancore-Cochin Financial Corporation at 12.1 per cent. In the case of the Andhra and Bihar Corporations, however, a good part of the accounting period was taken up by the preliminary work of organisation and loan operations started rather late. But the administrative and establishment expenses of the Punjab and West Bengal Corporations can be reduced considerably.

ENABLING AMENDMENTS

The principal Act was passed in 1951. And the first of the Corporation was established in 1953. Recent amendments have enlarged the coverage of the industrial sector by the Corporations. In September 1955, the Industrial and State Financial Corporations (Amendment) Act was passed and this enactment empowers the Corporations to extend financial assistance to industries to be newly set up also. Again, the Amendment of 1956 provides for the widening of the definition of 'processing industries'. The grant of short-term loans for working capital is ordinarily within the province of the commercial banks, and the Corporations do not, as a rule, grant loans for working capital. Meanwhile, however, until loans for long-term capital investment get into full stride, the Corporations may fruitfully employ their idle funds in moderate advances for working capital also. Bombay did make a departure in this direction in 1954-55 in cases in which accommodation was not available from commercial banks.

The gap between the loan applied for and the amount granted will be narrowed, as the industrial concerns gain experience in the intricacies of mortgage banking. The applications rejected are either for grant of working capital, or from industrial concerns which do not come within the purview of the Corporations or are based on unsound schemes backed with insufficient security, insufficiency of earning capacity to repay the instalments of principal and interest, unfavourable credit reports, bad management, etc. It is necessary in this connection that regional advisory committees should be set up as suggested by the Sucheta Kripalani Committee report, although the recommendations related to the Industrial Finance Corporation. These committees will help the Corporations to have a fuller knowledge of the industries as well as acquaint the applicant concerns with all procedural details.

STAMP DUTY

The stamp duty on mortgages along with the application fee and other incidental expenses constitute a rather heavy burden on borrowers. The former Government of Saurashtra and the Punjab Government gave concessions in this regard, which are a welcome relief to the borrowers from the Corporations. These concessions will remove the borrowers' complaint regarding the somewhat heavy initial expenses entailed by a loanee. In the Statitsical Section of this Blue Supplement will be found a table giving an elaborate analysis of the important aspects of the capital structure and financial working of the Corporations.

National Industrial Development Corporation

THE significance of the National Industrial Development Corporation, which was established in October 1954 by the Government of India as a private limited company, lies in the fact that the emphasis in the purpose and working of the Corporation is to be on development functions and not in the first instance on provision of finance. This is a distinctive feature which marks it out from the other existing agencies for the supply of industrial finance. It was started with an authorised capital of Rs. 1 crore of which Rs. 10 lakhs have been issued and wholly subscribed by Government, and a sum of Rs. 55 crores has been allotted for the activities of the Corporation by the Planning Commission. Conceived mainly as an instrument of Government, its basic aim is to secure an integrated and balanced development of industries in the private as well as the public sector. It will thus concentrate in filling up gaps in the industrial structure and try to achieve better co-ordination of progress in different fields.

As the Corporation has been started to launch on industrial enterprises, which are vital to the needs of the economy, it will plan and formulate projects for setting up new industries or developing new lines of production. While implementing the projects, it will try to ensure that the maximum possible use is made of the industrial equipment, experience and skill available in the country. The finances of the Corporation are provided by the Government in the form of grants and loans and it will undertake financing only in so far as it is incidental to the development of an industry. Thus it will be a kind of a path-finder where private enterprise feels hesitant to step in. Incidentally the industries it develops in their turn may encourage the growth of ancillary industries which the private sector may be able to take up.

FUNDAMENTAL OBJECTIVE

Having in view its fundamental objective of vitalising the economy by the creation of healthy industrial enterprises, the Corporation will have some flexibility in the methods adopted for the execution of its projects. There is no need for entering into any controversy over the desirability or otherwise of private or State ownership of particular enterprises and although initially the capital may be wholly from Government sources, it need not necessarily be the case in all instances or for all times. The Corporation could itself execute a project or it may allow a project to be executed by a subsidiary company, all the shares of which would be owned by the Corporation. It may also execute a project with varying degrees of collaboration with private enterprise.

The Corporation has placed a part of its resources (tentatively placed at Rs. 20 to Rs. 25 crores) to be utilised for assisting the modernisation and rehabilitation of the cotton and jute textile industries, whose role in the country's economy and as earners of foreign exchange is considerable. It is obvious that it would be difficult to maintain expanding exporting markets for cotton and jute goods in the face of competition abroad unless an extensive programme of renovation is undertaken. For the grant of financial assistance to the jute and cotton textile industries, two committees, one in Calcutta for the jute industry, and the other in Bombay for the cotton textile industry have been set up for scrutinising applications for loans. So far as the jute industry is concerned, three loans of about Rs. 83 lakhs have already been approved by the Corporation to three units and loans for some others are under consideration. An export survey of the textile

industry is also now being made with a view to determining the quantum of loan for each unit.

PROJECT PLANNING

Since project planning is the most essential function of the Corporation, it has to enlist the services of experts at diverse levels. It is now processing projects for the establishment of steel foundries, forges and fabrication of steel structurals. The second Five-Year Plan provides for a heavy foundry and forge project for the manufacture of heavy castings of iron and steel as well as heavy forgings weighing up to 20 tons or more apiece which are now being imported. The NIDC has now proposed to take up this project. Competitive quotations together with detailed project reports are being awaited from three foreign firms and final decisions will be taken when these are received. It will also set up capacity for fabricating certain categories of structurals near the steel plants. To eliminate the dependence of the country's growing rayon industry on imported wood pulp, its basic raw material, as also to help the growth of the newsprint industry, the Corporation is investigating a project for the manufacture of wood pulp. A foreign technical team has completed its survey and made a preliminary report. The foreign firm, which has sent the team, is now conducting experiments on selected Indian raw materials which have been sent to them.

So far as the project for the production of synthetic rubber based on utilisation of alcohol is concerned, the report of the team of experts from four well-known American companies in this field is favourable and the scheme seems to be under further consideration. Apart from these, the manufacture of carbon black, sulphur from pyrites, printing machinery, air compressors and fractional horse power motors and refractories are also under detailed investigation. Besides, rolls and rolling mill equipment required in ferrous and non-ferrous industries and manufacture of heavy equipment for earth-moving, mining, etc., are also within its purview.

Recently, the Government have decided on two important projects to be undertaken by the Corporation. One is for the establishment of a newsprint factory at Shakarnagar near Hyderabad with a capacity of 30,000 tons per annum and the other for setting up an aluminium plant at Mettur in Madras State with a capacity of 10,000 tons per year. Government have also decided to set up central capacity for the manufacture of primary intermediates so essential in any development programme for the dyestuff industry. A decision regarding the exact scope of the NIDC project and the manner of its execution will be taken after the programme of the various firms already in the field is clearly known.

SHORTAGE OF RESOURCES

The NIDC has thus taken on itself a large volume of work and naturally the question of resources assumes great importance. With about Rs. 20-25 crores set apart for modernisation of the cotton and jute textile industries, a sum of about Rs. 30 to Rs. 35 crores will alone be available for pioneering new basic and heavy industries. It means that the Corporation has to draw up priorities in regard to projects for implementation that will meet the pressure on the limited funds available. The Planning Commission itself has conceded that the Corporation may need more resources than have been allotted to it and has stated that the extent of the gap between the resources actually required and the provision of funds now proposed will ultimately depend on the pattern of financing adopted and the size of the Government's holding in the overall investments in the various projects.

More than funds, perhaps the real difficulty may lie in the shortage of technical personnel. It is patent that the country does not have the requisite number of capable technicians who have to process the different ventures. In the investigations that are in progress, wherever necessary, assistance is taken therefore, of foreign firms and experts and it is obvious that greater efforts may be required to obtain the services of more and more foreign technical personnel if the Corporation is to produce any satisfactory results.

Another factor to be borne in mind is that the Corporation should enlist the co-operation of private business if its objective to fill the gaps in the industrial structure is to be fulfilled. Correspondingly it entails an obligation on the part of private entrepreneurs to state their case fully and allow the Corporation to go ahead wherever they feel they may be unwilling to take risks. Finally it must also be emphasised that since the NIDC will have its eye on the third Five-Year Plan in the process of investigation of schemes relating to the manufacture of heavy machinery or schemes directly related to it, it must realistically face its commitments and limit its area of operations so that it may remain within manageable proportions.

Industrial Credit and Investment Corporation

THE launching of the Industrial Credit and Investment Corporation as a privately-owned and privately-managed limited liability company in January 1955 may be deemed an experiment in international investment which was much needed in this country. Its major objective is to give assistance to industrial enterprises falling within the private sector of industry.

The distinctive feature of the Corporation lies in the mobilisation of international finance as can be seen from the following facts. Out of the subscribed capital of Rs. 5 crores (the authorised capital being Rs. 25 crores) Rs. 0.5 crore has been subscribed by American investors who include the Bank of America, Olin Matheison Chemical Corporation, the Westinghouse International Corporation and Rockefeller Brothers. The British share of the subscription of Rs. 1 crore has been provided by eight eastern exchange banks, 12 insurance companies, the Commonwealth Development Finance Company and two industrial companies having interests in India. The balance of Rs. 3.5 crores forms the Indian share of which Rs. 2 crores go to institutional investors and Rs. 1.5 crores for the public. In the capital of the Corporation, therefore, the U.K. takes 20 per cent of the total share and the U.S. 10 per cent, leaving to India the remaining 70 per cent.

WORLD BANK LOAN

More interesting is the fact that the International Bank for Reconstruction and Development has sanctioned a loan of $10 million (Rs. 4.72 crores) for the Corporation. In addition to this, the Government of India has given it an advance of Rs. 7.5 crores. It is to be free of interest and is repayable in 15 equal instalments beginning after the lapse of 15 years. The significance of the advance lies in the fact that this money has been found from counterpart funds derived from the proceeds of the sale of steel supplied by the Foreign Operations Administration of the U.S. under the Indo-American Technical Co-operation Agreement. It is certainly a step in the right direction that the counterpart funds should be utilised for nation-building activities. This fact has to be borne in mind because of criticism in the earlier stages in Parliament itself questioning the propriety of placing at the disposal of a private-owned corporation Government funds without any interest charge. The Finance Minister rightly defended that though the proceeds were applied to the finances of industrial enterprises which are privately-owned, they conformed to the pattern of approved development satisfying the required test at the licensing stage. What is more important, which has silenced the critics, is that the remission of interest which the Government has granted would enable the Corporation to advance loans at 1 per cent below the rate it would otherwise have been required to charge.

Another feature of the Corporation is that it has undertaken to ensure that no group of industrialists or companies will be allowed to capture a dominating part of its total shares and thus prevent its independent character. The management is in the hands of a Board of eleven Directors and of these, seven represent the Indian shareholders of the Corporation, two the British and one the American while the eleventh Director is nominated by the Government of India. The Government of India has retained its right to nominate one person so long as any part of the Government's loan remains unpaid. It also retains the right to apply for the liquidation of the Corporation if default is committed in payment of the loan instalments or if the Corporation's capital is impaired beyond tolerable limit considered reasonable in the course of business. These are not only adequate safeguards for prudential use of the interest-free loan, but, what is of greater significance, it means that Government will be in a position to exercise effective control over the activities of the Corporation whenever it feels that they do not subserve the objective for which the institution has been started.

OBJECTIVES AND ACTIVITIES

The purpose of the Corporation, as already mentioned, is to assist industrial enterprises within the private sector of industry. This it will do either through providing finance in the form of loan and equity participation or through sponsoring and under-writing new issues of shares. It will also help by furnishing managerial, technical and administrative advice and services to Indian industry. The functions of investment, lending or underwriting will be exercised within the framework of a dynamic policy depending on circumstances and the type of industry that requires such help. Ever since its inception, the Corporation has received a continous flow of enquiries covering a wide range of industrial activities and coming from all parts of India. The industries which the Corporation has agreed to assist so far include the manufacture of paper, electrical equipment, fuel injection equipment, chemicals and equipment for the textile industry, refining of sugar and metal ores and cotton spinning. Since the Corporation examines all aspects of a project for the establishment of a new industry or the modernisation or expansion of an existing one before it agrees to give assistance, there is inevitably a time-lag between the receipt of an application and the disbursement of funds.

It is necessary to mention here a recent development that has had its effect in the structure of the capital of the Corporation. As a result of nationalisation of insurance the Government now owns nearly 18 per cent of the Corporation's share capital, a figure that represents the value of the Corporation's share held by the issurance companies now taken over by the Government. Now, the Corporation is wholly a private-owned business and it was on that basis that the co-operation of the various parties in the U.K. and U.S. and the World Bank was extended to it. Consequent on the nationalisation of insurance, Government have become its largest single shareholder. However, Government have assured the Company that they have no intention of taking advantage of their 'adventitious position' in this regard to influence the day-to-day working of the Corporation. This assurance should go a long way in allaying any fears that the Board of Directors might have entertained with regard to the position of the Government vis-a-vis the Corporation. The Corporation has come into existence at a crucial stage in the economic development of the country. Its potentialities are undoubtedly great and likewise there are reasonable hopes that conditions for stability would be assured for its smooth functioning.

International Finance Corporation

THE formation of the International Finance Corporation in July 1956 marks an important development in post-war economic co-operation. The World Bank has been in operation for a decade and its valuable experiment has stimulated practical interest in international financial assistance. But the World Bank has its own limitations of functions, operating as it does at the Government level. The idea of an international finance institution functioning at the private level was mooted long since, but three years of discussion, suspense and hesitation had to pass before it could be endorsed and taken up for active formulation. There was hardly any divergence of view on the proposition that the flow of international capital for development must be secured primarily from private sources and an effective way to encourage it was to launch co-operative action. Since the United States is the biggest exporter of capital its attitude was bound to influence efforts to set up an international organisation. Happily, it gave a firm lead in this matter too which induced other countries to follow suit. India signed the Articles of Agreement of the Corporation in October 1955 and deposited the Instruments of Acceptance immediately thereafter.

CAPITAL STRUCTURE AND DICTINCTIVE CHARACTER

The Corporation's initial authorised capital of $100 million (Rs. 48 crores) has been divided into 100,000 shares of equal value. It was a condition precedent of its formation that a minimum of 30 countries must subscribe to an aggregate share capital of $75 million. The table at the end of this article sets out the membership and the share of each member in the capital as on August 10, 1956. In all 32 member-governments contributed to a total of $78.4 million until that day. Since then 15 more countries which have joined it have brought a further capital subscription of $11.6 million making a total of $90 million. The Corporation's Board of Directors has been vested with authority to invest the authorised capital up to an additional 10 per cent to accommodate new-comers as well as the growing volume of demand for investment. The original members enjoy priority right to subscribe to the increased capital in proportion to their share holdings.

The Corporation has a positive relation with the World Bank which, however, does not detract from its

individuality. Its membership is open only to member governments of the World Bank and the rate of subscription to the capital is based on the ratio of its subscription to the World Bank. Executive Directors of the World Bank representing a minimum of one government which is also a member of the Corporation are entitled to serve on the Corporation's Board of Directors. The World Bank's President will be the ex-officio Chairman of the Corporation's Board of Directors and will have the right to recommend the choice of the Corporation's President. To this extent the Corporation will be an affiliate of the World Bank, but no further.

The Corporation, however, possesses a distinctive personality. It is an independent legal entity and is entitled to function under the authority of its own charter. Affiliation with the World Bank has secured for it a solid base of activity, especially in the less developed countries, but it does not in any manner infringe on its independent status. Membership of governments has a restricted implication. In its operations at all levels it will function in the sphere of private enterprise. Undoubtedly, one of its characteristic factors will be that it will ask for no guarantee from any government for loans advanced to borrowing concerns within its national frontiers.

POLICY FOR ESSENTIAL CO-OPERATION

The basic objective of the Corporation is to promote economic development, active assistance and encouragement to productive private enterprises and the bias of its investment operations for a considerable time to come will be towards assistance to under-developed and backward member countries. Since productive investment is to be the hall-mark of its policy it will insist on satisfactory proof of the production potential of the enterprises asking for assistance. But apart from offering its own resources it will co-operate in widening the range of participation in the capital exporting as well as importing countries and strengthening the base of co-operation between domestic and foreign private capital. It will be no part of its policy or function to arrange for the supply of technical know-how.

Alongside its investment operations its major activity will be to serve as an agency in facilitating procurement of experienced management. The sponsors of the Corporation have a firm conviction that management is a fundamental factor for the success of any enterprise—a factor which is in fact much more important, and also more scarce, than capital. Due to historical traditions the management patterns in less developed countries had inevitably to adhere to the pattern of family proprietorship and management. Modern business and industrial enterprises with their complex character and the vital need to absorb technological improvements to maintain their dynamic nature must of necessity adopt up-to-date techniques in management. The Corporation believes that it should be of assistance in promoting professional management as an essential of private enterprise in the less developed countries. Management on modern business principles is bound to raise standards of business efficiency which in course of time cannot fail to produce a healthy effect on the attitudes of the public as well as the political leadership towards private enterprise.

The resources of the Corporation are meant to be used for the promotion of economic activity in developing countries. This purpose does not exclude under strict interpretation the possibility of assistance to private enterprise in relatively advanced countries. But the Corporation's policy in practice will be to confine its operations in the intervening period which is bound to be of a long duration, to the less developed member countries. Investment in industrial, agricultural, financial, commercial and other enterprises in allied spheres is perfectly within its jurisdiction. Nevertheless, in view of the crying need for industrial finance and the limited initial authorised capital of the Corporation of the order of Rs. 48 crores, its functions will be restricted predominantly to industrial enterprises. Basic public utilities, even though owned and managed by private enterprises, such as transport, electric power, reclamation, and so forth, will be kept out of the purview of its activities. This is because of the obvious fact that they are proper subjects of assistance from the World Bank and in reality several private enterprises of this description have actually received finance from the World Bank over the last ten years.

CRITERIA FOR ASSISTANCE

In judging the eligibility of an applicant enterprise the character of government's participation in ownership or management will be a primary test. Enterprises which are predominantly private-owned but in which the government has a dominating share in management will not be eligible for assistance. On the contrary, minor participation of the government in ownership will be no bar to the Corporation's help, provided the enterprise is essentially private in its ownership as well as management. The formal test of eligibility, however, will be that the enterprise asking for assistance should contribute on its own a majority share of the funds needed for fresh investment at least in excess of fifty per cent of the required amount and the balance should not be available from other sources on reasonable terms. The new investment must be of a minimum amount of US $500.000 (Rs. 24 lakhs) and the size of the assistance required must be $100,000 (Rs. 4.8 lakhs) in the minimum.

The sole restriction on the types of investment which the Corporation can undertake is that it will not directly invest in capital stock or shares. The normal form of its investment will be by way of loans, but distinguished from the conventional form of loans stipulating the entire return in terms of fixed interest. A substantial part of the investment will be in venture capital. Ordinarily investments will take the form of convertible debentures together with a positive form of interest which will confer on the Corporation a right to obtain capital stock or shares. The terms of the investment will provide for part of the return in the form of a share in profits in addition to interest. The specific terms of participation in profit will be governed by the merits of each case.

Since the Corporation is precluded by its charter from making direct investments in share capital, the rights which it will acquire to participation in capital stock or shares cannot be exercised on its own. But they will be sold to foreign or domestic investors. Profits earned on successful investments will be of value in building reserves and cancelling out possible losses. The right to obtain share capital and convertible debentures is the key to the Corporation's investment policy. It is a basic objective of the Corporation to promote co-operation between foreign and domestic private investors. To this end the Corporation's investments will be placed on a revolving basis which implies that as soon as an enterprise is put on a sound operating basis the Corporation's interest will be transferred to investors and funds will be released for help to other enterprises. The Corporation's participation and the technique of revolving investment are expected to enlarge the area of international collaboration.

The funds which the Corporation will be prepared to invest will be available for use freely by the borrowing enterprise and will not be restricted to the requirements of the enterprise in terms of foreign exchange. In view of the top importance which this Corporation attaches to management, rigorous tests will be applied in judging this aspect of the applicant's enterprise. Their management must be of acceptable standards of competence and experience. In addition, proof ought to be forthcoming of their stake in the enterprise in the form of risking their own capital and their business reputation. The Corporation will not accept direct responsibility for the management although its consultation will be essential for any changes in the management of the beneficiary enterprise. It will, however, undertake to find managerial personnel in appropriate cases. It may seek safeguards for its investment in the form of representation of its interests on the Board of Directors. The Corporation will not ask for government approval of its projects of investment except in so far as the national law requires it. But when a government objects to any investment, it will refrain from it.

CLIMATE FOR INVESTMENT

In view of India's interest in inviting foreign private capital for industrial development, she would welcome expansion of the activities of the Corporation. Positive clarification of the approach with which it would treat requests for assistance is now available from public addresses of its President, Mr. Robert Garner, as also from the literature it has released for information. Since the Corporation would desist from leaning on the backing or guarantees of the governments of the participating countries in its operations it lays itself bare to normal business risks. Its approach to proposals for co-operation cannot but be governed by strict business principles and practices. The basic requirement which countries seeking its help have to satisfy is the creation of a climate suitable for the flow of foreign capital. Business leadership can undoubtedly contribute to the creation of such a climate by maintaining and raising standards of performance. But investor's confidence is a psychological factor which is susceptible to varied influences in other spheres. It is in these spheres that a climate of confidence must be sustained and improved.

Economic and political stability is its absolute precondition. But political attitudes and government policies towards private enterprise are of much greater significance. Clamping of too many regulations and legal restrictions on the freedom of private enterprise, inconsistent with the risks and responsibilities it consciously bears, may operate as a disincentive to the private investor who is entitled to his own reasonable expectations of freedom of operation and has also a choice of different countries for export of capital. The Corporation is now engaged in preliminary negotiations for projects of co-operation and it is gratifying that India ranks among the countries whose proposals have been placed before it. The gap in India's foreign exchange requirements in the very first year of the second Plan has impressed upon her policy-makers the importance of foreign investment. The latest directives on imports on private account have underlined the significance of this assistance. It is a logical obligation which rests on the country, but more so on the Government, to adopt policies conducive to the flow of capital from abroad.

Scope of Research

THE social researcher's laboratory is not so easily and neatly cut out as that of a chemist or physicist. Still, public opinion research with its special sampling techniques has advanced a great deal in the realm of social sciences in the West. These sampling techniques have found wide applications in many fields of opinion and attitude research: pre-election polls; gauging public opinion on political, social and economic issues; collecting useful social facts and critical data about men and things for administrative purposes; marketing, advertising and related research; audience research; social anthropology or sociological knowledge in the field of culture traits, etc. The scope of research is thus almost limitless, and it is an encouraging sign that this useful instrument in the methodology of the social sciences is being put to an increasing variety of uses in India too.

This Blue Supplement is only a modest contribution to a non-technical understanding of public opinion research. Even here only a small part of the ground is covered. The object is to focus attention on the public opinion poll as a device for predicting the behaviour of human beings as political beings and as consumers, for it has been scientifically established by now that human behaviour is predictable with a reasonable degree of accuracy. While consumer or market research is an eminently useful tool for industry and trade, political polls are an effective device of direct democracy inasmuch as they give importance to the individual citizen. The Blue Supplement is largely devoted to the latter branch of public opinion research.

Public opinion polling is as timely as it is relevant in view of some undemocratic trends in our infant democracy. The Union and State Governments in India are hardly in a position to know whether their actions are meeting with public approval and thus to bridge, as far as possible, what the citizen at any given moment thinks and what his government does. It is rightly said that "the essence of democracy lies in popular participation in policy-making." But a nation-wide referendum on every issue of policy and legislation is a physical impossibility; it is a costly and dilatory affair. In the words of that great constitutional authority, Lord Bryce, "the action of opinion is continuous, that of voting occasional, and in the intervals between the elections of legislative bodies, changes may take place materially affecting the views of voters." If the method of referendum cannot be called into play to record such shifts in public opinion and to make the will of the majority of citizens ascertainable at all times, the only other feasible alternative is to carry out from time to time surveys of a random sample, or what is called a representative cross-section of the population, in respect of important issues of the day. This is the supreme justification for political polls such as the ones that have just been initiated in this country.

Designing the Sample

PERHAPS the most technical part of public opinion research is designing the sample. Sampling technique has, during the last 25 years, developed so fast that it is possible now to predict election results with precision. Also it is now possible to plan in advance to control "sampling error" within required limits. The following table sets out the Gallup Poll forecast of the recent elections in Australia, England, United States and Canada.

AUSTRIA—DECEMBER 1955

	Gallup	Election
Liberal Country Party	50%	47.6%
Labour	45%	45.8%
Anti-Communist Labour ..	4%	5.2%
Independents	1%	1.4%

ENGLAND—MAY 1955

Conservative	50.0%	49.8%
Labour	48.0%	46.4%
Liberal	1.5%	2.7%
Others	.5%	1.1%

UNITED STATES—NOVEMBER, 1954

Nationwide:		
Democrats	51.5%	52.7%
Republicans	48.5%	47.3%
Outside South*:		
Democrats	48.5%	49.5%
Republicans	51.5%	50.5%

CANADA—AUGUST 1953

Liberal	50%	50%
Prog. Conservative	31%	31%
Co-operative Commonwealth Federation	11%	11%
Others	8%	8%

*35 States in North.

The two fundamental considerations which have to be borne in mind while drawing out the sample are: First, the size, that is, the number of interviews, and second, the manner of distribution of the sample. It is known that the size of the sample has to be moderately large. The statisticians have prepared tables based on the theory of probability, which show the number of interviews to be taken in order to arrive at results with known margins of error and confidence limits. The table alongside shows the sample size to ensure, with 90 per cent certainty, that the poll results are within a given number of percentage points of the true value.

The debate during the last two decades regarding the size of the sample has helped thinking on the right lines. At one time it was the opinion of some public opinion researchers that a bigger sample yielded better results. This myth has been exploded more than once. The classic case of The Literary Digest in the United States where no less than 2,500,000 people were interviewed and the results were quite wide of the mark, proved that the size is not the only consideration in planning the sample. The manner of distribution of the sample is of equal importance.

THE SAMPLE SIZE

Maximum percentage error	Frequency with which phenomenon occurs					
Either way	5 or 95%	10 or 90%	20 or 80%	30 or 70%	40 or 60%	50%
0.5%	5,141	9,742	17,319	22,731	25,978	27,060
1.0%	1,285	2,435	4,330	5,683	6,494	6,765
2.0%	322	609	1,082	1,421	1,624	1,691
3.0%	143	271	481	631	722	752
4.0%	80	152	271	355	406	423
5.0%	51	97	173	227	260	271
10.0%	—	—	—	57	65	68

Broadly, there are four methods of sampling which are commonly employed. These are, opportunist sampling, random sampling, area sampling and quota sampling. Opportunist sampling or accident sampling was in vogue when the sampling technique was in its infancy. This method of sampling involved a lot of bias and is no longer in use, as more valid methods are available.

The fundamental principle of pure random sampling is that every member of the 'universe' has an equal chance of being selected. Pure random sampling is rarely used where the 'universe' is infinitely large and not enumerated. Wherever it is possible to identify and number the individual units of a 'universe', the technique usually employed is to arrange the units in a sequence and take out a sample with the help of random numbers. Random numbers which have been tested for bias have been published by Tippet, Yates and a number of other statisticians and are available to all researchers. These genuinely randomised tables are used by all public opinion research organisations in the world. The all-India political pre-election poll of the Indian Institute of Public Opinion was also taken with the help of random numbers though randomisation was multi-stage.

In the case of area sampling, it is the house blocks which are numbered i.e., block enumeration is the first step. Afterwards, random numbers are employed to pick up the blocks and a sample could be drawn out of the families in the block. There are obvious advantages in area sampling as it conforms to the principles of randomness and has high statistical validity. Also, it is possible to calculate the sampling errors of the findings.

Quota sampling, often called proportional sampling, is used more by Marketing Research Organisations than by Public Opinion Institutes. Here, an attempt is made to stratify the population into groups according to selected controls such as age, sex, class, religion, etc. The total number of cases in the sample is then spread to the various divisions in its design in the same proportion as in the total. The principle of proportionality requires that each class in the 'universe' must have the same importance in the sample as it has in the 'universe'. The chief merit of quota sampling lies in its practicability and lower cost.

Technique of Gallup Polls

POLITICAL polls forecasting election results have come to be known as Gallup Polls after the name of the Director of the American Institute of Public Opinion, Dr. George H. Gallup, who pioneered "in this tumultuos realm of predicting political behaviour". The first Gallup Poll (1936) predicted that Franklin Delano Roosevelt would win in the race for US Presidency and that his Democratic Party would poll more votes than the Republicans. The forecast came true, but there was an error of 6.8 per cent in it as compared to the actual election results. In subsequent polls the margin of error has been less than 5 per cent. This may be known from the following Gallup Poll accuracy record:

GALLUP POLL ACCURACY RECORD

1936 RIGHT	error of 6.8 per cent
1938 RIGHT	„ „ 2.7 per cent
1940 RIGHT	„ „ 3.0 per cent
1942 RIGHT	„ „ 4.4 per cent
1944 RIGHT	„ „ 1.5 per cent
1946 RIGHT	„ „ 3.7 per cent
1948 WRONG	„ „ 4.8 per cent
1950 RIGHT	„ „ 0.7 per cent
1952 RIGHT	„ „ 4.4 per cent
1954 RIGHT	„ „ 1.2 per cent
1956 RIGHT	(Margin of error not exactly known but very small). Average error 3.3 per cent.

It is noteworthy that the forecasts of ten out of the eleven political polls conducted by the Gallup Institute had come true. The only time the Institute was wrong was in 1948 when President Truman's re-election falsified the forecast. This was something exceptional, for the 1948 Presidential contest was a neck-to-neck race and the Gallup Poll could not correctly spot the winner in such a circumstance though the margin of error was less than in the case of the 1936 poll. The exception was, however, a blessing in disguise for it underlined the need for perfecting further the technique of public opinion polls. This further perfection has since been achieved, and the political polls have now reached a highly scientific position where the best stratified sampling is proved to be normally accurate to within 1 or 2 per cent.

One may wonder if there is not something mysterious about a technique which makes political predictions possible with such a high degree of scientific precision. This is, of course, no mystery to the statistician or the social scientist, but the man-in-the-street will continue to wonder how the political behaviour of 50 or 100 million people could be deduced from the replies of just 2,000 or 3,000 persons among them. A non-technical description of the polling technique is, therefore, called for.

This description is best given in the words of Dr. Gallup himself who has answered a series of questions in his book: "A Guide to Public Opinion Polls". 'The story behind the Gallup Poll' is summarised as under:

There is nothing magical about sampling. Almost everyone uses sampling in the common-sense 'figuring out' of things in everyday life. An example of the sampling principle is the housewife who, in testing a few boiled grains from a pot of rice on the oven to know if they are well cooked, 'samples' the rice. (Example ours—Ed.). In short, a 'part' is selected from the 'whole' and subjected to analysis or measurement of one kind or another. It would be, in fact, foolish to sample more than a small portion.

The basic principle of public opinion sampling is the known scientific fact that, by sounding the opinions of a relatively small number of persons, 'proportionate to each population group and in every section of the country', the opinions of the 'whole' population can be determined. The most important requirement of any sample is that it be as 'representative' as possible of the entire area or group, or, as the statisticans say, the 'universe' from which the sample is to be selected. The universe normally sampled by the Gallup Poll is the adult civilian population of the United States living in private households.

A truly representative sample of this universe must be compounded of the same elements as are present in the whole. Among the most important elements are sex, age, occupation groups, education, economic status, racial, and religious groups. These major segments of the adult population must be represented correctly in each geographical region of the country, by cities and towns of various sizes, and by rural areas. For example, if 12 per cent of the adult civilian population lives on farms, then it is obvious that an accurate sample of the adult population will have 12 per cent of the total number of interviews with farm residents.

The secret of public opinion sampling is not numbers. Statisticians have repeatedly demonstrated that a few thousand voters correctly selected will reflect faithfully the views of an electorate of millions of voters. When the sampling process is executed with statistical skill, the voters in the miniature electorate will divide into opinion blocs in virtually the same way as all the voters would divide if their views were canvassed in a complete census. The belief that the accuracy of the poll results must increase in proportion to the size of the sample of voters is not borne out in practice.

A survey which predicts an election within 5 per cent is generally regarded as "amazingly accurate". Yet sampling experts are agreed that this degree of accuracy can be obtained with a sample of 1,000 persons properly selected. In its normal sampling operation, the Gallup Poll currently uses from 2,000 to 4,000 interviews. In election surveys upwards of 10,000 interviews are used.

How does the Gallup Poll work? Questions are put to selected men and women by trained interviewers, the answers are counted, turned into percentages and published in leading daily newspapers.

Interviewers call on people in their homes. Every interviewer carries a set of printed question forms. Each question is so framed as to avoid any likelihood that it will "suggest' an answer. The wording must be simple and the questions short. The 'tone' must be kept as neutral as possible. Words which have a high emotional content are avoided. Alternatives are given wherever possible: "Do you think you will 'or will not' ?" rather than simply "Do you think you will....?" Each set of questions is given a trial run by pre-test interviews to discover whether each question does in fact elicit the information it is designed to produce and to make sure that it is comprehensible.

In a typical Gallup Poll the interviewing covers the nation, with approximately 240 sampling areas — in big cities, small towns and rural areas — included. Different people are selected from survey to survey as interviewers are assigned to different block areas or township segments.

Toward the close of each interview the interviewer obtains and records many facts about the person being questioned — his occupation, his age, educational attainment, how he voted in the last election, etc. This is to make sure that the persons selected meet all the requirements of the cross-section. Of course, in no case

are the names of the people interviewed divulged. When the completed interviews have been returned to the Institute, they are coded and tabulated. Analyses of the results or breakdowns according to sex, age, occupation, political affiliation or geographic areas, and dozens of other variables are then compiled. The final results and percentages form part of three regular releases each week for subscribing newspapers. A nationwide Gallup Poll is normally completed in a period of about ten days. However, it is possible to complete a nationwide poll in a matter of hours through the use of the telegraph.

Opinion Research Units Abroad

PUBLIC opinion research has reached an advanced stage only in the West. Even among the countries of the West it is only the United States that has a large number of opinion research institutes and centres. A list of such institutes in the United States and in other countries is given in Vol. V. No. 3 of the 'International Social Science Bulletin' published by the UNESCO. The list, however, is not claimed to be exhaustive, but the following table is based on it all the same:

Country	Number of Institutes or Centres
United States	17
United Kingdom	4
Germany	4
France	3
Belgium	3
Netherlands	3
Norway	2
Sweden	2
Italy	2
Switzerland	2
Finland	1
Austria	1
Denmark	1
Argentina	1
Brazil	1
Canada	1
Columbia	1
Cuba	1
Mexico	1
Panama	1
Israel	1
Australia	1
Japan	1
India	1

The more notable among the 17 institutes functioning in the United States are the American Institute of Public Opinion with George H. Gallup as its Director; the National Opinion Research Centre, University of Chicago; and the Survey Research Centre, University of Michigan. In the United Kingdom the British Institute of Public Opinion has a long record of research. The Institute Fur Sozialforschung in West Germany, the Service de Sondages et Statistiques in France, the Italian Institute for Statistical Research and Public Opinion Analysis in Italy, the International Institute of Public Opinion and the Netherlands Institute of Public Opinion in the Netherlands, the Swedish Institute of Public Opinion Research in Sweden, the Instituto Brasileiro de Opiniao Publica e Estatistica in Brazil and the National Public Opinion Research Institute in Japan are among the other notable research units functioning in countries other than the United States and the United Kingdom. The character of these research units and the work done by them should be of interest to readers and researches alike in India. A brief description of some of these institutes is, therefore, given in the following paragraphs.

The American Institute of Public Opinion, Princeton, New Jersey, was founded in 1935 by Dr. George H. Gallup, the inventor of what has come to be known as the 'Gallup Poll'. It is the most well-known and influential public opinion polling organisation in the United States. And it is also the largest of its kind with its field corps of about 1,000 interviewers in the States alone.

The Institute's sole function is to measure public opinion on political, social and economic issues of the day and to report the facts for the benefit of all. The results of its surveys appear regularly in 120 leading U.S. daily newspapers with a combined circulation of about 21 million. The Institute's role as an organisation is one of strict impartiality, and it takes no sides on national issues.

The Institute has carried out, since its inception, 11 pre-election polls and about 300 surveys on political issues alone involving 60,000 questions. Surveys of public opinion have been taken on virtually all the major legislative issues of the New Deal subsequent to 1935, including social security, agricultural policy, wage-hour act, taxation, labour, as well as many social issues. In the period before Pearl Harbour, surveys covered the great national debate over isolationism vs. interventionism and the many aspects of rearmament, aid to Britain etc. In the war period surveys covered the many aspects of civilian morale, rationing, the food problems, etc. In the post-war period public opinion has been measured on hundreds of issues including the Taft-Hartley Act, Federal aid to education, segregation and civil rights, the fear of war, defence spending, foreign policy, the United Nations, Korea, etc.

The Gallup Poll is not exclusively confined to the United States. An affiliated Gallup Poll has been operating in Great Britain since 1937. Today there are Gallup Poll affiliates in 12 countries besides the United States. They are: British Institute of Public Opinion (Great Britain); Canadian Institute of Public Opinion (Canada); Institut Francais d'Opinion Publique (France); Dansk Gallup Institut (Denmark); Swenska Gallup Institutet (Sweden); Norsk Gallup Institutt (Norway); DOXA (Italy); Netherlandsch Instituut Voor de Publicke Opinie (Holland); Emmid, Institut fur Markt-Und Meinungsforschung (West Germany); Das Oesterreichische Gallup Institut (Austria); Suomen Gallup OY (Finland); Australian Public Opinion Polls (Australia).

The National Opinion Research Centre, University of Chicago, undertakes research on any basic problem in the social research field. The programme of basic research in recent years has covered such studies as: conflicts of values and conscience and how these are resolved in contemporary economic life; the process of decision-making in economic life; collective behaviour under emergency conditions; motives underlying philanthropic giving; the effect of widespread unemployment on a community's economy; the nature of opinion leadership; the measurement of interracial tensions; how panic can be controlled and morale maintained or reinstituted in times of community crisis, etc.

The Centre's programme of administrative research has covered: the reasons why medical personnel are unwilling to enter military service; the effectiveness of international programmes in increasing interest in and support for the United Nations, etc.

Since its inception, the Center has maintained a University affiliation in order to contribute to the education and research training of future social scientists. It derives its income solely from foundation grants for specific research projects and from research contracts with clients desiring administrative or basic research. As a basic social research organisation, the Center does not, as a general rule, undertake any research where the results must be kept secret. The sole exception to this rule is made in the case of Government research contracts where, for security reasons, certain types of data must be kept confidential.

The Survey Research Centre of the Institute for Social Research, University of Michigan, has been concerned with the application of sample survey methods to a variety of psychological, sociological, economic and political problems. It has conducted, since its inception in 1946 and till 1953, over 50 surveys, some of national scope and others restricted to special groups within the population.

The work of the Centre consists of continuing programmes of research in the following fields: psychological and social factors in economic behaviour; human relations in large organisations; attitudes and behaviour in public affairs; attitudes and behaviour in public health. Although some research projects in these fields provide information of importance to immediate problems of administration or public policy, they are not undertaken primarily for this purpose. The Centre's objective is to work toward a greater understanding of social factors influencing human behaviour and to contribute to basic concepts and theory.

The research programme in the field of economic behaviour is concerned with the dynamics of major economic decisions made by consumers and businessmen. How motives, level of information, attitudes and expectations influence their economic behaviour, is covered by the research projects. The theory of psychological economics based on the Centre's work has been presented in a book. The human relations research programme has the general objective of discovering the underlying principles applicable to the problems of organising and managing human activity. A series of studies have been carried out within functioning organisations in industry and government. Another important activity of the centre is the systematic study of the perceptions, values and behaviour of the American people in their role as citizens. These studies have been concerned with such topics as America's foreign policy, factors influencing voting in national elections, the influence of media for mass communication and the factors determining public participation in Governmental programmes.

The British Institute of Public Opinion, founded in 1937, is a Gallup affiliate. The Institute did some noteworthy work in the war period. It carried out daily interviews which formed the basis for the British Broadcasting Corporation's listening figures and by the time the Corporation took over the fieldwork, well over one million interviews had been made. Secondly, on behalf of the Ministry of Food, the Institute started in 1943 to weigh, at quarterly intervals, a sample of housewives and of persons working in factories without canteens. This work continued for four years, and the findings suggested that when adults' diet came down to the generally accepted minimum, 2,800 calories per day, they began to get lighter.

The Institute had conducted (up to 1953) election polls on 20 occasions. Although the Institute's forecast in 1939 was fairly badly wrong with an error of 6 per cent, the average error of 1 per cent over the whole series has confirmed the belief that it is possible to forecast human behaviour in certain fields.

This belief is being put to a practical use by forecasting the trend and extent of consumers' demand. In this field the British Institute has been working closely with the Netherlands Institute of Public Opinion. It is now considered possible to indicate the likely demand for a considerable variety of goods.

The Institute has also done research into the readership of the press, both editorial matter and advertisements. The 'impact' method is being applied not only to the press but to all other forms of communication as well.

The Netherlands Institute of Public Opinion, founded in 1945, is another Gallup affiliate. **The International Institute of Public Opinion,** founded in 1951, is a sister-organisation. Both institutes specialise in opinion research in its varied forms: The Netherlands Institute nationally and the International Institute internationally.

The Netherlands Institute has carried out 'impact' type studies of the effect of communications, such as leaflets, films and advertisements in the press. It has also developed some new approaches in opinion research. One is in respect of predicting future consumption of a variety of goods with the result that today continuous research of 'International Consumption Prospects' has become a fact.

Secondly, the Institute has developed a new method for observing and annotating attitudes. This is based on an almost completely non-verbal questionnaire technique, employing a picture of five white and five black squares. A respondent is asked to indicate his attitude, feeling or opinion about any subject by pointing to one of these ten squares so as to bring out the degree of intensity of his feeling on the positive or the negative side. The Institute's experience is that in most cases this appears to be a much easier job than verbalising respondents' attitudes and opinions. Some technical advantages are claimed for this technique, and these are: registering content and intensity of opinion in one operation; degrees of intensity being exact, equally spaced and always comparable; judgment by interviewer and researcher is eliminated and there is very little room for verbiage or for interviewer's bias; the non-verbal properties make it ideal for international studies, eliminating as it does most semantic difficulties; and it also does away with two problems in verbal-scaling techniques by clearly defining the subject of the attitude and by eliminating judgment about the content or direction of a respondent's attitude.

The Swedish Institute of Public Opinion Research, founded in 1952, developed out of a bureau for marketing research which had been in operation since 1947. The bureau's 700 interviewers are now working also for the Opinion Institute.

The Institute completed in 1953 its first important work commissioned by a Government department, a survey of the condition of transport trucks. One thousand truck drivers in all parts of Sweden, selected by a probability sampling method, were asked questions every day in one week about each trip they made.

The Institute has also been working on a plan for long-time studies of the morals, interests, opinions, etc., of the Swedish people covering all ages down to 11 years.

The Service de Sondages et Statistiques of France was founded during the last war. The SSS has a network of some 200 correspondents spread throughout the whole of France. It is claimed by Mr. Elmo Wilson, Chairman-Director of International Public Opinion Research, that in relation to the political distribution of the French population, the points of contact of the network of correspondents are so situated as to ensure a representative picture that is 95 per cent accurate.

The activities of the SSS are generally conducted in the fields of public opinion research (political, social, economic surveys, etc.), market surveys, psycho-sociology, etc. Since the end of the war the SSS has conducted a number of pre-electoral surveys. The average error in four such surveys in 1946 and 1947 was just 2.6 per cent. Further, a survey conducted in December 1949 on the distribution of the French population by age and civil status group produced figures diverging from those of the 'Institut National de la Statistique' to the following extent only: age group distribution, average divergence 2 per cent; civil status group distribution, average divergence 2 per cent.

The National Public Opinion Research Institute of Japan, statutorily established in 1949, is an autonomous organ attached to the Prime Minister's office. The purpose of the Institute is to conduct public opinion research fairly and independently in order to contribute to the forming of policy and the operation of the administration. During its seven years of operation, the Institute has been primarily concerned with the application of sample interview survey methods to various problems. It has conducted during the period over 60 surveys, some of national scope and some restricted to special groups. Since 1952 the Institute has conducted surveys in respect of local autonomy, telephone service, public education, attitude toward the peace treaty, purge of public officials, food supply, problems of minor enterprise, international issues, attitudes towards prostitution, the family system etc.

The World Association for Public Opinion Research (WAPOR) was founded ten years ago. It is merely an association of individuals and is prohibited by its constitution from carrying out any research as an organisation. WAPOR's purposes are merely to establish and promote international contacts in the opinion research field and to further the use of high standards of sample surveying in national and international affairs.

Record of Research in India

THE study of public opinion based on statistically planned surveys in this country has had its origin only in recent times. In fact it was only since the last war that any serious attention was bestowed on this hitherto unexplored field, and here the name of the Indian Statistical Institute at once comes to one's mind as a pioneer. Earlier, the work of the Institute had been connected with agriculture and socio-economic surveys which were done at the request of the provincial Governments.

One of the earliest public opinion surveys of the Institute related to a radio programme preference study conducted for the Department of Information and Broadcasting during the war. The main object was to gauge public reaction to war broadcasts from allied, neutral and enemy stations and this was sought to be achieved as an incidental part of a general study of programme preferences. The result was a bit revealing as it was discovered that the general public in and aroud Calcutta found enemy broadcasts more interesting and convincing than that of the Indian Radio. Similar interesting results were obtained as a result of a number of other studies undertaken by the Institute. For example, after a general public opinion study conducted in Calcutta, it was found that there was increasing opposition to religious instruction in colleges among the better educated and greater opposition to the remarriage of widows among women than among men. The surveys, however, had to contend against a number of difficulties and especially social prejudice which often operated to inhibit full and frank replies to questions of a sociological nature. Added to that was the low information and literacy level of the general public which led to heightened ambiguity in the interpretation of questions.

NATIONAL SAMPLE SURVEY

The most notable work on economic subjects in this field of public opinion research has, however, been done by the National Sample Survey. Initiated in 1950 by the Government of India at the instance of Mr. Nehru, the NSS has carved out a place for itself by popularising the sampling method which has now been recognised as one of the powerful methods in obtaining information and interpreting various factors at work in the Indian economy. It has already carried out a number of surveys in the rural as well as urban areas as a result of which economic data on large samples are now available which should prove a mine of information to a student on this subject. The bulk of the field work is being done under the direct control of the Department of Economic Affairs, Ministry of Finance but the statistical work, which includes the preparation of the sample design and schedules, the processing and tabulation of the data and the preparation of the reports, is being done in the Indian Statistical Institute. The first report of the NSS was published in 1952 and since then a number of reports have been published dealing with the surveys of the NSS in rural and urban areas, a survey of persons in the Live Register of the Delhi Employment Exchange and so on. Apart from this, the NSS has conducted special surveys and reports and data in tabular form have been supplied to different agencies from time to time. Mention should be made here particularly to the work done for the Press Commission (regarding habits of newspaper reading), the Taxation Enquiry Commission (regarding household consumption by expenditure levels) and the Ministry of Rehabilitation (regarding survey of refugees in Bombay).

I.I.P.O.'S SURVEYS

A non-official body known as the 'Indian Institute of Public Opinion' has been started recently for conducting public opinion research on political, social and economic subjects on a systematic basis. This institute can lay claim to some substantial work ever since its inception in the middle of 1955. The Institute's reports, based on the activities of its units in West Bengal, Travancore-Cochin and Delhi, show that economic as well as political and social subjects come within the Institute's purview and, especially with regard to the latter, its work in this country can be termed in a way as pioneering. Here an attempt is made to bring out the results of some of the important polls conducted by the Institute which are typical of the wide field it tries to cover.

With attention recently focussed on the 'socialistic pattern' of society and, arising out of it, the future of the private sector, the Institute bestirred itself last year to conduct a probe into the public's attitude to these questions. The result was a bit revealing; 82 per cent of those interviewed in Delhi had never heard of the Avadi resolution while the corresponding figures for Travancore-Cochin and Calcutta were 25.7 per cent and 26.9 respectively. This lack of interest in a subject of such momentous importance only went to disprove the contention that the majority of the urban population knew about the aims of the socialistic pattern. In the overall picture what emerged was that only a fourth had deeply read the Avadi resolution and the number of those who had really absorbed it might be one-sixteenth of the total population interviewed. That is with regard to the 'awareness' of the problem in general.

The poll, however, showed that among those who entertained an opinion, there was a powerful radical element when it came to the question of considering the ingredients of the socialistic pattern. In Travancore-Cochin for example, 66.8 per cent wanted existing industries and factories to be taken over by Government. However, when the radical element was balanced against the lack of interest of many questioned, it would appear that only a fourth wanted complete public sector administration. What was conclusive was that radicalism in the intelligensia was considerably higher than it was in the population as a whole. Another interesting result obtained was that the interpretation by the public of what was involved in a socialistic pattern was very different from what the Government of India and the Congress party proclaimed because for those who believed in this new pattern, it implied a vast area of Government ownership and control not only confined to large-scale industry and banks, but covering small-scale and cottage-industries, schools, colleges and hospitals.

With regard to taxation and people's contribution to the resources of the public sector also some new light was thrown. The results were clear that taxation would meet heavy psychological opposition among the great majority of the people and it would appear that the general view was public sector development should be financed by the rich only or tolerated as an 'evil necessity otherwise. Now what was the position with regard to the future of the private sector on which the poll was mainly concentrated? The results showed a substantial prejudice against the private sector particularly in relation to the exploitation of the consumers and the undue diversion of interest for profit-making. Of those who entertained an opinion at all, it would appear that except in Travancore-Cochin, there was no substantial agreement on the need for the extension of the public sector at the expense of the private sector. The view that private sector should be replaced by the public sector had a slight majority though there seemed to be no understanding of what such replacement implied. The conclusion that stood out was that the opposition to the private sector and the desire for its replacement sprang not so much from the quality of the service that it rendered as from the belief that Government administration would be more conducive to the welfare of the people.

PROHIBITION

The Institute conducted recently a poll on the controversial subject of prohibition to gauge the extent and nature of the support of the public to this policy and whether it should be given high priority when many more urgent problems are clamouring for solution. One thing that stood out from the survey conducted in Delhi and Calcutta was that the public had no clear idea as to the social cost imposed by dinking on the community. At the same time they were also unaware of the exact benefits that would follow by introduction of Prohibition. Moral disapproval of drinking seemed to be the factor deciding the question one way or the other. Another significant fact was that opinion in favour of Prohibition was not closely related to the considered possibilities of its success. Thus in Delhi though 84.4 per cent favoured Prohibition, only 62.8 per cent felt that the policy would be a success. The support for Prohibition in both Calcutta and Delhi showed a sharp fall among the well-educated classes. Contrary to popular opinion, only 2.4 per cent of the respondents in Delhi associated working class misery and poverty with drinking, though in Calcutta, the percentage who expressed this opinion was 16. The most striking result obtained was the fact that a great majority of the people were against prohibition becoming a priority issue. In fact, in Calcutta only 0.3 per cent of the respondent gave it first preference, 0.6 per cent the second and only 1 per cent gave it even third preference. Generally a policy of less haste was favoured and majority opinion both in Delhi and Calcutta supported a 'phased programme'. What was surprising was that even among women, though they enthusiastically supported Prohibition, majority opinion did not seem to favour its immediate introduction.

COLD WAR CONTROVERSIES

THE VISIT of the Russian leaders to this country towards the end of 1955 provided the Institute with an opportunity to embark on a survey of a political subject of first-rate importance, namely the Indian attitude on cold war controversies. The survey thus included not only the impression created by the Russian leaders but also India's attitude to military alliances and foreign aid. The survey showed that the Jan Sangh and the Communist Party showed the greatest interest in the visit of the Russian leaders while the Congress showed less enthusiasm. The interest of the Jan Sangh was explained by the fact that they believed the Russian leaders to be pro-Indian and anti-Pakistani on Kashmir. That apart, on the whole, though a large volume of interest was shown by the people in the visit of the Russian leaders as revealed by the survey in West Bengal, Delhi and Travancore-Cochin the permanent effects seemed to be negligible and the visit as such seemed to have played only a minor role in changing the opinion pattern of the public. The fact was that other factors like Kashmir and Goa and America's military alliances contributed to the crystallisation of opinion regarding the people's attitude to America and Russia.

The conclusion that emerged was that in the structure of Indian opinion towards the main contestants of the Cold War there was a strong element of emotion. This had nothing to do with the merits of the Cold War controversies as such but stemmed from an estimate of national interest of India and in terms of Kashmir and Goa. Since on both Kashmir and Goa the Russian leaders in principle had supported the Indian stand, the pro-Russian or anti-American replies given by the interviewers should be accounted for in terms of Kashmir and Goa. This was a significant result which went to explain Indian preferences in this matter. On the question of military alliances the results showed that while 92.1 per cent of those belonging to Jan Sangh questioned in Calcutta held that all military alliances were aggressive, the Congress percentage was only 27.5. Apart from this the broad picture in regard to attitudes to military alliances was one of wide divergence. Thus while in Calcutta the predominant impression was that military alliances did not help to preserve freedom, in Delhi the opinion was equally divided on the issue as to whether military alliances made for war or were always aggressive or helped to preserve freedom. There, however, tended to be heavier discrimination against the Free World's alliances, particularly the SEATO and Baghdad Pacts than against the Warsaw Pact or the Sino-Russian military treaty. On the question of foreign aid, the survey brought out the interesting fact that a great majority considered that India should receive aid from both sources (Russia as well as America) and similarly with regard to training personnel and technical assistance, opinion was that India should receive assistance from both the countries.

INDIAN SOCIAL ATTITUDES

One of the earliest ventures of the Institute was on a social subject and this related to the measurement of Indian social attitudes. This was, to some extent,

a pioneering survey. Here an attempt was made to find out how far the freedoms enshrined in the Constitution were reflected in the field on matters like caste, joint family, women's rights and various other aspects of social reform. The broad conclusion that emerged was that the Fundamental Rights of the Constitution remained very much a legal fiction and they were inadequately translated in the life of the people whether in the cities, towns or country. A striking result that followed the West Bengal survey was that the need for a change in the social system was more keenly felt in rural Bengal. Thus when asked what was uppermost in their minds, 72 per cent in the village recorded social problems as against 36 per cent in the towns. On the question of caste it was found that it was not more rigid in the villages than in the district towns. Even inter-dining with lower castes was not popular either in the villages or in towns. When it came to marriage about a third in the sample would not contenance a union even with members of a higher caste. On the question of joint family, a third of those interviewed asserted that it had a definite part to play in Hindu society. The conclusion that emerged was that caste still occupied an important place and the legal equalities provided in the Constitution were far from being applied in fact.

The account given so far thus gives a broad (though not exhaustive) picture of the public opinion surveys of the Indian Institute in the various directions. They serve to indicate the vast scope as well as the great possibilities that lie ahead provided one brings to bear over this fascinating field certain initiative, drive and enthusiasm.

India's First Gallup Poll

THE credit for carrying out, for the first time in India a national poll covering General Elections, goes to the Indian Institute of Public Opinion. In the first week of February the Institute interviewed 3,000 representative citizens scattered all over the country. They were selected with the aid of random numbers which ensured the representation of all classes and groups from all parts of India in the sample. A carefully-drafted questionnaire was given to the interviewers who went to the selected 3,000 citizens and recorded their Party preferences. The tabulated results — just announced by the Institute — predict that the Congress Party will poll 53 per cent of the total votes to be polled for the Lok Sabha in the impending General Elections. (This may be compared with a 45 per cent popular vote for that Party in the 1951-52 elections). The Institute also makes a cautious prediction to the effect that the Congress is likely to win more seats in the Lok Sabha than it did last time.

The Institute's sample of 3,000 was divided into smaller samples for different States. An idea of the territorial distribution of the sample may be had from the map at the end of this Supplement. The table which follows shows the size of the sample for different States:

TABLE - I

States	Area Sq. Miles	Population (1951 Census)	Number of Votes	Sample size
Andhra Pradesh	105,677	31,260,133	1,76,60,665	225
Bihar	66,161	38,925,947	1,95,63,747	300
Bombay	191,367	48,265,221	2,43,86,525	500
Kerala	14,601	13,549,118	75,59,047	300
Madras	50,171	29,974,936	1,75,99,056	300
Madhya Pradesh	170,909	26,071,637	1,38,80,209	150
Mysore	74,093	19,401,193	1,01,23,618	150
Orissa	60,136	14,645,946	79,51,805	200
Punjab	47,427	16,134.890	91,12,743	250
Rajasthan	132,439	15,970,774	86,93,031	200
Uttar Pradesh	113,433	63,215,742	3,47,70,434	300
West Bengal	34,944	26,160,217	1,51,18,061	300
Delhi	578	1,744,072	9,76,306	50

It may be seen from the above table that the sample in each State is not proportionate to its total population. It is stated that this distortion was deliberately done to bring out the peculiar political situation that has obtained in the States of Bombay, West Bengal, and Kerala. A smaller sample than 300 in each of these States might not have enabled the Institute to gauge political opinion with any accuracy. As it is, even a sample of 300 to 500 is not considered sufficient to enable the Institute to be absolutely certain of the forecasts with regard to different States. The results of the Institute's Poll — presented in the table below — will have, therefore, to be read with some reservation in so far as they relate to different States for the reason that the sample was mainly designed to predict the overall vote of the Congress Party in the Lok Sabha elections.

I States (Except Manipur, Tripura and Jammu & Kashmir)	II No. of Seats	III Total No. of Votes	IV Percentage of Congress Vote as shown by Poll results (Corrected for turn-out)	V Percentage Contribution of each State to total Congress Vote.
Andhra Pradesh	43	1,76,60,665	59.4	5.5
Assam	12	43,74,089	53.0	1.2
Bihar	55	1,95,63,747	46.0	4.6
Bombay	66	2,43,86,525	46.0	5.8
Kerala	18	75,59,047	41.7	1.6
Madhya Pradesh	36	1,38,80,209	57.0	4.1
Madras	41	1,75,99,056	59.8	5.5
Mysore	26	1,01,23,618	62.0	3.3
Orissa	20	79,51,805	45.0	1.9
Punjab	22	91,12,743	58.4	2.8
Rajasthan	22	86,93,031	46.9	2.1
Uttar Pradesh	86	3,47,70,434	55.0	9.9
West Bengal	34	1,51,18,061	53.3	4.2
Delhi	5	9,76,306	55.0	0.3
Himachal Pradesh	4	6,84,628	53.0	0.2
Total for All-India	490	19,24,53,964	53.0**	53.0*

* Congress is predicted to get 53 per cent of the votes polled.

** Congress will poll 53 per cent of the estimated total vote of 120 million likely to be polled.

The one certain trend revealed by the above table is that the Congress is heading for a definite and large victory in the Lok Sabha contests. Taking the turnout of 1951-52 as its basis, the Institute predicts that nearly 120 million votes will be polled this time in the entire country and that 53 per cent of these votes will go to the Congress.

The Institute's Poll also reveals that all over India some 30 per cent of voters are undecided about their party preferences. Some part of this large undecided vote may swell the Congress vote still further inasmuch as the bandwagon influence is likely to operate on the minds of those voters who have no rigid party preferences. A major share of this undecided vote may,

HOUSE OF THE PEOPLE (LOK SABHA)

Number and Percentage of Valid Votes Polled by the Congress in Contested Constituencies in 1951-52 Elections

Name of the State	Total No. of contested seats	Total No. of valid votes polled	Congress No. of Votes	Congress Percentage
PART 'A' STATES				
Assam	12	26,47,127	12,10,707	53.2

* Including electors of Naga Hills Distt. which is a part of House of the People constituency No. 2.

however, go to the Independents who have no party affiliations. In other words, a section of the 'undecided' may favour ultimately the winning party.

The Institute makes no confident prediction in respect of State-wise results of its Poll. From Column IV in the foregoing table a rough idea of the varying strength of the Congress Party in the various States may be obtained. The Congress is less strong in the States of Kerala, Bombay, Bihar, Orissa and Rajasthan than in other States. Kerala strikes one as the weakest point where the Congress vote is likely to be around 41 per cent.

From the analysis of the pre-election poll, it is evident that the Congress Party vote in Bombay State has decreased from the 50 per cent that it polled in the last General Election to 46 per cent. In other problem-States—West Bengal, Kerala, Andhra and the Punjab—it has, however, improved its voting strength. In Uttar Pradesh, the Congress party may fare better because elections there will be held after the results have been declared in most of the other States, and are likely to influence voters there. The analysis further reveals that while the Congress Party's loss in Bombay is due mainly to the creation of the bilingual State, the improvement in the Party's strength in other States is due largely to the benefits that have accrued to the people—mainly the agriculturists—as a result of the Congress Government's Five-Year Plans. State-wise the Congress has fared as follows:

BOMBAY

Of the 3,000 persons that were interviewed by the staff of the Institute in connection with its poll, throughout the country, 518 were interviewed in Bombay State alone. An analysis shows that the Congress Party has lost 4 per cent in its popularity since the last General Elections and that the influence of the Samyukta Maharashtra Samiti is less than that of the Maha Gujerat Parishad. In fact, the latter got 7.93 per cent votes as against barely 3.05 per cent that the Samyukta Maharashtra Samiti got. Pro-Gujerat feeling is likely to be reflected in the polling to the State Assembly where, according to the results of the poll of the Institute, the Maha Gujerat Parishad may well capture two times the number of seats that the Samiti wins.

There is, however, an element of uncertainty in the forecast. Thirty per cent of the "undecided vote" may change somewhat the pattern of the Institute's result.

WEST BENGAL

In this State, according to the Institute's poll, the Congress Party has increased its strength by 10 to 11 per cent since the last General Elections, The Communists, who have a solid bloc of voters, have not lost ground appreciably since then. The Institute therefore rules out the possibility of the Communists improving their present position.

KERALA

In Kerala, the poll shows that the chances of the Congress Party are brighter than they have ever been since 1951-52, in spite of the fact that the party got the lowest (41 per cent) vote in this among all the States. Of the 150 persons interviewed in Trivandrum and its surrounding areas, about 31 per cent were for the Congress—almost the percentage it polled in 1951-52. In the northern areas of the State, 52 per cent of the 150 persons favoured the Congress Party.

ANDHRA

The Congress Party's victory is a foregone conclusion. This is because the election is being held only in the Telangana area of the State and if the Congress Party were to lose all the seats—which is most improbable—the party would continue to remain in power on the strength of its present position in the State Assembly. This fact is bound to affect favourably the Congress Party's chances for the Lok Sabha. The sample poll shows that nearly 59 per cent are for the Congress Party; there is, however, also a slight improvement in the Communist vote.

PUNJAB

In this border State, the Congress Party's voting percentage is likely to be lowered slightly because of its split with Master Tara Singh, the Akali leader. The Communists and the Jan Sangh are, however, not likely to improve on the results of last General Elections, when they polled 6 per cent and 5 per cent respectively.

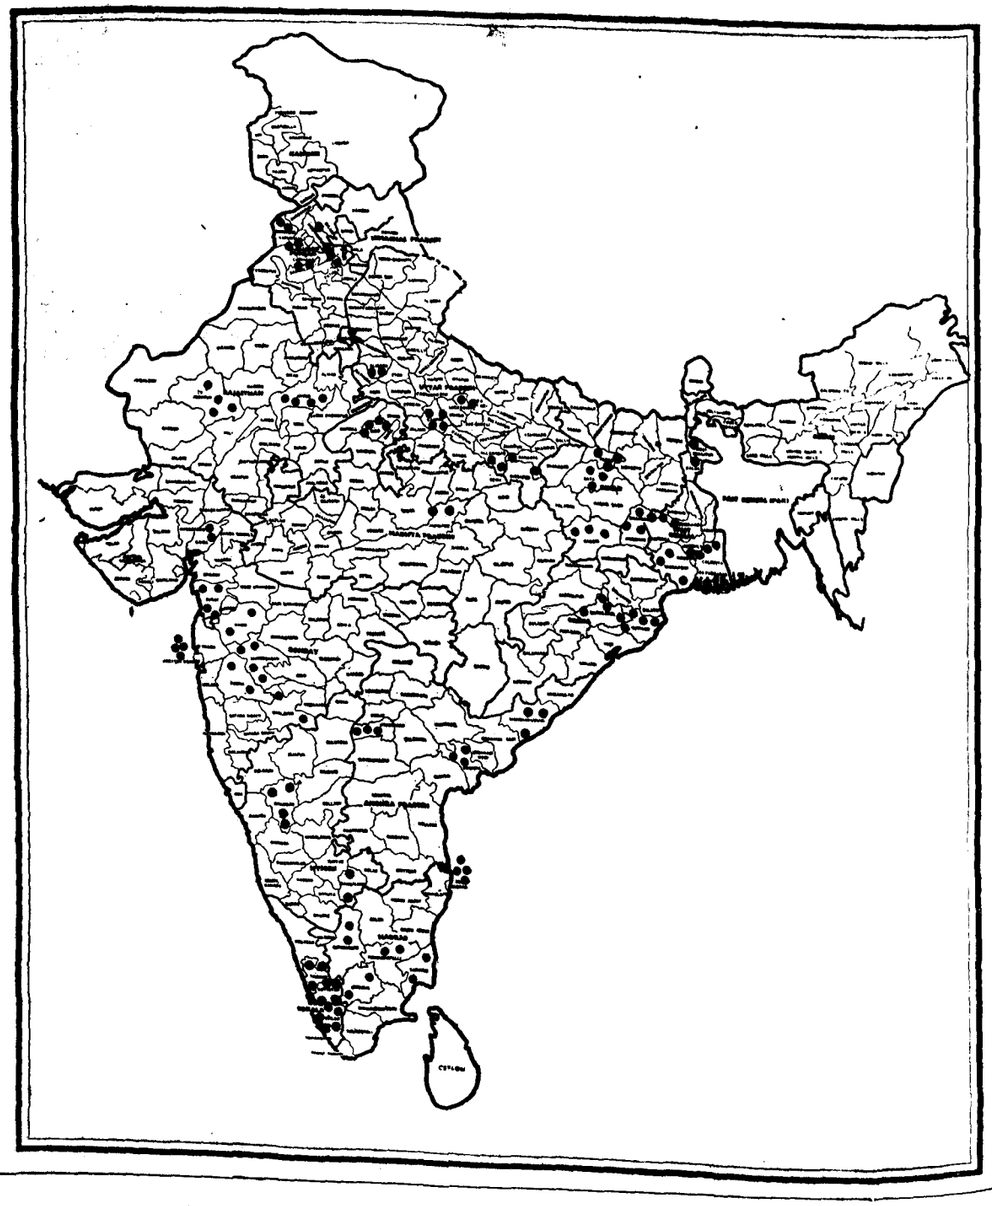
UTTAR PRADESH

On the basis of the poll, the Institute has drawn the conclusion that the Congress Party will get nearly 55 per cent of the polled votes. There are, however, chances of a landslide victory for it. There is a 35 to 40 per cent undecided vote whose choice is likely to be affected by the Congress Party's victories in other States where election results will have been announced by the time polling starts in this State.

Future of Research

BY all accounts public opinion research has a promising future in India. This future will be intimately connected with the future of democracy itself in this country. That Indian democracy may well grow from strength to strength, is the optimistic forecast of "The Eastern Economist" in its latest Annual Number devoted to a study of the next 20 years. There is ground for optimism on several counts. Firstly, the monolithic character of the Indian Revolution will have spent itself. Secondly, women will have emerged from their restricted life and will be playing, with the Constitution behind them, an equal role with men in many new undertakings. Finally, the mobility which industrialisation will bring, will probably work new miracles in spreading the seed of creative thought in fresh fields and pastures new. The public opinion poll may well assist and subserve such democratic growth in India by "ventilating the gigantic structure of Government with the people's thinking."

The possible contributions that public opinion sampling polls can make to the democratic process are many. In the first instance they can provide political leaders with a fairly accurate gauge of public opinion from time to time between one election and another. They can speed up the processes of democracy by providing swift reports of public opinion. They can help to focus attention on the major issues of the day. They can uncover how well-informed or ill-informed people are about government and about social, cultural, economic and international problems. They can help administrators of Government departments to make wiser decisions. They can provide almost the only check on the power of pressure groups. And they can help to



define the "mandate" of the people in the national elections inasmuch as they test public sentiment on single issues and single individuals when public interest is at its height.

These contributions have, in fact, been made by the public opinion polls in the Western democracies. These polls have, besides, shown that the common people do make good decisions and that they are not motivated in their voting solely by the factor of self-interest as many politicians have presumed. If, as Talleyrand laid down in a dictum, "the only thing wiser than anybody is everybody", there is no gainsaying that the public opinion poll is the "most useful instrument of democracy ever devised". That it may well turn out to be an equally useful instrument of India's infant democracy, is the hope of pioneering pollsters in this part of the world.

Problems of Economic Growth

AS in all cases of human growth, we are often attracted to the fact of growth by growing pains. In the case of economic growth we have recently stumbled on something like this unpleasant discovery of the need of a close analysis of what is involved in our own economic growth. These problems were relatively hidden while the car was running well; now that both the foreign exchange and internal resources positions are exacting, we are beginning to feel that economic growth has as great problems as it has opportunities. If, instead of approaching these problems in what might be called a personal sense, we had approached them as a historical process in which many other countries have had greater experience than our own, we might conceivably have avoided something of the strain which has now come upon us. Not, indeed, that nations, any more than individuals, can entirely escape the judgment of experience which means, simply enough, making their own mistakes in their own particular environment regardless of what they have learnt elsewhere abroad. Nevertheless, there have been underlined in recent years some great lessons in the philosophy of economic growth; fortunately these have been described in the last decade more abundantly than at any time in economic history.

Our present challenge comes opportunely in another respect. This is because of the Conference on Economic Growth which the Congress for Cultural Freedom arranged in Tokyo from April 1 to April 8 this year. The Conference was unique in that it brought together as happy a group of eminent economists as have ever studied these problems. There were papers of great value by some of the leading authorities of the world. It has unfortunately not been possible to publish all the papers or to publish even one in detail. In the pages that follow a selection of five papers has been made arbitrarily, and, from the point of view of the total subject, unfortunately so as to omit some important subsidiary issues. Nevertheless, there are here in a small compass some of the central ideas which were discussed at Tokyo. "The Eastern Economist" is deeply grateful to the Congress for Cultural Freedom which has permitted their reproduction in India in the same month in which the papers concerned were discussed at this remarkable Conference.

It is not necessary to say much more at this stage than that many of our easy generalisations on the capacity of an economic system to grow, given the requisite inputs of capital and labour, are extreme oversimplifications which have tended to mislead as much as they have tended to guide and instruct. In particular, a capital-output ratio, applied mechanically over a country so vast and so varied as India, must necessarily be misleading. One thing is now fairly sure. The extreme mechanical approach to Indian planning which takes little account of the intense variations in human psychology in response to given groups of incentives is bound to total failure in under-developed countries like our own. The element of psychology is reflected strongly in the most important field, which is agriculture. Why, for example, as the second Five-Year Plan has got under way, has the tempo of our agricultural progress tended to slacken if not to fall back? Almost no one dealing with capital-output ratios and cheerful projection planning can fail to recognise that the simple talismans do not here hold. And if they tend not to hold in agriculture, does not the whole plan for industrialisation come under qualification, since particularly with a large group of heavy industries, it is out of agricultural surpluses that industrialisation must proceed? These are burning questions, the more challenging since we have arrived at a crisis in which they form the central part.

"The Eastern Economist" does not pretend that the articles that follow do anything more than illuminate the grand theme. When many books written on the subject are unable to fit in with every case, no one will complain that these articles are not immediate solvents of our present condition. But it is believed that this Blue Supplement will serve the purpose of directing attention to various aspects of our problems which have not received anything like the study they deserve. "The Eastern Economist" is grateful again to the authors whose papers are here submitted; it apologises to them in advance for a process of editing which does justice to no paper, and less to the honoured names of some of the world's foremost economists with whom these daring liberties have been taken.

From Political Economy to Political Ecology

By BERTRAND DE JOUVENEL

THE science of economics deals with the labour of man and the fruits of that labour. For several generations its chief concern was to analyze the increasingly complex co-operation which was developing among men for the purpose of satisfying their needs. Economics showed how each individual producer, by means of increasing specialization, gained access to an increasing range of consumer goods. It explained how "the market" (a generic term covering a related series of mechanisms) distributed tasks and claims among society as a whole, constantly restoring the balance between the supply and demand of each product and maintaining the general economic balance. Many economists devoted particular attention to the causes of disturbance of that general balance (the "slump" theory), while some concentrated on the social evils inherent in the distribution of claims throughout the population (views on redistribution).

The present-day science of economics is concerned with basically different questions. Its chief interest is no longer economic balance, but economic growth. The economist no longer strives to understand what it is that maintains the present co-operation, thanks to which a people, as a whole, obtains for itself the whole range of consumer goods at present available; his aim is to recommend any changes in the form of that co-operation which may be expected to lead, in course of time, to an increase in the number of those goods. Time is a dimension of prime importance in the mind of the economist, and his subject is gradually transforming itself into an art of constructing the future.

It is, in fact, almost a new science, though one deeply rooted in the old one, from which its concepts derive. This leads to several difficulties. When we describe an existing economic system, in its present state, it is legitimate to disregard the specific character of the work done and the objects and services obtained, and to replace all these individual terms by their monetary equivalents. But this reduction of all concrete things to a monetary common denominator entails certain definite dangers, which today are clearly recognized, if we are endeavouring to compare the simultaneous condition of two geographically distinct populations. It entails other dangers, which have hitherto been insufficiently stressed, when we endeavour to compare the condition of a particular population at a particular time, with its condition at another time, tracing the changes in its condition within a given chronological period.

With regard to the comparison in space, we need only give an example. The economic services of the United Nations have informed us that in 1949 the national per capita income was $57 in India and $1,453 in the United States. As the expendable individual income is always lower than the national per capita income, and the median income always less than the average income, this is tantamount to saying that more than half the inhabitants of India are living as an American in the United States would live if he had less than $57 per year. But the latter would not live at all. This demonstrates the unsoundness of such a comparison. The drawbacks of expressing economic forecasts in monetary terms are, however, less clearly recognized.

DANGERS OF THE ABSTRACT ECONOMETRIC EXAMPLE

Present-day economists quite rightly attach considerable importance to the fraction of the (net) National Product which is allocated to (net) investments. Furthermore, they have devoted some very interesting research to the empirically observed relationship between increase in capital and the accompanying increase in Net product; and though the ratio of the new capital to the resultant new product appears to vary widely from one sector to another, experts in this field have arrived at an over-all estimate fixing this ratio (the so-called "capital coefficient"), at 3 to 1.

It is evident that with the help of the variable "investment rate" (taken as meaning the share of net investment in the net National Product) and the "capital coefficient" regarded as a constant, one can easily—setting aside the question of demographic changes—arrive at propositions such as the following:

With a net investment rate of 9 per cent, the Net Product will increase at the rate of 3 per cent per annum and be doubled in 24 years; with an investment rate of 12 per cent, the Product will increase at the rate of 4 per cent and be doubled in 18 years; with an investment rate of 15 per cent, the Product will increase at the rate of 5 per cent and be doubled in 15 years.

And these periods can even be considerably reduced, if we lower the capital coefficient by excluding investments with an exceptionally high capital coefficient, such as housing. If, by a suitable balance of investments, we reduce the capital coefficient to 2, an investment-rate of 12 per cent will result in an increase of 6 per cent per annum and the Product will be doubled in 12 years.

Here I would like to clear away two possible sources of misunderstanding: in the first place, I am not suggesting that any economist bases his views on such rudimentary examples as these; in the second place, I regard such examples as possessing tremendous instructive value, and it is thus that Professor Lewis uses them so effectively in his stimulating treatise on economic growth. Nevertheless, some masters play upon this instrument in a way which may lead their pupils to conceive economic growth as a species of multiplication of income by means of its invested fraction, with the capital coefficient as intermediary.

In unskilled hands, this method of reasoning will be in danger of the well-known but long-taught error about individual savings, which were represented as capable of unlimited expansion.

Every student of biology begins by learning that growth by compound interest is a natural tendency of Life; he then learns that tendency is opposed and offset by natural obstacles. The danger of reasoning in monetary terms is that it leads one to forget the natural obstacles.

THE NATURAL OBSTACLES

As an exercise, let us take the Europe of the E.C.S.C., whose population approaches that of the United States (160 million inhabitants, as against 169 million). Suppose, for the sake of our argument, that its present 'per capita' product amounts to half that of the United States in 1950. The question is: how long it will take the inhabitants of the E.C.S.C. countries to arrive at the point where the Americans stood in 1950, on the assumption that the European Product will increase at the rate of 4 per cent per head per annum. Reduced to arithmetical terms, this problem can instantly be solved by a child: the time required will be 18 years.

Well and good. But now let us open to page 5 of the Paley Report which shows the weights of the various primary products of different kinds, consumed per head of the population of America in 1950, and representing the "input" which formed the basis of the way of life we were proposing to have imitated by 1975. This entirely alters the aspect of our problem: it is no longer abstract; it is concrete. We have to obtain the indicated quantities of primary products, multiplied by the population of the E.C.S.C. Europe at its 1975 figure.

As soon as we put the problem in these terms, we begin to wonder how the E.C.S.C. Europe will obtain these quantities, where they will be found, what proportion of them will have to be imported, how those imports will be paid for, whether they will not be so high as to have an unfavourable result on the E.C.S.C. balance of foreign trade, to what extent this unfavourable result will tend to produce the effect of an increase in the capital coefficient in the export sector, whether it will not be necessary to cultivate many of the desired products in Europe, whether this would not lead to a high capital co-efficient, etc.

It is neither necessary nor possible to discuss this problem in detail. There are equal chances of its being solved easily, with difficulty, or of its proving insoluble. I merely wanted to show clearly that the problem does exist, that it is impossible to consider economic growth without taking into account the physical factors involved.

NATURAL FACTS AND THE INTELLECTUAL VANISHING-TRICK

When listening to a lecturer in economics, one will sooner or later find him referring to "the function of production", which represents the 'output', the results of the productive operation, as the result of the combination of various 'inputs'; and the time-honoured method is to reduce this wide variety of 'inputs' to three categories — natural resources (known for short as "the ground"), labour, and capital. If at this point we carefully follow the course of the lecture, we shall note that after mentioning these three factors, the lecturer soon drops the "ground" factor (natural resources) and continues in terms of only two factors, labour and capital.

This induces in the student a calm conviction that the flow of goods depends entirely on human labour. For though that labour is only one of the two remaining factors, the student learns that the other — capital — represents the objects "given", at the moment under consideration, as the basis of production — objects which were themselves produced by labour at a previous period. Thus, the means of production are reduced to human labour, in its different forms — labour represented by its concrete results, and labour available.

This method of representation has its definite value. It enables attention to be drawn to the marginal productivity of each of the two factors retained and makes it possible to discuss the conditions in which capital elements can most advantageously be substituted for labour elements (in other words, productive deviations").

But it has the great defect of suggesting that the flow of goods offered for the satisfaction of man's needs depends solely upon man's own effort, 'completely independent of his natural surroundings'. Here I would recommend the following experiment: Ask a class of students: "If the entire cotton crop of the world were destroyed by a pestilence, what would be the loss to world economy?" You will be surprised to find how many of them will reply that the loss will be equal to the estimated value of the crop, and how few will reply that it will be equal to the total gross product of the industries which make use of cotton, less the proportion of output which can be maintained by drawing on existing stocks.

In brief, people are not sufficiently clear as to the fact that what we call "production" can never be anything but the processing of natural resources, and depends entirely on those resources. It would be absurd to regard certain natural resources as the source of economic development, as its effective cause — as was done by those who declared that England became the world's leading industrial power because she was carried to that position by the wealth of coal in her subsoil; there was coal in other parts of the world. But it is permissible and salutary to regard natural wealth as a material cause, in the Aristotelian sense of the term.

It is imprudent to assume that any given form of economic development can be precisely duplicated in a very different natural environment.

For these different reasons, it seems to me that the teaching of economics should always be preceded by an ecological introduction. Before talking of the way men are organised for the purpose of obtaining goods, we should show that the goods obtained are related to the natural environment and that the essential purpose of the organisation involved is to get the best out of that environment.

ECOLOGY

The world "ecology" seems to have been used for the first time by Haeckel, the naturalist (who used the form "oecology"). It is very convenient as a contrast to "economy", ecology deals with the relationship between one species and the rest of Nature, and economy with the relationship between individuals belonging to the same species (the two relationships not being entirely independent of each other).

In a highly organized society such as our, Nature disappears behind the mass of our fellow-creatures; each individual believes that his living depends on his relationship with his fellows, the services he renders them and the return he receives for these; he has forgotten that he lives on what the population of which he is a member can draw from its natural environment. Everything he makes use of seems to him to be the product of human labour; this is true so far as concerns its form; but its substance is obtained from Nature. We recognize our borrowing from Nature in bread, but we forget it in the airplane — in its body, whose components are minerals, its rubber tires, and the fuel it obtains from the bowels of the earth.

Synthetic and artificial substances tickle our conceit; these, we think, are all our own unaided work. Yet plastics and artificial fibres are nothing but wood in disguise.

The proudest society, like the most primitive organism, lives parasitically on its surroundings; only it is an intelligent parasite, and varies its methods.

Every living organism, without exception, draws to itself certain substances which it obtains from its environment, absorbs those substances, transforms them, and utilises them. The growth of a whale, beginning with the egg, is a process of construction which, so far as concerns dependence on substances from outside itself, differs not a whit from the construction of a skyscraper; in both cases materials are taken, transformed and adjusted according to a plan. The difference between the two operations is that the one is biological and the other rational, and that the one procedure is

identical on every occasion, whereas the other is perfectible; whales were being constructed on the present pattern in the days when men were only building huts out of mud and the branches of trees.

Whether the unit in operation is a living organism or a factory, there is always an expenditure of energy, which must be compensated by a supply of fresh energy; and that supply is invariably derived from the natural surroundings. For a human community, as for the most fragile organism, there can be no activity without the absorption of energizing substances.

There is no need to elaborate on this theme of social metabolism. Zola called Les Halles (the Central Market) "the belly of Paris", and Verhaeeren, with a more felicitous choice of words, refers in a poem to "the tentacular cities" which, octopus-like, grope further and further to seek the ever-increasing variety of substances needed for the nourishment and growth of their huge bodies.

Every form of life is inevitably a form of exploitation of its surroundings, and a civilization is merely a form of exploitation which has been developed by the exercise of intelligence. As soon as this has been pointed out, it seems blatantly obvious; but it is not enough to accept it as a fact; we have to deduce the consequences to which it leads. They interested Montesquieu and obsessed Malthus. But the course taken by ideas is sometimes curious; some ideas are no sooner mooted, than willing supporters thrust them to the fore. Others remain dormant for generations; and such was the fate of the idea with which we are concerned today, and which has recently been occupying a great many other people too.

We need to be able to refer to an ecological history of civilizations, but that has not yet been written. The structure I have tried to erect here, borrowing my materials from a number of different disciplines, is merely a makeshift scaffolding. But it has, I think, some value as suggestion.

There is no one nowadays in the West who does not share the noble desire to further the improvement of ways of life in what are called the "underdeveloped" countries. Some of the most eminent economists have made this their speciality, and the subject of economic development is taking an increasingly prominent place in theoretical reviews. These are the circumstances which led me to the reflections set forth here, which were prompted by the fear that our own experience might be expressed in general terms, without sufficient regard for the specific differences between natural conditions.

I am apprehensive as to the consequences which might result from purely and simply applying, to countries rich in manpower and comparatively poor in natural resources, of a system of thought which is directed towards economizing labour and is indifferent to wastage of resources. I cannot feel certain that the economic policy indicated by the proposal to raise the National Product (as we count it) to a maximum will prove compatible with the policy of helping a population to live as happily as possible on its own natural resources.

We already have before us a great economic system built up by dint of imitation, the Soviet system, which aims at reproducing, by authoritarian means, the economic system of America. Here the physical conditions could not have been more favourable; yet the results, in terms of humanity, have not hitherto been satisfactory. With an economic system insufficiently endowed with natural resources, they might prove disastrous.

The Development of Agricultural Productivity

By COLIN CLARK

Two of the opinions most frequently expounded in the world today are, firstly, that most nations are poor and hungry because of imperialism, and secondly — a view expressed mainly by British and American propagandists — that most nations are poor and hungry because they are overpopulated, and that restrictions of population is the world's most urgent necessity.

These two schools of thought, naturally, attack each other strongly. But they have one thing in common. Both of them rest their case on what they believe to be a basic fact, namely, that "two-thirds of the world's population is under-nourished".

The amount of food required per head of population, and the amount which can be produced under various circumstances should be capable of quantitative statement. Once we have these figures, it immediately follows that we can deduce the interesting result, of the proportion of the whole labour force required for food production, and the remainder whose activities can be devoted to other ends.

In making these estimates for primitive and low-income countries (but definitely not when dealing with more advanced economies) it is expedient to make use of the device of the "grain equivalent". The first to make extensive use of this device was Professor Buck in his book "Land Utilisation in China", which was the fruit of a comprehensive survey of hundreds of Chinese agricultural villages, carried out by the University of Nanking in the year 1929-33. Tubers, nuts and oilseeds were re-expressed as grain in proportion to their carbohydrate content, and fruits, vegetables and minor crops were converted into grain equivalents in proportion to the relative prices prevailing in the local market. In Professor Buck's work livestock products were excluded altogether; but their relative importance in the product of Chinese agriculture is so small that this omission did not make any serious difference.

This method is feasible for low income countries in the first place because grain and kindred products represent a large proportion of their total food consumption; and secondly, because in such communities the relative price of minor farm products, particularly fruit and vegetables, is much lower than it is in more advanced countries.

Omitting one district where some livestock products may have been available Professor Buck found that production of grain equivalent per head (of all the population on the farm, not merely the working population) might be, under the most unfavourable circumstances, on the smallest farms, as low as 250-300 kilograms per year. Consumption must have been rather lower than this, because presumably even under these unfavourable circumstances a certain amount had to be exchanged for purchase of other commodities, payment of taxes, etc. Consumption per head in India, for which we have more precise records, similarly calculated, when it was at its lowest in the period 1951-54, stood at 300 kilos per head. Of this only 120 kilos per head was direct consumption of grain, and the remainder represented the grain equivalent of consumption of other foods. Alteration of the value equivalent attached to these other foods would not make much difference to the final result, except in the case of milk, which is consumed in comparatively large quantities in India, and which, at Indian prices, is equivalent to 2½ times its weight in grain, a ratio much higher than in Europe or America. If we put these alternative lower values on milk, the grain equivalent of all food consumption in India comes down to 250 kilos per head. This should be considered somewhere near a minimum. The Indian Government maintained rationing of food in all urban centres throughout this period 1951-54 and imported food, although it was very reluctant to spend foreign exchange for this purpose. So we may presume that consumption standards must then have been about at a minimum level. These figures include no allowance for textile fibres, hides and other inedible farm products, which might raise the total by some 10 per cent.

Before, however, we try to fix 300 kilos, or any other figure, as a minimum value of consumption per head, measured in grain equivalents, for all times and places, we must remember the factors, already mentioned, causing minimum standards to differ between different countries, particularly the age, consumption of the population, climate, and average body weight. In each of these respects, we would expect, average Indian consumption, per head to be considerably lower than that of almost any other country, even China, where the climate is colder and body weights are higher.

Of the other countries for which reasonably precise estimates of quantities of food consumption per head are available, Egypt comes next to India. Egypt shows a food consumption of 430 kilos of grain equivalent per head, or 350 if we reckon milk at European rather than Indian relative value.

Dr. de Vries considers that, for tropical oriental populations, where climates are warm and body weight low, a subsistence minimum is represented by 400 kilograms of grain equivalent of all agricultural produce (including livestock products, textiles and fibres etc.) measured per head of the farm population, equivalent to 300-350 kilos per head of the total population. In various low-income regions, consumption of grain as such has been estimated at over 200 kilos per person per year, as for instance by Redfield and Villa in Yucatan, who found an average consumption of 215 kilos. In a poor district in Guatemala, consumption of maize per head was estimated at 265 kilos, and an official family budget study in the Salerno region of Southern Italy gave a figure of 280. In the ancient world, where grain was certainly very scarce and costly relative to other foods, average consumption per head was estimated at 210 kilos per head per year Professor Michell quotes an estimate of 175 kilos as a minimum below which life was considered impossible, even for slaves in the ancient world.

It appears, therefore, that we must put the absolute minimum of requirements, including agricultural products other than grain, somewhere between 300 and 350 kilos a head. Turning to Professor Buck's figures for China, we find that the wage worker, who by definition might be expected to be even worse off than the farmer, and who generally has someone besides himself to support, in the poorest districts of China, was paid a wage equivalent to 660 kilos of grain per year. (In the more prosperous rice growing districts to the south, however, the wage was equivalent to 1,300 kilos; the rate of wages for a full year's work in the district in Guatemala quoted, which is paid in grain, is also about 1,300 kilos).

Professor Buck makes possible a rough estimation of the marginal productivity of labour by grouping the farms, in each of his regions, into five size classes. For each of these size classes were recorded the kilos of grain-equivalent produced per man-equivalent of labour input, and also the crop area per man-equivalent. (The phrase "man-equivalent" indicates that the work of women and boys was rated a little below that of men). In the rice area, the number of hectares per man ranged from an average of 0.53 in the smallest size group to 1.25 in the largest. The extraordinary result was that, with these very differing levels of labour input per unit of land, output per unit of land remained practically constant, at about 1800 kilos of grain equivalent per hectare per year over the whole range. In other words, the marginal productivity of labour, when the land is as crowded as this, is zero.

In the wheat area, the results are slightly different, but not very much. In the classes of farms recorded here the average number of hectares per man ranges from 0.7 to 2.0. With increasing labour input per hectare there are slight signs of a rise in yield, but only such as to indicate a marginal productivity of a mere 80 kilos of grain equivalent per man-year. The wage of farm labour, if it is employed, is equivalent to 660 kilos of grain. Clearly such labour will only be employed on the larger holdings. In this wheat area, the average return per hectare is only about 950 kilos of grain equivalent as compared with 1800 for rice.

That the marginal product of labour should actually fall to or near zero under these conditions of overcrowded settlement might at first sight appear to be rather an extreme result. But it is also borne out by some results from Japan. The province of Kagoshima (in the extreme south of Japan) has the sad distinction, as Prof. Murata points out, of having the lowest income per head, and the highest proportion of its population engaged in agriculture, of all Japanese provinces. Making a statistical survey of the results of 30 farms in this province, but omitting the best seven in which the ratio of land to labour was much higher than usual, and mechanical power was use, and statistically analysing the relative contributions of land, labour and all other inputs, he found that the marginal net product of a man-year of 3000 hours was only 192 kilos of grain equivalent (milled rice). Though higher than the Chinese figure, this is exceptionally low, far below the wage which even the poorest labourer would expect. Indeed, it falls short of the man's own expected food consumption. This result does confirm the impression that overcrowding, once it has passed a certain stage, can be, as it were, absolute, and not merely relative.

A rather less depressing result however is obtained from a further detailed analysis of the figures in another densely populated agricultural country, namely Bulgaria. The figures of the agricultural census of 1926 were published in sufficient detail to make analysis possible. Excluding predominantly forest holdings, we have a result classified into groups in which the number of hectares per unit of male labour ranges from 13 to 0.9 (rather lower figures if we include female labour as well). Some very approximate assumptions have to be made about the value of livestock output, but this does not constitute a large proportion of the whole. Over this range, with increasing labour input per hectare, a fairly steady marginal return is found, at the rate of 20,000 leva, or 2700 kilos grain equivalent, per man year. This is almost precisely the same magnitude as the average wage paid to unskilled labourers (65 levas per day). In the smallest holdings, average net income per man was of the same order of magnitude, as might have been expected, as the labourer's wage. But even on these small holdings, the return in grain equivalents per hectare was about 2500 kilos,

higher than on similar holdings in Japan (a little over 2000 kilos) and well above either the rice or the wheat holdings in China. The European seems to understand better the art of making a living on a very small area of land.

Data from which an estimate can be made of the marginal productivity in another low income agricultural area are available for India. In the western regions of the State of Madhya Pradesh, wheat grown with partial irrigation, with labour input per hectare of land ranging from 1000-2000 hours per year, shows a marginal return of 0.88 kilograms per man hour—a return of rather lower order of magnitude than that shown by groundnuts in West Africa. In this case, the marginal return appears to be fairly uniform, and shows no sign of falling off at the higher level of labour input. On similar land, with similar equipment, the growing of sugar cane, either first plantation or ratoon, shows a marginal return of 11 kilos of cane, representing 2.8 kilos of grain-equivalent, at world prices. So there is a strong incentive to divert resources to sugar production, where water is available.

These figures represent the result of cultivation with ox-drawn implements, not hand-cultivation as in Africa.

Rural labour can be obtained in India at a wage corresponding to 4 or 5 kilos of grain per working day, so when it is available, it is generally worthwhile to employ it. But the basic fact about Indian agriculture is that it suffers, in nearly all regions, from a longer dry season even than Africa. The result is an unhappy paradox of serious labour shortage in the wet season and long months of under-occupation in the dry season. Farmers occupying areas of similar climate in Australia are able to keep themselves fully occupied and to make a good living with an economy based on livestock, and large quantities of stored or purchased fodder. It will be some time indeed before such a type of agriculture can be organised in India.

Dr. De Vries has summarized the various levels of agricultural development, and their attributes. Not until agricultural production per head of total population reaches a level of 600 kilos of grain equivalent per year is it possible to set aside pasture land. Domestic animals in most Asian countries, for instance, have to subsist predominantly on straw and agricultural refuse, and their output of both meat and Milk is extremely low; the principal object of keeping them is generally to provide draught animals. These considerations apply 'a fortiori' in India, where it is forbidden to slaughter cattle, who have to be allowed to die a natural death, as a result of which the country carries a large population of cattle in a near-starved condition.

For this reason therefore an output of about 600 marks an important point in our classification. Of the countries below this level Dr. de Vries distinguished a sub-category, lying roughly in the range 500-600, of countries which can produce a surplus of rice for export.

Between 600 and 750 we have a form of agriculture in which livestock can have pasture and possibly some fodder crops, but cereals are still relatively too valuable to be fed to animals. It is not until we have passed the 750 level that we find livestock fed on cereals as a normal part of the agricultural routine. Generally speaking, this state of affairs prevails only in Europe, North and South America and Australia.

Against this background we can finally review the possibilities of increasing general agricultural productivity.

One of the most striking ways in which agricultural productivity can be improved in a poor and densely populated tropical country is by the use of "capital" in the truly classic sense of that word, i.e. products involving "waiting". The results which follow are calculated from information supplied by the Department of Agriculture in Ceylon, except for the conversion of other commodities into grain (rice) equivalents which is effected at 1953 world prices. They are not claimed as anything more than very rough orders of magnitude, but they are nevertheless striking.

With an amount of land of only about 0.4 hectares per man engaged, land can be planted to tea, yielding 1870 kilos of grain equivalent per man engaged, or over 600 kilos per head of the total rural population. The capital investment required is equivalent to about 5½ years gross output. At about 0.8 hectares per man, and a capital investment of 7½ years gross output, land can be planted to rubber, where returns per man however are less than with tea. With coconut, one man can look after 4 hectares; the capital investment is 6½ years gross output, and the return over 3000 kilos of rice equivalent per man, or over 1000 per head.

These capital-output ratios are high. In fact, the growing of these tropical plantation crops includes some of the most capital-intensive processes in the world. The cultivation of these products has made Ceylon and Malaya much wealthier than the neighbouring Asian countries. The necessary condition for successfully following this form of development is, to put it bluntly, to have a government which respects property rights. Property in such plantations is sometimes owned by foreigners, but much of it is indigenous. If such property is expropriated, or taxed excessively, these more productive forms of agriculture quickly disappear and the country slips backwards towards low-productivity subsistence agriculture.

Countries lacking abundant reserves of land however must try to increase productivity on existing acreage.

Dr. Bennet, with the boldness and vision which we can expect of him, has prepared a comparative table of wheat yields in England since the fourteenth century. After providing for seed, net return in bushels per acre, which is now about 40, stood at only 5½ in the fourteenth century, and rose at the rate of only about one per unit per century until the middle of the seventeenth century. By this time all the vacant cultivable land was occupied, and the process of improvement of yields through better cultivation and better manuring was accelerated—chemical fertilizers, of course still being hundreds of years in the future. By 1750 the net yield had risen to 12½ bushels per acre; but it was in the late eighteenth century, when population pressure definitely became serious, that the process of agricultural improvement was really accelerated, and the figure rose to over 20. (Just at the time when Malthus was asserting that such increase in agricultural productivity was bound to be slow). During the nineteenth and twentieth centuries a fairly steady increase has been continued.

In more recent times, of course, we have had in chemical fertilizers a potent instrument of improvement. The general conclusion from a large number of measurements throughout the world is that the application of one tone of ammonium sulphate (i.e. one-fifth of a ton of nitrogen element) on land previously un-fertilized, may be expected to give an increase in yields of three tons per annum of wheat, or 3.3 tons per annum of barley.

At present-day prices, these marginal returns are far higher than the cost of the ammonium sulphate, even after allowing for the cost of distributing it. (It will be remembered that this information refers to land hitherto unfertilised; where a considerable amount of fertiliser is normally used in any case, the marginal return is much lower). One might expect therefore a keen demand for fertiliser in all low productivity agricultural areas, as soon as its properties become known, and supplies are available. Even lack of transport will not check its use. In some cases, there have been records of Africans purchasing fertiliser which has had to be carried from the railway by head porters.

These results apply, perhaps in lesser degree, with other fertilisers.

Application to sugar cane may be more striking still. Mr. Shastri's results in India show that a ton of ammonium sulphate, at the margin, may produce an additional output of 23 tons of cane, i.e. 3 tons of sugar, which is the economic equivalent of 6 tons of wheat.

It is the application of ammonium sulphate, together with the breeding of better strains, which has been largely responsible for the improvement in Japanese agriculture. The principal crop, rice, yielded 1.6 tons of milled rice (4) per hectare in the 1880's, rising to 2.7 in 1935-39 and 3.5 now. Taking the productivity of Japanese agriculture as a whole, and converting all other products to grain equivalents by means of the FAO coefficients, we obtain the following table.

PRODUCTIVITY OF RURAL LABOUR IN JAPAN*

	Production in equivalents of millions of metric tons grain: Agriculture	Fishing	Combined	Male labour in agriculture and fishing (m)	Product per man (Ton grain equivalent)
1895-09 ..	13.89	1.82	15.71	10.0	1.57
1905-09 ..	16.97	2.45	19.42	9.6	2.02
1910-14 ..	19.22	4.52	23.74	9.35	2.54
1915-19 ..	21.75	6.75	28.50	8.8	3.24
1920-24 ..	22.26	10.15	32.41	8.5	3.82
1925-27 ..	23.99	13.50	37.49	8.4	4.46
1934-38 ..	26.50	14.50	41.30	7.7	5.36
1953-55 ..	31.53	16.15	47.68	8.9	5.36

* These results conform fairly closely ($R^2 = .89$) to a model based on the assumptions that the marginal return to labour is one-third of the average, and that the productivity of a given labour force rises at the rate of 1 per cent per year. (I am indebted to Mr. G. T. Jones for this result).

Growth in product per man was rapid while the labour force was being reduced. Since the war, and the temporary reduction of opportunities for industrial employment, the necessity for Japanese agriculture and fishing to re-absorb considerable amounts of labour have had the effect of checking the normal rate of growth of productivity. These results all seem to point to the hypothesis of a marginal productivity of labour extremely low in relation to the average, thereby making it possible to secure a large rise in average product per man, merely by removing some of the marginal labour; and at the same time an upward trend through time in the productivity of a given labour force. If this is so we have every reason to expect that the upward trend in productivity per man will be resumed when the surplus labour has again been removed from agriculture.

Bittermann's very interesting study of the increase in productivity in Germany since 1800 shows no great change in the first half of the 19th century, but from 1850-1950 the yield per hectare of wheat rose from 1.2 to 2.7 tons, of potatoes from 8 to 22 tons. Equally striking are Herr Bittermann's figures for increases in livestock productivity, which are generally more difficult to obtain than crop productivity. The number of animals available for slaughter, from a given livestock population, increased by 50 per cent in the case of cattle and pigs and doubled in the case of sheep, and the average weight of meat per animal slaughtered doubled for cattle and pigs and rose 60 per cent for sheep. For these reasons, from a given livestock population, a much greater output of meat per annum was obtained. For each cow, only 860 kilos of milk per year were obtained in 1800, rising to 1150 by 1861, and 2500 by 1935-38.

It remains to be said, rather abruptly, but summarising a great deal of information which there is no space to deal with here, that any country with a reasonably developed system of marketing and transport, and with a rural population adequately informed about agricultural improvements which might be expected to be within their reach, and which does not have to keep engaged in agriculture marginal labour of extremely low productivity, but is able to find other employment for it, should then be able to expect real product per man year to be expanded at the rate of 1 or 2 per cent per annum. In the more advanced countries, where greatly increased quantities of fertilisers, equipment and other industrial inputs are used, the rate of increase in gross productivity may rise to 3 or 4 per cent per annum (out of which higher figure the industrial inputs have to be paid for).

Sponsored Growth: A Challenge to Democracy

By W. ARTHUR LEWIS

THE theme of this article is the reconciliation of rapid economic growth with human freedom and dignity. By "rapid" I mean economic growth exceeding an annual rate of growth of output per head of 2 per cent. Two per cent is just over the rate achieved by the U.S.A. over the past seventy years; nearly twice the rate achieved in Western Europe; but substantially less than was achieved by Japan in the same period, or by the U.S.S.R. since 1929.

Two per cent is not a difficult rate to maintain once it has been achieved, and after an interval in which institutions, habits, ideals and the distribution of income have adjusted themselves to this rate of growth. The difficult ground is the adjustments which have to be made as a country shifts from stagnation or slow growth towards two per cent per head per annum. These adjustments are painful whether the drive towards growth is coming from the energies of private capitalists or from the aspirations of statesmen and administrators.

I nominate two per cent because I think the strains involved in getting to this rate are bearable, even though they are severe. Others would prefer higher rates, of three and four per cent. They are impressed by the achievements of the U.S.S.R., which they expect to be duplicated in China, and they fear that the peoples of Asia and of Africa may be attracted into the Communist orbit unless their countries attain similar rates of growth within a democratic framework. I am not impressed by this argument; provided these countries have reasonable success in raising their own levels of

living, there is no reason to expect their peoples to keep peeping over the wall to see what is happening in the Communist world — any more than the peoples of Western Europe have been disconcerted by the faster pace of the U.S.A. It is a serious question, for military reasons, how far Western Europe and North America can afford to lag behind Communist rates of growth; but in Asia and in Africa Communism challenges people not to a race but merely to a rate of movement adequate to their own needs.

At one extreme one may take the position that the main task of the government in a poor country is to clear the decks for private initiative. This solution, even assuming that it achieved my postulated two per cent, does not avoid the problems with which this article is concerned. Growth menaces accepted beliefs, habits and institutions equally whether it be due to private or public sponsorship. It also menaces democracy. In Western Europe the rising bourgeoisie were the champions of democracy, but there is no necessary association between democracy and the capitalist role. There is no assurance that democracy will be safer in Asia or in Africa if economic growth is sponsored mainly by private capitalists than if it is sponsored mainly by government agencies. The other extreme equally provides no escape. With the record of the Communist countries before us it is not necessary to demonstrate that democracy is not necessarily strengthened by concentrating all initiatives in the hands of public officials. Most balanced thinkers desire that mixture of private and public initiatives which will secure adequate economic growth with minimum strain. This is also the position of most of the Asian and African governments which are now planning to accelerate economic growth.

When the government of a poor country decides to try to accelerate economic growth, it needs to adopt measures of four kinds (1) changing institutions and habits, (2) providing new services and commodities, (3) controlling private activities, and (4) mobilising finance for development.

(1) **Institutions.** — Many habits, deals and institutions need to be transformed as a people moves from relative stagnation to rapid growth, and however, reluctant a government may be to interfere with traditions, its leaders inevitably find themselves having to give leadership on numerous issues with which governments in advanced countries may not concern themselves. Almost inevitably the government will be seeking to move somewhat in advance of public opinion, and it may therefore be tempted either to secure a monopoly of opinion, by controlling the press, radio, pulpit, and other media of communication, or to prevent public opinion from frustrating government objectives, by eliminating from Parliament those who hold contrary opinions.

How deeply does the government need to plunge into these spheres? This depends partly on how much change has already occurred. Also one must distinguish between actions which offend a powerful minority, and actions which arouse widespread dislike. A powerful minority will be offended by actions reforming land tenure, or abolishing slavery, but a popularly based government can take such measures in its stride. There may be wider opposition to measures promoting birth control or improving the status of women, or releasing the bonds of caste, or altering the laws of inheritance; and here progress may be relatively slow. Fortunately, much economic growth is possible even within the limits of archaic institutions, and one may concentrate on measures which do not arouse opposition, confident that in due course growth itself will undermine that which is no longer appropriate.

(2) **Expanding the Public Sector** — Next there is an enormous increase in the range of government operations. To begin with, adequate public services are a prerequisite of growth, so expenditures on schools, on public health, on research, on agricultural extension, on roads, and so forth, need to be increased greatly. In an article in the Manchester School (September 1956) I have shown that current expenditure on public services (i.e. excluding capital expenditure) needs to be about 11 or 12 per cent of gross national income, excluding expenditure on defence, on public debt, on social insurance and on agricultural subsidies. In many poor countries (for example India) such expenditure is now 7 per cent or less, and so there is a great deficiency in this area as there is in capital formation.

Apart from the public services, there is also considerable deficiency of public utilities — harbours, railways, electricity, urban water supplies, irrigation, telecommunications, etc.—and these are equally a prerequisite of growth. On the whole they are services which need to develop in advance of demand, because their existence creates much of the demand to which they cater; hence losses or subsidies are frequently required for a long period of development. Finally there is the initiation of productive units in manufacturing in agriculture, in mining and in other sectors. The important role of the Japanese government in initiating manufacturing industries is widely known, and will be widely copied.

(3) **Controlling the Private Sector.** — Apart from operating enterprises itself, the government has in some cases to control the use of resources by private persons. It may have a plan which requires the expansion of one industry at the expense of another, or the curtailment of imports, or the expansion of exports, or use of land for one purpose rather than another, or some other use of resources which is not in accordance with the free choice of the market. Most governments meet this situation first with persuasion; speeches are made asking people to use their labour or other resources in ways which involve personal loss. These appeals are unsuccessful, or if initially successful, lose their power with repetition. Next the government is tempted to resort to some form of licensing, or other prohibition. This is felt by the public to be an imposition and a nuisance, and even in the most law abiding communities it gives rise to black markets and other violations, as well as to some feeling of resentment and of frustration.

For a short period after the second world war it was fashionable to assert that economic planning could not succeed without this kind of licensing, but this fashion is now outmoded. It is more widely recognised that, as an alternative form of planning, the government can make it profitable for private individuals to do what it wishes them to do by manipulating prices, taxes or subsidies. There has been more criticism of the methods used to control the private use of resources than of the principle of control, because of the obvious disadvantage both of persuasion and of licensing — ineffectiveness, black markets, corruption, public resentment, etc. However, whatever the method, the principle of control involves dangers. It is based upon the assumption that the government knows best; it gives scope for improper influences upon government decisions; and it tempts the government to suppress criticism of its decisions. This is one reason for wishing to keep government control down to a minimum of strategic decisions; but even this minimum may be fairly large if the government is seeking a substantial shift in the use of resources.

(4) **Finance.**—I have referred earlier to the need to increase expenditure on current account on basic public services to 11 or 12 per cent of gross national income, and to the fact that several governments are

as much as 5 per cent below this level. The deficit in capital formation is of the same order of magnitude. Capital is required not so much for manufacturing, for agriculture and for mining (which even in advanced countries accounts only for about 30 per cent of capital formation) but rather for public services and public utilities (about 35 per cent) and for housing (about 25 per cent. Since productivity grows most rapidly in manufacturing, in agriculture and in mining, whereas the major capital requirements are in public services, public utilities and housing, it is not feasible to relate capital requirements directly to the desired rate of growth. The best one can say is that if housing is not to be neglected, and if public utilities are to provide adequate service, poor countries need to invest 15 to 20 per cent of national income gross; whereas very few poor countries are now investing more than 10 per cent gross.

Obviously the first resource is to encourage the public to save more, and to make its savings available for investment, rather than hoarding savings in gold or jewellery. There is now a network of post office savings banks, co-operative credit unions, and other agencies with this objective. Japan reports good success in stimulating small savings. In other countries, however, small savings constitute only a small percentage of national income. In most advanced countries the major part of saving originates in profits, distributed or undistributed, since for one reason or another profit makers have the highest propensity to save. It follows also that, since profits are only a small part of national income in most poor countries (except the few which have large mineral industries such as oil or copper) voluntary savings cannot be expected to produce the 10 to 12 per cent net which development requires.

The next resource is external finance. Up to 1929 it was possible for governments of poor countries to borrow in the private capital markets of London, Paris, New York and other great centres. This is no longer so. Wall Street will not handle foreign government bonds, except in two or three special cases. London and Paris are open to colonial borrowers, on a restricted basis, but not to foreign independent nations. For the most part, therefore, governments are restricted to what they can raise from the World Bank or from the Export-Import Bank, both of which handle only restricted types of finance.

It follows that in most of the poorer countries an adequate level of investment is impossible if reliance has to be placed exclusively upon voluntary and foreign investment. Some form of compulsory savings is essential. It is hardly necessary to point out that compulsory saving is not, of itself, undemocratic, any more than compulsory military service is undemocratic. There is nothing in the principles of democracy which says that the ratio of investment should be dependent upon the distribution of income, or more particularly upon the level of profits, which is the chief source of voluntary saving. The rate of investment is just as appropriately a matter for collective decision as is the size of the armed forces, or the amount to be spent on education or on public health. The best form of compulsory saving is taxation. Inflation is an alternative form, but except in restricted and occasional doses, its disadvantages are great when compared with the disadvantages of taxation. Some creation of money is possible without inflation because the demand for money increases with economic development. Neither is it possible to escape all signs of inflation, since history shows that all periods during which the ratio of investment to national income is increasing are periods of rising prices. The trouble is that it is difficult for inexperienced governments to keep inflations small and short; and if inflation gets out of hand its disadvantages are very great when compared with the disadvantages of taxation.

I am convinced that the governments of poor countries could raise nearly all the funds needed for development by taxing their peoples more heavily, and that the increased burden of taxation is not beyond what these countries can bear. I think that the richer countries have a moral duty to lend a hand, but the poorer countries need not wait for this. Several are progressing in the right direction. My conclusion is that economic development calls in the first instance for higher levels of taxation. This is not a popular conclusion. Many governments which do not lack the courage to attack deep religious convictions, to nationalise a wide range of industries, or to license and control private operations, falter when it comes to taxing their people adequately. If communist or other totalitarian regimes have an advantage over democratic regimes in promoting growth, this is where it is most likely to be revealed.

Accelerating economic growth thus involves a great increase in the role of the government in economic life. This has many dangers, the chief of which may be listed as follows: (a) **Inefficiency. — The public service swells rapidly.** The demand for skilled people exceeds the supply, so much dilution occurs. This is inevitable whether the acceleration is sponsored by public agencies or by private enterprise. This disadvantage can be exaggerated. Sometimes it is better that a job be not done at all rather than that it be done inefficiently (e.g. a brain operation); but in many other cases it is better that a job be done inefficiently than that it be not done at all (e g. amputating a dangerously infected limb). The real remedy is to multiply skills as rapidly as is feasible, and in the meantime to welcome imported skills. (b) **Corruption.** — The more the government does, the greater the opportunities for corruption. Here again the disadvantage can be exaggerated. Much petty corruption is due to failure to remunerate public servants adequately — whether civil servants or politicians. Moreover the existence of corruption is seldom a major hindrance to economic activities. The remedy is to remunerate public servants adequately, and the public will resent corruption and begin to stamp it out. (d) **Strangling private initiative.**— Governments cannot and should not do everything. Their function is to make it easier for the citizen to conduct his legitimate affairs. This problem is sometimes due to an ideological hostility of politicians towards private enterprise; they are not content to lay down the spheres where private business is permitted, and those where it is not permitted, but they deliberately harass private activity even in the sectors which the government has left open to it. This is a relic of a nineteenth century view of socialism, which is now disappearing. (d) **Dictatorship.** — The really serious danger is that a government may seek refuge in dictatorship, so that it may force its people to adopt policies for which they are not prepared. For example, they can be forced into collective farms, labour can be conscripted for useful public works. Taxation can be pitched at high levels. Capital formation can be pushed exorbitantly at the expense of consumption. Trade unions can be destroyed, or rendered innocuous. Farmers can be forced to adopt better cultivation practices. I believe that a dictatorship can increase output faster than a democracy, because democracies value many institutions which are obstacles to rapid growth. Since I value democracy more than material output, I do not think that countries should develop more rapidly than is feasible within the democratic framework.

A democratic government is more likely to succeed in carrying its people with it towards accelerated growth if it abides by the following rules than if it does not.

(i) It should always explain what it is trying to do, by means which reach even the remotest villages. (ii) The villagers should have a sense of participation, both in making plans and in enjoying their fruits. The "Five-Year Plan" is too often a document drafted in the capital city. There should be as much decentralisation of planning as is feasible. This in turn requires that units of provincial and of local government should be strengthened. Weakness of provincial and local administrations in relation to the centre is a defect of nearly every poor country. (iii) A big place should be given to community development schemes, which permit the villagers to choose for themselves the projects which they will support with voluntary labour or with taxes, subject to assistance from the centre. (iv) Plans should provide for increases in consumption, so that the people may see as soon as possible the fruits of their labour. Steel works and other capital goods industries are important, but so also are houses, proteins and hospitals. (v) Trade unions should be wooed, rather than fought. If plans provide for an expansion of job opportunities, for increased consumption, for technical training, and for opportunities to rise in the social hierarchy, trade unionists will collaborate willingly in carrying them out. (vi) Justice must be seen to be done. Land tenure must be on a satisfactory basis. The upper and middle classes must be made to bear a fairer share of taxation.

Given a government which genuinely seeks the advancement of the masses of its people, such as some poor countries now have (e.g. India and the Gold Coast, to mention Asian and African examples) I see no reason why growth at the rate of 2 per cent per head per annum should not be attained without infringing democratic principles. Democracy is insecure in poor countries, but this is not mainly because of strains imposed by sponsoring economic growth. It is partly due to the passions which have given birth to new governments in these countries; and partly due to national divisions. Sponsoring economic growth may, on the contrary, prove to be the remedy for both these ailments. It has a wide popular appeal, which transcends differences of race or religion or class. It can be dramatised as a national battle — against hunger, ignorance and disease — and there are daily victories, large and small — the opening of a new school, hospital or irrigation works, or the achievement of new production levels — which can be occasions of national triumph and rejoicing. Sponsoring growth provides temptations to undermine democracy, but it also provides even greater opportunities for men to learn to live peacefully with their neighbours.

International Financing of Export of Machinery to Under-Developed Countries

BY P. N. ROSENSTEIN-RODAN

TWO forms of financing of international trade, the acceptance credit and medium-term credit for machinery and equipment, have become victims of structural changes in international capital markets. The City of London supplied these credits before 1931 and to some extent even up to 1939. It found no successor in the post-war world. Single national attempts at financing such exports are "tied loans" and constitute at best most imperfect substitutes for united loans. Yet the need for financing of exports, especially for medium-term credit for equipment and machinery continues unabated. It is not sufficiently provided for "the other way round" by long-term investment credits given to importing countries. At Bretton Woods two types of financial needs were recognized: the need for secondary reserves, to be supplied by the International Monetary Fund and the need for long-term international investment to be supplied or rather supplemented by the International Bank for Reconstruction and Development. The third type of need for medium-term credit was not even recognized. It is contended that this gap in international finance forms a major obstacle to competition in international trade and leads to a deviation from the international division of labour.

Suppliers of equipment often fail to get the bid even when their offers are fully competitive in respect to prices and periods of delivery. In some cases this is due to buyers' preference of long-run connections, to a fear of being dependent on distant overseas suppliers who in war-time in the future may not be able to supply spare parts or to other rational and irrational factors. In many cases, however, substantially lower offers do not obtain a contract because the higher price offer carries with it an offer of credit for three, four or five years, while the lower price offer requires payment on delivery. Before the war or before 1931 there was no such 'link between the commodity and the credit market'. Goods were bought in the cheapest market and were financed—as a second and independent operation—in the cheapest credit market. Medium-term debentures, medium-term credit and to some extent renewed and prolonged acceptance credit in the City of London provided finance for investment goods in international trade. The cessation of these services means that the "principle of untied loans" is applied in the medium-term credit market even less than in long-term capital movements. In consequence, underdeveloped importing countries are often confronted with a "monopolistic" joint supply of equipment and credit, with an "all or noting" offer, while some efficient, but capital-poor, exporting countries cannot compete if they do not offer credit. Reducing prices alone does not increase their sales; they either have to supply a commodity 'and' credit or they cannot sell at all.

Where capital is scarce its price, i.e. the rate of interest should be higher than in capital-rich countries. This valid principle of the theory of comparative costs only refers to the price of capital insofar as it enters 'production costs'. It does not refer to the cost of capital (credit) insofar as it constitutes 'selling costs'. The link between the commodity and the capital market represents increased selling (not production) costs, and leads to a deviation from the international division of labour.

To reduce, to simplify and to stabilize US tariffs is rightly considered to be one of the important ways of arriving at an International Monetary Equilibrium. If this task were achieved, the United States would probably import $500—$600 million per annum more than at present. This would be an important contribution to the filling of the dollar gap. More important quantitatively than a revision of US tariffs, and easier to realize politically would be a truly untied export of capital from the United States. If the US capital exports amounted to around 1 per cent of its gross national product, say $4 billion per annum, non-US industries (largely Europe) could obtain 20—30 per cent off-shore orders for delivery to underdeveloped countries. Underdeveloped countries would be able to buy more cheaply, while Europe and Japan, if they were competitive, could find additional dollar exports markets for which

it is structurally fitted for $800—$1200 million, i.e. twice as much as from the reduction of American tariffs. In many cases European and Japanese industries are already or may be expected to be competitive, both as far as prices and periods of delivery are concerned. This is not, however, a sufficient guarantee that they will obtain off-shore orders. The link between the commodity and the markets creates imperfect competition in international trade of investment goods and prevents an optimum diffusion of US capital exports. Medium-term credits for financing of exports of investment goods would help to re-establish competition in international trade or at least to reduce its degree of imperfection.

Most European countries have taken measures to provide export credit guarantees. A long list of institutions, regulations and practices in this field is available. Not in all cases, however, can guarantees be extended to credits for three or four years after delivery. Only some countries can anyway afford an extension of such credits for balance of payments and shortage of capital reasons. Even countries with unused industrial capacity cannot expand three, four or five years' export credits which would allow a full utilization of their capacity because exports which would remain unrequited for that length of time would cause balance of payments troubles in the intervening period. There are two obstacles to the expansion of medium-term credit by exporters of machinery and equipment. The first is the country's estimate of the risk, i.e. of the creditworthiness of the importing country. Even if resources for granting of credit were available, the subjective judgment of the risk involved may be against granting or expanding such credits without some form of an international (or foreign) credit insurance arrangement. The second and frequently more important reason is, however, the lack of resources or of foreign exchange to finance for, say, five years unrequited exports. Let us examine more closely this second obstacle: what would be the effect on the balance of payments if an exporting country granted a, say, five years' credit of $100 million for export of machinery?

On a contract of $100 million of machinery, 25—30 per cent are presumably profits which do not absorb scarce resources of the exporting country. Another 20—25 per cent represent direct import—(i.e. foreign exchange) component of the machinery to be delivered. These imported raw materials or parts do not give rise to national income formation in the exporting country. Only 50 per cent of the value of the contract goes directly and indirectly into national wage-payments and income creation. Assuming a multiplier of 2 (it will be mostly somewhat under 2), additional income of $100 million will be created in the exporting country. Assuming a marginal propensity to import of say 30 per cent (in most cases short of overfull employment it will be less), there will be in the exporting country an additional demand for imports (or partly a fall in exports) of $30 million. Adding to these $30 million of "indirect additional demand for imports" the $20 million of the "direct" import component of exported machinery, the total effect of unrequited exports of $100 million on the balance of payments of the exporting country is likely not to exceed $50 million. In other words, the impact on the balance of payments of an extension of credit for exports is only equal to a part, say 40-50 per cent of the amount of credit. If this part, say 50 per cent, were provided for the exporting country through additional capital sources, for instance by discounting about 50 per cent of the export credit, a credit expansion under conditions of some unused industrial capacity would not cause any inflationary effects; it would then become possible.

It is proposed to create an International Re-discount Institute which would discount in dollars bills or promissory notes up to five years for exports of machinery and equipment goods to underdeveloped countries. Promissory notes would be re-discounted only to the extent of 50 per cent of their amount. National credit sources in the exporting countries would have to provide net 50 per cent of credit in order to obtain a 50 per cent dollar addition to their resources. Under circumstances only credits for the second, third, fourth or fifth year should be eligible for re-discount, while the first year's credit should also be considered to be the exclusive responsibility of national capital markets.

The International Re-discount Institute would operate on the principle of automaticity and anonymity like the acceptance market of the pre-1914 days. Any bill carrying two acceptable signatures of the importing and of the exporting country (for instance the signature of Finance Minister or Central Bank or any State-guaranteed export credit institution of the exporting country) resulting from export credits up to five years of machinery or equipment to under-developed countries can be re-discounted for up to 50 per cent of its value. No "project analysis" revealing trade secrets and causing loss of time, irritation and cumbersome bureaucratic procedures would be attempted. All that is involved is that the exporting country should assume the risk of granting-credit.

If, say, $300-$400 million were invested in such an International Re-discount Institute by the International Bank for Reconstruction and Development, the International Monetary Fund and/or American Foreign Aid Funds, Private U.S. and Swiss banks would probably be willing to contribute at least equal amounts. The Institute would thus effectively mobilize substantial additional private capital for productive and remuncrative use and provide at the same time a solution of an urgent problem in international trade.

Two objections are frequently raised against any expansion of medium-term export credits for machinery and equipment to under-developed countries: (1) Is it not better to finance imports by underdeveloped countries rather than finance exports? Long-and medium-term credits could then be grouped on the basis of an overall assessment of the development programme and of the creditworthiness of the importing country. The argument would be valid if an International Development Authority were in existence which could provide a volume of loans sufficient to provide additional capital for each underdeveloped country up to the limits of her absorptive capacity and her capacity to repay. Under present conditions the argument is not valid and is an example of non-functional perfectionism opposing a possible "good" for the sake of a, as yet impossible, 'better' The only institution which applies the principle of united loans is the International Bank for Reconstruction and Development. Its volume of lending is not sufficient to provide for all the needed imports of machinery and equipment by underdeveloped countries. All other credits are usually "tied". Untied lending would make it possible that in all public tenders and possibly in all private purchases of equipment the bids should go to the lowest price offer. Medium-term re-discount credit available to exporters would solve this problem more smoothly, more simply and automatically. (2) An expansion of medium-term credit would facilitate construction of unsound projects, lead to excessive indebtedness of underdeveloped countries and impair their long-term creditworthiness. Any credit and banking system involves risks, yet hardly anybody would seriously maintain that it would be better "not to have anything to do with banks". Technical assistance and co-operation in development programming are the way to prevent investment in unsound projects rather than the maintenance of imper-

fect medium-term credit markets. The link between the commodity and the credit market raises prices of equipment by making credit availability more arbitrary and more expensive. This may make many projects "poorer" than they need be and may also lead to selection of poorer projects because credit for them is available at the expense of sounder projects for which credit is not available. To "untie" international medium-term credit means to make the credit market less imperfect. This would probably increase the volume of lending and certainly improve its composition. Both effects are desirable.

There are several benefits which would flow from the International Re-discount Institute. It would enable underdeveloped countries to avail themselves of the opportunity of buying in the cheapest markets, without foregoing medium-term credit. It would reduce the handicap of countries which are poor in capital yet competitive in their export industry. It would thus reduce the handicap of Europe and Japan as against the United States.

Far from interfering with legitimate business of existing private and national credit institutions, it would effectively widen their scope by offering re-discount facilities. It would provide a basis for extending the volume of transactions rather than substituting one source of finance for another. Besides offering inducements to existing national credit institutions, it would also mobilize additional private capital of American and Swiss banks who would probably be able and eager to participate in or lend to the Institute. The Institute could have some additional guarantees from importing countries (for instance, a transfer guarantee) which no single private discount institute could obtain. It could also systematize conditions of granting export credits.

Only when an international medium-term credit market for exports of investment goods is established, shall we be able to say that if an industry cannot obtain orders, then it must be due to its not being competitive. Today such a statement need not correspond to the truth. The filling of the gap in international finance would benefit the underdeveloped countries as well as capital-poor industrial countries. It would be an important improvement in the international division of labour.

Capital-Output Ratios in Economic Development

By KURT MARTIN

HOW much capital must a country save or borrow abroad for domestic investment in order to attain a certain rate of economic growth? This is the question one wants to answer if one enquires into capital-output ratios and tries to measure them. On the face of it, the question should be easy to answer. There is plenty of statistical material giving information for various countries about the amount of investment undertaken over a certain period and about the growth in production that was associated with it or followed it a year or two later. Table A contains such information for a recent period. We have taken a number of countries in various stages of development and in order to obtain our coefficient have related the domestic capital formation during the years 1950-54 to the growth in production between 1951 and 1955; for some countries we had to a slightly different period.

The evidence for what it is worth, can be summed up very briefly:

(a) If investment net of depreciation is taken as the measure of the growth of capital—that is, of increase in capacity other than those that may result from mere replacement through improved designs—and if therefore the (marginal) capital-output ratios computed on a net basis are reported as the important ones, it appears that there was little or no correlation in that period between the size of these coefficients and either the level of development attained in the various countries or the rate of income growth achieved by them. The USA, UK, Germany, France, Italy, Greece, India, Burma, Ceylon and Latin American countries all had practically the same capital-output ratios, ranging between 2 and 2.5. Although there are some countries for which we get different values, the evidence (if one accepts it) suggests that if a country now-a-days invests about 12 per cent of its national income (net), production will probably rise by about 5 per cent.

(b) If gross investment is brought in, the picture is somewhat different. Although the amount of net investment per unit of additional output was as a rule very similar for poor and rich countries, the low income countries and the countries with high growth rates almost invariably had lower gross coefficients: they needed less investment for a given increase in production, if one wants to forget about depreciation costs (as usually conceived) and treat them as a mere accounting matter.

TWO CASE STUDIES

To show how differences in initial conditions and in policy objectives may affect capital-output ratios we will take two case studies: the Indian and the Italian Development Programme. They do give us the actual outcome but may tell us something about the factors that can be decisive for the outcome. The Italian programme aims at an annual average increase in income of 5 per cent over a period of ten years (1955-1964); investment in new fixed capital is to be at the rate of 18 per cent of income on the average of the period which implies a marginal capital coefficient of 3.6 when computed on a synchronous basis. Considering monetized fixed investment only, the corresponding capital-output ratio for India under the second Plan is 2.1 for a growth-rate of output of 4.5 per cent over five years. (The Indian ratio would be about 2.5 if we included inventory accumulation and allowed about 1 per cent of income for the non-monetary investment of the peasants as we did in Table A). Now how does this wide difference between the two capital coefficients—3.6 as against 2.1—arise in these estimates?

For an explanation one might look first into the composition of investment. In the present case the main difference in the composition of investment between the two programmes is that whereas Italy intends to spend about 22 per cent of total fixed investment on housing, the Indian proportion is only 12 or 13 per cent (the precise figure is difficult to establish); India also spends somewhat less, proportionately, on miscellaneous services; what she saves on housing and services goes into higher allocations to Public Utilities and Public Works (about 35 per cent of fixed investment instead of 31 per cent in Italy), to Mining and Industry (25 per cent instead of 21 per cent) and to Agriculture (18 per cent instead of 14 per cent). Since the housing proportion accounts for most of the difference in the composition of investment, one ought to assess its separate importance as a determinant of the aggregate capital-output ratio. Suppose India doubled her expenditure on house building, with an equivalent increase

in total investment. The share of housing would then be about the same as in Italy, and if we treat housing as a welfare item that does not produce an additional income, the capital coefficient for India would work out at 2.4 (or perhaps a little higher, allowing for ancillary investments). The figure is still far below the Italian coefficient.

CHARACTER OF AGRICULTURE

Since housing accounts for most of the difference in the sector distribution of investment but only for a small part of the difference between the two capital-output ratios, the composition of investment cannot give us the explanation we are looking for. The main explanation actually lies in the character of agriculture. If for an increment of output India had to invest in agriculture as much as Italy, the aggregate capital coefficient on the basis of the present distribution of investment would be about 3 instead of 2. As it is, India has an agriculture of the kind that can be improved with very little capital expenditure: the marginal capital-output ratio in agriculture is only about 1:1 (for monetized investment only) as against 6:1 in Italy. The figures from which these estimates are derived may not be strictly comparable but the difference is certainly very large. In India over a third of the expected increase in income still comes from agriculture although its share in total output is declining. The demand for food has a relatively high expenditure elasticity—about .8 for all food items together—but for the time being this demand can be met at a small capital cost; the effect of this is to keep the aggregate capital-output ratio low compared with a country such as Italy where the rise in personal income comes as well as balance of payments postulates also make fairly heavy claims on agriculture but where the capital cost of expanding farm output is much higher: the best and most easily accessible land is already in intensive cultivation so that the further expansion of agriculture demands costly investments in land improvements.

As to Industry, one would expect differences in the degree of mechanisation and hence in capital-output ratios when comparing countries where conditions of relative factor supply are different. But a comparison between India and Italy does not throw much light on this. We merely note in passing that the estimated capital coefficients for new industrial investment (including handicrafts) are very similar in the two countries: they lie in the range between 1.5 and 2. Yet India's factory investments are actually capital-heavier on balance; with her good ore and fuel resources India is mainly building up industries which for inescapable technical reasons have high capital-output ratios. What makes up for this (apart from excess capacity) is investment in village industries where direct capital requirements still appear to be below unity. Thus in the production of particular commodities the choice of technique is actually exercised in favour of labour-intensive methods as a matter of state policy; the resulting combination of quite different technical forms of production is a typical feature of under-developed countries where handicraft system exists.

The general tendency, however, is for the large-scale and capital-using industries to increase in importance in developing countries. Where new industries are set-up—and we are now no longer confining ourselves to India and the comparison with Italy—they use as a rule the technologies applied in the advanced countries. Very often there is no choice; in other cases the labour saving which these technologies afford is so substantial that even semi-mechanised processes cannot hold their own reasonably competitive markets. This of course, entirely depends on the cost of labour in relation to machine work; and where labour is really cheap, it may not pay to mechanise operations in which machines merely substitute for numbers employed. The capital-labour ratio is generally lower in the underdeveloped countries (for the same type of operation or industry) but the capital-output ratio is often the same if one takes all operations together; separately they may represent quite different techniques. Broadly speaking, the more lavish use of man-power makes up for initial deficiencies or disadvantages. This seems to be the general picture but no doubt there are many variations.

CHANGES OVER TIME

So far we have mainly considered differences between countries and we must now bring in changes over time. Up to a point we are on safe ground here. It is self-evident that when a simple economy where capital goods play a minor role is transformed into a more modern one the average ratio of capital to output will rise; it will be driven up by the fact that additions to output are costlier in terms of capital expenditure than the old handicraft output. Some of the changes which bring this about can be looked at as results of development (e.g. consumer demand falling more heavily on capital-intensive goods as personal incomes rise in poor countries) while others may be treated as casual or independent, e.g. the increasing use of inanimate energy per unit of output. But whether it is for the one reason or the other, the fact remains that during this transformation the importance of capital as an input increases. Where marginal coefficients are now around 2.5 in under-developed countries, it is clear that the average ratio of capital to output is actually moving up from its handicraft base, and there is evidence also that even at the margin capital coefficients are rising in some of these countries. The main rise in the capital-output ratio probably occurs as a network of public utilities and public works is being created large enough to give more widespread productivity increases. These are the most expensive investments: the public utilities may have capital-output ratios up to six or seven times the national average, and they always absorb a substantial part of the investment resources. Thus in order to form an opinion on the question we raised, one might try to find out—but this could only be done country by country—whether the expansion programmes already in hand in the utility field might bring the distribution of the capital stock in line with expected demands or whether still further shifts into these expensive assets are likely to be needed to support that growth rate that is considered desirable.

SCOPE FOR TECHNICAL PROGRESS

In a country where only very small quantities of capital equipment are in use, the scope for technical progress through the provision of power and the mechanisation of processes is always large, and these are forms of technical change which generally tend to raise the capital-output ratio. It is only when the major items of capital are in place and scale factors begin to tell that economies in the use of capital come into their own and may gain the upper hand. Capital saving improvements do of course, occur all the time as part of the process of economic growth. By this we do not mean measures such as using existing equipment closer to full capacity or buying second-hand equipment, or building temporary structures (postponing their replacement by more durable assets until later), and so on; all these are adjustments that make economic development less burdensome for a while but they are not "progress". We mean, among other things, the training of labour and managements which represents a lasting form of capital saving improvement in that it increases the output obtained from equipment at any given level of mechanisation. It is a function partly of time and experience, and partly of the amount

of money spent on it. More specifically, we mean improvements in the production of investment goods making them cheaper in terms of other commodities (not only in terms of labour). Any such progress in the investment sector, even if it should be capital-using at the particular point where the improvement is introduced, will tend to lower the capital-output ratio for the economy as a whole, in the sense that a smaller part of resources (valued at current prices) needs to be invested for a given increase in the quantum of capital and the real national income as the resources employed in the investment sector become relatively more efficient.

In current discussions the question is always raised whether aggregate capital-output ratios in underdeveloped countries are higher or lower at the margin than in the advanced countries. Referring back to our table, one could answer that there is no difference —or at any rate there was no clear difference in a recent period—between the capital requirements (per unit increase in output) of poor and rich countries. What a similar table will show in, say, 15 years' time, we do not know. Capital-output ratios in the advanced countries declined over the last thirty years or so, but one cannot extend this trend mechanically into the future; recent indications actually point to a rise. The question is usually put differently, however. The economic development of the now advanced countries was associated in the late 19th century with capital-output ratios steadily rising to a level of 3.5 or even 4. Will economic growth in poor countries entail a rise to a similar level or has development become cheaper in capital than it was half a century or more ago?

TWO REASONS

There are two main reasons for expecting that the capital cost of development may be lower in present-day conditions, or will not rise as far as it did in the past, except in countries which are very poor in natural resources. The one reason is that the developing countries have the benefit of the capital-saving progress—the increase in knowledge—that has occurred in the meantime. This is most obvious—or at any rate, most relevant—in agriculture but it equally applies to industry where the efficiency and serviceability of capital goods has been increasing and is increasing all the time relatively to their cost. The second reason is that population is increasing faster in these countries —or accumulated labour reserves are larger—than in 19th century Western Europe. One generally expects relatively high rates of output growth for a given amount of accumulation when the increase in capital is associated with a relatively large increase in labour. The argument applies both to the way capital is used (with or without more labour) and to the cost of constructing it, particularly in the field of building. The argument is particularly strong where at the same time the productivity of agriculture can be raised at a relatively small capital cost which makes the recruiting of labour for construction work and its tooling up for industrial work easier and less expensive. Where conditions in agriculture are different—as they often are—this argument loses much of its force or breaks down.

There is also the point that a high rate of population growth or of recruitment of labour from rural areas may necessitate high housing and urbanisation costs. Investment in housing is always difficult to deal with because standards are so different in different areas. But on the whole developing countries should have the advantage of the progress in low cost housing techniques (compared with fifty years ago) although this may not be very significant. And in so far as industrial techniques now-a-days demand more capital per employed worker (but not per unit of output), the ratio of urbanisation cost to output is reduced as fewer workers are brought into the industrial labour force for a given increase in output. It is mainly on the strength of the first reason however—the increase in knowledge—that we would not expect capital requirements for economic growth to rise to the 19th century level. But since one of the points of this paper was that serious estimates can only be made on the basis of country studies, not too much importance should be attached to this guess.

TABLE A.

AGGREGATE MARGINAL CAPITAL-OUTPUT RATIOS
(1950-1955)

Countries	Growth rate of Output %	Gross Investment Growth of Output		Net Investment Growth of Output	
		Fixed Investment	Total Investment	Fixed Investment	Total Investment
	(1)	(2)	(3)	(4)	(5)
USA	3.9 (3.7)	3.7	4.0	1.8 (2.0)	2.1 (2.3)
Sweden	3.0	6.3	6.5	3.3	3.5
UK	3.3	4.6	4.75	2.1	2.3
France	4.2	(3.3)	(3.7)	1.8	2.1
Germany (1952-55)	9.0	2.2	2.7	1.6	2.0
Netherlands	4.0	5.0	5.7	2.8	3.5
Italy	5.7	3.3	3.5	2.0	2.2
All Latin-America	4.3	3.8	4.0	2.5	2.7
Argentina	2.0	10.8	11.0	..	..
Brazil	5.3	2.8	3.0	..	..
Mexico	4.8	..	2.7	..	..
Japan (1951-54)	5.4	3.7	5.0	2.5	3.8
Greece	6.0	2.3	2.7	1.8	2.1

NOTES TO TABLE A.

The countries are listed roughly in order of income per head. The marginal capital-output ratios are calculated as the ratios of domestic capital formation during the years 1950-54 to the growth of output between 1951 and 1955; for some countries a shorter period was chosen. The terms of trade effects are eliminated only from the Latin-American figures, but during the period in question these effects were quite insignificant for most countries, except perhaps in two cases.

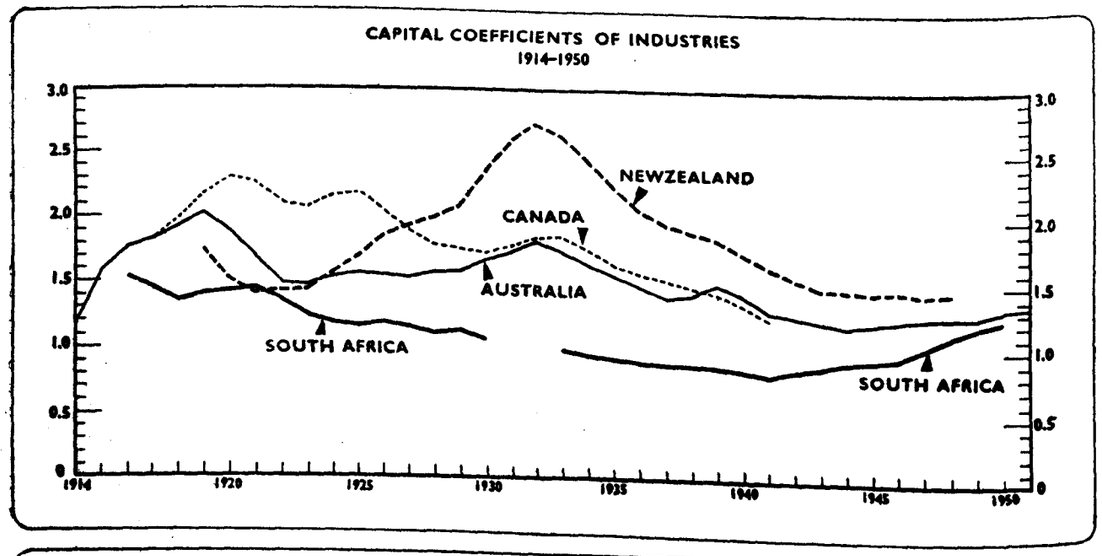
U.S.A.: The national output figures relate to the private gross product, those in brackets to the private net product. The difference is due to the change over the period in the capital consumption allowances calculated at constant prices.

Sweden: If terms of trade effects were removed, the growth rate of output might work out at about 2.8 per cent, with a corresponding increase in the capital coefficient.

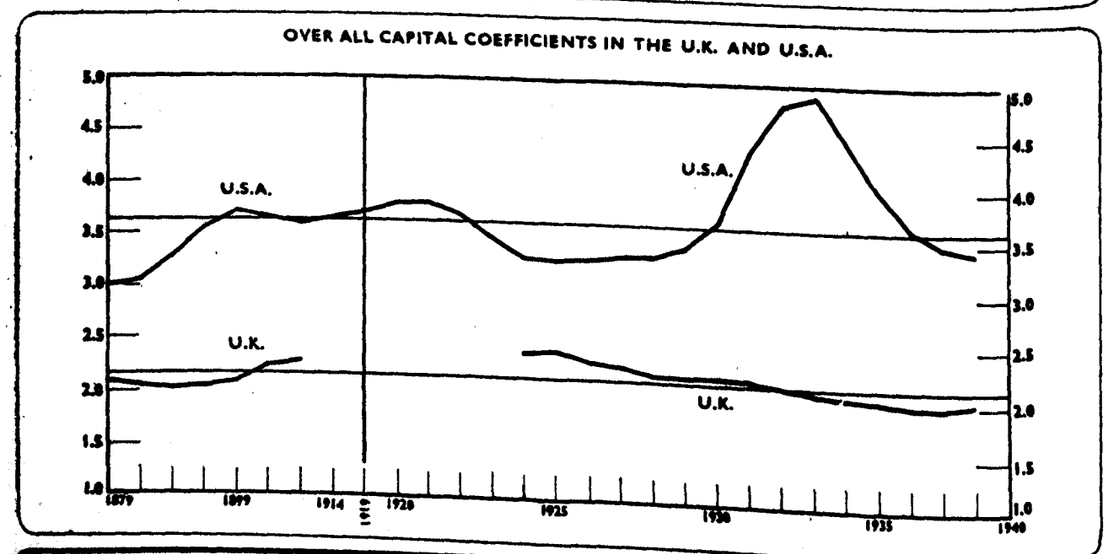
France: Official French figures of gross investment include expenditures on repair and maintenance. The figures in brackets are based on estimates of gross investment net of such expenditures (cf. Economic Survey of Europe in 1955, pp. 36 and 59).

Germany: The shorter period was chosen in order to exclude the period of reconstruction (or most of it).

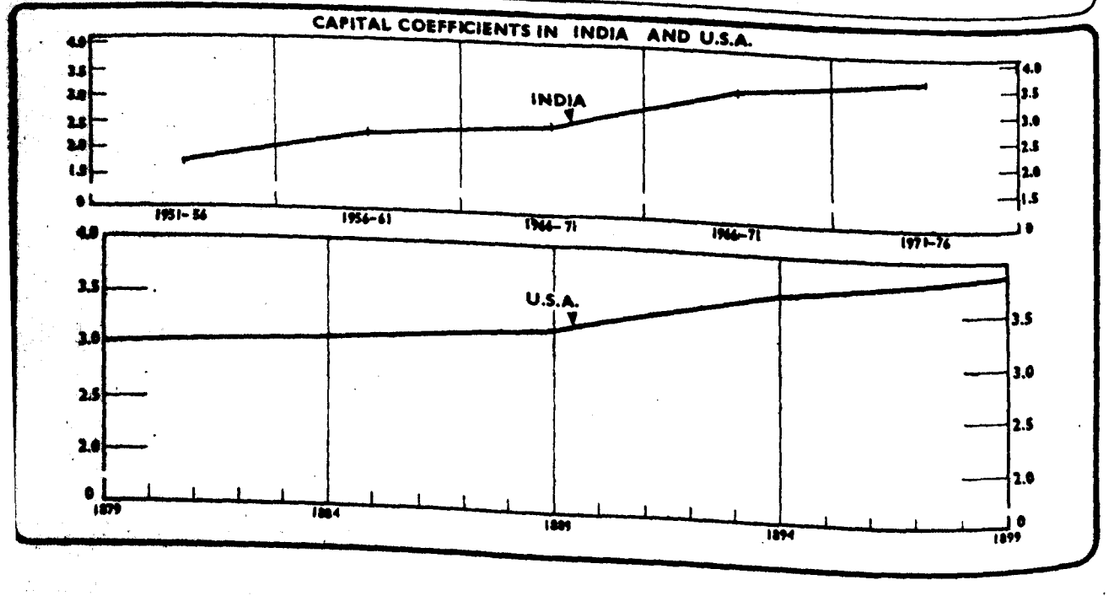
Yugoslavia: As in France, official figures of gross investment include repairs and maintenance. If they were excluded, the gross capital coefficient would probably be in the neighbourhood of 3.



Ceylon: A removal of the terms of trade effects might reduce the growth rate of output to about 4 per cent. No official figures of net investment are available but a recent survey of the Taxation Commission indicated that net investment constituted perhaps 85 per cent of gross investment. The figure in brackets is based on this estimate.



India: Capital coefficients are calculated on a synchronous basis for the period of the first Five-Year Plan (1951-52 to 1955-56). For the last year no separate figures of inventory accumulation was available. We allowed about 1 per cent of the national income for the non-monetary investment of the peasants; for monetized investment only, the capital coefficient in the last column of the table would be just under 2.



Burma: In the absence of a reliable terms of trade index, a short period was chosen over which terms of trade changes were small.

Cry, the Beloved Country

FROM all parts of India, there has risen a shrill, and almost agonised, cry against the new taxes imposed by the Finance Minister in his Budget on May 15. It is not the fact of a protest which is new; every Budget worth its name must stamp on someone's corns. It is the unique, and almost universal, character of the protest that has now been raised. There is no doubt that the vehemence of the protest has taken a large number of the supporters of the Government rudely aback. Thus it is not the volume of taxation alone which is in question, but its incidence on particular vocal groups, who are reflecting here undoubtedly the true feelings of the people. It is because this Budget is concerned as much with the people as with the Plan, that this Blue Supplement bears the title 'THE BUDGET, THE PEOPLE, AND THE PLAN.'

It is now clear that economic progress in India is to be a three-cornered business. If the instrument of finance is to be the Budget, and the reason for the application of the instrument is to be the Plan, it has now become clear that both instruments have to be brought into relation with a superior limiting factor —the attitude of the people, who are both for a bigger Plan and against the raising of the resources for it by excessive taxation or inflation. Herein lies the paradox, the significance of which has not been understood or explained in any recent economic literature. This is, however, only an old illustration of classical utility economic theory. The additional advantage of a larger Plan has to be balanced at the margin with the disutility of an additional dose of taxation. The cry that has risen all over the country is in fact a significant illustration of the point that the disutility of the Finance Minister's proposals outweighs the utility of a Plan of this size in the public mind.

The idea that the Indian people would vote for a bigger Plan at any price has thus been proved to be mistaken. It is not, however, enough merely to record this fact that the majority of the people in this country reject the current proposals even though they are in fulfilment of a national aspiration for economic progress. It is necessary to analyse closely the limits within which the disutility of taxation will overcome the utility of the Plan. Can it be that the standard of living of the Indian people is, with these proposals, being reduced, meaning in fact that the people are not being asked to contribute from increments but from their current standard of consumption? Or is it that, irrespective of the increments that have been produced, the Indian people would prefer to go more slowly in economic development in order to pay the price for a longer period? These are some of the points which are discussed in the current Blue Supplement. It is believed that for the lower middle classes as a whole, the limits of taxation and inflation have been passed.

It is suggested that the speed with which the excises have been developed is not in itself the core of the trouble. The middle classes have since 1948-49 suffered much more by the erosion of their incomes by inflation than by the strict incidence of new excises, though these, too, have been large. On the other hand, for the lowest income group it is clear enough that the taxes themselves are excessively burdensome. The total burden of both inflation and the new taxes is borne very unequally in the country. Those agriculturists who have substantial produce to sell would seem not to have been injured, for what they have lost in the higher prices of goods they buy and higher indirect taxation has been made good by the higher receipts for their goods sold. This cannot be said of the middle-classes who have lost both ways, at least so far as those who have had no increments of capital or substantial increase of income in the period.

Here, perhaps, one will find the majority of leaders, actual or potential, in the country's political life. Here, too, for the most part are the lower-paid civil servants and clerks and teachers and the vast army of opinion leaders in every democratic group. The kernel of India's political system is contained within their ranks. A grave risk is being run by the insistence that "the

people" — undefined — want a Plan of this size at any price. It is this consideration which makes it necessary to reduce the Plan or total economic outlay without further delay. In an article in this issue this case is advocated as the only immediate solution to our current difficulties. The Indian people will not take current levels of taxation; current levels of expenditure are not even necessary in themselves or for the Plan. It is just as vital that we should have a new expenditure pattern as that we should have reduced indirect taxation.

This is the theme of this Blue Supplement. It sets out, first, the burden of new taxes in the cost of living in general and secondly, of the middle classes in particular. It is not the current burden, however, alone which is important; it is the cumulative burden which makes a very different showing. It is argued that, since it is politically impossible to impose the burden on India's middle classes, the Government will need to cut its outlay substantially. To adhere to its present expenditure is unwise; in particular respects, it would be outrageous. The solution of the country's problems thus depends on a quick understanding by the Finance Minister that the political stability of the country is being shaken beyond repair by a wholly reckless exercise in academic finance.

The Excises and the Cost of Living

AT a Press Conference held on Saturday last the Finance Minister gave an official estimate of the impact of the additional excise duties levied in May to be of the order of 0.70 per cent in the case of a rural dweller and 1.38 per cent in respect of an urban dweller. Independent estimates have been made by the Research Section of "The Eastern Economist" to measure the increases in respect of the cost of living of these two classes. Table I below shows the impact on the rural cost of living higher at 0.96 per cent whereas in the case of the urban areas cost of living, it is practically the same at 1.17 per cent. But it needs to be emphasized that the above table omits matches and paper, which enter into the consumption pattern of an average Indian family. The omission is due to the fact that the weights to be assigned to these items are not available in the official National Sample Survey Reports. If they are taken into account the urban cost of living will approach the estimate given by the Finance Minister, while the rural cost of living will show a significant excess above the official figure of 0.70 per cent.

What is of much more practical value is the impact of the new duties on different income brackets, since it is obvious that the burden of the tax is felt with very different degrees of severity on different income groups. In table II below is shown the effect of the excise taxes on five income brackets in the city of Calcutta on the basis of the surveys conducted by the West Bengal Bureau of Statistics. It will be seen that the percentage increased burden varies as widely as from 0.47 in the highest income group (above Rs. 700 per month) to 1.03 per cent in the lowest income group (Re. 1 to Rs. 100 per month). Edible oils and sugar contribute heavily to the burden in the case of all the income brackets, and tobacco in the two lowest income groups. It is clear that the burden falls with particular severity on the two lowest groups, the greater by reason of the fact that the scope to manoeuvre expenditure away on these items is very restricted.

Measurement of the burden of excise duties considered in isolation in respect of the current financial year alone might indicate that the increase in the cost of living has been marginal ranging a little above one per cent. But it cannot give a real idea of the impact of the cumulative burden now being carried. Table III on p. (iii) sets out the growth in the net revenue of the Union Government from excise duties in the post-independence period. The rapidity with which revenue from excise duties is leaping forward is patent from the table. Between 1948-49 and 1957-58 net revenue from excise has mounted from Rs. 50.63 crores to Rs. 258.43 crores or more than five times over the whole period. This rise in excise revenue has been particularly steep since 1955-56. It will be seen that as against the total net revenue of Rs. 108.22 crores in 1954-55 the budget estimates for 1957-58 jump to Rs. 258.43 crores.

The leading contributors to the pile of excise duties are cotton cloth, sugar, tobacco, matches, and motor spirit. The last, of course, does not enter into the average family budget. But the remaining major contributors constitute important ingredients in consumer expenditure at the average or common man's level. Excise on cotton cloth was marginal at Rs. 0.87 crore in 1948-49 but now takes pride of place with a net revenue of Rs. 72 crores — a wholly astronomical figure in proportionate terms. Sugar shows an increase of more than five and a half time during the decade. The revenue from the matches shows a 100 per cent increase and tobacco a little more than 50 per cent.

What is the share of excise revenue in the total consumer expenditure in the economy? It is estimated that in 1957-58 consumer expenditure will be around Rs. 10,000 crores. If the Union Finance Minister succeeds in realising excise revenue of Rs. 258.43 crores in the current year, it will form two and half per cent of total consumer expenditure. This is the over-all average. The impact on lower income groups, especially on the middle class living in the cities is heavier.

The combined effect of all these excise duties on the lowest income groups (vide table iv) is of the order of more than five per cent. This burden becomes all the more severe in the lowest income group where the mean income of the family may be taken as Rs. 50 and the excise duties take away nearly Rs. 3. It is this sector of society which feels rebellious at the latest imposition, which just cannot be taken. In the highest income group where the income may be greater around Rs. 1,000 per month the increased burden amounts to Rs. 37 only. There is bitter injustice in the fierceness of the regression of these taxes.

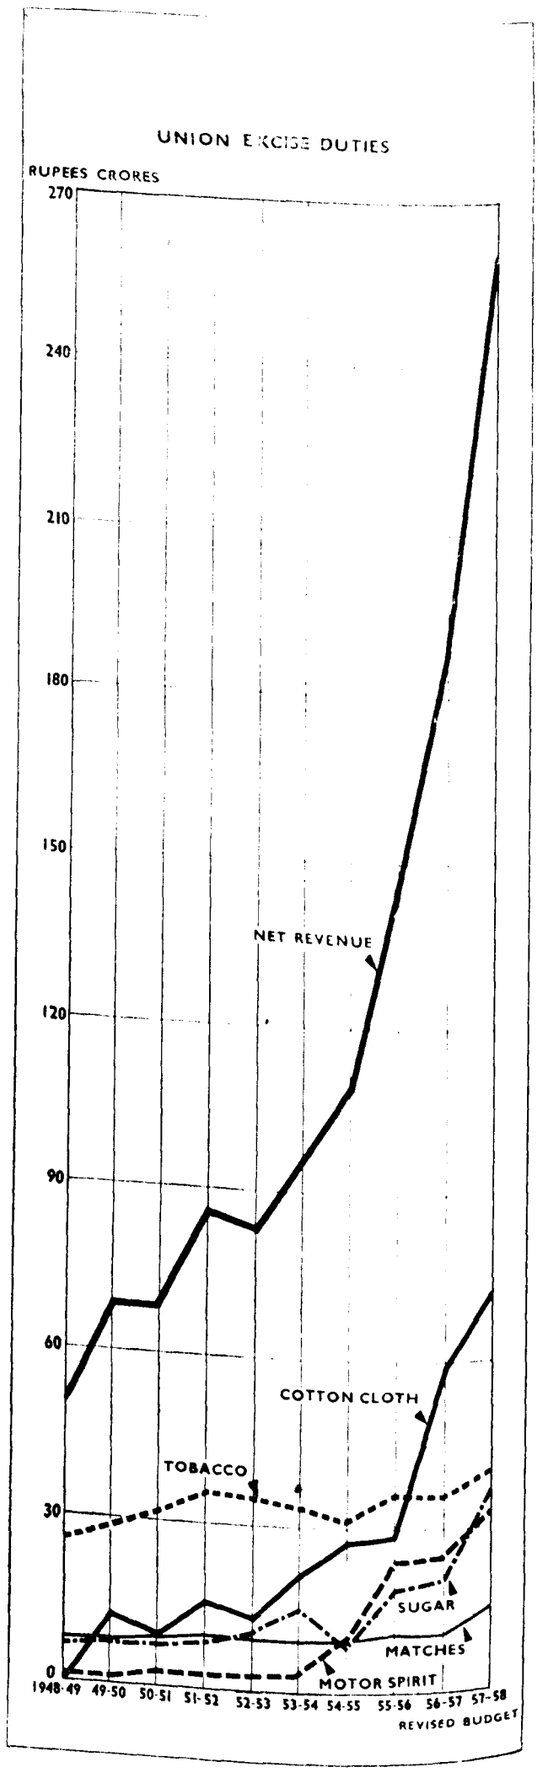
The Fate of the Middle Classes

IT is becoming increasingly clear that the lower middle classes, particularly in the large cities, have reached the limit of their capacity to bear additional taxation. This may look surprising since the average lower middle class income is substantially higher than the average per capita national income. It has been too often assumed that the middle classes are in a more fortunate position to bear additional taxation than the agriculturists. There are two important considerations which should now be recognised in order to correct this misapprehension.



In the first place, the effect of the rise in prices in general and of agricultural prices in particular have worked very unequally between agriculturists and lower middle class income groups. It is arguable that in the case of agriculturists, while they have to pay more for the goods they buy, they are no worse off than they were in 1948, and may conceivably be substantially better off. The graph on p. x shows that a parity index, showing the terms of trade for an agriculturist, has risen and fallen, but is now substantially above its 1948 figure so that it might be assumed that, so far an agriculturist with produce to sell is concerned, no injury has been done at present by the rise in prices. It is true that he has had to bear added excises but as the previous article will have indicated the total order of these impositions might conceivably be of the order of 5 per cent in the lowest income groups.

The position in respect of the middle classes is substantially different. This position is best described in the form of three tables setting out the real income of salaries class with money incomes from Rs. 50 to Rs. 1,000 per month in May 1948, May 1955 and May 1957. If we take the last two years it will be seen that a man with a monthly income of Rs. 400 after tax has an income of real pre-war value of Rs. 93.5 and a man of Rs. 1000 per month of only Rs. 222.9. In other words, in the last two years as Table IV will show he has had a fall in real income by 18.6 per cent at the Rs. 400 level and 18.7 per cent at the Rs. 1000 fall. Broadly, one might say that all income groups in the lowest income middle classes have had a fall in real income in the last two years of between

TABLE I.

REAL INCOME OF THE SALARIED CLASS AT PRE-WAR PRICES IN MAY 1957.

Monthly Income		Annual Income	Annual Income Tax	Annual Income after tax	Annual Income after taxes at pre-war prices	Monthly Income after tax at pre-war prices
Rs.		Rs.	Rs.	Rs.	Rs.	Rs.
50	..	600	—	600	141.8	11.8
100	..	1,200	—	1,200	23.6	283.7
150	..	1,800	—	1,800	425.5	35.5
200	..	2,400	—	2,400	567.4	47.3
300	..	3,600	18	3,582	846.8	70.6
400	..	4,800	54	4,746	1,122.0	93.5
500	..	6,000	120	5,880	1,390.1	115.8
600	..	7,200	192	7,008	1,656.7	138.1
700	..	8,400	305	8,095	1,913.7	159.5
800	..	9,600	419	9,181	2,170.4	180.1
900	..	10,800	550	10,250	2,423.2	201.9
1,000	..	12,000	688	11,312	2,674.2	222.9

18 to 20 per cent. This is the reason why the middle classes can take no further burden.

One should look at the performance of India's middle classes since 1948 in order to estimate the cumulative extent to which they have shouldered the burden of additional inflation and additional taxation. Prima facie indications are that for those whose money income has been constant it is of the order of 12 to 13 per cent in real income. It is true that most of this is not the result of taxation but the rise in prices, but the effect on the capacity to bear additional burden cannot be minimised.

What needs to be examined is whether in view of the steep fall in the standard of living of the lower middle class groups enthusiasm for the Plan can be expected from the people. The psychological feeling of having made contributions without acquiring any substantial benefits has grown to a point when it is likely to infect the body politic with an angry and possibly revolutionary vote. The benefit of the first Plan and presumably portions of the second have gone far more to agriculturists, to industrial labour and to the profit making classes than to the salaried classes in the income brackets described. It is time this trend was reversed.

TABLE II.

REAL INCOME OF THE SALARIED CLASS AT PRE-WAR PRICES IN MAY 1955

Company Profits, Taxes and Reserves

THE Finance Minister's Budget proposals in respect of taxation of company profits and company assets are of a mixed nature providing for a predominant increase in most respects and only fractional relief in two instances. It is pertinent to ask what would be the final effect of the budget proposals on company profits and their reserves inasmuch as these questions are quite crucial to the capacity of the private sector to fulfil its assigned part in the second Plan. An answer to this question would inevitably require a brief examination of the additional burden of direct taxes as offset by the partial relief which has been rendered.

It is significant that while the rates of income-tax on personal income have been reduced, the rate of income-tax for companies has been stepped up. As against the basic rate of 4 annas in the rupee, the new rate which the Finance Bill seeks to substitute is 30 per cent for income-tax. It will thus be seen that income-tax for companies has been increased by 5 per cent. The increase does not stop with income-tax alone. It is extended also to corporation tax. The corporation tax has been raised from 2 annas 9 pies in the rupee to 20 per cent, which means that there has been a change from 17½ per cent to 20 per cent. The Finance Minister has justified these additional levies on two grounds, namely, that its effect will be insignificant and it will help to check tax evasion. It is common knowledge that a high rate of income-tax is tolerated because the tax can be evaded; but the new theory propounded by the Finance Minister is that a still higher rate of income-tax would also serve to discourage tax evasion.

Consideration has been shown by the Finance Minister to the corporate sector in two directions. The excess dividends tax has been reduced from 12½ per

cent to 10 per cent on distribution of dividends between 6 and 10 per cent of the paid-up capital, from 25 per cent to 20 per cent on dividends between 10 per cent and 18 per cent and from 37½ per cent to 30 per cent on distribution in excess of 18 per cent. This reduction would go to mitigate the strain of taxation in some degree, but it is unlikely to have any mentionable effect on savings inasmuch as the lower rate cannot have the effect of discouraging distribution of dividends. In the next place the rates of super-tax for inter-corporate dividends which stood at 20 per cent for foreign companies and 17 per cent for Indian companies have been reduced to a uniform rate of 10 per cent. To the extent that this reduction serves as an incentive to investment of foreign capital in India, this relief is certainly to be welcomed. But this is only one among many important considerations governing the foreign investors' choice to invest in this country.

The hammer has come with full force on bonus issues. This tax has been raised steeply from 12½ per cent to 30 per cent. At the new rate bonus issues have been not only penalised but practically made prohibitive. There is a virtual ban on bonus issues which means no revenue will accrue under this head.

Undoubtedly the most controversial proposal of the Finance Minister is its imposition of the tax on wealth or on assets of companies. The Finance Minister has made a radical departure from Prof. Kaldor's proposals in extending the tax on wealth to companies which he never suggested. The Finance Minister's justification is that the tax on wealth for companies is called for in the peculiar situation prevailing in this country, but he has omitted to explain what the peculiar situation is. Its hardship will be manifold. A newly started company which may not have begun business will have to pay the tax. Whether profit or loss is earned, no company new or old can escape this levy. To add to this hardship, the tax on assets carries with it a positive element of multiple incidence. Company assets, shareholder's shares and the parent company's assets invested in the subsidiary companies will all bear the burden of tax at different stages but on the same subject-matter.

What will be the net effect of the new or enhanced taxes, minus reductions granted in two cases, on the reserves of companies? An attempt has been made to determine the nature of this effect with reference to the analysis carried out by the Research Department of the Reserve Bank of India in respect of the finances of 358 public limited companies before the present Companies Act came into force. The table alongside gives the important components of the finances of these 358 companies for the year 1955. For the sake of hypothesis it is assumed that all the components mentioned in the table except retained profits will remain stationary in the first year of the enforcement of the new taxes. The reason why retained profits cannot be assumed to remain stationary is obvious. The net additional burden of the new taxes, after making allowance for the two fractional reliefs granted, will directly go to reduce the quantum of retained profits. On approximate computation, the net increase due to the new proposals, other than the tax on wealth, will be to raise the total burden by Rs. 1 crore on the 358 companies. The tax on wealth is roughly estimated to bring a yield of Rs. 0.5 crore. In the result retained profits will be reduced substantially from Rs. 7.1 crores to Rs. 5.6 crores or by about 20 per cent. This is the effect of the new proposals on the selected 358 companies; it may be assumed the results of all companies will be of the same order. The Finance Minister's estimate of the proceeds from the tax on wealth in the aggregate is of the order of Rs. 15 crores. On a reasonable calculation the share of tax (wealth) from company assets may be placed at a minimum of Rs. 3.5 crores. Any way these proposals are examined, the level of corporate profits, corporate reserves and dividends will be substantially lower than it is now.

ANALYSIS OF 358 PUBLIC LIMITED COMPANIES

	Rs. Crores 1955
Paid-up Capital	138.4
Reserves	
General	50.2
Development	19.6
TOTAL	102.9
Borrowings	96.4

Provision for depreciation	13.4
Profit before Tax	31.4
Provision for Taxation	11.7
Dividends	12.6
Retained Profits	7.1
Effect of Taxes	
Net increase in the taxation by new imposition on companies	1.0
Tax on wealth	0.5
Retained Profits after Tax	5.6

Taxation: Present and Future

THE rate of increase in the Central Government's taxation has outstripped the rate of increase in national income since 1955-56. The estimated gross revenue from all taxes in 1957-58 (Budget) constitutes 5.5 per cent of the estimated national income of 1957-58 whereas the gross revenue from all taxes in 1955-56 (Accounts) constituted 4.5 per cent of the national income of that year. An increase of 1 per cent is not trivial, it may also well turn out to be something more for the 1957-58 estimates may turn out to be underestimates as budget estimates of tax revenue usually do. The only static part of the story is that the proportion of direct taxation to all taxation continues to be around 35 per cent in 1957-58 (Budget) as in 1955-56 and 1956-57. A fuller picture of the course of taxation can be had from the table on the next page.

TAXES LEVIED BY CENTRAL GOVERNMENT

	1955-56 (Accounts)	1956-57 (Revised)	1957-58 (Budget)	Percentage increase in 1957-58 over 1955-56
Gross Revenue from direct taxes (in Rs. crores)	170.2	192.1	225.1	32.3
Gross Revenue from indirect taxes (in Rs. crores)	312.0	359.7	426.4	36.7
Total Gross Revenue from all taxes (in Rs. crores)	482.2	551.8	651.5	
Direct taxation as a per cent of all taxation	35.3	34.8	34.6	
Percentage increase of all tax revenue over 1955-56	—	14.4	35.1	
Estimated National Income in 1952-53 prices (in Rs. crores)	10,800	11,336	11,872	
Percentage increase of National Income over 1955-56	—	5	10	
Total Revenue from all taxes as a per cent of National Income	4.5	4.9	5.5	

It may be seen from the above table that indirect taxation has increased to a somewhat greater extent than direct taxation. This, however, can be no consolation to the persons who pay taxes on their personal and corporate incomes, for it is not as if the burden of all indirect taxation can be wholly shifted to the consumer. In the circumstance it may be roughly taken that direct taxation has increased to the same extent as indirect taxation. Any case for some reduction in overall direct taxation, however, cannot be easily sustained without simultaneously pleading for a reduction in over-all indirect taxation so that the relative level of direct taxation might continue to be around 35 per cent.

One may plead here that the United Kingdom which has served as an example for this country in the matter of income-tax level should be also an example in the matter of direct-taxation proportion to all taxation. It is true that direct taxation in the United Kingdom constitutes as much as 52.5 per cent of all taxation (as of 1956) as against 35 per cent in India. It is, again, true that there are greater inequalities of income and wealth in India than in the United Kingdom. But what is likely to be forgotten in any such comparison between the two countries is that the one is an advanced or well-developed economy while the other is under-developed. While it has become more or less axiomatic in the context of post-war concepts of economic development of underdeveloped countries that public investment has to be relatively larger than ever before, the concept of mixed economy has also come to require that private investment should be encouraged to maintain a high level. As the pool out of which capital forms is a single pool, redistributive taxation (in so far as it constitutes capital formation in the public sector) has to be broadly related to the rate of savings in the economy as a whole. Such redistributive taxation appears to have reached a higher level consistent with the higher rate of savings and the higher level of economic development in the United Kingdom; in the same way redistributive taxation in India has naturally to be at a lower level consistent with her lower rate of savings and lower level of development. It should not be forgotten that if the United Kingdom as a most developed country is now most taxed, it was not taxed so much at the stage when it was not developed so much. It would, therefore, be appropriate if India as an underdeveloped country comes to have an optimum in the field of direct taxation for the duration of the second Plan which has decreed some spectacular capital formation in the private sector. That this optimum cannot be anything more than 35 per cent of all taxation, can only be pragmatically determined in the light of the complications caused in the capital and money markets by the taxation measures since last year.

As indirect taxation has reached the peak level in 1957-58 (the additional excise duties are nearly like the last straw on the camel's back), any additional taxation contemplated by the Finance Ministry may only be mostly in the field of direct taxes. If this logical possibility should become a probability, the proportion of direct taxation to all taxation would go considerably beyond 35 per cent. It is here that the Kaldor Report on Tax Reform acquires an alarming significance. Already three major taxes — on capital gains, wealth and expenditure — recommended by Kaldor have found favour with the Finance Ministry. Of these three, the capital gains tax is already on the Central fisc; the annual taxes on wealth and upper class expenditure, now proposed await, approval by Parliament. The general gift tax proposed by Kaldor hovers in the background. That the Kaldor Report is coming to be implemented by instalments, is now clear. The relevant question is why, in spite of the meticulous estimate of the Central Board of Revenue that the income evading tax cannot be more than a third of that estimated by Kaldor and in spite of the Board's confident judgment that the tax-evading income could be largely tackled by strengthening the Income-tax Department, the Finance Ministry has chosen to implement the crucial proposals in the Kaldor Report without at the same time bringing down steeply the maximum rate of tax on income as near as possible to the 45 per cent proposed by Kaldor.

It is only pertinent to ask that question because the Finance Ministry perhaps wants to have the best of both the worlds — high rates of income-taxation and the Kaldor taxes to boot. The basic justification for the Kaldor proposals is that the huge income (about Rs. 525 crores) evading tax cannot be got at except by diversifying the tax structure so as to catch it at different points. If, as the Central Board of Revenue has estimated, the income evading tax is not of the magnitude estimated by Kaldor, the case for taxes on wealth, expenditure, gifts, etc., falls to the ground. It is indeed contradictory that the Finance Ministry should believe in the Board of Revenue's estimate of tax evasion and act on that basis by not reducing steeply the maximum rate of income-taxation and that the Ministry should at the same time implement the Kaldor devices intended for getting at the income which is supposed to evade tax precisely on account of the high rates of income-taxation. If the Finance Ministry believes in the stand of Kaldor as well as of the Central Board of Revenue, it can only

mean that the burden of direct taxation is sought to be increased far beyond the level reached in 1955-56 when the Planning Commission itself thought that "some of the measures which might reduce inequalities are apt to react adversely on incentives". The country may have to pay a heavy price in terms of delayed development if redistributive taxation of the kind already prevailing is to be made fully egalitarian at a time when production should be the paramount consideration.

Pruning the Plan

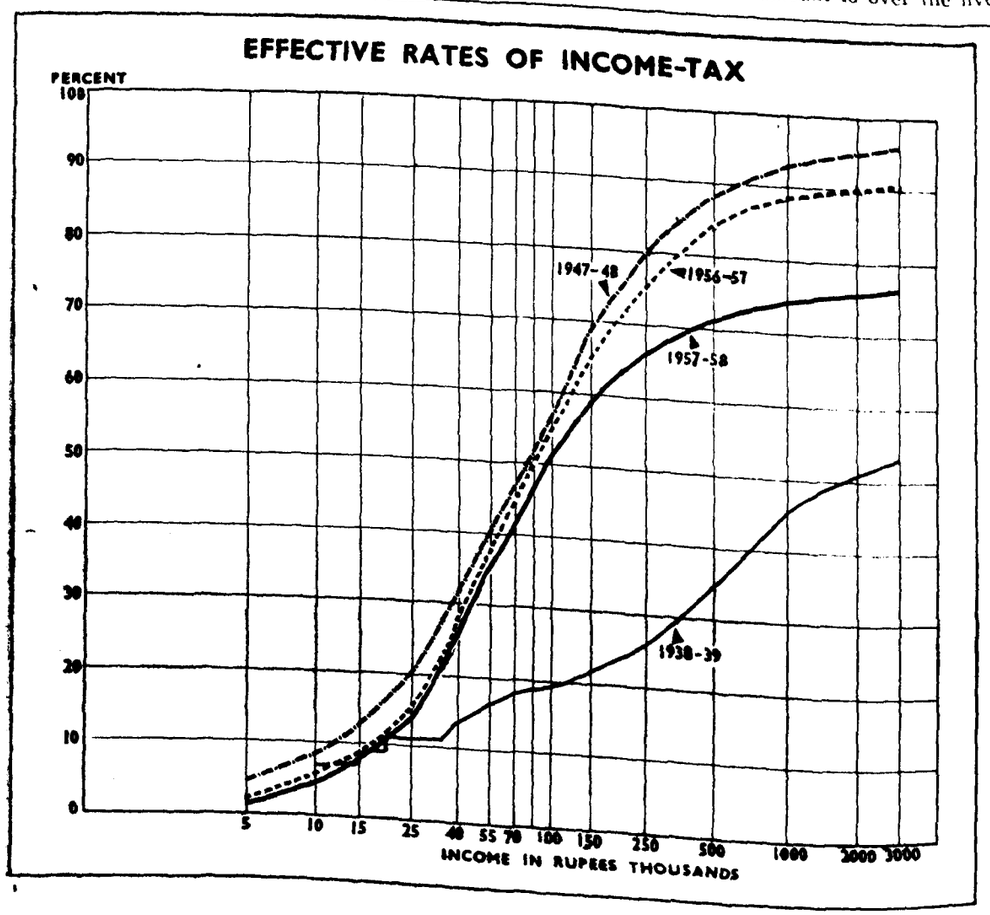
IT is now obvious that the second Five-Year Plan has run into difficulties even during its first year. This the Finance Minister himself has conceded. The strain on the economy has been both in the matter of internal and external resources. The steady decline in the foreign exchange resources, the sharp rise in domestic prices and the acute stringency in the money market even during the slack season are all symptoms that are unmistakable. They indicate clearly that the economy has been subject to an inflationary pressure of an intensity which calls for a re-thinking on the further progress of the Plan.

The Finance Minister has stated that it is not possible to say at this stage to what extent the progress of the Plan will be affected because of foreign exchange. But the decline in the reserves certainly calls for a slowing down of development. It is right that the Government should concentrate on carrying through the projects in the 'core' of the plan, viz, steel, coal, transport, and ancillary power and "not make fresh commitments till the outlook becomes clearer". In thus admitting the "inevitability" of some rephasing of the Plan, the Finance Minister has indirectly conceded that the Five-Year Plan cannot be completed in the scheduled period or alternately the targets should be pruned if the Plan is to run its course on an even keel.

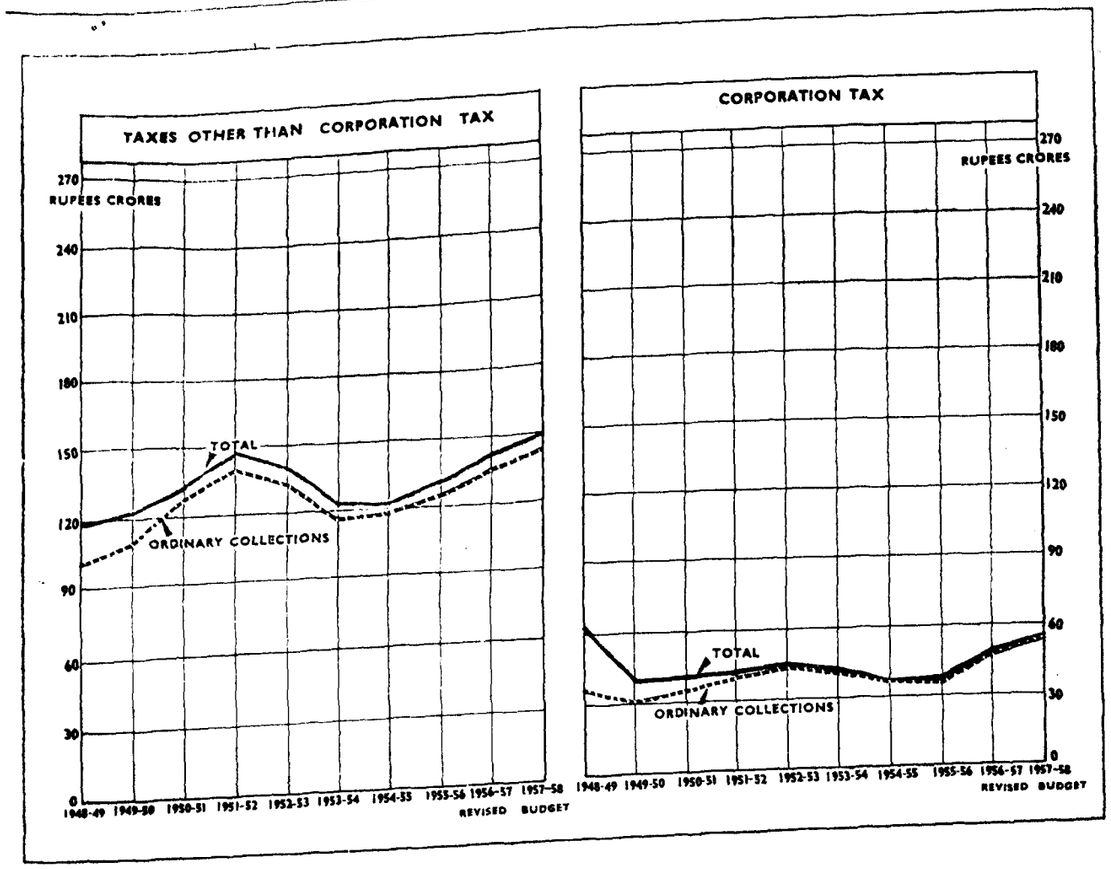
It is estimated that the actual outlay on the Plan in the first year was approximately Rs. 700 crores as against the budgeted outlay of Rs. 825 crores thus leaving a shortfall of Rs. 125 crores. If one were to take into account the rise in prices since last year the shortfall in real terms is likely to be larger. The moral is clear. To the extent that the target of the Plan expenditure has not been realised, to that extent the Plan has remained unfulfilled and there is no use clinging to a target that has no solid base in resources.

The total Plan outlay for 1957-58 of the Centre and the States has been put at Rs. 915 crores (Rs. 775 crores for the Centre and Rs. 140 crores for the States). The outlay on the Railway Plan has been increased by Rs. 200 crores which means that an extra Rs. 40 crores has been added to the current year's outlay, which makes for a total of Rs. 955 crores. "The Eastern Economist" in its Budget Number of March last has argued the case for pruning the expenditure by Rs. 150 crores (Rs. 80 on the schemes of the Centre plus Rs. 70 crores consequent on the shortfall that is likely to arise in the attempt to raise additional resources by the States considering their first-year performance). If the outlay on the Railway Plan for the current year to the tune of Rs. 40 crores is taken into account, it now becomes necessary to prune expenditure to the tune of Rs. 190 crores. A recent development which has not been taken into account when the Plan was framed was the rise in the defence expenditure. The estimates for Defence Services show an increase of Rs. 49.76 crores over the revised estimates for the current year and what this increase would amount to over the five-year period and its effect on the curtailment of the Plan are not yet known.

In the pruning of the Plan expenditure for the current year, the following factors may be borne in mind while assigning the priorities:



1. First priority should be given to the projects in the 'core' of the Plan which ensures the basic industrialisation of the country.
2. Schemes which contribute to an early increase in agricultural production.
3. Schemes which increase export earnings and reduce import needs without making an excessive claim on foreign exchange resources in the immediate future.
4. Schemes which have already been commenced and on which considerable expenditure has been incurred.

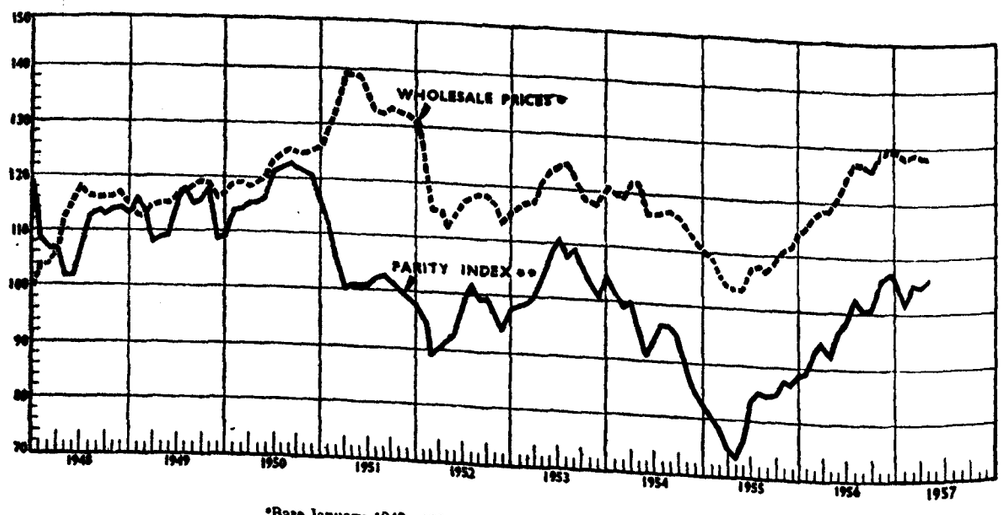


It is in the light of these considerations that a rough indication is given below of how some of the schemes sponsored by the various Ministries can be pruned from the current year's proposed outlay for which financial sanction is sought.

First of all the axe must be applied severely on lavish building programmes which is a luxury that the country cannot afford now. To mention just a glaring example, the construction of the Ashoka Hotel in the capital is an expenditure that is totally indefensible. The Government at first entered into participation in floating a public limited company and subscribed Rs. 26 lakhs and ultimately as the company was not in a position to meet the commitments it had already entered into, the Government had decided to take over the entire project. In the revised estimate for 1956-57, a provision of Rs. 58 lakhs has been made for the purchase of the remaining shares of the company. The sprawling of innumerable buildings in the capital as well as different parts of the country does not betray any sense of auterity or economy on the part of the Government that it often professes. Several State Governments also seem to indulge in the luxury of costly building programmes. A case in point is the lavish constructions in Chandigrah, the new capital of Punjab, which has drawn the scathing criticism of even a Congress member of the State's Assembly.

The schemes of the Ministry of Works, Housing and Supply on 'Delhi Capital outlay,' 'Capital outlay on buildings' and 'Other capital outlay' are of the order of over Rs. 14 crores and many of them can certainly be postponed or even shelved. For the construction of the Supreme court buildings costing about Rs. 45 lakhs in the capital, a provision of Rs. 6 lakhs is made in the budget estimates for 1957-58 and already over Rs. 36 lakhs seems to have been incurred on it. The housing programme of the Ministry also requires greater scrutiny. For example, the low income group housing scheme and the slum clearance scheme, though certainly laudable, cannot be implemented at this stage and a saving of about Rs. 6 crores can be effected in the current year on this account. The various schemes of this Ministry require severe pruning and drastic economy effected if Government's intentions to concentrate on the essentials are to carry conviction.

The Department of Atomic Energy is a newly created one and its capital outlay for the current year is placed at Rs. 9 crores. For Atomic Energy research, a provision of about Rs. 2¾ crores, to be met from 'Revenue', has been made. India is a late comer in



this field and since progress here is in any case bound to be slow, there is a clear case for 'going slow' on expenditure over this department. Since the 'core' of the Plan is steel, coal, transport and ancillary power, the schemes of the Ministries pertaining to these must be left more or less untouched. But even in regard to transport, development on civil aviation need not claim any high priority The capital outlay on civil aviation is about Rs. 3 crores which includes construction of new aerodromes, purchase of equipment and so on, and there seems to be no urgency in their implementation. A provision of Rs. 5 crores has been made for purchase of aircraft and other items of capital expenditure for the Indian Airlines Corporation. A reduction here is also certainly warranted. Some of the schemes with regard to communications like the expansion of the telephone system in many States also do not seem to be in the category of high priority. Similarly the proposal to lay an underground trunk cable between Bombay, New Delhi and Calcutta, estimated to cost Rs. 8 crores can be postponed for a later period.

With regard to the schemes that come under the purview of the Ministry of Irrigation and Power, the criterion should be to go ahead with those that have already been begun and have fairly progressed. The other schemes on which investigations are in progress and have just begun must naturally wait. For example, only preliminary works are in hand in the case of the Nagarjunasagar project and it is a big project to be taken up in three stages and the first stage itself is estimated to take seven years for completion. A provision of Rs. 5.5 crores has been made for this project for 1957-58 which can be naturally postponed. Some of the flood control programmes are also of a long-term nature and expenditure on these can be modified to suit the present exigencies.

The capital outlay on the schemes of the Ministry of Commerce and Industry runs into about Rs. 15 crores and besides this, expenditure is also met from revenue account. There is scope for considerable savings of expenditure on small-scale industries, village industries, khadi, handicrafts, silk industry and so on. For instance, the Ambar Charkha programme which is to cost Rs. 10.09 crores during the current year (Rs. 3.12 crores by way of grants and the balance by way of loans) seems to be ill-timed. So far as the schemes on social services are concerned, a drastic reduction in expenditure is essential if the Plan outlay during the year is to be reduced to manageable proportions. The grant to the Central Social Welfare Board for the year is to the tune of Rs. 1½ crores and since welfare activities of the type sponsored by the Board have no immediate urgency, expenditure on these also can be postponed. Similarly many of the schemes sponsored by the Ministries of Education and Health can be vigorously pruned. Though schemes relating to agricultural production claim undoubtedly a very high priority, here again importance should be given to those that will bring about immediate benefit like 'grow more food' schemes, minor irrigation, distribution of improved seeds and fertilizers etc. But a considerable reduction in expenditure is possible by pruning schemes of lesser importance. There seems to be also great scope for reduction of expenditure that now goes on the staff and establishments of various Ministries that requires closer examination. The magnitude of the task is no doubt colossal. But realism demands that all energies should now be bent upon cutting the Plan outlay to a realistic and manageable size. There is no denying that the Plan as at present is too ambitious and it is only by a drastic revision that a considerable portion of it can be salvaged. What is attempted here is just an outline of the several directions in which pruning appears to be necessary. It is realised that anything like a careful and detailed scrutiny of the hundreds of schemes that form part of the second Plan both at the Central and State levels would be possible only if the Planning Commission publishes, as in the case of the first Plan, details about the various development schemes.

The Rationale of Regulation

POWER like transport must get precedence over most of the industries in any developing economy. This strategic importance makes it essential that policy for power ought to ensure that all resources and reasonable facilities needed for smooth and rapid development of the electricity industry—which undoubtedly constitutes the predominant source of power in this country —are made available to it and in any situation no handicaps are allowed to be raised. It is an accepted principle that a public utility like electricity supply should function within a broad framework of legislative regulation. But in actual policy not enough appreciation has been shown that regulation ought to be based on liberal principles which will allow the industry to maintain basic flexibility.

This should be evident from the operation of the Electricity (Supply) Act, 1948, in relation to the undertakings in the private sector. The significance of these undertakings in the economy ought to be plain from the fact that at the present time they are responsible for half of the generation and three-fourths of the distribution of power in this country. Despite the deliberate emphasis on the expanding role of the public sector in all future development of power, the private sector is bound to retain its vital function in the economy. In the second Five-Year Plan, it has been enjoined to find resources for investment of the order of Rs. 42 crores. An examination of the regulation of this industry, therefore, is a matter of considerable importance and easily the legislative controls which have a direct bearing on the financial structure of the industry call for a critical analysis. The purpose of this Blue Supplement is to make a broad analysis of this issue.

The technical analysis which is attempted in the articles that follow centres round the salient provisions of the Electricity (Supply) Act, 1948, and the modifications contained in the Electricity (Supply) Amendment Act, 1956. It is a positive indication of the healthy attitude taken by private electricity supply undertakings that they are fully appreciative of the progressive modifications incorporated in the law by the Amendment Act of 1956. The Standard Rate of Return is no longer pegged to an arbitrary limit of 5 per cent fixed in the Electricity (Supply) Act, 1948. The Amendment Act of 1956 provides a mechanism for the automatic adjustment of the rate to the money market by linking it to the Bank Rate, the precise provision being that the rate should be fixed at a level 2 per cent higher than the Bank Rate. Some measure of overdue relief has been given to the industry by virtue of the provision which lays down that tax savings arising out of the Development Rebate allowed under the Finance Act are to be carried to a Development Reserve. In parenthesis it may be mentioned that the undertakings have been awarded a merited exemption from the radical restrictive measure of compulsory deposit of specified company reserves with the Reserve Bank.

Nevertheless, the fact cannot be disputed that executive policy may undermine reliefs granted to the industry in the supreme interest of flexibility. This point is best exemplified by the queer anomaly whereby the Reserve Bank's rate of interest on advances to scheduled banks was raised to 4 per cent, while the official (or was it notional?) Bank Rate was retained at 3½ per cent. This freak of policy threatened to deprive the industry of the real and tangible benefit of the automatic adjustment of the Standard Rate of Return even before it could become operative on April 1, 1957. The anomaly has since been rectified with the raising of the Bank Rate to 4 per cent.

One most vital financial problem of the industry still remains to be resolved. It relates to the Deferred Tax liability. It has been demonstrated in an exhaustive analysis of this question in the last article in this Supplement that the industry must be enabled to meet this liability by an appropriate legislative provision. In any event, the fullest consultation with the industry is essential to evolve the needed formula. It is a matter of encouragement that this issue is now under active consideration. All regulation of the industry, and regulation in executive policy in particular, must ensure that the investor's confidence in this industry which is now rudely shaken must be restored and fortified.

Revision of the Electricity (Supply) Act

WHILE the general tendency in post-independence Parliaments has been for the legislative process overtaking the needs of a situation, the Electricity Supply Industry is a classic example where there has been a legislative lag. Immediately following the enactment of the Electricity (Supply) Act in 1948, the need for modifying the law to promote a proper regulatory climate was keenly felt. Proposals for amending the law came to be considered as early as 1951, and it took as long as 5 years for the legislative process to be complete in this instance, leading to essential amendments to the principal law by the Electricity (Supply) (Amendment) Act, 1956.

The changes brought about by the new law could be grouped into three broad heads. They cover (1) modifications to the law in relation to the State Electricity Boards; (2) important changes to the financial principles affecting Licensees as are embodied in the Sixth Schedule, and (3) changes which, by and large, govern regulation.

Under the 1948 Act, the provisions governing removal or suspension of the Members of State Electricity Boards were in line with the general provision governing Directors' disqualification in a typical Company's Articles of Association. These have now been brought in line with analogous provisions in the Damodar Valley Corporation Act, 1948. Under the new Act greater powers of control over the Boards are vested in State Governments.

A State Electricity Board could prepare, on its own, schemes without any monetary limit under the old Act, but a restriction has now been placed in that no scheme or part of a scheme estimated to result in a capital expenditure exceeding Rs. 15 lakhs shall be prepared by the Board without prior consultation with the State Government. There has also been a loosening of control by the Central Electricity Authority in that the limit of capital expenditure on the schemes which can be now sanctioned by the Board without consulting the Central Electricity Authority has been raised from Rs. 50 lakhs to Rs. 1 crore.

Under the Electricity (Supply) Act, 1948, the State Electricity Boards are subject to income tax, but the law in tabulating the priority of liabilities of the Boards had made provision for a number of disbursements which would have left no "profit" liable for tax. The amending Act of 1956 has stipulated that taxes on income and profits should have priority after the operating and management costs have been met. The other statutory distributions can only come thereafter.

Under the principal Act a State Electricity Board was enjoined to maintain "such proper books of account and other books in relation to its accounts as the regulations may require". This provision has now been stiffened by the Board being called upon to keep proper accounts and other records, including a proper system of internal check. The Boards are also to prepare accounts, including the profit and loss account and the balance sheet "in such forms as may be prescribed by the State Government in consultation with the Comptroller and Auditor-General of India." The accounts of the State Electricity Boards are now to be audited by the Comptroller and Auditor-General of India or by such person as he may authorise in this behalf.

An additional obligation imposed on the State Electricity Board is that, while submitting to the State Government the annual report, an account is also to be given to the Government of the activities, if any, which the Board is likely to undertake in the next financial year.

By a new Section, the State Government is empowered to issue directions to the Board on questions of policy. If any dispute arises between the Board and the State Government as to whether a question is or is not one involving policy, provision has been made for the dispute being referred to arbitration by the Central Electricity Authority.

Under the amended law, general consumers of electricity are to have representation on the State Electricity Consultative Council.

These changes are intended "to ensure the co-ordination of development policies of the State Electricity Boards with those of Government Departments." The 1948 Act having proclaimed that it is semi-autonomous bodies such as Electricity Boards which are suitable for furthering development, it may be that the supervisory powers now vested in State Governments may cut across the original idea. The provisions in the Act with regard to Electricity Boards have remained unimplemented in most of the States, and it is therefore too early to say whether greater powers of control now vested in State Governments will promote or retard the development of electric power.

It is vital to refer at this stage to the changes in the law which are primarily of a regulatory nature. Under the 1948 Act, the State Government or the State Electricity Board, as the case may be, was empowered to issue directions to Licensees "for the purpose of achieving the maximum of economy and efficiency in the operation of the Station." This power of direction has now been extended to cover the undertaking or part thereof. To safeguard against abuse, it has been stipulated that the 'directions' given should be 'reasonable' and then again any disputes arising under the Section are subject to arbitration by the Central Electricity Authority.

Under the 1948 Act the Electricity Boards had powers to issue directions in regard to the amortization and tariff policies of Local Authority Electric Supply Undertakings, these undertakings being exempt from the financial provisions which apply to undertakings in the commercial sector. This power has now been circumscribed by a specific provision that the Board shall not issue any directions except after obtaining the prior approval of the State Government. This change has for its background the interests State Governments have in the financial policies of Local Authorities.

The Electricity (Supply) Act, 1948, when it fixed a limit on the return permitted to the investor, had also provided that the Licensees shall be free to adjust their rates to consumers in such a way as to enable them to earn the Reasonable Return, notwithstanding any limitations imposed by their licences. During the brief period the Act has been in force, one High Court had taken the view that the Act has not been explicit about Licensees' rights. The situation has now been rectified by the amending Act making it clear beyond doubt that the powers of Licensees for adjusting rates include enhancement of rates irrespective of the limits imposed by the Licence.

The power of the State Government or the State Electricity Board to enforce a Rating Committee under the principal Act operated as a deterrent against licensees adopting suitable tariff policies within the framework of the Act. A Rating Committee could previously be constituted if the regulating authority was "satisfied" that the Licensee had committed a breach of the provisions of the Sixth Schedule — a "discretion" which was regarded as "subjective". To adjudge a person guilty without indicating the grounds in that behalf offends against the established postulates of law. The 1956 amending Act has, therefore, made it obligatory for the State Electricity Board or the State Government, as the case may be, to give to the Licensee a "show cause" notice before the appointment of a Rating Committee and then again, if the issue or issues cited raise disputes, they are first to be arbitrated upon by the Central Electricity Authority. This equitable provision should introduce an element of stabilisation in rate-making policies of Electricity Supply Undertakings.

The composition of the Rating Committee has been improved upon. Under the 1948 Act, in the States where Electricity Boards have been constituted, the Rating Committee, when one was constituted, comprised two members of the Board, who, in turn, co-opted one representative from the Licensees' Association. With the Board initially determining whether or not a Licensee has committed a breach of the provisions of the Sixth Schedule, the recommendations of the Rating Committee (with majority representation for the Board) would in all probability not be different. The amending Act has, therefore, provided that the Board should not have more than one representative on the Rating Committee. The result is that, of the three members of a Rating Committee one is to be a judicial member (who is also to be the Chairman) to be appointed by the State Government, the other a member of the Board having experience of accounting and financial matters and a third a representative from the Licensees' Association jointly co-opted by the two members earlier mentioned.

A large part of the amending Act deals with changes in the financial principles affecting Licensees. Under the Principal Act a Licensee could not be considered to have violated the provisions of the Sixth Schedule if the clear profit did not exceed the reasonable return by more than 30 per cent. This margin was considered a necessary safeguard against Licensees being faced with the charge of violating the provisions of the Sixth Schedule if by chance they exceeded the limit of the Reasonable Return. Of this margin, one-third, subject to a ceiling of 7½ per cent of the Reasonable Return, was to be at the disposal of the undertaking as a premium on efficiency. The margin has now been limited to 15 per cent and the Licensee's share remains at one-third subject to a ceiling of 5 per cent of the Reasonable Return.

Deposits made by consumers against Bills were, where invested in the business, permitted to be included in the Capital Base under the 1948 Act. Such funds are now to be deducted from the Capital Base.

Under the principal Act interest on loan capital was permitted as an operating expenditure. The amending Act has laid down that such interest is not to be charged to revenue.

Interest on capital expenditure incurred from borrowed money was permitted to be capitalised under the 1948 Act. Such capitalisation is now restricted to new Licensees. This should not impinge existing Licensees seriously as under a case law established by the Central Electricity Authority in an arbitration, works-in-progress either at site or at manufacturers' works are permitted to be included in the Capital Base, thus ranking to earn the Reasonable Return.

Against these restrictions must be set the increase in the Reasonable Return consequent to the linking of the "Standard Rate" to the Reserve Bank Rate with a differential of 2 per cent.

The amending Act has also brought out clearly that no limitation on dividend or distribution of profits is intended in cases where the depreciation set aside for the year includes the normal component for the year and the equated instalment in respect of arrears, if any.

Another incentive feature of the amending Act is that the Electricity Supply Industry has been enabled to take the benefits of the Development Rebate permitted under the Finance Act of 1956. The "benefits" are, however, subject to certain limitations. The Reserve is available only for investment in the business. No return is permitted on the Reserve so invested, and on the purchase of the undertaking, the Reserve is to be handed over to the purchaser and maintained as such Development Reserve. The Licensees are also permitted to earn ½ per cent return on the accumulations in the Development Reserve as handling charges of the Fund.

An apprehension entertained by the Industry in connection with the Development Reserve was that the obligation to appropriate to the Reserve may encroach upon the Reasonable Return in case of inadequacy of the return. This difficulty has been met, first, by Licensees being permitted to reduce the appropriations to the Reserve to the extent of the shortfall in the Reasonable Return, and, secondly, by the permission granted to spread over the appropriation, if need be, over a period of five years.

The amending Act of 1956 has to a large extent sought to improve upon the provisions of the principal Act, both in respect of the Industry and the consumer. The paramount need for making provision in the statute enabling undertakings to build up a Reserve for meeting Deferred Tax liability (which forms the subject of an exhaustive analysis in another article in this Supplement) was very near to being achieved when this law was amended in 1956. It can only be hoped that there will be a greater understanding of the Industry's difficulty when this issue again comes up for presentation to the authorities.

State Electricity Boards

THE Electricity Boards visualised under the Electricity (Supply) Act, 1948, are charged with the function of co-ordinated development of electricity in India on a regional basis. Apart from this main function, these Boards are also vested with powers of price control in relation to Licensees.

At present five State Electricity Boards—Bombay, Delhi, Kerala, Madhya Pradesh and West Bengal—are functioning and indications are that by 1st July, 1957, almost all the remaining States will have constituted the Boards.

There is increasing recognition that industries in the Public Sector should be run strictly on a commercial basis, as otherwise there is danger of the price policies of such industries being used as a device for transferring income from one section of the community

to the other without Parliament giving due regard to such policies.

In the case of the State Electricity Boards, the law provides that they "shall not, as far as practicable.... carry on operations under the Act at a loss". It is of vital importance to assess how far this direction has been successfully implemented by the Boards which have for some years been in existence.

The Delhi State was the first to constitute the Electricity Board under the law. The Board came into existence on 20th March, 1951, and took over the entire Electricity Supply undertaking of the former Delhi Central Electric Power Authority Ltd., a private company limited by guarantee, as from 1st April, 1951. The record of the Delhi Board's activities has since then been embodied year after year in the Administration Report of the Ministry of Irrigation and Power, and it has only been for the financial year 1955-56 that the Report and Accounts of the Board are available in some detailed form.

During the year 1955-56, the Delhi Board grossed a revenue of Rs. 184.71 lakhs with a net surplus of Rs. 20.97 lakhs. This comparatively fortunate position is largely due to the Board's area of supply having a per capita consumption of 109 units per year—the highest overall per capita consumption among all the States. This distinctive feature is attributable to the composition of the area of supply. In contrast, the Electricity Boards in other States have large rural areas and extending electricity supply service into such areas is obviously not economic.

The State Electricity Boards have the advantage, denied to an undertaking supplying power to a specified area, of being able to use the surpluses from some of the urban loads of major schemes to buttress rural supplies, but this remedy is not a complete answer to the very low yield which can be derived from rural schemes for a number of years.

This difficulty is forcefully illustrated in the Administration Report of the Bombay Electricity Board (pre-State reorganisation entity) for the year 1955-56 leading to the Board taking the view that "unless the State Government is prepared to assist the Board by either offering capital subsidies or long-term interest-free loans or in some other acceptable form, the Board will not be able to consider any further schemes." So situated, the Bombay Board had to face a net deficit of Rs. 23,66,982 for the year.

The financial results of the West Bengal Electricity Board (constituted with effect from 1st May, 1955) for the year 1955-56 are still awaiting the State Government's approval, but tentative working results indicate a net deficit for the year of Rs. 10.74 lakhs. During 1956-57, this deficit is expected to increase to Rs. 14,86,200 in view of the prospect that "the revenue receipts for the new supply stations under commission or likely to be commissioned very soon under the Scheme are not sufficient to cover even the bare maintenance expenses, not to speak of depreciation and interest charges as the lines are constructed in remote places where development of load growth is comparatively slower". It will be some time before the financial results (in commercial form) of other Boards already in being and of those which are to be constituted shortly, will be available, but the patent fact which needs to be reckoned with is that as the Board's operations extend further afield greater deficits are likely to be faced at least for a few years to come. The hard core of the problem is that to sustain and develop rural electrification subsidy in one form or another is inescapable. This stark reality applies with full force to all agencies supplying power, be they licensees, State Departments or State Electricity Boards.

The Deferred Tax Reserve

BY

R. P. AIYER

THE concept of accelerated depreciation for corporate income-tax purposes as an instrument enabling industry to mobilise new capital for expansion has come to stay. This has, however, given rise to complications in respect of the Electricity Supply Industry in the country. This complication arises from diverse provisions with regard to depreciation between the Indian Income Tax and the Electricity (Supply) Act which give rise to Deferred Tax liability.

It is apparent that the financial working and profits of undertakings subject to the Electricity (Supply) Act are controlled by that Act within narrow limits. The financial code embodied in the Act has limited the Reasonable Return to a percentage of the Capital Base. While the concept of fair return is to be judged by the financial situation faced by the industry at a given time, it is only proper that this Return should be free of encumbrances or reduction by way of liabilities directly resulting from diverse provisions in law and outside an undertaking's control.

The Electricity (Supply) Act specifies two alternative methods of depreciation with the effect that the written down value of an asset is never lower than 10 per cent of the original cost. The Income Tax Act, on the other hand, specifies a third method of depreciation by which the written down value of an asset may be reduced to an infinitesimal fraction. The resultant written down values for a typical item of plant are shown in Graph A and it will be observed that during the life of an asset there is a difference (some times considerable) between the two written down values under the E.S. Act, on the one hand, and the Income Tax Act, on the other. Furthermore, the former always remains higher than the latter.

(Note: As indicated, in the case of the E.S. Act, 10 per cent of the original cost is not depreciated at all, vide Clause VI(1) of the Sixth Schedule to that Act. For this reason the written down value under the E.S. Act is never lower than 10 per cent of the original cost.)

The great disparity between the written down values under the E.S. Act and the Income Tax Act results from accelerated depreciation granted under the latter Act particularly in the early life of an asset. This accelerated depreciation was granted by the Government as a means of reducing taxable profits (and thus also the 'tax payable') in the early life of an asset 'so that funds would be provided for accelerated industrial development in the country's expansion plans.' Reference may be made to Graph B which sets out (in respect of the typical asset) the two kinds of annual depreciation allowances under the E.S. Act, and the annual depreciation allowance under the Income Tax Act. In each case it will be found that the successive amounts of yearly depreciation deducted from the original cost produce the written down value curves in Graph A.

In the long run, however, the total depreciation must be the same, i.e., the difference between the original cost and the residual value.

The effect of the above is that the consumers are charged,

(a) the depreciation in accordance with Graph B (under Clause XVII (2) (b) (x) of the Sixth Schedule to the E.S. Act), 'but at the same time also get the benefit of',

(b) the lower taxes resulting from the depreciation in accordance with Graph B (under Clause XVII (2)(c)(ii) of the Sixth Schedule to the E. S. Act).

If it is assumed that, (a) being a more evenly graduated allowance for depreciation during the ordinary life of an asset, it is more suitable as a charge to consumers, then the effect thereof on taxes ought to be considered.

Reference may now be made to Appendix C, wherein is set out for comparison in figures the relative depreciation and written down value under the E.S. and Income Tax Acts. For simplicity only one method of depreciation (the compound interest) under the E.S Act has been quoted; the alternative method (the straight line) does not involve any very great difference as will be seen from the comparison of the two relevant lines in Graph B.

Proceeding now to an examination of taxes payable, reference may be made to Appendix D wherein the addition of the same typical asset to a Licensee's block is discussed in relation to a notional Profit P. It is reasonably assumed that in the event of the sale of an asset or upon acquisition the least that a Licensee may expect to receive would be the written down value according to the E.S. Act.

It will be observed from Appendix D that the amount of Deferred Tax (at Rs. 219.30) is very high relative to an original cost (Rs. 1,000) of the asset added. So far there has been inadequate appreciation on the part of the authorities of the extent to which such Deferred Tax has accumulated since the introduction of the E.S. Act. It is true, and indeed it becomes obvious on reference to Appendix C, that the Licensees most affected are those who, despite the profit restriction imposed by the E.S. Act, are achieving expansion in the national interest. As to the accumulation of Deferred Tax, relative to present nett block, reference is suggested to Appendix E (which reflects figures in respect of certain typical companies).

The figures in column 5 of Appendix E show the extent to which the Deferred Tax liability has so far accumulated. It is difficult to see what can be done about the past, but liabilities to the extent indicated which would arise upon sale or acquisition should not be ignored. They represent liabilities which should properly have been recovered from consumers, for it is palpably unfair that a Licensee should have to bear them upon sale or acquisition, when, as pointed out above, they arise from the very rate of expansion undertaken in the national interest. At least a start should no longer be delayed to set the matter right.

Thus the seriousness of the position does at least fairly and reasonably demand that such liabilities should be recovered from consumers 'as they occur in future'. For this reason the creation of a Deferred Tax Reserve becomes essential. It arises purely because of the different systems of depreciation described, and accordingly it should be calculated in relation to depreciation, and not to clear and income-tax profits. Appendix F shows the appropriate method creating the Reserve.

It has been said that since the Deferred Tax arises primarily in the case of expanding undertakings, the resultant increased profits would cover the deferred tax liability. This is a misconception inasmuch as it ignores the tight control of profits implicit in the scheme of the 1948 Act. Under the Amendment Act of 1956, the maximum of any surplus profit which a Licensee may retain is 5 per cent of the Reasonable Return which in turn is to be (for the time being) 5 per cent of the Capital Base. The maximum retainable surplus would be 0.275 of one per cent of the Capital Base. Appendix G shows examples of the inadequacy of this in relation to current Deferred Tax liability. It must be remembered also that the profits of many undertakings are at or below the Reasonable Return and that these concerns have no surplus at all.

It may be that the misconception has arisen because it is known that taxes are allowed as an expense before calculating the profits. But if the profits are fixed by law as a percentage of capital employed in the business from time to time (which is an increasing quantity) and if the taxes are recoverable from the consumer (also in increasing quantity), the assumption cannot be maintained that increased profits will cover the Deferred Tax liability. What might be assumed that 'reduced costs' would cover it, but this is likely to be erroneous. As everyone knows, costs have developed a continuously rising tendency in recent times which even increased efficiency and increased utilisation cannot altogether counter. Despite taxes being allowed as an expense, an undertaking's return is statutorily limited and any excess is confined within the narrow limit described above.

The question of Development Rebate and the tax saved thereby has been entirely excluded from this analysis. This is because this matter has been already dealt with in the 1956 Amendment Act and is, in any event, in essence a separate matter.

The following is an extract from Volume II (at page 115) of the Report of the Taxation Enquiry Commission 1953-54 set up by the Government of India:

"The Electricity (Supply) Act, 1948, contains detailed provisions regulating the maintenance of accounts by electricity undertakings, and the basis on which they can charge consumers for the current consumed. One of the provisions is that depreciation is to be charged either on a straight line basis or on a compound interest basis, so that, by the end of the estimated life of the asset, an amount of 90 per cent of its original cost is accumulated. Another is that the charge to the consumer has to be periodically adjusted so as to leave to the undertaking only a clear profit of five per cent of the capital base 'plus' income from investments.

"This gives rise to various difficulties. In the first place, the Electricity (Supply) Act does not provide for initial and additional depreciation. Consequently, in the first few years after the installation of new machinery, the book profits would exceed the assessable income while the position would be the reverse in later years. At the same time, the charge to consumers has to be adjusted with reference to the book profits.

industry is also now being made with a view to determining the quantum of loan for each unit.

PROJECT PLANNING

Since project planning is the most essential function of the Corporation, it has to enlist the services of experts at diverse levels. It is now processing projects for the establishment of steel foundries, forges and fabrication of steel structurals. The second Five-Year Plan provides for a heavy foundry and forge project for the manufacture of heavy castings of iron and steel as well as heavy forgings weighing up to 20 tons or more apiece which are now being imported. The NIDC has now proposed to take up this project. Competitive quotations together with detailed project reports are being awaited from three foreign firms and final decisions will be taken when these are received. It will also set up capacity for fabricating certain categories of structurals near the steel plants. To eliminate the dependence of the country's growing rayon industry on imported wood pulp, its basic raw material, as also to help the growth of the newsprint industry, the Corporation is investigating a project for the manufacture of wood pulp. A foreign technical team has completed its survey and made a preliminary report. The foreign firm, which has sent the team, is now conducting experiments on selected Indian raw materials which have been sent to them.

So far as the project for the production of synthetic rubber based on utilisation of alcohol is concerned, the report of the team of experts from four well-known American companies in this field is favourable and the scheme seems to be under further consideration. Apart from these, the manufacture of carbon black, sulphur from pyrites, printing machinery, air compressors and fractional horse power motors and refractories are also under detailed investigation. Besides, rolls and rolling mill equipment required in ferrous and non-ferrous industries and manufacture of heavy equipment for earth-moving, mining, etc., are also within its purview.

Recently, the Government have decided on two important projects to be undertaken by the Corporation. One is for the establishment of a newsprint factory at Shakarnagar near Hyderabad with a capacity of 30,000 tons per annum and the other for setting up an aluminium plant at Mettur in Madras State with a capacity of 10,000 tons per year. Government have also decided to set up central capacity for the manufacture of primary intermediates so essential in any development programme for the dyestuff industry. A decision regarding the exact scope of the NIDC project and the manner of its execution will be taken after the programme of the various firms already in the field is clearly known.

SHORTAGE OF RESOURCES

The NIDC has thus taken on itself a large volume of work and naturally the question of resources assumes great importance. With about Rs. 20-25 crores set apart for modernisation of the cotton and jute textile industries, a sum of about Rs. 30 to Rs. 35 crores will alone be available for pioneering new basic and heavy industries. It means that the Corporation has to draw up priorities in regard to projects for implementation that will meet the pressure on the limited funds available. The Planning Commission itself has conceded that the Corporation may need more resources than have been allotted to it and has stated that the extent of the gap between the resources actually required and the provision of funds now proposed will ultimately depend on the pattern of financing adopted and the size of the Government's holding in the overall investments in the various projects.

More than funds, perhaps the real difficulty may lie in the shortage of technical personnel. It is patent that the country does not have the requisite number of capable technicians who have to process the different ventures. In the investigations that are in progress, wherever necessary, assistance is taken therefore, of foreign firms and experts and it is obvious that greater efforts may be required to obtain the services of more and more foreign technical personnel if the Corporation is to produce any satisfactory results.

Another factor to be borne in mind is that the Corporation should enlist the co-operation of private business if its objective to fill the gaps in the industrial structure is to be fulfilled. Correspondingly it entails an obligation on the part of private entrepreneurs to state their case fully and allow the Corporation to go ahead wherever they feel they may be unwilling to take risks. Finally it must also be emphasised that since the NIDC will have its eye on the third Five-Year Plan in the process of investigation of schemes relating to the manufacture of heavy machinery or schemes directly related to it, it must realistically face its commitments and limit its area of operations so that it may remain within manageable proportions.

Industrial Credit and Investment Corporation

THE launching of the Industrial Credit and Investment Corporation as a privately-owned and privately-managed limited liability company in January 1955 may be deemed an experiment in international investment which was much needed in this country. Its major objective is to give assistance to industrial enterprises falling within the private sector of industry.

The distinctive feature of the Corporation lies in the mobilisation of international finance as can be seen from the following facts. Out of the subscribed capital of Rs. 5 crores (the authorised capital being Rs. 25 crores) Rs. 0.5 crore has been subscribed by American investors who include the Bank of America, Olin Matheison Chemical Corporation, the Westinghouse International Corporation and Rockefeller Brothers. The British share of the subscription of Rs. 1 crore has been provided by eight eastern exchange banks, 12 insurance companies, the Commonwealth Development Finance Company and two industrial companies having interests in India. The balance of Rs. 3.5 crores forms the Indian share of which Rs. 2 crores go to institutional investors and Rs. 1.5 crores for the public. In the capital of the Corporation, therefore, the U.K. takes 20 per cent of the total share and the U.S. 10 per cent, leaving to India the remaining 70 per cent.

WORLD BANK LOAN

More interesting is the fact that the International Bank for Reconstruction and Development has sanctioned a loan of $10 million (Rs. 4.72 crores) for the Corporation. In addition to this, the Government of India has given it an advance of Rs. 7.5 crores. It is to be free of interest and is repayable in 15 equal instalments beginning after the lapse of 15 years. The significance of the advance lies in the fact that this money has been found from counterpart funds derived from the proceeds of the sale of steel supplied by the Foreign Operations Administration of the U.S. under the Indo-American Technical Co-operation Agreement. It is certainly a step in the right direction that the counterpart funds should be utilised for nation-building activities. This fact has to be borne in mind because of criticism in the earlier stages in Parliament itself questioning the propriety of placing at the disposal of a private-owned corporation Government funds without any interest charge. The Finance Minister rightly defended that though the proceeds were applied to the finances of industrial enterprises which are privately-owned, they conformed to the pattern of approved development satisfying the required test at the licensing stage. What is more important, which has silenced the critics, is that the remission of interest which the Government has granted would enable the Corporation to advance loans at 1 per cent below the rate it would otherwise have been required to charge.

Another feature of the Corporation is that it has undertaken to ensure that no group of industrialists or companies will be allowed to capture a dominating part of its total shares and thus prevent its independent character. The management is in the hands of a Board of eleven Directors and of these, seven represent the Indian shareholders of the Corporation, two the British and one the American while the eleventh Director is nominated by the Government of India. The Government of India has retained its right to nominate one person so long as any part of the Government's loan remains unpaid. It also retains the right to apply for the liquidation of the Corporation if default is committed in payment of the loan instalments or if the Corporation's capital is impaired beyond tolerable limit considered reasonable in the course of business. These are not only adequate safeguards for prudential use of the interest-free loan, but, what is of greater significance, it means that Government will be in a position to exercise effective control over the activities of the Corporation whenever it feels that they do not subserve the objective for which the institution has been started.

OBJECTIVES AND ACTIVITIES

The purpose of the Corporation, as already mentioned, is to assist industrial enterprises within the private sector of industry. This it will do either through providing finance in the form of loan and equity participation or through sponsoring and under-writing new issues of shares. It will also help by furnishing managerial, technical and administrative advice and services to Indian industry. The functions of investment, lending or underwriting will be exercised within the framework of a dynamic policy depending on circumstances and the type of industry that requires such help. Ever since its inception, the Corporation has received a continous flow of enquiries covering a wide range of industrial activities and coming from all parts of India. The industries which the Corporation has agreed to assist so far include the manufacture of paper, electrical equipment, fuel injection equipment, chemicals and equipment for the textile industry, refining of sugar and metal ores and cotton spinning. Since the Corporation examines all aspects of a project for the establishment of a new industry or the modernisation or expansion of an existing one before it agrees to give assistance, there is inevitably a time-lag between the receipt of an application and the disbursement of funds.

It is necessary to mention here a recent development that has had its effect in the structure of the capital of the Corporation. As a result of nationalisation of insurance the Government now owns nearly 18 per cent of the Corporation's share capital, a figure that represents the value of the Corporation's share held by the issurance companies now taken over by the Government. Now, the Corporation is wholly a private-owned business and it was on that basis that the co-operation of the various parties in the U.K. and U.S. and the World Bank was extended to it. Consequent on the nationalisation of insurance, Government have become its largest single shareholder. However, Government have assured the Company that they have no intention of taking advantage of their 'adventitious position' in this regard to influence the day-to-day working of the Corporation. This assurance should go a long way in allaying any fears that the Board of Directors might have entertained with regard to the position of the Government vis-a-vis the Corporation. The Corporation has come into existence at a crucial stage in the economic development of the country. Its potentialities are undoubtedly great and likewise there are reasonable hopes that conditions for stability would be assured for its smooth functioning.

International Finance Corporation

THE formation of the International Finance Corporation in July 1956 marks an important development in post-war economic co-operation. The World Bank has been in operation for a decade and its valuable experiment has stimulated practical interest in international financial assistance. But the World Bank has its own limitations of functions, operating as it does at the Government level. The idea of an international finance institution functioning at the private level was mooted long since, but three years of discussion, suspense and hesitation had to pass before it could be endorsed and taken up for active formulation. There was hardly any divergence of view on the proposition that the flow of international capital for development must be secured primarily from private sources and an effective way to encourage it was to launch co-operative action. Since the United States is the biggest exporter of capital its attitude was bound to influence efforts to set up an international organisation. Happily, it gave a firm lead in this matter too which induced other countries to follow suit. India signed the Articles of Agreement of the Corporation in October 1955 and deposited the Instruments of Acceptance immediately thereafter.

CAPITAL STRUCTURE AND DICTINCTIVE CHARACTER

The Corporation's initial authorised capital of $100 million (Rs. 48 crores) has been divided into 100,000 shares of equal value. It was a condition precedent of its formation that a minimum of 30 countries must subscribe to an aggregate share capital of $75 million. The table at the end of this article sets out the membership and the share of each member in the capital as on August 10, 1956. In all 32 member-governments contributed to a total of $78.4 million until that day. Since then 15 more countries which have joined it have brought a further capital subscription of $11.6 million making a total of $90 million. The Corporation's Board of Directors has been vested with authority to invest the authorised capital up to an additional 10 per cent to accommodate new-comers as well as the growing volume of demand for investment. The original members enjoy priority right to subscribe to the increased capital in proportion to their share holdings.

The Corporation has a positive relation with the World Bank which, however, does not detract from its

individuality. Its membership is open only to member governments of the World Bank and the rate of subscription to the capital is based on the ratio of its subscription to the World Bank. Executive Directors of the World Bank representing a minimum of one government which is also a member of the Corporation are entitled to serve on the Corporation's Board of Directors. The World Bank's President will be the ex-officio Chairman of the Corporation's Board of Directors and will have the right to recommend the choice of the Corporation's President. To this extent the Corporation will be an affiliate of the World Bank, but no further.

The Corporation, however, possesses a distinctive personality. It is an independent legal entity and is entitled to function under the authority of its own charter. Affiliation with the World Bank has secured for it a solid base of activity, especially in the less developed countries, but it does not in any manner infringe on its independent status. Membership of governments has a restricted implication. In its operations at all levels it will function in the sphere of private enterprise. Undoubtedly, one of its characteristic factors will be that it will ask for no guarantee from any government for loans advanced to borrowing concerns within its national frontiers.

POLICY FOR ESSENTIAL CO-OPERATION

The basic objective of the Corporation is to promote economic development, active assistance and encouragement to productive private enterprises and the bias of its investment operations for a considerable time to come will be towards assistance to under-developed and backward member countries. Since productive investment is to be the hall-mark of its policy it will insist on satisfactory proof of the production potential of the enterprises asking for assistance. But apart from offering its own resources it will co-operate in widening the range of participation in the capital exporting as well as importing countries and strengthening the base of co-operation between domestic and foreign private capital. It will be no part of its policy or function to arrange for the supply of technical know-how.

Alongside its investment operations its major activity will be to serve as an agency in facilitating procurement of experienced management. The sponsors of the Corporation have a firm conviction that management is a fundamental factor for the success of any enterprise—a factor which is in fact much more important, and also more scarce, than capital. Due to historical traditions the management patterns in less developed countries had inevitably to adhere to the pattern of family proprietorship and management. Modern business and industrial enterprises with their complex character and the vital need to absorb technological improvements to maintain their dynamic nature must of necessity adopt up-to-date techniques in management. The Corporation believes that it should be of assistance in promoting professional management as an essential of private enterprise in the less developed countries. Management on modern business principles is bound to raise standards of business efficiency which in course of time cannot fail to produce a healthy effect on the attitudes of the public as well as the political leadership towards private enterprise.

The resources of the Corporation are meant to be used for the promotion of economic activity in developing countries. This purpose does not exclude under strict interpretation the possibility of assistance to private enterprise in relatively advanced countries. But the Corporation's policy in practice will be to confine its operations in the intervening period which is bound to be of a long duration, to the less developed member countries. Investment in industrial, agricultural, financial, commercial and other enterprises in allied spheres is perfectly within its jurisdiction. Nevertheless, in view of the crying need for industrial finance and the limited initial authorised capital of the Corporation of the order of Rs. 48 crores, its functions will be restricted predominantly to industrial enterprises. Basic public utilities, even though owned and managed by private enterprises, such as transport, electric power, reclamation, and so forth, will be kept out of the purview of its activities. This is because of the obvious fact that they are proper subjects of assistance from the World Bank and in reality several private enterprises of this description have actually received finance from the World Bank over the last ten years.

CRITERIA FOR ASSISTANCE

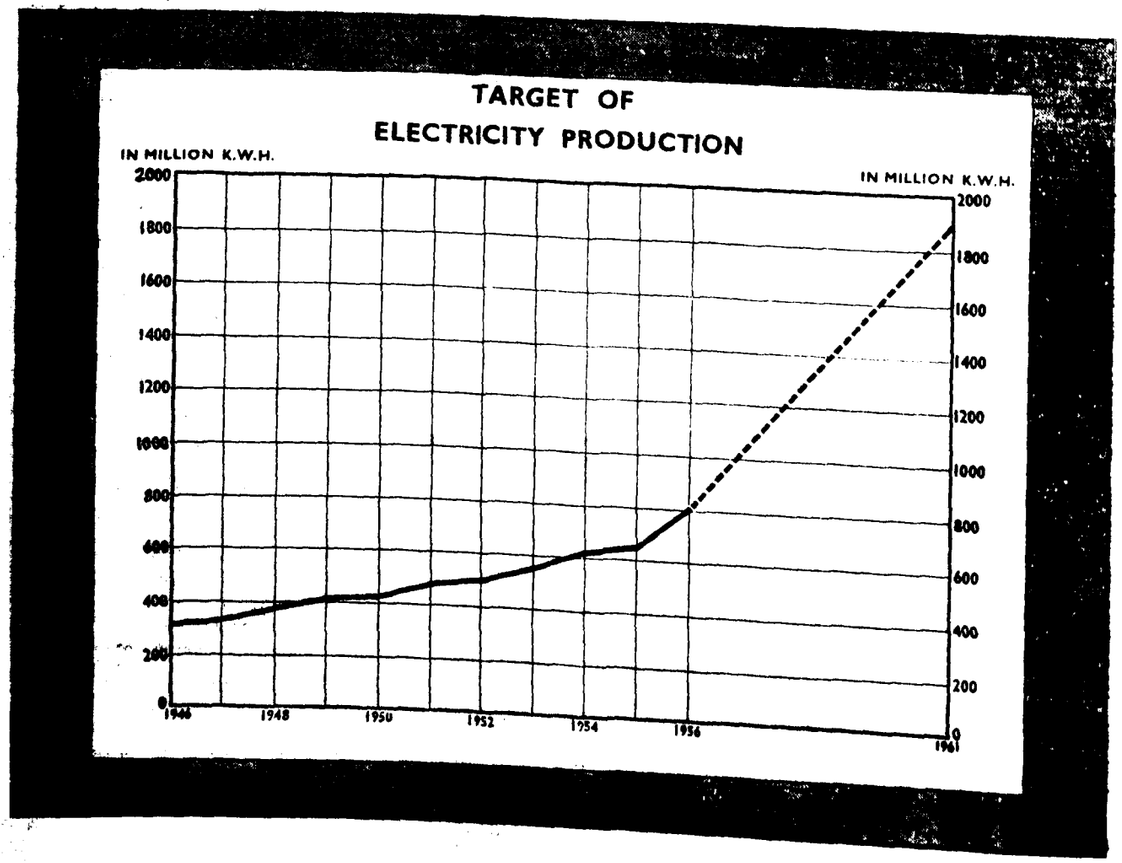
In judging the eligibility of an applicant enterprise the character of government's participation in ownership or management will be a primary test. Enterprises which are predominantly private-owned but in which the government has a dominating share in management will not be eligible for assistance. On the contrary, minor participation of the government in ownership will be no bar to the Corporation's help, provided the enterprise is essentially private in its ownership as well as management. The formal test of eligibility, however, will be that the enterprise asking for assistance should contribute on its own a majority share of the funds needed for fresh investment at least in excess of fifty per cent of the required amount and the balance should not be available from other sources on reasonable terms. The new investment must be of a minimum amount of US $500,000 (Rs. 24 lakhs) and the size of the assistance required must be $100,000 (Rs. 4.8 lakhs) in the minimum.

The sole restriction on the types of investment which the Corporation can undertake is that it will not directly invest in capital stock or shares. The normal form of its investment will be by way of loans, but distinguished from the conventional form of loans stipulating the entire return in terms of fixed interest. A substantial part of the investment will be in venture capital. Ordinarily investments will take the form of convertible debentures together with a positive form of interest which will confer on the Corporation a right to obtain capital stock or shares. The terms of the investment will provide for part of the return in the form of a share in profits in addition to interest. The specific terms of participation in profit will be governed by the merits of each case.

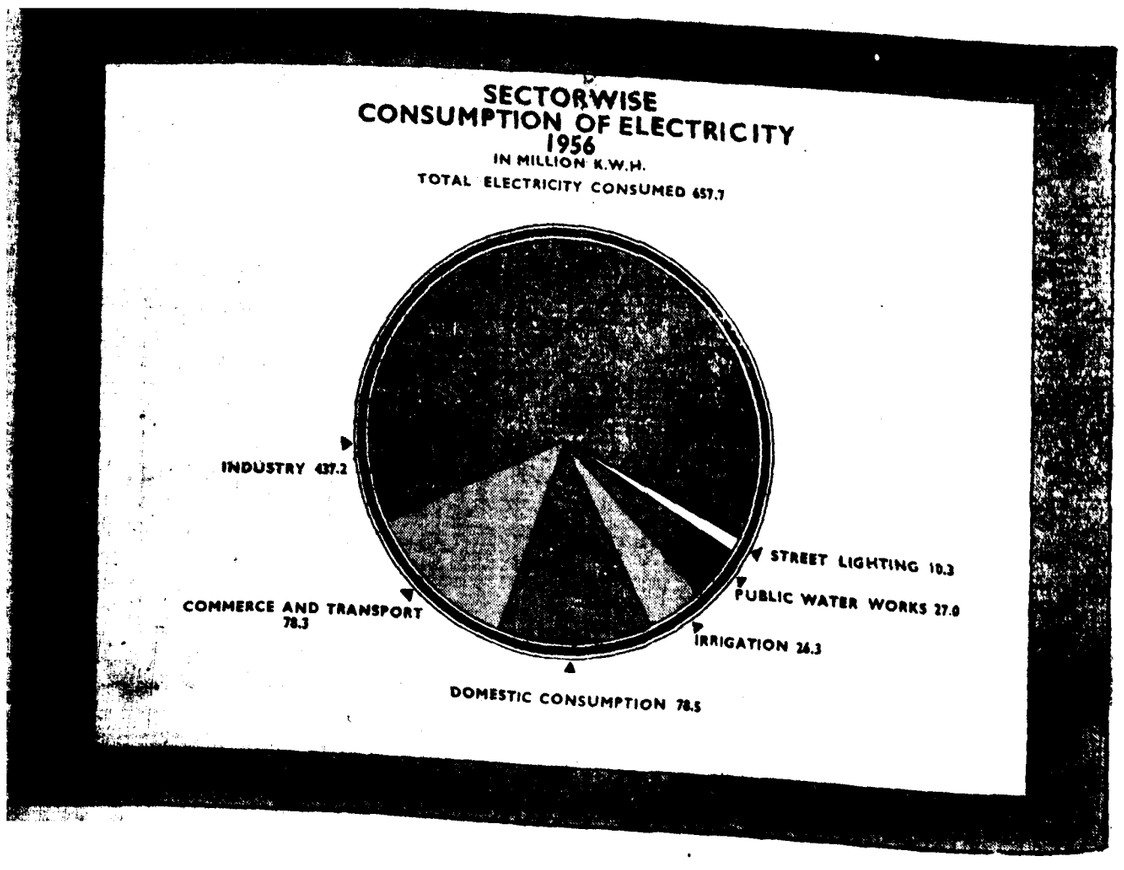
Since the Corporation is precluded by its charter from making direct investments in share capital, the rights which it will acquire to participation in capital stock or shares cannot be exercised on its own. But they will be sold to foreign or domestic investors. Profits earned on successful investments will be of value in building reserves and cancelling out possible losses. The right to obtain share capital and convertible debentures is the key to the Corporation's investment policy. It is a basic objective of the Corporation to promote co-operation between foreign and domestic private investors. To this end the Corporation's investments will be placed on a revolving basis which implies that as soon as an enterprise is put on a sound operating basis the Corporation's interest will be transferred to investors and funds will be released for help to other enterprises. The Corporation's participation and the technique of revolving investment are expected to enlarge the area of international collaboration.

The funds which the Corporation will be prepared to invest will be available for use freely by the borrowing enterprise and will not be restricted to the requirements of the enterprise in terms of foreign exchange. In view of the top importance which this Corporation attaches to management, rigorous tests will be applied in judging this aspect of the applicant's enterprise. Their management must be of acceptable standards of competence and experience. In addition, proof ought to be forthcoming of their stake in the enterprise in the form of risking their own capital and their business reputation. The Corporation will not accept direct responsibility for the management although its consultation will be essential for any changes in the management of the beneficiary enterprise. It will, however, undertake to find managerial personnel in appropriate cases. It may seek safeguards for its investment in the form of representation of its interests on the Board of Directors. The Corporation will not ask for government approval of its projects of investment except in so far as the national law requires it. But when a government objects to any investment, it will refrain from it.

CLIMATE FOR INVESTMENT



In view of India's interest in inviting foreign private capital for industrial development, she would welcome expansion of the activities of the Corporation. Positive clarification of the approach with which it would treat requests for assistance is now available from public addresses of its President, Mr. Robert Garner, as also from the literature it has released for information. Since the Corporation would desist from leaning on the backing or guarantees of the governments of the participating countries in its operations it lays itself bare to normal business risks. Its approach to proposals for co-operation cannot but be governed by strict business principles and practices. The basic requirement which countries seeking its help have to satisfy is the creation of a climate suitable for the flow of foreign capital. Business leadership can undoubtedly contribute to the creation of such a climate by maintaining and raising standards of performance. But investor's confidence is a psychological factor which is susceptible to varied influences in other spheres. It is in these spheres that a climate of confidence must be sustained and improved.



Economic and political stability is its absolute precondition. But political attitudes and government policies towards private enterprise are of much greater significance. Clamping of too many regulations and legal restrictions on the freedom of private enterprise, inconsistent with the risks and responsibilities it consciously bears, may operate as a disincentive to the private investor who is entitled to his own reasonable expectations of freedom of operation and has also a choice of different countries for export of capital. The Corporation is now engaged in preliminary negotiations for projects of co-operation and it is gratifying that India ranks among the countries whose proposals have been placed before it. The gap in India's foreign exchange requirements in the very first year of the second Plan has impressed upon her policy-makers the importance of foreign investment. The latest directives on imports on private account have underlined the significance of this assistance. It is a logical obligation which rests on the country, but more so on the Government, to adopt policies conducive to the flow of capital from abroad.
