But what is theoretically possible cannot be easily achieved in practice. For instance, can the Prime Minister carry through a major process of retrenchment without creating a political storm? As so much of the expansion in civil administration is indulgently looked upon as a partial solution to the problem of educated unemployment, any talk of economy here is so much wishful thinking. On the other hand, when the 'economy drive' begins to slow down, as it must sooner or later, the bureaucracy's irrepressible urge to expand may well re-assert itself. One wonders if the Prime Minister seriously believes he can change the attitude of civil servants by drawing their attention to the Parkinson's Law governing the multiplication of jobs in public services—a law according to which "an official wants to multiply subordinates, not rivals and officials make work for each other."

INDIAN EDUCATION: AN APPRAISAL

MAULANA AZAD put before the State Education Ministers' Conference lucidly and succinctly the salient problem of education in our country. He emphasized the divorce between general education and training for professions that existed in the minds of the people, and pleaded for the adoption of Basic Education, which was formulated by Mahatma Gandhi as a practical and effective solution to this and other allied problems. Doubtless, so much lip service has been paid to this type of education that it has almost become a fetish. Yet in seven years nothing has been done practically. The Union Education Minister admitted that most of the plans for educational reforms were still "paper schemes." This delay can be much more harmful in this field than in almost any other. During these formative years Basic Education is the only answer in a country such as ours, for as Maulana Azad defines it, "the real meaning of Basic Education is that the craft itself is the medium of their education for life."

The implementation of Basic Education will mean that young men and women will be ready to work without having to go through the University for a degree. This process of differentiation will in turn mean that colleges are no longer flooded with disinterested seek-

ers after a piece of paper certifying their status as graduates.

To achieve this higher standard Maulana Azad considers that the new three-year degree course is necessary. While there is merit in the fact that students will have more time to study deeply, it seems unconscionable to spend Rs 25 crores which is the estimated cost of the change-over from the present four-year degree course. This precious money would be better utilized, and it is surely possible to achieve a high standard with the present university system where the evils to be associated are many. But pouring money into changing a four-year degree course to a three-year one will not help. What will help is the giving of greater powers to the Central Government which by stricter planning and co-ordination can erect for the whole country an edifice of worthwhile and useful education. Maulana Azad pointed out that while the Central Government had only advisory, the State Governments possessed full executive, powers. This, he said, led inevitably to delays and non-implementation of schemes.

INDONESIA OUT OF THE WOODS

FOLLOWING A five-day meeting of delegations from outlying islands in revolt against the Central Government since January last, President Sukarno and the former Vice-President, Dr. Mohammed Hatta, have pledged to work together for the unity and prosperity of Indonesia. Prefacing this had come a proclamation incorporating the unanimous recommendations of the conference which made several major changes in Dr. Sukarno's plan of "guided democracy". Elucidated in February last, soon after Dr. Sukarno's visit to Russia and China, and with a view to removing "the political instability in the country," the plan had since its inception been described by Dr. Hatta and others as "undemocratic and totalitarian". The proclamation substantially amends that controversial plan. The National Council set up by Dr. Sukarno will not be a super-Cabinet neither responsible to nor removable by the elected Parliament. It will now be analogous to the Upper House common to democracies of republican and federal types, comprising representatives of the provinces. This should enable the provinces, which have been the main source of Indonesian troubles, to ventilate their grievances at the highest level without resorting to armed revolts. Dr. Hatta would be the chairman of the National Council.

Yet another concession to the provinces is the conference's decision to accelerate the grant of regional autonomy to them. Other demands of the provinces, like a fairer share in export proceeds and changes in the central administration in Jakarta, are now expected to be implemented.

These are steps in the right direction. Much of the trouble in Indonesia arose because the people of the outlying provinces feared that the Government with its headquarters in the island of Java was out to impose its will on them and exploit their economy for the benefit of the Javanese. Last year, the people of Java, for instance, received 75 per cent of the imports, though they had contributed 17 per cent of the country's exports. As against this, the people of Sumatra provided 71 per cent of the value of Indonesia's exports and received only 10 per cent of the imports. Recent attempts to introduce settlers from over-crowded Java to other islands were also bitterly resented by the local inhabitants. These regional feelings not unexpectedly sparked the revolts of the officers of the army which has in its ranks a large number of former guerilla fighters.

The fact that despite a series of revolts in various parts of the country and despite a considerable degree

of confusion in Jakarta itself, there is yet desire to work together shows an underlying sense of nationhood. This is perhaps Indonesia's major source of strength and resilience at present. By associating Dr. Hatta, who is respected universally for his integrity, with the National Council and by enlarging it to include more representatives from the outlying provinces, Jakarta may be able, in some degree, to win over the dissidents and separatists. It is, however, obvious that these are as yet stop-gap arrangements. They may not lead to national unity unless a plan is evolved aiming at unity of purpose. A national plan for reconstruction and an uncompromising campaign against corruption and maladministration are clearly Indonesia's immediate needs.

NEMESIS IN THAILAND

FIELD MARSHAL SARIT THANARAT'S armed coup will not have come as a surprise to any one acquainted with the politics of present-day Thailand. Coups in that country are normal enough. Field Marshal Pibul Songgram, the latest victim, himself rose to power as the result of a coup d'etat in 1932 when, as a young army officer, he assisted the liberal elements in the administration to frustrate the efforts of the princes to overthrow the constitution which had come into force a year earlier. By 1938, however, he had himself accomplished what the princes had failed to carry out. Once in office, Marshal Songgram managed to remain there till the present successful coup. But it would be well to bear in mind that Marshal Songgram could not have remained in power all this time without establishing vested interests in his rule. It would be rash to conclude finally that he is out for good.

Though the reasons for the present coup are still obscure, there seems to be little doubt that trouble started with Marshal Songgram's very half-hearted measures to give the country democracy. However, in 1955, after a visit to Washington and London, he restored free speech in Thailand and contemplated the introduction of democratic institutions. The newly emancipated Press immediately uncovered a number of scandals involving high officials and Ministers. This intensified general discontent.

In the "rigged" elections of February last, Marshal Songgram's party, Seri Manangisila, won 85 out of 160 elected seats. Since nearly half of the seats are nominated, he was in no danger of losing power. But after the elections, Marshal Songgram depended for his survival on the strength of nominated members, mostly army officers. In the present crisis, ironically, these very members deserted him. His position became precarious, and increasingly dependent upon the army. This prepared the way for Marshal Sarit Thanarat's coup d'etat. On top of all this, the Bangkok crowds, always politically articulate and lately restive, started vociferous demonstrations against corrupt Ministers. The end had come. Thailand's erstwhile dictator had made the mistake of not yielding to public demand after he had ushered in democratic institutions. The tide would not now be turned back.

It is doubtful, however, if the changes at the apex of the power pyramid will be felt by the mass of the people in Thailand. The personalities are, no doubt, different, but there is no reason to believe that either domestic or foreign policy will be changed. The struggle for power had little to do with political principles or social ideologies. Like the deposed dictator, Field Marshal Sarit Thanarat is also pro-West. It is significant that the first thing he did after capturing power was to emphasize Thailand's adherence to the South East Asia Treaty Organization.

A Window on the World

EASTERN RESENTMENTS AGAINST THE WEST

By
ODYSSEUS

IN INDIA, British rule introduced Western ideas of progress, administration, communications, and industry. These long-run benefits were achieved at the cost of the old Indian economic and social structure. In this, there lay the seeds of conflict, for, on the one hand, Western values, humanistic ideals, and rationalism, streamed in, while on the other, the Western onslaught on Indian traditions aroused defensive reactions which clothed themselves in the West's worst gift to India: nationalism. Every system has the defects of its virtues. And while, at best, democracy's ideal of abolishing government as the monopoly of a royal court, and associating it with all strata of the population, evokes creative patriotism, at worst it generates the aggressive nationalism which let loose two World Wars and from which Europe is at last struggling to free itself in such supranational institutions as the European common market, etc.

Although no Western power imposed its rule on China, the impact of the West undermined the basis of traditional Chinese society. The integrated empire of the Manchus gave way to Western republican forms of government and the economy was disrupted by Western imports. Barbara Ward makes the point in her admirable 82 page booklet—"The Interplay of East and West," Allen and Unwin, 10s. 6d.—that China underwent a worse ordeal than India because India gained a century of orderly administration and in 1947 inherited a functioning state and civil service, whereas "China was left to drift like a sailless junk, its old equipment destroyed by the West but no new machinery installed" from 1840. Japan accomplished an astonishing feat on the principle of "If you can't beat them, join them." She transformed her static despotism into the semblance of a Western democracy and went out to join the Europeans in aggressive nationalist wars and trade.

THE TWO PROBLEMS TO BE SOLVED

Eggs can never be unscrambled. The East cannot go back to its old static economies and social systems. The first problem that therefore arises is that there are two Western techniques from which to choose—the genuine democracy of the free world and the distorted democracy of the Communists. The second is: Having absorbed the nineteenth century Westernism with which it came into direct contact, is the East going to wallow in the nineteenth century rut or follow the West's present strivings to bring nationalism under control? If Europe's efforts succeed, and if the East does follow suit, the possibility arises of another explosive drive forward by a united Europe with a lagging East, weakened by the suspicions of nationalism that beset Asia. That would increase present antagonism between East and West. These are the two problems round which our whole discussion revolves.

The East must achieve modernisation because Western influence has uprooted the old economic system and has vastly increased the birth-rate by its hygiene.

There are two ways of speeding up the Industrial Revolution. Either (1) through a totalitarian state, with

the emphasis on compulsion and production to enhance the might of the State rather than the freedom and the consumption to the individual, or (2) through a mixed economy of democratic economic controls and free enterprise, with the emphasis on persuasion and a balanced production in which the needs of the individual are respected.

All non-totalitarian Western economies in free enterprises the U.S.A. and Germany, as in Welfare Britain, and Socialist Scandinavia, are moving towards a permanently mixed economy, in which the State assumes the responsibility for attempting to set the economic climate. But, as Barbara Ward points out, political freedom ceases if all power—political and economic—is in the hands of the State. There is, therefore, a point beyond which State planning and control jeopardises a healthy limitation of power. This is the choice for Asia—not crudely between Capitalism and Communism, but between a mixed economy compatible, and a totalitarian economy incompatible, with political freedom.

This distinction is blurred because the average Easterner is dazzled, on the one hand, by the alleged economic advantages of the totalitarian State and forgets its terrible political disadvantages and, on the other, he identifies the mixed economies of the West with Capitalism; he overlooks their mixture and takes for granted their outstanding virtue of freedom and respect for the individual.

The reasons for this attitude hardly need explaining to any Eastern reader, though it is hard for many Western to grasp it in this post-August 15, 1947 era. In the East, Colonialism is seen as a direct consequence of capitalism and free enterprise.

CAUSES OF ASIAN SUSPICIONS

We glanced last week at the reasons why an entrepreneurial middle class failed to find a congenial social climate in the East. On the other hand, the tradition of the civil servant, the loyal servant of the State, is ancient in China and India, so that the East has a bias in favour of the bureaucrat and against the enterprising individual.

To these age-old biases, Barbara Ward adds two events of recent history: (1) the type of Western education received by many of Asia's leaders and (2) the Soviet revolution. So many of Asia's leaders, having spent the formative years of their education in Europe or the U.S.A. in the 1930's, returned to the East steeped in the atmosphere of the West's great economic depression. Because the economists of the period took time to discover the remedy, people thought that the system itself must be wrong. It would have been just as logical to assert that Western medicine was useless because penicillin had not been discovered at that date. But whereas the West is realising, through bitter experience, that nationalisation adds

greater burdens to national economies by saddling them with industries for which the citizens must pay the upkeep for all eternity, the East is dominated by men who have not had to live through these chastening decades and who still think that "production for use, not for profit" means something other than raising extra taxation to meet the losses of nationalised industries.

Moreover, as I observed on June 21, all over the East most people identify poverty with holiness. This was also the attitude in Europe before the Industrial Revolution when the impact of poverty, plus the belief that it was an eternal feature of the landscape, made for a revulsion against riches. But the techniques that caused the Industrial Revolution, by enabling mass production to multiply goods, created an appreciation of worldly possessions that spread ever wider as the living standards of the masses rose. The East, unlike the West, has not yet experienced a long separation of the spiritual and the material and the Easterner is apt to assume that economic activities should conform to a spiritual pattern. This explains why private profit is axiomatically condemned in the East as immoral and Socialism seen as an idealised form of industrial community.

"By a paradox," says Barbara Ward, "this anti-materialist outlook in Asia has been reinforced by the experience of an economy which in theory is entirely devoted to materialism." The Soviet experiment has propagated the idea that State control is the quick way to modernisation. By suppressing the fact that there was any industry in U.S.S.R. before 1914 and that any Western aid was available for the first Five Year Plan, the Communists have built up a picture of the U.S.S.R.'s "stupendous leap" from primitive economy to industrial might. The idea that the U.S.S.R. has pulled itself by its own boot-straps has been one of the U.S.S.R.'s most persuasive points. The East's experience at the hands of Western "capitalists," the traditions of Eastern administration and religious outlook, and the propaganda impact of Soviet expansion, all promoted suspicion of Western free enterprise.

Must one conclude, then, that the East will inevitably go Communist? No, first, because there is a vast area for mutually profitable East-free-West co-operation, which many Easterners and Westerners are anxious to develop. Secondly, because the West has no monopoly of intelligence and the East can profit by the lessons of Western post-World War II economic experience—if it wishes to.

To many Easterners, the big argument in favour of democracy against Communism is that over the 39 years since the bolshevik revolution, an increasing number of Asians have visited the U.S.S.R. and seen for themselves that, far from achieving brotherhood, Communism denies freedom and promotes tyranny. Typical of many Eastern observers is Mr Braj-kishore Sastry, a prominent member of the Praja-Socialist Party who, after a conducted tour of Communist China, began his report (reproduced here on July 16 and 23, 1954) by saying that his visit "did nothing to substantiate the exhilarating picture that we had formed of China in the enchanting distance of our motherland." And delegates to the U.S.S.R. have returned as disillusioned. Many educated Easterners, who constitute Asia's natural leaders, have learned the attractiveness of personal freedom and of the rule of law in Europe and the U.S.A. Is it not probable that one reason for China's acquiescence in Communism is that China, unlike India under the British and Japan under the

American occupation, has never had first hand experience of the mechanics of political freedom?

There is hope for East-West co-operation in the reflection that freedom is infectious, slavery is not. If you doubt this, ask yourself why Communist countries prevent their citizens from travelling freely abroad.

(This is the second in a series of articles entitled "The Antagonism Between East and West.")

a pilfer-proof package for every product!

The manufacture of Metal Box's range of pilfer-proof containers and closures is backed by an active Research Organisation. The Central Laboratory in Calcutta assists suppliers in developing improved printing inks, surface finishes and protective lacquers, and maintains strict routine tests for all incoming raw materials to the Metal Box factories; on the spot control of operations is carried out by Branch Laboratories. This ensures pilfer-proof containers and closures of the highest quality, superbly printed and finished. Expert scientific advice from Associates throughout the world is available to assist in solving customers' packaging problems.

**A METAL BOX
PILFER-PROOF CONTAINER**

The MB Key Opening Can has both the top and bottom double seamed on for maximum protection.

The can is opened by winding off a strip round the can with a special key.

The lid fits back accurately after opening—an effective reseal. It is impossible to disguise the fact that the can has once been opened.

CO-OPERATION IN THE SAHARA

(From Our Special West European Correspondent)

PARIS, September 22.

AFTER playing with the idea of "going it alone" in the Sahara, the French have decided (or rather have been forced by the facts) to accept a large measure of international co-operation in the exploitation of this substantial oil reservoir. This decision has been received with an ill grace by those who had dreams of France opening up the desert in splendid isolation and keeping to herself every profit to be derived from this magnificent opportunity. But, although co-operation may raise political complications later, it will hasten development of the territory and is certainly in France's own interest. Paris has so far consented to take assistance only from American and British enterprise, which has experience of oil production elsewhere and has capital to supply for the urgent work of prospecting and drilling, but the spirit of co-operation may shortly extend to include the adjoining States, Morocco and Tunisia.

The occasion for associating foreign oil companies with the development of the Sahara came this month when prospecting permits issued several years ago fell due for renewal. The Anglo-Dutch combine, Royal Dutch Shell, already had an interest in this work for it held 65 per cent of the shares in the Algerian Petrol Company and a 35 per cent interest on the Sahara Petrol Research and Exploitation Company. But the main dispute in France was about allowing the Americans any share in the field. The American oil cartels usually get a bad Press in France as in most other countries, and when U.S.-French relations were in a poor state last year after the Suez crisis, loud vows were taken that never, never would they set foot in French Africa. They are popularly believed (on no worthwhile evidence) to be financing the Algerian rebellion with a view to monopolising the Sahara oil; and Britain's recent difficulties in Oman recalled the dangers of getting too close to a big American oil concern.

But by the middle of this year, it was evident that an appeal to American capital would be inevitable. French resources in oil development are strained to the limit and there is no prospect of expanding them fast enough to keep up with the work in the Sahara: technicians and material had to be imported quickly. French preference went to the "independent" American oil companies. These are the firms that dominate the domestic U.S. industry but have been kept out of the Middle East until lately by the "giants" (Standard, Socony, Gulf Oil, etc.). The approaching exhaustion of native American deposits makes it important for them to get a footing abroad and they are, therefore, willing to offer better terms than the giants. It was these independent companies, grouped in the combine Amerada, that obtained the concession for the neutral zone between Kuwait and Saudi Arabia by offering till then unheard of rates of return to the local authorities. Further, they have already entered the Sahara from the Libyan side; the government in Tripoli has granted them an immense prospecting region which is bounded on three sides by areas of the French Sahara where French companies are now prospecting.

This month some of these firms have combined with French to form new units: one such groups two French oil firms, the bank of Lazard Brothers and two U.S. firms, Sinclair Petroleum and Newmont Mining Corporation. Similar combines have been formed by French firms with British Petroleum. It is to such combines that

the new licences are being issued. French predominance is generally being preserved, the terms on which licences are given are strict; altogether the French, who sometimes seem to imagine that the whole world is conspiring to steal the Sahara from them, are satisfied that inevitable assistance is being taken on safe terms. In any case, within the French firms concerned, the major shareholder is often the French Government. Though fresh capital is urgently needed, the Government is not willing to surrender this major ownership, and it is trying the interesting experiment of selling to the French public vouchers which entitle the holder to the full return on a share but do not carry any legal ownership or voting power. The response from the public to all appeals for capital for the oil industry has been excellent.

Another reason why reluctance to admit foreign co-operation in the Sahara was overcome was that Paris hopes to involve her allies in her African empire and thus obtain their support in its defence. Experience shows that the State Department, which is apt to find dozens of glorious George Washingtons in other countries' colonies, becomes much less sensitive to progressive forces once an American oil company makes investments there. Thus the French calculation is probably a shrewd one. More generally, by bringing nearer the day when the Sahara will supply the bulk of European oil requirements, France can secure the co-operation of her Western allies in the task of maintaining her position in Algeria. As long as the Sahara oil was a mirage, and moreover a mirage whose dimensions were minimised by such American oil companies as could not obtain licences to inspect it closely, foreign capitals were inclined to regard the French bait of soft currency oil supplies as a desperate gamble. But with the present rate of feverish and determined activity, Sahara oil is no longer a mirage or a bait but a very near reality, and thus a concern for the political stability of North Africa is growing abroad.

The suspicion that Paris was overestimating the importance of the desert oil deposits has now vanished. It is definitely confirmed, for example, that at Hassi Messaoud there is a reserve of 100 million tons; and other regions are no less promising. Reserves of this order make it well worth while to face the considerable difficulties of extracting oil from these God-forsaken regions. Not only that, but the search for oil has revealed that there is water under the Sahara and that its use, although extremely expensive, will be perfectly possible if undertaken along with the extraction of oil. There is thus the hope of establishing an oasis agriculture large enough not only to support the oil industry but to provide exports of cereals and dates to the surrounding countries. An oil boom, and the beginnings of cultivation in the desert will make easier the exploitation of mineral deposits, such as the iron ore mines at Tindouf. Therefore, the Sahara scheme is not simply a gamble on oil but a general development programme.

The fructification of the Sahara will require that the French consent to co-operate not only with the British and American (and later possibly German) suppliers of capital, but also with the coastal States, and especially the former protectorates of Morocco and Tunisia. It is these countries that must allow access to the desert, because not all of it is most conveniently approached through Algeria; and they can supply manpower and some capital, as well as offering markets for such agriculture and industry as is established there.

Rabat and Tunis have sometimes suspected that Paris was seeking to exclude them from the Sahara venture, but in fact the view has always prevailed here that the task must be undertaken jointly and that it offers the basis for genuine new co-operation between the metropolitan power and the former protectorates. The illusion that France could go it alone without the least help from the littoral States was only entertained by the anxious nationalists who imagined that no recourse need even be had to British and American capital. However, it is believed here that the beginning of this co-operation, which could solve the economic dilemma of the poor North African countries, must be made conditional on Morocco and Tunisia being more accommodating, or at least less hostile, about Algeria. Plans for a joint effort in the Sahara are ready but will not be produced until Morocco and more particularly Tunisia cease to provide such active support to the Algerian rebellion.

After many years of hesitation, French interest in the possibilities of the Sahara is now acute. It is typical of the fumbling and procrastination of European imperialism that the really difficult work of associating colonial people in the ambitious task of development has been left till it is almost too late. Undertaken in time and on terms as generous as are now envisaged, this could have avoided most of the political and economic misery of the French North African empire. As it is, the job has to be tackled in the midst of a bloody war, when relations between the parties that must co-operate in it have been deteriorated by years of political strife, when the freedom of movement of the metropolitan power is reduced to a minimum by international impatience with her outdated imperialism, and when her own human and material resources have been reduced by decades of war and inflation. Quite apart from the reluctance of the North Africans to believe, after so many betrayals, in the genuine French readiness to share the gains of developing the Sahara, a major obstacle has been the weariness of the French people themselves; the history of the last two decades has brought most Frenchmen to regard any association with backward territories as a source of trouble, sacrifice, war and disappointment. It

is to a nation in this mood that the French Government has now to appeal for capital and labour to open up the Sahara, in fair co-operation with the North Africans. It is a tribute both to the French and to their former and present colonials in North Africa that it is still possible to hope that this great chance will not be lost.

THE VISCOUNT IS HERE!

Already in service with 18 of the
world's leading airlines, the Vickers
VISCOUNT offers you unparalleled
speed and comfort.

VICKERS VISCOUNT

TURBO-PROP AIRLINER JOINS I.A.C. FLEET

THE FIRST OF TEN THAT WILL
FLY IN YOUR SERVICE

THE FIRST of the ten Vickers Viscounts ordered by the I.A.C. to bring turbo-prop flying to India, is now here—to offer faster, finer air travel than ever before. The Viscount will operate on the Delhi/Calcutta, Calcutta/Rangoon routes from 10th October 1957. More Viscounts will be arriving very shortly and ultimately all I.A.C.'s major routes will operate with them.

INDIAN AIRLINES CORPORATION
VICKERS-ARMSTRONGS (AIRCRAFT) LIMITED

Represented in India by:

Vickers India Private Limited,
Killick House, Home Street, Bombay 1.

NO VIBRATION Because it is powered by turbo-props, the Viscount is free from irritating vibration—gives you a really smooth flight

NO NOISE You get almost perfect quiet in the sound-proofed cabin of the Viscount. It's fully-pressurised too...and comfortable as in your own home!

ABOVE THE WEATHER Cruising at 20,000 feet, the Viscount seldom encounters bad weather...it actually flies above the clouds!

QUICKER Flying at over 300 miles per hour, the Viscount gets you there much faster, thanks to its four powerful Rolls-Royce engines

LUXURY Adjustable armchairs and large panoramic windows add to passenger comfort. You really enjoy your trip

The new VISCOUNTS will fly on I.A.C.'s Delhi/Bombay/Karachi, Bombay/Calcutta, Delhi/Hyderabad/Madras/Calcutta, Bombay/Madras/Tiruchirapalli/Colombo and Calcutta/Delhi/Srinagar routes.

ports Rs. 85.60 crores; total trade Rs. 133.89 crores. **Treasure:** Exports (including re-exports) of currency notes Rs. 7 lakhs, others negligible. Imports of gold Rs. 1 lakh, currency notes Rs. 4.32 crores, others nil. **Balance of trade:** The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures, the total value of exports (including re-exports) of merchandise and gold fell short of imports by Rs. 37.32 crores.

Cement Imports: Through the efforts of the State Trading Corporation of India, which has been entrusted by the Government with the work of import and distribution of cement, about 2.58 lakh tons of cement were imported by the end of August 1957. The imports would have been larger but for the closure of the Suez Canal. Owing to foreign exchange difficulties the scope for entering into fresh contracts for import is considerably reduced. Against current contracts, however, it is expected that further quantity of about 1.5 lakh tons will be imported by the end of the year.

FINANCE

India, US Announce Convertibility Accord: India and the United States have signed an agreement on currency convertibility guaranties to encourage private US investments in India. Under the agreement, the US Government will provide guaranties that Indian currency receipts (rupees) from new or expanded private American investments in India can be converted into dollars.

Per Capita National Income: In a written reply to a question by Shri Nagi Reddy, in the Lok Sabha, the Prime Minister gave the following estimates of the per capita income of India during the first Five-Year Plan period, year by year:

Year	Per capita national income at 1948-49 prices
(April-March)	Rs.
1951-52	250.1
1952-53	256.6
1953-54	268.7
1954-55	271.9
1955-56	272.1

Occupation-wise break-up of these estimates was not available, the Prime Minister added. The source of information, he further disclosed, was 'Estimates of National Income, 1948-49 to 1955-56' issued by the Central Statistical Organisation.

Central Loan: The Finance Minister, Shri T. T. Krishnamachari said in the Lok Sabha that a sum of Rs. 105.97 crores was subscribed to the Rs. 100 crores loan floated by Government. Of this, subscription by conversion of the old loans amounted to Rs. 44.99 crores (3 per cent Victory Loan 1957 Rs. 9.80 crores and 3 per cent Loan 1958 Rs. 35.19 crores). Government considered that the results were not unsatisfactory.

Staple Fibre Yarn Exempted from Excise Duty: With a view to encouraging the production and consumption of staple fibre, the Government of India have decided to exempt staple fibre yarn from the whole of the duty leviable under the Central Excises and Salt Act, 1944, with effect from September 16, 1957.

Subsidised Industrial Housing Scheme Grants: Loans and subsidies totalling Rs. 8,82,900 were sanctioned by the Government of India during June and July, 1957, for the construction of 414 one-room tenements under the Subsidised Industrial Housing Scheme. The Government of Mysore will be given Rs. 67,500 as loan and an equal amount as subsidy for putting up 50

tenements at Hubli. The Government of Assam will get Rs. 1,02,600 (half as loan and half as subsidy) for constructing 38 tenements at Kharghuli, Gauhati, and a loan of Rs. 48,600 and an equal amount as subsidy for building 36 tenements at Tinsuka. The Punjab Government has been sanctioned Rs. 1,56,600 for putting up 58 tenements at Batala. Half of the amount will be loan and half subsidy. The total amount of loans and subsidies sanctioned to various States and organisations up to July, 1957, for the construction of 89,212 tenements since the inception of the scheme in September, 1952, is Rs. 25,19,52,277.

Invisible Earnings: According to preliminary estimates, the net total invisible earnings of the country in 1956-57 amounted to 147 crores i.e., Rs. 75 crores on Government account and Rs. 72 crores on private account. This represented an increase of about Rs. 21 crores compared with the figures for 1955-56.

Foreign Investments: According to preliminary figures available, the total foreign business investment in India on December 31, 1955, was Rs. 477.97 crores compared with Rs. 415.73 crores (Revised figures) on December 31, 1953 and Rs. 287.57 crores at the end of June 1948.

GENERAL

Community Development in India: The Community Development Programme will complete five years on October 2, 1957. The National Extension Service will cover the whole country by 1961, while Community Development blocks will cover about 40 per cent by the end of the period. The Community Development and National Extension Service programmes have identical aims but the National Extension Service movement is somewhat less intensive in character than the Community Development. The first 55 Community Projects were launched on October 2, 1952. There were 2,120 Community Development, National Extension Service and Post Intensive Phase blocks in operation on August 31, 1957, throughout the country, covering 272,756 villages and a population of nearly 15 crores. Each National Extension block covers one hundred villages with a population of approximately 66,000. The Gram Sevak looks after 6,000 to 7,000 people living in 10 villages under his charge in a Development block.

Employees Provident Fund Extended to Two More Industries: The Government of India have decided to extend the benefits of compulsory contributory provident fund under the Employees' Provident Fund Act, 1952, to workers in the Power and Industrial Alcohol and Asbestos Cement Sheets Industries. A Gazette Notification requiring the recovery of provident fund contributions from wages for and after the month of December, 1957, is being issued by the Ministry of Labour and Employment. The Act would now apply to 26 industries, five classes of plantations, and 4 categories of mines and newspaper establishments, giving the benefit of contributory provident fund to about 24 lakhs workers.

Electricity Output: During April, 1957, 770 public electricity supply undertakings generated 899.4 million kilowatt hours (kwh.), of which 734.5 million kwh. were sold to ultimate consumers. These figures show an increase in output of 26.7 million kwh. over that in March, 1957. The generating undertaking at Suratgarh in Rajasthan was the new addition during the month. The figures of output and sale of power for April, 1956, are 779.4 million kwh. and 643.7 million kwh. and for April, 1955, 704.7 million kwh. and 172.0 kwh. respectively.

NEWS IN BRIEF

INDIAN

The Indian Institute of Public Opinion, New Delhi was elected a Gallup affiliate—the first in Asia—at the recent meeting in Helsinki of the International Association of Public Opinion Research Institutes.

*

Subscriptions to the 4½ per cent Bombay and Mysore State Development loans amounted to approximately Rs. 742 lakhs and Rs. 503 lakhs respectively.

*

India is likely to export steel by 1961. The construction of the three public sector steel plants is progressing satisfactorily.

*

The Planning Commission has estimated that the second Plan provision of Rs. 524 crores for industrial development in the public sector will fall short of requirements by Rs. 180 crores.

*

The Punjab Government has decided to launch a concerted drive to promote industrial development in the State.

*

A scheme for strengthening Agricultural Research Institutes in Rajasthan in 1957-58 has been approved by the Government of India. The cost of the scheme amounts to Rs. 3.2 lakhs of which Rs. 2.4 lakhs have been sanctioned by the Government of India.

*

A new simple process for producing papain from papaya milk has been perfected at the Fruit Research Station at Saharanpur. Under the process, it is claimed papain of a very high quality can be produced.

*

A draft Indian standard specification for leather picking bands for looms has been circulated by the Indian Standards Institution for eliciting comments.

*

Three more housing colonies for handloom weavers, two in Orissa and one in Madras, are to be constructed under schemes approved by the Government of India. With these, 18 housing colonies for handloom weavers have been sanctioned in Andhra Pradesh, Mysore, Kerala, Bombay, Uttar Pradesh and Orissa.

*

Eight industrial estates, of which one will be on a smaller scale, than the rest will be set up in Kerala State.

*

A provision of Rs. 2 crores has been made during 1957-58 for the grant of scholarships to students belonging to scheduled castes. This amount is nearly Rs. 14 lakhs more than the expenditure incurred in 1956-57 for this purpose.

*

The Government of India has issued an order controlling the price of rice and paddy in Andhra Pradesh.

*

A sum of Rs. 5 lakhs has been sanctioned by Government of India for road development works in Assam, Himachal Pradesh and Tripura.

FOREIGN

The British Government has raised the bank rate by 2 per cent to 7 per cent in a drastic bid to halt rising prices and defend the £ against speculation abroad.

*

The Federal Bank of West Germany has lowered the bank rate from 4½ to 4 per cent.

*

The Greek balance of payments for the first six months of 1957 showed a deficit of \$121 million, 9 per cent more than in the same period of 1956.

*

Thailand's rice production in the crop year 1957-58 is expected to be between 7.5 million and 8 million metric tons of rough rice according to a preliminary official forecast.

*

The gross national product of Guatemala has risen at an average rate of \$51 million a year since July 1954, and in 1956 it reached the record high figure of \$688 million.

*

Details of loans totalling \$40 million to be raised in the US by the South African Government have been announced. The South African authorities plan to raise \$15 million on the open market and \$25 million in various currencies from the World Bank.

*

The Netherlands Government has concluded an agreement with the International Monetary Fund whereby Holland can levy foreign exchange—totalling \$137.5 million—from the I.M.F. against amount of Dutch treasury bills in guilders.

*

After a continuous fall since November 1, 1956, the external assets of Ceylon showed a slight increase in July. At the end of July, they stood at Rs. 979.2 million showing an increase of Rs. 1.2 million over the previous month.

*

Steel production in the UK is continuing to rise rapidly. Output last month, at an annual rate of 19.42 million tons was 9.8 per cent higher than in August last year.

*

A financial survey team from New Zealand has recommended the establishment of a bank in Western Samoa, to be owned by the Samoan Government and the Bank of New Zealand in the proportions of 45 and 55 per cent.

*

Ordered in June 1955 from William Simons and Co., Ltd., (Scotland) at a cost of £1 million, the 4,500 ton dredger being built for the Calcutta Port Commissioners is due to be launched towards the end of this month.

*

It is reported the Pakistan Government would set up an Agriculture Commission to study the problem of land reforms. The terms of reference and personnel are under consideration and would be finalized shortly.

Serving the Five-Year Plans

...ACC CEMENT

BETWEEN 1948 and 1955, the A.C.C. has doubled its production of cement... and its output continues to grow. Widely used for the mighty projects of the first Five-Year Plan, ACC cement is now playing a great part in the second Plan — helping to build today the India of tomorrow!

THE ASSOCIATED CEMENT COMPANIES LIMITED
The Cement Marketing Company of India Private Limited

PRODUCTION DOUBLED ...
2,00,000 tons per year

From one lakh tons of cement to two lakh tons a year ... that's our output today.

For quicker tempo, the country's development plans require more and more of cement and we, too, keep pace.

In the building of a better India, INDIA CEMENTS are proud to play a notable part by doubling the production of SANKAR BRAND Portland Cement—the cement known for its Soundness, Strength and Stability. •

The Business World

THE TELCO DISPUTE: A BALANCED VIEW

THE controversy over the price of Telco locomotives has become a hardy annual. The debate which took place on this subject in the Lok Sabha at the fag-end of its last session was, however, something out of the ordinary, both because of the force of Mr. Feroze Gandhi's attack, and the skill with which his facts were marshalled. In fairness to the company it must be stated that the position in which it was placed was unenviable. It amounted to its indictment in absentia. Since then Sir Homi Mody and two other directors of the company have explained their case at a press conference. Mr. Feroze Gandhi has in turn issued his rejoinder. Now that both sides have argued their case a balanced view of the dispute can be taken.

It is undoubtedly true that the agreement between the Government and the Telco which was executed in August 1947, but given retrospective effect two years earlier, was very loosely worded. Much of the controversy arises from ambiguities which were patent in this agreement. One fact which ought to be remembered, however, is that the Railway Board was anxious for reasons which are not difficult to understand to transfer the Singhbhum workshops to Tatas with the express purpose of developing it into a full-fledged locomotive factory. Tatas, in entering the deal, seem to have been influenced by special factors other than those of taking up a commercial undertaking. The whole tenor of the progress of Telco in the initial period shows that the programme of the production of boilers in the first instance and after that also of locomotives was not carried out according to the agreed schedule. Reference was made in the Lok Sabha debate to the financial assistance and financial concessions made by the Government to Telco. It is possible to argue that the Government erred overmuch in showing this sort of accommodation. Angry questions were asked in the debate why an ex gratia profit of Rs. 7 lakhs was allowed to be earned by the company and why the penalty clause was not enforced when repeated defaults were committed in the matter of deliveries.

The entire issue has been discussed in great detail by the Tariff Commission with the assistance of a foreign expert. The impartial enquiry conducted by this statutory organisation and the considered verdict which it gave are entitled to ungrudging acceptance. The Tariff Commission has recorded its view that delay in completion of the works and manufacture of products arose from causes which were not to a great extent within the control of the company. The question of production costs and pricing of locomotives has also been decided by the Tariff Commission after a minute weighing of evidence. Although it could be possible to express divergence on minor questions, the overall verdict given by the Tariff Commission deserves to be respected. A comparison of the prices of Telco locomotives with Chittaranjan locomotives clearly shows that there is considerable room for improvement in the economy and efficiency in the operations of Telco, which could be, and is now being, reflected in lower costs. But major aspects of distinction should not be overlooked. Telco has to function with the high cost structure of a small-scale unit and the necessity to manufacture two types of locomotives as against only one which is the case with Chittaranjan are circumstances which explain the cost disadvantage under which Telco labours. Similarly, the declaration of Chittaranjan as a protected area and the upsurge of acute Communist-inspired labour trouble

at Telco is another contrast which needs to be taken into account.

These handicaps deserve to be given the fullest allowance in assessing the level of cost at which the Railway Board is purchasing Telco locomotives. One point that needs to be noted relates to the composite character of Telco. The locomotive division and the automobile division of the company constitute water-tight compartments and the Tariff Commission which examined the financial position of both, in so far as it was relevant to the price enquiry, has come to the conclusion that the automobile division is not being sustained on the finances intended for the locomotive division. The presence of a Government-nominated director on the company's Board and of the Railway Board's representative in the accounts section of the automobile division constitutes an adequate safeguard against any diversion of finances or of interlocking of capital. Still another point which may be conceded in favour of Telco is the effect of accelerated depreciation in the initial years at double the normal rate. This acceleration was introduced in the cost structure of Telco on the insistence of the Railway Board and despite the company's unwillingness to consent to it. The result of squeezing depreciation in the earlier period has been to raise the cost of locomotives. But since the Railway Board will be the monopoly purchaser of Telco's locomotives, it can be reasonably expected that the effect of lower depreciation allowances in the subsequent period will be translated in lower prices.

Finally comes the question whether prices of Telco locomotives are not high. The latest price quoted by Telco to the Railway Board is Rs. 4.42 lakhs per unit. This is a substantial improvement upon the earlier high prices charged at Rs. 6.90 lakhs in 1954-55 and Rs. 6.37 lakhs in 1955-56. The relevant question is whether the current quotation of Rs. 4.42 lakhs is adequate or high. It has been contended by Sir Homi Mody on behalf of Telco that this price compares favourably with the duty-paid landed cost of a British locomotive at Rs. 4.87 lakhs on the basis of an offer about a year and a half ago. One element in this cost of the British locomotive is that it is the price quoted for negotiations. As proved experience shows the actual contract price would have been lower. In the next place, for a real comparison between Telco prices and imported prices, a deduction of 25 per cent ought to be made in the latter on account of freight, insurance, customs and similar incidental charges. The comparable price of the British locomotive then comes to Rs. 3.65 lakhs.

Telco's technical associate, Krauss Maffei, it appears, have quoted a price of Rs. 3.5 lakhs for 1956-57. In arguing preference for the British locomotive price as a comparable price and in rejecting the German or any East European locomotive price, it is emphasised by the company that the German and East European prices contain an element of subsidy and hence they are unacceptable. The extent of subsidy must, of course, remain a matter for surmise. Even so, it is questionable whether the subsidy in the case of the Krauss Maffei locomotive would be as high as 28 per cent (on the basis of the British price without subsidy) in a seller's market. All in all, it is not a bad thing that the fierce light of publicity should be thrown on operations in the private sector which have a public counterpart.

BUSINESS NOTES

LIBERAL LENDING BY THE I.M.F.

GREAT INTEREST attaches to the current annual meetings of the International Monetary Fund and the World Bank at Washington, although it would be too optimistic to expect spectacular results immediately. The principal financial problem of today, in the world context, is the disturbing re-emergence of the dollar deficit. While American exports to nearly all parts of the world have been increasing rapidly over the past nine months, her imports are on the decline. What causes further anxiety is that there are no indications of a possibility of arresting this trend in the foreseeable future. This contains the potentiality of a more serious problem of payments disequilibrium for most countries. If it has not already occurred, it is due, in no small measure, to the recent activities of the IMF. During the last year, the Fund made available dollar advances to member countries, including the UK, France, India and Holland on an unprecedented scale. The outflow over the past twelve months was as much as \$1,500 million, much larger than ever before in the Fund's existence of over a decade. Since the replenishment of dollar reserves by repayments constituted only a fraction of the huge outflow, the Fund's gold and convertible currencies suffered a sharp drop from nearly \$4,000 million to about \$2,650 million. If commitments of standby credits are taken into account, this figure would decline further by another \$800 million. One unpalatable accompaniment of the Fund's liberal lending is the concern over the critical position of its largely depleted resources. Genuine anxiety has been caused all round by the fear that the IMF may be compelled substantially to curtail its lending after only a single year's extensive operations.

It is obvious that so far as the IMF is concerned, the solution of the problem does not lie in slashing credits at this crucial juncture. If anything, such a course cannot fail to deteriorate the position and adversely affect world trade. In most cases, the brisk borrowing has been put to no purpose other than to be utilised on productive projects. The real solution lies in augmenting the resources of the Fund, which, in turn, lies in the power of the United States. However, if current conditions are any guide, a real danger exists even of reduced American aid. This is a particularly unhappy position at the present time when what is needed on the part of America is the same broad vision as was exhibited through Marshall aid.

Another threat that faces the world, though in different degrees in different countries, is inflation. As stressed by President Eisenhower in his opening address at the World Bank and the Fund's meetings, inflation is a "world-wide phenomenon today" which needs to be attacked before it unleashes "all the evil consequences," including those of a depression in course of time. The IMF has an important and significant role to play. One possibility of its continuing to be useful, even in the absence of adequate dollar reserves, is to utilise other currencies like the German Mark, wherever possible. Increased subscriptions from member countries are a remote possibility though because of the rising prices and thereby falling value of money this seems necessary. India is particularly interested in the growing role of the IMF which has come to her help by a loan and standby credit in her critical balance of payments a few months back.

THE BRITISH BANK RATE

FOR QUITE sometime cheap money policy has been under revision everywhere. But the latest move of the Bank of England to raise the Bank rate from 5 to 7 per cent is a dramatic decision designed to give a shock to the economy, particularly to those who indulg-

ed in foreign exchange speculation. Like all shock treatments the effect of it would be expected soon if it is not to be quite effective, or gradually if it is not to be fully effective. In his statement announcing the rise in the Bank rate the Chancellor of Exchequer said that "the Government is determined to maintain the internal and external value of the pound." Putting up of the Bank rate is not an isolated measure. It is to be coupled with restrictions on investment both in the public and private sectors. The idea is to have a general credit squeeze to curb inflation. The speculative pressure on sterling related particularly to the D Mark has been quite a problem to the country. The increased Bank rate is expected to relax this pressure greatly. How far the move will succeed in its objectives is a matter of speculation. Immediately at least it is in the nature of psychological treatment. The fundamental difficulties arising out of the recurrence of the dollar gap with its threatening consequences will still pose a problem which would require a long-term remedy. The risk that the British Government has run through raising of the Bank rate and the all round restriction of investments is great. Such a course will obviously have its effect on small and medium sized business in the country. There is also a danger of unemployment arising from this decision. The British TUC, already in a militant mood, will not tolerate such a situation. In the circumstances the duration for which the hiked up Bank rate and accompanying reduced investment measures persist might be a matter of great political importance. The interest of India is naturally focussed on the likely repercussions the raising of the Bank rate will have on her economy. Besides being a member of the sterling area, India has her special problems of foreign exchange gap to meet her developmental needs. Dear money in the U.K. will directly impinge upon the cost of loans likely to be raised in the London market. Our deferred payment arrangements in that country will also be affected. The difficulties of importers will be increased due to the higher cost of supplier's credit. In the circumstances hopes of large capital, institutional or private, from the U.K. will be wilted. It has already become clear for some time past that the U.K. had its own limitations in exporting capital to India.

There is little chance of any adjustment in the Bank rate of the Reserve Bank of India in the near future. The one sure effect that the new Bank rate will produce is to add to the already tight money conditions in this country. In the busy season ahead exchange banks in India, deprived of easy credit facilities abroad, will compete more vigorously with Indian Scheduled Banks for funds in the money market. This will all happen at a time when restrictions on credit are being prescribed by the Reserve Bank to hold inflationary pressure during the forthcoming busy season. Any developments in this regard will be closely watched.

IISCO DIVIDEND PROSPECTS

HOW SIR BIREN MOOKERJEE viewed with dismay the likely export prospects of Indian steel was discussed in the last issue of this journal. In his survey of the production trends and profits of the IISCO the general effect left by his address was none to buoyant. Sir Biren pointed out that the profits at Rs. 2,19,97,532, although a little lower than in 1955-56, showed only a return to "a more normal level." The financial position of the Company has been strengthened. However, the shareholders are still restricted from getting their due share of the prosperity of the company. The Chairman pointed out that the matter has more than once been brought to the notice of the Government. "It is a matter of great regret to your directors that the Government

STONEWARE PIPES
(for underground drainage)
salt glazed, acid-resistant and tested to standard specifications.

DALMIA PORTLAND CEMENT
for general construction

R.C.C. SPUN PIPES

for all industrial purposes; firebricks, mortars, insulating bricks in all heat ranges and shapes.

DALMIA CEMENT (BHARAT) LTD.
DALMIAPURAM (TIRUCHIRAPALLI)

have been unable to accept the view of the Board," he continued. The possible reason for this might be the feeling that any increase in the dividend distribution would "prejudice the finance of the cost of the expansion programme or the due repayment of the indebtedness that is being incurred." A ray of hope emerges from a letter to the Company dated the 29th July, 1957, wherein likely relaxation on dividends has been indicated on the completion of the expansion programme. Sir Biren cheered investors by disclosing that since the 1953 extensions are expected to be completed next year and one of the two batteries of coke ovens and one of the two blast furnaces will be ready for commissioning this year, prospects for higher dividends were bright.

Without questioning Government's policy in restrictions of dividends such as in the case of IISCO, one would hope its fiscal policies are so framed as not to corrode incentives to private investors. For quite some time a feeling is growing among private investors that Government policies are made without reference to the risks taken in an enterprise. The shareholders of IISCO have patiently waited for long, and a helpful turn in Government's attitude toward their profit margin is only called for.

PRODUCTIVITY MOVEMENT

IN RESPONSE to the demand by various experts drawn from labour, employer and management organisations that a national movement for productivity was highly essential in a country like India, a National Productivity Council is to be set up. The Indian Productivity Mission which visited Japan last year had also pleaded for the establishment of a National Productivity Council to inculcate productivity consciousness in the country. On the Council will be represented the organisations of employers, workers and Government nominees in equal proportion. Representatives of associations of technicians, professional consultants, research workers as well as other interests like small industries would be co-opted on the Council. The Council will work to improve continually the ratio of output to input at various levels of production in an industrial unit.

It is rightly recognised that the productivity drive should aim at increased production by improved techniques, proper utilisation of various resources, raising the standard of living of the people and improving the working conditions of labour. This would not only expand employment but would also improve the country's economy by stimulating expansion of industry. It must be emphasized here that co-operation between management and labour is, of course, indispensable for the success of productivity as a lapse on the part of any party could wreck the whole movement. The heartening feature of the scheme is that local productivity councils would also be formed in industrial centres to promote productivity consciousness at the local level. There is also the suggestion that local councils could have special committees for different industries. All these are no doubt steps towards the promotion of industrial democracy, but the success of it would depend on the spirit and outlook in which these Committees and Councils conduct themselves.

The annual reports of the Estimates Committee in regard to individual industries and the Parliamentary debates have pointed out that efficiency in the public sector industries is very low and there is a great room for improvement. From the Press reports it is not clear whether these industries would be covered by the productivity drive; although the presumption is that they would be. There is a strong case, no doubt, for productivity movement to be launched in the public sector industries which are likely to expand progressively in view of the goal of the socialist pattern accepted by the Government.

OPERATIONS OF THE LIFE INSURANCE CORPORATION

IT IS a matter of some satisfaction to know from Mr. G. R. Kamat, Chairman of the Life Insurance Corporation of India that its nearly all new business offices are now working normally. Much of the time of its brief existence has been taken by the transformation of numerous units into a single nationalised concern. While this difficulty should be appreciated, it explains only partly the drop in business that has occurred. Again, the figures of new business during the months of July and August are encouraging, but real progress will have been achieved only when similar and further progress is recorded over a longer period. As it is, the first six months of the current year show a lower business than for the corresponding period in 1956.

For expanding the field of life insurance operations, it is necessary to create confidence in the general public. Confidence can be the result as much of the status of the institution from which a policy is purchased as of the efficiency with which business and claims are settled. As a nationalised concern, the Life Insurance Corporation is completely assured of the former. But efficiency and good organisation can be effectively proved only by performance in future. It is gratifying that the Corporation realizes the scope for improvement in these directions. In this connection an improvement already introduced in the Southern Zone is the expeditious disposal of proposals under "express service". Efforts must be made to make the new service a success so that it may commend itself for introduction in all parts of the country. With nationalisation, life insurance has ceased to be purely a business. It is also a public service which must no longer be confined to certain limited sections of the community concentrated mainly in urban areas. For its healthy growth and usefulness, both for the insurer and the insured, life insurance will need to be extended far beyond the present boundaries on attractive terms. This is what is primarily expected of the nationalised Life Insurance Corporation of India and it is encouraging to know that it is now preparing itself for the task of spreading the insurance habit in the rural areas.

A Letter to the Editor

"REDUCTIO AD ABSURDUM": DIRECTORS' REMUNERATION

Sir,

Recently I re-read your leading editorial entitled "Reductio ad Absurdum" in "The Eastern Economist" dated October 19, 1956, in which you have commented that the interpretation of Section 348 of the Companies Act, 1956 by the Bombay High Court in *Ramabehn A. Thanawala Vs. Messrs Jyoti Limited* (59 Bom. L.R. 67) will hamper the development of private enterprise in the country. In this case Mr. A., who was one of the partners of the managing agency firm wanted to draw a salary of Rs 3,000 per month in his capacity as a technical adviser of his company, over and above his share in the 10 per cent maximum remuneration allowed under the Act for the managing agents as a whole under Section 348. The relevant points in the judgment are (1) that there was no objection to the drawing of any salary as technical adviser, (2) that, however, the amount so drawn will have to be subject to the maximum limit of 10 per cent, which should be deemed to include remuneration received not only as director but for services in any other capacity, like, say, a technical adviser, and (3) that, nevertheless, this salary as technical adviser will not attract the overall limit of 11 per cent under Section 198, which, unlike Section 348, does not include salaries payable for services 'in any other capacity' but comprises only remuneration paid to the directors as directors.

As the Sections 198 and 348 stand at present, the reasoning of Their Lordships of the Bombay High Court seems unassailable. It is pointed out that there will be many anomalous results. (1) External employees as technicians can draw fabulous salaries, while managing agents must be content with far less total remuneration, especially when the profits are little because the latter's remuneration is linked with net profits at an overall 11 per cent; (2). If a company should make loss in any one year, the technicians can nevertheless draw their salary, while the directors can have between all of them only a maximum of Rs. 50,000 if a provision in this behalf is contained in the articles of association of the company or the company had passed a special resolution sanctioning the same; (3) Where foreign technicians are employed, the disparities will be even greater because for three years these persons can receive tax-free income, while even the share out of the maximum Rs. 50,000 of a director's remuneration is not exempt from tax; and (4) That even the public sector would be affected because the law is the same for a civil servant acting as managing director of a public sector corporation. The remedy you have suggested is an amendment of Section 348 by raising the ceiling percentage. I would like to suggest further that the words most responsible for this state of affairs, in Section 348 ("or in any other capacity") be deleted to make this Section fall in line with the kindred Section 198, where there are no such world. This is one side of the picture.

It is apparent that if the amendment is made as desired and there is no mention of the capacity in which the services are rendered, it will still be a moot question whether or not the overall limit of 11 per cent will, or will not, apply to the salaries earned by the managing agents as technical advisers and not as managing agents. In other words if the limit of 10 per cent under Section 348 has to be enhanced, the limit of 11 per cent in Section 198 will also need revision, because there will be a conflict between them, unless it is also categorically mentioned (if further litigation is to be avoided) that any remuneration received in the capacity of technical advisers will be exempted from the limits prescribed therein. But, if really such exemptions are to be statutorily mentioned there will be no need at

all to increase the ceiling percentages already contained.

Now let us look at the other side of the picture. If ceilings are to be increased without providing for exemptions as indicated, what should be the new limits. Can any upper limit at all solve the difficulties apprehended? Incidentally, the provision regarding a minimum (maximum) remuneration of Rs. 50,000 for managing personnel in the event of loss or inadequate profits will still have to be there, unless it is also deleted or raised correspondingly. Still, even with an overall limit of 20 per cent it may happen that in some cases the managing director's remuneration will fall short of highly paid extraneous, and/or foreign technician's emoluments. This does not seem to be an effective way of solving the anomalies. And if no ceilings are at all prescribed, then the whole framework of the new Companies Act will have to be altered and many Sections of the Act will either have to be omitted or completely recast. There will then be no necessity for Sections 349, 350 and 351, for example, which give the mode of calculation of net profits for purposes of remuneration.

If, on the other hand, the salaries of technical advisers cum managing agents are exempted altogether, what would be the consequences? The practice will come to be more generally or more liberally adopted. Suppose a company makes a profit of only Rs. 3 lakhs in a year. It may be that if there are two managing agents employed as technical men on a salary of Rs. 2,000 per month each, their annual salary alone will amount to Rs. 48,000, while their combined remuneration as managing agents will be Rs. 30,000, as 10 per cent of the net profits. Whereas, to get this amount by way of remuneration as managing agents the company would have had to make about Rs. 5 lakhs as net profits which means even more as gross profits. The lesser the profit the greater will be the disparity, depending upon the quantum of salaries. Whether the company makes less or more profits the technical managing agents are assured of their regular salaries and thus there will be less incentive to make greater profits, which implies that there will be less care taken or industry bestowed to working the concern successfully. If their entire remuneration is dependent only on the net profits, surely the incentive to achieve better results and show better profits will be present. That will undoubtedly be more beneficial to the large body of shareholders, both from the long-range point of view as well as immediately in the payment of dividends.

It must be conceded, however, that there must be enough incentive provided for managements to work enthusiastically, human nature being what it is. But it appears to me on balance that there should be some ceilings on the remuneration earned by the managing personnel (not in the total sum, but in the percentage basis) and also in other ways according to the intentions of the Legislature in enacting the new Company Law. If perhaps a reasonable ceiling percentage is prescribed for remuneration earned in the capacity of technical adviser, just as there is a 10 per cent limit for managerial remuneration and some rules of inter-relationship between the two remunerations are also established, that may be a workable solution. Anyway, if the trend towards appointing managing personnel also as technical advisers on a monthly salary is interpreted as a growing dissatisfaction with the ceiling of 10 per cent or 11 per cent, because such remuneration is inadequate, then there is some justification for a revision of the policy.

Yours faithfully,
C. V. NARAHARI RAO, M.A., B.L.

BOOK REVIEWS

THE DUKE OF EDINBURGH'S STUDY CONFERENCE

His Royal Highness the Duke of Edinburgh's Study Conference on Human Problems of Industrial Communities within the Commonwealth and Empire 9 — July, 27, 1956. Vol. I: Report and Proceedings. Vol. II Background Papers, Appendixes and Index: Oxford University Press, London: Price 42s. Net (2 Volumes).

By R. P. Aiyar

In the wake of the Industrial Revolution, the little island of Britain paved the way for progress in technology, and although the giant across the Atlantic and the colossus very near to the East have spurt forward to achieve industrial supremacy, the enquiring spirit in Britain still continues to nurture progress in the economic field. The lead of Britain in harnessing nuclear energy for peaceful purposes is but one facet of this restless spirit. It was, therefore, in the fitness of things that Britain should plan, organise and "host" a conference "to conduct a practical study of the human aspects of industrialisation, and in particular those factors which make for satisfaction, efficiency and understanding, both inside industrial organisations and in everyday relation between industry and the community around it." The proceedings of the Conference, since published, give an indication of the extent of the success of this direction.

The personnel of this Conference with age limits of 25-45 years sought to ensure a reasonable amount of youthful enthusiasm and resiliency, fortunately resulting in a tolerance of outlook while speaking with sincerity and conviction. This resulted in a "willing suspension of disbelief" leading to an intensive programme being profitably tackled by 300 strangers in three weeks. The addresses to the Conference delivered by eminent personalities disperse a wealth of thought, the main theme being to create deliberately a constructive relationship between the leaders and the led, making all concerned to feel a purpose and a responsibility.

The perennial problems incidental to industrialisation whether in the technically more advanced West or in the aspiring East cannot lend themselves to any text book solutions and the orations in the Addresses while discussing diverse problems arising out of ambivalent attitudes on the part of the workers rightly saw that without improvement in material standards further progress in cultural and moral fields would be difficult.

The technologists, Sir Harold Hartley, in an outstanding address, has spoken of the need to develop a creative spirit in the adolescent mind and to quicken the intelligence and imagination by an inspiring picture of the changing world. As behoves a scientist he has spoken of the limitations of human perception in that "the further we penetrate nature's secrets the more we see ever receding frontiers of knowledge." His address conjures up the picture of a traveller approaching continually without arriving.

The collective experience stimulated by the background papers, the addresses, and the visits to industrial establishments in U.K. is well recorded in the oral reports appended to Vol. I of the Conference report. The central theme in all these reports has been that "human affections cannot be bought by flower beds and other material schemes nor with paraphernalia of personal wealth. These are the rewards arising out of a 'spirit of inquiry' at every level seeking change and improvement without waiting for pressure or discontent."

Industry is the means whereby man converts or transforms the fruits of nature to his needs. Education

and training — a continuous process — are necessary adjuncts to the industrial process. In other words, industry can grow and develop much faster than the educational system. The present stage of human affairs is such that the human problems of industrial communities need close and intensive study. It was this which the Conference mainly sought to promote — a venture successfully concluded by people coming from diverse background, but all having a quality suited for the job.

Early industrialisation can be described as a move from a subsistence economy with its (often illusory) security based on production from a plot of land to the richer exchange economy where security must be socially planned. The Duke of Edinburgh's Study Conference has been a landmark in this development, and the commemorative volumes are worthy records of a job well done.

INDIAN STUDENT IN RUSSIA

In The Shadow of the Kremlin: By Satya Dev Sharma: Published by Siddhartha Publications (Private) Limited, 35, Faiz Bazar, Delhi: Price Rs. 2.50.

Travelers to the Soviet Union fall broadly into two categories: first, those of the Faith who are on pilgrimage to the Socialist Fatherland; second, starry-eyed fellow-travellers of the Faith who gush impartially over everything they see. The objective traveller who does not belong to either of these categories and who has his eyes and ears about him and is not easily deluded by the sales talk of the Commissars is all too rare. Such a one is Mr. Satya Dev Sharma, the author of this absorbing travelogue.

A student leader, who has for a while been Chairman of the United Nations Students' Association, Mr. Sharma made the trip to the Soviet Union in the autumn of 1954 as a member of the Indian Students' and Teachers' Delegation to that country. The delegation was given the usual red-carpet treatment accorded especially to delegations from uncommitted countries of Asia; and was hustled breathlessly on the customary rounds in the company of attractive interpreters. The crowded itinerary allowed hardly any time for intensive observation of the various aspects of Soviet life or for introspection on whatever was seen. That despite these handicaps Mr. Sharma did manage to have a really deep look around is a measure of his shrewd curiosity.

A student himself, Mr. Sharma was naturally interested in knowing all about Soviet education. He spent the better part of whatever leisure was available between travelling and toasting to a study of the many aspects of Soviet education. His conclusion, arrived at after a painstaking study, is that every aspect of education in that country had a strong ideological slant; that Soviet education, in general, is far too much preoccupied with problems of the ideology of the rulers; that it is merely a device to drill into the consciousness of Soviet youth the ideological infallibility of the party that rules that country at present.

The author makes a number of penetrating observations on a variety of other subjects too that would be of interest to students of Soviet Union. But these observations notwithstanding, the book is primarily an account of the journey into different parts of the Soviet Union. Engagingly written, the book will certainly help fill the gaps in the ordinary reader's knowledge of the Soviet Union.

Firestone

New DeLuxe Champion

TUBELESS TYRE

the tyre with **BUILT-IN PEACE OF MIND**

Firestone BEST TODAY—STILL BETTER TOMORROW

The New DeLuxe Champion Tubeless Tyre gives you and your family protection never before provided in any tyre at any price. Ends fear of blowouts, gives longer, safer mileage, and has astounding non-skid qualities. It is truly the only tyre with built-in peace of mind.

How banking serves the SPICES INDUSTRY

There is tremendous demand throughout the world for pepper and cardamoms and South India produces the bulk of these spices. One-third of the entire world demand for pepper is grown between Karwar and Cape Comorin; and in 1951-52, India's exports earned more than Rs. 27 crores.

Within the last ten years there has been a remarkable increase in cardamom growing, particularly in the South Indian states of Mysore and Coorg, and the districts of Madura, Tinnevely, Malabar and Coimbatore.

The Indian spices industry has a happy future, and banking will naturally help to expand and improve it. The facilities and guidance of a good bank, such as the availability of ready funds when needed and the collection of dues from any part of the country, have become part of efficient organisation in every industry.

We at Palai are proud that many spice growers of South India employ the complete banking service we offer:

Current Accounts—Demand Drafts—
Telegraphic Transfers—Investments—
Letters of Credit—Bill Collection—
Deposits—Loans & Overdrafts—
Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI, KERALA
Branches at: Madras, Cochin, Quilon,
Trivandrum, Alleppey, Mangalore, Ban-
galore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

Company Meeting

THE INDIAN IRON & STEEL CO., LTD.

Speech of the Chairman, Sir Biren Mookerjee

The following is the speech delivered by Sir Biren Mookerjee, Chairman of The Indian Iron & Steel Company Ltd. at the Annual General Meeting of the shareholders, held on 11th September, 1957 dealing with the year ended March 31, 1957.

Gentlemen,

It is my privilege to address you this year as Chairman of the Board of Directors in the absence on very well-earned leave of Mr Leslie Martin. It is, however, the intention of the Managing Agents that on his return to India, Mr Martin should resume his former position as Chairman, and to this end I commend to you the resolution that will be proposed at a later stage of this Meeting to provide for his reappointment.

PRODUCTION AND DESPATCHES

The total production of iron at 695,156 tons showed a decrease of 11,830 tons from that of the previous year due to the reduced output of the Blast Furnaces at Kulti. These Furnaces with their ancillary plant are now very old and uneconomical and subject to frequent shut-downs for repairs. Under the 1953 Extensions Programme it had originally been the intention that heavy capital expenditure should be incurred in effecting their complete modernisation and rehabilitation, but on a later examination of the position in connection with the Company's 1955 Extensions Programme and the overall second Five-Year Plan of Government, the conclusion was reached with the concurrence both of Government and the World Bank that such expenditure would not now be warranted having regard (a) to the surplus pig iron that would be available from the new Blast Furnaces at Burnpur and from the other new or expanded plants, and (b) to the inevitable higher cost of production at Kulti owing to inherent operational difficulties. It was accordingly decided that the Kulti iron plant should be closed down when the new Blast Furnaces at Burnpur came into operation.

In consequence of this decision, Government withdrew as from the 1st January 1956 the special depreciation element of Rs. 6-8-0 per ton included in the sale retention price of iron to the Company despite protest that the resultant price was quite uneconomical. Possibly in view of feared delay in the bringing into operation of the new plants, Government have recently requested that the Company should examine the possibility of the Kulti Blast Furnaces being maintained in production for a period of about four years. This position would be capable of achievement only by the incurring of considerable expenditure on the plant and our Consulting Engineers are now examining the matter. In the meantime it has been indicated to Government that the Company would expect all such emergent expenditure to be met by Government and the retention price of iron to be adjusted in relation to the actual cost of production.

Production of the Burnpur Blast Furnaces was 476,336 tons against 473,172 tons for the previous year, the slight increase being due to the fact that the relining of No. 1 Furnace during 1956-57 was effected in a

still shorter period than that of No. 2 Furnace in 1955-56, thus constituting a fresh record for the Company.

As regards the out-turn and despatches of steel, you will have realised from the particulars given in your Directors' Report that a number of special factors operated to inflate the position for the year 1955-56. These factors did not recur during the year under review which accounts for the decrease shown.

PROFIT

In view of the reduction of 31,114 tons in the despatches of steel there is naturally a fall to a more normal level in the gross profit earned for the year under review and the effect on net profits of this fall has been greatly accentuated by the severe increase in the rates of corporate taxation imposed under the Finance Act 1957. The severity of this increase will be realised when I tell you that had the Reserve for Taxation been calculated at the rates previously prevailing, the charge would have amounted to Rs. 269 lakhs as compared with the sum of Rs. 319 lakhs that has had to be provided to cover liability at the new rates. The incidence of the increase of taxation on the profits of the year under review accordingly amounts to no less a sum than Rs. 50 lakhs.

In face of this position it was decided that the time had now come to commence adjustment of the large balance standing on the Reserve for Taxation Contingencies and an initial write back to Profit & Loss Account of a sum of Rs. 47 lakhs has accordingly been made in the Accounts now before you. The Reserve in question is maintained to offset the increased incidence of taxation in subsequent years as a result of the special depreciation allowances granted in earlier years in the case of plant and buildings. The major part of the Reserve is attributable to the initial depreciation granted in previous years which has the effect of cutting off any further depreciation allowance for taxation purposes once the value of the asset has been written down to a certain level, and write back from the Reserve on this account will, in consequence, operate only as and when that level is reached. In addition, further special depreciation is allowable on plant and buildings during the first five years of their life which has the effect of reducing the allowance for each subsequent year with a consequent increase in the liability for taxation. It is to offset the position in this latter respect that the write back of Rs. 47 lakhs, which is not an arbitrary figure, but a calculated amount covering the position up to the 31st March 1957, has now been made. It is the intention periodically to examine the position so that the balance of the Reserve may gradually be adjusted.

Initial depreciation now no longer applies having been replaced in the case of plant and machinery by the grant of Development Rebate giving an outright

exemption from taxation of 25 per cent of the cost of new plant and machinery installed. The approximate tax saving on this account for the year under review amounts to Rs. 9,50,000 which sum has accordingly been transferred to General Development Reserve raising the balance of this Reserve to Rs. 16,50,000. As and when the major items of the extensions plant are commissioned the Development Rebate and the consequent saving in taxation will be substantial and, as was explained last year, we count to a large extent on the continuance of the Rebate for finance of the 1953 and 1955 Extensions Programmes, which apart from the pure capital cost of the added plant will involve a very considerable increase in the working capital requirements of the Company for the finance of rolls, spare parts, stores, raw materials stocks and the generally increased financial requirements of the expanded undertaking.

DIVIDEND

The fullest representation was again made to Government for admission of the Ordinary share-holders to some added participation for the year under review in the continuing prosperity of the Company, it being urged that with the limitation of dividend imposed in the past, the financial position of the Company had been strengthened to such an extent that the stage had now been passed where it could be validly contended that a small increase in the dividend distribution would in any way prejudice the finance of the cost of the Expansion Programmes or the due repayment of the indebtedness that is being incurred. It is a matter of regret to your Directors that Government have been unable to accept the views of the Board in this matter and in their letter dated the 29th July, 1957, a copy of which has been appended to the Directors' Report, have notified that restriction of the dividend must continue until the Expansion Programmes have been completed. This reply is a slight improvement on the earlier attitude of the Government. As the 1953 Extensions are expected to be completed next year, whilst one of the two batteries of coke ovens and one of the two blast furnaces will be ready for commissioning this year, I trust it may be possible for the Government to relax their control in the near future. In the meanwhile, your Directors would again point out that the decision of Government cannot be challenged without serious detriment to the interests of the Company and would urge that the position be accepted with good grace in the hope and expectation that the justness of the claim of the shareholders to a reasonable participation in the improved and continuing prosperity of the Company must ultimately be recognised.

FUTURE PROSPECTS

I should perhaps sound a note of warning as regards the present year. We are now feeling the full effect of the disruption of current operations that is inescapable when a plant is being expanded and constructional and operational work has to go on side by side. In these circumstances there has inevitably been a drop in production and whether this can be made up will depend entirely upon the date when it will be possible to bring into operation the first of the new blast furnaces at Burnpur, a matter with which I will deal in more detail at a later stage.

As to the future in general, I have no hesitation in saying that if it depended entirely on the efficiency, diligence and enthusiasm of all of us alone, your prospects would appear to be bright. However, in the day to day changing moods of the workers, not only in the industries but in all those departments whether in the Government or outside, who have to make their contribution towards the national effort, nothing can be

said even with reasonable certainty as to what we may expect in future. Extreme lack of discipline has manifested itself particularly during the last few months amongst all classes of workers, in many essential Government or other services, the Ports, etc., accompanied by actual or threatened strikes and by violence. Political agitation, sometimes accompanied by violence, has also played its part in interrupting industrial production and disturbing the public peace. This state of affairs may, if it continues, entirely upset not only our own expectations as regards the future operations of our plants, but the entire economy of the country. I would, therefore, with all the emphasis I can command, urge upon Government the vital necessity that violence be severely dealt with and punishment meted out with promptitude not only to those by whom the overt act is committed but also to those to whose subversive background activities this violence is directly attributable.

In our own works, in spite of an almost continuous improvement during the last few years in the conditions of service and emoluments, to which I shall refer later, it is regrettable that the workers allow themselves to be influenced by a minority affiliated to a certain political party and activated by the motive of supplanting the recognised Labour Union. This unfortunate position has been evidenced during the year by sporadic illegal strikes of short duration in the essential services sections, which have been particularly serious in the case of the Gua Ore Mines where even murder has been resorted to in an endeavour to terrorise workers belonging to the recognised Union and to disrupt normal operations. I cannot too strongly condemn this manifestation of an influence which for the gaining of its own party ends can contemplate with equanimity the disruption of all planned progress towards the achievement of the country's social advancement and industrial self-sufficiency. As you must have noticed, similar troubles have been reported also from Jamshedpur in the speeches of the Chairman of the Tata Locomotive and Engineering Co. Ltd., and the Tata Iron & Steel Co. Ltd., at their recent annual meetings.

Mere condemnation, however, is of little use unless it is coupled with some suggestion as to how the position may be met. My personal opinion, based on a study of similar situations in other industrial countries, is that the evil can best be countered by the building up of really strong and representative labour unions having the full support of the workers and capable of restraining the subversive influence of those few who for their own ends attempt to cause disruption to the detriment of the general welfare and that no other unions should merit Government's recognition. I would in fact go further and say that what affects one section of an industry must have repercussions upon the whole of that industry and therefore the ultimate solution may lie in the building up on an industry-wise or craft-wise basis, of unions under the leadership of responsible bodies of men who have the interest of the country and the workers genuinely at heart and who are not swayed by political influences or the desire for self-aggrandisement.

We have progressed a long way since the days when an employer could contemplate with equanimity, as reducing the bargaining power of the workers, dissension within a single union or the formation of a number of rival unions. It is now the desire, I am inclined to believe, of all enlightened employers that they should be able to deal with one strong labour union enjoying the support and truly representing the interest of its members. Given such strong and representative unions, employers and workers could readily resolve the difficulties that must from time to time arise between them and could act together in full co-operation

tion and mutual trust, thereby enabling the country to advance to new fields of prosperity and social security.

There are, however, other difficulties which will discourage any prudent man from trying to peep into the future. The solution of these difficulties almost exclusively depends upon the success of the more than Herculean tasks to be performed by the Government according to schedule for the implementation of what has been lately described as the "hard core" of the second Five-Year Plan, particularly in respect of the supply of good quality coking coal and the transpost of this and all other raw materials and ultimately the finished products. This "core" consists of the development of iron and steel, coal, transport and ancillary power and necessarily includes the two major units in the private sector of the steel industry. I shall try and explain to you briefly how the success or the failure of the Government's efforts in this respect is likely to affect the operations of our extensions with which your future is naturally linked up.

EXPANSION SCHEMES

In your Directors' Report and in the report by our Consulting Engineers that was issued therewith, a full description has been given of the stage which the schemes have already reached. We have, as you are aware, two programmes of expansion in hand, the earlier of which is described as the 1953 Extensions and the later one as the 1955 Extensions. The latter scheme was undertaken by us at the request of Government to form part of the second Five-Year Plan. It is intended to enable us to produce more finished and expensive products by reducing the excessive output of the semi-finished ones and of the saleable pig iron contemplated in the 1953 extensions. The total production after the completion of the 1955 scheme will be 1,000,000 tons of ingot steel or 800,000 tons of saleable steel instead of 700,000 tons of saleable steel as planned under the 1953 Extensions.

The 1953 Extensions, which you may remember suffered an initial delay of nineteen months, are expected to be completed by the end of 1958 if no unforeseen difficulties arise in the meanwhile, in which case we shall have made up seven months of the delay. Towards the end of the current year we expect to bring into operation one of the two batteries of coke ovens and one of the two blast furnaces included in the scheme, and the conversion of the old 600 ton active mixer into a 300 ton steel-making furnace, whilst the second coke oven battery and blast furnace are expected to be completed and function towards the end of 1958 along with the completion of the new Open Hearth melting shop.

In order to work the first battery of coke ovens we shall require an extra 54,000 tons of coking coal per month. This will bring the total monthly requirements of coking coal for Burnpur to 146,000 tons and we have been advised, and very rightly, by our Consulting Engineers and by the plant manufacturers that the new coke oven battery should not be lighted unless we have built up and can expect to maintain a stock of at least 100,000 tons in our works.

At the moment I can only say that the attainment of this stock position by the time the new coke oven battery is ready appears to be remote and in fact even the maintenance of supplies of coal for existing operations causes no little concern. As an indication of the seriousness of the position I would say that during the current year we have literally been living from hand to mouth and that recently orders had to be given to reduce the throughput of the coke ovens owing to the dangerously low level of the coal stocks which in turn has meant a reduction in the production of steel. The fullest representation has all along

been made in official quarters and it has been somewhat disheartening to be referred from one department to another, each in turn refusing to acknowledge responsibility for this sad state of affairs. I am hopeful, however, that as a result of intervention at ministerial level lately, the position may improve.

Similarly, we shall require a further 60,000 tons of iron ore per month to work the first new blast furnace. Owing to the late delivery of mining plant and machinery, caused by the strikes in America and the closing of the Suez Canal, the full mechanisation of our Gua Ore Mines will be delayed by about five to six months. For this reason, we have been advised by our Consultants to stock pile about 225,000 tons of iron ore at Burnpur. Although the target has not been reached yet, we have every hope that this position will be achieved by the end of November next.

Each of the new blast furnaces is designed to produce about 1,200 tons of pig iron per day which can be converted into about 1,000 tons of steel. Taking the present average import price of foreign steel at Rs. 700 per ton, which is perhaps Rs. 150 per ton lower than the price at which steel is being imported at present, the bringing into operation of the first blast furnace will mean a saving in foreign exchange to the country of more than Rs. 2 crores per month. The completion of the second blast furnace will double this advantage.

The second battery of coke ovens and the second blast furnace will also need about 54,000 tons more of coking coal and about 60,000 tons more of iron ore per month. Our total requirements including our present consumption will, when the 1953 Extensions are completed, be about 200,000 tons of coking coal and about 185,000 tons of iron ore per month, which means the transport of more than 4 million tons per annum in addition to considerable quantities of limestone, stores and other essential materials of our Burnpur Works equal to another one and a half million tons. In addition there will be 800,000 tons of saleable steel per annum to be moved. Allowing only four days turn round for the wagons, the Railways will have to provide for us carrying capacity for about 24 million tons or so per annum, about one third of which will have to consist of specially built hopper wagons for iron ore. These, I would emphasise, are the transport requirements for Burnpur only and take no account of the requirements of your Kulti Works.

In this connection it may not be out of place for me to observe that when the three Government plants and the extensions of the Tata Iron and Steel Co. Ltd., come into operation, the problem of transport may prove to be very difficult as most of the steel works will have to draw their principal raw materials from more or less the same area or neighbourhood which will cause a considerable amount of congestion on the railway lines and consequential delay. In such circumstances it is natural on the part of the private sector to apprehend that in the distribution of the transport facilities some discrimination may be made between it and the public sector. We are quite certain that at the ministerial level any discrimination between the private and the public sectors is unthinkable. We cannot, however, be certain that unless strict control is observed at the ministerial level or by some other high authorities, the administrative staff in charge of the transport or supply of the raw materials, particularly coking coal, may not exercise some discrimination between the two sectors. They may naturally imagine that their primary duty is to enable the Government projects to function before those in the private sector. Some public assurance, therefore, that continuous priority will be given in respect of this matter to meet regularly the requirements of the private sector, both for stocking piling and normal use, is highly desirable

if the two producers in the private sector are to meet punctually their obligations in respect of the heavy foreign loans contracted by them to finance their extensions.

EMPLOYEES WELFARE AND EMOLUMENTS

In previous years we did not think it necessary to give an account of the wages and other emoluments of our employees and of the many amenities provided by us. But all those employed in industries in whatever capacity have in recent years attained what is now described as the status of partners in the fortunes of the industry concerned. It is desirable, therefore, that I should place before you briefly what we have so far done and plan to do in the future, as well as give you some idea of their wages and other emoluments and the amenities provided for them.

From past experience and statistics it is found that whenever an increase in wages has been given, the prices of food and other commodities have moved up almost simultaneously to the extent of 80 per cent of the rise and in order to combat this evil we firmly believe in providing permanent benefit by increasing amenities for employees. It will perhaps be of interest if I give an indication of the lines on which we are progressing. We have always taken pride in the medical facilities that are made available free of cost to our entire staff and workers and to their families. These facilities are now being enlarged by the considerable extensions that are being made to the hospitals at Burnpur and Gua where an augmented staff of medical specialists and general practitioners are equipped to give the fullest and most careful attention to all cases that may arise.

With the expansion of the Gua Ore Mines we have been able to plan on up-to-date and enlightened lines a model township which will provide an improved standard of living accommodation for all classes of workers. This position applies equally in the case of Burnpur where a large area of land adjacent to the steel works has been acquired for construction of a new township of the most modern design to provide more accommodation and amenities for our workers.

At Burnpur also, enlarged training facilities are being provided which will include four hostels for the accommodaition of those undergoing instruction for their future positions as artisans and supervisors; a new cinema has been built to provide film shows at concessional rates and plans have been drawn up for the construction of a building to form the headquarters of a social and welfare centre called the Mahila Mangal Sabha for all the womenfolk of the station. We are now building a large and modern canteen in the works for the workers in place of the older ones and at Kulti have a large construction programme for additional housing for the workers, of which much has already been completed.

We have up to March 1957 already spent large sums on the town including housing and the provision of many amenities. Our present programme which I have just explained involves an immediate expenditure in the region of one and a half crores of rupees and will be followed by further developments and expenditure in accordance with our plans for the progressive improvement of the standard of living of all employees. This is a matter to which I personally attach great importance. In order that shareholders may have knowledge of what is being done, I have had a small booklet prepared showing the designs of some of the amenities for issue to shareholders with the print of this speech.

EMOLUMENTS

We have given a great deal of thought to building up the structure of the wages and other emoluments of our employees on lines which on the whole have been generally acceptable to them. The total emoluments take the form of monthly cash payments or deferred payments and the provision of various kinds of amenities. The principal items constituting the total earnings or emoluments include a basic daily or monthly wage, a dearness allowance, free housing or grant of rent allowance in lieu thereof, a production or incentive bonus, a profit sharing bonus, Provident Fund benefits, leave allowances of various kinds, free medical service for all employees and their families and free or aided educational and training facilities.

It is not possible for me in a speech such as this to enter into any great detail, and I must therefore restrict myself to giving you in outline the position for the year 1956-57 in regard to remuneration as it concerns our entire Burnpur staff who are members of the Labour Union. Our First Staff, who form but a small percentage of the total number of employees and occupy the higher technical managerial and administrative jobs, are not members of the Labour Union and therefore nothing that I say now will have any application to them.

The target proportion of our employees are unskilled or semi-skilled workers on daily wages as distinct from the monthly paid workers who are mostly skilled men employed in the productive departments. The wages rates in both cases vary from department to department according to the nature of the work done and the ability of the worker. The semi-skilled and skilled workers naturally get higher wages and have higher earnings than the unskilled. The minimum daily wage varies between Rs. 1.00 and Rs. 1.94 per day according to the department concerned. At the former figure the total earnings, comprising basic wages, dearness allowance, quarters allowance and production bonus only, ranged between Rs. 73 and Rs. 90 per month again according to the department concerned. At the latter figure of Rs. 1.94 per day, the total earnings were Rs. 132 per month. The maximum departmental daily wage varies between Rs. 2.87 and Rs. 7.27 per day, the total monthly earnings aggregating Rs. 176 and Rs. 463 respectively, which latter amount was the maximum a daily rated worker in the Melting Shop earned.

In the case of the monthly paid workers the basic salaries vary similarly from department to department. The minimum basic salary is Rs. 60 per month, the total earnings in such case ranging between Rs. 144 and Rs. 183 per month, while the maximum basic salary is Rs. 460 per month resulting in total earnings of Rs. 1,042 per month.

In the case of most of the employees in question there is provision for the granting of annual increments.

Taking all the factors into account, I think you will agree that we are giving our employees emoluments, amenities and opportunities for advancement that compare favourably with other similar major organisations. Under the guidance of honest and competent Labour Union leaders powerful enough to eliminate those who, having infiltrated themselves into the Union or otherwise, are bent on causing disruption by fermenting sporadic strikes or go slow methods, the Company as well as the employees can ensure for themselves a better and more stable future.

DOMESTIC DEMAND AND EXPORT

Before concluding I would like to give you my views on the form the operation of the iron and steel industry may take after all the three Government plants and the Extensions of the two major producers have

not only begun to function, but reached their rated productive capacity. For this purpose an important assumption will have to be made to the effect that this event will happen as scheduled by 1959-1960. To my mind this is an optimistic assumption as regards the three Government plants, though no one will be happier than I myself if it proves to be well-founded. Grave delay in the election of the plants is likely to be caused by the admitted shortage of domestic civil engineering capacity.

The operation of the plants at their rated capacity implies not only their complete construction, but also the availability of ample traffic facilities, supply of electric power and of all the principal raw materials of good quality, particularly coking coal and limestone, and such auxiliary materials as refractories, ferro-alloys etc., without prejudicing in any way the provision of similar advantages for the private sector. It has also to be assumed that the necessary technical, skilled, semi-skilled and administrative personnel will have been trained and made available to meet their own requirements as well as those of the three Government townships.

Taking only the present demand into account, the output of the two major producers after their extensions have come into full operation may just be adequate, if the steel is carefully used, for domestic consumers including the Government. But as the Government plants begin to operate, there may be some exportable surplus. I am not prepared to make any forecasts as to what this surplus may be or when it may arise. But if the output up to the rated capacity does not materialise until 1959-1960, most of what may be produced may be required for the complete implementation of the re-phased second Five-Year Plan particularly relating to the projects for the manufacture of heavy castings, machinery, etc.

I am, however, prepared to assume that some surplus iron and steel may be available for export. The next question that requires consideration is the C.I.F. duty paid price at which it can be supplied to the export markets. In this connection it must be borne in mind that the entire iron and steel industry, particularly in Europe, including the Soviet block, may be competing in the same markets, for they are fast expanding the industry for this very purpose, as well as for domestic use.

As regards the selling price, we have to take into account first of all the works costs, of which no accurate estimate can be made. The estimates previously made must have already gone out of date for the reason that the prices of all the raw materials and of labour and the cost of transport have considerably increased since they were made. To the uncertain works costs will have to be added the overheads, including depreciation, interest on capital including provision for repayment, of borrowed money and perhaps a return on investment and such taxation as the Hindustan Steel Company may be subjected to. On these points we have no reliable information.

In the first place we are not told, and I am rather inclined to think that the Government themselves do not know, what the ultimate capital costs not only of the erection of the plants, but of the ancillary services which I have mentioned earlier, would amount to. We have been told from time to time that the capital costs have increased, but no reliable final figure has been or can be ascertained yet. But this I would say, that in view of the persistent rise in foreign and domestic prices and wages of labour, the capital costs and the overheads would in every case be very much higher than those, not only of the two major producers, but of the foreign competing producers who build their own plants,

and competition thereby may be made much more difficult than people seem to believe at present.

I do not propose to go into the theoretical economic aspect of the matter, but to a layman like me it seems that it may not be possible for the countries in the East, who may be our principal customers, to afford to import iron and steel unless they are able to pay the price by the export of their own products. The foreign exchange that we need is mainly from the sterling or hard currency areas where it is doubtful whether they would require the imports of our iron or steel at a price which would prove to be remunerative for us.

Finally, there is one more point in connection with this matter which has received less attention than it has deserved on its merits. The manning lists of the three Government plants in so far as they have been made available to the public, have assumed the employment of far fewer men than have to be employed by the two major producers for historical reasons. It is not beyond the bounds of probability that the employees under any labour union which may be established in the Government plants may compel the Government, which has promised to create more jobs through industrialisation, to employ a higher number of men than necessary and to bring them into the line with those almost compulsorily employed by the present major producers. Also, hundreds of Indians have been sent abroad for training, but from our own experience we know it is possible that when they return they may not be satisfied with the scale of wages that are prevalent for similar jobs, and Government may be compelled to accept their claims for higher wages. Then again, scores of foreign technical personnel are being imported at very high salaries and with many amenities and enjoying exemption from Indian income tax. This is bound to have its repercussions on the permanent employees in the private sector. It is plain that as a result of the operation of all these factors, the labour costs may rise to so high a level, as indeed they have been already doing throughout our economy, that our C.I.F. duty paid export prices may not be below the domestic prices prevalent in the competing countries and our own domestic prices may get beyond the means of our consumers.

ACKNOWLEDGEMENTS

In conclusion, I should like to express on behalf of all of us our appreciation of the services rendered by the General Manager, Mr. McCracken, and his staff throughout the year. Conditions are not easy when production and construction works have to proceed together and the fact that until such a late stage of the construction period the disruption of normal production has been held at such a low level speaks very highly for the careful and painstaking planning of Mr. S. L. Bengtson the head of our Consulting Engineers, the International Construction Company Limited, and for the spirit of mutual co-operation that exists on all sides. I would particularly mention the staff of the Gua Ore Mines who, in the circumstances I have earlier described, have most loyally carried out their duties under difficult conditions and at times even under threat of personal violence.

I should also like to express my great appreciation of the consideration shown by the World Bank during the recent negotiations in connection with the further loan of \$20,000,000 for finance of the foreign expenditure on the 1955 Extensions which enabled the negotiations to be concluded in such a short period and the loan consequently to be made available at a very favourable rate of interest.

NOTE: This does not purport to be a report of the proceedings of the Annual General Meeting, which will be sent to shareholders in due course.

Saved for the nation

by this factory in 14 weeks this year
-Rs. 1 crore in Foreign Exchange.

Our second mill has now gone into production and we are installing further plant to meet the whole national demand for steel tubes up to 6.5' 8" outside diameter.

Company Meeting

LIFE INSURANCE CORPORATION OF INDIA

Speech delivered by Sir G. R. Kamat (Chairman)
at the 11th Meeting of the Corporation on September 1, 1957
BOMBAY

Four weeks ago we submitted an Interim Report to Government giving a detailed account of our activities and achievement during the first ten months. This Report has been placed before Parliament and has been published. As indicated in the report, we devoted the greater part of our efforts during these months towards bringing about a smooth transformation of the life insurance industry. Even now the change-over is by no means complete in all respects. Nevertheless, almost all our new business offices are now working normally and after a brief initial shortfall, our new business, both as to proposals received and policies issued, has shown a progressive increase each month. Aggregate new business during the first six months of 1957, though somewhat lower than that for the corresponding period of 1956, compares favourably with the business underwritten by private companies during the first half of 1955. In the month of June, our new business offices in India surpassed the output of the earlier months by receiving insurance proposals of Rs. 21.64 crores and by underwriting new business of Rs. 21.68 crores, in terms of the sum assured.

This rate of progress has been maintained during the months of July and August. In July, the business introduced in India was as much as Rs. 24.5 crores and the complete business was Rs. 19.5 crores. Although up-to-date figures for the month of August are not yet available, the performance during the first three weeks indicates that the output for the month of August should be similar to that in July.

July and August are often regarded as lean months for insurance business. This record for the months of July and August further confirms that our divisional and branch offices are working efficiently. We can now look forward with added confidence to their rising to greater heights during the forthcoming busy season and to their justifying our expectation that we shall close the year with a high level of new business.

The publication of our Interim Report has been followed by various comments. Generally speaking, these comments have shown appreciation of our achievements and of our difficulties. Nevertheless, in some places there has been a tendency to draw pointed attention to the short-fall in our new business during the first new months, and to insist that since nationalisation, the standard of policy servicing has deteriorated.

Persons who continued to criticise us in this way, have not appreciated what a revolutionary change this nationalisation has brought about in the structure of the life insurance industry. It is not as if a going concern has been taken over by Government. Before the appointed day, some 243 autonomous organisations had been functioning in the life insurance industry. Over years and decades, these organisations had evolved certain procedures and methods of work. Most of these were competing amongst themselves for a greater share of the insurance business within limited sectors of the population. Their procedures and methods were adapted to suit the particular

needs of canvassing business in a highly competitive market, but within a narrow sphere. Frequently, the mismanagement and inefficiency of even a few units of the industry, affected the confidence of the common people in life insurance and placed further handicaps to the efforts of the well-managed concerns to expand their field of operation.

CHANGING PATTERN OF ORGANIZATION

It is the main objective of the nationalised life insurance industry to promote this confidence and to expand its business into those sectors of the population which the privately managed industry could not reach. Inevitably, the nationalisation of the insurance industry involved a transformation of the entire organisational structure. In place of so many units of the industry operating vertically, a single organisation was, therefore, brought into existence, dividing its work between Zones, Divisions and Branches on a territorial basis, so that eventually we reach all sectors of the population throughout the country. The relative responsibilities of each of these offices had to be carefully defined and the offices themselves had to be equipped with suitable personnel and equipment taken over from the private companies. New and uniform procedures had to be evolved for the effective discharge of the functions of these offices.

Considering the nature and magnitude of this structural transformation and of the accompanying readjustments, it is not surprising that at the outset there was some moderate dislocation in our business and some of the offices have taken time to reach an adequate level of efficiency.

Indeed the fact that such an organisation has been brought into existence and is now functioning effectively within a short period of time, with relatively small inconvenience to policyholders and to persons seeking life insurance protection is a tribute to the ingenuity and the resourcefulness of those who planned out this major operation.

The credit for this successful organisation of the life insurance industry is due to Shri H. M. Patel our first Chairman (of the Life Insurance Corporation) whose untiring zeal was matched only by the loyal support that he received from all my associates.

NEW BUSINESS ENCOURAGING

You will have observed that so far as the level of new business is concerned the statistical figures of our growing business themselves answer any criticism of our work. Regarding the alleged inadequacies and inefficiency of our policy serving offices, it has not been equally easy to provide a statistical measurement of their efficiency. However, certain broad facts may be stated to provide a right perspective. Our policy servicing offices continue to follow the same procedure that had been followed hitherto by the respective private companies. If any changes are made, those are

merely to further simplify their existing procedures. Again, these offices are staffed with persons who have been discharging similar functions in the past, frequently in respect of the same types of insurance policies that they had been handling before. Therefore there is no prima facie reason why, in the matter of efficient servicing of existing policies, our personnel in those offices should not maintain the same standards that prevailed in the private companies.

If the number of complaints in respect of indifferent work that are received in the Central Office is any criterion, this number is relatively very small, as compared to the aggregate number of servicing transactions that are carried out in these offices in respect of some 50 lakhs of outstanding policies; and, of course, those who are satisfied with our service hardly care to write to us. Furthermore, the declining number of these complaints, the rare and occasional praise that we do receive for prompt service as well as the reports received from various sources lead me to believe that even in this respect there has been a gradual improvement and that the improvement continues.

That is not to say that I do not accept the need for better and greater service in regard to settlement of claims, issue of premium receipts, grant of loans and payment of agents' remuneration. On my part, I consider that much of this criticism proceeds from a very legitimate expectation that, as a public institution, our performance should be not only as good as that of the private companies, but it should be actually better than the best of those companies.

"EXPRESS SERVICE"

As an illustration of the procedural improvements, let me refer to the recent instructions that we have sent to our Divisional Offices for the introductions in those offices of an expeditious way of dealing with new insurance proposals, known as "Express Service". This procedure has been tried with considerable success by some Divisional Offices in the Southern Zone, and all the other Divisional Offices have not been asked to adopt it without delay. This procedure applies to all proposals for life insurance below a certain amount which are received complete in all respects along with the payment of first premium and where medical examiner's report and other particulars indicate that the proposal requires no reference to any other office and can be accepted at standard rates. Such proposals would be dealt with expressly in the Divisional Offices and policies would be issued against these proposals within a period of not more than three working days. Some of the Divisions, in fact, might do better than this and issue risk note on the date of the receipt of the proposal and the policy on the next working day.

BUSINESS EXPECTATION

The level of new business that we reach in 1957 is only a starting point for further expansion. As I have stated the main objective of the nationalisation of the life insurance industry is to bring these insurance facilities within the easy reach of large sectors of the population. It is our aim to expand our business as rapidly as possible and amongst all sectors of the population and to offer insurance facilities to all those who stand in need of the insurance protection. We have a vast field open before us and it has been estimated by some persons that, even under present conditions, and without taking into account the rising income brought about by the progress of economic

development, the life insurance business could expand to something like Rs. 2,000 crores in terms of sums assured.

Keeping this aim and vast potential in view, it is now necessary that we should prepare ourselves for the orderly expansion of insurance facilities from 1958 onwards. The experience of the last twelve months provides a useful guide as to the nature and magnitude of the problems in this process of continued expansion. We may have to plan for opening more Branches and for employing more canvassers and organisers of the right kind. We have to impart sound training to these new personnel, as well as some of our existing personnel. We have to devise various measures and provide machinery for canvassing the large untapped potential amongst industrial employees, as well as amongst sectors of population in similar towns and prosperous villages.

Amongst the many changes that have come about in the life insurance industry, there is one kind of change that I should like to mention. More particularly after nationalisation, life insurance is now become both a business as well as public service. For success in this new venture, it is essential that all of us working in the cause of life insurance demonstrate this new spirit and strive in every way to achieve this high ideal of public service.

"I AM CRACKED"

shrieks Adipocere

(Pronounced 'adi-po-saire')

I have gone through a lot, detected underground, harnessed by a drill, transported to a Refinery, and put through the fractional distillation process. Now I am put through a further step of catalytic cracking...in fact, I'm being cracked.

(A catalyst is a substance which promotes chemical changes in other materials without undergoing change itself)

By this process of cat cracking, a higher yield of several products is possible. My final stage of processing includes "treating" and "sweetening" which removes corrosive and odorous impurities from me; in other words I am "refined". Keep watching these columns for what is to happen to me.

STANVAC — the name that stands for progress

The Stanvac Bombay Refinery is wholly operated and supervised by unit foremen all of whom are resident personnel.

Water is Not Enough

THE inauguration, last Friday, of the Maithon Dam, the Damodar Valley Corporation's third dam, by the Prime Minister marks another stage in the progress of India's great multi-purpose projects. It is right that this stage should be hailed as a substantial landmark on our new journey. There have, it is true, been many lapses from the original estimates and no one need be complacent about the rising costs of every single project. Nevertheless, it would be a mistake to allow these lapses to detract anything from the determination to complete the works already sanctioned. It is an equally great mistake to distract officers, who have arduous responsibilities for the completion of these works, by petty recrimination on some of the mistakes which have been made. No one need contend that the Damodar Valley Corporation is free from error. No one need contend that some of these errors have not been costly; but a substantial price for error is a necessary condition of any great undertaking. In the total context in which we set out, with very insufficient knowledge of detail and the monumental organisation required, the price cannot be deemed excessive. It would be an error of the first magnitude, particularly as these works are nearing com-

pletion and a heavy responsibility is still being discharged, to concentrate on the mistakes and on their cost instead of concentrating on the extent of achievement and its overall success. At this moment a tribute needs to be paid to all those who have contributed to the success of the multi-purpose projects; there should be—at any rate—for the duration of their responsibility—the fullest support of the officers who have made possible the completion of major undertakings in the past.

While there should be no criticism on persons or on partisan lines, there is everything to be said for a careful scrutiny of the return on these undertakings in the total economic picture which now prevails. It is obvious that India is being pressed for both foreign exchange and rupee resources. It would be unwise, at this moment, to spend our resources either on new undertakings which yield less than the current rate of interest or on undertakings which take so long to complete that they impound capital and output in a manner which must be strongly inflationary in the current situation. In the case of our multi-purpose projects, it would appear that, after the current revision of estimates, the return will be fairly

164816

three per cent even though the return to the nation will be substantially higher. Secondly, there is much to be said for concentrating on short-period measures to grow more food than to concentrate on the long-period attempt to increase irrigation in the grand manner symbolised by these projects. Not the least of the reasons for this change in emphasis arises from the depressing account now available of the utilisation of water already provided.

One of the serious proximate causes for dismay has been the recent report of the Central Water and Power Commission over the gradual decline in the use of irrigated water through the Bhakra canal system. The matter has been deemed important enough to be raised with the highest priority at the North Zonal Council Meeting to begin at Srinagar this week. Since the inauguration of the Bhakra canal system it would appear that the shortfall from the target has been progressively increasing, and up to 1955-56 total distribution had not reached half the target anticipated. Again, while five years ago the total distribution of irrigated water through Bhakra canals was 74.4 per cent, in 1955-56 it had dropped to 53.4 per cent. In other words, the provision of new irrigation is being offset to a very substantial degree by poor utilisation of water already on tap.

This depressing factor in water utilisation, apparent both in the Punjab and the Demodar Valley area, calls for far greater scrutiny of public policy than it has received. One of the naive assumptions of the Plan has been that the multi-purpose projects were giving rise to a net increase in irrigation actually utilised equal to the volume of new water impounded. This has by no means been the case, and it is now becoming clear that more attention needs to be given to the use of water in canals than to the building of mighty dams which have tended to attract more attention, both at Delhi and at the dam headquarters, than is appropriate in existing circumstances. Water is not an end in itself. It is a means to greater life upon the land, and can only be judged by its ultimate fruit in increased agricultural production. As far as can be determined at the present time, the increased fruit has been in no way commensurate with the vast expenditure which has already been incurred. It is obvious that India has not enough engineers to administer and operate water from every sluice, and nothing could be more erroneous than to suppose that the great loss which is incurred by non-utilisation of water is primarily the responsibility of irrigation officers. The utilisation of water is basically a revenue responsibility which means that, in view of the tremendous range of responsibility of revenue district officers, it is a matter of inculcating leadership of the right kind. It is by remote control only that the Revenue District Officer can get this job done.

Herein lies the rub. The process by which the Congress Party has concentrated more and more upon dramatic and spectacular undertakings has inevitably led to a change in emphasis from powerful local leadership to a concentration on central politics, so that the State Governments could be expected to bear upon the Centre their claims for larger and larger allocations of projects of the same kind. The sorry spectacle presented by the Assam Government at present, by which, having aside the prospects of agriculture, it has been wholly absorbed in the location of an oil refinery is merely one unhappy illustration of a

tendency which continues to grow elsewhere. The Congress Party as a whole is more and more absorbed in industrial projects and less and less interested in the problems of raising agricultural production by utilisation of resources already there. Yet, the most elementary calculation of the benefits of wise water utilisation will show that the profits to the country as well as to the individual State are likely to be much greater from agriculture than from the new large industrial projects which the Centre and the States could finance with equivalent effort either in money or in organisation.

This calls for a new assessment of the place of local leadership in the Congress organisation. It may be that other parties have equal opportunities to inculcate democratic leadership, but it is very doubtful whether they can have the capacity to organise local action as has the Congress Party. Therefore, today, the primary responsibility rests undoubtedly with the ruling party to see that the fruits of expenditure incurred both by the Centre and the States are, in fact, obtained. This means a campaign of ceaseless persuasion, so that village officers, on whom local leadership must be concentrated, do in fact utilise the benefits of the water which has been carried to their door.

This does not necessarily imply that existing policy or rates must be accepted without modification. Almost certainly, one of the factors which has operated to make water redundant in certain areas is the high charge which has been levied for its use, whether from large canals or from tubewells. At the present time in the area around Meerut it has been the experience of many tubewell-owning authorities that water available is rejected because the power authorities are inflexible to the point of foregoing all their revenue rather than create an inconvenient precedent on price. This, at a time when agricultural production is a matter of life and death to the Plan, must be ranked as a major absurdity, which calls for immediate intervention by the Central planning authorities. The problem of water utilisation is linked inevitably with the cost of power. Surely, the price of power must be responsive to the laws of supply and demand. It is not reasonable to withhold water because the power authorities are rigid. The test that is to be applied is not full utilisation of power alone, but the full utilisation of power and water together.

There are issues other than those of the appropriate water rates and power rates involved. Almost certainly, the problem has been accentuated by the disorder which has been introduced in local administration by the extreme pressure placed upon district officers to attend to a variety of duties connected with ministerial movements and even on lesser things. The responsibility for agricultural production is now enforced by almost nobody, and the Ministry of Food and Agriculture has reached a nadir in its fortunes, in no way remedied by the impressive figures for agricultural production which it purports to have achieved. A serious agricultural crisis is written into the current situation, which affords additional proof that the area shown as irrigated in the Agricultural Ministry's figures is theoretical and not real. The Congress Party needs to awaken to the current challenge. It is as much in its own interest that it should respond to this challenge, as it is in the interest of the country and of the land, which is now, more than ever, truly the mother of us all.

The Naga Settlement

THE agreement arrived at between the Prime Minister and the Naga delegation led by Dr. Imkongliba Ao is an event of more than passing significance for India. It envisages justice to the Nagas without prejudice to the unity of this country. The Naga demand for the constitution of the Naga Hills District in Assam State and the Teunsang Frontier Division of the North-East Frontier Agency, into a separate unit has been accepted by the Government of India. The proposed unit would be administered by the Governor of Assam on behalf of the President. The implementation of the proposal involves amendment of the Constitution, which would obviously be no insurmountable barrier to it. It is expected the next session of Parliament will accord the necessary sanction for this amendment and the agreement would from then on have the force of law behind it. It is a measure of the foresight and community of aims that general amnesty is proposed in respect of all offences, committed against the State in the past. At the same time it was but prudent to make the amnesty no blanket pardon for offences in the future. The Naga demand for the de-grouping of the villages has also been accepted. It will be progressively given effect to in areas where Government are satisfied that peace and order have been restored. Meanwhile further re-grouping of Naga villages has been stopped.

Since the Naga delegation did not claim to represent the hostiles led by Mr. A. Z. Phizo, it may be over-optimistic to expect an immediate end of violence in the Nagaland. But there is little doubt that the total and unqualified acceptance of the demands of the Kohima Convention should make it difficult even for the hostiles to evoke that enthusiasm for their activities and demands which have hitherto been their chief source of strength. The moderate leaders have now something concrete to offer to the Naga people and it should not be difficult to convince them that nothing would be gained by terrorist methods which the Government is in any case determined to put down. Moreover, there must now at least be people among the Nagas who would wonder if they have not all along been misled by Mr. Phizo and his confederates. After all the essence of the hostiles' demand at its best has been met. What has not been conceded is anybody's whim and ambition to shoot his way to power at the expense of the country as a whole.

What really causes uncertainty and doubt is, however, not the aim or activity of Mr. Phizo but the bureaucratic ways of our own officials. These officials may through procrastination and dilatoriness set at naught the very beneficent forces that the agreement promises. Continuation of repressive policy on one side and impatience on the other may turn out to be the grave of all hopes of peaceful evolution in the Nagaland. It is no secret that bureaucracy has hitherto looked upon the essentially political problem of the Nagas as merely one of law and order. To recapitulate the story would be unwise; bygones must now be treated as bygones by all concerned.

The purpose of the Government—though not expressly admitted—since 1952 has been to prevent a repetition of India's debacle in Tibet which the Chinese occupied in that year. The

Indo-Tibetan border being ill-defined, Indian authorities tried to push their military outposts up to the internationally recognized MacMahon Line agreed upon between the representatives of British India and Tibet in 1914. Doubtless, during the British occupation Nagaland was treated as an "excluded area". The British could afford to seal off the areas because they occupied India on one side of Nagaland, and Burma on the other. Tibet was then politically harmless. Moreover, Chinese maps have always shown the border as running much further south, and the Chinese Communists, despite their protestations of friendship for India, have shown no signs of changing these maps. But India's best security in Nagaland, as elsewhere, lies in popular contentment and co-operation with authority. It is obvious that strong-arm methods, cannot yield such a result. On the contrary they may create an atmosphere in which Chinese Communism may appear to be the only alternative to the Nagas. Such a development would be disastrous not only to the security of India but to the future of the Nagas themselves.

There is no doubt that a little more tact, sympathy and restraint on the part of the Government of India, with a view to winning confidence rather than commanding obedience, will have won the Nagas. The Kohima Convention and its leaders who visited Delhi are by no means individuals; they represent the collective experience and aspiration of the Nagas. Obviously the first essential is to give the Nagas a sense of being masters in their own house so that they may feel that the political dispensation they have got is in essence indistinguishable from the independence they dreamt of and for which some of them are still fighting. The distraction caused by Mr. Phizo and his supporters should not be allowed to interfere with the smooth and speedy and ungrudging implementation of the New Delhi agreement. Nor also should petty but irritating objections likely to be raised by vested interests of Assam be heeded. If the Assamese are nervous of middle class Bengalis, the Nagas entertain, perhaps more justifiably, similar feelings towards the Assamese themselves.

In this context, it is essential to readjust policies in the interest of harmony. It is necessary to prohibit alienation of land from Nagas to non-Nagas, to exclude merchants from the plains from operations in the Nagaland, and to suspend the sale of machine made cloth. It is these "innovations" which are being interpreted—and not unreasonably—by the Nagas as a "grave danger to their freedom, way of life and livelihood." On the positive side, it is also necessary to give generous economic aid to the Nagas. The Nagas, no doubt, have unsatisfactory and wasteful methods of farming—Jhoomar or shifting cultivation. The rice they produce is not sufficient for their needs. It will be desirable therefore, to subsidize supplies of rice. But that can only be an argument for generosity to them and for forbearance in regard to their primitive ways of earning their livelihood. The Government can gainfully make use of the kilonsers—traditional village Councils of Naga Elders—for popularizing consumers' and producers' co-operatives, now that we have adopted them as a matter of national policy. But success of the new experiment depends on the administrative officers in the area as much as on the Nagas.

The City of Tomorrow

A German Experiment

By JANE DREW

[In view of the challenge that "the new architecture" presents to modern town-planners, it is believed that an assessment of the German experiment by a leading architect, who helped to build Chandigarh, will be of special interest to 'The Eastern Economist' readers.—Ed.]

THE "INTERBAU" exhibition in Western Berlin is a great housing scheme, a new neighbourhood in the Hansa quarter of Berlin and the best architects from all over the Western World have been coaxed in to bring it into being. It is the work of sixty-three well-known architects and includes the exhibition 'City of Tomorrow', in which seventeen nations are taking part. All buildings have had to comply with the "Soziale Wohnungsbau", which limits the size and cost of both houses and flats.

The difficulties which forced Western Germany in starting this great enterprise were great. They were a people faced with a spectacle of desolation and who had lost a war; they lacked building materials other than brick rubble of which there was plenty. I do not know how much of Berlin was destroyed, since each guide gave a different figure varying between forty and fifty per cent; the only measure one could make it by was the state of Eastern Berlin, which was a desolate spectacle of ruins and brick rubble, among which some buildings stand and people live where they can, which is, I suppose, very much the state in which Western Berlin must have been. The Tiergarten area, where the "Interbau" exhibition is taking place, is an area in which the rich middle classes of Berlin lived and which was almost completely destroyed by bombing.

West Berlin used to be a fairly congested city and had a population of 1.8 millions immediately after the war which has now increased to 2.2 millions. 310,000 apartments were lost during the war and these are being replaced at the rate of 10,000 dwellings per annum. There is only one natural open space near the city, the Grunwald Forest, otherwise there is nowhere readily and cheaply available for the population for recreation.

This is the background, though it must be added that West Berlin is now so prosperous that it is possible for the Senate to lend money at low interest rates and act as trustee for new housing schemes until these are taken over by private companies.

Today, the visitor sees what is virtually a large park area in which are many blocks of flats designed by some of the best architects in the world, and it is a most impressive and splendid achievement. The flats themselves are universally good, though some, Pierre Vago's, of France, and Fritz Joaneche and Sten Samuelsson's, of Sweden's block are outstanding. The general planting and gardening is superb; the only criticism is that the layout is not satisfactory, because, although the blocks are well related in some cases as blocks, they are so different in character from each other that the total effect is not coherent.

There are, in addition to the housing, two churches — the one, the Roman Catholic Church, which is unsatisfactory externally, has a beautiful interior. The architect is Professor Kreuer and he has used his fellow artists in the interior

in the most original way. The story of the "Stations of the Cross", the history of the end of Christ's life is beautifully done by coloured mosaics set on one side of the fine asymmetrical interior. This medium of coloured mosaics is one most suitable for India.

In addition to the exhibition of housing, there is a pavilion on Town Planning of the future, where all kinds of experts, sociologists, psychologists, housewives and so on have contributed to create a most beautifully presented exhibition but, it must be confessed one without any very new message for the already well informed.

We went over to East Berlin. I can think of no greater contrast than the lively Kurfurstendamm of Western Berlin which now, together with the Champs Elysees in Paris and Piccadilly in London must rank as one of the important streets of Europe and the drab Stalin Allee, with its appallingly boring 1910 false pompous architecture.

It is the only large area of rebuilding in East Berlin and it is certainly a unity and peaceful to the point of boredom, being real axial academic architecture. It made one realise that neither the solution of East nor West Berlin was ideal; that the West was much the best, but what was needed was another solution where a "strong" but enlightened man guided the work of his fellow architects, so that there was more unity than in West Berlin and less boredom than in the East.

I have not mentioned the individual buildings of outstanding merit in West Berlin. — the New Berlin Congress Hall and the new Concert Hall and Corbusier's "Unity".

The former by Hugh Stubbins of America, is an extremely interesting building — a semi-suspended Congress Hall with a form like a squashed top hat. It is individualistic and, it must be confessed, rather coarse in detail, especially externally where it has an unsolved slightly tipsy appearance. Inside, it is much better.

The new Concert Hall is quite another thing, beautifully restrained and elegant and it lacked, in spite of its careful detailing, any expression. However, as with the Festival Hall in London, it has some beautiful ambient spaces and in these, the foyer, in particular individual works of art, give the necessary punctuation and focal points of interest to the generally interesting space.

The Corbusier "Unity" has been badly Prussianised on a splendid site and with splendid technique — the best concrete and quickest building Corbusier has ever had. It is nevertheless a partial failure, the Berlin law about the 8' 2" ceiling height has wrecked the proportions of the whole building, which now looks like a Frenchman unhappily dressed in a German uniform.

It remains, of course, very fine and is of enormous interest; but is not a great work of art and speaking personally, where this is not achieved, all is lost, for beauty of spirit and form is one and I think the image-making in India a splendid example of the right expression for the spirit.

THE RIOTS IN SOUTH INDIA

NO PART of India could be said to be entirely free from the disease of caste antagonism. However, in South India, especially in Madras, it recently appeared in its worst form. Caste riots between Maravars and Harijans raged in some of its districts for nearly a fortnight. From such accounts as have appeared in the Press, the Harijans seem to have been the victims of deliberate, brutal and armed attacks by the caste Hindus. The full story of the degrading riots has yet to be told. But on the authority of the Home Minister of Madras it can be stated that during the riots fifty villages were razed to the ground, and hundreds of villagers, mostly Harijans, fled their ancestral homes. The riots have left a bitter trail of death, destruction, hatred and fear.

The immediate cause of the caste riots was the murder of a political worker in the course of the election campaign early this year. But this would have been of little consequence had there been no estrangement and hostility (even though suppressed) between the caste Hindus and the Harijans. The Chief Minister of Madras Mr. Kamraj Nadar, admitted that the "feud" was two decades old and that it had been kindled during the general elections in February this year, and a by-election in July. The Harijans it has been suggested by the official Congress quarters, voted for the Congress in the last elections and the anti-Congress elements organised riots to wreak vengeance on them. This explanation is hardly adequate. In the by-election it was the Forward Bloc candidate who won, defeating the Congress nominee. If we do accept the explanation a question has to be answered: Was it not the duty of the ruling Congress Party to provide protection to its supporters? The official explanation does not touch on the apparently complete abdication of authority by the Government and the masterly inactivity of the Madras police during most of the crisis. Admittedly, the trouble had been brewing for some time. It is difficult to believe, then, that officials were taken completely unawares. One may ask pertinently why no action was taken to prevent such a situation from developing. The inactivity of the police is the more surprising because the Congress Governments have not given much evidence before this of suffering from qualms of conscience while resorting to police firing. Even the Minister for Harijan Welfare—the only one in the country and a source of pride to the State—and the Commissioner for Scheduled Tribes and Castes, whose function it is to look after their interest and work for their wellbeing, did not think it proper or important to visit the scene of devastation. Almost all the leaders of the State contented themselves with issuing stereotyped "peace appeals" from Madras. The political parties seemed to have disbanded themselves after the elections; there was no protest to talk of. In plain language, the way in which the situation has been handled by the Madras administration is disgraceful. An inquiry not merely into the rioting but also into its causes is necessary. The use of police force is not enough to solve problems which originate in the social and political life of the community.

The holocaust of Ramanathapuram is, incidentally, a grim warning that the problem of "integration" is neither simple nor responsive to haste. In a way, what has happened in Madras is comparable to the sort of thing that has recently been reported from the Southern States of the United States of America, where anti-Negro feelings have been stirred by the Supreme Court's desegregation order. Anti-Negro feelings still survive in the Southern States in spite of the Civil War; and separatist feeling based on caste still seem to be the

guiding force in South India. In the situation, it would be unrealistic to think of withdrawing the special privileges granted to the backward sections of the Indian people so long as the social and economic handicaps they suffer from have not been eradicated.

A DREAM COME TRUE

THE FORMAL opening of the Maithon Dam by Mr. Nehru last week was truly an event of national importance. Of the four dams planned to be constructed to tame the wild and wilful Damodar river, three have now been completed and work on the fourth has already begun, at Panchet Hill. If all goes well, the fourth dam will be ready by the end of next year. The reservoir created by the Maithon Dam will have an area of over forty-one square miles and the new underground power plant—unique in Asia—will have an installed capacity of 60,000 Kwh. The Dam has cost Rs. 2.19 crores which works out at 18.98 per cent of the total cost of the project.

It is too early to claim that the Damodar and its tributaries have been completely harnessed. Only last year there were disastrous floods affecting an area of about 10,000 square miles. More than 150,000 houses were damaged, and road and railway communications were interrupted for days. Nearby collieries were also flooded.

But in spite of this large-scale damage it has been claimed that the unfinished dam at Maithon was responsible for minimising damage. With the dam completed, it may be possible to more effectively control floods in the future. Besides, flood control, the Damodar Valley Project has three other objectives: power generation, irrigation facilities and navigation. Power has already reached Gaya, Patna and Calcutta, though the supply, it must be confessed, is yet neither cheap nor quite trouble-free. Expansion of irrigation is one of the main objects of the DVC, but progress in this respect also could have been more satisfactory than it is. Feeder canals, for instance, are yet to be constructed. Thirdly, the proposed navigation canal, which will connect the Damodar Valley with Calcutta Port continues to be stuff that dreams are made on.

These unexecuted parts of the scheme may well render nugatory the advantages which are expected to accrue immediately from the taming of the "river of sorrow". This unbalanced development will cause irritation by delaying the transformation of Bihar, Orissa and Bengal into the "Ruhr of India", to use Mr. Nehru's phrase. But there is no doubt that India is approaching fast that era of advancement which the advent of independence promised. And though little irritations mar the dreams that the mind spins out, contemplating a landscape of happiness and plenty, sense of pride and exhilaration is irrepressible. Dreams precede achievements.

RURAL DEVELOPMENT ABROAD: A STUDY

PROFESSOR D. G. Karve's "Rural Development" (published recently by the Agricultural Credit Department of the Reserve Bank of India) is of absorbing interest today, inasmuch as agrarian reforms happen to be the subject of current discussion all over the country. When the thinking of the powers-that-be, with regard to this problem is still highly idealistic, if not "utopian" in character, any dispassionate and objective study of the land problem, particularly vis-a-vis co-operation, should be welcomed. The present publication throws considerable light on these issues, containing, as they do, Prof. Karve's observations from an extensive for-

eign tour undertaken by him between March-June, 1956. The report shows how these problems are being tackled in the countries he visited — both well-developed and not-so-well-developed. The important problems covered include co-operation, rural finance, agricultural economics, land reform, extension and planning, among others, all of which are also exercising the peoples' attention in this country.

The publication deals at considerable length with the problem of "co-operation", a subject which has engaged the attention of the author for years now. His description of the co-operator's approach to land problems in India is accordingly as important as it is interesting. Says he: "Not only in the sphere of rural development, but also over the whole field of economic and social planning, we here are trying to adopt the principles of mutual service, as contrasted with employment of hired or profiteering middlemen, to the greatest possible extent. This is quite a different aspect of co-operative organisation, to be distinguished from the purely defensive or relief organisations of the under-privileged sections of the community which, during the day before the war, passed for the "co-operative movement". In short, there is to be found here a revolutionary reorientation, which has made it necessary to think of the various ways in which forms of co-operation may be adapted to the new context of planned development.

After this, the learned apostle of co-operation points out what co-operation should be like. To him, "co-operation is good business, for those who are engaged in it, and for the community as a whole". This, we are told, is the position in advanced countries, where the merit of co-operation consists in its being "a form of business organisation". He does not say, although he perhaps implies it, that co-operation in this country is anything but a business organisation. It is, however, time that this aspect of the problem received more emphasis.

In the section which deals with "planning and decentralisation", it is interesting to note that he has shown how the countries, which have not adopted public enterprise as the basic principle of their economic organisation, have made tremendous progress in rural development. The secret of their success seems to lie in what he describes as Extension Work. Dealing with the different features of this work, the Professor has underlined the importance of technical improvement of agriculture through organised extension programmes, especially in relatively under-developed countries like ours.

THE RESTRICTION ON DR. DEDIJER

WHEN MARSHAL TITO defied Stalin, he was hailed by many as a liberalist, and hopes were widely expressed of a new era of freedom dawning in Yugoslavia. However, the significance of Marshal Tito's break with Russia has continued to be limited to the fact that he is the only one of the satellite rulers who defied Stalin, using the Great Dictator's own language for his accusation and counter-accusation. This is in itself no mean achievement, though it must not be forgotten that Yugoslavia is strategically well-placed, being on the Adriatic, and could afford to exercise choice to some extent—unlike, for instance, the no less freedom-seeking Poland, which is surrounded by three "People's Democracies" and must keep the rulers of Russia in good humour. Beyond this Yugoslavia seems to have retained the totalitarian mould which is common to countries under Communist rule. A fresh reminder of this is the report that Belgrade has refused to grant Dr. Dedijer a passport to go to Manchester University. The lack of elementary individual freedom in Marshal Tito's Yugoslavia is emphasized when this report is considered against the background of Mr. Milovan Djilas's continued incarceration, and persistent rumours that preparations are being made to try him again.

Dr. Dedijer, it may be remembered, was Marshal Tito's official biographer. His well-known "Tito Speaks" was translated into many languages. His fault has been his friendship with Mr. Djilas and adherence to his views. In 1954 he was expelled from the Central Committee of Yugoslavia's League of Communists, and in 1955 awarded a suspended jail sentence of six months for making "hostile propaganda." It may be true that Yugoslavia's innovations in production relations and management—for example, the Workers' Councils—are extremely valuable contributions, and that its role as dynamic neutral in the cold war shows a practical approach in the search for world peace. But it is difficult for his admirers to view with equanimity and without embarrassment the traditionally totalitarian measures of Marshal Tito's Government. Would it be wrong to wonder, seeing the way critics of his Government are treated, whether the Marshal is absolutely confident of his people's support for him?

MR. HAMMARSKJOELD'S RE-ELECTION

THE UNITED NATIONS deserves congratulations for unanimously re-electing Mr. Dag Hammarskjöld as its Secretary-General. That none of the 82 members of the General Assembly occupying different political positions thought of another candidate is a high tribute to Mr. Hammarskjöld and a tacit admission that none was better fitted to fill the post. His election was also one of those few occasions when the members of the two Power blocs were in agreement and acted in unison. By his single-minded devotion to the principles of the United Nations Charter and consistent refusal to act as an agent of any nation or group of nations, Mr. Hammarskjöld has won universal esteem.

Succeeding the United Nations' first Secretary General, Mr. Trygve Lie, in 1953, Mr. Hammarskjöld has kept a watchful eye on actual and potential trouble-spots in various regions. He has never wavered in his championship of the law that helps the weak, the oppressed, and the helpless. Early in 1955, he visited Peking to negotiate the release of American airmen who had been detained by Communist China on the charge of spying. And it was due to Mr. Hammarskjöld's vigilance and tireless effort that the United Nations Organization ultimately succeeded in meeting the challenge to its very foundations when the Anglo-French forces, in collusion with the Israeli troops, invaded Egypt in October last. The withdrawal of the forces of aggression was as much due to Mr. Hammarskjöld's dexterous handling of the situation as to the pressure of world opinion. But for the several personal missions he undertook to Israel and Egypt it might have been well nigh impossible to create the United Nations Emergency Force. This will, in the words of the United Nations' President, assure him an honoured place in history.

Mr. Hammarskjöld's handling of the situation created by Russia's naked aggression in Hungary was at par with his performance during the Suez crisis and equally creditable, though less successful. History will give him full credit for bringing to light the facts about the Hungarian tragedy in spite of Russia's consistent refusal to allow him or a committee to visit Hungary. The standing ovation by the General Assembly prior to his announcement accepting the offer of re-election was, therefore, no empty courtesy; it was as much in the nature of felicitations as a recognition of his splendid service to war-weary humanity. The only jarring note to this general ovation came from India's representative, Mr. V. K. Krishna Menon, who observed that India reserved the right to criticise Mr. Hammarskjöld, if necessary. This was, to say the least, highly indiscreet. Even if for reasons of his own Mr. Menon thought fit not to share the United Nations Organization's overwhelming opinion of Mr. Hammarskjöld, he would have done well, in India's interest, to observe silence. Silence is, after all, sometimes golden.

The Story of Oil — I

As old as time

As industries go, the world's petroleum industry is quite new. Yet even the youngest deposits of crude oil originate from long before the dawn of Man. Scientists say our oldest reserves are more than 50,000,000 years old.

In prehistoric times much of what we now know as dry land was covered by warm seas. Giant trees and jungle plants and countless millions of tiny marine creatures flourished on the edges of the swampy, shallow waters. Their remains, when they died, fell to the bottom of the sea and were buried in layers of sediment.

As age upon age went by the original sea floors were folded or broken by tremendous movements of the earth's crust. Mountain ranges were pushed up. Parts of the earth cracked and slipped down

to become valleys and basins. Tidal waves invaded the land to form new seas. Old seabeds emerged as new continents.

These conditions—massive sedimentary deposits, decaying organic matter and gigantic earth movements—produced the crude oil we know today. The locations of the old seabeds are now fairly well known. They occur in almost every region of the world.

Parts of the continent of India have these marine sedimentary rocks beneath them. The waves of ancient seas once rolled over Assam, and here, close to the growing Himalayan and Naga ranges, the oil-pools of Digboi and Nahorkatiya began forming many millions of years ago.

FACTS BEHIND FIGURES

Revolving

over 10,000

times

a minute

Round and round whirl the spindles in the spinning frames of India's 419 cotton mills. Averaging a speed of over 10,000 revolutions to the minute, these spindles wind yarn for 5,000 million yards of cloth each year. Under the Second Five Year Plan this output will increase by 3,500 million yards. Ten years ago the Indian textile industry imported almost all their machines; today, Indian machinery manufacturers are increasingly meeting their needs. Texmaco, pioneer manufacturer of cotton textile machinery in India, supplies the complete range of spinning machinery for cotton and staple fibre, designed and built to established international standards in technical collaboration with the world renowned Howa Machinery Limited of Japan.

A Window on the World

WHAT EAST AND WEST HAVE IN COMMON

By
ODYSSEUS

WE ARE CONSIDERING the antagonisms of East and West, in hopes of seeing what can be done to promote co-operation, for without this there can be no world peace or prosperity, nor freedom for the individual in East or West. In the two preceding weeks we have seen that there were no antagonisms between East and West in the many centuries during which they shared similar religious, political, and economic outlooks; that disparity grew after the outburst of European development originating in the Renaissance (a word which means re-birth), and that hostility came when the re-invigorated West imposed its rule and/or its new economic system in the East. We saw that the East, having opted for modernization, has the choice of carrying it out through a democratic mixed economy or through Communism, and that many Asians, particularly in India and Japan, who have had first-hand experience of democracy prefer freedom to totalitarianism.

Now that Communism has been in operation in Russia for 39 years, many Asians are beginning to realize that it is not so uniformly successful as Soviet propaganda would have us believe. Certainly the Soviets have expanded, with Western aid in their first Five-Year Plan, the Russian industry that they inherited from the Czars, but the Soviets have been successful neither in increasing agricultural production nor in securing the co-operation and loyalty of the peasants. Every five or six years, points out Barbara Ward in her provocative booklet, "The Interplay of East and West" (Allen and Unwin, 1957, 10s. 6d.) an agricultural crisis recurs which is met by concessions—later cancelled—on prices and private production. In certain sectors, e.g., livestock, the Russian rural economy has remained stationary at about the 1928 level. Do you realize that in Eastern Europe, countries which used to have agricultural surpluses have been driven by Communism to set up food rationing? The USSR has been able to get by, despite its failure in agriculture, because it still has empty spaces and its resources remain greater than the pressure of its population. But the danger of imitating Communist methods in a country like India, where population is greater than resources and food now needs to be imported, is too serious to be overlooked. If Soviet attempts to coerce and to collectivise their country-side have ended in set backs, attempts to do the same here would end in disaster.

CAUSES OF RUSSIA'S FAILURE IN AGRICULTURE

Why, in fact, have the Soviets failed in agriculture? To this, Barbara Ward offers the interesting reply that an industrial revolution is set in motion by increasing agricultural productivity and then using the surplus from agriculture to develop industry. Since in all parts of the world, agriculture preceded industry, Miss Ward's thesis seems reasonable. What it means is that at some point, agriculturalists have to be squeezed in order to release resources needed for industrial growth. If a nation is fortunate, then innovators of genius like "Turnip" Townsend (1674-1738), or Coke of Norfolk (1754-1842), invent the rotation of crops and quickly raise productivity to a level at which, when the transfer of resources to industry begins, there is something left over for rural workers as well. The economy begins to rise as a whole.

There is a lesson for India in Japan's economic revolution after 1868, one of the bases of which was zamindari reform. The point to note is not that the landowners were expropriated (as they were) but that they received compensation in bonds invested in the beginnings of industry, and the landowners, instead of being reviled and being made to feel second class citizens, were drawn into the new managerial positions. It is estimated that Japanese agricultural productivity had risen by two-thirds by 1900, so that there was a margin of capital which could be taken from the land to be invested in industry. Moreover, the industrial revolutions in Japan, the United Kingdom, and the United States, were in the first instance directed to industries supplying consumers' needs—textiles, etc. The rural workers, therefore, had inducements to produce more because they could spend their extra earnings on consumers' goods. Note that India's second Five-Year Plan is essentially a heavy industry, non-consumer goods Plan. Heavy industries add to the might and power of the State, not to the possessions of consumers.

Thus the "natural" order of an industrial revolution is from (a) agricultural surplus to (b) industrial consumer production, and from the surpluses of (a) and (b) to (c) heavy industry. Certainly one can think of exceptions but that is the broad pattern.

The Soviets did the opposite. Heavy industry which produces armies, navies, and air forces, came first. Since the peasants were hostile to Communism—and here I open a parenthesis to note that the resistance to State control on the part of rural dwellers is universal, so that it seems healthy and natural, as compared with the servile reactions of the citizen already conditioned to the artificial controls of city life—their resistance had to be broken down by collectivization. This lowered productivity by cutting out the possibility of inducements to higher earnings. Russia's heavy steel mills were built on forced deliveries of wheat from the peasants and if these had had any surplus left to them there was nothing for them to buy.

RISKS OF INDIA AND CHINA COMPARED

We are enumerating some of the reasons why certain countries of the East, of which India is the leading example, would prefer democratic freedom to totalitarian tyranny, but we cannot afford to forget that persistence in the democratic mixed welfare economy must surely depend on winning the battle for capital accumulation. China may be risking disaster by coercing its peasant food producers but India may be risking it by relying on voluntary co-operation. Both countries face rising populations and they risk that any increase in productivity may be consumed by the annual increase in numbers to be fed. The problem in a free society, like India, is that unless the peasant has the inducement on consumer goods available to buy with his extra earnings, he will not increase productivity and will grow no more than is necessary to fulfil his personal wants and to buy what is available. (This seems the error in boosting expensive products available in limited quantities from handlooms instead of cheap products in virtually limitless quantities from the mills).

Barbara Ward sums up the point which we have now reached in our argument by saying: "The Indians are committed to the belief that expansion can be achieved by democratic means and democratic persuasion, and by creating the dynamism of expansion from the bottom. The Chinese are equally committed to the idea that the process must be directed from the top, with a total centralized control. So confident are they that they can squeeze out the surplus that they plan in the next decade to achieve a steel industry as large as Western Europe's. Indian planners are—and must be—much more cautious, and it may be that their slower rate of capital accumulation will give Asia's verdict to the Chinese method. This is, then, the decisive duel in Asia."

And Miss Ward sums up the stake that the West has in the success of democracy in the East thus: "India and Japan and the remaining Asian States are all, at the moment, opposed to Communism as an internal programme. They make up the 'uncommitted peoples' whose political weight in world affairs, particularly in such a form as the United Nations, prevents the balance of power from falling decisively on the Communist side. Yet, these nations know that if their present more liberal methods of modernization fail, Communism exists as an alternative—in fact, as the only alternative. Thus, if India and Japan fail in their attempt to preserve and expand the mixed economy, most of mankind will come to live under the totalitarian system and the pressure upon the West will become steadily more intolerable. Least of all can there be any surviving hope of creating a world community amenable to reason and the rule of law.... The West's economic interest is equally vital. Only if the world enjoys a growing and

expanding market can countries such as Britain or Germany.... hope to support rising living standards for themselves. In a static or shrinking world market, competition between exporters leads to impoverishment and dislocation. But the expansion of industry in such vast areas as India creates new demands and new outlets for manufacturers and traders everywhere. True, new opportunities would, no doubt, be created by Communist expansion but the Western Powers have already experienced the uncertainties inherent in trade which is conducted as an arm of political activity. Trade dependence upon growing Communist markets could involve political dependence as well."

I, in turn, now summarize the whole argument of this series to date by suggesting that what is at stake—democracy, the free way of life, respect for the individual—is no longer the monopoly of the West but is the common interest of East and West alike—of the West by inheritance, of the East (China excepted) by choice.

What impedes co-operation in defence of what East and West both hold to be so precious?

On the part of the East, it is the habit, engendered by the centuries of exploitation that is dead and gone, of resentment against the West that persists despite the removal of basic cause.

What impedes full co-operation on the part of the West, we will consider next week.

(Previous articles in this series were: "The Antagonism of East and West" and "Eastern Resentments Against the West").

COMMON MARKET AND FREE TRADE ZONE

(From Our Special West European Correspondent)

PARIS, September 30.

BRITISH attempts to persuade the Continentals to add a free trade zone to their projected common market are encountering increased difficulties, because the realization is dawning that what the British are asking them to do is to give up the idea of the common market. Neither being willing to join the common market nor able to stay out entirely, it was evident that Britain's aim would be to scuttle the scheme altogether. The vague and inconsistent plan for a free trade zone in West Europe is the instrument chosen for this operation, and of course, it has been welcomed on the Continent by all the opponents of Euromarket. For example, Professor Erhard, the West German Economic Minister, who differs from Dr. Konrad Adenauer is being opposed to close European integration and opposed to close co-operation with France, also prefers the free trade zone plan to the common market. Prof. Erhard is more interested in co-operation with Britain than with France, he is hostile to the Franco-German Bloc cherished by Dr. Adenauer, he scorns the idea of a "Little Europe" and does not favour the "European Minister" proposed to the Cabinet by the Chancellor. So his preference for the British free trade scheme is natural; at least he does not pretend that it can be added on to the common market without crippling the latter. Since Professor Erhard is Dr. Adenauer's most likely successor, his views on the question are important.

The contradiction between the British scheme and the common market was firmly underlined last week by the major organization of French industry, the CNPF (National Council of French Employers), which served notice on the Government that it should cease from all negotiations with Britain about the free trade zone. Apart from its conflict with Euromarket, the free trade plan is unworkable, the CNPF says, because it involves no common external tariff. Thus goods could be imported into the various member countries at varying rates of customs duty, and yet could be traded freely within the zone. Even if technical solutions could be found for this problem, their application would require so many controls and formalities that trade would be handicapped severely, whereas the idea is to liberate it. Rigid checking of the origin of all goods exchanged within the free trade zone would be necessary for the system to work, but no possible method of doing this has so far been found by the experts of OEEC. In fact for many types of goods, studies by French industrial associations show that no such method could ever be devised.

Comparing the free trade zone with Euromarket, the CNPF points out that the common market is a scheme for progressive economic integration in which the abolition of restraints on trade goes hand in hand with the harmonisation of social legislation and economic policies within the member-countries, whereas on the contrary the free trade zone does not aim at a unified economic community and excludes the harmonization of policies so as to leave governments their complete independence. To seek to combine them is to expect that during the next 12 or 15 years in West Europe there will function two conflicting systems of tariff disarmament: one for the six countries of Euromarket

which requires them to submit to numerous limitations, and a second which imposes no limitations on countries not belonging to Euromarket and which yet allows them to enjoy the same advantages within the common market.

Moreover, the British plan would apply only to industrial products; agricultural produce and food are excluded from it. Thus is because London wants to protect the interests of agriculture in the Commonwealth and in Britain itself. But this would quite upset the balance of gains and losses so delicately struck in Euromarket and would be to the disadvantage of those Continental countries whose main exports are also agricultural produce, such as Italy and Holland. Britain does not propose to ask other Commonwealth countries to join the free trade zone and nor does she intend to include the British colonies, whereas France has included her colonies fully in Euromarket. The CNPF concludes: "There is straight-out incompatibility between the establishment of the common market and the creation of a free trade zone. Furthermore, this latter, even supposing that it is technically realisable, would have disastrous consequences for the industry and agriculture of France."

This warning is quite clear and uncompromising. The French Government does not of course have to do what the employers tell it to do, but since projects such as are now under discussion simply cannot be made to work without the full co-operation of the industrial associations, the stand taken by the CNPF is probably fatal for the free trade zone. If the British had suggested the free trade zone before Euromarket was born in the Rome treaties, there is no doubt that French industry would have preferred it because it entails much less risk and disturbance than the common market. But by now, industry on the Continent has reconciled itself to Euromarket and has begun to make arrangements to meet its risks and exploit its advantages, so at this stage it prefers to go ahead with the bolder project rather than attempt to combine two incompatible schemes. By leaving it so late to propose the free trade zone the British have lost the support of those who were at first the enemies of Euromarket; and they have also succeeded in giving the impression that their only interest in the free trade zone is as a diversionary measure to upset the progress of Euromarket.

Not that Euromarket has made so much progress that its success is assured; it has made just enough progress for it to be unlikely that Britain will succeed in side-tracking it. The Euromarket scheme has got to the stage where personal and regional ambitions have been aroused by the prospect of the jobs and opportunities it offers — and anyone familiar with the back-stage manoeuvrings of politics knows that once a project or a law is able to whet the appetites of prospective top-jobholders, it begins to move forward as if under its own momentum. (Nationalisation laws and plans for autonomous corporations are examples of this rule of political life.) The Rome treaties (Euromarket and Euratom) offer 26 wonderful new jobs each entailing status about equivalent to an ambassadorship,

and equivalent pay — though money is less important than kudos. The sort of men who will be candidates for these posts already have enough power and influence in their own countries to push forward the application of the treaties in the face of all obstacles. Granted that aspirants for these plums much outnumber the posts available, we can guess that something like 100 ambitious and influential politicians and administrators in West Europe are at this moment seeking to hasten the setting up of the two European executives required for Euromarket and Euratom and of the European Investment Bank — and that adds up to a formidable political force, and a force moreover which acts not by public discussion but behind the scenes.

The jockeying for position in this struggle for supranational jobs has already begun, with the resignation of M. Rene Mayer from the presidency of the High Authority of the coal and steel pool in Luxembourg. This is designed to increase France's chance of getting one of the presidencies that Paris considers more important than the Luxembourg job, which will probably be allowed to go to a German. Paris has its eye on the presidency of Euratom, while the presidency of Euromarket will go to a Belgian or Dutchman. Added to these personal ambitions (which of course are overlaid with nationalist considerations, each government seeking to get its "fair" representation in each organisation) is the contest between cities for the right to house one or all of the European organisation. Luxembourg holds the seat of the coal and steel High Authority and is determined not to lose it and if possible to add the other headquarters to it. Paris is a candidate for all three and so is Brussels. Strasbourg is pressing its claim to be the "capital of Europe" and Milan is no less eager and will demand to house at least the headquarters of Euromarket. Complex arguments are being produced about the advantages of situating all the United Europe headquarters in one city, to avoid useless travelling about by ministers and officials, and about the advantages of scattering the headquarters, so that each country will see material evidence of supranational integration. Behind all such arguments are thinly disguised appetites for the economic and diplomatic benefits of receiving a powerful new super-government.

Competition of this sort is capable of carrying the integration schemes forward, and by the end of the year further paper progress will have been made toward the implementation of the Rome treaties. But meanwhile the basic economic issues that require to be settled if the common market is to work are being neglected. The French economy has fallen further away from free trade and no steps are being taken to prepare the country for the competition its industries would have to face if the common market were to begin to come into existence. The Government is supposed, according to the law authorising it to go ahead with Euromarket, to present along with the 1958 budget an economic plan designed to fit France to enter the common market under the best conditions; no such plan yet exists and the administration is too busy staving off immediate economic crisis to frame it. Equally, no international conference has been arranged to settle exchange parities, and the stubbornness with which Britain and West Germany are defending the present values of their currencies shows that governments are not ready for the concessions that a new exchange regime would necessitate. In short, there is much debate about who should be the High priests of Europe and where they should build their Temple, but very little discussion about what should be the content of their Creed.

WORLDGRAM

AGRICULTURE

Minor Irrigation in Community Development Areas: The Union Ministry of Community Development has indicated to the State Governments the need to ascertain the scope for the various types of minor irrigation works, as soon as a Block enters the Community Development stage. When there is scope for the expansion of private and co-operative irrigation, an annual programme for a three-year period is to be drawn up and targets fixed for the number of wells to be sunk and pumps to be installed in the Block. If, however, there is little scope for the full utilization of loan funds under minor irrigation, second priority is to be given to the restoration of State-owned tanks and the installation of lift irrigation schemes, including big tubewells under State management.

Research Schemes on Agriculture: The development of pasture grasses and legumes, cultivation of medicinal plants in hilly areas of the Punjab, survey of agricultural implements in order to undertake research for improving them, and award of trophies at regional flower shows to encourage cultivation of ornamental plants and flowers are some of the important schemes recommended by the Northern Regional Committee on Agriculture for financial aid by the Government of India. Thirty-seven schemes involving a total expenditure of Rs. 24 lakhs were considered at this meeting. The Committee has also recommended a scheme to investigate the potentialities of sprinkler irrigation as compared with ordinary flow irrigation in the production of fruit and vegetable crops. Another scheme aims at studying irrigation requirements of crops with a view to advising cultivators on the efficient use of water, particularly in semi-arid areas.

U.P. Evacuee Land Bill: The President has given his assent to the Uttar Pradesh Land Reforms (Evacuee Land) Bill, 1957. The Bill, which replaces an Ordinance, facilitates the final disposal of evacuee properties and extends the privilege of acquiring 'bhumi-dhari' rights in evacuee lands to a wider circle of occupants of such lands.

Eradication of Sugarcane Disease: A three-year scheme for controlling and eradicating the red-rot disease—a serious menace to 60,000 acres of sugarcane crop in border areas of eastern U.P. and North Bihar—has been approved by the Government of India. The work under the scheme is expected to start in October, and it is proposed to cover 30,000 acres of sugarcane crop in the two States in 1957-58. Before the actual operations for rooting out this disease are undertaken, a survey of the seriously-affected areas will be conducted and the incidence of the epidemic assessed. The control measures will include early crushing of the affected crops, replacement of susceptible varieties, and eradication of the diseased clumps. Some useful cultural practices, such as proper rotation and stoppage of ratooning of diseased crops, will also be popularised. The cost of the scheme is estimated at Rs. 2 lakhs, which will be made available to the two States by the Indian Central Sugarcane Committee of the Ministry of Food and Agriculture.

INDUSTRY

Industrial By-Products from India's Steel Plants: A number of industrial products will be available to the country as by-products when the three steel plants in the public sector go into production. At Rourkela provision has been made for producing light oil, carbolic

oil, naphthalene oil, wash oil, anthracene oil and pitch. Light oils will be further processed into benzole, toluol and xylol. From carbolic oil will be obtained phenol, cresol and xylonol. Anthracene oil will be converted into crude anthracene. Naphtalene oil will be converted into solid naphthalene. The exact quantities of these will depend on the composition of the tar which is not available yet. This in turn, would depend on the particular coals carbonised.

Production of Plastic Goods: The production of plastic goods by major units in India in 1956 was valued at over Rs. 4 crores. There are now 120 well-organised units producing plastic goods in the country as against five factories in 1936. In addition, there are several small units working on cottage industry basis. The industry is largely concentrated in Bombay and Calcutta, but there are also factories in Amritsar, Kanpur, Coimbatore, Hyderabad and Bangalore. During the year over 21.5 million gross of moulded goods, 2.6 million yards of leather cloth, 2.63 lakh square yards of PVC sheets, 11.57 lakh pounds of polythene films and tubing and 232 tons of phenolic laminates were produced by major units.

Second DDT Factory to Begin Trial Production: India's second DDT Factory, at Alwaye in Kerala State, is expected to begin trial production for next month. The Factory, which will have a capacity of 1,400 tons of technical DDT per year, is expected to attain full production by the beginning of next year. At the same time the expansion programme of the Delhi DDT Factory, which has been in production for the last two years, is likely to be completed by the end of this year. It will then have a capacity of four tons per day—1,400 tons per year. The production of the Delhi Factory has been steadily rising. As against the production of 172 tons in 1955 the Factory stepped up its output to 492 tons in 1956. The production this year is estimated to exceed 600 tons of technical DDT, the output in the first six months being 306 tons.

Coal Washeries for Steel Plants: Plans to set up two coal washeries other than the one at Kargali in Bihar have been finalised by the Government of India. The first of these washeries will be set up in Dugda between Bokaro/Kargali and Jharia fields and will supply washed coal to Rourkela and Bhilai steel plants. The second, which will be located near Patherdin, will supply coal largely to Indian Iron & Steel Works. The work at the construction site of the washery at Kargali is already in progress and the washery is expected to go into production by January 1958. The Kargali washery will meet the major portion of coal requirements of Rourkela and Bhilai steel plants.

Development of Small Industries on Co-operative Basis: A number of industrial co-operatives for small-scale and cottage industries are being set up in different parts of the country during the current financial year with financial assistance sanctioned by the Government of India. During the current financial year six schemes for the establishment of industrial co-operatives for small industries have been sanctioned so far. These are for the manufacture of storage batteries and moulded rubber goods at Batala in the Punjab, manufacture of bolts and nuts at Sriperumbudur in Madras and for leather workers and lock workers at Dindigul in Madras. Also the Perambur Arunthathiyar Leather Workers' Co-operative Society in Madras is to be reorganised. For these schemes the Government of

India have sanctioned assistance amounting to Rs. 3.3 lakhs to Punjab and Madras. Schemes for the establishment of industrial co-operatives for handlooms were also approved in 1956-57. They are at Sholapur in Bombay, Madurai, Aruppukottai and Karur in Madras, Bihar Sharif and Madhubani in Bihar and Trivandrum in Kerala.

TRADE

Encouraging Export of Vanaspati: In order to encourage the export of Indian Vanaspati to foreign countries, the Government of India have decided to grant a rebate of the excise duty on the vegetable non-essential oil content of the Vanaspati on its export out of India, in addition to the refund of the excise duty on the Vanaspati itself. The quantum of the excise rebate admissible on the oil content has been fixed on an 'ad hoc' basis, taking into account the availability of the non-duty paid oils in the market and the extent to which such oils are used in the manufacture of Vanaspati. The rate of rebate is 33/35 of the duty actually paid, if the duty has been paid at the rate applicable on and from May 16, 1957 and 6/7 of the duty actually paid, if the duty has been paid at the rate prevalent prior to that date. The procedure for the export of Vanaspati under claim for rebate of duty on the vegetable non-essential oil content will be more or less the same as that for export of Vanaspati under claim for rebate of duty on the Vanaspati itself.

Export Credit in West Germany: The Deutsche Bundesbank announced on August 23 that export drafts will be bought by the Deutsche Bundesbank only through November 30, 1957; bills representing renewals will still be bought after November 30, 1957, but only if they do not mature after February 28, 1958. The maximum amount of export drafts bought from one exporter may not exceed DM 300,000. The purchase of foreign acceptances has not been restricted. On August 28, it was stated that the Bundesbank's previous practice of buying foreign bills—i.e., foreign exchange claims maturing at a future date—at the same rates as spot foreign exchange made it possible for those exporters who obtained an acceptance for their foreign currency claims to transfer, without cost to them, to the Bundesbank the risk of loss on the rate; but that all other exporters, in order to avoid a loss, had to pay the premiums—at times very high—required in forward exchange trade, which were reflected in the correspondingly low forward rates of the individual currencies. When the forward rates remain below the spot rates for some time, the result is that the supply of foreign bills at the Bundesbank increases heavily, because of the increased creation of acceptances in precisely those currencies for which high discounts must be taken on the forward market. Therefore, the Board of Directors of the Bank has made it possible, by a change in the regulations for purchasing foreign bills with a maximum maturity of three months, for the Bundesbank to adjust its buying rates to the existing situation. For this purpose, the Bundesbank will consider primarily changes in supply and the rates prevailing in forward exchange trade.

Import Licensing in Egypt: In accordance with the regulations governing the import of goods in the third quarter of 1957, issued by the Egyptian Ministry of Commerce, applications for import licenses will be submitted to certain authorized banks instead of to the Import Control Department of the Ministry. An examination fee will be charged. License fees must be paid to the banks for imports whose value is greater than L.E. 5,000. An applicant may deposit with the bank a letter of guarantee in favour of the Ministry of Commerce. If the application is rejected, the fee will be returned by the bank. The banks' head offices are

to refer applications received by them to the Import Control Department, and the bank will issue import licenses in the light of the Department's decision on each application.

FINANCE

Ghana Joins Fund and Bank: Ghana became a member of the International Monetary Fund and the International Bank for Reconstruction and Development when the Articles of Agreement of these institutions were signed in Washington on behalf of the Government of Ghana by His Excellency K.A. Gbedemah, Minister of Finance of Ghana. The quota of Ghana in the International Monetary Fund is \$15 million and its subscription to the capital stock of the Bank is 150 shares with a total par value of \$15 million. Sixty-four nations are now members of the Fund and Bank. Admission of Ghana brought the total of members' quotas in the Fund to \$9,006,000,000. The total subscribed capital of the Bank is now \$9,333,400,000.

India's Foreign Assets: The decline in India's foreign assets which became serious in the second quarter of this year necessitating a loan from the International Monetary Fund has been progressively arrested from July last when the weekly average of decline fell to Rs. 8.3 crores to be followed by Rs. 6.2 crores in August and a little less than Rs. 4 crores during three weeks of the current month. The weekly averages of decline for August and September exclude the Rs. 10-crore sterling loan that India gave to Burma last month and the reduction by a little less than Rs. 10 crores in the book value of India's foreign assets consequent on the fall in prices of sterling securities as a result of the rise in the British bank rate. Financial observers attributed this progressive reduction in the decline of India's foreign assets mainly to the restrictive import policy announced in June last for the period of three months. At the beginning of the fourth week of September, India's foreign assets amounted to about Rs. 360 crores. In January this year the weekly average of decline was Rs. 2.5 crores, but in February there was an increase in the assets, the weekly average of increase being Rs. 8 crores. This increase was partly due to large exports of tea to the UK. But the weekly average of the months March-April showed a decline of Rs. 8.7 crores which necessitated the borrowing of Rs. 60 crores from the International Monetary Fund.

GENERAL

Economic Situation and Outlook in West Germany: For some months, the indices for prices of basic materials, industrial producer prices, and the cost of living have been more or less unchanged in West Germany. Nevertheless, the basic trend is still upward, although to a less pronounced extent than in 1956. In the first half of 1957, it was 7 per cent more than in the corresponding period of 1956, whereas between the first half of 1955 and the first half of 1956 the increase was 10 per cent. Provisional calculation show that output per worker in industry in the first half of 1957 was 4.7 per cent above that a year earlier, and output per man hour had risen by as much as 8.6 per cent. This means that the improvement in productivity so far in 1957 has been much more pronounced than in 1956. A number of indications point to a renewed cyclical expansion in the period ahead. In the first half of this year, orders received by industry exceeded those in the first half of 1956 by 3.6 per cent. The most important factor in the continuing economic expansion is foreign demand, especially for investment goods. Following a rise of 20 per cent in 1956, German exports are estimated to have risen by 19 per cent in the first half of this year.

NEWS IN BRIEF

INDIAN

India's linoleum production is steadily increasing. According to official figures production rose from 24,400 yards in June this year to 29,700 yards in July.

In accordance with their policy of keeping export duties under constant review, the Government of India have decided to abolish with effect from September 22. The export duty on zoda cotton, yellow pickings and sweepings.

Manganese ore exports to West Germany are likely to increase considerably in the foreseeable future, according to the Indian Economic Mission now touring that country.

The rate of rebate on retail and wholesale sales of handloom cloth will be slightly reduced from December 1, 1957 to make more funds available to the States for schemes for developing the handloom industry.

India exports its fruit products to UK, USA, West Asian countries, Europe and South-East Asia. Total exports in 1956 were estimated at 1,278 tons valued at approximately Rs. 2.25 million.

An Indian Standard Code of practice for installation and maintenance of induction motors (IS: 900-1956) has been issued by the Indian Standards Institution.

The Government of India have decided to postpone further the date of enforcement of Section 15 of the Central Sales Act, 1956 to January 1, 1958.

More schemes for the development of dying, printing, embroidery, zari work and carpet weaving have been approved by the Government of India on the recommendations of the All-India Handicrafts Board.

Silk draft silvers will be licensed freely for export to the end of December, 1957, says a Trade Notice issued by the Joint Chief Controller of Exports, Bombay.

The West Bengal Government is considering a proposal to set up spinning mills in refugee concentrated areas of the State.

It is reported an All-India Conference of Sugarcane Research and Development Workers will be held at the Sugarcane Research Institute, Pusa (Bihar) from October 25 to 31.

During the first quarter of this year, 125 units closed down temporarily or permanently in the States of Bihar, Madhya Pradesh, Madras, Punjab and Uttar Pradesh, affecting 20,465 workers, according to information available with the Labour Bureau, Government of India.

A reserve of 29 million tons of clay-shale in the Sindri area has been estimated by the Geological Survey of India. The survey was undertaken by the department to aid the planning of the cement factory now in production at Sindri.

FOREIGN

The Government of Turkey has purchased \$13,500,000 from the International Monetary Fund. Turkey purchased a total \$30,000,000 from the Fund in 1952 and 1953, and has since made payments to the Fund amounting to \$22,000,000.

The International Bank for Reconstruction and Development has announced that it had contracted a loan of \$75 million from the West German Central Bank. This loan will be notably employed to help underdeveloped countries.

Agreement has been reached between the Governments of Ethiopia and the Sudan for the establishment of an Ethiopian Commercial bank in Khartoum for the purpose of financing trade between the two countries.

An agreement to create an economic union between Egypt and Syria was signed in Damascus on September 3. It established the objectives of the Union and the methods to be followed to achieve its realization.

Preferential exchange rates applied to some non-merchandise transactions of the USSR since April of this year, through the introduction of a premium of about 150 per cent on the official rate for various foreign currencies have been extended to telephone calls and cables abroad.

The Monetary Board of the Central Bank of the Philippines is reported to have raised its rediscount rate from 2 per cent to 4½ per cent. In addition, a cash margin requirement of 100 per cent has been imposed on all letters of credit covering imports of non-essential consumer items.

Foreign investment in Japan in the form of foreign loans and of acquisition of Corporate stock, corporate debentures, and trust certificates amounted to \$125 million during the fiscal year April 1956—March 1957.

The Ministry of Agriculture of Thailand has announced that 51 million rai (2½ rai=1 acre) or 16.35 per cent of the total area of Thailand, was used for agricultural purposes in 1956. The value of output of rice, rubber, forest products, livestock and marine products totalled 25.9 billion baht.

The Ministry of Finance of the Republic of Korea has submitted a draft bill to the National Assembly which provides for a special tax on foreign exchange auctioned by the Bank of Korea.

A new agreement signed by Brazil and Argentina on July 30 calls for purchase by Brazil of 1 million metric tons (36.7 million bushels) of Argentina wheat annually during the three years 1958-60.

The International Finance Corporation announced recently that it had reached agreement subject to completion of the necessary legal formalities, for an investment of the equivalent of US \$520,000 (half in US dollars and half in Mexican persons) in Bristol de Mexico, S.A. for an aircraft engine overhaul and repair shop.

The secret of Popular Poplin —Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

Special Articles

A POLICY FOR SCRAP

THE announcement made recently by the Railway Board that sales of scrap iron arising in Indian Railways would not be allowed focusses attention on the Government's future policy relating to the disposal and use of scrap iron. The new policy is sought to prevent export of scrap, so as to put it to use internally. Statistics hitherto available about scrap iron are not sufficient to take a definite view on the wisdom of this policy. Some figures, available from trade sources, underline the huge loss the country is incurring in not pursuing a rational policy regarding proper utilisation of scrap iron. According to trade estimates two-thirds of "heavy melting" scrap remains unused. Only a small fraction (7.7 per cent) of the total supply of the light scrap is utilised; a little more than one-third of it is exported, and the rest allowed to turn to waste or deteriorate. In terms of money the national loss is estimated at about Rs. 5 crores per year.

Table I below gives the approximate figures, as estimated by the concerned trade interests, of the kind, availability and disposal of scrap material under three general heads:

TABLE I

ESTIMATED VOLUME AND DISPOSAL

Kind of scrap	Availability	Disposal	Balance
	Tons	Tons	Tons
Heavy Melting Scrap	3,00,000	1,00,000	2,20,000
No. 1, 2 and Light Scrap	3,00,000	1,30,000*	1,70,000
Turnings and Borings	60,000	25,000*	35,000

* Including exports.

If these figures are correct, even approximately, the question that naturally arises is as to why steps have not been taken to stop this waste in scrap utilisation. The need was never so urgent as today when our shortage of steel is acute. It seems incredible that steel-hungry India lets scrap iron go waste in this manner. Scrap iron and iron ore have much in common; both being crude for pig iron. Turning and boring scrap yields approximately 80 per cent metal. Iron and steel works situated far from iron ore mines could, therefore, turn to scrap iron with advantage. Increased production of steel, improvements in the supply position and the higher standard of living will increase the supply of scrap in the near future. In the circumstances it is essential that the Government plan for fuller utilisation of scrap.

Why domestic use of scrap has not become popular needs examination. In any case, if scrap arising in the country does not find adequate internal use, the only alternative that appears is of export. It should be remembered that while iron ore could be conserved for future use, lower grades of scrap, which are not consumed in the country, must be used to earn foreign exchange.

There is a grievance from the trade that necessary incentives are not provided for scrap collection in the country. It will be seen from Table II alongside that except for rerolling billets, the prices for other types of scrap here are much lower than what prevail in

other countries. There are undue restrictions on the export trade. Ceilings on exports are placed for different qualities of scrap iron irrespective of whether there is sufficient demand in the country or not. According to the Scrap Traders Association, the estimated availability of light steel scrap is 250,000 tons per year. Although there is inadequate demand for such scrap in the country only 168,000 tons of No. 2 and 3 quality sheet cuttings and nothing of No. 1 is allowed for export. While the anxiety of the Government to safeguard interests of domestic producers is understandable, the policy pursued in this respect by which the country loses foreign exchange goes beyond reason.

According to a current ruling, exporters are required to supply 10 per cent of good scrap in the ratio of their export to furnace owners in the country at a fixed price. The price so fixed is lower than the market price, and is of the nature of subsidy to buyers within the country. There are two steel companies that are expected to benefit from the arrangement. These are the Indian Iron and Steel Company and the Mysore Iron and Steel Co. But there is not much evidence to show that these companies are prepared to accept all the scrap thus offered.

There need to be two prongs to an iron scrap policy of the Government. In the first place, every encouragement should be given to scrap collection in the country. Scrap collection drives in England can serve as a guide to the importance of scrap to the economy. Secondly, it will be necessary that the available supply should be used entirely in the national interest. Scrap iron can be utilised within the country and there is also demand for it from outside. Although scrap iron can serve as a good substitute for iron ore or pig iron its use is so far confined to electric furnaces. Freight may be another factor in the use of scrap, especially in the case of those works that are situated near iron ore mines. As a long range policy conditions should develop for increasing use of scrap within the country. However, in the present state of domestic demand it will be worth while to experiment with a liberal export policy. Besides promoting scrap collection on a wider scale, such a policy will earn valuable foreign exchange.

The emphasis on supporting domestic production of steel from scrap and of earning foreign exchange will naturally vary from time to time. At the present time, with an acute foreign exchange crisis, it is obviously desirable to liberalise export, particularly as there are no signs that domestic producers are lifting the scrap available. It is sincerely to be hoped that the Government of India will act without delay.

TABLE II

COMPARATIVE PRICES OF DIFFERENT MATERIAL

FINANCIAL CONTROL—ITS PLACE IN MANAGEMENT

(By S. K. CHAUDHURI)

IN all spheres of management in India, whether in the Government or organizations in private sector, financial control with all its implications deserves special emphasis. The present study touches only the fundamental aspects of financial control of Central Government departments and also public corporations; it, however, deals at length with all financial control devices in regard to organization under private sector.

In Government departments the unity between finance and management is an inflexible arrangement. Every student of public finance knows the constitutional position that the Government financial system is based on parliamentary control. In actual practice there are various operations involved in securing this control. First, a department has to obtain parliamentary consent to the so-called "Ministry's Vote". Secondly, it has to be ensured that expenditure has been restricted entirely to the heads or sub-heads of the "vote". In the process — besides the spending department entrusted with the initiation of projects—important parts are played by Finance Department and Comptroller and Auditor General and two standing committees of the Lok Sabha — namely, Estimates Committee and Public Accounts Committee.

In the above context, financial control should mean effective and economic management. And for that, no doubt, the control by the Finance department coupled with the audit by Comptroller and Auditor General and secondly by the Public Accounts Committee at a later stage go to ensure that departmental zeal has not been carried beyond the propriety of expenditure against each "Ministry's Vote". If the Ministry has been indiscreet and if there have been questionable practices, more often than not they come to light — but under the system, rather too late, in the day. The criticisms of above bodies sometimes fathom what did not meet the eye. But yet can it be said that it has satisfied the criterion of economic and effective management?

It has often been said that in all Government departments the emphasis is more on the prevention of over-spending rather than an effort to make do with less than is available, whereas the commercial approach is more positive. Although this criticism has some merit, it should be admitted that the control by the Finance department and the Comptroller and Auditor General is a great deterrent. Here, one is tempted to say that although Appleby Report caused a great stir in the Government departments, it is all to the good that Finance department has not relaxed its control nor has the Comptroller and Auditor General, on the department's spendings.

In public administration it is difficult to devise methods of financial control where there is no quantitative measurement. But in the last analysis the solution may be through organization and methods — known as "O. and M." On the latter will fall the difficult task of maintaining each organization with special emphasis on functions to be performed and machinery best adopted to exercise them. We hear that Government has already been tackling this subject from this angle. The public sector of our economy now comprises an imposing array of enterprises such as multi-purpose river valley projects, fertilisers, locomotives, air-craft, telephone, cable factor, machine tools, ship-building and air-ways. The three steel works and also the Coke Oven plants are to be added to this list. All these undertakings are managed by public corporations although the idea of such corporation is still new to us. The cardinal idea of management by public corporation is that while it will be strictly responsible to the Government, it will have the freedom of action of

private corporation. According to this criterion, a public corporation should function as an autonomous unit free from Treasury control. Although some of the multi-purpose projects are run like public corporations, a considerable controversy has raged round the question whether it can be called autonomous in the strict sense of the term when it has to satisfy the Treasury as well as the Ministry by which it is controlled. The question is yet to be finally settled.

All these public corporations are intended to be run through their Boards more or less like private corporations and therefore the devices for financial control would be analogous to those employed by business undertakings in the private sector, discussed in detail in the following paragraphs, subject to the over-all control by the Finance department and the Ministry as the case may be, before the Board becomes accountable to the Parliament. We now pass on the devices for financial control for business or commercial organization in the private sector. Much headway has been made in the western countries in this direction. In our country too, the ideas have filtered in and they have become the topics of accountants, administrators and industrialists. In practice only very few of the large organizations have adopted some of the modern financial control devices.

In a business undertaking, financial control will have no meaning without a proper system of budgetary control for sales and also for profits. In the modern tendencies of the management practices in the western countries, particularly in the States, where the financial control devices have been developed to a sort of fineness, the management is always thinking of "tomorrow" and the historical past becomes valuable only for affording a basis for forecasting for "tomorrow". With this end in view, the devices for budgetary control for profit and for capital expenditure, standard cost with or without flexible production budgets, budget for sales, raw materials have been developed. It must however be understood that they are no substitutes for "line management". They serve as handmaids to management and not as its masters.

The writer, during his recent visit to the United States and other Western countries, carried the deep impression that all these budget devices flow from the main idea of forecasting for sales and for profits for three to five years ahead. Let us go into this root idea a little more in detail. When a sales budget forecast has to be made, it has to be broken down into various products with reference to the market conditions and other economic factors in the country. After the sales target has been fixed through the budget broken down into various products, the question comes up for fixing up the production programme to match up with the sales forecast. This brings in its wake, the production budget which again has to be broken down in a similar way into various products with an eye to the capacity of plant and machinery in each unit.

Production Budget is dovetailed with "standard costs". Without going into the complicated technique of working out the standard costs, it would be sufficient for our purpose here to say that the standard cost for each unit broken up into responsibility centres is pre-determined sometime with the help of the engineer and technical experts and sometimes on an average, achieved under normal conditions. When the actual costs are out, the difference between the standards and the actual is thrown out as "variance". These variances pin-point how up to the foreman level at each unit responsibility centre is faring and thus afford the most effective tools to the management known as

"Management control of cost by exceptions". Except, perhaps, in one or two very big organizations, it is doubtful whether any attempt has been made in our country to develop "standard costs" although the subject of productivity is discussed almost every day in connection with our second Five-Year Plan.

In the course of the preparation of the Production Budget, the expenditure incurred on administration have to be taken account of and for that an administration budget may be required for expenditure against administrative centres. The management has to be alert all the time that the administrative overheads are not getting out of gear with the works cost of the output and also with the prevalent selling prices.

Under the socialistic pattern of society, the industries in the private sector in general have as their objective, the earning of profit imbued with the sense of social responsibility. Within this framework, it must be admitted that profits are the sinews of industry and provide the internal resources for replacement and expansion. It will be appreciated that if no profits are earned or if profits are dissipated by a non-too-responsible management, the repercussions on the society will be quite sharp if the particular undertaking occupies an important place therein. It will not only affect the middle class shareholders but also it will jeopardise the interests of labourers working therein.

In the above context the value of "profit forecast" to management for three to five years ahead assumes great importance. If the projected results are not up to expectation, all estimates can be reviewed immediately to determine whether the budgets indicate weakness and what immediate steps can be taken to eliminate or minimise these weaknesses. The technique of developing the "profit budgets" is not complex. Once the sales budget with prices and also the production budget with its subsidiary budgets have been developed, it will be necessary to tie up the shipment out of this production product by product and put it in juxtaposition with the sale prices. The deduction of production cost from the sales figure broken down by products will indicate the margin on each product to show how the general overheads and profits of the undertaking would be covered by the margins. This "overhead" in the case of non-controlled products can be distributed among various products on the basis of demand and supply (more on the principle of what the market can bear) coupled with utility factor of certain products vis-a-vis different ancillary industries for which it caters. This allocated overhead deducted from the margins in each product will leave the profit on each of the products.

With this simple, technique, the forecast can be developed for three to five years. As each month's actual is worked out this can be placed side by side with the predicted profit and the forecast corrected according to the actual for the period thus arrived at. At periodic interval, say quarterly, this will pin-point to the management how the forecast is fluctuating as compared with the actual and what are the major reasons behind this phenomenon. If the actuals are showing a downward trend as compared with the forecast, actions are taken before it is too late. Aside from its purely mechanical function, this budget is a means of making people think. As a budget procedure becomes established in an organization, its continuous emphasis on profit tends to condition the thinking of its key personnel to the point where the profit motive becomes a dominant part of a supervisor's basic attitude. To cite an example, one of the largest motor corporations in the United States has had an outstanding successful budgetary profit control system in operation for many years and they recognize its effect on supervisory attitudes. They credit it as a factor in the success they have realized in developing the executives from the foreman level.

After the profit budget has been developed and compared with the actual, the next important stage for financial control is the preparation of the cash inflow and outflow statement arising therefrom. This, based on budgeted profit and actual, will indicate to the management the sources of cash resulting from the retained profits and applications of this fund to various expenditure such as, fixed capital expenditure, working capital, bank interest, dividend, and the like.

This brings us to the budget for forecasting for capital expenditure. As indicated above this has an obvious impact upon the cash resources and therefore cash inflow and outflow statement must be built up before the capital expenditure budget can be framed. In launching on capital projects, three simple criteria must be satisfied: (a) profitability of the expenditure; (b) use of marketing policy for further production which would be made through capital expansion, (c) the relevant time factor within the programme may be completed.

For public corporations and organizations in the private sector, important mechanisms of financial control have been discussed at length. Even then it may be that a number of important sections have not been considered although they may in some way constitute important tools for financial control. The ideas presented here are not novel; all that has been aimed at is to stress some of the outstanding important devices for financial control which can be very usefully employed by most of the organizations in our country including public corporation. An endeavour has been made to stress the importance of planning the control rather than in the post-mortem figures supplied after the event is over. What impresses us most, when we see the practices of financial control obtaining in industries in the U.S.A., the U.K. and West Germany is that there is an unremitting endeavour to improve the instruments used for the purpose. Two things are kept in mind. The first is to bring about an improvement in its various methods in the light of modern practices enlivened by a sense of research. Secondly, it must be ensured that the best practices, financial or otherwise, must not be restricted to a few; they must go deep into the various layers of "line-management".

Economic Report from the U.S.

WORLD BANK AND I.M.F. MEET

(By GUY SIMS FITCH)

WASHINGTON, Oct. 1.—Nothing illuminates the world economic scene as clearly as the views presented here last week at the twelfth annual meeting of the World Bank and the Monetary Fund. Some 500 experts from the 64 member nations of these twin United Nations instruments of international development and finance were in virtual agreement on the dominant trend of the day: the bulging requirements of economic growth, generating huge demands for capital and putting economies under varying degrees of inflationary strain. The central problem is to maintain an acceptable rate of expansion and yet to keep this expansion from upsetting financial stability.

It is a matter of record that in the face of the problem described at the meeting, free countries generally have been following internal monetary and fiscal policies designed to hold inflationary pressures in check. At the same time, in order to obtain needed foreign exchange and goods, they have for the most part been avoiding wherever possible restrictive external policies that might seriously hamper their trade with other free nations. Consequently, the Bank and the Fund have had the busiest time of their brief lives in the past few years. The Bank has been lending money to help capital-short countries proceed with soundly-drawn development plans and the Fund has advanced loans and credits to help member nations overcome temporary financial and exchange emergencies. The supply of international capital has been augmented by the generous amounts

of and from the United States and some other free nations. But this governmental assistance, however large, is nevertheless limited. And this is where the third and newest of the UN financial institutions—the 51-nation International Finance Corporation (I.F.C.)—comes into the picture.

I.F.C.'s function is to act as a "catalyst" in stimulating a greater investment of private funds in worthwhile enterprises. Around the world only one year old, the Fund already has committed \$6 million of its relatively small capital of \$95 million, in making five investments jointly with private enterprise—four in Latin America and one in Australia. And it has under consideration more than 20 other projects in virtually every part of the world.

Encouraging in this regard has been the growth of private foreign investment in recent years. This type of investment from the United States alone rose nearly \$4,000 million last year—far more than in any preceding year—to a total of \$33,000 million. A similar high rate of US investment is being maintained this year.

Even amid the difficulties which the world has faced in the past year, Bank and Fund officials have found many hopeful signs; they have been reassured by the enlightened internal and external policies of most free nations. And they have countered more evidence of basic economic strength than they dared expect only a few short years ago.

NORTHERN RAILWAY.

NOTICE.

The important changes in Time Table which will take effect from the 1st October, 1957, are notified as under:

(i) Additional trains introduced.

- (a) Nos. 1LJU/2LJU shuttle III between Ludhiana and Jullundur City.
- (b) Nos. 1AJ/4AJ " III between Allahbad and Jaunpur.
- (c) Nos. 13HH/14HH " III Hathras Jn. and Hathras Kilah.
- (d) Nos. 5DG/6DG between Delhi and Ghaziabad as an experimental measure.

(ii) Existing trains extended.

- (a) 49/50 Dn. Howrah-Varanasi Express extended to and from Jaunpur.
- (b) Delhi-Loharu Diesel cars will be extended to and from Sadulpur.

(iii) Trains cancelled.

- (a) 311 Up/312 Dn. (New Nos. 46 Up/46 Dn.) diverted to run between Delhi-Ambala Cantt. via Karnal instead of via Saharanpur.
- (b) 7 Up/8 Dn. (New Nos. 47 Up/48 Dn.) Varanasi Express will run via Mirzapur instead of via Janghai.
- (c) 9AP/12AP between Patli-Amritsar.
- (d) 3PM/4PM between Pathankot-Madhupur Punjab.
- (e) 10BQ/9BQ between Batala-Qadian.
- (f) 16JN/9JN between Jullundur-Nakodar.
- (g) 1MJ/2MJ between Moghalsarai-Jaunpur.

(iv) New stoppage provided.

Howrah-Kalka Mail will stop at Khurja from 19/27 to 19/29 hours from 1-10-57 though not shown in Time-Table and Guide.

(v) Air-conditioned accommodation will not be provided on the following trains though shown in the Time Table in force from 1-10-57.

Trains.	Stations between.
Amritsar Mails	New Delhi-Amritsar.
Mindorie Expresses	Delhi-Dehradun.
Punjab Mails	Delhi-Ferozepore Cantt.
Bikaner Mails	Delhi-Bikaner.
Jodhpur Mails	Delhi-Jodhpur.

Restaurant car services will be withdrawn from—

Howrah-Amritsar Mails	Amritsar-Moradabad.
Howrah-Delhi Janta Expresses	Howrah-Delhi (from vestibuled rakes.)

(vi) For other details and timings at intermediate stations reference may be made to October, 1957 Time Table and Guide on sale at Railway Bookstalls. Chief Operating Superintendent.

CONTEMPORARY AFRICA

You are invited to attend a course of public lectures arranged by the Department of African Studies, University of Delhi. Excepting for lectures 4 and 5 all lectures will be delivered in Lady Irwin College, Sikandara Road, New Delhi.

1. Tuesday September 24th, 1957, at 6 p.m.

Subject: "RELIGION IN AFRICA" Lecturer, Dr. S. Hofstra, Professor of Sociology, University of Amsterdam and Visiting Professor, University of Delhi.

2. Tuesday October 8th, 1957, at 6 p.m.

Subject: "COLONIAL POLICIES IN AFRICA" Lecturer, Dr. S. N. Varma, Reader in Politics, Department of African Studies.

3. Tuesday October 29th, 1957, at 6 p.m.

Subject: "AFRICA IN WORLD TRADE" Lecturer, Dr. J. C. de Graft-Johnson, Professor of Economics, Department of African Studies.

4. Tuesday November 5th, 1957, at 6 p.m.

in Sapru House, Barakhamba Road, New Delhi.
Subject: "THE NATIONALIST MOVEMENT IN GHANA" Lecturer, Dr. Amba Prasad, Reader in History, Department of African Studies.

5. Tuesday November 12th, 1957, at 6 p.m.

in Sapru House, Barakhamba Road, New Delhi.
Subject: "PROBLEMS OF PARLIAMENTARY DEMOCRACY IN CENTRAL AFRICA". Lecturer, Dr. S. N. Varma, Reader in Politics, Department of African Studies.

6. Tuesday November 26th, 1957, at 6 p.m.

Subject: "WATER POWER PROJECTS IN AFRICA" Lecturer, Dr. P. K. Sircar, Reader in Geography, Department of African Studies.

7. Tuesday December 10th, 1957, at 6 p.m.

Subject: "POLITICAL AND NATIONAL MOVEMENTS IN EAST AFRICA". Lecturer, Shri Peter Wright, Organiser, Department of African Studies.

8. Tuesday January 14th, 1958, at 6 p.m.

Subject: "LAND RELATION AND SOCIAL CHANGE IN AFRICA". Lecturer, Dr. P. K. Gopalakrishnan, Lecturer in Sociology, Department of African Studies, University of Delhi.

9. Tuesday January 28th, 1958, at 6 p.m.

Subject: "VOLTA RIVER PROJECT" Lecturer, Dr. J. C. de Graft-Johnson.

10. Tuesday February 11th, 1958, at 6 p.m.

Subject: "THE UNITED NATIONS AND SOUTH AFRICA'S RACIAL POLICY" Lecturer, Dr. Amba Prasad.

11. Tuesday February 25th, 1958, at 6 p.m.

Subject: "ASPECTS OF AFRICAN GEO-POLITICS" Lecturer, Dr. P. K. Sircar.

12. Tuesday March 11th, 1958, at 6 p.m.

Subject: "THE HISTORY OF EUROPEAN RELATIONS WITH AFRICA". Lecturer, Shri Peter Wright.

13. Tuesday March 25th, 1958, at 6 p.m.

Subject: "THE ROLE OF TRADITION IN AFRICAN SOCIETY TODAY". Lecturer, Dr. P. K. Gopalakrishnan.

Note:—Any alteration in dates will be notified in the Press.

Enquiries to:—
Department of African Studies,

PROBLEMS OF PLANTATIONS IN KERALA

By
CROESUS

ALTHOUGH Mr. Bhaktavatsalam, Minister for Agriculture in Madras, told the Annual Conference of the U.P.A.S.I. (United Planters' Association of South India) that it was no part of the Government's intention to "kill the goose that lays the golden egg", there still seems to be some doubt among plantation interests, in Kerala at any rate, whether the Communist Government there would not be forced by competing labour unions to enact legislation as might assist that frightful process. This fear was given expression to by Mr. R. M. Howie, Chairman of the Association of Planters of Kerala at its first (but 17th of the erstwhile Association of Planters of Travancore) annual general meeting the other day.

What led Mr. Howie to express such an apprehension was primarily the principle of graduated rate of taxation on income of agricultural companies introduced by the new Kerala Government into its taxation system. One must wholly endorse the grounds on which he objected to this unprecedented principle. Thus, he said it was so, because (1) the graduated scale as applied to corporation income in plantation companies is not on a par with such a scale when applied to individual incomes; (2) the assumption behind the tax is questionable in equity; (3) it is fallacious, as, unlike individual income, corporation income represents incomes to many shareholders whose number normally increases with the size of the company and (4) it is from this income that corporate bodies must look for the maintenance and development of their productive capacity. It is also true, as the A.P.K. Chairman observed, that, "unless it is changed in time, this measure would be a serious threat to corporate development in the State and might thwart industrialisation as such". But Mr. Howie must not forget that it is open to the Kerala Government to retort by asking whether the same objections do not hold good against the Centre's Wealth Tax on companies, which too is as unprecedented as it is unconscionable.

It was heartening to hear from Mr. Howie that the law and order situation in Kerala has since improved somewhat. "I should like to express our appreciation of the fact", he said, "that, in recent weeks, the police have been taking the necessary action against law breakers in most districts". This doubtless explains, as Mr. Howie also pointed out, why Pressmen, who have visited Kerala in recent weeks, have been reporting a general improvement, unlike what they used to do some months ago. But this gain on one industrial relations front seems to have been offset by an unfortunate development on another, namely, the Government's novel method of dealing with management in the matter of settling disputes. Latterly, it is alleged, the Kerala Government has been following the practice of sending for the Manager of a unit of the industry where there has been an industrial dispute, imposing on him any settlement it wishes to, and, what is even worse, regarding such a unilateral settlement as being applicable to the whole industry! This is carrying one step further the reprehensible practice of the Union Government at times of regarding strictly informal expression of views—and declared as such in advance—by representatives of an association or body of employers as the considered views of that association, a practice which the spokesmen of the Employers' Federation of India have repeatedly condemned.

Another version of this is the Kerala Government's constitution of committees and nomination to these committees of "obliging" individual planters whose

supposed views are flashed as representative of the whole industry, again, without reference to the association of the industry concerned. As Mr. Howie observed, "this has the effect of by-passing and nullifying the value of Employers' Associations, who are striving to preserve some unity of action in labour matters in the interests of industrial peace". Evidently, the Kerala Government is not satisfied with the doing away of functional representation which trade and industrial bodies enjoyed during the pre-Constitution days and wants to break the solidarity of these associations and see them disintegrate altogether.

That the Kerala Government does not sincerely believe in the democratic conference method but probably prefers the authoritarian approach in all these matters seems obvious from the way in which the State Government recently sought to change the wage structure of piece-rated tappers and pluckers, involving lakhs of rupees, by just a Gazette notification. Of course, the industry did not take this lying down and saw to it that no effect was given to the Government's new scheme by getting the High Court to pass a stay order. But this unpleasant episode might well have been avoided, if only the Government had the will. The absence of any such will can be clearly inferred from the delaying tactics of the Government in the matter of constituting a select committee to examine the future wage standards of plantation labour in Kerala and the possible solution of a bonus formula which was agreed to by representatives of both employers and employees as long ago as on May 18, 1957. At the time, I understand, the State Labour Minister even gave the impression that he had persuaded all the labour union leaders in the State to agree to this. All that was apparently left undone then was the appointment of a competent and unbiased chairman, but the Minister would appear to have promised to decide this also on receipt of a panel of names from the Association. Such a panel was sent even before the end of May, but, as the Labour Minister did not approve of these names and wanted another set of names, a fresh panel was sent.

The question was again raised in July last, at the meeting of the Standing Labour Committee on Plantations and the Chairman of the Committee gave a categorical assurance that no unilateral agreement would be forced on the basis of a proposed conciliation which had been arranged in the meanwhile—on July 8, 1957, to be precise—to discuss the wage level in Malabar. To say the least, this is most irresponsible. Apart from this having the effect of by-passing the proposed select committee, which would have been the proper body to discuss such an important issue, it has occasioned fresh trouble and, this time, from the followers of the party in power itself. Strangely enough, it would appear that no representative of the Communist union was a signatory to the July 8 conciliation at Trivandrum and so the Communist union has been openly repudiating the conciliation. Surely all this could have been avoided and a solution satisfactory to all concerned would have been found, had the problem been approached in the only way that is right, namely by constituting the select committee. This is not a case in which the planters have adopted any unhelpful attitude. No planter has denied that both wages and piece-rates on plantations in Kerala are due for revision. All that he wants is that he be given a chance to be heard before a decision on the question is taken by the Government.

Company Meeting

THE ALUMINIUM INDUSTRIES LTD.

Speech of Shri T. T. Rathnasabhapathy Pillai, Chairman of the Aluminium Industries Ltd., Kundara, Kerala State, at the Eleventh Annual General Meeting of the Company on 25th September, 1957.

Dear Shareholder,

I have very great pleasure in welcoming you to the Eleventh Annual General Meeting of the Company.

The financial results of the working of the Company for the year ended March 31, 1957, are already before you, along with the report of the Directors and their recommendations regarding the appropriation of the profits.

We have had another successful year and it is a matter of gratification to me that while we have maintained the usual tax-free dividend of 12½ per cent we have, in spite of the increased provision for taxation, necessitated by the increase in Company taxes incorporated in the latest Finance Act, been able to transfer a sum of Rs. 2 lakhs to the General Reserve making a total of Rs. 20 lakhs and a sum of Rs. 2 lakhs to the Dividend Equalisation Fund making a total of Rs. 6 lakhs while the Deferred Taxation Reserve is maintained at the adequate level of Rs. 6.25 lakhs.

The new insulated Cable plant has gone into production at Kundara and the current year will see the introduction of continuous shift-working and increasing turnover in that field. We have pioneered in this venture and are placing on the market a consumer article in very great demand, which will enable cheaper electrification of homes and factories.

The Company's Hirakud Project is making satisfactory progress. The Government of India have licensed the importation of the requisite capital equipment without any deferred payment terms. This is surely an indication of the importance Government attaches to this industry and the cognizance taken of the considerable foreign exchange saving that will result from the expansion of this industry. Despite the prevailing shortage of essential building materials, it is expected that the Rod-rolling Mill at Hirakud will be in operation in the third quarter of 1958 and the Cable Mill early in 1959. Subsequent years will naturally see an increased turnover, better service to our customers and enhanced profits. The world aluminium metal supply position has improved considerably since the close of the previous financial year and the manufacturing and trading prospects for 1957-58 are definitely better. The output graph in the Balance Sheet gives you some idea of the steady increase in our cable production and there is reason to expect that the upward trend of production will be maintained in the coming years. We shall thus be able to maintain on the double Capital of the Company the dividend which has been stabilized at 12½ per cent since we started paying it seven years ago, notwithstanding the fact that the Hirakud-plant will not be in commission till about the end of 1958.

The Kerala Government's policy, as you are no doubt aware, is one of continued support to all indus-

tries in the State. Every assistance and encouragement is being received by us for keeping the Kundara Plant operating at a high level of efficiency and on behalf of the Company I wish to tender my grateful thanks to the Kerala Government, for the same. We, on our part, re-dedicate ourselves to greater production of Aluminium Cables and accessories required so vitally for the electrification schemes of the second Five-Year Plan.

Now I request you to adopt the accounts already before you and to approve the appropriations for the year ended March 31, 1957, recommended by the Directors.

BUSINESS NOTES

IMPORT AUSTERITY: ITS IMPACT

THE NEW import policy for the next six months, announced on Monday last, is, in substantial part, three months old. The most important features of the latest licensing policy are that while the Open General Licence will continue to be suspended, the established importer of essential raw materials has received some slight consideration. This is welcome in so far as it may be hoped that this old and valuable link in the country's import trade has not been wholly broken. Meanwhile, the consumer in general will soon find a long list of over 160 items of import getting beyond his reach. The list includes a few essential articles as razor blades whose indigenous production is less than adequate, even if strict considerations of quality are not applied. There will be almost no one in the country who could have hoped for a less strict curtailment of imports. Indeed, in the present circumstances of worsening foreign reserves position, there appears to be no alternative to the new policy, especially when the prospects of a sizable foreign aid are not entirely clear.

It is being estimated that the restriction of imports during the next six months would save the country some Rs. 100 crores compared to the first six months of the current year. While the estimate is essentially vague and without any proper authenticity behind it, the figure is surely far too less than the conditions decree. Even as it is, there seems to be not much likelihood of achieving a saving of the order of Rs. 100 crores. The axe has fallen mainly on consumer goods. These have however, accounted for no more than Rs. 58 crores during the four months January to April, when total actual deliveries were running at a high rate. The vast bulk of foreign exchange, to the extent of Rs. 200 crores, was absorbed by raw materials and another amount of Rs. 66 crores by plant and machinery. It is not conceivable that the import of industrial raw materials or plant and machinery will be cut down to an extent when the country could pull itself out from the present crisis. If that were ever done, it would amount to adopting a desperate remedy making for still worse conditions. The definite minimum of the Plan—its core—must be implemented. All that can possibly be done is to arrange for deferred payments. But because of rising interest rates abroad and readiness there which is less than India imagined, severe limits are put on this too. Therefore, the real saving would arise from slashing imports of consumer goods more than from all other sources. Yet this forms only a small fraction of the total import bill. Again, the outstanding licences are of considerable magnitude and they are to be utilised. The combined influence of all these elements may mean a continued high pressure on foreign exchange. It may well be that at the end of the six months, the country may find itself in no better position than today unless, of course, the actual flow of foreign assistance changes the situation. In the short-term, however, it would be over-optimistic to hope that a saving of Rs. 100 crores can be made. The estimate is, to say the least, exaggerated.

To say that the merit of the import restriction lies in giving a fillip to indigenous industry is to restate an old theory. Import restrictions are no doubt conducive to indigenous industrial growth. But they are imposed as a matter of expediency in the short run and the benefits which industry at home can derive from it are limited. And that is not about all to it. More important is the determination to improve standards of quality in order to create permanent markets for the produce, both inside the country and abroad. In the ultimate analysis, this is the only way for correcting the im-

balance in the country's payments position. Perhaps as important as the import policy is the need to turn full attention to the aspect of increased production and productivity and thereby help hold the price level. The next six months, and many more to follow, will be a challenge for the authorities. Not a little toning up is needed for an adequate response.

THE WORLD BANK IN 1956-57

THE FISCAL year of the International Bank for Reconstruction and Development, ended June 1957, has turned out to be yet another one of increasing interest in the productive projects in less developed countries. The development of such projects has been the principal area of the World Bank's activities. In all, 20 loans were made during the year, amounting to \$388 million. In total terms, however, this figure shows a marginal decrease of \$8 million from the fiscal 1956. The gross total of the Bank's loans, numbering 170, given since its inception in 1946, comes to \$3,108 million, spread over 45 member countries. Much as usual, the development of electricity generation and distribution continued to be the leading purpose for which the World Bank lent during the period under review. Loans for this purpose account for as much as over a third of the aggregate loans granted during the year. Direct loans to industry, which had featured less prominently in earlier years, maintained the high level of \$95 million reached in 1955-56. Agriculture and transport received loans of the order of \$55 million each.

The largest single loan of the year, of \$75 million, went to Iran for her two-year old development plan, with Australia and Italy taking the second and third places respectively. In India, the Maithon Dam, under the Damodar Valley Project, which has now been completed, was the beneficiary of two loans from the Bank. Though the Dam is mainly a flood control structure, its other important advantages lie in the provision of power and improvement of power and water transport services in a developing industrial area of the country. In Bombay, the Trombay thermal power plant has come into operation, increasing that State's electricity by as much as 125,000 kilowatts. In addition to a loan given for this project in 1954, the Tata group of power companies was granted another loan during the year of a little under \$10 million for further expansion. The other loans given to Indian enterprises are the \$20 million loan to the IISCO and \$5.6 million to the Air India International. By far the most important is the recent \$90 million (or Rs. 43.75 crores) loan to Indian Railways for development under the second Five-Year Plan. The utility of this loan in particular, given at a critical time, cannot be over-emphasised. At the end of 1956, India had been sanctioned 9 loans of the net amount of \$184,940,582, the third largest in the world. Over the remaining period of the second Five-Year Plan, India expects to receive well over \$200 million worth of further loans from the Bank.

As a matter of general policy, the World Bank places special stress on the growth and expansion of the private sector of the economy. In respect of government projects, the Bank usually emphasises the need for quasi-autonomous or similar other authority for operation, to keep out political pressures or lengthy administrative procedures, usually loans to governments are granted for basic development requirements like agriculture, power and transport. Perhaps no less important than its lending operations is the World Bank's role in giving technical aid and advice to member countries. Expenditure on this aspect has been \$500,000 a year for the last three years. General survey

missions have been organised for various countries and facilities for training in various fields are provided. The help being offered by the IBRD towards solving the tangled problem of canal waters between India and Pakistan is widely known and appreciated.

REINSURANCE CORPORATION BEGINS WELL

ALTHOUGH the India Reinsurance Corporation, Ltd. held its first annual general meeting on Monday last week, the accounts presented thereat did not provide a correct picture of the results of working of the Corporation for a full year. Actually, the Corporation was registered on October 29, 1956 and it commenced business later still, that is, on January 1, 1957. So the accounts presented and adopted by the meeting related, in fact, to a period prior to the actual commencement of business—for the period ending December 31, 1956—or registration! This period hardly covered three months, inasmuch as the conference to obtain formal promoters' agreement to start the Corporation was itself held on October 18, 1956. But the idea was in the offing even from an earlier date, say, from early 1955, when a sub-committee of the Executive Committee of the General Insurance Council examined and reported on the problem of the net drain of foreign exchange out of India by way of reinsurance ceded abroad and on how to reduce this drain. The result was the formation of the Corporation.

Apart from conserving foreign exchange, as Mr. A. D. Shroff, the Chairman of the Corporation, observed at the first annual meeting, such a Corporation helps promote the development of the reinsurance market in the country and thereby makes the functioning of the indigenous market complete and well-integrated. The decision was timely, because the rapid industrial developments since have greatly expanded the base of the insurance market, which, in turn, has enlarged the scope for trading in reinsurance to and fro. The Corporation is international in character, which, incidentally, is one of the reasons why the Government of India agreed to let this remain as a purely private enterprise affair. It is a co-operative venture of all insurance companies, both Indian and foreign, functioning in the country.

During the brief period of its existence, apart from realising an estimated net premium income (for the first year's trading) of some Rs. 70 to Rs. 80 lakhs—distributed in the proportion of 45 per cent Fire, 30 per cent Miscellaneous and 25 per cent Marine—the Corporation has succeeded in evolving an underwriting system, which would be, to quote Mr. Shroff, "easy to operate, create the least possible difficulties for the members ceding business and be administratively economical." Under this system, even the smallest company is assured of a share by retrocession, commensurate, of course, with its underwriting limits. Hence the distinction between "listed" and "unlisted" risks in the Fire Department. It is a happy augury for the successful functioning of the Corporation that this system has been working smoothly all along.

PROGRESS OF THE I.F.C.

MUCH OF what the Chairman of the Industrial Finance Corporation, Mr. K. R. K. Menon, said at the ninth annual general meeting of the Corporation recently is heartening. There has been, during its last financial year ended June 1957, an impressive increase in its disbursements—from Rs. 2.20 crores in the previous year to Rs. 9.78 crores. The significance of this year's figure is not only in its being four-fold. It is also in the fact that the increase has occurred in spite of the considerable delay in draws caused by the closure of the Suez Canal and the difficult foreign exchange position. Both the eventualities contributed to reduced imports

even of capital goods. The difficulty in securing foreign exchange is reflected in the decline in the total volume of loans applied for, as compared to the previous year. This, in turn, has resulted in a lower total of loans sanctioned during the year. The drop in sanctions is from Rs. 15.13 crores in 1955-56 to Rs. 11.91 crores.

For the current year, 1957-58, the Corporation will have at its disposal some Rs. 20 crores. As much as Rs. 15 crores of this relatively bulky amount has been made available by the Government. Also, the IFC Act is to be so amended as to make it possible for the Corporation to borrow ten times its paid-up capital. The Amendment Bill is now pending before Parliament. The funds being thus substantially augmented, it is only necessary that the IFC should dispose of loan applications as expeditiously as possible in order to make the best use of the funds at its command. However, from what the Chairman has stated, it appears unlikely that all the applications waiting for disposal will be considered.

An important development in the working of the Corporation is that, during the year under review, it has been able to pay full guaranteed dividend on its paid-up capital without subvention from the Government. During its life of nine years, it is only for the second time that the Corporation has not had to draw on Government assistance for this purpose, the first time being in 1953. This welcome turn is born of higher profits for the year. Now that the Corporation has succeeded in striking roots deeper, it should be hoped that profits will continue to increase to eliminate all dependence on Government help. For this, the Corporation will need to be resilient in its policies so as to profit by its experiments. One innovation it had to adopt, which has proved useful, is the nomination of non-officials on the Board of Directors of a loanee company. An increasing use of technical, financial and administrative experts, from outside the official fold of the Corporation, can well lead to more fruitful results. The power to be conferred on the Corporation to enter the field of guaranteeing deferred payments by capital goods importers has come not a day too early. The guarantee will facilitate securing of goods on deferred payments which is one of the devices the country needs to adopt to tide over its present payments difficulties.

THE ALUMINIUM INDUSTRIES

A MEASURE of the successful working of the Aluminium Industries is provided by its maintaining the usual dividend of 12½ per cent, tax-free, in spite of increased taxation as a result of the provisions of the latest Finance Act. It is a matter of gratification that the Company is making good progress. The importance of the growth of aluminium industry in the country has never been in doubt. The Government has given sufficient recognition to this fact inasmuch as licences have been issued for importing equipment for the industry without the limitation of deferred payments. This is significant at a time when restrictions are imposed on all sorts of imports to arrest the deteriorating foreign exchange situation. Indeed, the expansion of the industry will save the country valuable exchange in course of time.

The Company's insulated cable plant at Kundara, in Kerala, has already gone into operation. This is a pioneering venture and will make available an article highly in demand. The electrification schemes of the second Five-Year Plan are bound to multiply the demand for aluminium cables. That the Company is preparing itself for meeting the demand is, therefore, to be welcomed.

Company Meeting

INDUSTRIAL FINANCE CORPORATION OF INDIA

Speech delivered by the Chairman, Shri K. R. K. Menon, at the
Ninth Annual General Meeting of the Shareholders of
the Industrial Finance Corporation of India held
on the 27th September, 1957.

Gentlemen,

I have pleasure in placing before you the Accounts of the Corporation and the Report of the Board of Directors for the year ended June 30, 1957. Printed copies of the Accounts and the Report are before you. These have also been circulated to all the shareholders. I shall, if you agree, take them as read. I would, however, make some observations on a few points.

2. It is my painful duty, to refer to the sudden demise, in March 1957, of Shri Syamnandan Sahaya, our esteemed colleague of the Board of Directors of the Corporation. Shri Syamnandan Sahaya served the Corporation in this capacity as the elected representative of Co-operative Banks from November 1953 till the time of his death. His indefatigable energy and his judgment in financial and business matters were of immense value in the deliberations of the Board, and I am sure you will join me in expressing our deep sense of sorrow at his passing away and conveying our sympathies to the bereaved family.

3. Shareholders will observe from the Accounts and the Report that the working of the Corporation for the year ended June 30, 1957, was even more satisfactory than that for the previous year. Our gross profit rose from Rs. 32.68 lakhs in 1955-56 to Rs. 43.06 lakhs in the year under report, and whereas there was no profit left for paying dividend last year, we have a net profit of Rs. 11,25,000 this year, which just enables us to pay in full the amount of the guaranteed dividend on our paid-up capital, without having recourse to any subvention from Government. This, you will observe, is after providing a sum aggregating Rs. 31.81 lakhs for estimated tax liability, doubtful debts and other contingencies. It may perhaps be of interest if I recall in this connection that, during the past nine years that the Corporation has been functioning, we have had to ask Government for a subvention every year, except once viz in 1953.

4. The total amount of our loans and advances which stood at Rs. 14.24 crores last year has also shown a marked increase; it now stands at 21.90 crores. With this steep increase in our investments, I believe we should be in a position, hereafter, to stand on our own legs without calling upon Government for help to meet the guaranteed dividend on our share capital.

5. In the matter of disbursement of loans also we have forged ahead in the year under report. Our disbursements during this year totalled Rs. 9.78 crores, as against the corresponding total of Rs. 2.20 crores in 55-56, Rs. 1.64 crores in 54-55, and Rs. 2.82 crores in 53-54. This very satisfactory result, it must be said, was achieved in spite of the fact that, due to the closure of the Suez Canal route and also the country's

tight foreign exchange position, delivery of capital goods from abroad was subjected to considerable delays, and there was, therefore, corresponding delay in the drawal of the loan amounts sanctioned. Among the important factors which helped us to speed up disbursements to this extent may be mentioned (a) the completion of the administrative reforms that were initiated in 1955-56 to which I had made reference in my last year's speech, particularly the quickening in the pace of completion of the necessary formalities in the head office and branch offices of the Corporation, (b) the extension of the system of having our own Law Officers to the two remaining regions viz., Bombay and North India (Madras and Calcutta having already been covered last year), and (c) further liberalisation of the procedure for granting interim loans pending completion of legal formalities.

6. There was a fall in the total volume of loan applications received from Rs. 27.70 crores for 1955-56 to Rs. 21.36 crores this year. It is to be noted, however, that this reduced figure of Rs. 21.36 crores represents a considerable advance on the total for 1954-55 viz. Rs. 11.27 crores, and Rs. 9.01 crores for 1953-54. There was a corresponding fall in the volume of loans sanctioned, which came down from Rs. 15.13 crores for 55-56 to Rs. 11.91 crores in the year under report, though both these figures compare very favourably with the corresponding figures viz. Rs. 7.34 crores and Rs. 5.27 crores for 54-55 and 53-54, respectively.

7. I surmise that one of the main factors which contributed to the diminution in the volume of applications this year was the difficulty experienced by Industrial concerns and entrepreneurs in the matter of securing adequate amount of foreign exchange for importing the necessary capital goods. The rise in prices of foreign machinery was also possibly another important factor which contributed to the contraction in the volume of loan applications.

8. You will notice from the figures given in the Annual Report that recoveries of interest and instalments of principal during the year were on the whole, very satisfactory. We have refrained from exacting our pound of flesh in the case of those defaulters who, we considered, after detailed examination of their financial affairs, deserved liberal and sympathetic treatment at our hands.

9. Our relations with the public and particularly with the various Chambers of Commerce and Industry, to which we had paid considerable attention in the previous year, as I said in my last year's speech, continued to be as close and friendly in the year under report, and I take this opportunity of thanking the representatives of the various Chambers for the valuable suggestions and assistance which we received from

October 4, 1957.

them as a result of the free and frank discussions we had with them on various problems of mutual interest.

10. In my speech last year I had mentioned that our Advisory Committees were in the process of being reconstituted so as to include a larger number of technical experts in each, and also so as to provide for a wider territorial representation. These Committees have now been reconstituted accordingly. As mentioned in the Annual Report, a fifth Advisory Committee for miscellaneous industries like electricals, paper, cement, glass, aluminium, non-ferrous metals, etc. was also constituted in the course of the year. The advice and guidance received from these Advisory Committees have been of immense help to the Board of Directors in dealing with the loan applications.

11. A noteworthy step that we took, as an experimental measure, in the year under report was to nominate non-officials to the Boards of Directors of a limited number of companies to whom we had granted loans. Hitherto we had been confining such nominations to the officials of the Corporation. We decided, on the basis of the results of the experimental measure introduced last year, to expand the scope of the scheme, and, in the current year, we propose to nominate several more non-officials. A measure of this kind is fast becoming unavoidable as, with the rapidly growing number of loanee concerns on our books, we have arrived at the stage where already it is becoming extremely difficult for our own officials to function as our representatives on the Boards of Directors of all, or even a majority of, these concerns, in addition to carrying on their normal duties, the volume of which has also grown considerably of late.

12. Before I turn to other matters of general interest I should like to invite your attention to one item in the accounts presented to you. Our Auditors have remarked that it would be desirable to increase the provision made for doubtful debts (viz. Rs. 22.25 lakhs) by another Rs. 5 lakhs.

As matters stand at present, and based on our present anticipations, which are cautious and conservative, we are in a position to assure you that the provision available in our account viz. Rs. 15.25 lakhs should prove quite adequate for covering our doubtful debts. In fact, if the negotiations for the reconstruction of certain of the Companies concerned and the sale or lease of their assets which are now in progress, bear fruit—as we hope they will—we should be left with a surplus in the provision that has already been made in this regard.

13. The figures given in Appendix I to the Annual Report showing the state-wise distribution of the loans sanctioned by us in the year under review as well as in the previous years will show that as compared with the position as it obtained on 30th June 1956, there has been a marked increase at the close of our financial year in June 1957, in the total of loans sanctioned to concerns located in certain States. Excluding those States which, relatively speaking, may be described as industrially advanced, the figures relating to the progress in some of the other States are, I think, worth inviting your special attention to. These are—

(i) Andhra—Increase from Rs. 1.29 crores up to the end of 1956, to Rs. 2.61 crores at the end of 1957.

(ii) Kerala—From Rs. 3.19 crores up to the end of 1956, to Rs. 4.28 crores at the end of 1957.

(iii) Punjab—From Rs. 2.01 crores up to the end of 1956, to Rs. 2.66 crores at the end of 1957.

(iv) Uttar Pradesh—From Rs. 2.96 crores up to the end of 1956, to Rs. 3.86 crores at the end of 1957.

14. In this connection I am glad to inform you that as part of a drive for increasing the volume of assistance rendered to industries in the relatively weaker States, and with a view to informing the Governments of these States regarding the functions and scope of activities of the I.F.C. I made it a point to hold personal discussions with the Chief Ministers of these States, and, in some cases, also with the Ministers in charge of Industries. They all evinced keen interest in the matter of accelerating the pace of industrial development in their States, and I was left with the impression that we may look forward with confidence to an increasing measure of participation by the I.F.C. in the financial assistance rendered to industrial enterprises sponsored by, or with the support of these State Governments, subject of course to our financial resources in the future permitting the expansion of our activities in this particular direction.

15. Turning to the general pattern of industrial units which were sanctioned loans during the year under report, sugar came first with a total of Rs. 4.63 crores. Chemicals and textiles followed with Rs. 2.51 crores and Rs. 1.85 crores respectively. This same pattern held good in the previous year also.

16. Co-operative Societies continued, in an increasing measure, to seek our assistance, and at the end of the year under report the total amount sanctioned to this class of concerns came to Rs. 10.73 crores as against the corresponding figure of Rs. 6.89 crores at the end of the previous year. All the 22 Co-operative Societies, distributed over six States, to whom we have sanctioned loans so far are engaged in the manufacture of sugar. The total cost of their Schemes comes to roughly Rs. 25.66 crores out of which Rs. 10.73 crores, as already stated, come from the I.F.C. as loan, and the balance Rs. 14.93 crores is accounted for to the tune of Rs. 4.23 crores by subscriptions raised from members, Rs. 4.16 crores by cash credits from Banks for working capital, Rs. 2.80 crores by subscription from the State Governments concerned, and the balance by deferred payments and other sources.

17. A fairly large number of our loanee concerns continued to earn during the year profits high enough to enable them to distribute dividends in excess of the usual 6%, with our prior concurrence. We continued to give such concurrence in all cases where the financial position of the concern, after careful examination by us, struck us as satisfactory. It has been our policy to be fairly liberal in this matter, consistent with the security of our loans, and the well-being of the concern.

18. In this connection I should like to invite your attention to the fact that only a small fraction of the total amount of loans sanctioned by us is accounted for by loans sanctioned to concerns which, at the time of such sanctions, had already been declaring relatively high rates of dividend. In the large majority of cases our loanee concerns fall in the category of either those which, at the time of the sanction of their loans by us, were not declaring any dividend at all, or those which, though declaring a dividend at that time, were not declaring dividend at relatively high rates. It is also worthy of note that in the majority of the concerns that had been sanctioned loans by us and which have been paying relatively high rates of dividend we have made it a condition for the grant of our loans that they should raise fresh capital of a considerable amount in each case from the capital market. In a few of these cases the amounts that they have been asked to raise

October 4, 1957.

THE EASTERN ECONOMIST

531

from other sources have exceeded the loans sanctioned by us, or nearly equalled them.

19. Conditions in the money market during the year under report were more tight than in the previous year, and we were obliged to raise the rate of interest on our loans by $\frac{1}{2}\%$, viz. from 6% to $6\frac{1}{2}\%$, with effect from the 23rd April 1957. It is not unlikely that we may have to pay higher rates of interest than we do now on our borrowings in the course of the current year; this will naturally affect our lending rates too.

20. In my speech last year I had invited your attention to the fact that our ways and means position was engaging our anxious attention. With a view to ensuring that we have the necessary funds to enable us to fulfil the important role assigned to us in the second Five-Year Plan we explored all possible avenues for raising additional funds in consultation with the Government of India. You will be glad to know that in spite of the very difficult conditions that have prevailed for some time in the money market we have been able, thanks to the good offices of the Government, to make arrangements for augmenting our resources to the tune of an additional sum of Rs. 15 crores, which will enable us to disburse, if we are called upon to do so, loans up to a total of as much as Rs. 20 crores in the course of 1957-58 alone. Our thanks are due to the Central Finance Minister and his Ministry for making this possible.

21. Another important development in this connection that you will be glad to hear about is that Government have also approved of our proposal to amend the I.F.C. Act so as to enable us to borrow sums aggregating ten times our paid-up capital and reserve fund instead of five times that it allowed by the Act at present. A Bill, incorporating, inter alia, the above-mentioned amendment has already been introduced in Parliament.

22. So much for the bright side of the picture. There is, however, the inevitable cloud attaching to the silvery future that I have just outlined to you. Loan applications from various industrial concerns which we have not been able to consider so far have already swollen to an unprecedented volume, and they still continue to come in. To meet this huge demand we have to try and raise further additional funds again almost immediately. Conditions in the money market which were, as I said, difficult enough last year have yet shown no signs of appreciable improvement, and it is not, therefore, unlikely that we should be faced this year with the prospect of having to hold over consideration of the bulk of the pending applications until such time as conditions change for the better. We are, however, at the moment, engaged in consultations with Government with a view to finding some solution to this problem. Government have been extremely helpful to us in this matter already, and, in spite of the heavy odds, I would not rule out the possibility of some amount being found for us this year.

23. A new field of activity which we are likely to enter this year is the guaranteeing of deferred payments by the importers of capital goods who are able to obtain this concession from the foreign manufacturers. As you are aware, our foreign exchange position has compelled Government to impose severe restrictions on the import of all foreign goods—capital and others—and importers of machinery are now obliged to secure terms of deferred payments before import licences are granted to them by Government. Some of the foreign exporters have asked that the deferred pay arrangements should be guaranteed by an institution like ours. Government decided, in consultation with your Directors, that we should be enabled to do this in appropriate cases, and they introduced a Bill in Parliament which seeks to so amend the I.F.C. Act as to vest in us the power to do so. This Bill, it is hoped, will come up for consideration in the November Session of Parliament, and as soon as it is

passed we shall formulate the procedure we will follow in regard to this new activity of ours.

24. Before I close, it is my very pleasant duty to convey my hearty thanks to my colleagues on the Board of Directors, as well as to the members of the various Advisory Committees and the non-officials who have served as our representatives on the Boards of Directors of loanee concerns for their co-operation and wise counsels. I have also great pleasure in conveying my thanks as well as that of the Board to the General Manager and the entire staff of the Corporation for another year of loyal and devoted work on their part.

POONA, NASIK-DEOLALI AND BROACH ELECTRIC SUPPLY COMPANIES

In line with other electricity companies, the Agents of the Poona, Nasik-Deolali and Broach Electric Supply Companies have published their Reports and Audited Statements of Accounts for the three-month period January to March, 1957. Under the Electricity Supply Act, the accounts and reports of all electricity companies are now to be made up for the 12-month period ending March 31 every year. In view of this, it is not strictly possible to compare the results of working of the three-month period under review with those of the corresponding periods in previous years. However, from the tables specially prepared to indicate the progress made by these companies, the progress in respect of number of consumers, connected load, units of energy sold and revenue from sales of energy, shows an improvement in the case of all the three companies—the Poona, the Nasik-Deolali and the Broach Electric Supply and Development Corporation. But, in the case of the first two companies, the increases in both the energy sold and the revenue derived therefrom are sizeable, compared to increases in the corresponding period of the previous year, due to higher sales, consequent on further relaxation by Government of the restrictions imposed on the consumption of energy, and the delegation of powers to the companies to connect loads, albeit for specific purposes and within specified limits.

The net profits for the three-month period of the three companies are as follows:

Poona	Rs. 1,41,934
Nasik-Deolali	Rs. 55,256
Broach	Rs. 1,792

Accordingly, the management has recommended dividends in respect of the first two companies, on both preference and ordinary shares, those on ordinary shares being Rs. 2.50 and Rs. 2 per share, respectively, free of income-tax in either case.

The causes for the increase in expenses and the net loss incurred by the Broach Electric Supply and Development Corporation, Ltd. were the additional provision required to be made for taxation both for the year 1956 and for the three-month period under report, as also the donation made to a political party — the All-India Congress — of Rs. 17,500. This increase in expenses necessitated a transfer from the Tariffs and Dividends Control Reserve and, even then, the carry-forward of loss actually amounted to Rs. 6,924.

INDIAN TRADE AND GENERAL INSURANCE COMPANY LIMITED

An overall improvement in Fire, Marine and Miscellaneous departments has been revealed by the audited accounts of the Company for the year ended December 31, 1956. In the Fire Department, net premiums amounted to Rs. 32,46,051 as against Rs. 28,87,406 in 1955, an increase of 12.4 per cent. Net claims paid and outstanding amounted to Rs. 11,57,296 giving a loss ratio of 35.7 per cent as against 44.8 per cent in 1955. Commissions, expenses of management and foreign taxes amounted to Rs. 15,04,207 being 46.3 per cent of the premium for the year as against 45.8 per cent in 1955. After placing Rs. 1,79,322 to the Reserve for Unexpired

liabilities, which now stand at Rs. 16,23,025 or 50 per cent, of the premiums, there remains a balance of Rs. 4,46,048 which has been transferred to the Profit and Loss Account.

In Marine Department net premiums amounted to Rs. 21,01,082 as against Rs. 19,77,035 in 1955, an increase of 6.3 per cent. Net claims paid and outstanding on account of 1956 and previous years amounted to Rs. 16,05,665, equivalent to 76.4 per cent of the premium income for the year as against 67.1 per cent in 1955. Commissions and Expenses of Management amounted to Rs. 690,010 or 32.8 per cent of the premiums as against 30.2 per cent in 1955. After transferring Rs. 2,15,800 from the Profit and Loss Account, the Reserve for Unexpired liabilities is increased by Rs. 77,142 and now stands at Rs. 19,75,083, equivalent to 94.00 per cent of the Premium Income for the year.

In Miscellaneous Department Net Premiums amounted to Rs. 14,54,818 as against Rs. 9,98,722 in 1955, an increase of 45.7 per cent. Net Claims paid and outstanding amounted to Rs. 6,99,952, equivalent to 48.1 per cent of the Premiums, as against 52.0 per cent in 1955. Commissions and Expenses of Management amounted to Rs. 6,23,177, equivalent to 42.8 per cent of the Premium income for the year, as against 45.7 per cent in 1955. After transferring Rs. 1,09,643 from the Profit and Loss Account, the Reserve for Unexpired liabilities is increased by Rs. 2,28,048 and now stands at Rs. 7,27,409 or 50 per cent of the premium income for the year. Profit and Loss Account is credited with the various items shown therein and after incorporating Expenses not chargeable to other accounts, and after transferring Rs. 2,15,800 to the Marine Revenue Account and Rs. 1,09,643 to Miscellaneous Insurance Revenue Account, and Rs. 25,333 to Reserve for Taxation, there is a balance of Rs. 1,03,505 that has been carried to the Profit and Loss Appropriation Account. After including the balance carried forward from the 1955 account, which amounted to Rs. 25,247 there remains a balance of Rs. 1,28,752. The Directors recommended payment of a Dividend for the year at the rate of Rs. 2 per share without any deduction in respect of Taxation paid by the Company; this payment will absorb Rs. 1,20,000. It is proposed to carry forward the balance of Rs. 8,752 to the next Account.

CLEVEDON TEA COMPANY LTD.

The audited Accounts of the Company for the year ended 31st December, 1956, disclose a profit of Rs. 3,66,123. On transfer of this sum to Profit and Loss Account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 2,12,277, of which Rs. 50,000 have been transferred to Revenue Reserve. The State Bank of Pakistan have sanctioned the remittance of the entire Pakistani trading profits of the Company for Season 1954 to this country and the amount has been received by the Company. A sum of Rs. 1,20,000 has been provided against a dividend distribution at the rate of 30 per cent for season 1956 payable on receipt of the remittance of the Pakistani trading profits for Season 1955, for which an application has already been made to the State Bank of Pakistan, leaving Rs. 42,277 to be carried forward. The dividend at 30 per cent for Season 1955 was paid on July 23, 1957. Crop during the year was 6,065 maunds as compared with 6,347 maunds in 1955. The average selling price realized was Rs. 2-1-4 per lb. as against Rs. 1-14-9 per lb. in the previous year.

COMMODITY NEWS AND NOTES

PRODUCTION OF IRON ORE IN INDIA

The production of iron ore in India during the quarter ending June 1957, was 1,206,000 tons, according to the Indian Bureau of Mines. Among the producing States, Bihar accounted for 512,000 tons, Orissa 493,000 tons, Mysore 125,000 tons and Andhra Pradesh 55,000 tons. Compared to the corresponding quarter of the preceding year, the production of iron ore increased by 63,000 tons. The production during the half year ending June, 1957, was 2,509,000 tons showing a fall of 26,000 tons as compared to the corresponding period of the preceding year.

INCREASE IN COTTON ACREAGE

The International Cotton Advisory Committee has predicted "some increase" in cotton acreage and production outside the USA in 1957-58. In its August review, the Committee said this increase would offset to some extent the probable decline this season, in US production although the net effect of acreage restrictions on US cotton output "has been mitigated by higher yields per acre." "Nevertheless," the Committee declared, "It still represents a major re-adjustment of supply and it is obvious that without acreage controls in the USA there would be no solution to the world surplus problem."

PRODUCTION OF MANGANESE ORE IN INDIA

The production of manganese ore during the quarter ending June, 1957 was 414,000 tons, according to the Indian Bureau of Mines. Among the producing states Orissa accounted for 122,000 tons showing an increase of 9,000 tons compared to the previous quarter while Andhra Pradesh increased the production by 5,000 tons at 72,236 tons. All the other producing states recorded lesser output during the quarter under review. Madhya Pradesh produced 76,000 tons and Bombay 72,000 tons. The share of Mysore and Bihar was 57,000 tons and 12,000 tons respectively. The production during the half year ending June, 1957 was placed at 8,84,000 tons. Compared to the corresponding quarter of the previous year the production of manganese ore fell by nearly 26,000 tons.

METHODS OF CHEMICAL ANALYSIS OF MANGANESE ORE

The Indian Standards Institution has circulated, for eliciting comments, draft Indian standard methods of chemical analysis of manganese ore. This standard specifies the methods of determination of moisture, silica, barium, manganese, manganese dioxide, iron, alumina, titanium oxide, phosphorus, sulphur, lead, copper and arsenic. While preparing this draft, due consideration has been given to the work being done on the international level and the facilities available in the country for analysis. Comments on this draft may be sent before November 8, 1957 to the Indian Standards Institution, 19 University Road, Civil Lines, Delhi-8.

COTTON PRODUCTION IN PUNJAB

The second largest cotton-growing State in India, Punjab, contributes 6.20 lakh bales—a little less than half to the country's total production of American cottons, the long and medium staple varieties much prized for high quality and early maturity. The area covered by these cottons in Punjab is at

present estimated at about 1 million acres—about 72 per cent of the total cotton acreage in the State. These cottons bring to Punjab farmers an income of about Rs. 25 crores per year and save an equal amount of foreign exchange for the country. Ten years ago, however, East Punjab had only 39,000 acres under such medium staple cottons producing 8,000 bales, while PEF/SU had 4,000 acres producing 1,000 bales. Three new varieties of long-staples—scientifically named 216 F, and H 14—suitable for Punjab soil and conditions, economical in cultivation and in some ways better than the earlier cottons, were developed and production increased from a mere 1.1 lakh bales or so in 1950-51 to 4.93 lakh bales in 1954-55 and to 6.20 lakh bales in 1956-57. These new varieties had special characteristics which made them popular with the cultivators. Their earliness was so marked that the entire crop could be picked by the end of October, while cotton picking in the varieties developed in the pre-Independence period extended up to the middle of January. Because of this earliness, both 216F and 320F could be successfully matured with three or four irrigations, as against at least six irrigations required by the varieties bred previously. This was a welcome quality, as irrigation facilities available in East Punjab were not as plentiful as in the canal colony areas of West Pakistan. Further, both 216F and 320F found to be much superior to the local 'desi' cotton in spinning performance their spinning performance, their spinning capacity being 40 highest standard warp counts, as compared to six to eight counts of the indigenous varieties.

COTTON AND JUTE PRODUCTION IN PAKISTAN

Cotton output in Pakistan during 1956-57 declined by 9.8 per cent despite a slight rise of 1.5 per cent in acreage under cultivation, according to official figures available for the period. Production of cotton during the year totalled 15.7 lakh bales. The decline is attributed to rains and pest attack. The production, combined with the carryover of 1.1 lakh bales, gave total supply of 16.8 lakh bales, as against 18 lakh bales in the previous season. An official survey on cotton said, export sales till the end of June, 1957, aggregated to 6.2 lakh bales, while another 8.7 lakh bales are expected to be absorbed by domestic mills. The cotton season is, therefore, likely to end with a small carryover. The official estimate placed the area under jute in 1956-57 at 12.30 lakh acres as against 16.34 lakh acres in the previous season. Though this meant a substantial decline in acreage, output at 64 lakh bales was well maintained, as compared with 65 lakh bales last season. The total supply, including the carryover of about 2 lakh bales amounted to 66 lakh bales, as against 68.5 lakh bales in previous season.

SUGAR PRODUCTION AND STOCKS

According to the Indian Sugar Mills Association, the total sugar production up to August 31, of the season 1956-57 was 20,21,000 tons (excluding 10,552 tons produced by Mandya factory for the season 1957-58, as against 18,62,000 tons last season. The off-take of sugar from the factories during the month of August, 1957 was 2,08,000 tons as against 1,72,000 tons during the corresponding period last season. The total despatch of indigenous sugar during the 10 months of the current season comes to 18,08,000 tons (including despatches for export) as against 14,44,000 tons during the same period last season. The total closing stock of sugar with factories on August 31, 1957 was 7,54,000 tons as against 8,25,000 tons on the same date last season.

time to applaud the winner. Science knows no barriers in nationality, and should know none in politics. From all over the world there should be unequalled admiration for the Soviet achievement. In India, whatever our political views, we should accord to the Soviet scientists the warmest and the most enthusiastic congratulations.

Because in this field of knowledge the Soviet scientists have struck a momentous blow for the human mind; their achievement ceases to be Russian and belongs, like all supreme achievements of the mind, to the human race. In this sense at least, the Soviet achievement ranks as one of the great liberating forces of history. It may be remembered that when the General Theory of Relativity was published during World War I, the scientific world, as well as all institutions of higher learning, gave to Albert Einstein the tribute which was his due, although at that time it was ranked as a German success and he bore German nationality. Today, the makers of the first artificial satellite must be above the hard controversies of Cold War I. Their achievement belongs to the whole world; it will be a great memory for many generations; perhaps it will leave a mark on history continuing to elevate and inspire those who would constantly adventure with the unknown in order to win new laurels for the human mind.

While, therefore, in its purely scientific aspect, there should be no cause of anything but congratulations to our friends in the Soviet Union, there must be a recognition that the instruments which have been employed for the launching of the satellite have other uses on which the consensus of support cannot be anything equally unanimous. The rocket technique, in which the Soviet Union has now shown itself clearly ahead of the Free World, has less happy implications in the terrible rivalries in the nuclear world in which we are now forced to live. It may be that the great scientific success of the Soviet Union, both with the Inter-continental Ballistic Missile and with the first satellite, will lead to more aggressive policies in the international world. It may be that these aggressive policies will hasten development in the Free World, involving greater expenditure on armaments and, therefore, less on schemes designed to raise standards of living. In either case we, in India, must recognise that things are likely to be done, as a result of the Soviet success, which are not necessarily in the interests of human values or of increased investment in under-developed countries. While, therefore, one can hail the Soviet success as a tremendous blow in the battle against ignorance with unqualified enthusiasm, one needs to recognise that its second-round effects are likely to be greater Cold War rivalry and less interest in the problem of raising living standards, in particular those involved in filling the gaps in India's second Five-Year Plan.

The fact that a diversion of interest to satellite physics and preoccupation with building bigger and more powerful rockets will delay investment plans in other directions should not lead us to lose perspective on the long-run advantages of satellite research. A cynical scientist has suggested this week that there is real risk in atomic experiments, and it would be wise for *homo sapiens* to find refuge on other planets or even upon the moon. One need not also encour-

age space travel competition as an escape valve to increasing difficulties upon the earth. These experiments, which are now being conducted with renewed vigour, have obvious advantages in shortening distances between men, so that, conceivably in ten years from now, rocket travel might bring India within two hours of the American continent. The shortening of distances between the continents will have the effect of making international understanding a far easier problem than it is today. It may well be that the long-run advantages of quicker inter-continental communication — of which the satellite which encircles the earth in 96 minutes gives full promise — will far outweigh the inconvenience which distraction with the satellite is likely to have on our current investment plans.

The earth is still unhappily so situated in terms of international political rivalry that the Congress of the United States is far more concerned today with Soviet rocket superiority than with the challenge which awaits it in the greatest living democracy of the world. And yet it should be clear that the balance of power has not been substantially shifted. Beyond a certain degree — and the critical limit is far below the Hydrogen Bomb — superiority here and there cannot be decisive in maintaining world peace. It can be no advantage to the Soviet Union, because it has reached rocket superiority, to launch an attack on the United States, merely because of its success at the margin. Retaliation with any hydrogen bomb is a deterrent enough to stop the exercise in war of the inter-continental ballistic missile. It cannot be, therefore, that the security of the world in terms of military power has been so substantially altered that the Congress of the United States has justification for forgetting the larger challenge to which democratic life on the world is being subjected. Everything needs to be done to show that peace has its victories no less renowned than war. In a sense, the satellite is a victory of peace, but its reactions have at the moment produced a war psychosis which needs to be argued against as much in the interest of the human race as it is in the special interest of the under-developed world.

The long-term outlook for the human race can be made to look more bullish as a result of the extraordinary crop of adventurous imagination which modern science seems determined to spread before our time and generation. The Prime Minister has been right to remark on the extreme anachronism of an armaments race in conditions in which the fruits of scientific victory might change from one side to another, and in any case the reserves of destructive power are already great enough to abolish life upon the earth. This calls for a far more vigorous approach to disarmament on both sides. This approach cannot be based on superiority of either the Soviet Union or the Free World. It must be based on the recognition of the superiority of the human values which both the Soviet Union and the Free World owe to the human race. One of the greatest tragedies of the present situation is that the tremendous successes of the scientists have not been matched by equal leadership in the arts of political leadership. Is the new moon a star of promise, such as one which appeared two thousand years ago describing a new hope of peace on earth and good will amongst men? There are many millions in the world today who are anxiously seeking such a sign in which they can conquer.

Strategic Retreat at Brighton?

THE Labour Party Conference last week at Brighton is important neither because of the absence of the usual factional fights nor because its proceedings were free of the struggle between private conscience and public realism which had been the bane of the Labour Party since 1930s. The conference is significant because it witnessed the end of Bevanism — a euphemistic term for orthodox Socialist thought and the right to entertain and express private opinions even when they are diametrically opposed to the official party policy. Mr. Aneurin Bevan, the stormy petrel of the British Labour movement, showed at the conference that he had developed the requisite degree of flexibility and that he would no longer be an electoral liability. The conference also saw the abandonment — at least for the time being — of the creed of nationalization, which has influenced the Party's thinking in a greater or lesser degree for the past forty years. The conference witnessed the odd sight of the neo-Socialist, the ex-rebel and the trade union boss — Mr. Hugh Gaitskell, Mr. Aneurin Bevan and Mr. Frank Cousins — acting in unison, having reached a new understanding under the pressure of a possible general election in the near future.

The retreat of what has come to be known as Bevanism is clear from Mr. Bevan's stand on the resolution pledging that a Labour Government would ban unilaterally the test, manufacture and use of nuclear weapons. Opposing the resolution, Mr. Bevan said it was not a question of who was in favour of or against the Hydrogen Bomb, but one of what was the most effective way of getting the "damn thing" destroyed. He argued that unilateral action by Britain would lead to "diplomatic shambles". "What this conference", Mr. Bevan continued, "ought not to do is to decide on dismantling of the whole fabric of Britain's relations without putting anything in its place". Moreover, it would not necessarily follow that Britain would be safer from the Hydrogen Bomb as a consequence, he observed. "If war broke out between the United States and the Soviet Union," he added, "this country would be poisoned with the rest of mankind". In his opinion, the carrying out of the resolution might very well precipitate incidents "conducive to a third war." "Do you call that statesmanship?" he demanded. "I call it emotional spasm."

The change in Mr. Bevan's attitude must have surprised and hurt many delegates. There is, however, little doubt that it is more in keeping with the mood of the country and the anxiety of the Labour Party to provide continuity of policy after the Conservative Government. This it has done by assuring the public that the British pragmatic tradition in foreign affairs would not be subordinated to ideological considerations. The impression will, doubtless, persist that after thirty years of being kept out of real power by men whom he knows are less able than himself, Mr. Bevan has mellowed himself so as not to be cheated of it when Labour next comes to power. This is the only way in which one can explain his opposition to the resolution on the Hydrogen Bomb. Otherwise, each one of his present arguments can be matched with his earlier counter-arguments.

Less surprising than the abandonment of a rigidly moral stand over nuclear weapons is the

fact that Mr. Bevan did not oppose the proposal for Government ownership of private industry through buying of shares instead of nationalization. Here "Gaitskellism" came up against remnants of the Bevanite Group and the Party's Old Guard who have never grown out of the concept of nationalization and hold to it as an article of Socialist faith. While commending the new proposal, Mr. Gaitskell warned the delegates that they should take care not to scare away millions of voters who, disillusioned as they may be by the Conservative Government, were still far from being convinced Socialists. It was, again, to woo these middle class voters that Miss Alice Bacon, while moving the resolution on the Rent Act, made much of the danger of eviction that would threaten nearly six million tenants next October, when houses whose rateable value exceeds £30 (£40 in Greater London and Scotland) are due to be decontrolled. The motion dangled before these tenants the idea that the Labour Government would promptly redress their grievances by getting a host of rent tribunals to establish a "reasonable rent".

It was also with an eye to the coming elections that the Labour Party leadership conjured up the spectre of unemployment which would stalk the land in the wake of the increased Bank Rate. Mr. Harold Wilson described the Government's measure as "vicious and calculated", and said that it "threatened a return to economic stagnation and an unemployment figure of between three and five per cent." The objective, he added, was to break the trade unions.

Judged purely from the Labour's desire to catch the floating vote, the Brighton Conference this year has surely been a success. First, it has demonstrated that Labour is not divided. Secondly, the policies it has pledged itself to follow have the right amount of ideological appeal for the partisan, and are at the same time mild enough not to frighten away those who distrust all ideologies. The uncommitted vote is suspicious of orthodoxy. Its political persuasion is middle-of-the-road. The battle for its vote cannot be won by doctrinaire appeals but by decisive enunciation of concrete policies. The more extreme these policies, the less likely are they to appeal to the floating vote.

The retreat from orthodoxy has been necessitated by the peculiar political phenomenon which has emerged from the recent by-elections in Britain. To be sure, these by-elections have revealed a swing of opinion away from the Conservatives. But they have not recorded any substantial gain for the Labour. The Liberal Party has instead polled a number of votes claimed to be its highest for the past 25 years. It is to win over these voters that the Labour Party seems to have discarded the slogan of nationalization and that Mr. Bevan has abandoned the posture of moral superiority over the question of the production and use of nuclear weapons. Thus, we have had at Brighton a Labour Conference in pursuit of the uncommitted voter rather than the vindication of orthodoxy. It met under the shadow of an impending general election and its deliberations were wholly subordinated to that contingency. The only questions still left unanswered are: Has Mr. Harold Macmillan really decided to yield his inheritance of office? And, will semblance of unity in Labour's leadership displayed at Brighton endure?

The Railway Plan Reconsidered

THERE are healthy signs in evidence that second thoughts are being devoted to the ever-pressing problem of revising the railway development plan. The drastic cut of over Rs. 350 crores which was applied to the Railway Ministry's original demand for outlay was a matter of expediency imposed by the size of the financial resources available for the total Plan. It was explicitly recognised at that time that the claim of the railways for higher expenditure and investment will have to be considered at appropriate stages.

On Monday this week Mr. Jagjivan Ram disclosed at a press conference that his Ministry had moved a step further from the position taken in the budget proposals of May last and had planned for a higher target of outlay than Rs. 200 crores contemplated there. This announcement must be hailed as encouraging. It is, however, not as heartening as it ought to have been. Its cardinal weakness lies in the fact that estimates of outlay are totally vague. It was surprising to be told at the conference that while a specific higher physical target has been fixed, its financial counterpart is still to be ascertained. The indications are that the revised targets of capacity and expenditure will fall short of the actual demands of the traffic offering.

Probably the most reassuring part of the revision of the railway expansion programmes is the bold decision on stepping up the target of the mileage to be newly electrified. This has been raised by about 57 per cent from 825 to 1,300 miles. The entire increase of 475 miles has been allotted to the East on the routes starting from Calcutta. This is precisely what was needed. Railway transport capacity in this area has reached the saturation point and it is beyond the potentiality of steam traction to carry higher traffic. The A.C. system which has demonstrated its superior benefits of efficiency and economy over the D.C. system is to be adopted on the lines to be newly electrified. It must, however, be remembered that the economies in cost which will be obtained from the higher loads and higher speeds of electric locomotives on A.C. system will be reflected in the operating costs. They bear no relation to the initial investment in electrification which will rise proportionately with the increase in the route mileage.

It was realised from the start that the truncated railway plan would have to be enlarged in respect of the provision of additional freight capacity. The magnitude of increased traffic to be generated by the different programmes of expansion in the overall plan could not be placed lower than 61 million tons in originating terms. Capacity of this order was the minimum that was required and it was obvious that the cut of 14 million tons which was applied tentatively in the plan could not be sustained. It is now announced that the cut has been restored. This announcement, however, must not be interpreted to imply that the new target of capacity will be adequate for the full requirements of the Plan. The original estimate in itself erred on the side of caution. It was assumed that miscellaneous traffic which covers a large number of development projects would increase at the rate of 5 per cent per annum. This assumption was unrealistic and it is clear from the last one year's trends in traffic that the increase is faster. Some of the major projects in the Plan have been allocated higher targets which inevitably would require larger transport

services. The average lead of traffic has been increasing since the last two years of the first Plan. A broad idea of the inadequacy of the new target of 61 million tons of capacity can be gathered from the revised plan for agriculture. The higher target for agricultural products now approved will itself swallow at least 10 million tons out of the 14 million tons of the increased capacity which has been recently allowed in the railway plan.

The rough estimates of expenditure on the newly expanded size of the railway plan are based on assumptions which lack any close analysis of costs. An overall allocation of Rs. 300 crores, which is 50 per cent more than what was envisaged in May last, is presumed to cover the higher outlay. Another presumption is that out of this amount Rs. 200 crores would be sufficient to meet the requirements of the creation of additional capacity, while Rs. 100 crores would cover the element of increased prices. These assumptions cannot be accepted straightaway. Even a broad analysis of the implications of the higher capacity target would show that the financial resources would inevitably fall short of the real requirements. An increase of 57 per cent in the mileage to be newly electrified would entail expenditure of something like Rs. 50 crores. The line capacity allocated in the original plan provides only for an increase of 50 million tons of additional traffic. The creation of more capacity to lift 10 million tons would easily cost anything like Rs. 40 crores. It is significant that the original programme of acquisition of increased rolling stock is estimated to cater for higher traffic of the order of 42 million tons. Movement of 19 million tons in addition to the stipulated rolling stock capacity would raise the cost of acquisition by Rs. 100 crores if not more. These three major items alone will absorb the amount of Rs. 200 crores supposed to cover the total cost of creating additional capacity.

It is an accepted implication of the financial scheme of the Plan that allocations of higher funds will have to be made in response to the progressive increases in prices of machinery, equipment and materials. The outlay needed to achieve the target of 61 million tons of increased capacity, even on the conservative estimate of the Railway Ministry, cannot be less than Rs. 1,325 crores. The provision for inflation in cost has been fixed at Rs. 100 crores over the entire period of the Plan. In effect the Railway Ministry's estimate proceeds on the hypothesis that the average increase in prices of equipment and materials over the Plan period will not exceed 7.5 per cent. It is obvious that this is an excessive under-estimate if the recent impact of inflation is any indication at all. It is curious that no clear idea has been obtained in any of the revised calculations about the increase in the foreign exchange component of the outlay. It is true that expectations of additional loans from the World Bank during the rest of the Plan period are based on reasonable grounds. The Planning Commission has taken a realistic decision in giving a categorical assurance to the Railway Ministry to provide the finances it will require during the Plan period. But certainly the Railway Ministry owes it to the Commission to give it a clear picture of its requirements. There has been a failure to act up to this obligation. The cost of this failure may turn to be inability to create transport capacity of the required size in time.

THE WEEK'S NOTES

INDIA AND JAPAN

THE PRIME MINISTER of India is at present visiting Japan—a country whose people have often been a source of inspiration to Asian patriots. It was Japan's decisive victory over Czarist Russia in 1905 which permanently exploded the myth of Occidental superiority over the Orient and gave a fillip to the freedom movements in the East. Again, the manner in which Japan modernized its economy and gained the status of a great industrial and political power also fired the imagination of Asian peoples. The Japanese achievements were all the more remarkable because their country was no more than four tiny islands, only an eighth of India's area, without any sizable sources of iron ore, coal or oil. On top of it all, its vast regions are barren and have to be supported a population which is nearly one-fourth of India's.

In the pre-war years, Japan used to get these essential raw materials from its Empire. But since its defeat in the second World War and its subsequent occupation by the United States, Japan lost its regions of "co-prosperity." In spite of this handicap, its recovery, both economic and political, has been remarkable. New records in respect of industrial productions have been achieved. The output of steel now runs over 11 million tons, of cement to over 13 million, and new shipping tonnage at 1.6 million. In rayon industry, Japan ranks next in importance to the United States of America, while its cotton textile exports are highest for any country. The Japanese have achieved these by their efficient ways of working. India, which is already adopting the Japanese methods of cultivation, can profitably take recourse to Japanese methods in industry. As Japan cannot recapture its pre-war markets in Asia and the Middle East on the old basis, it will have to explore markets for its capital goods—for which there is a growing demand in the newly liberated countries of the East.

While there is little doubt that Indo-Japanese trade and economic collaboration over the years have been unsatisfactory, there is wide scope for it in future. Now that Japan is no longer dominated by a junta of army officers, industrial magnates and feudal lords, and has, like India, been engaged in a common experience—that of making democracy a success—the chances for collaboration have surely increased. Moreover, both the countries stand for international peace and a ban on the hydrogen and nuclear weapons. They differ, to be sure, on the methods of achieving these objectives. Japan's distrust and apprehensions about its next door neighbour, Communist China, make it imperative for it to rely on economic and military aid from the United States, as a protection against possible Communist subversion or aggression. India reacts differently—at least to appearances—to Chinese Communism, in spite of danger signals in its north and south. But attitudes should not prevent the two countries from co-operating in the economic and political development of Asia. Indeed, together they represent an alternative and a challenge to China's dream of empire in South-East Asia.

VOICES OF SANITY

GIVING ASSURANCE, in course of a speech at Poona last week, that Hindi would not be developed at the cost of other regional languages, the Indian President referred also to the English language. In the last 50 years, he said, English dictionaries had grown four times because that language had not hesitated to assimilate words from other languages. Such a procedure, he added, should also be adopted in developing Hindi. What the President does not appear to have taken into consideration is the fact that English was not

artificially expanded; words were borrowed by individuals whenever they thought it convenient to do so. 'Projects' did not have to be set up for the purpose. Nor does the President seem to have expressed concern at the results of too hurriedly substituting Hindi for English. Even if it were accepted for the sake of argument that, circumstances being different, Hindi has to be enriched and brought up-to-date by special means, there would seem to be considerable reasons why English should not be dispensed with; for one, Hindi is not developed enough to be in a position to take the place of English; for another, English being in currency over almost the entire globe, the world's medium of intercourse, it would be the height of unwisdom to throw it away in scorn. Mr. K. M. Munshi, who is second to none in championing the cause of Hindi, remarked the other day: "It is one of the misfortunes of the country that we want to discard English as fast as we can. We seem to have developed an inferiority complex that speaking or learning English will denationalize us". Hindi, he added, would take considerable time to develop to the level of English.

Mr. Munshi's plea for the retention of English has been reinforced by Mr. C. Rajagopalachari, who said in Madras a few days ago that "the Hindi programme is a difficult programme. Whatever may be the utility of learning Hindi, it is unjust and improper to make it the official language of India". Which should remind us that Hindi has not been enthusiastically accepted in every State. We have but to look north, south and east to appreciate the heartburn that its being made a national language must cause to speakers of much more developed and rich languages, or to those who are apprehensive lest the national language stifles their. The reticence of the various non-Hindi-speaking States towards Hindi is evident from the analysis reported recently of how half-heartedly the Centre's grants for propagation of Hindi are used. In the last three years that the Central Government has directly contributed to the expenditure on State schemes for propagation of Hindi, no more than half has been utilized of the sanctioned Rs. 1,100,000. In 1956-57, out of the Rs. 2.83 lakhs contributed, only about Rs. 1.45 lakhs was utilized. These figures lend considerable weight to the suggestion that English should be retained as the official language along with Hindi, until the time when the latter has come up to the level of the former.

FRESH CONFIRMATION

THE NEWS that the Plan outlay for the current year (1957-58) would be pruned by about Rs. 150 crores has not come as a surprise. As early as July 12 last it was noted in these columns that the planned public sector outlay for the year might actually come to just Rs. 770 crores — nearly the same as the revised outlay of Rs. 761 crores for the first year (1956-57) — which, too, would be rendered possible only by a dose of deficit-financing of Rs. 275 crores. It is now stated that this target for created money is not possible of achievement in view of the rise in prices in general and in food grain prices in particular — a price rise which has cut into savings by way of increased encashment of national savings certificates, for example. The revised target for deficit-financing may, therefore, be Rs. 175 crores or, at the most, Rs. 200 crores. In the estimate made by "The Eastern Economist", only the likely shortfalls in resources expected from small savings, and market borrowings and additional tax revenue of the State Governments were taken into account. As, however, a reduction of the target for deficit-financing was not anticipated at the time, the then estimated public sector outlay (Rs. 770 crores) of the Centre and the States together has now to be reduced by Rs. 75 crores or Rs. 100 crores, which

means that the actual outlay in the second year of the second Plan may come to only Rs. 670 crores or Rs. 695 crores — something less than the first-year outlay.

Thus it comes about that investment in the public sector in the first two years of the second Plan would be about Rs. 1,350 crores or about a fourth of the originally-planned five-year outlay as revised for price rise to Rs. 5,300 crores. As the remaining three-fourths of this outlay would involve an average annual expenditure of about Rs. 1,300 crores in the remaining three years of the Plan and as this level of investment, according to all indications, will be beyond the reach of the public sector, it is not difficult to see that not more than two-thirds of the physical targets of the public sector will have been reached by the end of 1960-61, the last year of the second Plan. If "The Eastern Economist's" estimates which have been described humorously as Cassandra-like pronouncements have unfortunately come true, it is to be hoped there will be a favourable turn in the financial tide which will render this journal's prognostications for the remaining period of the Plan wrong.

RUSSIAN TECHNOLOGY

RUSSIA'S SUCCESS in rocketing into outer space a satellite body which is now circling the earth at a speed of 18,000 miles per hour is hailed as a magnificent achievement of her science and technology. Till recently the general impression was that Russia's scientists were on a par with their counterparts in Western Europe and in the United States in the realm of pure theory and fundamental research but that her technology (practical utilisation or application of scientific discoveries) was far behind the western level. The Inter-Continental Ballistic Missile and the Earth Satellite she has developed now prove that Russia has attained an equally high level of technological progress. The fact that labour productivity in industry has registered a seven-fold increase since 1928 also confirms this high level of technological progress without which such a big increase in productivity would not have been possible.

How has Russia registered such phenomenal progress? Perhaps her system of scientific and technical education has contributed to this progress. The merits of this system are not quite well known. But that it must have its undoubted merits can still be inferred from a set of relevant figures published for the first time by the Soviet Government in the 'National Economy of the USSR—Statistical Returns' (1957). Some of these figures which compel one's attention are:

Engineers and technicians formed 9 per cent of all industrial personnel in 1955 as against 5 per cent in 1932.

The number of inventions and technical improvements introduced in production has increased from 655,000 in 1950 to 1,160,000 in 1955.

The number of important new types of machines built has increased from 650 in 1950 to 1,056 in 1955.

The total number of specialists with higher and special secondary education has increased from 521,000 in 1928 to 5,553,000 in 1956.

The average number of specialists graduated annually from higher educational establishments has increased from 42,500 in the first Plan period (1928-1932) to 224,200 in the fifth Plan period (1951-55).

The average number of specialists graduated annually from technical and other special secondary educational establishments has increased from 78,000 in the first Plan period to 311,900 in the fifth Plan period.

The total number of scientific institutions has increased from 1,263 in 1928 to 2,950 in 1955.

The total number of scientific workers has increased from 162,500 in 1950 to 223,900 in 1955.

The number of post-graduate students to receive a

scientific degree has gone up from 1,978 in 1940 to 7,607 in 1955.

These figures are by no means exhaustive, but they should be sufficient to convey some idea of the crucial importance that has come to be attached to scientific and technical education in the USSR. It is worthy of note here that relatively far greater progress in science and technology has been achieved under the post-war plans than under the pre-war plans. Totalitarian planning which has made possible a tremendous diversion of scarce resources to the scientific and technological sector and the presence of a number of German scientists and technologists whom the Russians spirited away to their country have also been partly responsible for the remarkable progress registered to date.

DR. NKUMAH'S DANGEROUS GAMBIT

GHANA GOVERNMENT'S autocratic actions since June have caused pain to the well-wishers of the new African State and embarrassment to supporters generally of the African movements for freedom. It seems even as if the operation of rule of law has been subordinated to the whims of Dr. Nkrumah's Cabinet, and more especially to the Minister of the Interior, Mr. Krobo Edusie. Addressing recently a meeting of the Convention People's Party, Mr. Edusie is reported to have remarked that "my sword of power is two-edged and any civil servant or politician who plays the fool will be cut down at once". Matching deeds to words, he disclosed that he would be moving a Bill in the next session of Parliament investing him with power to remove to a "detention camp" anybody who "discredits the Government".

Unfortunately, the Ghana Government's actions speak even louder than Mr. Edusie's disturbing statement. Two journalists who did no more than be properly critical of the Government's high-handed actions and maladministration have been deported before the wishes of the Minister of the Interior have received parliamentary sanction. The way the deportations were effected is indefensible. The Government of Ghana deprived the Accra correspondent of the 'Daily Telegraph' of a lawyer's services by barring the entry of one engaged by him. There is hardly any point in trying a man in court if he is denied the freedom to choose his own lawyer. Two dissident politicians were similarly ordered to be deported—on the ground of being Nigerians, and not Ghanaians. Their petitions, challenging the order, were pending in court at the time of deportation. After deporting them, the Government asked for dismissal of the suit on the plea that it had become infructuous. Evidently, such safeguards of democracy as a free press and independent judiciary are in grave danger of disappearing altogether from Ghana.

As a new and young country, Ghana enjoys much goodwill in the world today. Most people would be prepared to overlook its lapses in these early days of independence. But it would be a mistake to tax this goodwill beyond reason. In addition to earning a bad name for Ghana, it could be used as another excuse by colonial powers in Africa for continuing their political domination in other parts of the continent. It would be a pity if Dr. Nkrumah, who led Ghana to independence, should give posterity an opportunity to judge him as one who retarded political growth in his own country, and the freedom movements in other parts of Africa. And this will surely happen unless parliamentary democracy can be made to succeed in Ghana. This can be done only if Dr. Nkrumah asserts his authority over Mr. Edusie, who, less than three years ago, was proclaimed by a committee enquiring into allegations of corruption, as "unfit for public office". If Dr. Nkrumah does not act soon enough, people will be constrained to conclude that his choice was not accidental but purposive.

"I AM NOW REFINED..."

and Adipocere looks ahead

(Pronounced 'adi-po-saire')

After successive stages of exploring, drilling and refining, I now take my final shape—guess what? I am transformed into various petroleum products (major products being gasoline, kerosene, fuel oils, lubricating oils and asphalt).

In other words, I am now refined and ready for the long haul. All that "crudeness" is no more. You won't recognise your old friend "Adipocere" about whom you first read in these columns.

They store me in the finished product 'tank farm'. Life here is serene...until the fast moving, action-happy marketing men come along.

Here they come in their sleek looking trucks and wagons with the Flying Red Horse painted all over. From now on I am forever on the move and help in the progress of everything that needs to move.

From here I go to market...

STANVAC — the name that stands for progress

STANDARD-VACUUM OIL COMPANY—Incorporated in the U.S.A. with Limited Liability.

PSSVOC. 51/37.

FACTS BEHIND FIGURES

**Travelling
over
82,000,000
train-miles
a year**

Across the country roll 225,857 railway wagons over a network of 35,000 track-miles. Covering over 82 million train-miles these wagons transported 115 million tons of freight. By the end of the Second Five Year Plan period this tonnage will rise by almost 35%. To meet the increasing needs of the Indian Railways the annual production of wagons will rise from 14,000 to 25,000 by 1961. Texmaco, pioneer in many fields of engineering, manufactures rolling stock and a wide variety of products for the Indian Railways.

A Window on the World

HOW THE WEST LOOKS AT THE EAST

By

ODYSSEUS

WE ARE RUMINATING over the antagonisms between East and West, in hopes of finding out what could be done to replace them by the co-operation necessary to ensure peace, prosperity, and the preservation of individual freedom not merely in the East or West but throughout the world.

In the past three weeks we have noted that the period of colonial exploitation of the East by the West created resentments which have remained a habit of mind even though the exploitation has ceased. But we need also to consider whether the West harbours resentments against the East. This is important because if the East is to get the material aid from the West that it seeks, it ought to know what the psychological barriers are.

Now, many Easterners are, in the first place, apt to be on the look out for signs of the Western "superiority" attitude and of European resentment at the loss of their imperial power, and if you read that section of the Western press typified by Lord Beaverbrook's 'Daily Express', you will find evidence of these attitudes on every page. But it is important to remember that while the 'Daily Express' may represent all that is up to date in newspaper techniques, it is written by craftsmen whose skill lies in ringing the changes on a collection of cliches covering all aspects of human endeavour, cliches whose familiarity produces reassuring sensations of excitement, comfort, or indignation, in readers whose mental age is 12. I am not saying that the 'Daily Express's' smear campaigns against Pandit Nehru—calculated to make 12 year olds enjoy sensations of righteousness—do no harm to Indo-British and Indo-Western relations, but their capacity to harm will be vastly reduced if Eastern readers grasp that the important decisions of policy taken by Western governments are not influenced by 12 year olds but by the views of those who lead and mould public opinion. What the 'Daily Express' does is to make more difficult the task of those who have in a democracy to jolly mass opinion along.

Nevertheless, the people who count are those who lead: politicians, economists, civil servants, educationists, business leaders, and other professional people, ranging from the moderate Right, through the Centre, to the moderate Left. By and large, it is the views of these people which spread out from the centre, and upwards and downwards in the social structure. They mould opinion because over a period of time their own opinions are modified by experience, study, and reflection. Few of these people, whom for short I will call the intelligentsia, are today tinged with the idea of white superiority, because that idea began to crumble with increasing rapidity in the light of the experience that befell the West from 1914-18 onwards. That there are some still tinged with the imperialist outlook, who resent the loss of empires, is certain, but one only need follow the debates in the House of Commons to see how helpless they feel in the United Kingdom. In France, their influence remains greater, but they are fighting a rear-guard action. The hopeful fact about

human beings is that they learn from experience, and I am therefore prepared to assert that Western resentments against the East arising from the liquidation of empires is of so little, and diminishing, importance in current relations that it can be ignored.

The biggest barrier to current East-West co-operation is Western indifference to the East. The West is so absorbed with its more immediate problems, which stretch from, say, Scandinavia to Arabia, that it has too little time to bother about the internal problems of the millions who live east of Aden. The disparity in the material conditions between Asia and Europe which grew wider every year from the Renaissance onwards has created a closer consciousness of European affairs among Europeans and made the East seem remote.

IMPEDIMENT TO EAST-WEST CO-OPERATION

An important impediment to uninhibited Indo-Western co-operation is India's foreign policy of non-commitment and apparent refusal to choose between the democratic West and the totalitarian States. I am not commenting on the intrinsic merits of this policy when I point out that nobody loves a neutral: he attracts the suspicion of both sides who interpret his every act as "siding with the enemy", and makes even his friends wonder if his friendship is worth having. If you want to know how India's policy strikes the average Westerner, remember that although the British policy is one of neutrality between India and Pakistan over Kashmir, nobody in India or in Pakistan believes this. It is obvious to every Pakistani that the United Kingdom backs India and to every Indian that the United Kingdom backs Pakistan. I have never suggested in this column any material change in India's foreign policy. I see no reason why she should spend money on arms or air bases for South-East Asia Treaty Organization. But it would not contradict this policy of material uncommittedness to make clear beyond misunderstanding that India's sympathies lie with the free world. What stirs Western resentment is that so many Indian newspapers put the best interpretation on Soviet policy statements and the worst on those of the United Kingdom and the United States. Such interpretations (which the Western reader assumes are approved by our official spokesmen to whom he believes the press to look for guidance) make the worst of India's proclaimed neutrality by robbing it of meaning. If we are going to be neutral, let's be neutral, but don't let us then complain if our neutrality makes the West hesitate to invest money in our country.

I revert to the thought that the East's big problem is the preoccupation of the West with its own affairs. The big propaganda job that the East has not yet begun to tackle or, perhaps it would be more accurate to say, has begun to tackle without having thought out exactly what the obstacles are that need to be overcome, is to persuade the West that in the interest of the survival of the ideals that the democratic East and West hold in common, the West must loosen its

purse strings on a substantially larger scale than it is loosening them today.

REPROACHES AND THREATS

Now, if you want to persuade someone, the first task is to study his outlook and interests and to decide what arguments are likely to appeal to him. This sounds so elementary as to be platitudinous. If so, it is a platitude ignored by every government propaganda service that I have ever come across (except the one that I was once in charge of myself). For most statesmen, and all politicians and government propagandists, normally use arguments that appeal to their own national public opinions. This pleases the national home audience by making them think that those damned foreigners are having their noses rubbed in necessary home truths, but it leaves foreign opinion uninfluenced, or stirred to active resentment, which was not the object of the exercise.

Three arguments frequently heard in the West from Indian sources seeking development loans are (1) in view of past colonial exploitation, the West owes the East reparation; (2) if the West won't help, the East will get it from Russia and the consequences will be nasty for the West; (3) the standard of living is so much higher in the West that it can afford to lend. The 400,000,000 people in the industrialised countries of Europe and America enjoy an average annual income of Rs. 3,900 per head, whereas the 1,000,000,000 people (excluding China) living in under-developed countries enjoy about Rs. 260 per annum. Q.E.D. I agree with these arguments myself—but I must point out that to the average Westerner they suggest either a reproach or a threat.

Average human nature being what it is, reproaches make a man seek to justify himself. "The United Kingdom is not lending you enough money—huh?" growls the Englishman. "What are the facts?" All the money that the United Kingdom can afford to invest abroad consists of the amount of the surplus from the annual balance of payments. From 1946 to 1955 inclusive the deficits in the United Kingdom balance of payments totalled £1,247,000,000 and the surpluses £961,000,000, leaving an accumulated deficit of £286,000,000. During these years the UK's net overseas investment totalled over £2,000,000,000.

This investment represents over one per cent per annum of the United Kingdom's national income and compares with an American investment of less than one quarter of one per cent of its national income. The East is but one member of a long queue for the United Kingdom's £2,000,000,000, which includes the United Kingdom's overseas territories (£239 millions), the Colombo Plan (£86 millions), United Nations Relief and Rehabilitation (£153 millions), loans, grants, and credits to European countries (£687 millions) etc., etc. Considering that the Treasury reckons that in order to meet United Kingdom commitments for troops, embassies, etc., and for foreign investment, a favourable balance of £350 millions a year is required and that this figure has never yet been attained in any year, the average Britisher feels that his country's post-war record needs no apology.

As to implied threats of turning to the Soviets, far from scaring the Westerner, this is apt to make him say: "Any money you can raise from Russia will be a relief to us," he says. "By all means let Russia take the burden of developing the under-developed."

Seeing is believing

... AND WHAT

THEY SEE IN

TRAYOPHANE

PRINTED BAGS

THEY BUY!

Many tests with manufacturers and retailers have shown that Trayophane bags bring in bigger sales. The customers like them because they're hygienic, convenient, weather-proof. The shop-owners know that Trayophane bags reduce waste, save time at the counter!

Now for the first time Trayons offer these colourful eye-catching bags in a range of sizes—up to 12.5/8" x 23.1/32". You can order your own special bag—with your name printed on it. Write for particulars today!

What has **steel** to do with Life Insurance? The answer has far-reaching implications.

The Life Insurance Corporation is a repository of the savings of millions of people. As such it has a responsibility to see that these funds are safely **and** gainfully invested in enterprises (both public and private) which benefit the country.

Such an enterprise is the Steel Industry. It is vital to our progress. Homes and factories, ships and trains, dams and tractors—they all need Steel and lots of it.

Indeed, investing its funds in Steel the Life **Insurance** Corporation is investing in the future of India.

Life Insurance Corporation of India

ASPLIC-ES

THE SHAH OF ITALY

(From Our Special West European Correspondent)

MILAN, October 6.

THE controversy about Italian foreign policy, the beginnings of which were described in a recent despatch ('The Eastern Economist', September 20), has gathered rather than lost momentum despite denials from the Italian President and Foreign Minister that any change in policy has been contemplated and denials from Washington that any US pressure was being brought to bear on Rome to forestall such change. (The official American denial, however, included the implicit admission that pressure had been imposed from another quarter, for it contained the curious statement that "the US Government does not confound the interests of the United States with those of private American companies", i.e. the oil cartels.) The few firm facts on which the debate rests seem relatively unimportant outside Italy, but one finds here that they have aroused considerable passion. For example, among liberals I hear the Italian President frequently referred to as "lo Scia di Italia", the Shah of Italy, as though he were attempting to seize personal power over Italian foreign policy in order to give it a new direction, namely the neutralist line of Marshal Tito, Col. Nasser and Mr. Nehru.

The vast disproportion between the few gestures of President Gronchi and the storm of disapproval he has awakened is not simply a case of Italian political wrongheadedness, but carries a more interesting lesson. It reveals the immense difficulties that would be encountered by any Western statesman, who chose to give the smallest Nehru-ite bias to his foreign policy, who sought to disengage his country however slightly from the power-bloc cold war to which it is bound by alliances, or who attempted to pose as mediator in the fruitless quarrels that now divide the Arab world from the West. Signor Gronchi (no more than his Foreign Minister Signor Pella) has never breathed the words neutralism, mediation or non-alignment, yet in his own country he has brought about his head torrents of obloquy usually reserved for Western fellow-travellers who recommend Nehru-ite policies in international affairs.

Signor Gronchi's only sins were to go to Teheran as the guest of the real Shah, to bless the signing of the Italo-Iranian petrol pact which has angered the American oil companies, to issue a communique with the Shah in which there is mention of a new style of association between European and Islamic countries, to get himself unofficially invited to Syria by the new and allegedly "satellite" regime there (and to refuse the invitation), and in general to make pronouncements on foreign affairs suggesting that Italy should, without prejudice to her membership of the Atlantic alliance, cultivate friendships in the Arab world, even with regimes that are not currently friendly with Italy's Western allies. True, his entourage orchestrated these few gestures with little rhapsodies about a "new course" in foreign affairs, a "dynamic" and "independent" policy, "neo-Atlanticism", etc; and there was talk about the Italian respect for "equality between the great powers and the young nations newly arrived on the international scene," between whom Rome wished not so much to practise mediation as encourage goodwill. In general, then, a pale and harmless echo of what Mr. Nehru has been saying these ten years past. This

was accompanied by protestations from Signor Pella of Italy's continued and total loyalty to her Western alliance and even the communique issued in Teheran at the conclusion of the President's talks with the Shah asserted that the foundation of both countries' foreign policy remained "entire loyalty" to the defensive alliances to which they had adhered, i.e., the Atlantic Treaty and the Baghdad Pact. Apart from this, Italy has concluded a few economic agreements with Islamic countries, which were recalled in my recent despatch; the most important are the oil deals with Egypt and Iran.

One would imagine that even the most determinedly pro-Western liberal could not see in this collection of actions anything truly subversive. One might indeed doubt whether anything important would come of it, in particular whether Italy could ever have much influence in the Middle East or could do very much to assist economic progress there as long as the great powers and local military dictatorships were more concerned with warmongering than with social and industrial advance. But if Signor Gronchi's goodwill proved to be ineffective, at least it would appear to be in the right direction, and many people, and not only in West Asia, would hope that France and Britain would follow a similar course, as indeed President Gronchi invited them to do. Italy is not a great power (though her engineering skills could be of immense benefit in the Middle East), but she has considerable cultural and diplomatic influence, and one could conceive of Signor Gronchi's new line being emulated, with much more beneficial results, by her more powerful allies who have spent so much time unsuccessfully trying to overturn nationalist regimes in West Asia. That, at least, is how we who are familiar with Nehruism would have received these beginnings of a revised foreign policy in Italy.

Nothing would have prepared us for the extremely violent reaction that Signor Gronchi awakened. The near-hysteria of the Italian Right and liberals reveals how deeply habits of thought have been affected by ten years of cold war, and with what fear and anxiety would be received any suggestion for a saner connection between West Europe and Arab nationalism. The comparison between President Gronchi and the Shah has already been mentioned but this was the most complimentary observation the liberals have made. No less common have been comparisons with Marshal Tito and Col. Nasser, the implication being that only dictators who have no public opinion to reckon with would dare imitate Mr. Nehru. Signor Gronchi has even been compared with Mussolini! Thus 'Il Mondo', the excellent Roman liberal weekly that has generally been friendly to the President, said last week: "The truth is that this new Mediterranean and Middle Eastern line covers nothing new, and just resuscitates once again the suicidal old policy of all Italian nationalisms and in general of modern fascisms, which seek, under the label of the Drive to the East or the conquest of new markets or cultural expansion or dynamism or independence, to cover up their own incapacity to resolve the chronic ills of domestic politics".

The comparison with Hitler and Mussolini is presumably intended to discredit Signor Gronchi once and for all, but the least reflection shows that it is wildly

absurd to accuse of aggressiveness or expansionism the first West European statesman to envisage more decent relations with young Arab nationalism. Indeed, the uncomplimentary comparisons might be more apt if applied to the unintelligent Western line that Signor Gronchi is hoping to break away from. That Italy has very urgent economic interests to satisfy in the Middle East is not denied: like all industrial nations she depends on the region for her petrol. But the means she is using to secure an independent supply of oil from Iran and Egypt can be very favourably compared with the means used by the oil companies. (Too favourably in fact, which is why the Western oil companies detest Signor Enrico Mattei and his nationalised oil corporation). There is no element of diversion or sideshow in Italy's present economic penetration of West Asia; Italy is not being starved of either capital or technicians to support her ventures in Iran and Egypt. The nationalised oil corporation is highly efficient, has a large body of technicians and a first-class engineering industry which can easily cater for all the work undertaken in the Middle East. That this programme should be even remotely compared with Mussolini's Abyssinian war shows with what slavishness the Italian liberals follow the Middle Eastern line dictated from Washington and London. Fundamentally, there is nothing revolutionary in Signor Gronchi's new line except the will to break this slavishness, to rid Rome of the fear that nothing should be done in Asia that might offend capitals further West.

While retaining all our doubts on the material effectiveness of Italy's new line in West Asia, we should

nevertheless hope that Signor Gronchi and his progressive entourage resist being stampeded out of their efforts by hysterical recalls to "Atlantic loyalty". There is nothing in the "Western cause" which precludes new and fairer relations with Arab nationalism; quite the contrary. It is by confusing the special interests of Washington, Paris and London with the Western cause in general, and thus preventing the many minor Western nations who seek new contacts with Asia from acting freely, that particular struggles (such as Nasser's quarrel with the great powers, or France's discomfiture in Algeria) are turned into racial conflicts in which it appears that all the white race except the Communists are fanatically opposed to Arab independence and progress.

Admittedly, the field of mediation between the Arabs and the West is rather overcrowded at present. Apart from westward-looking Arab countries like Lebanon, Morocco and Tunisia, there are the candidatures of Spain and Greece. But Franco's bid in this field is just another of his many attempts to live down his past by making himself useful to the Americans, while Greece has been led by her pathological sensitivity about Cyprus into a reckless neutralism where she hopes to act as broker—taking Enosis as her broker's fees. Italy is better equipped to persist in the moderate course Signor Gronchi has envisaged, and her success, even if modest, would find imitation among the smaller countries of Europe and North Africa such as might relieve the acuity of the present confrontation of mighty powers in the Middle East.

From Kabul to Cairo, in the countries where Indian products once enjoyed fabulous popularity there is today an insatiable demand for modern implements and amenities. The Delegation of the Engineering Export Promotion Council returns from its tour of the Middle East after making valuable contacts and surveying markets in which Indian engineering products have a competitive advantage. This information is at your disposal. Contact—

WORLDGRAM

AGRICULTURAL

N.E.S. Blocks Around Research Stations: The Ministry of Community Development has asked the State Governments to consider location of new National Extension Service blocks around the State agricultural research stations. This is in pursuance of the decision taken by the Co-ordination Committee for the Ministry of Food and Agriculture and the Ministry of Community Development. The Central Research Institutes, like the Indian Agricultural Research Institute and the Indian Central Rice Research Institute, have taken over a few villages around them for testing the results of research on farmers' fields, but the research stations in the States have not invariably done so. The location of N.E.S. blocks around the experimental and research stations would enable the research workers to conduct trials of the results of research on farmers' lands within the blocks.

Agricultural Training Under Colombo Plan: The Australian Government has offered correspondence scholarships in the agricultural field to South-East Asian countries under the Colombo Plan. The scholarships will be available for training, through correspondence by the Australian technical colleges, of those engaged in agricultural pursuits in these countries. The courses for training cover four selected agricultural subjects. The first course includes basic scientific and technical knowledge for growing a wide variety of crops and for better pasture utilisation. The animal husbandry course consists of care and breeding of animals, including sheep and cattle, pig raising, poultry farming, and dairy farming and management. The third course is for farm mechanics, and the fourth on farm management and economics.

Soil Testing Facilities for C.D. & N.E.S. Areas: The Ministry of Community Development have requested the Development Commissioners of State Governments to ensure that full use of the facilities offered by the Soil Testing Laboratories is made in the C.D. and N.E.S. areas. The soil testing laboratories evaluate soil productivity and help farmers to plan the use of fertilizers, based on soil tests and correlations of crop responses. At present there are 15 soil testing laboratories functioning at Bangalore, Calcutta, Coimbatore, Cuttack, Gwalior, New Delhi, Ludhiana, Nabha, Nagpur, Poona, Hyderabad, Sabour, Simla, Trivandrum and Bapatla. The remaining 9 laboratories expected to start functioning shortly are to be located at Hazaribagh, Agartala, Kotah, Junagarh, Jubbulpur, Rajahmundry, Bailhongur, Kanpur, and Jorhat.

INDUSTRY

Co-operative Spinning Mill for Bihar: A scheme to establish a co-operative spinning mill at Mokameh in Bihar has been approved by the Government of India. A loan of about Rs. 8 lakhs has been sanctioned by the Centre to the State Government for investing in the share capital of the co-operative. The State Government has itself contributed Rs. 7.68 lakhs for the purpose. The Mokameh co-operative spinning mill will have a capacity of 12,000 spindles. The Bihar Government, the Bihar Handloom Weavers' Co-operative Union, the Primary Weavers' Co-operative Society and other yarn co-operative societies in the State are members of the co-operative. The Bihar scheme is the fifth for which financial aid has been sanctioned by the Central Government. The other four schemes are for establishing co-operative spinning

mills in Madras, Andhra, Bombay and Orissa. Bombay has already been sanctioned a loan of Rs. 5,23,000 for investing in the share capital of the Saurashtra Co-operative Spinning Mill at Limbdi. The State Government has made a contribution of Rs. 2 lakhs. A loan of Rs. 10 lakhs was given to Andhra for establishing a mill at Guntakal. An equal amount was sanctioned earlier to the Madras Government for setting up a co-operative mill at Tirunelveli. The amount has not been utilised by the State Government. A loan of Rs. 5 lakhs has been promised to the Orissa Government for the purpose. Bihar has also been sanctioned a loan of Rs. 6.27 lakhs for the installation of 300 powerlooms in the co-operative sector. The amount, now sanctioned, represents the balance of the loan admissible for the purpose. With this, schemes for the installation of 7,155 powerlooms in the handloom sector in the country, have so far been approved by the Government of India, since it was decided to introduce 35,000 powerlooms in the country during 1956-57 and 1957-58.

Techniques of Production in Small Industries: Schemes to improve techniques of production of small industries in Bihar and Orissa have been approved by the Government of India. Loans and grants amounting to over Rs. 20.22 lakhs have been sanctioned to the two States by the Union Ministry of Commerce and Industry for implementing the schemes. Bihar has been given loans and grants totalling over Rs. 14.42 lakhs. In the industrial estate at Patna, a model foundry with a common facility testing laboratory is to be established. A scheme for the development of the bicycle and bicycle parts industry is to be implemented in the same estate. In the three industrial estates at Patna, Dharbanga and Ranchi a scheme for the manufacture of sports goods will be taken up. The manufacture of electrical accessories is to be undertaken at Patna. In Orissa a training institute for automobile diesel mechanics is to be established at Khapuria. The other new schemes, for which financial aid has been sanctioned, envisage the establishment of a training-cum-production centre for small industries and a physical testing and chemical laboratory at Cuttack.

Eight Factories Commence Production in Okhla Estate: Eight small-scale factories have gone into production in the Okhla Industrial Estate, seven miles south of Delhi. This is the first group of factories to go into production out of the 35 factories already constructed in the Estate. All the factories have been allotted to small entrepreneurs on lease. While production has already started in eight of the units, arrangements for installing machines are being made by other industrialists. For some factories, costly plants procured by the small industrialists on hire-purchase, through the National Small Industries Corporation, have arrived and are being set up. A few more are on their way.

Specification for Rim Latches: The Indian Standards Institution has issued a specification for rim latches (IS: 1019-1957). The specification lays down minimum requirements regarding material, dimensions, manufacture and finish of rim latches. The specification also defines the size of rim latches; a four inch rim latch means that the length of the face across the body would be four inches.

Packing Charge for Cement: On March 27, 1954, the Government of India announced that packing charges for cement would be fixed every quarter on the basis of the average of the maximum and minimum

market price for packing material during each week of the immediately preceding nine months plus Rs. 1.25 per ton to cover incidental charges. On this basis, packing charges for the current quarter were fixed at Rs. 13.72 per ton. The packing charges for the next quarter commencing from October 1, 1957, work out to Rs. 13.63 per ton. The Government of India have informed all the State Governments of the revised packing charges.

TRADE

New Trade Agreement between India and Czechoslovakia: Following the discussions between representatives of the Government of India and the Government Trade Delegation from the Czechoslovak Republic, a Trade Agreement between the two countries was signed in New Delhi recently. Under it the two Governments have undertaken to provide facilities for export and import of commodities listed in two schedules attached to the agreement. The exchange of goods and services between the two countries will be effected by means of contracts between Foreign Trade Corporations or other such bodies in Czechoslovakia on the one hand and the State Trading Corporation and other commercial organizations in India on the other. Payments for commercial and non-commercial transactions between the two countries will henceforward be made in Indian Rupees. For this purpose the State Bank of Czechoslovakia will maintain one or more accounts with Indian Commercial Banks dealing in foreign exchange. Any balance in the Rupee account maintained by the State Bank of Czechoslovakia with the Reserve Bank of India will be convertible on demand into pounds sterling. The two Governments, under the agreement, have also decided to encourage triangular trade arrangements as a means for widening and developing international trade. It has also been agreed that reasonable facilities will be made available to enable Indian ships to carry as large a proportion as possible of the goods to be exchanged under this agreement.

Protection to Plywood and Teachefts Industry: The Government of India have accepted the Tariff Commission's main recommendation that protection to the plywood and teachefts industry should be continued at the existing rate of protective duty of 35 per cent 'ad valorem' for a further period of three years, i.e. till December 31, 1960. Government have also taken note of certain other ancillary recommendations made by the Commission for assistance to the industry and will take suitable steps to implement them as far as possible. In the resolution, attention of the domestic manufacturers of plywood, commercial as well as decorative, has been invited to the Commission's recommendation that they should establish better liaison with the consumers to popularise their products.

Extension of Indo-Japanese Trade Privileges: The Indo-Japanese Peace Treaty, which was concluded in 1952, provided that pending the conclusion of treaties or agreements to place their trading and other commercial relations on stable and friendly basis, the two countries would accord, on a reciprocal basis, for a period of four years, certain privileges to their nationals, trade, shipping, navigation, air traffic, etc. This provisional period ended on April 27, 1956 and was last extended up to September 30, 1957, by exchange of letters. As a result of the discussions held in New Delhi between the representatives of the two Governments, letters have been exchanged between Shri K. B. Lal, Joint Secretary, Ministry of Commerce and Industry, on behalf of the Government of India and His Excellency Mr. Seiji Yoshizawa, Ambassador of Japan, on behalf of the Japanese Government, by which

the two Governments have agreed to continue to accord the same privileges up to December 31, 1957. During this extended period, the two Governments hope to complete discussions for the conclusion of a Trade Agreement.

Protection to Titanium Dioxide Industry: The Government of India have accepted the Tariff Commission's main recommendation that protection to the titanium dioxide industry should be continued for a period of four years, i.e. till December 31, 1961, at the existing rate of protective duty, namely, 35 per cent 'ad valorem' (preferential) and 45 per cent 'ad valorem' (standard). Government have also taken note of certain ancillary recommendations made by the Commission for assistance to the industry and will take suitable steps to implement them as far as possible.

FINANCE

IFC Reports Score of Loans under Consideration: The International Finance Corporation (IFC) reports that it has made five loans totalling \$5,920,000 since it began operating July 24, 1956. The Corporation, in its first annual report said the loans went to private enterprises in Mexico, Brazil, Chile and Australia. The total value represented by the enterprises, that range from a heavy electrical equipment manufacturer to a firm that does airplane engine overhaul, is \$34 million. The Corporation said it now has before it "between 25 and 30 proposals which appear to be within the scope of its operations and which offer reasonable prospects of being suitable for investment." Most of these, the IFC said, are located in Latin America; some are in Asia and relatively few in other areas. IFC now has 51 member governments, with capital subscriptions totalling \$92 million. Net income from investment of this capital was \$1.7 million as of June 30, 1957.

Subsidised Industrial Housing Grants: During August, 1957, the Government of India sanctioned a sum of Rs. 0.75 lakh (Rs. 0.50 lakh as loan and Rs. 0.25 lakh as subsidy) to the Shakti Nagar Co-operative Housing Society Ltd., Ahmedabad, for the construction of 31 one-room single-storey tenements. The total amount of loans and subsidies sanctioned to various States and organisations up to end of August, 1957, for the construction of 89,253 tenements since the inception of the scheme in September, 1952, is Rs. 25,32,84,776.

GENERAL

Employees' State Insurance Benefits Extended to Jabalpur: The benefit provisions of the Employees' State Insurance Act, 1948, were extended to Jabalpur area in the State of Madhya Pradesh from the mid-night of September 28, 1957. About 4,000 factory employees in Jabalpur Corporation limits and in neighbouring villages of Polipather and Maharajpur will be benefited by the Scheme. Medical care in this area will be provided by the State Government under Service System and for this purpose two whole-time dispensaries have been set up. Besides this, the medical facilities provided by the Perfect Potteries Co., Limited, Gwarighat, are being utilised. For the payment of benefits under the scheme, a local office has been set up. Employers of factories covered under the scheme in this area will now be required to pay the employers' special contribution at 1½ per cent as at present.

Coal Mines Provident Fund Board: The Coal Mines Provident Fund Scheme, which came into force in May, 1947, has a membership of about 3.33 lakhs of colliery workers. The total accumulations in the Fund as on August 31, 1957, were about Rs. 10 crores.

NEWS IN BRIEF

FOREIGN

The International Finance Corporation has entered into commitments totalling \$5.3 million since its establishment on July 24, 1956, states the first annual report which covers the corporation's operations to September 10, 1957.

Private industry in Pakistan will receive \$10 million to finance the import of machinery and equipment from the U.S. under a special programme, the International Co-operation Administration Office announced recently.

Last year the U.K. retained its position as the second largest exporter of machinery and electrical apparatus in the world.

Canadian exports to the U.K. in July fell to \$68.8 million (about £25.5 million) compared with \$75.6 million in July last year, according to the Bureau of Statistics. In the first seven months of this year exports totalled \$407 million (£150 million) against \$444 million in the corresponding period a year ago.

It is reported the Deutsche Bundesbank's interest rates for treasury bills have been raised by ½ per cent.

The Export-Import Bank has announced a loan of \$60 million (£21.4 million) to Japan, to finance the purchase of United States cotton.

During the first half of 1957, Ghana exported a total of £54,682,479 worth of goods. Cocoa which still dominates the country's economy accounted for £34,765,614, timber £5,726,046, gold £4,744,159 and diamonds £4,684,401.

The Government of Colombia has raised to 100 per cent the deposit importers must pay on a wide range of goods. The deposits must be paid at the rate of five pesos per dollar. Exceptions include food, drugs, agricultural machinery, fertilisers and car spares.

The World Bank has granted two loans to Ecuador one of \$14.5 million for highway construction and maintenance, and a \$5 million loan to expand an electric power plant serving Quito.

The Rhodesian Federal Government is exploring the possibilities of raising a loan in the United States. Development plans in the Federation envisage an expenditure of £223 million over the next four years.

Thirteen prominent French banks, including Banque de Paris and Credit Lyonnais, have jointly set up an investment company to finance mining, power and other development projects in the French Union.

From November 1953, until June of this year, the total capital imported into Greece was more than \$17 million of which rather less than half was for long-term investment.

Japan's balance of international payments in September resulted in a further deficit of \$55 million compared with a deficit of \$69 million in August, the Bank of Japan announced recently.

INDIAN

Cloth and yarn production received a severe setback in August this year, when 411 million yards of cloth and 139 million lbs. of yarn were produced as compared with 460.3 million yards and 149.6 million lbs. in the previous month.

Iron ore exports from three major ports, Calcutta, Bombay, and Madras fell further in August, 1957, to 104,041 tons from 116,896 tons in the previous month and 143,244 tons in June this year.

The Indian Standards Institution has issued a draft Indian standard specification for black lead pencils for eliciting comments by November 30.

It is reported the share of heavy goods in the total jute production, which declined from 59.1 per cent to the low level of 48.6 per cent during 1956, gradually improved to about 52.7 per cent in August this year.

Exports of mica from the three major ports, Calcutta, Bombay and Madras during August 1957, amounted 21,797 cwt. valued at Rs. 71.61 lakhs compared with 23,561 cwt. worth Rs. 72.77 lakhs.

The Government of India have decided to allow the export of Madras-Mysore silk waste against the quotas released in May and July this year till October 31, according to a public notice issued by the Joint Chief Controller of Exports.

A new record of concrete placement at the Bhakra Dam site was set up when 783 buckets were poured in an eight hour shift. The quantity of cement was 3,246 cubic yards, i.e. 5,850 tons.

Schemes for the development and revival of traditional handicrafts like ivory, wood and stone carving and lacquer-ware have been approved by the Government of India on the recommendations of the All-India Handicrafts Board.

During August 1957, the Government of India sanctioned loans amounting to Rs. 20.08 lakhs to the Delhi Administration and the Government of Assam under the low income group housing scheme.

The Ministry of Community Development have requested the Development Commissioners of State Governments to ensure that full use of the facilities offered by the soil testing laboratories is made in the C.D. and N.E.S. areas.

The second Finance Commission Report has been signed. The Report has been submitted to the President and is unanimous.

THAT the internal resources of the public limited companies played a major role in imparting a dynamic impulse to the corporate sector of the Indian economy during 1950-55 is amply demonstrated in an article on the financial behaviour of company finances published in the September issue of the Reserve Bank of India Bulletin. The article highlights the fact that depreciation funds and reserves of public limited companies constituted nearly 60 per cent of the total funds available for development in the first Plan period. A similar estimate by the Planning Commission, with a slightly different coverage, put the share of internal industrial finance at 44 per cent. In any case, both these estimates stress the fact that internal finance has played, and will continue to play, a dominant role in the expansion plans of the organised private sector.

The Reserve Bank study has based its conclusions on a scrutiny of balance-sheets and profit and loss accounts of no less than 750 joint stock companies covering the period 1950 to 1955. Public limited companies registered in India with a capital of not less than Rs. 5 lakhs have been included in the survey. The study, thus, covers nearly two-thirds of the total paid-up capital of all the public limited companies in India. Banking, insurance, investment companies and government companies are not included.

The results of this analysis are summarised in the table below. It shows that during the period 1950-55, which also corresponds to the period of the first Five-Year Plan, the public limited companies exhibited a rate of growth which exceeded the pace of development in every other sector of the economy. The net worth of the corporate sector improved by 26.8 per cent. Total assets rose by 34.4 per cent. The impetus given to gross capital formation was also substantial. Gross fixed assets rose by Rs. 33 crores only in 1951 over 1950; in 1955 the increase was of the order of Rs. 81 crores. This shows the spectacular pace with which the private sector expanded its business. Herein lies the key to the over-fulfilment of the targets assigned to the private sector in the first Five-Year Plan.

The Reserve Bank article also discloses that, contrary to popular belief, bank advances played a minor role in the industrial growth of the private sector. As

against the contribution of internal resources which was as high as 60 per cent, the banks accounted for only 6 per cent of the total funds available to these companies for investment. The industries which were mainly responsible for investment of the available funds were cotton textiles, iron and steel, engineering and sugar. Out of the total available funds of Rs. 443 crores, cotton textiles utilised Rs. 69 crores, followed by iron and steel with Rs. 66 crores, engineering with Rs. 61 crores and sugar with Rs. 37 crores. Thus, these four major industries accounted for more than half the internal finance utilised by all the limited companies under study.

The dividends as a percentage of the total paid-up capital showed a stable character throughout the first Plan period. It is explained by the fact that any variation in profits makes a sharp impact on the retained profits since all efforts are made to keep dividends at a stable level. This thesis is explained by the behaviour of profits in 1952 when total profits after tax of the public limited companies dropped by Rs. 21 crores. The decline suffered by dividends was only Rs. 3 crores. The rest of the loss of Rs. 18 crores reduced the retained profits by a similar amount. The picture is reversed in the case of rising profits when an attempt is made to increase the proportion of retained profits. The percentage of retained profits to profits after tax rose from 21 in 1952 to 46 in 1955 because gross profits rose steadily after 1952.

The study also brings out very clearly the excessive nature of taxation in this country. Out of the total profits before tax amounting to Rs. 382 crores during the first Plan period as a whole, the public limited companies under study provide nearly 41 per cent for taxation. Only 36 per cent was distributed by way of dividends while the rest was retained.

The growth in inventories during the first Plan period was not in keeping with the expansion in the sales of public limited companies. As against the total increase in sales at 38 per cent, the inventories improved by only 22 per cent. The price factor, perhaps, conceals the movements in the physical volume of inventories because there is a 'prima facie' evidence that the decline in inventories from 1952 to 1954 was

mainly due to a fall in raw material prices and not due to any absolute decrease in volume.

The Reserve Bank's Research Division needs to be congratulated for this impressive study of the corporate sector. It may be mentioned here that the first

article in the series comparing company finances for 1950 and 1951 was published in August 1954. It is hoped that the Research Division will make this a permanent feature, providing the most detailed information of corporate income and expenditure available for research study.

AGRICULTURE AND FORESTRY IN THE PLAN

(By Saif F. B. Tyabji)

THE state of our foreign reserves has taken a form which cannot but cause great anxiety. It is now clearly realised that many of the estimates contained in the Plan must be revised radically. Out steel plants are going to cost us possibly 50 per cent more both in foreign exchange and rupee expenditure. The completion of many schemes will be delayed. The Kosi Project, for example, has already had to be postponed and, to give another instance, the Bhadra irrigation project cannot be completed for lack of foreign exchange for the tunnel boring machinery, so that though the water is there it cannot be used. These are typical instances. We have been reduced to speaking of the "core" of the Plan as the absolute minimum which must be implemented.

The second Plan accords high priority to industrialization and especially to the development of basic and heavy industries to push up the rate of increase in the national income to 25 per cent in five years. In our planning we have been largely dominated by the model of Russia—whether consciously or otherwise is immaterial. Russia gave pride of place to the development of heavy industry and attained what is called a "balanced economy". With this balanced economy she fought and won the most terrible war that has yet been fought. This has confirmed our respect for what Russia has done. However, a balanced economy is a relative term and what may be balance in one set of circumstances may not be so in another. We must remember that Russia's first objective was the attainment of self-sufficiency in defence, for there was nothing of which the Soviet leaders were more apprehensive than of the impending onslaught by the capitalist countries. Our immediate objective is totally different. Our immediate objective is to raise the standard of living of our people. The question before us therefore is: Can India become wealthy only by "rapid industrialization" and the attainment of a "balanced economy", or can our objective be reached through other ways, and perhaps even better through agriculture supplemented by such industries as lie clearly within our foreign exchange resources?

The whole matter must be approached from a correct angle. If we are to revise the second Five-Year Plan and if we settle our first objective to be to raise the national income in a "sizeable" manner, logically the next question must be: How is this to be done? The answer must be, by utilising the natural resources that are most abundant in the country. Now the natural resources that are most abundant in this country are those of agriculture and forestry. The question of the production of food may be looked at from yet another point of view. According to the second Five-Year Plan, the present average consumption of food in India is 2,200 calories per day, while the minimum required for proper subsistence is 3,000 calories per day. At the end of the second Five-Year Plan period the supply of food in the country is planned to be increased to only 2,450 calories per day, still some 550 calories short of the minimum required for proper subsistence. Thus even at the end of the second Five-Year Plan period, the average Indian will remain

chronically underfed. With this degree of malnutrition, is it surprising that the productivity per person in India is many times lower than that in Europe and America, even allowing for the use of improved implements and tools in those countries?

In fact it is clear that until the consumption of food has been increased to the minimum of three thousand calories per day, food can only in a very incorrect sense be called "consumption goods", and given some lower priority to "capital goods". Until that minimum is reached, it forms an essential requirement for the human machine to be able to produce up to its full capacity. It cannot in principle be distinguished from the machine itself as the necessary requirement for the production of wealth. After the minimum of three thousand calories has been reached food becomes a consumption article in the correct sense.

The case for recasting the Plan laying greater emphasis on agriculture rests on this solid reasoning. It must not be forgotten that the dangers of deficit financing itself would be largely safeguarded against if the money raised by deficit financing is used in increasing the production of food instead of for starting heavy industry. Agriculture must of course include forestry as its integral part. It is significant that in advanced countries like Germany and America about 33 per cent of the land is forest, but it is tragic that in India it should be only about 22 per cent. But even this 22 per cent forest is only apparent, as any person can testify who has walked in the closely planted, carefully tended and healthy forests of Germany and through our own so-called forests, which are often more scrub than forest, and where the great majority of trees are of no value either as timber or as firewood.

Even this kind of so-called forest is far below the average of 22 per cent of the land in many parts of the country. For example, in many parts of the Deccan there is hardly any forest left at all. In the Bhir and Osmanabad districts of Marathwada the forest area is only 2 per cent of the land area. And this 2 per cent is itself forest only in name, much of it being just bare rock. This low percentage of forest land has many harmful effects. Firewood is not available to the people, and they are compelled to use cowdung instead, depriving the fields of valuable nourishment. This lack of organic manures cannot be cured by the increased use of chemical fertilizers. The evil effects of the lack of forests must be taken into account in addition to the principal consideration of the intrinsic value of forests, which even in highly industrialized countries like Germany and Sweden form an important source of wealth. Notwithstanding all these good reasons for the promotion of forestry, the second Five-Year Plan allots only Rs. 47 crores to forests out of Rs. 4,800 crores to be spent by the public sector, and these Rs. 47 crores are merely to provide for small increases in the forestry staff, for improving their conditions of service and for making a few forest roads. No appreciable provision for afforestation has been made. The expenditure on agriculture and afforestation must, therefore, be stepped up substantially.

The green colour code

IN THE STEEL CITY OF JAMSHEDPUR, green is the colour code for top priority. At every desk, a green envelope or a green memo spells instant action for the stationery bears the legend: TWO MILLION PROGRAMME—IMMEDIATE.

Work goes on in an endless race against the clock with a daily stocktaking to assess progress. Every phase of operation is closely watched—from the manufacture

of plant and equipment in three continents to work at the plant site, the ore mines and the collieries. Delays are at once spotlighted, whether in a distant Tokyo factory or nearer home on the rail route from Calcutta.

The project has already begun to yield results—two new 200-ton furnaces are producing the first additional steel under the Second Plan.

Shovelling dolomite into a recently completed 200-ton furnace in the new Steel Melting Shop.

Appearances...and a pair of pears

Pears, like appearances, are deceptive. You can't tell their quality by gazing at them. Moral: If you're buying pears, taste them first.

But testing by tasting gets you nowhere if, for instance, you are buying soap. For that (and most packaged goods, too), sensible shoppers have a surer guide to quality: they go by a name they can trust, a brand they have used and found reliable.

For nearly 70 years, people have trusted Hindustan Lever products because their high quality has been unvarying. And they trust because we test.

At Hindustan Lever, we examine *all* our products at *every* stage of manufacture. We make sure that they stand up to storage: we 'create climate' in a laboratory to observe them under all weather conditions. We check their performance by using them as you do in the home.

All this means 1,200 tests a week on products like Lifebuoy Soap, Dalda Vanaspati and Gibbs SR Toothpaste — familiar products because they are so widely trusted, and trusted because they are tested.

Hindustan Lever serves the home

The Business World

THE PHILOSOPHY OF PRIVATE ENTERPRISE

By

CROESUS

BY some fortuitous coincidence, when Mr. T. T. Krishnamachari was explaining to Americans in Washington the Indian concept of socialism, or rather our socialistic pattern of society, Mr. Ellsworth Bunker, was explaining the American concept of "private enterprise" to Indians in Bombay. This was clearly long overdue, for, as Mr. Bunker told the India-America Society last week, "words often mean different things to different people" and "among the terms one finds most often signifying different things to different people are 'private enterprise' or the less exact term 'free enterprise'." After listening to both of these, one may be pardoned if one were to ask: "What then is the difference between the two?" There seems to be so much in common between the two countries, and, if only because of this, as the American Ambassador insisted, "the search for a common ground of understanding and comprehension needs to be pursued more diligently than ever before." Such a pursuit, I feel, would be profitable not only from the point of view of our immediate needs but also from a long-term view, namely, that of better understanding between the two countries. This, by the way, underscores the fact that India and what she stands for have still not been adequately publicized in America.

Before describing the American economic system of today, Mr. Bunker thought it proper—quite appropriately—to refer to some of the philosophic concepts which have influenced the development of the American economic system. He listed three of the most important of these, namely (i) that political and economic freedom are interdependent — that you cannot have one for long without the other (ii) that freedom of dissent is basic to all progress, and (iii) that, in the long run, the judgment of the many acting and reacting on the market place is sounder than the wisdom of the few. Add to these the trials and tribulations of the early settlers and you have the conditions under which individual enterprise could not but flourish. To repeat Mr. Bunker's description of the American economic system. At the outset itself, he did well in stressing the obvious — and yet, perhaps, because of it, what is not generally fully appreciated — that "those who are most critical of capitalism are continually setting up a straw-man with features that have no recognisable relation to today's reality, merely in order to knock him down." This description aptly fits the critics of managing agents in our country today. Then, said the U.S. Ambassador, "Early in our development, we reached the conclusion that, wherever private capital exists and finds the incentive to invest, the job will be done more economically and more efficiently than by the Government and, therefore, at a lower cost to the consumer". This view is shared by most people in this country, among non-officials and officials alike, but many people suffer from one strong inhibition that, as the economy expands, this system leads to several abuses, and so it must be tabooed. Here, perhaps, India and, in particular, those who have the inhibition just referred to, may take a lesson from what America did in similar circumstances. Mr. Bunker disclosed that, even in his country, with the introduction of mass production in industry and the mechanisation of agriculture, abuses developed, and he also mentioned how these were overcome. Said he: "We sought to deal with these abuses in a way which would protect the general

welfare and, at the same time retain the incentive to investment and encourage a willingness to take risks."

Where, perhaps, America is more socialist in effect than we seem to claim we are orally is in the sphere of social legislation. Surprisingly enough, a growing social consciousness has been influencing the character of American legislation not merely in recent years but over the past 70 years, according to the American Ambassador. Of course, this has been enormously speeded up in the last 25 years. To quote Mr. Bunker, "Far-reaching social security, unemployment insurance, old age assistance, subsidies for housing, labour legislation, minimum wage laws, agricultural price supports, and regulation of the stock exchanges — these are just a few of the many measures which have contributed to our changing economic and social pattern." There is, of course, the effect of changes in the U.S. tax system, of which the graduated income-tax is regarded as the most outstanding example. Mr. Bunker characterised the consequent redistribution of income, carried out peacefully and gradually through the democratic process, as "one of the greatest social revolutions of history". We in this country also are following a similar course; only it cannot be said that our attempts at redistribution of income are as gradual, and then we have also to make allowances for the very much smaller number of rich people in this country and the relatively smaller volume of total income.

It is this system that has given the world, as the American Ambassador could say with understandable pride, "the efficient organisation of production and distribution" — with but 7 per cent of the world's land area and 6 per cent of its population, the U.S. turns out about one-third of the world's total goods and one-half of all manufactured products. It is under this system that the pioneering spirit, a willingness to take risks, has endured. Again, it is this system which has witnessed a wholesale shifting of industrial leaders — since the past 30 years, out of the group of 100 largest companies, 41 are no longer there and the 41 replacing them are in the newer and faster-growing industries — a shifting which gives a graphic picture at once of national growth, competition and changing habits in public demand. Furthermore, it is this system which has made it possible for everyone to feel that he is a capitalist or to want to become one, and, what is more, to feel sure that he can become a capitalist. This recalls to my mind what Mr. G. D. Birla told a mammoth meeting in Bombay sometime ago. He then said, he wanted to see every Indian become a capitalist. What has made this possible in America is the widespread ownership of securities — 10 million people (one out of every 11 adults) own shares in half a million corporations. Forty per cent of these have less than the average family income. 115 million people own life insurance policies and have thus a stake in business through the investments of the insurance companies.

So long as the movement from one level to another is free and constant and so long as only ability, intelligence, industry and integrity are the chief determinants of one's economic or professional status, there can be no fear of classes developing in a society nor of its concomitants, class consciousness and society snobbishness. Many in this country feel it is precisely

this kind of society that we ought to have, or aim at having. How we shall bring about that is our own business. It depends on our resources, on our genius, as also on our traditions and, more than everything else, on our will, if not the will of Providence. No less does it depend also on the extent of the aid, and also the speed with which we can get it, from sympathetic

TEXTILES AND TEXTILE MACHINERY

By
CROESUS

WITH the import curbs bidding fair to continue to stay with us longer than we seemed to have bargained for, it becomes imperative to explore the extent to which the gap created by the cut in imports can be filled by the indigenous industry. In this connection, the performance of the indigenous industry since Independence has been encouraging enough to pin our hopes on its ability to make up a good bit, if not the whole, of the leeway.

Even in the process of harnessing the indigenous industry to produce goods the import of which has had to be banned, it goes without saying, there is need for a certain amount of priority. For a distinction must be drawn between industries which earn a considerable volume of foreign exchange for the country and others. Similarly, it is needless to say that the better organised industries could be expected to gear themselves up sooner to the task than the industries not so well organised. Take, for instance, the Textile Industry of India, which holds a pivotal position in the country's economy. It is easily the biggest organised Indian enterprise and it is also the country's mainstay as an earner of foreign exchange. The anticipated total earnings during the five-year period 1956-61 from major exports are put at Rs. 2,965 crores, out of which earnings from textile manufactures (cotton yarn and manufactures and jute yarn and manufactures) alone would aggregate Rs. 985 crores over the five-year period, making an annual average of Rs. 197 crores. In other words, it is estimated that as much as 33 per cent of the total anticipated external earnings during the second Plan period would be realised through exports of textiles.

Notwithstanding this fact, apart from what one can judge from the steady decline in imports of items of textile machinery, there is no way of clearly assessing the progress made by this industry in the manufacture of textile machinery and also in other ancillary items that are required for the manufacture of textiles, comprising cotton, silk, wool, rayon, and jute. It must, however, be said to the credit of the Government of India that, recognising the importance of the textile industry, it earmarked as much as Rs. 20 crores for the rehabilitation of the jute and textile industries to be channelised through the National Industrial Development Corporation. But the Government's concern has not stopped with it, as witness the great interest it has been evincing in the proposed Textile Industries Fair, which is to be held in Bombay from December 7, 1957 to January 6, 1958. Indeed, the Union Ministry for Commerce and Industry has itself sponsored this Fair and it is noteworthy that, under the able personal guidance of Mr. V. Nanjappa, Textile Commissioner, Government of India, all sections of the industry and trade have been co-operating to make the Fair a success. This Fair should stimulate a wider public interest than seems to be the case today in the growth of this premier industry of the country. At the same time, those actually concerned, in particular the producers of textiles, would be enabled to assess the progress in the

and understanding countries like America, and, on this point, while it is too much to expect an Ambassador to commit himself, Mr. Bunker can be said to have gone as far as he could when he said to the Press Guild of India in Bombay: "I am sure that we will wish to keep on exploring with your Government means by which we may continue to help."

manufacture of textile machinery made by the country and to judge for themselves how far India has advanced towards the goal of self-sufficiency in this direction.

There is ample scope for the expansion of this important producer goods industry in this country, as is evidenced by the fact that, in the year 1956 alone, the total imports of textile equipment by the country amounted to more than Rs. 13 crores. But one can unhesitatingly say that, due to the Government's well-conceived policies aimed at safeguarding the interests of domestic producers, this figure will steadily dwindle down.

Some idea of the importance of the textile industry can also be had from the orders which the industry places with a number of auxiliary enterprises and others. The cotton mills alone, for example, consume every year as much as Rs. 36 crores worth of mill stores, dyes and chemicals and packing materials, besides fuel, electricity, and lubricants valued at Rs. 15 crores per annum. These auxiliary enterprises have been greatly helped by the two World Wars to increase the volume of their production, with the result that recent years have witnessed a remarkable progress in the manufacture of several items of mill stores, such as bobbins, shuttles, healds, reeds, pickers, starches, etc. The proposed Textile Industries Fair should provide an excellent opportunity for the manufacturers of these mill stores also to make known to the public the extent of the progress they have each achieved in their respective lives.

As an employer of labour the ACC can well point with satisfaction to the salary/wages and other emoluments paid to its employees and to the many welfare activities voluntarily undertaken over the years.

To take salary/wages first, compare these figures of ten years:

	1945-46	1955-56
No. of employees	17,500	29,000
Salary/wages & amenities	Rs. 127.3 lakhs	Rs. 421.5 lakhs

Thus while the increase in the number of employees was 66%, the increase in the salary/wages, etc. for the same period was over 230%!

As for welfare activities, employees of the ACC's 17 factories and two collieries have for a long time been enjoying a large number of amenities for their security and social welfare, namely: provident fund and gratuity; schools, hospitals and dispensaries, creches, canteens, cinemas, clubs, playing grounds; welfare and benefit fund, and co-operative societies.

All these benefits have been provided out of a consciousness of social obligation. The ACC believes that a well-paid, well-looked-after, happy and contented employee is the best employee.

BUSINESS NOTES

WHAT SECTOR SUGAR?

THE SUGAR industry is one among many industries outside the public sector which have endeavoured, and largely succeeded, to improve their performance during the last few years. Three years ago, India was spending substantial amounts of foreign exchange on the import of large quantities of sugar. Today, the position is entirely different. The country's production has already nearly doubled to close on 2 million tons, and there are prospects of export of this food item. Of great significance in this story is the fact that the production has increased mainly by a fuller utilisation of the existing capacity. New installations account for a minor proportion of the increase. Whatever may be said about the shortcomings in the country's sugar production, the credit for this remarkable progress belongs, in the main, to the factory units. If performance were the qualifying test, then the existing factories deserve encouragement and incentives. These can come in the shape of facilities for capacity expansion and credit. Unhappily, the current policy for sugar lacks both. In regard to bank credit, hasty restrictive policies were adopted, some time back, which had soon to be modified. Another source of credit, the Industrial Finance Corporation, gave largest amount of loans to sugar, Rs. 4.63 crores during the year ended June this year. But the entire amount went to co-operatives only.

As for new extension of the industry, all additions are to be, and have been in the recent past, in the form of co-operatives. The co-operatives are avowedly to be owned by farmers. However, an analysis of the financial structure of the co-operatives shows that the farmers' interest is only of the order of 30 per cent. The remaining 70 per cent comes from sources like the Central and State Governments, the IFC and co-operative banks by way of loans. Clearly, the main bulk of the resources comes from Government or like sources. This can easily be taken to imply that the expansion of the sugar industry is no longer to be in the private sector. In other words, it will increasingly belong to the State under the name of co-operatives. This inroad is both unfair and unnecessary. Indeed, it is harmful. All the resources of the State, whether rupee or foreign exchange, should go to implementing at least the core of the Plan which constitutes transport, river valley projects and heavy industries like steel. It is nothing new to state that the prospects even in this limited field are not bright. To take on new responsibilities at this critical time is, therefore, not advisable. State control of management is sure to hinder efficient and economical operation. Perhaps the greatest benefit to the farmer could be brought by teaching him better methods of cane cultivation and providing him with better seeds and fertilizers. When he achieves success in producing more and better quality cane, which is his first duty, he may then hope to don the robe of the manufacturer.

CUSTOMS REORGANISATION

THE COMMERCIAL community has reasons to welcome the appointment of the Customs Reorganisation Committee, though it has come a day none too soon. For it provides the trade an opportunity to place its frank views on the anomalies in the present customs administration, as also to offer its constructive suggestions for removing these anomalies. It is well known that the trade has been experiencing a number of difficulties, largely due to procedural delays and to the unsympathetic attitude, not infrequently, of the customs authorities. The Indian Merchants' Chamber, Bombay, in a comprehensive memorandum submitted by it to the Customs Reorganization Committee, has,

apart from just answering the official Questionnaire 'seriatim', highlighted the various difficulties that the trade has been experiencing in its dealings with the customs authorities.

Making certain general observations on the subject matter, to begin with, the Committee says that the customs difficulties have increased considerably during the last few years, and these are occasioned, according to the Chamber, "by some of the provisions of the Sea Customs Act regulating the foreign trade of the country and the procedural formalities thereunder, which have increased considerably over the years, both in number and complexity." Rigidity in administration has further accentuated these difficulties. "The main customs difficulty", says the I.M.C., "relate to classification and assessment of goods under the Customs Tariff Schedule, delays in completion of assessment proceedings by the Customs officials, delays in connection with the chemical and analytical tests, insistence on the part of the Customs authorities on frequent analytical tests, sudden changes in classification or articles and the consequent changes in the rates of duty leviable on them without prior notice to the trade, lack of uniformity in procedures adopted by the Customs authorities at different ports and difficulties caused by lack of co-ordination between the Import Trade Control authorities and the Customs authorities." Particular care must be taken by the authorities to formulate customs laws in such a way that the trade is not bothered too much and that no financial loss is incurred by the business community owing to procedural delays. This is as important as — perhaps even more important than — ensuring that the Exchequer does not lose any customs revenue. Inordinate delays in the submission of analytical and chemical test reports, to cite one instance, make the classification of goods difficult, and the result is that the duty leviable cannot be decided quickly, so that the clearance of goods is delayed, leading, many times, to financial loss to the trader. The importers are no doubt allowed to clear their goods against guarantees in such circumstances. But then these guarantees are required to be countersigned by banks, a service for doing which the banks demand of the importers deposits of large amounts with them. And this means locking up of further funds, which would be otherwise useful, and perhaps more productive, if employed in business.

Another important point raised in the I.M.C. memorandum relates to the question of uniformity in the customs procedure at the different ports. The prevailing lack of uniformity not only amounts to discrimination as between importers at one port and those at another, but also results in the anomaly of the same article being assessed to duty at different rates at different ports! "There is, therefore, imperative need", as the Chamber urges, "for steps being taken to bring about the maximum uniformity in the procedural aspects as between the customs authorities at different ports".

With regard to the provisions concerning the appellate machinery under the Sea Customs Act, the I.M.C. suggests the setting up of an independent appellate authority to hear appeals from the orders passed by the Customs officials on the same lines as the Income-tax Tribunal. The present system, it may be noted, provides only for departmental appeal, which is not always satisfactory, besides being wrong in principle.

INDO-U.S. INVESTMENT GUARANTEE AGREEMENT
THE GOVERNMENT of India have entered into an investment guarantee agreement with the U.S. Government. The question of India's participation in the U.S.

investment guarantee scheme was, of course, under consideration for some time and its general outline is as follows. The U.S. investment guarantee programme encourages American private investors to export capital to underdeveloped countries and provides insurance to those investors against possible risk of nationalisation in the country of investment without adequate compensation and possible currency restrictions in the country of investment making it difficult to remit back its investments or its sale proceeds. This programme covers only fresh investments and does not extend beyond 20 years from the date of insurance. It is extended only to those countries which agree to participate in it by undertaking to conclude agreements with the U.S. Governments to give identical guarantees in return to the latter, and is limited to such cases of fresh investments as are approved by the Government of the country where the investment is proposed to be made.

The Indo-U.S. agreement arrived at lays down that exchange control in India will provide facilities for remittance of income from private American investments in India as well as repatriation of capital. Although India's agreement relates only to convertibility of income or capital into dollars, it is in line with the ideas of U.S. business representatives who visited this country recently. Under the agreement the dollars will be provided by the Reserve Bank of India at the rate of exchange subsisting at the time of conversion of rupees into dollars. There is, however, no guarantee in regard to the rate of exchange and this is in keeping with normal commercial practice.

So far as guarantee against possible nationalisation is concerned, the constitutional position in this country is such that when an Act is passed by the Parliament nationalising an enterprise, the compensation fixed in the Act is final and cannot be challenged in the Court of Law. This in other words means that the adequacy or inadequacy of compensation in the event of nationalisation cannot be questioned. In actual practice, however, the policy is based on equity and reasonable compensation is awarded. When the Kolar gold fields were nationalised the British investors were fully consulted and adequate compensation was paid to them. The Central Government saw to it that the Mysore Government agreed to give adequate compensation. It is noteworthy that the oil refineries have been given a 20 year guarantee against expropriation. Although this sort of guarantee must by its very nature be limited to exceptional cases, the policy of the Government of India about the foreign investor is now absolutely clear. The Government of India does not want to nationalise any concern unless there are compelling reasons arising out of special circumstances. Even this is clear that fields in which foreign private investment will not be permitted will not be nationalised ordinarily. And in case of nationalisation, compensation would be absolutely adequate and fair which leaves hardly any room for the foreign investor to fear. The Indo-U.S. Investment Guarantee Agreement is likely to enthrone the U.S. investor to invest considerable foreign capital in this country of which there is bound to be felt urgent need for India's development programmes.

EXPORT RISKS INSURANCE CORPORATION

VARIOUS MEASURES are being adopted by the Government of India to step up exports to earn greater amounts of foreign exchange for the second Five-Year Plan. The recent establishment of the Export Risks Insurance Corporation is only another link in this chain of measures that have been adopted and are being adopted to promote exports. The Corporation would cover the risks that were involved in the export of goods on credit terms. But the risks which it would cover at present are only those which the Export Credit

Guarantee Committee has recommended in its report. There is, however, no bar to the Corporation covering risks that were likely to arise in the special export transactions. From the inaugural speech of Mr. Morarji Desai, Union Minister for Commerce and Industry, it is quite clear that the Government would readily give sanction to coverage of any insurable risk, which was not within the scope of the recommendations of the Export Credit Guarantee Committee.

The purpose of the Corporation is not to encroach on the field of insurance companies. The new concern in the public sector on the other hand will supplement the business of the companies. The entire scheme is based on the principle of insurance intended to provide a guarantee to the exporter against losses which are beyond his control, like unforeseen changes in regulations relating to foreign exchange, occurrence of war, defaults, incurring of extra delivery charges etc. One of the difficulties in the stepping up of exports has been the lack of facilities for export finance. It is expected that with all the risks covered greater financial facilities will be available to the exporters from the banks. The experience of other countries is a guide that the banks have given higher percentage of advances in case of insured transactions. The heartening feature of the whole scheme is that it would be complementary to the private sector and would cover special risks not covered by the private insurers.

How much business the Corporation will be able to underwrite, it is difficult to say at the moment. It is however certain that in the initial stages when the Corporation would be faced with all sorts of difficulties, the total percentage of covering of exports may not be very substantial. Much of the business that the Corporation will be able to attract would depend on the amount of premium fixed for covering the risks.

CLARON'S CONFIDENT START

IN APRIL, 1956, a new experiment in advertising business was launched by the formation of the Clarion Advertising Services in Calcutta. What was based on accident and faith then has today proved a successful venture. It will be recalled that Clarion was formed after the original Company, M/s. D. J. Keymer & Co., Ltd., decided to close their Calcutta branch. The novelty of this agency lies in that its capital is provided by its employees and is managed by its own senior executives. It may be argued by some that Clarion had the advantage of stepping into the shoes of a going concern of high repute. While this is true, the main credit must rest with the people in the Organisation headed by Sir Dhiren Mitra. They have exhibited a remarkable sense of responsibility and a spirit of self-help, for which they deserve appreciation.

An important aspect of the working of the Agency is that it has shown profits in the very first year of its operation. This has enabled the Company to afford its staff various benefits as well as absorb steadily unemployed personnel of Keymer's. Standards of service have been maintained of which the Company can rightly feel proud. The new set-up has brought about encouraging improvement in individual efficiency and discipline.

It is significant that the Agency has achieved success against many odds. Fabulous advertising is no longer the fashion of the day. The advertising budgets of almost all concerns, big and small alike, have had to be considerably axed for reasons of increasing taxation, the need for saving and investments and restrictions on imports. However, these are essentially temporary impediments. In course of time, advertising business can hope to share the prosperity that the country is trying to bring about. What is expected of the business is that it will expand into export advertising on scientific lines. This is not without its problems which the authorities should help to solve.

How banking serves the COIR INDUSTRY

PC-438

INDIA is the world's chief producer of coir and coir products, her yearly output being around 130,000 tons. More than half this output is exported, earning about ten crores of rupees in foreign exchange. The coir industry, which is exclusively South Indian, is concentrated in Malabar and Travancore-Cochin, and employs over six lakhs of workers.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the coir industry.

We at Palai are proud that so many leading coir goods manufacturers of South India employ the complete banking service we offer.

Current Accounts — Demand Drafts —
Telegraphic Transfers — Investments —
Letters of Credit — Bill Collection —
Deposits — Loans and Overdrafts —
Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI — KERALA STATE
Branches at: Madras, Madurai, Cochin,
Quilon, Trivandrum, Mangalore, Ban-
galore, etc. Also at: Delhi and New Delhi.

Economic Report from the U. S.

WORLD-WIDE ECONOMIC ADVANCES

(By GUY SIMS FITCH)

WASHINGTON, Oct. 8.—The recent meeting here of the World Bank and the Monetary Fund, with its call for continued progress with stability, placed new emphasis on what has been the dominant economic trend of the post-war period. For some 10 years now, the economies of the free world—exclusive of Communist lands—have been expanding at an unparalleled rate. This can no longer be regarded as a temporary "boom" nor, of course, as "catching up" with pent-up demands stifled by war-time restrictions. In the words of 'Fortune' magazine, a highly respected American business journal, "the world is in the midst of a classic age of economic and technical growth, one that might indeed transcend all the material progress of history."

A glance at the record shows that population in the free nations has increased by an unprecedented 30 per cent since 1938. Yet such has been the post-war economic expansion, that their total manufacturing output per capita is now 40 per cent above the pre-war level and 70 per cent above the level of 1948, when the world was beginning to show important signs of recovery from the dislocation of war. But what may be even more significant is that the economies of other countries, in the aggregate, have been growing at an even higher rate in the last decade than has that of the United States. This reverses the trend of the time before world war one. And this is no mean achievement when it is considered that the per capita US output of goods and services has itself advanced a remarkable 25 per cent since 1948, and is continuing to rise.

The world-wide economic advances have been accompanied and assisted by a truly phenomenal upsurge in international trade. Despite some domestic pressures for restrictive measures, trade policies in the United States and most other free countries have been liberalized well beyond the expectations of many practical economists. These enlightened policies, coupled with the new demand for goods and services created by increasingly vigorous economies, have led to an 85 per cent rise in world trade in the past decade—a record that outstrips even the rise in industrial production. Not all free nations have participated equally in the post-war gains, of course, as brought out at the Bank and Fund sessions. What these United Nations bodies call the "less-developed areas"—mainly Latin America, Asia, the Middle East and Africa—have not progressed as rapidly, in general, as have the so-called developed areas such as the United States. Nevertheless, these regions, too, have made significant progress. Their manufacturing production has doubled since pre-war days. Their energy consumption has increased 160 per cent. Their steel output has tripled.

One of their problems has been an enormous population growth, which has had a restraining effect on per capita output of goods and services. Many of them, moreover, are weak in what economists call the "infrastructure"—such basic economic elements as transport, public services, health, managerial training and skilled labour. In addition, with capital in great demand everywhere, they have found it difficult to both invest and consume heavily as they strive to develop their economies and at the same time raise their living standards. But in the light of the notable progress already made, most economists are confident that these problems can and will be overcome. It is entirely reasonable to expect that soundly drawn development and investment plans, aimed at by a thriving international trade, will lead to an eventful narrowing of the gap between the developed and the developing lands. After all, as 'Fortune' magazine points out, even those countries that are now considered highly developed economically needed some little time before they could build up their economies and raise their living standards to hoped-for levels.

COMPANY AFFAIRS

ELECTRICITY COMPANIES RECENT AND CHANGES IN THE ACT

Presiding over the annual general meeting of the Bombay Suburban Electric Supply, Ltd., (in the absence of the Chairman, Mr. K. G. Milne), Mr. P. D. C. R. Clark touched on the effects of the recent changes in the Electricity Law on the Company's operations. This was only to be expected, as, since the shareholders met last, several important amendments to this Act have been effected, such as those pertaining to the "Standard Rate" of return and the right to earn and appropriate to a statutory reserve (Development Reserve) the tax savings resulting from the Development Rebate introduced under the Finance Act, 1956, subject to the earnings of the year not resulting thereby in a shortfall of the "Reasonable Return", among others.

It is known to all now that, under the amended Act, the "Standard Rate" has been linked to the Bank Rate with a differential of 2 per cent so as to enable automatic adjustment with fluctuations in the money market. The industry would doubtless have appreciated a higher differential than this, but has reconciled to what has been done, consoling itself that Parliament has at last recognised that the return to the investor in the industry should bear a close relation to the Bank Rate. This done, the industry was hoping to get the benefit of the increase in the Reserve Bank's interest rate on lendings against Government and other eligible securities to 4 per cent in February, 1957, although, technically, it was held that this was different from the Bank Rate, which was also raised, but only after April 1, 1957. Inasmuch as it is the Bank Rate on April 1, every year that is taken whilst computing the Standard Rate, the industry was left high and dry, having to experience all the hardships of higher interest rates which became effective in February, 1957 itself. Although the Government of India seemed to appreciate the unenviable plight of the industry, it would appear, there were practical difficulties in the way of affording the relief sought by the industry in this behalf. The upshot of it all has been that, in so far as the current year (1957-58) is concerned, the industry has to be satisfied with only 5½ per cent as the "Standard Rate". But it can rest assured that, inasmuch as the Bank Rate is more likely to go up than to go down in the conceivable future, the "Standard Rate" also would be correspondingly higher. Only the industry must pray that any future increase in the Bank Rate takes place immediately before and not after April 1 every year.

While the industry appreciates the small benefits by way of the higher "Standard Rate" and the right to earn and appropriate tax savings under certain specified conditions, it seems to be somewhat worried about the provision making it necessary to service loan capital out of the "Reasonable Return", instead of out of operating expenditure as hitherto. This concern is understandable, especially in these days when the chances of raising further equity capital are not as good as in the past and electricity companies, just like any other industrial undertaking, have perforce to resort to short-term credit from banks and other sources. But no such facility can be availed of, it must be stressed here, unless the loan interest is lower than 6 per cent, i.e., the "Standard Rate", which seems rather improbable. In short, although there would appear to be a slightly better earning position as in the case of this Company (Bombay Suburban Electric Supply, Ltd.), this prospect is subject to the precondition of a given electricity company's tariffs to the consumer being so balanced as to yield a "Clear Profit" equalling the "reasonable Return". Mr. Clark accordingly expressed the hope that "power supply companies—who,

by and large sustain the core of the National Plan—will not in future be exposed to unfair weather". He had reasons to voice such a hope, because, as he frankly observed, issues like the question of tariffs have often tended, in the past, to be clouded by political considerations.

SURAT ELECTRICITY CO., LTD.

Shareholders of yet another electricity company have been assured of a dividend for the first three months of 1957, thanks to the new Electricity Rules which make it obligatory for all electricity undertakings to close their accounts on March 31 every year. But for this rule, the accounts of the Surat Electricity Co., Ltd., would have been made up as usual, for the 12-month period ending December 31, 1956. The accounts now published, however, relate to the 15 months ended March 31, 1957.

After charging depreciation (Rs. 5,68,939) and providing for taxation (Rs. 2,61,540) and adding the carry-forward from the previous accounting period (Rs. 5,073), the total disposable profit stood at Rs. 6,58,998. Out of this, a sum of Rs. 8,630 was written off, being the new share capital issue expenses, and Rs. 78,149 was set apart for Statutory Contingency Reserve, leaving a balance of Rs. 5,72,219. The interim dividends on preference and ordinary shares already paid absorbed a further Rs. 3,29,377, while the final dividends now recommended—Rs. 1-10-0 on preference shares and Rs. 3-12-0 on ordinary shares—account for Rs. 2,35,416. The balance of Rs. 7,426 is to be carried forward.

NOTICE

The Twentyfourth Annual General Meeting of the Shareholders of Rohtas Industries Limited will be held at the Registered Office of the Company at Dalmianagar on Thursday, the 31st October, 1957 at 11-30 A.M. to transact the following business:

1. To receive and adopt the Directors' Report and the Audited Accounts for the year ended 31st October, 1956.
2. To declare dividends.
3. To elect a Director in place of Shri B. N. Chaturvedi who retires by rotation but being eligible offers himself for re-election.
4. To appoint Auditors for the current year and to fix their remuneration. The retiring Auditors, Messrs. K. N. Gutgutia & Co., being eligible, offer themselves for re-appointment.

The Share Transfer Books of the Company will remain closed from 22nd October to 31st October, 1957, both days inclusive.

5. As special business:

To consider and if thought fit to pass with or without modification the following Resolution which will be proposed as Special Resolution:

"Resolved that the Articles of Association of the Company be altered in the manner following:
(a) For Article 28 the following shall be substituted, namely:

"28. The Company shall have a first and paramount lien upon all the shares (other than fully paid up shares) registered in the name of each member (whether solely or jointly with others) and upon the proceeds of sale thereof for all moneys (whether presently payable or not) called or payable at a fixed time in respect of such shares and no equitable interest in any share shall be created except upon the footing and condition that this, Article is to have full effect. And such lien shall extend to all dividends from time to time declared in respect of such shares. Unless otherwise agreed the registration of a transfer of shares shall operate as a waiver of the company's lien if any on such shares."

(b) For Article 29 the following shall be substituted namely:

"29. For the purpose of enforcing such lien the Board of Directors may sell the shares subject thereto in such manner as they think fit but no sale shall be made unless a sum in respect of which the lien exists is presently payable and until notice in writing of the intention to sell shall have been served on such member, his executors or administrators or his committee, curator bonis or other legal representatives as the case may be and default shall have been made by him or them in the payment of the sum payable as aforesaid for seven days after the date of such notice."

(c) For Article 30 the following shall be substituted, namely:

"30. The net proceeds of the sale shall be received by the Company and applied in or towards pay-

ment of such part of the amount in respect of which the lien exists as is presently payable and the residue if any shall be paid to such member, his executors or administrators or assigns or his committee, curator bonis or other legal representatives as the case may be."

By Order of the Board,
For Sahu Jain Ltd.,
A. K. JAIN,
Managing Director,
Managing Agents.

CALCUTTA,
4th October, 1957.

N.B. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself. Such proxy need not be a member of the Company. Proxies in order to be effective must be received by the Company not less than 48 hours before the meeting.

Explanatory Note:

The shares and debentures of the Company have been admitted on the official list of the Bombay Stock Exchange for cash dealings, and the alterations in the Articles of Association of the Company as proposed are desired to be made by them. The consent of the shareholders is therefore sought for the proposed special resolution. No particular interest is attached to the Director and/or Managing Agents of the Company in the above resolution.

COMMODITY NEWS AND NOTES

INCREASE IN COTTON AREA

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of cotton, 1957-58, puts the current year's area at 14,616,000 acres, as against the corresponding adjusted estimate of 14,559,000 acres for 1956-57. This shows an increase of 57,000 acres or 0.4 per cent in area during the current year as compared to last year. The increase in area during the current year has been shared mainly by Bombay and Punjab, and has been attributed to favourable weather conditions at the sowing time. The increase has, however, been offset to a great extent by decreases reported by some other States, especially Madhya Pradesh and Mysore. Among the different varieties of cotton, the increase in area has occurred mostly in Dholleras and Broach-Vijay. A considerable decrease in acreage has, however, been reported in Malvi and Oomras varieties. As regards staple lengths, the increase has occurred in medium staple cotton. This estimate generally covers the period up to the end of July 1957. Till then, the condition of the crop was reported to be, on the whole, satisfactory. In parts of Bombay, however, the crop was reported to have been affected by heavy rains and attacks of insects and pests. This estimate does not cover the entire area sown to cotton crop during 1957-58. Past experience has shown that the area at the first estimate stage forms roughly 65 per cent of the area under the crop finally reported.

OUTPUT OF COAL FROM STATE-OWNED COLLIERIES

Employing nearly 29,000 skilled and un-skilled workers, India's state-owned collieries produced 2,990,896 tons of coal during 1956. Valued at more than Rs. 4.8 crores, the coal was of different grades. Of the output 188,644 tons was of the grade of Selected A; 235,845 of Selected B; 1,950,601 tons of Grade I; 70,785 of Grade IIB and others accounted for 545,021 tons. The opening and closing stock of all grades at the beginning and end of the period was 15,556 and 29,137 tons respectively. Out of the production from the State-owned collieries 2,411,260 tons was despatched for LOCO consumption; 6,795 tons for defence; and 272,706 tons was used by other Government bodies. The amount of coal used by private organisations was 35,604 tons and the amount exported was 4,634 tons.

COAL OUTPUT DURING JUNE

Output of coal in India decreased from 3,793,377 tons in May, 1957, to 3,330,400 tons in June, 1957, according to official statistics released by the Chief Inspector of Mines in India. Despatches of coal amounted to 2,915,343 tons in June, 1957, as against 3,184,279 tons in the preceding month; coal stocks at pitheads amounted to 3,252,383 tons at the close of the month, as against 3,250,991 tons at the beginning of the month. During the month under review 830 collieries were reported to be working with an average daily employment of 336,385 workers. Output per man-shift was estimated at 1.15 tons for miners and loaders, 0.60 ton for all workers underground and in open-workings and 0.40 ton for all persons employed including surface workers. The percentage of absenteeism was of the order of 15.55. Nine coke plants at collieries and elsewhere produced 351,983 tons of hard, soft and other kinds of coke during the month and despatched 178,990 tons.

PRODUCTION OF LEAD AND ZINC ORES IN INDIA

The production of lead and zinc ores in India during the quarter ending June, 1957 was 22,095 tons as against 25,242 tons in the quarter ending March, 1957, according to the Indian Bureau of Mines. The production record-

ed an increase of 3,439 tons as compared to the corresponding quarter of 1956. The entire production is reported from the Zawar Mines of Rajasthan. The lead and zinc concentrates recovered from the ores during the second quarter of 1957 totalled 1,114 and 1,458 tons respectively as compared to 1,143 and 2,255 tons in the preceding quarter. The lead concentrates are sent to the smelting plant at Tundoo in Bihar.

FIRST ESTIMATE FOR SESAMUM, 1957-58

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of sesamum, 1957-58, puts the current year's area at 3,669,000 acres, as against the corresponding adjusted estimate of 3,854,000 acres for 1956-57. This shows a decrease of 185,000 acres or 4.8 per cent in area during the current year, as compared to last year. The decrease in area during the current year has been shared mainly by Madhya Pradesh, Bombay, U.P. and Andhra Pradesh, and has been attributed generally to unfavourable weather conditions at the sowing time during the current year as compared to last year. However, some increase in area has been reported by Rajasthan State. This estimate includes for the first time information in respect of U.P. and Kerala which were hitherto non-reporting States for the first estimate. The information given in this estimate covers the period generally up to the end of July 1957. Till then, the condition of the crop was reported to be generally satisfactory in almost all the States except parts of West Bengal. This estimate does not cover the entire area sown under the crop during 1957-58. Past experience has shown that the area at the first estimate stage forms roughly 55 per cent of the area under the crop finally reported.

Post-Monsoon Review

The Eastern Economist of July 26, the first leading Article bearing the title 'Mid-Mon-Review' recorded the opinion that the mon- was "very favourable"; with the gloomy now coming in from Bihar and Uttarash on the failure of rains, one sees how we at the mercy of chance there. Practically all optimism of July has departed. The danger is that we will relapse by the proved process the psychological pendulum to overestimate misfortunes with which we have been visited incidents of nature. It is clear that 1957-58 is going to be an *annus mirabilis* like 1953-54.

It is extremely unlikely that it will be even as good seasonally as 1954-55. We are back at best to a normal year with all the consequences that this implies when we have stepped up our rate of development to correspond with an annual rise in agricultural production of about 5 per cent per year. It is extremely unlikely that in the period 1957-58 the national income of the Indian Union will make any substantial real progress, however steeply money income might be deemed to rise.

While the present assessment is thus different from what it was in July, there is no reason to differ from one conclusion previously reached, that

the agricultural situation will not of itself initiate an inflationary spiral. This is largely because of the arrival of P.L. 480 imports now coming in steadily from the United States. If these sales are effected as quickly as possible, at a rate significantly below current prices, the level of agricultural prices, already on the decline, might be firmly held during the adverse price season between May and August next year. It is vital that stocks should be built up in the country to make certain that inflationary movements in the off-season will be kept in check; if this is done, agricultural prices need not run out of hand.

To the extent that the foreign exchange crisis — and the consequent withholding of rupee resources with which foreign exchange was matched — will lead to a decline in rupee expenditure there will naturally be less cause for inflation from other sources. If this means the balancing of our foreign exchange budget at a level which denies a third of our scheduled new income, the attainment of equilibrium provides no solution of the Indian problem. Similarly the balancing of domestic expenditure so as to eliminate internal inflation is no solution to our current challenge. To cut the Plan drastically is failure enough; to reduce its targets by a third to produce stability both in the foreign exchange and domestic fields would be to miss the wood for the trees.

It is clear that we have reached a stage in our economic lives in which fundamental economic thinking has again to be done in order to determine at this critical point where we go from now on. Any temporary concessions to circumstances, such as the absence of foreign exchange, must not blind us to the immense difficulties which remain elsewhere. However serious the foreign exchange crisis is — and it is serious enough notwithstanding the remarkably good account which the Finance Minister has given of himself in the United States — India's real difficulties at this hour are internal.

Consider, for example, the terrible defeat which we have sustained in agricultural production. At a conference in Srinagar last week many of the States through their representatives spoke of serious frustration both in the field of agricultural production and community development. These have no relation whatsoever to our foreign exchange resources or, indeed, to our resources at all. For example, it has been shown, over and over again, that individual farmers in particular villages with no additional resources and with no differential advantages frequently produce twice as much as other farmers in the same village by the mere process of studying their lands and their crops and seeking chosen seeds and other assistance at the proper time. If nothing more were done in the Indian Union than to see that, in each village, the lowest productivity rose to the level of the highest productivity under exactly similar circumstances, there might conceivably be a rise of about 40 per cent in Indian food production. The fact that we have not attained this rise indicates that community development has failed to carry the message of productivity from the good farmer to the bad even in the small village. The enormous disparity between different units of production of agriculture is a measure of the absence of a good system of "communications" in our agricultural extension work. This ranks as one of the major

failures in both Plans — weakness on which we are nowhere near solution at the present time.

At a different level — that of the District and State agricultural development committees — the process by which debates go on endlessly before action is taken and driven home calls not merely for a more energetic approach to "communications," but for an understanding of the extent to which current routine administration is not geared to the development. The fact that Finance Officers at all stages insist on protecting themselves by deferring decisions recklessly until they have obtained all the explanations required is a symbol of the obstinate determination with which law and order outlook has been impressed on the Indian administration. Our tradition in administration has never been to consider development work of very high priority. The whole attitude of the senior officers of the Government of India and the State Governments is one which seeks security beyond the risks of adventurous implementation. Under these circumstances, the spring of Indian agriculture, which looked as though it were beginning to work magnificently between 1952 and 1955 has shown itself brittle and incapable of providing the continuing impetus required. No gifts of foreign exchange resources can alter what is fundamentally a human and administrative problem, creating confidence and courage where there is now hesitation, excessive caution, and fear.

The time has come for a radical understanding of the basic obstacles to a self-generating process of development in Indian agriculture. Whatever the faults of Indian organised industry — they continue to be many — there is at least this to be said that in most of our industries there is the stamp of dynamism in terms of production. The remarkable progress of the Tata Iron and Steel Company, on the new additional million-ton project, the great rise in cement production, the sustained rise in cloth production, notwithstanding administrative discouragement and not a little consumer price resistance in the last three months, show that Indian industry in the private sector has springs of considerable force still in operation. He would be a bold man who on the record of the last two years in Indian agriculture or, indeed, of the reports heard in Srinagar last week of frustration in many matters relating to agriculture and community development would argue that Indian agriculture is in equally good heart.

It is vital that the Government of India — quite apart from the high-powered committee on Food and Agriculture whose enquiry is differently oriented — should set up a senior study group to examine the short-run administrative implications of implementation of the Plan. It is becoming increasingly clear that we need entrepreneurship in agriculture as we need it in industry. Much of the existing failure is due to the fact that Government routine and red-tape make entrepreneurship in the public sector all but impossible. No doubt there is a wish to cut out red-tape, but it seems in practice to have become more powerful than it has ever been. Can this be because it is a convenient instrument for men who have lost courage to act and the capacity to take risks? One of the urgent questions to be answered is whether the disease is in the men or in the system. In either case a ruthless remedy must be prescribed for a vicious disease; for, this disease, more than any other obstacle, is hindering our progress. It must be broken down, before it breaks the Plan. Who will cut this Gordian Knot?

Another Fall in Karachi

THE fall last week of Pakistan's fifth Cabinet in the ten years of its existence was not entirely unexpected. The storm had been brewing for some time, and political prophets had been forecasting the collapse sooner or later of Mr. Suhrawardy's coalition Government. However, it had not been expected in the midst of the Kashmir debate in the Security Council. The crisis had been brought to the surface by Mr. Suhrawardy himself. He had vehemently and openly opposed the West Pakistan Assembly's resolution demanding dismemberment of the one-unit and reconstitution of the former provinces which the Republican Party had supported. Being head of a coalition Ministry, of which the Republicans were the major partners, Mr. Suhrawardy might have remained in office if he had proceeded cautiously and carefully. He, on the other hand, undertook an extensive tour of West Pakistan, addressed public meetings — something that was not done by any Pakistan Premier after the late Mr. Liaquat Ali Khan — against the dismemberment resolution and called the Republicans "traitors". It seemed veritably that the Pakistan Prime Minister was deliberately working for the downfall of his Ministry. Was it that Mr. Suhrawardy was more certain of retaining the Prime Ministership by keeping the President happy than by keeping his coalition colleagues contented?

The zeal with which Mr. Suhrawardy has recently crusaded for the retention of the one-unit does appear a little odd. Not long ago he used bitterly to criticize the way in which the one-unit had been imposed upon the people against their wishes. Perhaps this was not wholly accidental — nor the recent change of conviction in this respect. Whatever may be the failings of Mr. Suhrawardy, lack of shrewdness is not one of them. One of the reasons is, of course, that by playing the martyr he can more easily stage a comeback; he will not fade from the political scene like Khwaja Nazimuddin. While out of office, he may use his time to build up his party, the Awami League, in West Pakistan, with the support of the former Minister for Information and Broadcasting, Sardar Amir Azam Khan, and the former Governor of West Pakistan, Nawab Mush-taq Ahmad Gurmani, both of whom are known to be nursing differences with the Pakistan President and the Republican Party. If he is able to do this, he will have set a precedent: the exit of Pakistan's Premiers has so far been either fatal or final.

Though the fall of Mr. Suhrawardy's Cabinet at the Centre does not directly affect the fate of the Awami League's Government in East Pakistan, it would be as well to expect to hear the repercussions of the political crisis in Karachi in distant Dacca. When Mr. Suhrawardy was given the reins of office 13 months ago, it may be remembered, East Pakistan had almost broken away from the western wing. His first task as Premier was to satisfy the aspirations of the people of East Pakistan. This he did by appointing a committee to examine the question of giving more regional autonomy to East Pakistan.

The current — or perhaps the continuing — political crisis in Pakistan has been attributed variously to intrigue or the Muslims' disdain for democracy. Prime Ministers in Pakistan have, it is undeniable, almost invariably risen to office on the dark wings of intrigue; to continue in office, they have to match the intrigues of other aspirants. It is hardly national achievement, or

popularity or failure, except in intrigue, which keeps a Prime Minister going. It is also true perhaps that Muslim countries generally have not so far made much headway in democratic methods: perhaps their psychological mould has something to do with this. Even in Turkey, the course of democracy is not very smooth. In Pakistan, except for general fanticism on the issue of Kashmir, which has been connected inextricably with Islam, there is hardly anything in the country today which can hold people together, and on the basis of which politicians can unite. Extravagance on the issue of Kashmir seems to have become the test of a politician's fitness for office — certainly in the eyes of people in the cities.

But Kashmir and the canal waters are at best temporary as uniting factors. In truth, there are other factors which are bound to hinder the growth of stability in the country. If the wide separation of the two parts of the country creates considerable difficulties in the way of political unity, the economic backwardness of the populous eastern wing as compared to thinly populated and comparatively advanced West Pakistan accentuates them. The people of East Pakistan want representation in the country's National Assembly on the basis of population; those of the western wing are determined to enjoy equality of representation with their eastern brethren.

With the Awami League out of the political picture at the Centre for the present, and the Muslim League though in a minority, not content with anything less than the Prime Ministership, the Republicans may well try to coalesce with East Pakistan's Krishak Shramik Party, the Pakistan National Awami Party and with Nizame Islam Party to form the next Government. The question worrying everybody is, however, as to who will be Prime Minister. The choice, is restricted; Hamidul Haq Choudhary, a former Foreign Minister and the leader of the Krishak Shramik Party; Syed Amjad Ali and Feroze Khan Noon, the Finance and Foreign Minister, respectively, in the outgoing Cabinet. Dr. Khan Sahib, the leader of the Republican Party, has already given out that only a Republican would lead the next Government; this leaves Syed Amjad Ali and Mr. Noon in the field. Dark horses should, of course, not be ruled out of calculation where loyalties are easy and intrigue normal. As no political party enjoys an absolute majority in Pakistan's 80-member National Assembly, one need not be a prophet to predict that any Ministry that assumes office will be essentially unstable.

So far as India is concerned, it has not been happy over the political instability in Pakistan since Mr. Liaquat Ali Khan's assassination. Four Governments have fallen during these six years; among other things, this makes it difficult to negotiate with any Pakistan Government. It is not possible to be sure whether agreements on Indo-Pakistan problems that are arrived at will be honoured by the next one. In fact, each successive Government has found it more convenient, for its survival, to stir up a *Jehad* atmosphere. Though India has not paid much attention to threats from the other side of the Indo-Pakistan border in the past, it is difficult to see how can it remain indifferent to these in the coming months. Political instability in Pakistan is, therefore, not the exclusive concern of that country's people. India, too, has a stake in it; so has the world.

Congestion at the Ports

THE arrival of the U.K. team of experts on port congestion in the last week in this country has focused attention on a problem of national importance which had assumed grave proportions only three months back. This problem cannot be considered in the narrow context of serious bottlenecks cropping up at any particular time. In essence, it is a problem of expanding port facilities on an adequate scale and in an effective manner for continued and accelerated development. If congestion in the major ports of India has become chronic, it only underlines urgent necessity of a comprehensive long-period view of the question. Investment itself presents another difficult issue and at present the World Bank's mission is here to assess the extent of credit which the Bank should provide for the programmes of port development in our second Plan. It is only a matter of chance that the arrival of the two missions in the country has synchronized. The U.K. team which has come under the auspices of the Colombo Plan is called upon to undertake a thorough investigation of the state of congestion of the ports. It is one of the most impressive teams of experts ever to visit this country. It is compact and every member has proved successes under conditions equally or more difficult elsewhere.

The U.K. mission will be concerned less with the issues of the immediate present; these have to be resolved at any cost. Its real function will be to examine the problem from the comprehensive and long-term angle. In the first stage of its investigation which is now over, the mission has given an unmistakable indication that this is the angle from which the question must be solved. This angle has brought to the forefront the changing pattern of the trade flowing through the ports as the predominating factor which will determine the nature of the facilities which will have to be provided at the ports. Sir Eric Millbourn, leader of the mission, lost no time in assessing this fundamental character of the problem. The broad conclusion which has been reached in the mission's discussions with the officials of the Government of India now seems clear. Special types of imports will continue to demand priority on our port facilities. They are: food grains, iron and steel, and machinery. Ores will constitute a strategic part of our exports. In their significance to the development requirements of the economy as well as in the volume of their trade, these articles will make a profound impression on the capacity of the ports and their ability to provide the required facilities. Any future expansion in the direction of new berths and other aids will have to make specialized types of facilities for these special categories. The new equipment which will be installed to cope with the growing volume of cargo will have to be selected on the test of its suitability to this traffic as well as other classes of traffic.

It is true that the Ministry of Transport and Communications has risen to the challenge of the recent crisis of congestion at the four major ports of this country. The measure of success achieved in the span of a few weeks can be gathered from the fact that congestion in Calcutta port has been reduced from 68 ships awaiting clearance of cargo early in August to about 19 late in September. Congestion as such can be said to prevail at the present time only in the Visakhapatnam port. In all the

other ports the necessary facilities were requisitioned as a matter of urgency and operations were conducted under the direct supervision of specially appointed high-powered officials. While credit must be given for the successful enforcement of these measures, the fact remains unaltered that all these measures were adopted as emergency measures to obviate the critical liability of the levy of a surcharge of 25 per cent which the international shipping services had threatened to impose. This is proof enough that the Government and the Port Trust Machinery can meet a situation of crisis. But this achievement has essentially a short-term significance. The root problem of meeting the long-run challenge of developing the ports and cargo-handling facilities still remains to be faced.

To meet this challenge is a function of a thorough investigation of the requirements of individual ports. The members of the U.K. mission are now addressing themselves to this important task. The nature of the special problem which the U.K. experts are called upon to tackle may be broadly indicated. Visakhapatnam is clearly marked out as a major port for the export of ores and vegetable oils. Available facilities there are not enough to handle even half the traffic at present offering. The nine berths in Madras port are under constant pressure and arrival of passenger ships or special vessels carrying steel and machinery compels detention of ships carrying other cargo. The backward state of facilities provided at Madras port is highlighted by the fact that ore is handled by manual labour. Poor stacking and storage facilities are the bane of Bombay port, while Calcutta suffers from bunching of ships and prolonged detentions due to weather and tidal conditions. Lighter fleets for loading or unloading in the stream is a common requirement. In the final analysis, the general problem is resolved into one of mechanizing the handling facilities to the utmost practicable extent and otherwise modernizing the ports.

Labour at the ports in any country has normally proved to be a militant force to deal with. The militant character of port labour seems probably due to the casual nature of employment and the insecurity as well as mood of indifference which it generates. In India labour unrest has been a potent cause of detentions of ships. It is an acknowledged fact that go-slow tactics persist no matter how far recurring demands are conceded. The scheme of decasualization which has been introduced with respect to certain categories of stevedore labour was expected to bring stability and remove the root cause of unrest. Piece-rate wages, which are already introduced in Bombay and whose extension in Calcutta and Madras is not far off, are decidedly bringing higher remuneration to labour as well as improved productivity. A long list of progressive terms of employment including welfare schemes, gratuity scheme in Madras port and provident fund schemes in Calcutta and Bombay ports, may be cited. None of these gains, it is clear, has brought balance and sobriety in the attitudes of labour. In the U.K. and other Western countries dock labour trouble has been successfully minimised. The secret of this success is to be found in firm but just dealing by port authorities no less than in extension of welfare benefits and higher remuneration. Will we be equally resolute on productivity; or will we excuse what we dare not replace?

Compare Allwyn tubular steel chairs and tables with any you've used so far! Such practical tested designs! Comfort that's exceptional! Strength that assures years of faithful service! Only India's

The Story of Oil—1

A miracle of nature

Crude oil, or petroleum as it is often called, occurs in many parts of the world—chiefly in regions where sedimentary rocks once formed the bottoms of ancient seas.

No one is sure how oil originated. The most widely accepted theory is that it resulted from the decay and alteration of the remains of prehistoric animals and plants. This organic matter was washed from the land into the vast jungle of marine life under the seas. The deposits, mixed with mud and sand, formed layer upon layer on the bottom. As these became buried, Nature's mysterious chemistry got to work. It slowly transformed the organic matter into the compounds of hydrogen and carbon which we now know as oil, and at the same time the fine

sediments which covered it were compressed into rock strata. The newly-formed oil oozed into the nearest layers of porous rocks, which held it as if in a sponge, and here it remained.

Throughout the millions of years that oil was being formed, many changes were taking place in the earth's crust. It rose and fell, was crushed and expanded. Lands were drowned, sea-beds became dry land. In some places cracks developed and the land slipped, forming 'faults'.

During these violent changes, some of the imprisoned oil escaped and was lost. In other places it was so near the surface that it seeped through and was discovered and used by man from the earliest times. But the bulk has remained trapped in its porous rocks beneath the surface of the earth.

THE WEEK'S NOTES

ELECTIONS IN NEPAL

THE POSTPONEMENT of the general elections in Nepal, though not unexpected, is sure to raise a new political storm. The Opposition parties will appear justified in criticizing and even condemning the King's discriminatory action in allowing Dr. K. I. Singh, the present Premier, to do what had been denied to Mr. Tanka Prasad Acharya, the former Prime Minister. In fact, the latter was, to all accounts, forced to resign precisely because he had expressed his inability to honour the pledge given by the King about eighteen months ago, to hold elections on October 8, 1957. The King's action is seemingly all the more regrettable because he has allowed Dr. Singh to remain in power, though the latter's first statement after assuming office contained a promise to hold general elections on schedule.

The bitterness of the Opposition parties in Nepal is thus easy to understand. But their threat to launch a civil disobedience movement from December 8, if the Government should fail to give an assurance by that date to complete the elections within the next six months is more deplorable than even the apparent dilatoriness of the King and his Government. This move seems to arise more from their desire to pander to the gallery than from either principles or statesmanship. The civil disobedience movement that they threaten may, indeed, delay elections further, by upsetting internal stability during this critical period. It would thus defeat the very purpose that the Nepali Opposition parties have in mind. In the peculiar political situation prevailing in Nepal, the Opposition parties cannot afford to assume a role pregnant with disastrous implications. The economic situation, for instance, reflected in the present scarcity of food, is likely to worsen from any large-scale unsettling of administration.

There can, however, be no two opinions on the necessity and advisability of holding the general elections as early as possible. That seems the only way to remove political discontent in Nepal. No matter how petty the various platforms appear, or how strong the opportunism of the politicians, any kind of discontent in that country, roofed geographically by the "Tibet regime of Communist China", contains the possibilities unpleasant to think upon. Moreover, the elections would measure, in democratic terms, not only the popularity of different political parties, springing into existence like mushrooms, but also assure to the people the government they desire. It is no secret that every ruling party in Nepal has so far been reluctant to test its strength through that universally accepted democratic procedure. None of them ever set about taking the necessary steps such as dissolving the constituencies and preparation of electoral rolls. But surely no purpose will be served by blaming the preceding Ministries, particularly the last one led by Mr. Tanka Prasad Acharya, for being dilatory. The best course for the King and Dr. K. I. Singh would be to fix a date for the general elections after consulting the Election Commission and stick to it. It would allay the apprehensions of the public and the misgivings of the Opposition parties. Any delay in holding elections will merely accentuate the political instability which no amount of capricious reshuffling of the country's Cabinet will be able to eradicate. Democratic rights can be denied to the people of Nepal only by endangering the institution of kingship itself.

ALGERIA: CORE OF THE FRENCH CRISIS

THE TWENTY-THIRD post-war French Cabinet headed by M. Bourges-Maunoury has fallen. The fact that it had subsisted on the sufferance of a motley crowd of its supporters had made this inevitable some time or the other. That both the extreme Right and the extreme Left voted together against the Algerian Reform Bill was neither unexpected, nor unusual, nor unnatural. Their reasons for it were of course different. The Conservatives, including the Poujadists, voted against the Government because, according to them, the Bill would give the Algerians too much, and would create chaos and bloodshed in Algeria. The Communists and a sizable number of Left-wing Radicals, led by M. Mendes-France, rejected the Bill on the plea that it did not give the Algerians enough. It conceded merely local autonomy and not independence to Algeria. Looking at the Bill dispassionately one cannot escape the conclusion that the proposed "reforms" practically reserved everything for the French Government. France was to retain control of foreign affairs, defence and finance. The other subjects were to be transferred to an executive council which was answerable to a legislative assembly whose composition was to be based on the principle of communal representation.

Even if the French National Assembly had passed the Bill, the Algerians would not have condescended to touch it with a barge pole. After all, it is too much to expect that diarchy, which did not satisfy the pacifists among the nationalists in India forty years ago, should satisfy Algerians in armed revolt today. Moreover, far from adding up to a national entity, the autonomous territories will mean fragmentation of the entire area, which will, in turn, retard the growth of Algerian nationalism. What Algeria requires from France—and this is a matter about which there can be no two opinions—is not a programme of reforms but a clear definition of political objectives. If these fall short of independence no pattern of internal reforms can be accepted as a substitute.

The crisis in Paris offers evidence of France's bankrupt policies in Algeria. The policy which a former French Premier, M. Guy Mollet, described as "military pacification" is inadequate to answer the political needs of Algeria today. It may even result in the formation of an effective Arab front, which would ultimately wrench more from France than even what Algerian nationalists now demand. The French would do well to remember their humiliation in Indo-China, which might have been avoided if they had not offered to the Indo-Chinese too little and too late. In the context of cold-war calculations, strengthening anti-West elements in the Arab world by denying them what is theirs legitimately can only provide opportunities for the Russians to create trouble in the Middle East. This makes it incumbent upon the other countries of the Western world, more especially the United States and Britain, to "advise privately" the next French Government on how not to sacrifice the concepts of individual freedom and democracy, and the strategic needs of the free world, on the altar of colonial greed and imperial arrogance.

At no time, it is true, has the solution of the Algerian problem been easy. Today, lost opportunities and past errors confuse the North African landscape, and darken the horizon. But this is certain, that neither inhuman repression nor the game of musical chairs played by French politicians in Paris will solve the problem. What may offer a solution is the example of Britain in Malaya: the grant of a status to Algeria similar to the

one granted to Malaya by Britain. French colons in Algeria are matched by British planters in Malaya: nationalists in armed revolt in Algeria could be equated (for the sake of argument) to with Communist armed guerrillas in Malaya. By granting independence to Malaya, Britain has not lost anything. It has, on the other hand, gained a staunch friend. Why shouldn't France?

MR. DJILAS'S INCARCERATION

A FEW days ago, the three-year prison term of Mr. Milovan Djilas was interrupted by the powers in Yugoslavia that had passed the sentence, and he was tried for hostility towards the State. In plain words, he was tried for having written "The New Class". The trial took place at Sremska Mitrovica, 42 miles from Belgrade, and lasted just one day. It is hardly necessary to state that it was a complete and cruel farce. It is also not very necessary to state the strappings of democracy exhibited by Marshal Tito's Government — such as bringing Mr. Djilas formally to court — have not convinced the non-Communist world: on the other side of the iron curtain democratic procedures emptied of content are part of normal life.

The incarceration of Mr. Djilas is, of course, symbolic of the forces of tyranny in our times that freedom-loving men are pitted against. But it symbolizes much more. It brings into focus the encroachment of expediency on man's moral conscience. It has been said, in support of Marshal Tito's action against Mr. Djilas that his "The New Class" is being exploited against Yugoslavia by the Russian Government, and that choice is between the well-being of many and the "foolhardiness" of individuals like Dr. Dedijer and Mr. Djilas. The argument is chauvinistic. No ruler can in the same breath talk of democracy and indulge in such specious reasoning, without laying himself open to the charge of hypocrisy. The aim of the State, to use Dr. Radhakrishnan's words, is to see that the light of human recognition does not grow dim in men's eyes. By the continued imprisonment of Mr. Djilas, Marshal Tito will lose many friends in the world. In this desperate time of political adventure and perverted understanding, when trust and gratitude rub shoulders with fear and suspicion friendship and goodwill are valuable.

COST OF ROCKET DEVELOPMENT

IT IS now known that Russia developed a 500-mile range rocket in 1951-52, a 2,000-mile range guided missile in 1955, a 4,400-mile range missile in 1956 and a long-range inter-continental ballistic missile in August, 1957. She has just launched an earth satellite and plans to launch a series of bigger and heavier satellites in the near future. This colossal development in a comparatively short period of six years is a near-miracle which takes one's breath away. But the estimated cost of capital outlay on the development of the first earth satellite alone over five or six years is no less breath-taking. A British estimate has it that the Russian research effort in launching a satellite costing anything from Rs. 8 crores to Rs. 13.3 crores should have involved a total development outlay of about Rs. 6,667 crores over the period. One wonders what the total cost would be if the development of rocket-missiles for military purposes is also taken into account. Although the Russians appear to have combined their research effort on military missiles with that on the earth satellite and thereby economised expenditure, it may not be wide of the mark to give an estimate of Rs. 10,000 crores as the over-all total of development cost in the two related fields.

That the Soviets have been able to plough such enormous resources into the sector of rocket development alone, gives a clue to what they must be spending on the development of nuclear and thermo-nuclear weapons and the defence forces in general and on other scientific and technological research. All this has meant a comparatively modest real standard of living for the Russian people. For example, even after 5 Five-Year Plans, production of textile fabrics in Russia is just 32 yards per capita per annum and that of sugar just 38 lbs per capita per annum. These two figures may be compared with 16 yards and 11 lbs. respectively in India which is a land of unparalleled mass poverty. And thereby hangs a tale.

MR. DESHMUKH ON EDUCATION AND LANGUAGE

IN HIS convocation address at the Poona University Mr. C. D. Deshmukh, Chairman of the University Grants Commission, has made some suggestions which deserve wide consideration. First, he suggested in connection with scholarships awarded to poor students, that every university student should contribute a rupee per annum towards a scholarship fund for the purpose. The University Grants Commission would then contribute a sum equal to the total collected by the students, up to a ceiling of Rs. 10,000. The merits of such a scheme are many, the most outstanding being that it will infuse into the students a sense of responsibility, and teach them the value of giving. Moreover, in India we seem to have developed a habit of thinking that only the very wealthy can help others; whosoever can change that impression and prove that "widow's mites" can also go a long way to make life meaningful for themselves as well as others, will have done a national service.

Mr. Deshmukh's second suggestion was in relation to provision of workshops of carpentry, smithy, assembling of electronic appliances, and so on, where students can learn these crafts in their spare time. He also said the Commission might help improve existing facilities for the students learning fine arts like music and painting. These schemes will, in the first instance, be implemented in ten universities. A sum of Rs. 25,000 is to be allotted for buildings, an equal amount for equipment, and Rs. 5,000 for staff. The aim of these schemes is two-fold; one, inculcation in the student of the dignity of manual labour, and second, the development of character. Mild objection may be raised to these suggestions, on the ground that there are many more pressing needs to be attended to by universities, in the sphere of education. But character-building is, surely, the central objective of education. And does not dignity of manual labour imply modification of a deplorable general attitude, a modification which is an essential step in character-building?

Another suggestion was contained in a reference to the language problem. Mr. Deshmukh made a significant statement. There have been so many flare-ups over language in various parts of India that it is easy to assume that the very existence of more than one language in a country is a factor making for trouble. Mr. Deshmukh stressed, however, that the root-cause of all such flare-ups was quite often unrelated to language. He pointed out there are perfectly integrated bi-lingual States in existence, and "even a multi-lingual State can be a haven of peace" if fears stemming from religion or unequal economic development or the problems arising from the existence of minority or minorities are removed. He suggested, as was done in these columns recently, that Indians should endeavour to become multi-lingual, and consider the achievement of such a goal a challenge.

Millions of tons of goods await transport by road. The Heavy duty Leyland Comet can clear more goods in a shorter time.

The LEYLAND Comet carries in two trips what others do in three or more!

YES, Leyland Comet can carry 50% more goods every time than any other chassis made in India. Just think what this means to your operating costs. You save on time, save on fuel and save on maintenance. And you get more business from satisfied customers.

The Leyland Comet is built to carry heavy loads over long distances. Any Leyland operator will tell you that you can depend on it to give you trouble-free, low-cost operation year after year.

Leyland 'COMET'

The only 7½ ton payload chassis made in India

MAIN DEALERS:

For Jammu & Kashmir:
Jay Kay Automobiles
Residency Road, SRINAGAR (Kashmir)
For Delhi, Himachal Pradesh, Punjab & Rajasthan:
Globe Motors Private Limited
Saraidham, 1/2 Jhandewala, NEW DELHI
For Uttar Pradesh:
Dharam Singh Ram Singh (Motors) Private Limited
25 Bhopal House, Lal Bagh, LUCKNOW
For West Bengal, Bihar & Assam:
Associated Indian Enterprises (Private) Limited
206 Lower Circular Road, CALCUTTA 17
For Bombay State & Andhra Pradesh:
Automotive Manufacturers Private Limited
108 Bazaar Ward, Kurla, BOMBAY 37
For Madhya Pradesh & Orissa:
C. Eduljee & Company
Kamptee Road, NAGPUR
For Madras & Mysore:
George Oakes Private Limited,
36 D. Mount Road, MADRAS 2

Every chassis is designed to carry a specific load. The 'F' form specifies it. Too frequently, overloading is adopted to enhance revenue with consequent increases on the incidence of breakdown and in the cost of operation. You don't have to overload a Leyland Comet. It's built to carry 50% more than any other chassis made in India.

The Forward-Controlled Leyland Comet Chassis is designed specially to combine large body space with easy handling. The quick starting, long life Leyland Diesel engine, with its high torque output, combines pulling power with remarkably low fuel consumption.

Madras

AL 119 a

India delivers the goods- and Jute protects them!

And not only do those familiar gunny bags protect India's exports—but jute manufactures as a whole also remain one of our largest sources of foreign exchange.

That is why the jute industry is one on which so much of the strength of India's economy depends. And, like many other industries, jute looks to oil to protect its capital equipment and to play its part in the manufacturing process.

We supply to the mills of West Bengal a specialized petroleum product known as Jute Batching Oil. When emulsified with water, this oil softens the tough fibres of the raw jute and enables them to be split, shortened, drawn into a smooth ribbon and wound on a bobbin.

We also supply a range of lubricants which covers the complete requirements of the jute industry, and which has been developed after many years of careful study and research. So in the jute industry too—Burmah-Shell help to deliver the goods!

BURMAH-SHELL...

in India's life and part of it

A Window on the World

A NEW APPROACH TO THE WEST

By
ODYSSEUS

WHAT APPROACH might be adopted by Eastern statesmen, politicians, civil servants, business leaders, editorial writers and publicists, anxious to increase the flow of foreign capital without which the democratic nations of the East can neither raise their standards of living nor remain democracies?

The fundamental argument, which will evoke a warm and friendly response in the West, is that the ultimate interests of the free democracies of the East and the West are identical: the peace and prosperity which will enable the greater part of the world to live under governments which respect the freedom of the individual. Failure, therefore, on the part of either East or West to co-operate can only injure the interests of both. This argument does not exclude frankness, essential if understanding is to be promoted, but it does mean giving the democratic West the benefit of the doubt, putting the best and not the worst interpretations on its policy statements.

It is worth noting that two problems in East-West relations, India's foreign policy of non-commitment, and the scarifying effects of Socialist legislation on the foreign investor, are differences that do not revolve about objectives but about means. The object of India's policies is not to promote Communism but to preserve democracy.

All this implies that both East and West should consciously attempt to avoid name-calling and resentful criticism in public that characterises too much of what is at present said and written. If the press of the East were to decide to revise its attitude in the light of such a suggestion, would the 'Daily Express' and its fellow backwoods imperialists follow suit, or would they continue to smear Pandit Nehru? Lord Beaverbrook is too old to grow up and his splashing in the mud should be treated as no more important than those of a small boy: they do not represent the opinion of the people who influence policies. Correspondents of Eastern newspapers and news agencies, and the sub-editors who receive their cables, might reflect that every time that they bother to repeat these smears, the 'Daily Express' scores. The popular press thrives on controversy and the shriller the shrieks of international anger, the bigger their headlines and the happier they are. To ignore them would be political realism and sound child psychology.

CAUSES OF WESTERN FEARS

As far as Socialism and free enterprise are concerned, there is no basic East-West difference. In all countries, even the U.S.A., entrepreneurs accept that it is the state's function to try to set the economic tempo in matters of credit control and unemployment. Socialism, in the sense of complete control of all production, exists fully nowhere and is on the defensive everywhere. The West sees its future not in a Socialist but in a mixed economy. Failure to realise this in India leads to suspicion that the West will not invest in India "because India is Socialist". It is not the fear of Socialism that makes foreign investors shy but that the emphasis on heavy industry in the second Plan will cause (1) inflation and internal

social dis-satisfaction by showing no return for Indian consumers for many years, and (2) threaten India's balance of payments, thereby making it impossible for the foreigner to be paid for his services.

WHY RAISE THE RATE OF INTEREST?

India's best reply to these objections would not be an argument but a deed. If we are ready to pay a competitive rate of interest, capital would be attracted away from other markets to India on a substantial scale. Foreign oil companies are understood to have been told that New Delhi considers 8 per cent a fair return. But if an oil company can get 20 per cent in South America, why come to India? To offer a commercial rate of interest would also re-assure foreign savers, for it would mean that India had discarded the idea that there is some point in the scale of interest rates which divides the moral from the immoral, that a low rate is moral, a high rate is not. But dividends are not a reward for good morals but for taking risks, and the judge of the risk cannot be the recipient of investment but the man who has foregone consumption. His judgment is coloured by the history of foreign investment, which shows that there never has been a country which has not sooner or later defaulted in its payments, or else created conditions which made it more and more difficult for the foreign company to continue working. The investor must, therefore, either be allowed to foresee a period in which he can get a high return on his money or he will invest elsewhere.

"Why raise the rate," an ex-Governor of the Reserve Bank of India is quoted as having said recently, "when we are doing all the spending ourselves? Why raise the rate against us?" But who, except a nationalised insurance company, wants to save in present conditions in order to buy a bond yielding 4 per cent? Does our ex-Governor comb the Calcutta stock exchange list to invest his personal savings in those shares with high risks and low yields? If a commercial rate of interest prevailed in India there would be a corresponding effort on the part of potential domestic savers. Give them plentiful food grains, cheap cloth, and a resounding return on savings, and the mofussil will roll up in their millions to finance the Plan. Do you remember when the U.K. went off the gold standard in 1931 how the mofussil dug up its buried gold to cash in on the profit that could be made by selling gold? They will do the same today if you allow them the same profit.

That a government, which cries aloud for savings, should follow tax and other policies which reduce capital values on the stock exchanges by 50 per cent, or more, makes no sense. Moreover, some political circles gleefully regard these losses as punishment for people whom they dislike and therefore call "wicked capitalists." No one apparently has ever explained to them that stock exchanges are mechanisms for collecting savings and that their clients are savers. "But no!" replies the knowing politician, "stock exchanges are frequented by anti-social speculators. They should be closed down." Which is the same as arguing that because some civil servants may be cor-

rupt, the whole machinery of government should be closed down. Without a bureaucracy you will have neither corruption nor a government, and without stock exchanges you will have neither speculation nor savings.

As Paul Bareau, the British economist, said on his return from India recently, each time that he remarked on the Industries Development and Regulation Act which gives powers of life and death over any private undertaking, he was told "That's not meant for honest people but for scoundrels". May be, but it is the law and could be used arbitrarily by another government, if not by this one. We are so terrified lest one dishonest man escape that we bash the heads of all honest men as a precaution. This may be sound morals but as a way of increasing savings and production it is odd.

A MARSHALL PLAN FOR THE EAST

Now is the time for the statesmen of the East to get together to formulate a common platform of friendship with the West because never have there been more Westerners conscious of their responsibilities to the East. Barbara Ward, on whose splendid booklet "The Interplay of East and West" (Allen and Unwin, 1957, 10s. 6d.) I have drawn in previous weeks, and Professor P.M.S. Blackitt, whose theme in his presidential address to the British Association in Dublin on September 4 was the need for Western sacrifices to speed the development of the East, are but two symptoms of this movement of Western opinion.

One recalls June 5, 1947, when General G. C. Marshall made the historic speech in which he exposed "the dislocation of the entire fabric of European economy," a dislocation so vast that "for the next three or four years Europe must have substantial help from America." But, he insisted, "the initiative must come from Europe . . . When European countries have agreed on their requirements and on the part they themselves will play then, and then only, can the U.S.A. take supporting action." In response to this, the Marshall Plan was formulated by the European foreign ministers. Of course, the U.S.A. had a stake

in European democratic stability, but the Europeans did not approach the U.S.A. with flesh-creeching threats of what would happen if U.S. aid were not forthcoming, nor did they reproach the U.S.A. for the consequences of its years of neutrality in two world wars—years during which the Europeans in general, and the U.K. in particular, were dispersing the accumulated savings of a century in a cause which was America's no less than theirs. No, they approached the U.S.A. in terms of common democratic ideals, taking all possible steps to reassure American investors.

The result was European recovery and the permanent machinery of the Organisation for European Economic Co-operation, which has a big part to play in the coming inauguration of the European common market and free trade area, the logical outcome of Marshall aid and of the O.E.E.C.

If it be objected that in the World Bank, the Colombo Plan, and other institutions, the mechanisms for Western aid to pour into the East already exist and that all that is required is for the West to use them, I urge that what would quicken the life of these institutions would be a new attitude on the part of the East. Pandit Nehru gave Asia a lead when he said on three separate recent public occasions that the habit of lecturing the West on how to be good was not conducive to East-West co-operation.

Above all, the East must see that if it really wants investment in a big way, it must approach money markets and private investors, not governments. Government lending must always be confined within limits, but if you offer commercially attractive terms to ordinary investors, the volume of savings that can be conjured up is limitless, and when I say limitless I mean limitless. What limits saving is a low rate of return combined with taxation and legislation that takes profits away from the man who makes them. It is no good crawling on your knees to the domestic and foreign saver to lend to you and then shaking your fist in his face when he wants assurances about conditions and profits. You must make up your mind to give him the cake he wants or do without the cake that you want.

A FRENCH FEDERAL REPUBLIC

(From Our Special West European Correspondent)

PARIS, October 12.

AT the time of writing, France is still without a government and without any prospect of getting a government that will be more than a patchwork compromise of uncertain duration and undecided action. This is the most serious political crisis to date in the Fourth Republic because it has made clear that the present legislature, elected at the beginning of 1956, cannot produce among its various permutations and combinations any majority for any policy in Algeria. This is why it is referred to in Paris not as a "cabinet crisis" but as a "crisis of the regime"; that is to say, it cannot be resolved by the formation of a new cabinet but only by extensive reform of the constitution. Of course, some sort of cabinet will emerge within the next few days, but it will obtain the support of the legislature only if it promises to undertake reform of the regime. Though all parties are agreed on the need for constitutional reform, unfortunately they all have different ideas on the sort of reform that is required, so the mere appointment of a government solemnly pledged to change the constitution will solve nothing but will mark the beginning of a long and arduous struggle. At least it will put an end to the pretence that France's domestic and imperial problems can be dealt with within the framework of the constitution that emerged after the Liberation.

Three extremist proposals for reform can be laid aside as quite unlikely to be taken up: the Communist, Poujadist and Gaullist. These groups are permanent advocates of constitutional change and have not awaited the present cabinet crisis to demand an end to the Fourth Republic; but they have no more hope of being heeded now than at any other time in the past few years. The Gaullist pretension is the least improbable of the three. Given further and prolonged deterioration of the political situation, it is quite possible that the legislature should vote an appeal to the General to form a government. But the time is not yet for that.

Three other proposals for constitutional change have support among the "national" or democratic parties and it is these that will be discussed and possibly implemented within the life of this parliament. These are: a strengthening of the powers of the executive; electoral reform designed to reduce the number of parties in parliament; and revision of Article 8 of the constitution so as to convert France from a unitary republic, "one and indivisible", into some sort of federation.

The first, a strengthening of the executive at the expense of parliament, is demanded by the Centre-Right groups. But by itself it would not solve any of France's present difficulties. It is in fact an example of the eternal prejudice of the Right in all countries, the belief that political issues can be boiled down to administrative or technical questions. France's problem is not that the government has inadequate powers; on the contrary, successive cabinets have been awarded by parliament the most extensive and absolute powers, of which "special powers" now enjoyed by the Lacoste administration in Algeria are one instance. The problem is rather the nature of these governments themselves, their heterogeneous make-up and their dependence on conflicting groups in the Assembly for their continued existence. As long as the executive is

at all responsible to the Assembly (that is, as long as France does not honestly opt for the Gaullist solution), then no matter how great its special powers it will always be at the mercy of a divided legislature that has no one dominant will on any major question. On the other hand, if the Assembly could produce such a dominant will, a stable majority on the major issues, then the executive representing that majority would not need special powers and would not require to be strengthened. Such a state of affairs could only be brought about by the second Plan for constitutional reform, a revision of the electoral system. Meanwhile however, there is much to be said for the suggestion Monsieur Pleven has made during his efforts to form a cabinet, that the national parties agree on a one-year truce and form a mixed government with a guaranteed span of life. This would provide as much "strengthening" as the executive needs but it would be helpful only if during that one year the government took further the two remaining plans for constitutional reform that are yet to be discussed.

The suggestion for electoral reform is especially canvassed by the Mendes-France wing of the Radicals and is the soundest proposal in the field. A simpler method of election could produce fewer parties and enable a stable majority to emerge, but just because it would wipe out or at least much reduce several parties now amply represented in parliament, it amounts to an invitation to many politicians to commit suicide. Besides, it would affect the make-up of the next legislature, not the present one; and since the new system would take very many months to push through, France would remain saddled during a crucial phase of her history with the worst parliament she has ever had.

The third suggestion for reform concerns the article of the constitution that declares France to be a republic one and indivisible. It is this doctrine, a cherished heritage from the French Revolution, that has made it impossible for France to develop her political institutions so as to find room for the colonial peoples. According to this principle, a colonial territory is either part of metropolitan France or is an independent country. There is no intermediate stage between the present juridical situation of Algeria and the present totally independent status of Indo-China or Tunisia — yet it is precisely some such intermediate stage that is required for Algeria. By contrast, the myth of the British Crown allows for a whole range of political connections, from the position of Northern Ireland to India's. The suggestion is to abandon this doctrine and set up a federation that would concede autonomy to the African territories, including Algeria, while maintaining in France a unifying federal power; moreover a "confederation" could be grafted on to this federation thus making room for a connection with fully independent countries such as Tunisia and Morocco.

It might appear that revision of Article 8, however important, would only change France's connection with her overseas territories and would not therefore resolve any of the internal political difficulties tackled by the two preceding plans for reform. But in fact it is the question of the link with the African territories, and in the first place of course with Algeria, that is at the root of French domestic troubles. Once the Algerian question were settled and provision made

that the other African territories should never find themselves in similar straits, the other constitutional issues in France could be easily dealt with over a few years.

As long as the problem is discussed only in general terms, there is agreement even within this legislature on the urgency of revising Article 8. The words federation and confederation are being bandied about as though they were charms, usually accompanied by approving but quite ignorant references to the structure of the British Commonwealth. So it is quite likely that France's next government will have taken a pledge to move away from the unitary republic towards a federal or commonwealth system. Unhappily, however, many of the most enthusiastic supporters of federalism have only the vaguest idea of what is involved and it is to be feared that when it is realised what extensive changes would be entailed in converting the French Empire into a federation, support will languish, especially on the Right.

One question which may appear important is actually not so: this is whether the overseas members of the Empire have any wish to be federated. Most of them do. The recent conference of political parties in French West and Equatorial Africa, held in Bamako, decided in favour of federation with France, and a similar willingness has been expressed by the people of Madagascar and the French Atlantic possessions. But of course all these people assume that it is a genuine federation that is in question, and not a make-believe that simply disguises the continuation of French domination. The Algerians might appear to be a more difficult case, and indeed it is unlikely that the FLN and MNA would here and now agree to join a French federation. But if the federation were associated with Morocco and Tunisia, the question would be narrowed down to whether Algeria were "federated" or "confederated", or to how she could move from the former

to the latter situation. Thus federalism would at least open the way to some sort of negotiated settlement of the Algerian question.

Assuming then that the 30 odd million overseas members of the French Empire are in favour of federation, it is from the 43 million metropolitan Frenchmen that difficulties would come as soon as it were realised what concessions of sovereignty France would have to make to institute a genuine federation. A true federation would include as fully equal members: France, Algeria, Madagascar, Togoland, the Cameroons, West Africa, Equatorial Africa, Guadeloupe, Martinique, etc. Each of these states would have its own constitution, a local executive responsible to a locally elected assembly over a range of subjects (the Indian "States list"). Sovereignty would rest in a federal government and parliament, sitting in France but elected by universal suffrage by all the members of the federation. What is now metropolitan France would thus have no army, diplomacy, currency or customs of its own and only limited taxation; these powers would all be transferred to the federal authority.

Apart from the very dubious question of whether France is ready to make these concessions, there is the problem of whether a Franco-African federation would long be viable. It would not rest (as do the American, West German, Austrian or Swiss federations which are being mentioned as models) on any unity of territory, customs, language, traditions, religion or national sentiment. It would be a confection such as modern history has never known, and in which centrifugal tendencies would be very high. This is not to say that it would not work. But it is to say that the difficulties of making it work have not been faced by the politicians in France and Africa who are today preaching federalism as the solution of the crisis between France and her African possessions.

WORLDGRAM

AGRICULTURE

Control of Parasitic Diseases in Livestock: A Co-ordinated Scheme for control of diseases caused by certain parasitic worms with special reference to liver-fluke disease in Mysore State was considered at the Parasitology Committee of the Indian Council of Agricultural Research which met here under the chairmanship of Dr H. D. Srivastava, Head of the Division of Parasitology of the Indian Veterinary Research Institute. Another Scheme discussed at the meeting was for control of a nasal disease in bovines caused by a blood-fluke particularly in Mysore and the neighbouring States. The Committee also reviewed technical programmes and progress reports of research schemes already in progress in various States.

Sheep and Wool Development in Rajasthan: According to a recent scheme for the intensive development of Sheep and Wool industry, subsidised by I.C.A.R., 99 extension centres will be established in Rajasthan during the second Five-Year Plan. Twenty-two centres out of these have already been started at different places in Bikaner, Jaipur and Jodhpur Divisions. A sum of Rs 2½ lakhs has been sanctioned for this scheme in the first year, out of which 50 per cent will be given by the Government of India and the rest will be shared by the State Government.

INDUSTRY

Development of Cottage Match Industry: A hundred more cottage match factories are to be established during the current financial year. This is under a programme of development of the industry which is being implemented by the Khadi and Village Industries Commission. The programme also provides for training, experiments in match manufacturing and organizing field demonstrations. Also grants and loans are sanctioned to statutory State Boards, co-operative societies and registered institutions for the purpose. The Commission has sanctioned over Rs. 5.87 lakhs as grants and Rs 6.4 lakhs as loans for the development of the industry during the current financial year. The target of production for the 100 additional cottage match factories, which are expected to operate by the end of the year, is 30,000 gross match boxes. The production in 1956-57 was 16,931 gross match boxes as against 2,690 gross match boxes in the previous year.

New Sealing Device for Containers: New sealing devices for drums and various kinds of containers have been designed and developed at the National Physical Laboratory, New Delhi. The new devices are both economical and easy to manufacture. These can be easily fixed to the drum and can be removed from the drum for re-use when the drum is wasted. The new device consists of a set of couplings, a suitable packing, primary and secondary sealing arrangements, etc., and can be made in different sizes varying from 3/4" to 2", as required for specific uses. It can be attached to the container or drum by welding, soldering or by packing through nuts. The sealing device at present in use cannot be detached from the drums and as such becomes useless once a drum is discarded. It is also liable to leak in the event of the packing ring getting damaged or being not properly pressed between the nut and the container top. Drums and containers are at present extensively used for storage and transportation in various industries, such as petroleum, vegetable oil, chemical, pharmaceuticals, etc. Usually a set of two closures at the feed and discharge openings is used for sealing the contents of each container. Nearly 6 lakhs sets of sealing closures are required for new drums or

barrels produced and approximately 25 per cent more are required for replacement. The annual demand of the sealing devices is estimated to be about 8 lakhs sets. Parties desirous of undertaking the commercial development of the process are invited to correspond with the Secretary, National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi-1.

Standard for Cash Boxes: The Indian Standards Institution has published an Indian standard specification for cash boxes (IS: 1046-1957). This standard deals with requirements relating to materials, dimensions and also constructional details, particularly from the point of view of security. Only one size of cash box, which is most commonly in use, has been covered in the standard. Copies of the standard can be had from the Indian Standards Institution, 19, University Road, Delhi-8 and also from its branch offices at 40/40A, Cawasji Patel Street, Fort, Bombay; P-11, Mission Row Extension, Calcutta and 23, Nungambakkam High Road, Madras-6.

TRADE

U.K.-Bulgaria Trade: The trade arrangement between the United Kingdom and Bulgaria, due to expire at the end of the year, has now been extended until September 30, 1958. During the extended period Bulgaria is to purchase U.K. goods at the existing annual rate of £2.5 million including machinery textile, cloth and yarns, fish, copper sulphate and wollen rags. The U.K. market remains open without restriction to imports of many Bulgarian products, including grains and oil seeds, and the issue of import licences for some £1.5 million of other Bulgarian goods is provided for.

Sino-Japanese Trade: The Yawata Steel Company has announced an order for 41,000 tons of steel products from the China National Metals Import Corporation. The order worth about £3.3 million is the largest for steel received by Japan from China, since the end of the war. It includes 12,000 tons of galvanised iron, 10,000 tons of tinplate, 11,900 tons of cold rolled steel and 5,000 tons of silicon steel plate.

Onion Export Period Extended: The Government of India have decided to extend the validity period for onion export quotas, allotted for the March-August period, up to the end of October, 1957, says a trade notice issued by the Joint Chief Controller of Exports, Bombay.

Mexico Barter with Italy: Agreement has been reached between Mexico and Italy on barter terms for Mexico to export to Italy goods to the value of the \$11.9 million. Of these, cotton will constitute 75 per cent, henequen 20 per cent and coffee 5 per cent. Italy will send to Mexico, cheese, wines and liquors, chemical products, clothing and machinery.

Peru's Imports in 1956: Virtually all of Peru's major imports in 1956 were well above those in 1955, reflecting the increase in economic activity last year. The value of imports totalled the equivalent of U.S. \$361 million, an increase of 20 per cent over 1955. In terms of volume, machinery purchases rose by 21 per cent, vehicles and transport equipment by 36 per cent, iron and steel by 37 per cent, and fuel and lubricants by 22 per cent. The volume of imports of chemical products fell by 4 per cent. Good market prices, a high rate of domestic production, and new development projects resulted in a 30 per cent increase in the value of imports of mining machinery. To a large extent because of increased government assistance, the textile

industry increased its purchases of machinery by 25 per cent. Imports of machinery for the milling and food-processing industry increased by 18 per cent. Imports of consumer durable goods rose substantially. Total imports of foods, however, rose by only 1 per cent, food grains rose by 1 per cent; meat imports declined by 14 per cent; and imports of milk and dairy products remained the same as in 1955.

FINANCE

Seventy Five Million Dollar Bond Issue Planned: The International Bank for Reconstruction and Development proposes to make an offering of \$75 million Twenty-three Year 4-3/4 per cent Bonds this month. The issue will be sold through a nation-wide underwriting group under the joint management of Morgan Stanley and Co. and The First Boston Corporation. As in the two most recent issues in the United States market, the Bank, in addition to offering bonds for regular delivery, will extend to certain institutional purchasers of Bonds of this new issue the privilege of making delayed payments giving them a selection of specified delivery dates between February 1, 1958 and November 1, 1960. This arrangement is expected to serve the dual purpose of co-ordinating a portion of the Bank's borrowing with its disbursements and of making it possible for purchasers to arrange their payments to suit their individual preferences in the light of their own projected cash positions. The bonds will be non-redeemable for 10 years. During this ten-year period a purchase fund of equal monthly amounts aggregating 5 per cent per annum will operate to purchase Bonds available in the open market. Beginning in 1967, a sinking fund will be in effect calculated to retire 50 per cent of the issue by maturity.

Economic Development Institute: The Economic Development Institute, a staff college for the study of economic development problems, began its third course on October 1, 1957 in Washington, D.C. Twenty-two senior officials of eighteen countries have been selected to participate. All the officials hold positions of responsibility in government ministries, central banks, national planning authorities and development banks. They are nationals of the following countries: Burma, Chile, China, Ecuador, El Salvador, French West Africa, Ghana, Guatemala, Indonesia, Iraq, Japan, Malaya, Nigeria, Pakistan, Sudan, Trinidad, Uganda and Yugoslavia. The Institute was established by the World Bank in 1955 with financial support from the Ford and Rockefeller Foundations. Its aim is to improve the management of economic affairs in less developed countries by gathering together a group of senior officials from those countries and studying with them the practical problems that arise in preparing and carrying through development programmes and projects. Each Government whose candidate has been accepted will consider him on leave of absence with pay and will make a contribution of U.S. \$1,500 toward the costs of the Institute. The two six-months courses so far organized by the Institute have been attended by 32 officials from 26 countries. All have now returned to their home countries. The Institute is designed to provide those taking part with an integrated approach to the problems of economic development. The course is devoted to a study of the preparation of development programmes, historical aspects of development, the economics of development, the structural relationships within an economy, monetary and trade policy, problems of agricultural development, public finance, international trade and payments, and problems of programme and project appraisal. Throughout, extensive use will be made of

specific cases from recent experience, particularly that of the World Bank.

I.F.C. Investment in Chile: The International Finance Corporation announced on September 16 that it has reached agreement, subject to completion of the necessary legal formalities, for a \$2.2 million investment in Empresa Minera de Mantos Blancos, S.A., a Chilean corporation engaged in the development of a copper mine and smelter in the Antofagasta region of northern Chile. Mantos Blancos is controlled by Empresas Sudamericanas Consolidadas, S.A., a Panamanian corporation. Consolidadas holds the extensive mining, industrial, and commercial interests of Dr. Mauricio Hochschild and his associates throughout the major countries of South America, North America and Europe. Corporacion de Fomento de la Produccion of Chile and other Chilean and foreign nationals have small investment interests in the enterprise. I.F.C.'s investment, its first in Chile, is part of a financial programme totaling \$12.8 million for development of the Mantos Blancos mine and smelter located 47 kilometers north-east of Antofagasta, largest city and port of northern Chile. The ore deposit has been known for many years, but the development of the property required new metallurgical methods for treating the ore and also an adequate and reliable source of water which became available only this year. The Hochschild interest have invested about \$3 million during the past several years in defining the Mantos Blancos ore bodies and in engineering, through extensive pilot plant operations, a satisfactory metallurgical process. The proved ore body will now be developed, and a metallurgical plant will be constructed to process 2,000 tons of ore per day, producing about 25 million pounds of refined copper per year. Full-scale operation is expected by mid-1959. Including the \$3 million already invested in common shares by the stockholders' group, the total capital of Mantos Blancos will amount to \$12.8 million of which half will be in the form of unsecured debt and half equity. The Hochschild group is committed to provide the total equity \$6.4 million and \$2.2 million in debt. The balance of debt financing will be provided by \$2 million from the American Overseas Finance Company of New York and \$2.2 million from I.F.C. The I.F.C. investment of \$2.2 million will be in debentures bearing interest of 7 per cent, with amortization completed in 1968. The Corporation receives option rights to purchase at par \$1.1 million of Mantos Blancos common stock. In addition, I.F.C. may receive additional payments dependent upon the amount of dividends. The debentures can be redeemed without premium.

GENERAL

Expenditure on Education: India spent Rs. 1,894 million on Education in 1956, as compared to about Rs. 551 million on March 31, 1948. This includes total national expenditure on Education from all sources, governmental or otherwise. In 1956-57, the amount provided for education was nearly 12.3 per cent of the total national budget as compared to 7 per cent provided in the first Five-Year Plan. Overall expenditure on Education, however, has been steadily increasing during the last decade. On March 31, 1947, the major States and Centrally-Administered areas together spent about Rs. 205 million on Education. The Central budget was less than Rs. 20 million. The figures for three recent years, 1954-55, 1955-56 and 1956-57 show that the total budget provisions for Education by the Central and State Governments together rose to Rs. 1,177, Rs. 1,517 and Rs. 1,798 million respectively. Thus, even during the last three years the amount has increased by about 52 per cent.

NEWS IN BRIEF

INDIAN

Tata Iron and Steel Co. has been able to secure dollar loans from the World Bank and American Commercial Institutions. Of the total loan 17½ million dollars is from the World Bank and 14½ million dollars from the private commercial banks. The company had previously received 75 million dollars from the World Bank.

The Government of India has issued a notification in the Gazette of India Extraordinary relaxing the operation of Sections 19, 20 and 21, of the tea, 195/29 of 1953 in the case of export licences for dust teas applied for before December 1, 1957, which will be valid till March 1, 1958.

For the manufacturing industry group the index of industrial relations (base 1939=100) for the month of July 1957 was 140.2 as compared to 178.3 (revised) for the previous month and 141.1 for the corresponding month of the previous year.

The Government of India have reviewed the export policy for coconut oil cake and have decided to release a further quota of 5,000 tons for export by all shippers for the period ending December, 1957. Detailed licensing procedure will be notified by the Export Trade Control authorities at the ports.

The production of bicycles rose from 5 lakhs in 1955 to over 6 lakhs in 1956. The Industrial Finance Corporation of India sanctioned loans aggregating Rs. 80.5 lakhs to two units of this industry, both of whom availed themselves of the loans to the extent of Rs. 50.5 lakhs.

The target for export of rayon yarn fabrics for the current year has been fixed at 10 million yards which would normally consume about two million lbs. of yarn as raw material.

The Andhra Pradesh and the Mysore Governments have agreed to take up immediate execution of the Rs. 22 crore Tungabhadra high level canal project a joint venture of both the Governments and complete the common portion of it within the next five years.

Export of creosote oil (heavy) will not be allowed, says an Export Control Trade Notice. The notice, however, adds export of creosote oil (light) will continue to be licensed freely till the December 31, 1957. Licensing will be done on shipping bills as hitherto.

The Indian Standards Institution has published a standard code of practice for structural safety of buildings: loading standards. This is one of a series of standards which cover the functional requirements of buildings such as structural safety, fire safety, conformance with hygienic, sanitation, ventilation and daylight standards.

The Central Water and Power Commission has decided to undertake investigation of the Rs. 70-crore Punasa Power Project in Khandwa (Nimar) district of Madhya Pradesh. The Project is expected to generate 300,000 kilowatts of electricity.

The Government of India have reviewed the export policy for raw cotton and have decided to release a quota of fifty thousand bales of Bengal Deshi.

FOREIGN

West German coal output in September of 10,034,000 tons was nearly 7 per cent below the figure of the corresponding figure of last year, when 10,769,000 tons were mined.

The Department of Agriculture has raised price supports on 1957 crop maize to \$1.40 per bushel from the preliminary \$1.36 because of an increase in the parity price.

A U.K. shipyard mission is due to reach India on November 3 and stay until November 23. The mission, which is under the auspices of the Colombo Plan and the U.K. Shipbuilding Conference, will advise on the site and layout of a new shipyard.

The World Bank has approved a loan of 15 million Deutschmarks (about £1¼ million) to help complete a 190,000 kilowatt hydro-electric project being built near the Lunersee (Luner Lake) in Western Austria.

Japan's balance of payments during September produced a deficit of \$55 million compared with a deficit of \$69 million in the previous month.

The International Monetary Fund has lent Brazil \$37.5 million (£13.4 million). The loan brings Brazil's borrowings from the I.M.F. to \$75 million (£26.8 million) an amount that equals half Brazil's quota.

South Africa's total gold and foreign assets in the week ended September 27, totalled £113,415,000 compared with £110,483,000 a week earlier.

Australia and Canada have signed a double tax agreement. It was the third double tax agreement entered into by Australia, the others being with Britain and U.S.

The Government of the Federation of Malaya is likely to set up soon an Industrial Development Finance Company to encourage small secondary industries.

China's tea productivity was only 1/6 of Japan's because tea processing was done by hand in China and by machine in Japan. But the quality of China tea was far superior to Japan's. Last year China produced 2½ million piculs of tea and Japan 1,600,000 piculs.

It is reported South Africa recently obtained loans of 25 million dollars from the World Bank and 20 million dollars from a group of American bankers.

The West German gold and foreign exchange reserves rose by DM148 million (about £12.6 million) to DM24,360.9 million (about £2,073.3 million) in the week ended September 30.

The Development and Resources Corporation of New York announced recently that it had been authorised by the Persian Government to complete preliminary work on a 460 feet high dam on the river Dez, estimated to cost about \$60 million.

THE CHANGING PATTERN OF INDO-JAPANESE TRADE

THE visit to this country early this year of the Japanese Prime Minister and the just-concluded return visit to Japan of the Indian Prime Minister have heralded a promising and fruitful phase in economic relations between the two countries. The political foundation for a mutually beneficial trade relationship is now laid, and this is also in accord with the emerging pattern of Indo-Japanese trade which has revealed some salutary trends since 1955. For example, in the matter of cotton textile machinery, Japan has quadrupled their exports (in terms of value) to this country in the nine months ending December 1956 as compared to the nine months ending December 1955 whereas the United Kingdom has stepped up hers only by half and the United States has just maintained her 1955 level. In absolute terms, value figures of cotton textile machinery exports to India from the United Kingdom, Japan and the United States have been Rs. 2.8 crores, Rs. 0.9 crore and Rs. 0.7 crore respectively in the nine months ending December 1955 and Rs. 4.2 crores, Rs. 3.6 crores and Rs. 0.7 crore respectively in the nine months ending December 1956.

There is a natural element of reciprocity in this salutary trend because Japan's problem has been to secure a sizable market for her textile machinery and India's problem has been to secure a stable market for her iron and manganese ores. For these two latter items of merchandise Japan has provided an expanding market since 1955. On the other hand, the markets provided by the United Kingdom, France and the United

States for manganese ore — iron ore does not come into the picture here — have declined in terms of value since that year; the relevant figures of manganese ore exports are Rs. 1.2 crores to the United Kingdom, Rs. 1.4 crores to France and Rs. 6.2 crores to the United States in the nine months ending December 1955 and Rs. 0.8 crore, Rs. 0.7 crore and Rs. 2.7 crores respectively to these countries in the nine months ending December, 1956. Again, in the matter of our short staple cotton, its exports to the principal countries (the U.K., West Germany and Japan) have generally declined since 1955; but the decline in the market provided by Japan (which, however, continues to be the biggest single market for this commodity) has been far less than in the case of United Kingdom and West Germany. Trade figures show that the U.K., West Germany and Japan absorbed cotton valued at Rs. 2.5 crores, Rs. 0.5 crore and Rs. 8.7 crores respectively in the nine months ending December 1955 and Rs. 0.4 crore, Rs. 0.06 crore and Rs. 6.0 crores respectively in the nine months ending December 1956.

As the pattern of Indo-Japanese trade has changed in a manner which renders it necessary for India to depend increasingly on Japan as a market for her iron and manganese ores and raw cotton, it is only in the fitness of things that India, for her part, should provide an increasing market for Japan's textile and other possible machinery. It is in this context that the agreement about to be signed with a delegation of Japanese textile machinery manufacturers for the

supply of textile machinery worth Rs. 5.5 crores on a long-term credit basis has to be viewed. It is, again, in this context that the likely trade agreement for the supply, over a period of ten years, of iron ore valued at Rs. 150 crores to Japan and the supply of Japanese capital goods and machinery valued at the same amount to India acquires great significance. What machinery other than cotton textile machinery can be supplied by Japan is not clearly known, for in the imports in recent years from Japan other items of machinery and millwork have not been quite significant. But an examination of the scores of machinery imported from different countries for different industries

shows that Japan has exported to India in recent years a wide range of industrial and electric machinery albeit in small quantities. Power cranes, parts of mining machinery, machinery for the paper industry, glass house machinery, cement making machinery, ball-bearings and electric machinery are particularly noteworthy in this connection. It is a safe guess that Japan will be in a position to supply a wide variety of machines especially for our small-scale and medium-scale industries. The expected provision of a yen credit of Rs. 20 crores for the next two years may well facilitate the flow of textile and other machinery to this country.

A PLAN FOR LOW-COST HOUSING

(CONTRIBUTED)

IN RECENT YEARS, various countries have developed different methods to finance mass housing needs. All have, however, the common denominator of requiring a large amount of capital that can be invested in long term housing mortgages. In India at the present time, it would seem that surplus capital to support housing programmes commensurate with the need is not available. There is, however, a surplus of labour. The unemployment situation contains a unique factor: The unemployed are often young and healthy; thanks to the joint-family system, they are able to exist as consumers only, whereas at their time of life, they should primarily be producers. It is suggested here that as one approach to easing the housing shortage and creating employment opportunities, this labour pool could be tapped for work through a programme which would create jobs in house building.

Research has shown that by utilizing modern techniques of planning and construction, it is possible to build durable, attractive dwellings for as little as Rs. 4,000. Of this, only about Rs. 800 need be spent for manufactured or transported materials, such as steel, cement and coal. The remaining materials, with proper organization, can be made on the spot or locally procured by the use of labour alone.

Briefly, this proposal is based upon the following wage-scheme:—25 per cent of the wages to be paid to the construction workers as immediate cash wages, and 75 per cent to be deferred wages, paid in the form of short-term (10-12 years) national savings certificates—these national savings certificates to be retired out of the rental proceeds from the dwellings constructed; the cost of materials to be covered by charging a cash-down payment as the first instalment of a hire-pur-

chase arrangement between the prospective homeowner and a duly constituted housing authority or analogous body.

To demonstrate:—Take the instance of a dwelling costing Rs. 4,000 to construct. Let it be assumed that of this sum Rs. 800 represents manufactured materials which must be paid for upon delivery. Rs. 3,200 represents total labour cost, of which Rs. 200 is wages for a skilled foreman, and Rs. 3,000 is wages for semi-skilled and unskilled labour. Let it be further assumed that there exist today, many in need of housing who could pay Rs. 1,000 as down-payment for a small house of say 500 sq. ft., this down-payment is to be followed by monthly payments of Rs. 25. The payments are to continue for a period of 10 to 12 years, at the end of which time the house would be fully paid for.

The important features which emerge are: (1) The initial payment would be sufficient to cover the purchase of materials and leave a sum of Rs. 200 for paying the skilled labour such as a foreman who would not be available except at competitive wages. (2) The initial labour payment of Rs. 750 to the general labourers would be financed by a Government loan, or investment by private company. (3) The rental receipts for the first 36 months at Rs. 25 per month will amount to Rs. 900. This sum is sufficient to retire the loan at 6 per cent interest. (4) Finally, 96 additional monthly payments at Rs. 25 would return Rs. 2,400, thereby retiring the labour loan (national savings certificate) within 11 years after the sale of the house.

There is definite possibility that these figures could be given an even more favourable form, as the costs of such small houses could conceivably be reduced by approximately 25 per cent to 30 per cent. This reduction could be based upon the use of a more economical material than burnt clay bricks for the walls, for instance, stabilized earth bricks, which have already proved their worth in South Africa and elsewhere. Alternatively, the same scheme of financing might be extended to houses costing as much as Rs. 5,000 to 7,000, the limiting factor in that case being the ratio of maximum amount of monthly rental to the latest maturity date practicable for the savings certificate. In this connection, it may be observed that if the savings certificate were to be permitted re-sale, and the original certificate owner or construction worker could sell his bond at a discount, the desirability of the certificates would be enhanced as they would represent an immediate cash value.

It is suggested that the scheme be implemented by the establishment of a national housing authority, or a national construction board. This body would have the power to arrange for the entire work, and to collect the rental payments. The savings certificates could be issued by the Government in arrangement with the housing authority. Upon completion of a group of houses, Government would issue the necessary bonds to the Regional Housing Authority, the bonds being secured by the houses already constructed, plus the anticipated down-payments, and would be retired by the housing authority. Thus, Government is involved in only two phases of the programme. The issuance of a short term loan (3 years for working capital) and guarantee of the bonds.

While the first objective of this proposal is to make possible the construction of a large number of houses with a limited amount of capital, there are several secondary advantages: (1) Government would secure thereby the use of substantial funds for approximately 9 years as interest-free money. For instance, the yearly rental from only one lakh of houses at Rs. 25 per mensem would be Rs. 3.0 crores; the accumulated rental at the end of 5 years (after paying off the investment) would be Rs. 7.5 crores, and at the end of 10 years (just before the bonds became due) it

would be Rs. 22.5 crores, all realized on an average investment of Rs. 3.75 crores for only 3 years. (2) By transferring ownership to the occupants on the basis of a hire-purchase scheme, the cost of maintenance is not borne by the Government, and the equity represented by an approximately 25 per cent down-payment plus the accumulating monthly rental charge should provide adequate safeguard against abuse of the property in case of forfeiture. (3) Such easy financing from the homeowners' point of view — Rs. 1,000 down-payment and Rs. 25 per mensem for 11 years,—should help to stimulate a large-scale house building or construction industry. It is generally recognized that the retarded development of a large construction industry represents an economic weakness. In most countries, the construction industry is the largest single industry and the prime source of employment after agriculture.

In essence, this proposal is based on two assumptions: The technical possibility of good cheap housing under tropical conditions (proved existing examples in many foreign countries, as well as by research in India); and second, that the large pool of unemployed youth would suffer no loss to themselves, their families or their country, if they were to take employment with partially deferred pay, and that under the security peculiar to the joint family system, this labour pool may be attracted to work for part pay, plus national savings bonds for the balance.

It should be noted that the scheme is not proposed as an approach to small scale house construction. The technical problem posed by allowing only 20 per cent of the construction costs for manufactured articles can be met only by precise and detailed planning and organization of the construction work and only within the scope of a sizeable project, initially not less than several thousand units, in order to amortize administrative and design costs. After a few experiences, the economic size of a project can probably be reduced to 500 to 1,000 dwellings.

It may be objected that this proposal is without precedent—that not only is it untried here, but it has not been done elsewhere. It may be contended that the programme as outlined here is visualized within the peculiar conditions that exist today in India, and probably could not be carried out anywhere else, as only in India does there exist this particular combination of massive unemployment side by side with the quasi-security of the joint-family against the background of an aggravated housing shortage that has caused widespread doubling up and forced rentals to very high levels.

The foregoing scheme has not included the cost of developed land as part of the house cost or rent, for the reason that it is not considered necessary to require the same amortization period for land purchase as for building purchase. Land being permanent and of generally increasing value, it would seem desirable to allow a longer payment period say 20 to 25 years. With such a period a piece of property of, say, 30 x 60 ft. (200 sq. yds.) might be valued at Rs. 1,200-1,800—assume a down-payment of 25 per cent then the monthly rent including 6 per cent interest would vary between Rs 7.5 and Rs 8.5 per month. The financing of the land development could be in two stages if necessary—in the first stage only water supply, sewage disposal and a portion of the road system need be built. Then in some years, from rents collected, electricity could be installed and the road system completed. With such a two-stage land development programme it should be possible to limit the initial cash expenditure for land development to Rs 400-500 per plot, plus labour. This of course will require rationalization of plumbing and sanitary practices in the same way it is suggested, as the building, planning and construction requires rationalization.

CONSULT US ON YOUR FOREIGN BUSINESS PROBLEMS

Do you have any special problems connected with your trade or travel abroad?

Do you wish to know more about the currency or customs of foreign countries?

Do you require any specific information on trading opportunities in overseas markets?

The State Bank of India has now established for the benefit of its constituents a full fledged INFORMATION SERVICE to provide answers to these questions and many more—all free and without obligation.

Here is an opportunity for expanding existing connections and building up new ones in your overseas trade. Your enquiries will receive individual and prompt attention.

Why not talk things over with your nearest Bank Agent or write for information?

The State Bank's branch at Delhi, one of more than 555 offices waiting to offer you complete banking facilities for overseas trade.

LABOUR AT THE CROSSROADS

By
CROESUS

FROM the recent deliberations of the Sixth Annual Convention of the Hind Mazdoor Sabha (H.M.S.) at Bangalore, it should be evident, to anyone who cares to discern it, that labour today is at the crossroads and that as much depends on those who are guiding the destinies of this country, as on those who are guiding the affairs of trade unions in India, to put labour on the right road. If further time is lost in doing this, the authorities would have to thank themselves for the consequences.

A storm that threatened to import chaos into the ranks of labour fortunately blew over in Bangalore. It was just as well that this storm made its appearance in the form of a seemingly innocuous resolution by Mr B. S. Mahadeva Singh asking the H.M.S. to disaffiliate itself from the International Confederation of Free Trade Unions (I.C.F.T.U.). For this served as a slot in the arm to the complacently minded trade unionists and made them suddenly realise whither they were being led. Yet, it is not without significance that the voting in favour of the resolution was still as much as 125 and that it was lost only by 37 votes (162 votes being against), inasmuch as it shows that the position is not altogether without cause for anxiety. Perhaps a more persuasive speaker than Mr Mahadeva Singh might have succeeded in tilting the scale in favour of his resolution. It must be made clear here that the objection of layman like me is not to the resolution as such, but to the implications underlying it which were clear from the observations of the mover. He wanted the H.M.S. to disaffiliate itself from the I.C.F.T.U. because of "the anti-communist nature of the I.C.F.T.U. and the assiduous efforts of that organisation to build up an anti-working class body like the I.N.T.U.C. in India."

After the previous day's presidential exhortation of Mr J. N. Mitra "to avoid the complications arising from interested political parties dabbling in this field," the H.M.S. could not be expected to accept Mr. Mahadeva Singh's plea that the H.M.S. should disaffiliate itself from the I.C.F.T.U. because of the latter's alleged "anti-communist nature." As for his charge that the I.C.F.T.U. "is engaged in undermining the strength of the Sabha and the working class movement," the very fact that his resolution was not accepted by the H.M.S. betrays its hollowness. In all probability, if he had merely said "undermining the strength of the Sabha," the resolution would have been passed. Be that as it may, Mr. Mahadeva Singh seems to have come to this extraordinary conclusion—that the I.C.F.T.U. was undermining the working class movement—because, according to him, the I.N.T.U.C. is an anti-worker organisation and supporting it amounts to the I.C.F.T.U. undermining the strength of the working class movement! A member of the H.M.S. accusing a rival organisation like the I.N.T.U.C. is understandable, but to dub it as an anti-worker organisation is going too far even for a rival unionist. All this far-fetched argumentation of Mr Singh to get the H.M.S. disaffiliated from the I.C.F.T.U. only establishes that at least some in the H.M.S. are not averse to importing politics into the trade union movement, as much as the other trade union organisations in India, one of the several weaknesses to which the H.M.S. President himself alluded in his address.

Referring to the causes of weakness of the trade union movement in India, Mr Mitra listed the following:

- i) Misconception of the real role and function of trade unions;
- ii) Low level of education, and even illiteracy, of the majority of workers;
- iii) Want of trade union education and proper leadership training;
- iv) Control by political parties for party purposes and the consequent wrong direction and frittering away of the energies and resources;
- v) Inadequacy of funds; and
- vi) Disunity and rivalry among the units and the national organisations.

Of all these causes, control of trade unions by political parties seems to be the worst bane of the movement. Thus, envious of the admitted hold of the Indian National Congress on the I.N.T.U.C., the other political parties naturally want and try both to wean away I.N.T.U.C. members and to damn the I.N.T.U.C. Now that this game has started, unless the Congress leaves the I.N.T.U.C. to itself without actively aligning itself with it, the future of the I.N.T.U.C. as a trade union organisation may become uncertain and that of the trade union movement unpredictable. The I.N.T.U.C. has become firmly established as a workers' organisation on Gandhian lines, although still not wholly, and can certainly stand on its own feet without having to rely on Government. If it is not allowed to do so, the division of the trade union movement on political lines is bound to become more pronounced, which would not be to the interests of the working class. It is heartening to note that at least some trade unionists are aware of this danger and have begun to see the need to steer clear of politics.

It is indeed a matter for gratification that trade unions have thus begun to do some heart-searching among themselves with a view to finding out and overcoming their weaknesses. But even more noteworthy is their anxiety to be prepared to take on a new and responsible role. One is happy to find that trade unions have at last come to realise that their role and function do not end with agitating for higher wages and more amenities and that they also owe a responsibility to the community at large. But this requires to be more explicitly expressed than did the H.M.S. President in Bangalore, when he visualised that "the aim of the movement of the present epoch must go beyond mere securing of increased wages and amenities and must radically transform industrial relations in the sphere of social production, so that the entire structure of the society is changed and a new set of values is introduced in the life of the society." However, later in his address, Mr. Mitra dwelt on the difficult dual responsibility of administration of the union and of the industry itself in our mixed economy and said that the agitational phase must recede and give precedence to the question of increased output through planned and shared management. What the H.M.S. chief left unsaid but what requires to be said and, in fact, stressed is that increased output cannot stem only from shared management—a trend that has perhaps come to stay—but hard work and a certain amount of sacrifice, especially at times such as the present. This, however, is more easily said than done, more readily promised than performed, as the experience of the U.K. has clearly shown.

A PROBLEM IN EXPORTS

By CROESUS

ANYONE can see that India has become export-conscious. It is not necessary to be unduly critical and investigate the reasons for this, such as whether she has been forced into this as a result of the present foreign exchange impasse or she has entered upon this phase merely in the normal course of evolution through which countries which embark on industrialisation must perforce pass. But it is necessary to examine whether India has been following in the wake of aggressive exporters like the U.K. and Japan. Despite dissimilar conditions in these countries, which have to export to survive, and in our own, which, like America and China, has a vast domestic market to cater to, it is a moot point whether we can at all make any impression in the few limited markets abroad, where there is still some scope for free and uninhibited competition, unless we too adopt the same methods and policies as these aggressive exporters. As competition grows keener and keener, these methods and policies also tend to get intensified and varied. Accordingly, the utmost vigilance is called for on the part of anyone entering this arena. One would sincerely like to hope that those in charge of export promotion—both official and non-official bodies—are aware of all these. None of these is new by any means, but, precisely for that reason, they are liable to be overlooked.

These reflections forced themselves on me when I heard about certain inconclusive discussions on a simple measure of export promotion such as how to make good the loss to the supplier of any raw material or an industry which is prepared to supply its products at a concessional rate to another industry for further processing and exporting. Exemption from excise duty (to the extent to which the component commodity that is subject to excise duty may be liable) occurs to anyone as being the most common, but then there are instances where just this will not do. In such cases, it may become necessary, in the larger interests of the country, — that is to export more and augment the foreign exchange earnings of the country — to compensate the interests concerned for any sacrifice that they may be called upon to make to stimulate exports, by permitting them to charge a slightly higher rate to domestic consumers 'within limitations.' The limitations are (i) that the increase so permitted does not add to the country's inflation and (ii) that it does not give rise to consumer resistance of a dimension that may adversely affect production and lead to unemployment. It is just as well that these limitations are there, inherent in the situation itself, as it were, so that there can be neither hue and cry by interested parties that the consumer is unduly mulcted by the industry and that the Government is a party to this exploitation, nor scope or temptation for the industry concerned to charge an unreasonable price to domestic consumers.

Subject to these, I feel, no serious exception can be taken to the proposal to permit an industry to charge a slightly higher rate to indigenous consumers in order to make up the loss on exports. If the Government can impose a penal excise duty on cotton piecegoods, as it has done, avowedly with a view to restraining consumption in the name of inflation (or as an anti-inflationary measure), there is no earthly reason why an industry, which is out to help the country's export drive, should not be permitted to charge a differential price to consumers within the country. Only care must be taken to see that, between two good intentions — one to fight inflation and another to promote exports — the resulting cumulative incidence of the burden on the indigenous consumers is not such as to drive him to go on strike, in other words to lead to consumer-resistance, with all its attendant unwelcome consequences, as already stated.

The industry in respect of which the foregoing

problem has currently arisen is the rayon industry. It must be said to the credit of this industry that, when it was suggested to it to supply yarn at a concessional rate to weaving mills undertaking a definite commitment to export, it readily agreed to do so. Naturally enough, no industry can be expected to make this sacrifice indefinitely without leading to complications. For one thing, the shareholders of some units of the industry may complain that this cuts into their dividends. Again, the newer units, which have not yet emerged out of teething troubles, may, not find it possible to make the sacrifice, even if willing. This explains why the rayon industry has agreed to make the sacrifice for a period of six months, as an experimental measure, without insisting on the indigenous consumer being asked to pay for this sacrifice during this six-month period. However, sooner or later, this question has to be decided and sooner the better.

It is not in regard to the export of rayon piecegoods alone that this question needs to be looked into. There are a number of other manufactured goods, besides, which seem to offer export potentialities, especially to our neighbouring countries. Electric fans, sewing machines, and bicycles are instances that readily occur to one's mind. It may be that, where any of these industries has a tie-up arrangement with a foreign manufacturer under a specific agreement, the said agreement precludes exports to given destinations, but one hopes these agreements do not bind the industrialists of our country for perpetuity. Here, it behoves the authorities to scrutinise all tie-up agreements, whether new or those that come up for renewal, to ensure that they are free from any obligation precluding the indigenous manufacturers from exporting to India's natural and neighbouring markets.

MANAGEMENT TOPICS

is the first and the fast growing monthly magazine for management in India.

WHY?

Because in "Management Topics" you find ideas that can mean so much to your future and to your present. Its format, size and articles have won for it the loyalty and confidence of Indian Management, may it be in Industry, Commerce, Trade or Government. Annual Subscriptions Rs. Six only.

BUSINESS NOTES

SOCIAL AND ECONOMIC LIFE OF ASIA

THE REPORT of the Director General of the International Labour Organisation prepared for the ILO's Fourth Asian Regional Conference to be held in New Delhi next month is revealing in many ways. It strikes a dismal note in living levels between Asia and the rest of the world which has widened in the last few years. Although progress has been made in Asian countries in the field of agriculture, industry and social services, it has not been in tune with the progress attained in the advanced countries of the West. The main cause of this slowness of progress is attributed to inflation, lack of external finance and the inability to mobilise fully domestic resources for economic reconstruction. While it is true that lack of external finance is hindering the development of Indian economy to a certain degree, it cannot be said in the case of this country that domestic resources are not being fully mobilised. The State and Central budgets which have been running into deficits in recent years prove that domestic resources have been stretched. Central Government taxation has been so heavy this year that the Finance Ministers in most States had to stay their hands in the matter of new taxation.

In so far as the level of education in Asia is concerned, there is no doubt that it is deplorably low. And this is responsible in a considerable degree for this uneven development of the Asian countries. There has been since 1950, perceptible rise in the level of literacy all over the world, but the progress has been least in Asia. While adult literacy is highest (more than 95 per cent) in Europe and North America, South-East Asia (estimated at 30-35 per cent) and South-West Asia (20-25 per cent) fall far below the world average. Mr. David Morse is right when he says that "unless there is substantial improvement in the levels of education in Asia, the gap between the highly industrialised countries and the less developed ones will remain as wide or become even wider than it is today." Some steps have been taken in technical and vocational training programmes for agriculture as well as industry, but they are planned on a modest scale and there is considerable scope for improving the quality of training. Probably what Mr. Morse had in mind when he stressed the point of education is technical education in particular. In this context the role played by the I.L.O. in Asian countries in imparting useful training, and bettering labour-management relations by enforcing social standards is welcome.

The lop-sided economic pattern calls for liberal assistance from more prosperous countries for developing the underdeveloped economies. The feeling is that too much is being spent in Western countries for arms and armaments. Perhaps much of that could be curtailed and the same could be utilised for improving the living conditions in underdeveloped countries. In Asia itself, there is urgent need that production of goods and services be expanded at a rapid rate as the acceleration of population growth is a constant menace to the economic growth of Asia.

EXPANSION OF EXPORTS

TIME AND again, the urgent need for expanding India's export trade finds expression in responsible quarters both in Government and trade circles. But it seems that much energy is spent on chalking out of programmes, while actual implementation receives less attention than is needed. The magnitude of the necessary export expansion drive can be assessed from the ever-increasing balance of payments deficits. The country has had to take recourse to severe restriction of imports which can be nothing more than a temporary expedient. A developing economy like India's can res-

trict imports only at the risk of restricting its economic development. It hardly needs to be stressed that a solution of the problem lies in reducing the gross imbalance in the country's imports and exports by increasing exports both in volume and value. Export expansion is, no doubt, beset with its difficulties. But it would not make sense to think that the difficulties are insurmountable. Nor has the country reached anywhere near the limit point in exports, notwithstanding the changing pattern of trade and commerce in many countries some of which are slipping out of India's market fold. These views have been particularly underlined by the Chairman of All-India Manufacturers Organisation, Mr. S. N. Haji, recently at a meeting of the Organisation. According to him, India exports no more than 5 or 6 per cent of her gross national product per annum. This percentage is as low as a fourth or fifth of the normal percentage of most other countries.

The difficulties in increasing exports lie as much in finding good markets as in producing for such markets. For example, Japan is pushing this country out of some cotton piece goods markets. A sizable part of the mica market, in which India holds a near monopoly, is gradually diminishing in size. A real threat exists even in the case of jute manufactures. All this points to one cardinal fact; while cheaper substitutes are being found abroad for a large range of goods, India is doing little towards popularising her wares and making them competitive. Again, sugar is one item where higher export earnings could be achieved rapidly if experiment with co-operatives were not pursued with the present zeal bordering on obstinacy. For achieving substantial results, it is imperative that the Government provide incentives in various forms like concessions on levies. Another effective means can be in liberalising, at least partly, restrictions on the utilisation of the increased foreign exchange earnings which may be used for raw material and similar other imports. Much needs to be done also in improving quality standards of the country's manufactures. This is perhaps the most important aspect which should engage the attention of the interests concerned. If the recommendation of the Export Promotion Committee, that the country's export trade can be increased by Rs. 100 crores, is to be translated into a reality, the Government should set about the programme with no further delay. Obviously the task is not so easy as that and there can be no doubt that the solution has been oversimplified by the committee. Manufacturers and traders have their own responsibilities and it will be very much to their interests to observe them.

INDIANS IN CEYLON ESTATES

DISTURBING REPORTS have come in of the Ceylon Government's decision to push forward its programme of 'Ceylonisation' of estates. The Labour Minister of Ceylon is stated to be thinking in terms of amending that country's labour laws in order to bring in more Sinhalese in the estates. According to this plan, in future, all the vacancies in some estates and 50 per cent in others would be shut out to labour of Indian origin. The problem of Ceylon Indians has been dogging the two countries for a long time. In fact it has, at times, given rise to bitterness on both sides, making it less easy to build ideal relations between the two countries. The present move is held out as designed to meet the unemployment problem facing that country. In real terms, however, it is no solution of the problem. All that it will achieve is to shift the burden from one section of the people to another. Any benefit that the policy may fetch to the Sinhalese cannot be of a substantial magnitude. Only, the pursuit of the policy will create new and more complex problems not only for the Government of Ceylon but also for the estates.

The 'Ceylonisation' policy is not confined to the estates or rural areas alone. In urban areas also, severe measures have been adopted for quickening the pace of repatriation of Indians in Ceylon. The question is, no doubt, one of the few points at issue between Ceylon and India, and has defied solution that would be acceptable to both the countries. But stripped of its political trappings, the economic consequences of the programme should not be encouraging even for the most enthusiastic Sinhalese. Particularly in the case of estates, the skill and efficiency acquired by the Indian labour in Ceylon is not a marginal factor. For many long years, the Indian labourer, along with the major and minor members of his family, has lived in these estates, contributed to their ever-growing prosperity and has become almost a part of them. To tear him away from there and substitute him by an uninitiated and, in many cases essentially unwilling, worker is bound to be detrimental to the production in the estate. The problem is not one that can lend itself to any easy and hurried solution. This is a problem which needs to be handled with caution and care if major upsets, economic and political, are to be averted.

WORLD BANK LOAN TO TISCO

THE TATA IRON AND STEEL COMPANY has succeeded in securing a \$32 million loan from the World Bank and American commercial institutions. The break-up is \$17.5 million from the World Bank and \$14.5 million from American commercial banks. This, it is significant, fulfills the company's foreign exchange needs for its expansion programme. It is without doubt a major achievement. The rupee part of the expansion programme would be met from the share capital to the extent of Rs. 13.5 crores and from local borrowings to the extent of Rs. 12 crores. The balance is to be met from recent earnings.

The company embarked upon its much delayed expansion schemes in 1953. At present the steel ingot capacity is 1.3 million tons per year. It is expected to reach on the completion of the current modernisation and expansion programme to two million tons. Despite certain unforeseen difficulties, considerable progress has been made. Orders have been placed for the major part of the equipment for the refractories plant being put up at Belpahar in Orissa jointly with Messrs. Didier-Werke A.G. and for the rotary calcining kiln to be installed at Salem in Madras State for supplying dead burnt magnesite to the refractories plant. The plants are expected to commence production by the middle of 1958. The installation of the plant by Messrs. Hukett Engineering Inc. of U.S.A. for the recovery of steel scrap from slag accumulated in the past or currently produced is nearing completion. Satisfactory progress has been made with the construction at Joda in Orissa of the electric ferro-manganese plant which is now expected to be completed by October, 1954. Orders have also been placed for the major part of the equipment required for the mechanisation of the Noamundi and Joda East Iron mines. While, at present, a part of the coal raised at Jamadoba and West Bokaro is washed at the coal washing plants located at these collieries, the company is expanding the Jamadoba coal washing plant so that by 1959 all the coal raised at the company's collieries may be washed. The new ferro-sulphide washing plant manufactured and erected near the coke ovens is expected to commence regular operations shortly.

So far as TISCO's output is concerned, the company has been showing progress in recent years as the following figures would bear it out:

	1954-55	1955-56	1956-57
Pig Iron	1,128	1,150	1,151
Steel Ingots	1,010	1,059	1,071
	(Tons in Thousands)		

The credit of securing the \$14.5 million loan from American commercial banks out of the recent total loan

of \$32 million goes to Mr. J. R. D. Tata and TISCO's management. The soundness of the expansion programme and the higher production targets achieved by the Company were responsible in a considerable degree in securing the World Bank loan. This incidentally is a clear instance of the massive contribution of the private sector in promoting the economic development of the country.

SUNDATTA COTTON-SEED UTILISATION, LTD.

THE FIFTH annual report of Sundatta Cotton-seed Utilisation, Ltd., is a notable example of what enlightened private enterprise can achieve in congenial circumstances. Within a period of just five years, this company, with a paid-up capital of approximately Rs. 7-1/2 lakhs, has reached a stage when its gross profits amount to nearly Rs. 5 lakhs. This is an undertaking, again, which has been fortunate enough to be engaged in an industry that is presently receiving every encouragement at the hands of the Government, and which has also managed to secure short-term credit facilities from the Export-Import Bank, Washington (U.S.A.). The support of a well-known industrial undertaking (The Tata Oil Mills Co., Ltd.) and the timely help and guidance of its good bankers (The Eastern Bank, Ltd.) have been helpful in finding profitable business for the Company and arranging deferred credit facilities for purchase of new plant.

Being a concern engaged in an industry which the Government is keenly interested in developing, Sundatta Cotton-Seed Utilisation, Ltd. has even got a loan sanctioned from the Industrial Finance Corporation. In short, the Company has been lucky to go through the years of teething trouble practically unscathed, although nature seems to have reminded the management that, in an essentially agricultural country like ours, the fortunes of an industry based on agricultural commodities are always dependent on timely and sufficient rains and a good crop. Thus, during the current year, the Company hopes to crush only 75 per cent of that crushed during the year under report (year ended December 31, 1956). In the latter year, the Sundatta crushed a little over 11,000 tons of cottonseeds, of which 1,750 tons were for the Tata Oil Mills Co. Ltd., on a contract basis. This was about the same as for the preceding year (1955) also. The virtual failure of the cotton crop in the region and its roundabouts where the Company's factory is located, coupled with the closure of the Suez Canal, affected the year's working. Uncannily anticipating this, as also the import cuts perhaps—it now seems in retrospect the management had ordered for a Solvent Extraction Plant in good time so as to be able to diversify its operations and products to meet all eventualities.

The Government of India has announced its determination to develop the cotton seed industry in a priority basis. In order to encourage the processing of cotton seed and the de-oiling of groundnut cake, it has recently done away with the export duty on cotton seed cake and drastically slashed the export duty on de-oiled groundnut meal (from Rs. 175 to Rs. 50 per ton). Further, the Vanaspati manufacturers have been asked to incorporate at least 10 per cent of cotton seed oil in Vanaspati. Moreover, the excise duty on cotton seed oil is only 50 per cent (Rs. 56 per cent) of what it is on other non-essential oils, and it is believed the Government is considering to abolish even this.

With all these facilities available to the industry, the management of Sundatta has done well not only to raise further share capital (of over Rs. 3-1/2 lakhs) but also to secure a long-term loan from the I.F.C. (of Rs. 4-1/2 lakhs), in addition to the short-term credit facilities (to the tune of Rs. 3-3/4 lakhs) from the Export-Import Bank referred to above, so as to take the maximum advantage.

FACTS BEHIND FIGURES

171 million
acre
feet water
for
power and
plenty

TEXMACO

serves India's basic industries

TEXTILE MACHINERY CORPORATION LIMITED

Astride India's rivers are rising mighty dams to bring power and plenty to the nation. With the completion of the major Plan projects, 171 million acre feet of India's river water will be harnessed. The new river valley schemes will release 2,000,000 KW power and irrigate 16 million acres. The total expenditure on irrigation, power and flood control during the next five years will be Rs. 913 crores, a 38% increase over the First Plan. These great development schemes constitute one of the most important aspects of the nation's efforts to achieve economic self-sufficiency. Texmaco, pioneer in many fields of engineering, working in technical collaboration with Voest of Linz, Austria, has constructed a wide range of hydraulic dam equipment for Rupar, Hirakud and other projects.

a pilfer-proof package for every product!

The manufacture of Metal Box's range of pilfer-proof containers and closures is backed by an active Research Organisation. The Central Laboratory in Calcutta assists suppliers in developing improved printing inks, surface finishes and protective lacquers, and maintains strict routine tests for all incoming raw materials to the Metal Box factories; on the spot control of operations is carried out by Branch Laboratories. This ensures pilfer-proof containers and closures of the highest quality, superbly printed and finished. Expert scientific advice from Associates throughout the world is available to assist in solving customers' packaging problems.

COMPANY AFFAIRS

THE KHATAU MAKANJI SPG. & WVG. CO., LTD.

The Khatau Makanji Spg. & Wvg. Co. Ltd., reports a net profit for the year ended June 30, 1957 of Rs. 15,39,481, after providing for depreciation (Rs. 22,58,966) but before taxation (provision for taxation being Rs. 14,15,000). As the amount at Rs. 1,50,709 left after providing for taxation was not adequate for the dividends recommended, a sum of Rs. 9 lakhs has had to be transferred from general reserves. Besides the usual dividend on preference shares of 4 per cent without tax the Directors have recommended a dividend of Rs. 4 per share on ordinary shares. In respect of the year under review, no appropriation has been made for development reserve, as, in the opinion of the Directors, "the amount provided so far is sufficient to cover saving in tax on development rebate till date."

In line with the general experience of the cotton mill industry, the profits of the Company showed a decline "due to adverse conditions in the cloth market and higher prices of Egyptian Cotton." It is noteworthy that the management has placed orders for new machinery of the value of Rs. 29,20,370 "with a view to improve and maintain the efficiency of the Company's plant and equipment."

THE BOMBAY STATE CO-OPERATIVE BANK, LTD.

The latest report of the Bombay State Co-operative Bank, Ltd., namely that for the year ended June 30, 1957, is the first report of the Bank to be published after the reorganisation of the States, as a result of which four districts constituting the Bombay Karnataka were transferred to the Mysore State. For the same reason, the new areas, including Kutch, Marathwada, Saurashtra and Vidharba, also should have come within the purview of the Bank. But, owing to the diversities of the co-operative structures in these areas, integration has yet to take place and awaits the recommendations of the committee set up in this behalf by the Government of Bombay.

The net profit of the Bank for the year ended June 30, 1957 amounted to Rs. 6,84,064. To some extent, very slightly albeit, the higher profits were due to the increase in interest rates generally and the increase in interest on short-term deposits and on savings account by the Bank. Deposits, on the other hand, registered a decline, the decline being as much as Rs. 138.36 lakhs, as against a rise of Rs. 206 lakhs in 1955-56, "owing to keen competition from commercial banks and other factors beyond the control of the Board." It is significant that the largest drop (Rs. 112.96 lakhs) was in respect of deposits of central financing agencies, the decline in respect of individuals being only Rs. 22.27 lakhs and that in respect of other co-operative institutions being lower still at Rs. 3.13 lakhs. Among other factors, the transfer of the business of the branches of the Bank in three districts to the newly established District Central Co-operative banks led to a loss of Rs. 27 lakhs.

A notable feature of the report is the extent of loans and advances to co-operatives for purposes other than seasonal agricultural operations. During the year under report, these were higher by Rs. 190.93 lakhs, out of which as much as Rs. 137.15 lakhs were accounted for by co-operative sugar factories alone. According to the report, four sugar factories were granted loans for Rs. 130.43 lakhs as working capital and six factories were given temporary loans to the extent of Rs. 84.24 lakhs, pending disbursement of the loans sanctioned to them by the Industrial Finance Corporation, and intermediate term loans of Rs. 60 lakhs on Government guarantee. Thus, co-operative sugar factories are not only given direct loans but also interim loans pending grant of loans by the Industrial Finance Corporation, as also loans on Government guarantee. This doubt-

less explains the remarkable progress of co-operative sugar factories in the Bombay State.

THE BURRAKUR COAL CO.

The profit and loss account of the Company for the half-year ended December 31, 1956, after providing for all charges and making provision of Rs. 5,77,826 for taxation and Rs. 5,77,161 for Depreciation shows a profit of Rs. 1,99,378. To this has been added the balance of Rs. 36,163 brought forward from previous half-year. A sum of Rs. 6,00,000 has been transferred from the General Reserve. The provision of Rs. 4,40,000 for Ropeway Rope Replacement has also been written back, making a total of Rs. 12,71,800. From this amount a sum of Rs. 45,200 has been transferred to tax contingency reserve, Rs. 25,000 to debenture redemption reserve, Rs. 18,000 to development rebate reserve, Rs. 70,000 to provision for aerial rope and Rs. 5,90,000 to provision for payments against Appellate Award. This leaves a balance of Rs. 5,23,600.

Dividends of 7 per cent and 6 per cent per annum on 1st Preference and 2nd Preference Shares, respectively, has been declared to be paid, without any deduction for Income-tax payable by the company. Dividend of 7½ per cent per annum, without any deduction for Income Tax payable by the company has been decided to be paid on Ordinary Shares, which will absorb Rs. 3,40,968. The balance of Rs. 92,391 has been decided to be carried forward.

COMMODITY NEWS AND NOTES

RAISINGS AND DESPATCH OF COAL DURING JULY, 1957

Coalfields in India raised 3,331,257 tons of coal during July, 1957. The amount of coal despatched during the period from all the fields in the country was 3,077,367 tons. The daily average loading for the month of August, 1957 from Bengal and Bihar fields was 3,794 wagons. This, however, showed an increase as compared to the previous month's loading of 3,576 wagons. The highest loading on any day during the month of August 1957 was 4,608 wagons and the lowest was 2,269 wagons. The tonnage of coal shipped during the period was approximately 1,88,472 tons in 29 ships. Out of these, the coastal shipping accounted for 85,734 tons in 13 ships and that in foreign accounted for 1,02,738 tons in 16 ships. A daily average of 276 wagons was allotted for shipment traffic during the period. It has, however, remained the same as against the previous month. The coal despatched to Pakistan during August 1957 amounted to 95,700 tons.

FINAL ESTIMATE OF TOBACCO FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of tobacco, 1956-57, puts that year's area and production at 1,022,000 acres and 306,000 tons, as against the partially revised estimate of 1,013,000 acres and 295,000 tons for 1955-56. This shows an increase of 9,000 acres or 0.9 per cent in area, and 11,000 tons or 3.7 per cent in production over 1955-56. The increase in area during the current year has been shared mainly by Bihar and Rajasthan States, and has been attributed to favourable climatic conditions at the time of sowing. The increase in production has occurred in Andhra Pradesh, Bihar, Bombay, Madras, Mysore and Rajasthan, and is due partly to increase in area and partly to favourable weather conditions during the growing period.

GROUNDNUT ACREAGE UP BY 9.4 PER CENT

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of groundnut, 1957-58, puts the current year's area at 9,895,000 acres, as against the corresponding adjusted estimate of 9,044,000 acres for 1956-57. This shows an increase of 851,000 acres or 9.4 per cent in area during the current year, as compared to last year. The increase in area during the current year has been shared by all the groundnut growing States, and has been attributed generally to favourable weather conditions at the time of sowing. The increase in groundnut acreage is more marked in the case of Bombay and Madhya Pradesh. The information given in this estimate covers the period generally up to the end of July 1957. Till then, the condition of the crop was reported to be generally satisfactory. The estimate does not cover the entire area sown to groundnut crop during 1957-58. Past experience has shown that the area at the first estimate stage forms roughly 62 per cent of the area under the crop finally reported.

INCREASE IN MESTA ACREAGE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of mesta, 1957-58, puts the current year's area at 225,000 acres, as against the corresponding adjusted estimate of 194,000 acres for 1956-57. This shows an increase of 31,000 acres or 16.0 per cent in area during the current year as compared to last year. The increase in acreage during the current year has

been shared mainly by Bihar and to a smaller extent by Andhra Pradesh, and has been attributed generally to favourable climatic conditions at the sowing time. The increase in acreage has, however, been offset to some extent by decreases registered mainly in Mysore State. This estimate covers the period generally up to the end of June or beginning of July 1957.

The Success of a Mission

THE Finance Minister who returned to India yesterday, after an absence of a month, has earned from the Indian people a warm tribute for the able and imaginative manner in which he has discharged his difficult mission. No Finance Minister of India has ever had at any time so enormous a task to accomplish both at home and abroad. At home expectations were unduly high, and abroad interest in India unduly low. The time was short, and the character of the assignment required explanation both in length and in depth, that is, over a wide area and intensively over certain industries and with certain high personalities. Perhaps the mission itself was unduly ambitious; many expectations in the country were wholly unrelated to the facts. What has been accomplished, however, is an impressive tribute to the capacity of the Finance Minister and the men who accompanied him to face deadly odds. They have done for the country a service in the

appreciation of which we should not show ourselves niggardly or small.

There are differences enough between different groups in the country and the Finance Minister, even if one excludes the Communist Party of India which has now chosen on a single controversial issue to oppose him on all. There are many who feel that his stewardship of the financial affairs has not assisted confidence in trade and industry. Today, however, one should recognise that his position is central both because he enjoys the political confidence of the Prime Minister, and because he is being understood and accepted abroad. This is no time for petty recrimination, or for a campaign of personal rancour. In the national interest, the Finance Minister must be accorded at this time and "for the duration" the country's unstinted support.

The success of his mission is to be measured for the most part in intangibles, in the creation

The Blue Supplement for October on Problems of Private Foreign Investment will appear in the next issue of The Eastern Economist dated November 1, 1957.

of an atmosphere of responsiveness in the highest circles of the United States. There is already indication that the low priority hitherto given to India's second Five-Year Plan in the counsels of the United States will be altered somewhat, and that concrete proposals for a loan will, in due course, be considered. It remains true, as the Finance Minister has stated in Bonn this week, that he has had no concrete promise of assistance in Washington, but there has been no time in the last twelve months when the atmosphere has been so favourable to large-scale participation in India's economic progress. Again, as a token of United States' interest, there can also be reckoned three significant achievements which, happily, were recorded during the Finance Minister's stay in the United States. The first of these was another World Bank Loan to the Tata Iron and Steel Company of \$16.5 million, the second, an equivalent sum from an American consortium of banks. Thus all the foreign exchange required by the Tata Iron and Steel Company for its expansion project has now been completely underwritten. This is a substantial sum, the more welcome because it is a hard core project and, unlike other private loans, stands on the basis of the highest priority. Mr. J. R. D. Tata and his colleagues who have negotiated this loan are to be congratulated on having achieved a substantial success for the private and public sectors together. Another private sector success is the loan of \$1.8 million granted to the National Rayon Corporation; this seems to be only the first of a significant number of Indian loans being considered by the Export-Import Bank. This month in the United States has, therefore, already been by no means unfruitful in providing a substantial element of foreign exchange both in and outside the hard core.

Equally happy — and possibly from the short-period point of view even more gratifying — is the response accorded to the Finance Minister in West Germany. It would appear both from the Finance Minister's own statement and from that of Dr. Ludwig Erhard, Federal Minister of Economic Affairs, that deferred payments now offered to India — to be finalised 'in a matter of weeks' — will provide credit to finance all India's adverse balance of trade with West Germany in the current year. A long-period loan from West Germany probably raises substantial difficulties which can be only removed over time. There is no reason, however, why in this process of interesting the United States and West Germany in our plans we should reckon success or failure in a short period. These are obviously long-period enterprises in which one need only to say that the Finance Minister has set a great beginning.

Mr. G. D. Birla who, in the last two months, as leader of our Industrial Delegation, has dealt more particularly with the private sector in the United States has drawn attention to the fact that in this continuing process of attracting private foreign investment to India from that country, we shall need not merely exposition but a concrete policy in India to show that our statements, that the private sector has the incentives and the opportunities which the Finance Minister advertised, are in fact real and not mere propaganda. For this purpose certain measures will need to be taken to modify current economic policy which is unduly harsh on some matters, particularly on the taxation of foreign personnel and on such details as the compulsory deposits scheme. The

Finance Minister will not be able to complete or, indeed, over a large period, continue his effort unless he can provide within the framework of his current policy the necessary modifications to attract private foreign investment on the only terms on which it can enter the country, namely, that it can operate at a figure of profit (net after taxes) higher than it can earn in other countries.

So far as the public sector in the United States is concerned, it is clear that the operations required of us are much more of a diplomatic than of an economic character. In a Special Article in this issue on a "rush" poll conducted by the Indian Institute of Public Opinion, it is indicated that Indian public opinion believes that foreign policy elements enter substantially into the foreign aid picture so far as the United States is concerned; this is undoubtedly the truth but indicates only one side of the problem. It is not merely that we need to refrain from unnecessary controversy while our request for a loan is being channelled through Congress; we must also sustain over the long period the kind of diplomatic explanation which our Ambassador in Washington has tried under great difficulties to execute with inadequate staff and very inadequate financial support. We need to throw in the high level advocacy of our case both in Bonn and in Washington, a much higher degree of imagination and effective use of our limited public relations resources than we have hitherto believed either necessary or desirable.

The mission, therefore, has to be continued on both fronts. Here in India there will need to be a reassessment of our financial policy, so that such help as can be obtained by private foreign investment in the filling up of the gap is accelerated and developed. In the public sector, there needs to be an integration of financial and foreign diplomatic policy so that the Ministry of External Affairs and the Ministry of Finance move hand in hand in a consistent policy designed to obtain loans from the United States and West Germany for which the Finance Minister has made requests during his latest trip abroad.

It is obvious that, in all these modifications of the financial and foreign policy, the position of the Finance Minister is central. He brings the Prime Minister a first-hand report on the prospects of filling the foreign exchange gap, and of the attitudes of foreign statesmen to our problems at this time. He also bears in a quite unusual way the burdens of the current crisis, the severity of which can by no means be dismissed by exhortation frequently heard in Delhi at this time that we can by hard work and determination overcome all the obstacles that now face us in our economic affairs. It is simply not true at this stage that we can surmount the major obstacles of the Plan without foreign assistance. If, however, we should succeed in surmounting the current crisis there will come a day when we can truly initiate and maintain economic progress without foreign help. As long as the crisis lasts the Finance Minister of India must be the central figure in our battle for resources. It is right that we should accord to him, in addition to the tribute for a job well done, the support and understanding necessary to all who bear in a critical measure the burdens of this nation. It is sincerely to be hoped that the country will not be distracted by political or sectional differences from according to him the support, both moral and financial, which is his undoubted due.

Pakistan's Musical Chairs

WITH the appointment of Mr. I. I. Chundrigar as Prime Minister, the Muslim League comes to power in Pakistan after an interruption of 13 months. Mr. Chundrigar's appointment came as a surprise; Dr. Khan Sahib, the leader of the Republican Party, had publicly declared that only a Republican would lead the next Government. But his party, in spite of its numerical superiority, acquiesced in the appointment of a Muslim Leaguer as the Premier, and joined the four-party coalition. Besides the Muslim League and the Republicans, the other two members of the coalition are the Krishak Shramik Party and the Nizame Islam Party. The new ruling coalition party claims a membership of 47 in the 80-member National Assembly.

It cannot be denied, however, that Pakistan's new Government is not new in the true sense of the term. The major component of the new coalition is the same as in the previous one—the Republican Party. Its alliance with the Muslim League has no more significance than its original cessation from it. It is only opportunism which has now brought the two together. It is, therefore, difficult to say with confidence that Pakistan will now have a stable Government. It seems unlikely, from the nature of the circumstances. With most of the political groupings in the country based on personal loyalties and ambitions, and not on political agreements or differences, there is neither logic nor consistency in the policy followed by Pakistan's politicians. Politics has become a game for adventurers, who change direction with the ease of a weather-cock. Any coalition is therefore bound to be unstable.

Indeed, it will not be surprising if Mr. Chundrigar's Government proves to be even more unstable than the preceding Ministries. This fear seems real in view of the domestic policy enunciated by the new Prime Minister. He has declared that his Government would move a Bill for the introduction of separate electorates in the whole of Pakistan. The re-opening of the electorate question might show up in relief the sharp difference of views between East and West Pakistan. The Awami League's Ministry in East Pakistan is wedded to joint electorates. Although there are hardly any non-Muslims in West Pakistan, it is the politicians of this area who are insisting on the introduction of separate electorates. Perhaps the aim of these politicians is to sow seeds of discord among the East Pakistanis and nullify their advantage of superior numbers over West Pakistanis. Whether this would help in the growth of Pakistan nationalism, or the contrary, does not seem to worry them.

The fear that the new Ministry's striving for endurance is bedevilled by a possible head-on collision between the Central Government and the Awami League Ministry in East Pakistan cannot be ruled out. The leaders of the two Governments hold diametrically opposed views. While the Awami League leaders are going ahead with radical land reform policies, the present Central Government's leaders, being themselves mostly landlords, are not likely to be in favour of such measures. It may not, therefore, be possible to avoid a clash. The immediate effect of the Muslim League's entering into a coalition with the Republicans at the Centre will probably be the emergence of a similar coalition in West Pakistan; that the mem-

bers of the coalition at the Centre will sit opposite each other in provincial assembly seems difficult to envisage. The re-entry of a strong section of the Republicans into the Muslim League, which they deserted over a year ago, cannot also be ruled out. The disintegration of the Republican Party is, therefore, imminent.

Perhaps a fair general elections, which will show the measure of popular support enjoyed by each of the political parties engaged in the scramble for office, would be a possible way out of the impasse. As at present, the election, according to the Election Commission, cannot be held before November next year. With the new Government's proposal to introduce separate electorates, the general election will be delayed further. After all, the Bill would have to be passed, delimitation of constituencies will have to begin all over again and the electoral rolls will have to be prepared afresh and printed. All this will make it necessary to postpone the election by two to three years or even more.

With the election date conveniently receding, Pakistan's politicians will perhaps rejoice in their freedom to continue their game of power politics. The pursuit of this game does not merely hamper the economic progress of Pakistan. It affects also its relations with other countries, most of all with India. Thanks to the efforts of political adventurers, 80 per cent of the total budget is spent on defence, even after the inflow of arms aid. In consequence, the country's economic development is not receiving the attention it deserves and needs. It is to be seen, however, how long Pakistan's leaders can continue to divert the attention of the people from the internal chaos and denial of democracy by cries of *jehad* over Kashmir and canal waters. Already, Mr. Abdur Rab Nishtar, President of the Muslim League, has warned India that he would not be able to put off much longer the day when these issues, which were "a matter of life and death to Pakistan", would be decided. The use of such threats probably means that the new Government will adhere to the old policy of war-psychosis. This policy will deepen the political crisis further. It would not, therefore, be wrong to say of the political situation in Pakistan that it tends to deteriorate with every change.

Pakistan, as a member of the Baghdad Pact and the South-East Asia Treaty Organization, feels strong enough to maintain an intransigent attitude vis-a-vis India. But it is a happy sign that the Western Powers seem to have, of late, realized that while the pacts are intended to ensure the protection of democracy, Pakistan is not a conspicuous example of its good practice. By contrast, India, although more wayward from their point of view, has shown itself truer to democratic principle and has acquired far greater stability in the process. They have, in consequence, begun to show a greater understanding of India's stand than they appear to have done in the past. It is perhaps due in part to this new understanding that the Western Powers have not so far made any new move over Kashmir in the Security Council. One can only hope that the new understanding will help, directly or indirectly, introduce stability into Pakistan, and peace upon this sub-continent, so that the two countries can turn their minds to urgent construction and reconstruction work.

Awards: Tightening the Screw

THE deliberations at the fourteenth session of the Labour Ministers' Conference last week proceeded on the assumption that the blame for lack of harmonious relations between employers and employees must be laid, by and large, at the door of the former. The major decisions of the conference are based on the conclusion that the corrective remedy lies in tightening the screw against the supposed defaulters. The conference actually met under the shadow of two major events. A section of railwaymen has held out the threat of a nation-wide strike in spite of the fact that in the course of the last six months the demands of railway labour have been conceded substantially and in addition liberal treatment has also been meted out to it. In another strategic sector of the economy, an illegal strike—that of bank employees in Calcutta—was then in progress but has happily now ended, for employees on a melancholy note. These significant developments apparently failed to bring a balanced and impartial approach to bear upon the attitude of the Ministers to an objective policy for labour relations.

The main decision of the conference relates to the legal machinery for settlement of industrial disputes to secure speed and implicit obedience. The diagnosis accepted by the Ministers has led them to arrive at the conclusion that strict sanctions must be provided for enforcement of the awards of industrial tribunals and wage boards by immediate amendment to the law. They have urged that deterrent punishment must be prescribed and failure to abide by the awards of tribunals and boards ought to be made a continuing offence, which should invite penalty for each day or week or a similar period of breach. The Ministers are obviously annoyed at the delays which take place in the proceedings before the labour courts and adjudication authorities. What is worse, in their view, is the growing tendency to a resort to appeals to law courts against the decisions of the original courts or tribunals. To cut short the delays, they have found an easy remedy in recommending amendments to the rules under the Industrial Disputes Act in order to secure that summary records shall replace fuller records of the proceedings.

These deterrents can at best treat the symptoms of the disease and that too at a considerable cost to the industrial economy. But any hopes that they can eradicate the root of the disease, or at least go a long way towards restoring healthy industrial relations, are totally misplaced. It needs to be appreciated far more fully than is the case that employers have as great a stake in the promotion and maintenance of harmonious industrial relations as labour or the Government or the community at large. If employers show reluctance in accepting with grace certain awards, the reasons for such attitude call for a careful and dispassionate analysis. Employers have shown heartening awareness of their social obligations. In certain far-reaching reforms, for instance, association of labour with management, private enterprise has stolen a march over the State sector. If in spite of that employers are constrained to resist the burden of awards in specific cases, wilful defiance cannot be attributed to them. The truth is that in a large number of awards, the full circumstances of the situation do not receive the consideration

they merit. The personnel of the tribunals do not necessarily and in all cases possess the technical equipment they require. This grave lacuna is reflected in the terms of the awards which pay little heed to the economics of the industry in several disputes. The colliery award is a glaring instance in which wages have been raised steeply, beyond the industry's capacity to pay and substantial price increases have been granted. While an increase in prices is unquestionably needed to raise part of the development finance of which the coal industry is desperately short, the claims of labour have been given precedence.

Mr. Gulzarilal Nanda's inaugural address at the conference lays repeated stress on effective implementation of labour laws to make it clear beyond doubt that the Government possesses the capacity as also the determination to enforce the obligations of the two parties. This pronouncement of policy would have found warm appreciation if only it was matched by action to apply it without distinction to both the parties. What is sadly lacking in the practical administration of labour laws is a will to demonstrate that Government is keen on ensuring that labour plays its part well. Frequent resort to go-slow methods and declarations of illegal strikes on occasions have often been allowed to escape their due consequences. The manner in which railway strikers at Kalka defied the ultimatum to resume duty by a specified date, but were allowed to retain their jobs subsequently, is typical of the kind of solicitude shown by Government even where labour is patently aggressive.

The entire machinery of adjudication in its operation has essentially served to encourage a tendency towards litigation. This was perhaps inevitable. The defects of the machinery are sought to be rectified, among other remedies, by expediting the settlement proceedings. Summary records of proceedings which are now urged may do more harm than good. In the absence of adequate record of evidence and proceedings, the appellate authority would be seriously handicapped in giving proper redress. The very purpose of maintaining the appellate authority — ensuring co-ordination in awards and decisions — would be defeated. Apart from the question of speed in settlement, the easy access to tribunals and labour courts has encouraged an attitude of irresponsibility on the part of labour. Employers' reaction to the extreme demands of labour in normal cases of disputes has accentuated the habit of litigation.

During the post-independence decade we had a plethora of labour laws. If the mere volume of legislation is a test of an impressive record in the pursuit of the right industrial policy, Government has rendered a good account of itself. It is, however, commonsense that the correct test lies elsewhere. It lies in the results produced by the crop of legislation. These results in their total effect show a failure to create harmony in labour relations. They underscore a chronic state of disputes and litigation. To place deterrent sanctions behind wrong remedies is to worsen the malady. The stage has certainly arrived to make a concerted effort to replace the adjudication machinery by collective bargaining as an enduring technique for securing peace in industry.

THE WEEK'S NOTES

IN MEMORIAM

THE FIRST anniversary of the Hungarian uprising fell on October 23. It is a date that Communists would, if they could, bury in the sands of time; it is a date that the world will never forget. On October 23 last year, the Hungarians responded to the natural urge for liberty, and rose as one. For eleven days thereafter they tasted, after years of slavery, freedom from occupation by the Russian armed forces. On November 4, these forces rolled back and mauled that freedom. The world felt silent, stunned. Some hung their heads, in shame and despair. Then followed a clamour of denials, charges and counter-charges that has not yet died.

In the year that has gone by the Hungarian people have paid dearly for those eleven days of freedom — and hope. Some have been executed, deported or imprisoned — some 50,000. Those who have not, are subjected to the tyrant's whip more ruthlessly than ever before. It is all being accomplished "legally" — it would be. A series of edicts has been promulgated by the regime of Mr. Janos Kadar — under the benevolent eye of the Kremlin. For Mr. Kadar and his kind friends from Moscow, for the faithful everywhere, the non-Communist world's clamour does not matter. Only contempt is reserved for resolutions like that of the General Assembly of the United Nations on June 20, 1957, which condemned the Russian aggression and demanded withdrawal of foreign troops from Hungary.

Let us remember with sorrow those who died, for they died fighting the tyrant, who crushed them with impunity while upholders of democracy and freedom watched in sullen silence, beneath the shadow of the mushroom cloud. Let us remember them with hope, for they that died fought against the tyrant with their bare hands, even when he came in tanks and armoured cars, kept alive with their blood the flame of ideals that man aspires to, that civilization stands for.

YUGOSLAVIA AND WEST GERMANY

THE DRAMATIC severance of diplomatic relations with Yugoslavia by the West German Government serves to underline the high feeling that exists in Bonn in regard to the recognition of East Germany by other countries. In view of India's growing relations with West Germany, it is appropriate that India in her own national interests should not recognise East Germany at this, and, possibly, at any stage. But it is difficult to see how similar considerations can apply to Yugoslavia; and it is difficult to appreciate the feeling in Bonn that India, somehow or other, is involved in Yugoslavia's action.

Yugoslavia has everything to gain by a recognition of both the Germanies; it is interesting in this connection to recall that she recognised West Germany long before East Germany apparently in the hope that something would be done in these years to reduce the tension between the two States. The fact that tension continues to exist and seems to be growing worse does not imply that a State like Yugoslavia which has based her foreign policy on the recognition of realities should ignore the existence of East Germany and deprive herself of the opportunities which good relations with East Germany imply. For Yugoslavia, these are rather greater than opportunities in West Germany in view of the co-ordination of her economy with other countries of Eastern Europe. In the circumstances it is difficult to see how the Indian Government can in any way be blamed or be required to use its good offices to change Yugoslavia's

views in this matter. By the same token, if the Indian Government were to submit to the Yugoslav Government its own views in regard to the non-recognition of East Germany (for whatever reason), would it not be bound by the same argument to press on West Germany recognition of Czechoslovakia and Poland on the plea that good offices on one side of the Cold War fence should be carried over to the other?

PAINFUL AND DISCONCERTING

THE LAW COMMISSION'S interim report to the Government of India makes certain revelations which are painful and disconcerting in the extreme. In restrained but unmistakable terms, the Commission has pointed out that the very springs of the fountain of justice have slowly been poisoned because of the "selection of unsatisfactory judicial personnel" at the High Court level since independence. Although reluctant to discuss individual instances, the "weight of testimony" has compelled the Commission to record that some appointments of High Court judges were seemingly made on considerations of "political expediency or regional or communal sentiment", and not on the basis of merit. What is even worse, canvassing for appointment to High Courts, previously unknown, has more or less tended to become a fashion. Instead of being considered a disqualification, the Commission regretfully states, canvassing is encouraged by "some persons on whom rests the responsibility for these appointments". Partisan considerations and the "play of rival and conflicting considerations" results in long delays in filling vacancies of judges in High Courts.

These unsatisfactory appointments and the delays in making them, the Commission says, cannot but adversely affect the quality of judgments and result in accumulation of arrears at the High Courts. In order to eradicate partiality in the appointment of the judges, the Law Commission has recommended, and rightly, that a panel should be prepared by an 'ad hoc' Committee presided over by the Chief Justice of India, from which additional judges may be appointed wherever necessary. The Commission is aware that in some States persons of requisite calibre and standing may not be available both at the Bar and in the services. It has recommended, therefore, that an all-India pool be created. If the Commission's recommendations are accepted by the Government, it is not unlikely that the States Reorganisation Commission's recommendation — that at least one-third of the judges of a High Court should belong to areas which do not fall within its judicial limits — will be implemented. The Commission has also done well to recommend the re-evaluation of the needs of each High Court and the appointment of additional judges — as an interim measure — to deal with arrears.

Objection has been taken generally to the proposal for appointing additional judges. It is said that, human nature being what it is, even a High Court judge may not give his best to the task assigned to him when he knows all the time that he is but a temporary incumbent who will be thrown back after some years into a competitive market to sell his legal talent as a means of livelihood. But, this fear seems unfounded. Whatever be the wishes of the Prime Minister and others, litigation is unlikely to decrease in India. In fact, the signs are that it will increase in future. There is, therefore, little ground for the apprehension that anyone appointed as additional judge may have to vacate his seat at the Bench after the expiry of his term.

Everyone who has the good of the country at heart and has faith in democracy would do well whole-

heartedly to support the recommendations of the Law Commission. Without their implementation, the danger is very real of an independent judiciary and rule of law coming to an end—and these are the twin guardians of democracy.

'DRY' FACTS

THE ORISSA Government is reported to be contemplating the scrapping of Prohibition in order to get the excise revenue which is now lost to the State Exchequer and to reduce its revenue deficit of Rs. 3.18 crores in the current financial year. It is not only the paucity of revenue resources that seems to have weighed with the Orissa Government in its contemplated move but also the virtual failure of Prohibition on account of the well-nigh insuperable difficulties of enforcement. This confession of failure may not, however, be pursued to its logical conclusion by way of actual scrapping of Prohibition. For one thing, the Utkal Congress Committee would have to approve of the proposal; for another even if the Utkal Congress Committee supports the State Government on this question, the Congress High Command may overrule the decision and the Union Government may take the stand that Prohibition figures prominently in the Directive Principles of State Policy of the Constitution. One has only to recall here what happened in the case of Andhra whose proposal to do away with Prohibition had ultimately to be dropped.

It would, therefore, appear that so long as Prohibition is in a way ordained by the Constitution, no State Government would be in a position to scrap it wherever it has been introduced unless the Constitution itself is amended. Even the Communist Government of Kerala, it may be noted, is not willing to scrap Prohibition and thereby to be accused of flouting a constitutional provision. In the circumstances it is not difficult to foresee that the Orissa Government's will be a still-born proposal. With the constitutional provision and the fanatical devotion of the Congress to Prohibition being what they are, the utmost that can be hoped for is a policy of indefinite postponement of extension of Prohibition so that the present excise revenue of Rs. 42 crores in all-India may continue to be available. Readers may recall that this approach has been suggested in a Special Article entitled "State Deficits: The Way Out" in "The Eastern Economist" issue of September 13 last.

As against this 'via media' approach there is the reported stand of the Union Government and of the A.I.C.C. that "the annual saving of about Rs. 110 crores by the community as a result of Prohibition is more important than the loss of about Rs. 40 crores to State exchequers consequent on the elimination of excise on liquor." This is an old argument which requires to be re-examined in the light of the actual working of Prohibition in the areas where it has been introduced since 1947. The assumption in this argument is that the money spent on liquor would be saved or be available for other consumption expenditure following the introduction of Prohibition. This assumption is no longer reasonably valid for some good reasons: Firstly, illicit distillation is known to be a flourishing cottage industry in the areas where Prohibition has been introduced; secondly, illicit liquor costs several times more than the customary country liquor; thirdly, according to a conservative estimate, the number of addicts and new addicts together who take the more costly and, probably, more injurious varieties of illicit liquor may represent 50 per cent of all the previous addicts. If it is assumed that 50 per cent of the examining areas where Prohibition could be introduced, they would no doubt have Rs. 55 crores for other essential consumption expenditure. But, if it is assumed that the other 50 per cent who would continue to drink would be spending on costly illicit liquor three times the amount they would have been spending on cheap

country liquor if there had been no Prohibition, their expenditure on liquor may then be estimated at Rs. 165 crores. And so the net result of total Prohibition in the areas where it is not now in force would be a net expenditure of Rs. 100 crores (Rs. 165 crores 'minu' Rs. 55 crores) by people who would continue to drink in any case. So, again, the myth that the community would save Rs. 100 crores as a consequence of Prohibition cannot be sustained.

AGRICULTURE AGAIN

THE PLANNING COMMISSION has finally laid down target-increases of 27 per cent for agricultural production as a whole and 24 per cent for food grains output in particular by 1960-61 over the production levels of 1955-56. According to the Union Food and Agriculture Minister, the revised targets of increase in agricultural production 'could' be achieved without any 'substantial' addition to the outlay on the agricultural sector in the Plan. Mr. A. P. Jain has not, however, explained how an increase by half in the originally-planned target-increase of 18 per cent by 1960-61 would not involve any substantial additional allocation of funds. But the directions in which greater effort is to be made to reach the revised target of 27 per cent increase are precisely the ones which would 'necessarily' involve increased financial allocations. This would be the case in the matter of creation of more seed multiplication farms, development of more organic manurial resources like rural and urban composts, possible subsidising of more chemical fertilisers, execution of more minor irrigation schemes and extension of contour-bunding in unirrigated areas. If, on the other hand, green manure crops are more extensively grown on most irrigated lands, it would be possible to realise the additional target of 9 per cent increase in agricultural production for it is well established that green manures could boost average acre-yields by anything from 15 to 20 per cent. What is more important, green manure propagation schemes require only 3 annas' worth of seeds or possibly less, cultivation costs of such crops would be negligible and multiplication of seeds can be done in two successive seasons and off-seasons so as to cover most irrigated lands in a three-year programme. Why the Agriculture Ministry is not concentrating its thinking and planning in a direction which is virtually inexpensive or least expensive, passes one's comprehension.

If it is unfortunate that the Agriculture Minister is not thinking more on such virtually inexpensive lines, it is still more unfortunate that he thinks the delay in carrying out land reforms impedes increase in agricultural production. Mr. A. P. Jain knows that in the land reforms that are yet to be implemented, the imposition of ceilings on existing landholdings is the most important and crucial item, for protective tenancy legislation including within its scope fixation of fair rents has been enacted in most States by now. But on this vexed question of ceilings thinking in the Agriculture Ministry still seems to be divided and confused. For example, Mr. A. P. Jain thinks at the same time that "it is only on the basis of data collected through farm management investigations conducted in the different regions in the country that we can evolve satisfactory criteria for practical application of the concept of family holding" on the basis of which alone, as he recognises, the size of a maximum holding could be determined. But such farm management studies cannot, with the best of effort, be carried out in a year or so. At least three years would be the minimum period required for organising and conducting country-wide studies of the kind. If, as he himself says, Mr. Jain sets so much store by these studies, there is all the more reason why he should not try to hold with the hare and run with the hounds if, as a realistic Agriculture Minister, he rates production above all else.

a pilfer-proof package for every product!

The manufacture of Metal Box's range of pilfer-proof containers and closures is backed by an active Research Organisation. The Central Laboratory in Calcutta assists suppliers in developing improved printing inks, surface finishes and protective lacquers, and maintains strict routine tests for all incoming raw materials to the Metal Box factories; on the spot control of operations is carried out by Branch Laboratories. This ensures pilfer-proof containers and closures of the highest quality, superbly printed and finished. Expert scientific advice from Associates throughout the world is available to assist in solving customers' packaging problems.

A Window on the World

SMALL SAVINGS IN INDIA

By
ODYSSEUS

ONE OF THE BIGGEST NONSENSSES ever absently-mindedly committed by economists was the idea promulgated in the 1920s that shareholders have no particular function and are some sort of parasite on the face of the economic earth. Out of such obiter dicta, lightly tossed off by the economists of thirty years ago, Socialists and Welfarists have built up a mythology which today hinders the amassing of savings over large parts of the world.

"What does the shareholder do?" the Socialist asks, and replies "Nothing. He just collects dividends." Well, if there were a few more million people just collecting dividends in the UK, there would be more surplus British funds to lend to India, and if there were many millions in India just collecting dividends, the search for foreign loans would be less feverish.

The fact is, of course, that the shareholder performs at least three important social functions. He saves. He invests. He kicks up a rumpus if after a reasonable interval, he does not get satisfactory dividends.

To take the last point first. The shareholder is often reproached by the Left because he is "apathetic" about what the directors are doing as long as he is getting his dividends. But the regular payment of adequate dividends is the basic sign that a company is well managed. It is precisely when dividends begin to fall off that directors would be asked to give explanations. And, of course, there may often be good explanations—because shareholders have to run risks.

For example, Tata's is one of the biggest and most solidly established steel works in the world, with a capital of Rs 10 crores. But few people foresaw such a wonderful future when the company was launched in 1907 with a capital of Rs. 66 lakhs. Its early days were full of difficulties. In no less than eighteen out of its first 28 years, the company was unable to pay a dividend and it averaged only 3 per cent per annum throughout that period. Today Tata's has a fine dividend record and shares issued at Rs 75 stand around Rs. 160. But between 1907 and 1935, Tata's could only have been classed as highly speculative, the type of share that widows, orphans, the faint-hearted, and other sheared lambs, should avoid. If there had been no shareholders ready to take risks, there would be no Tata's today.

AN ANACHRONISTIC HANG-OVER

"But," says the Socialist, "the shareholder is an anachronistic hang-over from a bygone capitalist age. Today, in a mixed Welfare State, profits instead of being distributed to greedy individuals are ploughed back into businesses."

In reply, I do not suggest that profits should never be ploughed back, but I draw attention to the fact that the distribution of dividends to shareholders—who besides being individuals, may, of course, be institutions, banks, insurance companies, building societies, trade unions, etc.—provides them with money which may be channelled into expanding or into new industries via the stock exchange. The directors of a company may be justified in their confidence that their

company and industry are capable of further expansion, but they are liable to have a bias in favour of their own companies. A shareholder, on the other hand, who may have spread his risks over many companies, has a more detached view and in consultation with his specialist adviser on the subject—his stock broker—will be more likely to consider the possibilities for advance in other industries.

In their anxiety to condemn the abuse of speculation, the Left overlook the social use of the stock exchanges, which is to collect information from day to day on the prospects available for making the best profits in as wide a selection of different kinds of risks as possible—a risk for every taste from the small saver to the wealthy individual or institution. Allowed to work properly, stock exchanges produce more remunerative outlays of national savings on a wider variety of new projects than any amount of mass self-financing by established companies.

It is fashionable today to regard stock exchanges as sources of speculative instability in an economy and to make comparisons with allegedly wise and stable choices made by government planners laying out sums vast beyond the concrete comprehension of the human imagination. In fact, the more widespread the buying of shares to suit all types of savers throughout the community, the wider the spread of risks and the less the instability that can arise, compared with the instability to the whole economy likely to be caused by the steadily mounting bank deposits created by inflationary planners. Individual and institutional savers, thinking in terms of their own interests and profits, are likely to achieve a better distribution of investment—better, i.e., in the sense of raising the overall national income—than that achieved by planners who consider political or doctrinal objectives to be more important than generous dividends. A flourishing stock exchange not only encourages saving but brings down the rate of interest.

What is more in all Welfare States in which the State is the prime saver and investor, you have varying degrees of inflation. This suggests the inadequacy of State action to produce real savings (as opposed to imposing forced savings). Note, also, that those countries which have the least shortage of savings are not those in which Welfarism offers incentives to consumption but those in which free enterprise provides incentives to produce.

ANTI-SOCIAL BEHAVIOUR

When the individual saves, you get genuine savings, that is, the foregoing of present consumption in the expectation of a greater benefit in the future. If the State saves by running a genuine budget surplus out of the proceeds of moderate taxation, you also get genuine savings. But this is as rare as being unable to obtain an alcoholic drink in a prohibition State. The pressures on consumption in a Welfare State are so great that politicians, fearful of losing votes by deflationary methods of decreasing present consumption, invariably take the line of least resistance and impose cuts in consumption on those with fixed incomes by means of inflationary investment. Inflation is not mere-

ly economically disastrous: I do not hesitate to call it anti-social behaviour on the part of those who countenance it. Why? Because it undermines co-operation between the classes by enabling any groups which are strongly enough organised to blackmail the community into giving them wage increases under threat of strikes, and by putting a premium on the hoarding of goods it brings into existence the type of speculation that is unhealthy. For these evils, I repeat, the wage earners and the holders of stocks of goods are not to be blamed. It is timid political leaders who refuse to lead courageously at whom the finger of scorn should be pointed.

India is today in desperate need of savings. The main effort hitherto to secure them for the Five-Year Plans has been through punitive taxation and inflation, both of which kill the incentive of the individual to save and, if persisted in, must lead to ever tighter controls and ultimately to the sacrifice of all personal liberty to the needs of the State. I cannot see people coming forward in these inflationary days in the vast numbers required to invest in post office savings and the other fixed interest securities traditionally deemed the small saver's mother and father.

The problem is how to get the small saver to put his money into risk-bearing ordinary shares, without undue risk to him as a small saver. In the USA and in the UK they have found an answer in what is called the unit trust investment movement. These trusts sell their shares in units of 10 shillings to small investors, and the sums so collected by the trusts are spread

over portfolios of ordinary shares. The capital of such investment companies in the UK now totals over £1,000 millions, much of it invested in large holdings in Commonwealth and American industry. Among the seven main groups of trust management companies, the Investment Trust Unit of the Bank Insurance Group has shown a threefold capital appreciation for those who bought a unit for 6sh. (Rs. 4) in 1947.

Not all the UK Trusts match this record because some were started in days when it was considered essential to invest a proportion of all small savers' holdings in fixed interest securities. That people are now awake to the gilt-edged threat to small savers was shown this year when a group was formed in the UK to launch a new trust: the Atomic, Electronic and General (AEG) unit. The immediate sale of half a million 10 sh. (Rs. 6.50) units created a fund of £250,000 to invest in equities in the new industries of the atomic era. Advance permission of the British Capital Issues Control, which fully grasps the anti-inflationary role of the unit trusts, has already been obtained to invest a further £250,000 as small savers take up more AEG units. An interesting point about this fund is the intention to plough back dividends collected on behalf of unit holders in order to give them capital growth instead of income.

I have no doubt that the large-scale development of these methods in India bristles with difficulties. But so does every other pioneer idea. Are we short of capital or not? Are we committed irrevocably to forced saving by inflation for the good of our souls for all incarnations to come?

EUROPE AT SIXES AND SEVENTEENS

(From Our Special West European Correspondent)

PARIS, October 18.

At a meeting of the 17 members of the European Organisation for Economic Co-operation that has been going on in Paris for the past three days, the six nations who will form the Common Market have been giving their reasons for rejecting the British plan to graft on to the Common Market a "free-trade zone". As I write, no account of the conference's decisions has been made public, but it is expected that the British will be told that their scheme is of no present interest: this will probably be conveyed in some suggestion for "further study". The members of the Common Market (France, West Germany, Italy and Benelux, hereafter "the Six") had a preliminary meeting last week in Brussels to settle a common approach to Britain's scheme for a seventeen-nation free-trade area, and at that meeting the French had no difficulty in convincing their partners that the answer should be a blank No. The opposition has come mainly from France who has very special reasons for resisting the British proposal, but all the Six are agreed that they cannot now accept anything that would delay or complicate implementation of the Common Market treaty—and such would be the effect of Britain's plan.

The British Government's proposal has been doomed from the beginning and presumably this was known in the Commonwealth capitals, whom London consulted and who, according to Sir David Eccles last week, all encouraged Britain to go ahead with it. What must have made the task of the British delegation at this week's Paris meeting all the more difficult is that it is obvious that Whitehall has only the most half-hearted and conditional support for its plan in Britain itself (even supposing that Sir David's claim of full Commonwealth backing were true). Last week's Tory conference endorsed it only because the prospect of a Commonwealth Economic Conference next year sets a limit to London's adventurism on the Continent; the TUC delegation that met Mr. Maudling this week before he came to Paris set a number of rigid conditions on their approval; while, finally, British industry has shown (as, for example, in this week's statement by the British Iron and Steel Federation) that it is less attracted by the positive virtues of the free-trade zone than by the negative effects it could be hoped to have on the Common Market.

Moreover, some of the European nations who do not belong to the Six but whom Britain hoped to interest in joining the Seventeen came to this week's meeting determined to express general support for the proposal and equally determined to see that nothing definite was done to implement it. The Swedes and the Swiss, for instance, are as suspicious of the Common Market as are the British, and have expressed a preference for the larger free-trade zone (provided that by its links with the other West European political organisations it does not jeopardise their neutrality), but their representatives at this week's talks argued that this was not the time to take any decisive steps that would upset the present economic balance of Europe. They sought, furthermore, detailed clarification on the technical aspects of the British plan, and it is the technical part of the scheme, the mechanics of making it work, that is its great weakness.

However, more than the limited support Whitehall has been able to find in Britain and more than the

hesitations of the other members of OEEC, it is the firm opposition of the Six that has wrecked the British plan. In a despatch published on this page three weeks ago ("Common Market and Free Trade Zone") an account was given of the vigorous criticism of the National Council of French Employers which ended with a clear warning to the French Government to desist from all negotiations with the British on the subject. That document alone was sufficient to kill all hopes of further progress. Since then an exactly similar line has been taken by the chamber of chemical industries, and in the face of this hostility it was plain that the French officials (who, it must be recalled, have been negotiating in the absence of a government) could not agree to any concessions to London. The basis of this hostility can be resumed in six main points.

1. The dismantling of customs barriers that is to be accepted by the Six in the Common Market is to be accompanied by and compensated by a mass of protective mechanisms which are designed to correct the inequalities between the industries of these countries. But there is no such system of protection and correction in the free-trade zone plan.

2. In the free-trade zone, the participants would retain their individual tariff systems and the control of the movement of goods within the zone would be governed by "certificates of origin." But the Continentals have no faith in the efficacy of this complicated device and argue that one country within the zone could become the channel by which American, Japanese and Russian goods, whose identification would be impossible, could flood the markets of West Europe.

3. The exclusion of agricultural produce from the free-trade system would be to the disadvantage of those Continental countries that export such produce. Worse, by favouring Britain unduly it would advantage British industry and thus increase its competitive power in the free-trade area.

4. Britain would get the best of both worlds, being a privileged member both of the Commonwealth preferential system and of the West European free-trade zone. This would make her the favoured place for investment by industries in third countries, notably the USA. American investors would prefer to invest in Britain so that goods eventually produced by such investment could be sold both within the Commonwealth and within the markets of West Europe, including even the markets of the Six. The result would be cessation of American investment on the Continent.

5. Various industries within the Six countries are already sufficiently disturbed by the prospect of increased competition they will have to face in the Common Market, without adding to this the more extensive competition they would encounter within the free-trade union. Some other industries, such as paper and electro-metallurgy, will not meet much increased competition in the Common Market because all the members of the Six nations are fairly equally placed for resources in these fields—but if Norway and Sweden, who enjoy vastly superior resources in these respects, were admitted, then the situation could become desperate. If the Common Market were in fact what it is said to be, a method of restoring fully competitive conditions among all the economies of the Six, then indeed

Mountains on the move

The face of India is undergoing a great change—huge dams and hydro-electric projects are under way—new townships, new industries, new roads are coming into being. And to accomplish this quickly under the Five Year Plan, mountains virtually have to be moved, requiring the use of modern earthmoving equipment. This equipment uses rugged tyres, standing as high as a man. In the past, these cost valuable foreign exchange, but now the Firestone factory in Bombay is producing earthmover tyres, to meet India's requirements for the achievement of the Plan.

WORLDGRAM

AGRICULTURE

Research in Fish Breeding: The breeding of major carps under artificial conditions in ponds and tanks is the latest development in fish culture research in inland waters of India. The experiments which were carried out in July and August 1957 in Angul and Killa Fish Farms in Orissa, aimed at inducing spawning through hormone treatment in four major carps — the Rohu, Mrigal, Calbasu and Catla. These experiments, undertaken by the Central Inland Fisheries Research Station, Calcutta, of the Ministry of Food and Agriculture, were successful, and the way has now been opened for breeding major carps artificially. This would help in maintaining good stock of quality fish seed for supply to fish farmers.

Survey of Agricultural Implements: A comprehensive survey of indigenous agricultural implements will be undertaken in the country shortly. This was one of the decisions of the Agricultural Engineering Committee of the Indian Council of Agricultural Research, which held its meeting in Bombay recently. A model scheme was prepared by the Committee for holding trials of imported and improved indigenous agricultural implements in the States. It was also considered desirable to have a model scheme for better application of irrigation water to farm land. Two other research schemes discussed by the Committee related to farm structures and rural housing and lift irrigation.

INDUSTRY

New Industrial Training Institutes in U.P.: The Government of India have approved of the Uttar Pradesh Government's proposals to establish industrial training institutes at Kanpur, Agra, Bareilly, Mirzapur and Gonda. The total seating capacity of these institutes will be 1608, half of which will be filled during the current year and the rest in 1958. With 624 seats, the institute at Kanpur will be the largest. These institutes will have facilities for training, among others, blacksmiths, carpenters, draftsmen (civil and mechanical), fitters, plumbers, pattern-makers and welders. The total expenditure on the institutes during the second Plan period is estimated at Rs. 46.61 lakhs, of which 60 per cent will be borne by the Central Government and the rest by the State Government. Under the second Plan, it is proposed to increase the seating capacity of training institutes in the country by 20,000.

Rise in Industrial Production in First Half of 1957: Industrial production in India during the first half of 1957 recorded an appreciable increase. The index of industrial production (1951 = 100) was higher than the average index for the whole of 1956 as well as for the corresponding period of last year. Notable increases have been shown by industries like cement, sugar, automobiles, diesel engines, machine tools, razor blades, coal, sewing machines and bicycles. During the half year period, 420 licences for industrial schemes were granted. Of these, 109 were for setting up new industrial units, 267 for expansion of existing units or the rest for carrying on the business of existing undertakings, regularisation and change of location. A number of new factories went into production during the period while some of the existing units expanded their capacity under schemes approved by Government. These cover the manufacture of automobile parts, sulphuric acid, ferro-manganese, bicycle parts, machine tools, paper, super phosphate, new drugs, dye stuffs, etc. Ten new spinning units also went into production.

Development of Doll and Toy Making Crafts:

Schemes for the development of doll-making, toy-making and artistic pottery have been approved by the Government of India on the recommendations of the All-India Handicrafts Board. Under the schemes training-cum-production centres will be set up and pilot centres, already in existence, will be continued. Loans and grants amounting to Rs. 4 lakhs have been sanctioned by the Central Government to the Board and State Governments to implement these schemes.

Increase in Machine Tools:

The number of diesel engines turned out during the period was 7,076 as compared with 5,656 in the first half of last year. The output of machine tools rose by more than 100 per cent. The value of their output in the first half of this year was slightly over Rs. 1 crore as against Rs. 42.5 lakhs in the comparable period of last year. Among electrical industries the production of radio receivers rose to 91,600 from 71,000. Electric fans showed even greater increase, from 1,65,700 to 2,47,000. Substantial increase was recorded by the power transformer industry, from 401,000 KVA to 568,000 KVA. The number of electric lamps manufactured rose by more than two million, from 12.1 to 14.3 million lamps. The output of paper and paper board was higher at 1,01,000 tons as compared with 94,000 tons in the first half of the previous year. Caustic soda, soda ash and bleaching powder registered increases while the output of power alcohol showed a slight decline. Tubes and tyres, both for automobiles and bicycles, recorded higher outputs. The production of bicycle tyres rose from slightly over 3 million to about 3.7 million while the output of tubes rose from 3.1 million to 3.6 million tubes. The number of automobile tyres manufactured rose from 4,56,000 to 5,07,000 and that of tubes from 4,24,000 to 5,01,000. A few industries recorded a slight decline in production, mainly due to lack of demand. Among these were hurricane lanterns, machine screws and teachest.

TRADE

Japan's Textile Exports: Japanese textile exports so far have shown substantial increases over last year — except for rayon filament fabrics, which have declined by 15 per cent. The Japanese cotton spinners Association said exports of cotton piece-goods during the first nine months of this year totalled 1,063 million square yards. Compared with 880 million during the corresponding months of last year. Total exports of cotton cloth this year were likely to reach 1,400 million square yards — a post-war record. Shipments of spun rayon fabrics increased by 38 per cent to 651 million square yards, silk fabrics by 47 per cent to 44 million square yards, cotton yards by 26 per cent to 26 million lbs., rayon filament yarn by 43 per cent to 18 million lbs. and spun rayon yarn by 29 per cent to 34 million lbs. Exports of rayon filament fabrics in the first nine months of this year totalled 281 million square yards — 15 per cent below the corresponding period of last year.

Trade Deficit with U.S.A.: India ran a "large deficit" of \$62 million during 1956 in its trade with the U.S.A. as against a surplus of \$33 million during 1955. This is revealed in a study of the Indo-U.S. trade published in the latest issue of the Reserve Bank of India Bulletin which says "The balance of trade continued to be unfavourable in the first two months of 1957." According to the study, the deterioration in India's balance of trade with the U.S.A. was mainly due to a sharp increase in imports from the U.S.A.

(\$79 million) and a decline of \$16 million exports to the U.S.A. In 1956, U.S. exports to India amounted to \$267 million as against \$188 million during the previous year, while her imports from India declined from \$221 million in 1955 to \$205 million in 1956. The sharp rise in India's imports was largely due to the accelerated tempo of developmental expenditure. The decline in India's exports to the U.S.A., however, took place despite an increase of 11 per cent in U.S. imports from the rest of the world — from \$11,384 million in 1955, the total imports of the U.S.A. rose to \$12,589 million in 1956. The study says that more than 60 per cent of the value of U.S. imports from India is made up of only six commodities namely, burlap, tea, mica, manganese ore, pepper and cashewnuts. In burlap, cashewnuts, mica, films and splittings, India enjoys a near monopoly position in the U.S. market.

*

Britain's Exports: The volume of exports in 1956 was nearly double that of 1947, when the pre-war level had already been regained. The value and volume of United Kingdom exports have maintained a steady upward trend; in the period January-July 1957, they were about 6 per cent in value and 3 per cent in volume above the corresponding period of 1956. The rate of exports to the USA and Canada in 1957 is some 10 per cent higher than in the previous year. The United Kingdom is second to the U.S.A. as an exporter of manufactured goods. Engineering products account for 40 per cent of Britain's exports. The annual value of exports of the aircraft industry exceeded £100 million in 1956, and this rate has been fully maintained in 1957. Among its traditional export products, Britain is the world's greatest exporter of high-grade woolen and worsted fabrics, and chocolate and confectionery. It is also the largest exporter of all types of motor vehicles motor-cycles and bicycles, textile machinery and electric generators, motors and transformers. Work performed overseas by British contractors was valued at £94 million in 1956-57. Examples of current work include the dredging of the Welland Ship Canal in Canada, a new bridge over Auckland harbour bridge.

FINANCE

IBRD Loan in Thailand: The World Bank and the Yanhee Electricity Authority of Thailand signed an agreement on September 12 for a loan equivalent to US\$66 million to help finance the Yanhee multipurpose project for the development of electric power, flood control, and irrigation. The loan had been approved by the Bank's Executive Directors on August 20, and signing awaited the enactment of legislation by the Thai National Assembly establishing the new Yanhee Electricity Authority. The Authority was established by law on September 8, 1957 as an independent government agency to operate the Yanhee project and all large power generating plants and transmission facilities in central Thailand. The loan is for 25 years and bears interest 5½ per cent, including the 1 per cent commission which is allocated to the Bank's Special Reserve. Amortization will begin October 15, 1963. The loan is guaranteed by the Kingdom of Thailand.

*

Monetary Development in Ethiopia: Monetary developments in Ethiopia during the first half of 1957 were determined to a great extent by unusually large exports of coffee. In the first quarter of the year, which is the main coffee export season, coffee exports averaged 7,000 tons per month; monthly exports in the second quarter are estimated to have been about half of that amount. The money supply increased by Eth\$32 million, i.e., by 19 per cent, during the first

quarter, mainly as a result of an increase equivalent to Eth\$25 million in the foreign assets of the State Bank of Ethiopia. There was also an increase of Eth\$5 million in private credit. During the second quarter, the money supply dropped by Eth\$12 million as foreign assets fell by Eth\$5 million and government deposits increased by Eth\$8 million. The substantial increase in the money supply during the first quarter did not have a significant effect on prices. During that period the general import index rose by 4 per cent while the general export index dropped by 5 per cent; in the second quarter, the import index remained fairly stable, and the export index declined by 2 per cent.

*

Grants for Development of Indigenous Systems of Medicine: Grants amounting to Rs. 89,200 were sanctioned during the month of September 1957, for the development of indigenous systems of medicine in the second Five-Year Plan period. The institutions which received the grants were: Rishikul Ayurvedic College, Hardwar, Rs. 12,000; College of Integrated Medicine, Madras, for the establishment of chair of History of Medicine, Rs. 7,200; and the Government Ayurvedic College, Hyderabad, Rs. 70,000, for 30 research beds and for the establishment of a herbarium.

GENERAL

Supply of Fertilizer Plants for Nangal Project: The Nangal Fertilizers and Chemicals (Private) Limited have, with the approval of the Government of India, placed an order for the supply, erection and commissioning of the fertilizer group of plants for the Nangal Project with a French firm, Messrs. Saint Gobain of Paris, on a turn-key basis. The order has been placed after consideration of competitive bids on a global basis. In terms of the contractual stipulations, half of the fertilizer plants are due to be erected and put into commission by December 31, 1959, and the remaining half by March 31, 1960. The assured production capacity of the plants will be 3,95,136 tons of nitro-limestone fertilizer per year. The fertilizer group of plants will consist of an air liquefaction plant, an ammonia plant, a nitric acid plant and a nitro-limestone plant with necessary bagging and storage facilities.

*

New Hope for Millions Who Suffer from Eye Diseases: New hope for millions of people in Asia suffering or threatened by diseases of the eye is offered by the recent establishment in Honolulu, Hawaii, of the Asia-Pacific Academy of Ophthalmology. The new academy will serve as a training station for prevention, treatment and dissemination on matters that transcend national boundaries. "Now, ophthalmologists from Japan will be able to tell to a wide and eager scientific audience of their successful treatment of trachoma, and Indian physicians can report on their advances in the battle against cataracts. In addition the academy will make interchange of information easier between eye doctors and scientists of the east and west. The academy will also offer post-graduate instruction in ophthalmology through lectures, round, table discussions, clinics, demonstrations, exhibits and films. It will stimulate research in tropical eye diseases particularly prevalent in Asia and countries bordering on the Pacific Ocean. Some of its other aims are to help to establish societies which will work to prevent blindness by publicising the most common dangers to good eyesight and by urging the public to use the best medical facilities. Finally the academy intends to work for the establishment of schools which will train the blind so that they will be able to live to their fullest capacity.

NEWS IN BRIEF

INDIAN

India had an adverse trade balance of Rs. 183.98 crores in the first half of the current year against Rs. 98.48 crores in the corresponding period of 1956.

*

Output of tea in North-East India during September is estimated at 92.63 million lbs. against 95.03 million lbs. in the corresponding month of last year, showing a decline of 2.5 million lbs.

*

The Rs. 12 crore Kakrapara Irrigation project on the Tapi river near Surat which was originally scheduled to be completed by 1953, is now expected to be completed by 1961.

*

It is reported a Rs. 15 crore synthetic rubber plant would be located at Bareilly.

*

The Government of India have decided to decontrol sisal carpets and floor coverings for export purposes with immediate effect.

*

The national rayon corporation purposes to raise additional equity capital with a view to put up tire cord plant. The company has obtained the necessary sanction from the Controller of Capital Issues.

*

Approximately 23.9 million lbs. of tobacco valued at Rs. 3.99 crores were graded and marketed for export in the quarter ended June, 1957, according to official sources.

*

Total approximate production of iron and steel by the Tata Iron and Steel Company at their steel works at Jamshedpur during September 1957 was pig-iron 88,600 tons against 88,700 tons in August, and steel ingots 92,500 tons against 85,000 tons in August. Production of saleable steel totalled 71,700 tons as against 63,100 tons last month.

*

The manufacture of diesel engines in India is rapidly progressing, according to an official report. The production of low H.P. engines, which find industrial application of different kinds in 1956 was 1,260.

*

Lac exports in September, 1957, dropped sharply by 22,901 packages from 32,428 packages in the previous month, according to the Calcutta Shellac Trade Association.

*

The Constitution of the Proposed Productivity Council to direct and co-ordinate a national movement for productivity in India will be finalised at a two-day seminar to be held in New Delhi on November 1 and 2.

*

The Indian Standards Institution has granted a license to Messrs. Tata-Fison Private Ltd., Bombay, for the use of the certification mark of ISI on BHC dusting powders, and BHC water dispersible powder concentrates.

FOREIGN

Sweden's first post-war trade agreement with China has been initialled in Peking for later signing in Stockholm. The commodities listed, without fixed quantities of values, comprise both traditional goods and products for which a market is likely to be developed.

*

French raw steel output is expected to reach a record monthly level in October. This calculation is based on the figures for September output, just published which show that nearly 1½ million tons of raw steel and 1¼ million tons of cast iron were turned out in France and Saar during the month.

*

It is reported a technical mission of refinery engines and marine experts has arrived in Karachi to examine the technical and economic aspects of a proposed oil refinery in Karachi with special reference to the selection of a suitable site and marine facilities.

*

Japanese textile exports so far have shown substantial increases over last year—except for rayon filament fabrics, which have declined by 15 per cent.

*

Japanese aluminium companies are planning to form a joint company with Canadian and Netherlands firms to develop the bauxite resources of Borneo.

*

Exports totalling £2.55 million to Pakistan have been arranged under the US foreign aid programme. Importers in Pakistan will pay in local currency into a special account to be rebased later by the Americans to the Pakistani authorities on the pattern of the former Marshal Aid.

*

The US Department of Agriculture has forecast a reduction in the probable output of cotton compared with a month ago. The latest estimate, as at October 1, is 12,401,000 bales against a figure of 12,713,000 bales in September.

*

Oil consumption in the UK has risen sharply since the end of the Suez crisis and is now higher than at the same time last year.

*

A Singapore co-operative bank, modelled on institutions in India and Ceylon, is to be established to provide the central source of credit for all co-operative societies in Singapore.

*

Australia finished the first three months of the current financial year with a favourable trade balance of £A18.2 million compared with a £A3.9 million deficit in the first quarter of the previous year.

*

The Department of Agriculture has raised price supports on 1957 crop maize to \$1.40 per bushel from the preliminary \$1.36 because of the increase in the parity price.

*

Although, West Europe's coal output in 1956, at 480 million tons, was the highest since the war, it was less than 1 per cent more than in the year before, and this year no increase at all is anticipated.

From a Neighbour

If there is a lot of comings and goings between Jamshedpur and Rourkela, that is only as it should be. Of all the steel plants, the one coming up at Rourkela is closest to Jamshedpur, India's first steel city.

If these comings and goings lead to an useful exchange of experience and ideas, that is again as it should be for Jamshedpur has been making steel these 50 years. And it is very happy to lend a hand with the training of engineers

Good Wishes to Rourkela

and technicians for Rourkela. There are nearly 150 of them at Jamshedpur—from key personnel to artisans.

Strengthening these ties of friendship are the surprisingly large number of old Jamshedpur faces that one sees at Rourkela. To them and their colleagues, Jamshedpur sends neighbourly greetings and good wishes.

ATTITUDES TO FOREIGN AID AND LOANS IN DELHI

(CONTRIBUTED BY THE INDIAN INSTITUTE OF PUBLIC OPINION, NEW DELHI)

IN view of the high topical interest in Mr. T. T. Krishnamachari's mission to the United States, the United Kingdom and Germany, the Indian Institute of Public Opinion within the last fortnight completed a "rush" poll on opinion in Delhi and New Delhi on attitudes to receiving aid, and on foreign policy as an element in the giving and receiving of aid. The results of the survey are set out below.

Q.1. Are you in favour of India's receiving aid or loans from the United States?		Actual	Percentage
Yes	146	73.0	
No	24	17.0	
Don't know	20	10.0	
TOTAL	200	100.0	

Of those answering 'Yes'			
Aid essential without strings	111	76.0	55.5°
Aid essential with or without strings	35	24.0	17.5°
TOTAL	146	100.0	73.0°

Q.2. Do you think that Mr. T. T. Krishnamachari has been right to seek a loan?		Actual	Percentage
Yes	120	60.0	
No	27	13.5	
Don't know	53	26.5	
TOTAL	200	100.0	

Q.3. Would you say that the Finance Minister has done a good job in the U.S.?		Actual	Percentage
Yes	77	39.5	
No	21	10.5	
Don't know	102	51.0	
TOTAL	200	100.0	

Q.4. Do you think our Foreign Policy stands in the way of American aid or a loan?		Actual	Percentage
Yes	53	26.5	
No	63	31.5	
Don't know	84	42.0	
TOTAL	200	100.0	

Of those answering 'Yes'			
The only hindrance	5	9.4	2.5°
Substantial	30	56.6	15.0°
But little	18	34.0	9.0°
TOTAL	53	100.0	26.5°

Q.5. If aid is not received and the Plan is to be cut, would you blame the Government?		Actual	Percentage
Yes	81	40.5	
No	64	32.0	
Don't know	55	27.5	
TOTAL	200	100.0	
Of those answering 'Yes'			
Entirely	48	59.2	24.0°
Partially	24	29.6	12.0°
But less than the people	9	11.2	4.5°
TOTAL	81	100.0	40.5°

Q.6. Which statement is nearest to your viewpoint?

India should not receive aid from any bloc	21	10.5
Should receive aid from the Anglo-American bloc only	12	6.0
Should receive from the Soviet bloc only	26	13.0
Only from neutrals	29	14.5
Don't know	54	27.0
From anywhere she can get it	58	29.0
TOTAL	200	100.0

* Starred percentages worked out in relation to total sample, i.e. 200.

THE SAMPLE

The sample, because of the need of speed, was restricted to 200 persons in the electoral lists; but great care was taken to give it a representative character except in one respect. As the volume of "don't knows" amongst illiterates would naturally be very high, interviewing was concentrated in areas where the middle classes were predominant. The effect of this choice was not to make the sample fully representative of the total population, but representative of what might be called literate opinion. Even so it was impossible, because of the random character of the sample, to eliminate illiterates, who comprised about 20 per cent of those interviewed. The age characteristics of the sample were 56.5 per cent between 21 and 35, 36 per cent between 36 and 50 and 7.5 per cent above 50. Age does not seem to have been a factor in determining the structure of the opinion. The monthly income structure of the population interviewed was 32.5 per cent below Rs. 100, 29 per cent between Rs. 101 and 200, 9 per cent between Rs. 201 and Rs. 350, 9 per cent in the group Rs. 351-700 and 7.5 per cent over Rs. 700. The last figure, probably, gives a bias to high incomes, but otherwise there is reason to believe that the sample is representative from an income distribution point of view.

THE RESULTS

It will be seen that, contrary to current opinion, a very large number in this sample, namely, 73 per cent, are in favour of aid or loans from the United States. 76 per cent of those replying either affirmatively or negatively think that this aid must be without strings. But 24 per cent — an unexpectedly high figure — consider the situation grave enough to argue that aid is essential "with or without" strings.

There is overwhelming support for the Finance Minister, in that 60 per cent of the total sample consider that he was right to seek aid or loans and 38.5 per cent think that he has done "a good job" in the United States. Only 10.5 per cent think he has not done a good job; the remaining 51 per cent either declined to answer or gave a 'don't know' response.

The questions on foreign policy are of also special interest. 26.5 per cent think that our foreign policy stands in the way of American aid or a loan. But only 9.4 per cent of the 53 who answered affirmatively consider this "the only hindrance". In regard to a question as to the direction of aid acceptable, 29 per cent think that India should take aid from wherever

she can get it. 10.5 per cent are against aid from either bloc, and 14.5 per cent would like to obtain from neutrals only. Only 6 per cent wish aid obtained from the Anglo-American bloc exclusively, and 13 per cent from the Soviet bloc exclusively. But these percentages must be read with the recognition of the significant sampling error which attaches to so small a sample.

One significant answer is in respect of the blame which attaches to the Government if the Plan is to be cut as a consequence of non-receipt of aid. There is obviously no disposition to excuse the Government,

45.5 per cent arguing that the Government is to be blamed if the Plan is to be cut; 59.2 per cent of these consider the Government "entirely" to blame.

For the rest, the questions speak for themselves. They show that there is a measure of support for the Finance Minister which, in present circumstances, and the controversy he has raised, is beyond expectations. Perhaps, this is a suitable subject for a wider poll in all important cities of India. On the face of it, there is no reason, however, to believe Delhi opinion is substantially different from that in other cities.

DELHI CORPORATION AND ELECTRIC SUPPLY SERVICE

(By R. P. AIYER)

THE Delhi Municipal Corporation Bill, 1957, now under reference to a Select Committee of Parliament, raises an important principle which has wider implications. This principle relates to the future pattern of electric supply administration in the proposed Delhi Municipal Corporation area.

The debate on the proper instrument for electric supply administration has been an old one, and was resolved, after extensive review and discussion, by Parliament enacting, in 1948, the Electricity (Supply) Act. The Statement of Objects and Reasons appended to that legislation, when in Bill form, proclaimed that it is bodies like the autonomous Electricity Boards "which are most suitable organisations for working Grid Systems on quasi-commercial lines."

As was only proper in the case of a Central legislation, it was the Central Government who, in March 1951, blazed the trail by setting up the first Electricity Board under the Electricity (Supply) Act. This was followed by Electricity Boards being constituted in the then Madhya Pradesh (April 1951), the then Saurashtra State (March 1954), the then Bombay State (November 1954) and West Bengal (April 1955). With the re-organisation of States, Boards have since been formed in Kerala, Madras, Rajasthan and the enlarged Mysore State. Electricity Boards, therefore, now exist in the following States, and it is reckoned that by the end of this year all the States in India would have constituted the Electricity Boards: Delhi, Bombay, West Bengal, Kerala, Madras, Rajasthan, Mysore.

This indicates a general acceptance, backed by expert opinion, that autonomous Electricity Boards which are non-political in outlook are the best instruments for promoting electrical development.

In this context the proposal in the Delhi Municipal Corporation Bill, 1957, to vest in the proposed Delhi Electricity Committee to be constituted under the Delhi Corporation, the responsibility for "development and maintenance of efficient, co-ordinated and economical system of electric supply in the whole of the Union territory of Delhi," and in the process dissolve the Delhi Electricity Board now functioning, has come as a measure which was least expected.

The very brief Statement of Objects and Reasons appended to the Delhi Municipal Corporation Bill makes a very casual reference to the transfer to the Corporation of the functions of the Electricity Board now in being in the area, and in so doing does not even attempt to discuss the merit of such transfer. The only deduction one can draw is that the shift in policy has for its object the desire to extend the area of local autonomy. Why the Union territory of Delhi should be singled out for such experiment is difficult to be understood. On the other hand, one would have thought that in an area, the welfare of which is the primary responsibility of the Union Government, an important field like electric supply would have been sought to

be placed outside the purview of local politics and local political pressure. This would in no way have diluted the concept of Municipal autonomy, and would only have meant the acceptance in respect of the Union territory of the pattern of development which Parliament in its wisdom had accepted as the best for electri-

the symbol of business efficiency

Carbon Papers

Hands, copies and desk remain clean when Kores carbon paper is used. The copies are sharp, legible and difficult to smudge. Kores carbon papers are very economical on account of their durability.

Typewriter Ribbons

It is a pleasure to type with a Kores ribbon. The impressions are well defined and positive from the very first day. Kores ribbons will not smudge even when new and each ribbon gives 20 lakhs impressions.

Drytype Stencils

With Kores Drytype Stencils the types of the typewriter remain clean and do not fill up. Round letters do not fall out and the typewriter rollers remain unaffected. Kores Drytype Stencils are also ideal for drawing and hand work.

Kores (India) Private Limited manufacture Carbon Papers, Typewriter Ribbons, Drytype Duplicating Stencils, Duplicating Ink and Accessories, Ink Tablets, Stamp Pads and Stamp Pad Inks.

KORES PRODUCTS are obtainable from all stationers

cal development in the country when the Electricity (Supply) Act was placed on the Statute Book in 1948.

In dealing with Delhi power supply, Parliament is not called upon to survey an uncharted sea. Power development in the country has been conditioned by the Electricity (Supply) Act, 1948, and prior to the enactment of the law the principles embodied in the legislation had been under discussion for a long period. To the Union territory of Delhi goes the credit for the first Electricity Board being constituted, and this Board has been functioning for a number of years. The Statement of Objects and Reasons appended to the Corporation Bill does not even, by implication, allude to any shortcomings on the part of the Board.

Reference has been made earlier to the Electricity Boards functioning on "quasi-commercial lines". This presupposes a healthy balance between earnings and expenditure, and this approach has been reinforced by the Statute in that the Electricity (Supply) Act, 1948, provides that a State Electricity Board shall not as far as possible carry on its operations under the Act at a loss. Such a safeguard is by no means inherent in the provisions of the Delhi Municipal Corporation Bill. Section 274 of the Bill casts on the proposed Delhi Electric Supply Committee a duty "to develop and maintain an efficient, co-ordinated and economical system of electrical supply..." but in the absence of a yardstick it is obviously difficult to assess how economically the power system would function in the future. Even in the case of Local Authority Undertakings functioning in the rest of India, they will have to contend with the provisions of Section 58 of the Electricity (Supply) Act, in pursuance of which the respective Board is empowered to issue directions to the Local Authority Undertakings concerned in respect of amortization and tariff policies. It is possible that the intention of the Delhi Corporation Bill is that such directions to the proposed Delhi Electric Supply Committee might emanate from the Central Government, but there appears to be no such provision in the Bill.

Sub-section (2) of Section 277 by which the General Manager (Electricity) is sought to be subject to "all the obligations of a Licensee under the Indian Electricity Act, 1910 or any other law for the time being in force relating to generation or supply of electricity" (emphasis provided) might perhaps be regarded sufficiently wide in scope, but it will certainly be stretching the language of the law too much to assume that this provision, by itself, would cast an obligation on the proposed Delhi Electric Supply Committee akin to the one cast on Electricity Boards under Section 59 of the Electricity (Supply) Act, 1948. Such a nebulous situation might well open up prospects of the Delhi Undertaking being exposed to financial loss, and should this eventuality result the community in Delhi, as well as the Exchequer at large, will be at a loss without any corresponding benefits.

The analogy of water supply would not appear to be appropriate in relation to electric power development. Unlike the rate for water, the price of electric power has greater ramifications in relation to the industrial economy of the area. One obvious hazard is the possible adoption of a price policy more related to the politics of the party in power in the proposed Corporation than to sound tenets of tariff making. Section 282 of the Delhi Municipal Corporation Bill is relevant in this connection, in that the charges leviable for the supply of electricity by the Corporation are to be such "as may, from time to time, be fixed by the Delhi Electric Supply Committee with the approval of the Corporation." The only safeguard against abuse here is the qualification under the Section that the charges to be leviable are to be "subject to the provisions of any law for the time being in force." It will be difficult to regard this qualification as offering sufficient safeguard against unfair price policies. Such a situation may not attract industries in the area.

When laws affecting basic industries are concerned, it is for consideration that principles adopted after extensive discussion should not be jettisoned because of some local expediency. There would, therefore, appear to be no convincing arguments to justify a reversal of the policy embodied in the Electricity (Supply) Act in relation to the Union territory of Delhi and the situation calls for the provisions in the Delhi Municipal Corporation Bill, 1957, seeking to vest on the proposed Delhi Electric Supply Committee the functions now exercised by the Delhi Electricity Board, being dropped and the arrangements by which the Board is now charged with the responsibility for developing and supplying electricity in the area being left undisturbed.

The Business World

CZECHOSLOVAKIA AND UNDER-DEVELOPED COUNTRIES

(CONTRIBUTED)

CZECHOSLOVAKIA'S relations with countries which have started on the road of independent economic development have many characteristics, which help to extend the platform of useful economic co-operation. The basis of these relations is the belief that peaceful co-existence of countries with different economic-political systems is possible and necessary. In political as well as in business praxis it means that Czechoslovakia recognizes the sovereignty of every country, recognizes its right for widespread economic development and respects, therefore, the interest of its national production. In this sense Czechoslovak trade policy as regards underdeveloped countries is the bearer of new relations between nations and upholds their right and endeavour to achieve and strengthen their economic and political independence. Economic practice itself will arrive at conclusions, how these relations, based on the principle of genuine co-operation and assistance are in agreement with the economic aspirations of underdeveloped countries. It will also demonstrate how peaceful co-existence of socialist countries with non-socialist countries can be made a reality.

The programme of industrial construction and rationalization of agriculture, which is the task which the majority of underdeveloped countries have set themselves and which are the expression of their basic economic requirements, present Czechoslovakia with a great opportunity for participation in their projected development. Czechoslovakia, as a leading industrial country, can, with its deliveries and technical aid, play an important part in the development of natural resources when these countries are engaged in establishing a national industry and carrying out mechanization of agriculture. Czechoslovakia possesses the necessary resources for such a task at the present time as few other countries can command. She herself carried out a gigantic reconstruction and development programme for her economy. Not only that. Czechoslovakia utilized to a great extent her capacity for industrialization of other European socialist countries for the building up of their electric energy basis, telecommunications, transport, mining, heavy as well as light industry.

In the same direction are developing relations with Asian socialist countries, which Czechoslovakia supplies with machinery and equipment in exchange for their products and supplements these deliveries with qualified technical aid. Czechoslovak industry exports to the Chinese People's Republic various machines and equipment, rolled material and chemicals in exchange for industrial raw materials, oil seeds, tobacco, tea, rice, wool, cotton, hides, sulphur, ores, metals and silk textures. Czechoslovakia supplies Korea with machines and equipment, chemicals, motor vehicles, medicines and textiles in exchange for non-ferrous metals, ores, tobacco; Vietnam with similar goods in exchange for vegetable oils, tea, rare timber, varnish and mother of pearl; with the Mongolian People's Republic a two-year trade and payment agreement was concluded in 1956 according to which Czechoslovakia imports furs, wool and horsehair in exchange for medical equipment, medicines, chemicals, textiles and footwear.

It is without doubt that similar advantages are gained through such trade by other countries, which have started on the road of economic emancipation. A natural basis of advantageous trade is the fact that these countries find in Czechoslovakia a long-term, secure market for their various goods, with which they are able to pay the deliveries of perfect industrial and

electric power equipment as well as agricultural machines which are necessary for their economic development.

These advantageous conditions for the exchange of goods were expressed in the past years by a significant increase in trade. In 1956, the volume of Czechoslovak trade with economically underdeveloped countries was raised approximately by 1/5 and their share in the total volume of Czechoslovak foreign trade increased to 14.2 per cent. Of Czechoslovakia's trade partners it is necessary to mention the typical case of India with which in the years 1953-1956 trade was more than doubled. With Indonesia trade increased during the same period by 60 per cent. A growing share in Czechoslovak deliveries was equipment of complete industrial plants. Czechoslovakia's trade is based in this sector on the basis of experience and past tradition which was demonstrated by pre-war deliveries of machines and equipment, especially for sugar mills, breweries and flour mills.

The present possibilities, which are estimated on the basis of the rapid expansion of trade in industrial requirements are by far wider. To illustrate, an order was secured from India in 1956 for the delivery of 3 sugar mills and 3 steam power plants. Czechoslovak industry supplies Syria with a great oil refinery and machinery equipment for a sugar mill. In Afghanistan a cement mill is being built; in Turkey a textile factory was put into operation last year and work is proceeding on a ceramic factory. Egypt ordered in Czechoslovakia a plant for the manufacture of leather footwear and in future Czechoslovak corporations will build in Egypt a cement mill, rolling mill for non-ferrous metals and the most up-to-date Egyptian textile factory.

For the purpose of maintaining the balance and continuity of trade, Czechoslovakia has to increase her import requirements as regards the volume as well as the assortment of imported goods. Czechoslovak imports from India include, besides iron ore, tea, pepper, mica, skins, mother of pearl, shellac, oil-cakes and textiles. From Ceylon she imports, besides caoutchouc, oil-cakes, almonds and graphite.

Czechoslovak supplies are to a steadily increasing extent accompanied by qualified technical co-operation, which, however, is not limited by the nature of business interests. In the sphere of technical aid, through bilateral agreements and the various agencies of the United Nations, Czechoslovakia places at their disposal part of her experiences gained in the building up of her own country. Czechoslovak specialists work in Afghanistan in the building industry, in the construction of roads, in the foodstuff industry as well as in land-surveying; in Ceylon, Czechoslovak geologists assist in the exploration of the mineral wealth of the country. India utilizes the high standard of Czechoslovak technique by sending her experts to Czechoslovak foundries; similarly, Afghanistan sends her experts to Czechoslovakia for training in the footwear industry. India, Indonesia and other countries accept the Czechoslovak offer which is placed at the disposal of the countries of Asia and the Far East, to provide scholarships to trainees in some fields. In this programme of technical aid under the auspices of this United Nations Czechoslovakia ranks among the leading countries in the world.

The importance of economic relations of Czechoslovakia and other socialist countries with regions economically underdeveloped cannot be evaluated only

from the quantitative point of view, even if the share of countries with a socialistic system is, for the majority of these countries, not decisive in the total turnover of their foreign trade. It brings into their economy an important moment of stabilization and especially it leaves them a larger freedom of action in their overall

economic policy. The existence of socialist countries itself, the possibility of supplies and sales to other markets, competition in quality of supplies as well as the standard of technical aid, has radically replaced their former one-sided dependence which was often misused against their national interests.

A DISMAL DIWALI FOR CLOTH

By

CROESUS

NORMALLY, 'moorat' trading is looked forward to by all sections of the trade with great hope and, unless there is something radically wrong with things as they stand or as they are apprehended to develop, as they stand or as they are apprehended to develop, the business community believes in initiating 'moorat' the business community believes in initiating 'moorat' business — commencement of transactions for the new year — in a big way. This is not just sentiment; decisions in regard to 'moorat' trading are taken not only after consulting the stars, in the age-old way, but after a thorough examination of the 'pros' and 'cons' of the prospects ahead. If this premise be accepted, he would be a bold man, indeed, who ventured to forecast a bright outlook for the Indian cotton mill industry in 1957-58. For, on the eve of Diwali, textile commentators have been predicting that the Diwali seasonal business in the Bombay market this year will not be more than 30,000 to 50,000 bales! This compares with 80,000 bales during the last Diwali season and some 180,000 to 200,000 bales in the years before that.

What has probably led to this dismal Diwali outlook in regard to the Indian cotton mill industry is the mounting cloth stocks with our mills, the estimated value of which today is about 50 per cent of the entire paid-up capital of the industry. The 'Indian Cotton Mill Industry', the latest and the most authentic publication of the Bombay Millowners' Association on the subject, has estimated the paid-up capital of the industry, which it rightly describes as "the nation's biggest organised enterprise," at Rs. 115 crores, representing nearly 12 per cent of the total paid-up capital (Rs. 1,019 crores) of all joint-stock companies in the country. At the end of September, 1957, the all-India figure of cloth stocks with mills was 572,163 bales (of 1,500 yds. each) exclusive of fents, indisputably an all-time record.

Somehow or other, for no stated satisfactory reason, the powers-that-be do not want to accept these figures — although these are their own published figures — of total cloth stocks, which include both unsold cloth (cloth on mills' account) and cloth sold but not taken delivery of (cloth on others' account). There may be some justification for this in normal times, when traders can be safely depended upon to take delivery of any quantity of cloth that they may have committed themselves to buy, on the stipulated date, but these are not normal times, in all conscience, considering that there have been several instances of traders having failed to take delivery of cloth which they ought to have done four months ago!

Be that as it may, let us examine the position with regard to unsold stocks only. At the end of September, 1957, these (again, exclusive of fents) stocks stood at 356,114 bales, a figure which is higher than that for any month since November, 1953; only in September and October of that year were the stocks slightly — only slightly — higher at 388,414 bales and 429,189 bales, respectively. True 1953 too was not normal for the cotton mill industry, but then, there is this difference between 1953 and 1957; there was none of the severe restrictions on credit that we are having today. This apart—in so far as Bombay city is concerned—in 1953, cloth stocks, on mills' account, on others' account, or total (even in September and October of that year)

were not higher than in 1957. Whereas the September and October 1953 total cloth stock figures were 162,000 bales (85,000 on mills' account + 77,000 on others' account) and 171,000 bales (96,000 on mills' account + 75,000 on others' account), stocks at the end of September, 1957 were about 196,000 bales. This doubtless explains the gloom that presently surrounds the Mulji Jetha market — the hub of the piecegoods trade in Bombay.

Several explanations have been offered for the steady accumulation of cloth stocks these few months past. In the first place, it is said that consumer resistance has started. On the facts of the case, this cannot be disputed, although it must be emphasised here that, compared to this time last year, when the Union Government imposed the penal excise duties on cloth with the dual purpose of restraining consumption and mopping up excessive purchasing power, cloth prices today are lower in the case of nearly all categories. The only explanation for consumer-resistance in regard to cloth then can be the high prices of food grains and other essential consumer goods. So it follows that, if consumer-resistance in respect of cloth is to be tackled successfully, the prices of food grains and other essential consumer goods must be brought down first; alternatively, cloth prices must be reduced, which would be feasible only if the excessive excise duties were drastically slashed. I must enter a caveat here, however, that, after the damage that has been done already, it is difficult for anyone to guarantee an appreciable increase in cloth sales immediately following the reduction of excise duties, even if prices of other essential consumer goods remain unchanged, let alone rise. That can follow gradually, as confidence is restored.

A second explanation is that, in many parts of the country, as a result of either floods or draught, the agriculturist has been hit so hard (especially in parts of Bihar where he has been subjected to this calamity for the third year in succession) that he simply cannot afford to go in for any cloth. This is certainly no exaggeration, judging from the reported accumulation of stocks in some of the leading West Bengal mills.

A third explanation is that the recent tightening of restrictions on bank advances against textiles has resulted in a sharp decline in the offtake of several individual cloth traders, especially in the 'moffusil', the cumulative effect of which has been reflected in the growing cloth stocks with mills. In the absence of relevant up-to-date figures, with which to compare the present position with that, say, a year ago or so, one is inclined to accept this explanation as perhaps the most plausible. However, some banking circles aver that, notwithstanding the recent select credit controls, advances against cloth stocks have registered a notable rise, thereby obviously wanting to question the validity of the argument that credit restrictions may well be the villain of the piece.

Yet another explanation is that, because of the varying incidence of the excise duty on the different categories of cloth — coarse, medium, fine, and superfine — there has been a tendency for every mill to produce the category of cloth attracting the lowest rate of duty. Although this seems understandable, the

category-wise break-up of the monthly all-India cloth production figures does not support the argument. It is true there has been a certain amount of fall in superfine cloth production but this could be attributed as much to shortage of foreign cotton. The monthly mill consumption of foreign cotton fell at one time — April, 1957 — to 41,084 bales, as against 53,732 bales in September, 1956. The monthly average mill consumption of foreign cotton in 1956-57 was only 47,290 bales, as compared to 50,270 bales in 1955-56. The present cotton cloth stocks accumulation seems to have affected different regions, nay different units even in the same region, in different ways. Thus, while Bombay, Kanpur and West Bengal regions have been complaining of cloth stocks accumulation, Ahmedabad and South India do not appear to be equally vociferous. Similarly, there are some mills in Bombay which are reported to have sold out six months ahead. (As stated earlier, this cannot always be taken to mean that the wholesaler will respect his commitments by taking delivery when he is expected to). At the same time, there are as many mills, if not more, which have been complaining of heavy accumulations. It has been suggested by some that this differing experience may depend on whether a given mill is an economic unit or not, but the results of a personal random sample survey by the writer do not fully substantiate this contention.

In these circumstances, it is difficult correctly to diagnose the problem, or rather to seek to generalise it in categorical terms. But this is not to agree with those doubting Thomases who facetiously conclude that, because cloth production has not slowed down or mills have not cut down the number of shifts, all must be well with the cotton mill industry. Evidently these people forget that, even if some mills jolly well want to reduce the number of shifts, they are precluded under the law from doing so. For mill managements are in the unhappy position of not being able to retrench by reason of the heavy cash compensation they have to pay in case of lay off, let alone straight re-

trenchment. But, if brutal truth is to be told, there is no knowing when these sorely distressed beings will throw up the sponge in despair. It would be statesmanship on the part of Government to read the writing on the wall and to avert that catastrophe.

FACTS BEHIND FIGURES

Generating

166,000,000 ft. lbs.

of power

Up and down the railway tracks of India run, on an average, 6,638 locomotives everyday. Together they generate nearly 166 million foot pounds of power during the year to carry 1,234,44 million passengers and 115 million tons of freight. The Second Five Year Plan schedules an expenditure of Rs. 900 crores (18.8% of the total outlay of the public sector) on railway development.

Carriage by rail is the most important method of transporting men, machines and materials across India. Providing steam power to keep the trains on the move are the locomotive boilers manufactured by Texmaco. Texmaco, pioneer in many fields of engineering, designs and builds locomotive boilers for the Indian Railways.

TEXTILE MACHINERY CORPORATION LIMITED

BUSINESS NOTES

A BUSINESSLIKE CONFERENCE ON ROAD TRANSPORT

LAST WEEK'S session of the All-India Conference of State Transport Commissioners and Controllers was marked by a businesslike dispatch of the subjects on the agenda which is not usual in conferences of this type. The entire proceedings were underlined by a sense of urgency that positive steps must be taken without unnecessary delay to augment road transport capacity in view of the fact that freight transport shortages are most likely to take an acute turn as the projects in the Plan advance. For the first time non-official organisations participated in the conference. The fact that they endorsed the decisions arrived at by the conference gives added importance to them and an assurance that they would be implemented effectively.

The conference uttered a warning that, if road transport capacity was to be stepped up to prevent grave bottlenecks, correct policies must be accepted and executed. The highlight of its recommendation was that a moratorium should be put on the nationalisation of goods transport services until the end of the third Five-Year Plan. This recommendation, besides being most valuable, is very easy to follow. It is crystal clear that private operators will hesitate to make substantial investments in projects of expansion of goods services unless they are given a reasonable security of tenure. Looking at the moderate, or disappointing, performance of nationalised passenger motor services (the failure of State road transport in Punjab is the latest example of the latter), it needs no argument that the State Governments should not blunder into making experiments in nationalising goods transport services at this critical time. It will be recalled that a few years back the Planning Commission had issued a recommendation urging the State Governments to desist from nationalising goods transport services. In the event of non-compliance, these Governments were informed that they would not qualify themselves for Central assistance to the extent to which financial resources would be so diverted. Only the Government of Bombay announced its intention to stick to its decision to take over goods transport services. It has not been able to carry out this decision. Now in the light of the multifarious problems created by the post-reorganisation set-up it should abandon this policy decision which exists only on paper. A moratorium on nationalisation, as suggested, would provide an effective incentive for rapid expansion of goods transport services.

The present strength of public carriers in the whole country has been estimated by a sub-committee of the conference at 1,25,000. In the sub-committee's opinion, increase in the immediate future by 50 per cent in this strength is the absolute minimum now required. The conference has urged that intra-State restrictions on movement of vehicles should be withdrawn and the number of vehicles permitted to operate inter-State routes should be stepped up by 50 per cent. Another important recommendation of the conference is the consolidation of motor vehicle taxes into a single tax to be levied and collected by the Union Government at the source. The ceiling for the tax is suggested at 75 per cent of the total taxes on motor vehicles in Madras which represent the maximum limit. This single tax is to be accompanied by a guarantee to State Governments of receipts at the existing level. This is sensible. State Governments have not concealed their opposition to reduction of motor vehicle taxes. Their difficulty is genuine, namely, that their revenues would suffer. A formula which can meet this legitimate ex-

pectation ought to be evolved now. The next step for the conference would be to make a thorough investigation into this question.

PAPER: PROSPECTS AND PROBLEMS

IT IS nothing more than stressing the obvious to say that the Indian paper industry is set for an important role and a bright future. As the country progresses steadily in the fields of education and industrialisation, increasing demands will be made on this developing industry. It is a matter of satisfaction that the performance of the industry during the last few years indicates that it is preparing for larger responsibilities. Its production during 1956 was the highest for five years. The first six months of the current year, also, show a further marked advance in this field. There has been an increase of as much as 7,116 tons over the production figure of 94,684 tons for the corresponding period of 1956. The way that the industry is progressing and the targets of investment as well as output are indicative that this rising trend will be maintained in the future. At the end of the second Plan period the installed capacity is expected to be 4.5 lakh tons with actual production of 3.5 lakh tons. This, of course, does not include newsprint. It is heartening to know from Mr. A. K. Jain, President of the Indian Paper Mills Association, that the expansion is being so planned as to reduce the country's dependence on imports of different varieties of paper requirements.

The recent import restrictions provide an incentive as well as an opportunity for the industry to increase its production. Substantial amounts of foreign exchange have so far been eaten up by paper imports. If the same is now diverted to the import of machinery and equipment, as far as possible, the production capacity can be increased. Nevertheless, lack of finance on the one hand and the extreme paucity of foreign exchange on the other are bound to retard the industry's growth. To get round these difficulties, certain improvisations would be necessary. For example, instead of insisting on the location of new units in particular areas, it may be more fruitful to help expand the existing units in order to effect savings in outlays. This, however, is only one of the many problems that the industry faces today. The availability of raw materials, their rising costs and the transport facilities that they need are among other problems which need active attention. It is not that the country is really deficient in the sources of raw material supply. Only, these sources stand in need of proper development and exploitation. The utilisation of alternative sources, like bagasse, will help not only in providing a new raw material to the paper industry; it will also promote the sugar industry which has not been able so far to put this waste to any useful purpose.

BUSINESS ASSOCIATES FOR S.T.C.

THE STATE TRADING CORPORATION has at long last realized that it is no longer profitable to follow a lonely course. In order to push up exports it has taken a wise decision to seek the collaboration of several hundred private concerns in the country. Leading firms engaged in the export of textiles, woollens, oils, handicrafts, engineering goods and consumer goods will be among those to be selected as the 'business associates' of the Corporation. The scheme is to send representatives abroad by the associates to explore the potential markets and tender advice on the best ways of matching the supply with the demand. It will also negotiate prices, particularly where collective bargaining is called for. The function of securing necessary railway transport, port facilities and licences will, of

BEHIND THE WHEELS OF INDUSTRY

Orient Industrial Motors are precision built from the highest quality materials to give high performance and long service.

Liberal designed, these motors have a high overload capacity and are capable of withstanding severe punishment.

Best insulating materials are used both in the slots and on the windings to give long life.

Dynamically balanced pressure die cast rotors are truly indestructible. Uniflow forced draft ventilation system keeps belt dust away from the rotor.

These and several other features make **ORIENT** motors truly **DEPENDABLE**.

course, be reserved by the Corporation. A part of the cost incurred by the business associates on foreign publicity and travel of their representatives will also be met by the Corporation.

It is worth noting that so far only a very small part of the foreign trade has been served by the S.T.C. during the 18 months of its existence. In this period, it has exported goods to the tune of Rs. 30 crores and imported goods worth Rs. 18.10 crores. That the Corporation has tried to bite more than it can chew is quite evident from the course of its activities. Its initial transactions with foreign buyers tell point blank that it has resulted in important losses to the country. To quote only one instance, sizable quantities of manganese ore were sold at approximately \$49 per ton around August 1956 when the markets in this product were particularly firm and indicated higher rates. Besides it is alleged, the Corporation failed to cover itself for stocks against commitments. So when the time came for the execution of orders, stocks were found to be lacking. In such cases the Corporation had to buy substantial quantities at a price higher than \$49 per ton. Although some improvements have been shown since then, the state of affairs is still not very happy.

Of course, it goes to the credit of the Corporation that it has been trying its best to expand commerce with a view to earning additional foreign exchange. The measures undertaken by the Corporation include institution of the system of rupee payment and grant of short-term loans to accommodate foreign buyers. Among the countries to which it has extended sizable short-term rupee credits are Egypt and Hungary to help them tide over their balance of payments difficulties at critical times for their economies. Being in an advantageous position to trade with Communist countries, it negotiated a deal with East Germany for the purchase of textile machinery worth Rs. 1.2 crores. Recently it has concluded an agreement for the import of textile machinery from Japanese Textile Manufacturers Association on a deferred payment basis. All this is to be welcomed for it may help in the rehabilitation of the textile industry.

SMALL SAVINGS

AT LEAST in the immediate future, India cannot hope to obtain foreign assistance to the full extent required for the implementation of the Plan. A sizable part of the foreign exchange segment of the Plan may, therefore, have to wait till better times. If this is true, it heavily underlines the necessity of mobilising all possible internal resources to retrieve a good part of the Plan. Since, however, taxation has almost reached the limit point in most cases, full attention needs to be turned to making small savings a helpful source for bringing rupee projects into rapid fruition. A successful small savings scheme would do much more than merely provide rupee resources. It would curb inflationary pressures, which is becoming more and more essential if serious upsets threatening the economy are to be avoided.

Unhappily, there is not much evidence to show that the real importance of this has been fully realized. Some measures have, no doubt, been adopted to increase the volume of such savings. For instance, the interest rate on savings was increased by 1 per cent in the last budget. But these measures have been essentially far short of the actual incentives needed. One of the major causes that has retarded progress in mopping up a volume of some significant magnitude has undoubtedly been the small share of State Governments in the funds so collected. This percentage has been revised upward from time to time. According to the latest reports, the share of each State has been fixed at some 66 per cent of the net collection, provided the State does not raise market loans. In

case of raising loans, the share would be reduced. This stepping up of the State share is calculated substantially to increase the collections.

It may be that the step will prove useful to some extent. But it needs to be remembered that the overall picture is not altogether happy. The cost of living, which has been continuously looking up, is bound to be further kicked up by the recent import restrictions. Internally, production of consumer goods is surely not sufficient to meet the total demand. Moreover, to strengthen the foreign exchange front, the country will be forced to export some of the consumer goods like sugar, cloth, etc., in larger quantities. The common consumer cannot escape its consequences and may not be able to save anything even with the best of will. Again, the vast bulk of the population living in rural areas has yet to be taught the habit of saving in any form other than gold and silver. And it is in these areas that much of the new prosperity has found its place. Therefore, what is needed perhaps more than anything else is the extension of banking and insurance to towns. This should be preceded by an imaginative campaign of popularising small savings among the masses.

STEADY PROGRESS OF JAY ENGINEERING

THAT THE Jay Engineering Works has made a steady progress is quite evident from the speech of Sir Shri Ram delivered at the annual general meeting of the shareholders of the Company. It is indeed creditable that the Company has been able to put on the market a table fan for Rs. 65 and a ceiling fan for Rs. 105, when the industry is still faced with the difficulty of obtaining various raw materials, particularly steel, pig iron and hard coke. The noteworthy feature is that the industry has been able to produce a satisfactory heavy industrial machine which is expected to go in production next year and is likely to meet the country's needs in yet another class of sewing machines. An effort is also being made to design zig-zag type of sewing machine and the Company hopes to succeed in this venture. So far as the production of needle plant is concerned, it is also reported to be fairly satisfactory. The sales of the Company have gone up to Rs. 3,89,49,999 in the year ending March 31, 1957, as compared with the year ending March 31, 1956 when the sales were Rs. 3,05,31,764. In the year ending March 31, 1957, the number of schools, the number of students in schools and the number of workers in the Works have also gone up as compared to the previous year.

It goes without saying that private industry has exceeded its quota of performance during the first Five-Year Plan. This performance of industry is to be read in the context of the contribution of industry to national income. The rate of increase in national income from industry is higher as compared to any other sector of the economy. Another noteworthy feature of industry is that the prices of industrial products have increased at a lower rate as compared to food products or industrial raw materials as is revealed from the rise in price index of food products, industrial raw materials and manufactures between October 1955 and September 1957. While all this is excellent, there is need, as the Chairman of the Company feels, for concentrating our energies on the export of industrial goods to foreign markets. The tight foreign exchange position in the country demands vehemently such an export production drive. So far as industry is concerned it is imperative that a determined effort at propaganda and publicity, development and study of markets and inspection of goods prior to export be made by all sections of the industry. But at the same time it is equally important that the Government should extend its helping hand to the industry in this matter. These observations of the Chairman on national economy deserve to be translated into action.

COMPANY AFFAIRS

AIR-INDIA INTERNATIONAL CORPORATION

The Fourth Annual Report of the Air-India International Corporation is the best that the Corporation has released so far. The results of working of the Corporation for the year ended March 31, 1957 show a substantial improvement in operating profit from Rs. 6.54 lakhs to Rs. 87.90 lakhs, while the net profit has increased from Rs. 3.78 lakhs to Rs. 38.42 lakhs. Similarly, the revenue ton miles performed by the Corporation increased from 19.6 million to 27.9 million, representing an improvement of 42.3 per cent. In consequence, operating revenues also rose from Rs. 676.53 lakhs to Rs. 964.88 lakhs, the average revenue load factor having improved from 55.8 per cent to 64.3 per cent. The improvement is due partly to the load factor having caught up with the increased capacity and partly to the inclusion of two credits, one of Rs. 6.2 lakhs relating to the operations of the previous year and another of Rs. 1.21 lakhs in respect of insurance rebate, also pertaining to the previous year. Even if these credits are ignored, it will be seen that the A-I.I.C's. profit has increased sizeably.

Out of the disposable profit for the year amounting to Rs. 38.77 lakhs, Equipment Renewals Reserve gets an appropriation of Rs. 36.00 lakhs and Insurance Fund Rs. 1.56 lakhs, leaving a balance of Rs. 1.21 lakhs to be carried forward. It must be added here that the "Equipment Renewals Reserve" was specially created, and has been credited with the amount of interest on the capital funds provided to the Corporation by the Government, thanks to the Government's decision not to charge interest for a period of five years commencing from August 1, 1953 on capital funds provided by it to the Corporation. The Board of Management deserves to be congratulated on this wise decision.

In order to finance the purchase of three Boeing 707-420 jet transport aircraft, to be delivered in 1960, the Corporation successfully negotiated dollar loans in the USA, of course with the help of the Government of India. The Corporation has thus been able to secure a loan of \$16.8 million, of which \$5.6 million, bearing interest at 5½ per cent per annum, from the International Bank for Reconstruction and Development and the balance of \$11.2 million, at 5 per cent per annum, from five leading US commercial banks. The repayment of these loans will commence six months after delivery of the last aircraft and will be spread in semi-annual instalments over five years. A feature of these loans is that the loan from the commercial banks, although bearing a slightly lower rate of interest, has to be repaid first. In addition to this, the Corporation has also negotiated a sterling loan of £1.5 million in London in order to pay for the British engines with which the three units of the Boeing aircraft are to be equipped.

At the instance of the World Bank, the outstanding 4 per cent Debentures (1949-59) amounting to Rs. 9.04 lakhs were redeemed on April 30, 1957, with the consent of the Debenture-holders.

The Corporation's activities included the addition of an important new route in the form of the Bombay-Sydney service, which was inaugurated on October 5, 1956. A part of this service, however, that is from Bombay to Singapore, had already been in operation since July, 1954, so that the new service was actually an extension of the existing service to Sydney via Darwin. Although this was the only new route to be opened the Corporation intensified its operations on the existing routes, the frequencies of many of them having been increased.

The A.I.I. Corporation's operations also were among the economic activities of this country that were affected by the Suez crisis in the Middle East

in the last quarter of 1956. This involved serious operational problems on the India-UK route, as normal operations through Cairo, Beirut and Damascus were temporarily interrupted and had to be diverted through Abadan and Istanbul and also, at times, through Basra. These problems would have been greater but for the extreme range built into the aircraft being such as to enable them to over-fly or by-pass the troubled areas. Naturally enough, all these meant additional expenditure.

Referring to the prospects, the Board observes that the future prospects are likely to be adversely affected by the ban recently imposed by the Government of India on all foreign travel, other than for essential medical, business or educational purposes. It notes that approximately half of the Corporation's passenger traffic consists of Indian nationals and a considerable proportion of it has consisted up to now of holiday and tourist traffic and the total denial of foreign exchange to these people has brought all such traffic to a standstill and caused an extremely serious loss of revenue to the Corporation. This, it is feared, would be reflected in the financial results of the current year and so the Board hopes that circumstances would permit of a relaxation of this measure at an early date. Subject to this, the Corporation looks forward to another year of satisfactory and remunerative operation.

To sum up, the year under review was one of consolidation and intensification of existing operations and not of expansion on any large scale, as the report itself reveals.

BIRLA BROS. PRIVATE LTD.**COMMODITY NEWS AND NOTES****WORLD'S NATURAL RUBBER OUTPUT**

Although world natural rubber output during August was 10,000 tons below the high level for July it was 27,500 tons above consumption, reveal preliminary figures of the International Rubber Study Group. Consumption rose by 5,000 tons to 152,500 tons, when allowance is made for the estimated imports into the USSR and China of 13,000 and 10,750 tons respectively. Production on the other hand fell from 190,000 tons in July to 180,000 tons in August. Indonesian exports during the month amounted to 72,694 tons, of which 28,745 tons were reported as being of estate origin. Between January and August world aggregate production was 1,247,500 tons, as against a consumption level of 1,262,500 tons, including estimated Russian and Chinese imports of 60,700 and 77,650 tons respectively. Output of the synthetic product for August was 105,000 tons, just 2,500 greater than consumption.

PRODUCTION OF DRIED FRUITS

Production of dried vine fruits in Australia this year is estimated at 77,900 tons—about 20,000 tons more than in 1956 but well below production of the previous three years, according to the Dried Vine Fruits Board. Production of both currants (10,137 tons) and raisins (5,370 tons) was well below last year's, but a 50 per cent increase in sultana production (62,400 tons) accounted for the rise in overall production. It is estimated that exports for this year will total almost 58,000 tons.

GERMAN STEEL OUTPUT

West German steel production decreased from 2,121,000 tons in August to 2,057,000 tons in September. Daily output, however, increased from 73,984 to 75,265 tons. In September 1956 steel output amounted to 1,925,000 tons.

EXPORT OF TEA

In September 1956 the Government of India decided that during 1956-57 a total quantity of 160 million pounds of tea could be exported from North India for auction abroad. In pursuance of the policy of progressive expansion of auctions held in India, Government have given careful consideration to the prescribing of a similar restriction during 1957-58.

After giving due weight to all available factors, internal as well as external, such as prospects of production and consumption, price trends, as well as the needs of other auction centres where Indian teas have traditionally found a market, Government have decided that for the current year a total quantity of 155 million pounds of North Indian tea may be exported for auctions in foreign countries. As in previous years Government do not propose for the present to impose a similar restriction on South Indian tea, and intend to take up this matter at a later date if it appears that the quantity of tea from this region that is being sent abroad for auction is disproportionately high in comparison with what is being auctioned at Cochin.

CENSUS OF MANUFACTURING INDUSTRIES

1947-54

	1947	1948	1949	1950	1951	1952	1953	1954
1. No. of registered factories in existence .	5,632	6,144	6,758	7,099	6,978	7,155	7,103	7,067
2. Factories from which returns were received	4,872	5,690	6,250	6,605	6,309	6,470	6,399	6,637
3. Percentage of (2) to (1)	87	83	92	93	92	90	90	94
4. Fixed Capital Employed (Rs. lakhs) . .	1,77,17	1,95,65	2,27,63	2,58,15	2,75,19	3,00,94	3,24,92	3,55,59
5. Working Capital Employed (Rs. lakhs) .	2,26,27	2,86,54	2,81,95	3,56,38	4,37,82	4,29,83	4,03,74	4,32,17
6. Total Capital Employed (Rs. lakhs) (5+4)	4,03,44	4,82,19	5,09,58	6,14,53	7,13,00	7,30,77	7,28,65	7,87,76
7. No. of Workers Employed (Thousands) .	14,87	15,46	15,22	14,68	14,78	14,96	14,71	15,34
8. No. of persons other than workers employed (Thousands)	1,46	1,59	1,63	1,64	1,54	1,53	1,57	1,81
9. Total number of persons employed (7+8)	16,32	17,04	16,85	16,32	16,33	16,48	16,28	17,15
10. Wages paid to workers (Rs. lakhs) . .	1,08,89	1,34,67	1,45,34	1,36,47	1,53,47	1,62,71	1,64,74	1,71,18
11. Salaries paid to persons other than workers (Rs. lakhs)	21,47	26,14	28,90	32,05	32,09	33,78	35,44	41,05
12. Money value of other benefits or privileges (Rs. lakhs)	5,34	5,00	2,95	3,65	3,63	4,25	5,03	6,32
13. Total salaries and wages paid (Rs. lakhs) (10+11+12)	1,35,71	1,65,82	1,77,19	1,72,17	1,89,19	2,00,75	2,05,21	2,18,56
14. Value at factory of materials, fuel etc (Rs. lakhs)	4,85,42	6,19,02	6,85,73	7,22,31	9,36,32	8,43,77	7,60,90	8,83,43
15. Value of work done for factories by other concerns (Rs. lakhs)	2,80	3,30	3,27	3,88	4,35	4,42	5,11	6,29
16. Depreciation (Rs. lakhs)	12,63	13,99	16,35	17,89	18,98	20,76	22,51	24,91
17. Total of materials and fuels consumed and depreciation (Rs. lakhs) (14+15+16)	5,00,15	6,36,31	7,03,38	7,44,08	9,59,65	8,68,94	7,88,52	9,14,63
18. Factory value of products and by-products (Rs. lakhs)	7,37,24	9,46,94	9,69,37	10,23,43	13,02,18	11,74,66	11,12,67	12,76,30
19. Value of work done for customers (Rs. lakhs)	5,74	6,71	6,70	4,59	4,68	9,30	10,11	11,25
20. Total of products and by-products manufactured for sale (Rs. lakhs) (18+19)	7,43,03	9,53,65	9,76,07	10,28,01	13,06,86	11,83,97	11,22,78	12,87,55
21. Value added by manufacture (Rs. lakhs) .	2,42,18	3,17,34	2,72,69	2,83,93	3,47,21	3,15,03	3,34,25	3,72,92
22. Value added as percentage of productive capital	—	—	53.6	46.2	48.7	43.1	45.9	47.3
23. Value added per person employed (Rs. Thousand)	—	—	16,18	17,39	21,27	19,11	20,53	21,75
24. Value added as percentage of gross output	—	—	27.9	27.6	26.6	26.6	29.8	29.0

The New Food Crisis

The announcement this week that India will need to import an additional two million tons of food grains in order to meet immediate requirements caused by the failure of rains in Bihar and Orissa is enough to depress the stoutest heart. In this unhappy year our misfortunes are falling as the proverbial autumnal leaves. If it should happen that the additional two million tons cannot be obtained by another P.L. 480 loan, this will be a new critical factor impinging on our foreign exchange resources, which may even tip the scales against our capacity immediately to meet all our foreign commitments. In plain terms this means that at least the greater portion of any new additional imports must be financed by an additional P.L. 480 application.

This conclusion, now that we have no option except to make a further application to the United States, is not likely to be received in the country with anything like enthusiasm. In one respect, any irritation with the Government is misplaced because it is an act of Providence—the failure of rains in Bihar and Orissa—which has been primarily responsible for this new and exacting demand upon our foreign exchange resources. Nevertheless, there is something in the public complaint that there has been a serious mismanagement of Indian agriculture. If the rest of Indian agricultural production outside Bihar and Orissa had been able to provide an additional 3.5 million tons—the scheduled increase in the Plan—the drought in Bihar and Orissa could have been

aken in our stride. As it is, an act of Providence is highlighting our own failure to perform scheduled tasks under the Plan.

Within the last three years the structure of Indian agriculture seems to have altered substantially from its promising phase in what is now appropriately called—as though it were a glory of the past—'The Age of Kidwai'. In barely three years from 1952 to 1955, Rafi Ahmed Kidwai was able to transform the bearish outlook in Indian agriculture which he inherited into one which looked for all time bullish. *The Eastern Economist*, like all other observers of the contemporary scene, failed at that time to see how greatly invested was his magic touch in the character of his success. In a significant sense, Rafi Ahmed Kidwai's administration was unique. He could raise food production in the countryside by decontrol, he could ~~pass~~ ^{pass} sugarcane production by control, and he could manage speculators and hoarders by a campaign of public relations which has seen no equal since Independence. He was literally ahead of his adversaries—whether cultivators, business men or bureaucrats—on every move. In the result he was able to obtain a degree of dynamic co-operation which has been sadly lacking since his premature departure left Indian agriculture in an orphaned and unpredictable state.

In this sense the success of Indian agriculture between 1953 and 1955 was certainly accidental, not so much because of the rains as because of the large element of improvisation which went into the making of agricultural policy. Improvisation itself is not a perpetual answer to any problem, and it is time, particularly as the genius of Rafi Ahmed Kidwai cannot be found again, to base our development on sound analysis and a flexible agricultural policy which works at least over the greater portion of the Indian Union. One of the great tragedies of the present situation is that we know nothing more about Indian agriculture than we did ten years ago. Its response to price changes, to increased irrigation, to abundant fertilisers and to changing markets has nowhere been documented so as to permit of any universal conclusions. There is almost no one who can describe the absolutely sure means to raise agricultural production by the levels incorporated in the Plan.

In part the difficulty arises because of the strange dichotomy which exists in the heart of Indian agriculture. Much the greater portion of it, perhaps three-fourths, is what has been frequently described in the textbooks as 'Subsistence Agriculture'. Any turn in the terms of trade in favour of agriculture is supposed, in this description, to decrease the incentives to produce. It may be that this is one factor which has operated, meaning that many agriculturists are working less because agricultural prices have been so unfavourable. On the other hand, there is certainly a large area—even if it is only one-fourth in value terms—in which price incentives operate. This has been proved over and over again in the case of commercial crops, jute, cotton and groundnut which always attract land when prices are sufficiently high. Some policy must be devised by which incentives favourable to commercial crops do not impinge unfavourably on others. But how can such a policy be determined unless we know how the incentives operate elsewhere?

It is obvious that we need two policies and not one. A policy for areas where water and

power are available and where fertilisers can be made available is one which is *prima facie* manageable. For, there, the manipulation of water and power rates and the price of fertilisers should normally be able to make for full utilisation of all three. This must mean in practice substantial differentials in water rates, power rates and rates in the price of fertilisers in different areas. The fixing of these differentials will require close analysis, though, one hopes, not prolonged academic study. What is here required should be only a firm decision to regulate all these prices.

In a very large area in which price manipulation of water, power and fertilisers, or seeds cannot be effected, it is useless to propound any purely economic remedy. As was indicated in a Leading Article in *The Eastern Economist* issue of October 4, "Water is Not Enough", here the fault is, above all, administrative—the absence of imaginative administration which uses both political as well as educational techniques so as to persuade cultivators to adopt newer methods where they can be shown to be profitable. Over the last three years, the incentive to change should have been embedded in Indian agriculture by the tremendous expenditure on agricultural extension services and the community development projects. Something has gone seriously wrong and, in this respect, not with the community development projects only. Obviously the administrative apparatus at district headquarters and at State capitals has been too slow intelligently to assess or quickly to act so that again we are threatened by stagnating agricultural output.

The crisis which faces this country at the present time is not merely to be measured by the additional imports of two million tons now imperative. It is the absence of any indication that the solid agricultural base, on which alone a large industrial expansion can be built, has not been secured by any means. To increase developmental expenditure with an agricultural base so uncertain and so unpredictable in its price implications is merely to invite inflation.

The country must use its best talents now to analyse and remedy a dread disease. It is clear that the magic spell which Rafi Ahmed Kidwai cast upon our agriculture has now ceased, for whatever reason, to operate. In any case personal magic and improvisation cannot be made substitutes for a lasting policy which will bring results as surely as night follows day. Our academic thinking here has been barren. Perhaps the Universities have something to say on the point, but they have been notoriously ineffective on agricultural problems in the last ten years. Perhaps our Agricultural Research Institutes have something to say both technically and statistically, but, if so, they have obviously not made their knowledge known. In the result we face a crisis almost without rudder and compass. It is essential that in the emergency which has arisen the country should treat its unhappy agricultural situation as its primary challenge. If there is no adequate response to this challenge, the Plan—and much else with it—will fail with repercussions which will be heard round the world. We gain nothing by shrieking annually for help. We must apply our own minds in a sturdy self-reliant way to find the key to our own troubles. They are grave by any standards; but let us like Solomon pray, above all, for wisdom, and not only for foreign assistance, even though we need that, too, in full measure.

Uttar Pradesh: Congress on the Decline?

IT is a picture of declining popularity for the Congress that emerges from the latest civic elections in Uttar Pradesh, the most populous State in the Indian Union and erstwhile stronghold of that party. Only in 29 out of 104 municipal boards to which elections were held has the Congress won absolute majorities, while emerging as the largest single group in 39 other boards. What is still worse, the party has annexed only 856 seats out of a total of 2,222 seats in all the boards. By all accounts, this is pretty bad performance by a party of the standing of the Congress. It may be that this anti-Congress trend is most pronounced only in the urban areas and the rural voters, by and large, still retain their allegiance to the party. Such a construction, however, cannot be sustained in the background of many a surprise that the General Elections of March last produced. The popular vote in favour of the Congress then fell to 43 per cent from the 48 per cent of the 1952 Elections, and the party's majority in the State's Vidhan Sabha was also greatly reduced. This surprising result was due, at least in part, to a decline in Congress popularity in the rural areas. It is not inconceivable, therefore, that the continuing anti-Congress trend revealed by the latest civic elections in urban areas is also reflected in rural areas.

While the anti-Congress trend in Uttar Pradesh is thus unmistakable, it has to be recognised at the same time that it is not a distinct trend in favour of the Leftists—Praja-Socialists, Socialists or Communists. None of these parties has fared even reasonably well: the P.-S.P. has won absolute majorities in just two municipal boards while emerging as the largest single group in four others; the Socialist party has secured absolute majority only in one board while coming out as the largest single group in two others; and the Communist Party has neither won absolute majority nor come out as the largest single group even in a single board. On the Right, the Jan Sangh has fared no better, having won absolute majority in one board and emerging as the largest single group in three others. What appears to be a Centrist group under the name of the United People's Progressive Front has secured absolute majority only in one board while coming out as the largest single group in four others. Many Independents, on the other hand, have secured absolute majorities in 28 boards. As for the number of seats won by these groups, it is 178 in the case of the P.-S.P., 48 in the case of the Socialist Party, 27 in the case of the C.P.I., 168 in the case of the Jan Sangh, 127 in the case of the U.P.P.F., and 789 in the case of Independents.

The gains made by Independents in particular are hardly surprising in the context of some popular dissatisfaction with the organised parties. But these Independents many of whom are dissident Congressmen are hardly likely to respect the voters' verdict for they might allow themselves to be won over by the Congress at the time of the Chairmanship elections, thus enabling that party to gain control of more than 50 per cent of the municipal boards. While the Congress may thus retrieve the situation, it will have lost a good deal of prestige in the process. In any case this can hardly undo the election results in terms of its own unpopularity.

The reasons for this increasing unpopularity of the Congress can be figured out more or less clearly at the moment. One of these appears to be that in districts like Meerut, Muslims have largely voted against the Congress. This anti-Congress trend on the part of Muslims does not appear to be a sudden development, for the pre-election poll conducted by the Indian Institute of Public Opinion in February last had clearly revealed that while only 47 per cent of Muslims were in favour of the Congress in the 1957 Elections, 56 per cent of them had voted Congress in 1952. As there is reason to believe that this decline in the popularity of the Congress with Muslims is greater now, only a small percentage of Muslims might have voted Congress in the civic elections. This can also be inferred from the fact that the Muslim candidates set up by the Congress have been mostly defeated this time while the non-Congress Hindu candidates set up by the Awami Party (a Muslim Party in Meerut and some other districts) have mostly won.

Another reason is probably that the urban voters who have been subjected to hardship in recent months by the rising food grain prices have come out strongly against the ruling party. Incidentally the Institute's poll revealed as early as February last that 42 per cent of voters thought they were worse off economically under the Congress rule. The number of such discontented people may well have increased in recent months. Disunity in Congress ranks is probably another reason for the Party's defeat. This should have conveyed an impression of weakness and instability to a section (more than a third) of the voters who, according to the pre-election poll of the Indian Institute of Public Opinion, favoured the Congress in February last for the reason that it was strong and stable.

If it is true that the Congress is losing its character for strength and stability in a crucial State like Uttar Pradesh, it is unfortunate that no other moderate party is strong and stable enough to take its place. If the Socialist Party of Dr. Lohia and the Praja-Socialist Party do not combine into a single party, there can be no certainty that the anti-Congress sentiment will be canalised on constructive lines. The Communists may well increase their influence to some extent in a situation of confusion, but the possibility of their replacing the Congress in a State like Uttar Pradesh where they were never strong may be ruled out. There is thus no alternative to the Congress becoming stronger again. For, if the Congress does not set its house in order and close its ranks by weeding out casteism which has played an ugly role in the civic elections, it is quite on the cards that its popularity will continue to decline with the result that neither it nor any other party may have an absolute majority in the next General Elections. The picture that has emerged from the civic elections can easily be reproduced in the next Elections if group rivalries continue to weaken the organisation. If the Congress were to go under in Uttar Pradesh, it would be almost wholly due to its own weakness and not due to the strength of any of the opposition parties. It is really amazing that the Congress should fare so badly as it has done now in the face of so much weakness on the part of the opposition.

The San Francisco Conference

THE International Industrial Development Conference, which was recently held in San Francisco, is one of the most significant and portentous events in the history of world economic co-operation. Over 600 delegates from 61 countries, most of them great leaders in banking, industry and commerce of their respective countries, participated in this Conference with a marked degree of enthusiasm and earnestness. Available reports of the statements made at the Conference show that it is destined to become a historic landmark in the growth of world economic order just as the United Nations Organization has given shape, however imperfectly, to the ideal of a world government and an international order. It is not perhaps without significance that this Conference was also held at San Francisco which gave birth to the United Nations Organization after the second World War.

The host country naturally took the lead in the deliberations, which was altogether appropriate as today the USA is undoubtedly the most economically advanced nation in the world and will have to bear the largest responsibility in organizing measures to increase international economic co-operation and to provide the necessary outflow of investment capital and economic aid for the rapid development of the less industrially advanced nations of the world.

The important policy statement made by the Vice-President Mr. Nixon at the Conference banquet as well as the keynote address of Mr. Eugene Black, Chairman of the World Bank, with which the Conference was inaugurated, and the concluding address of Mr. Henry R. Luce, Editor-in-Chief of *Time*, *Life* and *Fortune*, were unanimous in pointing out that the USA will have to play a much more active role in the process of the industrial development of the less advanced countries and in ensuring economic stability of the advanced Western nations who are now faced with great and pressing problems of rising prices, trade disequilibrium and high rates of interest.

It may be noted that an equally important and significant feature of the proceedings of this Conference was the abundant realization of the great urgency of these problems, particularly the need for the supply of "marginal" capital to the underdeveloped countries like India which are doing their utmost to mobilize their economic resources, which are admittedly insufficient by themselves to ensure the minimum rate of economic progress necessary for the maintenance of democratic institutions in these countries, and satisfy the aspirations of the newly independent peoples of the world for a rise in their standard of living.

As was naturally to be expected the philosophy of private enterprise and its great virtues found earnest and enthusiastic expression in the Conference and gained warm approval of most of the members who represented by and large the private sector; but at the same time the available reports also show that the Conference proceedings were marked by a high degree of economic realism and fortunately a dogmatic approach to the solution of the world's economic problems was totally absent. Mr. Eugene Black in his opening keynote address struck a note of great economic realism

when he observed: "There are real dilemmas here, and they are not going to be solved by dogma. I am as impatient with those theologians of capitalism who preach that private capital can meet all the world's development needs as I am with those theologians of socialism who preach that only State enterprise can satisfy today's demands. Nevertheless, I think it can be shown that, on any realistic analysis, there are vitally important advantages to be gained in the developing countries from the growth of a healthy and vigorous private sector."

An even more significant proof of this sense of realism pervading the Conference was the extraordinary applause accorded to Mr. H. V. R. Iengar's statement on the Indian Government's economic policies, a tribute no other speaker was accorded in a like manner. Such a high degree of warm appreciation was as much a tribute to Mr. Iengar's high ability and obvious sincerity underlying his speech, as it was indicative of the appreciation on the part of the audience of the fact that the Government of India's policies favouring a mixed economy were essentially of a democratic nature and were dictated by a high degree of economic realism.

It is a happy augury for the world's economic progress and particularly for the progress of the underdeveloped countries that the USA and other leading industrial nations of the world, where private enterprise has played more or less an exclusive role, have been able to recognize that in the less advanced industrial nations of the world the entire economic development cannot be left as an exclusive field of private enterprise and that the State has a vital and significant role to play in the development of various essential services and large economic undertakings for which private enterprise will either not have sufficient resources or the willingness to undertake on account of its low profit-earning or non-remunerative nature.

Although it would be unwise to expect any immediate results from this Conference by way of increased financial assistance and larger capital investment from the industrially advanced countries of the world, it would be equally imprudent not to notice a new ray of hope in the events of the last few days at San Francisco. The deliberations at this Conference have at least achieved one important and significant result, namely, that the world is now much more aware than ever before of the urgency, vastness and complexity of the economic problems facing the underdeveloped countries and the necessity of solving these problems in the interest of economic stability and democratic freedom of the free world. This is well illustrated by the following remarks of Mr. Henry Luce in referring to the speech of Mr. Iengar:

"As he told us so calmly, so lucidly, about the peaceful revolution in the world's biggest democracy, I confess to having had a feeling of abashment or embarrassment: at least my pride in America was shaken when I was forced to consider how comparatively simple our problems are compared with the tremendous undertaking to create a new India."

The Story of Oil—2

A miracle of nature

Crude oil, or petroleum as it is often called, occurs in many parts of the world—chiefly in regions where sedimentary rocks once formed the bottoms of ancient seas.

No one is sure how oil originated. The most widely accepted theory is that it resulted from the decay and alteration of the remains of prehistoric animals and plants. This organic matter was washed from the land into the vast jungle of marine life under the seas. The deposits, mixed with mud and sand, formed layer upon layer on the bottom. As these became buried, Nature's mysterious chemistry got to work. It slowly transformed the organic matter into the compounds of hydrogen and carbon which we now know as oil, and at the same time the fine

sediments which covered it were compressed into rock strata. The newly-formed oil oozed into the nearest layers of porous rocks, which held it as if in a sponge, and here it remained.

Throughout the millions of years that oil was being formed, many changes were taking place in the earth's crust. It rose and fell, was crushed and expanded. Lands were drowned, sea-beds became dry land. In some places cracks developed and the land slipped, forming 'faults'.

During these violent changes, some of the imprisoned oil escaped and was lost. In other places it was so near the surface that it seeped through and was discovered and used by man from the earliest times. But the bulk has remained trapped in its porous rocks beneath the surface of the earth.

THE WEEK'S NOTES

THE PRESS AND THE PRIME MINISTER

AT HIS recent press conference, the Prime Minister took strong exception to the publication of "secret" official documents in newspapers. Allowing his heart to have the better of his head, he even went on to say that such "scoops" betrayed "lack of responsibility" on the part of the Press and threatened to take legal action under the Official Secrets Act for any such lapses in future. This surely was a deplorable outburst, the more deplorable because the provocation for it was the "leakage" of the "preliminary comments" made by the Law Commission on the selection and appointment of high court judges. The "leak" was, it may be remembered, not favourable to the Congress Government. Evidently this had upset the Prime Minister. No doubt Mr. Nehru also objected to the publication of his confidential circular letters to Chief Ministers of States. But these letters have regularly been published in the Press for some time, without any objection being raised by any one, not even by Mr. Nehru himself. This leaves little doubt that the Prime Minister's chagrin was in the main over the scoop relating to the Law Commission's "preliminary comments".

The reasons that prompted Mr. Nehru to make the remarks are, however, less important than the vital issues they raise, especially as the Prime Minister has held out the threat of legal action for any violation in the future of the Official Secrets Act. The issues involved are those of the freedom of the Press and its role in a democracy. In a democratic country the Press is by no means responsible to the Government. It has to perform its duty to the people. It would be a betrayal of that solemn duty if the Press were to accept the proposition that it should not publish anything about what goes on in the official world unless the Government graciously passes it out in publicity handouts. No newspaper worth the name can agree to be a mere reprint of the official gazette and other publications. The freedom of the Press in a democracy is, and can be, limited only by the demands of accuracy, public morality, national security and public interest. If a story passes these four tests, no Government claiming to be democratic can take any action against the newspaper which publishes it—except in a court of law, where the newspaper has full freedom to defend its action and expect justice.

Besides, it is no use ignoring the fact that the Official Secrets Act was framed years ago, in different circumstances and by a foreign administration. In course of time it also became almost a common practice to mark every Government paper as "secret" or "confidential". That absurd practice still persists, though British rule ended ten years ago. As one correspondent pointed out at the Prime Minister's Press Conference, even the tour programme of a Deputy Minister is a "secret" document, under the Act. Mr. Nehru himself admitted that every paper marked "secret" was not necessarily secret. "Government secrets" cannot be, by any stretch of imagination, equated with those likely to endanger the security of the State. It is the duty of the Press to fish them out and publish them. The criteria of "accuracy", "public morality" and "public interest" are important, and every responsible newspaper should try to honour them but they are not categorical imperatives, except in a limited sense. If a news is incorrect, it can be contradicted or denied. "Public interest"—always an elastic phrase—too is best safeguarded both by the public and the Government issuing their own versions of the news. Imposition of a ban on news is no way to protect "public interest" in a democracy.

If the Government unwisely decides to take action against any newspaper publishing such "secrets" as do not pertain to the security of the State, a conflict between the Press and the Government is inevitable. The Press cannot abdicate its duty towards the people, who are, in the last analysis, the sovereigns in a democracy.

THE CRISIS OF NATIONAL COMMUNISM

THE "OCTOBER REVOLUTION" in Poland last year does not seem to have solved all of the country's political problems. It has, in fact, created some new ones. This is evident from the fact that Warsaw has been of late the scene of demonstrations and strikes by students and workers; even serious rioting broke out in the Polish capital, following a strike by the transport workers. Students and workers, it may be remembered, constituted the force that brought Mr. Gomulka to power. The Government was of course able to curb the rioting, break the strike, frighten the demonstrators, and suppress the anti-Stalinist youth journal, "Po Prostu". But the manner in which the challenge was met reinforces the belief that Communism, national or otherwise, cannot exist without employment of the well-tried methods of Stalinism. This is perhaps the price which Communism must pay in order to survive. The alternative would be a progressive trend towards liberalism.

Mr. Gomulka's retreat into Stalinism could perhaps be attributed to the delicate position vis-a-vis the Soviet Union in which he finds himself after Russia's ruthless suppression of the Hungarian uprising. Since the suppression, Mr. Gomulka has been appealing almost tearfully to his compatriots not to abuse the little freedom they have gained—implying, of course, that they could easily lose it again to the Russians. This interpretation would encourage some to charge Mr. Gomulka of acting on the basis of expediency. The charge would be unwarranted. Mr. Gomulka has not forgotten that while Russian machine-guns were mowing down Hungarian freedom fighters, the West did nothing but look on, and talk. If the Russians entered Poland, it is probable that the West could do the same—in the interests of preventing a world war.

However, the Polish riots have shown clearly that there can be no half-way house between Communism and individual freedom, and that the attempt to reconcile Communism and certain basic democratic rights within the constitutional framework is doomed to failure. The two are, in truth, incompatible and cannot co-exist. To be sure, discussion of the kind of Socialism that people would like to have, of the role of the Communist Party in a Socialist State and of the place of democracy, are heresies from the point of view of orthodox Marxists and fanatical Communists; such a discussion would challenge the fundamental concepts on which Communist regimes are built.

But the challenge to the Communist hierarchy does not come from Poland alone; and this is a sign of its coming end. It is very much to be seen in Hungary, in the form of a seething discontent, even though Mr. Kadar's regime has been forced to dissolve the Works Councils, which were probably the last democratic apparatus left in that "People's Democracy". In Yugoslavia, Marshal Tito, who was able to achieve a bloodless break with Stalin's Russia, is faced with a similar problem. The problem has been squarely stated by Mr. Milovan Djilas in his "The New Class". He says: ".....in establishing itself the Communist bureaucracy achieved the monopoly of power in history. But after

having achieved industrialisation, the new class can now do nothing more than strengthen its brute force and pillage the people. . . . Smothering everything except what suited its ego, it has condemned itself to failure and shameful ruin". The cycle of what could be called the Communist epoch is coming to completion; the next phase will see the exercise of authority that takes its sanction candidly from brute force, without pretensions of ideology. From the womb of the resulting tyranny will be born its antithesis. For these are the only consistent forces in history—the tyrannical force and the individual's struggle for freedom. History is, after all, the story of liberty.

THE CHANDIGARH SURVEY

THE ECONOMIC and Statistical Organisation, Punjab, has recently carried out a socio-economic survey of Chandigarh. This survey of the Capital of Punjab in the initial stage of its development is most appropriate, for a re-survey at a later stage could well bring out the City's progress in the intervening period. The survey is both a house-to-house census and a sample survey—a complete human census which collected broad particulars about each resident and also a sample survey of selected households (10 per cent of all households) which were interrogated more intensively on some relevant questions. Another object of the survey was to measure the pace of progress of house construction in public and private sectors, and this part of the survey was done by assembling replies to a questionnaire mailed to 629 selected plot-owners who had not started construction work on their plots.

The most important finding of the preliminary report is in regard to the slow progress of construction work since 1949, the number of completed houses, as of June 1957, being just under 9,300 of which nearly 2,400 are Kutcha huts, nearly 5,200 are in the public sector and 1,700 in the private sector. In at least nine sectors out of the thirty into which the town is divided practically no construction work has so far been done. The fact that three sectors alone have fully developed to the point of having more than half the Capital's population of 38,000 throws light on the enormous amount of house construction that is yet to be done in the other sectors. Incidentally this also throws some light on the difficulties of constructing a new capital city from mere scratch. The reasons for the slow progress of private house building, when made known to the public, should be even more enlightening.

The data on Chandigarh households are equally interesting—and even surprising. An average household consists of only 3.6 persons of whom 1.2 are earners and 1.9 are non-earning dependents. The number of unemployed males in the age-group of 20-55 years is only 240 out of a total male population of nearly 11,000 in that group; this may be due to the construction work that is going on. Another noteworthy finding is in respect of the distribution of households according to income. Nearly 600 cases of income below Rs. 50 per month are mostly of manual labourers with no regular jobs. About a third of the households earn between Rs. 51 and Rs. 100 per month, and about an equal number earn between Rs. 101 and Rs. 200. One household in six has income between Rs. 201 and Rs. 500, and households making more than Rs. 500 are one in twenty. Only 48 households earn more than Rs. 2,000 per month. It is also a revealing fact that the size of the household goes on increasing with income until the largest number of 5.5 persons is reached for incomes between Rs. 300 and Rs. 750 per month; this is probably due to the circumstance (which is a matter of common observation)

that the middle class has to support more non-earning dependents than the working class.

Some other findings of the survey are that Government service absorbs 28 per cent and 12 per cent of all earners in Chandigarh in administrative work and in constructional activity respectively and that as much as 62 per cent of the city's population above the age of 5 years is literate. The standard of education attained is also high, with nearly 25 per cent out of every hundred of the entire population above the age of 5 years having passed at least the matriculation examination. Again, as many as 42 per cent of all students in schools and colleges are females. These are highly progressive trends, and Chandigarh may well be proud of them for, in the last analysis, it is only the educated population that will add lustre to the new Capital which is the pride of Punjab, second only to the great Bhakra-Nangal Project.

UNIVERSITY AUTONOMY

UNIVERSITY AUTONOMY has been a subject of heated and continuous discussion in the country since independence. While the academicians have demanded complete freedom to manage the affairs of universities in the manner they deem proper, State Governments have tended to interfere with their day-to-day activities. The latter's excuse is that they provide financial sustenance to the universities on an ever-increasing scale. In some States, universities have been reduced to the position of an adjunct to the Ministry of Education.

The situation has become particularly disquieting since textbooks were nationalized in some States. Not infrequently, some of the "nationalized" textbooks are no more than propaganda pamphlets of the party and persons in power. As these books are for use by students of an impressionable age, the danger of undesirable indoctrination becomes very real. The Kerala Communist Ministry's University Act is another step in the same regrettable direction, and a much worse one. Under the provisions of this Act, the University of Kerala has become virtually an instrument for the Kerala Ministry of Education.

University authorities and State Governments would in this context do well to heed the statesmanlike advice given last week by Mr. C. D. Deshmukh, Chairman of the University Grants Commission. Speaking in Madras, he suggested that a part of the funds transferred to State Governments from Central revenues should be earmarked for universities by the Finance Commissions. This would eliminate the possibility of undue State interference in the management of universities, while ensuring them adequate funds. But, as Mr. Deshmukh rightly pointed out, adequate financial arrangements, though important, will not alone be enough. For, absence of funds is not the only factor corroding into the universities. What is needed most are men of quality for the teaching staff. It is only when we have dedicated men in charge of higher education that we can expect our universities to become what they should really be. Among other things, higher salaries for teachers should help attract suitable persons. It is only when this condition has been satisfied that autonomy will have meaning for the universities. Mere provision of ample funds will only result in mismanagement. Absence of control has already resulted in maladministration and has turned the universities into hotbeds of petty intrigue. A proper remedy for this situation would be a phased programme of granting autonomy to universities. A cautious approach is called for, not precipitate haste.

A Window on the World

QUEEN OF ENGLAND OR HEAD OF THE COMMONWEALTH?

By
ODYSSEUS

ALL THAT CONCERNS the Commonwealth is of concern to India. The recent rumpus in the UK over the criticism of the Queen's choice of personal advisers launched by Lord Altrincham's special issue on the monarchy of the "National Review", and followed up by Malcolm Muggeridge (remembered by some in India as Assistant Editor of "The Statesman" in 1934-35) in the American "Saturday Evening Post", has raised more heat and dust in the popular press than cool reflection. But it may serve a useful purpose.

First, let me recall what the "National Review" said. I cannot, of course, reproduce the whole of the special section of the August "National Review" consisting of five articles—"The Monarchy Today" by Lord Altrincham; "The Private Secretary" by Dermot Morrah; "Foundation Stones and Things" by B. A. Young; "The Finances of the Monarchy" by Humphry Berkeley; and "Asia and the Head of the Commonwealth" by R. Tamitegama, which between them covered no less than 18 pages. I can only say that these articles constituted a serious discussion and had nothing in common with the hypocritical "Let's not rake muck" attitude of a section of the British popular press. The "National Review's" articles were, on the contrary, promonarchical in intention, their criticisms were constructive, their language forthright but reasonable.

The essence of the "National Review's" criticisms was that the monarchy should not rely on its survival solely on the mystical appeal that it makes to the non-Asian members of the Commonwealth but should take thought for its position in a world of changing values. Since the monarchy is not the head of a purely European Commonwealth it must transcend race, and the Review pointed out that the Duke of Edinburgh, whose merits are universally extolled, is British only by adoption and that he gives the impression of being a citizen of the Commonwealth wherever he goes. In this he shows his awareness of the new pattern within which the monarchy must work—and "work" is the word—in the difficult years ahead.

Secondly, the "National Review" insisted that the monarchy should transcend class. Social distinctions are bound to exist in any large community. To pretend that they do not exist in, for example, the UK, the USA, the USSR, and India, is naive. But the Crown must not seem to be identified with any particular social group, and on this point the "National Review" felt less happy about the Queen. It observed that she was given a conventional British upper class education, culminating in the round of the London society "season", the race course, the grouse moors, and Canasta parties, and commented "all this would not have been good enough for Queen Elizabeth I!" The "National Review" considered that it said much for the Queen that she has not been incapacitated for her job by her inadequate training. She has dignity, a sense of duty and goodness of heart—all precious assets. But will she have the wisdom to give her children a different education? Will Charles mix in his formative years with children who will not only be future landowners but also bus drivers, dockers, engineers, trades unionists, etc?

TOO UPPER CLASS AND TOO BRITISH

The "National Review" emphasised that the Queen's choice of her personal friends is not a legitimate matter for public comment, but that the choice of her official Palace civil servants was. That the Queen's present personal staff is drawn exclusively from a single social type—the upper class British lady and gentleman—creates an unfortunate impression. These people may be shrewd, broadminded, and thoroughly suitable for the positions that they occupy, but there are plenty of equally shrewd, broadminded, and suitable people in other social strata. The "National Review" laments that, worse still, the Queen's courtiers are nearly always citizens of one Commonwealth country: the UK. While the monarchy has become popular and multi-racial, Buckingham Palace has remained a little enclave of the British gentry.

This brings us to the nub of the "National Review's" argument: "The Queen should surely now be surrounded by advisers and companions with as many different backgrounds as possible. A truly classless and Commonwealth Court would not only bear eloquent witness to the transformed nature of the monarchy, but would also give the Queen and her family the advantage of daily contact with an interesting variety of personalities and points of view. It would not, of course, be desirable to appoint courtiers on any strict rationing principles—so many Canadians, so many Africans, so many trades unionists, so many aesthetes, so many socialists, so many Tories, and so on. This would be an absurdity. But granted the fitness of some for a post at court, political and social considerations should also be taken into account before an appointment is made. Thus there would be no sudden or artificial change, but over a period of time the composition of the court would gradually become more catholic and more representative."

WANTED: NEW ROYAL GHOSTS

The "National Review" also criticised the quality of the speeches written for the Queen by her staff. "The personality conveyed by the utterances which are put into her mouth is that of a priggish school girl, captain of the hockey team, a prefect, and a recent candidate for Confirmation. It is not thus that she will be enabled to come into her own as an independent and decisive character." In other words, the "National Review" wants some new blood in the Queen's ghost writers. Most public figures in all countries are compelled by the calls on their time to employ them. The wise statesman chooses a writer of personality and imagination. Franklyn Roosevelt, for example, included Robert Sherwood, the gifted playwright, as one of his principal ghost writers.

How does all this affect India? I have never concealed my belief in the value of constitutional monarchy, and today I throw out the idea that one of the injustices inflicted on India by the British was to deprive India of its own all-India monarchy, and to keep the rulers of the old princely states on their gadis in such sterilised conditions as to render it increasingly difficult

—though by no means impossible—to be simultaneously a prince and an intelligent human being. By removing the Mughal emperor and substituting loyalty to a foreign emperor of a different ruling race, and by turning most of the Indian princes into puppets, the British rendered the rejection of monarchy certain on their departure.

This I believe to be India's loss, because among the most elementary and yet profound needs of every human being is a national figure to whom he turns as the symbol of his patriotic aspirations and of the national unity which transcends race, caste, creed, and political differences. A flag, or an institution, still more an elected politician, is, in my view, a poor substitute for a person who has round him the aura of a long established dynasty and the traditions of the nation's history.

As I wrote here in an article entitled "Are Kings Useful?" on February 15, 1952, while I believe democracy to be the least unsatisfactory system of government so far devised, it has many obvious weaknesses. Party government tends to divide the nation into factions which party strife constantly stimulates and periodically whips to fever heat. In order to catch votes, politicians flatter the masses by exalting the virtues and importance of the Common Man to whom this age is said to belong. Politicians appeal to the lowest common denominator of human passions and prejudices, so that this Age of the Common Man is also the age of rampant vulgarity, meretricious ideals, and false values. If I could order things as I liked, I should not flatter the Common Man but encourage the Uncommon Man. If I assert that I have no desire to identify myself with the Common Man, but that, on the contrary, it is the exceptional man of parts, gifts, and culture, who interests me, I risk the accusation of being un-democratic—to such a perversion of values have we come.

A monarch can provide an extraordinary force to hold all these dividing and debasing tendencies in check to an extent out of the reach of any politician, or even statesman. The American President, for example, is not, as you might at first suppose, an American rallying point: he is a party chief. Unless I had ex-

perienced it, I could not have believed the rage and bitterness that mention of the name of Roosevelt, the Democrat, used to stir up among Republicans. I remember a patriotic American citizen in Denver, Colorado, who ostentatiously turned his back on me at a party because I ventured what seemed the harmless opinion that Roosevelt was a great man.

That India's princely states were amalgamated was as sensible as it was inevitable, but that the princes have been eliminated remains to be seen. I am ready to go on record here as forecasting that there will be many who will stage resounding come-backs in public life.

Meanwhile, what of our acceptance of the Queen as Head of the Commonwealth? The words of the communique issued when India became a republic were: "The Government of India have, however, declared and affirmed India's desire to continue her full membership of the Commonwealth of Nations and her acceptance of the King as the symbol of the free association of its independent member nations and as such the Head of the Commonwealth." Let us not get the Crown's role out of perspective: the operative words are: "acceptance of the King as the symbol of the free association of its independent member nations." On the other hand, as long as we do wish to remain in the Commonwealth, it is in our interests that the Commonwealth's symbolic Head should be as representative as possible, and it seems to me that we should support those who are campaigning towards that end.

For my part, I add that the more that can be done to emphasise the Queen's position as symbolic Head of the Commonwealth—and to root out the idea that she is a special UK interest, perquisite, or possession—the better for the Commonwealth. There is no reason why the monarchy should not be represented by a resident Governor General in the UK, as it is in Canada or Ceylon. This would set the Queen free to reside in, or to visit, the rest of the Commonwealth, and it would, I submit, strengthen the links between us all by providing occasions for non-political meetings of Commonwealth minds.

SPECULATION AND THE CURRENCIES OF WEST EUROPE

(From Our Special West European Correspondent)

PARIS, October 27.

THE official journal of the European Coal and Steel Community says in the issue for this month, by way of introduction to its usual review of the West European economic outlook, "Opinions concerning the economic situation in the Western world, and concerning its future evolution, are at present much more divergent than is normally the case". This is something of an understatement. Opinions on the question in the various European commercial centres are violently contradictory, and within any one city one can hear contrary forecasts expressed in banks, finance ministries and stock exchanges. Share prices have fallen sharply in most West European bourses and, impressed by this, and by the uncertain trend of production and employment figures, there are commentators who promise us a substantial deflation. But wages and industrial goods prices continue to rise and government outlays show no sign of falling, and these are invoked by central banks for the round of bank-rate increases that have occurred in most European countries except West Germany. The wisdom of these increases is challenged by those who point to the accumulation of stocks in some industries, the downward trend of raw material prices in international markets, the slight but significant retreat from over-full employment and the nervousness of the main stock exchanges on both sides of the Atlantic.

Suggesting that this confusion will continue for some time yet, the Coal and Steel Community journal hints at one of the main causes when it says: "As long as the situation is not entirely clear as regards exchange parities, industrialists will have difficulty in making plans for the immediate future. Speculative influences on international balances of payments will continue to be felt, and will incite central banks to adopt credit and interest rate policies which do not always correspond to the economic situation of the moment". In other words, speculators gambling on a realignment of exchange rates, or taking advantage of differences of interest rates, are causing movements of capital across European borders which oblige central banks to take measures inconsistent with the requirements of industry within their own country.

It is not suggested here (and the journal just quoted does not pretend) that this is the whole story. Indeed the whole story of the present economic situation in West Europe is too complicated for anyone to unfold; the best we can do is to follow out one thread and show its undoubted influence in half a dozen European economies. That thread is this: the immense and persistent balance of payments excess accumulated by West Germany has caused a speculative flight of capital out of the other European countries, leaving those countries in a position where investments were in excess of available savings and necessitating a rise in the price of money to stem the flow of capital, limit investment and stimulate new saving—whereas, if those funds had remained where they were, they would have been so far in excess of new investment that central banks would have been encouraged in some cases to guard against emerging deflationary dangers by cheapening money.

We will begin with the example of a country where this mechanism can be seen operating in the pure state:

Switzerland. The Swiss economy has been under no tensions arising from domestic mismanagement, over-importing, dangerous inflation or over-full employment. There had been, it is true, some signs last year of an excessive liquidity, but interest rates are normally low and staple in Switzerland. When funds began to get scarcer this year, the authorities were at first quite content, but the process continued until the Institute of Issue had to recognise the tense state of the money market by raising the official discount rate to a figure that has not been known in Switzerland for over a generation. This has touched off a lively controversy because the Swiss are quite unused to dear money, and the restriction of credit has had several awkward results, as on agricultural prices for example. The measure was however inevitable, firstly because Swiss capital had migrated in large amounts to earn high interest (and benefit from a possible revaluation) in West Germany, and secondly because foreign banks that normally keep substantial deposits in Switzerland were obliged to withdraw funds because the same thing was going on in their home countries.

Belgium has presented a striking picture of falling stock markets, a slight fall in industrial production—and dearer money, forced on a reluctant Government by a central bank disturbed by the speculation against the currency. Floating capital usually resident in Belgium has fled to West Germany, taking a proportion of Belgian funds with it. Belgian industry has been hit by credit restrictions elsewhere, especially in Holland and France, restrictions which, as will be mentioned, had a similar origin to Belgium's: the flight of capital to Germany.

A similar unbalance in payments with West Germany was the cause of the rise in interest rates in Sweden this autumn. Foreign trade is heavily in deficit and the fall in freight rates reduces a usual substantial source of invisible earnings. If the deficit in Sweden's case shows up more in the trade balance than in simple capital movements, this is because it is the Swedes who have been speculating against their own currency, i.e. accumulating speculative stocks, especially of West German goods.

Interest rates have risen in Holland and further credit restrictions are believed to be imminent. The balance of payments position has deteriorated rapidly, one-third of the reserves having been lost in 16 months. Here again the deficit is largely with West Germany, and the United States, and it is speculation against the florin that has aggravated the situation and so far defeated the Dutch Government's efforts to restore the balance.

There is no need to go into detail about the cases of Britain and France because the recent evolution of their currency values and interest rates is well known. In both cases the flight of capital to West Germany was a significant aggravating factor. The British Government, curiously, did all it could to increase this strain on sterling by orchestrating a campaign in favour of revaluation of the West German mark; to the extent that speculation has ceased, this is less the result of the cessation of that campaign than of the draconian

Ready Shortly:

THE GUIDE TO WEALTH TAX ACT. (fully annotated)

by Sri A. Ramaiya, Advocate, Author of the
Popular Edition of Guide to Companies Act.

The Wealth Tax Act of 1957 has come into force from April 1957 and applies to all individuals Hindu undivided families and also Companies (Foreign and Indian).

Returns have to be submitted before the 31st December, 1957: Submission of returns is incumbent on a person or firm who is liable to the Wealth-tax and those who fail to furnish such returns are liable for punishment or prosecution.

Every probable assessee should therefore be fully aware of the provisions of the Wealth Tax Act.

This Guide to the Wealth Tax Act gives you a complete and exhaustive annotation of the Act and will help you in your tax problems. The concessions, exemptions etc with which one should be familiar are dealt with fully.

Please place your orders for a copy immediately:

tightening of credit by means of a 7 per cent bank rate. Speculation against the French franc, in connection with the deficit in trade with West Germany, reached such immense proportions that Monsieur Gaillard was forced to a partial devaluation; the recent ministerial crisis and wave of strikes has revived speculation, and a full and frank devaluation may be forced on M. Gaillard's successor.

In none of the six countries referred to has the speculative movement of capital to West Germany been the sole reason for balance of payments deficits and the rarefaction of credit. But in all of them it has played a role, and since all of these countries are neighbours and trading partners, the measures they have taken to protect their currencies and money markets against Germany have had further restricting effects on each other's trade and credit. These facts are not recalled here simply to bear out the forecasts made on this page many months ago during the spring and summer that, despite the continuing expansion of West Europe's economies, Europe was heading for a foreign trade crisis and that the cause of that crisis would be West Germany's relative deflation; they are recalled in order to enable us to judge how far recent changes in West Germany's own credit policy will contribute toward a restoration of balance.

These changes are in the direction of mild inflation. In part they have been forced on a rigidly "sound-money" Government by the speculators, as for instance the fall in interest rates caused by the afflux of capital to West German banks. In the month of August several thousand million Deutschmarks of liquid funds poured

into Germany, making inevitable the decision taken in September to reduce the bank rate to 4 per cent. The closing of the gap between German interest rates and the rates ruling elsewhere in Europe has limited the flow of capital, but has by no means reversed it. Of more significance were the price rises that the Adenauer regime held up until it had won the elections; when one is conducting an election campaign on a sound-money programme it would not do to announce an 8 per cent rise in coal prices. This increase is being reflected throughout the economy, beginning with steel, gas, electricity and transport prices. Moreover, once the elections were over the West German unions began to agitate; the metallurgists have demanded a 10 per cent rise in wages, and several million working men are expected to present similar demands soon. Finally, another unpopular question that was kept quiet during the elections is now being faced up to: West Germany is committed to an increase in military expenditure which will weigh heavily both on the budget and on the reserve of foreign currencies.

Is this the beginning of inflation in West Germany, which will take some of the strength out of the mark? The rest of West Europe hopes so, but it is as well to remember that strictly orthodox financiers remain in control in Bonn and there is no likelihood of the mark losing much of its purchasing power abroad. Wages can well afford to rise in Germany, for they are still, despite the country's long prosperity, among the lowest in all West Europe. What we can hope to see is enough softening of the mark to put an end to the campaign for its revaluation and, thus, to the speculative movements that have affected currencies all this year.

WORLDGRAM

AGRICULTURE

Kerala's Irrigation Schemes: Five irrigation projects, which will benefit an area of 1.17 lakh acres in Kerala State, have been included in the second Five-Year Plan. The total cost of the schemes is estimated at Rs. 691.5 lakhs. A sum of Rs. 4.50 lakhs has been provided for investigations. The Boothathankettu scheme, estimated to cost Rs. 348 lakhs, will irrigate an area of 63,000 acres in Kottayam and Trichur districts. The Rs. 105 lakh Neyyar (Stage II) scheme will provide irrigation water to an area of 19,000 acres in the Trivandrum district in Kerala State and the Tinnevely district in Madras State. The Meenakara scheme, on which a sum of Rs. 127 lakhs will be spent, will irrigate 11,000 acres in Palghat district. The Chalakudy scheme (Stage II) will irrigate an area of 20,000 acres in Trichur district. The scheme is estimated to cost Rs. 60 lakhs. A provision of Rs. 47 lakhs has been made for the Cheerakuzhi scheme which will benefit an area of 4,000 acres in Trichur district.

Control of Animal Pests of Crops: A co-ordinated scheme on an all-India basis for the control and elimination of white flies, mites, aphids, jassids and jumping plant lice—some of the serious pests of crops in India—was recommended by the committee of the Entomology and Animal Pests of Crops of the Indian Council of Agricultural Research. Two other schemes recommended by the committee related to a study of the Indian scale insects and rice army worm. The committee approved extension for three years of another research scheme for control of the rice stem borer in Andhra Pradesh, Madras and West Bengal. A scheme on insect pests of pulses, now being conducted in Gujarat, was also recommended.

First All-India Banana Show: To encourage cultivation of banana, one of the most popular Indian fruits, a two-day All-India Banana Show—the first of its kind—will open at Hyderabad on November 3. Organised by the Indian Council of Agricultural Research, the Show will be in the nature of a competition for fruit growers, particularly in the Southern zone States, namely, Bombay, Madras, Andhra Pradesh, Mysore and Kerala. Awards and prizes, to be given for the best exhibits in five categories of bananas, are valued at about Rs. 4,820.

F.A.O. Liaison Committee: The establishment of a National Nutrition Committee for raising nutritional levels in the country and for evolving a better diet for the masses was recommended by the National F.A.O. Liaison Committee at its 11th Meeting held in New Delhi recently. The Committee also recommended that the Indian Delegation to the forthcoming session of the F.A.O. Conference should take up the question of establishment by F.A.O. of an International Commission on Nutrition and Home Economics with special reference to under-developed countries. With regard to the question of giving greater publicity to F.A.O. activities, the Committee recommended wide distribution of F.A.O. literature to Universities and other educational institutions. The scientific information contained in these publications, it was felt, could also be disseminated through the agricultural journals published by Indian Council of Agricultural Research.

INDUSTRY

Specification for Hot Rolled Carbon Steel: The Indian Standards Institution has issued, for eliciting

comments, a draft Indian standard specification for light gauge structural quality hot rolled carbon steel, sheet and strip. This standard specifies the requirements for three grades of hot rolled carbon steel, sheet and strip intended for the manufacture of cold formed structural members, which are produced in mass generally by cold rolling. The specification lays down general requirements for supply, inspection sampling, chemical analysis, etc. Specific requirements for manufacture, chemical composition, freedom from defects, tolerances, finish etc. are also covered.

Silicones and Mud Walls: The Central Building Research Institute at Roorkee is at present carrying on investigations into the performance of silicone compositions as applied to building materials under local conditions. Preliminary trials with coated and uncoated 'kutchha' briquettes, bricks and wall panels confirm that treated materials withstand water erosion satisfactorily. These investigations have been extended to panels and wall surfaces in village houses to test their effectiveness against natural weathering. Silicones have great potentialities for use in water-proof coating compositions for buildings. They can also be applied to mud walls with great advantage; they not only confer water-repellant properties, but also allow breathing as they do not block capillary pores. Silicones can be applied either with brush or by spraying, without affecting the appearance of the surface.

Handicrafts Design Centre for Srinagar: A design centre for handicrafts is to be established in Srinagar. This is under a scheme of the Kashmir Government, which has been approved by the Government of India on the recommendation of the All India Handicrafts Board. There are already four regional design centres, set up by the Board, at Bangalore, Calcutta, Bombay and Delhi. A design centre has also been established at Lucknow by the Uttar Pradesh Government. These centres will concentrate on the redesigning of old forms and creation of new ones for the guidance of craftsmen and they will maintain close contact with artisans. The designs are executed by master craftsmen assisted by other craftsmen engaged in each centre. Arrangements are made for the widest possible distribution of such designs to production centres and craftsmen. The new design centre in Srinagar will take up in the first year, the development of only four crafts, wood carving, papier machie, namda and turquoise.

Increasing Output of Quality Silk: A scheme to set up a foreign race seed station in Jammu & Kashmir has been approved by the Government of India. A sum of Rs. 7 lakhs as grant has been sanctioned for the purpose. The scheme is designed to provide adequate facilities for the preservation and multiplication of foreign races of silk worms. This would help to increase the output of better quality silk in this country. A site near Pampore, 10 miles from Srinagar, has been tentatively selected for locating the station. Proposals for construction works are under consideration. Under the scheme, a mulberry garden will be established on an area of 25 acres. Two rearing houses with cellars for rearing of silk worms, one grainage building, two wells with water pumps, overhead tanks and channels for irrigation, an incubation chamber and a cold storage, will also be set up.

TRADE

U.K. Trade in September: Figures for United Kingdom imports and exports in September were lower than for any previous month this year, largely because of

WE USE

seasonal factors, according to full trade statistics for the month just published by the Board of Trade in London. The trade gap, however, closed slightly. Imports fell in September by £27,000,000 to £308,400,000, exports fell by £23,000,000 to £246,300,000, and re-exports fell by £700,000 to £9,800,000. The visible trade deficit was £52,300,000. These are the final figures for the month, confirming the provisional figures published on October 11. The decline in trade in September has followed the now established seasonal pattern, and in recent years the summer check to export shipments has tended to fall more heavily in September than in August. It is pointed out in London. As in August, the fall in exports was well spread over the main commodity groups, and for imports the fall was chiefly in meat, sugar, wool and coal—most of it being directly seasonal, but some part arising from falling commodity prices and lower freight rates.

Supply of Textile Machinery from Japan on Deferred Payments: An agreement was signed in New Delhi recently between the State Trading Corporation of India and the Japan Textile Machinery Manufacturers' Association providing for the supply of textile machinery from Japan on deferred payment basis. Under the agreement, different item of textile machinery will be supplied by Japanese manufacturers to Indian mills, with the co-operation of the S.T.C. on the one hand and the Japanese Association on the other. Contracts will be entered into, on the basis of deferred payments agreed upon between the two organizations, by the purchasers and suppliers directly. Such contracts will be registered with the S.T.C. who will ensure their implementation. The Japanese Association on its part will assist the suppliers in the export of machinery and try to keep prices at a reasonable level. Ten per cent of the value of each contract will be paid immediately on the placing of the contract and another 10 per cent will be payable on presentation of shipping documents. The balance 80 per cent of the value will be paid in ten equal half-yearly instalments. The rate of interest will be 6 per cent. The items of textile machinery will include carding engines, speed and ring frames, blow room machinery, automatic looms, high speed winding and warping machines, sizing machines, drawing frames, combing sets, cotton waste spinning plant, and spinning and weaving machinery for silk, art silk and spun silk.

FINANCE

M.P. Taxation Law Extension Bill: The Madhya Pradesh Taxation Laws (Extension) Bill, 1957, has been assented to by the President. The Bill seeks to bring about uniformity in Madhya Pradesh in respect of fiscal laws relating to court and registration fees, entertainment, stamp and electricity duties and profession and motor vehicle taxes. As a result of States reorganisation there are different laws in force at present in different areas of the State.

Loans to East Pakistan Refugees: According to latest figures, the Rehabilitation Finance Administration has sanctioned 75 more loans amounting to Rs. 4.3 lakhs to displaced persons. Of these, 72 loans for Rs. 4.03 lakhs are for displaced persons from East Pakistan. Three loans to displaced persons from West Pakistan which had been previously cancelled have also been re-instated.

Loan Assistance under Plantation Labour Housing Scheme: The Government of India have decided to raise the ceiling of loan assistance to be given under the Plantation Labour Housing Scheme of the Ministry of Works, Housing and Supply. Henceforth the maximum loan permissible per house will be Rs. 2,400 and Rs. 1,920 for houses built in the northern and southern parts of India respectively. This increase has been approved due to rise in building costs. Originally the scheme, which was formulated in April 1956, restricted the amount of loan to a maximum of Rs. 2,000 per house in the north and Rs. 1,600 per house in the south.

Exporters of Powerloom Fabrics to get Rebate of Excise Duty: In order to encourage exports, the Government of India have decided to extend the concession of rebate of excise duty on powerloom fabrics exported out of India to exporters other than manufacturers. It has also been decided to permit exporters other than manufacturers to export rayon or artificial silk fabrics under bond. Exporters of powerloom fabrics may contact the nearest Collector of Central Excise for detailed information.

Compensation for Land Nationalisation: The last date for submission of applications for compensation under the Burma Land Nationalisation Rules 1954 has been extended by the Government of Burma to December 31, 1957, from September 30, 1957. Forms may be obtained at the Office of the Chief Compensation Officer, Rangoon, Burma, or at the Office of the District Compensation Officer (Superintendent of Land Records) or through Nattukkottai Chettiers' Association, Rangoon.

GENERAL

Aerial Survey of Burma: A contract for the aerial survey and photographing of 200,000 sq. miles of Burma has been awarded to a British firm (Fairley Air Surveys Ltd. of London) and its Indian associate (Air Survey Co. of India Private Ltd.). It is believed to be the largest single contract of its kind for aerial photography ever to be signed between a Government and a private firm. The contract—which covers virtually the whole of Burma—is valued at £200,000 and was won in competition with tenders submitted from France, Germany, Israel, Japan, the Netherlands and the U.S.A. In announcing the signing of the contract, the Burmese Ministry of Land Nationalisation said that "apart from aerial photography the companies also undertake to train the personnel of the Department of Survey and the Burma Air Force in the details of field and flight operation of aerial photography and that the survey "would assist Burma in her economic and social development: Photographic operations will begin in November, and must be completed before April, when weather conditions deteriorate. Four aircraft are to be used including two Dakotas modified for high altitude flight. The operation will cover more than 1,500 flying hours, during which 40,000 negatives will be exposed and 200,000 separate prints produced.

Expansion of Sindri: A section of Sindri's Rs. 11-crore expansion scheme comprising the grinding mill section of the new ammonium sulphate plant was inaugurated on October 28 last. This will be followed successively by other sections of the ammonium sulphate plant and by the gas reforming plant, ammonia plant, urea plant, double salt plant, etc. It is expected that by the middle of 1958 all plants will be functioning. The ammonium sulphate plant was erected entirely by Sindri's own staff and mostly Indian materials were used. This marks the first stage in the completion of Sindri's expansion scheme under which its production capacity will be increased to 60 per cent and two new fertilisers — urea and sulphate nitrate — will be manufactured.

Russia's Purchases of Indian Pepper: Soviet Russia replaced the U.S.A. as the major buyer of Indian black pepper in the first quarter of this year. According to official figures Russia took 66,000 cwt. of pepper valued at a little more than Rs. 55 lakhs in January-March, 1957, while the offtake by the U.S.A. was only 49,959 cwt. worth Rs. 54 lakhs. As a result of the higher offtake by Russia and larger shipments to Canada, France, Italy, Poland, West Germany and other countries, total shipments in the first quarter of this year rose to 148,473 cwt. from 97,139 cwt. and 80,517 cwt. in the same quarter of 1956 and 1955 respectively.

NEWS IN BRIEF

INDIAN

The Government of India have decided to license freely for export uncrushed elephant bones to all permissible destinations according to the Joint Chief Controller of Exports.

Copper ore, lead ore, iron ore, gypsum, marble and magnesite ore are some of the important minerals found in U.P. according to surveys carried out by the geological survey of India and the Directorate of Geology and Mining, U.P.

The export of rice including paddy and products of rice and paddy other than rice bran from Punjab has been banned.

Tea production in South India during September was estimated at 12.12 million lb. compared with an actual crop of 9.62 million lb. in the same month last year.

The profits in the paper industry between 1951-55 fluctuated widely, according to official statistics. The profits after tax in 12 units of the paper industry amounted to Rs. 1.68 crores in 1951 but in the next three years there was a steady decline to Rs. 1.56 crores, Rs. 1.5 crores and Rs. 1.27 crores respectively.

The Government of India have decided to release a further quantity of chillies for export to Ceylon. This decision was taken following detailed discussions between an official trade delegation from Ceylon and representatives of the Government of India.

Ninety-nine extension centres will be set up in Rajasthan under the second Five-Year Plan, according to a scheme for intensive development of the sheep and wool industry subsidised by the I.C.A.R.

Export of silk worms will not be allowed with immediate effect, says a trade notice issued recently by the Joint Chief Controller of Exports, Bombay.

Since World War II, there has been a sharp increase in the level of employment in Indian cotton mill industry. According to authoritative figures, the average daily number of workers employed by the cotton textile industry has gone up from 490,815 in 1940 to 676,523 in 1951 and 806,702 in 1956.

Exports of iron ore from the three major ports of Calcutta, Bombay and Madras during the last month improved to 114,942 tons valued at Rs. 64.33 lakhs from 104,041 tons worth Rs. 59.07 lakhs in the previous month.

New export markets for Indian paper have been found in Czechoslovakia, Poland, Bulgaria, Rumania, East Germany, Denmark and Switzerland.

FOREIGN

The World Bank has lent Pakistan \$31 m. in various currencies to meet part of the foreign exchange cost of a programme of reconstructing the country's two railway systems. The Bank of America and the First National City Bank of New York are participating in the loan without the World Bank guaranteed to the extent of \$850,000.

The Deutsche Bundesbank has reduced treasury bill rates by $\frac{1}{4}$ per cent to $3\frac{1}{2}$ per cent for 30 to 59 days and $3\frac{5}{8}$ per cent for 60 to 90 days.

Plans to nationalise road transport in Ceylon moved nearer realisation with the approval recently of a Motor Transport Bill by the House of Representatives.

In order to implement the Sudan Government's policy of credit restriction, The Sudan Bankers' Association which embraces all banks there, has agreed to raise interest rates on loans by 1 per cent to a minimum of 6 and a maximum of 7 per cent.

Five German steel companies have founded Ferum Investment in Montreal with a capital of \$1 m. to represent their interest in the Ungava ore mines, Labrador. The same five have a 50 per cent participation in the Ungava Ore Company, the other 50 per cent being held by Cyrus Eaton, the U.S. industrialist.

The prices spiral, which has sent the cost of living soaring in Australia in recent years, was halted in the June-September quarter, when the overall retail price index for the six capital cities showed no change.

Currencies of the European multilateral group ("paris club") countries are now being quoted on a daily basis for payment of exports through the official market (as distinct from the free exchange market) the Argentine Central Bank announced recently.

It is reported the Central Bank of Argentina is borrowing \$27 m. from nine American banks for dollar exchange purposes.

South Africa's total gold and foreign assets in the week ended October 11 totalled £109,781,000 compared with £107,873,000 a week earlier.

Trade between the U.K. and the British West Indies in the first eight months of this year shows a rise of £18.5 m. In August U.K. imports from the area rose by £1.6 m. to £27,248,000 and her exports to the B.W.I. by £1.3 m. to £5,686,000.

It is reported Britain had a balance of payments surplus of £211 m. in the twelve months to June 30 last, which was a considerable improvement on the result expected this year.

A sharp rise in private imports in the first nine months of this year was the main cause of a deficit of £1 m. in New Zealand's overseas transactions for the year to September 30.

The Joint Israel-Ghana shipping company, the Black Star Line, the establishment of which was decided upon during the recent visit of the Ghana Ministerial delegation to Israel, will start operations next month.

You don't **Test** a product before buying

Your confidence rests on
the *name* it bears

Whether you buy a machine or a yard of cloth it is the confidence you have in the name that counts. Confidence comes from experience—your own experience and the experience of people whose opinion you value. That is why the name of **BINNY'S** is one that you can trust.

BINNY'S fabrics available in cotton, silk, wool and mixed varieties in a wide range of colours and design—products of The Buckingham & Carnatic Company Limited and The Bangalore Woollen, Cotton & Silk Mills Company Limited—are famous throughout India and overseas because of their enduring high quality

BINNY'S engineering connections offer a host of implements and wares needed in India's expanding industry; to mention a few: heavy electrical goods, sugar machinery, cranes, dredgers, diesel and gas engines, boilers, mill stores, cables, pumps,

high grade paints and many other items.

BINNY'S Engineering Works (Private) Limited are manufacturers of industrial machinery and plant, are licensees for the "Mechanite" process for high duty ferrous castings and undertake structural steel work and the fabrication of oil storage tanks, cargo barges and similar constructions.

BINNY'S offer shipping, stevedoring, insurance and clearing and forwarding facilities. They are also booking agents for sea and air passages.

he helps to safeguard your health, Bhai Sahib...

You may be surprised, Bhai Sahib, to learn that over 300,000,000 lbs. of tea are sold in Calcutta every year and most of this is sold in public auctions.

Each lot that falls under the auctioneer's gavel has its own particular characteristics. Even teas from the same garden vary in quality week by week, depending on climatic conditions.

That, Bhai Sahib, is just where the tea taster comes in. He selects the different qualities and varieties to blend together. Leaf appearance, 'body' and flavour are the major considerations when blending to give you the 'cup that cheers'.

It is always advantageous to buy blended tea in packets; thereby assuring yourself of the same all-round good brew each time you buy your packet of tea.

Above all, Bhai Sahib, the tea taster guards you against inferior qualities and can be said to be a true guardian of the nation's well-being.

HERE ARE SOME FACTS ABOUT TEA TASTING AND BLENDING, BHAI SAHIB:

Each garden usually makes about 12 grades of tea which include the well-known types—O.P., B.O.P., Fannings and Dust.

In North-East India there are over 1,100 tea gardens, situated in Assam, Darjeeling, Dooars, Cachar, Terai and Tripura. In this area alone the annual crop averages over 500,000,000 lbs.

Each week in the Calcutta auctions approximately 65,000 chests of tea are sold. A large proportion of these are for Export.

In the Calcutta auctions lots are sold at the rate of four per minute.

An experienced tea taster may taste and value about 600 pots a day.

In an average Brooke Bond blend there may be teas from 40 to 50 gardens.

In Brooke Bond's five blending and packing factories over 2,10,00,000 packets per week are produced.

To market, to market

goes refined Adipocere (Pronounced 'adi-po-saire')

After being refined into various petroleum products, stored in tanks and taken for a ride in trucks and wagons, I am brought to the market. But this is not the type of market you are thinking of. The word is used by oilmen to describe my movement from the refinery to you, the consumer. My destiny is worked out by a highly organised group which has been supplying India with quality petroleum products for well over sixty years.

Stanvac have distributed to Indian consumers millions of gallons of Kerosene, Gasoline and Industrial fuel.

And how do they market me? Well, I'll tell you later in the columns of this paper.

STANVAC—the name that stands for progress

STANDARD-VACUUM OIL COMPANY—Incorporated in the U.S.A., with Limited Liability

The Business World

SUGAR CO-OPERATIVES IN BOMBAY

By CROESUS

ONE gets a vivid idea of the increasing importance of industrial co-operatives in the economic set-up of the country from the detailed reference to the working and financing of co-operative sugar factories in the Bombay State, contained in the address of Mr. R. G. Saraiya, the Chairman of the Bombay State Co-operative Bank, Ltd., at the 46th Annual General Meeting of that Bank.

According to Mr. Saraiya, 18 co-operative sugar factories have been registered so far in the Bombay State. Of these, two are in Poona district and two in Surat district, and these are being financed by the central banks of the respective districts, so that the BSCB's responsibility is confined to the task of financing only the remaining 14 factories. Of these 14 sugar co-operatives, five are in Ahmednagar district, four in Kolhapur district, two in South Satara district and one each in Nasik, North Satara, and Amreli districts. During the last season, four of these, including the Pravaranagar and the Kopergaon factories, started operations. Out of the remaining, five will be in production during the current season, while seven are expected to start production in the coming season, and licences have yet to be issued in the case of two more factories.

The problem of financing the erection of sugar co-operatives has perhaps constituted the heaviest strain on the resources of the Bank, and the Bank could stand this only because of the assurances of the Government of Bombay about the whole-hearted support of the Reserve Bank of India and the State Bank of India. It is noteworthy that the Bombay Government has not only promised financial help thus, but has also taken effective steps to ensure proper administration, and even management, of these co-operative sugar factories.

The extent of financial assistance that the co-operative sugar factories in Bombay have received will be evident from the fact that they have not only got working capital from the B.S.C.B. but also capital expenditure, in the form of loans, from the Industrial Finance Corporation. There is generally considerable delay in receiving the latter loans, but the B.S.C.B. has been providing temporary accommodation, pending receipt of the Industrial Finance Corporation loans. In addition to this, the Bank has also been furnishing guarantees to dealers in foreign exchange for establishing letters of credit and for deferred payments against machinery to be supplied to these co-operative sugar factories. By the way, even the co-operative sugar factories, it seems, could not escape the effects of the Suez crisis. In the case of factories which were expected to manufacture sugar in January, 1957, the delay

consequent on the Suez crisis would appear to have resulted in an increase in the capital expenditure of Rs. 15 lakhs in each case! But, even here, the Industrial Finance Corporation has not been slow to come to the aid of such factories by making an additional loan of Rs. 7½ lakhs; the balance of Rs. 7½ lakhs is proposed to be provided by the B.S.C.B. itself, in the form of an intermediate-term loan repayable in three years. Of course, in all these cases, it should be borne in mind, the Bank's interests are fully protected by the guarantee of the State Government.

During the year ended June 30, 1957, the B.S.C.B. furnished interim finance to co-operative sugar factories against loans receivable from the I.F.C. to the tune of Rs. 2.15 crores. The working capital provided by the Bank directly for the same period amounted to Rs. 1.64 crores, while the foreign letters of credit opened by it involved a sum of Rs. 1.34 crores. Besides these, inland letters of credit accounted for a further Rs. 14.74 lakhs. Again, the guarantees offered on behalf of the factories towards the amount of deferred instalments payable to the manufacturers came to another Rs. 37.49 lakhs at the end of the period. All in all thus, directly and indirectly, the B.S.C.B.'s commitments to sugar co-operatives during 1956-57 aggregated over Rs. 5.65 crores.

The B.S.C.B. is obviously fully aware of the risks involved in embarking on this new adventure, as witness the further provision of Rs. 4 lakhs that has been made under doubtful debts in view of the magnitude of the lending activities and the risks associated with its large commitments to co-operative sugar factories.

All this has been possible because of the full support of the Government of India which has been forthcoming by reason of the fact that this form of co-operative endeavour is unique and the Union Government believes that such will change the entire economic outlook of the villages growing sugarcane. But, if this hope is to be fulfilled, the co-operative sugar factories must acquire adequate internal strength, an aspect which Mr. Saraiya did well particularly to stress. At the same time, he called upon the shareholders of these sugar co-operatives (who are mainly cane growers) to make sacrifices of their present returns and work in a co-operative spirit to build up the complete ownership of their sugar factories. There is no reason why, with all the facilities and encouragement that they command, the cane growers should not do so. Even in the private sector, in the initial years, the shareholders of joint-stock companies go without any dividends and have to wait for at least five years, if not more, to get any return.

ECONOMIC COLLABORATION WITH ETHIOPIA

By CROESUS

THE subscription list for the Indo-Ethiopian Textiles S.A., the first joint economic venture by India and Ethiopia, which was registered in Addis Ababa on December 11, 1956, has just been opened. The list will be kept open till November 25, 1957. Intending subscribers can have the satisfaction of investing in a good and promising industrial undertaking and also of having lent a helping hand in the economic development of an underdeveloped country.

The total authorised capital of the Company is Eth. \$4,500,000 or Rs. 85,71,428.57, the whole of which, consisting of 45,000 shares of Eth. \$100 or Rs. 190.48

each, has been issued. Out of this, the Imperial Ethiopian Government has agreed to take up 51 per cent, that is 22,950 shares, so that the balance of 22,050 shares is now on issue, including shares of the value of Rs. 6,61,500 already agreed to be taken up by the promoters, directors, friends and associates. Only 25 per cent of the face value of the share or Eth. \$25, that is Rs. 47.62, is payable along with the application, the balance being payable as and when needed by the Company and at dates and in amounts as decided by the management in future.

The preliminary expenses and other expenses pay-

able by the Company in connection with the issue are expected to amount to Rs. 2,12,000. It is estimated that the whole of the share capital of Rs. 85,71,428.57 required to be raised would be needed to get the Company going, for building and machinery alone takes up as much as about Rs. 85 lakhs.

Messrs. Birla Bros. (Private) Ltd., who have considerable experience of organising and managing cotton textile mills in India and Pakistan, have been appointed Managing Agents for a period of 15 years which is, of course, renewable thereafter by the shareholders of the Company. With the help of the Birlas, it has been decided to establish a cotton textile mill in Ethiopia with an initial capacity of 14,000 spindles and 300 looms. There is still no textile mill in Ethiopia with a dyeing or bleaching plant, although there is a very great demand in the country for Khaki drill. Accordingly, to begin with, the Company proposes to manufacture only Khaki drill and another variety of cloth known as abujedid, which too is very much in demand. But manufacture of other types or further expansion is not ruled out.

As inducements to the new Company, the Ethiopian Administration has exempted it from payment of income-tax on profits for a period of five years from the date of production and has also allowed import of all machinery to be installed for the purpose of the Company in Ethiopia free of all customs duties. It is significant that this Indo-Ethiopian venture does not entail any outflow of foreign exchange on the part of India, for the Ethiopian Government has agreed to let the Company purchase foreign exchange from the State Bank of Ethiopia to the extent necessary to meet its obligations abroad and also to remit dividend to shareholders residing abroad,

subject, of course, to the Ethiopian Exchange Control Regulation.

BUSINESS NOTES

SHIPPING NEEDS

IN THE drive to retrieve the foreign exchange position, the development of Indian shipping should attract more than normal attention. Every year, the foreign currency reserve of India is run down by about Rs. 150 crores by way of freightage paid to shipping concerns abroad. During the next few years, the amount should be expected to increase further, as heavy plant and equipment would be pouring in. This would imply that over a period of some four years, the country would pay out around Rs. 700 crores in foreign currencies as freightage alone. In other words, if India had all its own shipping, the difficulties that the second Plan has run into, because of foreign exchange, would not have arisen. However, it hardly needs to be stated that the indigenous capacity in building more and heavier ships cannot be developed in a short period. Already, the Visakhapatnam Yard is booked for the period of the second Plan even if it is assumed that supplies of necessary materials will be maintained to schedule. It is for this reason that the provision made in the Plan for acquiring additional tonnage was criticised by responsible sections as inadequate. As prices continue to rise in all markets, this is becoming more and more obvious. Indeed, orders for the construction of a tonnage of 170,000, placed before the 1956-57 financial year came to a close, had absorbed very nearly the entire Government outlay of Rs. 37 crores. The remaining tonnage, together with 90,000 tons for replacements, is 2,20,000 GRT. This, if achieved, would, of course, do nothing more than satisfy the accepted minimum requirements of the country.

To acquire even this minimum of tonnage is, in the present circumstances, beyond the capacity of the largely strained resources of India. Therefore, some radical and rapid steps will need to be taken if the situation is to be rescued from becoming more critical. It now seems necessary, for example, to relax the conditions of foreign participation in Indian shipping. According to the present policy, foreign capital participation is limited to the extent of 25 per cent. It is also encouraging that Germany and Japan seem to be favourably inclined towards helping this country. Both countries are large shipbuilders and some Indian orders have already been placed with them. Full attention needs to be given to exploring all possibilities of acquiring tonnage from them on deferred payments. Shipping is one industry which enjoys the excellent position of being able to earn foreign exchange and, therefore, repay loans rapidly. The World Bank is yet another agency to be tapped. Alongside the need to develop tonnage is the necessity of ensuring that India also is entitled to carrying a higher percentage of her overseas trade through her own bottoms. As it is now, only a negligible proportion is carried by Indian ships. In regard to coastal shipping, the number of small vessels can be increased at comparatively less expense, which would carry the bulk of coastal trade.

COLOMBO PLAN AND ASIAN PROGRESS

THE REPORT of the ninth Colombo Plan Conference just to hand is of considerable importance for it brings to light the economic conditions in South-East Asia and the progress these countries have made as a result of the Colombo Plan aid since its inception in 1950. While the growth in the per capita income in the South and South-East Asian region covered in the Plan seems to have been maintained, there are definite indications of deterioration in trade in many countries of the region as a result of fluctuations in export and import prices. The terms of trade have moved against a majority of

the countries. The balance of payments difficulties have been accentuated. On the industrial and agricultural front, the trend, of course, is on the upward march with the exception of tea and rubber recording a lower output. Most countries of the region are giving high priority to expenditure on agriculture and irrigation and to production of basic services such as power, transport and communications. Foreign private investment has been encouraged by providing facilities for repatriation of capital and remittance of current earnings particularly where such investment is likely to be of benefit to economic development.

Although a substantial change and improvement has been brought about by assistance from the Colombo Plan, much remains to be done. The problems involved are many and complex. They vary from pest control to river valley development, from cottage industries to steel production, from primary education to atomic research. There is paucity of technological knowledge and skill of a high order. In addition to this, there is the dearth of specialized equipment most of which is imported from highly industrialized countries. Economic and technical assistance by the Plan's six donor nations totalled \$1,000 million in 1957, while \$3,500 million were made available, since the Plan's birth. During 1950 to 1956, 13,000 persons were trained and 6,000 experts were sent to the recipient nations of the Colombo Plan. Although there is no lack of appreciation of the aforementioned aid, it is considered to be woefully inadequate for the vast region as southern Asia. In order to maintain the economic growth now in progress and to halt the influence of Communism, it is highly essential that this aid be increased manifold. South and South-East Asia plays a large part in the world trade, both in exporting primary products and manufactured goods and in providing markets for the products of other countries. Particular attention needs to be diverted to the improvement of the agricultural sector of the region for it is from this sector that most of the people in South-East Asia derive their livelihood.

In the context of the Colombo Plan aid the establishment of the new U.S. Development Fund announced at the Saigon meeting is to be welcomed. The Fund will be administered as part of the International Co-operation Administration, and already 300 million dollars for the Fund's initial operations have been appropriated. Since the terms of the loans will be flexible and the loans will be repayable on a long term basis, it is highly suited to the economies of the underdeveloped countries of South-East Asia who are struggling with their foreign exchange difficulties.

SLOW MOVEMENT OF MANGANESE

THERE IS much substance in the apprehension expressed by the Bharat Chamber of Commerce that the export, by the private sector, of manganese ore may suffer because of inadequate allocation of railway wagons. The Chamber has stated in a communication addressed to the Government that, particularly since July last, the wagon supply has been far too short of the increasing requirements. The actual position as obtaining today has been made sufficiently clear by the Chamber by means of figures. Thus, it would be found that during the period July to mid-September last, the supply of wagons over the section from Barajamda to K. P. Docks was 1929. This shows a decline of as much as 50 per cent from the 3,802 wagons supplied during the same period in 1956. The steep fall in the supply position has occurred simultaneously with a considerable increase in the export quota of manga-

nese ore. The quota from Calcutta Port for 1957-58 (July-June) has been raised to 3.56 lakh tons — an increase of 44 per cent, from 2.48 lakh tons in 1956-57. This makes the situation doubly disquieting.

The Chamber has included in the communication comprehensive data which seek to show that the coming of the State Trading Corporation has impinged on the private export of manganese ore. In addition to being exporter of some proportion of manganese ore, the State Trading Corporation is the sole exporter of iron ore. The export quota of iron ore has also been stepped up by 9 per cent. But there has been an increase in the number of wagons made available for moving this material which is entirely out of proportion with the increase in the quota. Till recently, the allocation of wagons between the two was nearly on par. The position has now altered with heavy odds for manganese. Whether or not the State Trading Corporation is receiving more than due attention is only secondary and less material to the real problem. The important fact is that the hampered movement of manganese is putting the exporter in an embarrassing position. His stock with the importer abroad is bound to decline. It must not be ignored that fulfilment of agreements with our purchasers abroad according to schedule is of great importance to secure stability in the overseas demand. Again, it is not altogether likely that at some future date he may be accused of sluggishness in attaining the target of export. Meanwhile the paucity of wagons for moving manganese will mean that the country will delay the earning of foreign exchange from its export.

INDIAN MERCHANTS' CHAMBER MEETING

THE SPEECHES of both Mr. Naval H. Tata and Mr. G. P. Kapadia, President and Vice-President, respectively, of the Indian Merchants' Chamber, Bombay, at the second quarterly meeting of that body last week, were as interesting as they were topical. While the I.M.C. President dwelt on some of the very important issues and problems confronting the economy of the country generally, such as prices, production, foreign exchange, import policy and labour situation, Mr. Kapadia, who apparently believes in the adage that "fools rush in where angels fear to tread," confined himself to an able analysis of the Government's taxation policy, a sphere in which he is an adept.

Among the many topics that he touched on, Mr. Tata chose to discuss at some length on the new import policy. In view of the country's acute foreign exchange position, he concluded that the present highly restrictive import policy was perhaps inevitable. It represents, he said, an attempt, on the part of the Government, to utilise the limited available foreign exchange in the best possible manner. On the labour situation, Mr. Tata pointed out that, in recent years, there has been a distinct slackening of discipline in the ranks of industrial workers. In view of the recent wave of labour unrest in the country, he considered the "Code of Discipline" — since forged at Delhi — as a document of considerable significance. It might be helpful in maintaining healthy industrial relations and induce a sense of co-operation between workers and managements, he thought, but he added an important proviso — "if it is faithfully implemented."

In the course of his speech, Mr. Kapadia referred, in particular, to the wealth and the expenditure taxes, and stated that, now that these two taxes have become a part of our tax system, the Government should take great care to ensure that "arbitrary exercise of the extensive powers vested in the administrative officers by the provisions of the Act do not result in the harassment of the assessee." In insisting on this, he only voiced the one common apprehension of all sections of the commercial community. The Vice-President of the I.M.C.

also offered certain pertinent remarks on the Administrative Tribunals, whilst alluding to the Central Sales Tax and some Customs difficulties. The proposal to establish Administrative Tribunals for the disposal of questions arising out of the administration of fiscal laws relating to Income-Tax, Estate Duty, Customs, Excise, etc., in this country, he said, had caused much concern to business men, as it involved a fundamental change in our judicial system. To quote Mr. Kapadia's own words: "To set up administrative tribunals outside the supervisory jurisdiction of the High Courts and the Supreme Court would mean the subservience of the Judiciary to the dictates of the Executive, and this would be detrimental to the growth of our infant democracy." This is a genuine fear. Also it is doubtful whether the proposal is not still too premature, in the sense that we have yet to build up the sound tradition of an independent judiciary. Unless the process of separating the executive from the judiciary is completed — a process about which we are still doing more arguing than acting — it is meaningless to talk of an independent judiciary.

ORE DEAL WITH JAPAN

CLOSE ON the heels of signing a deferred payments agreement for textile machinery between the State Trading Corporation of India and the Textile Manufacturers of Japan, there has come another delegation from Japan to have now an iron ore deal with this country. Much of the ground for this was prepared during the Prime Minister's visit to Japan. The understanding is that Japan would help in developing India's iron ore resources to expand her ore capacity. Since the iron ore resources are not intensively exploited, it naturally involves the development of iron ore deposits in Orissa, Madhya Pradesh and Andhra and the provision of new or additional railway facilities linking the ore site to Visakh before any deal is negotiated. The development of the ore mines together with the necessary transport and port facilities is proposed to be undertaken with Japanese assistance. The mining, railway and port development works are likely to cost about Rs. 15 crores and would take at least two or three years to complete. As the development of mining and railway transport is likely to take some time, actual ore exports may not start till the end of the second Five-Year Plan. Part of the foreign exchange cost of these development projects is likely to be met by the US from out of the President's Special Regional Development Fund.

It may be noted that Japan has already agreed to purchase from this year iron ore to the tune of 7.2 million tons. This arrangement is to last over a period of five years. The proposed arrangement would be in addition to this and would spread over a longer period. It is gathered that the supply of iron ore of about 2 million tons for which negotiations are going on at present would fetch about Rs. 11 crores of foreign exchange to India. In the year 1956, India exported about 1.5 million tons of iron ore to Japan. With increased exports to Japan under the five-year contract already negotiated this figure is likely to rise to about 2.5 million tons.

The Press reports indicate that the alternative sites of ore, development costs, problems of transport, port capacity, shipping, the period of agreement, and other relevant matters have already been discussed. The main question now left is the examination of technical issues in detail, which is likely to be finalized very soon. The agreement when arrived at would be of mutual benefit to both the countries. In the case of Japan, it would satisfy her steel industry's requirements in regard to the supply of iron ore, while in case of India it would enable her to secure capital goods against the exports visualized.

FACTS BEHIND FIGURES

Crystallising

1,900,000

tons of sugar

TEXMACO

**serves India's
basic industries**

TEXTILE MACHINERY CORPORATION LIMITED

Drop by drop supersaturated cane juice crystallises into 1,900,000 tons of sugar in the pans of India's 160 sugar mills. Under the Second Five Year Plan this annual output will rise by 35% to over 2.5 million tons. During the past 23 years the sugar industry, India's second largest industry, has imported Rs. 19.23 crores worth of mill machinery. Today, Indian machinery manufacturers produce Rs. 28 lakhs worth of machinery a year; by 1961 this annual output will rise to Rs. 250 lakhs, sufficient to meet the country's requirements.

Texmaco, pioneer in many fields of engineering, working in technical collaboration with Stork Werkspoor of Holland, manufactures and supplies sugar mill machinery of international standards.

Economic Report from the U.S.

TRADE AGREEMENTS PROGRAMME

(By GUY SIMS FITCH)

WASHINGTON, Oct. 22.—The Eisenhower administration is now preparing, as part of its legislative programme, the specific foreign trade recommendations it will submit for congressional action next year. From all indications, it intends to press for a continuation of the liberal policies which have been the cornerstone of US trade relations for nearly a quarter of a century. A telling piece of evidence is a speech made last week to delegates from more than fifty countries by Vice-President Richard Nixon. In a thought-provoking address to the international industrial development conference at San Francisco, Mr. Nixon called not only for a sizable expansion of US private investment abroad but also for a five-year extension of the US Trade Agreements Act and for congressional approval of US membership in the Organization for Trade Co-operation. (O.T.C.) "Trade," Mr. Nixon noted, "is the great generator and vehicle of the capital the world so badly needs."

The US Trade Agreements Programme has been in continuous operation since 1934, and has been the principal instrument for reciprocal tariff reductions since then. It was extended for three years, back in 1955, and is up for renewal by next June 30. The Organization for Trade Co-operation is designed as a permanent administrative body for the General Agreement on Tariffs and Trade (G.A.T.T.), to which the US has been a party since its inception a decade ago. G.A.T.T., which now includes 35 nations conducting about 80 per cent of the world's trade, places on a multi-lateral basis the bilateral principles of reciprocal trade agreements. There is no doubt that G.A.T.T. could continue to operate satisfactorily without O.T.C., as it has for some ten years, but US officials believe a permanent secretariat would add to its influence and effectiveness. The impetus given by the US Trade Agreements Programme and G.A.T.T. to peaceful international commerce is seen in a few figures. Since 1938, world trade has nearly quadrupled, and last year reached a record total of \$93,000 million. This year it may well exceed the \$100,000 million mark. Over the same period, US trade has expanded at an even faster pace: US exports are up about six-fold, while US imports, now running at a record annual rate of about \$13,000 million, are about seven times larger than they were in 1938.

Whether Mr. Nixon's suggestion for an extension of the Trade Agreements Act for five years will coincide exactly with the final administration proposals remains to be seen. Heretofore, three years has been the usual renewal period. But whatever the period finally decided on, the administration already has served formal notice that it will seek the twin goals of trade-15 extension and O.T.C. approval. This was revealed two weeks ago by the foreign trade sub-committee of the US House of Representatives Ways and Means Committee. An administration statement was one of 56 papers released in a sub-committee compendium on trade policy. The administration paper, prepared by President Eisenhower's expert staff, pointed out that the Trade Agreements Programme has helped achieve the objectives of a liberal foreign economic policy in the past and should continue to do so in the future. It gives no indication of what changes, if any, will be sought in the programme as it now stands. In the last

renewal, Congress not only extended the programme for three years, but also granted the President significant new authority to cut tariffs. It is hoped in some official quarters that full details of the administration's trade proposals may be announced in another month or so. This would allow public study even before Congress, which is not now in session, reconvenes in January—another sign of the importance the administration attaches to its liberal trade programme.

Company Meeting

JAY ENGINEERING WORKS LTD.

Steady Progress of the Company

Sir Shri Ram's Speech at the Annual General Meeting

The following is the text of the speech delivered by Sir Shri Ram, Kt., Chairman of the Jay Engineering Works Ltd. at the Annual General Meeting of the Shareholders of the Company held at Calcutta on the 16th October, 1957.

Gentlemen,

The Balance Sheet and Profit and Loss Account and the Directors' Report have been in your hands for some time and with your permission I will take them as read.

The year under report was one of steady progress as in the past, which is evident from certain figures given below:

Particulars	Year ending 31-3-1956	Year ending 31-3-1957
Sales	Rs. 3,05,31,764	Rs. 3,89,49,999
Profit before providing for Taxation	„ 27,26,497	„ 35,76,491
Number of Workers	2934 Nos.	3506 Nos.
Number of Usha Schools	150 „	196 „
Number of Students in Schools	11,000 „	15,000 „

As mentioned last year, we have been able to put on the market a Table Fan for Rs. 65 and a Ceiling Fan for Rs. 105.

We are continuously making efforts to improve the quality and reduce the costs of our products and with success.

The erection of the factory at Bansdhani of which I made a mention last year, has been completed, and most of the Fan Section has been shifted to the new factory and is running satisfactorily. I can say with some pride, that it is one of the best laid out factories in the country.

The Needle Plant was put up during the year under report, and its production is steadily going up. The quality is absolutely satisfactory.

I am glad to say that we have been able to produce a satisfactory Heavy Industrial Machine also and we hope the same will go in production by early next year, and thus we will be meeting the country's needs in yet another class of Sewing Machines.

We are also making efforts to design Zig-Zag type of Sewing Machine, and we hope to succeed in this effort soon.

The difficulty for obtaining various raw-materials, particularly Steel, Pig Iron and Hard Coke is greater now than what it was last year.

I am glad that the Government of India have, to some extent, made it easier to get draw-back on goods

exported, and will also supply a certain quantity of Steel at controlled rate on the basis of goods exported.

FOREIGN EXCHANGE

Last year I drew the attention of brother industrialists, to the importance and necessity of taking steps towards increasing exports, and earning foreign exchange. The position has not improved, and we all know the difficult foreign exchange position in which the country finds itself today, and I feel that Indian Industry as a whole owes a duty to the country in this hour of need.

Indian Industry has arrived at its present stage of expansion and development, as a result of various reasons — the Swadeshi Movement of 1905, the spirit of Swadeshi as manifested in the boycott of foreign goods, the protection given from time to time to industries, due to the pressure of the nationalist movement, and more recently, the restriction of imports of manufactured goods.

It is true that private industry has expanded very considerably, and has exceeded its quota of performance during the first Five-Year Plan. Probably, this will be repeated during the second Plan as well.

It is also true that the rate of contribution towards the increase in national income is higher, in the case of industry, than it has been in any other major sector of economy.

It is also creditable that the prices of industrial products have increased at a lower rate, as compared to either food products, of industrial raw-materials, as may be seen below:-

Rise in Price Index Between Oct. 1955-Sept. 1957

1. Food Products	+ 29.2 %
2. Industrial Raw Materials	+ 21.6 %
3. Manufactures	+ 9.9 %

This, it might be emphasised, has been so in spite of sizable additional burdens, on account of various excise duties, or increases in excise duties levied recently, and sales taxes, etc., etc.

Nonetheless, in these difficult times, attainment of targets — even exceeding of targets — and maintenance of lower and stabler price levels are not enough in themselves. Indian industry owes more than this to the country, at this difficult time. I am convinced that if we fully make up our minds, and make deter-

mined and sincere and honest efforts, Indian industry can export goods of the additional value of about Rs. 50 crores a year.

I realise that there are difficulties in the way, and that often the return in foreign markets is much smaller, than the return from sales within the country. But this is not the time for industry to concentrate on its immediate gains, or on its self-centered purposes.

I am glad that in this connection the Export Promotion Board recently set up, has made some valuable suggestions. I hope that the various Ministries will take early action, and implement the suggestions.

CO-OPERATIVE EFFORT

So far as the industry itself is concerned, they could very well join, on a voluntary basis, in a co-operative effort at propaganda and publicity, development, study of markets, inspection of goods prior to export, and take such other steps as would help in exporting larger volumes than has been the case in the past. It is equally important that those who are not exporters at all today, should also take part in the drive towards attaining greater exports.

Naturally, the greater responsibility in this matter would attach to the bigger industries. The case of the Cotton Textile Industry, faced with huge stocks and

poor demand, comes readily to my mind. It is tragic that in the largest Indian industry, there should be talk today about closing down factories, or reducing shifts when greater and greater production is necessary in the national interest. Besides Cotton Textiles, Rayon Weaving factories, Sugar Mills, Vanaspati factories, and various Engineering Industries like Bicycles, Sewing Machines, Fans and many others could join hands for achieving larger exports in this time of the country's need.

On our part, I am glad to state that the Directors of The Jay Engineering Works have made up their mind, to steadily increase their exports and thus earn, in whatever measure they can, additional foreign exchange for the country.

And I hope that my friends in various industries will forego my presumption in giving this advice to them.

Last year I closed my remarks by expressing the hope that it will be possible for us to give better account of the working of the year under report, and I am glad to say that due to the efforts and hard work put in by my colleagues at all stages, right from Mr. E. S. Agarwal and Mr. T. R. Gupta to the junior most worker, the results are quite satisfactory for which I am extremely grateful to them.

COMMODITY NEWS AND NOTES

NEW MARKETS FOR INDIAN PEPPER AND CASHEWNUITS

New markets for the export of Indian pepper have been found in Czechoslovakia, Poland, Bulgaria, Rumania, East Germany, Denmark and Switzerland. In 1956-57, over 1100 tons of Indian pepper valued at over Rs. 30 lakhs were exported to these countries. Of this, 517 tons were exported to Czechoslovakia. Barring a small quantity in 1953-54, Czechoslovakia had not imported Indian pepper before 1956-57. Poland imported 295 tons during 1956-57 as against 40 tons in 1955-56. Poland also had not imported Indian pepper earlier. Bulgaria took 135 tons of Indian pepper in 1956-57 as against 41 tons in 1955-56 and 12 tons in 1954-55. Rumania imported 100 tons and East Germany 15 tons during the period. The other countries, Denmark and Switzerland, imported for the first time in 1956-57, 16 tons and 4 tons respectively. Of late the Soviet Union has been importing sizeable quantities of Indian pepper. It imported 3,950 tons in 1955-56 as against 676 tons in the previous year. In the first 10 months of 1956-57, 1100 tons of Indian pepper were imported by the Soviet Union.

MILD STEEL TUBES AND TUBULARS

The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard specification for mild steel tubes and tubulars. This draft standard covers their requirements of welded and seamless, screwed and socketed mild steel tubes and tubulars and of plain and steel tubes of nominal bores from 6 mm. to 150 mm. (1/8 in. to 6 in.) Three grades of thicknesses designated as 'Light', 'Medium,' and 'Heavy' have been included in this draft standard. This draft, however, does not indicate the service for which the three classes of tubes is appropriate. Comments on this draft may be sent before January 10, 1958 to the Indian Standards Institution, 19, University Road, Delhi-8.

EXPORT POLICY FOR RAW WOOL

The Government of India have reviewed the policy for export of raw wool and have decided that for the period October 1957 to March 1958 licences will be issued on shipping bills against firm contracts to established exporters and established newcomers within a ceiling on a 'first-come-first-served' basis subject to production of a certificate of Agmark Grading. Permission will nevertheless be given to established exporters and established newcomers to ship raw wool on a consignment account up to a maximum of 25 per cent of their individual allotment during the immediately preceding period. Licences will also be issued on shipping bills to fresh newcomers against firm contracts within an overall ceiling. Trade notices inviting applications will be published by the licensing authorities at the ports.

POLICY FOR IMPORT OF COTTON

The Government of India have decided to permit the import of 15,000 bales of cotton of over 1-3/16" staple length from soft currency areas. Government have further decided to permit the import of 10,000 bales of cotton of over 1-3/16" staple length against a special payment procedure. These imports will be permitted only against contracts approved by the Textile Commissioner, Government of India, Bombay. Intending importers may contact the Cotton Adviser, Office of the Textile Commissioner, Bombay or the Joint Chief Controller of Imports and Exports, Bombay for details regarding the grant of these licences.

PRODUCTION AND OFF-TAKE OF SUGAR

The production of indigenous sugar amounted to 20.25 lakh tons up to October 15, 1957, in the current season, as against 18.59 lakh tons in the corresponding period of the last year. The total off-take, including quantities despatched for exports, was 20.24 lakh tons. The stocks with the factories on October 15, 1957, stood at 5.44 lakh tons.

THE REVEALS TRUTH RUNNING DEER SYMBOLISES ADVANCE

The fact that we have been satisfactorily catering to the cloth requirements of our clients since over thirty years is enough proof of usefulness durability and cheapness of our products.

OUR SELECTED VARIETIES

COMPANY AFFAIRS

TATA CHEMICALS LIMITED

The Eighteenth Annual Report of Tata Chemicals, Ltd., namely for the year 1956-57, makes satisfactory reading in that production, total sales and profit all showed improvement over the previous year. Thus, after providing for depreciation (Rs. 26,56,583 including Rs. 10 lakhs towards arrears), taxes (Rs. 7,97,000), bonus (Rs. 3,53,000), Managing Agents commission (Rs. 2,80,910) and provision for retiring gratuities (Rs. 50,000) the profit amounted to Rs. 16,94,672 as against Rs. 16,94,482 for the previous year. Unlike in the previous year, there was no transfer from the Dividend Reserve Account and yet the total by way of dividend proposed works out to Rs. 14,19,530 as compared to Rs. 13,49,549 in respect of the preceding year. There has been a slight increase in the dividend from Rs. 0.75 to Rs. 0.80 per ordinary share, the dividend being free of tax in hands of the shareholders. In other words, the Company has become liable to Income Tax for the first time.

There was further improvement in the production of soda ash, sodium bicarbonate and caustic soda. While the production of benzene hexachloride which had been closed down in June 1956, was resumed (in March 1957) that of salt and marine products was maintained at the previous years' level. The magnesium sulphate, also was recommissioned during the year under review (this had been out of operation since 1954-55 for want of the proper quantity of bitterns) and a new product namely Ethylene Dibromide which is manufactured from bromine was put on the market for the first time. The full benefit of all these is not, however, reflected in the results of the year under review but may be expected to do so during the current year.

The total sales of the Company increased from Rs. 238 lakhs to Rs. 266 lakhs and according to the directors the sales would have been higher still but for the transport difficulties and congestion at the ports. Although there was no increase in the prices of chemicals, fuel prices, railway freights and wages recorded increases thereby affecting the profits to some extent. During 1956-57 also the Company benefited to the extent of Rs. 3 lakhs by way of tax saved as a result of the development rebate; the amount has gone to swell the Company's development reserve which now stands at Rs. 6 lakhs.

The Company's expansion schemes which include an increase in the capacity of soda ash plant from 200 tons to 400 tons per day, an increase in the capacity of the chemical caustic soda plant from 20 to 30 tons per day, an expansion of the capacity of the sodium bicarbonate plant from 15 to 30 tons per day, besides expanding steam and power plant for meeting the increased requirements of these expansion schemes, entail an estimated expenditure of Rs. 424 lakhs which it is proposed to finance partly from retained earnings, partly from borrowings and partly from an increase in the issue of capital. As the amount expected to be raised from internal savings and proposed borrowings is not enough for the purpose it is proposed to issue fresh capital. As the opinion of the shareholders at the last annual general meeting was not in favour of raising the capital in preference shares, the directors have proposed this time an issue of 11,20,000 ordinary shares at par to offer in the first instance to the exist-

ing shareholders. The unissued ordinary shares forming part of the Company's authorised capital to the tune of Rs. 10 lakhs falls short of this number and so it is proposed to increase the authorised capital from Rs. 5 crores to Rs. 10 crores by issuing 25 lakh additional ordinary shares of Rs. 10 each and 25 lakh unclassified shares also of a like denomination. With the proposed reorganisation of the capital structure there is expected to be a better balance between it and the gross block. As at present whereas the issued capital is only Rs. 2 crores the gross block expenditure is already over Rs. 4.04 crores which is expected to increase further by 1960-61 to about Rs. 7.8 crores. The decision to increase the capital has thus come none too early.

The directors refer to the coming into being of Tata-Fison Private Ltd., on June 28, 1957 which has been appointed the Company's sole distributors of the Company's insecticidal and fungicidal products. Fisons Pest Control Ltd., U.K. with which Tatas have combined to form this new Company are well known in this field and have both suitable personnel and considerable knowledge in the technology, marketing and sale of pest control materials. Among others, the Tata Chemical shareholders are called upon to approve the selling arrangement with this Company at the forthcoming annual general meeting.

Specially produced for Industry...

Ngo Dinh Diem

THERE is a tide in the affairs of States which, taken at the flood, leads on to friendship. In the case of India and Vietnam we find ourselves at this time on this tide. The main credit for choosing the time and sensing the tide must belong to Mr. Ngo Dinh Diem, President of the Republic of Vietnam, who arrived in New Delhi on November 4, and has just left the country after a most successful series of engagements here and in Nangal. There are few heads of Asian States that have been able, in so short a time, to create so deep a sense of sincerity and of personal independence. It so happens that in India the role of South Vietnam has been constantly obscured, first by the unhappy Bao Dai regime and secondly, by the belief that the President after the Geneva Conference was, in fact, being influenced by anti-Communist forces outside himself. In our days of simple speaking, we now know that the picture of Mr. Ngo Dinh Diem as a creature of foreign powers is false in the extreme. Here, ever, was a representative of an Asian people proud, passionate, and convincing; a man in and of Asia's own heart.

The visit will be significant for many reasons, not the least being the ancient ties of culture and trade between India and Vietnam. Contacts between these two countries — in fact, between Asian countries generally — dimmed away in the 13th and 19th centuries, when the Europeans conquered them. This state of affairs began to end only after the Second World War, when, one after another, India and several other countries of Asia attained independence; gradually, these nations began to look around for the threads which they had dropped during foreign subjugation.

But time had passed; circumstances had changed, and in a world hurtling through the atomic era, the mass of the Asian people fumbled in ignorance, hunger and misery. These are immense problems, common to the newly independent countries of Asia, but they are problems which only independent nations are privileged to encounter. Like other free Asian countries, the Republic of Vietnam is confronted with tremendous social, economic, political and defence problems. They are, in greater dimensions and more

urgent in form, the problems that India herself faces. The common-ness of these problems and the common-ness in the two countries of faith in democracy and individual dignity imply common-ness of purpose and to some extent of the solutions that have to be sought. It is but natural that the two countries should come closer. Mr. Diem's present visit, and the recent visit to Vietnam of Dr. Radhakrishnan, India's Vice-President, are evidence of it. Dr. Radhakrishnan, it may be remembered, had remarked in Saigon that "we (in India) are trying to combat hunger, disease, illiteracy etc. in our country, and we are attempting to do so by democratic process. It is good to know that in the task we have the sympathy of friendly countries like Vietnam. Vietnam is engaged in the same task." This might profitably be put beside Mr. Diem's remarks in the course of his inaugural address at the recent Colombo Conference: "We all face the problem of attaining economic progress, of raising living standards, and of enlarging the volume of trade around the world from which all countries may benefit. How else can we quench our passion for equality, respect and status? How else can we leave behind man's ancient enemies — poverty, disease, ignorance, and political instability?"

Apart from all this, Mr. Diem's visit also has a significance which Indians would do well to ponder — a significance in respect of this country's approach to her foreign alignments and frontier defence. For too long has this country been hoping that words would have the significance of bonds. Bandung and Panchsheel have been the expression of this hope. And so far as she is concerned her own word has indeed been her bond. But India has discovered from experience that the world is not yet ripe for replacing vigilance by verbal assurances. That seems to be the reason for the comparative restraint and wariness which characterizes her attitude to China today. China's dubious attempts to manoeuvre a position for itself in Nepal, and along the India-Tibet frontier generally, have been far from reassuring. If it is true that such a reorientation has taken place then realism would seem to have entered our thinking and policy. In this age of atom-splitting and satellite-rattling, old national frontiers have little meaning. The world has, for good or bad, crystallized into two widely divided blocs; and national frontiers have tended to merge into a single frontier, between democracy and its antithesis: nationalism is now practically an antiquated concept. Non-alignment is, of course, an excellent thing, academically speaking; but let us not forget that, in time of crisis, it is the enemy who will decide whether we remain neutral. And in the present case, the enemy has left nobody in doubt about what is being aimed at: he is committed to aid and abet insurrectionary and subversive activity in a country not to his liking.

It is true that, since 1955, China has not entered into open conflict with any South-East Asian country; but it has certainly not departed from its policy of small-scale military pressure at weak and ill-defined peripheral countries like Burma, Vietnam and Malaya. It has not given up its well-planned proselytizing mission of "world revolution" in the indeterminate future. Considerable evidence of long-term aggressive aims is provided by official maps printed in the People's Republic of China as late as in December, 1956. These maps show as Chinese territory the Kachin and Wa states of Burma, parts of Kashmir, Assam, Afghanistan, the whole of Tibet, and other non-

Chinese territories. Specifically, this means using Communist parties, where they exist, trade unions and front organisation; Chinese communities; illegal immigration; and Chinese newspapers. The recent troubles in Burma, Cambodia and Singapore should help correct the pleasant picture presented by its apologists and partisans.

President Diem should be helpful to us in deciding how to remain uninvolved in power blocs or military arrangements such as South-East Asia Treaty Organisation and the Baghdad Pact without compromising or endangering our economy or political stability. This great Asian has accepted aid from the West, particularly the United States, but he has consistently refused extraneous commitments, without any damage to his country. It will be equally wrong to assert that the stability that we find in Vietnam is due to American aid. Our neighbour, Pakistan, which has received several times more aid from America, is still far away from achieving either political or economic stability. The stability in Vietnam is due to Mr. Diem's deft and clever handling of the tasks and problems facing his country.

Doubtless, India does not show indifference to the issues that ultimately have a vital bearing on her, or any other country's independent nationhood. Only our policies are too woolly and idealistic at times. It is to be hoped that the visit of Mr. Diem will start a new line of thinking in New Delhi. India would, therefore, be acting in her own interest in enlightened manner if she raised her sights higher than the Indo-Pakistan border, with which her leaders seem pre-occupied, and brought her defence strategy abreast of political facts today. For purposes of defence, India's frontier — the free world's frontier — begins from the Caspian Sea north of Iran, goes along the Oxus, loops over Kashmir, comes down along the MacMahon Line, follows the northern boundary of Burma and Indo-China, and cuts through Vietnam at the 17th Parallel. It would be military wisdom for us in this country to consider the 17th Parallel in Vietnam as our strategic defence limit in South-East Asia; and, since war is an extension of politics, it would be political wisdom to remain as friendly with peoples this side of the above delineated frontier, as it is in our power to be, specifically as a warning to a potential aggressor that he will have to face united opposition.

Thus it has come about that India's relations with Vietnam have entered today on a new chapter. It is a chapter fraught with great possibilities, not merely for Vietnam whom we are likely to help in a greater measure in technical co-operation and economic education. Events are compelling us to move from our position of relative isolation in South-East Asia to recognise that we really occupy a fulcrum of a great balance which is held in equilibrium as much by our internal stability as by weights that go into its end-points. Vietnam as a strategic end-point is now, we feel, in safe hands; and pressure on the fulcrum is less whether or not we agree on many details such as the character and expression of Mr. Diem's anti-Communism. In a sense, we have both moved some little distance in the last month. That is in the nature of friendship which requires mutual accommodation on detail when the purpose of friendship is known to both sides to be enduring. To Mr. Ngo Dinh Diem again goes the success of having reached out his hand to us; to us the success of having clasped it well.

The Problem of Productivity

THE Seminar convened on November 1 and 2 by the Ministry of Commerce and Industry of the Government of India to discuss the setting up of a vigorous productivity movement in the country was an imaginative and far-sighted move which deserved fully the warm support that it received. On this particular occasion—which is not the case always—the ground was very well prepared. It will be remembered that a study team had examined the productivity movement in Japan, and its report recommended the formation of a National Productivity Council in India with very specific objects and a constitution which would both generate popular enthusiasm and be effective in detail on the shop-floors of the country. The preliminary papers of the Seminar circulated by the Government of India showed they had gone through this report minutely and added valuable elements to it. In the result, the hundred participants of the Seminar were served with a precise framework for action, which in itself was one of the reasons for the success of the Seminar.

From the discussions at the Seminar, one might, perhaps, be tempted to believe that there was general unanimity. The need for a productivity movement caught every interest in its wide sweep. There were, however, differences of approach not only between employers and labour but between elements in the "other interests" groups. Mr. H. N. Kunzru, in particular, thought that the productivity movement proposed had accorded an insufficient place for consumers. There was substantial discussion on the relation between the National Productivity Council, the Governing Body for the movement, and the Local Productivity Councils. The preponderance of practical advice, whether from employers or from labour, was in favour of placing due emphasis where, surely, it should belong—first, on the shop-floors and then on Local Productivity Councils. It was, however, recognised that for a National Movement there was some gain from a large Council drawing its strength from the country's enthusiasm as a whole. This enthusiasm could create a climate or a consciousness, which could act as a catalytic agent for Productivity enterprises in areas not yet informed adequately about detailed action.

The compromise which was reached was to have a substantial National Productivity Council with a very small but effective, governing body at the Centre; but the National Council would do no more than provide a "model" constitution for Local Productivity Councils. This loose association is likely to be more effective than the original proposals in which much direction was left to the Centre. Much of this realism was induced by the power of good persuasion. Dr. Vikram Sarabhai, who was the leader of the delegation which visited Japan, needs to be given a tribute, not only because of the character of the delegation's report, but because of his insistence in the discussions of the Seminar on the importance of the shop-floor in every productivity movement.

There are, naturally, differences as to how productivity on the shop-floor can be most rapidly achieved. But at least two suggestions which were made deserve special consideration. One of these was the suggestion that productivity teams on the model of those of the Anglo-American Productivity Council should be constituted both on a unit and, if possible, on an industry basis to carry

the impulse of efficiency in the good units into those mediocre or bad. The analogy of the Anglo-American teams was a fruitful one. For these teams give a model not only of organisation, but also a model for precise reports showing exactly what productivity teams have to do and how they can set out their conclusions. The second suggestion was a matter of spirit. The movement was to be essentially an experiment with decentralised authority at the point where managerial decisions were made. The assurance was given by Mr. Manubhai Shah, Minister of Industry, that the productivity movement would never be forced on by the exercise of Government powers and regulation and control. Thus, the principle has been adopted that this is to be a private sector, not a public sector, effort. The movement is essentially permissive, notwithstanding the powers of the Governing Body on the withholding of grants. Thus it comes about that a happy beginning was established both in the spirit and the letter of the new movement.

It was interesting to see from some figures quoted in the process of discussion that productivity in India has already got off to a good beginning, the increase in Indian industry being something of the order of 6 to 8 per cent in each of the last three years. It would be a mistake, however, to suppose that this substantial increase in productivity is at all general. There is room for enquiry why there are so many exceptions.

There is certainly a big job in public relations to be performed, particularly in respect of labour. One forceful labour speaker pointed out that in the last three years profits had fared better out of increased productivity than other contributing elements in production. While this is true of some industries, it is doubtful if it can be shown that as a result of the productivity movement, either here or elsewhere, this is a general danger. One of the remarkable results of the productivity movement in the United States has been the setting up of a trend by which substantial gains have been won for labour in terms of its percentage share of net product of American industry. It is a vital responsibility which rests on managements now to see that workers share adequately in the benefits of productivity increases. We shall build on sand unless labour feels that the productivity movement is its own.

There remain, as always, difficulties of implementation. But the consensus of opinion after the Seminar was that a very happy beginning had been made. It is not necessary that one should ask at this stage for more. But there is, luckily, a general confidence that under the guidance of Mr. Manubhai Shah, who showed great awareness of the problems involved, implementation will be as good as the preliminary preparation. One of these problems is how to remove the apprehension that the productivity movement, by streamlining industrial processes and techniques, would make some labour redundant and thus add to unemployment. The experience of other countries does not warrant any such fear. In any case positive measures could be undertaken to avoid any possible unemployment in the initial stages, and one of these is careful advance planning in the introduction of productivity schemes. If the productivity councils evolve suitable procedures by detailed advance study, implementation should present no insuperable difficulties.

Exports for the Plan

THE extent to which the Export Promotion Committee has acquitted itself of the task set before it may be judged from two angles. The problems posed before it in its terms of reference are basically of a long-range character. It would be reasonable to assess the value of its labour from this angle. This was one of the objectives of the Government in appointing the Committee. But undoubtedly it was not as pressing and urgent as the other objective. The preamble to the Government resolution appointing the Committee makes it clear that the widening gap between the foreign exchange required to execute the second Plan and the volume available for this purpose was the major reason which influenced Government's decision to obtain the expert advice of the Committee. It was, therefore, expected to suggest ways and means for raising the effective contribution of exports in augmenting our earnings of foreign exchange in the immediate future.

Our imports have been cut to the bone; nevertheless, the obligations which have been incurred by virtue of firm commitments on import orders ought to be honoured. There cannot be an iota of doubt that they will be honoured. Only four days before the Committee's report was released, an ordinance was promulgated on October 31, to vary the terms of the statutory requirements of the currency reserve. The new conditions of the statutory reserve, which facilitate larger withdrawals of our sterling balances, are calculated to meet the demands of external payments during the next ten months or thereabout. Withdrawals of this order may not be necessary in all probability. But this exceptional measure which has been undertaken is sufficient to underline the urgency of augmenting foreign currency resources for the Plan. The Committee was called upon to tender an interim report (which it did early in June), presumably to assist immediate measures of policy to stimulate exports. It is, therefore, inescapable that the Committee's report should be scrutinised primarily from this angle.

It is difficult to say that the Committee's report provides an effective answer to this crucial challenge. The chapter dealing with the policy and programme for foreign trade is significant as explaining the Committee's approach to the problem of the immediate future covering the remaining period of the Plan. Almost the entire relevant discussion of the subject reveals either an academic treatment of the subject or lack of clarity in thought in coming to grips with the issue in an objective manner. The Committee envisages two stages in the development of the future pattern of our external trade. What is really surprising is its reluctance to accept the logic of the probable developments in our foreign trade during the first stage. The second stage in which the composition of our exports will be characterized by a distinct change towards diversification, marked by a larger content of manufactured goods and a wide range of consumer goods, is a matter of some distant future.

The first stage which is of immediate relevance is the one through which this country is now passing. Its predominant features are well stressed by the Committee: "At first,

on account of intensive internal development, imports will increase largely due to massive imports of metals, plant, machinery, transport equipment, mineral oils and industrial raw materials, which are the sinews of economic advance, while exports will tend to remain stationary or even show a tendency to decline on account of an increasing proportion of indigenous raw materials and metallic ores being processed within the country and retained for domestic consumption." The legitimate conclusion drawn is that what cannot be met by exports must be met by withdrawals of sterling balances and foreign loans or grants.

There is a little lack of objectivity in the Committee's analysis of this problem. There is too much stress on the creation of an export climate and export consciousness, without enough description of what constitutes these desirable intangibles. Similarly, an exhortation to trade and industry to organize themselves to take deliberate risks and launch an export promotion campaign may not carry the economy forward.

The report is, finally, unreal on the omnibus target which it has recommended. Adverting to the programme of expansion of exports laid down in the Plan, the Committee records its firm view that the target of average annual exports of Rs 593 crores is conservative and actually slightly below the performance in 1955. But it hastens to add a rider that the conservative level at which the export goal is fixed is "right," since a developing economy gives rise to increased incomes and increased pressures on domestic supplies. The challenge of the widening deficit, however, is a stark reality which must be faced. To face it is the function of export promotion. From this premise, the Committee immediately arrives at the conclusion that our exports must be stepped up to Rs 700-750 crores from now on. It emphasises that this is in no sense an ambitious target. How this eminently desirable target is to be reached is not specified in the report. There are no targets set for individual commodities nor is there any amplification about the markets which would provide outlets for exports of the anticipated order.

To point out these grave gaps in the report is not to underrate the importance of a document which is bound to prove a valuable guide for long-range policies to stimulate exports. For the major part, the Committee confines itself to programmes for export commodities in a detailed manner. It also deals exhaustively with aids and incentives which would be essential to promote exports. The modest tax reliefs which it suggests for exports and exporters present a choice between sacrifice of some rupee resources for the public sector in the Plan and gains in foreign exchange resources for the total Plan. How the choice should be made is obvious. The different types of aids recommended by the Committee are all matters involving organizational machinery which can be created over a period of years, if diversification of goods and markets is to be achieved on a secure basis. At least a brief but special treatment of selected commodities for concentrated attention in the export drive in the immediate future would have enhanced the utility of this report.

THE WEEK'S NOTES

MARSHAL ZHUKOV'S DISMISSAL

AFTER A week of inconclusive speculation, the air of mystery about the future of Russia's relieved Defence Minister, Marshal Georgi Zhukov, has cleared: he has been demoted and is in disgrace. Mr Khrushchev's statement, that Marshal Zhukov would get a new post in keeping with his qualifications and experience, indicates another military job. Probably he will be posted in an outlying territory far from the hub of Soviet power in Moscow. This was exactly what Stalin had done in April, 1946, when he recalled Marshal Zhukov from Berlin and sent him to look after the fortifications in Odessa. Little was heard of him until 1953 when, after Stalin's death, he was appointed Deputy Defence Minister. Those were the hey-days of the theory of "collective" leadership. But, as is natural in a totalitarian society, the struggle for power began soon after among Stalin's heirs. Beria was executed and his political police rendered powerless with the support of Marshal Zhukov, who was Russia's war-time hero. It was, again, with his decisive support that Mr Molotov, Mr Malenkov, Mr Kaganovich and Mr Shepilov were stripped of power in July last, after a critical struggle in the Central Committee. The result may well have gone against Mr Khrushchev if Marshal Zhukov had not gathered together from all over Russia the members of the Central Committee to vote for him.

From the time the "anti-Party" group, led by Mr Molotov, had been got rid of, it was generally expected in the Free World that a showdown between Marshal Zhukov and Mr Khrushchev, for first place in the Soviet hierarchy, would begin. Apart from the Communist Party, the only organized body which could exert its influence all over Russia was the Red Army. Perhaps in the very act of helping Mr Khrushchev to power, Marshal Zhukov had sealed his own political fate. With the dismissal of Marshal Zhukov, Mr Khrushchev has apparently emerged as Russia's Number One; the only other member of the old guard, Marshal Bulganin, has fallen far behind. This is evident from his being left out of Russia's recent delegations to the satellite countries. "Collective" leadership, which was resorted to after Stalin's death, has apparently been decollectivized.

But the changes in the Soviet hierarchy do not bear even remote resemblance to Bonapartism—a term which has erroneously been used in the Indian Press. It is not a soldier but a civilian who has captured power. It would be more appropriate to call it Stalinism. Following Lenin's death in 1924, it may be remembered, Stalin took four years, with the support of Mr Kamenev, Mr Bukharin, Mr Zinoviev and Mr Rykov, to oust Trotsky. These allies were liquidated in the "great purges" of the thirties. In 1937, Marshal Tukhachevsky, 374 generals and 34,000 of lower-rank officers were shot after a secret trial. Stalin reigned supreme thereafter. Mr Khrushchev seems to have accomplished the job in less than five years. But the last act is not yet over. Fortune is notoriously fickle but nowhere perhaps more fickle than in a totalitarian society.

RUSSIA SCORES AGAIN

RUSSIA HAS added a golden chapter to the world's scientific history by successfully launching two artificial earth satellites in rapid succession. These two man-made moons are now circling the globe at an orbital speed of five miles per second. The latest "Sputnik"—Russian word for "fellow-traveller", here the natural moon's artificial fellow-traveller—which weighs half-a-ton is, however, an even more spectacular achievement than the first one which took the world by storm early last month. As a scientific and technological feat, the launching of such a heavy body at such a height as 1,000 miles above the earth is truly Herculean. One wonders if the new Hercules who has

taken the half-a-ton sphere to its orbit is some kind of nuclear fuel unknown to the West. If the Russians have discovered such a fuel, it means they must have made giant strides in chemistry. In fact, it is not only in this field that they appear to have advanced greatly but in all such scientific fields as are related to rocketry—namely, ballistics, astronautics and metallurgy. Again, Russian progress in these fields appears to have been made possible by some remarkable basic research in mathematics and physics.

This Soviet progress, remarkable as it is, may not give the Russian scientists any permanent lead over their counterparts in the West in general and in the United States in particular. There is already a great stir among the American scientists, and the National Science Foundation has just recommended a series of energetic measures for promoting the growth of basic research in the United States which has all along devoted greater attention to applied research. The American giant is thus awakened to the need for more basic research, and the recommended scheme of incentives to be provided for industry, private organisations and individuals to increase their gifts for such research is in the best American tradition. If Federal grants for basic research do not also carry undue restrictions on the freedom of scientists and universities, American research performance may soon catch up with the Russian. It is the world's hope that this scientific competition between the two giants—the United States and the Soviet Union—will be a healthy one, making for mankind's happiness.

A MOMENTOUS MEETING

THE INFORMALITY of the recent visit of Mr Harold Macmillan, the British Prime Minister, to Washington does not detract from its urgency. The visit took place under the shadow of the Sputnik, a warning of the technological lead which Russia has obtained over the Free World. The difficulties into which the Eisenhower Doctrine has run in the Middle East have created confusion in American minds; the British tradition of diplomacy, despite the Suez blunder, would possibly be of value to the Americans in that matter. Mr Macmillan's statement at Ottawa, that he and President Eisenhower had been able to work out a new theme—of interdependence of free nations in the interests of the free world—confirms this impression. That the United States administration should think of a change only after the Russian triumph is one more example of this great democracy's unwillingness to recognize its errors until it has suffered its worst consequences. Till now the United States had turned a deaf ear to Britain's plea for sharing of scientific knowledge, even after the latter had perfected and tested nuclear weapons. To what extent Anglo-American co-operation in the political, economic and scientific spheres has actually been ensured time alone will tell.

Strangely enough, the rest of the joint communique issued by President Eisenhower and Mr. Macmillan contains nothing new to signify any change in strategy to meet the challenge of the missile age. It merely reaffirms the old disarmament proposals, the desire to reinforce "local defensive shields" with deterrent and retaliatory power of nuclear weapons and continued reliance on military pacts. It has ignored the main lesson of the new scientific developments: neither the Western nor the Communist powers can any longer base their strategy on negotiating from "positions of strength." As both the blocs are in possession of the absolute or near-absolute weapons, a major war has definitely been ruled out. The only sensible strategy, therefore, seems to be the establishment of the superiority of their respective systems in the various fields of life. The Western Powers should realize that subversion by

totalitarian forces can be effectively checked not by military alliances, but by a better ideology; only a free, prosperous and educated community can recognize and resist the totalitarian appeal. It will be somewhat ironical if the launching of the Sputnik proves a spur to only a more frantic arms race. What the Sputnik age demands is not a new arms race but an arms agreement between the two contenders and a new approach to old problems.

RED CROSS CONFERENCE

THE NINETEENTH session of the International Red Cross Conference which opened at New Delhi on October 26, is the most representative gathering of nations ever to meet in Asia. It is being attended by nearly 400 delegates and observers from as many as 83 countries. That the Conference represents Red Cross, Red Crescent and Red Lion and Sun Societies is not a little significant in the context of the cold war. If there is a lesson to be drawn from the success of the International Red Cross, it is surely this: that the nations of the world should be able to co-operate in other humanitarian tasks such as providing food and clothing for the millions of under-privileged men and women.

Red Cross is, indeed, a child of war. The idea under-lying the movement was born on the field of battle, its primary object being to relieve the suffering of, and provide succour to, victims of war. But gradually its activities have expanded; and these days its hand is visible in the humanitarian activities of every kind. Today, in the context of nuclear war apprehension, the question of relieving distress will hardly arise. The question is one of 'preventing' such a war. It was naturally expected that the Red Cross Conference would give consideration to this question. But some of its proceedings obviously betray a lack of correct understanding, on the part of the delegates of the tasks facing them. For instance, the decisions of the Humanitarian Law Commission suffer from lack of realism. The Commission has recommended to participating Governments a draft, emanating from the (Swiss) International Committee, which is not likely to be observed in time of major war. Surely, no responsible military commander would permit enemy power sources to operate against him even if they are situated in towns. Similarly, it is difficult, if not impossible, both, to define what constitutes a "civilian area" and to limit the operational area in a nuclear war. It would be well to remember that the much less ambitious conventions relating to prisoners of war and civilians were found pitifully inadequate to cover concentration camps and to prevent mass deportations, shooting of hostages and other similar crimes.

The reason for this abstract idealism of the delegates may be attributed to their effort at pandering to the public gallery. Otherwise, there is hardly any excuse for such a impracticable approach to the most pressing problem of today. This development does not augur well for the great humanitarian movement. The noise of the squabbling at the Conference, in the unseemly wrangle over Formosan representation seemed ominous. Many among those who sympathise with Red China's stand nevertheless found the raising of the issue at such a conference distasteful. We will witness more of such disruptive tendencies if the spirit which prompted Mr. Henrie Dunant to found the movement is allowed to die.

PLANNING CHIEF ON THE PLAN

SOME OF the points made by Mr. V. T. Krishnamachari, Deputy Chairman of the Planning Commission, in a broadcast talk on Sunday last on the Plan call for critical comment. In the first instance, his reference to "the large-scale evasion that takes place in income-

tax" is rather out-of-date in the context of the new structure of taxation of income, wealth and expenditure that is being assiduously evolved. As the income evading tax, according to the meticulous estimate made by the Central Board of Revenue, is only about a third of what Dr. Kaldor has estimated and the new variegated structure of taxation that is being evolved is intended to get at the evading income at different points, even the relatively small-scale tax-evasion will soon be a thing of the past. One wonders, therefore, why Mr. V. T. Krishnamachari wants public opinion to assert itself strongly against this evasion. If public opinion is to assert itself strongly, it should be against the State Governments which, as the Deputy Chairman himself admits, have allowed large arrears in land revenue and fertiliser and other loans and also delayed the implementation of schemes for the assessment and levy of betterment taxes where these have fallen due.

Elsewhere in his broadcast talk Mr. V. T. Krishnamachari has said that "the Plan cannot be implemented unless the nation recognises the need for and accepts the minimum controls called for to maintain prices which would be fair to producers and consumers and which would make possible an expanding economy". What minimum controls are required to hold the price line, the Deputy Chairman of the Planning Commission has not indicated. There can be no guarantee that such controls, when once instituted, will always remain at the barest minimum level. If, for example, the suggestion of some Congress Members of Parliament that both floor and ceiling prices for food grains should be enforced is accepted, what guarantee is there that physical controls like compulsory procurement and rationing will not follow?

A Window on the World**BALANCE OF PAYMENTS PROBLEMS**

By

ODYSSEUS

A NUMBER of my friends, who read this column more in sorrow than in anger, often have a shot at bringing my economics up to date.

Take the balance of payments problems which are in the news these days, what with India's shortage of foreign exchange to pay for the Five-Year Plan, and what with the European common market and free trade area looming larger every day, to say nothing of the continuing universal shortage of dollars. Now, a school of economists has cropped up, of which Professor Meade of Cambridge is a distinguished example, which favours free rates of exchange. Suppose that the value of the rupee were determined by the day-to-day supply and demand for it, the dollar shortage would, for instance, disappear. Instead of exchange control authorities grudgingly rationing out dollars, they would be available to anyone at whatever price kept the demand for dollars equal to the amount of rupees offered by traders or tourists. Fluctuations in price would keep supply and demand for the two currencies in equilibrium.

The case for free exchange rates, according to my up to date friends, is that they would leave a country free to pursue its own independent national monetary policy. India could expand the supply of money to push forward the Five-Year Plan, or she could contract it in order to restrain inflation or a boom that threatened to get out of hand.

A PRE-HISTORIC MONSTER

This case for free exchange rates is, of course, also the case against the gold standard. To modern economists, the gold standard has all the fascination of the skeleton of a pre-historic monster to an anthropologist. Any country on the gold standard undertook to meet a deficit in its balance of payments by exporting gold. In order to avoid what was regarded as the excruciating international disgrace of being driven off the gold standard, a country raised its bank rate and took other measures to reduce money incomes. With less money in their pockets, people had to cut down their buying of imports. What is more, owing to the reduction in national money incomes and wages, internal prices began to fall and domestic products became more attractive to buy than imports. Exports were stimulated. Of course, if trade unions will not allow wages to be reduced, labour costs will not fall, and then neither internal prices nor the prices of exports will fall. The only way in which a firm can pay the same wages with a smaller supply of money is to employ fewer people. So you get unemployment, and if this snowballs you end in a depression. "All for what?" ask modern economists. "For the pleasure of staying on gold and keeping price levels in all countries stable in relation to each other. Absurd! To uphold the gold standard is to forgo national sovereignty in monetary policy and employment. We must each retain our liberty of national action."

Well, whenever I do not understand a problem I find that it helps to translate it out of abstract or technical terms into concrete every-day language. What, then, is meant by "a balance of payments deficit?" This occurs when a country has been buying abroad more than it has been earning by selling abroad and,

with nations, as with individuals, this cannot go on indefinitely. It must stop as soon as you have exhausted your cash in hand at the bank or your power to borrow from friends. And my comment is: No amount of fiddling with exchange rates or with credit expansion can alter that fact.

Take the up to date economist who favours free rates of exchange; if you do not sell enough abroad to pay for what you want to buy, you must decrease your consumption, and in this case decreased consumption will be enforced by the exchange rate going higher and higher against you until you are only buying what you can afford to buy.

The only difference that I can see between allowing a free rate of exchange and maintaining the gold standard is that free rates, by responding at once, will decrease your consumption quickly, whereas the possession of reserves in gold or hard currencies enables you to buy time in which to decide whether you are going to equalise your imports and exports by decreasing your imports (presumably because your export industries are comparatively inefficient or engaged in the manufacture of commodities for which world demand has permanently fallen) or by increasing your exports, which means raising your productivity by longer hours of work, or lower wages and salaries, or a lesser return on capital, or by increasing the amount of capital invested per worker, or by some combination of these methods.

YOU CAN'T EAT CREDIT

Suppose you have a balance of payments deficit because a slump has started in the USA and Americans are buying less of your exports. For the life of me, I cannot see how pumping credit into your national economy will prevent your standard of living from falling. If you're selling less, your income has fallen and you cannot import as much. Your consumption must come down. You can only isolate yourself from a fall in world demand if your economy requires you to sell no exports because you need no imports. But, ex-hypothesi, you are an exporting and importing nation because you are worrying about exchange rates and gold standards. The only nation which can contract out of a world slump is some happily obscure country, such as Tibet (before liberation), and even Tibet had some foreign trade which made its contribution to the Tibetan standard of living.

Of course, the extent to which your national income must fall after some fall in world demand before you find a new point of balance between your exports and your imports will depend on the kind of goods in which you trade internationally. Before the war, luxury goods—like Scotch whisky, Rolls Royces, and quality textiles—formed a large proportion of America's imports, so that when her national consumption fell by only 4 per cent in 1938, her foreign buying fell by 25 per cent and inflicted serious losses on overseas exporters. If you are a country like the UK which imports most of the raw materials for its export industries and most of the food that it eats, then a sizeable reduction in the internal supply of money may be

needed to bring about a 10 or 15 per cent cut in import-consumption.

The case for retaining national control of credit is that if world demand for your exports falls, then you set to work creating alternative employment for those who would otherwise have either been thrown out of work or forced to take wage cuts. Again, I cannot see how this enables you to avoid a decrease in consumption and a fall in your standard of living, since I assume that international trade takes place because the two (or more) countries exchanging goods gain through economies achieved by specialisation. If, by expanding credit, you switch capital and labour from the production of bicycles (the export market which you have, say, just lost through a change of taste or a slump abroad) to the growing of more foodstuffs and to the manufacture of previously imported typewriters, you are ex-hypothesi re-allocating your national resources in a manner less efficient, less productive than before, and your price level will rise. Whatever happens to money incomes how can you be richer?

The disadvantage of free rates of exchange or devaluation is that they make it difficult for politicians and public alike to follow the elementary truths behind a balance of payments deficit. They focus attention on symptoms, such as "the rise in the cost of living", whereas the discipline of the gold standard focuses attention on the facts, e.g., that, for whatever reasons, certain national export industries are no longer competitive. The cure for this is either to resign oneself to consume less or else to make efforts to raise productivity. A devaluation—providing other countries let you get away with it and do not devalue in step with or faster than you—can give you breathing space to set your economy in order, but the likelihood is that as the real issues are obscured, wages and other money incomes will be allowed to rise until they cancel out the effects of your devaluation and you are back again where you started, with people with more money to spend buying more imports than they are earning. One of the £'s troubles this year was that because the UK devalued in 1949, the rest of the world suspects that every time a persistent sterling area deficit appears, the line of least resistance will be taken and another devaluation occur.

The disadvantage of devaluation is precisely the lack of confidence it spreads, which in turn tends to contract world trade to the detriment of all. The advantage of the gold standard is that it creates confidence and promotes international specialisation—the most profitable allocation of capital and labour within each nation—and, a point of interest in India, it steps up international investment.

The modern economist rejects deflation to remedy a deficit. But what else is there? Back to the 1930's when each country thought that it could contract out of the depression by setting up ever higher tariffs, import restrictions, and quotas, or depreciated its money (as France did thrice between 1936 and 1938)? Such measures merely reduce all national standards of living. You cannot consume more than you produce, and what the gold standard does is (1) to ensure that your share of world income is equal to your individual output, and (2) to give you a strong incentive to increase your output. Whereas devaluations and inflations by focusing attention on the rising cost of living let loose debates on "fair shares" and promote the egalitarian outlook which emphasises consumption and tends to make increased production more difficult.

Certainly the size of the US economy is such that an American slump could have dire world repercussions, but (a) as I said before, unless you are Tibet you can't insulate yourself, and (b) it is gratuitous to believe that the Americans have learned nothing from Keynes and would be as inept today at dealing with

a slump as we all were in the 1930's. Which leads me to my final point: If it is international co-operation on monetary and employment policies that we seek, we shall not get this as long as we all proclaim our sovereign rights to promote our individual policies. By professedly adopting the gold standard we would make international co-operation easier and more effective. A straw in this wind is the European common market which is in process of being set up. By whatever name they call the monetary system on which it is to be worked, it will not work unless it observes gold standard rules in fact. The Treaty recognises this and provides for machinery to ensure unity of European policy.

**VIA
JAMSHEDPUR**

Four hundred young engineers who will man the three new State steel plants will spend six weeks at Jamshedpur before they go abroad for training.

Here at the steel city, an orientation course will acquaint them with the first essentials of steelmaking in India. And they will undoubtedly get a friendly tip or two from Tata Steel veterans.

Jamshedpur is proud to welcome these steelmakers of tomorrow.

HISTORY OF A WAR

(From Our Special West European Correspondent)

PARIS, November 1.

THREE years ago today the armed rebellion broke out in Algeria. Attempts were made on the lives of Europeans in various parts of the country, and the first "maquis" was begun in the Aures. The order to transform Algerian political demands into systematic violence was given by the Revolutionary Committee for Unity and Action, which had been formed a few months before, after the split in the Movement for the Triumph of Democratic Liberties. The war had begun, but no one in France noticed it. The incidents were reported, naturally, but were taken to be another outburst of sporadic terrorism such as had occurred before and such as had been easily stamped out. The Prime Minister of France at the time was Pierre Mendes-France: in July of that year he had signed the armistice that put an end to a seven-year war in Indo-China; he had promised the Tunisians "internal autonomy" which he knew, as well as Bourguiba, would be the first stage toward that complete independence they have obtained since; he had not yet had time to take up the Moroccan dossier but it was evident that he would negotiate a similar dispensation for that country. As for Algeria, he had time only to appoint as Governor-General a brilliant young anthropologist, Jacques Soustelle, whose liberal views were so well known that he was received in Algiers by the European community with sullen hostility. Soustelle was an advocate of integration, or the complete and literal equality, economic and political, of all the people of Algeria and metropolitan France; and in this he had the support of Algerian leaders such as Ferhat Abbas.

The war still had the appearance of random acts of terrorism when in February 1955 the Mendes-France government was overthrown. Its successor, the Edgar Faure cabinet, confirmed Soustelle in his post, and for eleven months Soustelle sought to limit the progress of terrorism and to carry through his policy of integration against increasingly effective opposition from the local European community. But by August of 1955 the rebellion had assumed alarming proportions and in that month there occurred an uprising in the Constantine in which more than 100 Europeans were massacred. Shocked by this violence, the French socialists and radicals began to agitate for recognition of "the Algerian personality", i.e. the abandonment of integration in favour of negotiations for some sort of autonomy; while Soustelle, on the contrary, began to evolve toward the Right, becoming the popular prisoner of the European community that had at first detested him. Spectacular violence succeeded also in carrying the affair to the international scene, and in September 1955 the UN General Assembly voted Algeria on to its agenda. France quit the UN and two months later the General Assembly unanimously decided to drop the Algerian question.

The Faure government was overthrown at the end of 1955, parliament was dissolved and in the ensuing electoral campaign the socialists and radicals formed the Republican Front, led by Mollet and Mendes, which fought and won the elections on the slogan "peace in Algeria". Thus, at the beginning of 1956, there was no doubt that the majority of the French people were in favour of liberal courses in North Africa. Mollet, become head of the new government, sacked Soustelle, then judged too far compromised with the reactionary

section of the Algerian Europeans, and named in his stead a liberal general, Catroux, who had the confidence of the North Africans. But when Mollet visited Algiers on February 6, 1956, he was the victim of a violent demonstration by the Europeans which either broke his nerve or else revealed to him for the first time the vigour of the reaction he would have to fight in order to increase the political rights of the Arabs. At all events, Mollet at once began that retreat from the Republican Front programme that has been so disastrous. He abandoned Catroux and named Lacoste Minister-Resident, and in March he obtained from the French Assembly "special powers" to intensify the war in Algeria; these special powers were voted him by the French Communists, just as eight years before they had voted in favour of the beginning of the Indo-Chinese war.

During the remainder of 1956, the war increased in violence and horror. It became clear that the rebels had support from outside the country, that they had a large measure of sympathy in the UN and that they were being aided by both Communists and Catholics among the Algerian Europeans. Disillusioned by the unrelenting concentration of the Mollet cabinet on a military victory, supporters of the Republican Front began to take their distance. Mendes-France resigned from the Cabinet, Ferhat Abbas rallied to the rebels in Cairo, the few remaining Algerian leaders not involved in the armed uprising started to give pledges to the rebels and the Socialist Party itself was split by an anti-Mollet faction. Mollet and Lacoste were left hostages to the French Right, trying to implement a two-faced policy whose sterility Mollet has only this week admitted: the deal was that the socialists should fight an unpopular war for the Right, while the Right should suffer him to put through social reforms at home. He was indeed allowed to raise old-age pensions and increase paid holidays but for this he was obliged to pay the fantastic price of the Algerian and Suez wars. When, in his bid for investiture during the current cabinet crisis, he sought to increase his share by giving workers' committees greater powers in the management of industry and by extending socialised medicine, the Right refused to play any further. Mollet calls this ingratitude but it is also common sense because the package deal he was offering entailed a roaring inflation, caused by war abroad and socialism at home, which has brought France's prosperous economy to the verge of bankruptcy.

Meantime, toward the end of 1956, international anxiety about the deterioration of the Algerian situation grew. The governments of Tunisia and Morocco called the rebel leaders to a conference in Tunis, while the UN for the second time wrote Algeria on to its agenda. The response of the French to the first gesture was to kidnap the rebel leaders and thus put an end to the only useful attempt at mediation that was possible. The UN's attempt in the same direction was defeated with US help. By the beginning of 1957 it was apparent that not all the military vigour of Lacoste and Mollet had disarmed the suspicion of the Algerian Europeans; an extremist plot to seize power in Algiers with the aid of a section of the French Army was uncovered, while a general judged too lenient to the rebels was the target of an assassination attempt.

The rebels' military power had not ceased to grow and during last winter they launched the battle of

Algiers, a ghastly series of terrorist outrages in the Algerian capital. The French won this battle but at what price has only lately begun to emerge. First they were obliged to use Gestapo methods to put down urban terrorism, to an extent that revulsed the greater part of French national opinion, severely shook the morale of the army itself, destroyed what faith French liberals still had in their right to hold out in Algeria and lost France much international sympathy. Worse from the immediate point of view, they were obliged to concentrate their forces in Algiers, leaving the rebels free in the countryside to organise in peace an army that is now probably the best in the whole Arab world. Meantime the Mollet government fell when the financial results of its combined nationalist and socialist policy became clear, and in the succeeding Bourges-Maunoury cabinet the most reactionary elements of the Centre parties were left free to worsen the situation in Algeria. The hopelessness of this arrangement was quickly realised when the Bourges-Maunoury cabinet sought to introduce a "framework-law" of reforms for Algeria which split its patchwork majority into those who thought the law too liberal and those who thought it too timid, both agreeing to vote against it. This produced the impasse of an five-week cabinet crisis which as I write has not yet been resolved.

Three obvious opportunities to end the war have been spurned by the French. First, the despatch of massive reinforcements to Algeria when the Mollet government obtained its special powers provided a chance to persuade the rebels to negotiate; instead, contacts were left until the rebels saw that they could succeed in containing even an army of half a million men. Second, the Tunis conference between Bourguiba, the King of Morocco and the rebels could have been

expected to produce some sort of compromise offer; instead, Ben Beila and his lieutenants were kidnapped, once again destroying Algerian faith in French sincerity and estranging the former protectorates. Third, Bourguiba's offers to mediate contained, and may still contain, the hope of a settlement; instead, Bourguiba was rebuffed as an interloper and Tunisian sovereignty was invaded by the despatch of French troops across the border in pursuit of fleeing rebels. But the refusals have come just as often from the rebel side; every offer of a cease-fire by Paris has been rejected and the moderating influence of Bourguiba and the Moroccans has been refused.

So the third anniversary of the Algerian war sees the opponents entrenched in more extreme positions than when it began. French capacity to continue the struggle is undiminished, despite economic and political troubles at home; it is physically possible for France to maintain her present effort for at least another ten years. The rebels' capacity has, on the other hand, much increased; they have an excellently organised army of 65,000 men which is expected soon to attain 100,000—at which level it becomes a force not only for the French to reckon with but a factor that will quite upset the disposition of power in the Arab world and all around the Mediterranean. The Algerian war will quite likely see a fourth anniversary but if it does France's position not merely in Algeria but in all Africa is doomed. It has often been said on this page that there exists no Algerian nation for the French to liberate. That was true, then. But the French have succeeded in forging an Algerian nation. If they continue to contribute to its strength and unity by fighting it they will have called up a force that will burst their African empire and dominate the fate of the other independent nations of North Africa.

WORLDGRAM

AGRICULTURE

Co-operative Development During 1956-57: The co-operative year 1956-57, which was also in a large measure the first year of the second Five-Year Plan, came to a close on June 30, 1957. Information is now available with regard to the progress of co-operative development in the agriculture sector in various parts of the country. The co-operative year 1956-57 was marked by significant developments, like the enactment of the Agricultural Produce (Development and Warehousing) Corporations Act, 1956; establishment of the National Co-operative Development and Warehousing Board, formally inaugurated by the Prime Minister on November 7, 1956; and the establishment and maintenance by the Reserve Bank of India of the National Agricultural Credit (Long-Term Operation) Fund with an initial contribution of 10 crores and annual contribution of 5 crores; and the setting up of the Central Warehousing Corporation. The Second Conference of the State Ministers of Co-operation held in Mussorie in July, 1956 made important recommendations for the organization of large-sized societies and marketing societies and stressed that this should be accelerated with a view to its completion within the first four years of the second Plan. Reports about Co-operative activities during 1956-57 in the fields of credit, marketing, processing, storage and warehousing of agricultural produce, indicate that satisfactory progress was made and fresh ground was broken in several new directions.

Jammu and Kashmir Irrigation Projects: Nine irrigation and multi-purpose projects, which will benefit certain areas in Jammu and Kashmir State, have been included in the second Five-Year Plan. The total cost of the scheme, some of which will be completed in the third Plan period only, including surveys, is estimated at about Rs. 301.20 lakhs. Of this amount, Rs. 200.70 lakhs will be spent during the second Plan period.

State Warehousing Corporation to be Set Up at Jaipur: A State Warehousing Corporation with a share capital of Rs. 20 lakhs will be set up by the Rajasthan Government at Jaipur shortly. The Board of Directors of the Central Warehousing Corporation, which met here recently, has also decided to contribute 50 per cent or Rs. 10 lakhs to the share capital of the State Corporation. It was stated at the meeting that five warehouses for storage of "kharif" crops at Amravati, Gondia, Sangli, Gadag and Davenagere in Bombay and Mysore States have been acquired by the Central Corporation, and were expected to start functioning by the end of November. The Corporation is also likely to acquire one warehouse each in Orissa, Andhra Pradesh and Madras soon.

Andhra Pradesh Flood Control Schemes: The Government of India have allocated a sum of Rs. 3 crores to the Andhra Pradesh Government for the execution of flood control schemes during the second Five-Year Plan. During 1957-58 the State Government proposes to continue work on the Budameru division scheme, started last working season, and to take up two more flood protection works involving the building of flood banks on both sides of the Budameru. Earth-work to the extent of 45.3 per cent was completed on the Budameru division scheme up to the end of April, 1957. A sum of Rs. 11.65 lakhs was spent during 1956-57 on the various flood protection works. Investigations for a dam on the Godavari at Ippur, a reservoir across the Bodderugedda near Godigummi, two reservoirs across the Tandava near Gautavani Kothagudom and Rekhanipalem, the Raivada reservoir on the Saraha river,

the Kalayana-Pulwa reservoir on the Baraha river and a detention reservoir across the Tammilleru near Yerrampalli have been completed. Survey work for improving and widening the Upputeru river channel and for a reservoir across the Yeerakalva near Appalara—Jaguden has also been finished.

INDUSTRY

Pilot Centres for Development of Handicrafts: Eighteen pilot centres for training and research in traditional Indian handicrafts have been set up by the All-India Handicrafts Board to foster the development of handicrafts on modern lines. Six more centres are being opened during the current financial year. Of the 18 centres already in existence, 6 are for training, 3 for training and production, 7 for research and experimentation and 2 for production. The centres have been so chosen as to suit the needs of the handicrafts peculiar to different areas. The All-India Handicrafts Board, which advises Government on the development of handicrafts, has been in existence since 1952. The Board examines schemes for improvement of handicrafts received from State Governments and recommends financial assistance from the Centre. In addition, the Board itself formulates plans and implements them. Apart from pilot centres other schemes being implemented by the Handicrafts Board include the setting up of design centres, holding of exhibitions of handicrafts in India and abroad, publicity, provision of marketing service for handicrafts and research.

Development of Silk and Woollen Handloom Industry: Scheme to develop the silk and woollen handloom industry in a number of States have been approved by the Government of India. For implementing these schemes, the States have been sanctioned loans and grants amounting to about Rs. 7.6 lakhs by the Central Government. The schemes for silk weaving industry include financing of the share capital of over 3,500 weavers for joining co-operative societies and supply of better equipment for handlooms for increased production. Of the 3,500 weavers to be brought in the co-operative fold, 1,500 weavers are in Bihar, over 900 in Madras, 400 in Madhya Pradesh, 200 each in Uttar Pradesh, Orissa and West Bengal and 100 in Andhra.

Development of Handloom Industry: Seventy-three schemes involving an expenditure of Rs. 1,20,57,839.75 for the development of handloom industry in different States of India were recommended for sanction by the Schemes Committee, appointed by the Government of India to scrutinise handloom development schemes. The committee held eight meetings on different days during September and considered ninety-six schemes received from State Government. The total amount sanctioned to State Governments for the development of handloom industry during September 1957, was Rs. 39,29,508.67, whereas the total amount sanctioned between April 1, 1957 and September 30, 1957 stood at Rs. 1,30,23,473.34. The estimated production of handloom cloth from indigenous yarn during seven months from January 1957 was 1,077.62 million yards, while production during the corresponding period in 1956 was 935.70 million yards.

New Foaming Agents for Production of Foamed Concrete: The Central Building Research Institute, Roorkee, has developed a new process for preparing foaming agents from indigenous resources which are stable and need no settling accelerator. The low-density foamed concrete prepared by using these foaming agents has properties which compare favourably with those of foamed concrete prepared by using imported pro-

proprietary brands. Besides, the use of this indigenous foaming agent is expected to result in about 60 per cent saving in respect of cost of foaming agent as well as saving in foreign exchange. The foaming agent is also suitable for production of high-density foamed concrete used for making non-load bearing pre-cast slabs, thermal insulating floor screeds, etc. Low-density foamed concrete (insulation concrete) is used for heat insulation in cold storage structures and air conditioned buildings and is a good substitute for cork which is mainly imported into India. Foaming agent is one of the important ingredients for producing foamed concrete. Up to now only foreign proprietary foaming agents have been used for preparing foamed concrete. The Government Housing Factory at Delhi has been given the right to exploit the products.

TRADE

Protection to Machine Screw Industry Extended: Government have accepted the Tariff Commission's main recommendation that protection to the Machine Screw Industry should be continued for a further period of two years, that is till December 31, 1959, at the existing rate of protective duty, namely, 50 per cent 'ad valorem' or 60 naye Paise per gross, whichever is higher. Government have also taken note of certain ancillary recommendations made by the Commission for assistance to the industry and will take suitable action to implement them.

*

US World Trade on the Rise: US world trade is booming in most areas and is at a record or near-record peaks in some regions, the US Department of Commerce has reported. The department stated that US trade with the Far East this year is expected "to considerably surpass the 1956 level." The report said that exports to Far Eastern countries, accounting for almost 17 per cent of the US total, rose in the first half of 1957 to an annual rate of \$3,300 million, compared with \$2,300 million for 1956. Imports from the Far East area, now running at 13 per cent of total US imports, are at about the annual rate of 1956, a total of about \$1,700 million. US exports to the 20 Latin American Republics in the first five months of 1957 totalled \$1,200 million, while US imports from the area during the same period amounted to \$1,700 million. Both exports and imports were higher than in the comparable period in 1956. US imports from Western Europe in the first half of 1956, were valued at \$1,500 million, while US exports to Western Europe amounted to \$3,100 million during the same period. US trade with the Near Eastern area, including Egypt, Greece and the Sudan, declined in the first half of 1957, with exports at \$368 million and imports at \$131 million, compared with \$384 million, \$206 million in the first half of 1956.

*

Protection to Diesel Fuel Injection Equipment Industry to be Continued: Government have accepted the Tariff Commission's main recommendations on the continuance of protection to the Diesel Fuel Injection Equipment Industry. These are that the existing protective rates of duty of 60 per cent 'ad valorem' on single cylinder pumps, and 60 per cent 'ad valorem' (standard) and 52½ per cent 'ad valorem' (preferential) on nozzleholders, should be continued for a further period of two years ending December 31, 1959, and that these rates of duty should also be applied to elements, delivery valves and nozzles. Government have also taken note of certain ancillary recommendations made by the Commission for assistance to the industry and will take suitable action to implement them as far as possible.

FINANCE

Customs and Excise Revenue Collected in Indian Union Statement for July: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during July 1957 amounted to Rs. 16,63 lakhs as compared with Rs. 11,77 lakhs in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 15,05 lakhs as against Rs. 10,28 lakhs, export duties for Rs. 129 lakhs as against Rs. 124 lakhs and land customs and miscellaneous for Rs. 29 lakhs as against Rs. 25 lakhs. The total gross collection of Union excise duties amounted to Rs. 20,63 lakhs as compared with Rs. 14,41 lakhs. During the four months, April to July, 1957, the grand total of gross customs and Union excise revenue realised was Rs. 141,89 lakhs as compared with Rs. 107,91 lakhs during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 55,59 lakhs as against Rs. 43,14 lakhs, export duties for Rs. 532 lakhs as against Rs. 703 lakhs, land customs and miscellaneous for Rs. 131 lakhs as against Rs. 95 lakhs and Union excise duties for Rs. 79,67 lakhs as against Rs. 55,89 lakhs.

*

UK to Pay Off £503-Million Loan: The British Government is to pay off a £503 million debt. A Government 2½ per cent loan issue, which matures on November 14, is to be paid off, although financial circles were anticipating that stockholders would be offered a new security in exchange. The Government's decision is in line with the official policy of preventing an increase in the floating debt and of trying, whenever possible, to reduce it. So far, during the present financial year, three loans amounting to more than £900 million will have been repaid. Only one small loan of £100 million has been issued in their place.

GENERAL

Family Budget Enquiries: The Government of India have selected 50 industrial centres where family budget enquiries are to be conducted on an all-India basis. The first phase of the enquiries, which will be undertaken by the Labour Bureau of the Central Government, with the help of the National Sample Survey Organisation, is expected to begin in November. The object of these enquiries, which will cover factory workers, miners and plantation labour, is to compile a new series of consumer price index numbers on a uniform basis. The existing series of consumer price index numbers, it is pointed out, are based on old and out-of-date enquiries and therefore do not reflect correctly the present cost of living of industrial workers. Besides, the bases of the consumer price index numbers, which are being compiled by the Central and State Governments, vary.

*

Employees' State Insurance Scheme Extended: The benefit provisions of the Employees' State Insurance Act, 1946, have been extended to Beawar in Rajasthan from the midnight of October 26, 1957. About 5,000 factory workers in the Beawar Municipal Area will benefit by the scheme. Medical care will be provided by the State Government and a whole time dispensary has been opened for this purpose. Besides, it is proposed to utilise a mobile dispensary to cater to the needs of workers in outlying areas. For the payment of cash benefits under the scheme, a local office has been set up. The employers of factories covered by the Act in this area will be required to pay their special contribution at 1½ per cent of the total wage bill.

NEWS IN BRIEF

INDIAN

By an Ordinance issued by the President the Reserve Bank of India Act has been amended to reduce the minimum currency reserve in foreign securities. Under the new arrangement, the overall minimum reserve to be maintained by the Reserve Bank for backing the currency will be Rs. 260 crores of which not less than Rs. 115 crores will be in gold coins and bullion.

*

The Government of India have decided to remove the export duty of Rs. 50 per ton leviable on de-oiled groundnut meal with immediate effect, says a Ministry of Commerce and Industry Press note.

*

The Government of India is understood to have appointed Messrs. Foster Wheelers Corporation of U.S.A. to prepare project reports for Gauhati and Barauni for the proposed oil refinery in Assam.

*

The Khadi and Village Industries Commission, New Delhi, has urged the Union Government to sanction Rs. 14 crores during 1958-59 for the execution of development programmes of the village oil industry.

*

Mica exports from three major ports of Calcutta, Bombay and Madras in September, 1957, were well maintained at 21,812 cwt. as compared with 21,797 cwt. in the previous months.

INDUSTRIAL GROWTH IN THE UNITED STATES & THE SOVIET UNION

THE basic goal of Soviet planners has all along been to catch up with the United States in industrial production and ultimately to surpass it. Despite the tremendous driving force behind the economic programme, Soviet industry — manufacturing, mining and electric power — could produce (as of 1955) only about a third of the quantity of goods produced by United States industry. This absolute gap (amounting to two-thirds of United States' output) between the levels of output in the two countries may or may not be closed completely at some point in the decades to come. It may be closed only on the two-fold assumption that the annual average rate of Soviet industrial growth (11.5 per cent according to official Russian estimate and 7.7 per cent estimated in a recent study on behalf of the Joint Economic Committee of the U.S. Congress) in the period 1928-55 will get accelerated in the future and the annual average rate of American industrial growth (3.6 per cent) in the same period will decline considerably in the years to come. Any such assumption, however, would be too large a one to make and cannot be validly based on the short-term (1950-55) trend either. Incidentally this short-term growth trend, expressed as an annual average rate, has been 13.1 per cent in the Soviet Union according to official Russian estimate and 9.9 per cent according to the estimate of the Joint Economic Committee staff, and 4.4 per cent in the United States.

On the other side, it cannot also be confidently postulated that American economy "will suffer either stagnation or collapse" although it is the doctrinaire hope of Soviet Communists that this will happen — and so the absolute gap between the levels of output in the two countries may not come to be completely closed in the near future. But there is also the probability, according to the Joint Economic Committee staff, that "Soviet growth rates may continue enough higher than those of the United States that in time the levels of output in the two countries could begin to close." Although thus the gap may begin to close in the long period, it may not completely close at all. For, if the absolute gap is to narrow to about half the output of the United States by 1965, the annual average rate of growth in Soviet industry will have to be round 16 per cent in the period 1955-65 as against an assumed growth rate of 3.5 per cent per annum in American industry in the same period. That Soviet industry will not be

able to accelerate its rate of growth to that extent may be inferred from the fact that the gap between the output of the United States and that of the Soviet Union has somewhat widened and not narrowed in recent years, according to the finding of the study prepared for the Joint Economic Committee.

This comparative picture of industrial growth rates in the two countries is thus not too favourable to the Soviet Union or too unfavourable to the United States. It is, however, the picture of growth rates pertaining to individual commodities that is more relevant from the point of view of Russian capacity to support a formidable military machine. Table 2 gives this comparative picture in respect of selected commodities. It is found, for example, in the case of such strategic industries as lumber, coal, petroleum, steel, cement and machinery, the growth rates have been far more favourable to the Soviet Union than the general industrial growth rates in the long and short periods alike. At the same time it may be noted that the Soviet/United States production ratios are generally higher in heavy or producer goods industry, and lower in light or consumer goods industry. Some of these ratios covering production in 1955 are: In the case of pig iron, 0.47; steel ingots and slabs, 0.43; copper, primary refinery, 0.33; cement, 0.44; presses and forges, 0.80; ships, 0.82; radios and television, 0.18; refrigerators, 0.05; washing machines, 0.02; automobiles, 0.01.

United States industry, on the other hand, produces a much larger share of its output for direct personal consumption. In the case of steel and petroleum in particular, the finding of the Joint Economic Committee Staff may be quoted here to complete the picture: "In 1955, for example, the U.S.S.R. produced about 43 per cent (45.3 million metric tons) as much steel as the United States (106.2 million tons). In the Soviet Union, however, only an insignificant proportion of that steel goes into satisfying consumer needs for automobiles, washing machines, refrigerators, etc. The bulk of it — perhaps as much steel as in the United States — is available for production of military goods or for items conducive to further economic growth. The same kind of comparisons may be made for petroleum. The relative absence of private automobiles leaves a very large share of petroleum for military purposes as well as heavy industry and agriculture."

1. ANNUAL AVERAGE RATES OF INDUSTRIAL GROWTH IN U.S.S.R. AND U.S.A.

Foot-wear	5.9	6.2	8.7	1.6	2.8
Meat	0.3	5.2	12.2	1.7	3.5

How the Soviet Union has been able to maintain a higher rate of industrial growth than the United States in comparable periods can also be inferred from the figures of gross national product by use in the two countries. According to Table 3 which gives these figures, gross investment in the Soviet Union accounts for (as of 1955) 26.9 per cent of gross national product as against 18.7 per cent in the United States, although the Soviet national product as such is only about one-third that of the latter country. But a relatively smaller share of Soviet investment is allotted for the development of consumer goods industries, and this accounts for the lower level of living of an average Russian. The per capita availability (as of 1955) of some consumer goods in the two countries is revealing in this connection. The relevant figures are: 30 linear metres of cotton fabrics per average Russian and 72 linear metres per average American; 1.5 and 2.4 metres respectively of wool fabrics; 0.5 and 18.7 metres respectively of rayon and synthetic fabrics; 3.9 and 11.0 pairs respectively of hosiery, 1.7 and 5.7 numbers respectively of knit underwear; 1.4 and 3.9 pairs respectively of shoes; and 4.8 and 32.0 square metres of housing. As for durable consumer goods, their per capita availability is far greater in the United States than in the Soviet Union except in the solitary case of motorcycles. How long it will take for Russia to catch up with the United States in consumer goods production is anybody's guess.

But there is one field—the field of science and engineering—in which the Soviet Union will have nearly overtaken the United States by 1960. (Incidentally the rapid rate of progress in this field may well be a major factor in maintaining a high rate of industrial growth in the foreseeable future although the absolute gap in the levels of output in the Soviet Union and the United States may still not be closed.) By that year the number of engineers and other professionals in the natural sciences will be about 800,000 and 260,000 respectively in the former and 750,000 and 320,000 respectively in the latter. This will be hardly surprising in the context of the American preference

for the social sciences in which as many as 72 per cent of that country's graduates received training in 1955. On the other hand, the Russian preference for the natural sciences is truly amazing, what with 52 per cent of that country's graduate students having taken to those fields as against 16 per cent in the United States. It is no wonder, therefore, that the Soviets have succeeded in creating a wide scientific base which has made possible such scientific marvels as space satellites and which, by enabling a still higher rate of scientific progress to be maintained in the years to come, may well make even space travel possible. All this achievement may still not mean a richer and fuller life for an average Russian as compared to an average American in the foreseeable future. If simple living and high thinking can go together, then surely great scientific achievement and low standard of living may go hand-in-hand!

PUBLIC RELATIONS ABROAD

(CONTRIBUTED)

THOSE who think that propaganda abroad by various governments is a novelty are very much mistaken. Any reader of history will have come across innumerable instances of propaganda of all sorts and gradu-

ations. Then as now there was good and bad propaganda; sincere efforts to make other peoples understand one's own country's or government's point of view; information for foreign consumption, perhaps some-

times a little too florid, to convince the foreigner of the advantages of one's friendship. And at times, lies shod in half truths, or open threats, to lure those at whom they were aimed into false beliefs or simply to intimidate them.

Over the past quarter of a century a special type of propaganda has been set apart, with its own techniques and limitations. Somewhat maltreating the English language we call the specific actions of "influencing of public relations", by the same nouns by which we also name the state which we do wish to create, i.e. "Public Relations".

Up to the first World War the task of creating the "right" public relations with foreign governments and peoples, and to nurse them, was that mainly of the ambassadors and envoys sent abroad, supported, maybe, by individual travellers and missionaries (religious and others). The public representatives abroad—ambassadors, ministers, consuls, etc.—still are the top ranking "Public Relations Officers" of their countries. But their radius of action is today even smaller than it was in the past. And more often than in the past they are very much restricted in their task by their political heads at home.

Now, however, every mission abroad has attached to it a special "public relations" section. Listening to the judgment of most pressmen abroad one would come to the belief that their own country's public relations set-up is either bad, certainly not good, at best passable.

Let us admit immediately that such criticism is based mostly on the particular, and always too optimistic expectations of the critics. Whether a public relations section can do its job well depends in the first instance on the guiding instructions it receives and, secondly, on the co-operation it gets, from its hive—in other words, from the Ministry to which it belongs. The extent of the work of any such section must vary, too, according to the specific circumstances of the moment.

There are times when nothing more is required than the giving and spreading of straightforward information about men and matters of one's country. When that task is not well done by the information and public relations officers one can take it almost as axiomatic that certainly part of the failure is in the first instance caused "at home"; the failure, namely, for the particular department of the government concerned to provide the essential facts, be they figures, descriptions of happenings, or important announcements of Ministers, as soon as they are available. It is less than useless to wait half a week after the Prime Minister, or the Minister of Finance, has made an important speech, then to send the text by air mail. That speech (or whatever the pronouncement was) should have gone by cable to all the missions, as the journalists say, "before it happened"—in other words, without a minute's delay. That would enable public relations officers to have the news distributed 'in extenso' to the press of their locality before shortened and therefore often misleading reports have led to misinformed or badly informed comments in the foreign press. Again it is little help to your propaganda for increased trade if the public relations section abroad receives ONE copy of a report, or ONE set of statistical information, by "sea mail" six weeks after the thing has been published at home. And these things do happen, as this writer knows from his long experience. So don't shoot the P.R.O. until you know "why" he failed to come up to scratch.

A few weeks ago an Indian Editor was the guest of a small dinner party. After dinner the guest was subjected to a cannonade of questions relating to the financial and exchange difficulties in which the directors of the second Five-Year Plan find themselves. All the diners were people who knew a fair amount of India's economy and commerce; some of them had been out in India for years, the rest were connected in one way or another with India. Every one of them a friend of India. Yet their questions were clear evidence of the insufficient information they had on the subject. "How", said the editor after the party had dispersed, "will those be able to understand our problems who are not our particular friends, when our best friends harbour such 'bearish' views?"

The answer to that question is (a) there are evidently too few people abroad who are able to judge the situation fairly, simply because only the bare facts have been made public but little or no real guidance was given as to how to interpret those facts. In other words, insufficient Public Relations abroad; (b) people and nations abroad also have their problems and these, quite naturally, engage their minds more immediately; (c) the third and perhaps most important point for any public relations work is the fact—as was very clear from that dinner party discussion—that if you want to get your own point over, first make sure what your opposite wants to know.

The problem of foreign exchange and investment is no doubt a specially difficult one for the Public Relation Officers, whoever they are. The only section of officers of whom one may fairly expect that they should know the subject, are the heads and some of their staff of the Commercial Sections of our missions abroad. They, however, have quite a lot to do within their own particular compass of duties. Nor are they necessarily trained for general public relations work. On the other hand, it is not only on economic matters that straight propaganda has failed. There are some political matters where even now there is, except perhaps in Foreign Offices, confusion about what, or what not, the Government of India is intent on.

When one thinks of the variety of problems which must arise from time to time, on which it is important that people (not only Governments), certainly some sections of other nations should be well informed, it immediately becomes clear that no one person, however keen and intelligent, can possibly disseminate really useful and effective informative propaganda unless he is briefed on "how" to present the facts. The good public relations officer is a person with a flair for judging the outlook of those whom he wants to convince; a person with a vivid mind which easily grasps the fundamentals of ideas, facts and theories and is able, when properly briefed, to "get over" a convincing story; but he can only do it if he has a "proper line."

Let us not be prevented from studying this problem of Public Relations abroad by saying, as is perfectly true, that few, if any other nations have been exceptionally successful at it. Practically everywhere it is the segregation of the departments which are barriers to the proper functioning of the Public Relations Sector. The P.R.O. must have the active, indeed very active, co-operation of the department for whom he has to act as P.R. Counsel and Advocate at the court of world opinion. It is for the foremost brains of the department concerned to provide all the material, then discuss with the P.R. personnel all probable and useful angles of interpretation to the various publics or sections of the public abroad. It is for the P.R.O. to detect the best line of attack. All this should be done before any major information projects are started.

Economic Report from the U. S.

FOREIGN INVESTMENT GUARANTEE PROGRAMME

(By GUY SIMS FITCH)

WASHINGTON, October 29.—Indicative of the growing interest abroad in private capital from the United States is the expansion of a U.S. Government programme designed to encourage just such investment. It is the foreign investment guarantee programme administered by the International Co-operation Administration (ICA). Actually, the investment guarantee programme is a deep-rooted element in the post-war foreign economic policy of the United States, dating back to the time the Marshall Plan was launched in 1948. But only in the past few years has gained full recognition here and abroad as a major instrument of economic development.

The reasons for this new interest are not hard to find. They begin with the acute shortage of capital, particularly of dollars, around the world. Many countries, especially the less developed, are caught in a squeeze between the mounting demands of economic growth and inadequate capital resources — a squeeze which has become increasingly evident in recent years. As a result, they are investigating worthwhile methods of attracting constructive private investments from external sources. Obviously, a bilateral government guarantee agreement with the United States — the most fruitful source of private development funds — is one such method. It offers the American business man protection against the kind of risks which have prevented or discouraged some foreign investors in the past. Thus, it can help overcome the reluctance — justified or not — of many American business men to invest in productive enterprises in other lands. This reluctance, coupled with the demand for capital at home, undoubtedly has caused American business men to pass up some worth while investment opportunities

abroad from which both they and the foreign countries involved could have benefitted. Even so, American private investments in other countries registered a record \$4,000 million rise last year. This receptivity to U.S. capital reflects the willingness of American business men to be "good citizens" in the lands in which they invest. It also is evident, of how great potential there is for an expanded international flow of needed private capital.

To help speed this flow, Congress has authorized ICA to step up the total value of its investment guarantees to slightly more than \$500 million. Until last June 1, ICA already had issued guaranties amounting to more than \$147 million, covering investment abroad by 118 companies and individuals in 18 countries. What is more, applications are pending in the amount of \$646 million. Another encouraging factor is the low cost of the investment insurance. It is generally available at only one half of one per cent of the value of each investment, and runs for periods of up to 20 years. All told some 36 countries in nearly every part of the world have entered into investment guarantee agreements with the United States. One of the most recent to do so was India, a country which is making a whole hearted effort to meet admittedly ambitious development goals. Only last month, Indian officials visiting the United States expressed the view that private American investment could contribute importantly to India's economic progress. By helping to stimulate this type of investment, ICA's guarantee programme becomes a significant factor in increasing the production of wealth, expanding employment and raising living standards abroad — particularly in areas where private American capital otherwise might not venture.

A Letter to the Editor

'DRY' FACTS

Sir,

"The Week's notes" in your issue of October 25, carries a note under the above head which I have read with considerable interest. After your able analysis of the reported stand of the Union Government and of the A.I.C.C., viz., "the annual saving of about Rs. 110 crores by the community as a result of prohibition is more important than the loss of about Rs. 40 crores to State exchequers consequent on the elimination of excise on liquor," you have drawn the conclusion: "the myth that the community would save Rs. 110 crores as a consequence of prohibition cannot be sustained."

In dealing with this question, it would appear to be assumed that the sum of Rs. 110 crores, which is presumably the total amount spent on liquor, would be available to the community as savings, if there was total prohibition. To start with, is not this presumption of rather doubtful validity? In considering this question, the consumption of liquor by the community deserves to be analysed under two heads viz., foreign liquor and country liquor. I have no idea as to the actual amount spent on each category; but, even assuming that about 25 per cent represents foreign liquor, the gross amount spent on this would be, say, Rs. 25 crores. This figure would include the import duty, excise duty and other local taxes which go into the Government coffers, as

well as profits earned by the dealers in India, all of which remains within the community. Hence probably less than half of this amount, or say, Rs. 10 crores might represent the amount actually paid out to the foreign suppliers and irretrievably lost to the community. However, the balance of about Rs. 100 crores out of the total consumption would represent money spent in the country. A considerable portion of this represents Government revenue in the form of excise duty, sales tax etc., and remains within the community. As far as the remaining portion is concerned is it not merely a question of distribution within the community? What is a debit in the case of the liquor consumer is, per contra, a credit in the hands of the various elements of the community concerned in the production and distribution of the liquor. Thus what 'A' pays provides the income (or even the livelihood) of several persons say, 'X', 'Y', 'Z'. If 'A' refrains from spending, it follows that 'X', 'Y' and 'Z' will cease to have a corresponding income. Therefore, even though individuals, as such, may save or lose, for the community as a whole, there can be neither any saving nor loss as far as the Rs. 110 crores are concerned.

Yours faithfully,

"A READER"

THE FUTURE OF MOTOR TRANSPORT

By K. SANTHANAM

IN 1939, when the Motor Vehicles Act was passed, Motor Transport in this country was in its infancy. India was just recovering from the great economic depression. That Act was based on three main assumptions. (1) Railway revenues should be safeguarded against motor competition; (2) Motor transport should be private enterprise; and (3) It should be operated as far as possible by small operators so that there would be competition and the public might benefit by low fares and efficient service resulting from such competition.

When the present writer became Minister for Transport, conditions had greatly changed as a result of World War II. Movement of goods had increased to such an extent that there was more than enough work for Railways and Motor Transport and the fear of the Railway revenues falling as a result of motor competition had disappeared. It was also clear that the small operator with a few buses could not provide satisfactory or efficient service. Without an up-to-date workshop, reserve vehicles, stock of spare parts, and well trained and well paid staff, the small operator could not maintain his buses in sound condition or provide punctual or comfortable service. Everywhere, there were loud complaints about the state of motor transport, the only exceptions being big operators who had a fleet of buses and sufficient capital resources to operate them efficiently. The State Governments had, therefore, to enter the field. Though in some cases the remedy proved worse than the disease, there were significant successes in some States like Bombay and U.P.

In the Industrial Policy Resolution adopted by the Government of India on April 30, 1956, motor transport has been included in Schedule B. The general policy laid down for the items included in this schedule is as follows.

"With a view to accelerating future development, the State will increasingly establish new undertakings in each industry. At the same time, Private Enterprise will also have the opportunity to develop in this field either on its own or with State participation."

Thus, though motor transport is a legitimate field for State enterprise, there is no justification for replacing private enterprise in areas where efficient service is provided.

The time has now come for a comprehensive review of the policy regarding Motor Transport. It appears that the future development should be on the lines laid down for Banking. The present banking structure consists of the Reserve Bank and the State Bank of India and its branches which are entirely under State management. There are again the big scheduled banks which are managed by private enterprise but which are controlled and assisted by the Reserve Bank. Lastly there are the minor banks. Similarly in the case of transport in each State, there should be a field of State Transport which should be run as an autonomous concern on business principles. Side by

side, there should be areas where motor transport is managed by well organised, big operators with a minimum fleet of about 100 units and the requisite workshops, capital and other resources. While minor operators working in this field should not be normally hurt, new licences should not be given to such operators except in special circumstances and every encouragement should be given for the merger of existing small operators into bigger concerns.

It may appear surprising to some to plead for the big operator against the small capitalist. On abstract theory, the small capitalist is to be preferred to the big and, no doubt, in some fields like processing and light consumer industries ways and means should be found to give active preference to the small capitalist. But there are industries in which the small capitalist cannot function effectively and motor transport is one of them.

A word may be said about motor taxation. It is admitted that Madras has the highest taxation in the country. However, this high taxation has not only helped the revenues of the State but also made motor transport in this State more efficient than elsewhere. It requires great ability, skill, organisation and economic management to make motor transport paying in spite of this heavy taxation. That Madras can boast of many concerns like T.V.S. and Sri Rama Vilas is an indirect result of this heavy taxation. There is little doubt that other States will slowly come up to the Madras level. It should not, however, be misunderstood to suggest that the existing taxation in this State can be further increased. That will be killing the goose that is laying golden eggs.

The Railways are unable to handle the traffic which is growing on account of our development plans. It requires urgent relief and this can be provided by motor transport which can be expanded more quickly and easily than the Railways. If ways and means can be found to co-ordinate railway and motor transport so that the bulk of short distance traffic, both passenger and goods, is transferred to motor transport, the pressure in the railways may be eased. Central legislation has provided for railways participating in State Road Transport Corporations. It should be possible to extend this partnership to well organised private corporations. If this can be done, minor Railway stations may be handed over to the motor transport concerns and Road-cum-Rail tickets and way-bills can be issued so that passenger and goods trains need not stop at short intervals.

For the State Governments, expansion of irrigation facilities and development of electric power are the most important tasks. Motor transport can only take the third place. It should be hoped that the State Governments will permit such concerns as are established to continue and expand their services and concentrate State enterprise in non-transport areas where new services have to be provided or existing services are unsatisfactory.

CO-OPERATIVE CREDIT: POSSIBLE PITFALLS

By CROESUS

AT the rate at which the Government has been increasing financing agencies and expanding the scope of operations of the existing ones, one fears, there may soon develop a very keen competition and a stage may

even be reached when the weaker among them, especially if they happen to be in the co-operative sector, will seek special Governmental protection. As a matter of fact, the process has already begun with the establish-

ment of the higher interest rate monetary pattern which finds co-operative banks lagging behind in the race for deposits. Even sound and well-established units like the Bombay State Co-operative Bank, Ltd. are not unaffected, so much so that its Chairman, Mr. R. G. Saraiya, felt compelled, the other day, to appeal to all co-operative institutions, particularly banks, to stand by the co-operative movement by ensuring that their surplus funds are not kept outside co-operative banks. For quite some time past, if I remember my facts, the Registrar of Co-operative Societies has been insisting on this, but he does not seem to have suggested so far that it is only thus that these institutions would be deemed to have maintained co-operative discipline.

Be that as it may, after making such an appeal, I wonder whether it can lie in any co-operator's mouth to complain that commercial banks are proving to be serious competitors and are attracting deposits from both the general public and the co-operative sector at the cost of co-operative institutions. Surely no co-operator can insist that joint-stock banks shall not offer a higher rate of interest on deposits than the co-operative banks. This would mean that co-operators are not satisfied with merely asking co-operative institutions to transfer their deposits from joint-stock banks to co-operative banks but that they would also want the general public to entrust their idle funds to co-operative banks. What, for instance, would be the reaction of co-operators, one would like to know, if, as a 'quid pro quo', joint-stock banks were to ask co-operative banks to raise the rate of interest on advances to their clients, as the relatively low rates at which these co-operatives advance loans operate as a source of serious competition to them? It is not enough to dismiss this — as I know will be done — by saying that co-operative banks and joint-stock banks don't work on the same principles.

By the way, let me not be mistaken as trying to put any new suggestion into the heads of joint-stock banks. They don't need it though. Recent developments themselves have been such as are certain to compel them, sooner or later, to complain against the slow and steady encroachment of the State-cum-co-operative sector into their domain. Meanwhile, it looks as though all canons of sound banking, such as that commercial banks should confine themselves to short-term credit and provision of trade finance, and not dabble in mixed banking by indulging in long or even intermediate term credit, are meant only for joint-stock banks. For co-operative banks bid fair to enter the banking arena in a big way. They are no longer required to restrict their activities to agricultural credit. They are now encouraged to take up the financing of even industrial co-operatives, especially those interested in small and medium scale industries, although I am not quite sure whether one is right in regarding a sugar factory, even if it be under the co-operative umbrella, as a small or medium scale industry. Sugar co-operatives or any industrial co-operatives, for that matter, would need several facilities, such as the provision of working capital and capital expenditure, not to speak of guarantees to other banks against deferred payments for plant and machinery, both imported and indigenous. So long as the Government of India, the State Government, the Reserve Bank and the State Bank of India continue to provide funds to co-operative banks, it would be feasible for these institutions freely to provide intermediate credit facilities to these co-operatives, but the difficulty would arise when the flow of funds from this pipeline stops, as it must needs do sooner or later, sooner perhaps than some may be inclined to concede. If such a contingency should arise, would there not be a conflict on the part of these co-operative banks as to whether they should prefer their new-found and, often times, prosperous industrial clients or

their age-old agriculture clients who would be content if they could just make both ends meet?

There is one other aspect to extension of co-operative credit or credit by urban co-operative banks to small and medium industries. When the State is out to encourage these industries, it follows that considerations of whether or not financing a particular case is economically sound cannot arise. Viewed thus, it seems a sound policy that, rather than canalise such credit through the normal competitive channels of commercial banks, such should be routed through co-operative credit institutions, compensating them against losses or even subsidising them to some extent to make the work worth their while. Here, again, this cannot last indefinitely or even for a reasonably sufficiently long time. Suppose a stage is reached when, for financial reasons, the State cannot afford to extend these facilities, what will happen to the industries concerned, especially if they have not grown strong enough betimes to stand on their own feet?

Finally, does it not appear somewhat of a contradiction if unrestricted credit is made available to one sector when the purse strings are deliberately being tightened to restrict it in respect of others in the name of credit control? The difficulty with regard to the new lines of co-operative credit which the Government has embarked upon, doubtless with the best of intentions, is that they don't lend themselves to be judged by the same type of rigorous tests as other credit lines so that the brake may be applied whenever the exigencies of the situation demand such a course. Co-operation is undoubtedly entitled to State aid and support, commensurate with the risks it has to shoulder as an instrument of development in accordance with the State policies, as Mr. Saraiya observed, but it should not be forgotten—and he also stressed this—that its intrinsic worth lies in its own inherent strength. It is here, more than even in ensuring that all deposits of co-operative agencies are diverted to co-operative banks, that the solidarity of co-operators is needed.

Mr. A. M. Walker—General Manager

It's 1,000 miles across the room...

RATTLE, clatter, thump goes the toy engine at the little boy's heels... rattle, clatter, thump across the room. And, to him, it's a thousand-mile trip! So what's vital to him is movement and speed.

To us, at Hindustan Lever, speed and distance are no less important. For you, we cover thousands of miles every day — every inch of India's 35,000 miles of railroad, for instance. But before our products are despatched, we must consider how they will travel. Plane or train? Road or waterway? Handcart, head-load or mule-train? The answer depends on a great many factors — for instance, on the kind of territory those goods must cross and how soon they must arrive.

But arrive they must — and arrive in the best condition. For people have come to trust the goods we make — things like Sunlight Soap and Vim, Rexona and Dalda Vanaspati. The need for these products is growing — everywhere, all the year round.

We take trouble to satisfy this need — and so add another service to the service that the goods themselves perform. We add the service of regular supply.

BUSINESS NOTES

NEW FLOOR FOR THE CURRENCY RESERVE

THE ORDINANCE issued by the President on October 31 last amending Section 33(2) of the Reserve Bank of India Act did not come as a surprise at all. On October 25, our sterling balances reached the all-time low of Rs. 323 crores. There was thus a bare margin of Rs. 23 crores which could be further drawn upon under the then existing position of law. The current rate of the withdrawals of the sterling balances is approximately Rs. 8 crores per week. It was thus obvious that an ordinance was quite essential to facilitate foreign payments.

Under the amendment introduced by the ordinance a new floor limit has been laid down at Rs. 200 crores for the total currency reserve. The old distinction between the backing in gold and backing in foreign securities (mostly held in sterling) has been done away with. Under the old dispensation the currency reserve had to consist of Rs. 115 crores in gold and Rs. 400 crores in foreign securities. The ordinance now provides that the total backing is to be a minimum of Rs. 200 crores. In theory the entire backing might consist of gold. But in view of the fact that there is little likelihood of any additions in the foreseeable future to the present gold reserve of Rs. 118 crores, foreign securities of at least Rs. 85 crores will have to be maintained untouched. It means that out of the present sterling balances of Rs. 323 crores we can draw upon Rs. 243 crores. This amount would be enough at the current rate of withdrawals for a period of 10 months. But it need not be presumed that the entire permissible margin of withdrawals will be used up. The firm commitments of imports which India ought to honour have been the main factor in determining the size of the currency reserve. The foreign assistance which may be available from the World Bank, the US Development Fund and West Germany has not been taken into account in this behalf.

The reaction abroad to the change in India's currency reserve requirements, particularly in the UK which is directly affected by it, recognizes the circumstances under which it has been brought about. There is no element of surprise in it. In the UK there is appreciation of the fact that, since a loan for India in sterling did not materialise, rapid withdrawals of sterling balances would be the only available means of tiding over the temporary balance of payments difficulties. But concern is expressed in that country that strain will be imposed on the reserves of the sterling area. This is true. However, it ought not to be forgotten that during the first Five-Year Plan India added to her sterling balances. In fact, the war-time build-up of sterling balances imposed an abnormal strain on the Indian economy. It is implied in the understanding among the members of the sterling area that they should pursue sound policies and exert their utmost to maintain even balances, but particular situations may involve strain for some.

HOUSING: A BIG QUESTION MARK

IF RECOGNITION of a problem should mean that part of the problem is over, then the frank admission, recently by the Union Minister for Works, Housing and Supply, of less than necessary progress in India's housing activities is welcome. As in other fields, like, for example, employment and food production, in housing also, the country needs to run faster and faster if only to keep to the same place. This is sufficiently illustrated by the figures given by Mr. K. C. Reddy at the

second Housing Ministers Conference, which was held at Mysore. In 1951, shortage in urban housing was assessed at 2.5 million houses. (In the first Plan period the number of houses built in urban areas is estimated to be 1.3 million). By the end of the second Five-Year Plan, this shortage is expected to double, reaching the figure of some 5.7 million units. This is after account is taken of the construction during the decade 1951 to 1961 in which well over 3 million houses will have been built. The calculation is based on the assumption that urban population would register an increase of 20.6 million in the same period. So far as the assumption of increase in population is concerned, there are no indications at the present time to show that this is liberal. It, therefore, only underlines the tremendous magnitude of the problem facing the country.

Much more staggering than this is the problem of rural housing. In nearly 5.59 lakh villages in the country, as many as 295 million people live in no more than 54 million houses. On an average, this works out at between five and six persons to a house. Perhaps this would not sound very shocking if only the houses were habitable in the real sense. As it is, the vast bulk of 50 million houses are admitted to be in urgent need of being either rebuilt or improved considerably. Again, the condition of schools, dispensaries and similar other necessary amenities is too well known to be mentioned. Not even in all the community project areas has the face of the country been substantially changed.

It is true that large amounts of money have been earmarked for the purpose of improving housing conditions. In the case of slum clearance alone, the second Plan provides Rs. 20 crores made up of Rs. 15 crores from the Centre and Rs. 5 crores from the States. It is unfortunate that not much solid achievement can be written against this black spot in the nation's life. Not very dissimilar is the case of low income housing schemes. It is not so much due to the inertia of the people that not full advantage of the scheme is being taken as because of the very difficult and circuitous conditions for obtaining advances. This perhaps explains why out of Rs. 21.53 crores offered to State Governments for loans under this scheme in the first Plan period, a mere Rs. 11.10 crores was utilised. Three months back, that is even after 1½ years of the second Plan, this figure was no more than Rs. 18.41 crores. Whether it is subsidised housing, rural housing or slum clearance, the important thing is to devote more time and energy to coming to grips with the practical problems rather than sit in conference halls and research centres. It must be constantly remembered that the problem over the whole country is not necessarily uniform. Different regions present different conditions and must be attended to likewise. There is no doubt, however, that in any such scheme, the full co-operation of the people is essential for achieving real success.

1953 CLOTH STOCKS CRISIS REPEATS

THE FOREWORDS to the Reports of the Committee of the Millowners' Association, Bombay, always make interesting reading and that to the Report for 1956, the latest, is no exception. For, apart from the authentic statistical data about cotton mills all over India that it customarily provides, the Report not only discusses the domestic problems of the Bombay cotton mill industry, but, what is important, it does so against the background of important national and international events. Obviously, by the time of actual publication, many of these cease to be of topical importance, although their value for purposes of record (which is,

indeed, what the Report is intended to be) cannot be gainsaid.

The observations in the Foreword to this year's Report on the present state of the industry, however, hold good even today, thanks to the leisurely way in which the authorities in our country are sometimes want to treat even the most pressing economic issues. The problem that has been exercising the cotton mill industry most for some time past is the mounting cloth stocks with mills, both unsold and sold but not taken delivery of by wholesalers. It is the considered view of the B.M.A. that, in this respect, the industry has drifted back to the position as it existed in 1953, when special measures were taken by the Government to assist the mills in clearing their stocks. It is felt that similar relief is again needed and, in this connection, the Association opines that "perhaps no measure could be more effective than a judicious scaling down of the excise duty."

Referring to the export target of 1000 million yards, the Association says this will remain an elusive goal, unless strenuous efforts are made to improve the competitive power of Indian cloth in the world market. Apart from the competition from the traditionally exporting countries, it says, India has to contend with such newcomers as China and Pakistan which enjoy a distinct advantage over her with their comparatively new and up-to-date productive equipment. Notwithstanding these handicaps, the Indian mill industry feels confident it can score over most of its overseas competitors if the industry is encouraged to modernise its machinery and thus impart greater competitive strength to its products.

EXPORTS TO WEST GERMANY

AT THE time when export promotion drive is being launched to earn extra foreign exchange for the country, the report of the trade delegation which visited West Germany recently is of paramount importance. This brings to light the possibilities of increasing our exports to that country. It is surprising that there is considerable lack of publicity in that country about the goods which India can export there. It also shows at the same time that very little advantage has been taken of the trade fairs and exhibitions held in Western Germany to display our goods. To add to it to all, the most interesting aspect is that even the visit of this Indian delegation to West Germany was prompted largely by Germany's own anxiety to ensure that India's increasing adverse trade balance does not stop her from being a large-scale buyer of German products.

In recent years West Germany has been claiming an increasing share in the import trade of India. At present it is the third largest supplier of goods to this country. In 1956, the value of imports from West Germany totalled Rs 81.8 crores against exports worth Rs 15 crores. In 1955, India exported goods worth Rs 15.8 crores and imported goods valued at Rs 53.8 crores. This shows an adverse balance of trade of Rs 18 crores in one year. With the impact of a heavy programme of industrial expansion, in the current Plan, it seems certain that the adverse balance of trade would continue to grow in the years to come. The approximate estimates are that the imports may soon rise to the tune of Rs 100 crores annually. This adverse trade balance obviously calls for boosting exports to West Germany towards which the Indian delegation has drawn greater attention. The delegation suggests the setting up of a permanent trade promotion organisation in West Germany by different Indian organizations interested in the export of special commodities. The proposed organization would "provide necessary commercial intelligence, promote business and help build a network of agencies for Indian products." Since India has no effective and continuous means of studying market conditions, trade

promotion organization as suggested by the delegation would undoubtedly be of immense help in increasing our exports to West Germany.

While the establishment of such an organization deserves high priority, there is at the same time need for more individual contacts between the traders of the two countries. The delegation has also brought to notice the high protective tariffs levied by the German Government and has urged for its revision for it helped merely one trade at the expense of the other. Increased possibilities have been indicated in the export of items like manganese and iron ore, handicrafts, tea, coffee, tobacco, cashewnuts and black pepper, hand-made fabrics both silk and cotton. Improved quality and producing according to specifications is, of course, called for as without it the Indian made goods will not be able to compete successfully with the goods of the other countries. The delegation is understood to have qualified its report by the important finding that the scope for expansion of India's exports there is modest.

INEFFICIENCY IN THE P. & T.

THERE IS real urgency for improving efficiency in the Posts and Telegraphs Department. Indeed, it will be more in order to say that the Department needs to be rid of the inefficiency it has acquired over the past years. The P. & T. Department had established a high reputation in competence and expedition which has unhappily been on the decline in recent years. It may be argued that the post-partition confusion and, later, the tremendous increase in the pressure of work have been mainly responsible for the increasing inefficiency. While this is true, it provides only partial explanation. The Department, as almost all other Government Departments, has been gradually over-burdened with a bureaucratic structure which hampers its quick and efficient movement. Ample evidence of this is found in cases of great hardship caused by delays which are ventilated in the Press. It should be admitted that all cases of genuine hardship do not find expression for one reason or another.

It is not entirely proper always to blame the paucity of funds for delay in all types of services. As Mr. Lal Bahadur Shastri, Minister for Transport and Communications, pointed out recently in a conference of the heads of P. & T. Circles, in many branches and in some works amounts provided had lapsed. It is also known that where such amounts do not lapse, they are not always put to the best use. Not unoften, large amounts are expended hurriedly only towards the end of the financial year with little consideration for productivity. Even otherwise, increase in efficiency and productivity should sometimes also mean better and quicker service in the same time and with the same equipment and personnel. This is particularly true for India at the present time when "better utilisation" of each rupee should yield place to "the most urgent".

It is gratifying that there is some recognition of the factors responsible for the present unhappy conditions. For example, there is a single residential training institute for the entire country. This speaks eloquently for the extreme inadequacy of training facility which is one of the factors making for efficiency anywhere, more so in Posts and Telegraphs where the nature of work is not simple. Again, there must always prevail a sense of urgency in disposing of the legitimate grievances of workers if only to help them realise and understand their own responsibilities for quickness. This calls for a thorough overhaul of the whole administrative set-up. It must be the aim of the authorities to run the Department on commercial lines in all respects. Efficient service is among the hallmarks of a commercially operated undertaking.

"I look forward to meeting you"

— Adipocere (Pronounced 'adi-po-saire')

I am detected underground, pumped to the surface, refined into various petroleum products and sent to the market.

My journey to the consumer is mapped out in a thorough efficient manner by, among others, the fast-moving marketing men in Stanvac's territory offices in the four principal cities.

They plan my movement through seven sales offices located in strategic places throughout the country, nine terminals, 131 inland relay depots and over 250 agency depots. From here I go to over 1400 dealers and 500 agents who sell me to you.

Stanvac dealers collectively make their own contribution to the business growth in India.

I will tell you more about them later.

STANVAC—the name that stands for progress

STANDARD-VACUUM OIL COMPANY—Incorporated in the U.S.A. with Limited Liability

The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

ACP. 4361 (Rev.)

COMMODITY NEWS AND NOTES

NORTH INDIAN TEA EXPORTS

Tea exports from North India again suffered a severe setback in September this year. Total exports during the month were only 39.2 million lbs., as compared with 51.91 million lbs. in September, 1956. The decline of 12.61 million lbs., has to be viewed in the light of increased offtake by Russia, which was 1.9 million lbs., last month. There was no shipment to that country in September last year. The UK, the largest consumer, mainly accounted for the fall in exports, but the loss suffered by the North Indian tea in other markets was also considerable. Offtake by the UK amounted to only 29.05 million lbs., as compared with 33.27 million lbs., in September, 1956. Tea shipments to Egypt during September at 734,960 lbs. showed a fall of more than 2 million lbs., and those to Canada at 1.11 million lbs., were less than half as compared with September last year. Offtake by the USA also fell to 1.46 million lbs. from 2.15 million lbs. Similarly exports to the Continent, countries in the Middle East and Australia also recorded a marked decline. The only exceptions were Iran and Turkey, which increased their offtake 1.48 million lbs., and 618,018 lbs., from 866,051 lbs., and 344,858 lbs., respectively, in September, 1956. Total shipments in the first nine months of the current year at 237.18 million lbs., showed a decline of 57.17 million lbs. over the corresponding period of 1956.

US DEMAND FOR HESSIAN EXPANDING

India has not been able to take full advantage of the expanding US demand for hessian. Total imports of burlap into the USA, which were steadily rising since 1953-54, reached the record level of 256,400 tons in 1956-57, showing an increase of 33,700 tons or 17.8 per cent over the previous year's figures. Supplies from India also increased but not in the same proportion to those from other countries. While imports from India into the USA increased from 181,800 tons in 1955-56 to the record level of 201,400 tons the next year those from other countries at 55,000 tons showed a rise of 19,100 tons. Thus, nearly half of the increased imports into the USA came from countries other than India, and although the 1956-57 figures reached an unprecedented height, India's percentage of total imports fell by nearly 5 per cent from 83.7 per cent in 1955-56 to 78.7 per cent during the year under review.

IMPORT OF COTTON FROM EGYPT

The Government of India has announced that the ceiling of 15,000 bales fixed for import of Egyptian and Sudan cotton of staple length over 1-3/8 inches had been reached and hence no further applications would be entertained. The Joint Chief Controller of imports and exports announced on October 22 last that 15,000 bales of this variety of cottons would be permitted to be imported on a "first-come first-served basis."

EXPORTS OF TAPIOCA

Exports of Tapioca from Singapore this year were negligible because the overseas Tapioca business is concentrated in Penang. The year opened with dull market and this state persisted through the six months under review. The main overseas market, the United Kingdom, was well stocked at the beginning of January and this coupled with slight over-production contributed largely towards the dull trend. Prices were comparatively low in January at \$17.50, \$19.00 and \$25.00 per picul for No. 1 Seed, Pearl and Flake respectively but fell steadily to \$14.50, \$16.00 and \$20.00 by the middle of May, the lowest levels recorded for several years. Total exports show an increase of some 17 per cent compared with the same period last year due

mainly to increased shipments to the Australian and Asian markets.

NO CHANGE IN TEA EXPORT DUTY

The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty, at Rs. 3.30 per pound as against Rs. 3.48 per pound in force from October 1, 1957. There is no change in the existing rate of duty of Naye Paise 38 per pound.

PROMOTING EXPORT OF GROUNDNUT OIL

A scheme for promoting export of groundnut oil against the import of coconut oil has been submitted to the Development Wing of the Union Ministry of Commerce and Industry by the oil trade. If implemented, the scheme will, it is contended, ensure in the country an adequate supply of some edible oil at a reasonably low or fair price and also earn at the same time much-needed foreign exchange. It is stated that the margin that will accrue to the country by the transaction of this nature will bring Rs. 533.2 a ton. An addition to the foreign exchange, India will also be able to retain the market abroad for Indian groundnut oil. The Development Wing has, it is learnt, asked for more particulars and statistics from the trade to enable the Government to take a decision on the matter.

REGULATING SUPPLY OF GRADED HIMACHAL PRADESH SEED POTATOES

The Government of India has issued a notification regulating the purchase, sale or storage for sale of seed potatoes in the Union territory of Himachal Pradesh. Under this Order—known as the Himachal Pradesh Seed Potato (Control) Order, 1957, which has been published in an Extraordinary issue of the Gazette of India—any person selling seed potatoes or storing them for purposes of sale is required to obtain a licence, to be issued by the Director of Civil Supplies of the Territory. The object of issuing the notification is to ensure supply to growers in various States of improved and graded seed potatoes from Himachal Pradesh, which is the main hill potato-producing area in the country. The Order further provides for grading of seed potatoes according to the variety or size. The Himachal Pradesh Administration has also been empowered to examine seed potatoes in storage or transit, and seize stocks if it apprehends contravention of the Order.

NICKEL RECOVERY FROM SPENT CATALYST

A new method for the recovery of nickel from spent nickel catalyst obtained as a waste in the fat hydrogenation industry has been developed at the Department of Chemical Technology, University of Bombay. The recovery of nickel is 90-93 per cent when using theoretical amount or a slight excess of mineral acids such as sulphuric, nitric or hydrochloric acid. Fat is removed from the acid digestion by extracting with commercial hexane. Iron, an impurity, is removed by oxidising it with hydrogen peroxide before precipitating it as hydroxide. Excess of acid is neutralised with sodium carbonate and calcium carbonate. After removing fat, iron and excess of acid, the purified nickel salt is treated with sodium formate to give nickel formate which is crystallised in monel evaporator. The prepared samples of formate compare favourably in activity with commercial samples of nickel formate. Considerable quantity of nickel catalyst is used in the fat hydrogenation industry in India. Due to the shortage of nickel in India, attention is now being paid to the utilization of all available sources. Recovery of spent nickel catalyst obtained as a waste in the fat hydrogenation industry is one of them. Fuller details of the process are published in the September 1957 issue of the 'Journal of Scientific and Industrial Research'.

Editors in Conference

THE Thirteenth Annual Session of the All-India Newspaper Editors' Conference held last week would not call for special notice if it had been only the hardy annual affair which Delhi, as the country's political and social centre of gravity,

sees all-too-frequently. The present session of the Conference, however, was invested with quite unusual interest and importance and not merely because of the unhappy dispute on the Wage Board Award, which threatens to disrupt all good

relations inside the arena. The Time Spirit is on the side of the Press. It is quite clear that the Indian Press has now to handle more exacting duties than it has had to face "in the age of the revolution." The Prime Minister seemed aware of the critical point which the Conference had reached by choosing to make this platform—too often neglected in recent years both by Government and proprietors—a place to make a vital policy announcement.

In a sense it is the Prime Minister's speech which was the kernel of this Conference. This is not to do any injustice to other speeches or to the Resolutions. The speech of Mr. J. Natarajan, President of the Conference, was full of constructive interest and conceived in a critical way. As he put it, "there has been a steady decline of the Conference for the last five years" and "had fear not clouded our vision, the decline might have served as a warning against the dangers inherent in strength being dispersed into its components of power among sectional sister associations." There is, indeed, a major crisis in the A.-I.N.E.C. Organisation. But its roots lie outside the Conference, and are concerned with the state of the Indian Press as a whole. If the surrounding country had been free from clamour and controversy, the right of Editors to speak for their newspapers might never have been called into question.

While, therefore, there needs to be criticism of both Government and proprietors when they have tended to detract from the power and responsibility of Editors, the real solution to the present crisis in the Conference lies elsewhere. It is, in fact, in the restoration of internal harmony in the industry that a solution can be found; and internal harmony can only be attained when there is general agreement that growth, not its opposite, is essential. This is what invested the Prime Minister's speech with particular force. He asserted that the Government would approach the problems in the belief that it was necessary that newspapers should grow in quality as well as in quantity. He was particularly anxious to ensure that small and medium newspapers were not only able to survive but also to prosper. While he wanted journalists to have a fair deal, he could not acquiesce in burdens being placed on small newspapers which involved their closure. In as many words the Prime Minister said that, while the Wage Board Award for Working Journalists would need to be implemented if the Supreme Court found it in order, the Central Government's attitude to all problems raised would be flexible, based on the two principles of the necessity of improvement in quality and quantity of all newspapers and the survival of small and medium units.

Because the Prime Minister's lead indicated the opportunity for their good offices, the Editors in plenary session decided on a resolution requesting the Government to appoint a commission of enquiry consisting of a High Court Judge and a Chartered Accountant to look into the finances of newspapers as they will be affected by the Award. This was not, as has been represented, a dilatory move. All that is intended is that there should be a quick survey which would give findings almost at about the same time when the Supreme Court's decision was available for enforcement. Thus the promise of the Prime Minister to consider real difficulties which militated against growth

could be placed, so to speak, in operation by recourse to the facts which might induce moderation being available at that time. It is sincerely to be hoped that the Government of India will act quickly on this resolution, which is, in a sense, no more than the implementation of the Prime Minister's general approach.

While this dispute inside the industry to which constant reference was made by the President of the Conference and the Prime Minister is central to the development of the Indian Press, it is obvious that its long-range responsibilities are not less important than its immediate obligations. The Chairman of the Reception Committee put these problems in historical context in the following words:

"In the period of the great national struggle, the Press of India made a great, but not a unique, contribution to this nation. In a sense, the Press in those exciting days had no separate existence. It was carried along within the broad current of national passion; that current was not principally of our making and we may be said to have climbed on the country's bandwagon or, to vary the metaphor, we arrived at success on the crest of a popular wave. But favourable elements—the tremendous force of a truly national current and the capacity of the Press to borrow its garments and even all its ideas from the popular heroes of the Revolution—will naturally decline as the Indian Revolution recedes. It can be no serious complaint that the Indian Press, as the child of the Indian Revolution, should have acted as it has done; but it would be a serious error for us not to realise the extent to which, in the age which is now dawning, we will need to justify ourselves by our deeds on a different plane. The Fourth Estate of the Realm needs to become the Socratic midwife, bringing to life in a complacent society the constructive elements of new, and possibly passionate, thought. We can no longer remain merely the channel of interpretation or communication of the thinking and acting of representatives of the people."

It would appear that the fulfilment of the heavy obligations that rest on the Indian Press to think for itself as well as for the country cannot be fulfilled except over a long period of time and after a long period of preparation. The formation of the Press Club of India was happily announced at this meeting and it was resolved that it would contain a Research Institute within itself to assist journalists to prepare themselves for the challenge. It is sincerely to be hoped that every effort will be made to place the Press Club of India on sound and enduring financial foundations. On this last question some doubt still remains.

It was generally agreed that this Conference was one of the most valuable in reviving the prestige of the All-India Newspapers Editors' Conference and in turning its light inwards. There is always a danger that commentators will become preachers; it is not unhealthy for them to take a quick, and not too favourable, look at themselves. Will this cursory examination of conscience bring forth fruit in the next few years? That question is being asked. It is for the Press to answer; it is by their deeds only that we will know them. Meanwhile the country can afford to wait and see: here as elsewhere.

The I.L.O. in Delhi

FOR the second time in ten years the Asian Regional Conference of the International Labour Organisation is meeting this week at New Delhi. In a sense this conference constitutes a milestone in the regional work of the I.L.O., for it synchronises, more or less, with the beginning of a period of more intensive industrial development in Asia. This industrial development in the region has generally involved relatively greater investment up till now in what is called the "infrastructure" of the economy, particularly power and transport, although in some countries, notably India, China and Japan, manufacturing industries have expanded significantly in recent years. More ambitious plans of development are just under way in most countries of the region; these may well reduce the disparity between Asia and the rest of the world in living levels which have widened in recent years as *per capita* commodity output in the larger part of the region has not regained its pre-war level. But the second phase of development, now beginning, is also bringing in its train many problems in the labour and social fields — problems which are so succinctly and ably discussed in the report of the Director-General, Mr. David A. Morse.

It is to some of these problems that the regional conference is now addressing itself. Perhaps the most important of these is the problem of labour-management relations in the context of industrialisation of under-developed countries whose traditional systems of social and family life are being dislocated in the process. With rising industrial tempo, the problem is gaining in importance, and there is now, as Mr. Morse says, "a conscious endeavour to focus labour-management relations in the industrial rather than the political field, to seek the bases for collective dealings between the two parties to industry, and to find new methods needed to promote industrial peace and industrial democracy during a period of transition towards industrialisation." And the need for good labour-management relations is being recognised best in those countries which are undertaking extensive industrial programmes.

The Asian labour-management situation is thus changing in a manner that augurs well for the future. For one thing, expanding trade union membership is accompanied by a certain amount of trade union consolidation under more experienced leaders who are getting into closer touch with the problems of management. For another, the improvement in labour-management relations is, at least in part, due to the changing attitude of management; this is evident from the fact that more and more employers are recognising trade unions and some of them are also paving the way for joint consultation and co-operation. The increased availability of trained and experienced managers is also accelerating the tendency to work with trade unions instead of fighting their right to exist. Yet another hopeful trend in a number of Asian countries is in the direction of tripartite co-operation to solve common problems facing labour, management and government. Collective bargaining is also making headway, although slowly; so in most Asian countries very few workers are now covered by collective agreements. Such agreements as have been concluded in recent years — for example in India and the Philippines — are, however, a good beginning. One of these agreements — that between Tata Iron and Steel Co. in

Jamshedpur and the workers' union in 1956—has won the praise of Mr. David Morse who describes it as "a significant example of an up-to-date agreement worked out after detailed consultation between the two parties and covering a very wide range of matters of common concern" and thinks that its provisions "are of outstanding interest in the industrial history of Asia."

All this is evidence of the progress towards better labour-management relations although such progress is not accompanied by an immediate drop in industrial disputes. Ultimately these disputes are bound to decrease in number, but they are currently on the increase on account of the fact that the number of trade unions has increased. At the same time it cannot be said that industrial strife is increasing in importance. With "the increasing recognition that legislation and public machinery and supervision of industrial relations are not sufficient to bring about the desired improvements in this important area of industrial and social policy" and that "the real onus lies on the employers and on the workers, in their own sphere of responsibility and jointly through co-operative effort", there is slowly but surely coming about in Asian countries a shift in emphasis to collective negotiations.

No less important than the problem of labour-management relations — discussions on which would be facilitated by a report prepared for the regional conference — is the one relating to small and handicraft industries in the context of Asian industrialisation. On the latter problem, too, the conference is having the benefit of a report which analyses "the social and economic implications of the increasing competition by modern forms of factory production in the traditionally small and handicraft industries in Asia." As this is a problem which is still being discussed with not a little heat in this country, what the report has to say on it is of great interest. The report, of course, declares emphatically that "economic development in Asian countries is synonymous with industrialisation" because their land resources are inadequate to provide full employment to their population. At the same time the question is raised "whether plans for the promotion of manufacturing should emphasise the development of new large-scale factory units or the fostering of the small-scale industries — when the choice is possible."

This question is answered in the report in a manner which suggests preference for small-scale industries which can employ relatively more labour and which need less capital and a more modest level of organisational and managerial talent than large-scale factories. And so the report concludes that "more extensive enquiries in the field might be particularly rewarding in view of the fact that in principle small industry seems to fit into the economic and social conditions of most Asian countries better than large-scale production." Even this cautious preference for small and handicraft industries — where choice is possible — may not be sustained by the suggested enquiries if the multiplier effect of investment in large-scale industry and the secondary and tertiary employment opportunities arising from such investment are fully estimated. After all, the experience of industrialisation in the West and in the Soviet Union suggests critical shortages of labour for large-scale industry and not the continued existence of a vast reserve army of labour.

Indo-Vietnamese Co-operation

PRESIDENT DIEM'S visit to this country has much greater significance than a goodwill visit in response to the invitation extended to him by Dr. Radhakrishnan at Saigon. It was undoubtedly motivated by a keen desire on the part of the President of Viet-Nam to revive active contacts with neighbouring Asian countries, while intimate and fruitful contacts were being established with friendly countries in the West. The importance of both needs to be realised in a full measure. Shrinking distances are bound to draw nations of the world closer, but the value of fraternal ties on a regional basis does not diminish for that reason. The President's visit will serve to fulfil this objective. There was, however, much more in it.

The joint communique issued over the signatures of President Diem and Prime Minister Nehru and the statements made by the former at a press conference on the eve of his departure to his home country lay a frank emphasis on the imperative need for newly liberated Asian countries to give a solid economic content to their political freedom. In this era of growing inter-dependence, economic prosperity cannot be achieved without international co-operation. The joint communique announces the keen desire of the two countries to broaden the basis of such co-operation. An important fact which has not received due publicity in the Indian press is the inclusion of a team of thirty technicians and experts in the President's party. Their silent work is sure to prepare the ground for a new phase of wider economic co-operation between the two countries.

The potentialities of economic co-operation will naturally be influenced by the degree in which political stability can be maintained. Events in the last three years show that the period of peace since the Geneva Agreement became operative has been turned to effective use in putting an end to internal disorder in Viet-Nam. Under the dynamic leadership of President Diem much has been achieved besides restoration of order through the suppression of armed resistance led by Ba Cut. Vice and corruption so widely rampant under the Bao Dai regime were rooted out. The country, blessed with peace, order and a clean administration, but above all a Head of State inspired by a profound religious spirit of dedication, gained a new confidence with which to face the challenge of the future. Within four months of the declaration of Viet-Nam as a Republic on October 26, 1955, general elections were held throughout Viet-Nam and a Constituent Assembly was elected to draft the Constitution which was inaugurated on the first anniversary of the Republic. The broad-based policies which were adopted ever since the assumption of power in June 1954 by President Diem were now vigorously pursued in a drive for the reconstruction of Viet-Nam's economy.

The prospect for economic co-operation between Viet-Nam and India, and for that matter any other country, must be viewed in the correct perspective of the economy of the former. Its economy stands very much disrupted by the war-time damage and the destruction inflicted by the post-war Communist ravages. Constant state of terror from Communist insurgents virtually paralysed agricultural operations and other economic activities in the country-side. In approximate

terms, not less than 50 per cent of the pre-war cultivated area was abandoned and over 50 per cent of agricultural production, and the production of rice in particular, disappeared. Small-scale industrial equipment in semi-urban areas was destroyed and rice mills in the towns were dismantled. What was worse, river transportation in active operation was reduced to a mere 20 per cent of pre-war. With the return of peace after the Geneva Armistice new problems of a great magnitude arose. The influx of refugees began to pour at a rapid rate. Viet-Nam has to provide for a refugee population which is about one-tenth of its normal population of 11 million. With the tapering off of boom conditions unemployment has reared its head.

The magnitude of these problems has only put President Diem's administration and the country to their mettle. As a staunch realist, the President has lost no opportunity to impress upon his people the basic fact that agriculture must remain the foundation of their economy. Reconstruction of agriculture has proceeded apace. The problem of refugee resettlement has been very nearly solved by the Commissariat of Refugees which has under its charge 300 out of 325 villages in which they are to be rehabilitated. The broad and imaginative agricultural experiment of the Cai-San project in Viet-Nam's rice bowl — the Mekong River Delta — has shown a new way of life on the modern pattern. It is a major integral part of the Vietnamese programme of rehabilitation and development to devote energy and resources to the construction of dams and multi-purpose river projects for the expansion of agriculture and industry. In the sphere of industry, President Diem is absolutely clear that ambitions in the near future ought to be limited to the establishment of a wide range of light industries. Foreign capital has been offered all reasonable protection and assurances, including facilities of remittance of profits within the availability of foreign exchange. Viet-Nam is free from ideological fads. Its firm aim is to achieve progress through greater production under the auspices of free private enterprise.

This picture of the economic outlook and policy indicates the broad lines on which co-operation can be strengthened between Viet-Nam and India. At the present time the Planning Bureau of that country is engaged in preparing a five-year plan of development. India is associated with the U.N. personnel who are assisting the Government of Viet-Nam in the formulation of the plan. President Diem and his advisers had valuable discussions with the Planning Commission, and it appears that the Indian technique and objectives of planning will prove of direct use to Viet-Nam. More specifically, Indian assistance will be required in the spheres of hydro-electric engineering, community development projects, programme evaluation and statistics, and the establishment of light industries. One of the concrete achievements of President Diem's visit was an understanding reached between the two Governments whereby Vietnamese students are to be provided with facilities for technical training in this country. As the next step of deputing Indian technicians in the required spheres to Viet-Nam is taken up, economic co-operation between the two countries will gather momentum.

FACTS BEHIND FIGURES

Revolving

over 10,000

times

a minute

Round and round whirl the spindles in the spinning frames of India's 419 cotton mills. Averaging a speed of over 10,000 revolutions to the minute, these spindles wind yarn for 5,000 million yards of cloth each year. Under the Second Five Year Plan this output will increase by 3,500 million yards. Ten years ago the Indian textile industry imported almost all their machines; today, Indian machinery manufacturers are increasingly meeting their needs. Texmaco, pioneer manufacturer of cotton textile machinery in India, supplies the complete range of spinning machinery for cotton and staple fibre, designed and built to established international standards in technical collaboration with the world renowned Howa Machinery Limited of Japan.

TEXMACO

serves India's basic industries

TEXTILE MACHINERY CORPORATION LIMITED

a pilfer-proof package for every product!

The manufacture of Metal Box's range of pilfer-proof containers and closures is backed by an active Research Organisation. The Central Laboratory in Calcutta assists suppliers in developing improved printing inks, surface finishes and protective lacquers, and maintains strict routine tests for all incoming raw materials to the Metal Box factories; on the spot control of operations is carried out by Branch Laboratories. This ensures pilfer-proof containers and closures of the highest quality, superbly printed and finished. Expert scientific advice from Associates throughout the world is available to assist in solving customers' packaging problems.

THE WEEK'S NOTES

J.P.'S TESTAMENT OF FAITH

MR. JAYAPRAKASH NARAYAN'S reiteration of reasons for his exit from active politics need cause no surprise. He expressed his intention, to that effect, some four years; devotion to the ideals of Sarvodaya has ever since been his almost exclusive pre-occupation. His continuation, nevertheless, as a sort of elder statesman of the Praja Socialists has kept Mr. Narayan's announcement this side of a sensation. But what is yielded up by way of excitement is perhaps more than compensated for by the profoundness of his reasons for the decision.

Mr. Narayan has described at length his transition from Marxism, "the Popular Front fallacy," State Socialism and the politics of party and power to Sarvodaya. In that process he found that amoral politics and the mechanical replacement of the "bourgeois" State by a "Socialist" State would not have the consummation desired; equality and brotherhood would remain mere ideals. Indeed, where the replacement has taken place, parties have become monolithic and all-powerful; the State, instead of withering away, has become more firmly entrenched and its grip tighter; instead of a classless society, a new class, more ingrown, exclusive and tyrannical, has risen to subdue man as an independent entity. Western Socialism has failed, he says, to offer anything significant or worthwhile to backward countries, because of its evolution in a different environment. Disillusioned, Mr. Narayan has sought the secret of a new order and found the way to the "beautiful" revolution—Sarvodaya. Although he now regards Sarvodaya as the best idea, he is not dogmatic. He concedes that "many flaws in Sarvodaya thought and practice will be discovered and removed in future."

Mr. Narayan seems to hope that political parties will take up the cause of Sarvodaya, which pre-supposes a radical change in their conception of politics and Government. What he appears to have overlooked is the fact that while organised parties suffer from intellectual inertia, the large loose mass of the Indian people is still impressionable enough to be carried away by slogans. In these circumstances it is difficult to see how the implications of the Sarvodaya approach would be appreciated. The citadels of power having been thrown open to those who can muster the largest number of votes, political thinking has yielded place to political manoeuvring, ideals to chicanery. However, without going into the question of whether politics in the modern world is all-pervasive or not, it has to be accepted that Sarvodaya, too, as its very name implies, embraces politics. It would, therefore, be impossible for Mr. Jayaprakash Narayan completely to renounce politics. Besides, he himself has explicitly stated his path and that of his political colleagues "will often meet" and that at the journey's end, they will perhaps merge. The country will, we therefore hope, continue to have Mr. Narayan's advice on political matters even though he may not figure in partisan political controversies.

At the present stage of political evolution in India, one cannot help contemplating possible implications of Mr. Narayan's decision. Now that he has decided to devote his life entirely to Sarvodaya, it is possible, that the movement will gather momentum. It will not be surprising if Mr. Narayan succeeds in capturing the imagination of the people. Mahatma Gandhi's success is a proof that Mr. Narayan is dealing with a mass of people amenable to sincerity and that saintly, renunciational gesture, which would be an oddity in politics as it is normally understood, in India is not impossible to hope for. Gandhiji visualized in his last phase a political pattern free from domination of political parties. Mr. Narayan begins where the Saint involuntarily ended—in tragic circumstances.

KERALA ON THE MARCH?

THE COMMUNIST Government of Kerala has been in power for more than six months now. It may, no doubt, be too early to say whether the Government has succeeded or failed to solve the State's problems. The Chief Minister, Mr. Sankaran Namboodiripad, has just claimed that some initial steps have been taken towards success. What, in the main, are these initial steps? In the first instance, the Government has pleaded with the Planning Commission to increase the second Plan's allocation for the State from the original figure of Rs. 87 crores to Rs. 200 crores at one stage and to Rs. 125 crores subsequently in view of acute unemployment there, but has failed to get an assurance that the original allotment itself may not be reduced. Thus the first step in persuading the Centre to agree to a larger State Plan for Kerala has failed. There is, therefore, no question of the Communist Government (assuming it runs its full five-year term) realising even partially its objective of "mobilising all the resources in the development of a modern industrial-cum-agricultural economy so as to enable the people to lead a prosperous life". But it is refreshing to find that the Chief Minister has not only not taken this failure to heart but has shown his full awareness of the financial and price difficulties already besetting the national Plan as a whole.

The second major step taken by the Kerala Government in pursuance of its "basic goal of recasting the mode of distribution of wealth so as to give a larger share of it to the basic masses producing it" is by way of a new (neutral?) role assigned to the Police in industrial and agrarian disputes which inevitably result from the Government's efforts "to enable the working class, the peasantry and other sections of the working people to more effectively carry on their struggle for the improvement of their working and living conditions." Mr. Sankaran Namboodiripad claims that "far more industrial disputes have been settled in this period than in any previous period". But they appear to have been settled in such a manner and in such conditions that private capital (which is as much a basic factor of production as labour) is being frightened away from Kerala. If private enterprise thus does not come forward enthusiastically to do its part in possible mobilisation of the State's resources, it can only mean that the magnitude of Government's failure in the matter of its first basic objective will be still greater. The Government's third major step is the appointment of an Administrative Reforms Committee to recommend changes in the present administrative system which, according to Mr. Sankaran Namboodiripad, "is inefficient in the matter of properly mobilising and utilising the resources (of the State), while it is unjust and oppressive in its relations to the basic masses producing the wealth." It may be that the reforms which are likely to be recommended by the Committee will be such as not to subserve the first basic objective of greater production in the context of a mixed economy. The reforms may, of course, be informed by familiar Communist ideas which, however, cannot work without disrupting the current constitutional and economic framework and without producing class conflicts. How can Kerala, then, be on the peaceful march?

A NOVEL EXPERIMENT

ONE YEAR after the re-organization of Indian States, the President has issued an order setting up two Regional Committees for Punjab—one each for the Punjabi and Hindi regions—and defining their tasks. Under the new scheme, the Regional Committees will primarily concern themselves with development and

economic planning within the framework of the general development plans formulated by the State legislature. They shall also deal with matters of local self-government, public health and sanitation, primary and secondary education, agriculture, cottage and small-scale industries and a few others. Should the assembly reject or change substantially any Bill coming up from a Regional Committee, the Governor will send a message to the Assembly asking either for withdrawal of the Bill or for its passage in its original or amended form; the message will have the force of a decision of the legislature. Thus the Governor of Punjab will enjoy power that no other Governor enjoys in the country.

The constitutional experts have found an indication of triarchy in the present scheme, comprising as it does the State Assembly, the Regional Committee and the Governor, and are of the opinion that the conflicts among the three are inevitable. It is also probably true to say that the new scheme will complicate administration, lengthen discussion, and delay work. But perhaps these Regional Committees were necessary to meet the developmental needs of linguistic minorities in a bilingual State, to allay fears of the minorities in respect of possible neglect by the majority, and to ensure the removal of existing social, economic and educational disparities. Moreover, such a scheme is surely preferable to separate States based in theory on language, but actually on communal considerations.

The experiment is certainly novel, and full of possibilities. But communal and regional amity is essential for its success. If the members look upon themselves as the custodians of their own areas, without developing ~~politics~~ and rivalry, the Regional Committees can be of real help in the development programme. If, however, they begin to encourage separatist tendencies, they may do more harm than good. By working the new scheme effectively an example can be set for other bilingual States in the country.

SOVIET SCIENCE AND INDUSTRY

AS MORE details are coming in about the scientific and technological discoveries that have made the launching of Sputnik II possible, interest is naturally being focussed on their bearing on the future development of Soviet industry. The discoveries in metallurgy, for example, have included the making of special metals to contain unusually corrosive chemicals used as rocket propulsion fuels, to resist high temperature in the rocket motors, to resist friction and high temperatures on rocket skin and to insulate the dog-carrying cabin. In the field of chemistry the discoveries have included high energy producing fuels — probably pentaborane and diborane or monatomic hydrogen — and solid fuels for separation of burnt-out rocket stages and final ejection of satellite. And in the field of physics the discoveries have included the making of high precision radar capable of controlling the initial stages of launching rocket's flight up to 100 miles and radar detection apparatus capable of following satellite during flight — vital for accurate prediction of orbit; electronic units inside rocket for overseeing flight control, for regulating separate rocket stages and for final ejection of satellite on course; special equipment for controlling dog's living conditions and electrocardiogram and electromechanical devices for recording dog's heart rate, breathing and blood pressure; Geiger counters and photo-electric cells for recording cosmic and solar radiation; radio-communication and telemetering devices — satellite to earth signals — for collecting information recorded by satellite during flight; and computers for designing rocket and satellite, for interpreting coded signals and analysing information and forecasting orbit.

Some of these discoveries of Soviet science are probably not new or unknown in the West. It is, however, freely acknowledged that the Russian discovery of special metals, rocket fuels and electronic devices is something extraordinary, and may well accelerate the

growth of Soviet industry in the years to come. The well-known commentator on Russian affairs, Mr Isaac Deutscher, for example, thinks that with atomic energy harnessed to production, with automation covering ever wide areas of industry and with electronics opening up new vistas, further Soviet progress may be much quicker than Western and even Soviet opinion anticipates. The Soviet Union may not have to imitate and assimilate American technological achievements any more. Soviet progress is now likely to proceed, in the opinion of Mr. Deutscher, by leaps and bounds, overtaking many intermediate stages of Western industrial development. This forecast of more rapid industrial progress in the Soviet Union in the coming decades is also in accord with the finding of a study prepared for the Joint Economic Committee of the U.S. Congress. Whether or not the present absolute gap (amounting to two-thirds of the United States output) in the levels of industrial output of the U.S.S.R. and the U.S.A., comes to be completely closed in the foreseeable future, there is no gainsaying, as Mr. Deutscher thinks, that "Communist parties (all over the world) can look forward to a time when the appeal of Communism may be as much enhanced by Soviet wealth and technological progress as the attraction of liberal democracy has in our days been enhanced by the fact that it has had behind it the vast resources of the United States."

PROMISE AND PERFORMANCE

LAST WEEK Communists all over the world celebrated the 40th anniversary of the "Great October Revolution". Even its worst detractors would not deny that during these forty years Russia has made remarkable progress in numerous directions. While in 1917 Russia was the most backward country in Europe, now it is second only to the United States in industrial and agricultural production. The Sputniks are certainly a mighty achievement of which even the United States cannot help feeling envious. These man-made moons hurtling through space, certainly speak volumes of Russian progress in science and technology. At the moment Russia's progress in the field of nuclear science compels the world's utmost admiration and apprehension.

It would, however, be wrong to infer from Russia's momentous and spectacular scientific and technological achievements that its totalitarian political and economic system is superior to democracy. Doubtless, considered in terms of production, an authoritarian regime has advantages over a democratic State because heavy industry can be built up to the exclusion of everything else — through terror and regimentation. But since the 20th Congress of the Communist Party of the Soviet Union even Russia's ardent partisans cannot deny the incredible "mistakes" made by the Soviet planners, the evils of bureaucracy prevalent in the Soviet system, the folly of collectivization which led to the liquidation of millions of peasants and cattle-heads, and the hardships the people had to undergo to attain the plan targets. The apologists of Russia will not also deny that forty years after the Revolution, Russia is politically still unstable and totalitarian. Mr. Khrushchev, like Stalin before him, is continuously trying to get rid of all his rivals, without violence if possible, with violence if necessary. The State has neither withered away to usher in a classless society, nor ceased to be a Leviathan. It will be, therefore, not wrong to say that between the ideals of the October Revolution and the reality of Soviet development remains a vast margin cluttered up with cruelty, intrigue, and tyranny.

This has resulted in heart-searching even among Russia's zealous admirers. There is now questioning of the very foundations of the Soviet system which is neither what Marx had visualized nor any other version of a humane society. The advocacy of "different roads to socialism" increasingly being heard is evidence of the cracks in the monolithic structure of Lenin's dream-land.

A Window on the World

INDIA, SOCIALISM, CREDIT, AND INFLATION: GERMAN VIEWS

By
ODYSSEUS

IN the course of a tour through Dusseldorf, Cologne, Bonn, and Frankfurt, to study Germany's economy and European common market problems, I caught echoes of Mr. T. T. Krishnamachari's discussions with the German government. Unfortunately when I was in Bonn, Professor Muller Armack, Dr. Gocht, and other members of Germany's economic Brains Trust were in Brussels, so I was unable to get any authoritative background on the German government's financial intentions towards India. I did, however, have the good fortune to have, on your behalf, interesting talks with German leaders in business, industry, and banking, some of whom were men of influence in their spheres. Several had met Mr. T. T. Krishnamachari.

Our Finance Minister created a favourable impression and, as far as intelligence, charm, and capability carry weight, he did a splendid public relations job for India. His aide, H. M. Patel, was also liked and respected. The personal popularity of our two representatives seems to have caused such a degree of rosiness in news reports to India that I fear that national good manners and international good will may lead some in India to expect too much in concrete results.

That India will receive some aid from Germany is certain and by the time that these words are in print you may perhaps know how much, but this article will deal not with the figures of German aid but with the ideological background, which is important.

The German government has in the nine years since the reform of the currency staged the most spectacular demonstration of the efficacy of free enterprise in creating order out of chaos, and prosperity out of poverty, that the world has ever seen—and I do not forget twentieth century USA or nineteenth century Britain. Germany's leaders, political and industrial, feel no need to argue the objections to state planning and the strengths of free enterprise. "Look around," they say. "Study the pre-war indices of production, national income and distribution of wealth. Compare them with those of today. What Socialist country, including the USSR, can compete with our record?" The combination of a stable currency, an uninflated economy, and the prospects of profits for all, led to a rise in the index of industrial production (1936=100) from 54 in June, 1948, to 136 by June, 1950, with an export surplus which has (notoriously) been mounting ever since. That was what free enterprise achieved in Germany within two short years. Today the index of industrial production stands at 212 compared with 54 in 1948 and 100 in 1936.

Consequently, when the Government of India asks for financial help to bolster its "Socialistic pattern" Five-Year Plan, the Germans' first reaction is: "Why should we help to bolster a system which has proved itself pernicious in other countries, which is apt insidiously to lead to dictatorship, and which has been proved less efficient than free enterprise in raising the standard of living of the masses? If we help to bolster India's Five-Year Plan, shall we not be boosting the state-controlled sector of Indian economy at the expense of the free enterprise sector?"

WHY HELP SOCIALISM IN ASIA?

Several influential Germans argued that whereas the Western world knew that it owed its original deve-

lopment of wealth to free enterprise which thus formed part of its national experience, so that there was reasonable hope that the growth of socialism could be kept in check in the West by appeal to that experience, in Asia, on the other hand, free enterprise was a tender plant which had not yet had time or real opportunity to prove itself. All the more reason to try to help free enterprise, not Socialism, in Asia.

My German informants were discretion itself as to what line Mr. T. T. Krishnamachari and Mr. H. M. Patel had taken on these matters, although one informant told me that they had been much more modest, less dogmatic, and readier to listen, than Pandit Nehru had been on his earlier visit. They also referred me to the issue of "Time" dated October 28, 1957, which, reporting the International Development Conference which assembled in San Francisco 551 bankers, government officials and business leaders from 62 countries, said: "But while the conferees differed hotly on ways and means of boosting productivity, there was general agreement, even by delegates from socialist-minded nations, that private enterprise should and could shoulder an increasing share of the burden. The most dramatic evidence of renewed faith in free enterprise came from Reserve Bank of India Governor H. V. R. Iengar, close friend and advisor of Prime Minister Nehru. Disavowing the tepid brand of socialism long preached by Nehru, Iengar emphasised that India is looking for private capital and free enterprise to develop its resources and industrialise the nation."

A QUERY FOR PANDIT NEHRU

My German friends said that Mr. H. V. R. Iengar's conversion to free enterprise was, if accurately reported, most satisfactory, but was sudden enough to arouse reflections on its possible duration. They urged me to enquire whether Pandit Nehru would now disavow (a) socialism or (b) Mr. Iengar. Frankly, the Germans find it less easy than "Time" to believe that the Indian leopard has changed its socialistic spots.

Mr. T. T. Krishnamachari was reported as having told the German paper "Die Welt" that he could hardly prevent a certain rise in prices in India. This created a poor impression on my informants who bluntly asked "Why not?". The German horror of inflation has hitherto been unfashionable among other European (and indeed most Asian) countries, which have laughed at this peculiar German phobia. But enough countries have now been hit by inflation for the laugh to be with the Germans. The table given on the next page, showing the inflation in 18 countries, was given me by the German Central Bank.

My informants observed that Japan, Sweden, Norway, Finland, Denmark, Holland, and Italy had halted inflation, while the UK was engaged in a determined battle, the outcome of which could not as yet be foreseen, but about whose chances German banking circles felt soberly confident. Although India stood satisfactorily low in the list, my informants pointed out (a) that India's average annual rise in these eight years of 2.3 per cent had accelerated to 3.4 in 1957, that India was one of the countries which was making no effort to halt inflation, and that Mr. T. T. Krishnamachari apparently is reconciled to its acceleration. The point may seem

of small importance in India and irrelevant to the case for securing German help for the Five-Year Plan. In German eyes, it is relevant and important. The Germans have suffered two disastrous inflations and they are understandably fearful of them. They argue that most of their average price rise of 1.9 per cent a year has been due to imported inflation. When faced with their rising export surpluses, other countries tell the Germans to up value the mark or to allow the full effects of the export surpluses to be felt internally in credit expansion. The Germans reply "why should we inflate and risk currency stability just because you other countries cannot keep your economies in decent working order?" Although I do not think that the German authorities have fully explored the alternative policies open to them, I sympathise with their attitude towards inflation.

RISE IN RETAIL PRICES

	June 1950 to June 1957	June 1956 to June 1957
Greece	72.7	2.2
Austria	56.4	.6
Japan	48.3	2.4
Norway	46.4	1.3
United Kingdom	43.8	3.2
Sweden	43.6	4.3
Finland	40.2	10.9
France	39.4	1.3
Denmark	35.6	4.5
Spain	33.3	8.2
Holland	32.7	11.1
Italy	31.3	5.2
Belgium	20.3	5.2
Canada	19.3	3.2
India	18.6	3.4
USA	18.1	3.4
Germany	15.5	1.4
Switzerland	12.4	1.5

All authorities agreed that German industrialists would not invest in India unless the German government guaranteed them against expropriation and ensured, by treaty agreement, that profits were freely exportable from India. They pointed out that in any case (1) the amount of capital available for export was small, since Germany was short of capital at home, and (2) current rates of earnings for domestic capital were 12 to 15 per cent, so that substantially higher returns would have to be available from India before German capital went there.

But when all this had been said, my informants were confident that some help would be given India. There was naturally the desire to strengthen a democratic country in Asia, but the motive which, it was emphasised to me, carried weight with the German authorities was their desire to ease the difficulties of the sterling area.

There are still some countries whose policies are apt to be influenced by irritation at the persistence of the sterling area. The Germans are not among these. Two crushing defeats in war and two terrible inflations condition their thinking, so that they seek to promote stability and international co-operation wherever they

can. Unfortunately their past record—the Kaiser's war of 1914, Hitler's inter-war aggressions and final madness of 1939—make it hard for many people to credit Germany's present good intentions. This is a pity, for there is ample factual evidence of Germany's sincerity. This is the moment to cash in on it and to integrate Germany's interests with those of the free world. Her economic policies are such that one sees her going from strength to strength. If she is rebuffed today, it may be less easy to secure her co-operation tomorrow. Fortunately, more and more of the free world's leaders recognise Germany's potentialities.

TERRORISM IN FRANCE

(From Our Special West European Correspondent)

PARIS, November 9.

AN aspect of the Algerian nationalist struggle that gets little notice abroad (and, to tell the truth, got little notice in France until recently) is the atrocious conflict within that large section of the Algerian working class that has migrated to metropolitan France. If one thinks back to the Indian community of pre-1947 London and then compares it with Algerian community of present-day Paris, one realises what contrasting activities can be lumped together under the heading of nationalist politics. So far this year in France (mainly in Paris and the industrial north) two Algerians per day have been murdered and nine others per day have been attacked with murderous intent. All of these aggressions have been committed by fellow-Algerians and all of them have been political crimes connected with the nationalist struggle in North Africa. The victims are either working men who have "forgotten" to pay their regular heavy subscription to the cause and are therefore shot down by terrorist commandos, or are members of one or other of the two rival wings of the nationalist movement, the FLN (National Liberation Front) and the MNA (Algerian National Movement). These two movements are at present carrying on a war of extermination on French soil, parallel to the war they are waging against each other in Algeria itself and of which the massacre of Melouza was an incident.

During the whole of last year, 70 Muslim workers were executed by their fellows in France. In the first ten months of this year, almost 600 have been murdered and 2,200 injured. Since there is no reason to suppose that Muslim workers in France have become more reluctant to pay their terror-taxes to the nationalists, this vast increase must be due to the embittered strife between the two branches of the independence movement. Indeed this is clear in the recent outburst of shootings, which has decapitated the Muslim workers' unions that admit allegiance to the MNA and for which the FLN has not hesitated to claim the "credit".

As long as this fratricidal warfare among the Muslims working in France was of limited proportions, it was a matter for the French police, though even then it threw grave discredit on the Algerian cause. But the reckless extension of the struggle this year, the horrible proportions of the bloodshed, the overflow of terrorism from the medinas and casbahs of Paris on to the streets of every part of the city, the deliberate concentration of the FLN killer-gangs on trade-union leaders, and the involvement of other North Africans (Tunisian and Moroccan workers) who have no part of the Algerian quarrel, have all combined to give the matter a seriousness far exceeding the maintenance of law and order in France. The MNA is seeking help to bring the case before the United Nations, the international trade union movement is discussing it at the current W.C.F.T.U. meeting in Brussels, and the leaders of Morocco and Tunisia are to confer on ways of bringing pressure on the FLN to cease the slaughter.

The FLN has so far been quite insensitive to all appeals in this sense, though they have come from quarters not remotely connected with French colonialism. The French Communist Party has been publicly urging the FLN to cease terrorising Muslim working men; the trade unions of all faiths have been outraged by the systematic assassination of union leaders;

Messali Haj the imprisoned nationalist leader has issued an appeal to the nationalists to desist from atrocities that damage their own cause; and this week the Tunisian Ambassador, obliged to intervene because his citizens in this country are being mistaken for Algerians by both sides in the gang war and by the French police, denounced the wave of "criminal irresponsibility". (This last expression is the strongest condemnation of Algerian methods so far expressed by an Arab diplomat.) The response to these warnings from the friends of the Algerian nationalist cause was a communique from the FLN stating that it was not going to be influenced in its "sacred" effort by the "snivelling of the accomplices of colonialism". In other words, the Algerian nationalists are showing in this affair, as throughout the war in Algeria itself, a political stupidity and callousness that handicaps the progress of their cause and makes it more difficult for the liberal section of French opinion to declare its opposition to the rigid policies of the Paris Government.

Most Parisians by now have seen some incident or other in this gang warfare within the Algerian community, especially since the terrorists have begun shooting down their victims in the main boulevards in the centre of the city, in cinema foyers, in underground stations or sports arenas. (Your correspondent, for instance, saw a Muslim working man stabbed recently in a main thoroughfare on the Left Bank). It is evident what conclusions French people draw from such events, because the whole problem in Algeria is whether the minority community of Europeans and Jews would be safe in an independent Arab state. The Right in this country can complacently argue that the nationalists are providing evidence each day in the heart of Paris itself that minorities would not be safe in a free Algeria. And not only the Right: this week the New Left, a dissident Communist movement that has ardently campaigned for Algerian independence, says in a statement condemning the wave of terrorism that it "causes serious anxieties about the future of the Algeria of tomorrow and particularly about the fate of political and racial minorities." Since it is certain that Algerian independence cannot be won by a straight-out military victory over the French army in North Africa but must ultimately be achieved by negotiation, it is tragic that the Algerians are dissipating the political sympathy they enjoy in metropolitan France, especially among the working classes.

The victim of this terrorism is the body of 400,000 North Africans who have come to work in France, and the prize of the struggle is their wages. Algerians working in France receive French pay and benefit from the same working conditions as the metropolitan working class. They are thus much better off than their fellows at home; in fact their revenues would probably exceed the income of all the other eight million Algerians put together. This makes them the rich aristocracy of the Algerian people and thus they are called upon by the nationalists to pay the greater part of the cost of the war against the French. The mass of them, while no doubt sympathetic to the national cause, are not politically active—otherwise they would have joined the rebel army rather than coming to France to work. Thus their contributions have to be extorted by force and terror, especially because the nationalist levy is not light but on the contrary claims a large part of their weekly pay-packet. (The contribution de-

manded of an Algerian cafe owner in Paris, for instance, exceeds 1,000 rupees a month). The funds thus collected are sent to the Egyptian Embassies in West Germany and Switzerland, whence they go to buy arms for the rebel army.

But the Algerian nationalist movement is split into the FLN which does most of the fighting in Algeria and thus needs most of the money, and the MNA which, as a working-class party, has most of its strength among the migrant workers in France. So the struggle in this country is between FLN terror squads who are seeking to raise money from workers who mainly support the MNA, and the counter-terror gangs of the MNA who seek to protect their own supporters so that they can go on collecting taxes from them. The active members of these rival terrorist parties probably number about 50,000 at the outside; the remaining 350,000 North African workers live in sullen fear of the politicians. They dare not, and from solidarity do not even wish to, seek the support of the French police who are thus powerless before a crime wave that is making France the bloodiest country in the civilised world. Many of the murders are committed by men who are forced to shoot down a compatriot by the threat that if they do not, they themselves will be executed; even when such killers are caught, the police are no nearer tracking down the instigators of the terrorism.

To meet this wave of political crime, which has no parallel since the days of the Spanish Civil War when rival sections of the working class parties exterminated each other in Barcelona for Franco's ultimate benefit, the French authorities have resorted to exceptional methods of administrative detention, just as were used in India at the height of the Communist terrorism. This extension of the special powers used in Algeria to the French Republic was opposed here by the Left as the institution of concentration camps, but since the common law was powerless to deal with the case and since in fact only 20 Algerians have been thus interned, the measure seems inevitable. Nevertheless, the FLN which has so far refrained from acts of terrorism against Europeans on French soil (limiting itself to terrorist attacks on Europeans in Algeria) has announced that it regards this extension of the special powers to France as a challenge to it to carry the war across the Mediterranean. How seriously this threat needs to be taken is not yet clear; in recent weeks there have been nine French people assassinated and 30 injured, including ten policemen, and an attempt was made last month to shoot down in the street a prominent French Right-wing politician. Is this the prelude to the extension of the Algerian war to the French homeland?

The Algerian nationalists have probably not yet decided on that terrible course but it is plainly a possibility if the war in Algeria takes a turn for the worse. The results of an organised campaign of sabotage and terror against metropolitan French people are incalculable; the murderous vigour which the FLN has brought to similar campaigns directed against the Algerian French and against their own compatriots in France suggest the scale on which such operations could be conducted. The Lacoste administration and the FLN leadership have shown over the past few years a common and equal political stupidity, and both are equally to blame for the deterioration of the Algerian nationalist struggle into a series of atrocities and assassinations. In the wholesale extension of these methods to metropolitan France the FLN has taken an initiative that could have fearful consequences for both sides.

Good-bye, MR. BOTTLENECK!

Why fret and fume if you don't find the facts when you want them? Why waste time and effort thumbing through all those files?

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much.... VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Work the VISADEX way to get the best out of your men, machines and materials.

WORLDGRAM

AGRICULTURE

Aerial Spraying Against Pests: An area of 1,282 acres of sugarcane crop in Sehore in the Bhopal region of Madhya Pradesh was recently sprayed with insecticides by a Beaver aircraft of the Directorate of Plant Protection, Quarantine and Storage of the Ministry of Food and Agriculture. This operation — the fifth since the aerial unit of the Directorate started functioning in May last — exterminated the pests which had attacked the crop. No ground operations could have been carried out in this area, as the crop had a dense growth and had attained a height of about 10 feet. So far a total area of 8,461 acres — 3,134 acres of sugarcane and 5,327 acres of cotton crops — has been aerially sprayed in five separate operations for elimination of pests during the last six months. The first operation was carried out in the Plassey area of West Bengal and three in Dhuri and Fazilka region of Punjab. The average area sprayed by the aircraft in one flying hour is about 100 acres. On a rough estimate, the total additional net income the cultivators will secure as a result of these operations, will be about Rs. 4 lakhs — Rs. 2.3 lakhs in cotton and Rs. 1.7 lakhs in sugarcane. The additional average yields per acre in cotton and sugarcane are estimated at 3 maunds and 45 maunds respectively.

Wheat Sales in U.P., Punjab: The Government of India has, for the first time, applied the amended provisions of the Essential Commodities Act in respect of wheat, in order to arrest the upward tendency of wheat prices which has of late been noticed in U.P. and Punjab. Government will now have powers to require any stockist in these two States to sell his stocks at the average price of the past three months — not the market price prevailing on the day of sale. These powers are already exercised by Government with respect to rice in the States of Andhra Pradesh, Assam, Bihar, Bombay, Madhya Pradesh, Madras, Mysore, Orissa, Punjab, Rajasthan, Uttar Pradesh and West Bengal, and the Union Territories of Delhi, Himachal Pradesh and Tripura.

C.D. Programme as Subject for University Degrees: The Ministry of Community Development has requested the Vice-Chancellors of all Universities in India to include the subject of Community Development in the syllabus for the degree and post-graduates examinations in Economics and Education, and the subject of extension in the syllabus for degree in subjects such as Public Health, Agriculture and Veterinary Science. To meet the shortage of personnel by reorientating the personnel recruited and the officials already serving in the various departments for the implementation of the vast social experiment of the dimensions of Community Development all over the country, the Union Ministry has established a number of Extension training centres. To ease the problem of training the vast numbers of workers engaged in the implementation of the programme the Estimates Committee had recommended a greater co-ordination between the Community Development programme and the Universities through the inclusion of the subject of Community Development in the curriculum for the degree and post-graduate classes. Already, some of the Universities, such as Delhi, have made Community Development programme a part of the course for degree in Social Work. Certain other Universities, like Aligarh and Patna, have carried out research in regard to reactions of the people in the countryside towards the programme.

INDUSTRY

Cloth Production: The production of cloth, in the organised mill sector as well as in the decentralised

sector, has recorded a progressive increase in the last six years. The total production in 1956, which was over 7,124 million yards, was some 54 per cent higher as compared with the production in 1950, which was 4,618 million yards. The production of yarn also increased considerably. The production in 1956 was 1671 million pounds as against 1174 million pounds in 1950. The production of handloom cloth increased by over 90 per cent in 1956 as compared with that in 1950. Over 1540 million yards of handloom cloth was produced in 1956 as against 804.8 million yards in 1950. In the case of powerloom cloth, the output stood at 278 million yards in 1956 as against 148.25 million yards in 1950 — an increase over 88 per cent. The production of mill-made cloth increased from 3,665 million yards in 1950 to 5,306 million yards in 1956 — an increase of over 45 per cent. In the first half of 1957 the production stood at 2,709 million yards as against 2,583 million yards in the comparable period of last year. The target of the total production of 6,400 million yards by mills and handlooms with a per capita consumption of 15 yards of cloth, envisaged in the first Five-Year Plan, was reached in 1954 itself. The total production in that year aggregated to about 6,560 million yards.

Economy in Use of Steel: The Indian Standards Institution has published an Indian standard specification for rolled steel beam, channel and angle sections (IS: 808-1957). This Standard lays down the nominal dimensions, weight and basic geometrical properties of rolled steel beam, channel and angle sections produced in India prior to 1954 was based almost entirely on British standard specifications. As part of the Steel Economy Programme, the Indian Standards Institution undertook a detailed study of sections produced in India as well as throughout the world to determine whether more efficient and economical sections could be evolved for production in the existing and future mills to be erected in India. A memorandum outlining the study made, is given in appendix A to this standard. As a result of this study rational, efficient and economical series of Indian standard rolled steel beam, channel and angle sections have been evolved which would result in considerable savings in steel used for construction purposes.

Training of Tribals in Cottage Industries: Nearly 10,000 persons from Tribal Areas will be given training in various cottage industries during the next Five-Year Plan. The cottage industries are bamboo and cane-work, mat weaving, tanning, soap manufacture, hand-paper making, blacksmithy, bee keeping, fruit preservation, umbrella making, knitting, footwear making carpentry, etc. The State Governments have also been suggested to introduce ambar charkhas in the multi-purpose project areas wherever feasible. In addition, 20 craft centres and 20 co-operatives will be established in Kerala for the development of cottage industries. In Manipur 20 training centres for tribal youths, in Tripura 3 and Himachal Pradesh 4 such centres will be established. A provision of Rs. 1.19 crores has been made in the State sector and Rs. 1.44 crores in the Central sector of the second Five-Year Plan for the development of cottage industries and opening up of training-cum-production centres in Tribal Areas.

Industrial Production in Sweden: Industrial production in Sweden during the first six months of 1957 is estimated to have risen by 5 per cent in comparison with the corresponding period in 1956, according to the Swedish Economic Research Institute. As previously, capital goods account for the major part of this rise. The engineering and metal-working industries report increased domestic demand, while the export

figures seem largely constant, with the exception of those for the electro-mechanic industry which show a slight decline. The total amount of export orders in hand and the sales prices for export in the engineering industries in the second quarter were on a level with those of the first three months. The exception was the iron and metal-working industry, which experienced a slight reduction in foreign demand, this trend is expected to remain during the third quarter, probably resulting in falling prices. The electro-mechanic industry reports increased stocks, whereas stocks in other branches of the engineering and metal-working industries are maintained at about the previous level or have been reduced somewhat. Liquidity as a whole improved during the first six months of 1957, although the improvement is almost entirely accounted for by the mechanical engineering industry.

TRADE

Import Policy for Steel Announced: In view of the restricted availability of foreign exchange, the Government of India have decided that for the licensing period, October, 1957 - March 1958, licences for the import of steel will be issued for certain special categories only. Licences to importers who import for sale will be issued on the basis of their past imports. Certain actual users will be granted licences on the basis of their minimum requirements. The following categories of steel will be licensed to those who have imported these categories during at least two of the three years ending March 1955, 1956 and 1957: tin plate secondaries, steel wire, box strapping, industrial and rerollable scrap and tool, alloy and special steel. Importers who fulfil these conditions should apply to the Iron and Steel Controller, Calcutta, or the Deputy Iron and Steel Controller, Bombay or Madras, before November 20, 1957, giving the necessary data. The following categories of steel will be licensed to actual users who import for their own use and have imported before as actual users: Prime and secondary tin plates, terne plate, steel wire, skelp, wheels, tyres and axles, forgings and tool, alloy and special steel. Actual users should apply through the sponsoring authorities concerned to the Iron and Steel Controller, Calcutta, or the Deputy Iron and Steel Controller, Bombay or Madras, before November 20, 1957, giving the necessary data. Fuller details of the licensing procedure have been notified in a public notice published in the Gazette of India.

Import Requirements of Small Industries: Attention of actual users in the small scale sector is invited to the provision made in the Import Policy for the current half year (para 46 of the Red Book) under which applications from small scale industries for import of essential raw materials, machinery and components will be considered by the licensing authorities on an 'ad hoc' basis. To assist these industries, the form of the Essentiality Certificate, to be obtained from the State Director of Industries concerned, has been simplified and published in the current Red Book. Applications from small scale industries, duly supported by the Essentiality Certificate, should be made to the licensing authority concerned through the Regional Joint Development Commissioner for Small Scale Industries. Applications should be submitted to the licensing authorities direct. Suitable instructions to the Directors of Industries and the Joint Development Commissioners have also been issued in this connection.

Protection to Oil Pressure Lamps Industry to be Discontinued: The Government of India have accepted the Tariff Commission's main recommendation that protection granted to the oil pressure lamps industry may be discontinued when the present period of protection expires on December 31, 1957. In the Commission's view the industry no longer stands in need of protection. The attention of oil pressure lamps manufacturers, who

import brass rods and tubes and finished components like pressure gauges, mantle holders, nipples, pump valves, etc. has been invited to the Commission's recommendation that they should take immediate steps to meet their requirements of these articles from indigenous sources. The attention of manufacturers, who do not have candle power testing equipment, has also been drawn to the Commission's recommendation that they should take steps to instal such equipment without delay.

FINANCE

Evacuee Deposits: The Governments of India and Pakistan have agreed that movable property including money deposited by evacuees in criminal courts of either country, should be restored on reciprocal basis. Displaced persons interested in such deposits are, therefore, advised to furnish the following particulars of their deposits in criminal courts in West Pakistan to the Custodian of Deposits, Jammagar House, New Delhi, not later than January 1, 1958:

1. Name of depositor.
2. Particulars of the court including the name of Tehsil and district in which the deposit was made.
3. Particulars and value of the deposit, for instance, cash security etc.
4. Date on which deposit was made.
5. Case number.
6. Any other relevant information.

Soon after January 1, 1958, a list showing details of the deposits will be exchanged between India and Pakistan for verification by the courts concerned. Applications received after January 1, 1958, will not be entertained.

GENERAL

U.N. to Set Up Regional Housing Centre in New Delhi: Shri Anil K. Chanda, Deputy Minister of Works, Housing and Supply, disclosed in Mysore recently that the Government of India had agreed to the proposal of the United Nations that in addition to its functions the National Buildings Organisation should also serve as a Regional Housing Centre for the dry tropical areas of the ECAFE region. A U.N. team of experts had made recommendations to this effect after examining the set-up of the Organisation. A formal announcement from the U.N. regarding the opening of the centre at New Delhi was now awaited. Shri Chanda also told the Council that a tentative scheme for a housing census with the next population census had been drawn up by the Organisation in collaboration with the Union Ministry of Home Affairs. The details of the scheme were now being examined by the Planning Commission. The organisation had also formulated the lines on which statistics of housing and building materials might be collected in the States through housing cells.

Bombay Slum Clearance Schemes: The Government of India have sanctioned two slum clearance schemes of the Government of Bombay. The projects are the Bhamburda and Kashiwadi slum improvement schemes whose approved cost is Rs. 16,07,000. Of this amount, Rs. 8,03,500, i.e., 50 per cent, will be given to the State Government as loan and Rs. 4,01,750 (25 per cent) as subsidy. The balance of Rs. 4,01,750 (25 per cent) is to be provided by the State Government as a matching subsidy. It is proposed to build 548 pucca tenements under these two schemes for 548 families now living in slums. The Bhamburda Slum Improvement scheme envisages the construction of 424 one-room single-storey tenements at a cost of Rs. 11,97,800. The Kashiwadi Slum Improvement scheme provides for the construction of 124 one-room single-storey tenements at an estimated cost of Rs. 4,09,200.

NEWS IN BRIEF

INDIAN

Total production of iron and steel by the Tata Iron and Steel Company at Jamshedpur during October, 1957, was 95,100 tons of pig iron against 38,600 tons in September and 96,500 tons steel ingots against 92,500 tons.

The Government of India have decided to release a quota of 2,00,000 lb. of Madras Mysore silk waste for export up to the end of February, 1958, says a Press Note. Details of the licensing procedure are being notified by the Joint Chief Controller of Imports and Exports, Madras.

Egypt has contracted to buy 2,000 tons of Indian tea for immediate delivery. Negotiations for the purchase of finer quality of Indian tea for which there is a smaller demand are in progress between the Egyptian Government and the Indian Charge d'Affaires.

India imported from Japan 1,67,829 yards of woollen and worsted fabrics in the first three months of 1957, as compared with 1,28,572 yards in the same period of 1956, according to trade statistics.

The Andhra Pradesh Government will soon appoint a committee to recommend measures for effecting uniformity in the land revenue structure in the Andhra and the Telengana regions of the State.

The Government of India by a resolution dated October 12, 1957, have accepted all the major recommendations of the Tobacco Expert Committee.

The period of licensing and shipment for the import of 50,000 bales of East African raw cotton permitted by the Government of India on July 26, 1957, has been extended up to the end of December, 1957.

Time-loss due to industrial disputes during August 1957, decreased by 1,67,155 man-days as compared with the previous month. The average duration of disputes current at any time during August was 6.7 days as against 8.6 days in July.

The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for three pin plugs and sockets.

Employment Exchanges secured 18,052 placements during August 1957 as compared with 19,934 in the previous month. A comparatively large decrease in placements was recorded in Madras, Delhi, Uttar Pradesh and Punjab, while Rajasthan and Kerala reported an increase.

India is likely to import some quantity of rice from South Vietnam.

It is reported Philips India Private Ltd., has been converted into a public limited company. The decision followed the recent approval of the Government of India for an increase of Philips, which was applied for to enable the company to give effect to the second part of the expansion programme, which was taken up a number of years ago.

FOREIGN

The sterling area's gold and dollar reserves rose by \$243,000,000 during October and stood at \$2,093 million on October 31. A sum of \$130,000,000 was paid to the European Payments Union (EPU) in respect of September and \$3,000,000 was paid to creditors of the Union in bilateral settlements.

Eleven countries including Japan, Egypt, Czechoslovakia, Germany, France and the United Kingdom will be represented through their jute associations at the International Jute Conference scheduled to open in Dacca on November 25.

The World Bank is granting a loan of \$600,000 to Ecuador for repairs on the State Railways.

It is reported that the recent London negotiations between the U.K. Treasury and Iraq's Minister of Finance, resulted in Iraq's obtaining an additional £10 million worth of gold bullion to cover the Iraqi currency.

Russia bought about 100,000 lb. of tea at the auctions through a firm of Ceylon brokers. This is the first Russian entry to the Ceylon tea auctions in the post-war period. In 1936 Russia bought about 3.25 million lbs.

It is reported West German-Iranian discussions have reached an advanced stage regarding the building of a steel works at Aznak, 250 miles south of Tehran.

The Canadian Treasury had a surplus of \$6.9 million in September compared with a deficit of \$71.8 million in September last year.

Australia's export wool income in the three months to September 30 at £A80 million was up by some £A15 million on the same period of the previous year.

West German machine tool exports during the first half of 1957 were worth £36 million against £27.3 million during the corresponding period of 1956.

It is reported the U.S. Government is to offer \$500,000 to O.E.E.C. in the current financial year for the training of West European scientists and technicians.

While rubber production in Malaya and Singapore declined by 3,311 tons, stocks at the end of the month were higher even than in August.

A German concern has indicated interest in British Guiana's silica deposits. A representative of Ernest Leitz and Co. has visited British Guiana to explore the industry and to discuss the establishment of a glass industry.

FOREIGN EXCHANGE THROUGH SUGAR EXPORTS

THE pressure on India's foreign exchange resources has directed attention to commodities which, with a little sacrifice in so far as the domestic market is concerned, could easily be put on the export list. White sugar is one such commodity. An encouraging rate of growth during the last two years and prospects of a better yield in the current year have emboldened both the Government and the private sector to recommend expansion in exports of white sugar in a bid to earn foreign exchange for capital goods so as to keep the pruning of the second Plan to the minimum.

It needs to be remembered that during the last two decades sugar never enjoyed the status of an export commodity in India's foreign trade accounts. The small quantities exported in 1951-52 and 1952-53, as shown in the table below, were a mere fraction of the imports of sugar in the following years. As a matter of fact, sugar has in the past been a drain on our foreign exchange resources. During the three years ending 1955-56, the imports of sugar were valued at a little over Rs. 42 crores. It is only in the year 1956-57 that the Government of India allowed exports of white sugar to the tune of 200,000 tons. This had been made possible by domestic output at 20,50,000 tons, which, incidentally, was an all-time high in the history of the sugar industry in this country. Total exports in 1956-57 have not been more than 170,000 tons, the shortfall being mainly due to non-availability of shipping space.

The estimates for the year 1957-58 put yield of white sugar anywhere between 21,50,000 and 22,00,000 tons. With the carry over from the preceding season at 4,70,000 tons, the total estimated supply for the current year may be put at nearly 27,00,000 tons. According to the most optimistic estimates, the internal consumption of sugar is not expected to exceed two million tons. That naturally leaves a surplus of 7,00,000 tons of sugar at the end of the current season in case no exports are allowed.

Recently, the Export Promotion Committee recommended a further quota of 200,000 tons of sugar to be exported. There are suggestions that the quota for exports could be doubled to 400,000 tons without disturbing the domestic stability of sugar price. In case it were possible to export 400,000 tons of white sugar, the estimated yield of foreign resources would be nearly Rs. 20 crores which is not a mean sum in view of the acute shortage of foreign exchange.

The only complication which arises in case a decision is taken on accelerating the volume of exports in the current year is in regard to the gap between the domestic and the international price levels of white sugar. It is estimated that the highest price per maund which Indian sugar could obtain in the international market would not be more than Rs. 20 per maund. On the other hand, the fair internal price of sugar may be put at nearly Rs. 27 per maund after excluding the excise duty, the cane cess and the sales tax. The loss in this way works out to nearly Rs. 7 per maund in addition to the loss of revenue to the Government because of the excise duty, cess and the sales tax. Assuming for the sake of argument, that the Governments both at the Centre and in the States are willing to forego the revenue on the volume of sugar exports, how is the wide gap of Rs. 7 per maund to be bridged?

Once a decision is made that larger volumes of sugar ought to be exported as a matter of expediency as well as on the ground of long-term policy, a solution must be found to close the gap which now exists between the domestic price and the international price. Two solutions have figured in the recent discussion of this problem. One of them is that approved sugar units, selected on the basis of their proved production performance in the past, should be permitted to produce larger quantities than their present installed capacity allows. They have already reached the limit of capacity in actual output. To enable them to produce increased quantities, it will be essential to permit expansion of their capacity. This sector of the industry is prepared to bind itself by an assurance that in case it is allowed to produce more quantities it will utilise an adequate part of it for export and cancel out its losses on exports out of its higher earnings from domestic sales. This proposal involves a complicated machinery of supervision and, besides, it is bound to create discontent and discord in the industry.

In the alternative, it has been suggested that the domestic price of sugar should be raised by Rs. 2-8-0 per maund so that on the current volume of production, domestic sales would suffice to provide subsidy for exports. The urgency for stepping up export earnings is so pressing in the present crisis of foreign exchange that the contention to the effect that it will involve an additional dose of inflation in domestic sugar prices will not carry much force. The choice is between a higher price at home to earn something like Rs. 20 crores of foreign currency and loss of this opportunity. There can hardly be two opinions that the exigencies of adding to our foreign exchange earnings override the other consideration. Moreover, a higher domestic price may go to discourage consumption at home and save larger quantities for export. On balance, the practicable solution seems to lie in putting up the home price of sugar by something like Rs. 2-8-0 per maund to make exports possible.

WHITE SUGAR: PRODUCTION, IMPORTS, EXPORTS, AND RECOVERY (PER CENT)

1948-49—1956-57

LIVELIHOOD TRENDS IN TOWNS IN UTTAR PRADESH

By DR. G. RAGHAVA RAO

A KNOWLEDGE of the general nature of the trends in the means of livelihood of population over a fairly long period is essential for comprehending fully the significance of the present pattern of living. It is essential to understand how an increase or decrease in the number of persons in one of the means of livelihood affected the number of persons in the other means of livelihood. An attempt is made to study the nature of the trends during 1911-51 in the means of livelihood of the population in fifteen towns in the U.P. and the relationship among the different means of livelihood viz. production other than cultivation, commerce, transport, miscellaneous and other services. Reference is made here to conditions in the major cities, though for the sake of convenience fifteen towns in the U.P. were selected — Agra, Aligarh, Allahabad, Banaras, Barailly, Farukhabad, Gorakhpur, Hathras, Jhansi, Kanpur, Lucknow, Mathura, Meerut, Moradabad and Saharanpur. These were selected with the idea of observing the conditions in a variety of towns and cities, small as well as large industrial as well as commercial, historical, religious, cultural and other types. The means of livelihood were classified under eight groups as follows:

Cultivators of land wholly or mainly owned; Cultivators of land wholly or mainly un-owned; Cultivating labourers; Non-cultivating owners of land, and other agricultural rent receivers; All persons engaged in non-agricultural production; All persons engaged in Commerce; All persons engaged in transport; and all others including non-agricultural rentiers, pensioners and other miscellaneous income recipients.

With the idea of drawing inferences which are as reliable as possible, non-working dependents were left out of consideration. Persons whose means of livelihood was agriculture were left out of consideration, because their number in towns was negligible. The four non-agricultural classes were however, taken into consi-

deration. The percentages which are mentioned in subsequent paragraphs are worked on the total of the four non-agricultural classes. "Construction and Utilities" were shown separately from the census group "production other than agriculture," because the former are quite different from the latter. Construction and maintenance of roads, bridges, transport works, telegraph and telephone lines, irrigation works, electric power and gas-supply, sanitary works, scavenging services etc. come under the head "construction and utilities". Miscellaneous and other sources of livelihood is a class too broad to study changes in it. The most important subdivision, which comprised of domestic servants, was studied. It has to be remembered, while interpreting the census data, that they refer to a particular day in a year, but not to the entire year, and that, therefore, slight fluctuations have no significance. It has also to be remembered that the 1921 census data are less reliable than the census data of the remaining years.

It is essential to be clear about the concept of trend. A trend is a show of a specified tendency or drift over a period of time. It may be desirable from a particular point of view, but undesirable from another view point. Trends are noticeable clearly when all or most of the components in a phenomenon work in one direction. But generally all the components of the phenomenon do not move in one direction over a long period and, thereby, bring about a zigzag movement in the pattern of living. There is also no necessity for them to move in one direction even in a progressive country. When the usage of natural resources changes, when the technique of production changes, and when economic, political, social, cultural and religious ideals change, livelihood pattern also changes.

The percentage distribution of the working population in the fifteen towns into the different classes and divisions of livelihood during the last forty years is shown in the following table:

(1)	(2)	(3)	(4)	(5)	(6)	6(a)*	6(b)	6(c)
Year	Production other than cultivation	Construction and utilities	Commerce	Transport	Miscellaneous and other sources	Unorganised personal Services	Domestic Servants	Others under Miscellaneous and other sources
1911	27.5	6.7	15.7	5.8	44.3	31.4	14.6	12.9
1921	24.4	4.7	21.0	6.4	43.5	32.0	14.6	11.5
1931	25.6	5.2	20.6	7.6	41.0	19.7	11.7	21.3
1951	28.4	3.8	20.8	9.1	37.9	19.6	5.4	18.8

* Figures in col. 6(a) include the figures in col. 6(b).

Employment in transport increased steadily, while employment in miscellaneous and other sources and particularly employment in domestic service decreased steadily and remarkably. During 1911-41 the population of towns increased chiefly on account of immigration from villages. A large proportion of these villagers were unskilled and joined in unorganised personal services. A considerable proportion of them joined as domestic servants. But in course of time they joined as unskilled workers in transport service, which is generally organised. During the last forty years employment in commerce increased. Some of those engaged in personal services might have taken to hawk-

ing daily requirements like vegetables and cloth. Employment under production other than cultivation also increased, though not spectacularly. Some of the unskilled rural immigrants shifted from personal services to establishments of organised production as unskilled labourers. Thus the rapid growth in towns of transport, commerce or industrial production brought about a shift in employment from unorganised personal services to unskilled labour in transport and factories. The percentage under construction and utilities decreased considerably.

The magnitude and nature of this change varied from town to town.

In 1911, 43.5 per cent of the working non-agricultural population in Aligarh had miscellaneous and other sources of livelihood. The percentage of the working population in each of the other classes, namely, production other than agriculture, commerce and transport was less than in the miscellaneous group. It can be said that Aligarh was then a town of persons with miscellaneous services. Gradually the percentage in the miscellaneous group decreased to 27.6 in 1951. In 1951, 34.9 per cent of the working non-agricultural population was found in production other than agriculture, while the percentage in each of the remaining classes was less. Aligarh became an industrial town before 1951.

In Banaras also the percentage under domestic servants decreased steadily. The percentage under production other than cultivation increased from 32.6 in 1911 to 40.1 in 1931, and declined to 36.8 in 1951. The decrease was probably due to an increase of imports of silk cloth. The percentage under commerce decreased from 19.3 in 1911 to 15.8 in 1931. During 1931-51 some weavers of silk fabrics might have taken up retail trade of imported silk cloth and cheap cotton cloth, and hence the percentage under commerce increased to 21.7 in 1951. The percentage under transport increased from 3.1 in 1911 to 6.6 in 1951.

In Jhansi non-agricultural rentiers, pensioners and other miscellaneous income recipients decreased from 50.4 per cent in 1911 to 38.8 per cent in 1951. Production other than cultivation decreased during 1911-31 and increased later on. The increase may be attributed to the opening of railway workshops. The percentage under transport increased steadily up to 1931 and decreased remarkably by 1951.

In 1911 Kanpur was a town of miscellaneous services with 54.8 per cent of its working non-agricultural population in miscellaneous services. The percentage of domestic servants on the whole did not decrease. It was 31.84 in 1911, 26.75 in 1921, 36.22 in 1931 and 34.56 in 1951. During the same period population in production increased from 21.8 per cent to 44.9 per cent. In 1951 the percentages under each of the remaining groups were less than that under non-agricultural production. It can, therefore, be said that Kanpur became a markedly industrial town some time before 1951. Large scale production must have commenced earlier but large scale employment was found in 1951.

Trends in Lucknow reveal interesting developments. The percentage of domestic servants decreased from 69.27 in 1931 to 39.70 in 1951. The percentage under production other than cultivation decreased up to 1931 and increased later on. Some of the domestic servants might have joined as unskilled labourers in production establishments during 1931-51. The percentage under transport was constant. The percentage under commerce may be said to be stagnant.

In Moradabad the percentage of workers in unorganised personal services decreased rapidly from 27.4 in 1911 to 14.4 in 1951. But the percentage of domestic servants increased up to 1931 and decreased remarkably later on. This synchronised with an increase in the percentage under transport from 6.1 to 10.1. But the percentage under production other than cultivation decreased from 32.3 in 1911 to 26.5 in 1931, and increased to 33.9 in 1951. The fall during 1911-31 was probably due to the introduction of labour saving devices, while the rise during 1931-51 may be due to some domestic servants joining factories as unskilled labourers.

Some important conclusions from the above study may now be set out. It can be said on the basis of the

changes described in the earlier paragraphs that during 1911-51 employment in unorganised personal services decreased, while employment in transport and commerce increased. The proportion of domestic servants to persons in unorganised personal services decreased throughout and remarkably during 1931-51. This synchronised with an increase under production other than agriculture. Probably, many of the domestic servants joined factories as unskilled labourers. Some of them probably took to retail trade.

The percentage of population in miscellaneous services in earlier years in Aligarh, Banaras, Kanpur and Moradabad was larger than the percentage in each of the remaining three non-agricultural groups. But in 1951 the percentage of population in production other than agriculture was larger than the percentage in each of the remaining three non-agricultural groups. It can, therefore, be said that these towns became relatively industrialised in 1951.

There has been a move from the unorganised sector of personal services, specially domestic services, to the organised sector like unskilled labour in factories, retail trade and transport. This is natural, when the population of towns increases to a large extent on account of immigration from villages.

THE RECORDS & STATISTICS

(Quarterly)

New Subscription rates in force from 1st May, 1957.

Annual subscription	Rs. 16
For 'The Eastern Economist' subscribers	Rs. 14
Single Copy	Rs. 4

The Subscriptions are to be renewed on Volume basis and not on yearly basis. Each Volume contains four quarterly issues.

BOOK REVIEWS

COMPANY TAXATION

Taxation of Companies: By G. C. Sharma: Publishers: Taxation, 3, Daryaganj, Delhi-7: Pp. 717: Price: Rs. 25.

Unlike the company-tax systems of most of the other countries which charge a single uniform tax rate on company profits, the system in India consists of an intricate structure of taxes. These taxes include: income-tax refundable to individual shareholders, super-tax or corporation tax with various rebates according to different criteria, additional super-taxes on distribution of excess dividends and issue of bonus share, a penal super-tax on undistributed profits of a private company or a closely-controlled public company and a capital gains tax. A number of amendments have been made and a rapid succession of new provisions have been introduced during recent years. There has long been a need for a systematic applied exposition of the provisions concerning company taxation and this has become all the more pressing in recent years. The publication of Mr. Sharma's book of nearly 700 pages meets that need.

Mr. Sharma is well qualified to handle the subject of company taxation which requires knowledge of jurisprudence and mathematics and practical experience in the assessment of companies. His experience as Income-tax Officer must have provided him insight into the problems faced by companies and understanding of the official interpretation in respect of the various tax provisions. The aim of his book being objective analysis and exposition of the tax legislation, Mr. Sharma's presentation is not affected by the handicap of an official in expressing, as an author, personal opinion on controversial subjects.

The book begins with a history of corporate taxation in India. Chapter II explains and illustrates the procedure involved in assessing the tax liability of the shareholders in respect of dividend income. The third chapter deals with the taxation of private companies and closely-held public limited companies which are subject to the application of Section 23A of the Income-tax Act. Chapter IV contains a number of examples to illustrate the computation of tax liability of both Indian and foreign companies, according to the various criteria in the statute, such as the nature of the company, the source from which the income is drawn and the amount of dividend distribution. Chapter V explains, besides other special provisions, those relating to exemptions from company tax of new industrial undertakings and intercorporate dividends and to depreciation allowances and development rebate. Separate chapters are devoted to the assessment of foreign companies and directors, managers and managing agents of companies.

The last four chapters are designed to bring the book up to date in respect of the various provisions. The changes and new provisions introduced as a result of the latest Finance Act, which was presented in May 1957 and has recently been passed by Parliament, are discussed in these chapters. Comprehensive details of the new scheme relating to deposit of company funds with Government are given. This scheme, which was severely criticised by the business community, provides that, unless a company deposits with Government prescribed percentages of its reserves and undistributed current profits, it will not be allowed the benefit of depreciation allowances and development rebate in its assessments.

It is the great merit of this book that it provides a happy blend of clear exposition and telling examples to explain, from a practical point of view, the complicated provisions of company taxation. It should be of great benefit to both Indian and foreign companies.

INVESTORS' ENCYCLOPAEDIA

Investors' Encyclopaedia, 1955-57 (20th Edition): Compiled by Kothari and Sons, Share, Stock and Exchange Brokers, "Oriental Buildings", Armenian Street, Madras-1; Pages 2,329: Price (Inland) Rs. 20 (plus Rs. 4 for packing and postage); (Foreign) £2/3 (Postage Free).

"The Investors' Encyclopaedia" is an institution by itself and its usefulness to the investor and the student of company affairs alike has been increasing with the years. It is indeed remarkable that the publication has grown from its modest size of 349 pages covering 168 companies in 1936 to its present size of 2,329 pages containing details of about 1,560 companies and giving a lot of information about the set-up of various industries in the introductions to the different sections. The latest edition covers almost all new flotations during the year and its contents are up-to-date with the latest available Balance Sheets included therein. An analysis of a large number of new industries that have sprung up in recent years and detailed information regarding State enterprises are also given. The first section containing a general review of economic conditions and the introductory surveys of industries alone are sufficient to confirm the publishers' success in their endeavour to make this publication an authentic and complete reference book on company affairs. Its usefulness and size are bound to grow with the continuing growth of Indian industry and banking. From the point of view of the investor, this Encyclopaedia's analysis of working (in a single tabular statement) of each and every company in six, seven or eight successive years in the immediate past will be, as it has always been, the best source of ready reference.

THE EASTERN ECONOMIST

New Subscription rates in force from 1st May, 1957

PROBLEMS OF SUGAR EXPORT

By
CROESUS

THE Export Promotion Committee is the latest to stress the export potentialities of sugar. Before this, the industry itself, as represented by the Indian Sugar Mills' Association, and both the Government and the industry, as represented by the Development Council for the Sugar Industry, had urged that every effort should be made to stimulate exports of sugar. The same subject was expected to figure prominently at the meeting of the Indian Sugar Mills' Association.

Whether about the desirability of exporting sugar in order to augment the foreign exchange earnings of the country or about the availability of the commodity for purposes of export, there would appear to be complete unanimity, although there is a section of public opinion which urges caution before taking on excessive or unduly ambitious commitments. This school recalls that it was not very long ago, that is between the years 1953-54 and 1955-56, that we had to import large quantities of sugar (nearly 800,000 tons). But even this school concedes that India could afford to spare about 200,000 tons for export. As a target, this compares favourably with the total export sales for the latest completed sugar season (1956-57) of over 170,000 tons. In other words, this target — which is the official one — seems, on the basis of the statistical position, to be more realistic and practicable than the 400,000 tons target which the sugar interests would appear to urge.

The fixation of an export target or the resolution to export a given quantity of sugar is one thing, and perhaps a simple one at that, but the actual implementation of it is not that easy. For, at every stage, right from the collection of all the sugar required for exporting to the point of finally exporting it, the export of sugar is bedevilled with several thorny problems. Thus, how is all this (200,000 tons) sugar to be collected? First of all, a formula acceptable to all sugar factories must be evolved. Obviously, the simplest and easiest formula that occurs to one is that every sugar factory must contribute to the export pool a certain quantity in proportion to its actual production. This may be production for the latest completed season or the average production for a given number of years.

Secondly, a decision is needed as to whether the I.S.M.A. should be asked to handle all exports or the trade itself left to undertake it. Normally, this should not have presented much difficulty, but, by reason of the absence of any uniformity in the matter of cane cess and sales tax concessions in respect of the sugar export, the balance of advantage seems to rest with the second approach. However, if these difficulties in regard to cane cess, sales tax, etc. could be overcome, as the I.S.M.A. hopes and says this could be — it is to be hoped that Government would see to this — it would be in the best interests of the industry to let its central body — the I.S.M.A. — assume this responsibility. The present is hardly the time for indulging in any serious clash on the issue, what with the Sword of Democles, in the form of the State Trading Corporation, dangling above the head of any commodity of trade.

Thirdly, there is the very important question of quality. It is no doubt true the Indian Sugar Industry has made great strides in the matter of quality production. But then the quality produced by all the factories is not of the same grade. Also the quality of sugar to be exported depends solely on the importing country; some may prefer fine grain, some others bold, and yet others just raw sugar. No one sugar factory can be expected to cater to all these exacting tastes, but a central organisation like the I.S.M.A., which knows the specialities of every one of its member-factories, may be expected to give a better account of itself.

The memorandum on the subject of sugar exports prepared by the I.S.M.A. no doubt lists a number of neighbouring countries—as many as 16 from Aden to Zanzibar—in which it should not, in its opinion, be difficult for India to establish a foothold. The annual import requirements of these countries range from a mere 4,200 tons to as much as 210,000 tons. It would be unqualified optimism to hope that Indian sugar could penetrate into every one of these markets, unless India could supply the best quality of sugar at the cheapest price. With concentrated effort and attention, perhaps, the industry may succeed in manufacturing the best quality of sugar, but it is too much to hope or even to expect the industry to offer sugar at a competitive price in the world market, for the simple reason that other sugar-producing countries have made such spectacular advances that it will be several years before India can say she is on a par with those countries. In the matter of per-acre yield of cane, in regard to sucrose content, in respect of disease-resisting varieties and in the adoption of the latest labour-saving machinery, some of these countries are years ahead of us. Notwithstanding these inherent advantages, the Governments of these countries have not been averse to giving their sugar industry every conceivable inducement to export sugar. Not until our Government also is imbued with such an aggressive export psychology will it be possible for India to make the targeted headway in her sugar exports. Although it is not so simple as all that, the authorities in our country seem to feel that their task is over if they can make a given quantity of sugar available for export, by making it prohibitively costly for the domestic consumer. Surely, after having nursed and nourished the home sugar industry by ungrudgingly bearing the burden of protective duties for years, the Indian consumer does not deserve this unseemly treatment now, even to earn the encomium of having helped his country during a period of foreign exchange crisis. It is, therefore, rightly accepted and argued by all, and not by the consumer alone, that, if India should make a success of her sugar export drive, the sacrifice this time must be by neither the industry nor the domestic consumer (and certainly not the foreign consumer) but by the Government — both the Centre and the States. In these days of deficit budgets, no such suggestion would be palatable to the powers-that-be, but the prevailing circumstances are such that even Governments must gulp down some unpalatable doses such as this. It is they that are on trial now.

EXTERNAL ASSISTANCE

By

CROESUS

THERE is much impatience in this country in drawing inferences about the prospect of external assistance for our second Plan. The tendency is to take a depressed view of the problem. But the statement made by Mr. T. T. Krishnamachari in the Lok Sabha his Wednesday will correct this trend. Some pointers to a correct appraisal are to be gathered from Mr. G. D. Birla's statement in the course of his visit to the U.S.A. and some European countries. In addition, there are the views of some prominent visitors to this country and also of the senior representatives in India of a few leading countries. I had the occasion to listen, during the past few days, to the considered views on this subject of Mr. George Currian Vice-President of the Bank of America, which is reputed to be the largest commercial bank in the world, and of two eminent ambassadors, the U.S. Ambassador to India, Mr. Ellsworth Bunker, and the U.K. High Commissioner for India, Mr. Malcolm Macdonald. It is noteworthy that all these are unanimous in holding that both the missions, the official as well as the non-official, have accomplished a great deal by way of clarifying India's policies and removing a number of unfounded misapprehensions in the minds of foreign investors. None of these, however, has given hopes about the possibility of any large-scale assistance forthcoming immediately. Nor should one expect and government, especially of a democratic country, to rush to our rescue forthwith, without reference of the question to its own parliamentary institutions, however pressing our needs may be. But even so, the bright prospects, if not the certainty, of such helpful measures as the postponement of the payment date in respect of the value of machinery supplied by Germany to the Rourkela Steel Works, the conversion of the 190 million dollar wheat loan into a rupee loan by the U.S., and the willing help to India by the Export Credits Guarantee Department of the U.K., are little straws that indicate how the wind is blowing across the oceans. We should not underestimate either the significance or the importance of these.

Having said this, I would like to refer, in some detail, to the observations of the latest foreign Government spokesman to visit Bombay, namely, Mr. Malcolm Macdonald. Addressing the Rotary Club here, he pointed out how difficult the problems of economic development are that are presently being faced by the underdeveloped countries and how willing the industrially advanced countries are to help the former in raising their standards of living. Speaking for his own country, Mr. Macdonald was naturally anxious to allay the feeling that Britain has (allegedly) not done as much as was expected for her. Accordingly, he declared that the assistance to India given by the U.K. has been "continuous, immense, and far greater than that given by any other country". In support of this claim, the U.K. High Commissioner listed the following as the more important forms of assistance that the U.K. has extended:

1. The U.K. is the largest purchaser of India's exports accounting as she did for as much as Rs. 188 crores in 1956 on the basis of the figures for

the first nine months of 1957, the annual rate of these works out to Rs. 208 crores.

2. The U.K. is far and away the highest external investor in India, her share being 82 per cent of the total foreign investments, as per the last Census of Foreign Investments in India by the Reserve Bank of India.
3. The U.K.'s Export Credit Guarantee Scheme has been working to the advantage of India. Thus, as against only 1/20th in respect of the total exports to other countries, as much as one-fifth of the exports to India is covered by this beneficial arrangement.
4. The U.K. has also been helpful to India by participating in the economic development programmes assisted by the World Bank. Thus, she has given £60 million to the World Bank for lending to the Commonwealth countries, and India has already received £18 million out of this.
5. In addition to these, Britain has also participated directly in some construction industries, as, for example, in the steel-producing industry (vide the contribution of the consortium of some of the well-known British firms to the tune of Rs. 15 crores that of the British Government of Rs. 20 crores).

Besides these, Mr. Macdonald went on to point out, Britain had been helping India through the Colombo Plan, by collaborating in Atomic Research and by providing training facilities to Indian youths and technicians.

These are facts and no one can dispute them, but there is a perspective through which all this impressive help must be viewed. Here is a record of mutual co-operation of two countries which had been bound by political ties for over two centuries, Britain having been the privileged partner always, which is only natural. True, even after independence, British investments continued to be there. As a matter of fact, between 1948 and 1953, these investments rose by as much as Rs. 117 crores. But Mr. Macdonald did not mention that, since then, there has been considerable disinvestment also — of some Rs. 100 crores.

Again, it is true that the U.K.'s reserves stand to be strained greatly by India's decision to draw more rapidly on our sterling balances. As Mr. B. M. Chinal, who proposed the vote of thanks, observed, the U.K. is herself in great economic difficulties, and whatever she does, even the smallest gesture, requires to be fully appreciated. While no right-thinking Indian fails to do so, one cannot simply overlook the stark reality that it is when India's back is being strained to its utmost, thanks to her economic burdens, as now, she is finding even her best friends either unable to do anything or to be sitting on the fence. That unfortunately is the irony of the situation.

BUSINESS NOTES

THE STERLING AREA'S RESERVES IN OCTOBER

THE STERLING area's gold and dollar reserves as on October 31 last show a heartening improvement in their position. They stood at \$2,093 million and showed an increase of \$243 million during the month under review. This increase in the reserves is undoubtedly impressive for the past few months. But there are some complex factors in this month's position which make it difficult to draw clear and bold conclusions. Actually they represent the settlement of EPU account for the month of September. An amount of \$130 million was paid by the UK in the month of October to EPU for the deficit incurred in the month of September. Likewise the UK paid \$3 million to the creditors of EPU in bilateral settlements. The actual payment made towards the settlement of the deficit incurred during September was very heavy because this is the seasonal characteristic of the UK's payments liabilities in this part of the year. In October \$250 million were drawn upon out of the credit granted by the US Export-Import Bank immediately after the Suez Canal crisis. It will thus be seen that the position of the reserves was subject to these two important factors. None of them is normal.

But the very fact that the gold and dollar reserves have secured a substantial addition is a pointer to healthy trends. According to one well-informed estimate, if the credit of \$250 million from the Export-Import Bank is left out of account and the position for the month of October is taken into consideration, it would show improvement of the order of \$142 million. In its statement of the position announced by the Treasury in London on November 4, it has been pointed out that the provisional figures for October disclose a surplus of £9 million for the UK with EPU. Of course, this will be due for settlement in November. If this provisional estimate is taken into account, the conclusion is well warranted that the post-Suez phase has been reversed. The drastic action taken by the Chancellor of the Exchequer in raising the Bank Rate to 7 per cent and in imposing ruthless controls on bank advances and investments has begun to produce tangible results. The improvement which has been registered in the reserves is due to normal commercial operations as well as to the reduction of speculative pressures on sterling. It is, of course, difficult to apportion the share in the improvement of each of these two factors. Confidence is steadily but surely being reinforced in the value of the pound. The present reaction to the improvement in the strength of the pound is one of guarded optimism. It is clearly recognised that at the present time one important factor which will have a decided influence on inflation is the attitude of the trade unions in pressing for higher wages. At the same time it is realised that curbing of inflation will depend upon the determination and capacity that will be exhibited by the Government in resisting undue wage claims.

SOVIET CREDIT FOR INDIAN INDUSTRIES

IN AN atmosphere otherwise charged with uncertainty, the signing of a credit agreement between the Soviet Union and India on November 9 last has been received with some relief. This agreement has taken final shape after prolonged discussions. This fact and the size of aid will have their proper reaction in the country. The agreement provides for a total credit of 500 million roubles. In rupee terms, the amount equals over Rs. 60 crores. The credit is to come in the form of machinery and plant for the public sector mainly for five projects. These are a heavy machine building plant, a coal mining machinery plant, a thermal power station, an optical and ophthalmic glass factory, and equipment for coal mining at Korba. Nearly as important as the credit itself are the terms and conditions on which the Soviet Union has agreed to supply the equipment. The interest rate is fixed at 2½ per cent. Repayment of the loan

has been made easy inasmuch as the first of the 12 equal instalments will not be paid before one year after the delivery of the complete machinery. In other words, repayment will start some time like March 1961, by which time India is expected to get over her current and anticipated payments difficulties. The Russians will also provide training facilities for the personnel to man the projects. Again, the possibility that a further rise in the general price level may create some shortages has been anticipated by the provision of further credit to meet the exigency. Clearly, therefore, the conditions of the credit are more liberal than even those of the Bhilai steel project.

There is no doubt that with the setting up of the enterprises, which are expected to be completed by 1960, India will have taken a substantial initial step towards organising, for the first time, the production of heavy machinery, etc., on a large scale, within the country. For example, the initial capacity of the heavy machine building plant will be 45,000 tons a year. The coal mining machinery plant will be of 30,000 tons and the thermal power station at Neiveli of 2.50 lakh k.w. The Neiveli power station is of particular importance in so far as it can take off the lignite that is under operation of being ored there as soon as it is ready for utilisation. It thus comes about that the agreement as a whole is of no ordinary significance.

While the significance of the agreement should be recognised by all, it does not solve the pressing problem of foreign exchange. On present reckoning, the crisis is expected to continue over the next year and a half. It is only Western countries, like the USA and to some extent West Germany, which are in a position to help India in this field. Approaches, both official and non-official, that have been made in these quarters have been tactful. It will not be very long before a clearer picture of the fruits of the efforts will be made available to the country. Already, hopeful signs have commenced to appear. But it needs to be remembered that if any considerable assistance is to be obtained for saving a good part of the Plan, the Government should strive more to make the atmosphere conducive for such assistance to come.

CHEMICALS: PRODUCTION AND DISTRIBUTION

THE INDIAN chemical industry has been showing a rising trend in production. In certain items the increase is phenomenal. The output of ammonium chloride, for example, multiplied nearly three times over, from 1,683 tons in 1955 to 4,700 tons in 1956. This is by no means a solitary case. There are other chemicals like bleaching powder, liquid chlorine, caustic soda, which have given an impressive performance. The year 1956 also witnessed the production, for the first time in India, of hydrogen peroxide, D.D.T., salicylic acid, etc. All this is gratifying; the growth of a country's chemical industry is an index of its overall industrial progress. Nevertheless, it also indicates how much leeway India has still make up in this field. This country has been importing various chemicals worth many crores of rupees. Notwithstanding the current severe restrictions on import, it is more than likely that chemicals will continue to figure prominently on India's import bill for some years to come.

If the production in some cases has been highly satisfactory, the same cannot be said in regard to distribution where it has ceased to be in the hands of the trade. As has been pointed out by the Chairman of the Indian Chemical Merchants' Association, there are some really disquieting developments on the distribution side. Mr. M. L. Das has given a few instances to illustrate this. A chemical like, for instance, titanium

dioxide, is being sold in retail at as much as Rs. 4.50 per lb., against the manufacturers' price of only Rs. 1.25. In 1956, when supplies were still available for normal trade channels, the price did not go beyond Rs. 1.40 or thereabout. The consumer is thus suffering heavily. The effect will spread to production. Already shortages have been occurring now and then in important industrial chemicals, like acetic acid, calcium carbide, phosphoric and citric acids, among others. A regular and adequate supply of these vital commodities is essential for industrial production to maintain and improve its level. It, therefore, calls for an active consideration and review of policy.

BOMBAY PORT TRUST FORGES AHEAD

IT IS instructive to know that the Bombay Port Trust coped with the volume of traffic with the inadequate resources at its disposal. The administration report, 1956-57, of the Port Trust records a remarkable increase in the weight of the cargo handled at the Docks and Bunders during the year which amounted to 11,979,352 D.W. tons. Incidentally, it sets up a new record for the port. As compared with traffic of 1955-56, the increase amounts to 1,673,553 D.W. tons. The important variations in the tonnage of principal items of imports handled at the Docks and Bunders were in bricks, cement, sand, chemicals, grains, iron and steel, kerosine oil, machinery, boilers and railway materials etc. So far as exports handled at the Docks and Bunders are concerned, the variations are marked in cotton, grains, kerosine oil, manganese ore, oil cakes, ores other than manganese, seeds, vegetable oils etc. The Docks working shows that the volume of imports rose from 2.36 million tons in 1955-56 to 3.53 million tons in 1956-57. The total traffic aggregated 5.39 million tons as against 4.5 million tons in the previous year. The principal increases in imports were in iron and steel, machinery, copper sheets, cement and wheat. The main commodities of which the exports decreased were cotton, waste cotton and wool, rice, grains other than rice and wheat, groundnut and oil cakes. The port had to cope with imports of iron and steel aggregating 534,500 tons.

So far as the financial position is concerned the general account for 1956-57 closed with a surplus of Rs 233.10 lakhs as against a surplus of Rs 141.33 lakhs envisaged in the revised estimates. The Pilotage Account showed a surplus of Rs 6.78 lakhs as compared to the estimated surplus of Rs 4.11 lakhs. In regard to the General Account the improvement over the revised budget was due to an increase of Rs. 25.70 lakhs in receipts and a saving of Rs 68.08 lakhs in expenditure. The increase in receipts was mainly under Wet Docks due to higher recovery of wharfage, demurrage fees, ground rents and handling charges and under Bunders due to higher recoveries of wharfage. The saving in expenditure was the result of slow progress of repairs and maintenance, new minor works and dredging and less expenditure than anticipated on the Chief Engineers, Workshops, Docks, Hamallage, and Station Establishments. An expenditure of about Rs 37.85 lakhs on Capital Account has been met by withdrawal from the General Reserve Fund. The aggregate revenue on the General Account, including surcharge, amounted to Rs 1,107.61 lakhs in the year under review as compared to Rs 961.92 lakhs in 1955-56. The total expenditure on General Account amounted to Rs 874.51 lakhs in 1956-57 as compared to Rs 676.01 lakhs in the previous year. The total revenue on General and Pilotage Accounts (excluding Special Receipts for the year was Rs 1,127.21 lakhs as against Rs. 980.99 lakhs in the year 1951-56. The total expenditure on General and Pilotage Accounts (excluding Special Expenditure) was Rs 887.33 lakhs as against Rs 688.76 lakhs in the previous year.

PRIVATE US AID FOR SMALL INDUSTRY

A BEGINNING is now being made to provide satisfactory arrangements for meeting the requirements of finance for small industry. Some part of the finance required is supplied by State Governments under the

provisions of their State Aid to Industries Acts. To a very limited extent medium and long-term finance is beginning to be provided by State Financial Corporations. The recent aid in the field is the offer of an American millionaire Mr. William Graham, who proposes to invest about half a million dollars in small industries. His scheme in short is to invite people wishing to expand a small industrial enterprise or start a new one. If an Indian entrepreneur of proved bona fides, but limited resources, can show that he has a workable, profit-making venture either in existence or ready to be started, Mr. Graham will be prepared to put in the required capital and help direct the enterprise until it becomes paying. No interest is chargeable, but profits, of course, would be shared between the entrepreneur and Mr. Graham.

The scheme is in no way based on outright grants but on the principle of exceptional loan facilities and a "partnership with deserving intelligent young men to help them on a good start in life." The scheme has not only gathered response from business men in America, but even in this country industrialists like Mr. G. D. Birla have offered to help in the implementation of the scheme. According to reports Mr. G. D. Birla has offered to contribute Rs. 10 lakhs in starting his project in this country. The whole idea is based on the technique of extending finance to the enterprising individual who has no institutional support. The proposition stems from Mr. Graham's warm regard for free enterprise. He is a firm believer that free enterprise is the cure for Asia's all economic ills and if given the stimulus of capital can do what State enterprise cannot do. The scheme no doubt has considerable potentialities and when executed would not only help in stimulating the progress of the small industry, but would also go some way in increasing employment in non-urban regions.

MUKAND IRON

THE MUKAND IRON AND STEEL WORKS has not only rehabilitated itself but entered a stage of development and profit-earning capacity. This is evident from the speech of the Chairman Mr. Kamalnayan Bajaj delivered at the 19th annual general meeting of the company. If the working results are any guide, the company has definitely turned the corner in its march towards stability and progress. To give effect to its expansion programme, it has entered into a technical aid agreement with the well-known British steel foundry, Messrs. David Brown Industries Ltd., for a period of 8 years during which the company will get technical guidance on problems relating to the steel foundry including training facilities for its personnel in the works of the British partner.

The relations of the management of the company with labour have been quite cordial. The average earnings per worker have increased by 57 per cent over his earnings in 1950-51, while the cost of living index during this period has increased by 13 per cent thus giving a net increase of 44 per cent in the earnings of the workers.

The Tariff Commission which has been entrusted with the work of fixing conversion charges for the steel re-rolling industry for converting steel billets into bars and rods, the Chairman reveals, is at present seized with the matter. It is hoped that the Tariff Commission and the Government of India would make, as in the case of major steel producers and the cement industry, adequate provision in the costs payable to the industry so as to cover the industry's need for rehabilitation, modernisation and expansion. Since the prosperity of the country is linked with the hard core of the Plan it is essential that every help be given to the industry for its rehabilitation and modernisation programme. The recommendations of the Committee on Electrical Furnaces, Steel Foundries and Steel Re-rolling Mills which was appointed in July 1956 ought to be implemented now as much time has elapsed since the report was submitted to the Government.

Economic Report from the U. S.

NUCLEAR POWER INDUSTRY

(By GUY SIMS FITCH)

NEW YORK, Nov. 5.—The infant nuclear power industry of the U.S. is fast outgrowing its swaddling clothes and is on its way to becoming a full-fledged and established business. This is the conclusion to be drawn from the realistic discussion that marked the fourth annual convention here last week of the Atomic Industrial Forum, a group of about 500 private companies engaged in various aspects of atomic energy work. More and more, the Forum showed, pioneers in this new and still largely uncharted field are now face to face with the practical realities of designing and building economic nuclear power plants. A hard-headed realization of the concrete problems to be overcome has replaced optimistic generalities. And nearly every expert at the Forum agreed that this may well be the best thing for the nation's growing nuclear industry.

At the heart of the difficulties, of course, has been the absence of any realistic precedent for computing the costs of building and operating atomic power plants. As a result, computations in most cases were too low and more in the nature of educated guesses, affecting estimates down the line from prospective owners of plants and designers, to builders and suppliers of machinery and components. This tendency toward underestimating costs is traceable, in part, to the generally rising prices of labour and equipment. But a more important factor may have been the initial inexperience in this field — an inexperience which obviously is being overcome. Thus, most of the atomic plants now under construction or being planned actually will cost substantially more than originally estimated. The cost of one modest plant, for instance, is up from \$8.4 million to \$11.5 million. Another is up from \$5.5 million to \$14.4 million. Larger plants also are affected. A proposed 134,000 kilowatt plant is expected to cost \$41 million instead of the projected \$35 million. And plans for a \$55 million private plant producing 236,000 kilowatts of electricity have twice been raised to a figure of \$90 million for 275,000 kilowatts.

It follows from this that few companies are making money at present from atomic power. But they see their greatest hope in gaining solid practical experience and winning economic rewards from it later. A company represented at the Forum, for instance, expects to be "in the black" — that is, to be making money — out of its atomic power work within four or five years. Another anticipates a fully established and stable U.S. nuclear industry within 10 years. In fact, U.S. Atomic Energy Commission chairman Lewis L. Strauss stated the belief that private industry will completely take over the development of peacetime atomic energy within 10 years, with the government's role limited to assuring uniform safety regulations. Over the next decade, according to some experts at the Forum, the market for U.S. power reactors will approximate 120 units and will have a value of more than \$2,000. In a longer range prediction, one expert whose company has been in the forefront of peacetime atomic programme

estimates the market of the U.S. nuclear industry about \$10,500 million for the 1966-75 period. Last week's proceedings are infused with a decidedly encouraging glow, within which shines the promise of practical and significant achievements in peacetime atomic power.

the symbol of business efficiency

Carbon Papers

Hands, copies and desk remain clean when Kores carbon paper is used. The copies are sharp, legible and difficult to smudge. Kores carbon papers are very economical on account of their durability.

Typewriter Ribbons

It is a pleasure to type with a Kores ribbon. The impressions are well defined and positive from the very first day. Kores ribbons will not smudge even when new and each ribbon gives 20 lakhs impressions.

Drytype Stencils

With Kores Drytype Stencils the types of the typewriter remain clean and do not fill up. Round letters do not fall out and the typewriter rollers remain unaffected. Kores Drytype Stencils are also ideal for drawing and hand work.

Kores (India) Private Limited manufacture Carbon Papers, Typewriter Ribbons, Drytype Duplicating Stencils, Duplicating Ink and Accessories, Ink Tablets, Stamp Pads and Stamp Pad Inks.

KORES PRODUCTS are obtainable from all stationers

Company Meeting

MUKAND IRON & STEEL WORKS LTD.

Speech of the Chairman Shri Kamalnayan Bajaj

The following is the speech of the Chairman Shri Kamalnayan Bajaj, delivered at the 19th Annual General Meeting of the Shareholders of the Mukand Iron and Steel Works Limited, held at Bombay on Tuesday, November 5, 1957.

Gentlemen,

I have great pleasure in welcoming you to this, the 19th Annual General Meeting of the Company, and in presenting to you for adoption the Audited Statements of Accounts for the year ended 31st March 1957 and Reports of the Directors and Auditors thereon. As the Statements of Accounts and the Reports are in your hands for some time now, with your permission, I take them as read.

The working results of the year have been fairly satisfactory and we can say with renewed confidence that the Company has now definitely turned the corner in its march towards stability and progress. The production of steel bars and rods in the steel rerolling mills of your Company has increased from 23,610 tons to 32,123 tons in 1956-57, an increase of 35 per cent. The production of steel castings has shown a rise of 63 per cent from 2,549 tons to 4,153 tons. The gross profit is Rs. 27.72 lakhs as against Rs. 16.09 lakhs for 1955-56. All this is indicative of the advance made by the Company in that direction.

It is a matter of great satisfaction to me and my colleagues on the Board that it has been possible for us this time to recommend to you declaration of dividends on ordinary and deferred shares. After the rude shock of partition in 1947 which involved the Company in a loss of its major assets in Lahore, the Shareholders of the Company have been patiently waiting for the last ten years for a return on their investment. I trust they now feel that the confidence which they placed in the management of the Company all these years has resulted not only in rehabilitating this Company but also in bringing it to its present stage of development and profit-earning capacity.

With the growing industrialization in India the demand for steel castings in the country is increasing. The Company has expanded its activities to a certain extent by making improvements. It has further planned an expansion programme for steel castings for which an application has been made to the Government of India under the Industries (Development and Regulation) Act of 1951. It is hoped that the necessary sanction will be granted by the Government shortly.

In order to plan the expansion activities of the Company on an efficient basis and to further improve the existing working, the Company has entered into a technical aid agreement with the well-known British steel foundry, Messrs. David Brown Industries Ltd., England, for a period of 8 years during which the Company will get technical guidance on problems relating to the steel foundry including training facilities for the personnel of the Company in the works of the British company.

Our relations with labour have, throughout the year, been cordial and happy. As you may have noticed from the chart published in the Annual Report, the average earnings per worker of your Company have increased by 57 per cent over his earnings in 1950-51, while the cost of living index during this period has increased by 13 per cent, thus giving a net increase of 44 per cent in the real earnings of the workers. In the ultimate analysis, after a certain limit, the increase in the workers' earnings will have to be achieved only by increase in his skill and better application of his mind to the work allotted to him as would result in greater productivity.

In order to combat inflationary trends in the economy, of which wage increases are contributory factors, reduction in costs is necessary by increasing productivity. The quality of the products should also improve. For this purpose improvements and modernization in plant and equipment should continue to be made by the industry. I trust that the Government of India would give all necessary facilities to the industry for this purpose, and such foreign exchange requirements as may be essential would be given high priority.

To meet the increasing needs of the Company for finance, the Directors propose to issue new ordinary share capital. Sanction from the Controller of Capital Issues has already been received for Rs. 20,47,475.

In my address to you last year I had referred to certain difficulties. The question of increased power supply was one of them. I am glad to inform you that additional power has since been sanctioned to us by the Government of Bombay. Regarding the rates of electricity, the tariff has recently been revised by the suppliers and there is a slight reduction of rates though not to the extent was desired. The question of railway siding is still pending.

The Tariff Commission which has been entrusted with the work of fixing conversion charges for the Steel Re-rolling Industry for converting steel billets into bars and rods is at present seized with the matter. Its report is likely to be ready in the early part of 1958.

The need of the industry for rehabilitation and expansion was also referred to by me in my speech last year. I trust that the Tariff Commission as well as the Government of India would make, as in the case of the major steel producers and the cement industry, adequate provision in the costs payable to the industry so as to cover the industry's need for rehabilitation, modernization and expansion.

The Committee on Electric Furnaces, Steel Foundries and Steel Re-rolling Mills appointed by the Government of India in July 1956, to which reference was

made by me last year has submitted its report to the Government, which is now on the floor of the Parliament. The Government have not yet taken any final decision on the same. The report has made out a strong case for import of sufficiently large quantities of billets on the ground that the steel rolled by this industry is needed for the projects which are part of the core of the national plan. It has also recommended that the existing rolling mills should be permitted to improve and modernize their plants for better and more efficient working. In the matter of the steel foundry industry also, the Committee has recommended that existing industries should be allowed to expand. I trust the Government would take a favourable decision on these recommendations at an early date.

The prosperity of the industry in which your Company is engaged, in fact the prosperity of the country as a whole, is linked with the success of the Plan, or rather the hard core of the Plan. We are now amidst the second year of the second Five-Year Plan. The Plan is encountering difficulties, particularly in the availability of foreign exchange. These difficulties should not dishearten us. As our Prime Minister has repeatedly said, these are difficulties of progress, not of stagnation. The real cause for anxiety is, however, on the agricultural side. In spite of the emphasis on the industrial development in the second Five-Year Plan, food remains the key to the success of the Plan.

I thank the Executives, Staff and Workers for the efforts made by them in improving the working of your factory, without which it would not have been possible to get the satisfactory results as disclosed in the audited Balance Sheet and Profit & Loss Account which you are going to consider this evening.

COMMODITY NEWS AND NOTES

INCREASE IN ACREAGE OF KHARIF PULSES

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of kharif pulses other than tur, 1957-58, puts the current year's area at 11,907,000 acres, as against the adjusted corresponding estimate of 11,704,000 acres for 1956-57. This shows an increase of 203,000 acres or 1.7 per cent in area over last year. The increase in acreage during the current year has been shared mainly by Andhra Pradesh, Bombay and Madhya Pradesh, and is attributed generally to favourable weather conditions at the time of sowing. The increase in acreage has, however, been offset to some extent by decreases in Rajasthan and Uttar Pradesh. As between pulses, the increase has been shared generally by all pulses excepting 'moth'. This estimate generally covers the period up to the end of August 1957. Till then, the condition of the crop was reported to be generally satisfactory.

COAL RESERVES

Reserves of 11,727 million tons of coal are present in the Barakar measures of the Jharia coalfield up to a depth of 2,000 feet, according to a recent survey carried out by the Geological Survey of India. An earlier survey in 1926-28 had calculated these reserves to be 4,537 million tons, i.e., less than half of the new estimates. The newly-estimated reserves include 2,145 million tons of coking coal which are indicated to be of superior quality (Selected and Grade I), according to the Indian Coal Grading Board's classification. A large number of new coal seam outcrops have also been traced in the area as a result of this survey. The total output of coal of all grades from the Jharia coalfield during the years 1895 to 1951 has been estimated at about 450 million tons. The quantity of coal exploited so far should, according to the Survey, be 50 per cent more, i.e., 675 million tons. Most of this is likely to have been received from depths less than 1,000 feet and from the Barakar coal measures. All the superior varieties of coal of the Jharia coalfield are of coking quality, according to the Survey. The production of these during the past 50 years at an average rate of 7 million tons per year was approximately 350 million tons. This excludes 50 per cent loss during mining. The total quantity of superior coking coal exploited so far is thus to the order of 525 million tons. The balance of coal, of the total quantity exploited so far, may be regarded as of inferior grade. Besides the Jharia coalfield resources, the survey gives estimates about the Raniganj coalfield which total 180 million tons of reserves of coal indicated to be Selected B and Grade I.

NO RELAXATION OF BAN ON EXPORT OF GROUNDNUT OIL AND GROUNDNUTS

The withdrawal of export duties on ground-nut oil-cake and de-oiled groundnut meal has, in some quarters, been construed as indicative of a change in Government's general policy towards commodities which are important for domestic consumption. This view is not correct. The export duties in question were removed so that the surplus available in the country may be exported on the best possible terms. Government do not propose to relax the present ban on exports of such commodities as ground-nuts or ground-nut oil till such time as total availabilities and prices are such as to permit a reasonable amount of exports without detriment to the interest of domestic consumers.

"AGMARK" ATTA OF STANDARD QUALITY

A staple diet for a third of the people in the country, 'atta', made of whole wheat, is one of the agricultural commodities which is graded under the Agricultural Produce (Grading and Marking) Act, 1937. In 1956 a total quantity of about 3,100 tons was marked under the "Agmark Seal", enabling consumers to obtain whole-

some and pure atta of standard quality. To spread the practice of grading atta among the producers, the Directorate of Marketing and Inspection, Ministry of Food and Agriculture, has issued a pamphlet titled "Atta Grading Instructions". Besides explaining the salient features of the Act, the pamphlet gives useful information on how atta should be packed, graded and marked in the interest of both producer and consumer.

REPORT OF THE TOBACCO EXPERT COMMITTEE

The Government of India, by a Resolution, dated October 12, 1957, have accepted all the major recommendations of the Tobacco Expert Committee under the Chairmanship of Shri K. Raghuramaiah, M.P. The Committee's main recommendation regarding the criterion of assessment of non-flue-cured unmanufactured tobacco has, it will be recalled, already been implemented through the Finance (No. 2) Act of 1957. The Committee has reported that accurate classification of tobacco for purposes of assessment, on the basis of percentage of use for the manufacture of biris in specified areas, is not possible and on the other hand has encouraged smuggling and given rise to malpractices. Restrictions on the movement of lower-rated tobacco from one area to another where it was assessable at the higher rate has resulted in flow of trade from higher-rated to lower-rated areas, causing hardship to certain varieties of tobacco. The Expert Committee has, therefore, recommended that in order to provide a uniform and stable basis of assessment, varieties of tobacco which, by reason of their physical form and characteristics, viz., tobacco cured in whole leaf form and tied or packed in bundles, bunches or hanks; or in the form of ropes twists or coils; dust of tobacco, granules of tobacco not larger than 1/16" sq. in size (including similar granule of stems); and uncrushed stems larger than 1/4" in size are incapable of being used in the manufacture of biris, should be assessed at the lower rate and all other tobacco should be assessed at the higher rate. The Committee has also "inter alia" recommended that:-

(i) processing of tobacco into a form in which it could attract the lower rate of duty should be freely permitted in warehouses;

(ii) the present statutory time-limit for storage of tobacco in curer's bonded store-rooms should have a provision for extension in deserving cases.

Korea

It is said that an ancient ruler of Korea, to stamp out all conspiracy against him, made the people wear very large hats. His reasoning was that if men cannot put their heads together, they cannot whisper, and therefore cannot conspire.

This tale may or may not be true, but the fact remains that Korea today has many elaborate hat styles.

Here is a Welsh style hat tied under the chin. The long loose kimona style coat covers baggy trousers, and the shoes are made of thick felt.

There is no end to the variety of costumes all over the world.

Wherever you go
—they're good

"Our highways of to-morrow ...

can be built by
CATERPILLAR*
*Caterpillar and Cat are Registered Trademarks of Caterpillar Tractor Co., U.S.A.
to-day!"

Because India's expansion programme is in full swing many new industries are coming into existence and due to the 'Grow More Food' campaign more food is being produced. More and more goods are being carried by road transport.

To open up new areas, to take care of the increasing traffic, new roads must be built and old roads have to be improved.

Better roads can be built with Caterpillar equipment. You do not save time by stopping the clock. Neither do you save money by buying cheap equipment. Caterpillar equipment will save you both time and money by giving you better output with less downtime and more economical operating costs.

Invariably the first choice among Government engineers and leading contractors, CATERPILLAR will, no doubt, play a leading part in building India's future Highways.

CATERPILLAR* Paving the way to India's progress

The Failure of a Funeral

agitated debate on the Finance Minister took place in the Lok Sabha on Wednesday Thursday this week might be summed up in the phrase "The Failure of a Funeral". The

Communist Party of India—aided misguidedly in this matter by Acharya J. B. Kripalani—sought ostensibly to dismiss the Finance Minister and to arrange his departure with every sign of

most truths of Indian agriculture are hidden behind a mesh — or an ambush? — of statistics, which resist, and probably will resist for all time, precise evaluation, — whether by curve fitting, or by even more sophisticated tools in the statistical laboratories of the world. Thus the pseudo-scientific estimates contained in Chapter V of the Food Grains Enquiry Report can be no better, even if they are no worse, than the raw material on which the ponderous tools have gone to work.

Two possibilities — and possibly only two — need to be entertained. The first is that the raw material is moderately sound; the second that it is untenable. In the first case, the Committee's conclusions would appear to be moderately sound, in the latter the whole report is built upon sand. Since the latter alternative can never be a guide to policy, it is wise to accept the fundamental analysis of this report at least as a basis for further argument. But it would be quite foolish to attach to what necessarily must be substantiated guesswork the abject veneration given to a profound revelation. It is wise to be prepared for the worst, but one need not in desperation come to the conclusion that we live in the worst of all possible worlds. Almost certainly, the authors have placed themselves, so far as production is concerned, at the lowest limit of doubt permitted by available statistics.

As firmly as it can, the Committee asserts that the current production targets of the second Five-Year Plan are untenable. Working by different statistical methods, the authors arrive at the conclusion that the likely production of 'superior' grains in 1961 may be 54.4 million tons against the estimated demand of 56 million tons, and the increase in total food grain production during the second Five-Year Plan may be of the order of 10.3 million tons — representing only two-thirds of the Plan target. This conclusion amounts to a bitter censure of the Government of India and all its works in the agricultural field. How, it will be asked, has failure been so complete? Obviously, if the analysis in this report is to be accepted, the whole basis of the second Five-Year Plan is undermined.

It is no solution, as the Committee thinks, to provide on paper for imports to overcome a shortfall of something like 5 million tons. It is one thing to make an arithmetical balance sheet; it is quite another to finance imports of this order and obtain supplies under P.L. 480 loans, which may expire in March 1958. Precisely because this report looks competent, and because its desperate conclusion leaves us no short-period escape, the evaluation will need to be critically examined before it can be accepted. *The Eastern Economist* believes that the Report overstates the agricultural crisis; but this is not to imply that no crisis exists. Much has recently been written in these pages to indicate that this is the most severe economic problem of our time.

It is a just criticism of the report that its recommendations and its factual analysis belong to different worlds. If the situation were as grave as the authors make out, it would be rational, on this analysis, to recognise a grave emergency with the need for total mobilization of all talent for the rehabilitation of Indian agriculture. The relatively moderate recommendations of the authors are by no means consistent with the harrowing picture that they have drawn of the dismal failure in the field of production.

Not, indeed, that the report has no constructive side. There are many sound recommendations. The most important of these pertain to water rates under major irrigation and tube well projects and to minor irrigation, fertilisers and improved seeds. Irrigation rates, it is recommended, should be fixed on the basis of "net benefits" and not on the basis of the 'cost' principle; concessional water rates be charged in the first two years in areas where rainfall is usually sufficient; the responsibility for constructing subsidiary channels should generally be on the Irrigation Department; and concessional water rates be charged under tube wells as in the case of major irrigation projects. The other important recommendations are that the repair of existing minor irrigation works should be given as high a priority as the construction of new ones, the number of seed stores in each block be increased to at least four, chemical fertilisers to the value of Rs. 100 crores be imported, more fertiliser factories be set up to ease the strain on foreign exchange resources on account of fertilizer imports, and land reforms be backed up with a strong machinery for enforcement as such reforms, it is thought, will contribute to the growth of agricultural production.

The inadequacy of the Committee's plan for food prices is mostly related to the establishment of a Food Grains Stabilisation Organisation to undertake buffer stock operations. These operations can, perhaps, "be a most effective instrument for the stabilisation of the prices of food grains". But, then, the organisation would have to start operating, as the Committee says, "from a position of strength, with sufficient stocks at its disposal and sufficient funds to invest". The snag here is in respect both of "sufficient funds" and "sufficient stocks" for, to find itself in the position of a dominant trader in the economy and to be able to control the market effectively, the Organisation would require much more than Rs. 100 crores for its purchase operations. And it is also expected to build up reserve stocks of 2 million tons, besides the buffer stocks (which would probably have to be much larger) for market operations. And apart from stocks, where from will the fund of skilled knowledge to operate so complicated a commercial venture come? All the experience of the world shows that food grain commodity markets are the most dangerous and the most unpredictable animals of their kind. How can socialisation — whatever this much-abused word may mean in this context — solve problems for which no human mind has hitherto shown itself capable? Or does this Committee really think that what this exacting problem needs is only one more slogan?

Thus it comes about that this stimulating essay has not made less arid the difficult and unexplored regions in Indian agricultural controversy. The conclusions appear too pessimistic; the recommendations too inconsequential; the call to action too lukewarm; the spirit behind the solution too ideological; the total result too ineffective. Perhaps these weaknesses belong inevitably to those who would venture with merely human minds into one of the most intricate problems which God invented with his wonderful world. Perhaps one day in His compassion at this terrible affliction, He will also throw down the key which will unlock the mysteries of this verse. Who then will be an instrument, like Ahmed Kidwai, to show us glimpses of the promised land?

NATO: An Agonizing Appraisal

AFTER Mr. Harold Macmillan's recent pilgrimage to Washington, it was generally assumed that the wounds of Suez have been healed. But the assumption seems to have been somewhat hastily arrived at. The North Atlantic Treaty Organization is once again in trouble. Cracks seem to have appeared in its structure. The French delegation actually walked out from the North Atlantic Treaty Organization's Parliamentary Assembly in protest against the Anglo-American decision to deliver arms to Tunisia. She has charged the United States and Britain of afflicting the Atlantic Alliance with "real danger" by their move; she condemns it as being "contrary to Western solidarity which rests on the respect by all the allies of the essential interests of each". Already boycotting the current session of the Assembly in Paris, France has threatened to keep out of the forthcoming "summit" conference as well. The decision is not quite understandable, and even less wise.

Doubtless, feeling in France runs high over a war in Algeria in which nearly 40,000 Frenchmen have been killed, a large number of them by arms allegedly brought through Tunisian territory. To allegedly brought through Tunisian territory. To this "offence", Mr. Habib Bourguiba, President of Tunisia, has recently added others, including officially backed demonstrations against the French base in Tunisia, and the suggestion that the naval base of Bizerta should be vacated. But if Tunisia is independent, as the French themselves admit, then surely she has the right to obtain arms from anywhere, not merely through France; in addition she has the right to use them where she will, and no country, France or any other, may dictate conditions upon this. Tunisia is a sovereign State. On the other hand, it was incumbent on the Western countries to provide Tunisia, "which had freely chosen to identify itself with the West, the opportunity to purchase its means of defence" from them. Refusal to do that would surely make her dependent on Egypt, and indirectly upon Russia. The West can ill-afford to let Mr. Bourguiba drift into the area of Russian influence.

The irreconcilability of objectives among the Western nations seems also to be emphasized in the recent survey carried out by the North Atlantic Treaty Organization's political advisory group. The group has pointed out that the ground forces of the Organization were "disintegrating", and that the process must be stopped "at all cost". The "disintegration" has begun consequent upon the Soviet Union's latest strategic, technological and political successes which have shaken Western Europe's confidence in the United States' policy of "massive retaliation" for deterring Russian aggression. Geography as well as past experience has perhaps much to do with the sense of insecurity on the Continent. Western Europe is within easy reach of even the conventional forces of Russia. Moreover, both the United States and Britain place more reliance on nuclear striking power than on the defence arrangements in the NATO countries. This means, in effect, that if there is a war, the West's strategy of "massive retaliation" may not be sufficient to prevent advance and occupation of the Continent up to the Channel coast. It is a different matter, of course, whether a total war is at all possible any more, and is a sufficiently reckonable factor in strategic calculation. Ours is a time of "local" eruptions, blisters caused by

the cold war; ours is, in truth, the age of "war by proxy".

However, the danger of war may be dismissed as the figment of a defeatist's imagination only at peril. The NATO political advisory group's depressing survey admits that Soviet penetration of the Middle East, France's colonial wars in North Africa, and Britain's increasing reliance on strategic thermonuclear forces, to the detriment of its contribution to the NATO shield, have "disorganized" Western defences. Judging by the pleas of Western European members of the Atlantic Alliance for stronger ground forces for NATO's defence, they have always doubted the effectiveness of the "great deterrent". They have, moreover, tended always to accuse the United States and Britain of not sufficiently appreciating the threat of Soviet invasion, separated as the two are by water barriers. NATO's Continental members give, indeed, the impression that they have even begun to contemplate the only "safe" alternative in walking out of NATO and making peace with Russia—of course to the latter's advantage.

Such policy is self-defeating. International Communism has demonstrated repeatedly that it prefers to expand by propaganda, subversion and economic penetration rather than by aggression and violence. What is needed, therefore, is better integration between the NATO partners. This is necessitated by the need for an efficient defence system. The NATO countries have hitherto insisted on maintaining their own forces in each of the three arms—air, land and naval. This has not at all resulted in the creating of a properly balanced force for the alliance as a whole. The need is imperatively for a common plan for NATO, an equitable division of the common effort and subsequently a common defence budget. This will require ruthless re-organization of the NATO Council—its supreme governing body—so that it is no longer bound down by the unanimity rule but is able to decide on the spot the nature of the aggression committed, and whether the use of nuclear weapons would be justified. What is proposed here is, in short, the setting up of a Cabinet of the Western World, empowered to bypass national parliaments and commit countries to war if need be. Mr. Macmillan may have had this in mind when he recently remarked: "... Nations of the free world must in the near future make an even more and significant contribution of their national sovereignty to the common cause".

It is very doubtful if the member countries will be prepared at this stage to make such a sacrifice. Nationalism is of course outdated, and it is probable that most people would admit this. But the sentiment of patriotism, the root of nationalism, has been nurtured for centuries. It would be too much to expect that even the unprecedented danger of a world conflagration should widen individual and national horizons all at once. But the North Atlantic Treaty Organization will continue to be a weak bastion as long as its leading members are torn by contradictory objectives. Fears mutually shared cannot bear unity. It is necessary, therefore, to have a positive plan of action. Without such a plan the free world cannot prevail, cannot safeguard freedom, and cannot extend it in a world threatened by the most formidable and totalitarian society that it has ever known.

A Fair Deal to the States

THE Second Finance Commission has recommended, and the Government of India have just accepted, what is claimed to be a balanced scheme of devolution of some revenue and grants from the Centre to the States. The effect of the proposed scheme will be that about Rs. 140 crores a year by way of shares of taxes and fixed grants-in-aid will be transferred to the States in the five-year period beginning from April 1, 1957, as against an average sum of Rs. 93 crores received by them under the first Commission's recommendations in the five years ending March 31, 1957. This estimated addition of about Rs. 47 crores a year to the States' revenues may be deemed too generous in the context of the present and prospective financial circumstances of the Union which has heavy responsibilities for defence and national development. At the same time, it may be deemed too parsimonious in the context of the financial circumstances of the States which simply could not raise anything more than 35 per cent of the target (Rs. 230 crores) of additional revenue for the entire first Plan period and which have had successive revenue deficits ranging round Rs. 70 crores a year since 1955-56. Much, of course, may be said on both sides, but the fairest description of the Santhanam Commission's proposals would be that they constitute, on the whole and on balance, a fair deal to the States.

How do they constitute a fair deal? In the first place the additional devolution, to the extent of Rs. 31.5 crores a year, by transfer of shares of taxes, does not include an annual sum of about Rs. 15 crores which the States will be receiving from the new Centrally-levied tax on railway fares. Secondly, it does not include an estimated Rs. 7.5 crores being the difference between the net proceeds of Rs. 40 crores expected from the proposed additional excise duties on mill-made textiles, sugar and tobacco (including manufactured tobacco) in replacement of sales taxes on these commodities and the present income of Rs. 32.5 crores on account of such sales taxes. Thirdly, the Commission's scheme for consolidating the large number of loans (now given by the Centre to the States at widely varying and mostly high rates of interest) into four distinct categories and for rationalising the rates of interest and fixing them at not more than 2½ per cent per annum in the case of two categories of loans and at not more than 3 per cent in the case of the other two categories, would result in a reduction in interest charges of about Rs. 5 crores per annum for all the States together. As these three items together would represent an additional revenue of Rs. 27.5 crores per annum, the additional tax revenue of Rs. 31.5 crores a year under the Commission's scheme of devolution does not appear to be niggardly.

As for grants-in-aid of revenues, the position will be no less favourable for the States under the Commission's scheme, what with Rs. 39.5 crores to be transferred to them every year in the second five-year period as against an annual average of Rs. 24.5 crores in the first five-year period ending March 31, 1957. The total revenue to be transferred to the States on all the counts listed above (both inside and outside the Commission's scheme of devolution) would thus come to Rs. 167 crores per annum. Thus the total revenue deficit (Rs. 77 crores) in the 1957-58 State Budgets will be nearly wiped out by the additional revenue of Rs. 74 crores (Rs. 167 crores minus Rs. 93 crores)

to be transferred to them. In the circumstances, the Commission's claim that it has framed its scheme of devolution so as to enable the States to balance their revenue budgets seems to be quite justified. On the other hand, the Commission's claim that it has taken into account the requirements of States for their second Plan schemes on the revenue side does not appear to be wholly justified. The exact position in this regard is that if the pre-1951 figure of about Rs. 50 crores by way of States' share of income-tax is not taken into account, the amount really available for the States' revenue schemes under the second Plan would come to Rs. 117 crores (Rs. 167 crores minus Rs. 50 crores) per annum or Rs. 585 crores in the five-year period. It is, however, gratifying that the shortfall on this account would only be Rs. 125 crores in the States' plan expenditure of about Rs. 710 crores assigned to their revenue budgets.

This helpful devolution of revenue from the Centre may still not solve all the financial difficulties of the States if they seek to make up, in the remaining years of the second Plan, the first two years' shortfalls in their Plan expenditures by assigning more schemes to the revenue budgets. In which case, revenue deficits may continue to plague them in the years to come. It is by no means certain that the States will take the sound advice of the Finance Commission contained in these words: "We cannot over-emphasise the paramount importance of States balancing their revenue budgets. . . . With a massive development plan under implementation, there is a grave risk of the budgetary deficits of the States endangering the country's economy by adding to the inflationary potential. Now that all expenditure creating permanent assets are being treated as capital outlay, deficits on current account covered by borrowing result in an unfair shifting by the present generation of its burdens to future generations. Development expenditure should, therefore, be adjusted to the available resources and States should not run into a revenue deficit even for meeting such expenditure".

That last sentence in the quotation means that the State Plans may have to be somewhat pruned. If they are not so pruned, there will be no Finance Commission to come to the States' rescue for another five years and they will have to raise additional revenue by taxation for which there is not much scope except in the case of land revenue. But, fortunately or unfortunately, any proposal to raise land taxation would not be palatable to the ruling Congress Party which derives its basic strength in the rural areas from the millions and millions of landowning agriculturists. It has been argued, for example, in a Special Article in a former issue of *The Eastern Economist* that "the comparatively greater prosperity of the landowning classes as a result of the higher prices they have been receiving for their surpluses since decontrol and on account of the larger aids they are being given through Community Projects and otherwise provides good enough justification for stepping up the rate of land revenue assessment to an extent that might be agreeable to them in the context of their increased well-being." It would require a good deal of courage on the part of Congress Governments to take what they believe to be, but what is really not, an unpopular step.

Here comes the 7-15...!

People in the South say: "Set your watch by the TVS buses—they are always exactly on time". Building a reputation like this for punctuality and efficiency is no easy matter...it takes a lot of supervision, skilful planning and technical experience.

Behind the scenes are the TVS workshops, where the largest private transport fleet in the South is regularly serviced and maintained. On converting their fleet from Petrol to Diesel engines, a heavy duty crankcase oil was needed. Shell Rimula Oil 30—an oil with a high additive content—has been chosen for this job, and TVS tell us that they are very pleased with its performance.

T. V. Sundram Iyengar & Sons in Madras State is one of the many industrial undertakings—large and small—which have come to rely on lubricants bearing the Shell or B.O.C. name and trade mark.

To reach our goal of self-sufficiency in food production, millions of acres of arid land are being reclaimed for cultivation. Huge dams are being erected, miles of canals are being dug and vast tracts of land being cleared and levelled.

In all such major projects, construction engineers and contractors everywhere invariably rely on Caterpillar equipment for their rugged strength and versatility.

THE WEEK'S NOTES

KHRUSHCHEV'S PREMATURE CLAIM

THE RECENT Jubilee Session of the Supreme Soviet of the U.S.S.R. heard Mr. Khrushchev saying that "within the next 15 years the Soviet Union will be able not only to overtake but also surpass the present volume of output of important products in the U.S.A." The Soviet leader, of course, conceded that U.S. economy too might make headway in that time but regarded the task of speedily overtaking the United States as perfectly feasible in view of the fact that the rate of growth of Russian industry was much higher than that of American industry. Mr. Khrushchev also made the forecast, on the basis of preliminary figures supplied by Soviet planners, that in about 15 years' time from now the annual industrial output in his country would attain the following levels: Steel — 100 to 120 million tons; petroleum — 350 to 400 million tons; natural gas—270 to 320 billion cubic metres; electric power — 800 to 900 billion kilowatt-hours; cement—90 to 110 million tons; and footwear—600 to 700 million pairs. These are impressive figures, but they would have to be examined more carefully before Mr. Khrushchev's claim can be substantiated or rejected.

This examination is easily done with the help of that objective and scientific study prepared for the Joint Economic Committee of the U.S. Congress (vide: Special Article on "Industrial Growth in the United States and the Soviet Union" in "The Eastern Economist" issue of November 8 last). According to this study, the annual average rates of growth of production for the relevant industrial commodities (listed by Mr. Khrushchev) in the United States in the period 1928-55 are 2.7 per cent, 3.8 per cent, 6.8 per cent, 6.7 per cent, 1.9 per cent and 1.6 per cent respectively. If it is assumed that these rates of long-term growth alone will be maintained in the next 15 years, the output of these commodities by the end of 1970 in the United States may be estimated at 150 million tons in the case of steel, 525 million tons in the case of petroleum, 535 billion cubic metres in the case of natural gas, 1,250 billion kilo-watt hours in the case of electric power, 65 million tons in the case of cement and 785 million pairs in the case of footwear. It may be seen that the expected levels of output of these commodities in the Soviet Union will still be less than those in the United States except in the case of cement. At the same time, it cannot be validly assumed, as Mr. Khrushchev all too readily assumes, that the present (1955-56) far higher annual growth rates of production for these commodities will continue to be maintained in the next 15 years in the Soviet Union. In which case the Soviet levels of output will be less than those visualised by Mr. Khrushchev. In any case it would appear that even if the most favourable growth rates are assumed for Soviet industry and the least favourable ones for American industry, the former will not have overtaken the latter in terms of absolute output in 15 years' time.

CHINA'S POLICY FOR STEEL

COMMUNIST CHINA'S planners are reportedly initiating a new policy whereby the iron and steel industry is to be developed in the period 1958-62 not by constructing giant steel projects but by launching medium and small plants. The revised plan would involve the dispersed construction of eight medium plants — one each in Hopei, Shantung, Shansi, Kiansi, Kiangsu, Hupeh, Kwangsi and Szechwan, with an average annual capacity of 150,000 tons of steel — and of nine small plants — one each in Honan, Chekiang, Anhwei, Fukien, Kansu, Hunan, Kweichow, Uighur and Kwangtung, with an average annual capacity of about 60,000 tons. These 17 plants, it is estimated, will have a total annual output of about 1.7

million tons of steel. And together they will involve a capital investment of up to 700 million 'yuan' only as compared to an investment of more than 1,000 million 'yuan' required by a big plant with an annual capacity of 1.5 million tons.

This estimate, even if correct, of smaller capital investment on the 17 medium and small plants together cannot be the only reason for a decentralised structure proposed for the future development of China's iron and steel industry. Perhaps there are some political and strategic reasons for the planned dispersal of new steel plants practically throughout China; perhaps regional claims in the matter of location of heavy industries are pretty strong. The reasons can only be guessed, for there is as yet no light on them. Whatever be the reason, there is at least no warrant for the impression that there are sufficient reserves of iron ore and coal in each of the 17 Provinces and there need not, therefore, have to be a further concentration of heavy industry in Manchuria which has large natural resources. As all the 17 provinces do not have adequate natural resources, the dispersed construction of new plants would involve long-distance transportation of either iron ore or coal to many of them. This would add to their production costs which, on account of the comparatively small capacity of a medium or small plant, might be already higher than in a big plant.

Even if there comes about some economy in capital investment on medium and small plants as compared to a big one, there will probably be none in the cost of production of steel. Perhaps Communist planners are not quite mindful of the cost factor in the early stages of planning for more production. (Incidentally it is only now that the need for appraising the work of industrial units "not only from the angle of output but also from the stand point of costs" is being emphasised in the Soviet Union.) Whether China's experience in "the dispersed construction of medium and small iron and steel plants" will have any lesson for India can be known only in 1961 when the new plants will begin to produce. However, as of today, India's three giant steel projects — at Rourkela, Durgapur and Bhilai — are already in several stages of execution and, whatever their ultimate cost, they will have to be completed. It is, therefore, too late in the day to rectify any distortion that may have taken place in the structure of public investment as a consequence of these projects. If, by any chance, China were to succeed in her new policy of "small capital investment for quick returns" and in producing steel at the same unit cost as in the case of a big plant, the lesson of her success would not, of course, be lost on India where there is as much need as in China for a possible lower capital-output ratio as far as the iron and steel industry is concerned.

DR. K. I. SINGH'S RESIGNATION

KING MAHENDRA of Nepal has accepted the resignation of the Premier, Dr. K. I. Singh, and imposed direct rule "for the time being". It is curious that neither the King nor the outgoing Prime Minister has made public the reason for the resignation. Lasting for 110 days, Dr. Singh's Cabinet, sixth in six years, reportedly fell on some vital administrative issues over which he differed with the King. According to some sources, Dr. Singh wanted some of the key appointments in the administration to be treated as "political" and wanted to remove some high officials who had originally been appointed by the King.

Whatever may be the reason of Dr. Singh's resignation, the King's dilemma is unenviable: if he under-

takes another prolonged period of direct rule he will unite almost all the politicians against him; if he admits the "old guard" politicians to office they may attempt to curb his powers and do nothing to mitigate the difficulties that beset the country. Moreover, the political circumstances obtaining in the Himalayan Kingdom at the moment are hardly helpful for the unfettered functioning of any democratic Government. Differences are bound to arise at some stage or other between the King and his nominated Government on various issues concerning the administration, leading to political crisis. The nominated office-holders prefer to consider themselves nonetheless representatives of the people.

Perhaps the only solution of the chronic state of instability in Nepal is an early general election. This alone can test the democratic credentials of the various parties and give the necessary authority to carry out its programme. The least that the King can do is to order an election as early as possible. In truth, only an election can clear the political air of that country and give a reasonable chance for the formation of a stable government and save the country from a catastrophe. After all, how long can the afflicted people continue to put up with the goings on of a small, self-seeking and irresponsible coterie? Events seven years ago demonstrated that the capacity of even proverbially patient Nepalese may be tried.

SOVIET AID TO INDIA

AN AGREEMENT was concluded between India and Russia over the disbursement of the 500 million rouble credit (roughly equivalent to Rs. 60 crores) offered over a year ago. The terms of credit are even more liberal than those for the Bhilai steel plant, although the rate of interest will be 2½ per cent in both cases. In the case of the present Soviet loan, repayment will be made in 12 equal annual instalments beginning one year after the delivery of the machinery and equipment in respect of each of the five projects covered by this loan. Under the agreement the Russians will set up a heavy machine-building plant with an annual capacity of 80,000 tons, a coal-mining machinery plant with an output of 30,000 tons, and an optical glass factory that will manufacture 200 to 250 tons of ophthalmic and optical glass every year. In addition, the Russians will set up a thermal power station with a capacity of 250,000 kw.h., and provide equipment for the Korba coal mines. This equipment will include machinery for mining 2.5 million tons of coal at Korba every year, a washery for processing two million tons of coal and a central workshop for repairs and maintenance. If the foreign exchange needs of these five projects exceed 500 million roubles, further credits will be provided. The Soviet Union will also train the Indian personnel required for manning the five projects. A more favourable agreement would be difficult to envisage.

While all the projects will help India save a great deal of foreign exchange every year after they are completed — during the current plan period according to the tentative schedule — the heavy machine-building plant will be an asset in India's drive towards industrialisation. At the moment, though three steel plants, with an individual capacity of one million tons, are being constructed in the public sector, all the machinery required is of foreign manufacture and a drain on our exchange resources. When the heavy machine-building plant goes into operation, it will be possible to set up steel, cement and sugar factories with indigenous machinery and without drawing upon our foreign exchange resources. A solid foundation for India's industrialisation will then have been laid.

The announcement of the loan from Russia will be contrasted by many with the time the United States is taking to give aid to India. But lest the perspective

gets warped, it is well to remember certain facts. Russia's total aid to date is a little over Rs. 1,325 million, while India has obtained from Western sources, mainly the United States, aid totalling about Rs. 7,950 million. More. During the current year India has received from America as much as Russia's total aid and a good portion of it in the form of grants, or of loans, which although technically repayable, are in fact lent back to India for development purposes.

CRIME AND PUNISHMENT

A HUNDRED-POINT "charter of demands" was placed before the Government of Uttar Pradesh by the first-convicts and ex-convicts conference which ended its three-day session last week at Lucknow. The demands included responsibility for jail administration to be entrusted to panchayats elected by prisoners; abolition of forced labour; training of prisoners in traders and vocations according to their "natural aptitude"; and arrangement for marriages of those women convicts who express a desire of matrimony. The conference also proposed the imposition of a tax on the general public for providing financial assistance to the families of the prisoners who had no means of subsistence. The primary object of the tax, it was pointed out, was to keep society "vigilant to this problem". In keeping with the changed attitude of the Government towards criminals, it was urged that jail should be described "Sudhar Grah" (Reformatory) and punishment as "Sudhar". The conference had been convened by the Uttar Pradesh Government to devise it on how to tackle the problem of crime and punishment.

Doubtless, the prison system in India still retains some degrading and barbarous features and needs radical change. The ugly incident in the Ferozepur Central Jail some months ago is a reminder that an advance towards a more humane and civilized means has to be found for the maintenance of discipline among prisoners. But it is one thing to improve the existing system and quite another to substitute it by an alternative under which a prison becomes not so much a place of correction as a pleasure resort! If the demands put forward by the conference are accepted, it will not be surprising if in these days of high prices and growing unemployment, many will be tempted to commit petty crime to solve the problems of food and shelter.

The problem of prison reform and rehabilitation of the criminal as a useful member of the community is part of the wider social problem, that of creating conditions in which an individual aberration is considered as psychological and curable, defect. It is now being increasingly realised by criminologists that unhappy home conditions impede the development of a socialized character and produce juvenile delinquency; that poverty, unemployment, hunger, and social misery generally are to a great extent responsible for the disintegration of human personality, suicides, prostitution and trafficking in women. What is, therefore, needed is the building up of a happy, prosperous and therefore, generous, society in which an individual is not faced with the various existing fears. No doubt, till such a society is established an ex-convict will have to be assisted to enable him to restart life without, as far as possible, being subjected every day to social discrimination and censure. It may be mentioned that the police official who sends for an ex-convict for interrogation as soon as the report of a crime is lodged with him is the principal obstacle to this process of rehabilitation. Such interrogations are not only humiliating; they also perpetually remind the ex-convict of his anti-social activities, and also that he can never again be an honourable member of the community. The major necessity in the present conditions is a change in the attitude of the police and of society towards the ex-convict; other idealistic reforms can follow.

A Window on the World

THE CASE FOR FLEXIBLE EXCHANGE RATES

By

ODYSSEUS

ONE of the disadvantages of flexible rates of exchange is that they make it more difficult for people to grasp the elementary truths behind a balance of payments deficit. They focus attention on symptoms, such as the "rise in the cost of living," whereas the discipline of the gold standard focuses on the facts, e.g., that certain export industries are no longer producing at internationally competitive prices. In these circumstances a nation must either resign itself to consume less or must make efforts to raise its productivity.

That was the proposition that I elaborated here last week. Since then I have had the good fortune to spend four stimulating hours with Friederich Lutz, Professor of Economics in the university of Zurich. The old hands who have fought and bled in many an economic battle with this column will know my respect for the late Walter Eucken, the great German economist, whose views on the abolition of state planning and in favour of free enterprise, adopted by the West German government, have given Western Germany the strongest economy in Europe. Professor Lutz is the most distinguished of those economists who studied under Walter Eucken. His views are entitled to attention because the soundness of the theories of the school to which he belongs have been factually demonstrated in resounding fashion. In 1946, 25 per cent of houses and factories in Germany lay twisted ruins. Such goods as were being produced could only be sold on black markets, the existence of which alone enabled any goods to be forthcoming. Firms selling in legal markets could not replace their raw materials nor keep their workers. Vast hordes daily trekked into the country, laden with old clothes, bits of furniture, anything which had survived the bombs, in hopes of bartering them for food. Following Walter Eucken's teachings, Ludwig Erhard, Minister for Economics, had the courage, in the face of the allied occupation authorities' strongly expressed disapproval, simultaneously to reform the currency, abolish rationing, and inaugurate a freely competitive economy.

NO "GERMAN MIRACLE"

The result is known as the "German miracle." This is nonsense. It was the application of elementary economic commonsense. Once a currency in whose stability the people had confidence had been restored, goods reappeared in the markets overnight, and once business men knew that if they made a profit they could keep it, production raced ahead. (As I gave the basic figures last week, I need not repeat them). And the workers have their share in this prosperity: hourly wages rose from DM 119 in 1949 to DM 198 in 1956, compared with the equivalent of DM 80 in Hitler's controlled and planned economy of 1938.

This article, however, is not about Germany's fabulous economic success but about balance of payments problems. I cite Germany's prosperity only to suggest that you cannot dismiss Eucken's disciples as impractical theorists. They have erected to themselves the most solid economic monument in the whole contemporary world.

Professor Lutz agreed broadly with my observations on the gold standard, notably that it imposed its own discipline, but he emphasized that it was this dis-

cipline which no country seems likely ever to accept again. To argue, as I did, in favour of the gold standard was, he suggested gently, unimpeachable but unrealistic economics.

After listening to him, I feel that the currency dilemma which faces all countries today is that while all authorities regard the gold standard as obsolete, their policies are conditioned by the idea of the fixed rate of exchange embodied in the gold standard. All countries try to defend their rates of exchange with all the resources at their command and then, if economic forces gain the upper hand, they carry through a forced devaluation to a new rate which becomes another point to be defended until it too has to be abandoned, and so on. Thus we have the disadvantages of the gold standard without its compensations.

The re-establishment of convertible currencies is the first objective and Professor Lutz asks whether this requires the introduction of flexible rates for at least a limited period after which the return to fixed rates may again be envisaged. Next, he asks whether the return to fixed rates in the longer run is in itself desirable or not. I confine myself this week to the problem of attaining convertibility and reserve the long term problem for next week.

Since "convertibility" is often loosely used let us begin with definitions. "Full convertibility" exists if everyone, whether a resident of the country or a foreigner—can change the currency freely into any other. "Convertibility for foreigners" exists if foreigners who acquire the currency can change it freely, whereas residents cannot. "Convertibility for residents" means that residents can acquire foreign currency but foreigners cannot convert into other currencies. All three types of convertibility are compatible with quantitative import restrictions. Some authorities, however, consider the absence of import restrictions as part of the definition of "convertibility for residents" on the grounds that a resident who cannot import whatever he wants is in fact prevented from making the purchases of foreign currencies that he would otherwise make. Professor Lutz prefers to talk of "liberalisation of imports" for the abolition of quantitative import restrictions and reserves the term "convertibility" for the freedom to exchange currencies against each other. Otherwise we should be obliged to admit that the convertibility of currencies had disappeared in France and elsewhere as far back as 1930 when quantitative trade restrictions were imposed long before the breakdown of the gold standard.

FRIGHTENED CAPITAL

While full convertibility is our aim, it cannot be attained in one step. Nor does it seem likely that convertibility for residents will be allowed soon because this implies freedom of capital movements—a step which many countries hesitate to take for fear of flights of capital (a fear which seems to me to be the strongest condemnation of the economic policies that they must be following, for if you take steps to ensure a flourishing economy, as in Germany, you will attract capital).

The practical issue lies between (a) "convertibility for foreigners" and (b) complete liberalisation of imports (or "convertibility for residents" for current—as opposed to capital—transactions).

Convertibility for foreigners would direct international trade into channels preferable to those in which it moves at present because it would get rid of the motives for discriminatory trade practices. Thus if the UK introduced convertibility for foreigners, she would no longer have any advantage in discriminating against US imports, since an import surplus from any other country could deprive her of dollars just as much as would an import surplus from the USA. Therefore if the UK could not achieve convertibility for foreigners without the aid of import restrictions, she would at least impose such restrictions in a non-discriminatory way, e.g. restrict luxuries no matter whence they originated. In other words, UK importers would be able to buy, to the extent that they were allowed to buy at all, wherever goods were cheapest, a result in the UK's own best interests. This type of convertibility would also benefit the UK by making sterling more attractive to hold and by removing the discount on transferable sterling in relation to the dollar.

Convertibility for foreigners implies that the country should have attained approximate equilibrium in its overall balance of payments or—where it trades with soft currency countries with which it has an export surplus the proceeds of which are not convertible—that it should even have an overall surplus; and it may be unable to attain this equilibrium or surplus without the aid of import restrictions. Professor Lutz then balances the advantages of non-discriminatory trade practices against the disadvantage of maintaining or tightening import restrictions. He concedes that many economists believe that the liberalisation of imports should precede convertibility, but he argues that the double objective of the return to convertibility, even if only convertibility for foreigners, along with the liberalisation of imports, may be impossible without flexible exchange rates.

There are three categories of countries: (1) those which despite import restrictions still have balance of payments deficits; (2) those which with the aid of import restrictions just manage to keep their payments in equilibrium; and (3) those which have surplus balances. In category (3) import restrictions are reduced to a minimum, retained not for the balance of payments but from protectionist policy. If in these circumstances all countries remove import restrictions, and if all exchange rates remain fixed, category (1) will increase its deficit, category (2) will run into a deficit, and category (3) will increase its surplus. In these circumstances, categories (1) and (2) cannot introduce convertibility; they will remain soft currencies, having their deficits financed by the surplus countries through the European Payments Union, or through the machinery of their sterling balances in London, unless either (a) the deficit countries deflate their domestic income and price levels in order to remove their deficits, or (b) they restore balance of payments equilibrium by flexible exchange rates. As there will be strong resistance to deflation because of the unemployment likely to follow, flexible rates seem the way out.

Convertibility for foreigners can be introduced, at existing exchange rates, with the aid of import restrictions; and liberalisation of imports can be achieved at existing exchange rates, provided some countries, at least, refrain from introducing this type of convertibility, i.e. remain soft currency countries; both aims together, however, cannot be achieved unless exchange rates are allowed to move. All that this means is that the existing exchange rate structure is wrong and must be set right if currencies are to be made convertible and imports to be liberalised. Sudden "once-for-all" devaluations of currencies will not be the appropriate device, since the correct exchange rates cannot be calculated in advance but must be found by the market.

We will consider further next week the advantages, disadvantages, and practical difficulties of flexible exchange rates.

From a Neighbour

If there is a lot of comings and goings between Jamshedpur and Rourkela, that is only as it should be. Of all the steel plants, the one coming up at Rourkela is closest to Jamshedpur, India's first steel city.

If these comings and goings lead to an useful exchange of experience and ideas, that is again as it should be for Jamshedpur has been making steel these 50 years. And it is very happy to lend a hand with the training of engineers

*Good Wishes
to Rourkela*

and technicians for Rourkela. There are nearly 150 of them at Jamshedpur—from key personnel to artisans.

Strengthening these ties of friendship are the surprisingly large number of old Jamshedpur faces that one sees at Rourkela. To them and their colleagues, Jamshedpur sends neighbourly greetings and good wishes.

Ambassador Service

It's 1,000 miles across the room...

RATTLE, clatter, thump goes the toy engine at the little boy's heels... rattle, clatter, thump across the room. And, to him, it's a thousand-mile trip! So what's vital to him is movement and speed.

To us, at Hindustan Lever, speed and distance are no less important. For you, we cover thousands of miles every day — every inch of India's 35,000 miles of railroad, for instance. But before our products are despatched, we must consider how they will travel. Plane or train? Road or waterway? Handcart, head-load or mule-train? The answer depends on a great many factors — for instance, on the kind of territory those goods must cross and how soon they must arrive.

But arrive they must — and arrive in the best condition. For people have come to trust the goods we make — things like Sunlight Soap and Vim, Rexona and Dalda Vanaspati. The need for these products is growing — everywhere, all the year round.

We take trouble to satisfy this need — and so add another service to the service that the goods themselves perform. We add the service of regular supply.

HLL-6-134

SIX WEEKS TO THE COMMON MARKET

(From Our Special West European Correspondent)

PARIS, November 16.

IN six weeks' time the six-power treaty instituting the European common market will come into force. Nothing will happen on that day, nor for that matter in the ensuing 12 months—fortunately. The scheme begins with a year of preparation, during which time the various national economies are meant to brace themselves to meet the terrors of competition. Still, January 1, 1958, is the great day on which the common market becomes a legal reality. So, naturally, the scheme has been the subject this month of much discussion: at the Gatt meeting in Geneva, the coal and steel pool congress in Rome, in the United Nations, and in the latest report, issued this week, of the Organisation for European Economic Co-operation.

To begin with the last-named, the OEEC report shows that West Europe is quite unprepared for the experiment and that the initial period of 12 months will be none too long if the six nations are to be ready to accept reductions in customs tariffs from the beginning of 1959. The OEEC says that the continuing increase in West German exports (a 20 per cent rise in 1956) is a "menace" for European co-operation and has posed serious liquidity problems for the whole Continent. Laying the blame for this situation on Bonn's deflationary monetary policy, the report adds: "The most urgent task then is to slow down the rate of accumulation of reserves (by West Germany). Otherwise, we could find ourselves in a position where no further progress would be possible in the direction of exchange liberalisation in Europe, and a retrogression might even occur". The measures so far taken by the Bonn government being inadequate, the report favours an increase in domestic consumption in West Germany, an increase in savings and investment there and a stimulation of foreign loans and exports of capital. "It is indispensable", it continues, "that Germany follow a monetary policy that permits a certain strengthening of the long-term capital market. It will be necessary also to find a means of increasing the loans of the public sector to foreign countries, especially since some time must elapse before capital exports can begin to flow through the long-term market".

Since this OEEC report was compiled, the deflation has eased somewhat in West Germany (the signs of this change were described in a despatch published on this page on Nov. 1) but the OEEC is correct to emphasise that even more vigorous corrective measures would only act slowly, and with the common market only six weeks away Bonn will need to move more quickly.

The case of France is no less a menace for the future of West European co-operation and it is more obvious here that balance cannot be restored quickly. Indeed the new Premier, Monsieur Gaillard, spoke this week of an effort that will "take months or years", which plainly means that France will not be in a position to stick to the time-table laid down in the common market treaty. The OEEC report says: "It is indispensable that appropriate measures be taken now to get the French economy out of its present difficulties before the common market and free-trade zone whose creation is proposed begin to function.... Without a moderation (of French investments, demand and public expenditures) France will not be able to play her

proper role in the establishment of a freer trade and payments system."

The report admits that the current French crisis, for all its acuity, should not be over-dramatised, because the French economy is expanding and prosperous as never before; its difficulties are spectacular but superficial. The report says: "Repeated inflationary situations and balance of payments crises have tended to disguise the remarkable progress of the French economy since the end of the war. In the last ten years the standard of living has soared, and the development of industry and agriculture is comparable to the achievements of almost all member-countries. The crisis that France now faces, like all those in the past, arises from the fact that a comparatively small adjustment of economic policy was not made at the proper time".

Here again, since the OEEC report was compiled the French position has improved somewhat: the devaluation of the franc is now complete except on paper, exports have increased (October exports were 23 per cent above the 1956 average), and a comprehensive tax programme has been prepared. But an immense amount remains to be done, and all the progress could be wiped out by a wave of industrial unrest and wage increases. The real danger for France at present is not so much economic as political: a foreign loan will be necessary to tide over current payments troubles and it is quite probable that the lender (namely, the US government) will insist that the Algerian war be brought to an end, if necessary on terms less favourable than French political opinion is yet prepared to accept. But even this would be a blessing in disguise. Whatever bitterness might be caused by concessions in Algeria imposed by a foreign government as a condition of financial aid, an end to this war would considerably alter the prospects for France's comfortable entry into the common market.

The congress of the coal and steel pool in Rome this month was the last before the incorporation of this institution in the general common market, and was thus the occasion for the defenders of both schemes to point complacently to the achievements of the Schuman project in its first five years. There can be some discussion about the value of those achievements but the only point worth taking up here concerns cartellisation because this trend could well be repeated in the general common market. At the Rome meeting, the socialist opposition, especially the West German deputies, accused the High Authority of permitting an excessive concentration of enterprises and of suffering firms to resort to organised price-fixing. In the debate that followed one had the curious spectacle of liberal politicians defending controls and organisation, and of socialist politicians calling for more freedom and competition.

There can be no doubt that the life of the coal and steel pool has coincided with a process of concentration, both vertical and horizontal, in this industry. The end of de-cartellisation in Germany (decreed by the Allies at the end of the war but since reversed), the resurrection of the Krupp empire, and the recent case where all the "competitive" coal producers in West Germany just happened to decide on an 8 per cent price increase at the same moment, are the outstanding examples of this process. After a complicated and devi-

ous series of manoeuvres, Krupp now finds himself once again at the head of a combine that produces 3,300,000 tons of steel a year, while Thyssen controls an organisation that produces 4.5 million tons a year now and will produce 6 million tons annually by 1960. The danger that these two large concerns will dominate the common market in coal and steel naturally disturbs West European opinion. But what is of more interest to the economist is that this process of concentration has gone on in all the member-countries of the pool, and the causes that have produced it in the case of coal and steel will henceforward be operating on many other industries inside the common market.

We might have grave doubts about whether the common market will "work", whether customs barriers will be dismantled at the rhythm specified in the treaty, and so on. But this does not remove the danger of concentration, for that process can go on even though trade does not become any freer; it is in fact a measure of protection that large enterprises take to insure themselves against the terrors of competition. The association of small businesses in West Germany has expressed the fear that the one certain result of the common market will be "a vast wave of cartellisation in Europe," and these fears were echoed this week by the corresponding organisation in France. The small businesses are of course anxious about this prospect because it is so much easier for their bigger competitors to join forces, both inside and across national boundaries.

A leading French economist wrote this week: "Logically, the first ten years of the common market should see an epidemic of closures of family businesses and

craftsman enterprises", and he added, no doubt having in mind the support that Hitlerism drew from the ruined German shopkeepers, that the sufferers in this process would go to swell the ranks of the Poujardist movement. This is, no doubt, a possibility. But once we discard the myth that the common market is some sort of restoration of economic liberalism and accept the fact that it will constitute rather an encouragement of industrial concentration, this "cartellisation" need not cause any anxiety. The economies of West Europe are handicapped by the perpetuation of a host of small and inefficient concerns and by the non-competitive duplication of larger industries behind the tariff barriers of each nation. Tax evasion and rent control are responsible for the survival of enterprises that should have fused together or disappeared long ago: businesses that are too inefficient to earn the marginal rate of profit can keep going because they are paying 1919 rents and defrauding the tax collector. If the common market brings about their disappearance West Europe will be so much the better off.

At the official level, therefore, nothing will begin to happen next New Year's Day, but governments will be able to take the fact that the common market thereafter exists as an excuse to implement policies that should be enforced in any case, common market or no. And through out next year the important consequences of the common market will already be making themselves felt at the level of private agreements among enterprises which will be making arrangements to combine or specialise just in case customs barriers begin to fall during 1959.

WORLDGRAM

AGRICULTURE

Government Aid to Fishing Firms: For speedy development of fishing industry, the Central and State governments should help in the formation of fishing companies in the private sector for catching, handling, processing and distribution of fish, both for domestic consumption and export purposes. This was one of the recommendations of the conference of Ministers of Fisheries of maritime states, which concluded its two-day session in Bombay recently. The conference adopted a set of 37 recommendations. Of these, six deal with fishing industry, including off-shore fishing and processing, and 14 with fishing operations. There are 12 recommendations relating to the fishermen's co-operatives in production, marketing and transport. The remaining recommendations are on the subject of training, utilisation of community development and NES blocks and extension in fisheries. In the opinion of the conference, the formalities regarding operation of fishing vessels and customs should be suitably revised to enable existing ventures to carry out fishing and ancillary operations efficiently. The need for observing high-quality standards for export products was also emphasised, and it was recommended that suitable steps be taken to ensure that only high-quality products are exported.

Flood Control Schemes in West Bengal: The West Bengal Government have been allocated Rs. 7 crores by the Union Government for flood-control scheme during the second Five-Year Plan. The allocation includes a provision of Rs. 3.16 crores for the flood-control portion of the Damodar Valley Project. During the current working season, schemes already in hand will be continued and a few new schemes, including the second phase of the Barnes-Domohani embankment, taken up. Satisfactory progress was made on the construction of embankments and other flood-protection works in the 1956-57 working season. Four major schemes for the protection of Jalpaiguri, Cooch-Bihar, Alipurduar and Mathabanga towns and the first phase of the scheme for the protection of the Barnes-Domohani area were completed. The protection work on the left bank of the Diana river below Kalabari in Jalpaiguri district was also completed. In addition, 14 minor schemes were taken up; of these 13 were executed. The total expenditure incurred on these schemes during 1956-57 was about Rs. 60 lakhs. Surveys and investigations for the second Plan were also carried out. Surveys were completed for the model test regarding the proposed barrage on the Karala river. Work on the model of the Teesta River near Jalpaiguri and Barnes Bazar was also started. For protecting Ramsahai Mainaguri area, a survey of the Jaldhaka river was conducted. Investigations for long-term schemes of soil conservation were undertaken. Reconnaissance surveys were made in the upper catchments of the tributaries of the Teesta river lying within the Darjeeling District and in upper Sikkim and also in the valley of the Great Ranjit river. Detailed surveys of the catchment area of the Teesta in Sikkim were in progress. The catchment areas of the river Lish, Gish, Chel and Neors were also surveyed.

INDUSTRY

Five-Fold Rise in Output of Electrical Consumer Goods: The production of electrical consumer goods, like lamps, fans, radio sets and batteries, had increased from Rs. 5 crores in 1948 to Rs. 25 crores in the current year. The target of production for the second Plan was Rs. 40 crores per year. This meant that a gap of production worth Rs. 15 crores is to be bridged.

N.I.D.C. Schemes: The Minister for Industry, Shri Manubhai Shah, stated in the Lok Sabha recently that there had been fair indications that collaboration with suitable foreign firms would be available in many of the projects investigated by the National Industrial Development Corporation. Shri Shah was replying to a question by Shri Morarka and Shri Nathavani. He said, technical aspects and project details of most of the N.I.D.C. schemes were almost finalised. Apart from technical collaboration, availability of foreign capital or suitable long-term payment facilities for plant and machinery was a vital factor. This was under active negotiations.

Stocks with Textile Mills: The Minister for Commerce Shri Nityanand Kanungo, said in the Lok Sabha recently that at the current rate of production the cotton textile industry carried stocks equivalent to just eight weeks' production. It was not abnormal for the industry to carry stocks of this magnitude. The Minister revealed the total stocks with the industry at present were estimated at about 6.06 lakh bales—3.91 lakh bales unsold and 2.15 lakh bales sold but not lifted by the trade. Shri Kanungo said, Government were watching the position of the cotton textile industry very carefully. Individual cases of textile mills requiring finance for rehabilitation of plant and machinery, etc., to help them to bring down the cost of production and improve the competitive selling capacity were considered for grant of financial assistance in the form of loans from the National Industrial Development Corporation.

Draft Specifications for Sewing Machine Components: The Indian Standards Institution has issued, for eliciting comments, draft specifications for a number of the more important sewing machine components, like bobbins, needle bars, pressure foots, and pressure bars used in the household model sewing machines. It is intended to issue similar draft standards covering a number of other sewing machine components in due course. These draft standards cover the more important dimensions of the components and the materials to be used in their manufacture. Simultaneously, the Institution has also circulated, for eliciting comments, a draft specification giving the general requirements for sewing machines of the household model. This draft specification covers hand-operated, foot-operated and motor driven machines and the requirements include the details of driving arrangements, sewing mechanism, arrangements for lubrication, as also the table, base and cover for the machines. A table of tolerance limits for the performance of different parts of the machines has also been included. Comments on these draft standards may be sent before December 26, 1957 to the Indian Standards Institution, 19 University Road, Civil Lines, Delhi.

New UK Rolling Mill: A new steel rolling mill described as the most advanced of its type in the world will shortly be completed in Britain. Built at a cost of £18,000,000, this universal beam rolling mill will produce new steel sections giving greater strength for less weight. The mill is being built by the firm of Dorman, Long (Steel) Ltd., of Middlesbrough, and represents the climax of the company's £80,000,000 post-war development scheme. It is hoped to begin experimental rolling at the mill early in 1958. The output is estimated at 8,000 tons of steel a week.

TRADE

Foreign Trade of India in July, 1957: The provisional figures of foreign trade of India by all routes—sea, air and land—on private and Government accounts during July 1957, according to data so far available in

the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise, excluding transit trade of Pakistan and other overland foreign countries viz. Nepal, Tibet, Sikkim and Bhutan: Exports Rs. 55.44 crores, re-exports Rs. 35 lakhs, imports Rs. 81.04 crores; Total trade Rs. 136.83 crores. Treasure: Exports (including re-exports) of currency notes Rs. 11 lakhs, current coins (excluding gold coins) Rs. 1 lakh, imports of gold Rs. 2 lakhs, currency notes Rs. 4.51 crores, current coins (excluding gold coins) Rs. 2 lakhs. Balance of trade: The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures, the total value of exports (including re-exports) of merchandise and gold fell short of imports by Rs. 25.27 crores.

UK Trade in October: The value of United Kingdom exports in October was £271,800,000—£25,000,000 more than in September, it was announced by the Board of Trade on November 12, releasing provisional trade figures for the month in London. Imports in October amounted to £353,200,000—£45,000,000 more than in September. Re-exports in October were valued at £11,200,000, two per cent above the monthly rate in the first nine months of this year, and the excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) was £70,300,000, which was £18,000,000 more than in September. United Kingdom exports to North America in October amounted to £35,400,000—£3,000,000 more than in September. Exports to the United States amounted to £19,700,000—£500,000 more than in September—and exports to Canada £15,700,000—£2,500,000 more than in September.

Enquiry into Protection for Para-aminosalicylic Acid Industry: The Government of India have requested the Tariff Commission to enquire into the question of protection to the Para-Aminosalicylic Acid (pharmaceuticals and fine chemicals) industry in India. Persons or firms interested in the Industry or in any industry using this acid, who desire that their views should be considered by the Commission, should write to the Secretary, Tariff Commission, C.G.O. Building, 101, Queens Road, Bombay-1.

FINANCE
New Foreign Capital Investment: The Deputy Minister of Finance, Shri B. R. Bhagat laid on the Table of the Lok Sabha recently two statements showing the new foreign capital investments made in India in 1956, the industries in which those investments were made and the countries of origin. According to the first Investment, the industrywise investment of foreign capital during 1956 was as follows:

INDUSTRY OR TRADE		(Rupees lakhs)
A. Manufacturing:		Total Invest-
		ment
Iron and Steel Products	..	53.78
Automobiles and Accessories	..	44.63
Machinery and Machine tools	..	8.40
Building and building materials	..	4.74
Heavy chemicals	..	22.63
Sugar	..	49.45
Cotton goods	..	16.76
Others	..	15.09
TOTAL	..	215.48
B. Trading:		
Machinery and machine tools	..	5.84
Exporters and importers	..	1.40
Total	..	7.24
C. Other:		
TOTAL	..	0.96
GRAND TOTAL (A+B+C)	..	223.68

The countrywide investment of foreign capital during 1956, given in the second statement, was as follows:

Country:		(Rupees lakhs)
United Kingdom	..	134.16
United States of America	..	13.33
West Germany	..	14.67
Switzerland	..	9.27
Belgium	..	1.40
British East Africa	..	50.41
Others	..	0.44
TOTAL	..	223.68

These figures do not cover (i) investments in branches of foreign companies (ii) investments made out of retained profits (iii) investments in oil refineries, and (iv) a major part of investment in the shape of goods.

The investment figure shown against British East Africa, the statement points out, is perhaps a repatriation of Indian capital there rather than a foreign investment from that country.

Amendments to Estate Duty Rules, 1953: In exercise of the powers conferred by the Estate Duty Act, 1953, the Central Board of Revenue have amended the Estate Duty Rules, 1953, to include two new rules, namely, rules 39 and 40. The new rules prescribe the procedure to be followed when any question of valuation of property, which is the subject of an appeal, is referred to the arbitration of two valuers under the Estate Duty Act. The Act itself provides that in the event of the two valuers failing to reach an agreed decision, the matter should be referred to a third valuer. According to the new rules, the appellant who wishes to make such a reference has to submit an application, in the prescribed form, nominating one of the two valuers to be appointed for the purpose. He has also to deposit in the Treasury the costs of arbitration within one month from the date of such application. The rules require the valuers to give a hearing to the appellant as well as to the department before they decide the question of valuation. The final decision of the valuers will be communicated to the Central Board of Revenue and to the appellant.

GENERAL

Urban and Rural Welfare Schemes: Financial assistance to four new types of welfare programmes to be undertaken by voluntary welfare organisations in rural and urban areas would be extended by the Central Social Welfare Board. One of these programmes relates to welfare projects to be started in slum areas in towns and cities in different States. The programme and the basis of assistance to it would be on the same pattern as that which obtains in the case of Welfare Extension Projects in the rural areas. Another scheme relates to the starting of welfare activities in villages presented to Shri Vinoba Bhave in the form of 'gram dan' but will not be confined to such villages. The third scheme provides for special grants to be given to women's welfare organisations of long standing to enable them to train adult women between the 20 and 30 years of age to acquire the minimum basic educational qualification and thereafter to give them further training as gram sevikas, mid-wives or other health personnel. Under the fourth scheme special grants are proposed to be given to voluntary organisations to enable them to start small production units in urban areas to provide gainful employment to destitute women. The outlines of the scheme are being worked out in consultation with the Small-Scale Industries Corporation, the All-India Handicrafts Board and the Commerce and Industry Ministry.

NEWS IN BRIEF

FOREIGN

China's annual steel production will reach 5 million tons by the end of this year, and coal production will probably total 120 million tons according to a report from Peking.

Norway is seeking a World Bank loan to help finance a new hydro-electric development project in the country for Trondelag.

Parliament of France has approved the French Government's Plan to borrow Frs. 250,000 million (£210 million) from the Bank of France.

Nearly half the rise in the pithead price of coal in Belgium is to be absorbed before reaching domestic consumers. This is part of an energetic campaign to restrict the rise in the retail price index.

Negotiations have been concluded by the Jamaica Government with the Harvey Aluminium Company of the US granting the company special exclusive prospecting licenses for bauxite mining on all Government-owned lands in six parishes. The company plans to prospect for three years.

A further decline in German foreign exchange reserves is foreshadowed in the latest report of the Deutsche Bank.

It is reported Britain's bicycle exports in September, 1957 numbered 112,699 compared with 106,809 in September, 1956.

The World Bank lent a record amount in any quarter in the three months ended September 30, 1957. It made 11 loans totalling \$214.3 million during the period, bringing the total number of loans to 181 in 45 countries and raising gross commitments to \$3,322 million.

Mr. Boyd-Carpenter, Britain's Minister of Pensions and National Insurance has announced the biggest increases in retirement pensions and other National Insurance benefits since the present scheme was instituted. They take effect at the end of January or the beginning of February.

The British firm, Dexicon, which manufactures prefabricated steel building units, has decided to establish a small plant in Greece. The Greek Government has given permission for the import of capital for this purpose. The initial amount of capital will be £75,000.

An industrial advisory Committee is to be set up for Malta. The Committee marks a step taken by the Maltese Government, with the support of the UK to encourage the establishment of new industries in Malta.

Australian manufacturers are spending more than £A200 million a year on new buildings, plants and machinery, according to estimates made by the Department of Trade.

INDIAN

The Government of India have decided to extend free licensing of all varieties of cotton piece goods (mill-made and powerloom) and cotton manufactures including cotton waste blankets, other than restricted varieties, to all permissible destinations except Nepal, Tibet, Bhutan, Sikkim and the Portuguese possessions in India for shipment up to June 30, 1958.

The report of the Food Grains Committee headed by Mr. Ashoka Mehta has been submitted to the Government of India.

It is reported the Madhya Pradesh State Government would introduce into the next Assembly session a Bill for the integration of secondary education in Madhya Pradesh.

The Government of India has announced that licences will be issued for a small balance of Sudan cotton left over from the quota of 15,000 bales released for import on October 22.

Following the recent conference of Ministers of Agriculture in Srinagar the Government of India have asked the State Governments to take urgent action on the conference's recommendations relating to increased production of food under the Grow-More-Food campaign.

It is reported prospects of the early development of a satellite port near Calcutta are encouraging. A scheme for building a subsidiary port at Geonkhali 35 miles from Calcutta, has already been submitted to the Centre by the West Bengal Government.

India continues to be the biggest market for Japanese steel. According to trade figures, Japan exported in the first three months of 1957 a total quantity of 224,498 tons of iron and steel, of which India's share was 103,884 tons. In 1956, Japan's total export of iron and steel was 1,290,540 tons. Of this India's share was 325,322 tons.

The Life Insurance Corporation has started paying compensation to insurance companies which were nationalised in January, 1956.

The tempo of jute goods exports was slackened considerably in 1957, when only 56,867 tons of jute manufactures were licensed for export compared with 90,203 tons in the previous month.

India exported soaps valued at Rs. 452,145 in the first six months of 1957. The exports consisted of toilet soaps, medicated soaps, laundry soaps, flakes and chips and other sorts. Toilet soaps, however, were the most important, accounting for a total of Rs. 413,218.

The Forward Market Commission has sent a directive to the Bombay Oil Seeds Exchange to appoint a sub-Committee of its board to go into the question of speculative trading in castor and groundnut seeds and to take effective steps to arrest the rising trend in prices, failing which it has threatened severe and swift action.

Nearly Rs. 74 lakhs will be spent in the second Five-Year Plan to improve the agriculture, transport, cottage industries and social services in the Laccadive, Amindivi and Minicoy Islands.

TARGETS

FOR STEEL

STEEL

IS THE STARTING POINT

Use steel only when
you must today,
there will be more tomorrow.

Six million tons a year
is India's immediate target
for steel—the absolute
minimum for her
present needs.

Eighteen million tons is the
target for the Third
Five Year Plan—it can
be done.

India's deposits of iron ore,
with the highest iron
content in the world, can last
a hundred years.

Adequate supplies
of metallurgical

coal and other
raw materials abound.

The combination of
technical skill and high quality
materials makes India the world's
cheapest producer of steel.
IISCO'S immediate
target—eight hundred
thousand tons of finished
steel and two hundred and
eighty thousand tons of pig iron.

SOME REFLECTIONS ON "THE INTERPLAY OF EAST AND WEST"*

By PEGGY HOLROYDE

IN 1955 Barbara Ward delivered the second in the series of Sir Edward Beatty Memorial Lectures to McGill University. Her subject was the same that had been dealt with, but in a different way, the previous year by Dr. Sarvapalli Radhakrishnan—the subtle, evolving relationships between East and West. These have now been published in book form under the title "The Interplay of East and West". The measure of their worth is evident in the fact that over 2,500 Canadians came, 'in singularly wintry weather', to sit on hard seats for three evenings to listen to her.

It is a platitude to talk of a shrinking world and the implication therein that we are all near neighbours concerned in each other's welfare but even at this juncture the Westerner still has to be reminded of his interests in the economic well-being of Asia, as India's Finance Minister well knows. The old memories still exist in the sub-conscious of the glorious days of expanding trade following the red areas of Empire on the maps.

Politically, perhaps, the Western man in the street has been made aware by so many pronouncements on the part of his statesmen, that, if the democratic, less immediately efficient but more sure human methods fail in Asia, Asians have recourse to one alternative—the totalitarian, state-planned economy. But economically he fails as yet to see how closely his own financial welfare and the pressures on his purse are linked with the economies of Asia—even the glaring fact that expanding economies here mean expanding export markets there for him.

Barbara Ward's first lecture is concerned with the fundamental nature of this delicate problem of relationships in a shrinking world where psychological understanding is still lagging behind the technological and political intercommunication. Her point is that before we, as Westerners, can understand the East we have to realise in what way they look at us. This is something new for past imperial powers who never were concerned with what the people over whom they ruled, thought of them. The West has for many long hundreds of years been the disturbing force in the world, bringing mixed blessings in "the blind drive of our own dynamic development". We have to face this fact but in our arrogance too few of us still really acknowledge it, believing that only beneficial results came in our wake. Even Prof. Toynbee has shown, though, how such 'blind drive' became transformed into aggressive imperialism in both Russia and Japan. It was a lesson that they learnt from the West.

Barbara Ward draws a distinction between those contacts in time when "like was coming into contact with like", and those after the break-up of mediaeval Europe when all the explosive content of the Renaissance changed European society and thinking forever, when Europe "was attempting to make all things new." She emphasises the philosophical difference that emerged out of this, between Eastern thought "of material reality bound to a recurring wheel of change" and Hebraic thought which came to its culmination and changed the Western world with the dynamics of its belief in "a progressive unfolding of God's purpose in

time, and therefore in history." Christians have always tended to see the world as a testing ground, "a creative area in which men could prove themselves and try to find out the dynamic purposes of God", a very personal God interested in their welfare, unlike the stupendously impersonal and scientific concept of Brahma. "Man's record therefore was not simply a fatality or a succession of meaningless events. It was more like a drama, a drama in which a part was played out in time by both God and man. Time itself," she writes, "therefore became important. Time was something which you could not neglect." Could the same be said of India?

If Westerners are ever to understand why there are differences of approach to problems and in the patterns of living which different societies work out for themselves they will have to take more notice of these deep undercurrents that suffer the seachange to take place. The same holds true for those Asians concerned with development and change if the mutations are to be true genetic ones. Barbara Ward rightly points out that "the Greek concept of a human being as a citizen with rights and the Jewish concept of the sinner with 'personal responsibility' (my emphasis) held in embryo the belief in personal individual freedom, and a concern for society" which has led to the culmination in a Welfare State—the political embodiment, in fact, of the philosophical conception of the importance of the individual in time and the whole fabric of existence.

This is particularly relevant to India who is trying (and through no fault of her own, having been tutored in Western concepts for 250 years) to graft a Western skin on the Hindu body 'politik'. One wonders sometimes if India's leading politicians have considered sufficiently the rationale of the "socialistic pattern of society", how it grew because it was inherent in Greek and Hebraic thought, and whether it can be grafted onto the timelessness and unhurried nature of Hindu thought which is different and is not urgently concerned with the fate of man in the finite world of time and space.

Again in the second lecture, dealing with the nature of the economic relationship the author goes beneath the surface explanations to the deeper impulses which have caused the rise of capitalism and industrialisation and technological achievement. The basic concepts of Greek and Hebraic thought which have fashioned Western Christian civilisation (and Communism, as a perversion of religious concern with the fate of one's fellow man) have sent Western man out searching restlessly, ever asking the question "how" rather than the question "why," unlike his Eastern confrere. "The passionate quest for exact knowledge," she writes, "heralded the scientific revolution." With this was coupled the "the Calvinistic glorification of work and saving and wealth, 'not as a means to luxury' (my emphasis again) but as the basis of further industry". This was a "strong psychological factor in creating in the West the middle class entrepreneur who was ready to take the long risks of industrialisation and to work creatively in the building up of enterprises which would demand not only work today, and risk tomorrow, but a lifetime of work and control and creation." It would seem to me that this too has meaning when India is now embarked on such vast attempts to industrialise. Is there a similar

* Barbara Ward "The Interplay of East and West"—Allen and Unwin.

will to work on the part of the ordinary, average man? Is there the same dynamic drive upwards within the philosophical base which supports the whole Indian pyramid? In fact, she says that merchants in Asia have been more engaged in commodity trading rather than exhibiting the "long, rugged determination to build up a full scale industrial structure." One knows very well that one of India's immediate problems is to find money for investment yet in the confines of its own land there is a great deal of money—but it is static money locked away in jewelry and gold. The dynamic impetus is not there, for several reasons, including a suspicion on the part of the villager as to the safety of banking, to recreate more wealth out of wealth.

Has India then, because of the very nature and difference of her philosophy, other answers to give to the problems of the organisation of society? Though Barbara Ward does not herself ask this, as she is primarily concerned with making an impassioned appeal to the West to cross the 'Great Divide of parochialism', the question lies uneasily and insistently in the context of the third lecture. She expresses the present Christian concern with moral responsibility in modern politics, 16 per cent of the world's population forms the Atlantic community yet this community enjoys 70 per cent of the world's income. It was the Christian sense of concern for the have-nots in its own society that gave birth to the Welfare state. The analogy is plain. There are many Westerners whose sense of guilt for the exploitation of past years in Asia and African lead them to the inescapable conclusion that the wealthier nations of the West should undertake a "long-term co-operative effort to raise the standards of Asia."

INDUSTRIAL DELEGATION'S STATEMENT

By

CROESUS

ALTHOUGH the Indian Industrial Delegation, which has just returned after an extensive tour of the U.S., the U.K., Canada, West Germany and France, cannot claim — nor has it done so — like Julius Caesar, "I came, I saw, I conquered", it has every reason to be proud of what it has achieved. In an admirably drafted statement issued by the Delegation at the first press conference in India after its return, addressed by Mr. G. D. Birla, leader of the Delegation, in Bombay (when other members of the Delegation also were present), this modest claim has been made: "We believe that we have created an atmosphere, which, if properly exploited, will lead to larger foreign investments, and also the obtaining of larger commercial credits". It is significant that the claim is as guarded as it is modest, and it is very important to bear this in mind, before passing any judgment on the success or failure of the Delegation, immediate or eventual. What has been stated by the Delegation in effect is that it has done its part, but, before that can bear fruit, something more remains and requires to be done, namely, the proper exploitation of the atmosphere created by the Delegation. Mr. Birla did well, therefore, in underlining the imperative need for this, both at the press conference and in his address to the Rotary Club. In the ultimate analysis, as he said, "we certainly are the masters of our own destiny. Whether we shall succeed in marching towards progress or shall get stuck up depends entirely on our own wisdom and forethought".

It is indicated in the Delegation's statement that "the object of the Delegation was a goodwill and study tour, coupled with discussions and implementation of specific projects which certain members of the Delegation had in view, but, by implication, it covered almost every problem associated with the import of capital

Some Asians may regard this sense of guilt as humbug, and hypocritical. Nevertheless it holds true among thinking people in the West and the writer of this book is one of the few discerning economists who is not shy or embarrassed (as most English people painfully are) in proclaiming a religious faith in the belief that all aspects of life are one, and not to be treated in water-tight compartments of politics, economics, church-going, etc. Her last lecture, for this reason, is the most complex and debatable for the very reason that she is interpreting the future. She may not be quite correct in her estimation of what is going to happen in Asia. If we can keep our faith in the ultimate truth of religious insight, in fact the Eastern idea that the highest aim of man is to achieve unity with a higher consciousness, to move to new levels of freedom by breaking away from the constraining egoisms of the self, . . . God willing we shall be able to help our Eastern brothers when they go through the darkness of doubt, when they too are engulfed in technology and materialism, when they forget the divine image in which they are made and believe that the purpose of science is not to make truth manifest but to make gadgets. That day will come and perhaps we can be prepared for it, because it is a dark valley through which we have gone, and out of which we are beginning to emerge." But, she goes on, and it is a very big But, "the fact that should check any facile optimism is that the rational and materialist revolution in thinking which has harrowed the West since the 18th Century is now spreading to the East, acting as it did in Europe as a dissolvent of old faiths, and as generator first of doubt and scepticism and later of new dogmatic faiths, intolerant of all but supposedly 'scientific formulas'".

goods, capital and know-how from abroad." From the observations made by Mr. Birla, it should be abundantly clear to all by now that the Delegation has left behind a fund of goodwill and studied conditions abroad at first hand and thoroughly, while its individual members have had discussions on several projects, such as non-ferrous metals, rayon, chemicals, pulp, pharmaceuticals and several others. Many of those present at the press conference in Bombay regarded this as being rather vague and wanted more specific details of the deals concluded. For obvious reasons, the curiosity of the Press on this point could not be satisfied. Another effort of the Press, however, met with a better fate. This was a question about the total probable aid from America. Overall, declared Mr. Birla, that is direct aid, P.L. 480, Export-Import Bank and T.C.A., all put together, about \$250 million could be expected. The leader of the Delegation added that India would receive a substantial amount of aid in the coming few years from America, Germany and France. Incidentally, Mr. Birla disabused the fairly common notion in this country about the ability of France to give aid to India. The franc may be weak, the French Government may be in a mess, but the French people are prosperous and can help, he added, quoting, at the same time, a French saying in support of this view meaning more or less this in English: "The Frenchman invests his deficit at home and his surplus abroad". About aid from Britain, Mr. Birla saw no possibility whatsoever because of the tight situation in that country, but Britain has been very sympathetic and helpful otherwise, he felt.

The leader of the Delegation mentioned a few notable points that made for the success of the Delegation's mission and these are really significant. In the first

place, this is perhaps the first Indian Delegation to go abroad which has worked with such a singleness of purpose and in some complete agreement. Secondly, by a fortuitous coincidence — "fortuitous" needs to be stressed here, because questions were asked whether this was not by design — the Finance Minister of the Government of India, Mr. T. T. Krishnamachari, was also in America when the Delegation was there. Thirdly, the Press in America took a very keen interest in the visit of the Delegation. And, fourthly, the climate in America for investment in India is better than at any other time before.

Elaborating the last point in his Rotary Club talk, Mr. Birla recalled how, although he had been visiting America a number of times since 1945, it was not until last year that he discerned any interest on the part of the Americans to invest in India. This would appear to have been on the increase since, and Mr. Birla gave these valid reasons for this. First, he said, capital formation was very high in the U.S.; secondly, there was a disposition to restrict American investment in Canada, because of the growing volume of complaints in that country that the Canadian economy was fast being dominated by America. (The U.S. has invested about \$13 billions in this country of only about 16 million people!). And, lastly, Americans had come to admire the political stability and the law and order situation in this country in contrast to the highly unsettled political conditions prevailing in some of the South American countries nearer home.

This is good in so far as it goes, but what about American prices? Are they not too high? These questions were asked and answered too. According to Mr. Birla, American prices are high in some cases and competitive in others, but, on the whole, the quality of American goods is better; also the terms of supply, such as period of credit, rate of interest, etc. are more favourable. Thus, one can arrange deferred credit from there anywhere up to eighteen years, while other countries, it seems, are not prepared to wait for more than five years. Further, the rate of interest charged by the American supplier is relatively lower, as compared with Germany, for instance.

Mr. Birla also dispelled several doubts that many in this country seem to have about doubts entertained by the investor in America. One of these, for example, is that the American visitor is inhibited by the non-alignment policy of the Government of India. According to Mr. Birla, this is hardly the case, and there would appear to be no hostility towards Indians on this score.

Another doubt of some of our people is that the value of the Indian Rupee is in danger of going down, but Mr. Birla was categorical that the Rupee was as stable as the dollar and India's credit as high as ever, what with her record as the only country in the world which has not been a defaulter in respect of her obligations so far.

This should not lead one to suppose that the American investor has not been entertaining any

doubts about India. As Mr. Birla himself pointed out, "there existed a lot of misapprehension and doubts among them about our economic policy. The spate of recent fiscal and taxation measures came in for a good deal of discussion. There was still a fear of nationalisation and there were also doubts about the role of the private sector. The scheme of compulsory deposits and heavy taxation in the last budget too came in for criticism. There was complaint also of too much interference by Government. The restriction on the quantum of royalty on the licence to manufacture also came in for criticism". To this list was added, at the press conference, fears about the operation of the State Trading Corporation as well. As practical business men, the members of the Indian Delegation did not pause to inquire whether misgivings on all these counts were imaginary or genuine, but readily took cognisance of their existence and straightaway proceeded to dispel as many of them as possible. It is only after doing so could they claim, as they have done in their statement, that "we were happy to find that we had succeeded, to a large extent, in dispelling many doubts and misgivings. We also found a satisfactory response to participation in capital and towards supplying of commercial credits".

Perhaps the most significant portion of the Delegation's statement is that which refers to "the contradictory currents in our present economic problems and difficulties which need the attention of all those interested in our progress."

Especially paradoxical is the situation that, whereas the private sector in this country is able to get all the foreign exchange it requires but is confronted with the problem of raising internal resources, the public sector is hard put to it for its needs of foreign exchange. In other words, as the statement itself points out, "if the private sector is stuck up due to the scarcity of internal resources, the public sector is held up for want of foreign capital. The path to progress is thus completely blocked". The Delegation is, therefore, right in holding that, until we can solve the problem of the scarcity of internal resources, even with the foreign capital available, we shall not be able to make any progress. It is in this context that the importance of proper fiscal and monetary policies of the Government lies and, as Mr. Birla pointed out, only the pursuit of proper monetary and fiscal policies will meet the present situation. It is the Delegation's belief that the Government is not unalike to this problem and it is also hopeful that it would receive due attention at the hands of the Government, but it has left no room for doubt that further progress must continue to remain in abeyance so long as the problem is unsolved. If, as the Delegation observes, so many in the world are desirous of helping us to achieve economic progress, the least that we in this country—both people and the Government — should do is to strive and create the requisite climate for receiving such help and channelising it in the most constructive and beneficial way possible and practicable. The next few months should show how far the nation's energies are bent to meet the challenge facing it.

A Letter to the Editor

THE RAILWAY PLAN RECONSIDERED

Sir,

Appropos your Editorial under the above caption appearing in the issue of 'The Eastern Economist' of October 11, I feel that there is one point which requires consideration. This is, whether it is possible for the Government to obtain the same additional freight capacity as envisaged in the railway amended Plan at

less cost than that estimated by them by an alternative service.

We have a system of National Highways built for carrying inter-State long-distance traffic of the same type as is handled by the railways. Its length is about 14,000 miles of which about 2,000 miles have a two-lane carriage-way capable of carrying articulated vehicles and truck-trailer combinations. The remain-

ing about 12,000 miles are capable of carrying mostly trucks. Most of this length has a modern dustless surface.

It has been estimated that if through communication is provided on this system by building about 56 major and some minor bridges at an estimated cost of about Rs. 40 crores it will be capable of carrying, in addition to the traffic it carries at present, about 75,000 additional goods trucks with a freight capacity of about 50 million tons p.a. with an average lead of 300 miles i.e. the same as in railways. (Average load per truck 6 tons, load factor $\frac{1}{3}$ th, 200 miles per day, 250 days in a year—a minimum of 15,000 million ton-miles p.a. for 75,000 trucks. Divided by an average lead of 300 miles).

The value of these trucks imported in the C.K.D. condition works to about Rs. 100 crores including the value of accessories and the cost of assembling. Deducting about 25 per cent import duty on them which will be realised by Government the net cost is about Rs. 75 crores. At an average tax, including all heads, of about Rs. 2,500 per truck the yield from taxation on 75,000 trucks works out to about Rs. 18.75 crores p.a. which, therefore, means that if these trucks can be obtained on the basis of deferred payment their cost, after deducting import duty, of about Rs. 75 crores can be paid in a period of about 4 years. Therefore, the only extra amount to be provided by Government will be about Rs. 40 crores required for bridges.

The original railway estimate for a 15 per cent increase in passenger traffic and an increase of 47 million tons p.a. in good traffic (42 on account of second +5 on account of first plan) making in all 162 million tons p.a. including 115 millions tons carried in 1955-56 was Rs. 1,125 crores subsequently increased, on account of rising cost, to Rs. 1,225 crores. Now it is said that another about Rs. 200 crores (Rs. 1425—Rs. 1225) will be required to raise the goods freight capacity by about 19 million tons (181—162) on account of the second Plan and 5 million tons on account of the first making about 24 million tons p.a. Against this figure of about Rs. 200 crores for an additional capacity of about 24 million tons of traffic the road estimate of about Rs. 115 crores, of which Rs. 75 crores for trucks can be paid back in about 4 years, for an additional capacity of about 50 million tons certainly seems an economic proposition. It will still be economic even if on account of delays in execution a figure of say 33 million tons is reached. It may be that in the railway figure of Rs. 200 crores there may be provision for improved line capacity which will be of use for the traffic of the future also but the same is true of road bridges which have a life of about 100 years and will therefore be of use for the future traffic. From the point of view of Government finding money immediately the road proposal deserves serious consideration.

In regard to implementation the present time is most propitious. As a result of an excellent lead by the Central Ministry of Transport the recent conference of Transport Commissioners at Mussoorie has taken a number of decisions on the liberalisation of permit system, taxation, economic loads, credit facilities and so on. Also the Government of India proposes to appoint soon an Inter-State Transport Commission which is just the type of agency to carry out a scheme of this nature. Then, there is another aspect also, by 1960-61 the country will have spent on its roads about Rs. 726 crores. Most of this investment is lying idle as the present density of our road traffic is only about 1.5 vehicles per mile including the truck-equivalent of our bullock-carts. Obviously it is not in the interests of the country to allow this investment to remain idle for a longer time by developing the railways further.

Out of a sum of about Rs. 100 crores mentioned above for trucks about Rs. 65 crores will be foreign exchange from three countries payable in about 3 years if deferred payment can be arranged.

Yours faithfully,
B. V. VAGH.

The Business World:

TARGETS FOR LIGHT ELECTRICAL INDUSTRIES

THE light electrical goods industries do not by themselves constitute a part of the core of the Plan. But they are directly concerned with the effective expansion, in some measure, of electrical power which is an essential component of the core of the Plan. Because of this relationship they are entitled to some priority in the allocation of resources whose rationing has now become essential. The Development Council for Light Electrical Industries, which held its eighth session last week, will be called upon to devote attention to a reconsideration of the targets fixed for different electrical industries. It is true of this group of industries, as it is true of several other industries which have a large import component, that the foreign exchange problem has raised a problem of no small magnitude for it.

The most important part of the opening speech of the Union Minister for Industry, Mr. M. M. Shah, related to the effect of the foreign exchange difficulties on the expansion of light electrical industries during the second Five-Year Plan. A vital characteristic of these industries is that they depend for their development not only upon imports of plant and equipment, but of raw materials and components in a large number of cases. The import licensing policy on raw materials and components has severely restricted issue of licences on the basis of the production levels in 1956. Obviously, for industries which have been assigned a role of vigorous expansion, great embarrassment will be caused by this restriction on imports. Light electrical industries are unlikely to secure the facility of deferred payment for imports on the required scale. This fact complicates the problem for them. The solutions suggested by Mr. Shah to tide over the difficulties may be useful partially at best. He has urged that these industries should put the foreign exchange allotted to them to the maximum use, which, in reality, does not assist them in any mentionable degree. Prices of imports are already going up. He has exhorted small-scale units to manufacture components conforming to the requisite specifications for the use of large-scale manufacturers. Large manufacturers, in turn, have been asked to provide technical assistance to the small units. This sort of co-operation will now become increasingly necessary, but it has a limited scope.

The conclusion cannot be resisted that the targets for light electrical industries will need to be revised. But it cannot be assumed that they must, under any situation, be revised downwards in respect of all the industries. It may look paradoxical, nevertheless, it is absolutely necessary, that the targets in respect of some of these industries at least will have to be revised upwards. How the revision of targets is to be made is to be determined by the nature of the industries. One class of these industries offers opportunity for reduction in foreign exchange expenditure by a downward revision of targets. The targets of capacity fixed for this class are much in excess of the targets of production. Another class of industries includes cases in which the prospect for stepping up exports is sound and, what is far more important, the domestic demand for them is likely to exceed by a considerable margin the targets now assigned. To seek to limit the internal consumption of their products is likely to affect adversely the non-industrial consumption of electricity.

The revision of the targets of light electrical industries will necessarily have to be related to their present stage of growth as determined predominantly by the levels of consumption. This factor of consumption of

electricity is of vital importance to the larger issue of the development of electric power. Limited experience about the power generated as a result of the multi-purpose river projects as well as other projects has demonstrated that, Government's policy must take particular care of stimulating consumption of electricity. From this angle light electrical industries are of positive value. Not all of them have made impressive strides. But the six industries shown in Table I below have certainly achieved remarkable progress.

TABLE I.

PROGRESS OF LEADING LIGHT ELECTRICAL INDUSTRIES IN PRODUCTION

	1951	1956	1957 (Estimate)	Percentage increase in 1956 over 1951
1. Electric Lamps				
a. GLS and others . . .	15.52	29.85	33	93
	millions	millions	millions	
a. Fluorescent Tubes . . .	—	880,000	1	—
			million	
c. Miniature Lamps . . .	—	3.52	8.5	—
		millions	millions	
2. Electric Fans . . .	212,000	338,932	513,000	60
3. Radio Receivers . . .	82,800	150,596	185,000	82
4. House Service Meters . . .	1,736	230,303	330,000	—
5. Dry Batteries (million Cells) . . .	143	181.4	180	27
6. Storage Batteries . . .	212,000	314,199	320,000	48

Severe import restrictions in the last one year have provided an added stimulus to the growth of a wide range of light electrical industries. But as their progress since the first Plan shows, their expansion was proceeding at a rapid rate even in the absence of an austere import policy. Some of these industries have found an export market in Burma, Indonesia, Ceylon, Iraq, Iran, Saudi Arabia, Egypt, East Africa, and so forth. They include primarily electrical fans, electrical lamps, radio receivers and storage batteries for motor vehicles. Storage batteries in particular can now claim self-sufficiency plus exports. While the majority of these industries is still not in a position to satisfy fully the demand in the home market, the case for their exports stands on sound reasoning. In the initial stage, competition of imports and consumer resistance at home will make it difficult for new lines of production to cater to the whole of the domestic demand. An export outlet therefore provides a stable basis for expansion. From the long-range policy, of course, exports must be encouraged. The procedure for drawback of duty on imported components and raw materials is now simplified. A practical step forward of great significance has been taken with the establishment of the Directorate of Export Promotion in the Ministry of Commerce and Industry. This sector of the electrical industries is entitled to special consideration at the hands of the Directorate on the same basis as industries in general with export potentialities.

Table II below sets out the different targets for the major light electrical industries.

TABLE II.

CAPACITY AND PRODUCTION TARGETS FOR LIGHT ELECTRICAL INDUSTRIES

Industry	Production Target 1960-61	Present installed capacity	Additional capacities licensed/ approved	Total capacity which will be available
1. Electric Lamps				
a. GLS & other similar lamps	50 Millions	43.13 Millions	13.13 Millions	56.26 Millions
b. Fluorescent tubes	2 Millions	800,000 Nos.	2.31 Millions	3.11 Millions
c. Miniature lamps	30 Millions	17.2 Millions	21.48 Millions	38.68 Millions
d. Photo flash lamps	—	—	1.5 Millions	1.5 Millions
e. Mercury vapour lamps	—	—	60,000 Nos.	60,000 Nos.
2. Electric fans	600,000 Nos.	401,700 Nos.	484,000 Nos.	885,700 Nos.
3. Radio receivers	300,000 Nos.	240,000 Nos.	64,600 Nos.	300,600 Nos.
4. House Service Meters				
a. Single phase	650,000 Nos.	334,000 Nos.	440,000 Nos.	774,000 Nos.

b. Poly phase	75,000 Nos.	—	99,000 Nos.	99,000 Nos.
5. Dry Batteries	225 Million cells	224 Million cells	—	—
6. Storage Batteries				
a. Motor vehicle Batteries	600,000) Batteries)	316,500 Nos.	127,200 Nos.	521,700 Nos.
b. Train lighting batteries	84,000) celis)	—	78,000 Nos.	—

An important feature of the targets apparent from Table II is the excess in the planned capacity targets over the production targets fixed for 1960-61. Two important cases stand out as exceptions. In the case of radio receivers for which the domestic and export markets are developing rapidly the capacity and production targets are identical, which clearly implies that the likely demand may not be satisfied for want of installed capacity. Motor vehicle batteries represent a glaring instance in which the capacity target in the last year of the second Plan is far below the production target. This is an industry in which there has been serious under-estimation of the probable demand.

Considering the potential home requirements and the reasonable possibilities of export, it would be safe to state that the capacity targets for electrical lamps, electric fans, radio receivers and storage batteries must be raised by varying margins between 25 per cent and 50 per cent. In a majority of the remaining light electrical industries, targets of installed capacity provide room for downward revision. On balance, it would appear that the saving in outlay on foreign exchange will be marginal, if at all.

when
STAMINA
counts...

A runner knows the value of stamina on the track—and so it is with the truck or bus operator who uses Caltex products. Caltex fuels and lubricants mean more stamina for trucks when hauling and climbing. For the extra stamina that means extra performance with extra economy—

BUSINESS NOTES

GUARANTEE FOR DEFERRED PAYMENTS

THE LOK SABHA has just passed the Industrial Finance Corporation (Amendment) Bill which, among other things, seeks to empower the Corporation to stand guarantee for deferred payments on import of capital goods by private parties. The need for this amendment has been felt for some time in the context of the difficult foreign exchange position. With the increasing tempo of industrialisation under the second Plan and the considerable increase in the import of capital goods, it has been simply impossible for the Government to find immediately all the foreign exchange needed. So the scheme of deferred payment has been in operation since the early months of this year to meet this situation to some extent. In spite of all the encouragement to the scheme, not much headway could be made because many exporters abroad have been insisting on guarantees to be obtained from the Government or semi-government institutions in respect of deferred payments. The Bill now permits the Industrial Finance Corporation to give such guarantees.

The deferred payment scheme is, of course, well known by now. For the import of machinery and equipment and even imports of components and expensive raw materials, the Government up to the end of August had approved 137 deferred payment schemes to the total value of Rs. 59.27 crores which include cash payment of Rs. 16.95 crores, foreign capital investment of Rs. 5.94 crores and deferred payments of the value of Rs. 36.38 crores. Industry-wise the schemes covered 27 sugar projects, 19 industries based on iron and steel, 14 engineering industries, 14 chemical and pharmaceutical industries, 10 textile plants and 5 automobile plants. A large number of applications under the deferred payments scheme is stated to be still pending with the Government and under active consideration. On the whole the response to the deferred payments scheme from foreign suppliers has been fairly encouraging as a result of the efforts made by the industrialists and the Government and the good and friendly response of foreign countries. The amendment to the Bill is bound to give a greater fillip to the scheme as it now fulfills the demand of foreign exporters in regard to the guarantee which, they have been insisting, the industrialists must obtain from Government or semi-government institutions. Along with this measure effective cover, however, against exchange risks needs to be provided, for without it, no business man will care to buy capital goods on a deferred payment basis.

The amendment can in no way be considered a measure that would enable the private sector to get foreign exchange at the cost of the public sector. On the other hand, it would relieve the Government of the responsibility to the extent to which private enterprise received help from abroad. The fact cannot be ignored that the Industrial Finance Corporation had been set up with the sole object of assisting the private sector in starting new enterprises.

LABOUR INDISCIPLINE IN A COLLIERY

IT IS not merely the passing over of the dividend referred to by the Chairman of the Hingir-Rampur Coal Company Ltd., Mr. A. N. Haksar that is disappointing but even more so the woeful tale of labour indiscipline that he had to unfold. The results of the working of the Company for the year under review provided a striking proof that the prosperity of the Company is directly dependant on the maintenance of

labour discipline. But from what Mr. Haksar said in the course of his speech, the Company has been the unfortunate victim of illegal strikes in the years 1952, 1953 and 1956 as also of organised attacks by large gangs of labour resulting in considerable damage to officials on the spot as well as to the Company's property. The latest of such disturbances which took place on June 15, 1957 culminated in the brutal murder of the Colliery Manager and in serious injuries to several other employees. The relation between these acts of hooliganism and the recognition of the trade union, the members of which are alleged to be responsible for these incidents cannot be ignored. For it is only since then, namely in 1951 that illegal strikes and hooliganism would appear to have started. The fact that even the police on the spot could not control the situation and the fact that people are afraid to take up responsible positions in the undertaking are too serious to be overlooked by the authorities both at the Centre and in the State concerned, notwithstanding a sympathetic attitude towards the Company and its problems.

What is not understandable is that despite all the professions of Government's spokesmen and labour leaders, the Code of Behaviour for Industrial Workers and Management evolved in July last has been observed more in the breach than otherwise. It may be noted here that the basic principles embodied in the Code prescribed illegal strikes, "go slow" tactics, damage to property and acts of violence, intimidation and coercion among others. In view of this, it is somewhat comforting that the Standing Labour Committee of the Government of India are considering measures to ensure that the Code of discipline is obeyed in future at least and have proposed certain "sanctions" should be imposed upon Workers' organisations violating the Code. (This has since been done, as readers would have noted, and it remains to be seen how far this will work in actual practice.)

EMPLOYMENT EXCHANGES

A VERY pressing problem facing the underdeveloped countries today is that of raising the living standards of their people. By far the most effective way of tackling this is to ensure higher productivity and to create more opportunities for gainful employment. While the former is the direct responsibility of industries, the latter (although it is also their responsibility, albeit indirectly) is now increasingly devolving on the Governments of the countries concerned. The agency through which the latter approach the problem is the Employment Exchange. In providing gainful employment, even though to a fraction of the millions of the unemployed as it can only do, the Employment Exchanges do play a useful role. One of the best ways of using this vast manpower scientifically is by means of proper job evaluation, that is, by ascertaining the precise needs of employers, on the one hand, and the special aptitude of the employees, on the other, and by directing the right person to the right job. It must be conceded that the problem has been tackled more or less along these lines by the Employment Exchanges, though the results have not been very impressive yet. For sometime past, the Employment Exchanges have come under the purview of the State Government and the first anniversary of this event was celebrated in Bombay last Monday.

Mr. Shantilal Shah, Bombay's Labour Minister, did not make any reference either to the progress in job evaluation or to the actual performance of the Employment Exchanges in the State, as one expected, whilst

speaking at the Symposium "on how Employment Exchanges can render more efficient and effective service", held in Bombay this week to mark the first anniversary of the taking over of the Exchanges by the State Governments. However, all the speakers, including the Minister, were of the view that greater use of the Exchanges should be made by the private employers also for recruiting their staff. If this is to be possible, more vigorous work by the Exchanges, both in collecting the data, which, incidentally, would be immensely useful for our planning, and in providing jobs to those who have registered themselves with the Exchanges, has to be done. Even this will not solve the problem fully. A certain change in the attitude of those who man the Exchanges, as also in the educational system of the country as a whole, is no less necessary. In this connection, What Mr. Chandravadan Shah, Principal of 'Jivanbharati', said in Ahmedabad, on the occasion of the inauguration of a new training scheme in his institution by Mr. Shantilal Shah, is particularly apt. Education all along has been a plan, he said, for the few who succeed in examinations, but how we will have to plan for the 60 per cent of the students who either fail or do not even reach the final examination; only thus can we avail ourselves of all this manpower, the maximum benefit of which we have not been having today, he added. If we can make more people fit enough to take up jobs by offering them suitable training at different stages thus, there should no longer be the anomaly of the existence of several vacancies, on the one hand, and the absence of people with the requisite qualifications or practical training that can fill these vacancies, on the other.

PENSION SCHEME FOR RAILWAYMEN

A PENSION scheme for the railway staff has just been evolved by the Government of India. The scheme is in no way different from the pension scheme already operating in the other Central Ministries except that the compulsory subscriptions at present made to the provident fund by railway servants will continue even after the introduction of the pension scheme. The move to bring the railwaymen in line with Government servants in other departments marks a decisive step for improving social security for this important sector of Government employees. It also satisfies the demand of the National Federation of Indian Railwaymen which had suggested that a scheme of compulsory insurance, premia for which would be deducted from salary, should be introduced simultaneously with the pension scheme. The most notable concession made to Class IV employees is that all their permanent service as well as half their temporary service will count in the determination of their pension. Since a large number of Class IV employees started subscribing to the provident fund only from 1941, their retirement benefits would be considerably improved with the introduction of the pension scheme. On the whole over a million railwaymen would derive the advantages of this pension scheme. What the financial implications of the scheme would be it is difficult to assess at present, for the cost of the provident fund system and the pension system is affected by a variety of factors, such as the rate of interest, expectation of life after retirement, extent of casualties in the course of service and advancement of individuals in the service.

Come,
meet my friends—

invites Adipocere

(Pronounced 'adj-po-saire')

After being refined into quality petroleum products, I am transported to the market. Here, through a well organised distribution system, I finally come to meet you—the consumer. Before I do that, however, you must meet my friends who bring me to you.

Stanvac, working through its Sales Offices, dealers and agents located throughout the country, is a good example of a well-knit organisation which markets me in my various forms. Its dealers and agents are an important element in the distribution chain. They are efficient and independent businessmen—big and small—who supply quality petroleum products so vitally needed by you. Stanvac helps these dealers by way of free advice and training their personnel to give efficient and courteous service to the customer.

By helping these enterprising businessmen to progress in their chosen field, Stanvac plays a significant part in the fast developing economy of the community and, indeed, of the nation as a whole.

The Story of Oil—2

A miracle of nature

Crude oil, or petroleum as it is often called, occurs in many parts of the world—chiefly in regions where sedimentary rocks once formed the bottoms of ancient seas.

No one is sure how oil originated. The most widely accepted theory is that it resulted from the decay and alteration of the remains of prehistoric animals and plants. This organic matter was washed from the land into the vast jungle of marine life under the seas. The deposits, mixed with mud and sand, formed layer upon layer on the bottom. As these became buried, Nature's mysterious chemistry got to work. It slowly transformed the organic matter into the compounds of hydrogen and carbon which we now know as oil, and at the same time the fine

sediments which covered it were compressed into rock strata. The newly-formed oil oozed into the nearest layers of porous rocks, which held it as if in a sponge, and here it remained.

Throughout the millions of years that oil was being formed, many changes were taking place in the earth's crust. It rose and fell, was crushed and expanded. Lands were drowned, sea-beds became dry land. In some places cracks developed and the land slipped, forming 'faults'.

During these violent changes, some of the imprisoned oil escaped and was lost. In other places it was so near the surface that it seeped through and was discovered and used by man from the earliest times. But the bulk has remained trapped in its porous rocks beneath the surface of the earth.

Economic Report from the U. S.

ROLLING READJUSTMENT

(By GUY SIMS FITCH)

WASHINGTON, Nov. 12.—One of President Eisenhower's top economic aides has made it clear that the administration is prepared to "moderate" any sharp business swings with "flexible" policies designed to assure steady and sound economic growth. Gabriel Hauge, the President's administrative assistant for economic affairs, said as much in an address here last week to the American Finance Conference. At the same time, US Federal Reserve Board Chairman William Martin declined to say that his agency, which has maintained a "tight" monetary and credit policy in the face of inflationary pressures was planning any policy changes in the near future. In fact, both he and Dr. Hauge emphasized their continuing confidence in the underlying strength of the economy. And both suggested that inflation is still to be feared despite the fact that business—while still vigorous—has not come up to expectations.

It follows, then, that these government officials reject a "premature" policy relaxation that might jeopardize the gains already made in the fight against rising prices. Any loosening of the reins thus would depend on the accumulation of more evidence than is now at hand that the economy may really be headed for a noticeable downturn. True, a number of economists have forecast a general, though moderate, slump that may last as long as a year. And it is true that a number of important industries are operating at well below capacity levels, while business investment in new plant and equipment is showing signs of a modest decline after more than two years of steady and even spectacular expansion. On the other hand, there are signs of renewed activity in important economic sectors that had been lagging behind the gains of the past few years. As an example, housing began to slide in the latter part of 1955, and remained weak until this past summer. But recent statistics show a rise in new housing construction contracts.

In the case of automobiles, sales dropped off sharply in 1956 following the phenomenal record of 1955, and continued to drop slightly in the early months of 1957. But in recent months they have spurted sufficiently to indicate that 1957 will be a better year than 1956. It is interesting to recall that in the moderate downturn of 1953-54, both housing and automobile sales were among the first industries to show signs of firmness, more or less taking the lead in what became a record economic upsurge. But business outlays for new plant and equipment, which now appear to be falling off slightly, tended to follow rather than lead the general trend. They did not show signs of softening until the downturn was well under way, and did not rise significantly again until months after most other industries had started to recover and the economy was in the midst of its upswing.

All this has revived interest in that oft-used expression, "rolling readjustment". Is the US economy going through just such a period now, with declines in some industries partly offset by rises in others, thus

maintaining over all strength despite a slackening of activity? Only a few weeks ago, members of the business advisory council of the US Department of Commerce, made up of some of the nation's top business executives, expressed the view that the US actually was undergoing this kind of economic adjustment. If that is the case, it certainly has been up to now one of the least painful adjustments any economy has ever experienced. While the overall industrial production index has remained at previous levels and the economy has not been expanding at its anticipated seasonal rate, such factors as employment, personal income, consumer spending and the total output of goods and services all have been rising. As Reserve Board Chairman, Mr. Martin remarked last week, the US economy may well have more adjustability, in it than is sometimes supposed.

COMPANY AFFAIRS

SURAT ELECTRICITY CO., LTD.

Although Mr. K. G. Milne, Chairman of the Surat Electricity Co., Ltd. told the shareholders at the last annual general meeting of that Company, "other things being equal, there is no reason to doubt the Company's ability to earn the current basic 5½ per cent rate for the financial year 1957-58" on the basis of the existing tariff structure, it will be remembered, he added a proviso that "if, however, during the financial year, the Company is faced with a trend in earnings not in tune with expectations.... it is now beyond doubt free to increase its rates to consumers by giving the State Government and the State Electricity Board two months' notice of its intentions." Whether or no any electricity undertaking does this, the industry is no longer in any doubt on the point, as hitherto. The position had been "murky" in this respect, to say the least. For, until recently, before an increase could be effected, the Regulating Authority would impose on the Licensee a Rating Committee and until that Committee is satisfied itself about the rating date and approved of the new rates, the Licensee was not permitted to increase the rates. But before it can appoint a Rating Committee now, the Regulating Authority must allege a breach of the Financial Principles of the Act on the part of the Licensee and issue him with a show cause notice. Even after this, if the allegation raises a dispute, the Licensee may refer the matter to the arbitration of the Central Electrical Authority and the hands of the Regulating Authority, 'vis-a-vis' the Rating Committee, will be stayed, pending the outcome of the arbitration. This is, indeed, a most welcome safeguarding factor for electricity undertakings in the private sector.

Mr. Milne also drew attention to another feature of the changes in the Electricity (Supply) Amendment Act, 1956 in the course of his speech which deserves notice. It is the further liberalisation of the Electricity Law which provides, in the case of expanding electricity undertakings, a useful resource for development. Under this provision, the Licensee is permitted to earn one half of one per cent as interest on the full amount of the Development Reserve. It may be noted here that, following the Development Rebate introduced by the Finance Act of 1955, the Electricity industry was asked to appropriate to a statutory reserve, called the Development Reserve, an amount equal to the saving in tax brought about by the rebate. But, if, at any time, the figure of Clear Profit is not sufficient to equate with the Reasonable Return, the amount to be so appropriated can be reduced to the extent of this shortfall.

However, there are certain strings attached to this Development Reserve provision. In the first place, this reserve has only to be invested in the business. Secondly, this reserve does not earn to the investor (the Licensee) any ordinary rate of return. Further, in the event of any sale of the undertaking, the Reserve should be handed over to the Purchasing Authority. On the face of it, this last is a very wholesome provision, in that it ensures that the Statutory Reserve, which is intended to be used only in the undertaking concerned, is not dissipated, a sort of compulsory capital formation measure, as it were. But, with the coming into being of State Electricity Boards, the prospects are that only these Boards would purchase electricity undertakings and the provision in question ensures that the State Governments, if and when they take over an Electricity undertaking in private hands, are not saddled with financially unsound concerns.

Electricity undertakings have been exempted from the compulsory Deposit Scheme, but not from Wealth

Tax. This is unfortunate, because to the extent that an electricity company is subjected to this tax its rates of supply cannot but be increased to the consumers. As a matter of fact, this industry (especially the established units) does not stand to benefit from any of the concessions granted under the Wealth Tax Act. The five-year tax holiday applies only to new electricity companies.

From what Mr. Milne stated, it does not look as though consumers can hope for much relief in future. So long as the State Electricity Board's bulk tariff for licensees remains unchanged, the latter cannot be expected to reduce their rates. The licensees have undoubtedly fought valiantly in this behalf, but to no purpose. Nor can the State Electricity Boards reduce their tariffs until they greatly augment their own power-generating capacity. So the vicious circle continues.

AHMEDABAD ADVANCE MILLS, LTD.

While the Union Minister for Commerce and Industry has categorically stated that there will be no reduction in the excise duty on cloth, reports on the working of mills continue to make disappointing reading. The latest instance is the report of the Ahmedabad Advance Mills Ltd. for the year ended June 30, 1957, which shows a profit for the whole year of just Rs. 4,666 as against Rs. 13,11,721 for the previous year. The Directors themselves observe in their Report that the result is disappointing and attribute this to the "constant rise in the cost of production and the crippling effect on the cloth trade of the country brought about by the drastic increase in excise duty."

According to the Report, up to August 1956, trading conditions were quite normal with sustained demand for cloth, at fairly remunerative prices, but, from September onwards, with the steep rise in excise duty, there came a precipitate fall, both in demand and prices, resulting in substantial increase in stocks and entailing heavy interest and insurance charges. Simultaneously, severe credit restrictions were imposed by banks which aggravated the trade crisis. And, to make matters worse, as it were, the Government imposed restrictions on the holding of stocks by mills and wholesalers beyond a certain limit, which compelled the mills to dispose of stocks at sacrificial prices.

The effect of the disappointing trading results of the company in 1956-57 is reflected in the inadequate appropriation for depreciation, which amounted to only Rs. 1,50,000, as against Rs. 10,39,958 in the previous year and in the forgoing of even the minimum commission of Rs. 50,000 due to them by the Managing Agents.

An otherwise redeemable, feature of the Report, however, is that a substantial part of the mills' reorganisation and modernisation plan was carried out during the year under report. A sum of Rs. 25 lakhs was spent on new machinery and other equipments, including 25 Ring Frames, motors for individual drive of Speed Frames and Ring Frames, a second Barber Colman Winding and Warping Machine, a High Speed Winding Machine, Humidification Plants in Winding Warping, Spinning and old Weaving departments with the necessary housings, a Damping and Cloth Conditioning Machine, a Double Folding and Plaiting Machine. In order to meet the heavy capital expenditure on this account, the Company issued Rs. 3,00,000 worth of debentures. The installed capacity of the mills is 49,144 spindles and 1,016 looms. A dividend of Rs. 5 per ordinary share without deduction of income tax, as against Rs. 12 per share last year has been recommended by the Directors.

COMMODITY NEWS AND NOTES

U.N. COCOA ESTIMATES

U.N. estimates for the 1957-58 cocoa crop of 811,300 metric tons were 10 per cent lower than estimates of 902,000 tons for 1956-57. Consumption of raw cocoa during 1958 will also be lower, according to the U.N. Food Committee's forecast. The world was expected to consume 802,000 metric tons next year, nine per cent below this year's revised estimates but almost equal to the 1956 consumption of 804,000 tons. The predicted drop in off-take is ascribed to the rise in cocoa bean prices. The Committee's forecast of crops from area's given below follows: Ghana — expected drop of 38,000 tons to 2,30,000 tons due to harvesting delays and to heavy losses from black pod. Nigeria and Cameroons — fall of 30,000 tons to 107,000 tons. French West Africa — expected yield 63,000 tons—drop of 9,000 tons. French Cameroons—5,000 tons lower at 55,000 tons. Brazil—production of cocoa beans this year at 150,000 tons, 11,000 tons less. A smaller proportion of crop to be processed during 1958.

U.S. COTTON CROP ESTIMATE

Cotton supplies in the U.S. this season are likely to be substantially lower than a year ago. The American Department of Agriculture has announced that the estimated crop, according to advices would amount to 11,786,000 bales. This compares with the forecast of 12,401,000 bales a month ago and the final output of 13,310,000 bales last season. After the new record levels for the yield per acre indicated earlier in the season the rate of output has dropped at 413 lb against 435 lb a month ago and the final figure of 409 bales last year. A month ago the U.S. forecasters provided a surprise by reducing the probable output by 300,000 bales. On this occasion the adjustment has been even more drastic and again proved in excess of market expectations which anticipated production of around 12 million bales. Weather conditions in the growing areas have been far from ideal, and a further decline in the available supplies was generally expected. A feature of the current crop has been the slow rate of ginnings. So far this season these are at the lowest comparable level for many years past. Up to November 1, they were put at 5,594,000 bales, against 9,709,000 bales at the same date a year ago. As a result the crop is singularly vulnerable to late climatic interference due to frost or other harmful influences. Already it is believed that the average grade of the crop will be much lower than last season. On the other hand no shortage of supplies for export is likely as there are at least 2 million bales of good cotton in the Government held stocks.

EUROPE'S STEEL OUTPUT RECORD

Steel production (ingots and castings) in the European coal and steel community in October reached a record total for any month at 5,420,000 metric tons. The October total compares with 5,071,000 tons in September and 5,175,000 tons in October 1956, which was the previous record month. For the first 10 months of 1957, the total was 49.5 million tons, against 47.2 million in the January-October period of 1956, or a rise of 5 per cent.

TEA PRODUCTION

Tea production in North-East India has shown a rise of 1.7 million lb. in October as compared to the corresponding month last year. However, total production during the current season up to the end of October has declined sharply by 28.4 million lb. to 462.61 million lb as compared to the corresponding period of last year and 468.21 million lb being average for the last three years.

IRON CASTINGS OUTPUT IN BRITAIN

Production of iron castings during the first half of 1957 totalled 1.91 million tons, compared with 2.06 million tons during the same period last year and 2 million tons during the first half of 1955. This was reported by the Executive Committee of the Joint-Iron Council at its annual convention recently. Earlier in the year, according to the report, falling demand at home caused stocks of iron castings to rise substantially, but in spite of increased export allocations, the situation was still causing concern at June 30—the end of the period covered by the report. The principal reasons given for this decline were the "underlying policy of restraint adopted by the Government. The difficulties arising from the Suez crisis and the strikes in the engineering and ship-building industries. The only upward trend in demand is in castings for the motor industry — now approaching a record level.

INCREASE IN SUGAR OUTPUT

The production of indigenous sugar amounted to 20.26 lakh tons up to October 31, 1957, in the current season, as against 18.59 lakh tons in the corresponding period of the last year. The total off-take, including quantities despatched for exports, was 21.21 lakh tons. The stocks with the factories on October 31, 1957, stood at 4.58 lakh tons.

INCREASED OUTPUT OF IRON ORE IN AUGUST

The estimated total output of iron ore in India increased from 316,720 tons in July 1957 to 346,422 tons in August 1957, according to official statistics released by the Chief Inspector of Mines. Returns received from 113 mines for the month of August 1957 show despatches totalling 258,253 tons to the iron and steel plants and 109,014 tons to the export market. The reported stocks as at the end of the month amounted to 1,427,513 tons.

This may shrink

This will not shrink

That's why people look for 'Sanforized' on the label!

The Trade Mark 'Sanforized' inspires such confidence that people all over the world pick fabrics trade marked 'Sanforized'—knowing they bear this assurance: *This garment will not shrink out of fit—even after many, many washings!*

It adds value and prestige to your own label—enables you to sell with confidence—and assures the public that you take trouble to give them value.

People rely on you to serve them well—so serve them cloth labelled 'Sanforized'.

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements

The Failure of a Funeral

agitated debate on the Finance Minister took place in the Lok Sabha on Wednesday Thursday this week might be summed up in the phrase "The Failure of a Funeral". The

Communist Party of India—aided misguidedly in this matter by Acharya J. B. Kripalani—sought ostensibly to dismiss the Finance Minister and to arrange his departure with every sign of

joyous mourning. The purpose of the exercise, as was indicated by Mr. Frank Anthony in a remarkably able speech in the debate on Thursday, could not possibly have been so single-minded. Obviously the Communist Party of India cannot, merely because of one single attack by the Finance Minister on Russia and China—which has since been explained away even if it has not been totally denied—argue that India's prestige or policy has been mortally hurt. One might argue, perhaps controversially, that India's prestige has been more hurt by her surrender on Tibet and on her ambivalence on Hungary than it can possibly be by ten Finance Ministers casting equivocal aspersions on the Soviet Union or China. The Communist Party has not shown itself so tender of India's prestige in respect of Tibet or Hungary that it can lightly throw the first stone. Obviously the debate had some other purpose. Surely this is because the party feels that closer economic relations with the countries of the West might, in time, dampen our enthusiasm for the East. If this was also the purpose of their attack on the Finance Minister it has been equally defeated, not indeed by eloquence but by the hard facts of the situation to which Mr. Frank Anthony also referred.

The question, which is relevant to the country, is whether the posture adopted by the Government of India via the Finance Minister is one which is, or is not, in the national interest. As far as can be determined from the reports received, there has been a studied dignity in our request for aid. No evidence was adduced in the debate to indicate anything to the contrary. What really is involved, therefore, is not the Finance Minister's approach but whether a request for aid—mistakenly described "as a begging bowl"—is or is not proper to the dignity of India at this time. That two whole days should have been spent on an issue so blatantly clear seems to argue a distortion of the economic facts as they are written into current Indian needs. These facts are two, and two only. In the longer period, covered by the second Five-Year Plan, we have both existing commitments and future commitments inevitably written into our economy as a result of the determination to proceed with the "hard core". In the shorter period, perhaps in the next six months, as a result of the failure of rains, we have an intense pressure in our food supplies which can only be met by large-scale imports. Is it the contention of the Communist Party of India that we do not need these food imports; or that we do not need the foreign exchange for the hard core of the Plan? If so, none of their spokesmen made this point clear in the debate. It is the essence of the matter.

If it is granted that India needs these food supplies and foreign exchange adequate enough to fill the gap, whom, above all, does she need to turn? There is no country other than the United States that has an adequate wheat surplus available for our needs. There is no country which is prepared to lend us a million tons of wheat on P.L. 480 terms or terms even less generous. Therefore, the request to the United States is inescapable to meet the second of our immediate problems. It is arguable on the first that the USSR might conceivably give us a substantial volume of deferred payments as, indeed, it has

agreed to give to Egypt in the last week. India's needs are not those of Egypt; they are, at the present time, at least ten times as large. Is it conceivable that the Soviet Union and Eastern European countries can meet the major portion of India's foreign exchange requirements on the hard core? This is a question to which the country urgently needs an answer.

No one should be so misguided as to decry the assistance which this country has already received from the Union of Soviet Socialist Republics. No one should be misguided as to derogate anything from the great scientific achievements of the Soviet Union symbolised by Sputnik I and Sputnik II. No one, indeed, should suggest that it is in India's interest to depart from any friendship with the Soviet Union which will imperil our security in any way. But to argue that the Soviet Union—if, as one member suggested, a delegation visited that country—can supply the foreign exchange needs of the Indian Union for the second Five-Year Plan, is to fly flatly in the face of all available facts. It is these facts and not the remarkably able and forceful speeches of the Prime Minister and the Home Minister that really dismissed the Communist move. The response of the Government of India to charges of overpartiality to the West was not merely moderate but deeply objective. Thus the Prime Minister did not fail to admit that he was disturbed by some elements in the *New York Times* interview as he was disturbed by the angry remarks made by Mr. Krishna Menon in the United Nations which have since been withdrawn but which were obviously in as bad politics as they were in bad taste. This frank admission of his differences with his colleagues showed the Prime Minister in his best form. There was no duplicity or evasion in his speech in reply which will be ranked as one of the best parliamentary contributions he has made.

As the dust on this controversy settles, one should draw at least one personal conclusion. Both the Finance Minister and the Defence Minister enjoy the confidence of the Prime Minister. It might be assumed, as though it rationally followed, that they wore the same outlook. This is obviously not the case, and if it is argued that the Finance Minister deserves the entire support of the Cabinet because of the remarkably efficient handling of his mission, surely it should be admitted that to the extent that Mr. Krishna Menon makes that mission difficult he is out of place. That he has done a good job on Kashmir except for his irritating losses of temper does not withdraw from the fact that he has not been a good representative of the Indian Union abroad. If, as *The Eastern Economist* believes, the work that Mr. T. T. Krishnamachari has begun should be pursued to a successful conclusion, it is essential that personalities that disrupt or hinder this work should be withdrawn from the areas in which they create animosity. This is no more than to say that one needs at the present time to make some concession to the views of other nations with whom we are intimately concerned. India's prestige does not require that we should insist on maintaining our personalities as well as our policies whatever their consequences abroad. The economic consequences of Mr. Krishna Menon need now to be taken into consideration.

Evasion on the Plan?

THE resumed debate in the Lok Sabha on the second Plan concluded last week—and probably left the man-in-the-street no wiser in his understanding of the likely ultimate size of the Plan. Even the more discerning public might be excused if it got the immediate impression that there was more evasion than enlightenment in the fighting intervention of the Prime Minister and in the chastened reply of the Finance Minister. On second thoughts, however, it would appear that evasive as the official replies were, they were not wholly unenlightening. Evasion was perhaps inevitable where the Government was obviously waiting, like Micawber, for something to turn up on the foreign exchange front, and such enlightenment as there was could thus be read only between the lines.

The Prime Minister's seemingly stout defence, for example, of "the basic structure of the Plan" let the cat out of the bag where it admitted that the problems and difficulties facing India today were due to the fact that "she was trying to go ahead fast" and the Plan compelled the country "to stretch itself to its utmost". In conceding that the strains and stresses had developed in spite of what he believed to be a modest rate of capital formation of 7 to 7½ per cent per annum at present, the Prime Minister probably forgot to mention that if a different kind of treatment had been meted out to the agricultural sector, the economic strains and stresses he spoke of might not have manifested themselves even in a possible attempt to maintain a rate of capital formation of 10 per cent or a little more per annum. But, then, it was supremely important for the ruling Congress Party to avoid the political strains and stresses which would have flowed from any such squeeze on agriculture.

As this was an insoluble dilemma—to tighten or not to tighten the screw on agriculture—it was implicit in the Prime Minister's statement that some things would have to be stopped or delayed as there were no resources. That Mr. Nehru was painfully aware of the fact of a crisis even on the internal resources front, could be inferred from his angry insistence on a "self-help movement" in the rural areas for digging temporary 'kutch' wells, for repairing small tanks, for growing short-duration crops like potatoes, 'bananas', etc. (Incidentally, it was amusing that the Prime Minister, in his understandable impatience with the slow-moving peasantry, thought he knew something of husbandry when he described 'bananas' as a short-duration crop!) It was, therefore, good to know there was coming about a shift in emphasis from the big things like major irrigation projects to small things like minor irrigation from tanks and wells. After all, it may yet turn out that in the difficult field of agriculture small things done in a big way would be more productive of good than big things that cannot be done in a big way for lack of resources, both external and internal.

The Finance Minister's speech was a shade more enlightening than that of the Prime Minister although he chose this time to speak of "the essential priorities in the Plan" instead of the "hard core". This terminological change was probably intended to convey that "the basic structure of the Plan" would be kept intact. It was,

possible that the structure of relative priorities, after deletion or postponement of some individual schemes and projects under each priority head, could well be the same as before. So, what was most relevant to note in his reply was not the proclaimed determination to keep the basic structure of priorities intact but the near-probability of some major projects being dropped. This was clear from his own statement that "in fact, if there is any diminution in the Plan of a substantial character in the public sector, it might have to be in the power projects and, perhaps, even in the one, two or three of the fertiliser projects". It was also clear that some of the programmes of industrial development in the private sector could not be undertaken for the present inasmuch as they required further commitments of foreign exchange.

Mr. Krishnamachari, of course, mentioned some power and fertiliser projects by way of example. That he had probably other major or minor projects in mind could be inferred from his other statement that the Government was "trying to provide funds, both external and internal, for carrying forward the projects which have already advanced considerably" and "to complete, to schedule, the programmes in respect of the railways, major ports, steel, coal and ancillary power" and that no new commitments were being undertaken outside them except against external assistance and foreign investment on deferred payment terms. In the context of the Prime Minister's and the Planning Commission's emphasis on minor irrigation, it could also be inferred that such major irrigation projects as had not been taken up or had not advanced considerably would be dropped or postponed. Since there would be a "bunching" of external commitments over the next 18 months and a large part of the deficit of Rs. 700 crores in foreign exchange would arise within this period, it was not difficult to see that a number of projects would automatically get postponed in point of time, if not dropped altogether.

As for actual performance in the first two years of the Plan, the picture described by the Finance Minister was not reassuring. For the two years together (1956-57 and 1957-58) expenditure on the Plan would be somewhat less than a third of the Plan outlay of Rs. 4,800 crores; the actual financial outlay would, of course, be considerably less than a third if the higher prices were taken into account. The Finance Minister did not appear to be very hopeful of finding resources for matching a target for the remaining three years of more than two-thirds of the total outlay of Rs. 4,800 crores when he said mildly there were "uncertainties in the situation" and politely told the Communist Members of Parliament: "There is a section of the House which is of the view that the Plan should not be pruned and the physical targets set down in the Plan must be adhered to. I appreciate the sentiment. But, in the ultimate analysis, a community gets the equivalent of what it puts in by way of its own effort and sacrifices". What the Indian community could put in "by way of its own effort and sacrifices" without collapsing in the process was by now clear, and if the Communists wanted that the Plan should be implemented as it was, their motives were not above board.

The State Trading Corporation

THE State Trading Corporation's annual report cannot, in view of the controversies it has raised, fail to awaken abundant interest. The earlier recommendations of the Committee on State Trading were evidently inconclusive, and in any event it is nobody's case that they served as the inspiration for the formation of the Corporation. The Corporation does not owe its existence to a statute of Parliament which, apart from the fact that it would have brought accountability to Parliament, ought to have been chosen as the sanction behind an instrument of such a radical departure from policy. It came into being quietly under normal registration in the middle of May 1956 with little indication from previous references to it on behalf of the Government that it would suddenly take concrete shape. Its purpose and functions have been defined in terms that leave room for uncertainty as to the scope of its operations. A reasonable and constructive approach demands that its trading operations and business techniques should be scrutinised to evolve a definite policy for its role as a supplementary agency to augment the country's trade.

The Corporation's report for the first accounting period ending on June 30, 1957, gives evidence which can be read or misread by chance. The Corporation has strayed into spheres where it has caused considerable overlap or superfluous replacement of existing arrangements which had demonstrated their utility as well as efficiency. The crucial figure in its financial results clearly reflects the genuine nature of its activities. Gross profits from trading operations have amounted for the thirteen-and-a-half-month period to Rs. 35 lakhs which is merely half of the profits from agency commission plus some income from service fees. In effect, the Corporation has elected (on its profits performance) to relegate its chief duty as a direct trader to a subordinate position. For the major part the Corporation has leaned heavily on procuring and selling agencies as also on business associates all of whom were long established in their individual lines of business. The very fact of their retention gives clear enough proof of their value in the country's trade. It has been neither demonstrated nor claimed on behalf of the Corporation that in the absence of its intervention these agencies would not have functioned as effectively as the demands of trade required. If the Corporation has been able to step in as an extra agency, it is because of the sanction which it derives from its character as a State organisation.

The report claims and should be given credit for the Corporation's specialised contribution in the form of what is described as link arrangements of items of essential imports with exports. These arrangements are in reality the outcome of bilateral transactions as in the case of Viet-Nam and Hungary where negotiations were needed at a Government level. The deal with Egypt is to be interpreted in the light of the strains exerted on her economy in the last year. But while credit is that without the major and active collaboration of the established trading firms or business houses the Corporation could not have been able to face up to the task of performing the contracts arising out of the link arrangements.

Exports more than any other sector of the country's trade demand, in the current phase, real effort for expansion and it is on the test of a successful drive for intensification of exports that the performance of any trade agency will continue to be judged. Credit is due to the Corporation for establishing certain new markets including iron ore in Italy, chrome ore in China, gunnies and Sann hemp in Viet-Nam and salt in Indonesia. The Corporation has also rendered considerable service to small-scale industries to enter the export market of which handicrafts and footwear are typical illustrations. Expansion of exports is an arduous and time-consuming function. But when full allowance is made for this factor, the Corporation has only a modest measure of success to claim. Nevertheless this is good work which should not pass unrecorded.

In essence, the Corporation has adopted a policy of devoting its resources to established lines of exports and almost entirely to export of ores. There exists a seller's market in iron ore by reason of the acute pressure of demand generated by the race for intensified production of steel in the producing countries. The Corporation was able to ship bulk consignments of iron ore on its own account on a very small scale. In the sphere of ores in the larger context, it took a wise decision to act in concert with the traditional private channels and it has frankly acknowledged the extent to which its activities were facilitated by the active co-operation of the liaison committee set up under the auspices of the Federation of Indian Chambers of Commerce and Industry. Many of the misgivings about the Corporation's participation in manganese exports could be removed after clear indications were given that the Corporation would move on the basis of joint sales programmes to be executed in a full spirit of collaboration.

The controversy over the Corporation's monopoly of imports and total internal distribution of cement has now become a matter of intimate knowledge to those interested in the problems of trade. It has not been demonstrated in this latest document how public interests have been promoted by vesting the monopoly in the hands of the Corporation. One significant fact which has transpired from the report is that the loss on imported cement amounted to Rs. 48 lakhs. It could have been larger as anticipated, if shipments had not been hampered by the Suez crisis. Thus there was no justification for earning a "surplus" of the order of Rs. 5.01 crores. The Corporation has been awarded a service fee at the rate of 1½ per cent of the gross turnover, while the disposal of the residue remains undecided for the present.

The Corporation has accepted a prudent policy in maintaining undisturbed the established channels of trade in a majority of cases. It is likely to stay as an integral part of this country's trade mechanism. But it would be well to recognise clearly the limitations on its capacity to function as a direct trader and conserve its resources for procurement of goods on Government account where existing departmental arrangements involve waste of time and money. In that event, resumption of other trade, in which it has participated, by the traditional agencies will be a smooth process.

The Story of Oil—3

Buried power

'Rock Oil' is the literal translation of the Latin words 'petra' and 'oleum' which make up the name petroleum. Trapped underground in the cells and fissures of porous rock, petroleum is a raw mineral consisting of liquid crude oil and natural gas. These are usually found together, and between them they are a major source of power for the world today and the basis of thousands of commodities useful to mankind.

Petroleum is a mixture of substances called hydrocarbons. These are chemical compounds made up of the elements carbon and hydrogen (the former heavy, the latter light in weight). Hydrocarbons vary widely in nature and behaviour according to the different proportions of these

The drawing at the top shows the inside shape of an anticline. Compression has buckled up the earth's crust, squeezed it into these folds. The other illustration is of a fault, a dislocation in rocks. Two sections of the earth have been forced in different directions until they cracked, slipped out of position, and upset the alignment of all the rock strata involved. The black section indicates oil-bearing rock.

two elements they contain. Most are liquids at ordinary temperatures, but some are gases and other solids like bitumen.

Despite popular belief, this petroleum does not collect in large underground pools. If it did, exploration and discovery would be comparatively easy. Instead it lies, usually with a quantity of salt water, in layers of solid looking porous rocks closed in by walls or caps of non-porous rocks which prevent it escaping. There are three main types of oil trap—the 'anticline', an arch-shaped upward fold in the earth's rock layers; the 'fault', or fracture in the earth's crust whereby a non-porous layer has slipped to cut off a porous layer; and the 'stratigraphic' trap, where because of changes in the type of rock a porous layer becomes sealed off by non-porous rocks.

Thus, when geologists begin their search for oil, they start with the knowledge that certain types of rock formation are more likely to yield oil than others.

ACC HONOURS THE CODE

3

"Employers owe it to labour to recognise that welfare is not conceived in terms of philanthropy, but as a social obligation. Men and women engaged in production shall do so with dignity, honour and a sense of security. Fair wages should be paid for work done. Working conditions shall be as pleasant as possible."

Code of conduct—FORUM OF FREE ENTERPRISE

As an employer of labour the ACC can well point with satisfaction to the salary/wages and other emoluments paid to its employees and to the many welfare activities voluntarily undertaken over the years.

To take salary/wages first, compare these figures of ten years:

	1945-46	1955-56
No. of employees	17,500	29,000
Salary/wages & amenities	Rs. 127.3 lakhs	Rs. 421.5 lakhs

Thus while the increase in the number of employees was 66%, the increase in the salary/wages, etc. for the same period was over 230%!

As for welfare activities, employees of the ACC's 17 factories and two collieries have for a long time been enjoying a large number of amenities for their security and social welfare, namely: provident fund and gratuity; schools, hospitals and dispensaries, creches, canteens, cinemas, clubs, playing grounds; welfare and benefit fund, and co-operative societies.

All these benefits have been provided out of a consciousness of social obligation. The ACC believes that a well-paid, well-looking, after, happy and contented employee is the best employee.

THE WEEK'S NOTES

THE SPHINX AGAIN

THE NEWS following General Amer's visit to Moscow that the Egyptian request for a new Russian loan has been accepted will naturally be interpreted differently in different countries. In the West, notably in the United States and Britain, it will be read as a balancing act to prevent Egypt's strained economy from tilting under Western pressure. That economic pressure has been great, following what have been described as 'impossible' conditions on the purchase of Egyptian cotton and the slowness with which the West has been willing to grant Egypt a loan following the promising visit of Eugene Black, President of the World Bank, cannot be doubted. Whether or not this was intended, Egypt has been forced to approach the Soviet Union for assistance. In applying the heat surely the West has been unwise.

In the East, no doubt, there are political stakes both in the exuberant presence of Mr. Khrushchev at the reception for General Amer in Moscow and the indication that the loan—believed to be 700 million roubles or £60 million at the official exchange rate—will cover Egypt's deficit in payments for a period of at least two years. This economic security may, or may not, be dearly bought. In neutral countries where no particular importance is attached to receipt of aid from either side of the Iron Curtain, one is tempted to look upon the operation without political undertones.

So to regard it would be a serious mistake. It is obvious, even without any political instructions, that the receipt of a vast amount of equipment and capital goods of Russian types will involve, both for the purchase of spares and for replacements as a whole, a bias towards the Soviet group of countries for imports far beyond the period covered by the loan. Indeed, the loan comes on top of a great "natural" increase in Soviet-Egyptian trade for the first seven months of this year. One estimate is that the trade between the two countries at about \$40 million six times what it was in the same period of last year. Russian participation in Egyptian imports must grow quickly and, since the Soviet Union dislikes unbalanced trade, undoubtedly Russia will be a strong buyer of Egyptian cotton in years to come. In our quieter moments we will recognise that this is a double loss to us. There will be less Egyptian cotton available for us to purchase, and less of Russia's foreign capital for investment in India. We need not, therefore, hail Egypt's success with anything approaching enthusiasm. The fact that so many intelligent Indians fail to see the national interest in deals such as this provides more unhappy evidence of emotional elements which destroy sound perspective in Indian economic affairs.

BERTRAND RUSSELL'S APPEAL

IN AN 'open letter' (published in the 'New Statesman' of London) to President Eisenhower and Mr. Khrushchev, Bertrand Russell has made a powerful plea for agreement between "the two most powerful countries in the world" on the ground "that the matters in which the interests of Russia and America coincide are much more important than the matters in which they are thought to diverge". The identical interests of the two countries, according to Russell, lie in the consideration that "neither side can desire" a world war which would result "in the extermination of both". There is also the consideration that "the international anarchy which will inevitably result from the unrestricted diffusion of nuclear weapons is not to the interest of either Russia or America". The third point that Russell has made out is that "so long as the fear of world war dominates policy and the only deterrent is

the threat of universal death, so long there can be no limit to the diversion of expenditure of funds and human energy into channels of destruction". With such an identity of interests, the two Powers, it is hoped, "will abandon the futile strife and agree to allow to each a sphere proportionate to its present power" and to devote themselves jointly to the preservation of peace throughout the world. At the same time, "they can jointly refuse military or economic assistance to any country other than themselves which persists in the manufacture of nuclear weapons."

One wonders if Bertrand Russell who lays so much stress on the identical interests of the two countries and plays down their divergent interests does not concede the force of the latter where he pleads for "each a sphere proportionate to its present power". As the United States and the Soviet Union alone are the two most powerful countries, a sphere proportionate to the present power of each would virtually mean a division of the entire world into two major 'spheres of influence'. Will the 'divergent interests' of these two Powers disappear merely because the world is divided up into two spheres of influence? Will other sovereign nations agree to Russia and America being joint policemen of the world for preserving peace? Will not Russia claim the entire eastern hemisphere (where Communism has already advanced greatly) as her sphere of influence? Will America be willing to pay this enormous price for agreement with Russia? Will not a possible agreement of the kind pave the way for Communist rule in the West European democracies whose people are any day better off than the Soviet people? Will even India which aspires to be a leading democracy in Asia take kindly to an arrangement under which her possible coming under Communist rule might be facilitated? Questions like these suggest themselves when Bertrand Russell's open letter is perused, but there are no answers to them in what is otherwise a high-souled appeal for world peace.

WILL THE RUSSIAN STATE WITHER AWAY?

ONE OF the answers that Mr. Khrushchev gave in an interview he recently granted to the Chief Correspondent of the American "United Press" Agency in Moscow is, to say the least, unconvincing. This answer was about the Communist theory regarding 'the withering away of the state'. Here Mr. Khrushchev asserted that the state's withering-away process was already under way in the Soviet Union as changes were taking place in some organs of compulsion, but he did not specify what changes were taking place in which coercive organs of state power. In the same breath, the Soviet leader added that the process would be quickened if the danger of external pressure or attack greatly diminished, but he did not mention that this external pressure, if any, could only be of a defensive character and have been caused only by a world Communist movement guided informally, if not formally, by the Soviet Communist Party. That this informal guidance is very much of a fact may also be inferred from Mr. Khrushchev's remark elsewhere in the interview that periodic meetings with the top-level leaders of the Communist movement in other countries "are useful". The inference, therefore, is clear: So long as the pressure of World Communism continues unabated, the defensive counter-pressure of Democracy may be expected to continue as a natural consequence, and this circumstance (described by Communists as 'Capitalist encirclement') will only be used as an excuse for making the Soviet state still more powerful. The state's withering-away will then be as far away as ever.

To look at it from another angle. The withering-away of the state, it has all along been supposed, will

take place only in the stage of ultimate Communism, and no Communist theoretician has up till now claimed that the Soviet Union has reached anywhere near the end of her socialist phase. When Mr. Khrushchev claims that the process of the state withering away is already under way in Russia, he is definitely not on sure ground because it would mean that the system of "from each according to his ability and to each according to his need" is already coming into vogue and that the "administration of men" is being replaced by the "administration of things". Only dupes and simpletons outside Russia might believe that this millenium has arrived in that country, but surely nobody under Communist rule would be so naive as to believe that this is happening.

YUGOSLAVIA'S SECOND PLAN

YUGOSLAVIA IS celebrating her Republic Day on November 29. The usual political significance of the Day this year is overshadowed by the coincident circumstance that Yugoslavia is elaborating her second perspective Plan of economic development—the second Five-Year Plan of 1957-61. Although the second Plan is just under way after a lapse of five years from the close of the first Plan in 1951-52, there have been annual plans in the intervening period when the emphasis was not predominantly on heavy industry and when industrial production increased at an average annual rate of about 13 per cent. There is still less emphasis on heavy industry in the second Plan, even as there is no over-emphasis on small investment by way of reconstruction and enlargement primarily for the development of the light processing industries. Again, the second Plan does not favour agriculture at the expense of industrial production although it does provide for investments in the former. It is thus claimed that the Plan, as it is now designed, would ensure harmonious development and avoid scarcities of goods and stagnation of the individual sectors of the economy.

A unique feature of Yugoslav planning is decentralisation of investment funds as far as agriculture and small enterprises are concerned. As the Plan provides for a large number of small investments in the existing enterprises and in agriculture through co-operatives, the economic independence of enterprises in the disposal of funds is to be further emphasised. At the same time, the small enterprises, having larger funds at their disposal, will be objectively led by the very mechanism of the system towards unification and co-operation. On the other hand, the major industrial and other projects are scheduled individually under the central plan, and their financing and implementation will rest with the central authority.

It may be that, with the strengthening of decentralisation in the matter of decision-making regarding the allocation of small investments and with the retention of central decision-making in the matter of large and basic projects, Yugoslavia will have found a satisfactory answer to the question of centralisation and decentralisation in the organisation of a planned economy. But this is by no means certain, for the process of co-ordinating the need for planned regulation from the centre and the need for stimulation of the initiative of enterprises and lower economic organisations is an extremely difficult one. It is intriguing in this connection why a process of unification of small enterprises is also expected to come about. If this means consolidation of small enterprises into large units, the question arises whether the latter ones will come under central control and direction in due course or whether they will continue to be autonomous. It is, therefore, not clear if the Yugoslav experiment in economic decentralisation will be an unqualified success and thus have any lesson for India which faces an identical problem in planning.

AN ECONOMIST'S JUDGMENT

IT WAS a very constructive speech that Mr. Leon H. Keyserling, former Chairman of the Council of Economic Advisers to the President of the United States, made here at a recent meeting of the Members of Parliament. The speech was particularly noteworthy for the suggestions advanced to improve economic planning in India. One of these was that in order to reduce the clashes between the public sector and the private sector, there should be inter-related objectives and unifying goals extending over the whole economy and the policies and programmes in one sector should be mutually beneficial to those in the other sector. This suggestion is worthy of respect because it is intended to ensure the smooth functioning of a mixed economy which has a recognised place in democratic planning. If, as Mr. Keyserling says, 'constructive agreements' are to be substituted for 'deadening disputes', what is required is only a common willingness on the part of both sectors to learn from the experience of mixed economies in the West. This is, of course, more easily said than done, for the 'golden mean' is easy to contemplate but difficult to reach in practice.

Mr. Keyserling also expressed the view that "no amount of financial juggling can take the place of insufficient physical resources" and that "neither any mere re-sharing of an existing physical product nor any mere regulation thereof can take the place of expanding production and rising productivity". It is not clear if the American economist had deficit financing and egalitarian or redistributive taxation in mind when he referred to 'financial juggling' and 'mere re-sharing of an existing physical product'. If he had had these in mind, his judgment, mature as it is, may command respect. Perhaps the Union Finance Ministry has already reached the position that deficit financing and taxation alike should be kept within reasonable bounds for the rest of the second Plan period. As hints have been dropped to the effect that deficit financing would be limited to Rs. 900 crores and only marginal adjustments in the tax structure would be made, the remaining years of the second Plan will probably not have any more 'financial juggling' of the kind that Mr. Keyserling has criticised.

IS AN "ORDERLY" DEVALUATION POSSIBLE?

By

ODYSSEUS

WHAT IS THE CASE for flexible rates of exchange?

On November 22, we discussed their use as a temporary measure pending the return to convertibility of currencies at present divided into hard and soft and hedged about with various import restrictions. This week we turn to consider the idea of flexible exchange rates as a permanent feature of international currency relations. The leading advocate of flexible rates of exchange is Professor Friedrich Lutz of Zurich, with whom I recently had an opportunity of discussing the practical difficulties involved.

Professor Lutz observes that those who favour fixed rates of exchange frequently point out their advantages without explaining what is to be done when a serious balance of payments deficit arises. If all countries could bank on constant equilibrium in their balances, there would be no need for wide fluctuations, and fixed or flexible rates would be to all intents and purposes identical. But India's current foreign exchange deficit illustrates the point that fundamental disequilibria can arise.

If the policy is to keep exchange rates fixed, the authorities, when faced with disequilibrium, can institute deflationary pressure, which is the equivalent of returning to the gold standard and is what the UK seems currently to be attempting. If UK prices, and in particular UK wages, prove flexible downwards, deflation will work in the same way as a fall in the exchange rate. For in both cases, the equilibrium in the UK balance of payments will be restored by a fall in the UK domestic price level relative to the world price level. But in the contemporary world, when workers in most countries can rarely be persuaded to accept lower pay, downward flexibility of prices and wages must apparently be regarded as a thing of the past, a deflationary policy produces unemployment and a decline in national income, and thereby reduces the demand for imports.

The difficulties of restoring equilibrium through deflation are, Professor Lutz stresses, likely to be increased by the reactions of "surplus" countries. Unless they are engaged for other reasons in expansionist policies (e.g. as a cure for unemployment), they will be reluctant to increase the money supply which the rules of the gold standard prescribe, so that the entire burden of the deflationary adjustment will fall on the deficit country. It was this line of reasoning which led Professor Lutz to rebut my argument for the gold standard (published here on November 8), with the observation that, however desirable it is, no country is likely today to be ready to subject itself to the discipline which the gold standard imposes.

THE DANGER OF IMPORT RESTRICTIONS

A second way of maintaining fixed exchange rates in the face of a deficit is foreign exchange control and import restrictions, quotas, and licences. To continue to use these methods would be to reverse the direction in which post-war economic co-operation has sought to steer international trade. But, points out Professor

Lutz, those who, while objecting to the gold standard method of dealing with deficits, advocate fixed exchange have no choice but foreign exchange or import restrictions as the only way of ending a balance of payments crisis. And there undoubtedly remains grave danger that resort to this method may be made in the future. The disadvantages of this method are matters of post-war history: the arbitrariness of the administrative measures that have to be enforced; the direction of international trade into channels other than those determined by comparative advantage; the time-lag with which the measures are taken; the difficulty of abolishing controls once vested interests have grown up under their protection; the possible retaliation by other countries; the unforeseen domestic repercussions which frustrate the objects in view, as when consumers, prevented from buying imported goods, spend their money on buying goods previously exported.

Many who advocate fixed exchange rates as the ideal admit that they dislike deflation and import controls and are therefore willing to compromise on sudden devaluations thereby substituting a new "fixed" rate for the old one which can no longer be held. This is the method recognised by the International Monetary Fund, the authors of whose statutes approved of "orderly" (sic!) devaluations by which they meant that they thought that devaluations could be agreed upon by all members of the Fund so that competitive devaluations should be avoided.

Professor Lutz is against this method because:

(a) One of the main advantages of fixed exchange rates — the encouragement that they give to long-term international capital investment — is lost once the possibility of a sudden devaluation is admitted. When investors can no longer rely on the maintenance of fixed rates in all circumstances, they will — as today — think twice before investing in a foreign country.

(b) Whenever a strain on the exchange rate develops, the possibility of devaluation will induce speculators to sell the currency. This type of speculation is almost without risk, since the worst that can happen is that, if devaluation does not come, speculators will make no profits, but will incur no losses except for the minor costs of their operations. Professor Lutz stresses that under this system there can only be one-way, "bear" speculation, and no counter "bull" speculation, so that a devaluation may be forced which might have been otherwise avoided.

(c) The "orderly" devaluation exists only in the pious imagination of the IMF's founding fathers because within an hour of such a possibility having been mooted in its conclave, rumours of it would sweep the world and touch off universal "bear" speculation.

(d) The decision to devalue is usually put off until the strain, aggravated by speculation, becomes so intolerable that devaluation is forced.

A CHOICE OF EVILS

These are the weak points of fixed exchange rate policies, but Professor Lutz is at pains to point out that every policy has its weak points — including the flexible exchange rates that he himself advocates — and that in most of this world's problems there is no ideal solution but only a choice between greater or lesser evils. There is no perfect way of getting out of a balance of payments crisis (except not to have one) and even if the advantages and disadvantages of different policies can be set forth clearly, and agreed upon, the alternatives leave room for personal judgments and preferences. Some experts will prefer import controls, others fluctuating rates of exchange. Their choice will be much influenced by their prejudices for or against government intervention in economic affairs.

The main advantage that can be claimed for flexible rates is that they allow a country to avoid quantitative import controls and to follow (within certain broad limits which we will look at next week) an "independent" monetary policy, i.e., a policy that is unaffected by deficits or surpluses in its balance of payments. Under flexible rates a deficit does not force a country into contraction of its monetary supply followed by unemployment, nor does a surplus force it into an expansion of its monetary supply followed by rising prices.

In most discussions of flexible and fixed rates, only the avoidance of deflations is usually stressed, but the avoidance of monetary expansions is surely just as important. From time to time the authorities of some of the countries which are members of the European Payments Union have shown nervousness because of the credit expansion which surpluses threaten to cause. The classic example at this moment is, of course, Germany. Professor Lutz takes this nervousness to be a clear indication that these countries would not be — are not — ready to follow the rules of the gold standard, which would require that, when confronted with a balance of payments surplus, they should increase their money supply.

[This is the third in a set of four articles discussing the pros and cons of flexible and fixed rates of exchange. In the first article, entitled "Balance of Payments Problems", which appeared here on November 8, Odysseus outlined his own prejudices in favour of the orthodox gold standard. Thereafter, last week and this, he has outlined the case for flexible rates of exchange as propounded to him by Professor Lutz in a conversation in Zurich where the Professor holds the chair of Economics. Professor Lutz is the outstanding survivor of the School of economics initiated by the late Walter Eucken, whose influence was all-important in directing Germany back to a free enterprise economy with such impressive results after World War II. Next week, the final article of this series will cover the point made by some central bankers that the obligation to maintain fixed exchange rates provides them with a powerful defensive weapon against inflation, the objections, that fluctuating rates would (a) hamper international trade by adding to the risks of traders, (b) reduce the volume of international lending, and (c) provoke demands for higher wages from trades unions whenever the currency depreciated, (d) would encourage continuous "bear" speculation, and (e) would necessarily mean unstable rates. Economists who are interested in a full exposition of Professor Lutz's views on flexible rates will find them dealt with at length in a study that he published in the 'Banca Nazionale del Lavoro' Quarterly Review, dated December, 1954. —Ed.]

FRANCE ON HER OWN

(From Our Special West European Correspondent)

PARIS, November 25.

BY the time this appears in print, the debate on Algeria should have begun at the United Nations, in the Political Committee, and the Americans will be rounding up their retinue of retainers to ensure a vote favourable to France, "favourable" in giving Paris another reprieve. The French Government, at least, is this week quite confident of a suitable outcome to this second U.N. discussion of the Algerian war; it is notably confident that it will have the verbal support of its two chief allies, Washington and London. So, as far as appearances go, France will not be alone in New York. But in Paris there are few illusions. The excuses, apologies and promises lavished from the Anglo-Saxon capitals in the last ten days, and even the assurance of support in the U.N. debate, have done nothing to efface the realisation that the delivery of British and American arms to Tunisia means that henceforth France is very much on her own in continuing the Algerian war.

It may seem curious, especially to readers in India, that this realisation has been so slow in dawning. But the French are very much convinced of the righteousness of their cause in Algeria (even if half of them are less so about some of the measures used to defend it) and have thought that, however embarrassed their allies might sometimes be about it, their case was too strong ever to be challenged within NATO. Washington and London have been saying this week that the decision to send arms to Bourguiba did not constitute such a challenge, but in diplomacy first impressions are often more reliable than the honeyed hypocrisies that follow. And last week the first impression throughout the Continent and North Africa was that Paris had been served a sharp and humiliating admonition for her dilatoriness, together with a warning that Anglo-Saxon tolerance for her Algerian policy was approaching the limits.

French opinion took it this way and there ensued an outburst of passionate anti-American and anti-British feeling which was not only extraordinary in its proportions, even in this politically excitable country, but attained classes of people usually free of the Latin distrust of the English-speaking nations. The sillier Persian newspapers took it for granted that this was another step in the Anglo-Saxon conspiracy to rob France of the Sahara petrol; but even the more level-headed ones saw in it an attempt to restore an Anglo-American joint management of the Western world, such as existed during the last war and such as it has been France's wish to avoid since. The British are suspected here of desperately wanting to restore this two-power hegemony, if not to revive the glories of the Churchill-Roosevelt condominium then at least to promote themselves to the position of the U.S.A.'s privileged ally. This British longing excites distrust everywhere on the Continent and in exploiting the fear of it France can usually manage to get support from the other Continental members of NATO. Most West European countries are ready enough to accept America's necessary leadership of their alliance, and even when America's wider responsibilities oblige her to cross a European nation's interest (as during Suez), the Americans are sooner or later forgiven — but what is not accepted is Anglo-Saxon leadership, and what is less readily for-

given is a situation in which the British seem to "gang up" with the Americans.

As will be shown below, the French case in the dispute about arms aid to Tunisia is absolutely baseless; the Anglo-American decision was undoubtedly a wise one. But the fact remains that British behaviour in this incident has been distinctly peculiar, and it is this that has given the affair its curious flavour. France's Arab policy was resoundingly disowned by the Americans during the Suez crisis, but then the British were with the French; in this new opposition to France's Arab policy, the British are with the Americans, and naturally attention here has been concentrated on this "desertion" or "betrayal" of the ally of last year more than on the reasons for the American decision. Rational or not, this reaction must have been foreseen in London and it is this that makes British anxiety to be the first to deliver arms in Tunis more strange. After all, the reasons invoked were the need to keep Tunisia in her present pro-Western mood and the urgency of forestalling deliveries from the Communist bloc and its appendages. But this task is normally left to the USA, who are quite capable of fulfilling it without British help. Deliveries of American arms alone would have met Tunisia's needs, served the Western strategic cause sufficiently and done much less damage to the unity of NATO (it being understood now in West Europe that the USA has other responsibilities besides its European alliance). Certainly no one would have thought it odd, least of all the Tunisians, if the British had not been associated with the delivery of arms. Belgium, Italy and possibly other European countries had declined to provide arms, not only because they wished to avoid offending the French but because they knew the Tunisians would not suffer since the USA would in the last resort fill the bill.

It was the British haste not to leave the job to the Americans and not to do as the other European nations had done, moreover to ensure that their unnecessary assistance arrived in Tunis before the American weapons and, by coincidence, during the visit of the British War Minister, generals and R. N. vessels, that made it obvious that the Tunisian affair was not just part of Western anti-Communist strategy in the Arab world but had other implications. It is the search for these other implications that has made the affair a full-scale NATO crisis. Without the precipitate British intervention, the affair would have seen initial French indignation being quickly assuaged with reminders of America's anti-Communist duties (or obsessions). As it is, observers (and not only in France) have cast about for explanations in such fantasies as Britain's wish to "pay France off" for the Common Market scheme which London is represented as determined to scuttle at all costs, in the repentance of the traditionally pro-Arab Foreign Office for its collusion with the Israelis last year, in Britain's anxiety to demonstrate in the Mediterranean that her holding on to Cyprus has nothing to do with colonialism, or in a British desire to make clear that London prefers her "special" connection with America to NATO unity and the Entente cordiale. Even if none of these suspicions are true (though the last can scarcely be unfounded) British participation in the Tunisian affair has brought it home to the French that, anti-Communism and Western strategy quite apart,

their Algerian policy finds no real support among their allies, not even in an imperialist country.

Whatever may have been Britain's special motives and, however much these may have given the affair its peculiar importance, the fact stands that France's position is indefensible and inconsistent. Paris claims that she was on the verge of providing arms for the Tunisian army, so the hysterical cries that Anglo-American arms will be used by the Algerian rebels to kill French troops must be insincere; the assurances France would have obtained from Bourguiba would have been no more valuable than the assurances he has given London and Washington. Moreover, though it is a fact that Tunisia is passively supporting the Algerian rebellion to a degree quite incompatible with her international obligations, it is also true that no weapons formerly belonging to the Tunisian forces have ever been found in the Algerian rebels' possession; arms are smuggled into Algeria via Tunisia but that is another question. The French attitude that more stringent conditions could have been imposed on Bourguiba before he received any arms is a reflection of the French unwillingness to take Tunisian independence seriously. Tunisia is admitted to be juridically independent but in many practical matters some French politicians and officials imagine that Tunisia can be treated as a dependent nation.

Both the anxiety about how much aid Tunisia will give or suffer to be given to the Algerian rebels and the limited acceptance of that country's independence are based on recognition of an undeniable fact that the writ of the Government in Tunis does not run throughout Tunisian territory. For it is a fact that Mr. Bourguiba's sovereignty is more readily accepted in international capitals than it is in many parts of Tunisia itself. Hence the main French argument in this affair is that Bourguiba is not master in his own house, and that is why it is folly for the Anglo-Saxons to entrust him with arms when a war against one of their allies is going on at Tunisia's doorstep. All of this is true, but far from supporting the French case, it justifies the Anglo-American decision. The reason the Government in Tunis is not master of Tunisia is just that it lacks the army and security forces required to enforce its will throughout the country. Most important, the infant Tunisian army and police are quite outnumbered

by the Algerian rebel forces that non-chalantly make themselves at home in Tunisia. Bourguiba cannot logically be charged with allowing the rebels to use his territory as a base and at the same time denied the force necessary to ensure that the rebels respect Tunisian sovereignty. A little more patience from the French and a lot less fuss, and it would probably emerge within a few months that the use Bourguiba makes of his new weapons would assist the French cause in North Africa.

It is not suggested that Bourguiba is going to use his new weapons to declare war on the Algerian rebels and thus join the French in their blind Algerian repression. But it is only the influence of Tunisia and Morocco that can bring nearer a peaceful solution in Algeria, and that influence cannot make itself felt as long as Tunisia has no power of its own, no allies willing to provide it with arms and no authority to prevent the rebels using Tunisia as their comfort station. The Algerian rebels, as was pointed out on this page earlier this month, are becoming a formidable military force, not strong enough to evince the French by main force but strong enough to dominate the Arab Governments of North Africa. As long as a solution in Algeria is still to be sought, the Governments in Rabat and Tunis will need to have increased physical force and prestige — while if that solution, when it comes, involves Algerian independence then it will be more than ever necessary that the neighbouring Arab nations have sufficient strength to avoid domination by a new Algerian people forged in war and bloodshed, respecting only the power of violence and (although not inclined to Communism) far from well disposed to the Western allies of France. It is, no doubt, that long-range calculation that weighed with the USA in deciding on a course that would plainly produce, and has produced, a vehement emotional reaction in France. In so far as this affair has shown the French how alone they are in continuing the Algerian struggle, one cannot prophesy what results it will have on their North African policy. One likes to imagine that this humiliating warning will incite them to seek a settlement with the rebels, but it is just as likely that it will increase their stubbornness in persisting in a war that must prove the ruin of their African empire and of their waning world influence.

WORLDGRAM

AGRICULTURE

River Valley Projects in Rajasthan under Second Plan: Twenty irrigation and multi-purpose projects, (other than the Rajasthan Canal) which will irrigate an area of 7.74 lakh acres in Rajasthan State, have been included in the second Five-Year Plan. The total cost of the schemes, some of which will be carried over to the third Five-Year Plan, is estimated at about Rs. 18.01 crores. Of this amount, Rs. 10.54 crores are likely to be spent during the second Plan period and 2.11 lakh acres will receive irrigation benefits during this period. A sum of Rs. 13 lakhs has been allocated for investigations during this Plan.

Proposed Poultry Farm at Bhubaneswar: A pilot poultry farm at Bhubaneswar was proposed to be set up by the Government of India, said Shri A. P. Jain, Minister for Food and Agriculture, in a written reply to a question by Shri Sanganna in the Lok Sabha recently. Shri Jain also stated that the Orissa Government had agreed to place a plot of land near Bhubaneswar at the disposal of the Government of India free of cost for setting up such a farm there.

Study of Agricultural Extension in India: A group of 17 senior officials from eleven Asian and Far Eastern countries will tour India for two weeks to study agricultural extension policy and administration in the country. Organised by the F.A.O. as a co-operative project, in which the Governments of India, Japan, and Philippines have agreed to serve as hosts, the Indian tour will begin on December 1. Similar tours have been undertaken in Japan and Philippines since November 4. This step has been taken to implement a recommendation of the F.A.O. Agricultural Extension Development Centre, held at Bhenal in December 1955.

INDUSTRY

Production Centres in Kerala: Schemes for the development of small-scale industries, envisaging the setting up of training and production centres, industrial co-operatives and common service centres in the States of Kerala, Madras and Mysore, have been approved by the Government of India. In Kerala seven training cum production centres are being set up for the manufacture of cycle parts, hardware fittings, locks and toys. Seven production units would be set up for the manufacture of precision instruments, furniture, doors and window frames, carpentry, lacquer work, and bell-metal and plastic products.

Handicrafts Emporium to be Set Up in Agra: Three more emporia for marketing handicrafts are to be set up under schemes sanctioned by the Government of India. About Rs. 8 lakhs as grants and loans have been sanctioned for the purpose by the Union Ministry of Commerce and Industry to the All-India Handicrafts Board and to the States of Uttar Pradesh, Mysore, Bombay, Orissa and Rajasthan on the recommendations of the Board. Of the three new emporia to be established, one will be at Agra and the other two at Mangalore and Belgaum in Mysore. The emporium in Agra will be near the Taj. This would help to increase the sale of Indian handicrafts, particularly to tourists who invariably visit the Taj.

Production of Mill-Made Cloth: The production of cotton textiles by mills during the first ten months of

1957 was 4,447 million yards as against 4,397 million yards in the comparable period of 1956. The total number of workers employed in cotton textile mills in 1956 was 9,32,855 as against 8,02,000 in 1953. The average number of workers employed in the first eight months of 1957 was 9,50,256.

Credit Facilities to Small Industrialists: Financial assistance of over Rs. 1.5 crores has been sanctioned by the Government of India to different States and Union territories for providing loans to small industrialists. These loans will be disbursed during the current financial year by the State Governments and the Administrations of Union territories under the State Aid to Industries Act and other regulations in force. Almost all State Governments have liberalised the rules for advancing funds to small industries under the State Aid to Industries Act. Loans will be given to bonafide small industrialists up to Rs. 1,000 on a personal bond and up to Rs. 5,000 on the security of one or more personal sureties.

Kargali Coal Washery Plant: Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, said in the Lok Sabha that the coal washery plant at Kargali was expected to work to its full capacity by July 1958. The Minister added that owing to difficulties met in the foundations of the coal washery and also in obtaining some imported machinery, delay had occurred and the plant might not be commissioned by January 1958 as anticipated earlier. Sardar Swaran Singh detailed further information about the washery plant and stated that when it was in full production, the number to be employed in its operation will consist of 132 unskilled categories of workers, 16 of skilled categories and 11 executive, supervisory and clerical personnel.

TRADE

Protection to Textile Machinery Industry Extended: The Government have accepted the Tariff Commission's main recommendation that protection to the cotton textile machinery industry in respect of complete ring frames, spindles, spinning rings, fluted rollers and automatic looms should be continued beyond December 31, 1957, for a further period of three years ending on December 31, 1960, and the protective duty should be continued at the existing rate of 10 per cent 'ad valorem'. Government have also accepted the recommendation that protection in respect of plain looms should be discontinued with effect from January 1, 1958. Government have taken note of certain other recommendations made by the Commission for assistance to the industry and will consider suitable action to the extent possible. The attention of the industry has been invited to the Commission's recommendations that it should (a) get in touch with the Forest Research Institute, Dehra Dun, and provide it with the information which it may require in carrying out investigation into the types of wood suitable for looms, (b) submit its case for the export of its products to the Export Promotion Directorate of the Ministry of Commerce and Industry, and (c) take steps to provide quick and adequate after-sale services at the centres where machines manufactured by different units are installed.

U.K. Trade in October: United Kingdom overseas trade showed its usual seasonal revival in October compared with September, although imports rose more sharply than exports, according to a Board of Trade announcement confirming the provisional figures for

NEWS IN BRIEF

October issued earlier. British exports, at £271,800,000, were over £25,000,000 more than in September; and re-exports, at £11,200,000, were £1,500,000 more. Imports, rose in October by nearly £45,000,000 to £353,100,000. The visible trade deficit rose by £18,000,000 to £70,100,000.

Protection to Stearic and Oleic Acid Industry: The Government have accepted the Tariff Commission's main recommendation that protection to the stearic and oleic acid industry should be continued for a period of 2 years, that is, till December 31, 1959, at the existing rate of duty, viz., 35 per cent 'ad valorem' or 50 Naye Paise per lb., whichever is higher. Government have also taken note of certain ancillary recommendations made by the Commission for assistance to the industry for consideration and implementation as far as possible. The attention of the industry has been invited to the Commission's recommendation that it should actively collaborate with the Indian Central Oil Seeds Committee and make earnest efforts to establish the use of oils extracted from oil seeds like cotton seed and mowra seed for production of fatty acids. The attention of the manufacturers of derivatives of stearic and oleic acids has also been invited to the Commission's recommendation that they should take necessary steps to standardise their processes of manufacture so as to produce materials which would satisfy the requirements of the consuming industries.

FINANCE

Assistance Under P.L. 480 Programme: The Deputy Minister of Finance, Shri B. R. Bhagat revealed recently that the agreement entered into between the Governments of India and the U.S.A. on August 29, 1956 under the United States Public Law 480 had enabled India to obtain wheat, rice, cotton, tobacco and dairy products worth Rs. 109 crores from U.S.A. in rupees up to October 31, 1957. The purchase had meant considerable saving in foreign exchange and had resulted in making increased quantities of food grains available for domestic consumption and for building up reserve stocks.

Estate Duty Collections: The Finance Minister, Shri T. T. Krishnamachari, placed on the table of the Rajya Sabha a statement showing collection of Estate Duty from the year 1954-55. According to the Statement estate duty collections amounted to Rs. 85,14,416 in 1954-55; Rs. 1,73,26,756 in 1955-56; and Rs. 2,10,75,135 in 1956-57. During the current financial year, collections amounted to Rs. 64,09,654 up to the end of October. The statement also gives State-wise breakdown of the estate duty collections.

Inter-State Sales Tax: Shri B. R. Bhagat, Deputy Minister of Finance replied in the affirmative to a question by Shri Ramakrishna Reddy in the Lok Sabha whether the operation of Section 15 of the Central Sales Tax Act had been postponed from October 1 this year to January 1, 1958. The Deputy Minister added that an officer of the Finance Ministry had discussed with certain State Governments the difficulties anticipated by them on the enforcement of Section 15 of the Central Sales Tax Act, 1956. The agreed decision reached in the light of the above discussions would be incorporated in a Bill that would be brought before the House shortly.

Bank Payments Abroad: Shri B. R. Bhagat, Deputy Minister for Finance, told Sarvashri H. N. Mukerjee and M. Elias, in the Lok Sabha that the High Commission of India in the U.K. made remittances through the Reserve Bank of India, London. The amount of payments made by the Reserve Bank, through foreign banks, were: January-June 1956: £9,236,600 (Rs. 12,31,54,667); July-December 1956: £9,274,876 (Rs. 12,36,65,013); and January-June 1957: £30,806,461 (Rs. 41,07,52,813). The details of such payments made by the Indian Embassy, Washington, as available at present, were: January-June 1956: \$2,434,605.98 (Rs. 1,15,93,361.81) and July-October 1956: \$1,878,904.22 (Rs. 89,47,162.94).

Securities Contracts (Regulation) Act 1956: The Government of India have declared Section 13 of the Securities Contracts (Regulation) Act, 1956, to apply to the area comprising the limits of the Ahmedabad Municipal Corporation with effect from November 16, 1957. As a result of this declaration every contract in securities in this area which is entered into after November 16, 1957, otherwise than between members of the Ahmedabad Share, and Stock Brokers' Association, Ahmedabad, which has already been recognised by Government under Section 4 of the said Act, or through or with such members shall be illegal.

GENERAL

Janta Policies: The total value of the Janta policies issued up to October 28, 1957 was Rs. 62,95,961, according to a Statement laid on the Table of the Lok Sabha recently by Shri B. R. Bhagat, Deputy Minister of Finance. The centres that had been opened up to September 30, 1957 for issuing Janta policies were: Hyderabad and Kakinada in Andhra Pradesh; Bombay City, Sholapur and Ahmedabad in Bombay State; Madras, Kumbakonam and Coimbatore in Madras State; Rohtak and Sonapat in Punjab State; Kanpur in Uttar Pradesh; Calcutta and Siliguri in West Bengal and Delhi.

Electricity Output: During June, 1957, 799 public utility supply undertakings generated 896.1 million kilowatt hours (kwh.) of which 728.1 million kwh. were sold to ultimate consumers. The output in May, 1957, was 930.2 million kwh. Six generating undertakings were the new additions during the month. These are at Mangaldai in Assam, Katihar and Saharsa in Bihar and Mahuva, Nakhira and Nakhatrana in Bombay.

Traffic Handled at Calcutta Port: The total traffic handled during the second half of October, 1957, by Calcutta port amounted to 394,056 tons — the highest ever handled in recent months. In the second half of September, 1957, the port had handled 370,545 tons. The landing of 48,340 tons of steel during the fortnight also set up a record, the next best figure being 42,200 tons handled in the second half of March, 1957. Imports handled during the fortnight amounted to 203,521 tons, of which steel accounted for 48,340 tons and food grains, 44,976 tons. Exports were 190,535 tons of which ores were 36,052 tons. The tonnage of ore shipped from the new mechanical ore-berth on October 19 in three shifts amounted to 2,300 tons. The number of vessels which entered the port during the second half of October was 82 and the number which left was seventy-eight.

INDIAN

Applications for further export of rice products by shippers who have completed shipment of the maximum quantity of five tons will be considered on ad hoc basis, according to an Export Trade Control Notice.

It is reported Import licenses for lead and tin are being issued and some importers have actually received the licenses.

The Government of India have clarified that the expiry date of December 31, 1957, should be the date of arrival of goods into India in respect of the concession for importation by sailing vessels (country crafts).

Shipping bills for export of cotton yarn under the free licensing scheme will be validated for three months from the date of passing, in the first instance, instead of one month as hitherto.

The Rajasthan Government has created a health fund of Rs. 5 lakhs and has launched a vigorous drive to raise contributions for this fund.

It is reported iron ore exports from the three major ports of Calcutta, Bombay and Madras in October declined sharply to 76,900 tons from 114,942 tons in the previous month.

A room in the F.A.O. building in Rome, furnished with articles made from Indian timber and other materials has been presented to the World organisation by India.

The Government of India have accepted the Tariff Commission's main recommendations that protection to the automobile leaf spring industry should be continued up to December 31, 1959, and the standard rate of protective duty should be retained at the existing level of 50 per cent 'ad valorem'.

By the end of June 1957, 15,62,553 handlooms had been registered in different States under the Handloom Registration Order.

About 19 lakh houses are expected to be built during the second Five-Year Plan period in the public and private sectors against 13 lakh units added in the first Plan.

The Government of India has released a further quantity of 1.70 lakh tons sugar for free sale, says a Ministry of Food and Agriculture Press note.

The Indian standards Institution has issued two standard specifications for items relating to maize starch (corn flour) and IS:1007-1957 for custard powder.

Nearly Rs. 5.45 lakhs have been allotted for the uplift of backward classes in backward areas of Himachal Pradesh for the year 1957-58.

FOREIGN

Japan and New Zealand are expected to begin talks for a trade agreement at the beginning of next year. New Zealand is believed to be particularly interested in Japanese heavy electrical equipment and rolling stock.

Antigua is to seek a £130,000 loan in London for the extension of the Island's electricity scheme. Approval for this has been given in the Colony's Legislative Council. Steps are now being taken to purchase land for the site of the new power station.

Portugal's exports of sardines during the first nine months of this year rose to 23,284 tons, compared with 21,283 tons during the corresponding period of 1956.

The Malayan Government has extended its ban on the export of rubber seeds to cover all types of colonial seeds because all available seeds are needed for a small-holder's rubber replanting scheme.

The International Tin Council will meet in London on December 11, instead of on January 29 as originally planned. It is generally assumed that the main purpose in calling the meeting earlier is to consider whether or not to impose export quotas.

West German car and vehicle production in October reached all-time record with 115,119 units, compared with 101,458 in October 1956.

A French financial group headed by the nationalised Credit Lyonnais is to form, in association with Iranian interests, a Franco-Iranian bank in Tehran. French interests will hold 49 per cent of the capital. Another Franco-Iranian agreement provides for the building of a paper mill in Iran.

Germany is closely behind Britain as a leading export nation. With a record £277.3 million last month, German exports were 13.8 per cent higher than in October, 1956, and just 2 per cent below the British figure of £283 million. Imports amounted to £245 million, 10.3 per cent above a year ago.

It is reported China's National Economic Commission has approved the dispersed construction of 18 medium and small iron and steel plants.

The Ceylon Government has approved an 18 million rupee (£1.35 million) a year programme of rehabilitation for the tea industry. The programme, which will run for five years, contemplates the replacement of old bushes by fast yielding plants. Funds will be raised by a levy of about 1d on each pound of tea.

The world's merchant fleet rose sharply by 5,046,000 gross tons to a new record level of 110.2 million tons during the year ended July, 1957. Apart from the war years, for which figures are not available, this is the largest annual increase in world tonnage since 1920.

A Franco-Israeli trade agreement providing for a 25 per cent increase in Israel exports to France in 1958 has been signed.

Economic Report from the U. S.

CUT IN DISCOUNT RATE

(By GUY SIMS FITCH)

WASHINGTON, Nov. 18.—In a sudden, though not entirely unexpected move, the United States Federal Reserve Board last Thursday lowered its discount rate, signalling a relaxation of the tight rein it has held on the nation's credit supply for the past four years. The discount rate is the interest charged on loans that the nation's Federal Reserve Bank extends to commercial banks which are members of the Federal Reserve system. By making it less expensive for commercial banks to borrow money from the reserve, a reduced discount rate obviously increases their ability to grant loans and thus tends to stimulate general lending activity. The reduction, effective today, is from 3.5 to 3 per cent, and affects at this time only four of the reserve system's 12 district banks—those at New York, Atlanta, Richmond and St.-Louis. The other eight banks also are expected eventually to lower their rates to the 3 per cent figure.

Discount rate changes also may tend to set new patterns for all interest rates. Many analysts, for instance, expect the "prime" rate—the interest charged by commercial banks to customers with top credit ratings—to follow the discount rate downward. The prime rate at major banks now is generally 4.5 per cent. Once this is cut, other commercial rates also may start to drop. What makes this week's discount rate cut particularly significant is the fact that it is the first such reduction since April 1954—nearly four years ago. From a level of 1.5 per cent, the rate has been moved higher seven times since April 1955 the most recent boost coming last August, when it was raised from 3 to 3.5 per cent. These increases reflected the F.R.B. aim to curb surging money demand—a primary factor in the inflationary pressures of the

past few years—by making borrowing more costly. This first relaxation in nearly four years does not mean that the Board's experts see a marked economic downturn in the making, with the inflationary trend giving way to a serious deflation. All their recent statements indicate that they still consider inflation the chief threat to economic stability over the long run. But spokesmen for the Board, which seldom offers official explanations for its moves, have said that this week's discount rate cut was approved because inflation, for the time being, had ceased to be the dominant factor in the economy.

The recent drop in the volume of bank loans probably has been another significant factor in this week's F.R.B. action. Indicating that the "tight" money policy had taken hold, commercial bank loans to business in principal cities have dropped since the middle of this year by 800 million dollars to a total of 31,300 million dollars. In the same period last year, these loans increased by more than 1,200 million dollars. Whether the cut in the discount rate will be followed by other policy relaxations remains to be seen. So far, however, Board spokesmen have denied that any really dramatic policy reversal is in the wind. What all this seems to add up to, is a more or less gentle easing of tight policies in line with the moderate slackening in the rate of economic expansion—a good example of the government's "flexible" monetary policies in action. The discount rate reduction thus may be said to assume the role of a preventive rather than a remedial measure, one to help ensure that no serious deflation occurs and that economic growth continues on a sound and orderly basis.

FORUM OF FREE ENTERPRISE

An Appeal

The economic difficulties confronting the country have been accentuated by the recent failure of food crops in several States. This has created a critical state of affairs, which is reflected in inflationary pressures and a serious rise in the basic cost of living. This has brought with it hardship and suffering to many of our people.

The situation is such that the Government and the country need the support of all who can help, and particularly do we see a challenge to Free Enterprise to rally to the aid of the Nation.

This can be done in several ways. By a vigorous and resourceful determination to overcome the many difficulties which have arisen to retard our plans for industrialisation; by maintenance of the highest standards of integrity and fair dealing in the conduct of our business; by scrupulously eschewing any tendency to exploit a shortage of consumer goods; and by such realistic adjustment of Government's economic and financial policies as would enable the Nation to meet the situation effectively.

The Code of Conduct enunciated by the Forum is a model for Free Enterprise to follow. It is for each one of us, whether industrialists, businessmen or traders, to measure up to this Code in the steadfast and sustained determination to see the country through the troublous times which now beset her.

Astride India's rivers are rising mighty dams to bring power and plenty to the nation. With the completion of the major Plan projects, 171 million acre feet of India's river water will be harnessed. The new river valley schemes will release 2,000,000 KW power and irrigate 16 million acres. The total expenditure on irrigation, power and flood control during the next five years will be Rs. 913 crores, a 38% increase over the First Plan. These great development schemes constitute one of the most important aspects of the nation's efforts to achieve economic self-sufficiency. Texmaco, pioneer in many fields of engineering, working in technical collaboration with Voest of Linz, Austria, has constructed a wide range of hydraulic dam equipment for Rupar, Hirakud and other projects.

The Business World:

THE PLIGHT OF POWERLOOMS IN MAHARASHTRA

SOUTH Maharashtra constitutes the major area of the concentration of powerlooms in this country. This industry is operated either on a small or medium scale. The weaver in this region has shown a capacity for adaptation and assimilation of modernised techniques of production. The majority of the powerloom establishments are without requisite financial resources. Finance for working capital, and yarn are provided by trading firms on agreements of sale of output to them. The existing arrangements and terms of provision of finance have been evolved on a basis of mutual benefit. The fact that they are attractive from the weaver's viewpoint is borne out by operation of powerloom establishments in three shifts.

A crisis of closure has suddenly developed in the major powerloom centres of South Maharashtra. Available information for three centres shows that already 113 establishments with an installation of 396 powerlooms, and employing 663 workers have been closed down. An additional number of 18 establishments with 86 powerlooms, employing 133 workers are due to be closed on December 1, unless the notices of closure are withdrawn which seems highly unlikely. It is indeed ironical that this crisis should have been precipitated by the perverted view which the excise administration in Bombay State has chosen to take in the matter of interpretation of the departmental rules applicable to the excise duty on cloth.

When cotton cloth manufactured on powerlooms first became subject to the levy of the excise duty in May 1955, fabrics produced in factories or establishments with powerlooms not exceeding 4 were exempted from it. It was revealed in the course of the administration of the excise duty that attempts were made by some powerloom manufacturers to escape duty by resort to fragmentation of their units so as to bring them within the ambit of exemption. To plug the loophole, the relevant rule was amended in March 1956 to convey that cotton cloth manufactured by or on behalf of the same person in one or more factories in which less than 5 powerlooms in the aggregate are installed would be exempted. The real significance of the change lay in the shift in emphasis from the factory to the manufacturer. The exemption was related now to the manufacturer.

A crisis of closure has suddenly developed in the altered rule by the excise administration in Bombay and the term "manufactured by or on behalf of the same person" was interpreted to include the trader supplying credit to the individual weaver-proprietors of the factories. Notices have been issued against some of these trader-financiers for recovery of the excise duty at the rate of the composite mills calculated on the basis of square yards of cloth produced which is higher than the compounded rate of duty applied to powerloom factories. This interpretation and action has created serious embarrassment to the traders who remain genuine traders and can be considered in no sense as manufacturers. The liability so unwarrantedly imposed on them has compelled them to cease purchases from the small factories with less than 5 powerlooms. Deprived of their only stable and continuous source of supply of working capital, the small operators were constrained to close their establishments.

The intention behind the change in the rule effected in March 1956 and its correct interpretation need not be in doubt. Simultaneously with this change, the Collector of Excise, Bombay, clarified the position that the duty now related to the manufacturer and not to the factory. In the course of the last annual session of the Mahratta Chamber of Commerce and Industries in June last, Mr. B. R. Bhagat, Union Deputy Minister

of Finance, replying to the criticism against this un-called for levy of the duty, explained that the objects of the changed rule were to discourage fragmentation of factories to avoid the duty and to ensure that exemption is available only to genuine small manufacturers with less than 5 powerlooms.

It is clear that a technical flaw in the draft of the prevailing rule has caused all this confusion with its distressing consequences. Mr. A. R. Bhat, Secretary of the Mahratta Chamber of Commerce and Industries, has issued a fervent appeal for redress to the stricken small powerloom producer by withdrawing the notices which have brought catastrophe on him. The straight remedy consists in issuing clear and specific instructions to officials below regarding the tests to be applied in determining who is a genuine small manufacturer and where colourable arrangements have been made under cover of fragmentation to avoid the excise duty.

This tragic episode should underscore a major difficulty in the cotton textile plan. The second Plan assigns a production target of 400 million yards to the powerloom component of the textile industry on the assumption of a substantial addition of powerlooms to replace handlooms. A basic principle accepted in the Plan is to organize powerloom producers in co-operatives. The present plight of powerloom weavers in an area of concentration shows the feebleness of the drive for organisation of co-operatives to strengthen their resources position.

"A HOUSE THAT STANDS FOUR SQUARE WITH PROGRESS"

By
CROESUS

By a fortuitous coincidence, the century year of our First War of Independence also marks the completion of the hundredth year by the well known British Firm of Messrs. Killick Nixon and Co. known since the last ten years as Killick Industries Ltd. Although as a limited Company under the latter name the undertaking is only ten years old, it cannot be forgotten that, even as a limited Company, it is known only as heir to the high traditions set up by the old partnership formed on November 24, 1857, when Mr. Charles Killick and Mr. Robert Preston Nixon formed their partnership firm of Killick Nixon and Co.

Starting initially as a trading organisation, Killick Nixons was destined to promote and foster several successful industrial enterprises. These include the railways, cotton mill, mining and mineral (manganese and coal) development, shipping, electricity, and cement, among others. It is difficult today even to imagine the enormous pioneering effort that must have gone into the conception and execution of each of these undertakings. True, industries even today have many hurdles to cross and difficulties to overcome but in comparison with the difficulties of the last century, these verily pale into insignificance.

Although it was only in February, 1948, that Killick Nixon and Co. became Killick Industries Ltd. and there was an extensive change of ownership from British into Indian hands, the firm had always believed in working in co-operation with Indian interests, as witness a number of Indian directors on its Board and its efforts in bringing into being the Indian Cement Manufacturers' Association, a forerunner of the Cement Marketing Company Ltd. Closely in the wake of this came the eventual amalgamation of cement Companies managed by Killicks, namely the Bundi Cement Co., Ltd., Lakhari and the Punjab Portland Cement Co., Ltd. to form the present Associated Cement Cos., Ltd.

The change-over in ownership of the interests comprising Killick Industries Ltd. marks an important chapter in the transfer of British business interests to Indian hands. Thus, on February 1, 1948, out of an issued and paid-up capital of Rs. 1 crore, well over 80 per cent of the Company's capital was taken over by Indian nationals. It is interesting to note that 98.5 per cent of the share holders are Indian nationals. Another interesting feature, one that relates to the pattern of share holding in Killick Industries, is that as many as 97 per cent of the shareholders are those who own less than 100 shares, while only 2½ per cent own between 100 and 500 shares. In other words, the composition is wholly democratic.

Killick Industries Ltd. have always enjoyed the confidence of the Indian investor. This is clearly brought out by the fact that the Company has been able to raise over Rs. 7 crores by way of share capital alone since 1948. And what is even more noteworthy is that, on every occasion, the shares of the Company have been over-subscribed. Excluding the Company's investment in the A.C.C. amounting to some Rs. 17 crores, the total investment in the Killick group exceeds Rs. 25 crores.

The latest change affecting the Killick undertaking has been the acquisition of the sister interests represented by Messrs. Killick Nixon and Co., Ltd., which has now become a wholly owned subsidiary of Killick Industries Ltd. But far more important than this deve-

lopment is the Company's decision to branch out into light industries such as manufacture of steel files which fully entitles the Company to the claim that its record, as well as those of its managed units, during the last decade is "one which marches in step with the country's needs and desires as epitomised in the National Plans".

In a brief review, it is not possible to deal with everyone of the units—trading and industrial—of the Company although it is needless to point out that the Company's progress itself is bound up with the expansion and consolidation of all these units. Suffice it to say, therefore, to quote from the epilogue to the brochure brought out by the Killicks to mark the completion of a hundred years of trading and industrial service to the nation, that "all the undertakings of the Killicks have had modest beginnings and their transmutation into thriving units in the service of the country is not based on any magic process of alchemy but is the result of the conscious endeavour on the part of the pioneers, nurtured by unflinching hard work on the part of their successors in office and sustained by an investing public who have had no hesitation in sharing all their confidence". That, in a nutshell, is the notable achievement of a unit of Free Enterprise; a unit that not only takes legitimate pride for its past achievement but also considers it its moral obligation to sustain and enlarge the very material contribution that it has made to the progress of our nation. The least that one placed in my position can do—and I do so wholeheartedly—is to wish the House of Killicks Godspeed in this laudable aim of theirs.

BUSINESS NOTES

CONFERENCE ON JUTE

THE INTERNATIONAL CONFERENCE on Jute convened by the Government of Pakistan at Dacca this week is of particular interest to countries like India which have got a vital stake in the jute industry. Although the session of this Conference was brief, it covered important topics for group discussions on the jute trade, economic price for the jute grower, supply of raw jute to the purchaser abroad, rationalisation of jute contracts, review of transport problems, customs regulations, rules framed by the State Bank of Pakistan, and so forth. Fifteen countries were represented at the conference among which India was one.

The official aims of policy for raw jute were described in broad outline by the Chief Minister of East Pakistan and the Minister in charge of Jute and Co-operation. Substitutes for jute held a potential threat and as such it was of utmost importance that stability in prices and supplies ought to be ensured in the international market at competitive levels. Since these two objects were the basic essentials of the future of jute trade, it was explained that the Pakistan Government's policy was aimed at achieving them. An unfortunate fact about the jute trade was the very wide fluctuations in prices which undermined the future stability of its trade and gave ample scope for substitutes to make a headway. These fluctuations were due in a large measure to rank speculation which was rampant in the jute trade. The Pakistan Government's policy, therefore, was to remove the element of the speculating middlemen to minimise the fluctuations. Stability of prices and regulation of the crop were sought to be ensured in order to safeguard the position of jute in the commodity markets through the government-sponsored agency—the East Pakistan Jute Marketing Corporation. It was explained that the aim of Government's policy was not to nationalise the jute trade but to rationalise it in order to subserve the above objectives.

As basic aims of policy these objectives are laudable. But it is problematic how far State participation in and direction of trade can help to realise them. The experience of state trading in free economies is far from encouraging. India has found over the years that the high price of raw jute is an important factor which hampers her exports of jute manufactures. If the group discussions at this conference yield some tangible results, especially on the problems of prices, it will be to the good of the jute manufacturing as well as importing countries.

RATIONALISATION OF PROCEDURE FOR REBATE

IT IS now common knowledge that a sense of urgency has been imparted by the problem of foreign exchange to the drive for intensification of exports. Acting promptly on the recommendation of the Export Promotion Committee, the Government of India has simplified and liberalised the procedure for obtaining rebate of import duty and excise duty entering into the cost of exported articles. Since the Sea Customs Act, 1878, was amended towards the fag-end of 1953 and rules were framed thereunder, provision of drawback of import duty paid on raw materials used in the manufacture of exported articles has not proved to be of full value as intended for obvious reasons. Registration of individual manufacturers and their products as well as the quarterly revisions for rates and other complicated administrative details made the entire procedure so cumbersome and irksome that in practice many exporters preferred to forgo the rebate. A serious handicap raised by the procedure was the difficulty of

taking the rebate into account in quoting prices for contracts of sales overseas. In effect, the object of the concession of rebate to enhance the competitive strength of Indian exports could not be realised in a large number of transactions.

The procedure now rationalised dispenses with niceties of calculation and allows full rebate of import duty paid on raw materials in place of $\frac{1}{3}$ of it as heretofore. The rates fixed for different commodities are to remain constant for a minimum period of six months, as against three months before, to make continuity of quotations possible over reasonable periods. In case flat rates of rebate are difficult to be fixed on the basis of commodities, the rates will be prescribed for individual manufactures. There is further an assurance that the amended rules would be published two months in advance of their coming into force to facilitate due intimation for price quotations in contracts. Rules have already been framed for 22 articles and over 20 cases are under consideration for their purpose. Extended application of the liberalised facility of rebate will depend on the interest shown by manufacturers and exporters in setting the official machinery in motion.

Rebate of excise duty under the replaced formula presented real difficulties in practice. Long delays were involved in the departmental investigation of claims for rebate and in the meantime funds of exporters were locked up enhancing the size and interest charges of investment in exports. Alternatively, exporters had the option of executing bonds (apart from other collateral prescribed documents) accompanied by deposit in cash of the amount to be furnished by the exporter, with the guarantee of a scheduled bank plus endorsement by the Reserve Bank of India. The rationalised procedure brings claims of rebate of excise duty on a par with that for import duty in all material respects. Where both the elements of import duty and excise duty are involved on various materials which enter into the manufacture of the final product, a composite rate is to be fixed wherever practicable.

This rationalisation would undoubtedly go to remove the outstanding handicaps. It is to be trusted that there would be similar willingness on the part of the Government to eliminate such difficulties as may be revealed by experience.

POWER DEVELOPMENT IN AHMEDABAD: UNCERTAINTY

THERE WAS a pointed reference, in the speech to the shareholders, at the last annual general meeting of the Ahmedabad Electricity Co., Ltd., by Mr. K. G. Milne, the Chairman to the pattern of future power development in Ahmedabad region. The subject has suddenly assumed importance because of the pending decision of the Government of India regarding the location of the first atomic power station in the country. While the Government is credited with the intention of making known its decision before the end of the year, the business interests of Gujerat have been strongly urging the location of the plant in Ahmedabad. If, as is supposed, a Calderhall type of power station is put up eventually its capacity would be some 140,000 kw. Meanwhile, the capacity of the Ahmedabad Electricity Co. Ltd., itself which began as a small diesel station of just 282 kw. in 1915, is expected to reach a total generating capacity of 157,500 kw. by the end of 1958, after bringing into service the 15,000 kw. turbo-alternator set already ordered by the company. In addition to this, the Company proposes to instal a further 30,000 kw. set with two associated boilers as the first part of the second half of its "C" station. Even after this, there

would still be room on the present power station site for the addition of a further 30,000 kw.

The Ahmedabad Electricity Co. Ltd. is not conspicuous merely by its potentialities as described above. It has a commendable role of service to its credit in the industrial development of the city of Ahmedabad for the past so many years (45 years). In view of this, and also by reason of the present financial stringency, what with the foreign exchange crisis looming, so large on the economic horizon of this country, it is a point for consideration whether the country should be at all overreager to push ahead with its atomic power project, however fascinating the idea, and the prospect. In any case, although the electricity supply industry may not at present rank as the "hard core" of the Plan, as Mr. Milne remarked, it is debatable whether we can afford to stagger our power development, especially in such industrially developing regions as Ahmedabad. To aim high has certainly its virtues, but in the pursuit of a high aim, it is very important that one must be of the earth earthy, or, in other words, one must be a practical realist.

CLEARANCE OF CONGESTION AT PORTS

THE STATEMENT laid on the table in the Rajya Sabha on November 26 by Mr. Humayun Kabir, giving an outline of the suggestions made by Sir Eric Millbourne, leader of the UK Team of Port Experts invited to India under the auspices of the Colombo Plan, gives an indication of the expeditious manner in which the team means to tackle its business. The first problem which needs prompt attention is the ways and means to increase the rate of the flow of cargo through the ports in order to ensure that goods from the ships to internal destinations or from the sources of original despatch to the ships are handled as swiftly as possible. This question would necessarily require a study of the present methods of handling such cargo before decisions can be arrived at to evolve improvements upon them. Another question relevant to this investigation would be the acquisition of necessary mobile equipment.

An examination of these two questions is intended to mitigate the current pressure of cargo traffic on port facilities. As an immediate short-term problem it has undoubtedly the first priority. Nevertheless, real relief lasting over the long period can come from provision of additional berths. Before the berths can be provided it will be necessary to acquire and instal cargo handling machines to cope with bulky cargoes such as food grains and mineral ores. Two members of the team—Mr. Cave and Mr. Smith—who were entrusted with the task of carrying out this investigation are said to have submitted their reports on their visits to the ports of Calcutta, Bombay, Vishakhapatnam and Madras, to the Central Government. These reports are being studied by the port authorities. Congestion at the ports is now fairly liquidated, but its recurrence may be threatened any time. The recommendations of the team are calculated to arm the port authorities to deal with any such eventualities.

WOOL PARADE IN BOMBAY!

WITH THE mercury still standing as high as 33 degrees centigrade in Bombay, although Bombayites are about to enter the last month of the calendar year, many must have wondered at, if not doubted, the wisdom of the International Wool Exhibition (Indian Branch) in holding a "Fashion Presentation" of woollen dresses. But, barring the participants who had no other alternative audience, it is to be wondered if anyone who witnessed the Presentation went away still entertaining such a doubt. For the vivid presentation opened up a vista

of uses to which wool—the sponsors would perhaps prefer to say 'only wool'—could be put and effectively, too by those who have the right taste.

It is to be doubted whether in spite of all its attractions, wool would win over the Bombayite, who seems destined to perspire even with his cotton garments on for as many as ten out of the twelve months year in and year out. But it is apparent that wool and wool interests have shaken all complacency out of Bombay's non-wool interests—cotton, silk and art silk interests. These interests must already be preparing—if they have not, it is really high time they did so in particular the cotton textile interests; what with the cloth stocks in our cotton mills accumulating so heavily—to arrange for similar fashion parades by mannequins, attractively attired in the best cotton dresses that sartorial artists and dress designers can devise. Fortunately for them, a splendid occasion is soon presenting itself in the form of the forthcoming Textile Industries Fair. This eagerly looked forward month-old event is expected to attract millions of visitors not only from all over the country but even from abroad. It would not be a bad idea if the Fair authorities themselves were to sponsor such a show, for a little while on each day of the Fair. They should not be satisfied with just a night's fashion show and ball as they are believed to be contemplating at present. Already they have allowed wool interests to steal the thunder right under their feet and maybe, the wool interests have some other surprise up their sleeves to throw on the slow-moving cotton interests at the Fair itself.

SINDRI'S SWIFT STRIDES

THE ANNUAL report of the Sindri Fertilizers for the year ended March 1957 just to hand shows all round progress attained by this project. Not only is there increased production, but the gross profits for the year are also fairly high as compared to the preceding year. The total production of ammonium sulphate during the year was 3,33,705 tons as against 3,26,062 tons during the preceding year, an increase of 7,643 tons. Monthly production of 32,397 tons was achieved in October 1956 establishing a record daily average of 1,045 tons. The despatches of fertilizer to the various states were also larger. The gross profits for the year amounted to Rs. 4,09,59,873 as against Rs. 3,75,17,773 an increase of Rs. 34,42,095 over the preceding year. After providing Rs. 1,91,38,029 for depreciation and utilising Rs. 13,50,000 in paying interest on the loans to the Government of India at 4½ per cent per annum, and adding Rs. 18,06,048, the amount brought forward from last year's account, the balance available was Rs. 2,22,77,892. Out of this amount Rs. 32,28,632 is provided as reserve for repairs and renewals, Rs. 40,00,000 as taxation reserve, and Rs. 45,00,000 as general reserve and Rs. 85,00,000 as dividend to the shareholders, namely, Government of India at 5 per cent per annum on the capital. This leaves a net profit of Rs. 20,49,260 as against Rs. 18,06,048 during the previous year.

So far as the progress of expansion schemes is concerned, a considerable headway has been made in Sindri's Rs. 11-crore scheme. A good deal of work in construction of buildings and installation of equipment has been completed. The work on the installation of an additional boiler has been started and the building of the extension to the sulphate plant has sufficiently progressed. More amenities and increased housing facilities have been provided for the workers. Relations with labour have continued to be cordial. The credit for this excellent performance in the field of production as well as labour-management relations is to be given to those in charge of the undertaking. While the performance in Sindri is to be applauded, it would be well if the spirit of Sindri be imbibed in other public undertakings.

BEHIND THE WHEELS OF INDUSTRY

Orient Industrial Motors are precision built from the highest quality materials to give high performance and long service. Liberally designed, these motors have a high overload capacity and are capable of withstanding severe punishment. Best insulating materials are used both in the slots and on the windings to give long life. Dynamically balanced pressure die cast rotors are truly indestructible. Uniflow forced draft ventilation system keeps belt dust away from the rotor. These and several other features make **ORIENT** motors truly **DEPENDABLE**.

Letters to the Editor

THE 'COMPETITION' FROM CO-OPERATIVE BANKS

Sir,

I shall be grateful if you will kindly publish the following letter in response to the comments of 'Croesus' in the issue of your esteemed Journal dated November 8:-

The fears expressed by 'Croesus' in your issue of November 8, that 'at the rate at which the Government has been increasing financing agencies and expanding the scope of the existing ones, there may soon develop a very keen competition' are unwarranted. The fact is that these agencies are not created by Government nor is it responsible for expanding their scope. Since the area of operation of each co-operative institution is exclusive, the question of competition against each other also does not arise.

'Croesus' opines that it does not lie in any co-operative's mouth to complain of competition from commercial banks in the matter of deposits. Is he aware that even the Indian Banks' Association exclusively confined to joint-stock banks has not viewed the unhealthy competition amongst banks for deposits with favour? He seems to be under the impression that agricultural credit is the only legitimate function of co-operative banks. I would humbly request him to glance at the history of co-operative banking in this country as well as in other parts of the world.

His main complaint is that the co-operative banks are providing also medium term and long term finance to co-operative sugar factories with the help of the Reserve Bank, the State Bank of India and the Government guarantees. Factually, these Banks are not giving any long term finance to sugar co-operatives and credit for their fixed assets is given only pending the receipt of the Industrial Finance Corporation loans. If facilities for raising the funds are being provided, that is because the Government has not sponsored an institution such as the Industrial Credit and Investment Cor-

poration of India, Bombay, whose activities are exclusively confined to the private sector. The question is: Are the facilities made available to the co-operative sector by the Government in excess of what are available to the private sector?

Yours faithfully,

G. M. LAUD.

GERMANY AND INDIA

Sir,

In the last issue of 'The Eastern Economist' appears an article claiming to reflect the views of German businessmen and government officials, which are supposed to be inimical to assisting India with financial credits during the second Five-Year Plan.

I have been carrying on interviews continuously in Germany from the spring of 1956 to last August. I have interviewed the leading industrialists of Germany, and the top government officials. My conclusions are diametrically opposed to that of your correspondent. Most Germans with any acquaintanceship with Indian problems, whether former Vice-Chancellor Franz Bluecher, Fritz Berg or Otto Wolff von Amerongen are convinced that India can do no different than what she is doing. There is a great deal of sympathy with India's problems, and an expressed desire to help India as far as German capital and government can.

Yours faithfully,

DR. DAVID RODNICK

COMPANY AFFAIRS

THE BELAPUR COMPANY LTD.

According to the Report of the Directors of the Belapur (Sugar) Co. Ltd. for the year 1956-57, the Company achieved further records during the year under review. Thus, the net profit for the year, namely Rs. 7,94,580 and the quantity of sugar produced (valued at Rs. 193,40,464) are both stated to be all-time records. The record production of sugar during the year under review is especially creditable, because the percentage recovery was actually slightly lower than the highest reached by the Company, thanks to the extended crushing season.

After providing Rs. 2,60,407 for depreciation (as against Rs. 315,675 for the previous year) and providing Rs. 20,00,000 for taxation which includes Rs. 60,000 for Wealth Tax (as against Rs. 17,75,000 for the previous year), the net profit amounted to Rs. 47,94,580. Adding to this Rs. 70,646, being excess provisions written back, and Rs. 52,911 brought forward from the previous year, the total available for appropriation amounts to Rs. 49,18,137. Out of this, it is proposed to appropriate Rs. 25,37,874 for paying a dividend of Rs. 18 per share free of Income-tax (as against Rs. 16 per share for the previous year) and to transfer to General Reserve, Reserve for Housing, and Reserve for Gratuity Rs. 10,00,000, Rs. 10,00,000 and Rs. 80,000, respectively. This still leaves a balance of over Rs. 3,00,000 to be carried forward to the current year, as against a sum less than Rs. 53,000 brought in from the previous year.

The Directors' observations on the sugar prices during the year under review, although of academical interest now, are significant. They say there was not a great rise in sugar prices throughout the year, the tendency being slightly upward, except when the Government doubled the Excise Duty which had the effect

of putting up the market rates, but even then only to the extent of the increase. This clearly disproves the charge that sugar interests charged consumers more than what the rise in the Excise Duty actually warranted.

THE AHMEDABAD ELECTRICITY CO., LTD.

As in the case of other electricity undertakings, in the case of this Company also, the latest accounts are not for a whole year. They are only for the six months ended March 31, 1957. The six months' total supply of energy for purposes of public and private lighting, fans, etc.; for power, and for bulk supply to North Gujarat Grid amounted to 285.7 million kW. hours, which compares with 548.7 million kW hours for the 12-month period of 1955-56 and nearly 486 million kW. hours for the year 1954-55.

After providing Rs. 22,04,814 for depreciation as per provisions of the Electricity (Supply) Act 1948 and Rs. 4,93,400 for taxation, the gross profit of the Company for the period under review amounted to Rs. 26,30,393. Adding to this Rs. 468 brought forward from the previous accounting period and Rs. 26,03,383 transferred from the Equalisation of Dividends Reserve, the total disposable amount works out to Rs. 32,24,361. Out of this, a sum of Rs. 3,39,681 has been set aside for the Statutory Contingency Reserve, and a total of Rs. 40,521 written off on Account Promotion Expenditure, Stamp Duty and Brokerage on Mortgage Debentures, New Share Capital Issue Expenses and Discount on new issue of Mortgage Debentures, leaving to be distributed Rs. 23,44,159. The dividend of Rs. 3.25 per share recommended by the directors in respect of the accounting period under review takes away Rs. 28,43,006, so that there remains a balance of only Rs. 1,153 to be carried forward to the current year's accounts.

COMMODITY NEWS AND NOTES

INCREASE IN AREA FOR TUR

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of tur, 1957-58, puts the current year's area at 4,923,000 acres, as against the corresponding adjusted estimate of 4,803,000 acres for 1956-57. Thus, the current year's area shows an increase of 120,000 acres or 2.5 per cent in area over last year. The increase in area during the current year has been shared mainly by Uttar Pradesh and Bombay, and has been attributed to favourable climatic conditions at the sowing time. This increase has, however, been offset to some extent by decreases registered in Madhya Pradesh, Andhra Pradesh and Madras States. This estimate covers the period up to the end of August 1957. Till then, the condition of the crop was reported to be generally satisfactory. This estimate does not cover the entire area sown to the crop. Past experience has shown that the area under the crop at the first estimate stage forms roughly 85 per cent of the area reported at the final estimate stage.

COAL OUTPUT IN JULY 1957

Coal output in India during July 1957 was 3,296,150 tons—about 20,000 tons less than the output in the previous month. According to information received from the Chief Inspector of Mines in India, despatches of coal during July were 3,044,875 tons as compared with 2,896,909 tons in June. Coal stocks at pitheads at the end of July were 3,065,599 tons as against 3,254,448 tons at the beginning of the month. During July, 830 collieries were reported to be working with an average daily employment of 317,565 workers. Output per man-shift was estimated at 1.16 tons for miners and loaders, 0.59 ton for all workers underground and in open-workings and 0.39 ton for all persons employed including surface workers. The percentage of absenteeism was 15.53. Nine coke plants at collieries and elsewhere produced 364,390 tons of hard, soft and other kinds of coke during the month, and despatched 207,388 tons during the month.

DEVELOPMENT PLAN FOR WOOL

A comprehensive programme for the improvement of sheep and wool in the country has been drawn up by the Union Ministry of Food and Agriculture. This includes research in evolving superior breeds followed by field tests and a regular supply of stud sheep to flock-owners. A provision of Rs. 1.5 crores has been made for this purpose in the second Five-Year Plan. Under this programme three new Sheep Breeding Farms, with testing laboratories attached, will be set up in Himachal Pradesh, Madhya Pradesh, and Saurashtra, for producing superior stud rams, both for pure breeding and cross-breeding. For evolving superior breeding stock in rural conditions 24 Sheep and Wool Extension Centres were established in 1956-57; another 166 will be set up during this year; and by March 1961 a total of 396 Centres at a cost of Rs. 150 lakhs will have been set up in major wool producing States—Andhra Pradesh, Bombay, Himachal Pradesh, Madras, Madhya Pradesh, Punjab, Uttar Pradesh, Mysore and Jammu and Kashmir. These centres will provide superior woolled rams, introduce better management practices, organize proper shearing and marketing of wool, and give first-aid to sheep. Besides, it is planned to set up during 1957-58 three Wool Utilization Centres in the existing Sheep Breeding Farms in Uttar Pradesh,

Rajasthan and Bombay. A programme of compulsory grading of wool meant for export being carried out for the last two years by the Directorate of Marketing and Inspection is being continued. This ensures grading of wool according to specifications laid down in this behalf and ensures that only quality wool will be exported.

Searchlight on Community Development

NO Plan project has been subjected to such continuous evaluation and searching criticism in the last four years as the National Extension Service and Community Development programme. It was only in April last that the fourth Evaluation Report, based on a sample survey of 702 villages spread over 17 evaluation areas, revealed a none too flattering state of affairs in all the development blocks which were three to four years old. The survey revealed, among other things, that only about 39 per cent and 2 per cent respectively of all villages were covered by minor irrigation from wells and tube-wells, that land reclamation, soil conservation and consolidation of holdings were done only in 23 per cent, 12 per cent and 18.5 per cent respectively of all villages and that credit and non-credit co-operatives were functioning only in 51 per cent and 13 per cent respectively of villages. It was, however, a redeeming feature that improved seeds and manures and/or fertilisers were being distributed in 89 per cent and 88 per cent respectively of all villages and improved methods of cultivation were being propagated in 60 per cent of villages.

Behind these figures, however, there were even more disquieting ones where the Report summed up the level of different activities. For example, the average area benefited from minor irrigation was just 8.84 acres per village and the average number of irrigation wells was just 1.96 and the average number of actively working co-operatives only 0.62 per thousand population. The most disappointing state of affairs was seen in the non-use of 9 per cent of ordinary wells and of 57 per cent of tube-wells and in the inactivity of 13 per cent of credit and 30 per cent of non-credit co-operatives.

This was the picture of performance in the field of Community Development by the end of last year — a picture that was handed down to the Study Team led by Mr. Balvantray G. Mehta. The latest report by this Study Team of the Committee on Plan Projects, coming so soon after the Fourth Evaluation Report in April last, is at once a measure of the crucial importance attached to Community Development in India's planned economy. Some of the Team's findings are frankly critical of the programme's failure in at least two crucial respects — the attempt to evoke popular initiative and the effort to bring about additional food production. These findings also, it would appear, merit summary recapitulation before the Team's relevant recommendations for improving the Community Development programme are examined.

"One of the least successful aspects of the C.D. and N.E.S. work", says the Team's Report, "is its attempt to evoke popular initiative. We have found that few of the local bodies at a level higher than the panchayat have shown any enthusiasm or interest in this work; and even the panchayats have not come into the field to any appreciable extent. An attempt has been made to harness local initiative through the formation of *ad hoc* bodies mostly with nominated personnel and invariably advisory in character. These bodies have so far given no indication of durable strength nor the leadership necessary to provide the motive force for continuing the improvement of economic and social conditions in rural areas". Out of this withering criticism has flowed the Team's recommendation that the existing local bodies like the district boards, the block advisory committees and the district planning committees be replaced by a single representative institution — "statutory, elective, comprehensive in its duties and functions, equipped with necessary executive machinery and in possession of adequate resources" — to take charge of all aspects of development work in the rural areas.

What is visualised, in the creation of such an institution, is a complete devolution, by the Government, of certain duties and of control over the resources required for discharging those duties. This would mean decentralisation of responsibility and power below the State level in the entire field of development covering agriculture, animal husbandry, co-operation, minor irrigation, village industries, primary education, local communications, sanitation, health and medical relief, local amenities, etc. This is a formidable assignment to a local body like the recommended Panchayat Samiti — to be constituted in each N.E.S. Block area by indirect elections from the village panchayats of that area — which, the Team believes, will not turn out to be inefficient or corrupt. This belief is based on the Team's im-

pression — which may be deemed more or less correct — that "the lack of efficiency of many of our present rural self-governing bodies has been due to too large a jurisdiction, too few powers and too scanty finances" and on their conviction that corruption can be eliminated "by constant and intelligent vigilance on the part of the citizens". But, as indirect elections may or may not hinder possible corruption, one cannot be too dogmatic on this score. In any case the considerable sources of income to be assigned to the Panchayat Samiti — sources like 40 per cent of the State's land revenue, share of motor vehicles tax, surcharge of duty on transfer of immovable property, voluntary public contributions, Government grants, etc — would appear to call for a degree of governmental control and regulation which, however, is ruled out by the Team. It is open to doubt if the suggested 'guidance' alone in technical and administrative matters would be sufficient to ensure efficiency and integrity where enormous responsibilities and finances are involved.

The Study Team's finding in respect of agriculture is no less disquieting than its finding in respect of popular initiative. "The all-India average of additional food production in the Community Development and N.E.S. Blocks", the Report records, "comes to only 10.8 per cent, varying in individual States from 2.7 per cent to 19 per cent; only Andhra Pradesh shows 41.4 per cent. These figures make unhappy reading and merely emphasise the need for greater attention to the agricultural sector in our schemes of community development". This disappointing performance is attributed to the small average quantity (2,468 maunds) of improved seeds distributed per annum per block, to lack of attention to evolving and distributing improved seeds of coarser grains especially for unirrigated lands, to the fact that only 331 seed farms (out of the 4,328, each of about 25 acres, proposed for the first three years of the second Plan period) have so far been established, to the widespread acute deficiency of soil nitrogen, to the abandonment of compost manure pits after a time on account of their distance from the cultivator's house and to virtual lack of attention to green manures.

The Team's diagnosis appears to be wholly correct. But what is the remedy in the present situation of shortage of chemical fertilisers? The Report has hit the nail on the head where it proves the distinct possibilities of green manures as one of the best sources of nitrogen: "In every field, whether irrigated or not, it is possible to produce its full requirements of green manure in all areas with over 20 inches of rainfall. By growing the green manure plants or shrubs on the borders of fields, it has been demonstrated in Madras that the usual crops are not affected. A small 2 to 4 oz. packet of green manure seeds, costing about one anna, helps to sow on the borders of an acre field. . . . Experimental work already done shows that green manuring not only increases the yield of paddy but lowers its water requirements as well. Green manuring which is the cheapest form of manuring paddy is capable of very rapid extension within a short period". There is absolutely no exaggeration in the Team's estimate of the possibilities of green manuring which, in the context of shortage of chemical fertilisers, could well be the biggest single factor for raising agricultural productivity at least in the N.E.S. and Community Project areas.

The Colombo Plan

SEVEN years of sustained co-operation in development projects under the Colombo Plan have justified the wisdom of giving flexibility to its structure and operating techniques. Although at its inception it looked like another step in economic collaboration among the countries of the Commonwealth, it had never been the idea of its original members to give it a limited complexion. It is clear that the enlargement of its scope, covering at present sixteen member countries, has brought indisputable gains to it. The entry of the United States in 1951 in the very second year gave it massive accession of strength. During the seven years of its career an outlay of the order of \$3,500 million has been incurred on capital and technical assistance. The United States contribution to it has been as solid as \$3,000 million. In the seventh year, nine-tenths of the outlay of \$1,000 million has flown from this major donor. This pattern of assistance could not be otherwise for it conforms to the general pattern of economic aid in the larger international set-up. But the assistance provided by other extra-regional participants — Canada, the United Kingdom, Australia and New Zealand — is of great intrinsic value since the requirements of the receiving countries of South and South-East Asia in respect of technical equipment, expert guidance and training facilities were substantially fulfilled by them.

Easily the most outstanding fact about the Colombo Plan in its seventh year is the accelerated rate of its progress which reached a new peak. This development is not only significant but it is bound to strike as paradoxical when it is read in the context of the course of world economy last year. While the tempo of expansion of world economy continued last year, it undoubtedly registered a relative decline. World industrial production went up in 1956 above the level of 1955 by 5 per cent which was only half as much as the rate of increase in the previous year. The overall reflection of growth is seen in the volume of world exports which disclosed a declining rate of expansion from 10 per cent in 1955 to 8 per cent in 1956. The United States economy witnessed a slackening in the pace of growth and each of the remaining countries outside the South and South-East Asian region participating in the Colombo Plan as a donor had to contend with inflationary pressures. While all indications pointed to a note of moderation in external economic aid, the outlay on capital and technical assistance under the Colombo Plan in 1956-57 reached two-seventh of the total during the seven years, or double the annual average for the period.

The Colombo Plan lays no pretence to serve as a regional Master Plan nor does it imply integration of any sort of the individual national plans of the countries of South Asia even in respect of the aid offered under its auspices. This absence of direction of resources and priorities is probably the strongest point of the scheme of assistance which has served to step up its tempo. It has helped, in its own measure, to fortify faith in planning as a technique of orderly development. With the exception of Thailand, all the countries of the Asian region have now their programmes of development operating at various stages. The new strides taken in the sphere of planning in 1956-57 are impressive as marking a new phase in economic development in the region. The

Colombo Plan has a positive contribution to its credit in it.

The report of the Consultative Committee of the Colombo Plan for 1956 recorded the significant finding that over the region as a whole national income continued to rise at a rate somewhat above the rate in the growth of population at 10 million per annum. The latest report states that this increase in national income was maintained last year. Higher levels of agricultural output had their own contribution to the growth in national income over the last two years. Nevertheless, the new accent which is being placed on industrialisation is also a positive factor in this progress. Planning in the countries of the South and South-East Asian region has dictated the inevitability of diversification of the economies of those countries with deliberate expansion of industry. New demands have been created for rapid adoption of scientific techniques of production in the domain of industry as well as agriculture. It is as a consequence of this simultaneous pressure of demand for skills that the technical assistance provided under the Colombo Plan has proved so fruitful and has been accelerated. Basic resources in agriculture, irrigation, transport and communications, power and mining are the major objects of technical assistance in which the Commonwealth extra-regional participants are providing the major share. But the demands of industry have produced a distinct impact on the programmes for technical assistance. It is neither necessary nor strictly feasible to assess the value of the individual contributions of the "outside" countries to technical assistance, but the vital fact which needs to be mentioned is that towards the close of 1956-57 there were 1,858 trainees studying abroad and 207 experts loaned to Asian countries under the Colombo Plan.

The seventh year has highlighted one of the front rank problems in planning in the South and South-East Asian region. Despite the comparative success achieved by the countries of the region in sustaining higher output of food grains, increasing industrial production and large imports, pressures of inflation proved too strong to control. Evidently, high outlays on programmes in the public as well as private sectors, much in excess of the savings actually mobilised inevitably required expansion of credit which accentuated the levels of money supply, income and demand. Public sector investment in development in these countries has kept on rising at a rapid rate from £611 million in 1954-55 to £803 million in 1955-56 which is estimated to be raised to £1,023 million in the current year. It is obvious as the examples of India and other countries have underlined that a fast rate of increase in development outlays carries real risks of landing them in balance of payments difficulties of a great magnitude. It only emphasises the necessity for maintaining flexibility in planning by a process of adjusting outlays to available resources mainly to be raised domestically. Assistance of the kind provided under the Colombo Plan has an undoubted effect of easing the impact of payments disequilibrium on the economies. There can be no room for doubt, therefore, that, when the question of extending the life of the Colombo Plan beyond 1961 is taken up two years hence, the unanimous decision will be to preserve and expand this institution.

Taxation and Private Foreign Investment

THE National Council of Applied Economic Research has now released in the form of a book its illuminating thesis on the subject of taxation in India and its impact on the inflow of private foreign investment. Its story is quickly told. There is no doubt that the climate for foreign investment in India is, at the moment, far more favourable than in many Asian countries but still our tax laws and regulations have created several unfavourable reactions abroad and have been responsible for impeding a regular inflow of private foreign capital. The Director-General of the Council, Dr. P. S. Lokanathan, and his colleagues need to be congratulated for the precise manner in which they have made recommendations for changing the tax structure of the country.

The underlying principle which governs the flow of private foreign investments is that the investor is interested in having "something more" than is obtainable in his own land. If we need more foreign capital, we have out of necessity, to exert ourselves to attract it. The idea that foreign capital is hammering at our doors for entry is the crudest nonsense conceived in view of the fact that recently tax laws in a very large number of countries have been designed to woo the investor, who turns out to be *persona multissima grata* in every free country of the world.

The crux of the problem is corporate taxation. The Council has recommended that foreign companies, (their branches as well as subsidiaries) should not be subject to the compulsory deposit scheme under Section 10 of the Indian Income-Tax Act. The Government's anxiety to disallow any misuse of resources is being taken for improper interference in private business by the capital-exporting countries. The extremely adverse effect of this scheme on foreign investors necessitates its complete withdrawal. In regard to the taxation of bonus shares, the Council has recommended that "the tax on bonus issues be reconsidered in conjunction with the recommendation that for the purpose of the excess dividends tax, the dividend rate of companies be computed upon the basis of total capital employed rather than upon the basis of paid-up capital. If the excess dividends tax is applied to the total capital, the issue of bonus shares will not become a method of evading this tax. There would then be justification for the levy of a tax on bonus shares".

A complete chapter devoted to Section 23A companies makes a searching analysis of the reaction of the foreign investor to this Section in the Income-Tax Act. The Section under question has been made extremely harsh by the Government of India with the only object of checking evasion of super-tax on personal income by those who control the working of these companies. The Council has recommended that a new definition would not apply to a company which was not a private company within the meaning of the Companies Act and of which "shares carrying not less than 33-1/3 per cent of the voting power had been allotted unconditionally to or acquired uncondi-

tionally by and were throughout the previous year beneficially held by the public if the shares were at any time during the previous year dealt in at a recognised stock exchange in India". Also if the "affairs of the company or the shares carrying more than 66-2/3 per cent of the total voting power were at no time during the year controlled or held by less than 6 per cent," it should come under the purview of the new definition.

The Council has also suggested that no company should be brought within the purview of Section 23A on the ground that a substantial part of its capital was held by such public companies as the Life Insurance Corporation of India or the Industrial Credit and Investment Corporation of India Ltd. Also a company whose share capital is owned by two or more companies to which Section 23A does not apply should be exempted from the application of that section.

On the subject of taxation of non-resident companies the Council is of the opinion that all those non-resident companies which limit their activities in India to only purchasing operations should be exempted from income-tax in India. In a similar manner, royalty payments, technical service fees, and interest payments to non-resident companies should be exempted from super-tax.

An important recommendation which the Council has made relates to emoluments of foreign technicians. The Council has suggested that the tax exemption for foreign technicians should be broadened in order to include a "limited" number of essential management personnel and staff approved by Government for each eligible enterprise. At what rungs of topmost management is this incentive most needed? Perhaps only trial and error will show. In general, however, it would be wise to err on the side of liberality at least in the beginning. This has already been *The Eastern Economist's* recommendation in its Blue Supplement 'Problems of Private Foreign Investment'.

What is the probable magnitude of private foreign investment that might be had if all the recommendations of the Council were accepted by the Government of India? The immediate impact, it has been acknowledged, may be a slight fall in the yield of revenue but the recommendations have been made more for the sake of attracting additional private capital in the long run in stead of solving any short-term problem of foreign exchange. It is known that the only country which has a great potential for exporting capital is the United States. During the last twelve years investments made by U.S. firms abroad totalled nearly Rs. 4,400 crores. The major recipients have hitherto been Canada, Latin America, West Europe and the oil-bearing areas of the Middle East. The share of the Indian Union does not exceed Rs. 40 crores. If a congenial climate for foreign investment were created by accepting the recommendations of the Council, this figure could, without doubt, be increased manifold.

THE WEEK'S NOTES

THE PASSION FOR IRRELEVANCE

THE DEBATE on food in the Lok Sabha on Tuesday this week has shown how easily marginal issues can distract the public mind. Major headlines in Delhi were to the effect that licensing was to be introduced in the food grains trade and that private enterprise was to be allowed to start fertiliser units. As far as could be determined from the very unsatisfying reply by the Food Minister, this was the full extent of the policy changes which the Asoka Mehta Committee has brought forth. Not, indeed, that the Committee itself had much more constructive to suggest. But if its analysis of the situation is accepted, the Government would have needed a much more dramatic revision of policy than the Food Minister seemed to consider necessary. The Food Minister said nothing to suggest he differed from the analysis of the Mehta Report. How then can the Food Minister be so complacent?

The Food Minister asserted that the failure of land reforms in the States was not a failure of the Centre. He wanted the Centre to have larger powers in this regard. But no one was told exactly how these larger powers were to be applied.

Thus, it would seem, with certain long-term propositions — the removal of alleged speculation by licensing, the possibility (only) of new private fertiliser plants, and some vague promises of land reform — the Food Minister proposes to deal with the current crisis in production. If this satisfies the country, the country will deserve the Food Minister it has got.

COMMONWEALTH UNITY

THE INDIAN Finance Minister's speech at the Commonwealth Parliamentary Conference here contained an academic analysis of the problems connected with economic relations between Commonwealth countries but, as he himself said, it advanced no suggestions for solving them. If a right diagnosis could be half the cure, the posing of problems in the manner he did was worth having although some of them were, perhaps, inherently insoluble. One of the latter set of problems stemmed from the fact that the economies of many Commonwealth countries were non-complementary in the sense that they had to depend on the export of one or more commodities, largely agricultural. The Commonwealth, however, could not provide any cushion for price fluctuations in these commodities. And so Mr. Krishnamachari did well to pose the problem frankly by saying that "it is obvious that aid should be sought from outside the Commonwealth or, in the alternative, ways and means must be found of making the Commonwealth area mutually more self-sufficient within and less dependent as a unit on outside countries". If the latter alternative should happen to be not feasible, the case for mutually beneficial economic relations between India and countries outside the Commonwealth was clear. In this connection the inability of the more advanced countries of the Commonwealth to meet the larger part of the capital requirements of the under-developed member-countries was also obvious.

It would, therefore, appear that any attempt to secure Commonwealth unity in the sense of economic inter-dependence in the largest measure is not likely to succeed. But it would not be anything like a tragedy if such perfect economic unity does not come about. The idea that economic unity is a basic condition for political unity is not quite tenable in a world where

politics determines economics to a far greater extent than economics determines politics. It is, therefore, much more important to maintain and improve the political unity of the Commonwealth—the kind of unity which, in spite of the stresses and strains to which it has been subjected in recent years, is still an eyesore to world communism—if such economic inter-dependence as there is already is not to be undermined completely. The utility of the Commonwealth as a political entity and the need for maintaining its unity in that sphere need not be over-emphasised.

The utility of the Commonwealth as the biggest political laboratory for establishing the vitality of the two-party system is also there. It is sound common-sense on the part of voters in Canada, Great Britain, Australia and New Zealand that has helped in the evolution of two nearly equal parties which could alternately come to power and ensure stable and balanced progress in the social and economic spheres in the conditions of parliamentary democracy. This commonsense is worthy of emulation by citizens in such younger and newer parliamentary democracies as India and Ceylon. The choice of Labour in one election and the choice of Conservatives or Liberals in another may well ensure, for example, the general acceptance of the welfare goals of socialism and the emergence of moderation as far as nationalisation and other extreme economic programmes are concerned. Such a thing has happened in the United Kingdom, and the British Labour Party's public ownership plank has undergone a change for the better in the direction of moderation as a consequence, probably, of the operation of the two-party system. Where one is a party of the Right and the other a party of the Left, a balanced two-party system may mean that the former would be rendered progressive and the latter moderate. With parliamentary institutions prevailing in all the countries of the Commonwealth, the continued political unity of this institution of international co-operation would also be in the lasting interests of Democracy itself.

COMMUNISTS AND TRUTH

THE FULL text, printed in "The New York Times," of the recent Moscow declaration of the Communist parties of the twelve Socialist countries — Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Rumania, Russia, China, North Korea, Outer Mongolia and North Viet-Nam — is a Communist document true to its type. It is a model of long-windedness, verbosity and repetitiveness, and this is understandable, for more words are needed to distort or conceal truths. Some of these truths could still be seen in such exaggerated statements as are quoted below if the reader merely recalls the opposites (with or without qualifications, as the case may be) of what the Communist words convey:

It (socialism) has insured development of the productive forces at a rate unprecedented and impossible for capitalism, and the raising of the material and cultural levels of the working people.

In the Socialist states the broad masses of the working people enjoy genuine freedom and democratic rights.

In many respects (in the capitalist countries) modern science and engineering are not being used in the interests of social progress for all mankind, be-

cause capitalism fetters and deforms the development of the productive forces of society.

The temporary high business activity (in the world capitalist economy) helps to keep up the reformist illusions among part of the workers in the capitalist countries.

The broad invasion (in the greater part of the capitalist world) of agriculture by the monopolies and the price policy dictated by them, the system of bank credits and loans and the increased taxation caused by the arms drive have resulted in the steady ruin and impoverishment of the main mass of the peasantry.

The aggressive imperialist circles of the United States, by pursuing the so-called 'positions of strength' policy, seek to bring most countries of the world under their sway and to hamper the onward march of mankind in accordance with the laws of social development.

The Communist countries base their relations on principles of complete equality, respect for territorial integrity, state independence and sovereignty and non-interference is one another's affairs.

It (the imperialist bourgeoisie) misrepresents socialism and smears Marxism-Leninism, misleads and confuses the masses.

The Communist parties are loyal defenders of the national and democratic interests of the peoples of all countries.

The working class and its vanguard — the Marxist-Leninist party — seek to achieve the Socialist revolution by peaceful means.

Any comment on these quoted sentences would be superfluous except in the case of the last one. The emphasis here on 'peaceful means' is merely tactical, it does not denote any change in the basic strategy of violence. Communists believe that "today in a number of capitalist countries the working class headed by its vanguard (that is, the Communist party) has the opportunity, given a united working class and popular front... to secure a firm majority in parliament, transform parliament from an instrument serving the class interests of the bourgeoisie into an instrument serving the working people, launch a non-parliamentary mass struggle, smash the resistance of the reactionary forces and create the necessary conditions for peaceful (sic.) realisation of the Socialist revolution". It would require uncommon naivete to believe that there will be no 'violence' in state power as wielded by the Communists and in non-parliamentary mass struggle. Perhaps the Communists believe that killing alone is violence and, short of killing, everything else is non-violence! Communists, in Marx's time, disdained to conceal their aims, but the Bolsheviks of today disdain to reveal theirs wholly. Success in capturing power has probably been responsible for this change from revelation of aims to their concealment.

FOREIGN EXCHANGE FOR EGYPT'S PLANS

THERE IS now more light on how Egypt has nearly solved the problem of financing the foreign exchange cost—estimated at £120 million—of her industrial plans. Of this, £80 million is expected to come, by way of machinery and factory equipment on deferred payment terms, from two Communist countries—the Soviet Union (£60 million) and Czechoslovakia (£20 million). Although the proposed agreements with the two countries, the expected net earning of foreign ex-

change on trade account and the foreign exchange revenue from the Suez Canal may, together, suffice for her industrialisation programme, Egypt will still not be in a position to build the High Aswan Dam and other public works unless she comes to terms with the West on the outstanding issue of compensation for the nationalised Suez Canal Maritime Company. That Egypt is anxious to get her external reserves (blocked in the West) as well as long-term finance from that side for her Aswan Dam project could be inferred from her asking the World Bank to mediate in the matter of compensation to the former Suez Canal Company. If the Egyptian Government comes to display a fair and helpful attitude in this regard, it is not inconceivable that the World Bank may again come into the picture for possible financing of the Aswan project. Both Egypt and the West may, then, return to the point where they broke off in July, 1956. That is a consummation to be devoutly hoped for if the likely increase in Russian influence in the mercurial Middle East area is not to result in further tensions.

the symbol of business efficiency

Carbon Papers

Hands, copies and desk remain clean when Kores carbon paper is used. The copies are sharp, legible and difficult to smudge. Kores carbon papers are very economical on account of their durability.

Typewriter Ribbons

It is a pleasure to type with a Kores ribbon. The impressions are well defined and positive from the very first day. Kores ribbons will not smudge even when new and each ribbon gives 20 lakhs impressions.

Drytype Stencils

With Kores Drytype Stencils the types of the typewriter remain clean and do not fill up. Round letters do not fall out and the typewriter rollers remain unaffected. Kores Drytype Stencils are also ideal for drawing and hand work.

Kores (India) Private Limited manufacture Carbon Papers, Typewriter Ribbons, Drytype Duplicating Stencils, Duplicating Ink and Accessories, Ink Tablets, Stamp Pads and Stamp Pad Inks.

KORES PRODUCTS are obtainable from all stationers

FACTS BEHIND FIGURES

Performing
230,000,000,000 ft. lbs.
per minute
of work

Up and down the railway tracks of India run, on an average, 6,638 locomotives everyday. Together they develop approximately 7 million h.p. and exert a tractive force of 70 million lbs. They thus perform work at the rate of 230,000 million ft. lbs. per minute to carry 1,234,44 million passengers and 115 million tons of freight.

The Second Five Year Plan schedules an expenditure of Rs. 900 crores (18.8% of the total outlay of the public sector) on railway development.

Carriage by rail is the most important method of transporting men, machines and materials across India. Providing steam power to keep the trains on the move are the locomotive boilers manufactured by Texmaco. Texmaco, pioneer in many fields of engineering, designs and builds locomotive boilers for the Indian Railways.

TEXMACO

serves India's basic industries

TEXTILE MACHINERY CORPORATION LIMITED

a pilfer-proof package for every product!

Metal Box pilfer-proof containers and closures, individually designed for each product, are precision engineered and superbly printed. This ensures product safety, purity, and powerful sales appeal. Reputable manufacturers use them to pack:

Ghee	Breakfast foods	Vanaspati and other food oils
Butter	Cocoa	Baking powder
Evaporated and Condensed milk	Coffee	Tea
Barley	Biscuits	Honey
Glucose	Confectionery	Processed fruits and vegetables
	Cashews	

A METAL BOX PILFER-PROOF CONTAINER

Complete pilfer-proof protection is guaranteed by double seaming both top and bottom to the can body.

This cross-section of a precision engineered double seam shows how the rubber-like compound lining ensures air-tightness.

Only a can opener, destroying the top of the can, will open it. It cannot be reused by unscrupulous dealers to repack with spurious products.

A Window on the World

EXCHANGE RATES: FIXED OR FLEXIBLE A CHOICE OF EVILS

By
ODYSSEUS

ARE FLEXIBLE RATES of exchange practical? We are mulling over this question because (1) it is relevant to India's balance of payments difficulties, and (2) proposals for flexible rates are suspect to many central bankers, business men, and economists. I shared this suspicion. (See this column for November 1). I have been led to re-consider the problem by a talk that I subsequently had with Professor Friedrich Lutz in Zurich.

Professor Lutz states the case for flexible rates with such fairness to alternative policies that his moderation compels respect. Whatever your conclusion, you may agree that the choice between fixed and flexible rates is not one between good and evil but between evils.

An argument that I put to Professor Lutz was that fluctuating rates would impede trade by adding to business risks, but the Professor maintained that with a freely functioning forward exchange market, exporters and importers could shift the risks onto speculators — those much maligned people whose profession it is to deal in risks. Whatever policy is adopted there will always be risks. If deflation is pursued to cure a balance of payments disequilibrium, the trader risks a decline in domestic demand and prices. If import controls are instituted, they may decrease or cut off his supplies.

Flexible rates would reduce the volume of trade? Professor Lutz concedes that they might if — as in the 19th century — investors could be certain that the countries in which they invested would never alter their exchange rates or institute exchange control. Today's investors, with a quarter of a century's experience of international fooling around with rates and restrictions, would utter a hoarse laugh if any Finance Minister were to announce that he would never again use such measures to protect his balance of payments. We must realise that, even with a formal proclamation of fixed exchange rates, private capital will never again flow as easily and willingly across frontiers, wherever wanted, regardless of nationality, as it did in the 19th century. A burnt investor dreads the fire as much as any child.

Do flexible rates start off wage-price spirals? A fall in the exchange rates make imports more expensive, raises the cost of living, provokes demands for higher wages. If these demands are granted, the objectors argue, the beneficial effects of the depreciation of the currency will be lost. But this objection applies as much to sudden devaluations as to flexible rates. If wage demands are met, the central bank will have to finance them by expanding the supply of money. If the central bank refuses, unemployment will follow — because you can only pay the same wages with less money by employing fewer people. In that case, flexible rates would have much the same result as maintaining fixed rates by deflationary pressure. Nevertheless, Professor Lutz argues, the effects would not be identical because the unemployment created would be less than that caused by a deliberately deflationary policy, since under deflation the real wages of the

workers remaining in employment rise instead of staying at their old level. Nevertheless one of the advantages of a flexible rate would be lost. If, on the other hand, the central bank does provide the necessary addition to the money supply, the nation is in fact allowing the trades unions to lay down its monetary policy. This is the dilemma which arises whenever unions get wage increases higher than productivity justifies. Wage grants which follow a fall in the exchange rate amount to wage increases exceeding productivity, because the deterioration in the terms of trade caused by depreciation means a lower productivity of labour which should be reflected in lower real wages. To maintain real wages is to shift the decline in real income on to other groups, including those who become unemployed.

But even if demands for increased money wages following a fall in the exchange rate cannot be entirely resisted, Professor Lutz observes that in no case will the rise in the cost of living index fully reflect the fall in the exchange rate because a large (usually the larger) part of the commodities in the cost of living index are domestic goods and services. A wage-price spiral will modify but cannot nullify the effect of a currency depreciation on the balance of payments. Moreover the time lag between (a) the depreciation and whatever rise in the cost of living it causes and (b) the rise in the cost of living and rise in the wage level, provides a considerable interval in which the depreciation exerts a maximum effect on the balance of payments.

Import restrictions — the alternative to flexible rates — divert expenditure from imports to other goods which may be exports, or imports still on the free list, or domestic goods not on the cost of living index, so that import restrictions may not improve the balance of payments as much as was hoped. When the grave disadvantages of trade restrictions are borne in mind, the argument seems to support Professor Lutz's preference for flexible rates — unless you are one of those central planners whose eyes light with joy at opportunities for restrictions, quotas, licences, and other ways of compelling people to do what you think is good for them.

Would flexible rates promote "bear" speculation? When speculators anticipate movements in rates, and by buying or selling according to their forecasts, smooth out these movements, they perform an important service. If most speculators guess the future course of the rate approximately correctly, they bring into action at an early stage the forces which lead to adjustment in the balance of payments. The effect of speculation is to provide incentives to export more and to import less from the very first moment that balance of payment trends reveal themselves in one direction or another. If we could be sure that speculators would always forecast trends correctly, flexible exchange rates would, just because of speculation, adjust the balance of payments quickly and smoothly.

But would not speculators always be driving the rate below the equilibrium level? The risk of this is much greater with a so-called fixed rate, that you are

trying to defend as long as you can, than with flexible rates when you move at once in accordance with market supply and demand. Do not forget that with flexible rates the over-buying of foreign currencies could not persist since the cheapening of your own currency would sooner or later cause exports to rise and imports to fall enough to create an excess supply of foreign currencies, and this would lead to the rate's recovery. Secondly, to assume over-speculation implies that the speculators must in the end have incurred losses. But the forecasts made by speculators will, from a certain point onwards, begin to differ and therefore to cancel each other out and to flatten the curve in the rate. Flexible rates encourage bulls as much as bears.

Professor Lutz thinks it unlikely that speculation would accentuate rate fluctuations. Those who fear over-speculation are thinking of the 1930's when purchases of foreign currencies came partly from people seeking safety for their savings in flight. That the rates were then sometimes pushed below the level warranted was not therefore due solely to professional speculators. Speculation against the Franc was, as long as France clung to a fixed rate, just the sort of riskless, one-way speculation that flexible rates would render impossible.

Would flexible rates require Exchange Equalisation funds? Such funds would only be useful if the salaried officials who operated them were abler than risk-taking speculators and judged the future of rates more accu-

ately. I can think of no reason why they should. What is more, officials in attempting to smooth out day to day fluctuations may quite easily be led to "defend" the rate in situations which need fundamental adjustment of the balance of payments through a fall in the rate. Moreover if several countries follow flexible rate policies and each has its own equalisation fund acting independently, they may start fighting each other.

Professor Lutz's final word is that flexible rates do not necessarily mean unstable rates. As long as the balance of payments was approximately in equilibrium, rates would not move widely and the difference between (a) flexible and (b) fixed rates would not be much noticed. The fear that flexible rates would involve radical changes is unjustified — except, of course, in the event of a serious balance of payments crisis. It is in precisely that event that Professor Lutz believes that a flexible rate policy minimises the adverse effects on the country involved.

These ideas should it seems to me, be chewed over in the Ministry of Finance and in the Reserve Bank.

(This is the final article in a series of four discussing balance of payments problems. Economists interested in a full exposition of Professor F. A. Lutz's views will find them in the "Banca Nazionale del Lavoro Quarterly Review", for December, 1954.—Ed.)

THE CRISIS IN N.A.T.O.

(From Our Special West European Correspondent)

PARIS, December 2.

PRESIDENT EISENHOWER'S inability to come here to Paris for the NATO meeting next month considerably reduces the importance of that conference and postpones a settlement of the Western alliance's major problems until next spring—but that is probably no bad thing. The atmosphere in Paris is, and will remain throughout December, quite unsuited to rational discussion of those problems, at least at the political level. At the military level, the reorganisation of NATO can proceed undisturbed by the storms created by French politicians and the uncertainties created by the President's health, and it is in fact going forward under the direction of General Norstad, Commander-in-Chief of the Allied Powers in Europe. If these military plans can be completed during the winter, it will be time enough for a political confrontation in the spring and by then the air may have cleared in Paris. Mr. Macmillan's visit here this week showed the uselessness of trying to discuss the future of NATO as long as the French are thinking not about the common defence against Russia but about the defence of Algeria from the rebels.

For the French have succeeded in creating a noisy side-show, which threatened to change the whole meaning and purpose of the NATO conference next month. As an American put it ruefully the other day, "We're worried about Russian atomic missiles and the French won't stop talking about a few hundred lousy rifles we gave the Tunisians. What century do these people live in anyhow?" Next month's conference is supposed to deal with interdependence and Atlantic unity, but at present the Anglo-Saxons mean one thing by unity and the French quite another. It is better that a top-level meeting be delayed until all parties are willing to talk about the same subject, and since the question that is worrying the Anglo-Saxons is vital it can be hoped that within a month or two the French will have returned to their senses and will be ready to discuss the defence of the West against Russian missiles.

The smokescreen of diversion is so thick here that it is necessary to look back to the month of October and recall the real reasons for the spectacular decision of President Eisenhower to come to Paris for the NATO meeting. Mr. Macmillan had gone to Washington immediately after the successful Russian launching of long-range missiles and of artificial satellites, and it was the Western reply to this new threat that was discussed in Washington. The French were absent from those talks through their own fault: they were having their longest and most obscure cabinet crisis to date. It was clear to the Americans after those talks (though perhaps less clear to the British) that no Anglo-American partnership would be adequate to counter the new Russian threat and that new forms of co-operation would be required between all the members of NATO. It was then that the President decided to come to Paris, to promote this new co-operation; and just to make plain that it was an all-NATO affair and not an Anglo-American directory that was proposed, he threw in a snubbing for the British by declining to go to London to return the Queen's recent visit to Washington. This snubbing was duly appreciated on the Continent and at that stage everyone was clear on the fact that the

urgent problem was to devise a new and unified plan for the disposition of missiles to meet the Russian threat.

A leakage in the London Press about the form this new plan would take suggested that in practice it would amount to the creation within NATO of a privileged Anglo-American partnership, based on the fact that only these two countries possessed hydrogen bombs. Such a plan was denied to exist, both in Washington and London, but in any case it was not an unreasonable scheme and could have been 'put across' in some disguised form by President Eisenhower at the Paris meeting. But at this stage there supervened the incredibly clumsy collusion between the British and Americans about supplying arms to the Tunisians. (Why this decision was wise in intention but clumsy in execution was argued on this page last week.) This incident aroused fears on the Continent (and not only in France) that Anglo-American domination within the new defence scheme would be at the expense of the other partners. Thus the "unity" that was to be the subject of the December meeting quite changed meaning: it no longer meant a united defence against Russian missiles but united support for all members of the alliance in their minor political difficulties, notably for France in Algeria (which is a minor problem for the West alongside the defence against Russia).

When the smokescreen has cleared it will be seen that the basic problem stands. The essence of that problem lies in the fact that the Russians have, or will have in significant numbers soon, missiles with a range of 5,000 miles, while the Americans have missiles with a range of only 1,500 miles. (The "Snark", which indeed has a range of 5,000 miles is not a missile but a pilotless plane and is more vulnerable than a normal bomber.) This means that the USA can be attacked from Russia but Russia can only be attacked from West Europe. It has often been said since the last war that America's main line of defence was in Europe but for the first time that is quite literally true. This situation will not last indefinitely, for presumably within a decade the USA will be as well protected by long-range missiles as Russia is now; when that day comes, the importance of West Europe will relapse to the "relative" importance it had for American defence before 1957. But meanwhile its importance is not relative but absolute: the only possible American defence against Russia must be based in the other NATO countries. Indeed, within this limited period, the USA can have a definite advantage over Russia because it is likely that medium-range missiles can be produced by the West in large numbers before Russian long-range missiles are ready in equal numbers.

Now the new fact that for a few years the defence of the USA can only be undertaken from foreign territory (and by defence we mean not ultimate defence in a long war but the actions that must be taken in the first half-hour of a war) poses evident political problems. These are all the greater because the retaliation that the use of such defences would invoke would be so immense and devastating that there could obviously arise differences of opinion about when and on whose authority they would be used. If the decision to launch medium range missiles on Russia from West Europe

A TREASURE TO OWN

About 1800

A PLEASURE TO SMOKE

Willis
The "Three Castles"

TC/140

were left to the West Europeans, then, granted that this is the USA's only immediate defence against Russian attack, America could be virtually disarmed by Russian intimidation of West Europe. But if this decision were left entirely to the US forces in Europe, West Europe would be virtually disarmed because there could be no guarantee that the Americans would be willing to start an atomic war for the sake of what appeared from Washington to be a "limited" objective.

The disproportion in the ranges of Russian and American missiles can be cancelled out, as far as the main antagonists are concerned, by the geographical advantage of the Americans, thanks to the bases in West Europe. So from the point of view of the two principal powers, the balance is still even—but only as long as there is full and confident agreement within the Western alliance about the use of those bases. Such agreement and such confidence do not exist today, and yet this is an essential part of Western defence and of the defence of US territory itself. The Americans do not have confidence in the Continentals because they realise the danger of the Continentals being sensitive to this argument now being addressed to them from Moscow: "Why mix yourselves up in Russo-American quarrels? We Russians do not need to attack your countries as long as they do not contain American bases because we are quite capable, with our long-range missiles, of dealing with the Americans over your heads. Even if a nuclear war comes, you can escape it unscathed, for in a war carried on in the 5,000-mile range you are no longer in the firing line, unless you insist on putting yourselves there by harbouring American missiles—which moreover you have no guarantee will ever be used in your defence because the retaliation for their use would fall not only on yourselves but on the USA itself. In a pinch the Americans will sacrifice you rather than have our long-range missiles begin falling on US cities."

And precisely because the Continentals are sensitive

at least to the latter part of this argument, they do not trust the Americans. In France particularly, people are saying, "The Americans sacrificed our vital interests in the Suez war, even though we were under the threat of Russian missile attack, and now they are ready to sacrifice our vital interests in Algeria by arming our enemies via Tunisia. No doubt the Americans do not regard us as completely expendable; there would come a point where they would fight, even for us—but that might be too late on our calculation of what constitutes our vital interests. Meantime we are expected to resign our right to make our own nuclear weapons and yet to run the risk of harbouring American missiles". While, in West Germany this month, Professor von Weizsacker, the atomic scientist, asked, "Would the USA be ready to risk destruction of their own cities to protect the town of, say, Munich against Russian attack?"—the professor did not say the answer was no, but he showed no confidence that it was yes. The NATO parliamentarians who met in Paris earlier this month admitted "In all the member-countries of the Atlantic Pact one can see an increasing anxiety and an indecision in public opinion, to the detriment of a firm will to defend themselves"—and the French delegation underlined the fact by walking out of that conference because of the delivery of arms to Tunisia.

These are the problems that NATO must discuss when a top-level meeting takes place. Meanwhile a complicated system of mutual guarantees between the Americans and their Continental allies must be worked out, including specific agreements about the conditions in which missiles stocked in West Europe would be used. General Norstad is engaged on this task now. But the military understandings must be endorsed in a political covenant, because they will pre-suppose that there is unification of foreign policy within the alliance. But a united foreign policy, especially as regards Africa and the Arab world, is impossible until the Algerian problem is resolved.

WORLDGRAM

AGRICULTURE

Fishery Co-operation and Administration: A six-week training centre in fishery co-operation and administration will begin at Sydney and Adelaide in Australia on December 16. The centre has been organised by the FAO in co-operation with the Australian Government and the Indo-Pacific Fisheries Council. It is expected that four Indian officers—one from the Orissa and three from Bombay will participate in the centre. The programme includes practical instruction, demonstration and discussion on special problems of organisation and methods in fishery co-operatives in the Indo-Pacific region.

Cow-Dung Gas Plants: Cow-dung gas plants had been installed in 11 villages of the Union Territory of Delhi, which were under intensive cultivation scheme of the Indian Agricultural Research Institute of the Ministry of Food and Agriculture. These villages were Nangloi (two plants), Qumarrudin Nagar, Nilothi, Baprola, Gheora, Tikri Kalan, Hasthal, Tilangpur Kotla, Bakre Wala, Hiren Khudna and Ranhaula. Experiments were continuing on this gas plant for utilisation of leaves, straw, etc., along with dung for gas production. Other experiments were for operation of larger sized gas plants and modification for manipulation of the counterpoise weights. As a result of experiments, it had been possible to simplify the design, and reduce the cost of the gas plant to Rs. 350.

INDUSTRY

Co-operative Sugar Mills: Replying to a question by Shri Raghunath Singh in the Lok Sabha, Dr. Panjabrao S. Deshmukh, Union Minister for Co-operation, said that 39 licences had so far been granted for the establishment of co-operative sugar mills. Of these, eight factories had already gone into production, while another four had completed construction work and were expected to catch 1957-58 season. The Minister added that, besides these, three factories had started erection work. One of them was expected to have a trial run towards the end of February 1958.

Manufacture of Manganese Sulphate and Copper Oxide: The Union Minister of Education and Scientific Research told Shri Barman and Shri S. C. Samanta in the Lok Sabha that processes on (i) "manganese sulphate from Indian ores" and (ii) "electrolytic cuprous oxide" had been developed at the Central Electro-Chemical Research Institute, Karaikudi. There were some possibilities of exporting manganese sulphate, the Minister added, to foreign countries if production costs were low. There appeared no possibilities of export of cuprous oxide. The full implications of possible savings in foreign exchange by indigenous production would be known only when commercial production was established. The process 'electrolytic cuprous oxide' had been leased out to industry for commercial exploitation. Negotiations for commercial development of the process 'manganese sulphate from Indian ores' were in progress.

TRADE

Trade Arrangement between India and the Democratic Republic of Viet-Nam: An agreement was concluded recently between the State Trading Corporation of India and the National Corporation for Import and Export of Agricultural Products, a State enterprise of the Democratic Republic of Viet-Nam, for the supply of 7,000 metric tons of rice by the latter. The Viet-

Nam Government have agreed to utilise the sale proceeds of the rice for purchase of Indian goods specified in the Trade Arrangement between India and the Democratic Republic of Viet-Nam.

Indo-West German Trade: In reply to a question by Shri P. C. Bhanj Deo in the Rajya Sabha, the Deputy Minister for Commerce and Industry, Shri Satish Chandra said that the adverse balance of trade with West Germany amounted to Rs. 75 crores during 1956-57. The adverse balance in 1955-56 was Rs. 45.4 crores and Rs. 25.5 crores in the year before that. Shri Satish Chandra said the adverse balance was expected to be redressed by curtailment of imports, expansion of exports and diversification and development of foreign trade on a multilateral basis. It was considered that it was possible to augment the export of ores, cotton piecegoods, jute manufactures, tea, tobacco, pepper, cashewnuts, leather manufactures, handloom fabrics and handicrafts.

Import of Silver Coins from Tibet: According to a Statement laid on the Table of the Rajya Sabha recently by the Deputy Minister of Finance, Shri B. R. Bhagat, 2,76,10,450 pieces of silver coins were imported from Tibet during 1956-57. In the current financial year up to October 1,48,96,267 pieces of such coins were imported from Tibet. The weight of these coins was 2,37,09,766 ounces (Troy) during 1956-57 and 1,28,00,999 ounces (Troy) up to October in 1957-58. The amount of import duty levied on the coins was Rs. 1,23,77,699 and Rs. 65,02,006 in 1956-57 and 1957-58 (up to October) respectively.

FINANCE

Bank Advances against Food Grains: The Deputy Minister of Finance, Shri B. R. Bhagat, laid on the table of the Lok Sabha recently a Statement showing the comparative figures of bank advances against food grains since 1954. According to the Statement, the position of all India Bank advances against food grains was as follows:

Date	Total advances against all types of food grains	Advances against paddy and Rice	Advances against wheat and other food grains
30-8-1957	20.2	6.5	13.7
31-8-1956	26.0	7.5	18.5
26-8-1955	18.1	5.8	12.3
27-8-1954	19.6	7.0	12.6

The Deputy Minister also placed on the table of the House a second statement showing bank advances against paddy and rice in certain States. According to it, the advances were as follows:

Name of State	(In lakhs of rupees)	
	Amount as on the 30th August, 1957	Amount as on the 31st August, 1956
West Bengal	63	79
Assam	3	5
Orissa	12	3
Andhra (including Hyderabad)	282	343
Madras	42	57
Kerala	19	15
Mysore	20	15

The Deputy Minister added that complete data regarding the position as on 31st October, 1957, was not yet ready.

Bank Deposits and Company Reserves: The Finance Minister Shri T. T. Krishnamachari revealed in the Lok Sabha that the statutory deposits of banks with the Reserve Bank as on October 4, 1957, amounted to Rs. 94.15 crores. The Reserve Bank, he said, did not accept time deposits. For the State Bank, only consolidated figures of "deposits and other accounts" were available and these stood on October 4, 1957, at Rs. 349.49 crores. Figures of "demand and time liabilities" of the Scheduled Banks as on October 4, 1957, were Rs. 723.18 crores and Rs. 626.50 crores respectively; figures of demand and time deposits as such were not available. The Finance Minister said that information in regard to deposits of non-scheduled banks as on the above date was not yet available. As on the last Friday of May 1957, the demand deposits and time deposits with them were Rs. 27.08 crores and Rs. 45.87 crores respectively. Asked to state the total reserves of Joint Stock Concerns at the beginning of the current financial year, the Finance Minister said that information was available only in regard to 750 joint stock public limited companies registered in India with paid-up capital of not less than Rs. 5 lakhs each, excluding banking, insurance and investment companies, Government companies, companies limited by guarantee and non-profit associations. Their total reserves in the accounting year July 1955 to June 1956 aggregated Rs. 332.50 crores.

*

Customs and Excise Revenue for August, 1957: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during the month of August 1957, amounted to Rs. 15.76 crores as compared with Rs. 13.42 crores in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 13.20 crores as against Rs. 11.14 crores; export duties for Rs. 2.13 crores as against Rs. 1.98 crores and land customs, miscellaneous and air customs for Rs. 43 lakhs as against Rs. 30 lakhs. The total gross collection of Union excise duties amounted to Rs. 23.17 crores as compared with Rs. 15.12 crores. During the five months, April to August, 1957, the grand total of gross customs and Union excise revenue realised was Rs. 180.83 crores as compared with Rs. 135.55 crores during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 68.79 crores as against Rs. 54.28 crores, export duties for Rs. 7.64 crores as against Rs. 9.19 crores, land customs, miscellaneous and air customs for Rs. 1.74 crores as against Rs. 1.24 crores and Union excise duties for Rs. 102.66 crores as against Rs. 70.84 crores.

*

Foreign Investments: The Finance Minister, Shri T. T. Krishnamachari laid on the Table of the Lok Sabha two Statements showing the extent of foreign investments in some important industries and its percentage to total foreign investment in this country, as at the end of 1953. According to the Statements 32 per cent of the total foreign investment in this country has been in the manufacturing industries; 23 per cent in trading; 17 per cent in plantation; 12 per cent in utilities and transport; 2 per cent in mining and 14 per cent in other fields.

*

Industrial Finance Corporation: The Finance Minister, Shri T. T. Krishnamachari revealed in the Lok Sabha that it has been decided tentatively to

grant an additional loan of Rs. 5 crores to the Industrial Finance Corporation during the current financial year. The total amount of loan given by Government to the Corporation till September 30, 1957 was Rs. 10 crores. The Finance Minister explained that the loans so far made available carried 4½ per cent interest and were repayable in 17 annual equated instalments. Shri T. T. Krishnamachari also stated that the total amount of loans sanctioned by the Corporation up to the end of September this year was Rs. 55,11,50,000. Loan amounts actually disbursed up to the above date was Rs. 28,32,37,522.94 np. The largest amount of loan given to a single concern was Rs. 3.06 crores (inclusive of an additional loan of Rs 50 lakhs sanctioned subject to Government guarantee) and the largest amount sanctioned to a group of concerns under the same management was Rs. 3,39,25,800 (inclusive of the Rs. 3.06 crores loan mentioned above).

GENERAL

Provident Fund Benefits for Workers: The number of workers getting benefits under the Employees' Provident Fund Act, after its amendment by Parliament in December 1956, was 4.94 lakhs up to September 30, 1957. Nearly 292 factories covered by the Act had not so far deposited the provident fund money with the concerned authorities according to the provisions of the Act. Recovery proceedings under Section 8 of the Act had been undertaken. Prosecutions had also been launched where necessary.

*

Foreign Shipping Companies: According to a Statement laid on the Table of the Lok Sabha by the Deputy Minister of Finance, Shri B. R. Bhagat, estimated freight payments to foreign shipping interests on account of our imports and exports (on private and Government accounts) during the years 1954, 1955 and 1956 were Rs. 55 crores Rs. 67 crores and Rs. 74 crores respectively. The total freight payments on food imports were as follows:

Year	(Crores of Rs.)
1954-55	6.17 (including Rs. 3.58 for sugar)
1955-56	3.02 (" Rs. 0.42 " ")
1956-57	18.31

The Deputy Minister added that steps had been and were being taken to expand industrial tonnage to the maximum extent possible under the first and second Five-Year Plans.

*

Expenditure on Exploration of Mineral Oil: Shri K. D. Malaviya revealed in the Lok Sabha recently, that the expenditure incurred by the Oil and Natural Gas Commission yearwise was: 1955-56—Rs. 3 lakhs; 1956-57—Rs. 79 lakhs; and 1957-58—Rs. 87 lakhs (From 1-4-57 to 31-10-57). The Government of India had also contributed the following amounts towards the cost of Indo-Stanvac Petroleum Project for exploration in West Bengal, in which Government had a 25 per cent interest: 1954-55—8 lakhs; 1955-56—30 lakhs; 1956-57—30 lakhs; and 1957-58—41 lakhs.

*

Electricity Output: During June, 1957, 799 public utility supply undertakings generated 896.1 million kilowatt hours (kwh) of which 726.1 million kwh. were sold to ultimate consumers. The output in May, 1957, was 930.2 million kwh. Six generating undertakings were the new additions during the month. These are at Mangaldai in Assam, Katihar and Saharsa in Bihar and Mahuva, Nakhira and Nakhatrana in Bombay. The figures of output and sale for June, 1956, are 794.9 million kwh. and 658.5 million kwh.

NEWS IN BRIEF

INDIAN

Heavy booking of orders for 75 machine tools reached at about Rs. 30 lakhs is reported by the State owned Hindustan Machine Tools factory at Bangalore for the month of October, 1957. This brings the total orders booked during the current calendar year up to date to 478 machines valued at over Rs. 1.9 crores.

*

The Indian Standards Institution has published an Indian standard specification for copper naphenate IS: 1078—1957.

*

The Government of India has decided to release a fresh quota of onions for exports for the period September 1957—February 1958, the Commerce and Industry Ministry announced in a press note released recently.

*

Problems relating to the production of standard quality goods—industrial as well as agricultural—will be discussed at a seven-day convention in Madras convened by the Indian Standards Institution.

*

A sum of Rs. 1,17,354 has been collected by way of small savings by the University Planning Forums, according to reports received so far.

*

There are at present 5,58,089 villages in India with a population of 29.5 crores, and there are about 5.4 crore houses to accommodate this population.

*

The Government of India have decided, as a further measure to promote exports, that exporters will be allowed full rebate of the import duty paid on raw materials used in articles which are exported.

*

Goods worth over Rs. 10 lakhs were produced by the cottage and small-scale industries, till July this year, in the Bihar Sharif industrial pilot project.

*

The Indian Institute of Science at Bangalore has found out a new technique for the utilisation of power alcohol as fuel for diesel engines by which it was claimed that 80 per cent of diesel oil required could be replaced by power alcohol.

*

The total loans granted by the Industrial Finance Corporation to industrial co-operatives amounted to Rs. 10,72,50,000.

*

The total freight bills on our export and import cargoes for the three years 1954, 1955, 1956 were Rs. 63 crores, Rs. 80 crores, and Rs. 91 crores respectively.

*

It is reported that timber worth Rs. 18,54,069 was exported by the Andaman Forest Department during the year 1955-56.

*

Shri K. D. Malaviya, Union Minister of Mines and Oil, stated in the Lok Sabha that Messrs. Foster Wheeler Corporation of the USA had been selected as consultants for the preparation of the project studies for the proposed refinery. The preparation of the report was likely to cost approximately Rs. 3 lakhs.

FOREIGN

It is reported the Australian trading banks have decided to increase the interest rate on advances for wool shipped overseas from 6 to 8 per cent.

*

An agreement has been concluded between Swedish iron-ore exporters and West German importers for delivery in 1958 of an unchanged total of 6.5 million tons. Prices are also unchanged, but there will be a 30 per cent price reduction, according to reports.

*

A 30 per cent increase in investments in West European coal and steel industries is planned for 1957-58, according to the High Authority's annual investment survey. The total for the two years is put at \$2,670 million of which \$1,482 million was originally scheduled for 1957, although part will be carried forward to next year.

*

The Japanese governing Liberal Democratic Party has announced a draft economic plan designed to increase exports to \$4,730 million by 1962 from \$2,500 million last year.

*

A bank is being set up in Turkey to promote private industrial undertakings. The name of the new institution is the Industrial Bank, which will have branches in all industrial areas.

*

During the first nine months of 1957, Turkish exports to Britain amounted to 17.94 million against imports worth £16.76 million. This is the first time for several years that exports to the UK have exceeded imports.

*

Foreign companies are showing increasing interest in the development of Israel's natural resources, particularly of potash, phosphates and copper. Several companies have expressed readiness to invest capital in these projects.

*

A plan has been submitted to the Dutch Government for a 1,640 metre road bridge over the river Maas between Rotterdam and Dordrecht. This would be the largest bridge in Holland and would cost about £4.2 million. It would be completed by 1962.

*

Newzealand's overseas transaction for the year ended October 31 showed a deficit of £14.2 million compared with a surplus of £4.6 million last year. Total receipts rose by £8.2 million to £330.4 million but payments rose by £27 million to £344.6 million.

*

It is reported negotiations for a trade agreement between Australia and the Federation of Malaya will start early next year. This is the first country with which the Independent Federation will have such an agreement.

*

Egypt is to receive £20 million worth of industrial credits from Czechoslovakia. The terms are similar to those of the Russian £62 million loan with a 12-year repayment period at 2½ per cent interest.

*

A balance of payments deficit of Rs. 140.9 million for the July-September quarter is reported by the Pakistan Ministry of Finance. Receipts totalled Rs. 399.4 million and expenditure Rs. 540.3 million.

KORBA AGAIN

(CONTRIBUTED)

A MILE to the north of Korba town, almost on the bank of the Hasdeo river, the National Coal Development Corporation is sinking a colliery to work the good coal of the Ghordewa Seam. Twin inclines, 150 feet apart, are burrowing down the dip of the seam. The coal here is about six feet thick, the dip is one in five. Both inclines are already one hundred and fifty feet into the coal, and, at that depth, a cross gallery is being driven to link the two. Some day in the future long wall working will begin and a conveyor belt, laid in the eastern incline, will bring this good coal to the surface. Two miles to the south of this colliery, within a quarter of a mile of Korba station, a great pit has been opened up in the ground. Over an area of about six acres, the overburden, twenty feet or so of earth, has been removed to lay bare the mass of poor coal and shale which go to make up the Thick Seam, or Jatraj Seam as it is more precisely called. Indeed it will save confusion if, in these notes, the term Jatraj Seam is always used. Then the two main seams, Ghordewa and Jatraj, will each be identified with the name of the village where they were first discovered and where, for the first time, boreholes were sunk through their thickness. At the bottom of this open quarry at Korba, a large power excavator is busy digging out the coal with its two ton capacity bucket. As it digs it makes a space for its own future work. It is standing on the coal itself, for, as yet, only the upper portion of the seam has been dug out. And the whole seam is eighty foot thick. Tipping trucks cart the coal from the excavator's bucket to the station yard at Korba. North of the present pit a further six or more acres are being prepared for work. This is hand labour; women carrying baskets are taking away the earth to expose the coal that lies beneath.

Thus then the two main assets of the Korba field are in simultaneous exploitation: the Ghordewa Seam, five to seven feet thick, an ash content of 11 to 12 per cent, good coal, useable at once by many customers, the Jatraj Seam, existing in enormous quantities, 80 to 150 feet thick, an ash content, for the whole seam of about 35 per cent, useable, in its present state, in only a few industries. There are, indeed, several other seams in the field but these are the two of main importance.

It is curious to note how the pendulum of interest has swung from one seam to the other during the passage of time. When the pioneers first went to Ghordewa they were moved by a very simple creed. They knew that, in those years, there came every day seventy to eighty wagons of coal from the east. They brought the good coal from Jherria and Raniganj to feed the locomotives of the Bengal-Nagpur Railway, and of the G.I.P. Railway beyond Nagpur. They brought coal for the mills and factories of Nagpur, Bombay and the industrial west. From the coalfields of Bengal and Bihar to Bilaspur was a journey of 400 miles. If, so the pioneers argued, they could find good coal, as good or even nearly as good, as the coals from Jherria and Raniganj, then four hundred miles of journey would be cut out, locomotive power saved and turn round of wagons hastened. They did find the good coal, first at Ghordewa, then at Surrakacher, then at Dangania and finally, by a large leap into the unknown, at Rajgamar on the other side of the Hasdeo,

eight miles east of Korba. They did not neglect the Thick Seam, they drilled through it at Jatraj—118 feet thick—and at Binjra—156 feet thick. But they regarded the exploitation of this thick seam as something for the future, looking to the establishment one day of a Thermal Power Plant on the banks of the Hasdeo. Their concentration was on the steam raising coal of the Ghordewa Seam and, had it not been for the world slump of 1930, that coal would long ere this have been on the market.

This aspect of the field, the priority of importance of the Ghordewa Seam remained their guiding policy in 1946. In 1948, however, the new industrial policy for India was announced. The Government of Madhya Pradesh took an interest in the field. At once the enormous quantities of the Jatraj Thick Seam attracted their attention. The Board of Industries, set up by the Government of Madhya Pradesh, produced a plan for a power station at Korba to burn the low grade coal of the Jatraj seam. This was to generate current to smelt the bauxite from the neighbouring hills and produce aluminium bars. Electrical machinery was ordered from Switzerland and reached Champa station. There it remained for some six months while the scheme was reconsidered. Then the project was abandoned and the machinery sold away to South India. The Board of Industries also investigated the Ghordewa Seam. Working along the line of strike already established by the pioneers on the western side of the river, the Board established the existence of the same seam of good coal north of Korba. There was talk of the Railway Board taking up a block north and east of Korba.

Then in 1952 there came a reversal of policy. The opening up of the Korba field was to be left the private enterprise. Once more the emphasis turned to the Ghordewa Seam. Once more the geographical factor assumed prominence. Markets in far-away Bombay were interested in the supply of this good coal, four hundred miles nearer than Bengal or Bihar. Plans for the mining of 40,000 tons per month were set in motion.

But this phase was of short duration. Two years had not passed before everything was changed once more. The second Five-Year Plan was taking shape and with it the Bhilai Steel Plant. Korba was to be a major item in the programme of the nationalised production of coal and was specifically linked with Bhilai. Power for Bhilai—and for other users—was to be raised at Korba in a plant built to burn the poor coal of the Jatraj Seam. Coal from the Ghordewa Seam was to go direct to the steel plant. In the heyday of optimistic generalisations there were some very wild guesses as to what the Korba field could contribute to the industry of India. There was the target of four million tons by the end of 1960. Once again the size and apparent ease of working of the Jatraj Seam attracted imagination. Eventually in the summer of 1956, press comment envisaged the opening of one deep mine and three open cast mines, an emphasis on the Jatraj Seam of three to one.

There was also some optimistic miscalculation as to the coking qualities of the Ghordewa Seam. In 1952, the Madhya Pradesh Board of Industries working upon

relatively small samples brought from Rajgamar, thought that 40 per cent Ghordeewa Seam coal, mixed with 60 per cent coking coal from Jherria would give a good metallurgical coke. It was even suggested that the mixture might be 50—50 per cent. Today, more critical tests show that only 20 per cent of Ghordeewa coal can be used in the make up of coke for the Bhilai blast furnaces.

All that makes it essential to revert to the old consideration of the railway wagons. Today, the traffic of coal into Bilaspur from points east, nearly all of it from Jherria and Raniganj collieries four hundred miles away, has risen to about 250 wagons a day. But the requirements of Bhilai alone will be in the nature of 200 wagons a day. And, quite obviously, the increase in rail traffic between Bilaspur and Bhilai is going to bring with it increased consumption of coal in railway engines. If, therefore, Ghordeewa coal is only going to contribute 20 per cent towards Bhilai's need for metallurgical coke, that will mean that about 150 extra wagons each day will have to come to Bhilai all the way from Bengal or Bihar. Surely the only way to get this problem straightened out is to mine Ghordeewa coal as quickly as possible for steam raising purposes so that it can replace Bengal and Bihar coal in all the other outlets—apart from Bhilai—at Bilaspur and west thereof. For, though the doubling of the line will greatly increase the capacity for the running of trains, the problems of wagon space, locomotive power and wagon turn round remain as serious as they were thirty years ago. And the completion date for the doubling of the line may yet be far away.

For the treatment of the Jatraj coal, washing is proposed. It is hoped to produce a washed product with an ash content reduced to 20 per cent. The recent agreement with Russia provides for a washery to be erected at Korba with a capacity of two million tons a year. If the machinery, as reported, is to come in 1959 it seems unlikely that the plant will be in operation before 1961. Till then, if the Jatraj coal is to be sold on the market it can only be sold to brick burners, lime burners and such like customers. Moreover it is not an attractive load for overburdened railways. After all, in every train of fifty wagons the equivalent of seventeen wagons will be carrying useless ash. Though the fuel may be cheap the wagon problem remains.

By the end of next year the Korba Power Station will commence to burn the Jatraj coal in the specially constructed furnaces. That is, provided that the present programme of building is maintained and the high power transmission lines across one hundred and twenty miles of country to Bhilai are erected by that time. For the rest, until the washery is completed, the Jatraj coal, if sold at all will have to be sold on the basis of 30 per cent ash, at best.

The emphasis shifts back to the Ghordeewa Seam. It is rumoured that the railway bridge planned to carry the line westwards over the Hasdeo at Korba to open up the field at Dangania and Ghordeewa may have to be postponed owing to shortage of steel. Perhaps, of all the bridges in the Plan, this one would most quickly pay returns on its building. But perhaps it is not essential. The development planned by private enterprise in 1953 provided for an aerial ropeway, to carry up to 100 tons per hour, to cross the Hasdeo and link the colliery at Dangania with railhead at Korba. That would have cost seven lakhs of rupees. What its cost would be today is another question. But the need is great and some such improvisation may be necessary.

There is another aspect of the whole matter. When the planners of the second Five-Year Plan first looked at Korba it may have seemed as if it would be a

Nationalised Project catering for Nationalised Industries. In other words that the coal raised at Korba would be used almost entirely by the state-owned Steel Plant at Bhilai, by the Indian State Railways, by the Madhya Pradesh Electricity Board and perhaps in the far future by a state owned aluminium plant. But now it looks as if the field must sell its coal on the open market and particularly to those private consumers west of Bilaspur who now buy from Bengal or Bihar, if only to prevent an intolerable strain falling on the main South-Eastern Railway line.

It is said that India is to have a mixed economy. It is often added in conversation that Great Britain has a mixed economy. But in Great Britain there is not much mixing within each great industry. Railways, coal mining, electrical power, these are all nationalised. Steel, chemicals, textiles, the automobile industry, the aircraft industry, the huge range of machinery building these are in the hands of private enterprise. In Germany, France, and also in Italy there are, indeed, instances for both state-owned and privately owned works and factories engaged side by side in the same industry. But in these countries care is usually taken to see that state-owned works are left, so far as is possible, free from direct control by the state. The great Howaldt Werft at Hamburg, which has built so many ships for India is entirely owned by the German state. But it is conducted as if it were a private enterprise. Herr Theodor Schecker, the managing director, is himself an employee of the firm he so capably controls. He most certainly is not a German civil servant. What applies to European countries does not necessarily apply to India, but there is no harm in looking overseas to see how things are managed there. If the Corporation is to work as a component part of a great coal industry of India, entering the open market and competing on fair terms with private enterprise, then, it would seem, it should be given flexible organisation and a great measure of self control, subject always to the necessary safeguards for its own shareholders — the people of India.

As for the Korba field, it is important to keep always in mind that its special geographical position gives it an importance in the industrial pattern of India on its own merits, quite apart from its links with any other projects in the second Five-Year Plan. It is forty years now since W. J. Considine sat on Bilaspur station and counted the railway wagons as they rolled in from the east carrying coal to Bilaspur and points west thereof. The conclusions that he reached are as valid and important today as they were then, for they are based upon geography.

Economic Report from the U.S.

DEFENCE SPENDING

(By GUY SIMS FITCH)

WASHINGTON, Nov. 26.—It appears clear now that the Eisenhower Administration, backed by an awakened public and a determined Congress, will be stepping up its defence spending next year. But it appears equally clear that the step-up will be moderate, and that it will largely take the form of accelerating some programmes and re-evaluating others. Final budget decisions for the coming year will not be announced for some weeks. But defence department officials have indicated that the increase in defence outlays will come to \$2,000 million at most. In that case, total defence spending next year would not exceed \$40,000 million, an increase of less than 5 per cent over the current rate. Research and development programmes, in particular, would receive increased emphasis. But this would be balanced somewhat by trimming less urgent defence outlays and keeping a tight hold on Federal spending for civilian functions. Thus, next year's budget outlays may not be much larger — if at all larger — than this year's spending rate of about \$72,000 million.

On this basis the increase in defence spending would have only a limited impact on the nation's economic activity. And it becomes evident that the Administration is not looking toward higher Federal outlays as a means of bolstering an economy that has showed signs of levelling off in recent months. Nor does it mean that a balanced budget necessarily takes precedence over national security — quite the contrary, in fact, as President Eisenhower has stated. It is generally recognized, however, that money is not the only or even the primary solution to the problem of scientific progress, whether in the defence or non-defence fields. After all, the defence department, already is spending more than \$5,000 million a year on programmes related to research and development, and more than \$2,500 million on missile procurement—areas in which substantial progress has been made. And while spending large sums for advanced weapons, the department is continuing to pump money into the more conventional arsenal that stands ready to help defence free nations today. There is no doubt, however, that new defence funds could be put to good use. They could help push proven new weapons into production more quickly, for instance, and could further stimulate the kind of basic research that may enhance man's knowledge and lead to important practical applications. But it is in other factors, which would prevail regardless of defence developments, that economists see the major sources of U.S. economic strength. Anticipated, for example, are further rises in state and local government spending for public services, and in new construction contract awards. Even housing, which has been lagging this year, is expected to show improvement next year.

And if any economic stimulants are needed. They probably will originate in the Government's flexible monetary policies. In view of the new stress on defence spending, a tax cut is not considered likely. But a taste of the kind of action that could be taken is seen in the Federal Reserve Board's recent reduction of its discount rate — the interest charge on loans made to commercial banks that are members of the Federal Reserve System. Of course, the Administration will be using these so-called anti-recessionary weapons with great care. There is no desire to see a resurgence of the inflationary pressures that have

only recently abated; last month, for the first time in more than a year, the consumer price index — the commonly accepted measurement of living costs — showed no rise over the previous month. But these monetary policies, rather than a modest boost defence spending, are the principal tools of economic stabilization. And it is their availability, coupled with the basic soundness of the U.S. economy, that strengthens the belief that the current showdown in business activity will be moderate and buried.

The Story of Oil—3

Buried power

'Rock Oil' is the literal translation of the Latin words 'petra' and 'oleum' which make up the name petroleum. Trapped underground in the cells and fissures of porous rock, petroleum is a raw mineral consisting of liquid crude oil and natural gas. These are usually found together, and between them they are a major source of power for the world today and the basis of thousands of commodities useful to mankind.

Petroleum is a mixture of substances called hydrocarbons. These are chemical compounds made up of the elements carbon and hydrogen (the former heavy, the latter light in weight). Hydrocarbons vary widely in nature and behaviour according to the different proportions of these

The drawing at the top shows the inside shape of an anticline. Compression has buckled up the earth's crust, squeezed it into these folds. The other illustration is of a fault, a dislocation in rocks. Two sections of the earth have been forced in different directions until they cracked, slipped out of position, and upset the alignment of all the rock strata involved. The black section indicates oil-bearing rock.

two elements they contain. Most are liquids at ordinary temperatures, but some are gases and other solids like bitumen.

Despite popular belief, this petroleum does not collect in large underground pools. If it did, exploration and discovery would be comparatively easy. Instead it lies, usually with a quantity of salt water, in layers of solid looking porous rocks closed in by walls or caps of non-porous rocks which prevent it escaping. There are three main types of oil trap—the 'anticline', an arch-shaped upward fold in the earth's rock layers; the 'fault', or fracture in the earth's crust whereby a non-porous layer has slipped to cut off a porous layer; and the 'stratigraphic' trap, where because of changes in the type of rock a porous layer becomes sealed off by non-porous rocks.

Thus, when geologists begin their search for oil, they start with the knowledge that certain types of rock formation are more likely to yield oil than others.

SUTLEJ COTTON MILLS LIMITED NOTICE

NOTICE is hereby given that the 23rd Annual General Meeting of the SUTLEJ COTTON MILLS LTD. will be held at the Registered Office of the Company at 39 The Mall, Amritsar on 10th day of December 1957 at 3.30 P.M. to transact the following business:

1. To receive and adopt Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31st March, 1957.

2. To declare Dividend.

3. To consider and if thought fit to pass the following resolution as Ordinary Resolution of which a Special Notice as required by Section 281 of the Companies Act, 1956 has been received by the Company.

"RESOLVED that pursuant to provisions of Sections 280 and 281 and other applicable provisions if any of the Companies Act, 1956, in case of Shri R. D. Birla, an Ex-Officio Director of the Company and nominated by Messrs. Birla Brothers Private Ltd., Managing Agents of the Company, who has attained the age of 65 years, it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the said Act shall not apply to him."

4. To appoint a Director in place of Sir Rahimtoola Meharally Chinoy who has attained the age of 75 years and who retires by rotation but being eligible offers himself for re-election and to consider and if thought fit to pass the following resolution as Ordinary Resolution of which Special Notice as required by Section 281 of the Companies Act, 1956 has been received by the Company.

"RESOLVED that pursuant to provisions of Sections 280 and 281 and other applicable provisions if any of the Companies Act, 1956 Sir Rahimtoola Meharally Chinoy who has attained the age of 75 years and retires from office by rotation be and is hereby appointed a Director of the Company and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the said Act shall not apply to him."

5. To elect a Director in place of Shri Ramanlal Gokaldas Saraiya who retires by rotation but being eligible offers himself for re-election.

6. To appoint Auditors for the current year in the place of the present Auditors Messrs. K. N. Gutgutia and Co. who retire but offer themselves for re-appointment and to fix the remuneration of the Auditors and in this connection also to consider and if thought fit to pass the following resolutions in respect of each of which a Special Notice as required under the provisions of Section 225 the Companies Act, 1956 has been received by the Company from a shareholder.

(i) "RESOLVED that Messrs. K. N. Gutgutia and Co., Chartered Accountants and retiring Auditors of the Company be not reappointed Auditors of the Company for the next term."

(ii) RESOLVED that Messrs. S. R. Batliboi and Co., Chartered Accountants of 1B, Old Post Office Street, Calcutta-1, be appointed as Auditors of the Company for the current year on the same remuneration in place of Messrs. K. N. Gutgutia and Co., Chartered Accountants, the present Auditors of the Company who are to retire at the next Annual General Meeting."

7. To transact any other business which may be

brought before the meeting with the permission of the Chair.

By Order of the Board,
For SUTLEJ COTTON MILLS LTD.,
Birla Brothers Private Ltd.,
Managing Agents.

AMRITSAR.

Dated 8th Nov., 1957.

Notes: 1. A Member entitled to attend and vote is entitled to appoint a proxy and the proxy need not be a member.

2. An explanatory statement as required by Section 173 of the Companies Act, 1956 concerning the above resolutions is annexed.

3. Shareholders are requested to notify any change of address failing which the Dividend Warrants will be posted to their addresses as registered with the Company.

4. Dividends as recommended by the Directors if sanctioned at the Annual General Meeting will be paid to the shareholders whose names are in the Register of the Company as on 10th December, 1957 through the United Commercial Bank Ltd. on and after 10th December, 1957.

5. The Share Transfer Books of the Company will remain closed from 25th November to 10th December, 1957 both days inclusive.

ANNEXURE TO THE NOTICE DATED 8TH NOV., 1957 CONVENING ANNUAL GENERAL MEETING ON 10TH DEC., 1957.

Explanatory Statement as required by Section 173 of the Companies Act, 1956.

To,

THE SHAREHOLDERS
OF THE SUTLEJ COTTON MILLS LTD.

Dear Sir/Madam,

In conformity with the Companies Act, 1956 the following explanatory statement as required by Section 173 of the aforesaid Act sets out all material facts relating to the special business mentioned in the notice dated 8th Nov., 1957.

1. ITEM NO. 3. Shri R. D. Birla who is an Ex-Officio Director of the Company nominated by the Managing Agents M/s. Birla Brothers Private Ltd., and who is not liable to retirement by rotation, has attained the age of 65 years and under the provisions of Section 281 of the Companies Act, 1956, an Ordinary Resolution with a Special Notice specifically waiving the age limit is necessary in respect of his continuing as a Director of the Company and a Special Notice in respect thereof has been received by the Company.

Shri R. D. Birla is an industrialist, business man and financier of wide and varied experience and it is in the interest of the Company to have the advantage of his services and guidance by his continuation on the Board of Directors of the Company by specifically waiving the age limit in his case. Shri R. D. Birla is a Managing Director of M/s. Birla Brothers Private Ltd., Managing Agents of the Company.

2. ITEM NO. 4. Sir Rahimtoola Meharally Chinoy has attained the age of 75 years and retires by rotation but is otherwise eligible for reappointment. A Special Notice has been received by the Company from a shareholder of this resolution as required by Section

281 of the Companies Act, 1956.

Sir Rahimtoola Meharally Chinoy is a business man of very wide experience and the Company has had the advantage of his valuable services and advice during the period of his association with the Company as a Director. As it is in the interest of the Company that it should continue to receive the benefit of his experience it is desirable that he be reappointed as a Director of the Company and the age limit be specifically waived in his case.

3. ITEM NO. 6. The present Auditors of the Company retire at the conclusion of the Annual General Meeting but have offered themselves for re-appointment. In this connection a Special Notice of resolution under Section 225 of the Companies Act, 1956 has been received from a shareholder stating that the present Auditors shall not be reappointed for another term. Another shareholder has given a Special Notice of a resolution under Section 225 of the Companies Act, 1956 to appoint Messrs. S. R. Batliboi and Co., Chartered Accountants, Calcutta, in place of the present Auditors. No representation has been received from the present Auditors pursuant to Section 225 of the Companies Act, 1956.

By Order of the Board,
For **SUTLEJ COTTON MILLS LTD.,**
Birla Brothers Private Ltd.,
Managing Agents.

AMRITSAR,

Dated 8th Nov., 1957.

TWENTY-THIRD ANNUAL REPORT, 1957 DIRECTORS' REPORT

To,

THE SHAREHOLDERS,

Your Directors beg to place before you the Audited Accounts for the year ended 31st March, 1957.

After debiting all expenses including interest and commission, providing for depreciation and Indian and Pakistan taxes, the combined Revenue and Profit and Loss Account is Rs. 16,79,076 which together with the old balance of Rs. 30,60,554 carried forward from the previous accounts makes a total of Rs. 47,39,630 which includes the credit balances of the Company's branches in the former Indian States not transferred to the Head Office:

Your Directors recommend that the above amount be dealt with as follows:

To transfer of General Reserve ..	Rs. 9,00,000
To pay dividend on 1,50,000 ordinary shares @ Rs. 6 per Share free of tax ..	Rs. 9,00,000
And to carry forward ..	Rs. 29,39,630
TOTAL ..	Rs. 47,39,630

The Profit and Loss Account for the year under review discloses a fall in the profits of the Company as compared to the previous year. This is due to the increasing competition in the Cotton Textile Industry in Pakistan and due to consumable materials and stores, which were already in short supply as a result of the stringent import policy of the Government, becoming more scarce and costlier on account of the Suez crisis.

In order to capture the market for finer qualities in which the competition is not yet so keen, efforts were being made to obtain licences for the import of Chamber sets and Printing Machinery necessary for the production of these finer varieties but your Directors regret to report that in spite of their best efforts, it has not yet been possible to secure the licences. The search for additional markets which became necessary

to face the growing competition, is however being intensified and the Company has already established a new Sales Depot in East Pakistan, namely in Dacca in addition to the one we already had in Chittagong.

SHRI RAMANLAL GOKALDAS SARAIYA retires as a Director by rotation, but being eligible offers himself for re-election.

SHRI R. D. BIRLA, who is an Ex-Officio Director of the Company, has attained the age of 65 years and it is necessary to pass a resolution under Section 281 of the Companies Act, 1956 specifically declaring that the age limit prescribed for the Director under Section 280 of the Companies Act 1956 shall not apply to him for which the requisite special notice has been received by the Company as required by Section 281 of the Companies Act, 1956.

SIR RAHIMTOOLA MEHARALLY CHINYOY retires as a Director by rotation and being eligible offers himself for re-election. As he has attained the age of 75 years it is necessary to pass a resolution under Section 281 of the Companies Act, 1956 for his appointment specifically declaring that the age limit prescribed for the Directors under Section 280 of the Companies Act, 1956 shall not apply to him for which the requisite special notice has been received by the Company as required by Section 281 of the Companies Act, 1956.

The Auditors, Messrs. K. N. GUTGUTIA & CO., Chartered Accountants, also retire and are eligible for re-appointment. A Shareholder has, however, given notice of a resolution for the appointment of Messrs. S. R. Batliboi and Co., as Auditors. Another Shareholder has given notice of a resolution expressly providing that Messrs. K. N. Gutgutia and Co., should not be re-appointed as Auditors.

You are requested to appoint Auditors and fix their remuneration.

R. D. BIRLA,
Chairman.

The secret of Popular Poplin — Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co., Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

OUR CURRENT search for all possible exploitable sources of augmenting our foreign exchange earnings is beginning to yield results in the form of concrete and practicable suggestions. The Scrap Traders and Exporters' Association, Bombay, has made a fervent plea for a complete rehaul of the Government's existing policy for export of iron and steel scrap with the specific object of promoting exports. It is apparent from the case it has made out that available sources in the shape of cast iron borings, turnings and mild steel scrap, which producers are unable to dispose of for sheer lack of demand, can be put to effective use in export without prejudice to the demand for home consumption. Reasonable incentives covering different aspects of the scrap trade will need to be offered, as they are offered in other countries, to direct sizeable quantities of scrap into the export channel.

The existing position is governed by the Scrap Control Order under the administration of the Iron and Steel Controller. In terms of the Control Order, railways, ordnance factories, and major engineering firms have been declared to be "controlled sources," subject to the obligation of placing their scrap arisings at the disposal of the Iron and Steel Controller. The system of control involves grouping of scrap into three groups and a complicated classification of scrap into 70 categories. Their central flaw is that they not only overlap but are too intricate for the producers to follow. In consequence large quantities are lost to the trade. The controlled prices of heavy melting scrap have been pitched at a low level of Rs. 100 per ton. There are salutary aspects of the control policy like compulsory allocation of specified types of scrap by the exporter to the local furnaces in the proportion of 10 per cent of exports. But the price fixed for allocated scrap is said to be below the exporter's procurement cost. On the whole, the Control Order evolved against the background of conditions obtaining during the last war is causing hardship to the trade and loss of exports. It needs to be rationalised and made to suit present and prospective requirements of the country.

It would appear that genuine ground exists for making a reassessment of the country's resources in scrap. The Scrap Traders and Exporters' Association has gone into comprehensive estimates in this respect. Only the crucial figures may be touched here for a general assessment. The Association has pointed out major discrepancies in the estimates of available scrap from major sources made by the Scrap Investigation Committee. The Committee has taken the figure of consumption of finished steel in 1956 at 1,800,000 tons and in deducing the quantity of scrap it has assumed the ratio of capital scrap to process scrap at the level of 1:1 as in the UK. Process scrap arisings have been taken at the ratio of 10 per cent of finished steel consumption. The figure of process scrap works to 180,000 and together with capital and re-roller scrap, it totals up to 400,000 tons. The discrepancies pointed out by the Association are that consumption of finished steel in 1956 was 3,100,000 tons and the UK ratio between capital and process scrap was 2:1. On this basis, the arisings would amount to 510,000 tons of process scrap and 620,000 tons of capital scrap alone adding up to 930,000 tons. It is not necessary to accept the Association's assumptions of 15 per cent as the ratio of arisings of process scrap and 2.4:1 as the ratio between capital and process scrap for India since they are open to question.

The incentives for export intensification which the Association has urged briefly are: Export policy should be liberalised to allow shipments of heavy melting

scrap along with bundled scrap, control of scrap prices should be dismantled as the controlled prices are unreasonably low by international standards, including standards accepted even by steel non-producing countries, and railway freight should be lowered. These demands are on the whole unexceptionable. The demand for withdrawal of compulsory allocations of scrap to local furnaces carries little force, particularly when the change in the price policy is realised. Allocation ought to be retained in the interest of the small producer. The earnings of foreign currency, on the assumption of acceptance of this policy, are placed at Rs. 10 crores per annum immediately with progressive increase above Rs. 15 crores a year during the second Plan period.

MERGER OF RAILWAY FEDERATIONS

IT IS a matter of satisfaction that the differences between the National Federation of Indian Railwaymen and the All-India Railwaymen's Federation have been ironed out and the two have decided to unite. The rivalry between the two unions has long been a source of uneasy labour relations on the railways. The recent strike threat by the A.I.R.F. was mainly attributed to this rivalry and the reluctance on the part of the Government not to recognise this body as representative of labour. It is not for the first time that the two unions have accepted the unity formula. As long ago as 1953, the rival labour unions merged into the National Federation of Indian Railwaymen, but again split into two a couple of years later, each claiming the exclusive right to represent the new Federation. With the efforts of Mr. Giri and Mr. Jaya Prakash Narain some sort of rapprochement was arrived at in March in 1956. According to the formula then accepted a certain procedure was laid down for determining the strength and status of each organisation and for establishing a joint machinery for achieving unity in the common interest. Provision was also made for settlement of disputed issues through arbitration by a retired High Court or a Sessions Judge. This agreement, however, remained on paper on account of the insistence of the A.I.R.F. to claim parity with the N.F.I.R. It needs to be pointed out that personal factors and purely sectional considerations were also responsible in undermining the unity between the two Federations.

The March 1956 agreement had provided that the last date for elections for office-bearers should be July 31, 1958, and for setting up of a joint committee of the two groups which would be in charge of the implementation of the terms of the agreement. Any dispute arising in respect of the implementation, it was provided, should be discussed by the Committee in the presence of observers and then recourse would be had to arbitration. Under the unity decision now arrived at although the offer to provide for the two Federations a common channel of reference and negotiation for all important disputes has been accepted by the A.I.R.F., it is laid down that the working of the joint committee and the unity formula would be reviewed after three months. This, however, may not cause any anxiety if there is willingness to maintain unity. It should not be overlooked that this is by no means a small "if". The immediate need is to complete the election of office bearers by July next as laid down in the agreement for it would help the members of the two unions to exercise their right of democratic practice as to who should represent them. So far as the decision regarding the recognition of one trade union for one industry is concerned, it is, of course, a wise one for the healthier growth of the trade union movement. The earlier this principle is extended to other industries the more conducive it will be to smoother industrial relations.

PROSPECTS OF COFFEE EXPORT

FROM WHAT the Chairman of the Coffee Board, Mr. K. Srinivasan, said at the Board meeting recently, it is obvious there are some encouraging trends about coffee production. For example, the two qualities of the crop, Arabica and Robusta, had registered increases to a total, up to the end of October 1957, of 41,498 tons, the largest so far. The final payments are expected to be not less than the previous year's level and it is not unlikely that they may be even slightly higher. However, the crop currently being picked is estimated to be some 5,000 tons lower. This has been attributed to various reasons. Among the more important are those that always affect agricultural production in India, namely, the unkindly behaviour of rainfall and the spread of pests and diseases.

In the matter of off-take also, whether in the internal market or abroad, the figures have shown an advance. But whereas internal prices ruled fairly high, the same was not true in regard to the prices realised on exported quantities. Apparently, therefore, there is a definite demand for more coffee in the home market. In the larger interest of the country, however, a healthier development would have been if more and more Indian coffee were exported to earn for the country foreign exchange which is its greatest requirement at the present time. It is heartening that exportable surpluses are becoming sizable. Over some time in the past, it has been seen that among a number of importing countries West Germany is India's largest customer. It is true that in the case of certain countries like the United States, Sweden, Finland, and Australia, regulations and impediments at the other end put a check on exports from here. But in some others, it appears that a little more imagination and understanding may help in developing those markets into larger ones. The visit of a trade delegation including a few members of the Board to Europe and the U.K. could bear fruitful results.

In any case, it needs constantly to be remembered that any foreign market can be held and developed only if export quantities are examined thoroughly and no goods below standard find their way into them. At the same time, there is every reason to hope that when open bidding is introduced it would attract more enterprising customers. The urgent need of today is to find effective ways and means in order that at least 20,000 tons of coffee may be sold abroad in the first six months of each year. Therefore, the accent must be more on propaganda and publicity in foreign markets. This, however, has to be backed up by research at home both in regard to production and storage, and usage. Again, there needs to be a general atmosphere conducive to higher production. In this respect, recent happenings in Kerala estates have not been altogether happy.

FINANCIAL ASSISTANCE FOR SMALL INDUSTRIES

AT THE fourth conference of State Financial Corporations held in Bombay towards the end of last month, many points were made which should, if implemented, help in a smoother working of the Corporations and a greater assistance to small industries. By and large, the Corporations have been set up with the main purpose of making available finance to small industrial entrepreneurs. It is agreed on all sides that on the improved production of small industries depends to a considerable extent the successful implementation of the Plan. Even while the Plan was still in its initial stages, much store was being laid by on small industries. To the apprehension expressed in some quarters that the Plan was

weighted heavily on the heavy industry side, the planners' answer was that production in small and village industries would be organised such that large quantities of goods would be manufactured both for consumption and for further use by large scale industries. For, what is the final product of a small industry is, in many cases, the raw material or a necessary component in the manufacturing process of a large industry.

It is now sufficiently known that performance in this sector has fallen far short of expectations and requirements. Obviously, the failure should be the consequence of the combination of various factors. Perhaps the most important of these factors is the paucity of finance with the small entrepreneur. The arrival of the State Financial Corporations may be said to have eased the position. But in the overall picture of the country's needs much more will have to be done. The effort has necessarily to be co-operative with full co-ordination between the various agencies like the State Bank, the Financial Corporations and commercial and co-operative banks. It needs no emphasis that the State Bank of India has to play a dominant role in this field which was one of the major considerations underlying the idea of setting up the Bank. Again, more and more accent must be placed on the supply of finance by institutions, rather than by Government departments, for a more proper utilisation of the loans disbursed. This has been the experience of other countries like Japan where small industries play a substantial part in the making of a prosperous economy.

RUPEE TRAVELLERS' CHEQUES

IN ORDER to promote tourism in the country the State Bank of India has introduced the rupee travellers' cheques to provide easy currency facilities to tourists. In view of the tight foreign exchange position, the scheme is to be commended for it is bound to help the tourist trade and thereby bring us more foreign exchange earnings. Since the development of tourism depends a lot on the facilities afforded to the foreign travellers, the facilities that a traveller would always like to have is a mode of carrying travel funds in a safe, spendable and refundable form. The advantage of this rupee travellers' cheques scheme is that it combines all these requirements.

The inspiration for the scheme was derived from the report issued by the Statistical Section of the Ministry of Transport following the pilot survey conducted by them in 1955 on the pattern of tourism in India. The position revealed in the said report was that foreign tourists not infrequently prefer to convert a portion of their travel funds into rupees and would be inclined to spend more if they felt that they would get the rupee funds changed back into their own currency when they depart. This is quite natural as no tourist would ever like to be left with a large fund of currency which he might be required to reconvert at a discount. It is to be borne in mind that the commission paid on conversion and reconversion is not inconsequential. There is no doubt that the rupee travellers' cheques would sell and gain in popularity as the rupee is quite stable.

The State Bank proposes to utilise its 600 offices and network of its correspondents in almost every town of importance in the world to popularise its rupee travellers' cheques. It is not only the foreign tourist that the State Bank seeks to serve, but the traveller within the country too and thus foster internal tourism. In order that the rupee travellers' cheques should become quite popular, it is essential that they be given effective publicity.

COMMODITY NEWS AND NOTES

LAC EXPORTS

Exports of lac from India in 1956-57 fetched foreign exchange worth nearly Rs. 9.5 crores. The value of lac exports was Rs. 6.7 crores in 1953-54. The principal markets for Indian lac are the United States, the United Kingdom, the Soviet Union, West Germany, Italy, Argentina, France, Australia and Japan. An Export Promotion Council has been set up with Government assistance to maintain and promote lac exports. Indian lac has been displayed in a number of international exhibitions and it has been included as one of the items for exports from India in trade agreements with a number of countries. Measures have also been adopted to remove unhealthy speculation in this commodity since this is an important factor in the export of lac. On the recommendation of the Forward Markets Commission futures trading in lac was banned in December 1954. The ban is still in force. The National Council of Applied Economic Research has been asked by Government to undertake a study of export markets for lac and lac products. An interim report was recently submitted by the Council and the final report is expected shortly. Gramophone records, electrical goods, varnishes, sealing wax, floor polishes, toys, abrasive paper, and lacquerware are some of the articles in the production of which lac is used. Measures adopted for increasing the production of lac include the setting up of regional farms, intensified campaign to popularise cultivation of lac and imparting of training in lac cultivation. The States of Bihar, Madras, Uttar Pradesh, West Bengal, Orissa, Punjab and Madhya Pradesh, where lac is grown, have been given financial assistance for increasing output. The production of stick lac, which is the raw material for producing shellac and seed lac, is expected to go up to 15.5 maunds per year by the end of the second Five-Year Plan from the present level of 11 lakh maunds. India, till recently, used to produce nearly 90 per cent of the world production of lac. But now there is competition from certain other lac growing countries particularly Thailand, and from synthetic resins.

PRODUCTION OF COPPER ORE IN INDIA

The production of copper ore in India during the quarter ending September 1957, was 98,352 tons, according to the Indian Bureau of Mines. The production of copper ore during January-September 1957 was 299,723 tons which showed an increase of 16,131 tons compared to the corresponding period of the previous year. The entire output of copper ore is from the Singhbhum district of Bihar State.

SUGAR PRODUCTION

The production of indigenous sugar amounted to 0.56 lakh tons up to November 15, 1957, in the current season, as against 0.43 lakh tons in the corresponding period of the last year. The total off-take, including quantities despatched for exports, was 0.72 lakh tons. The stocks with the factories on November 15, 1957, stood at 4.13 lakh tons.

INCREASED PRODUCTION OF LEAD AND ZINC ORES IN INDIA

The production of lead and zinc ores in India increased to 24,004 tons during the quarter ending September, 1957 from 22,095 tons in the preceding quarter, according to the Indian Bureau of Mines. The production was also higher by 4,318 tons as compared to the corresponding quarter of 1956. The entire production is reported from the Zawar mines of Rajasthan. The lead and zinc concentrates recovered from the ores

during the third quarter of 1957 totalled 1,340 and 1,906 tons respectively as compared to 1,114 and 1,458 tons in the preceding quarter. The lead concentrates are sent to the smelting plant at Tundoo in Bihar. In the absence of a smelting plant in India, zinc concentrates are sent to Japan for smelting.

IRON ORE DEPOSITS IN HIMACHAL PRADESH

Deposits of iron ore had been recovered in the Chachiot Tehsil of Himachal Pradesh by the Geological Survey of India, said Shri K. D. Malaviya, Union Minister for Mines and Oil, in reply to a question by Shri C. L. Varma in the Rajya Sabha. "These deposits, however, occur in remote areas and the quantity of good quality iron ore is not large", stated the Minister and added that the Geological Survey of India had included the systematic mapping of parts of the Mandi district in the field programme for the year 1957-58. Exploitation would depend on the result of the investigations. Production of Iron and Steel as a cottage industry, however, was not economic, concluded the Minister.

EXPORT DUTY ON SOFT COTTON WASTE REDUCED

In accordance with their policy of keeping export duties under constant review, Government have decided to reduce the export duty on soft cotton waste from 30 per cent 'ad valorem' to 15 per cent 'ad valorem' with effect from November 29, 1957.

A Good Report

ACTIVITY is still the soul of wit. Everyone will recognise, therefore, at least one outstanding feature in the report which the Indian Industrial Association has made to the Federation of the Chambers of Commerce and Industry on its tour abroad. It is a blue book, at least in that its cover is, happily, covered by a blue cloth. But it is not a blue book in content or in style. The entire report is contained in 52 pages of large type and displays a remarkable effort at compression. The appendices, another 20 pages of smaller type and in their own way are as informative on the details which they deal. It is, however, the general character of the report which should raise discussion and even controversy.

Some confusion has been caused by an apparent contradiction in the report on the political situation in the United States. In one portion of the report the authors refer to the point that a loan from the United States is unlikely because the Congress of the United States is "economically minded and not politically very favourably

disposed towards India". In another, it is said that there is no political hostility against India. Surely, the explanation is to be found in the point that hostility is a permanent and unchangeable attitude of mind whereas the "unfavourable opinion at the moment is based on misunderstanding on certain aspects of the implementation of our policy. But this can be a passing phase if we work towards the removal of misunderstanding". The inconsistency is, therefore, more apparent than real, the implication being that there is a shadow at the present time but not a permanent or unchangeable condition. It would have been helpful if the authors had more to say on this point.

The Delegation has done well to raise directly issues, which must inevitably be controversial, in a provocative manner. This is no reason, however, to question the facts as stated. The Delegation is convinced that there will be "reasonably large" investments from the United States and some from Germany. As regards suppliers' credit, "there seems to be no difficulty in the

United States, France or Germany", and the present difficulties in Britain are regarded "as of a temporary nature". But both the volume and the timing of these investments is limited by the raising of the rupee capital with which in most cases the foreign investment is to be matched. This implies "about 20 per cent of the cost of foreign equipment in cash and almost the whole of the rupee counterpart of expenditure on the project". The Delegation is impressed—one might almost say oppressed—by the difficulties of obtaining this necessary rupee capital.

It is here that the central problem of economic development in India arises. It is argued that, unless a major change in policy is designed to foster savings in both the personal and corporate sectors and to change banking policy on the lines of Japan and Germany, no breaking of the bottleneck will be possible. The problem of encouraging savings raises at once the issue of taxation. The Delegation has published in detail a note presented by the Department of Commerce, Washington in which it is clear that Indian tax rates are acting as a severe deterrent. The Commerce Department's note states: "While the rate of Wealth Tax ($\frac{1}{2}$ per cent for firms) is not in itself onerous, its very existence does tend to discourage the foreign investor. At the present time, corporate tax and super tax as well as personal income tax in India is quite high. While recently enacted changes in Indian Income-tax Law did effect modest reductions in certain categories of taxes, on balance the tax liability of both foreign and domestic companies in India still remains one of the highest in the world." There are also adverse notes on the deposits scheme, on the screening procedure, and the outlook the Government has on the private and public sectors. The note, obviously, has the approval of the Delegation although this is not precisely stated. But the question, naturally, arises, however, whether changes in taxation even on the lines of the Department of Commerce's note will achieve the requisite rupee capital formation which is, as stated above, the limiting condition of Indian economic development.

Assuming—which is on the face of it unlikely—that alterations in the tax structure of the country could augment personal and corporate savings by something like Rs. 50 crores a year, there would still be left a major problem in regard to rupee capital formation. This is in part due to the fact that profits in the corporate sector have fallen substantially in the last 12 months, and diminished steeply as food prices have risen. In neither case can a modification in domestic policy be decisive. So far as changes in taxation and private savings are concerned, they must be deemed to be marginal in the total context of what is to be accomplished. At one stage the Delegation argues that productive investment of the order of Rs. 4000 crores in the next five years is possible. It is obvious that only a major mobilisation of banking funds can provide the greater portion of the rupee capital to go into so large an undertaking. Assuming the foreign exchange component is Rs. 1600 crores, the rate of current rupee capital formation in industry would need to be about Rs. 500 crores per year. Even if all welfare expenditure were removed—and this is not practical politics—this could not be accomplished except by a drastic change in the depth, as well as volume, of bank advances.

The central point raised by this report, therefore, relates to the use of the banking system to finance medium-term development. The authors have probably taken insufficient note of the spectacular rise in bank deposits in the last four months and the remarkable easing of the position in regard to bank resources, for which part at least of the credit must go to the Reserve Bank of India's pressure on the scheduled banks to reduce advances against food grains and sugar. It is not, however, so much the past which is in question as the future. *The Eastern Economist* holds the view that the banking system has within itself at the present time a capacity for providing rupee finance on a scale which makes bank finance, and not a change in taxation to produce private capital formation, the central element in the solution of the acute dilemma which this report underlines.

This is in no way to approve of the measures of taxation which the Finance Minister introduced in his last Budget. But even if all these obnoxious measures are removed, the addition to private capital formation cannot conceivably exceed Rs. 50 crores per year or Rs. 250 crores in five years—in other words, there is no complete solution to India's capital formation needs to be found from marginal, or even drastic, changes in taxation policy. These changes are required to remove serious deterrents to foreign investment, not to add very significantly to rupee capital. They are, of course, none the less necessary but the purpose of their removal should not be confused. The rupee dilemma can only be met in an adequate degree by a large-scale mobilisation of bank resources, not by marginal, or even substantial, changes in taxation alone.

Happily the time is now opportune to introduce reforms in the banking system which will enable the scheduled banks to get integrated into the operations of industry like the banks in Germany and Japan. If this stimulating report did no more than bring about new thinking on the utilisation of banking resources it would have been well worth while. As it is, the report is full of other fare—for the business men, the economist (and the economic historian) as well as the administrator. Let each throw in, in the language of the old socialist gospel, his talents to the limit of his capacity and take according to his contribution.

It would be unwise to suppose that this stimulating and helpful report changes in any manner the short-period character of the current crisis. The foreign exchange problems which are upon us and even the rupee problem to which the authors draw pointed attention cannot be solved in the very short period. It is no fair criticism of the report to say that it has no solution in the short period of the deepening crisis. It presents a sound economic philosophy; over the last few years we have tended as much in a fit of absence of mind as of emotional ideology to go the wrong way. If this report shows the price we are paying for our errors its work would have been worth while. It is, above all, in the intellectual analysis of our difficulties at the moment that great contributions can be made. It is unfair to expect industrialists to coin new money both here and abroad. Alchemy, or the art of transmitting the basic metals into gold, is buried in the past. But the use of the mind to increase wealth, as a modern form of an ancient art, is not less valuable on this account.

Life Insurance after Nationalisation

THE Lok Sabha debate on the Life Insurance Corporation's interim report has not strengthened the case for nationalisation. When the full report for the period ending with the current calendar year will see the light of the day, the picture is hardly likely to show any variation except in the trend crying a halt to the precipitous decline in new business. The interim report has only served to lend corroboration to the consensus of opinion already voiced on the Corporation's standards of servicing and discharging its overall functions. These standards have disclosed a distinct deterioration. The initial difficulties with which the Corporation was confronted need not be minimised. Integration of 243 heterogeneous units was undoubtedly a task of great magnitude. The haste with which nationalisation was pushed through ignored this magnitude. Its price has been dearly paid in terms of the setback which this industry has received in its vital, dynamic phase.

The teething troubles of the Corporation have stemmed essentially from the problems of reorganisation of the pattern of business administration and integration of staff. Old policies which form the bulk of this business continue to be serviced by means of the stop-gap arrangement necessitating the retention of the identity of the erstwhile independent units. Devolution of this function to the divisional offices is still far off. Settlement of claims, disposal of routine business, grant of loans, payment of agents' remuneration and most other normal functions are performed without due sense of urgency and with little regard to the hardship or vexation that is caused. The spirit of service which was so characteristic of the pre-nationalisation set-up is not much in evidence.

Nationalisation engendered exaggerated hopes of a generous deal in terms of pay and conditions of work which precedents in public sector undertakings have served to foster. Integration of the services of the supervisory, clerical and subordinate staff raised genuine difficulties because of wide variations in scales of remuneration and grades prescribed in different units as well as in the levels of experience and proficiency required. Standardisation of pay scales and grades could not obviously be fixed on the basis of the levels obtaining in the top units as insisted upon by the staff unions. The terms have been finally agreed upon with a wide degree of accommodation. The net effect of the liberal terms is to increase the wage bill for these categories by Rs. 60 lakhs per annum. Insurance is a basic business and the question will need to be answered how far the increased emoluments are related to capacity to pay. On the score of the quality and volume of service rendered, the higher remuneration remains to be justified. Procurement of new business is directly dependent on the incentives offered to the field workers who have been awarded a belated deal only a couple of months ago. Reorganisation has not been conducive so far to efficiency in operation. Will the promised amendment Bill for reorganisation close this protracted chapter?

Investment policy is admittedly the crux of the management of life funds. It is difficult to understand why the Corporation should still be in search of a policy for investment, when its basic structure has already been evolved by law and convention over the years and has stood the

tests of security and profitability. In the Lok Sabha debate investment policy was the target of bitter criticism. In launching a vehement attack against investment in equity shares and debentures, however, bias was permitted to bypass the statistical position. The Corporation's investments on June 30, 1957, at Rs. 361 crores show an excess of Rs. 20 crores above the volume on the eve of taking over. The excess has been distributed in the proportions of a little more than a half for government and approved securities and the residue for equity capital. The percentage shares of the two have been very nearly maintained. The Corporation has performed a timely and valuable function in imparting strength to the capital market in the private sector. It is possible to argue that it could have handled its investment portfolio more cautiously and effectively. But the Finance Minister's impassioned statement must suffice to repel all insinuations about extraneous influence in individual investments. The reality of the situation is that the imbalance in investment lies in the allocation of a low share in the neighbourhood of 25 per cent to debentures, preference and ordinary shares, mortgages and loans.

Nevertheless, the Government has taken a proper policy decision to set up a statutory investment board which would ensure safe placements by virtue of intimate knowledge of movements in the capital market. The bifurcation of functions which it will secure is bound to leave the Corporation free to concentrate its resources on efficient servicing of old policies and energetic procurement of new business. The Finance Minister is reported to have stressed in the course of the debate that the Corporation's funds should be invested in public concerns expanding under State auspices and that that was the culmination to be desired. If this statement attributed to him is correct and made without qualifications, it would certainly constitute a crucial departure from the avowed policy. The firm assurance given on behalf of the Government during the discussion on the nationalisation bill to the effect that the proportion of life funds then available for investment in equity and other private requirements would be maintained unimpaired must be implemented without any reservations.

It is reassuring that no attempt was made to explain away the failure of the Corporation in acquiring new business warranted by conditions prevailing in the insurance market. Mr. Krishnamachari has put the Corporation's performance in the true perspective in his categorical statement that no marshalling of a few extenuating circumstances here and there could wholly cover up its lapses. A serious lapse has occurred in the steep fall in new business of the order of about Rs. 60 crores in 1956. Achievement in the first half of 1957 at Rs. 75 crores presented a dismal prospect. The position, however, has been retrieved since then and the volume of new business has been stepped up to Rs. 196 crores in the latter half of November. Allowing for the higher tempo of procurement since June last and the year-end rush activity, it is apparent that a shortfall of Rs. 35 crores, or perhaps more, will be disclosed below the peak year of 1955 while actually business should be curving up. Judgment on the quality of business ought to be reserved until the expense and lapse ratios are disclosed. Or, should the Corporation's silence on these vital criteria be interpreted as an eloquent testimony?

An Ill Wind

INDONESIA has been in a ferment following the failure of the Afro-Asian resolution in the United Nations calling for a renewal of negotiations between Jakarta and The Hague over the future of West Irian (West New Guinea) now in Dutch hands. The resolution which was supported by 41 nations and opposed by 29 others could not, however, become operative because it failed to get a two-thirds majority. Indonesian disappointment which has since found its vent in popular demonstrations and retaliatory measures against Dutch nationals and industrial and trading concerns in Java and elsewhere in Indonesia appears to have been as much over the supposed disinclination of the United Nations to support Jakarta's claim to West Irian as over the failure of that body to assist negotiations between the parties for a peaceful settlement of the dispute.

The plausible explanation that the Indonesian Government has had to resort to some coercive measures, in the circumstances of national resentment, to forestall the Communists who would otherwise have exploited the situation may not cut much ice in a country like India which is not too far away to size up the unwisdom of jeopardising present Dutch investments and discouraging future flow of capital into under-developed Indonesia for the doubtful advantage of a largely jungle territory that West Irian is. A more convincing explanation is that President Sukarno has deftly exploited the situation to rally his divided country—divided by bitter internal differences—under one platform over a national issue. If this is the right explanation, it cannot be flattering to the Indonesian leaders who have thus sought to divert people's attention away from internal problems. It is not difficult to see the wholly negative approach of a President giving nationalist horse the reins and provoking extreme popular excitement over an external issue which is no more capable of an early or easy solution than the confusing internal situation. This country, true to its peaceful tradition, has therefore done well to counsel moderation and abjuration of violent means in the matter of this dispute.

This dispute, by its very nature, is not such as to call for a violent solution because the Dutch case is no less understandable than that of Indonesia and West Irian is not such a valuable territory (except for some oil that it has) that may be recalled, West Irian was specifically excluded by the Dutch from the terms under which the East Indies were turned over to the Indonesian Government; its future was left open to mutual negotiations. But the talks broke down in 1950 because the Indonesian Government demanded unconditional transfer of the territory to its sovereignty. The dispute then went to the United Nations where, like the Kashmir dispute, it has become a "perennial".

The fact that Indonesia agreed in 1949 to the exclusion of West Irian from her sovereignty for the time being may not be overlooked in this connection. There should have been some special reasons for the then exclusion of a territory which formed part of the Dutch East Indies. Were these reasons connected with the oil fields of Sorong in which the Dutch had invested? Did Australia owning the eastern half of New Guinea have any

objection to the outright transfer, without safeguards, of West Irian to Indonesia? The reasons can only be guessed in the light of the joint statement recently issued by the Netherlands and Australia to the effect that they would retain control of New Guinea until such time as the Papuans "will be in a position to determine their own destiny". If this means that Australia has reasons to fear a possible future Indonesian claim to East New Guinea on the ground that an otherwise homogeneous island was artificially divided into two halves, the Dutch alone cannot be held responsible for the present stalemate. Where thus Australia is also in the picture, her case in regard to this matter may also have to be understood before the dispute can be settled to the satisfaction of all the parties. Where a third country like Australia is also involved in the affair, the case for a negotiated settlement is further reinforced if Indonesia's external relations are not to get embittered.

It may suit the purposes of Communists who are surrounding President Sukarno to bring about a deterioration in the external relations of Indonesia with non-Communist countries and a situation of economic instability and chaos on the internal front by driving out the Dutch who have interests accounting for about 70 per cent of the total estate production and 70 per cent of the inter-island, shipping. That they have nearly succeeded in their purposes may be inferred from the alarm and dismay caused by the strikes in Dutch firms, the seizure of many vessels of the Dutch Inter-island Shipping Company, the expulsion of jobless Dutch citizens and the seizure (nationalisation?) of Dutch estates and factories. These measures which were strongly suggestive of expropriation have been most unfortunate not only because they have produced adverse reactions in the West—Mr. Hugh Gaitskell, British Labour leader, has just described them as "arbitrary, unjustified and lacking in humanity, whatever the merits of the question"—but also because they represent a tremendous blow to the confidence of foreign investors who have all along been expected to contribute to the economic progress of under-developed Asian countries including Indonesia.

The statement made on behalf of the Indonesian Government that the seizure of Dutch interests was not nationalisation can hardly allay the fears of foreign investors. The contemplated management without ownership, by the Indonesian Government, of the Dutch enterprises under a new law on foreign investment may be well within the sovereign rights of that Government but may not restore the shattered confidence of investors. It is to be devoutly hoped that the proposed law would be fair to foreign investors not only in the interests of Indonesia but in those of some of her sympathisers and well-wishers in the region. It would not be in the interests of Indonesia if, by taking over the Dutch estates, she were to lose technical assistance and financial credit and to risk losing some markets for her exports on which her economy depends so heavily. And it would not be in the interests of any non-Communist Asian country if Indonesia were to persist and go too far in her present course for, in that event, foreign capital will have been frightened away from Asia. It is an ill wind that blows nobody any good.

The Story of Oil—

Exploring for oil

It is impossible for anyone to say exactly where petroleum will be found. It accumulates in isolated subterranean traps, and these are what the oil-explorers seek, rather than the oil itself.

It must first be decided where conditions in past geological time have favoured the formation of oil. This is usually land which was once the site of an ancient sea. Having selected a likely area, the next step is to survey the surface, mapping exposed rocks and searching for any oil which has seeped to the surface.

The geologist is all the time patiently searching for signs that could point to the existence of underground rock traps. Traps suitable for an accumulation of oil consist of porous rocks in which the oil (if any is there) is hemmed in on all sides by non-porous rock. Clues to such buried

structures may be found in the banks of rivers and streams, for here the earth's rock layers are often exposed to view, enabling the geologist to calculate their age and measure the directions in which they slope beneath the surface. The rocks may contain the fossilised remains of plants and animals that lived millions of years ago, when crude oil was being formed.

Aerial photographs help the geologist too. They reveal a surprising amount of geological evidence, even in densely wooded country, enabling him to map the differences in rock structure.

When all surface sources of information have been exhausted, the next step in the search for oil is to explore deep beneath the surface of the earth. The science which makes this possible is known as geophysics.

Serving the Five-Year Plans

...ACC CEMENT

BETWEEN 1948 and 1955, the A.C.C. has doubled its production of cement...and its output continues to grow. Widely used for the mighty projects of the first Five-Year Plan, ACC cement is now playing a great part in the second Plan — helping to build today the India of tomorrow!

THE WEEK'S NOTES

CASTE SYSTEM AND UNTOUCHABILITY

EVERY MAN hath some self-respect, and the Harijan is as much a human being as any other. If an upper caste Hindu refuses to drink the water offered by a Harijan, the latter's self-respect demands that he find a man from whom he will not take water. The 'higher caste of Harijans' of Dabhoda village in Ahmedabad District may, therefore, be excused if they do not allow the Bhangis to draw water from their public wells. This small fact of social discrimination practised by one section of Harijans against another section — a fact recorded in the 1956-57 Report of the Commissioner for Scheduled Castes and Scheduled Tribes — may not be startling to those who are well aware of the divisive character of the Hindu caste system with its multitudinous sub-castes and sub-sub-castes. Even this small fact is a significant reminder of the difficulties in the way of dissuading a 'superior' caste or sub-caste from its traditional practice of social discrimination. It is truly amazing that while every 'superior' caste or sub-caste has a vested interest in denying social equality to an 'inferior' caste or sub-caste, it feels hurt when it is looked down upon by a caste or sub-caste still further up. So long as every caste or sub-caste is not willing to do unto others what it would very much like others to do unto itself, the process of eradication of caste consciousness in which it is soaked is going to be very, very slow. No amount of angry declamation against the caste system can conjure it away, and this is realised by the Prime Minister himself. So long as caste distinctions and caste prejudices continue, the observance of untouchability in some form or other, more particularly in the rural areas, is bound to continue. This is actually the position today although untouchability has been abolished under the Constitution and the Untouchability (offences) Act has been in force since 1955. The Commissioner for Scheduled Castes and Scheduled Tribes is, therefore, right in saying "that any number of enactments would not by themselves transform the situation unless there is a change in the mental attitudes of the people".

DIRECT AND INDIRECT TAXATION

THE PLACE of direct and indirect taxation in democratic socialist countries was discussed at a parliamentary seminar here. A British Labour M.P. expressed the view that an elaborate use of indirect taxation could be a "swindle" and that the disincentive effect of direct taxation was very often exaggerated. This is an extreme view not applicable to a country like India which cannot be described as "socialist". So long as India's is a mixed economy in which the private sector is predominant, the disincentive effects of taxation are not irrelevant. The Labour M.P.'s view may be in consonance with his party's plank regarding egalitarian taxation—a plank which has obviously to appear more radical now that its public ownership plank has become moderate. It is not quite certain that his view is wholly applicable even to a country like Britain which has reached a high level of economic development. Dr. B. N. Ganguli, on the other hand, appeared to be on surer ground when he said that tax methods, however refined they might be, could not bring about radical changes in income distribution. If, thus, the redistributive effects of direct taxation are exaggerated and its disincentive effects on saving and investment are all too obvious in actual practice, there is no case for a predominant emphasis on it. As far as India is concerned, even the present proportion (35:65) between direct and indirect taxation in the Central fisc appears to be unreasonable in the context of the country's under-development.

TAX LOAD ON ELECTRIC SUPPLY INDUSTRY

TAXATION HAS always been a sore problem with the Electric Supply Industry. Thus, as Mr. K. G. Milne, Chairman of the Federation of Electricity Undertakings of India, told at the annual meeting of the Federation, last week, in Bombay, "not only has a quirk of law resulted in large numbers of consumers of electric power getting their ever increasing demands at a price free from the usual income-tax addition, but the resulting loss of tax revenue to the State is being transferred on to the shareholders of the supply companies when the law has set out to promise a reward 'free of tax!' Further, while the law has saddled the shareholder with the problem of tax deferred till later years, the consumers are not even called upon to contribute to the development funds adequately. This explains why the share of even the largest and quite rapidly growing electric supply undertakings are standing below par. In view of the increasing importance of electric power, the plea of Mr. Milne to make all attempts "to grapple with the unsolved problems arising from provisions for deferred tax liability and denial of grossing up of dividends in the hands of the shareholders" deserves the utmost consideration.

It is interesting to note, in this connection, that Mr. S. K. Patil, the Union Minister for Irrigation and Power, who inaugurated the annual meeting of the Federation, assured consideration of all the genuine difficulties of the private sector, especially the provision for deferred tax liability. In view of the low 'per capita' generation of electricity in the country, which stands only at 25 kw, as against 6,500 kw in Norway, 4,860 kw in Canada, and 3,520 kw in the U.S.A., and the increasing demand for power as a result of rural electrification, the work of generating power should receive top priority. It is accordingly gratifying to note, from the reassuring reply of the Union Minister, that this industry has been included in the priority list, despite its being in the third category. The past record of private enterprise in this field which has, according to Mr. Patil himself, made remarkable progress during the past ten years, is at once a proof and guarantee of its capacity to meet the increasing energy needs of the country in the years to come. With proper incentives and encouragement from the Government, the target of 6.9 million kw. set for the second Plan period should not be difficult of achievement.

YUGOSLAVIA AND MOSCOW DECLARATION

THE MOSCOW declaration of the twelve ruling Communist parties, it may be recalled, laid down a set of "basic laws" governing socialist development. Two of these were about "the abolition of capitalist ownership and the establishment of public ownership of the basic means of production" and "gradual socialist reconstruction of agriculture". The declaration further laid down that "exaggeration of the role of national peculiarities or departure, under the pretext of these peculiarities, from the universal Marxist-Leninist truth on the Socialist revolution and Socialist construction is harmful to the Socialist cause". When the Communist Party of Yugoslavia refused to be a signatory to this declaration, one of the interpretations at the time was that Marshal Tito's representatives were not convinced of the wisdom of spelling out the "basic laws" of socialist development in that manner. One wonders if the renewed charge of "revisionism" against Yugoslavia is on the ground that that country's "socialist development" deviates from the "basic laws" laid down in the Moscow declaration.

It is, however, not clear that the accusation of "revisionism" is on the score of economic reorganisation. The Yugoslav Communist Party has merely stated that the Moscow declaration "contains certain attitudes and appraisals which are contrary to its standpoint and which it considers to be incorrect". What parts of the Moscow declaration are considered by Yugoslavia to be incorrect, is not made clear. As Marshal Tito has resolutely rejected the "insinuation of revisionism", it looks as though another controversy analogous to the one between the Cominform and Yugoslavia in 1948 might come about. But this expected controversy will probably not be as acrimonious as the 1948 one for two reasons. For one thing, the Moscow declaration does tolerate a degree, although very limited, of diversity among Communist parties in regard to both means and ends; for another, the agreed "common line" of the twelve ruling Communist parties contains enough ambiguities which could be differently interpreted by different Communist parties. As the doctrine of "different roads to Socialism" is, by its very nature, realistic, it is not inconceivable that Yugoslavia this time may have allies in some other ruling Communist parties.

MALAYA'S PLAN PROBLEMS

IN NOT a few essentials does Malaya's Five-Year Plan for development run parallel with our own. The central problem is of finding the necessary finance. No less difficult to overcome is the dearth of technical personnel within the country to pull the Plan to a successful conclusion. The total outlay of the Plan has been put, in terms of Indian rupees, at some Rs. 217 crores of which over Rs. 40 crores is yet uncovered by any resource, even after it is assumed that nearly as much will come in the form of foreign loans and aids. While, therefore, a substantial part of the financial requirements, in foreign exchange or domestic resources, is still intangible, as the Plan proceeds the rising prices of capital goods throughout the world may further add to the country's worries. To that extent it would not be wholly incorrect to characterise the Plan as ambitious. But like India's second Plan again, there is nothing outrageous about the targets. The vast bulk of Malays are far too low on the economic ladder even compared to their own countrymen of Chinese origin, whether in trade or in plantations.

If that is true, then, from the Malay angle, the Plan should appear tilted. Roughly, replanting of rubber alone absorbs as high a percentage as 60 of the total Governmental investment in agriculture and industry. Generally, Malay areas are over-populated and there is little scope of further development mainly for lack of land. Being concentrated in such areas, Malay holdings are naturally small. Replanting would cause an unavoidable lapse of time between one crop and another which they can ill afford. It needs to be understood that rubber is not only the country's most important estate crop. It is also the smallholders' principal commercial crop.

In the development of electric power as much as in other public utilities like roads and railways, Malays do not give the impression of being altogether happy. That, however, should not suggest that the Plan is not essentially sound. Even if it is admitted that by far rubber plantations or tin mines owned or run by big Chinese and Europeans, it cannot be denied that ultimately the country as a whole will stand to gain. There can hardly be any all-round 'balanced' development over short durations like five-year plan periods. Planning is a long-term process and development can be termed balanced or otherwise after a series of plans have been put through.

Malaya like most other under-developed countries desires to industrialise rapidly in order to raise her

living standards. She has chosen her own way of attracting capital for developmental purposes. At the moment her decision to give tax and other concessions to foreign capital seems to be feasible. Once a base is established, it would be comparatively easier for the indigenous private capital to cast off its shyness. For the financial requirements of the public sector also, new resources have to be developed. Although there has been substantial increase in the national product during the past few years, Government revenues have not gone up in the same proportion. This is attributed to a narrow coverage of income and profit taxation. Expenditure, on the other hand, has been mounting, particularly in the spheres of education and other social objectives. All in all, the Plan deserves the sympathetic and co-operative understanding of all friends of Malaya. On the successful implementation of this depends, to a large extent, the future of democracy in this youngest State.

LABOUR VICTORY IN NEW ZEALAND

IN NEW ZEALAND'S General Election Labour has come out victorious defeating the National Party which had ruled the country for eight years. The number of seats annexed by the victorious party is forty-one, while those captured by the defeated National Party are thirty-nine in a House of eighty. The Communists and the Social Credit League have been completely routed. The votes of the Social Credit League dropped by a third, whereas all the five Communist candidates lost their deposits.

On the face of it the defeat of the National Party looks surprising particularly when that party had given an era of prosperity to New Zealand. But a further probing reveals that the New Zealanders were not happy with a rising cost of living and had a simmering discontent against the National Party. The dismantling of controls created by the earlier Labour administration was also responsible to some extent for the downfall of the Nationalists. As a matter of fact the defeat of the National party was the result of a variety of incoherent grievances that had piled.

It remains to be seen whether Mr. Walter Nash, the new Prime Minister, will be able to establish a stable foothold as the path that lies ahead of him is certainly not a bed of roses, what with a precarious majority. He certainly has no clear mandate to begin radical repairs and additions. The party is committed at the moment to an immediate income tax rebate; there is the promise of an income tax rebate of up to £100 on the gross tax levied for the financial year that ended in March 1957. Then again there are the extensive promises to improve the present retirement pensions and freeing them from means tests when the age of 65 is reached. All this involves a huge financial outlay and the question is being asked where the money for all these purposes would come from. There is, however, no doubt that the Labour Party would make a definite bid to build up New Zealand's depleted overseas balances. Since the Labour Party in New Zealand has always stood for a protectionist policy, the protective cover for most of its industries is a foregone conclusion. The most crucial problem that faces New Zealand at the moment is the falling prices of its exports which consist mostly of dairy products. Mr. Nash, the new Prime Minister, has said that trade posts would be established in Asia, Africa, Europe and America as alternatives to Britain. On the foreign policy front, it is certain that the Labour party would stand for strong Commonwealth ties. Death penalty may be abolished soon in New Zealand for it has never found favour with the Labour party.

BRITISH OVERSEAS AIRWAYS CORPORATION

For you, the best—Bhai Sahib !

Do you know how many cups of Brooke Bond Tea are drunk every day in India? Over 5,50,00,000 cups! And, what is more, every cup contains tea that is fresh and uniform in quality guaranteed in every Brooke Bond packet.

This is no magic but the result of a sound plan—the plan that aims to give you the best tea you can buy.

The network of our modern factories makes this guarantee possible and ensures that you get Brooke Bond Tea that is satisfying from the first sip to the last.

FACTS ABOUT BROOKE BOND'S FIVE FACTORIES:

Number of packets produced per week	... 2,10,00,000
Number of nails used per week	... 250,000
Steel strapping used per week	... 70 miles
Paper used per week	... 2,240,000 yards

* One of our largest godowns holds 10,000,000 lbs. of tea

A Window on the World

THEIR FINEST MEMORIAL

By
ODYSSEUS

IT WAS my happiness this week to chance upon two books, and a BBC broadcast, which should make every Indian friend of Britain and every British friend of India rejoice. The books are "The Viceroyalty of Lord Irwin: 1926-31" (Oxf. Univ. Press. 1957. 21s.) by S. Gopal, the distinguished historian son of a distinguished philosopher and statesman father, Shri Sarvagopal Radhakrishnan; "Talking of Gandhiji" (Orient Longmans, 1957 Rs. 6) by Francis Watson, British biographer and broadcaster, who spent the years 1938-45 in India; and "India's Attitude to the Commonwealth", a BBC broadcast by Dr. V. K. R. V. Rao, Vice-Chancellor of Delhi University, reproduced in the "Asian Review" (3 Victoria St., London. SW. 1) for October. 1957.

When I recall that India waged a nationalist struggle against the British with ever mounting heat and bitterness during the half century preceding August 15, 1947, these three publications strike me as extraordinary tributes to the qualities of head and heart of Indians and British alike. Consider: Lord Irwin of Indians and British alike. Consider: Lord Irwin was viceroy during five years which saw some of the bitterest moments of the nationalist struggle; there was a general protest against Dyarchy; the arrival of the Simon Commission to report on further constitutional development had stirred up political unrest, intensified communal feelings, sharpened political rivalries, fanned anti-British feelings to white heat among the politically minded, and Gandhiji's new methods were awakening the masses to political consciousness. Gandhiji let loose the boycott of British goods and followed this up with the second civil disobedience campaign. The Round Table Conference (out of which the Government of India Act of 1935 was to emerge) began in discouraging circumstances; the turmoil in India, far from scaring the British, aroused anti-Indian feelings, stiffened the attitudes of both the Conservative and Labour parties, convincing both that the time for independence was not yet, and rendering difficult and thankless the task of forward-looking, liberal-minded statesmen, such as Sir Samuel Hoare, the Secretary of State for India. In short, this was a period when passions ran high in India and in Britain, the sort of period that gives birth to a combination of virulent hate propaganda against the enemy, and a heroic mythology around their leaders by the rank and file of both antagonists.

IRWIN AND INDIA

As one turns the pages of Mr. S. Gopal's book, Lord Irwin emerges as a man who, once he had decided what the best course was, pursued it with courage, regardless of the hostility and disagreeable political consequences entailed for him at home—a great statesman, a great peace maker, a man of great piety. Mr. Gopal depicts Irwin as "in the great line of Wellesley, Dalhousie, and Curzon" in an age when air travel and radio communications made it easy to throw all problems into the lap of the British cabinet and leave the responsibility for awkward decisions to them. Since Edwin Montagu's declaration of 1917, expectations in India had risen ever higher. The problem as Irwin saw it was this:

"I am always racking my brain as to how to get out of this futile and vicious circle by which we say

'No advance without co-operation' and they say 'No co-operation without advance'. I cannot help feeling that it is a question much more psychological than political. One of the extreme swaraj people said to me the other day that if only they could trust us it would not matter to them whether they waited five or fifty years. How, then, to make them believe that we mean what we say?"

Irwin, says Mr. Gopal, realised "that the Congress was divided in mind, fretting and fumbling, lacking the assurance either to wait or to strike, and that the initiative could be seized by the government." He therefore went to London with detailed proposals for constitutional advance and, finding no response, determined to act on his own. He spiked the guns of the hesitant Conservatives and Labourites in London by announcing on his return to India that he had been "authorised on behalf of His Majesty's Government to state clearly that in their judgment it is implicit in the Declaration of 1917 that the natural issue of India's constitutional progress, as there contemplated, is the attainment of Dominion status."

Thus it was Irwin who started the train of events which led to the Act of 1935 which provided the foundation on which the structure of independent India was raised on August 15, 1947. As Mr. Gopal says, "It was clear that the viceroy... was anxious to carry forward the established aspirations of the Indian people. The statement, it is true, failed to divert the Congress from civil disobedience, but in all the confusion and upheaval that followed it remained a spar afloat; and it was that, and not the Simon Commission Report which finally reached the shore. The Round Table Conference, and the participation of the Congress in it, were the achievements of the Government of India and not of the statutory commission. Throughout the hurried sequence of events in 1930, Irwin never lost his foothold; while asserting authority, he was always on guard lest patience fail and judgment falter; never retreating, he was yet ever ready to treat."

GANDHIJI AND BRITAIN

Books on Gandhiji are innumerable. I do not, however, hesitate to assert that one of the most outstanding, on a par with "Essays on Mahatma Gandhi", edited by S. Radhakrishnan and "Mahatma Gandhi" by Po'ak, Brailsford, and Pethick Lawrence (Odhams, 1949), is Francis Watson's newly published "Talking of Gandhiji". This, the script of four BBC Third programme productions, brings Gandhiji's aims and personality to life through the skilfully combined reminiscences of 64 men and women who had intimate dealings with him at various periods of his long life. Although originally meant to be heard, the script is extremely readable. The book is the permanent record of the biggest project ever devoted by the BBC to the presentation of one man. It took four years to record the 15 miles of tape containing 190,000 spoken words, which have been sub-edited down to 35,000 words.

Many of these reminiscences throw new light on the characters and actions of the participants, among whom are H. N. Brailsford, Devadas Gandhi, Indira

Gandhi, Pandit Nehru, Dr. Zakir Hussain, G. B. Mav-lankar, Lord Mountbatten, Gilbert Murray, Padmaja Naidu, Pyarelal and Sushila Nayar, Rajendra Prasad, C. Rajagopalachari, B. C. Roy, Ian Stephens, H. S. Suhrawardy, Samuel Hoare, and G. D. Birla. From their joint efforts, there emerges a wonderful portrait of the politician, saint, and genius, that was Gandhiji. Neither politicians, nor geniuses, and still less saints, have ever been easy to understand. To the ordinary mortal, they often seem full of inconsistencies. But Francis Watson's recordings strikingly bear out Mr. Gopal's view that Gandhiji "was one of those immortals who transcend all boundaries, and his genius is difficult to define. But its fundamental traits are clear. His intellect never broke away from his emotions; he was sagacious but was also overborne by moods of impulsive gallantry.... A direct approach on a personal level could dissolve the vehemence that he showed in rebutting rational arguments; the common belief in the invincible forces of faith could transform for him an adversary into a partner. Irwin... appreciated both the strength and the virtues of Gandhi. He knew that Gandhi was not merely a powerful leader who voiced the inarticulate dissatisfaction of millions but also a politician inspired by spiritual values and a genuine friendliness towards Britain. Hence the viceroy could with confidence initiate negotiations and 'drink tea with treason'. Even if the parleys had ended in failure to reach a settlement, they would have been worth while. For the burden of the hours that the two men spent together was not a series of compromises on the various points at issue but an acceptance by each representative figure of the sincerity of the other."

WHITE, BROWN, YELLOW, AND BLACK COMMONWEALTH

Dr. V. K. R. V. Rao's broadcast on India's attitude towards the Commonwealth is a constructive refutation of criticisms of the UK. He covers much ground and contributes to clearer thought on controversial points. Dr. Rao concludes: "I believe that the Commonwealth will grow in numbers and prestige and will stand out in the world as a mosaic of white, brown, black, and yellow peoples of sovereign nations, linked in freedom and democracy. It will no longer be an Empire Commonwealth; it will just be a Commonwealth; and the empire, to the extent that it remains a memory, will be a selective memory of pleasant things characteristic of the best of British culture and civilisation rather than use of the unpleasant concomitants of colonial rule. The Commonwealth will stand for racial equality, peace among nations, and economic development of the underdeveloped countries of the world."

These three important writings suggest that independent India should be a source of pride to Indians and British alike, because it is a joint Indo-British product. The British brought with them to India the fruits of the European Renaissance in politics, learning, the arts, and economics. That was their contribution. But if Indians had not had the intelligence, capacities, and cultural inheritance, needed to assimilate these ideas, and to seize with both hands the opportunities opened up, independent India would have been a vastly different and poorer place. A nation's finest and most abiding memorials are not roads, railways, or buildings, but the new vision with which it endows men's minds. That it should be an Indian historian who helps us to a juster appreciation of the contribution towards the independence of India made by a great Englishman seems to me the finest possible tribute to the British. That it should be a British writer, sponsored by the official British Broadcasting Corporation and by an Indo-British publishing company, who throws fresh

light on a great Indian saint, is equally the finest possible tribute to Indians. That the Vice-Chancellor of an Indian university should be anxious to strengthen Indo-British co-operation, I take to be further evidence of the intermingled-ness of Indian and British aims and values. One has only to pose the question "What motive led those two Indians and this Briton to wish to undertake the task that each set himself?" to realise the tremendous force of the joint Indo-British impact on our two peoples.

THAT'S why nearly 30% of Government of India's investments in the successive Five Year Plans are devoted to the development of nationwide transport.

The assembly and progressive manufacture of Royal Enfield motor cycles and three-wheelers fill a major gap in the transport needs of our economy. Motor cycles are an essential item of equipment of our Armed Forces. Police, Post & Telegraphs and other Government Departments use motor cycles in increasing numbers. Motor cycle is the most economical form of automotive transport for our business executives, engineers, technicians, agriculturists, salesmen, insurance agents and others doing field work who must go places to do their work efficiently and on time. For local deliveries in our steadily expanding cities and towns there's none so ideal as the Royal Enfield three wheelers for quick despatch of goods in easy, economical lots.

Planned and progressed in collaboration with the Enfield Cycle Company, Redditch, England and backed by the entrepreneurs with the experience of over a generation in the motor cycle and engineering lines in India, Enfield India factory and their business organisation are truly a model of achievement. Already expansion plans are in hand to increase the production capacity to serve the growing transport needs of our country.

OVER-EXPORTATION AND SLUMP DANGERS

(From Our Special West European Correspondent)

PARIS, December 8.

THE view that there is any danger of a world economic depression at present is very much a minority view, but still a view that is well represented in the European financial Press. 'The Tribune de Geneve' lately forecast that the Dow Jones index would fall to 400 shortly; 'The Neue Zürcher Zeitung' in its last quarterly review of world commodity markets picked out the signs that for the first time for over a decade prices were coming under cyclical depressive influences; the share prices with unusual attention, and feeling about them was summed up in M. de Jouvenel's observation the other day: "The most important person in the free world today is undoubtedly Mr. William McChesney Martin, Junior, President of the Federal Reserve Board." And now in Der Volkswirt, a German economist, Dr. A. Reithinger, has produced the most categorical, detailed and reasoned slump forecast since Colin Clark's. (Clark is mentioned precisely to recall how wrong such forecasts can be). Reithinger's article has attracted considerable interest among the specialists; 'Les Problemes Economiques', for instance, reproduced it as the first article in their current issue. But whether he is right or wrong about a slump, Reithinger does focus attention on a curious situation that has arisen in international trade, a situation in which India finds an evident place.

His argument is that the pyramiding of private credit between 1926 and 1929 which led to the great depression has a direct parallel in the over-exportation that has occurred between 1953 and 1957; there has occurred a vast increase in world exports which are inadequately financed and herein lies the danger of an international payments crisis which could produce a depression. Most observers look only at the expansion of world trade that this over-exportation causes, and conclude that we are in a period of sound and durable prosperity. But Reithinger looks rather at the artificial credit foundation of this export boom, especially the extent to which it is made possible only by generous export credits, long-deferred payments and by the running down of currency reserves in the importing countries. These are proofs that the importing countries cannot and could not settle their swollen import bills by any supply of goods and services nor by acceptable long-term credits, and their ability to do so would shrink even further if the current fall in raw material prices continued.

It is admitted that any failure in the indebted countries would today have less spectacular effects than the failures that began in East Europe in the late twenties, because then private credits were involved and thus when the British and American banks found that their credits were frozen this had immediate consequences on the British and American economies. Today the position is healthier in that exports have to a large extent been financed not by short and medium term bank credit but by Western Governments through their State budgets and through international financial institutions, and the freezing of these credits need not have immediate and disastrous effects on the national economies of the lending and exporting countries. But these are dated credits withal, and are not the genuine export of perpetual capital such as ordinary investments. Moreover the payments deficits of the

importing countries are financed by bank credits in the exporting countries, which are thus tied up just as they were in the twenties. That such risks are often covered by a State guarantee and that there is in the main exporting countries a continual inflation to feed these credits does not convince Dr. Reithinger that they are without danger.

More significant, he draws attention to the pathologically large part that export industries now play in the national economies of many Western countries. In West Germany exports now absorb 24 per cent of the output of the capital goods industries, against 12 per cent for the pre-war Reich; this proportion is even higher, 30-50 per cent, in some West German heavy industries. It is 40 per cent in several Scandinavian countries. Excessively high proportions are also found in Great Britain, where exports have been feverishly promoted to maintain that country's position as the sterling area's banker, in Italy where exports have been intensively developed to absorb domestic unemployment, and in general in Western countries where full employment, cheap money and the political anxiety to play a part in the industrialisation of backward countries in Asia and Africa have all combined to push exports beyond a safe level. Reithinger concludes that Europe's excessive dependence on exports and the backward countries' excessive reliance on imports both rest on an artificial credit foundation which is not in turn founded on a real export of capital.

Before passing on to the figures that are the most interesting part of this study, notice that it is significant that this view should be put forward precisely in West Germany. For even if Reithinger's case does not have general validity, he is pointing to the pathological aspect of West Germany's present trading position: the fantastic and unhealthy expansion of exports by a country that pays its own workers among the lowest wages in West Europe, which is unwilling to advance real capital exports to the rest of the world, and which has run all its trading partners into debt so that it has caused a dangerous lack of liquidity throughout West Europe and the Middle East. On this limited part of his case we can fully agree, and in the following quotation Reithinger says no more than has been said on this page repeatedly: "The elimination of the extreme creditor position of West Germany, which is at present denying the world more liquidity than the recently restored dollar gap, is more urgent than the improvement of the French economic situation."

The following table shows the increase in exports from the two major industrial areas of the trading world, the United States and the OEEC countries of West Europe:-

EXPORTS IN THOUSANDS OF MILLIONS OF DOLLARS

Year	From OEEC	From USA	From both together
1950	18.6	10.1	28.7
1953	26.1	15.6	41.7
1956	34.8	18.8	53.6
1957 (First six months doubled)	39.8	21.8	61.6

Of course, a good part of this large increase in exports is paid for in reciprocal exports and thus is no cause for anxiety, but a very good thing. But the disturbing thing is that the expansion of exports is being directed faster toward the less advanced industrial regions than to the various parts of the heavily industrialised world. This comes out in the following table which shows the distribution of combined US and OEEC exports among four zones: the European Payments Union area, the dollar area, the sterling area apart from Great Britain, and the rest of the world:

EXPORTS IN THOUSANDS OF MILLIONS OF DOLLARS

From USA and OEEC	To EPU	To \$ area	To outer sterling area	To rest of the world
1950	17.8	6.0	3.7	5.0
1953	23.3	8.8	4.8	9.7
1956	32.0	10.5	7.1	11.1
1957 (First six months doubled)	35.3	12.2	7.8	14.0

Thus exports to the sounder credit countries (the two left-hand columns) have only doubled, while exports to the countries whose credit is less sound (or at least depends more heavily on raw material prices, which seem to be falling) have almost trebled.

Reithinger then seeks to calculate the amount of "over-exportation" that occurred in 1956 and the first six months of 1957 by adding up the deficits accumulated in the various regions, i.e. the imports they took in excess of their ability to pay for them otherwise than by drawing down their currency reserves and obtaining dated credits. He gets this result:

PAYMENTS DEFICITS IN THOUSANDS OF MILLIONS OF DOLLARS

Europe	2 to 2.5
Asia	1 to 1.5
Near East and Africa	1 to 1.5
Latin America, etc.	0.5
Together	4.5 to 6

These deficits occurred despite the fact that the USA was pumping dollars into the world trading system by means of military and economic aid and by other measures. This supplied \$4,000 million in 1956 and without it the above total for over-exportation would have been about \$10,000 million — ten thousand million dollars in eighteen months.

Whether this situation in itself is as dangerous as Reithinger argues will depend on the movement of raw material prices, which are the main sources of earnings for the indebted overseas countries, and on the extent to which in the exporting countries bank credit is involved in this remarkable expansion of exports. Even if it could not by itself cause trouble, this overemphasis on exports to backward countries whose ability to pay for them is problematical would gravely complicate any cyclical depression arising for other reasons. It is as well to say again that the belief that any such cyclical depression is in sight is a minority view. But it is also a minority view that, if such as cycle began, modern governments could easily stop it with a few Keynesian incantations. The optimistic opinion, once expressed by a gentleman who has since become India's Finance Minister, that slumps can be quickly cured nowadays is shared by no one.

GUJARAT

a pilfer-proof package for every product!

Metal Box pilfer-proof containers and closures, individually designed for each product, are precision engineered and superbly printed. This ensures product safety, purity, and powerful sales appeal. Reputable manufacturers use them to pack:

Ghee	Breakfast foods	Vanaspatti and other food oils
Butter	Cocoa	Baking powder
Evaporated and Condensed milk	Coffee	Tea
Barley	Biscuits	Honey
Glucose	Confectionery	Processed fruits and vegetables
	Cashews	

A METAL BOX PILFER-PROOF CONTAINER

OPEN
TOP
CAN

Complete pilfer-proof protection is guaranteed by double seaming both top and bottom to the can body.

This cross-section of a precision engineered double seam shows how the rubber-like compound lining ensures air-tightness.

Only a can opener, destroying the top of the can, will open it. It cannot be reused by unscrupulous dealers to repack with spurious products.

round
the
world

To and fro fly the shuttles in the 70,000 looms of India's 105 jute mills. Each travelling at a speed of 9,000 picks an hour (the length of a pick averages two yards), these shuttles together cover a distance equivalent to about 70,000 trips round the world, weaving 1,000,000 tons of jute cloth each year. The jute industry is India's most important foreign exchange earner; jute products form over 60% of India's dollar exports. Texmaco, pioneer manufacturer of cotton textile machinery in India, also supplies this important industry with the complete range of jute mill machinery, designed and built to established international standards, in technical collaboration with the world renowned British company, Fairbairn Lawson Combe Barbour Ltd.

AGRICULTURE

Two Central Warehouses for West Bengal in 1957-58: Two warehouses of the Central Warehousing Corporation — one at Midnapore and the other at Cooch-Bihar—were proposed in West Bengal in 1957-58. The number of marketing societies proposed for West Bengal was 21. These included seven marketing societies of the primary type. One apex marketing society to be newly organised, and 13 marketing societies to be reorganised during the year 1957-58. Further a sum of Rs. 11.29 lakhs was approved for marketing schemes.

Growing Sea Island Cotton in India: As part of the campaign for increased agricultural production efforts are being made to step up country's out-put of better quality cotton. A scheme was launched in June this year which envisages the coverage by 1961 of over 2½ lakh acres of land under the "Andrews" variety of Sea Island cotton — the world's finest cotton. In its home in the West Indies, which commands a monopoly, the staple length of some of its constituent varieties is as high as 1½" to 2" capable of spinning over 150's counts. Already over 1,200 lbs. of "Andrews" seed, obtained from last year's crop, have been sown to produce 50,000 lbs. of seed at the end of this year. Through the process of multiplication, 25 lakh lbs of seed will be made available in 1959-60, sufficient to cover 2½ lakh acres — 1.30 lakh acres in Kerala; 1 lakh acres in Mysore and 20,000 acres in Assam.

Schemes for Evolution of Superior Strains of Paddy: The evolution of superior strains of paddy suitable for the areas which are inundated during the rains and for alkaline and saline soils, and a study of the improved technique of the Chinese methods of paddy cultivation were three new research schemes approved by the Advisory Board of the Indian Council of Agricultural Research, which met here recently. The Board had also recommended setting up a committee to advise on the design and structure of farmers' houses, storage godowns and cattle-sheds. Presided over by Dr. M. S. Randhawa, Vice-President of the Council and Additional Secretary, Union Ministry of Food and Agriculture, the Board has approved about 195 new and current schemes for research in agriculture, animal husbandry and veterinary science. The schemes will now be considered by the Standing Finance Committee and the Governing Body of ICAR, meeting of which are expected to be held towards the end of December.

Training in Farm Management at National Level: To spread the results of the FAO farm management development centres at the international level, each member-country should organise a national centre for training of suitable persons. The member-countries might also request the FAO for services of specialists. This was one of the recommendations of the four-week FAO Farm Management Development Centre for Asia and the Far East, which concluded here recently. The recommendations, available, have been forwarded to the FAO for consideration. The New Delhi Centre, in which 35 delegates from ten countries, namely, Burma, Ceylon, Malaya, Nepal, Indonesia, Japan, Thailand, Philippines, Pakistan and India, participated, also suggested that three similar centres should be organised annually for the next three years in Asian or the Far-Eastern countries. The centres will study methods of using farm management research to improve planning execution and evaluation of development projects at the farm and village levels; improving extension work in farm management under different technological and welfare conditions; and farm management problems in

accumulating, allocating and economizing the use of capital. The Centre further recommended the appointment of a FAO farm management specialist at Bangkok. This, it was stated, will help member-Governments in organising international development and national training centres, conducting studies, and exchanging experiences in farm management. The Centre also suggest that the FAO should organise a working party, consisting of four or five specialists from the FAO and member countries, to assist in preparation of manuals for use by extension workers and an annotated bibliography of farm management research and extension literature.

INDUSTRY

Draft Specifications for Fire Fighting Equipment: The Indian Standards Institution has issued six draft specifications for fire fighting equipment. These specifications cover motor fire engines of capacities 350-500 GPM, 700-1000 GPM motor fire engines 300-500 GPM with pump and water tank, small motor fire engine 80-120 GPM with portable pump set and water tank, emergency tender, and mechanically operated turntable ladder for fire brigade use. These specifications form part of a series of specifications prepared by the Indian Standards Institution to cover fire fighting accessories and fire fighting units comprehensively. Earlier specifications covering fire fighting equipment and fire fighting accessories have been widely circulated and are now under finalisation. The specifications lay down requirements for the engine, pump, as also the accessories, that are to go with each unit. Performance tests regarding suitability and performance under road conditions for each of these engines have also been prescribed.

Sweden's Paper Output: Swedish mills rolled out some 1.57 million tons of paper and board. This is a two-thirds improvement on the pre-war peak recorded in 1937 and fifteen times as much as in 1900, the Svenska Handelsbanken "Index" writes in a survey. Slightly less than 3 per cent of the world production of paper and board takes place in Sweden. At the beginning of this century exports of paper represented 2.5 per cent of Sweden's total exports; today the corresponding share is 9 per cent. Last year's paper exports totalled 920,000 tons or, in terms of money, more than Kr. 900,000,000 (£62,000,000); (\$175,000,000). Domestic consumption of paper has risen markedly in recent years. This is clearly shown in the percentage of production devoted to exports, viz. 75 per cent during the early 1920s, 66 per cent during the middle of 1930's and less than 60 per cent during the past few years.

TRADE

Total Commonwealth Trade: A rise of seven per cent in total Commonwealth trade in 1956 is shown in the 77th edition of the 'Statistical Abstract' for the Commonwealth and the Sterling Area, just published for Britain's Board of Trade by H. M. Stationery Office. The 'Abstract,' which brings together in one volume the basic trade statistics of the Commonwealth and Sterling Area countries up to 1956, discloses that imports into India rose by 21 per cent from £505,000,000 in 1955 to £610,000,000 the following year. The 'Statistical Abstract' shows that intra-Commonwealth imports were practically unchanged in value and amounted to two per cent less than total imports in 1955. Intra-Commonwealth exports rose by £100,000,000 in value in 1956, but were also two per cent less than total exports in the previous year. Total Commonwealth imports in 1956 amounted to £10,045 million — a rise of almost

£600,000,000 over 1955, while total exports rose by £625,000,000 to £8,682 million. The increases in imports were mainly in mineral fuels, base metals and machinery. A large part of the increase was taken by Canada, whose imports rose by £363,000,000 to £2,074 million.

*

Trade With Middle East Countries: India's exports to the middle East countries has registered an increase of about 65 per cent during the past four years. Exports in 1956-57 were worth Rs. 43.10 crores as against Rs. 26.14 crores in 1953-54. India's total trade with these countries has increased by about 30 per cent during this period. The total trade in 1956-57 was of the order of Rs. 127 crores as against Rs. 98.35 crores in 1953-54. Exports to Egypt were worth Rs. 11.39 crores in 1956-57 — an increase of over three times the value of exports in 1953-54. Exports to that country were valued at Rs. 8.09 crores in 1954-55 and Rs. 9.47 crores in 1955-56. India exported goods worth Rs. 4.56 crores to Iran in 1956-57 as against Rs. 1.52 crores in 1953-54. In the case of the Sudan also the increase was sizeable. Indian exports to that country in 1956-57 were valued at Rs. 9.42 crores as compared with Rs. 5.11 crores in 1953-54. India's exports to Saudi Arabia were worth Rs. 5.59 crores in 1956-57 as compared with Rs. 3.48 crores in 1953-54. The value of exports to Iraq increased slightly to Rs. 2.83 crores in 1956-57 from Rs. 2.45 crores in 1953-54. There was also a slight increase in the exports to Bahrain. While exports to Turkey and the Lebanon were almost steady the value of exports to Syria showed a slight decline. The principal commodities exported to the Middle East countries are tea, jute goods, spices, cotton textiles and engineering goods. Raw cotton, mineral oils, dates and dry fruits are the main commodities imported by India from these countries. The value of imports from Iran in 1956-57 (Rs. 32.68 crores) was 16 times the value of imports in 1953-54 (Rs. 2.04 crores). India imported goods worth Rs. 16 crores from Saudi Arabia in 1956-57 as against Rs. 14.82 crores in 1953-54. Imports from the Lebanon increased to Rs. 28 lakhs in 1956-57 from Rs. 7 lakhs in 1953-54. Imports from Bahrain islands and Egypt showed declines while from the other countries these were almost steady. Imports from the Sudan increased from Rs. 7.48 crores in 1953-54 to Rs. 9.29 crores in 1956-57.

*

Protection to Copper and Aluminium Conductors Industry: Government have accepted the Tariff Commission's recommendation that protection granted to electrolytic copper rods (tariff item No. 64(4) and bare copper conductors and A.C.S.R. (tariff item No. 72(12)) may be continued at the existing rates of protective duty for a further period of three years ending December 31, 1960. Government have also accepted the Commission's recommendation that all aluminium conductors (A.A.C.), irrespective of their conductivity in terms of copper wires may be protected and brought under I.C.T. item No. 72(12) and assessed to the same rate of protective duty as A.C.S.R. i.e. 35 per cent 'ad valorem'. The protective duty on A.A.C. is being brought into force with immediate effect.

FINANCE

Ford Foundation Grants to India: A total grant of over \$2.4 million was announced by the Ford Foundation for various educational schemes in October 1957. Out of this grant, \$2,045,000 are meant for various schemes sponsored by the Government of India including \$885,000 to English Language Teaching Institute and \$418,000 to All-India Council for Secondary Education for establishment of departments of extension services at secondary schools teachers' training colleges. An

amount of \$400,690 has been granted to private organizations. This amount, among other schemes, includes \$120,000 for Southern Language Books Trust, \$69,000 to India Literacy Board, Lucknow, for training in the preparation of reading material for neo-literates and \$14,000 to Agricultural Missions Inc., New York, for research and writing on changes in village life and caste system.

*

Short-term Investment: As it appears that there is a demand on the part of institutional investors and the market generally for short-term investment, the Government of India have decided to create a further issue of 3½ per cent Bonds 1962 for Rs. 30 crores. The securities will be available for sale on Government account by the Reserve Bank of India through the usual procedure for the sale of special issues at prices to be ascertained from the Bank.

*

Rebate on Excise Duty: The Government of India have decided that the procedure for export out of India of articles under claim of rebate of duty on excisable goods used in their manufacture should be extended to Tarpaulins as well. It is already applicable to ready-made apparel, tents, sugar products, cotton bags, umbrella cloth, chaddars, pillow cases, table covers, embroideries and laces. Manufacturers of tarpaulins who wish to export them out of India under this procedure may contact the Collector of Central Excise in whose jurisdiction their factory is situated for further detailed information.

GENERAL

Assistance Under the Wheat Loan Educational Exchange Programme: During 1955-56 and 1956-57, books for Indian institutions of the value of \$487,700 and \$325,000 respectively and equipment for Indian institutions of the value of \$516,000 and \$375,000 respectively were received under the Wheat Loan Educational Exchange Programme. Besides 11 Indian librarians and 21 scientists were invited for study tours in the U.S.A. and the services of two U.S. scientists were made available to India during 1955-56, and 24 Indian teachers, one scientist, one administrator and one librarian were invited for study tours during 1956-57 and the services of nine general educational experts were made available during 1956-57. Among the universities which have received equipment under the programme are Aligarh, Agra, Allahabad, Andhra, Annamalai, Banaras, Baroda, Bihar, Bombay, Calcutta, Delhi, Gauhati, Gujarat, Jammu and Kashmir, Karnatak, Lucknow, Madras, Nagpur, Osmania, Patna, Poona, Punjab, Roorkee, Saugor, Travancore and Utkal. Besides, nine institutions in Bombay, Calcutta, Delhi, Madras, Agra and Coonoor also received the equipment.

*

Welfare Schemes for Ladakh: Provision of Rs. 64.63 lakhs has been made for the execution of development schemes in the Ladakh area during the second Five-Year Plan period. The allotment includes Rs. 18.47 lakhs for road construction, Rs. 15.15 lakhs for Community Development and Rs. 14.00 lakhs for the execution of medium irrigation works.

*

Employment Situation During September: Employment Exchanges secured 16,805 placements during September 1957 as compared with 18,052 in the previous month. The decrease was mainly reported by Exchanges in West Bengal, Bihar and Kerala. Exchanges in Punjab, Delhi and Bombay, however, registered an increase. Of the total placements, 4,422 were under the Central Government, 7,961 under State Governments, 1,813 under quasi-Government establishments and local bodies and the rest under other employers.

VIA JAMSHEDPUR

Four hundred young engineers who will man the three new State steel plants will spend six weeks at Jamshedpur before they go abroad for training.

Here at the steel city, an orientation course will acquaint them with the first essentials of steelmaking in India. And they will undoubtedly get a friendly tip or two from Tata Steel veterans.

Jamshedpur is proud to welcome these steelmakers of tomorrow.

TATA STEEL
ON TO TWO MILLION TONS

THE TATA IRON AND STEEL COMPANY LIMITED

Minimum earth-moving costs!

Compact and engineered for rugged, on-the-job service, the Euclid S-12 Hydraulically Operated Scraper is unequalled for performance, maintenance, accessibility and design. Power packed with a 218 h. p. engine...featuring a wide, shallow bowl with sectional cutting edges that can be arranged to suit the job...complete hydraulic controls which eliminate cable breakage etc.... with large, big capacity tyres for maximum flotation—the S-12 cuts earthmoving costs to the minimum.

NEWS IN BRIEF

INDIAN

The exportable surplus of coffee out of 1957-58 crop has been fixed at 7,180 tons. This was based on the revised estimate for the season placed at 37,000 tons, consisting of 24,000 tons and 13,000 tons of Arabica and Robusta respectively.

Bombay is now the largest State in India, more than half the size of Pakistan. In population, however, it ranks second in the country, the first place being enjoyed by Uttar Pradesh, with 63 million persons, 15 million more than Bombay.

To give impetus to the export of sugar products, the Government of India has further simplified the procedure for the grant of rebate on excise duty on the sugar used in the manufacture of these products.

The Government of India has issued a notification fixing the price of tea, for the purpose of determining the export duty at Rs. 3.35 per pound as against Rs. 3.30 per pound in force from November 1, 1957. There is no change in the existing rate of duty of 38 nP per pound.

It is reported the Government had approved in principle the request of the Hindustan Motors Ltd., for the manufacture of trucks in collaboration with the General Motors Corporation of the United States of America. The requirements of the country for trucks and buses by 1960-61 would be about 40,000.

A sum of Rs. 20 crores has been earmarked during the second Plan for slum clearance to provide 1,10,000 developed plots or tenements.

The children of mica mine workers in Bihar will be provided with further facilities for education under a new scheme sanctioned by the Government of India.

A sum of Rs. 595 lakhs was allotted for the Mysore Iron and Steel Works under the second Five-Year Plan and a production of 85,000 tons of finished steel per annum was envisaged. The present annual production of steel works at the beginning of the second Five-Year Plan was about 36,000 tons per annum.

The total amount of deposits under the compulsory deposit scheme up to the end of October this year in respect of all the assesses was Rs. 2.96 crores.

Deficit financing by the Central and State Governments during 1956-57 amounted to Rs. 238 crores, the Deputy Minister, Shri B. R. Bhagat revealed in the Lok Sabha recently.

For development of fruit production, grants and loans amounting to Rs. 3,75,155 and Rs. 31,07,000 were sanctioned for 1957-58 for nine States and three Union Territories.

The Deputy Minister for Finance, Shri B. R. Bhagat, told Shri P. C. Bhanj Dev in the Rajya Sabha recently that Government had so far obtained loans amounting to \$356.34 million from the World Bank.

The Indian Standards Institution has issued for eliciting comments, two draft standards for cotton spindle tape and for cotton tubular banding to drive spindles in cotton textile mills.

FOREIGN

A bank to specialise in financing trade with the Soviet Union and its satellites has been formed in Berlin. Registered as Berliner Import and Export Bank, it has a basic capital of DM 4 million.

The Committee appointed by the Government to report on the tenure of urban land in Northern Rhodesia recommends that the Government should make a positive declaration of policy in favour of freehold, with the exception of African townships and housing areas in European municipalities.

It is reported strong Italian and German economic delegations have arrived in Iran for trade and investment talks.

Australia's wheat crop this year is estimated by the Bureau of Agricultural Economics at little more than 90 million bushels, which would be the smallest since the 1944-45 drought, when the harvest was only 53 million bushels.

It is reported the Russian credit to Egypt of £62 million can be used to obtain industrial equipment from any other Communist country, but the offer of £20 million by Czechoslovakia applies apparently only to products of that country.

The short-term credit to Belgium of Swiss Frs. 75 million provided by an international banking consortium at an interest rate of 5½ per cent has been granted to a semi-State Company but is guaranteed by the Belgian State.

Poland is to expand and modernise her oil industry. One of the country's oldest refineries at Glinik Moreampolski, in South-Eastern Poland is to be rebuilt and brought up to date. When completed it will have a yearly capacity of 150,000 tons, equal to that of the whole Polish oil industry at the present time.

The £8.5 million titanium-dioxide plant of the Bayer Chemical Works was inaugurated at Urdingen, near trefeld. It has an initial output of 150,000 tons per year — to be raised soon to 50,000 tons.

More than 400 British companies are now established as manufacturers in Australia or financially associated with Australian manufacturing concerns, according to a Survey just completed by the Trade Department.

A Company to conduct trade with Ghana is being established in Israel as part of the Israeli drive for closer economic relations with the new African State.

The Swiss Confederation's public debt will be reduced to Sw. Frs. 6,519 million (£503 million) by the provision for repayment of Sw. Frs. 7,125 million (£555 million) by the provision, for repayment of Sw. Frs. 638 million (£52 million) in the 1957 and 1958 budgets.

It is reported the Ministry of Power intends to cease all imports of U.S. coal after January 1958. This will produce a saving of over \$57 million a year.

A Letter to the Editor

THE 'COMPETITION' FROM CO-OPERATIVE BANKS

Sir,

I have carefully read the letter, addressed to you by Mr. G. M. Laud, Managing Director of the Bombay State Co-operative Bank, Ltd., and published in 'The Eastern Economist' dated November 29, 1957, in reply to my article on "Co-operative Credit: Possible Pitfalls". I am afraid Mr. Laud has missed the crux of my complaint, namely, that, after trying to monopolise the business and deposits of all types of co-operative institutions (even by making them withdraw their deposits, if any, with commercial banks), it cannot "lie in any co-operator's mouth to complain that commercial banks are proving to be serious competitors and are attracting deposits from both the general public and the co-operative sector at the cost of co-operative institutions". Otherwise, he would not have maintained, as he has done in his letter, that, "since the area of operation of each co-operative institution is exclusive, the question of competition against each other also does not arise". For this would mean that I was referring to competition among co-operative institution. Actually, I was not thinking here so much of competition among co-operative institutions 'inter se'—and I believe my wording (which I have reread) does not lead to this interpretation either—as between co-operative institutions and commercial banks, a bogey which co-operators have themselves raised. Evidently these co-operators, it looks, are not going to stop with just creating this bogey, but seem to be making a bid to create a separate sector for themselves—the co-operative sector, as distinct from the private and the public sectors. So the private sector will henceforth have to watch the steady encroachment of not only the public sector but also the co-operative sector. Already the first shot has been fired by the Bombay spokesman of co-operators when he challengingly asks: "Are the facilities made available to the co-operative sector by the Government in excess of what are available to the private sector?" I must say the question, as it stands, is very carefully worded, but, to be fair, it should have read: "Are the facilities made available to the co-operative sector by the Government in excess of those made available to the private sector by the Government?" Surely you can't blame the private sector for creating more facilities for itself. Anyway, in the modified, proper form in which the question is put, it is, to say the least, a rhetorical question, that is a question for which the answer is implicit (and it is an affirmative answer, if this has also to be added, so as to leave no room whatever for doubt in any one's mind). Considering the resources and the turnover of co-operative institutions 'vis-a-vis' the resources and the turnover of the private sector, the facilities made available to the co-operative sector by the Government are relatively excessive.

Mr. Laud has questioned whether I am "aware that even the Indian Banks' Association, exclusively confined to joint-stock banks, has not viewed the unhealthy competition among deposits with favour", and adds: "He (Croesus) seems to be under the impression that agricultural credit is the only legitimate function of co-operative banks. I would humbly request him to glance at the history of co-operative banking in this country as well as in other parts of the world". My answer to this is that, thanks to the courtesy of the Indian Banks' Association, I am aware of its views on the subject of unhealthy competition among banks for deposits. But this is besides the point. What is relevant in this context is to see whether it is fair for co-operative banks to want to keep for themselves, of

course with the help of Government, all the monies of co-operative institutions, thereby shutting out the commercial banks from even entering into this sphere and, at the same time, to complain that commercial banks, by offering higher rates of deposits, are trying to wean away deposits of co-operative institutions. When Mr. R. G. Saraiya, the Chairman of Mr. Laud's Bank, has himself appealed to co-operative institutions to keep all their deposits with co-operative banks and the Registrar of Co-operative Societies also has backed up this appeal, how can commercial banks take away the deposits from co-operative Banks whatever the rates of interest they offer?

If I had the power to direct the co-operative movement in this country, I would not only have insisted on co-operative banks confining themselves to agricultural credit, but would have taken pride if only I could have succeeded in achieving that much honestly. In 1955-56, agriculture contributed Rs. 4220 crores out of the net domestic product at factor cost of Rs. 9650 crores. Is it not overvaulting ambition for co-operative banks not to be content to cater to a productive economic activity—accounting for as much as about Rs. 43.75 per cent of the total national income of the country?

Now for a few words about co-operative banks' assistance to industrial co-operatives. I am not opposed to this, but here, again, I fear, there is a woeful lack of sense of proportion. Whether as short-term or as medium or intermediate term, or on long-term, advances to individual co-operatives tend to hamper, eventually, if not now, the primary and more legitimate work of co-operative banks, namely that of giving help to agriculture. Take the case of sugar co-operatives, for example. What is the stake of the participants in a sugar co-operative of Bombay State? On the basis of Rs. 100 lakhs (estimated to be the requirements of a sugar co-operative up to the time it reaches the stage of crushing cane), these participants contribute only Rs. 15 lakhs and the State Government contributes a like sum, the entire remaining amount of Rs. 70 lakhs having to be found by co-operative banks directly or indirectly. There are 18 sugar co-operatives in the State in different stages, and, barring the 4 or even 6 which have advanced far enough, the requirements of the others would aggregate Rs. 840 lakhs, which is not a small sum. To divert so much of money, even if it be for only short intervals, thanks to Government's active assistance to co-operatives through the Finance Corporation, the State Bank of India and the Reserve Bank, is to starve the legitimate needs of agriculture. Perhaps I am mistaken. If so, I shall be glad to have enlightenment on this point from my esteemed friend, Mr. Laud.

I am grateful to Mr. Laud for asking me to refresh my memory about the history of co-operative banking in this country as well as in other parts of the world. After doing so, as per his advice, I must say I feel more than ever convinced that the extension of the co-operative movement to any other sphere before satisfying all the needs of agriculture or at the cost of agriculture is not in the best interests of our country, notwithstanding the sacred injunction in our constitution that our ideal is to be a co-operative commonwealth.

Yours faithfully,

CROESUS

Dated December 7, 1957.

What's the job going to cost!

Before you buy your earthmoving equipment find out the job-costs

It's the *total job cost* that should be considered and not *only the purchase price* of equipment. Get the best for your job—buy "Caterpillar" earthmoving machines. You will have less downtime, lower operating costs, better service and ready supply of parts.

Pushing, pulling or carrying, on tracks or rubber, "Caterpillar" will move more earth in less time at less cost per cubic yard than any other machine. The high efficiency of Caterpillar performance more than offsets the initial costs.

KEEP AHEAD OF SCHEDULE WITH

PRIVATE VS. PUBLIC SECTOR

(By P. KODANDA RAO)

THE question of private 'versus' public enterprise seems to be a problem with no solution. It has attained special importance and urgency in India today, not only because of the policy of the Government of India, but also because of the climate of opinion in foreign countries, like Britain and Germany and, more particularly, America, which are in a position to give economic help to India for her second Five-Year Plan. It may be useful to review the problem as objectively as possible by those who are not committed to either preference.

The anti-thesis, implicit in the concept of private 'versus' public enterprise was valid when the state was the king, and the ruler and the ruled were two different, separate species, as it were, and with interests not always identical. The anti-thesis loses much, if not all, of its validity in a democracy, particularly with adult franchise. Sovereignty rests in all the enfranchised citizens, and the rulers are themselves the ruled. The relation between the citizens, the legislature and the cabinet corresponds broadly to the general body, the managing committee and the manager of any business or social service organisation. There is inherent anti-thesis between the sovereign people and their agent, the government. If today the notion still prevails, even in a democracy, of the people 'versus' the government, it is largely a hang-over of past history. In every democratic country, including America, the sovereign electorate has delegated an increasing share in national economy to its agent, the government, in the national interest. The American Government has assumed the rôle of the supreme manager of the total economy, as regulator of individual welfare and as re-distributor of the wealth created by the economy.

Perhaps it was not true that undiluted private enterprise prevailed even in America at any time. It has been mixed economy, because of subsidies, tariffs, etc., which the state gave private enterprise at the expense of the public. In India, even before independence, state enterprise and state assistance to private industry were considerable. Mixed economy has been accepted by free-enterprisers. The only relevant question is the extent of each economy. In this matter there seems to be no subjective agreement or objective criteria, but only a traditional bias and arbitrary demarcation. It is not easy to decide on any objective tests if, say, the steel industry should be allocated to the private or the public sector. In India today it is in both sectors. While the state in India runs both the postal and the telegraphic services, the state in America runs only the postal service, while private enterprise runs the telegraphic service.

It is generally claimed that private enterprise, because of the 'profit' motive, is more efficient and in consequence, renders better service to the public than state enterprise, which has only the service motive. There are vast fields of service, where the profit motive is not the primary incentive, which may not, on that account, be held to be inefficient. Nor is the profit motive absent in state enterprises, as for instance, the Indian railways, if profit is the surplus of income after meeting the expenses. The only difference is that profits in private industry accrue to the fewer shareholders, and profits in the public industry accrue to the generality of the public. In so far as the profit

incentive stimulates efficiency, it operates only when the 'producer' of the profit gets the benefit of it, as when a carpenter works for himself, and not when it accrues to another, whether in the public or the private sector. It happens that profits are produced by the active workers, from the general manager to the unskilled labourer, while the profits accrue to the passive contributors of capital, like the shareholders in private enterprise and the general public in public enterprise. The producers of profit in either case receive only their salaries and wages, fixed without reference to the profits. There is no convincing reason why workers, from the high executive downwards, will work with higher efficiency in a private enterprise than in a public one, if in either case they do not profit by the profits they work to produce. The profit motive will operate if the profits accrue to the producers thereof, at least in part, in the form of bonuses, profit-sharing, etc. To the extent this is effected, the distinction between profit-producer and profit-consumer is reduced, if not eliminated.

Much of the discussion on the relative merits of public and private sectors is qualitative and subjective, and not quantitative and objective. Advocates of either side produce partisan evidence to prove their case, like lawyers, but few take a judicial view, like the judge. It is not true that all private enterprises are efficient and profitable, and all public enterprises are inefficient and unprofitable, making the choice easy and certain. Perhaps the most sensible view was presented by Mr. Arthur Gaitskill, till recently the Chairman of the State Board and Managing Director of the Gezira Irrigation Scheme, Sudan, in his paper submitted to the Study of Human Relations in Industrial Communities in the Commonwealth, held in Oxford in July 1956. He said that his Board "did not get bogged down by emphasising either private enterprise or state enterprise as better because it had some esoteric ideological virtue", but concerned itself with the right objective of raising the standard of living and suited the means to the end. Its success depended on the personality of its promoters and their devotion to social and democratic as well as economic ideals. He added that the main problem of our age, especially in under-developed countries, was not the conflict between state and private enterprise, for both are needed, but whether the state is to be the master or servant of the people. The political is more significant than the economic aspect.

It seems a paradox of democracy that while any citizen, however un-informed or ill-informed, is free to give public expression to his incompetent views and criticise the government, some of the best-informed and most competent citizens like judges and other high civil servants are, because they are government employees, precluded from giving public expression to their views, particularly if they are critical of government. They are no doubt free to submit their candid views to government confidentially through the proper channels and appraise government of them. But in so far as efficiency of democracy depends on well-informed public opinion, it is denied access to one source which has a wealth of knowledge and experience and of wisdom that comes from both. It is a double denial. The civil servant is denied one of the fundamental rights guaranteed by the Constitution, and the public is denied

access to knowledge and experience which it needs to form well-informed public opinion.

In justification of the denial it is often said that if the civil servants differed from their Ministers publicly they would not loyally carry out the latter's policies. This assumption is questionable. In the first place, it is one of the strongest traditions of the service to implement loyally the decisions of government, even if they disapproved of them. Secondly, if so minded, they can even now sabotage them by a great variety of means. The public expression of their differences with the Government will not, on that account, undermine their implementation of the order of their superiors. On the other hand, it will be of the greatest value to the public in the formulation of well-informed opinion, basic to efficient democracy. There is no case for private enterprise simply to overcome the political disadvantages of public enterprise. It is better in every

way to give civil liberties to civil servants.

While the economic differential between private and public enterprise has lost much of its validity today, the political differential is as valid as ever. As a rule, employees are not permitted to criticise their employers in public. The greater the number of citizens who are employees of government, the greater the number of citizens who are denied the right to criticise it publicly. In consequence, the more extensive the economic sphere of government, the more the number of government employees, and the more citizens who are precluded from criticising the government. If the state becomes the sole employer, all will be state employees and none shall be free to criticise it publicly. If free enterprise is one of the greater freedoms in a democracy, so is freedom of speech, including the freedom to criticise government. It is also an obligation. The drawback of public enterprise is more political than economic.

The yardstick of value

How can you measure 'Value'?

From the earliest times value has always been measured by comparison with some substance of intrinsic worth, usually gold. This substance becomes the standard or, in a sense, the yardstick of value. People speak of Binny's cloth as 'the yardstick of value' because, from three generations of experience, they know that Binny's cloth is a reliable standard of the best quality in textiles.

TEXTILE INDUSTRIES FAIR

Sponsored by
THE MINISTRY OF COMMERCE &
INDUSTRY, GOVERNMENT OF INDIA

7th. DEC. 1957
6th. JAN. 1958

ADMISSION: • 30nP Adults • 15nP Children below 12 years. HOURS: 3 p.m. to 11 p.m.

Inaugurated by

Shri MORARJI DESAI

Union Minister for Commerce & Industry

ON

7th. DEC. 1957

Venue of the Fair: Nariman Point, Bombay.

An exhibition of textile machinery, stores, auxiliaries, dyestuffs and products of handloom, handicraft and small scale industries.

Special Section: Textile machinery, textile stores, textile auxiliaries, dyestuffs, chemicals and products of allied textile manufacturing industries.

General Section: Cotton, silk, rayon and woollen manufacturing industries, handlooms & small scale industries; Amusement Park, Entertainments, Restaurants, etc., etc.

Economic Report from the U.S.

NUCLEAR POWER PLANTS

(By GUY SIMS FITCH)

WASHINGTON, Dec. 4—The first full-scale peacetime atomic power plant in the United States underwent a successful operating test at shippingport, Pennsylvania, this week—and the news was greeted with quiet satisfaction here in the nation's capital. For this initial test-splitting of uranium atoms marked the major preliminary step to the actual production of commercial quantities of nuclear-powered electricity at shippingport. The target date for full operation of the shippingport plant is set for sometime before the end of this year—well ahead of earlier schedules. A number of additional tests will be made with the reactor (the atomic furnace of the plant) in the next few weeks, according to US Atomic Energy Commission (AEC) officials here, and the power level will be raised gradually. When it reaches full power, the shippingport plant will produce a minimum of 60,000 kilowatts of electricity, and will help meet some of the power needs of the city of Pittsburgh.

Several smaller power reactors already are operating in the United States, of course, and a full-scale plant has been operating for about a year at Calder Hall, in the United Kingdom. The shippingport facility, however, is believed to be the world's first major nuclear station devoted exclusively to civilian needs. While it will be a fully commercial operation, the shippingport plant will be far from competitive, economically, with modern conventional power stations in the coal-rich Pennsylvania area. This was recognized when work on the plant was begun some three years ago. The primary purpose of shippingport then is not to produce atomic electricity economically but to advance reactor technology for peacetime power generation, and this underscores one of the most significant aspects of the US peacetime atomic energy programme.

American companies certainly know how to generate electricity from the atom. But as with other US scientific endeavours, great care is being taken to solve basic problems and lay firm foundations for fruitful progress. The intention has not been to develop and build a particular reactor quickly, as a kind of "show-case" for the rest of the world. On the contrary American industry, working in co-operation with government agencies, has been testing various types of reactors to determine the most practical methods of using fission energy to produce electric power at reasonable cost. As of last September, there were in the United States 14 major nuclear power reactors being built or under study—all recommended as feasible by A.E.C. experts—by 69 electric power companies and projects are destined to produce, when completed, 1.5 million kilowatts of electricity, enough for a city of one million persons. The government is footing a good part of the bill for most of these undertakings, but the companies involved also are earmarking a total of about \$400 million for them. In the case of the \$110 million shippingport plant, the A.E.C. is sharing utility which will operate the station, and the Westinghouse Electric Corporation, which designed and built the

reactor. The lessons learned in constructing the shippingport reactor, particularly in the development of new engineering processes and the fabrication and use of new materials, will be of great help in building other types of reactors for other nuclear stations. Shippingport's heavy steel-plate reactor vessel, or container, for instance, required special welding, machining and heat-treating methods—all involving industrial and scientific pioneering. To build the shippingport reactor—and other reactors, too—engineers, metallurgists and chemists also have been working with new materials, like beryllium and zirconium, capable of withstanding radiation and corrosion. And they have been developing mechanisms that cannot leak or break down. As they continue to meet and surmount problems, American scientists are bringing ever closer the day when nuclear power will be both economical and commercial, and peacetime atomic power plants will be standard arts of electricity-generating systems around the world.

Specially produced for Industry...

WHEEL BRAND Industrial Glycerine

Wheel Brand Industrial Glycerine conforms to the highest standards of quality—quality that has been proved by use in many industries. Guaranteed to contain not less than 98% glycerol.

The Business World:**THE ROLE OF THE TEXTILE INDUSTRY**

By

CROESUS

I DO not know whether the textile interests concerned conceived the idea of the Textile Industries Fair, inaugurated by the Union Minister for Commerce and Industry, Mr. Morarji Desai, last Saturday, with a view to focussing public attention on the cloth situation in the country today generally and on the state of the Indian textile machinery manufacturing industry in particular. But the inaugural speech of Mr. Desai was eagerly looked forward to, especially by the mill interests, for some hopeful indication of the government's mind as to what it proposed to do to resolve the daily worsening crisis of cloth stocks accumulation in the country. Although there was no categorical promise of relief to the mill interests, there was an indirect indication, in a somewhat round about way, when Mr. Desai said that the Government was fully seized of the position, and that it would come to the rescue of the industry, albeit only after making certain that the remedy in view would meet not only the short-term needs of the industry but also the long-term ones. Whatever this may mean, it has served to kindle some hope in certain quarters at least. From the mill industry's point of view as well as from the point of view of the economy of the country as a whole, on the other hand, the effect of the Minister's remarks has been, to say the least, disappointing.

Although I listened intently to the long, and, at times, desultory, speech of the Union Minister for Commerce and Industry on this occasion, I could not help feeling that, even in the highest quarters of Government, there is still rather insufficient appreciation, if not understanding, of the widespread ramifications of the textile industry into the economic fabric of our country. Whether by intent or otherwise, Mr. Ramnath A. Podar, Chairman of the Reception Committee of the Textile Industries Fair, did well to make a pointed reference to these ramifications in the course of his welcome speech. Because of the extreme importance of this aspect of the matter, I make no apologies to reproduce in full the relevant remarks here, in the words of Mr. Podar himself:

"The Textile Industry" he said, "is also the mainstay of the Handloom Industry, which draws its supply of yarn from it, to produce over 1,600 million yards of cloth. The powerloom industry, which produces about 250 million yards of cloth, derives also its sustenance in the form of yarn from the Textile Mill Industry. A Producer Goods Industry like the Textile Machinery Industry and a number of auxiliary enterprises, together with farmers, earn their living by supplying goods to the Textile Mills. The advent of the Dyestuff Industry is largely due to the Textile Industry which is a major consumer of coal-tar dyes. As a natural corollary to the Dyestuff Industry, we have the embryo of a Pharmaceutical Industry which holds out promise of developing into a national enterprise of vast dimensions. A contributory cause to the growth of the Heavy Chemical Industry is the existence of a prosperous and well-established Textile Industry".

My purpose in drawing pointed attention to these remarks is to indicate the potential risks of the Go-

vernment still refusing to do anything about giving relief to the cotton mill industry by way of either a reduction or abolition of the excise duty on cloth. If the industry has to await, as Mr. Desai seems to be contemplating, a well considered remedy to the ills of the textile industry for all time to come, the remedy may be not only too late to prove helpful to the industry but serious damage to the economic fabric of the country may befall betimes. For, the effect of delaying relief to the mill industry is bound to start a disastrous cyclic effect. Thus, if cloth remains unsold, the mills would be obliged to curtail or stop further production; this would mean the cutting down of orders for not only the textile machinery industry, which Mr. Desai has promised to help in every possible way, but a number of industries besides, such as the dyestuffs industry, the pharmaceutical industry, and the heavy chemical industry, among others. Also, the handloom and the powerloom industries may be in danger of insufficient supplies of cotton yarn and all these, in turn, are sure to impinge, in no uncertain degree, on the employment position in the country. Hence the urgency of affording relief to the mill industry.

But this despatch must relate more to the T.I.F. which, as is by now evident to all, is the biggest Industries Fair ever held in the country. I do not think I can improve upon what Mr. Podar has said about the importance and the objectives of this Fair. Said Mr. Podar:

"It is the first time that a Fair of this nature has been conceived and executed on such an elaborate scale. This Fair also fulfils a longfelt want for an organised effort to exhibit what our infant machinery manufacturing industry has achieved during its short existence. It gives, moreover, a comprehensive view of the variety of items that the Textile Stores and Accessories Industries can produce. Displays of this type bring to light the gaps in the industry and throw into relief, against the background of the well-developed industry in the West, our achievements and our shortcomings. To those who have embarked on the field of machinery manufacture, this is a challenge and an opportunity to fight and overcome the odds that beset this infant industry, and strike new paths. It appears to me that, from the point of view of maintaining the machinery production at the highest pitch of efficiency, maintenance of a high standard of manufacture, and from the point of view of the application of new and improved techniques, exhibitions of this nature are essential and should be at least a triennial feature, if not an annual affair".

After this, it is only necessary to say a few words about the textile machinery manufacturing industry. Historically speaking, as Mr. K. K. Birla has observed in an exhaustive article in the comprehensive T.I.F.'s Souvenir, published by the T.I. Fair Committee, this industry is a product of the exigencies of the Second World War. For reasons which Mr. Desai explained, the industry could not make much headway until the attainment of independence by this country. Actually, organised production by the industry began only in 1953, when, for the first time, in a big way, spinning machinery and some processing items were manufactur-

ed here. It is estimated that the production of textile machinery manufacture in India in the year 1953-54 was of the value of Rs. 1.75 crores. As against this, the production in 1956-57 was valued at as much as Rs. 9 crores per annum. This is no mean achievement by any standard of judgment, and it is just as well that the interests concerned should give the credit for this achievement as much to the Government as to the manufacturers of textile machinery themselves. The protection to the cotton textile machinery industry, which has only recently been continued for a further period of three years, that is until December 31, 1960, has not only stopped the import of the machinery of the types produced in this country, thereby saving precious foreign exchange for India, but has also speeded up the pace of collaboration with foreign enterprises which might otherwise have taken years to achieve, as Mr. Podar rightly remarked.

Notwithstanding the progress that the textile machinery manufacturing industry of this country has achieved

ed so far, it is gratifying to note that there is no tendency in the concerned circles to rest on their oars. On the contrary, it is the industry itself that has taken the lead, in active collaboration with the trade and with the blessings of the Government, to take stock of the achievements to date, not so much with a view, be it noted, to patting itself on its back for its past achievements as to be ready and prepared to take on further obligations. 'There remains as yet a great deal to be done; a very substantial area in the sphere of manufacture has yet to be covered', exhorted Mr. Podar. In doing so, the T.I.F. Reception Committee Chairman asked the textile machinery manufacturers not to limit themselves to the production of conventional types but to be alive to vast technological changes that have taken place and continue to take place around us. 'A machinery producer', as he rightly advised, 'should not only be a research worker but he should for ever be a diligent student'. Viewed only thus and thus alone can it be said that there is almost unlimited scope for this industry.

TRADE DELEGATION FROM SUDAN

By

CROESUS

NEGOTIATIONS have begun between the Sudan Trade Delegation which is now in India, and the cotton textile interests of this country in regard to purchase of Sudan cotton. The talks in Bombay, held early this week, in this connection, are but a preliminary to the final agreement that the Delegation and the Government of India are expected to reach shortly in Delhi. Meanwhile, from available reports, the talks with the textile interests do not appear to have begun well enough, in that the Leader of the Sudanese Delegation is believed to have taken up a somewhat firm stand on every one of the points on which Indian cotton and textile interests are hoping to get some reassuring replies from the Delegation.

Now there are two or three points on which India would particularly appreciate a gesture from the visiting Delegation. The first is an arrangement whereby Sudan cotton could be imported by India against payment in Rupees. This is, of course, purely a temporary arrangement necessitated by the acute foreign exchange shortage of this country at present. Although the last word may not have been said by the Delegation on this subject, there are reports in some Bombay cotton circles that Sudan feels hesitant to accede to this — contrary to what Indian interests had been led to expect. While this may be partly due to Sudan's own foreign exchange difficulty, there is a disposition among Indian cotton interests to attribute this rather sudden change of attitude to the recent brisk sales at the Khartoum auctions. Be that as it may, the Leader of the Delegation is stated to have justified his country's alleged inability to accept payment in Rupees by arguing that the pattern of trade between the two countries enables India to acquire more sterling from Sudan by way of exports to that country and that, therefore, India should not grudge utilising the sterling so got from Sudan herself to pay for imports of Sudan cotton.

The second, and a rather ticklish, point would appear to be the question of who should benefit from the recent substantial reduction in the export duty on cotton by the Sudanese authorities. One expected that the Delegation would readily accede to the suggestion of Indian interests that this benefit should go to Indian buyers, especially as Indian buyers did not grudge to take on the burden of the increase in import duty on

Sudan cotton effected on February 28, 1957. However, according to certain cotton circles, the Sudan Delegation was disposed to take a more legalistic view of the contractual obligation and to have insisted that the benefit of the reduction in export duty ought to pass on to the producers of cotton in Sudan.

There is, however, a section of cotton interests who argue that the attitude of the Sudanese Delegation as alleged above is a distortion of the correct position and that the chances are still bright for the conclusion of an agreement that would be mutually acceptable. One devoutly hopes that this section is in the right.

BUSINESS NOTES

OIL REFINERIES: A HAPPY CONCLUSION

WITH THE announcement recently in Parliament about the Government's decision to set up two oil refineries, one in Assam and the other at Barauni in Bihar, an unpleasant tugging draws to a happy close. Not a little of the credit for this compromise belongs to the Burmah Oil Company which has offered a £10-million loan to the rupee company for meeting the foreign exchange requirements of the project. It will be recalled that negotiations were going on between the Government of India and the B.O.C. and Assam Oil Company for quite a long time regarding the formation of a rupee company which would take on the exploitation of oil reserves discovered in Nahorkatiya and other areas in Assam. Under the terms of the agreement now reached, the company will sell its crude oil production to the two refineries which are to be under the public sector. The refineries are to be set up in two stages. In the first stage, 'the pipelines and other related facilities' are to be laid up to an intermediate locality somewhere in Assam. Later, the facilities will be extended up to the larger refinery at Barauni. The decision to commission the two refineries with an intermediate break of a year or so is appropriate inasmuch as, in the initial stages, crude oil would not be available in sufficient quantities to keep both the refineries fully occupied. It is expected that the first refinery in Assam, which would be necessarily smaller than the Barauni refinery for reasons of the limited market, would be on stream in three years.

There is, however, in the present decision something more than merely a compromise between the contending States of Assam and Bihar. It has been estimated that two-thirds of the total share capital of the company, approaching some Rs. 58 crores, is contributed by the A.O.C. and the remaining one-third by the Government of India. Of the Rs. 58 crores, Rs. 18 crores would be absorbed in the production of crude oil and Rs. 40 crores for the laying of pipelines etc. As much as 50 per cent of the entire amount is to be in foreign exchange which will be contributed wholly by the A.O.C. Perhaps more than for other considerations, the decision should be welcomed for the flexibility the Government has shown in regard to the shareholding. But for this change in attitude on the part of the Government, it would have been considerably more difficult to arrive anywhere near a successful solution. The tremendous drain on the country's foreign exchange reserves, and its likely continuance for some time more, has heavily underlined the need for a substantial departure from erstwhile policies. It may not be too much to hope that this agreement is only the first of similar others to follow to cover various branches of India's developmental programmes.

PROSPECTS OF INDO-GERMAN TRADE

THE REPORT of the Indian Trade Delegation to West Germany, which is now available, contains many important points that should receive proper attention at appropriate levels. It is now known that, with all her goodwill for India, West Germany would always like to purchase from the best possible source, irrespective of the origin of the goods of purchase. In this she is no different from other countries which like to exercise caution in developing new trade relations. In other words, West Germany is no easy market for Indian manufactures unless all efforts are put in to overcome their caution. It is, however, of no ordinary significance that there is awareness in West Germany that the present current of trade, which is flowing in almost only one direction, cannot conceivably continue indefinitely. If the position is to be rectified to any degree, it would need promoting imports into Germany of

Indian goods in larger quantities, apart from the other means, of no less importance, of greater investment by West Germany in India. Almost certainly, India's imports from West Germany will continue to increase, which only underlines the necessity of vigorously pushing Indian goods in the German market.

The position as it stands today is largely depressing, notwithstanding the inevitable results of the changing pattern of India's foreign trade. Over the years between 1950 and 1956-57, the position has been changing with amazing rapidity. Thus, 1950 was the last year when India had a surplus balance with West Germany. From then on imports have been multiplying with the result that the balance has been increasingly adverse for this country. More recently, in 1954-55 the adverse balance was of the order of Rs. 25 crores which went up to Rs. 45.5 crores in 1955-56. According to the partly estimated figures for 1956-57, it has leapt up to as much as Rs. 76 crores. On the export side the performance is not altogether happy. In point of fact, it has failed even to maintain the 1954-55 level. Thus, there has occurred a decline in India's exports to West Germany from Rs. 15 crores in 1954-55 to Rs. 14.8 crores a year later, and further to Rs. 14 crores in 1956-57.

To say that the growing industrialisation in the country absorbs larger quantities of goods exported hitherto, like groundnut oil, manganese and iron ores, only partly explains the decline. Not even the import regulations in West Germany provide a full answer. There are some items like tea, coffee, cotton, wool, tobacco, among many others, to which no import control applies. There are others like cotton piecegoods, leather, wool and art silk fabrics, etc., in the export of which India is interested but has not been able to utilise even the not very liberal quotas allotted under the existing Indo-West German Trade Agreement. Obviously, the scope for expansion of Indian exports does exist. It is not necessary to work only for direct exports which has its advantages as well as disadvantages. What is necessary at the present time is to concentrate on expansion of exports, whether these be direct or indirect. Perhaps the most important method would be to conduct market research in order to determine German tastes and requirements, and endeavour to supply goods accordingly.

CONSERVATION OF FOREIGN EXCHANGE THROUGH SHIPPING

SIR A. RAMASWAMY MUDALIAR has made definite suggestions for the conservation of foreign exchange through expansion of Indian shipping as well as its more intensive employment in the course of his presidential address at the recent annual meeting of the India Steamship Company. He has made out a strong case for the grant of development rebate on shipping, at the higher rate of at least 40 per cent (in place of the current 25 per cent) to equate it with the recently enhanced rate in the UK. He has, likewise, argued with cogent reasons that foreign exchange difficulties should not be given the same weight in the development of shipping as in other development projects, for the obvious reason that the potential of shipping to earn direct foreign exchange is unquestionably high. Both these matters touch long-range policies and it is hardly expected that immediate decisions will be taken on them. Their inherent force does not diminish for this reason.

But it is in the sphere of Government's discretion as a bulk shipper that Sir A. Ramaswamy Mudaliar's sound plea for intensive utilisation of Indian shipping ought to find ready acceptance. He has dilated at some length on the contracts which the State Trading Cor-

ALLWYN, India's leading craftsmen in steel, enjoy a nationwide reputation for quality products. National sales bring down prices, naturally.

poration has entered into for the export of bulk commodities on an f.o.b. basis. This basis yields complete power to the foreign importer to exclude Indian shipping from our export trade and patronise shipping of his choice. Following the widely prevalent practice, it is not difficult for the State Trading Corporation to secure, on a reasonable basis of understanding, definite terms in its trade contracts, whereby employment of Indian ships in the transport of our export commodities can be secured. In this specific matter there will be definite additions to our invisible earnings of foreign exchange. The Chairman has made a timely and pointed reference to an impending threat to the prospective interests of Indian shipping. The Government is reported to be considering actively a proposal for chartering ships, presumably owned by foreign concerns since Indian companies have no charter services as such, on the ground that charter rates are lower than liner rates. This assumption is open to question. But apart from this consideration, as the Chairman has pointed out, it may be possible for members of the conference lines to offer special quotations, provided Government guarantees shipments of required quantities. It is to be trusted that Government will take serious note of the Chairman's suggestion that Indian shipping concerns should be consulted at a departmental level before making commitments on shipping contracts with foreign concerns on Government account.

SUGAR EXPORTS

THE POINTED reference to the problems of sugar exports by Mr. F. Edwards, President of the Deccan Sugar Factories' Association (D.S.F.A.) in his speech at the eighteenth annual general meeting of that body, held this week in Bombay, is both pertinent and timely, by reason of the prevailing trends in international sugar trade. Due to declining world sugar prices, the prospects of sugar exports from our country are not at all bright. In fact, export of Indian sugar seems well-nigh impossible, except at a price very much lower than that prevailing in the domestic market today. It is, therefore, imperative that the Government should formulate, as Mr. Edwards suggested, a policy whereby manufacturers could be induced, "perhaps with some incentives by way of tax and cess concessions, to sell their sugar overseas and thus earn some much-needed foreign exchange for the benefit of the country as a whole".

Apart from providing such fiscal concessions for exports, there is yet another—perhaps a more important—problem to be tackled. It is that of reducing the cost of production of sugar in India. Without this, there is every chance of other countries pricing India out of all markets, as their cost of production is but a fraction of our cost of production. Accordingly, "concentrated and intensive research is needed", as the D.S.F.A. Chief declared, "to ensure that the proper heavy-yielding variety of cane is found to suit the particular qualities of soil in different areas". In other words, Mr. Edwards was stressing the important point that sugar is made on the field. Along with this, irrigation and cultivation methods also must be studied. Such methods have not only been studied but implemented, and have actually produced good results, in the factories of Deccan. But this should be followed in other parts of the country also, so that the attainment of the production target of 22.5 lakh tons set in the second Five-Year Plan may not become an unduly uphill task.

CONFERENCE ON TRANSPORT

THE TWO-DAY session of the Transport Conference attended by all the important official and non-official transport interests under the auspices of the Federation of Indian Chambers of Commerce and Industry has some

positive achievement to its credit. The major achievement is to be seen in an important policy pronouncement made by Mr. Lal Bahadur Shastri in his inaugural address. He announced that the Government was determined to give content to the powers it had assumed to set up an inter-State transport commission. The implementation of these powers would speed up co-ordination and regulation of inter-State transport. Many of the present barriers to inter-State transport would be removed as the Central Government utilises its authority and good offices to bring a sense of urgency in their solution. In so far as clearing up the arrears in transport development was concerned, Mr. Shastri had hardly any definite proposals to announce. It is certainly regrettable that the Government does not even now appreciate the importance of giving the much-needed incentive to motor goods services. Adverting to the demand for a moratorium on nationalization of motor freight services until the end of the third plan, the Transport Minister merely stated that Government was keeping an open mind on this question and it would give it due thought before the present plan comes to an end. This is nothing but an attitude of procrastination. Since railway traffic capacity cannot be raised to respond in full measure to the pressure of demand, it is urgent that road transport services should be strengthened without loss of time in dilatory consultations.

The chairman of the conference has drawn attention to an important issue which has come up in recent discussions of transport problems, namely, that since railways are capital-intensive it would be worth while to give greater attention to the expansion of motor transport. No controversy of competition between the two now exists because shortage of transport is going to prove a challenge to both these major modes. Besides highlighting important transport problems, the conference has made a strong plea for giving priority to the provision of missing links and bridges on the national highways, encouragement to indigenous automobile manufacturers for the production of trucks, bank credit to operators of goods services for purchase of vehicles and a definite start with truck-trailer services to maximise the use of vehicle capacity. In one important respect, however, it is difficult to subscribe to the plea made by the conference. It has recorded its view that, in consequence of the inadequacy of resources, railway transport capacity should be increased by improving operational efficiency rather than by increased capital outlay. This view exaggerates the potentiality of higher operational efficiency to close the gap in rail capacity.

U.S. CENSUS OF AGRICULTURE

THE NATIONAL Industrial Conference Board's analysis of the last quadrennial census of agriculture in 1954—a census released earlier this year—shows the trend is towards larger and more efficient farms with more intensive mechanisation permitting greater output with fewer workers. Another trend is a rise in farm owners and a decline in farms operated by tenants. Farm owners rose from 57 per cent of total operators in 1935 to 75 per cent in 1954. At the same time, tenant-operated farms declined from over 40 per cent in 1935 to less than 25 per cent in 1954. The analysis indicates that the bulk of the decrease in the number of farms has occurred in the 10-acre to 179-acre group. The number of farms in the 1,000-acre-and-up category rose 8 per cent from 1950 to 1954, while farms in the 500 to 1000 acre group increased 5 per cent. The reduction in farms has been confined chiefly to small, low-income units, and the land thus abandoned has generally been put to more efficient use by integration with other farms.

Appearances...and a pair of pears

PEARS, like appearances, are deceptive. You can't tell their quality by gazing at them. Moral: If you're buying pears, taste them first.

But testing by tasting gets you nowhere if, for instance, you are buying soap. For that (and most packaged goods, too), sensible shoppers have a surer guide to quality: they go by a name they can trust, a brand they have used and found reliable.

For nearly 70 years, people have trusted Hindustan Lever products because their high quality has been unvarying. And they trust because we test.

At Hindustan Lever, we examine *all* our products at *every* stage of manufacture. We make sure that they stand up to storage: we 'create climate' in a laboratory to observe them under all weather conditions. We check their performance by using them as you do in the home.

All this means 1,200 tests a week on products like Lifebuoy Soap, Dalda Vanaspati and Gibbs SR Toothpaste—familiar products because they are so widely trusted, and trusted because they are tested.

Hindustan Lever serves the home

HLL 5-122

The International "500" at Monza, Italy, was famous for tyre safety as well as speed. The same quality control and the same manufacturing skill built into those race winning tyres are the things that create that extra safety you too can have by fitting Firestone "family type" tyres on your car.

COMPANY AFFAIRS

THE CENTRAL PROVINCES RYS. CO., LTD.

The uncertainty of Wealth Tax in respect of the Central Provinces Railway Company Ltd., is reflected in the large carry-over from the Company's latest accounting period, 30-9-57, despite the very satisfactory results of working during that period. Thus, gross earnings from both coaching and goods traffic during the period under review are the highest in either case, for the past three years. Indicative of the pressure on railway transport is the number of passengers which, in fact, reached the record figure for the past five years of 2,020,899.

Although worked by Private enterprise, this railway company has contributed Rs. 1,82,567 to the Government, being the latter's share of surplus profits for the year of report in addition to taxes which may amount to over Rs. 3½ lakhs (The actual provision made is Rs. 3,57,691, an increase of Rs. 1,14,134 over the previous year). The net profit after all these payments and provisions is Rs. 2,50,060. An 'ad interim' dividend of Rs. 4 per cent per annum has already been declared and a final dividend might also have been possible but for the possible contingency of Wealth Tax. Although the directors are clear in their own minds that, inasmuch as "the property in the various assets acquired by the Central Railway out of the funds provided by the Company does not vest in the latter", Company prudently is not liable to Wealth Tax, they have decided to carry over the entire balance of profit pending a clear ruling from the concerned quarters.

INDIAN CABLE CO., LTD.

The Company has shown a marked improvement in the working during the year ended March, 1957. The Sales have increased to Rs. 697.5 lakhs against Rs. 614.5 lakhs during the previous year. The Net profit, after making provision for Taxation, Depreciation, and contingencies amounts to Rs. 49.6 lakhs. Provision for Depreciation and Taxation is also higher at Rs. 15.77 lakhs and Rs. 79.5 lakhs against Rs. 14.5 lakhs and Rs. 68.0 lakhs respectively for the previous year.

An amount of Rs. 10.0 lakhs has been transferred to General Reserve and another amount of Rs. 5.0 lakhs has been Reserved for Replacement of Fixed Assets. A Dividend at the rate of 12½ per cent per annum and cash Bonus at the rate of 2½ per cent per annum, free of Income Tax, has been proposed to be paid on both Preference and Ordinary Shares. A balance of Rs. 41.8 lakhs is being carried forward.

During the year there has been a further increase in the value of fixed assets, although to a lesser extent than in the preceding year due to the fact that the main factory expansion projects are nearing completion.

Adequate provision has been made by the Company for amounts which will be payable to the staff under on Retiring Gratuity Rules. Due to the stringent financial conditions it has been thought prudent to increase the provision for Bad and Doubtful Debts by Rs. 10.0 lakhs.

Apart from the normal annual increase in the case of salaries and wages which is to be expected in the expanding company like this, the balance sheet shows

the full expense of the Sales organisation compared with that of only three months in the last Accounts.

THE KARWAR ELECTRIC SUPPLY AND TRADING CO., LTD.

This is still an infant electricity supply undertaking, the nine-month period under report (period ended March 31, 1957) now published to conform to the Indian Electricity Rules, 1956 being only the third year of the actual working of the Company. Even so, the Company shows a profit of Rs. 9,476, after providing for interest, Managing Agency remuneration and office allowance, as also a part of depreciation amounting to Rs. 8,772, as against Rs. 45,479 required to be set apart under provisions of the Electricity (Supply) Act.

The Company added a third small generating set and, with the installation of this set, the powerhouse has begun to function for 18 hours a day.

The difficulties for finance, especially for small electricity undertakings, are reflected in the case of this small and infant concern. Although the amounts needed by these companies may be small and could be met by the issue of new shares, it is obligatory, under Section 81 of the New Companies Act, first to offer any such new shares to the existing shareholders. While the idea underlying this insistence is no doubt understandable, there are two snags, namely, (1) of delay in at least securing the funds required and (2) a forced concentration of shares in the hands of only a few.

COMMODITY NEWS AND NOTES

PRODUCTION OF CHROMITE IN INDIA

The production of chromite during the quarter ending September, 1957 was 12,318 tons, according to the Indian Bureau of Mines. The figure represented an increase of 4,134 tons compared to the output in the corresponding quarter of 1956. Orissa, which is a leading producing State, accounted for 9,942 tons while output from Mysore and Bihar States totalled 1,903 and 473 tons respectively. The production of chromite in India during the period January-September, 1957 was 56,794 tons as against 40,215 tons in the corresponding period of the preceding year.

INCREASED PRODUCTION AND CONSUMPTION OF COTTON

The Minister for Commerce, Shri Nityanand Kanungo, revealed in the Rajya Sabha that the production of cotton in India in the 1956-57 season was 51.2 lakh bales, an increase of 4.2 lakh bales over 1955-56. Shri Kanungo said that the consumption of Indian cotton by mills increased to 46 lakh bales during the same period from 43.7 lakh bales in the previous year. The consumption of foreign cotton by mills during 1956-57 was 6 lakh bales — almost at the same level as in the previous year. About long staple cotton, the Minister said that India now produced 1.5 lakh bales of cotton of staple length from 1" to 1-1/16". The entire quantity was consumed by the Indian mill industry and the dependence on imports of foreign cotton had been reduced to this extent. Efforts were being made to grow more long staple cotton to reduce this dependence further. It might, however, still be necessary to import considerable quantities of Egyptian and Sudanese cotton varieties which were in a class by themselves and which, for the present, at any rate could not be produced in India owing to soil and climatic conditions.

INCREASE IN IRON ORE OUTPUT IN SEPTEMBER

Output of iron ore in India increased from 341,396 tons in August to 373,794 tons in September. Returns received from the Chief Inspector of Mines in India from 95 mines during September showed that 258,850 tons were despatched to the iron and steel plants and 88,349 tons to the export market. Iron ore stocks at the end of the month were estimated at 1,332,711 tons.

IMPETUS FOR EXPORT OF SUGAR PRODUCTS

In order to give impetus to the export of sugar products, the Government of India have further simplified the procedure for the grant of rebate on excise duty on the sugar used in the manufacture of these products. The special features of the procedure are:-

- (1) The manufacturers of such products will not be licensed but the exporters will have to get themselves registered with the Collector of Central Excise in whose jurisdiction such exporters conduct their business. The concession of rebate is confined to sugar products manufactured in accordance with the provisions of the Fruit Products Order, 1955.
- (2) The sugar for the manufacture of sugar products need not necessarily be purchased from the excisable factory direct.
- (3) The condition regarding identity of sugar used in the manufacture of the sugar products with the duty-paying documents, has also been relaxed and no special accounts for that purpose will be necessary.
- (4) The exporters, after registration in the prescribed manner, will prepare an application for export, obtain the certificate of the customs authorities that the Sugar Product has been exported, and present it together with shipping document etc. to the Collector of Central Excise, designated for the purpose, for grant of rebate in cash or by cheque.

(5) The Sugar Products, and the rate of rebate admissible, on their export, are as follows:-

Sugar Products	Rate of Rebate
(i) Mango Chutney containing not less than 50 per cent of sugar by weight.	Rs. 5.35 per cwt. of such product.
(ii) Jam and Jellies containing not less than 60 per cent of sugar by weight.	Rs. 6.40 per cwt. of such product.
(iii) Canned Fruits in Syrup containing not less than 16 per cent of sugar weight.	Rs. 1.70 per cwt. of such product.
(iv) Squashes containing not less than 40 per cent of sugar by weight.	Rs. 4.30 per cwt. of such product.

(6) The concession of rebate under the revised procedure will not be available for export of such products to Nepal, or for export by parcel post to any country, including Nepal.

For further details the exporters may contact the Collector of Central Excise of their area.

EXPORTS OF TEA

The Minister for Commerce, Shri Nityanand Kanungo, replying to a question by Shri Raghunath Singh and five other Members in the Lok Sabha recently, said that the exports of tea from India during the period January to September 1957, did not indicate any fall compared with the average during the period January to September of the four preceding years. Shri Kanungo said, the tea exports during the first nine months of this year were 302 million pounds. Exports during the same period in 1953 were 315.5 million pounds, in 1954, 273.1 million pounds, in 1955, 259.5 million pounds and in 1956, 352 million pounds. The Minister said that while Government did not consider that the situation was so alarming as to call for any immediate specific action, efforts were continually being made on general lines to achieve an overall improvement in exports.

The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Owned by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

INDIA STEAMSHIP COMPANY, LIMITED

Address of

Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon).

Delivered at the Annual General Meeting of the Shareholders of the Company, on December 6, 1957.

Gentlemen,

The Directors' Report shows that the freight earned during the year was Rs. 6,00,17,168 as against Rs. 5,26,11,831. The freight carried in the Liner trade was 4,88,266 freight tons as against 5,07,773 in 1956. The total number of round voyages made during the year was 22½ as against 26½ in the previous year. The less number of voyages is accounted for by the fact that owing to the closure of the Suez Canal the ships had to go the round Africa instead of coming through the Mediterranean. The higher freight earned in spite of the fewer voyages is to be attributed in part to the fact that our modern ships are faster and partly to the surcharge on freight rates consequent on the longer voyage entailed. The delay at ports continued as in the previous year and the turn-round of the ships took a much longer time than should normally be the case. It must therefore, be a matter of satisfaction to you as it is to me that in spite of these handicaps the Company made a net profit of Rs. 1,07,21,588 after providing for depreciation.

PROGRESS

I referred last year to the two ships — 'Indian Resolve' and 'Indian Resource' which had been added to our fleet, one in March, 1956 and the other in June, 1956. Since then another ship the 'Indian Splendour' which was delivered in May, 1957, has augmented the fleet. We have thus at present twelve ocean going vessels and one Coastal vessel. Another ship is being completed in the German shipyard and it is expected to be delivered towards the end of March, 1958. The Company has ordered a further four ships, two of which are expected to be delivered at the end of 1958 and two at the end of 1959. They will be built at the same German Shipyard. Besides these the Hindustan Shipyard Private Ltd., has an order from the Company to build a vessel of 5,500 tons, the keel of which is expected to be laid shortly.

SOME PROBLEMS OF INDIAN SHIPPING

(a) **Development Rebate** — The Shipping Industry of any country engaged in Overseas trade is subject to world-wide international competition. It cannot be protected or safeguarded by tariffs or quota limitations as the industries of a country can be. I have referred in previous speeches to the assistance given by several countries to their National Marine. This assistance takes various forms from downright operational subsidy to loans without interest and exemption from taxes. We are thankful for the loans that the Government of India have granted to Indian Shipping at a comparatively low rate of interest and the Develop-

ment Rebate of 25 per cent which has been sanctioned. The cost of obtaining new ships which can fairly stand comparison in speed, in cargo handling facilities and in other directions is increasing and bears no relationship to the cost only a decade back. If Indian Shipping interests represent to the Government of India that further consideration may be given to questions like Development Rebate, it is in no ungracious spirit that the request is made. The Government of the United Kingdom have in the last Finance Act raised the Investment Allowance (which corresponds to the Development Rebate) from 20 per cent to 40 per cent in order to maintain the Mercantile Marine of the country in the best possible state of adequacy and efficiency. I trust that taking a long range view of the position of Indian Mercantile Marine, our Government would give consideration to the question of equating the relief in this direction with at least that given to the most powerful National Marine of the world.

(b) **Expansion of Shipping** — Shipping companies all over the world have adopted as a basic policy of existence, the continued and phased programme of adding to their tonnage not merely to replace ships which have to be scrapped or sold as uneconomic units for their trade but also to meet the legitimate needs of shippers. Your Company has made a modest programme of phased expansion, to meet both these needs. There are difficulties of foreign exchange which, seem to come in the way of Government's consideration of assisting such expansion, notwithstanding its sympathy. Shipping companies have pointed out with considerable force that they earn foreign exchange far more rapidly than any other local industry and that such earnings — invisible income as it is called — form the hard core of the solution of the balance of payments in many countries. They have also suggested that for the time being the foreign exchange earned by Indian Shipping may be earmarked for the development of Indian Shipping both Coastal and Overseas.

(c) **State Trading Corporation and Shipping** — Indian Shipping companies have been very much concerned to learn, with what exactness it is difficult to state, that the State Trading Corporation contemplates entering into their field and has otherwise seriously jeopardised their interests. I offer no opinion on the policy of State trading though at the inception it related to inter-governmental trading only. I am concerned only with that aspect of the State Trading Corporation's activities which cuts across or impinges on the legitimate interests of Indian Shipping. Indian Shipping Companies have constantly addressed the Government to have their point of view represented before trade agreements involving shipping are con-

cluded. It is a matter for regret that while shipping interests are closely kept in touch with various issues facing the Government like the Suez Canal crisis, in the United Kingdom, Holland, Italy, France and Germany and while their advice is sought on all occasions Shipping interests in India are not taken into confidence by Government and not consulted on such issues as deeply affect them. It is most desirable that in tackling these shipping problems Government Departments should take into confidence the Indian Shipping companies who have undoubtedly wide experience in these matters. It is understood that in some cases at least the State Trading Corporation has made contracts for the sale of bulk commodities such as ore on an f.o.b. basis which means that the importing country can completely shut out Indian Shipping in such trade. I trust that this subject will receive consideration by the Government at the highest level.

Another issue that has confronted the Shipping companies is the proposal stated to be receiving active consideration, of Government chartering ships to carry the export and import trade organised by the State Trading Corporation. That this cuts across the principle so clearly and emphatically laid down by the Transport Minister last year will be obvious. The Hon'ble Minister for Transport said 'I may state very clearly that it is not our intention that shipping in the public sector should run in competition on routes in which existing private shipping companies have established themselves.' When it is added that these chartering activities of the State Trading Corporation may even cut across those of shipping in the public sector itself, the position becomes so Gilbertian that further comment seems to be needless.

It has been suggested that the rates charged by Conference Lines are greater than the rates obtainable through chartered tonnage. In the first place Indian Lines, it can be proved beyond dispute, have successfully fought for lower rates in the interest of the trade of the country and have brought about reductions in such rates. Secondly, it can be equally clearly demonstrated that till recently chartered tonnage was far more costly than tonnage carried by Conference Lines and Government or the shippers have been spared the payment of vast sums of money by entrusting the freight to Conference Lines. Thirdly, it is always possible to get a special quotation from Conference Lines if Government gives a guarantee of shipping only through Conference Lines their required quantities. Lastly, it must be clear to Government as a shipper of large tonnage over a long period that it cannot adopt the policy of some occasional shippers who take a short range view and try to obtain a small initial advantage by resorting to charters when charter rates are comparatively low.

Shipping companies have pleaded more than once that a co-ordinated and consistent policy may be adopted by all departments after full consultation and that shipping interests may have the opportunity of giving their experience and placing their knowledge at the disposal of the departments concerned at an inter-departmental conference. I hope fervently that such a conference will be held to the mutual advantage of both interests.

FOREIGN SHIPPING AND RESTRICTIVE PRACTICES

I have so far referred to internal factors and policies. These assume even a more grave aspect when they are considered in conjunction with the handicaps of Indian Shipping through the restrictive practices which foreign shipping adopt without logic to protect vested interests. The Indian trade is a happy hunting

field for the foreign shipping of numerous countries. Neither their initial entry into the Indian trade nor the extent of shipping tonnage employed by some of them has any relationship to the trade subsisting between India and such countries. In fact some of them have hardly any interest in such trade and yet the fleet that they employ and their ever increasing demand for the employment of more tonnage is in inverse ratio to the interests that their nations have in the Indian trade. The problem has assumed serious proportions and the stage has come when it should be firmly tackled. The exclusion of Indian Shipping from the trade of countries like Burma and Ceylon, from the trade from ports on the direct route to the United Kingdom and the Continent such as Aden, Port Sudan, Alexandria and onwards, has been mentioned more than once. The rejection of the application of Indian Lines for membership of these truncated conferences has been 'justified' on the ground that there is adequate tonnage serving these trades; yet when it comes to the Indian trade approval is readily granted to more and more Lines coming in or increasing their fleets notwithstanding the fact that there is often over tonnage in the trade. It is a situation that cannot and ought not to be tolerated further. If the policy of freedom of the seas is accepted it should be real and effective and should not be used for protecting vested interests.

THANKS

We owe a debt of gratitude to Shri Lal Bahadur Shastri, the Minister of Transport whose re-entry into the Cabinet we heartily welcome and whose acceptance of the Transport portfolio we specially appreciate. His interest in Indian Shipping is deep and abiding and we are grateful for such interest. We also welcome Mr. Gupta the Secretary of the Department who has experience of shipbuilding and so of Shipping. We are thankful to other officers in the Secretariat to Dr. Nagendra Singh the Director General of Shipping, his deputies and assistants from whom we have continued to receive advice and assistance.

Cambodia

Birthplace of the ancient empire of Khmer. This empire, founded by a race from India, grew into prominence as a nation in the early 5th century A.D. Many fine architectural examples of this highly civilized race have been rescued from the ever-encroaching forests. With the exception of some magnificent monuments, all traces of this great empire have long since vanished and the Cambodians today are more akin to the Siamese as can be seen by the style of their national costume. This consists of a piece of material which is gathered at the waist forming a trouser-like-skirt. An embroidered jacket or coloured draping covers the bodice, leaving the shoulders and arms bare.

There is no end to the variety of costumes all over the world.

Summary of Regulations on Southeast Asia's Foreign Capital Introduction

	Legal Sources	Restrictions on Investment Objects	Restrictions on Foreign Shares	Transfer of Profits and Repatriation of Capital	Requisition or Expropriation
Formosa	Statute for Investment by Foreign Nationals (1954)	Limited to enterprises connected with the domestic or export industry, or conducive to the development of important industries or public utilities, or to the improvement in technologies.	—	Investors may apply for the transfer of profits and the repatriation of capital up to 15% annually of the total capital invested except during the first two years.	Enterprises with foreign capital amounting to 51% and more of the total will not be expropriated or requisitioned.
Cambodia	Loi d'Investissement des Capitaux Etrangers (1956)	Limited to enterprises conducive to the economic development of the country.	Max. 50%	Profits may be transferred up to 8% of the total capital invested, and capital repatriated up to 6% except during the first three years, both of which will be raised up to 20% in the case of liquidation and concession.	Authorized investment will not be requisitioned for the first 10 to 20 years.
Philippines (a)	Constitution and Memorandum of Central Bank	The disposition, exploitation, development and utilization of the natural resources shall be exclusively reserved to Philippine citizens, and corporations or associations at least 60% of the capital of which is owned by such citizens. The above right will be extended to the American investors for a period not beyond July 1974.		Profits may be transferred from 10% up to 25% of annual net profits. Capital may be repatriated up to 20% annually except during the first five years.	
Indonesia (b)	Statement of Government (1955)	Not authorized for social public utilities and traditional small industries.	Max. 49% for basic industries.	Transfer of profits after deduction of taxes and capital repatriation are authorized.	Enterprises with foreign capital will not be nationalized without owner's consent.
Burma	Constitution and Investment Policy Statement	Not authorized for major public utilities and munitions manufacture.	Max. 40% for extraction, development, or utilization of natural resources.	Foreign remittance of dividends and current earnings, is authorized, and the repatriation of capital will be allowed over a reasonable period of time.	Authorized investment will be guaranteed against nationalization over the first 10 years.
India	Statements of Government (1948, 1949, 1950, 1952)	Arms, ammunitions, atomic energy and railway transportation are the monopoly of the Government. The Government will be exclusively responsible for the new undertakings in some other fields (coal, iron, shipbuilding, etc.)	The major interest in ownership and effective control must be in Indian hands, but foreign control will not be objected to, if found to be in the national interest.	The Government has no intention of placing any restrictions, but remittance facilities will depend on foreign exchange considerations.	Compensation will be paid on a fair and equitable basis when compulsorily acquired.
Pakistan	Statements of Government (1954, 1955)	—	Max. 60%. The case of public utilities concerns will be considered on merit.	Capital invested in industries after the 1st Sept., 1954 in projects approved by the Government may be repatriated at any time.	Just and equitable compensation will be paid when nationalized.
Ceylon	Statement of Government (1955)	—	The combination of local and foreign capital will depend on the circumstances specific to individual investments.	The Government will permit freely the remittance of profits, dividends and interests as well as the withdrawal of foreign capital.	In the event of compulsory acquisition, investors will be entitled to the fullest compensation.

Notes: (a) Measures pertaining to foreign capital introduction are in preparation.
 (b) A "Foreign Investment bill" is in preparation.

A Call to Confidence

THE annual meeting in Calcutta of the Associated Chambers of Commerce which was addressed by the Prime Minister on the 14th December was significant for the tone of robust confidence in which Mr. W. S. Michelmore, President of the Associated Chambers, chose to look at the confused current economic situation. It was not a small thing, at a time when the internal crisis is deepening, one mark of which is the serious cloth situation, and with the cuts in the plan — some of which were effected in Delhi this week — that a leader of a group of Chambers, in terms of industrial production larger than any other group, should speak of the future as Mr.

Michelmore did. His concluding words were one of appropriate balance in the context of things which are happening in other countries: it is not for us to compare ourselves with countries which are so well advanced as well as those which are so close to recognising at this time that the road through which we are passing is, by a long way, an end of the road affair. Mr. Michelmore said: "On the economic front, although I certainly do not wish to minimise the difficulties which face us at present, India has been very much more stable than many countries which are supposed to be economically much more advanced than we are. In this country the value

nobody can claim the right to know what is happening around.

Mr. Eisenhower, on the other hand, has been more forthright than most people would have imagined. The U.S. President has made a point of profound significance in stating that nuclear test cessation is doubtless laudable, but not enough. Simultaneously with the stopping of nuclear tests should be ended the production of such weapons. A bold and important step would be to agree to devote all future production of fissionable material to peaceful uses. The Soviet Union has yet to agree to such a proposal. Meanwhile, at least to level up with the Soviets in nuclear technology, strategy and prudence dictate that America will need to proceed with the tests. It needs to be properly understood that unless there is some sort of a parity between the two major powers, and especially as long as the advantage lies with the totalitarian bloc, world peace is not secure. It is true that this concern can be felt more in the United States and Western Europe, which face the nozzle end, than elsewhere. Nevertheless, the concern should be shared by all who sincerely desire to attain a lasting peace. President Eisenhower has given sufficient proof of his sincerity to find a solution acceptable to all by his resilient attitude, during the last NATO Council meeting, towards the Soviet Union in regard to disarmament. The declaration that the greatest victory is that in which no side loses was truly in the Buddha spirit. It only needs patient persuasion to make the other side appreciate its meaning.

INTERIM RELIEF TO GOVERNMENT SERVANTS

THE GOVERNMENT of India have just accepted the recommendations of the Pay Commission in regard to interim relief to Central Government employees. The Commission has recommended a further increase of Rs. 5 per month, with effect from July 1, 1957, in the dearness allowance of all Central Government employees drawing a basic pay not exceeding Rs. 250 per month. The interim relief is justified on the ground that in 1957 there was a significant rise in the cost of living. (It may be recalled that on two previous occasions also, in 1949 and in 1951, ad hoc increases in dearness allowance were granted following the then increases in cost of living). It is a welcome feature of the present award that the arrears of interim relief would be paid in National Plan Savings Certificates. It is estimated the amount due in arrears for the six months from July to December at the rate of five rupees per mensem would come to a total of about Rs. 6 crores for 20 lakhs of Central Government employees. The total burden on the exchequer as a result of this interim increase is likely to be a little under Rs. 9 crores during the current year and about Rs. 11-12 crores in a full year. The additional charge on railway receipts would also be considerable as the interim increase in D.A. is being made applicable to railway employees in identical classes.

Left to themselves, the Government servants may well recognise that in the context of this considerable charge on public revenues and railway receipts the interim relief is not niggardly. But unfortunately the reactions of certain labour leaders to this interim award have not been favourable for they would have liked the increase in dearness allowance in accordance with the recommendations of the Central Pay Commission (1956). The Government, of course, could not think of an increase to that extent as that would have resulted in serious deficits in the General and Railway Budgets and intensified the forces of inflation. It cannot also be ruled out that even this small increase in non-developmental expenditure is likely to tell on the second Five-Year Plan to some extent and add to the inflationary pressure. While this may be true, it is also recognised that it is not easy to freeze wages when the cost of living is soaring high. So, if the Government is to meet the demands for wage increases, it must move vigorously towards stabilising the

cost of living. This can be done only by stabilising food prices at their present level or at a slightly lower level. It will also have to think of more economies in its expenditure in as many directions as possible.

INDUSTRIAL UNREST

BESIDES THE foreign exchange difficulties, industrial strikes and lock-outs have of late been responsible to a considerable degree in hampering production and thereby holding the successful execution of the second Five-Year Plan. On account of its repercussions, this industrial unrest has naturally evoked a good deal of attention by all concerned, the employer, the worker and the Government. In the fitness of things the question of industrial unrest was discussed at length in July last at the Indian Labour Conference. To mitigate the industrial unrest, a code of discipline was evolved, which, it is claimed, if implemented faithfully, would go a long way in fostering healthier industrial relations in the country. The code stressed that there (a) should be no lockout or strike without notice (b) no unilateral action should be taken in connection with any industrial matter (c) there should be no recourse to "go slow" tactics (d) no deliberate damage should be caused to plant or property (e) acts of violence, intimidation, coercion or instigation should not be resorted to (f) the existing machinery for settlement of disputes should be utilised (g) awards and agreements should be speedily implemented and (h) any action which disturbs cordial industrial relations should be avoided. The code of discipline by no means implies that the workers cannot go on strike which no doubt is their constitutional weapon for redress of their grievances.

The main cause of industrial unrest is assigned to the unlawful activities of irresponsible labour leaders who have been encouraging the workers to go on strike. Mr. S. P. Jain, rightly stressed, while addressing the thirteenth annual meeting of the Bihar Chamber of Commerce, that these unlawful activities of irresponsible labour leaders need to be effectively controlled. Mr. Jain pointed out "the interested parties seem to be instigating agitation for increase in wages and protest against government's move to conserve resources for national development." Mr. Jain urged that the remedy to set the state of affairs right lies in the successful co-operation of all sections of the people, may it be trade unionists or labour. To achieve that purpose, it was highly essential that the code of discipline agreed be adhere to in letter and spirit. Since industrial indiscipline was often the result of accumulated grievances, it was also necessary that any sense of injustice in workers' minds be promptly corrected. At the same time it was the duty of trade union leaders to lead the way by taking disciplinary measures against those responsible for indulging in any action which may impede production.

FACTS BEHIND FIGURES

Revolving

over 10,000

times

a minute

Round and round whirl the spindles in the spinning frames of India's 419 cotton mills. Averaging a speed of over 10,000 revolutions to the minute, these spindles wind yarn for 5,000 million yards of cloth each year. Under the Second Five Year Plan this output will increase by 3,500 million yards. Ten years ago the Indian textile industry imported almost all their machines; today, Indian machinery manufacturers are increasingly meeting their needs. Texmaco, pioneer manufacturer of cotton textile machinery in India, supplies the complete range of spinning machinery for cotton and staple fibre, designed and built to established international standards in technical collaboration with the world renowned Howa Machinery Limited of Japan.

TEXMACO

THE ITALIAN STEEL INDUSTRY

(From Our Special West European Correspondent)

PARIS, December 15.

THE Italian steel industry is probably the only one that is comparable to India's with respect to size, rate of planned expansion and extent of Government ownership. It is also the most vigorous in Europe, the 'infant prodigy of the Schuman pool'. So, in spite of considerable differences between Indian and Italian conditions, it is one from which something can be learned. Before the war Italy produced 2 million tons of steel a year and she now produces 7 million tons. This is done by an industry that is a mixture of public and private enterprise but in which State control dominates slightly. And it is done in a country that has no natural advantages as a steel producer and where technological ingenuity and relatively cheap labour have had to compensate for grave handicaps. Thus there exist the grounds for a comparison with the Indian experiment.

In the past six years Italy has increased her steel output by 120 per cent, against an 80 per cent increase in West Germany, 42 per cent in France and 23 per cent in Belgium. This phenomenal rate of expansion is not just the illusory percentage increase achieved by any concern that starts from scratch, because in the previous three years, from 1949 to 1952, the Italian industry had already expanded by 72 per cent, which was the same rate of expansion as was recorded in West Germany, then in the stage of post-war reconstruction, and four times the rate attained in France at that time. When Italy entered the six-nation coal and steel pool she was producing 8.5 per cent of West Europe's steel; today she produces 11.5 per cent.

This increased output of steel has both made possible and been stimulated by the general expansion of the Italian economy. Before the war (i.e. when the Fascist armaments industry was at its height) Italy consumed only 2.5 million tons of steel, a figure comparable with India's present consumption, though of course in the smaller country it represented a much higher per capita consumption, about 110 lb. per head per year. Under the triple impulse of the building, automobile and methane gas industries, this consumption has now increased to more than 6 million tons, which is again comparable to the nearer Indian targets. At 286 lb. a head per year this Italian consumption is still small compared with France (660 lb.), Britain (880 lb.) and West Germany (990 lb.), but of course far in excess of any likely Indian achievement for many decades.

Where Italy differs from any other steel producer of any size is that her industry has been built up "against nature". The country has only small resources of iron ore (deposits on the islands of Elba and Sardinia) which supply about half her needs; the rest has to be imported from Goa, Sweden, Turkey, Venezuela, Greece, North Africa, in fact just about anywhere. A more settled arrangement for supplies of ore has been made possible by the State steel corporation buying a 15 per cent share in the French combine Miferna which is to exploit the rich deposits in the Western Sahara. Worse, Italy has no coal: there is a symbolic output of 1.5 million tons against West Germany's 140 million tons. So coal has to be imported, from the USA, Germany, England, France, Russia and Poland; most of it is coked in Italy. Despite these substantial imports of the two basic raw

materials, Italy still has to go looking for pig-iron where she can find it (about half a million tons a year at present, from Austria, Russia, Germany and France), and collect all the scrap she can import from the USA, Canada, France and Germany. In short, whereas she is competing inside the coal and steel pool with the powerful industries situated amid rich raw material sources on both banks of the Rhine, Italy's steel industry is built on massive imports—and yet it has grown faster than its rivals.

To produce steel under such conditions must surely be uneconomic, one would think. But an Italian economist has calculated that every extra ton of steel costs 40 dollars in imported raw materials if it is made in Italy, whereas it would cost 120 dollars if bought ready-made abroad. These figures are an eloquent answer to any attempt to apply liberal division-of-labour arguments to this basic industry. The cost of home-produced steel is roughly equal to the landed cost of French and German imported steel, and prices were low enough to permit a 2000 per cent increase in exports in the last six years: Italy now sells abroad half a million tons a year.

The capital required for this expansion has been collected from all the usual sources: new issues, auto-financing, the American banks, some Marshall aid. But a large part has come from the State, which has a majority interest in the steel industry. The mixed public-private corporation Finsider controls 55 per cent of the steel output (and 65 per cent of the pig-iron output). Finsider holds a majority share in half a dozen steel companies and when these raise new capital the corporation subscribes in proportion to maintain its dominant position. Finsider itself is not a government body but a corporation in which the State owns 55 per cent of the shares and private investors 45 per cent; and Finsider in turn is the steel affiliate of the gigantic State holding company IRI which controls half the engineering industry (notably Alfa-Romeo), 80 per cent of the banking sector, the four major shipping companies, the national radio, as well as a substantial share in the chemical, telephone and transport industries. This ingenious system of mixed private-public ownership in the strategic parts of the economy can be recommended to those in India who think there is no other way to achieve the mixed semi-socialist economy than straight-out nationalisations and departmental industries.

The striking expansion of the Italian steel industry despite natural disadvantages has a multiple explanation. The existence of the coal and steel pool must be mentioned first, for Italy has got more out of this than any of the other five member-nations. It has assured her supplies of German coal and has subsidised her imports of American scrap. The stimulus provided by the general boom in the Italian economy has already been mentioned; here as everywhere else the automobile industry has been the pilot of the economy as a whole and the mainstay of the steel mills in particular. A special aid has come from the natural gas discoveries in Northern Italy, where at Corte Maggiore 5,000 million cubic metres of gas are now produced annually. This gas has not only provided fuel for the steel mills, but the need to store and transport it by pipelines (a pipeline is proposed now to carry the gas to the south of

Steel is the starting point in a country's progress towards economic self-sufficiency. In India today there exists a wide gap between requirements and production of steel. While the present annual production is only 1,430,000 tons, by the end of the Second Five Year Plan the country will need at least 6,000,000 tons a year.

The public and private sectors have joined hands to narrow this gap by the establishment of three new

there will be more tomorrow.

steel plants at Rourkela, Bhilai and Durgapur and by expanding the existing works.

The Indian Iron & Steel Company Limited plan to expand their ingot output to 1,000,000 tons by 1961, as their contribution towards the needs of the nation's ever growing economy.

INDIAN  STEEL

THE INDIAN IRON & STEEL CO. LTD.
Works: Burnpur and Kulti
Head Office: 12 Mission Row, Calcutta.

the peninsula) has set up a demand for steel in large quantities.

Another factor has been the lower level of Italian wages, which are the cheapest in West Europe: 22 per cent less than French steel industry wages and 18 per cent less than West German. Still, wages in the Italian steel mills are much higher than in the rest of Italian industry, one-third higher than the average and a quarter higher than in the engineering and chemical industries. A further cause of competitive strength is the vertical concentration of much Italian industry, connected in part with the interlocking of mixed private-public holding companies described above. Thus the steel Finsider produces is consumed in the engineering industry that Finsider controls, and so, although the cost of raw steel in Italy is slightly higher than in Northern Europe, by the time it has been transformed into cables, cars, ships and washing machines, and has absorbed the lower wages paid in those industries, the finished industrial product is cheaper than north of the Alps. This is not peculiar to the public sector: Fiat produces its own steel, which it sells only in the form of motor-cars. Next, the various units in the Italian steel industry, both private and para-public, are highly specialised: one plant produces only rails, another only large sheets, another only steels for motor-cars, and so on. This division of labour has reduced costs notably and, it is hoped, will limit the effects of a possible recession to certain parts of the industry.

But above all it is technological ingenuity that has

made possible the development of a steel industry in Italy. The emphasis has been on Martin furnaces and electric steel (these account for 94 per cent of the output); the low electric furnaces, of Norwegian origin, are said to be 30 times cheaper than the traditional high furnaces. The technical details of Italian steel-making obviously cannot be gone into here but it should be noticed that while most of these technological innovations are due to Italy's curious position as a steel-maker who has no coal or iron ore but has good sources of electric and gas power, they are also relevant to the manufacture of steel in any out-of-the-way place where the transport costs of one element or another are a difficulty. It is for this reason that the French are much interested in certain Italian innovations because they can be used in the industrialisation of the Sahara, where iron ore deposits exist but at great distances from sources of natural gas and electricity.

Steel, then, is another example of the successes of the mixed industrial economy in Italy—in addition to the efforts of the Italian petrol corporation which has brought a new style into the oil business in the Middle East. It is a mistake to dismiss these interesting forms of semi-socialist State capitalism as an inheritance from the Fascist corporative economy; that, no doubt, provided the foundation, as free enterprise capitalism in turn provided the foundation of the Fascist economy. But in the Italian democracy they have taken on new forms and are today no further removed from free enterprise than they are from straight-out nationalised or departmental industries.

The Story of Oil—

Exploring for oil

It is impossible for anyone to say exactly where petroleum will be found. It accumulates in isolated subterranean traps, and these are what the oil-explorers seek, rather than the oil itself.

It must first be decided where conditions in past geological time have favoured the formation of oil. This is usually land which was once the site of an ancient sea. Having selected a likely area, the next step is to survey the surface, mapping exposed rocks and searching for any oil which has seeped to the surface.

The geologist is all the time patiently searching for signs that could point to the existence of underground rock traps. Traps suitable for an accumulation of oil consist of porous rocks in which the oil (if any is there) is hemmed in on all sides by non-porous rock. Clues to such buried

structures may be found in the banks of rivers and streams, for here the earth's rock layers are often exposed to view, enabling the geologist to calculate their age and measure the directions in which they slope beneath the surface. The rocks may contain the fossilised remains of plants and animals that lived millions of years ago, when crude oil was being formed.

Aerial photographs help the geologist too. They reveal a surprising amount of geological evidence, even in densely wooded country, enabling him to map the differences in rock structure.

When all surface sources of information have been exhausted, the next step in the search for oil is to explore deep beneath the surface of the earth. The science which makes this possible is known as geophysics.

AGRICULTURE

Increased Cultivation of Medicinal Plants: The States which had submitted schemes for cultivation of medicinal plants on an increased scale during the second Plan period were Assam, Himachal Pradesh, Jammu and Kashmir, and Madhya Pradesh. The amount of financial assistance for implementation of the schemes was Rs. 1,33,527 for Assam, Rs. 33,200 for Himachal Pradesh, Rs. 50,000 for Jammu and Kashmir, and Rs. 6,750 for Madhya Pradesh. The main plants which would be cultivated on an increased scale for consumption in the country and for export were Rauwolfia serpentina, Ipecac, Pyrethrum, Artemisia, Belladonna and Digitalis.

G.M.F. Schemes in West Bengal: The reports so far received from the West Bengal Government indicate that the additional production through grow-more-food schemes for 1956-57 was 24,980 tons, and the expenditure Rs. 82.15 lakhs. Complete information, however, regarding additional production and expenditure thereon had not been reported by the West Bengal Government.

INDUSTRY

Schemes for Development of Handloom Industry: A number of schemes for the development of the handloom industry—silk, woollen and cotton—in different States have been approved by the Government of India. About Rs. 82.5 lakhs have been sanctioned by the Union Ministry of Commerce and Industry to the State Governments for implementing the schemes. The schemes envisage, among other things, financial assistance to handloom weavers for their share capital to join weavers' co-operative societies, setting up of dye-houses and sales depots, provision of rebate on handloom sales, and supply of improved equipment to weavers to increase production.

Production of Cloth and Yarn by Mills: The cotton textile mill industry's cloth production in November 1957 is provisionally placed at 429 million yards and yarn production at 146 million pounds. During the first eleven months of the current year the textile mill industry produced 4,877 million yards of cloth and 1,624 million pounds of yarn as against 4,827 million yards of cloth and 1,516 million pounds of yarn during the corresponding period of 1956.

Equipment for Industrial Training Centres: Equipment worth Rs. 21.7 lakhs has so far been received under the Point IV Technical Assistance Programme of the USA and supplied to various industrial training centres and institutes in the country. The equipment is being utilised to provide training to craftsmen trainees. The total amount sanctioned for equipment to be obtained under the Point IV Programme is about Rs. 30.87 lakhs. Equipment from the USSR under the UN Technical Assistance Administration was yet to arrive in the country. The actual amount sanctioned under this programme was Rs. 20 lakhs.

Copper Enamels: The Central Glass and Ceramic Research Institute, Calcutta, has developed enamel compositions which have given comparable performance for application on copper metal. These compositions have been developed as a result of systematic investigations. The new technique has completely eliminated the use of toxic substances like lead oxide and arsenic oxide and the necessity of employing the time-consuming techniques. The enamel compositions so far

in use have been known to consist almost entirely of lead arsenate, the use of which is risky not only to the consumers, but also to the workers handling poisonous raw materials at different stages of manufacture. Also, the technique of manufacture so far employed requires a high degree of skill on the part of the operator. Vitreous enamels for use on copper metal find wide application in the manufacture of indicating instruments and meters which require dials. The most common examples are the clock dials, the telephone dials, and water-meters and electricity meter indices, which have so far been entirely imported into the country. Although no authentic figures are available, the value of enamelled copper articles imported may be estimated at about Rs. 3 lakhs per year. Parties desirous of undertaking the commercial development of the process are invited to correspond with the Secretary, National Research Development Corporation of India, Mandi house, Lytton Road, New Delhi-1.

TRADE

India has Trade Agreements with 24 Countries: India has Trade Agreements or trade arrangements with 24 countries in Asia, Africa, Europe and other parts of the world. The countries are Afghanistan, Austria, Bulgaria, Burma, Ceylon, Chile, China, Czechoslovakia, Egypt, Finland, East and West Germany, Hungary, Indonesia, Iraq, Italy, Norway, Pakistan, Poland, Rumania, Sweden, the Soviet Union, North Viet-Nam and Yugoslavia. The agreement with Chile was the first of its kind concluded by India with a country in North or South America. A recent publication issued by the Ministry of Commerce and Industry contains the texts of all the Trade Agreements concluded and the letters exchanged between representatives of the Government of India and the country concerned until the middle of August 1957. The lists of commodities mentioned in different agreements are also included in the publication. A number of agreements provide for payment for imports into India in Indian rupees, convertible into sterling.

Indo-German Co-operation in Trade and Industry: An Economic Council has been set up by the Indo-German Society of Stuttgart to promote Indo-German co-operation in the fields of commerce and industry and to devote special attention to the requirements of Indian trainees in Germany. The Council consists of some leading industrialists, bankers, business men and publicists.

Indo-British Trade: Separate returns issued by the Board of Trade in London show a continued favourable trend in Britain's trade with India at the end of October this year, when imports into the United Kingdom increased by more than £12,000,000 and exports to India by over £6,000,000 compared with the 10 months ended October 31, 1956. The figures were £131,998,077 for 10 months imports into Britain during 1957 compared with £119,181,965 during the same period last year. Exports to India were worth £147,998,224, last year's figure being £141,332,846. By the end of October, Britain had imported nearly as much tea as her total purchases in 1956; these imports were more than £14,000,000 higher in value than the figure for the first 10 months of last year. The figures were: £68,257,703 at the end of October 1957; £53,754,230 at the end of October 1956; and £68,892,724 at the end of December 1956. Miscellaneous textile manufactures showed a slight increase from £10,231,125 during the period under review last year to £10,400,452, while cotton yarns and woven fabrics rose by nearly

£2,000,000—from £6,691,569 to £8,627,200. British purchases of animal and vegetable oils continued their downward trend from £7,692,699 last year to £3,403,030. However, "miscellaneous animal and vegetable crude materials" were still in demand and rose from £3,509,311 to £3,782,560. Leather and leather manufactures, too, improved from £10,115,238 to £11,525,798, and hides and skins from £397,593 at the end of October last year to £469,323. Other commodities which the United Kingdom purchased from India showing increases on last year's figures were: crude fertilizers and crude minerals, excluding fuels, £1,871,182 (£1,521,387 in 1956); metalliferous ores and metal scrap, including manganese ore, £3,796,338 (£2,171,678); miscellaneous textile fibres, £1,083,437 (£794,412); and wool and other animal hair and tops, including raw sheep's and lambs' wool, £3,976,673 (£3,665,384). Cotton purchases showed quite a substantial drop from £3,198,399 at the end of October 1956 to £2,077,969 on October 30 this year. India continued to show interest in industrial goods, and she bought £38,057,070 worth of machinery (other than electric) during the period under review as compared with £37,721,497 in the same period last year. Her purchases of electric machinery, apparatus and appliances increased from £18,024,635 to £19,016,290, but those of railway vehicles dropped from £5,899,708 to £5,259,971. On the other hand, India's purchases of road vehicles and aircraft increased from £9,860,539 to £14,332,490. India, however, bought less chemicals during the period under review—£14,729,000 compared with £15,403,962 in 1956. Her purchases of rubber manufactures also dropped to £915,722 from £956,399.

FINANCE

Excise Rebate on Cotton Fabrics: With a view to giving impetus to the exportation of typewriter ribbons, Government have decided to grant rebate of excise duty on the Cotton Fabrics used in the manufacture of such ribbons.

The special features of the procedure are that—

- (1) the manufacturers of such ribbons will not be licensed but the exporters will have to get themselves registered with the Collector of Central Excise in whose jurisdiction such exporters conduct their business;
- (2) the Cotton Fabrics for the manufacture of such ribbons need not necessarily be purchased from the excisable factory direct;
- (3) the condition regarding identity of cotton fabrics used in the manufacture of such ribbons with the duty-paying documents, has also been relaxed and no special accounts for that purpose will be necessary;
- (4) the exporters, after registration in the prescribed manner, will prepare an application for export, and present it to the Collector of Central Excise designated for the purpose, together with the Bill of Lading or Shipping Bill duly certified by the Customs authorities to the effect that the ribbons have in fact been exported.
- (5) the ribbons and the rate of rebate admissible on their export, are as follows—

Products	Rate of rebate
(i) Ribbons for standard typewriters, that is to say, the ribbons the length of each of which is not less than twelve yards.	Rs. 50.00 per hundred dozens of such product.
(ii) Ribbons for portable typewriters, that is to say, the ribbons the length of each of which is not less than six yards.	Rs. 25.00 per hundred dozens of such product;

- (6) The concession of rebate under the revised procedure will not be available for export of such ribbons to Nepal, or for export by parcel post to any country, including Nepal.

For further details the exporters may contact the Collector of Central Excise of their area.

Profits of Textile Mills: Shri Morarji Desai, Minister for Commerce and Industry, in a written reply to a question by Shri Damani in the Lok Sabha, stated that in a normal year the average net profit of textile mills might be assumed at about 6 per cent on turnover, or roughly between Rs. 25 to Rs. 30 crores, for the cotton textile industry as a whole. Shri Desai said precise information on the profits earned by the mills was not available. Profits or losses varied from mill to mill and from year to year according to the relative efficiencies of the mills. Out of the 412 textile mills which existed at the beginning of 1956, Shri Desai said, balance sheets for the last year had been received in respect of 236 mills. Of the 236 mills, 213 had made a total profit of nearly Rs. 20 crores while the remaining mills suffered a loss of about Rs. 2 crores in all. Balance sheets for the remaining 176 mills, for most of whom the accounting year ended on March 31, 1957, were still awaited.

US Import-Export Bank Credit: The Minister for Industry, Shri Manubhai Shah, stated in the Lok Sabha recently that the Import-Export Bank of the United States was reported to have offered a credit of 1.8 million dollars to the National Rayon Corporation for expansion of its rayon plant in Bombay. The terms of the offer, he said, were under scrutiny. The negotiations were conducted with the knowledge of the Government of India.

GENERAL

Employees' State Insurance Scheme: About 14,500 factory workers at Patna, Katihar, Monghyr and Samastipur in Bihar will get the benefits of the Employees' State Insurance Scheme from the mid-night of December 14, 1957. The scheme will be inaugurated by the Bihar Chief Minister, Shri Sri Krishna Sinha, at a ceremony at Patna. Medical care will be provided by the State Government under the service system and 7 whole-time dispensaries—4 at Patna and 1 each at Katihar, Monghyr and Samastipur—have been opened for this purpose. For the payment of cash benefits under the scheme, one local office each at Patna and Katihar and one sub-local office each at Monghyr and Samastipur have also been set up. The employers of factories covered by the scheme will be required to pay their special contribution at 1½ per cent of the total wage bill. The benefit provisions of the Employees' State Insurance Act, 1948, have already been extended to 54 industrial centres in the country covering over 11.63 lakhs of workers.

Educational Facilities to Workers: Forty-five multi-purpose institutes have so far been established in the coal mine areas to provide educational and entertainment facilities to workers and their families. In addition, 8 adult education centres have been opened. The number of adults receiving education at these places are 1,234. Facilities for teaching crafts such as knitting, tailoring, embroidery work, needle work, clay modelling, etc. have been provided. The staff of the centres also visit dhowrahs of the workers to give talks to women on family planning, sanitary habits, economy measures, etc. Adult literary classes are also held in the multi-purpose institutes for the benefit of women workers. Games are organised and national holidays are celebrated at the centres.

NEWS IN BRIEF

INDIAN

It is reported that the erection of the plant and machinery in the D.D.T. factory at Alwaye in Kerala has already been completed. The production trials were being carried out, and regular production would commence after the guarantee tests had been completed and sufficient quantity of liquid chlorine was available from an adjoining chemical works.

An additional provision of Rs. 10,000 for the development of cottage and small-scale industries in NES Blocks has been made in the Block budget, on an ad hoc basis, by the Ministry of Community Development.

The names of industrial concerns which have allowed their workers to participate in management are the Tata Iron and Steel Co., Jamshedpur, Bihar, the Simsons Group of Industries, Madras, the Modi Spinning and Weaving Mills Co., Ltd., Modinagar, U.P., and State Transport, Madras.

The Minister for Industry Shri Manubhai Shah stated in the Rajya Sabha that the output of textile machinery in India had increased by about 600 per cent in the last five years. The output in the current year was worth about Rs. 9 crores as against Rs. 12 crores five years ago.

A series of concrete measures were taken to produce more food grains in the community development areas during the current year. Among these measures were effective supervision by the officers of the State Government over the block staff for the planning, execution and evaluation of agricultural programmes etc.

The total area of railway lands so far licensed out for cultivation of food grains is approximately 29,268 acres. The rent realised for such lands during the last five years was approximately Rs. 4,00,504.

It is reported that ten engineering colleges had been established by the State Governments in accordance with their second Five-Year Plans or by private agencies since the beginning of the current plan period.

In order to encourage handloom products and products of cottage industries, the Railway Board has agreed to their sale at railway stations.

Membership of the co-operative societies during the last three years, from 1953 to 1956, has increased by about 52 per cent; paid up capital of co-operative societies by 70 per cent, working capital by 61 per cent and assets and investments by 90 per cent.

The Government have accepted the Tariff Commission's recommendations that protection granted to non-ferrous alloys and manufactures should be discontinued from January 1, 1958.

Recommendations for the more efficient and economical execution, likely to result in an estimated saving of at least Rs. 30 lakhs, of the Lakkavalli Project in Mysore State have been made by the Irrigation and Power Team appointed by the Committee on plan projects.

FOREIGN

Britain and Germany have agreed to establish closer economic co-operation and a British delegation will soon go to Germany to pursue the matter further within the framework of the Anglo German Economic Committee.

Germany, for the first time since December 1952, had an E.P.U. deficit of DM 112 million (\$25.8 million) in November. The November deficit compares with a surplus in October of \$20.3 million, in September of \$236.6 million and a peak figure in August of \$280.8 million. Germany's E.P.U. credit now totals \$1,010 million.

Trade between Finland and the Soviet Union will increase considerably under an agreement for 1958 signed by the two countries recently.

Economic activity in the Scandinavian countries is expanding, says the report on economic conditions in Denmark, Iceland, Norway and Sweden, published by the Organisation for European Economic Co-operation.

Australia increased her favourable trade balance with Asian countries to £A148.7 million in the past financial year from only £A50.8 million in the previous year. Imports dropped from £A112 million to £A107.2 million while exports increased by almost £A100 million to £A255.9 million.

Egypt's five-year industrialisation plan will increase the country's national income by £E130 million a year. At present the national income is £E900 million.

Soviet Russia provided virtually all the designs for the products of China's machine-building industry in the past four years, according to a Government report from Peking. The report lists 3,000 products, which were based on Soviet designs.

German steel mills last month produced an average 79,645 tons—a new record. Total November output was 2,177 million tons, January-November production was 22.62 million tons of crude steel, compared with 21.35 million tons in the comparable period of last year—an increase by 5.9 per cent.

The Netherlands Bank's gold and foreign exchange reserves in the week ended December 2 fell Fls. 20 million to Fls. 3,689 million and note circulation jumped Fls. 117 million to Fls. 4,111 million.

Sweden's trade with the U.K. in the first nine months of this year resulted in an export surplus of Kr. 127 million or Kr. 81 million less than a year ago.

Japanese steel mills are making strenuous efforts to gain control over the industry's annual production programme, which has hitherto been the responsibility of the Ministry of International Trade and Industry.

Japan and Russia have signed three agreements, which are expected to result in greatly expanded trade between the two countries next year.

AT YOUR SERVICE

affirms Adipocere (Pronounced 'adi-po-saire')

From deep down below the earth, where I have remained for millions of years, I am located, pumped out, refined and distributed in several forms. Each one of these forms has a significant influence on your life.

The purr of an automobile and the throb of an aeroplane are like the beat of my pulse for I power them both and lubricate their mechanism. I propel them with my life-blood and carry you on your way.

The light of your lamp is my brilliance—the working of the machines that give you your clothes, the tractors that harvest your food, the factories that feed you with life's necessities—are all my contribution to your welfare and happiness.

I am omnipresent—limitless in performance and possibility. I am the Prime Mover.

FINANCE FOR THE SHIPPING PLAN

THE annual meetings of the Indian National Steamship Owners' Association have precisely the same significance for the shipping community which the annual sessions of the Federation of Indian Chambers of Commerce and Industry have for the business community and the country at large. A healthy convention has now been established whereby the Transport Minister makes policy pronouncements in his inaugural address at the yearly sessions of the Association. This year's session held at Bombay last week had assumed more than the usual importance. For about a year the shipping development programme has been practically deadlocked. This stagnation has arisen from the same cause which has produced a critical situation in the second Five-Year Plan — dearth of foreign exchange. Expectations were, therefore, legitimately raised that a positive clue would be given how the Government proposed to break the deadlock.

Mr. Lal Bahadur Shastri's inaugural address gives reasonable indications that this deadlock will not be permitted to continue for long. It is, however, no reflection on the earnestness and determination on the part of the Government to find out effective solutions to say that Mr. Shastri's speech was much less precise than the situation demanded. Since the solutions depend in a considerable measure on external factors a formula for a complete cure of the present difficulties was certainly not expected. But a direct statement on the action proposed to be taken to attack the problem, in whatever measure practicable, would have helped to clear up the air of uncertainty.

There was, on the contrary, a lopsided emphasis in Mr. Shastri's speech. He has highlighted the Government's decision — which was not unknown — to create a non-lapsable shipping development fund. This emphasis gives the erroneous impression that there is a recurring failure year after year to utilise fully the funds allocated for the purchase of additional tonnage. This is simply not true. This fund is to be built out of the annual contributions from the Consolidated Fund of India plus allocations which may be made from time to time by the Government. Repayments of loans advanced by the Government to the shipping companies together with payments of interest charges would also be thrown in this pool. The development fund should be welcomed to the extent it goes. But it does not go far enough. Mr. Shastri stated that the immediate accretions to the fund would be of the order of Rs. 7 crores raising it to a total of Rs. 44 crores including the amount of Rs. 37 crores allotted as Government's share of shipping development finance. We must remind ourselves that almost the entire amount of the Plan allocation of Rs. 37 crores has been spent up already. What is really relevant to the current problem of finance is that this fund will be a rupee fund. Since the capacity of the Visakhapatnam shipbuilding yard is fully booked for the period of the second Plan, direct expenditure from the non-lapsable fund will be very small. The rupee fund does not solve the crux of the problem of finance which is foreign exchange for the outstanding purchase programme.

The magnitude of the outstanding acquisitions of tonnage in the second Plan and the present tightness in shipping ought to be set out in bare outline. Towards the close of the first year of the present Plan orders were placed for a total additional 170,000 g.r.t.

which are estimated to have consumed nearly Rs. 35 crores out of Rs. 37 crores allocated by the Government and Rs. 2 crores out of Rs. 10 crores to be provided by the shipping companies. The balance of additional tonnage, including replacements as envisaged in the text of the Plan, that remains to be acquired is about 220,000 g.r.t. It will raise Indian tonnage to 900,000 g.r.t., which is a very conservative target when read in the context of the original target of 2,000,000 g.r.t. approved for fulfilment in 1954. Costs are steadily rising, but it would be fair to assume that the outstanding balance of 220,000 g.r.t. will require an outlay of Rs. 50 crores or probably more.

There is a continuous shortage of ships to carry the cargo offering on the coastal trade. A breach has been made in the reservation of coastal shipping for Indian tonnage since foreign chartered ships have to be commissioned under pressure of traffic. One reason of the lag in the purchase of ships for the coastal and adjacent waters is to be found in the high rate of interest charged by the Government on the loans advanced for purchase of coastal ships. This rate varies between 4 per cent and 4.5 per cent per annum. Government has at long last conceded the request of shipping companies to lower the rate and equate it with the rate charged for loans for overseas ships. Mr. Shastri announced the reduction of the rate to an effective rate of 3 per cent — effective because any excess over 3 per cent to be paid by the companies will be subsidised out of the non-lapsable development fund. The new rate will raise the cost of loans for overseas ships by half a per cent. This was inevitable in the context of dear money and equal rates for the two categories of loans.

The question how finance in foreign currency is to be found for the completion of the remaining programme of expansion of shipping has not been answered with clarity. Clarity in this context does not by any means imply absolute certainty about the availability of the funds required. It is largely dependent on outside factors. But Government's decisions on the proposals made by the shipping companies are not firm and positive. The shipping companies have proposed that the foreign exchange earnings of ships plying the non-coastal waters should be earmarked for the purchase fund. Mr. Shastri announced in his speech of last week that this proposal was not acceptable to the Government. The reasons for its non-acceptance were not explained. Probably, Government does not want to forgo this acquisition of foreign exchange needed for the general requirements of the Plan.

If this interpretation is correct, it seriously underestimates the priority which ought to be given to shipping. Overseas shipping has a direct potential to earn foreign exchange. Furthermore, it will partially stop the drain of foreign exchange expenditure on our freight carried in foreign ships. Current foreign exchange earnings of Indian ships are placed by a spokesman of shipping interests at Rs. 2 crores per year. In the remaining three years of the present Plan their net proceeds will cover a good share of the cost of the tonnage required. Government does not seem to be fully convinced of its policy on this specific question. Mr. Shastri has stated that in particular cases current foreign exchange earnings of existing ships may be permitted to be used for additional purchases.

On what criteria this special permission is to be granted is not clear. It is difficult to see why, if permission is granted in some cases, it should be denied in others. The purpose for which the facility will be sought is the same. It is, however, reassuring to find that Government is prepared to allow the net foreign exchange earnings of new ships to be employed in further acquisitions.

Shipping companies have been promised full Government backing in any schemes of self-financing which they can negotiate with foreign shipbuilders or landing institutions for the supply of ships. It was in the context of such schemes that the Transport Minister gave a commitment on the use of the net foreign exchange earnings of new ships as a mode of financing. Government has now appreciated the force behind the argument that cargo on Government account or for the State Trading Corporation could be carried in much larger volume than at present in Indian vessels. A special agency is to be set up at an inter-Ministerial level for adopting effective measures to ensure intensive employment of Indian tonnage and it is to be supplemented by liaison agencies of the shipping companies. It is only reasonable to expect that savings of external payments which will thus be effected should

be diverted to fresh purchases irrespective of the fact whether the freight is earned by existing ships or by new ones — a recent official distinction which has little justification. One condition imposed on agreements of deferred payments for purchases is that payments should commence after the end of the present Plan. In case the Industrial Finance Corporation of India is advised to underwrite the deferred payments agreements for shipping, it would be possible to make some headway. Nevertheless, expectations of results from self-financing or deferred payments schemes can be pitched only at a modest level.

Mr. Shastri has deliberately chosen to be brief on the likely external assistance in the form of loans from the United States, Japan and Germany. But his optimism that these loans would prove of considerable value in crossing the payments hurdle may prove to be well warranted. A World Bank loan must be regarded as a reasonable certainty in the light of Mr. Eugene Black's clear reference to it in his letter to the Finance Minister last year. These loans, in fact, constitute the mainstay of the solution of finance for shipping. It will be hasty to rush to any inferences about the execution of the shipping plan until the position in respect of these loans becomes clear.

Economic Report from the U.S.

FOREIGN TRADE PROGRAMME

(By GUY SIMS FITCH)

WASHINGTON, December 9.—The Eisenhower Administration today revealed the details of the foreign trade programme it will present for Congressional approval early next year. As had been expected on the basis of earlier statements by Administration leaders, the proposals call for a five-year extension of the Trade Agreements Act, with additional tariff-cutting authority for the President. The details were disclosed in a joint announcement by Secretary of Commerce, Sinclair Weeks and Deputy Under-Secretary of State for Economic Affairs, Douglas Dillon — men who will be playing a major role in rallying public and Congressional support for the Administration's recommendations. Legislative leaders were previously informed of the proposals. If approved, the five-year extension of the Trade Agreements Act would be the longest voted by Congress. The present extension, which expires next June 30, was for three years. The Act, which has been in continuous existence since 1934, gives the President authority to enter into reciprocal trade agreements with other countries and forms the basis for US participation in the 37 Nation General Agreement on Tariffs and Trade (GATT), multinational tariff-cutting instrument.

Under the proposals announced today, the President would ask Congress to authorize him to reduce any rate of duty existing on July 1, 1958 by 5 per cent a year

for five successive years. To make sure that none of this authority is lost, he could also reduce a duty by the same total amount over a three-year period, so long as no annual reduction exceeded 10 per cent. To take care of imports which already carry exceptionally low duties, the President could reduce tariffs by three per cent 'ad valorem' (figures on the basis of value), so long as no yearly reduction exceeded one percentage point. The proposals also would continue in force a provision of the recent Act, whereby any existing duty in excess of 50 per cent 'ad valorem' could be reduced to that amount. In such cases, not more than one-third of the total reduction could be made in any one year. This provision has not been used much in the past three years mostly because there are so few US imports that still carry rates this high. Of course, the Administration is aware that American business should have adequate safeguards in any trade liberalization move. And it recognizes the importance of such safeguards if it is to obtain public and non-Congressional approval of its liberal policies. Thus the new recommendations generally continue the safeguards already incorporated in the present Trade Agreements Act. A few changes are envisaged to provide more prompt and effective action in cases where imports cause serious injury to American industry. But as in the past, any such proposed action will be scrutinized very carefully before trade modifications are authorized.

WASHINGTON, December 10.—In recommending this week that the U.S. Reciprocal Trade Agreements Act be extended by Congress for five years with additional Presidential authority on our tariffs, the Eisenhower Administration has recognized the importance of continuity in international trade relations — a continuity from which both the United States and its trading partners would benefit. In addition, the Administration believes that a five-year extension, the longest since the US reciprocal trade programme was launched in 1934, would demonstrate beyond question what is generally understood here, but is not always understood abroad — that the United States sincerely intends to maintain the liberal trade policies it has been pursuing.

Yet another cogent argument for a long-term extension of the Act is provided by the projected six-nation European Common Market, which may lead to some significant changes in world trading patterns. The six nations involved will be setting up a new unified market that is roughly comparable in size so that of the United States, and will have common tariffs vis-à-vis non-members, including the United States. It is, therefore, in the US interest as well as the interest of the 37-Nation General Agreement on Tariffs and Trade (GATT) — in which the United States and the Common Market countries participate — that the Common Market's tariff walls be as low as possible.

How important this is to the United States is seen in the excellent trade relations this country historically has maintained with the six Common Market countries. In 1955, for instance, one-seventh of all U.S. exports — \$2,000 million out of a total of \$14,000 million — went to those six countries. In 1956, the proportion rose to one sixth more than \$2,800 million out of a total of \$17,000 million. Administration officials are openly hopeful that the new trade agreement recommendations particularly the five-year extension, will meet with Congressional approval. They believe that a factual and straight-forward presentation of the case, such as the Administration intends to make, will carry considerable weight in legislative counsels. To give Congress as much time as possible to study and act on the recom-

mendations, the White House will probably send the legislative message incorporating its trade proposals to Capitol Hill early next year, shortly after Congress goes into session. The Administration also will recommend that Congress approve U.S. participation in the Organization for Trade Co-operation (OTC), the proposed Administration body for GATT. But this recommendation will not be an integral part of the trade legislative message since a bill to that effect already is before Congress.

While the Administration consider OTC approval a desirable move, it is at this stage giving first priority to the Trade Agreements Act as the basic element in the liberal US Trade Agreement Act as the basic element in the liberal US trade programme, and is not trying it to OTC in a single legislative package. There is some feeling here that OTC approval may be a logical step after legislative action is taken on the more fundamental Trade Agreements Act. At the same time, the Administration as a matter of national policy remains firmly opposed to import quotas as a protective device for domestic industry. Officials emphasize that quotas, which they consider highly restrictive, should be used, if at all, only in very exceptional circumstances — for instance, in costs involving serious world trade dislocations. In drawing up its liberal trade proposals, the Republican Administration is clearly looking for a good deal of bipartisan support from a Congress controlled by the rival Democratic Party. Officials here consider this subject as above partisan politics. They recall that the chief architect of the reciprocal trade programme nearly a quarter of a century ago was Cordell Hull, Secretary of State in a Democratic Administration. And they point out that this programme has been supported wholeheartedly ever since by Democratic as well as Republican Administrations. This helps explain the confidence displayed by some Administration leaders — none of whom discounts the probability of a lively debate on the subject — as they embark on the campaign to win Congressional support for the foreign trade programme made public this week.

coal is prime mover.

Indeed, without coal much of our industrial and commercial life would be brought to a standstill. What's more, the coal industry must continue to grow if it is to keep in step with the country's expanding demand.

and in the progress of this vital industry, the Life Insurance Corporation of India plays a significant part. As the largest institutional investor in the country, it channelizes the savings of millions of policy-holders.

By investing funds in the coal industry, the Life **Insurance** Corporation benefits the Policy-holder in two ways. Directly, by ensuring a secure investment with profitable returns. Indirectly, by fostering an enterprise basic to the national economy.

Life Insurance Corporation of India

high-quality
ACC
FIREBRICKS

**for Cement Kilns • Foundries
Smelting Furnaces • Boilers**

FROM the ACC's Firebricks Factory at Katni, now expanded and modernised, come high quality refractories with medium, high and super alumina content to meet all your requirements.

Because of their great resistance to spalling and abrasion, these refractories ensure long and trouble-free service and low maintenance cost. Complying fully with the I.S. Specifications 6-1953 and 8-1953, ACC refractories are made to the shape, size and quality you require. They are far more economical than ordinary firebricks. And the ACC hallmark on them is your guarantee of high quality and dependability.

BUSINESS NOTES

COMMON MARKET QUESTIONS

WITH THE setting in of the New Year will come into force the European Common Market which is a development of far-reaching consequence. That it will mean no less than 15 years before the Common Market takes full shape does not detract from its extraordinary significance. This is true not only for India but also for the international trade in general and most countries in Asia and Africa in particular. In their report, the Export Promotion Committee had stressed the need for discussing the topical problem in the GATT meeting held at Geneva recently. With the return of Mr. L. K. Jha, India's representative at the GATT Conference, some encouraging reports have now appeared about this country's position. It should be comforting, for the present, to know that no arrangement that the six contracting parties to the Common Market—France, Italy, West Germany and the three Benelux countries—may make would be in conflict with the general principles of the GATT. Perhaps more important than anything else is the allaying of the fear that the dependent African territories of the six countries would be included in the Market. According to these reports, a team of experts has been set up to report to the Inter-Session Committee of the GATT about the effects, on other countries, of the association of the dependent territories in the Common Market. The Inter-Session Committee is expected to meet in April next. The question of their association has, therefore, been kept open till the information becomes available.

If this is true, the results of the GATT Conference provide a substantial relief for India as well as for other Asian and African countries. The primary question that concerns India is that of the effect on her exports, with the coming into being of the Common Market. The export items likely to be affected are jute goods, tobacco, cotton waste and cashew kernels, among some others. For one thing, the duty, even if it is the proposed arithmetical average of the present tariffs, is expected to be higher in the case of some countries. For another, there will be a free movement of goods between the countries within the Common Market. This will, in particular, affect India's exports of jute manufactures and coir products. So far as the inclusion of colonies is concerned, India's loss would be chiefly in her exports of cotton textiles and other products to these territories. It would also, in all likelihood, reduce her exports of groundnut oil to the European countries who would depend more and more on their colonies for this commodity. Again, as the Export Promotion Committee has put it, a second development which would affect India, like other countries, could be in the reduced European investments here. As the Committee has argued, this is so because a special investment fund, to be set up to develop the economies of the territories. The strengthening of their economies by normal channels of external aid is undoubtedly to be welcomed. But in this case it is to be linked with their incorporation in the Common Market whose value to them is not beyond doubt.

FROM TRADING CONCERNS TO INDUSTRIAL UNITS
ADMITTEDLY, THE palmy days of mere trading concerns are over in this country which is bent on figuring prominently on the world's industrial map and ranking equally, if not higher still, among the economically advanced countries. This is clearly reflected in the steady switch over to industries of even long well-established trading concerns. As is only to be expected, the tendency is for such concerns first to explore the possibilities of manufacturing within this country some of the goods being traded in by them. An instance in point is the decision

of Rallis (India) Ltd. to establish a plant in India for the progressive manufacture of Wolf electric tools. Wolf tools, which are the products of the famous Wolf Electric Tools Ltd., London, constitute a very big range of electric drills, grinders, sanders, blowers, etc. It may be recalled that Rallis became the sole distributors of these tools in India in 1951. At the end of 1955 already, in collaboration with the British firm, they were ready with a scheme which they presented to the Government of India for its approval. This approval was obtained in April, 1956, and work was actually commenced in July of that year. According to Mr G. M. Wolf, who met the Press this week in connection with this important industrial project, the factory should be in full production by the end of 1958.

The importance of this industry to India can be judged by the fact that, whereas, in a fully developed country, the demand for such tools is of the order of 8 to 10 machines per 1,000 population, per year, it is only 1/10th of a machine per 1,000 population per year in India today. The total capital outlay of the project will be some Rs. 20-25 lakhs, with the Rallis holding a slightly higher percentage of shares than the British concern. This Indo-foreign collaboration in an important industrial venture, although of modest dimensions, is not without its advantage to our country, particularly in these days of foreign exchange scarcity. Thanks to the participation of the Wolf interests, the bulk of the plant and machinery needed would be brought in by the Wolf Electric Tools Ltd., so that the actual requirements of foreign exchange involved in the project are negligible. Indeed so negligible are those requirements that the Government of India has not seen it necessary, it is believed, to insist on any deferred payment for the supply of plant and machinery in respect of this undertaking.

Although, to begin with, a greater percentage of the components has to be imported, by 1960-61, Mr. Wolf assured about 99% of the components (in value) would be of Indian manufacture. A feature of interest in connection with this industry is that there is no other manufacturer of these tools not only in this country but practically in the whole of South-East Asia, save Australia, where there is a smaller unit already operating, also in conjunction with the same British firm. This means that, as and when India is able to make progress, she will have not only the demands of the whole Indian peninsula to cater to but those of the entire S.-E. Asian region. The prospects for such a consummation are reasonably assured, what with a reputed concern like Rallis (India) Ltd. whose affairs are being ably supervised by an industry-minded Managing Director like Mr. M. Paspatti, and the unstinted co-operation of the Wolf interest from Britain.

It may, incidentally, be added here that, at the Press conference in question, Mr. Paspatti also disclosed that Rallis have other industrial ventures as well in view, some fairly well-advanced, such as the manufacture of electric fans, and others still in the offing, like the manufacture of umbrella ribs.

FAITH IN THE FUTURE?

RECENT CHANGES in tax structure involving heavy burdens on industrialists and shareholders, the ever-widening participation of the State Trading Corporation, and the woeful deterioration of law and order in parts of the country have, while causing considerable concern to the people generally, also greatly shaken the confidence of business men all over the country. If, as Mr Sheppard, Chairman of Killick Industries Ltd., said in addressing the shareholders at the recent annual general meeting, "if this sapping of morale and of faith in future was confined only to large business houses, it would not be so dangerous, but, unfortunately, it is reflected at

every point of industrial society. Everyone—the producer, the consumer and the investor, whether big or small—is today lacking the virile faith needed to face the challenge of the future.” This is undoubtedly an unenviable situation to encounter for any country. The more so to one that has embarked on an ambitious programme of economic development. It is this sorry state of affairs, in fact, that has been a major obstacle to the inflow of foreign capital into our country in any significant measure, together with the technical know-how which goes with it and which, as the Killick Industries’ Chief was certainly entitled to remark, “have often been of great assistance to Indian industries in the past.”

Thanks to the deteriorating labour situation in parts of the country, Mr Sheppard could not resist the urge to make a pointed reference to it in this Chairman’s speech of his also. For, since he spoke last on the subject, the problem has assumed even more serious proportions. It is important to distinguish here between labour indiscipline of this nature, on the one hand, and genuine trade union development, on the other. And so shrewd a businessman as Mr. Sheppard could not be expected to deny the value of healthy trade unions, which, if effectively organized, could be expected to champion all the right and legitimate causes of its members. Unfortunately for this country, many trade unions are under wholly unwholesome influence and are often proving to be a “menace to the community,” while only ostensibly showing off to be helpful to labour. Blissfully ignorant of, or wilfully blind to, the rudiments of economics, such unions do not hesitate to put forward the most impossible demands. To quote Mr Sheppard, “unions of this type put forth demands based on what labour wants without any consideration as to what it is entitled to receive. They continue to make these claims, whether justified or not, and, by strong arm methods, ensure that they are granted.” It is high time, therefore, that the Government took a serious and realistic view of these problems and saw to it that these do not hinder progress in what Mr Sheppard happily termed “the people’s sector”—thus avoiding the words “private sector.” which, for no valid or justifiable reason, seem to have become anathema to the powers-that-be even out of its anxiety to push through all the objects in the public or the private sector.

GROUNDNUT OIL CAKE: IMPEDIMENTS IN EXPORT

AT A time when the country must go all out to step up the exports of Indian goods in order to relieve the prevailing tightness of our foreign exchange position, one would expect the authorities concerned to place as few impediments as possible,—if not to remove them altogether—in the way of exporting at least those items which are allowed to be exported. But, unfortunately, this does not happen to be the case, at any rate according to the exporters of groundnut oil cake (expellers).

It may be recalled that, in respect of this commodity, the Government generally prescribes a ceiling and allows exports freely until the ceiling is reached. One can understand and even appreciate the fixing of such a ceiling on groundnut oilcake, inasmuch as it is a valuable cattlefeed in this country. However, in the implementation of the Government’s policy in this behalf, certain anomalies arise, as, for example, recently when a 25,000-ton export quota was announced on November 7, 1957 and this was followed by a Press ‘communique’ that the ceiling was reached only eight days of the initial announcement, namely, on November 15, 1957. Normally, exporters get busy immediately after the quota is announced and collect the materials from various producing centres and offer them to their foreign agents and other importers. In other words, there must be a reasonable time interval before any export deal is negotiated and finalised. But, in the case in question, there were just eight days, with the

result that obligations in regard to some of the export deals that had been put through could not be met. In the case of the parties whose ‘bona fides’ cannot be questioned sales had been concluded prior to the announcement that the ceiling had been reached and when, technically, export was still permissible. It could not be that the parties who are thus adversely affected are many, or that the amount involved so excessive as adversely to affect the availability of groundnut oil cake for domestic consumption. Even otherwise, non-fulfilment of contractual obligations by ‘bona fide’ exporters of this country, besides involving heavy penalty payable by the defaulting exporters, would create a wrong impression in the minds of our foreign buyers to the detriment of our export trade. It is necessary to mention here that foreign buyers do not entertain any offers unless export licence is guaranteed by the exporters. In view of this, it seems unwise, especially after a severe blow which the exporters least bargained for, to deny even consideration of their applications for export in respect of deals concluded before the announcement that the ceiling was actually reached. There is ample evidence to show that this refusal by the export control authorities has hit genuine exporters very badly, in that they have been called upon to pay heavy penalties by the importers for non-fulfilment of contracts. But this is not the end of the tale of woe of our exporters. Not only would they have to pay these heavy penalties but they would also have to risk huge losses resulting from a resale of the export goods already bought by them. There seems, therefore, a very good case for the export authorities to look into this, and it is to be hoped that, if only not to dampen the enthusiasm of genuine exporters, they will take prompt and proper action.

MINERALS IN FOREIGN TRADE

THE TWO important ores that figure prominently in India’s export trade are those of iron and manganese. From July last, the iron ore export has been wholly taken over by the Government through the State Trading Corporation. The story in regard to manganese ore is only slightly different; here also, from an earlier time, export on private account has been largely cut down and the STC is progressively taking it on. This policy was adopted with the argument that the mining trade was in need of development along more rational lines and that the taking over of trade by the State would augment the foreign exchange earnings. Whether or not these laudable aims have been actually realised cannot be stated with any amount of certainty at the present time. It is true that from time to time information is given out regarding the conclusion of contracts with foreign buyers. But there is as yet available no adequate data to enable a proper assessment to be made of the actual performance.

Whatever that may be, a complete elimination of the private exporter of manganese ore is hardly called for. As the Chairman of the Western India Minerals’ Association, Mr. N. S. Worah, has assured, at their second annual general meeting, the private export trade is ‘fully alive to the needs of our expanding economy’. He has made a point of no ordinary significance in saying that a frequent change in the export policy for this important mineral can have very adverse effects for India. One bad result is that some major purchasers like the USA have already decided to encourage mining in other countries much nearer to their own. Thus, new mines would make supplies plentiful and cheaper, at least to the extent of freight charges, and diminish India’s bargaining position. Already, the trend is disheartening. The demand for low grade ores has been declining to almost negligible quantities. Mr. Worah has drawn attention to many problems that confront the trade. He has, happily, gone further and has suggested some measures to resolve them. It is only proper that these should receive adequate attention by the authorities concerned.

a pilfer-proof package for every product!

Metal Box pilfer-proof containers and closures, individually designed for each product, are precision engineered and superbly printed. This ensures product safety, purity, and powerful sales appeal. Reputable manufacturers use them to pack:

Ghee	Breakfast foods	Vanaspati and other food oils
Butter	Cocoa	Baking powder
Evaporated and Condensed milk	Coffee	Tea
Barley	Biscuits	Honey
Glucose	Confectionery	Processed fruits and vegetables
	Cashews	

A METAL BOX PILFER-PROOF CONTAINER

Complete pilfer-proof protection is guaranteed by double seaming both top and bottom to the can body.

This cross-section of a precision engineered double seam shows how the rubber-like compound lining ensures air-tightness.

Only a can opener, destroying the top of the can, will open it. It cannot be reused by unscrupulous dealers to repack with spurious products.

The Metal Box Company of India Ltd

BOUND VOLUMES of THE EASTERN ECONOMIST and RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

THE EASTERN ECONOMIST Rs. 75.00

RECORDS & STATISTICS Rs. 18.00

POSTAGE EXTRA

PLACE YOUR ORDERS NOW. ONLY LIMITED VOLUMES AVAILABLE.

Company Meeting

KILLICK INDUSTRIES LIMITED

Speech of the Chairman, Mr. E. D. Sheppard

Gentlemen,

This year 1957 is of very special significance to the House of Killick, for it was a hundred years ago that Messrs. Killick and Nixon arrived in Bombay and started the business that so proudly carried their names. Though the firm of Killick, Nixon & Co. was discontinued in 1948, the two new Companies Killick Industries Ltd., and Killick Nixon & Co. Private Ltd., between them undertook the work started by the founders and fostered through the years by succeeding generations, and it is fitting that in this memorial year, Killick Industries Ltd. having acquired ownership of Killick Nixon, the family is united again. Thus although the corpus is changed, we may say that the spirit of the Killicks has been preserved for a century past. May this spirit of unity in our family, of service to the nation, and of courage to face the future, continue to pervade our thoughts and actions in the years that lie ahead.

In my speech last year I tried to examine the implications of the impact which the pursuit of a "Socialistic Pattern of Society" would have on industrial development, and hence on the affairs of your Company. I had then forecast that, if the pursuit of this goal was continued along a path of increasing State control and diminishing individual responsibility, the results would not be happy. It is with a sense of sorrow and concern for the future, and not in any spirit of pride in the vindication of one's forecast that one sees these fears being realised as the second Plan runs its course. Around us we see a growing deterioration of business confidence, and the onset of apathy amongst those whose function it is to promote and develop industry. If this sapping of morale and of faith in the future was confined only to large business houses, it would not be so dangerous, but unfortunately it is reflected at every point of the Industrial Society. The producer, the consumer, and the investor, whether big or small, is today lacking the virile faith needed to face the challenge of the future.

What are the reasons for this lack of confidence? Let us examine them.

Firstly, there is the numbing frustration which an endless series of tax measures each following closely on the heels of the other, have produced among industrialists and shareholders, though one cannot but have a profound respect for the imaginative brain which has welded into one whole such a divergent and almost contradictory set of taxes. The Finance Minister has succeeded in performing a balancing feat on the tight rope of national finance which would be the envy of the most nimble witted. In an economy over-extended as ours is, there is little scope for the introduction of incentives, yet this is what the last budget has succeeded, albeit in a minor way, in doing. The total of Income Tax and Super Tax at the highest salary level has been reduced from 92 per cent to 77 per cent, thus making possible the retention of some measure of enthusiasm in the managerial class for harder work and greater endeavour, but a price has been paid for this concession, a price which might well result in crippling incentive altogether. The price, of course, is

the introduction of the Expenditure and the Wealth Taxes. But it is the Wealth Tax on companies particularly which can have no possible justification, either moral or material. If ever there was a measure designed to grab money irrespective of justice or reason, this tax is surely it.

The combined rate of Income Tax and Super Tax and Surcharge on Companies has been increased from 43.4 to 51.5 per cent. In addition, companies have to pay special taxes on dividends, on the issue of bonus shares, on the non-distribution of profits, on capital gains, on their net assets, and as if that were not enough are then required to deposit a part of their reserves under the Compulsory Deposit Scheme. It is just not possible for companies to bear this fantastic burden of taxation for very long, particularly at a time when they are required to carry out an expansion of their productive capacities in terms of targets set by the second Plan, far in excess of those which normal commercial practice would dictate. The sum effect of such taxation is virtually to eliminate the possibility of raising equity capital in the investment market for new ventures because of the levels to which even the soundest shares have declined. It has been estimated that since August 1956 shareholders are poorer by 200 crores of rupees.

Almost as disturbing as the taxes themselves have been the inordinately long periods which have elapsed between the framing of taxation proposals and their ultimately becoming law. During the many months out of the last twelve when the country has been virtually without a definite tax structure it has been impossible for any would-be entrepreneurs to finalise their plans.

Further, all these facts combined have deprived us of the entry, in any significant measure, of foreign capital, and of the technical skill and advice which goes with it, and which in the past have often been of great assistance to Indian Industrialists.

Secondly, there is the ever-widening scope of the activities of the State Trading Corporation. The avowed objectives for which the S.T.C. was founded—namely to trade with Communist Nations and to augment exports where the existing trade channels were inadequate—were wholly laudable, but they have far exceeded this charter. Their entry particularly into the cement and manganese ore businesses was quite justifiable as these were being efficiently run by S.T.C.'s enterprise. The specious reasons given for the S.T.C.'s intrusion do not bear examination. The objectives sought to be achieved could well have been reached without the S.T.C.'s intervention.

Further, in these commettment in promoting trade risk, makes no organisation altogether disproportionate and yet takes unto its offits. ately large share of "

passing interest that at the Meeting of all the earlier this year, the policy of State held in Lc-oundly condemned without one single Trading oice. disser'

I would like, however, to make it clear that we have no quarrel with those entrusted with the management of the S.T.C. Our objection is fundamental and concerns only the policy which requires them to carry out such duties.

Thirdly, there is the sad deterioration of Law and Order in many parts of the country with which unfortunately is bound up the question of Labour Relations.

In a recent pronouncement the Hon'ble Shri Morarji Desai, the Union Minister for Commerce and Industry, stated that "If industrialists expect to get so many things from the State, then they must be prepared to provide the money for these through taxation". No one can take exception to the underlying premise of the argument of the Hon'ble Minister which is that no State can provide services for the community which are beyond its capacity to finance. But the first service any taxpayer in any country expects, and rightly so, is the protection of life and property and the preservation of law and order. Here in India all industrialists are in fact paying to the State a very high rate of taxation, as I have already pointed out and in return are not, in some cases, being provided with even the elementary degree of security that is a prerequisite to the conduct of business and industrial growth.

Serious labour indiscipline at the Hingir-Rampur Colliery for some time past culminated in a violent riot in June this year when our Colliery Manager was murdered by the workers. This dreadful incident took place several months ago, and we are still waiting for effective action to be taken to punish the murderers and to be assured of the protection that is necessary to prevent a repetition of the tragedy.

In the Free World today it is inevitable that trade unions acquire great strength—sometimes a dangerous strength which is frequently misused. No one will deny the value of strong and healthy trade unions effectively organised to champion the cause of their members. But trade unions subject to little or no control, and those under bad influences are an increasing menace to the community. Whereas again no one will deny the right of a man to withhold his labour in order to voice a genuine grievance, yet there can be no excuse for violence and hooliganism being employed as the means of doing so.

The plain fact of the matter is that the time is long overdue for a show down with this type of labour organised and led in this manner and towards these ends, and yet it continues to be protected and mollycoddled by those in authority. Without reference to even elementary economics, Unions of this type put forth demands based on what labour wants without any consideration as to what it is entitled to receive. They continue to make these claims, whether justified or not, and by strong arm methods ensure that they are granted. And who is to blame them? Why should they want when the methods of getting what they want when they use these methods of getting what they want when the methods themselves have been continually successful? The formality of conciliation having taken place, it is much simpler to refer demands to adjudication rather than to incur the odium for the Governments concerned to incur the odium of telling labour that it has gone too far and must of telling labour that it has matter to labour if their draw. What then does it approaching them are basic and the methods of get results?

I will not examine further the indiscipline as here, like in other countries of labour political slant and I have no desire to bring this into my speech. But the other two measures which I have referred—increased taxation and expansion of capital to make steel, to dam rivers, to raise coal

activities with their damaging effect on the People's Sector—have been introduced solely and wholly to provide money for "The Plan" or rather for that part of the plan which falls in the State Sector.

Before we proceed to examine the Plan and the results that are expected to flow from it, let it be quite clear that it is a composite Plan and if either Sector fails then the Plan fails.

The doctrine that the Plan is inviolate has been thrust down one's throat, although it has been plain for months past that a process of stretching it out has become inevitable. The main constituents of the Plan may not be significantly changed, but they will certainly take longer to complete. This is a heavy industry plan for within the total set aside for industrial development rather more than half is to be spent on the production of steel, and the greater part of the remainder on Industry manufacture capital goods.

We are told that—come what may—the "hard core" of the Plan will be carried through. What is the "hard core"? In one word it is steel. Steel, and coal and power with which to make it and railways to transport it, in effect just steel. Of what avail will this steel be if the People's Sector is to be prevented from erecting the secondary and tertiary Industries to use it? We shall be told that it can be exported, but it is axiomatic that an essential prerequisite to a profitable export trade is a flourishing home market. Therefore, if only the "hard core" is carried through, the Plan, as such, will still not succeed.

The question, therefore, that faces the country today is how far can this concentration on Heavy Industry be pushed? Undoubtedly among our planners and Economic thinkers there is a school, and a very powerful one, who would push the heavy industry concept to its utmost limits. This is of course an enormously expensive business as has been shown by the rate at which the nation's foreign exchange reserves have run down and moreover, throws the Plan out of balance. We are still waiting to see how the planners and those in authority are going to react now that difficulties have occurred and the Plan is getting bogged down in a succession of crises. The Finance Minister has returned from his tour of the USA, Canada, the UK and Germany, during which no man could have made more valiant efforts to procure the exchange we require. In the light of the information he has gleaned a decision will need to be taken very soon as to whether the Plan is to be adjusted to manageable proportions or whether a forlorn attempt is to be made to fulfil it even at the cost of imposing methods of austerity and compulsion.

Having said this, let us also look at the other side of the picture. If we had been content to increase the national product only in relation to the available resources of the country, or those which could be readily obtained, it is doubtful whether the total volume of planned investment activity would have been more than half of what has actually been embarked upon. It is clear that the second Plan is deliberately aimed at achieving far more than the available resources of the country will admit of, and that this is sought to be justified by the pressure of social obligations and the need to do sufficient for the people, quickly enough, to prevent them from turning to other than democratic methods to quench their frustration.

Another fundamental paradox in the Plan is the pre-occupation with heavy industry on the one hand and cottage industry on the other. In the result it seeks to achieve a compromise between the intensive use of capital to make steel, to dam rivers, to raise coal

and develop Railways, and the pressure to put to productive and gainful employment the hordes of willing but unemployed workers who populate our countryside and do not find work for more than three or four months in the year. No one can have anything but the deepest sympathy with people who are faced with the resolution of such fundamental dilemmas, and the responsibility for evolving Economic policies which are to succeed in spite of them. At the same time we of the People's Sector of the Nation's Economy, cannot help but be perturbed at the way things are going, for, in a planned Economy, the whole future of our own businesses is inextricably mixed up with government decisions.

There is no doubt that in the course of time India is going to be a great industrial power. The principal resources are available, iron ore, coal, mineral wealth, hydro-electric power, and a large mass of people prepared to work for comparatively low wages, and here let me say, that the unschooled peasant of India has already in the Indian Army given abundant proof of his capacity to acquire mechanical skill and technical competence with good equipment and training. The mistake that we are making is a mistake of timing. There is too much made of this business of competitive co-existence with countries of other ideologies. A great deal of the haste and the rashness which has been applied to our planning has been due to this. As a result, through this planning and through much of the legislation and taxation which goes with it, conditions have been created in which a proper generation of the vigour and power of Free Enterprise is no longer possible.

In the modern world, some form of social organisations are of course inevitable if man is not to go back to the disorder of unbridled individualism, but all to the organisations must be for the benefit of the individual and not the individual for the benefit of the organisation. By the same token let us be very clear that the Plan is for the people and not people for the Plan. If the needs of the two come into conflict with one another then it must be the Plan and not the people to give way.

No one wants the Plan to fail. If the economic choices that now confront us seem difficult, it must be remembered that they are infinitely simpler than would be the political and social consequences of a Plan that failed because it got out of hand. Today the pressures of the Plan are being demonstrated very clearly in a rise in domestic prices and the constant threat of inflation. It is now—though somewhat belatedly—well understood that, if the food front is not firmly held, and gets out of control, all the benefits of heavy industrialisation would vanish in a trice, and all talk of increasing real incomes be rendered meaningless. To say that an endeavour to double the per capita income over a period of 17 years of a people as poor as ours is not ambitious, is a statement that no one would deny, but to go on and say that unless the impossible pace set for these five years is maintained, that revolution would follow is most certainly not justified. The people of India, and particularly its peasants are sturdy beings of good sense. Their devotion to the soil they till and the values they cherish, have wrought an iron frame which is not going to be bent or twisted by a lengthening of adversity. This is not the link in the chain that will break. If the chain snaps, it will be the weakest link that will give way first; and that will not be the common people of India, but its educated leaders. If these great sons of our soil have the leadership which they merit, then it is certain that they will be prepared to accept whatever length of time may be necessary to bring about the economic betterment that they undoubtedly deserve, but in a manner that does

not in the meantime endanger their own traditional democratic free Indian way of life. Anyway, who is to say that it will take 17 years to double the per capita income, and that we must therefore get off to a start with a false burst of speed which will leave us spent and trembling before half the race is run? It would be more prudent to start at a pace which will allow us to go steadily on and complete the course. The pace of scientific advancement is such that today weapons for economic betterment are being placed in the hands of under-developed countries which were never available to the countries of the West during their struggle for industrialisation. It may well be that these breath-taking advances of science will enable us to achieve the increased standard of living even more quickly than the 17 years at present envisaged. What however is certain is that neither these techniques nor any other measures will help us if we push the country to calamity by whipping it up to a speed which it is not capable of sustaining.

It would not be sensible nor would it be patriotic for any one in the country to gloat over the miscalculations of our planners and the consequential difficulties of the Finance Minister. The probability that something would go pretty wrong with the second Plan might be said to have been built into it from the very start. What one can and should legitimately criticise is the attitude that is adopted towards those honest, able and patriotic Economists and Industrialists who have from the very beginning had the courage to say that the Plan was incapable of fulfilment within the country's resources in the time set for it, and consistent with the maintenance of the democratic principles enshrined in our Constitution. It is tragic that those in power are prepared to label these good men as anti-national defeatists, while those who blindly shout their approval of every official measure from the house tops, are lauded as patriotic pillars of the Private Sector.

One of the objectives to be sought from the completion of the Plan is the creation of the Welfare State, the absolute desirability of which has always so far been taken for granted and without question.

Let us however pause for a moment and examine the progress of the Welfare State in the UK where it has been established for some years and the effect it has had on an important section of the citizens.

A sample survey recently conducted in a leading University revealed a remarkable and disturbing state of affairs. Of the students questioned, 38 per cent said either that they were seriously thinking of emigrating as soon as they have completed their course, or else had already firmly decided to do so. These young people are among the most intelligent, most highly educated and the most enterprising in England. They are people who are willing to make their own arrangements and to take their own risks. And they are under no illusions about life in a strange land. Many of them have worked overseas during their long vacations and are familiar with the disadvantages and possible hardships that emigration might entail.

This is a serious position. Britain is doing everything to provide the best education for the best brains, and the service of the best brains is urgently and increasingly needed in England. How then does it come that nearly half of those so trained immediately take themselves somewhere else and add to the progress and prosperity of another country? The reason is that they are fleeing from the Welfare State. They have strong practical objections to it. They realise that it is financed out of crushing taxation and they know from the experience of their fathers that the weight of taxation comes most heavily on people like themselves. The

whole system of taxation, rebates and subsidies, works against the educated and enterprising middle class. Worse still it is precisely meant to work that way. Whereas fifty years ago the man who forged ahead and made a great name and a great fortune for himself was admired and respected, today he is regarded with envy and resentment. More than the monetary penalties of the British fiscal system is this envy, and the assertion of the superiority of the mediocre which is driving young people of talent and vigour abroad. They want to go to a country where they can forge ahead without provoking sulky hostility. The want to feel that a life's work of exceptional quality and usefulness will not be held against them. They want to escape from a socially stifling atmosphere and to get away from a country where no exceptional talent is gladly recognised. If this draining away of Britain's best brains continues to increase, then the mass of British people will be brought in the end to recognise that while they cannot do without the direction and services of the elite, the elite can very well do without them.

This is a lesson which can be learnt with advantage in other parts of the world.

Turning now to the affairs of your own Company, you will have seen that it has been necessary to withdraw Rs. 2 lakhs from the Equalisation of Dividends Reserve in order to maintain the usual dividend. The principal cause of this is extra provision for taxation of Rs. 3.28 lakhs—of which Rs. 1.77 lakhs is in respect of the previous year—due to the 1957 Finance Act. You will recall that I foresaw this possibility when addressing you last year. Another reason is that due to the change in the accounting years of two of the

Electricity Companies, no Agents' Commission was received from the Surat Electricity Co., Ltd., during the period covered by the Accounts. This would have amounted to about Rs. 1.1 lakhs. Consequent upon the necessity of closing the accounts of all the Electricity Companies on 31st March each year, your Directors are considering altering the Financial Year of your Company so that it will close on 30th November in future instead of 30th June as at present.

Otherwise, the Accounts are self-explanatory and have appended to them the Accounts of your Subsidiary Company, Killick Nixon & Co. Private Ltd.

The progress of our plans for Industrial Development has been detailed in the Directors' Report and other projects are under consideration.

The continued expansion of your Company's activities has of course necessitated capital investment and a point has now been reached when further finance is needed. This matter has been receiving the attention of your Directors and although no decision has yet been reached it is possible that an application may be made to the Controller of Capital Issues for permission to make a new issue of Ordinary Shares next year.

As regards the future, I would only say that your Company is well poised for prosperous development. It is only political policies which threaten to impede fruitful progress.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting which will be sent separately to Shareholders.

Company Meeting

THE WESTERN INDIA MINERALS ASSOCIATION, BOMBAY

Speech of the Chairman, Mr. Natwarlal Shamaldas Worah.

At the Second Annual General Meeting on November 9, 1957.

Gentlemen,

The Committee's report and Audited Statement of accounts for the year ended 30th June, 1957, having been in your hands for some time, I will, with your permission take them as read.

As you all know, under the new Mineral Export Policy covering the period 1-7-1957 to 30-6-1958, the entire Iron Ore Export Trade has been taken over by the Government and the State Trading Corporation has been entrusted with this task. Similarly, the Private Sector's share of the country's Manganese ore trade has been vastly curtailed and it would seem that the Government's intention is to eliminate progressively the Private Exporters and hand over this trade also to the S.T.C. However, I would remind the Government that the Manganese ore trade differs from trade in other commodities in certain fundamental aspects. These must be considered and appreciated if a rational and long-

term planning is to be formulated for the country's Manganese ore trade in the national interest.

I would like to assure Government that the Manganese Export Trade is fully alive to the needs of our expanding economy inspired by the ideal of a welfare state, and is willing and also prepared to adjust its workings so as to attune itself to the prevailing pattern of Mixed economy which the Government has accepted as the basis of our national economy. However, I would like to remind all concerned that the manganese ore trade is a risky one since the fortunes of the trade depend entirely on the degree and tempo of industrialisation in some of the important steel producing countries, like the U.S.A., Canada, the U.K., the Continent of Europe and Japan.

You are all aware that the Manganese and Iron ore Industry and Trade is facing a very serious problem.

The foreign buyers are more or less on strike and whatever demands there are, they are mostly for high grade ores. For lower grade ores, there are practically no demands. In the case of Manganese ore as we all know, it is a good foreign exchange earning commodity, particularly the hard currency. Till about 1955-56, America and several other steel producing countries continued to have their main requirements of Manganese ore from India. This position is now receding since June 1956 due to several reasons, more particularly due to the Government's new Mineral Export Policy and to the incursion of the State Trading Corporation into this field. However, as mentioned earlier I am sorry to say that the State Trading Corporation, despite having all the resources at its back has not been able to make a very impressive show in fulfilling its contractual obligations, resulting in its Export quota remaining unutilised, which has produced far reaching repercussions.

Internally the State Trading Corporation has not been able to satisfy Mineowners and Exporters in the discharge of its contractual obligations of purchases of considerable quantities of ores; yet the State Trading Corporation thought it fit to commit itself to sell mainly high grade ores with very low impurities and did not attempt to understand the different grades of ores produced in the country and the disposal thereof with average manganese contents and impurities. It is a matter for regret to note that the State Trading Corporation having contracted to purchase medium and low grade manganese ore from the Trade and Industry, has not been able to lift the same for the last six months and consequently large sums of money have remained locked up which the mineral Trade can ill afford. Added to this the State Trading Corporation is reported to have suggested cancellation of its lower grade purchase contracts which if true, I am constrained to say, does not reflect well on the part of an organisation having the backing of Government.

We do not mind the existence of the State Trading Corporation but its role must be a positive one. In a great and growing economy such as ours there is enough room and justification for the co-existence of the Public and Private Sectors, but the proper role and the Principal object of the Public Sector should be, not to encroach upon the existing Private Industry and Trade but to develop new areas and increase mining operations by employing all its available resources and using the most up-to-date, scientific and economical methods and similarly develop additional markets in the export trade. State Trading Corporation with all the resources of the Government at its back will be in a better position to undertake such new developmental works than the Private Sector and if it does all these, there will be increased mining and trading activities, greater employment and larger earning of foreign exchange.

But during the past one and a half years, all that the State Trading Corporation has achieved is appropriating to itself a large share of the export business which legitimately belonged to the Private Sector. In the field of developing or increasing mining operations, or in the matter of finding new outlets for our ore, the State Trading Corporation has done precious little or nothing. Its achievement in this direction is negligible.

During the year under review an important development took place. Through the good offices of the Federation of Indian Chambers of Commerce and In-

dustry, New Delhi, of which we are members, a Mineral ores Liaison committee was formed to deliberate, discuss and advice on problems confronting the Mineral Trade. Unfortunately, despite several meetings, of this body, it could not play any significant or effective role as the advice and suggestions tendered by the representatives of the Mineral Associations serving on this body were not acted upon, and ultimately these members resigned en bloc from this body as it was found that no useful purpose would be served by remaining on this committee.

Presently the foreign buyers have not been satisfied for the last one year with the delivery schedules of ores due to the restrictions of quota system and the State Trading Corporation has not been able to satisfy them either. To a certain extent they have lost confidence of getting regular supplies from India and in order to instil confidence in them, it is necessary to sponsor a delegation consisting of Members representing the Mineral Industry and Trade to visit all the main consuming foreign countries to have personal contacts to find out their requirements, to study the market potentialities, the difficulties experienced by them and to find out ways and means by which we can best utilise our resources at home.

In order to overcome the present difficulties facing the Mineral Trade and Industry I would request the Government to take the following remedial measures with a view to putting the manganese ore trade back on its feet.

- (1) The export quota system imposed on manganese ores should be abolished. Exporters and Mineowners will have more incentive only when they are allowed to function freely without such restrictions. Similarly, movement quota system need not be imposed on Railway sectors where the wagon position is easier.
- (2) The system of levy of Export Duty on Manganese ore is having a constricting influence on the country's export Trade and the same should be abolished immediately. In any case the export duty on medium and low grade ores should be abolished forthwith in order to make these grades competitive and marketable.
- (3) The Trade Commissions in the producing and consuming countries should be equipped to study the trend of production in each such country and the trend of consumption in many steel producing countries. They should give periodical reports of purchases made by these main consuming countries from different producing countries.
- (4) One of the greatest difficulties in increasing production of manganese and Iron ores is that there are no proper roads from mine-heads to the loading stations. All State Governments should be requested to construct transportable roads immediately.
- (5) All pending applications for Prospecting Licences and Mining leases should be disposed of by the States concerned as early as possible and that too very liberally.
- (6) Manganese ore is mainly an item of Export and when the country is expanding its exports, there should be no imposition of a Sales-tax or Purchase-tax on the transactions of manganese ore in States as well as on Inter State transactions.

Before I close, I think it is my duty to thank our Honorary Secretary and Jt. Secretary, Shri T. K. Uchil and Shri Dayashankar Bhatt and my colleagues on the working committee for their continued co-operation and enthusiasm shown to study the various problems of the Mineral Trade and Industry and in presenting them to the proper quarters.

GOVERNMENT OF INDIA

I. 15-YEAR ANNUITY CERTIFICATES—SECOND SERIES

(FREE OF INDIAN INCOME-TAX)

Annuity Certificates securing a monthly payment of Rs. 25, Rs. 50, Rs. 100 and Rs. 200 respectively for a period of fifteen years will be available from the 2nd January, 1958, until further notice at issue prices given below:

For monthly payment of Rs. 25	issue price of Annuity Certificate Rs. 3,325
-do- -do- Rs. 50	-do- -do- Rs. 6,650
-do- -do- Rs. 100	-do- -do- Rs. 13,300
-do- -do- Rs. 200	-do- -do- Rs. 26,600

These certificates will be available to INDIVIDUALS only and no applications will be entertained from or on behalf of institutions, firms or corporations.

The maximum amount that may be invested in the certificates will be

For an individual Rs. 26,600 (or Rs. 28,000 inclusive of holding of 1st series)

For two individuals jointly Rs. 53,200 (or Rs. 56,000 inclusive of holding of 1st series)

Monthly payment will commence after expiry of one calendar month from the date of receipt of the purchase price. Such payment will be free of Indian-income-tax and will not be taken into account in calculating the total income of the holder for the purpose of income-tax.

Annuity Certificates will be accepted for safe custody by Public Debt Offices and monthly payments remitted to the holders, if so desired.

Applications will be received at the offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi; branches of the State Bank of India, State Bank of Hyderabad and Bank of Mysore Ltd. conducting Government treasury business; and treasuries and sub-treasuries in India at places where there is no such office of the Reserve Bank of India or branch of the State Bank of India, State Bank of Hyderabad and the Bank of Mysore Ltd.

II. 4 PER CENT TEN-YEAR TREASURY SAVINGS DEPOSIT CERTIFICATES.

(FREE OF INDIAN INCOME-TAX)

From 2nd January, 1958 and until further notice deposits for Treasury Savings Deposit Certificates will be received in multiples of Rs. 50/- instead of in multiples of Rs. 100/-.

Deposits will be refundable at any time after the expiry of one year from the date of deposit at certain discount.

The other terms and conditions of issue etc. will be the same as at present.

FOR FULL PARTICULARS APPLY TO ANY OF THE OFFICES, BRANCHES OR TREASURIES MENTIONED ABOVE.

December 20, 1957.

The Problems of the Scheduled Banks

THE BELAPUR COMPANY LTD.

According to the Report of the Directors of the Belapur (Sugar) Co. Ltd. for the year 1956-57, the Company achieved further records during the year under review. Thus, the net profit for the year, namely Rs. 7,94,580 and the quantity of sugar produced (valued at Rs. 193,40,464) are both stated to be all-time records. The record production of sugar during the year under review is especially creditable, because the percentage recovery was actually slightly lower than the highest reached by the Company, thanks to the extended crushing season.

After providing Rs. 2,60,407 for depreciation (as against Rs. 315,675 for the previous year) and providing Rs. 20,00,000 for taxation which includes Rs. 60,000 for Wealth Tax (as against Rs. 17,75,000 for the previous year), the net profit amounted to Rs. 47,94,580. Adding to this Rs. 70,646, being excess provisions written back, and Rs. 52,911 brought forward from the previous year, the total available for appropriation amounts to Rs. 49,18,137. Out of this, it is proposed to appropriate Rs. 25,37,874 for paying a dividend of Rs. 18 per share free of Income-tax (as against Rs. 16 per share for the previous year) and to transfer to General Reserve, Reserve for Housing, and Reserve for Gratuity Rs. 10,00,000, Rs. 10,00,000 and Rs. 80,000, respectively. This still leaves a balance of over Rs. 3,00,000 to be carried forward to the current year, as against a sum less than Rs. 53,000 brought in from the previous year.

The Directors' observations on the sugar prices during the year under review, although of academical interest now, are significant. They say there was not a great rise in sugar prices throughout the year, the tendency being slightly upward, except when the Government doubled the Excise Duty which had the effect

of putting up the market rates, but even then only to the extent of the increase. This clearly disproves the charge that sugar interests charged consumers more than what the rise in the Excise Duty actually warranted.

THE AHMEDABAD ELECTRICITY CO., LTD.

As in the case of other electricity undertakings, in the case of this Company also, the latest accounts are not for a whole year. They are only for the six months ended March 31, 1957. The six months' total supply of energy for purposes of public and private lighting, fans, etc.; for power, and for bulk supply to North Gujarat Grid amounted to 285.7 million kW. hours, which compares with 548.7 million kW hours for the 12-month period of 1955-56 and nearly 486 million kW. hours for the year 1954-55.

After providing Rs. 22,04,814 for depreciation as per provisions of the Electricity (Supply) Act 1948 and Rs. 4,93,400 for taxation, the gross profit of the Company for the period under review amounted to Rs. 26,30,393. Adding to this Rs. 468 brought forward from the previous accounting period and Rs. 26,03,383 transferred from the Equalisation of Dividends Reserve, the total disposable amount works out to Rs. 32,24,361. Out of this, a sum of Rs. 3,39,681 has been set aside for the Statutory Contingency Reserve, and a total of Rs. 40,521 written off on Account Promotion Expenditure, Stamp Duty and Brokerage on Mortgage Debentures, New Share Capital Issue Expenses and Discount on new issue of Mortgage Debentures, leaving to be distributed Rs. 23,44,159. The dividend of Rs. 3.25 per share recommended by the directors in respect of the accounting period under review takes away Rs. 28,43,006, so that there remains a balance of only Rs. 1,153 to be carried forward to the current year's accounts.

The Course of Deposits

BACK in 1951 the bank deposits took a downward course due to dissaving by middle-class depositors encouraged by all round inflation. This tendency continued for the next two years and a halt to this downward trend was noted in 1954. Ever since then the deposits of banks have been rising steadily. In the last six months alone, deposits rose by as much as Rs. 126 crores. Table I below sets out the deposits of scheduled banks since 1949. It is still premature to estimate the probable impact of rising prices on bank deposits. The current rise has undoubtedly been the result of increased development outlay on programmes laid down in the second Five-Year Plan. It is this expansion in the economy all round which has put deposits at an upward trend. The expansion of deposits, however, has lagged much behind the expansion of currency.

TABLE I

SCHEDULED BANKS IN INDIA DEMAND AND TIME LIABILITIES

(In Crores of Rupees)

Year Ending	Demand Liabilities	Time Liabilities	Total*
1949	579.81	282.97	862.78
1951	553.74	292.47	846.21
1952	517.45	313.27	830.72
1953	508.10	330.02	838.12
1954	566.84	365.28	932.12
1955	608.90	415.20	1,024.10
1956	643.55	457.16	1,100.71
1957 (June 28)	712.13	548.90	1,261.32

* Net of inter-bank borrowings.

A study of the ownership of deposits in Table II shows that during the last three years makes the startling statement that a maximum increase has taken place in personal deposits. As against the total rise of Rs. 165 crores in scheduled bank deposits in two years, personal deposits alone account for Rs. 79 crores. Business deposits have shown a negligible rise of Rs. 18 crores. Other major increases have occurred under deposits of Government and Quasi-Government bodies, Unclassified and Miscellaneous Deposits. Rise in personal deposits has taken place mostly in time and saving deposits. The conclusion can be reached clearly on the basis of this fact that higher rates of interest offered by the banks have been a strong factor in pushing up bank deposits. The new factor of inflationary pressure which took an acute form in 1957 will no doubt have its repercussions in slowing down the rate of advance of these deposits. At the same time projects in the second Plan are being held back with the intention of reducing investment. That also is likely to help in relieving the strain on the banking resources.

During the last year and a half, attention was focussed on bank deposits which, despite a phenomenal increase, failed to remove the tightness in the money market. It is not true to say that the banking system failed to respond to the expansionist wave in the economy under the impact of heavy development expenditure in the second Plan, because during the last few months, deposits of banks have been rising at a rate faster than ever before. It may look a paradox that our money

supply which is at an all-time peak at this time, has failed to relieve the money market of its tightness. The business community has felt this tightness very acutely during recent months. This tightness is not born out of a decrease in money supply, but is the result of an excessive increase in demand resulting from ambitious development outlays.

TABLE II

OWNERSHIP OF DEPOSITS OF SCHEDULED BANKS

(In Crores of Rupees)

Type of Deposits	Dec. 1954	Dec. 1955	Dec. 1956
I. Business Deposits:-			
(a) Trading Concerns	164.0 (18.0)	173.3 (17.4)	171.3 (15.9)
(b) Financial Concerns	71.3 (7.8)	75.6 (7.6)	66.6 (6.2)
(c) Other Business Concerns	85.5 (9.4)	104.0 (10.5)	100.1 (9.3)
Total Business Deposits	320.8 (35.2)	352.9 (35.5)	338.0 (31.1)
II. Personal Deposits	409.0 (45.0)	440.6 (44.3)	488.0 (45.4)
III. Deposits of Government and Quasi-Government bodies	84.7 (9.3)	76.0 (7.7)	111.5* (10.4)
IV. Other Deposits	84.1 (9.3)	94.9 (9.6)	104.5 (9.7)
V. Unclassified **	11.3 (1.2)	29.2 (2.9)	32.8 (3.0)
Total of I to V	909.9 (100.0)	993.7 (100.0)	1,074.8 (100.0)

Note: Figures in brackets are percentages to totals.

It is true that the fault lies partly with the state of development of the whole banking system in the Indian Union. Unlike the Western people, Indian masses are not bank-minded with the result that the ratio of deposits to total notes in circulation has remained always less than one during the last twenty years. On the other hand, in advanced countries like the United States and the United Kingdom, this ratio has tended to be between three and four and has sometimes even exceeded that. This fact is borne out by Tables III (a) and III (b) which set out the ratio of demand deposits to total currency in the United Kingdom and the United States of America. If time deposits are also included, this ratio goes up significantly. It is usual, however, to ignore time deposits because they do not enter into the computation of money supply with the public. The only way to enhance this ratio is to inculcate in

* The sharp increase in deposits is mainly due to the change in classification.

** Accounts of less than Rs. 500/-.

the masses the habit of using the banking system for investing their savings instead of hoarding them. For this purpose, an extensive educative plan needs to be launched which will penetrate into the interior of this country. This however, can bear fruit in the long run.

(TABLE III (a))

1955	1.73	3.97	230.60
1956	1.84	3.92	215.2

The argument that the slow growth of deposits in this country is to be attributed to the lack of the banking habit must not be over-emphasized. In fact it should be clear that deposits are exhibiting a new dynamism in the last three years and given the necessary impetus through proper techniques there is no reason why they should not rise much faster. A major factor contributing directly to the growth of deposits must not be overlooked. Effective spurt in deposits must come, in the final resort, from an increment in currency. The scale on which developmental activity is envisaged in the Plan makes it imperative that the system should have more currency pumped into it to sustain that activity. The currency so injected will induce a growth in the

volume of deposits. Assuming that the present ratio of deposits to currency remains what it is, the expansion of currency by Rs. 200 crores during the next two years will bring into the banks an amount of Rs. 150 crores, if not more. This, however, is a conservative estimate. The experience of first half of 1957 has demonstrated that an addition of 10 per cent to the volume of currency is accompanied by an addition of 10 per cent to bank deposits. It is obvious therefore, that the increase in deposits consequent on progressive increments in currency will be much more than the 75 per cent ratio generally assumed.

The upshot of this analysis is that any expansion in bank deposits in the short period is dependent in a substantial measure on the expansion in currency. Ramification of bank offices in the rural regions and an increase in the velocity of circulation of money are long-term solutions. In the context of the near future, the function of giving impetus to deposits devolves largely on currency in circulation.

Advances and Industry

BANK advances, which have been steadily rising for the last four years, stood at Rs. 793.6 crores on December 31, 1956. The previous peak of 1951, the year of Korean boom, was crossed in 1955 and there has been an increase by about Rs. 150 crores during 1956. That this sharp upturn is caused essentially by the expanding economy is evident from the fact that the share of industry in this increase of Rs. 150 crores was to the extent of Rs. 85 crores. The private sector, while fulfilling its obligations of raising industrial output, has to depend, for a part of its finances at least, on bank advances.

There has been a firm rise in industry's share of bank advances from Rs. 166.5 crores on December 31, 1953 to Rs. 305.5 crores at the close of 1956. Cotton textiles accounted for an increase of about Rs. 32 crores, which is perhaps the single largest rise. This has been caused partly by expansion and renovation programmes of the industry and partly by increased production of textiles, adding about 140 million yards to the stocks with mills. Advances to jute industry increased by

Rs. 12 crores. In this case increased stocks of raw jute, which rose from 9.9 lakh bales at the end of 1955 to 11.3 lakh bales by the end of 1956, contributed to the increase. The stocks of jute manufactures also increased considerably. The textile group has taken advances around Rs. 129 crores, which exceed their deposits by about Rs. 100 crores.

Advances to sugar and gur, which increased by Rs. 7 crores during 1956, have been caused by higher production recorded by the industry. On the contrary, advances to vegetable oils industry declined by Rs. 72 lakhs. A considerably large share of advances to consumer goods (24.4 per cent out of 33.5 per cent) is natural in view of the structure of our industry. At present the bias is predominantly in favour of consumer goods. It is evident from the fact that textiles alone have the weightage of 48 in the official index of industrial production, the total weightage to consumer goods being about 75.

The producer goods industries, some of which are of comparatively recent origin, too have received a

reasonable share. Advances to this section have been doubled between 1953 and 1956. The share of the Engineering industry during 1956 increased by Rs. 27 crores and that of Iron and Steel industry by 64 lakhs. Between these two, there has been a net borrowing of about Rs. 50 crores at the end of 1956. In engineering, the light industry has the major part of this advance—Rs. 39 crores—while the heavy Engineering industry has taken Rs. 20 crores. This increase can be explained by the remarkable expansion of the engineering industry; the rise between 1951 and 1956 being more than 100 per cent. Advances to Coal and other mining industries are about Rs. 8 crores, and to chemicals about Rs. 14.6 crores. Here again a significant rise has been noticed. The latter industry is among the most expanding ones and is certainly going to claim a bigger share of bank advances in the future. Thus it can be observed that the financial assistance from the banks to the expanding industrial sector is steadily rising.

From the total advances of Rs. 377 crores to commerce at the end of 1956, wholesale trade has a pre-dominantly large share of Rs. 271 crores. Out of this amount Rs. 166 crores have been advanced by Banks to wholesale traders of non-agricultural commodities, while Rs. 105 crores have gone to dealers in agricultural commodities. This also reflects, in a way, the expanding industrial activity in the country. Advances to dealers in agricultural commodities, however, fluctuate with seasonal stocks. Advances against wheat and other grains (except rice and paddy) on February 28, 1957 were Rs. 7.3 crores while on May 17, 1957 they were at more than double that amount. Traders in Hardware and Machinery have a share of 6.3 per cent and 6.1 per cent respectively, out of the total advances.

Bank advances to agriculture are generally quite modest, except for cash crops, which were above Rs. 13 crores at the close of 1956. The share of Personal, Professional and other purposes has recorded a sharp fall; the percentage of the total has declined to 4.9 per cent at the end of 1956 in sharp contrast with 13.9 per cent a year ago.

The expansion of advances of banks was not accompanied by expansion in deposits on a commensurate scale. In an article on the Course of Deposits in this Supplement the reasons of the comparatively

lesser growth of deposits have been explained. It need not be emphasized, however, that the expansion of advances without a corresponding rise in deposits cannot be pushed, consistently with safety, beyond a reasonable limit. The ratio of advances to deposits which was around 50 in 1950 went up to 63 in 1951 under the impact of the Korean boom, when banking companies reacted promptly and increased their credit facilities. Advances dropped again and for the next three years the ratio did not touch the 1951 level. This level was recaptured in December 1955. In 1956 there was a further sharp upturn in advances and the ratio fluctuated between 68 and 70 which indicates a level of expansion beyond what would be really warranted by cautious use of their resources. The trend towards a sharp increase in advances continues and the latest position is that it shot up to 70 to 75 per cent in the first six months of 1957.

The unequal race between advances and deposits, when the expansion of advances outstrips the expansion of deposits by a large margin, produces certain repercussions on banking operations. The scramble for deposits forces their interest rates up and because their volume is inadequate other devices like reducing the investment portfolio and lowering the cash ratio are resorted to. Furthermore, when banks increase their advances out of proportion to deposits, their liquidity is naturally affected adversely. This is likely to impinge on the safety factor in particular situations. This, however, was not the case with the Indian banking system in the last two years of marked expansion of advances. Banks in India have wisely chosen not to discard a conservative attitude which they have inherited from the traditions of the British banking system.

Short-term advances constitute a sphere where Indian banks have developed a substantial part of their credit operations. Commercial banks in this country have evolved their technique to deal with a variety of clients for short-term accommodation. But a shift in the character of bank advances is now taking place. The requirements of the private sector of industry for medium-term finance are increasing fast. But provision of medium-term finance inevitably affects the turnover of banks. The tendency for some industries to take short-term advances and by a process of renewals to use them practically as medium-term advances has

ADVANCES OF SCHEDULED BANKS ACCORDING TO PURPOSE, 1953-1956

(Rs. lakhs)

July 26, 1957.

gone on increasing in the recent past. It has posed a problem which requires critical investigation as to their long-range implications. The demands on credit for industry from all sources has been so much intensified due to the Plan programmes that attention has been focused on the question of the desirability of commercial banks changing over their conventional credit policies and participating in the provision of industrial finance. It is pertinent to state that the Shroff Committee has expressed its view that banks should provide medium-term and in some cases long-term advances to industry on a modest scale. This transition will necessarily have to be spread over a long period by a gradual process.

The problem of the immediate future, however, relates to provision of credit for the requirements of industry in respect of working capital. The pressure of short-term loans over medium-terms have accentuated the slow but not widely detected process of extension of short-term loans over medium-terms have accentuated the problem of stringency. How far banks should change over to medium-term industrial credit is a matter of long range policy decision. In the present context the difficulties of supply of working capital need to be solved. Another article in this Blue Supplement examines this problem of finance for the private sector in industry in some detail.

Finance for the Private Sector

THE accommodation which banks can offer to the private sector in organised industry merges into the larger problem of the provision of finance for the private sector in the second Plan. The size of assistance which is to be expected from the resources of the banking system must, of course, be related to the aggregate requirements of the private sector. This is a matter of broad estimates because the question of banking has not been examined in the second Plan even in general outline.

The Planning Commission has estimated that the total requirements of finance as contemplated under the programme of the National Industrial Development Corporation and the private sector (excluding mining, electric power, plantation and small-scale industries) would be in the neighbourhood of Rs. 720 crores, to be divided into Rs. 570 crores for new investment and Rs. 150 crores for replacement and modernisation. Deducting the separate provision of Rs. 55 crores already made for the programme of financing by the NIDC, the additional resources required by the private sector of industry are placed at Rs. 665 crores. The break-up of this estimate of outlay into investment and replacement and modernisation should make it clear that it does not take into account the private sector's needs of working capital. The detailed scheme for raising the required resources for investment and replacement set out in the text of the second Plan shows that out of Rs. 665 crores provision has been made to the tune of Rs. 620 crores. It means that even here there is an uncovered gap of Rs. 45 crores.

The general scheme of finance for investment and replacement made in the Plan is subject to one important qualification. That qualification relates to the level of prices of machinery, equipment and materials. Since prices of machinery, equipment and materials have been rising this original estimate was made prices have been rising steadily. It would, therefore, appear that the actual gap in the financial resources of the private sector would be much larger than Rs. 45 crores as envisaged by the Planning Commission. The total amount of private sector finance for investment, replacement and modernisation would be positively higher than Rs. 700 crores if allowance is made for price inflation. The requirements in respect of working capital are to be determined in relation to this figure and it would be safe to estimate that they would be of the order of anything between Rs. 275 and Rs. 300 crores, an appreciable part of which is expected to be provided by the banking system.

How are resources for private industry's requirements to be raised to the adequate level? On this problem there has been far too much complacency on the part of the Planning Commission. The Commission has taken the view that, considering the high rates of investment attained by organised sector of industry during the first Plan period and the dynamic strength of the capital market, the resources required for fixed

investment in the second Plan could be raised without difficulty. The Planning Commission's optimism on the score of raising working capital is still more dogmatic. It has asserted that the task of providing working capital would present even less difficulty in view of the programme of deficit financing proposed to be undertaken in the second Plan. How this confidence has proved to be a miscalculation is now amply borne out by the tight situation in the capital market and the continuing stringency through which banks are passing despite an encouraging expansion in deposits following the expansion of currency.

It is necessary to remember in this context that the private sector's task of finding working capital has become more onerous now in view of the fact that the resources of the State Bank of India will not be available to it in future on the scale on which liberal assistance was usually forthcoming from its predecessor, the Imperial Bank of India. The burden for providing working capital to the private sector, therefore, falls much more heavily on the commercial banks than ever before. As emphasised elsewhere in this Blue Supplement, there has been an appreciable increase in the utilisation of bank finance for medium-term requirements of industry. This result has not occurred due to a deliberate change in the credit policy of commercial banks. But by a process of rolling over short-term credit has been allowed to be used virtually for medium-term requirements. In the present stage of the development and resources of the commercial banking system of this country, it would be inadvisable to ignore this trend and to take no corrective action. This is essentially a function of the Reserve Bank, the State Bank of India and other industrial finance agencies. What is pertinent for the credit requirements of the private sector from banks is ways and means to enlarge their resources for providing essentially working capital.

Since the Shroff Committee tendered its report in June 1954 some of its recommendations have been implemented by the Reserve Bank of India. The object of this implementation, of course, is to provide accommodation to the private sector on a more liberal scale than before. Thus, for instance, the shares and bonds of the Industrial Finance Corporation of India and of the State Financial Corporations have been placed on parity with Government securities for the purpose of advances to scheduled banks under Section 17(4)(a) of the Reserve Bank of India Act. The Bill Market Scheme has been made much more broad-based and accessible to a far larger number of scheduled banks. The minimum limit of advances has been reduced from Rs. 25 lakhs to Rs. 10 lakhs and the minimum amount of an individual bill has also been reduced from Rs. 1 lakh to Rs. 50,000. All licensed scheduled banks have now been declared eligible for advances under the Bill Market Scheme, no matter whatever the size of their deposits. During the year ended June 1956 advances

under the Bill Market Scheme aggregated Rs. 100 crores, or Rs. 33 crores more than the advances in the previous year.

There is still much more to be done by way of expanding the base of credit available from the banking system. It is urgent now that at least the important recommendations of the Shroff Committee and those contained in the Report of the All-India Rural Credit Survey should be implemented. Thus, for instance, the representation of the leading scheduled banks to the effect that they should be recognised as eligible to provide banking facilities to quasi-public institutions needs to be granted with a view to augmenting their funds. If commercial banks are to be enabled to tap the rural resources by opening branch offices in those areas, they should be freed from the rigid and prohibitive conditions of salaries of staff laid down in the Bank Award. Reasonable discretion ought to be given to them to relate salary scales to local conditions of cost of living as a partial relief against losses which offices in these areas will necessarily have to incur over a long initial period.

Provision of working capital will continue to re-

Earnings, Expenses and Profits

THE present phase of stringency through which the Indian banking system is struggling its way calls for a candid examination of the different aspects of bank operations. Trends in the earnings, expenses and profits of banks form a vital part of these operations. Their analysis is essential not only for a correct appraisal of the broader problem of stringency but for judging in what sense the assumption generally made to the effect that banks in India have entered upon a period of prosperity with higher profits is substantiated by facts. The course of these three indicators as disclosed in the working of exchange banks is included along with the developments in the operations of Indian scheduled banks in the analysis in this article for the purpose of comparative assessment. It establishes the conclusion that earnings and expenses have kept on expanding. The crucial year for the structure of costs is the year of the Bank Award — 1953 — which altered the ratio of expenses to earnings. Compared with 1953, bank profits have exhibited a healthy trend towards a rise.

The table in this article comprising major groups of operations sets out their course in absolute figures. Current operating earnings are what really matter as the criterion with which the ratios of other items of operations ought to be compared to determine progress or decline in working during individual years. The comparisons of the trends in earnings, expenses and profits in the analysis which follows are expressed as percentages of current operating earnings. The difference between total current operating earnings and total earnings is negligible and is accounted for by a minor factor which adds to the size of the latter.

Discount on bills and interest on loans and advances is the mainstay of bank revenues. The volume of interest on loans and advances forms the bulk of the earnings of Indian scheduled banks in the group, bills, loans and advances, and it increased from Rs. 16 crores in 1951 to Rs. 19.5 crores in 1955. Discount on bills purchased varied from Rs. 2.2 crores to Rs. 3.7 crores between these two years which shows marked percentage rise. The structure of earnings of Indian scheduled banks reveals changes which need not be regarded as altogether unimportant. Discount and interest on bills and advances declined, as a percentage of current operating earnings, from the peak of 59.1 per cent in 1952 to 56.1 per cent in 1955. The percentage in 1955 is marginally lower than the percentage of 56.4 in 1951. Earnings from government securities have recorded a

main the proper function of scheduled banks in their role vis-a-vis the private sector of industry. It is obvious that scheduled banks will be looked upon as the major source of this type of accommodation by the private sector. This is for the simple reason that the demands which have been made by the Plan programmes on the private sector are too exacting. The course of deposit expansion and growth of advances by scheduled banks during the last two years conclusively establishes that in spite of a larger flow of deposits, the pressure of credit requirements cannot be eased. The ratio of advances to deposits is increasing at a rate which only adds to the current stringency. Positive action therefore, needs to be taken to augment banks' resources. An immediate remedy available for this purpose is to liberalise the scheme of channelling the proceeds of the P.L. 480 Commodity Loans into the projected Refinance Corporation. These proceeds ought to be distributed between the public sector and the private sector on a 50:50 basis. Still another remedy which can be indicated in the present situation is to enlarge the assistance of the Reserve Bank to the commercial banking system.

steady rise from 20.9 per cent in 1951 to 21.8 per cent in 1955. It is likely, however, that this upward trend is being halted, or perhaps reversed, owing to the depletion of the investment portfolio for enlarging banks' lending resources. "Other earnings" derived from commission on bills tendered for collection, Telegraphic Transfers and Demand Drafts as well as service charges form the third large source of revenue. If the boom year of 1951 is excluded, this group of earnings discloses a firm trend in the last two years of the period under survey — 18.8 per cent in 1955 as against 17.9 per cent in 1952.

The pattern of the earnings of exchange banks has also undergone a change, but it reveals somewhat different variations from the operations of Indian scheduled banks. Revenue from bills purchased and discounted has always assumed a relatively high proportion in their earnings of discount and interest for the obvious reason that they continue to retain the lion's share in financing the external trade. This proportion ranges approximately between 40 and 45 per cent in the group of bills and loans. The most striking factor of exchange bank earnings which emerges during this period is that the share of income from bills and advances shot up suddenly from 67.9 per cent in 1951 to 77.7 per cent in 1952 and it has shown only marginal changes from the 1952 level. Interest on government securities shows that although its percentage share in current operating earnings remained virtually the same in 1951 and 1955 at 9.4 per cent, the peak in 1953 and 1954 has now passed away. The gains in discount and interest have been made largely at the cost of "other earnings" whose ratio shrunk from 22 per cent in 1951 to 12.7 per cent in 1952 and this latter level was maintained in 1955 after a fall in the two intervening years.

Much of the prosperity in earnings of banks has been cancelled out by the steep rise in current operating expenses. There has been a spectacular increase for Indian scheduled banks from Rs. 23.9 crores in 1951 to Rs. 33.6 crores in 1955 and this increase has assumed high progression in the last three years since 1953. A higher proportion of operating expenses is undoubtedly implicit in a rising volume of business and earnings, but the rise in the two indicators shows much disparity. Easily, the biggest individual item of mounting costs is establishment expenses. Its proportion to current operating earnings rose markedly from about 37.3 per cent in 1951 and 1952 to 38.7 per cent in 1953. This sudden

increase is explained by the impact of the Bank Award. Higher banking activity came as an opportune relief and enabled the banking system to absorb the shock of the Award. The subsequent higher levels of establishment expenses are to be ascribed to the higher volume of business. The ratio of these expenses rose to 39 per cent in 1955. Payments of interest on deposits have imposed a heavier and rapidly increasing liability on the expenses of banks. Another article in this Blue Supplement discusses elaborately the course of deposits. It is now a commonplace that banks in India have entered a continuously intensifying scramble for deposits. It is but inevitable that this scramble should bring in its train a heavy bill of interest charges. For the Indian scheduled banks, the ratio of interest on deposits to current operating earnings spurted up from 22.9 per cent in 1952 to 26 per cent in 1953 from where it jumped to 28.6 per cent in 1955.

The upsets caused by the Bank Award in the structure of expenses of exchange banks also were noteworthy, but their impact seems to have been heightened by the decline in current operating earnings in 1953, the year of the Award. Their establishment expenses went up suddenly from 27.7 per cent in 1952 to 33.9 per cent in 1953. It is a striking feature of their establishment expense ratio that it came down to 31.8 per cent in 1955, a factor which is explained by the increase of about Rs. 2 crores in current earnings as against an increase of Rs. 30 lakhs in establishment expenses. Another striking fact about the expense trends of exchange banks is the steep rise in interest on deposits from 14.2 per cent in 1953 to 16.2 per cent and 17 per cent in the two following years. This burden seems to be due to their increasing participation in the competitive arena of deposits which has become necessary for them since funds from home are now available on a smaller scale owing to the rising rate of interest.

Neither the year 1951 which represented the abnormal factor of the Korean boom nor the next year can serve as a realistic base for making an assessment of

the trends in profits. A new and vital element was introduced in the pattern of bank earnings, expenses and profits by the Bank Award in 1953. The effect of the Award is clearly seen in the depressed levels of net profits before taxes — Rs. 6.52 crores for Indian scheduled banks and Rs. 2.62 crores for exchange banks. This burden on costs is a permanent ingredient and precisely because of this fact the course of profits ought to be compared with profits in this year. The improvement which was registered in the following years in absolute terms is evident from the table itself in respect of both the classes of banks. In percentage terms there was a marginal decline in 1955 in the profits of Indian scheduled banks as compared to the previous two years' level of 19 per cent, but exchange bank profits rose slightly from 22.4 per cent in 1953 to 22.9 per cent in 1955.

The disposal of net profits and accumulated surplus discloses that the share of employees in profit by way of payment of bonus in the Indian scheduled banks has improved from 13.1 per cent of the total sum made available for disposal in 1952 to 13.8 per cent in 1955. The improvement in the case of exchange bank employees indicates that their share has gone up from 6.5 per cent to 8.9 per cent in the corresponding years. The contribution of exchange bank offices in India to dividend distribution merges in the head office account. But the return to shareholders — dividend etc. — in the case of Indian scheduled banks indicates that it improved from 31.4 per cent, (of the total sum available for disposal) in 1952 to 33.1 per cent in 1955. The other striking development revealed by facts is the state of the reserves of Indian scheduled banks. There was abnormal withdrawal from reserves in 1951 of the order of Rs. 2.2 crores and the total withdrawals reached Rs. 2.78 crores. Allocations in the subsequent years have served to replenish this heavy drain and it was because of a deliberate policy of liberal appropriations to reserves that there was a net addition of Rs. 36 lakhs over the period.

The Role of Banks in the Plan

I. The Urban Sector

THE arrival of planning as an integral feature of the country's economy has introduced powerful new elements to which banks, like many other institutions, have to adjust themselves. Elsewhere in this Blue Supplement it has been shown by means of both argument and statistics that the financing of the rapidly expanding commerce and industry has placed heavy strains on the resources of banks, which have not been able to keep pace with the ever-increasing demands. The large developmental expenditures, in the public as well as in the private sector, injecting more money into the market, also unaccompanied by a commensurate increase in the availability of consumer goods, has created a situation of inflationary pressures which has affected the banks as much as the other sectors of the economy. It is important further to remember that with the taking over, by the State, in 1955, of the Imperial Bank of India, the private sector has lost an important financial institution which was playing a substantial and significant part in the financing of trade and industry. The new responsibilities of the State Bank of India are bound to divert part of its resources from the key services which its predecessor was rendering to business. With the nationalisation of life insurance a year later, another source of finance was largely blocked for the private sector. The cumulative effect of these developments has been for the commercial banks to have to shoulder increasingly heavier responsibilities.

That the responsibilities coupled especially with the steep rise in the demand for credit have turned out to be too heavy for the banks is well known. The pressing demands for advances have not been fully matched by higher levels of deposits. Consequently, there has ensued a scramble, among banks, for deposits, leading to dearer money both in the case of deposits and advances. But, by and large, monetary stringency has been dogging the economy for a long time now. The unequal race between expanding advances and deposits underlines the necessity of providing larger resources to banks. Credit expansion is inevitably in the wake of developmental activity, and normally restriction of credit is bound to produce more harm than good in a phase of expansion. One immediate result expected of credit control is to keep in check price inflation. But in Indian conditions, with banking operations spread to a limited area, this function can have only a restricted influence. The answer to the problem

of stringency lies not in credit restriction but in larger funds to meet reasonable and genuine requirements.

Bank advances have not been confined mostly to short-term loans contrary to the popular belief. In the recent past a definite change has taken place in the pattern of advances and loans of Indian scheduled banks. Short-term loans have tended to be projected into medium-term loans. The banking system has now assumed some responsibility for short-term industrial finance. Long-term needs of industry have found no mentionable place in the activities of Indian banks. It should be clear that this is not their function. In this area, the coming into existence of specialised credit institutions like the industrial finance corporations, the Industrial Credit and Investment Corporation, the Refinance Corporation, etc., is a welcome step forward. Some of these institutions also have projected into the medium-term advances, which, it would appear, has reduced the field of commercial banking operations. However, these institutions themselves are bank-based, in so far as their surplus resources are to be maintained by the banking structure.

What shape the new pattern of banking should take is a matter which needs concrete discussion and careful thought. Nonetheless, some spade work may be said to have already been done in this direction. A detailed plan has been formulated on the initiative of the Indian Banks' Association which has attracted some public attention. The plan envisages extensive expansion of commercial banks side by side with their rationalisation to prune their wasteful projections. Insurance of bank deposits, which was a recommendation of the Shroff Committee, forms another proposal of the plan, which is calculated to expedite the progress of deposit banking. For banking to run on scientific lines, it is necessary to evolve a banking service cadre which would be abreast of the latest trends in banking in other parts of the world and adapt such trends to the conditions, and needs of this country. One of the most important steps that needs to be taken without any delay is the creation of proper co-ordination between the commercial banks, and between them on the one side and the other banking and financial institutions, like the co-operative banks, the State Bank of India and other State-owned banks, on the other. In all this, the Reserve Bank of India will have to play a leading role.

II. The Rural Sector

THE recent trend in legislation regarding suppression of usurious lending and strict regulation of the business of traditional money lenders through licensing etc., indicates a healthy development. The question, however, that still remains to be answered is what agencies replacing the money lender are being developed to meet the credit requirements of the rural areas adequately. The importance of this subject has increased in view of the developments taking place in the economy and the greater role agriculture and village and small industries are expected to play in the second Five-Year Plan. Efforts of the Government in promoting co-operatives, so far, have not gone a long way in solving the problem. Even after fifty years of existence co-operatives today supply only 3 per cent of the total finance needed by agriculture. They have done little as regards the financing of small and village in-

dustries. It will be essential to examine the possible role that commercial banks can play in this direction.

Till recently commercial banks in India have as good as excused themselves from participation in the supply of rural credit. The reasons for their hesitant attitude to venture into this field are not far to seek. In the case of agriculture as well as small and village industries commercial banks rightly find too great a risk to entertain. For one thing, they are not equipped to advance medium and long-term credit, for another, the market for the produce of decentralised industries is very uncertain. The result is that as estimated by the Rural Credit Survey, commercial banks supplied only 0.5 per cent of the total rural credit requirements in 1950-51, not less than 60 per cent of which was of short-term nature.

With the implementation of the plan, the role that the banking system will be called upon to play needs no emphasis. It needs to be considered what demands will be made on it in the rural sector. The growth of agricultural production and incomes as envisaged under the plan will exert great pressure on credit facilities. The expansion of the monetised sector will also entail a higher level of money supply with consequent growth of the deposit component. The mobilisation of savings, a great factor in the implementation of the plan, will be greatly facilitated by the capacity of the banking system. Success or failure of the programme of development of small and village industries, upon which the plan lays so much emphasis, will again be determined by the way they are able to meet their credit requirements. The establishment of the State Bank of India is in response to all these anticipated needs of the economy. The State Bank by terms of its statute will provide credit and banking facilities in the semi-urban and rural areas. It proposes to make contribution to rural credit by way of branch banking and easy remittance facilities. Financial assistance, for instance, through purchase of debentures of land mortgage banks, or through direct advances against agricultural produce or small-scale industry products, will also be provided. The State Bank of India makes a departure from orthodox commercial banking practices as regards securities against which loans will be granted. In accordance with this, the Bank's policy will be to give indirect assistance in regard to provision of long-term finance for agriculture through Land Mortgage Banks. In the case of small-scale industries credit can be given on the basis of capacity to produce and sell.

The appearance of the State Bank on the scene, however, does not eliminate the necessity of prodding commercial banks in this respect. The problem is too huge to be tackled by the State Bank alone. The progress of the Bank in branch banking is not very en-

couraging. Thus, out of the 400 branches scheduled to be opened by July 1960, the State Bank was able to open only 46 until recently. The role that commercial banks might be called upon to play in the sphere of small and village industries is of increasing importance. The magnitude of credit requirements can be imagined from the plan outlays. A development expenditure of Rs. 200 crores is planned in the public sector in small-scale and village industries during the second Plan period. No separate breakdown for small and village industries is available for the private sector; but it would not be wide of the mark to assume that one-third of the total of Rs. 300 crores indicated in the Plan for agriculture and small and village industries will be required for the latter. Since the bulk of plan expenditure is only of developmental nature, large demand for working capital and medium and long-term accommodation is anticipated. On a rough estimate this demand can be put at Rs. 75 crores.

Ramification of bank offices in rural areas is bound to prove very expensive and unremunerative for a long period. This is true as much of commercial banks as of any other banking institution. The point is already conceded in the Reserve Bank's and Government's commitment to subsidise losses incurred by the State Bank in its programme of branch expansion. In the circumstances, to encourage commercial banks in this field something of the nature of subsidising losses will be necessary. Besides relaxation in rules regarding liquidity and securities concessions in enforcement of pay scales for the staff consistent with local cost of living is also necessary. The acute stringency through which banks are passing at the present time indicates that their resources will be required for their normal operations in urban and semi-urban areas. Expanding demands in this sector will claim priority. Nevertheless, it would appear desirable that a positive beginning should be made for spreading their activities to serve rural requirements.

Conclusion

IT may be helpful to state together the conclusions arrived at in the articles preceding. In the first place, it has been shown that deposits have exhibited a fair degree of elasticity and that the banking habit, contrary to current opinion, is growing steadily. Some interest attaches naturally to the ownership of the new deposits. It will be seen that both corporate and personal deposits are rising, but there is ground for believing that personal deposits are more elastic. As the system continues to expand, not only will total deposits rise, but the percentage of personal deposits as against corporate deposits might conceivably rise with it. Is this an indication that liquidity preference is increasing and that the urge to hold more money is increasing more rapidly than the urge to invest it?

On the side of advances, it has been shown that there was a marked departure after the year 1954 when the banks were called upon to finance much more of India's dynamic industrial production in the organised private sector. It would now appear that the banks have actually advanced more than Rs. 100 crores in the last two years on a basis quite different from that prevailing before 1954. Slowly, but nonetheless surely, the banks are entering into the provision of medium credit, giving the private sector investment resources other than strictly working capital. This is a development the significance of which has not yet been realised. It implies that the private sector has not only found a new dimension of finance, but the banks themselves have taken on themselves greatly increased obligations. It is this medium-term credit which is a large factor in the current stringency situation.

The reason why medium-term credit is much more onerous for the banking system is clear. In the case

of the Tea industry, for example, advances have hitherto been for a single year on the basis of crop hypothecation. There has never had to be more than Rs. 12 crores outstanding at a particular time. If, however, replanting, which would normally require loans for a period of six years, were to be bank financed, substantially greater credit would be needed. The changing character of banking advances is thus a major element in producing both a rise in advances and a slowing down in the rate of turnover. In part, of course, this is connected with the Plan which calls for heavier medium-term investment, but it is probably part of a permanent change which the Indian banking system is undergoing with expansion, even outside the Plan.

Both because of the limits under which the banking system can finance medium-scale industries and of the fact that the Plan imposes a level of advances out of relation to the normal rise of deposits, it is clear that additional finance has to be placed in the hands of the banking system. The particular method suggested has been of greater assistance through the Refinance Corporation on the basis that the proceeds of PL 480 loans should be equally divided between the private and the public sectors. This, however, is not the only means, by which banks can be assisted. In view of the fact that they are now undertaking medium-scale duties such, for example, as are involved in replanting, they should be eligible for Government loans, since it is part of Government policy to lend money to the agricultural system in order to keep its turnover high and rising. There is much to be said for an expert analysis of the new strains imposed on the scheduled banking system by the pattern of its medium-term obligations, which should more properly have been undertaken by the Reserve Bank and the State Bank of India.

The Appetite for Steel

AUGUST 26, 1957, marks the fiftieth anniversary of the Tata Iron and Steel Company. It is a day of national significance for, half a century ago, on this day, was laid the foundation of India's steel industry. The nation pays a tribute to Jamsetji Tata, father of the great venture, for his vision and pioneering spirit. His unflinching faith in the future of this country's industry was the real force behind his determination not to allow any opposition and obstacles to deter him from his cherished but difficult goal.

The world's appetite for steel keeps on growing in the proverbial manner. There is nothing surprising in this tendency because steel constitutes one of the primary indicators of the health and vigour of the economy in any country. It is in the light of this fundamental trend that this Blue Supplement surveys the present and prospective position of steel in India as also in the other countries of the world on this important occasion.

To take India first. It is undoubtedly a matter which should create confidence in the capacity of this country to exploit its industrial potential that four steel units—now changed to three on amalgamation—could be established and developed in a period in which the country did not enjoy sovereign status. Independence released the forces which accelerated the tempo of industrialization. The second Plan in particular gave a powerful impetus to the urge for launching a phase of rapid expansion of industry. Heavy industry, including capital goods manufacturing industry, has been of course, assigned an important place in the second Plan. Steel takes the pride of place among these industries. In fact it has been recognized as forming the leader among the industries which constitute the core of the Plan.

Two articles in this Blue Supplement on Steel Expansion and Technical Manpower discuss in great detail India's programme in the second Plan for the development of the steel industry, the problems posed by them and the resources provided. In the context of the Industrial Policy Statement all future new units in the steel industry will come under the public sector. This feature ought not to obscure the great contribution which private enterprise has made to the growth of the steel industry in a difficult phase when the obstacles

were frequent. Even at the end of the second Plan, half of the steel production will come from units in the private sector. The article on Technical Manpower describes the magnitude of this problem and the manner in which it is proposed to be tackled. Technical skills present one of the principal teething troubles in the early phase of industrialisation in any country. It is inevitable that we may commit mistakes costing us dearly in meeting this challenge of technical skills. But this is the price of progress which must be paid. The Case Study on Human Relations demonstrates the progressive attitude of private managements. This performance is far more telling than all the talk about the State posing as an ideal employer.

Looking at the comprehensive global picture, it is clear that there is a keen race for developing and strengthening the steel sector of industry in all the countries which have already made considerable strides in industrial advancement. Nevertheless, the contrast between the level of growth achieved by the United States and the USSR emphasises the disparity in their industrial and defence potential. This difference between the strength of the two leaders of the free world and the communist world is of great significance. The rate of estimated growth in the production of steel in the immediate future would be higher in countries which have made a late start in the race for steel than in countries which had already proceeded much ahead. In terms of quantity, however, the reverse is the case.

The future markets for world exports in steel will tend to be concentrated predominantly in the industrially backward countries of Asia, Latin America and, after a time, also of Africa. This trend implies that in the coming phase of the development in these backward countries accent will be placed on the expansion of consumer goods and transport industries. But it would be a great mistake to suppose that they will postpone their aspirations of building their own steel industry as a base for rapid industrialisation to the extent their resources make it possible. International division of labour is an abstract principle and even under-developed countries have to guard themselves against possible emergencies.

Expansion in Steel

IN terms of heavy industries, the last six years have been a period of accomplishment without equal in Indian history. The next five years promise to be even more eventful: an indication of which can be seen in the work that has already been done in the steel industry. By 1960-61, India will have an annual production of 6 million ingot tons of steel, and this may rise to 15 million ingot tons by the end of the third Plan. How has this come about? At the end of the war, the industry was caught short with obsolete equipment and low capital reserves. A Steel panel appointed by the Government in 1945 recommended immediate expansion to meet the demands arising out of post-war construction and development, but little progress could be made for a time because of financial stringencies.

In 1947, Government decided to set up immediately two steel plants, each with a capacity of 500,000 ingot tons. Following this announcement came the Government's now famous Industrial Policy Statement of 1949. The State reserved to itself the exclusive right to set up new units, while the question of existing units was left open, to be reviewed at the end of 10 years. This gave the investor a feeling of uncertainty, making it extremely difficult to find finance for expansion. The industry had already made detailed plans for expansion. As early as 1946, Tata Steel engaged a firm of consultants to draw up plans for the renewal and rehabilitation of plant, to maximise production within the existing framework, and to diversify production. In 1951, in response to repeated requests, Government allowed the producers to set aside a special allowance over and above the standard rates of depreciation to compensate for the greatly increased price of capital goods. Finally in 1953, the steel industry embarked upon its much delayed expansion schemes. Two events of note occurred in that year. The Steel Corporation of Bengal was amalgamated with the Indian Iron and Steel Company and Tata Steel launched its modernisation and expansion schemes. Indian Iron planned to increase its capacity to 700,000 tons of finished steel and 400,000 tons of pig-iron with the help of a World Bank Loan of \$31 million, a special advance of Rs. 10 crores and an interest-free loan of Rs. 7.9 crores from the Steel Equalisation Fund. Tata Steel's programmes which involved repairs and renewals, diversification of production and a target of 931,000 tons of steel a year, was estimated to cost Rs. 25 crores and a loan of Rs. 10 crores from the Equalisation Fund was obtained to implement this project.

The success of the first Five-Year Plan encouraged Government to set a more ambitious target for the second Plan. In 1955, Government decided on the target figure of 6 million tons by 1960, to which the three new plants at Bhilai, Durgapur and Rourkela were to contribute a million tons each. Simultaneously, Indian Iron and Tata Steel were allowed to go ahead with projects of further expansion which involved in the case of Indian Iron an increase in output to one million tons, and a doubling of Tata Steel's output to two million tons by mid-1958. In December, 1955, Tata Steel entered into a \$130 million agreement with Kaiser Engineers, a division of the Henry J. Kaiser Company of the USA, to undertake the designing, procurement and construction of new facilities to raise output to two million tons. This project is scheduled to be completed by May 31, 1958, in exactly two and a half years from the date it was launched. The Two Million Ton project embraces every aspect of steel-making from the winning of ore to the rolling of finished products. A blast furnace with a 28 foot-hearth—the

largest in Asia—and a capacity of 1,650 tons a day is to be added. This blast furnace is designed for top pressure operation. A battery of coke ovens, a sintering plant of 5,000 tons per day capacity which will use iron and fines, and three new rolling mills are features of the project. A highly mechanised steel melting shop, comprising seven 200-ton furnaces is being installed. This shop is equipped with one of the largest cranes of its kind in Asia. By May 1957, nearly all the procurement work was completed and the overall project was more than half way to completion.

Each of the three State plants will have a capacity of one million ingot tons a year with provision for further expansion. Estimated to cost Rs. 462 crores, they are scheduled to commence producing pig-iron by 1958 and steel by 1959. The first State steel plant, at Rourkela, is being installed with the help of Krupps and Demag of Germany. The plant at Bhilai has the technical and financial assistance of the Russian Government, and the Durgapur plant is being set up with help from a consortium of British engineering firms. Hindustan Steel (Private) Ltd., formed in June 1953 to undertake the Rourkela project, has since March 1957 been invested with overall responsibility for all three State plants. While day-to-day matters will be settled by the respective local boards of each plant, policy questions will be dealt with by Hindustan Steel. Mr. S. Bhoothalingam is confident that the three plants would not only save foreign exchange at the rate of Rs. 150 crores a year but the annual steel output would also enable the country to finance two one-million-ton steel plants every five years.

Several technological advances have been incorporated in the new plants. In Rourkela, for instance, a limited use of the Linz-Donawitz process will be made for smelting steel. In this process considerable saving is obtained by blowing oxygen instead of air through the molten metal. Coke ovens are being equipped for the recovery of crude benzol at each plant. The Durgapur and Bhilai works will also rectify benzol to its by-products and fixate ammonia in the form of ammonium sulphate. Another new technique—high top pressure in the blast furnaces—is also being adopted. At Rourkela, good progress has been made in the establishment of a township for 100,000 people. Government is developing Taldih, some 60 miles from Rourkela, to supply iron ore to the plant. Bhilai will obtain its iron ore from the rich deposits of ore in Dhalli-Rajhara in Madhya Pradesh, which were discovered by Tata geologists 50 years ago. The coal supplies for Bhilai will be drawn from the new mines at Korba, also discovered by Tatas, which it is hoped will start supply by 1960 at the latest. While the Rourkela plant will concentrate on the manufacture of flat products, the Bhilai Works will produce rails, beams, structurals, sleepers and billets. The Durgapur plant will mainly manufacture rolled products and railway materials. It will have a wheel tyre and axle plant—which together with the one in Jamshedpur will fully meet the country's requirements. The Damodar Valley Corporation will set up a thermal power station to supply power to this plant. A fourth steel plant at Bokaro has been actively discussed in recent months as one of the third Five-Year Plan's schemes.

The expansion of production at Bhadravati steel plant is one of the major schemes of the Mysore Government, but in the total picture of the steel plan its significance is very modest. The plant concentrates on high priced steels rather than mild steel products. The economics of the unit because of its using costly electric

furnaces has been presenting a special problem. The Central Government advanced a loan of Rs. 151.66 lakh during the first Five-Year Plan. The production of finished steel reached 30,300 tons and that of pig iron 52,400 tons in 1955-56. The progress in achieving the targets set for the plan period, has however, been very slow. Thus only 35 per cent of the target was achieved for finished steel and 52 per cent for pig iron. The target of production for ingot steel has been fixed at 100,000 tons for the year 1960. The schemes included in the second Five-Year Plan are estimated to cost Rs. 6 crores.

With the rapid increase of India's steel-making capacity, steel-using industries too will expand at a fast pace. The re-rolling industry, for instance, will be able to operate at its optimum capacity with the achievement of the steel target. Though the industry has, at present, a basic three-shift capacity of 700,000 tons, the total supply of billets and semis available to it is around 250,000 tons. Two foreign heavy engineering firms, one British and the other Russian, were invited to report on the establishment of a heavy engineering industry in India. An expert committee under the Chairmanship of Sir Jehangir Gandhi, appointed by Government to study their reports, recommended that an integrated plant be set up which combined in itself the following six separate units: a foundry-forge shop, a heavy machine building unit, a heavy machine tool works, a heavy plates and vessels unit, a heavy structurals shop, and a unit for coalmining equipment. The whole project is expected to cost about Rs. 70 crores during the second Plan, of which the foreign exchange component will be of the order of Rs. 40 crores. Apart from this, steel foundries for heavy castings are being established by TELCO and the Chittaranjan Locomotive Works. They will help to meet the requirements of heavy castings for the railways entirely from within the country.

An expansion of this magnitude naturally gives rise to many problems. These relate to the supply of raw materials, power, transport and the availability of technical and other personnel. In the matter of iron ore, about 8 million more tons will have to be mined. In the public sector, plans are being made to develop the Barsua mines, in addition to Taldih, to supply ore to Rourkela. In the private sector Tata Steel is mechanising the Noamundi mines to raise a larger tonnage and is opening up an entirely new mine at Joda. Concrete steps are being taken to export manganese ore after manufacture, in order to take advantage of the high export prices for ferromanganese. Seven ferromanganese plants are scheduled to be set up during the second Five-Year Plan, the first of which came into operation in April 1956. Tata Steel's ferromanganese plant at Joda, which will have an initial capacity of 30,000 tons, is expected to be completed at the end of this year—ahead of the scheduled time. In regard to coking coal, an additional quantity of about 10 million tons will be needed. Since India's reserves of coking coal are limited, a substantial part of the additional demand will be met by beneficiating and

upgrading inferior grades of coal. For this purpose, Government intend to set up four washing and blending plants at Kargali in the Bokaro area, and at Dugdha, Pathardih and Bhojudih in the Jharia area. It may be recalled that coal washing was first introduced in India by Tata Steel, who have had two washeries at their Jamadoba and West Bokaro collieries for years. Limestone requirements are expected to increase by three to four million tons. Similarly, no less than 550,000 tons of refractories will be required for the expansion and another 405,000 tons annually for maintenance. Refractory production, therefore, will be increased from 200,000 tons to 950,000 tons. The Tata-Didier project at Belpahar is perhaps the most important of the project schemes. This plant will have an initial capacity of 60,000 tons of refractories a year with provision for doubling the output when necessary.

The last, but perhaps the biggest problem of all, is transport. The present freight-carrying capacity of the railways is not sufficient to meet the greatly increased needs of the steel industry. Arrangements are being made to lay double lines over a total distance of 307 miles and to construct new lines totalling 232 miles. Tata Steel is investing over Rs. 3 crores on the import of giant size well-wagons because the railways have only a small number of such rolling-stock. The Indian Railways have taken the decision to electrify the Asansol-Sindri-Tatanagar-Rourkela and Raj-Kharaswan-Dangoapani sections, over which the raw materials for the steel works will move. As an interim measure, 80 diesel engines have been ordered to handle the increased traffic.

It has been assessed that the three State steel units alone will require 2,100 men for supervisory and technical staff and an additional 30,000 to 35,000 men for skilled and semi-skilled work. Government is making arrangements to have some of its key personnel trained abroad. Specific mention ought to be made here of the facilities provided by the USA for the training of about 900 engineers from India in the steel works in that country. These arrangements, however, are hardly adequate. The Committee has estimated that at the end of the second Plan, there will still be a shortage of engineers in the steel industry. Major industrial units, such as Tata Steel had their own schemes for training technical personnel. Currently, Tata Steel is providing training to about 150 Rourkela personnel, from apprentices to the senior-most supervisors. Besides, Tata Steel is providing a six-week orientation course in batches for 400 young graduate engineers recruited for the State plants before their departure for training abroad. It will start training 300 operatives for these plants as soon as accommodation is ready for them at Jamshedpur.

It took Britain 30 years during the Industrial Revolution to achieve the expansion on the scale envisaged under the second Five-Year Plan. A rate of expansion as steep as this naturally raises many difficulties, but taking into consideration the priority accorded to the steel industry under the Plan there is little reason to assume that these difficulties are insuperable.

Technical Manpower

FIFTY years ago, when the first steel works went into production in India, there was no institution where an engineering student could acquire sound knowledge of metallurgy and steel making. A large number of engineers and technicians needed to start and run the pioneering venture could ill afford, at salaries which the infant industry could not afford. But apart from the expense, it was always the avowed intention that this Swadeshi enterprise should

be run by Indians themselves. "Let the Indian", Jamsetji Nusserwanji Tata had said, "learn to do things for himself." It was therefore only natural that Tata Steel should have taken early steps to set up a Technical Institute at Jamshedpur to train Indian supervisory personnel. This Institute, the first of its kind to be set up by an Indian industry, gave metallurgists and other engineers an extended theoretical course and intensive shop-floor training to equip them

if the support of good principles and procedures be wanting."

It is not possible in a short case-study to delve in detail into company policy governing matters affecting human relations. We have touched below on a few important headings and, based on the policy (of the Company in question) in respect of each, have attempted to lay down certain basic principles. Finding three generations of employees is not at all a rare phenomenon in this steel city. A Labour Bureau functioning under the Director of Personnel looks after the proper selection and placement of personnel. The Company believes in the principle that, "Recruitment, selection and placement should be on a fair basis and the employees of the firm and employee's relations should be among those given preference for employment." Where there is no security of service, there is industrial unrest. The advent of the machine has progressively led to the replacement of man on a job and although of ultimate benefit to the community, it has often resulted in large-scale retrenchment of workers, bringing untold hardship to the working class. In the steel works too, machine replaced man in progressive stages, but thanks to the enlightened policy of the Founder and his successors, in this undertaking, there has been what may be called, 'rationalisation without tears'. There is no retrenchment. A worker, on his being rendered surplus, is simply trained for an alternate job in this fast expanding enterprise and is guaranteed his previous earnings during the period of training as also on placement in the new job. The principle followed by the Company is: "Security of service is guaranteed to an employee doing a fair day's work and conforming to the rules and regulations of the company."

The worker as an individual strives to gain recognition and improve his standard of living by seeking opportunities of advancement. If these opportunities are denied him, he loses interest in his job and forms a nucleus of unrest. In this, as in all other steel plants, promotion has to be subject to the worker being trained and qualified. The works of this Company were built where formerly there was a dense jungle. Unlike Western countries, it could not be serviced by State organised polytechnics and training centres. So, it started its own training institute which is, today, perhaps the best of its kind in the country. Nor is the training confined to workers alone. Supervisors and executives receive a wide variety of training ranging from the Company Information Course and T.W.I. programmes, to a four-week session at a domestic Staff College in Poona where senior supervisors from various other firms under the same managing agents meet to cultivate an awareness of what the Management of the particular industry stands for, realise where it stands in the changed conditions of modern India, provide some opportunity for the study of management and business problems at various levels and in relation to the various units participating in the course, have a forum for discussion and exchange of information and ideas on problems and projects typical of the organisation and create a fellowship amongst the various participating units. There is no gainsaying the fact that trained supervisors contribute as much towards good human relations as trained workers. Hence the policy of this Company is to offer a wide variety of training facilities for self-advancement to workers and supervisors alike in their respective fields of work.

The welfare function contributes lavishly towards good human relations. Apart from its pioneering role in providing amenities and facilities referred to earlier, the Company incurred a deficit of no less than Rs. 63.71 lakhs in the year 1955-56 in running a well-staffed, well equipped hospital for its employees and their relatives, schools for employee's children and a host of miscellaneous services which make this steel city one of the cleanest and best administered cities in India. In

addition, the personnel department runs a number of community centres and organises various sports and entertainments for the worker and his family. No wonder that the worker in his work unit as well as in his social unit, being well looked after, has also contributed towards better human relations. In keeping with tradition, this Company believes that: "Welfare amenities should be up to the standard if not more liberal than those laid down by legislation. They should not be restricted to the worker in his work-life but should embrace various activities outside the factory area for the worker and his family. The Management should strive to make the worker a well-adjusted and happy member of the community at large."

In 1955, the Company started a Management Research Unit to make a continuous study and review of the organisation structure and methods of management, provide information on Management questions within the organisation, study management's thinking and practice elsewhere in India and abroad with a view to their application to the Company and help in the development of supervisory training programmes. As mentioned earlier, the agreement signed on the January 8, 1956, between the Management and the Union provides for specific procedures to be laid down in certain matters affecting human relations. With the help of line-management, and the personnel department, the Research Unit evolved, among other things, instruments of delegation for various levels of management.

The promotion policy of an organisation contributes in a large measure to the maintenance of good human relations. In this firm, from the beginning, the emphasis has been on promotion from within as far as possible, at the same time ensuring that technicians and supervisors possess adequate job knowledge and experience. The Training Department helps a worker to add to his knowledge by attending classes outside duty hours. As and when higher vacancies arise, these are filled mostly by men down the line who have acquired the minimum qualifications. Briefly speaking, the promotion principles in the Company may be enunciated thus: To confine fresh appointments to the lowest category as far as possible; To stipulate minimum qualifications where necessary; To verify the selection and placement by a follow-up of employees; To ensure that placement and selection are done in a manner which will promote good community relations and keep employment costs consistent with the objectives.

The Supplemental Agreement signed by the Company and the Union on August 4, 1956, provides for the establishment of various joint committees and councils. Such joint committees, however, are not new to the Company. The first joint committee started functioning in 1919 and over the past 10 years no less than 24 such committees handling matters such as development and production, grievances, rates, trade tests, and minimum qualifications, have been functioning and they have paved the way for this new experiment.

The policy of the Company is to consider a worker, however humble, an end in himself and not merely a means to an end; and to build up a system of closer association of employees with management in order to satisfy the workers' urge for self-expression and, at the same time, promote increased productivity in the interest of the workers themselves, the Company and the nation.

These are but a few facets of human relations. There are many more which have not been touched. No more has been attempted here than to draw some lessons and bring out a few principles from five decades of experience and achievements of the largest steel manufacturing unit in India.

The International Perspective

STEEL consumption per head has come to be regarded as one of the most important indicators of the industrial advancement of a nation. The importance attached to this indicator has its basis in the fact that all the countries which consume more steel per head rank as leaders and most prosperous nations in the world, the prosperity being based on industrialisation. The graph below shows that the countries which stand out conspicuously in this regard are the United States of America, West Germany, Sweden and the United Kingdom. India takes a very low position. It was this shortcoming in the economy which impelled our planners to assign high priority to steel output in the second Plan. The pressure of imports of capital goods was too heavy for the Indian economy to be continued for long, and if the cherished dream of progressive industrialisation was to be realised, there was no go except to have our own steel plants within the country.

Plans for stepping up the production of steel in the post-war era have shown brisk developments all the world over. A comparison between the current output figures and those of the pre-war era shows the passion for steel exhibited by every nation. Before the war, total world production of steel was 136.1 million tons out of which nearly 59 million tons was produced in Europe, excluding the USSR, and 47.9 million tons in the USA. The USA and the European countries thus monopolised the production of steel before the war. The rest of the world did not produce more than 12 to 13 million tons of steel. The picture altered materially after 1945 because the European and the North American countries stepped up production significantly, taking the world output to 269.3 million tons in 1955. The share of the underdeveloped countries has been reduced in percentage terms because even though some of the underdeveloped countries have increased their output significantly, the increments are no match with the growth in the European and North American countries.

The race between the Communist world and the free world in steel output has, however, gathered momentum after the war. Before the war, the steel production of the Communist world lagged very much

behind the free world. The USSR, for example, produced only 17.6 million ton of steel in 1939 as against the total world output of 136.1 million tons. The relative position has changed radically since then. The USSR has now put up its crude steel output to nearly three times the pre-war level. Its current production of crude steel is around 50 million tons. The total world production of steel, on the other hand, only doubled itself by 1955. The USA also has only doubled its production as compared with the pre-war level of output. The rate of growth, then, is faster in the communist world than in the free world or in the USA. Estimates made for probable capacities in 1960 show that communist countries are working hard to minimise the disparity between their output and the output of the free world countries. The share of the communist world, including eastern European countries and China, will increase from the current level of nearly 24 per cent to 26½ per cent. Before the war, the production of the USSR, the Eastern European countries and China was only 18 per cent of the total world output of steel. It is clear that it will not be possible for the USSR to over-take the free world in this race unless it succeeds in drawing within its orbits more steel producing countries from the free world.

How far can the communist figures of production of steel be treated as fully authentic? During the Stalin era, a strong iron curtain shut off the communist world from the rest of the world. It was, therefore, not possible to test the authenticity of the Soviet figures of production of iron and steel. A number of people who visited the USSR and members of the steel mission, which visited South Russia recently have gathered the impression that scepticism in the past about Russia's capacity to produce iron and steel was unfounded. The figures published by the USSR in regard to the output of steel are not mere propaganda and likewise it is wrong to conjecture that industry in the USSR is inefficient.

The estimated rate of increase in apparent crude steel consumption in the next five years shows a downward trend in the case of the industrially advanced

countries such as the USA, the USSR, Western Germany and the UK. This fact is brought out very clearly in the table alongside. It shows that immediately after the war the rate of rise in the consumption of steel was spectacular in West Germany and the USSR followed by the USA, ECSC countries excluding West Germany and the UK. Other countries also showed a significant increase in growth rate. In the quinquennium 1950-55 the rate of growth slowed down almost in every case except the ECSC countries. The overall trend during the period 1946-1955, therefore, shows the average rate of growth for a period of ten years. It is quite clear that the rate of growth in these countries has been so high in the past and in the course of time they have built such a heavy base that it is difficult to maintain the same compound annual rate although in absolute or quantitative terms their increases are large.

A hypothetical illustration should serve to clarify this point. In the case of country 'A' whose total consumption of steel is only 5 million tons, it is easy to put it up by 100 per cent in the short period by taking total consumption to 10 million tons. But in the case of country 'B' whose production is already 100 million tons, the rate of rise of 100 per cent in the short period is out of the question. This explains why the rate of growth in the USA is estimated to be 4.3 per cent during the quinquennium 1955-56 as against

7.3 in the preceding decade. Similarly, the rate of growth in the USSR at 8.6 per cent in the next five years would almost be 50 per cent of the rate in the decade 1946-65. Similar is the case with Western Germany and the UK. But in the case of the rest of the world (which includes mostly under-developed countries which are being newly industrialised, like India and China) the rate is high but absolute growth is not as significant as in the case of industrially advanced countries.

Average Annual Increase in Apparent Crude-Steel Consumption in Selected Areas, 1946 to 1955, and Estimates for 1955 to 1960

(In percentages—compound annual rates)

Area	1946 to 1950 Inclusive	1950 to 1955 Inclusive	1946 to 1955 Inclusive	1955 to 1960 Inclusive
United States	12.0	3.7	(7.3)	4.3
USSR	22.4	10.2	(15.5)	3.6
ECSC (less Western Germany)	8.3	9.8	(9.1)	5.3
Western Germany	38.9	16.2	(25.8)	8.6
United Kingdom	5.9	6.0	(6.0)	3.7
Rest of World	16.4	9.4	(12.5)	9.0

The Outlook for Exports

LONG-TERM projections about the size of the export market for steel have often proved elusive. Production costs as well as estimates of demand in non-producing or substantially importing countries have shown considerable fluctuations. Probably because of this uncertain factor, these projections have been limited to medium periods of about five years in formulating production policies. A report of the United Nations Economic Commission for Europe on European Steel Exports, prepared in 1953 against the background of the post-Korean recession, naturally took a cautious view of the prospective trends in exports and it is not surprising that its main conclusions were based on anticipations of a competitive market. This situation changed soon after and recovery was well under way in the first half of 1954. Supply could not overtake demand and we have now a seller's market with all its concomitants — an upward trend in prices, the growing margin of excess of demand over supply leading to full order books, long delivery dates and so forth. It is unlikely that this upsurge will subside in the near future and at any rate a recession is not in sight.

International supply of steel is influenced by several complex factors. It is not necessarily correct to assume that an increase in production will create something like a similar increase in the volume of the surplus available for export. Internal demand is expanding at a rapid rate in major producing countries like the United States and the USSR. If they have been able to keep their imports from Western Europe in check, it is because rising home output has to satisfy increasingly the higher levels of consumption. Defence requirements constitute an important source of consumption of steel and so long as disarmament continues to defy the best efforts for solution releases of steel for constructive purposes will be postponed. Production costs is still another factor which has its repercussion on the supply side of the equation. This factor has considerable importance since the potential markets are to be found in under-developed countries with low purchasing power. West Germany which is preparing to launch a vigorous drive for exports has to contend with the problem of high costs of imported ore

and coal as well as rising wages. Rising costs is generally a headache with all the producers from which there appears to be little room for escape in the light of the prevailing inflation.

Quite a fair share of the exports in steel was required by even the leading producing countries either because their total demand was in excess of home output or they did not produce specific types of steel. This source of demand in the international market is bound to exist as its normal feature. In the past few years, however, the main demand for steel imports came from countries which took a relatively earlier start among the less developed countries. They were Canada, Australia, New Zealand and South Africa. Since their industrialisation has proceeded a good deal, their demand is not likely to be sustained on the same scale as before. The potential markets from which orders for steel imports are expected in future are the under-developed countries of Asia and Latin America and in course of time demand will emanate from the countries of Africa also. They are naturally anxious to industrialise in order to raise their national income. Some of them, like India, are now entering upon the second phase in industrialisation marked by an accent on heavy or capital goods producing industry. There are, however, two considerations which indicate the need for caution in building high hopes on these markets. In the first place, their estimates of requirements are not usually objective since they are based on elementary data. In the next place, their balance of payments position makes their demand erratic. But these countries are bound to absorb an increasing share of the exportable surplus of steel.

The table in this article gives a general picture of the trends in iron and steel exports as in 1955. This table will show that the direction of steel exports follows more or less the direction in over-all world trade. The United States takes the top-most position as an exporter. It is significant that the bulk of its exports go to the dollar area, mainly to Canada. Latin America is another large market for the United States. It is, however, pertinent to emphasise here that Japan is emerging as a competitive exporter in the Latin American

market. The value of exports shown in the table closes that Belgium and Luxembourg in the first place and France thereafter are the next big exporters. But the major part of their exports is to the countries of Western Europe. Since these three countries are members of the European Coal and Steel Community, their exports to Western Europe largely take the character of intra-ECSC trade. Nevertheless, the exports of these two groups to overseas countries are substantial at the level between \$160 million and \$190 million. The United Kingdom really emerges as the second biggest exporter. Its mainstay is the overseas sterling area. West Germany comes a little lower than the United Kingdom, but it will be seen that her exports also are in a large measure part of intra-ECSC trade.

The United States will retain without doubt its position as the premier exporter. Japan is coming into her own at a fast rate. She aims at catering not only to the neighbouring markets of Asia and Africa but also in a very increasing measure to the markets in Latin America. This is a significant trend. The United Kingdom has put special emphasis on steel in its drive for export promotion. The value of its exports in the first half of 1957 rose four times as high as the value in the same period of 1956. Its main problem is of rising costs of production. The Iron and Steel Board's second development report strongly suggests an export target of five million tons in 1962 as against four mil-

lion tons in 1956. This increase is likely to correct the threatened price disadvantage. Germany is launching an intensive export drive for which her industry is quite well tuned. Her special advantage in the export market is that the prices of every variety of rolled steel at home are considerably below the world market prices. Hitherto, the rest of the countries of Western Europe had a relative disadvantage because more than half of their production was of the Thomas quality. One handicap is that the use of Thomas quality steel requires changes in the specification of machinery using steel of open-hearth quality. But a counter-balancing factor is its cheap price. Indian railways, for instance, which are faced with an acute shortage of steel from abroad have come to the conclusion that with minor modifications in their rolling stock they can use Thomas quality steel.

The countries of the communist world are unlikely to come into the picture of the world steel export market. The USSR has to achieve her target of 60 million tons by 1960 and the other fellow countries — Czechoslovakia, Hungary, Poland and East Germany — have to reach the target of over 20 million tons by the same time. Their trade will be confined to the Communist bloc including China which is industrialising fast. Their exports to the rest of Asia and Latin America will be very marginal. In the meantime, their own appetite for steel will grow rapidly.

IRON AND STEEL EXPORTS BY VALUE: 1955

(\$ million at 1950 prices f.o.b.)

Exporting Country	Importing Area					Total overseas countries	Western Europe	Total world	Dollar area	Eastern Europe
	United States	Canada	Latin America	Overseas Sterling area	Affiliated overseas territories

* Including British colonies.
** Excluding the sterling area.
*** Including unallocated exports

Shorter Notes

ALUMINIUM VERSUS STEEL

Aluminium, in its commercially pure form, has some distinctly better properties than steel. Its weight (for equal volume) is lighter, it resists corrosion and conducts heat and electricity better, and it is more easily workable. Although its mechanical qualities like tensile strength, elasticity and hardness are not good, it has a high degree of ductility. But it acquires improved mechanical properties when alloyed with other metals like copper, magnesium, manganese, silicon and zinc. Such alloying is also done more easily and at a lower temperature than in the case of alloy steel, and this explains the commercial use of at

least 150 named alloys of aluminium. These alloys are also easily worked in all semi-fabricating processes such as rolling, extruding and forging. These distinctive properties have thus invested aluminium with some capacity to compete with steel in a variety of commercial uses.

It is, therefore, generally thought that aluminium is currently and potentially a formidable rival to steel. The facts of aluminium production and consumption, however, largely belie this impression. As regards current production, the fact is that the steel equivalent of world production of aluminium (as of 1954) is 8.12 million metric tons representing 3.6 per cent of world

production of steel (223.5 million metric tons in that year). (Incidentally the steel equivalent is calculated by multiplying the actual tonnage of aluminium production by 2.9 which is the ratio between the density of steel and that of aluminium, the specific gravity of the two metals being 2.7 and 7.8 respectively.) As regards production in the foreseeable future, it is estimated that the steel equivalent of world production of aluminium in 1960 will be 12.5 million metric tons representing 3.5 per cent of the then estimated world production of steel. The rate of growth of aluminium industry will thus be more or less the same as that of steel industry at least up to 1960; in other words, the position of aluminium relative to steel will not have changed to the detriment of either in the foreseeable future. It may also be noted that the aforesaid figure of 3.6 or 3.5 per cent sets the quantitative limit to competition at the present time and in the near future.

Although, thus, aluminium is not a formidable rival to steel, there is no denying that within the limits set by production there is some acute competition between the two. The facts of consumption (as of 1952) show that very nearly 50 per cent of aluminium consumption results in the displacement of an equivalent quantity of steel (consumed tonnage of aluminium multiplied by 2.9). This displacement is caused by the use of aluminium as flat products, light structural shapes and tubes (including bars and wires) and castings and forgings in construction and building, mechanical engineering, household equipment, road transport, packaging and containers, and ships and railways. Nearly 40 per cent of consumption of aluminium is in electrical, aircraft and chemical industries where its physical properties preclude any real choice between it and steel; there is, therefore, no question of steel competing with aluminium in this area. The remaining 10 per cent of aluminium consumption is unclassified.

The sum up, the pattern of competition between the two metals shows that aluminium will take the place of at least 6.2 million metric tons of steel in the latter's usual commercial uses. This much likely displacement of steel is by no means an alarming prospect, for it will be easily absorbed by a wide variety of developing industries. In a sense this will be a welcome development inasmuch as it will relieve the world-wide pressure of demand on steel. Anything like an alarming competition may arise only if and when the rate of increase in aluminium production outstrips the rate of increase in steel production. This is not likely to happen because the location of primary aluminium producing plants is essentially dependent on the availability of cheap hydro-electric power, the capital investment required for such plants is enormous and the relative prices of aluminium and steel are such as to render the former more expensive than the latter. The decisive factor here may well be the price of aluminium which, even after a slight decrease expected in future, will still be 'much' higher for equal weight and higher for equal volume than the price of steel. The processing cost of aluminium will also be higher although its installation and maintenance costs will continue to be lower than in the case of steel.

OTHER ALTERNATIVES TO STEEL

The competing alternatives, other than aluminium, to steel are plastics, asbestos-cement, concrete and timber. All these materials, like aluminium, have the common quality of being lighter than steel for equal volumes and all of them, except timber, resist corrosion better. They are all better insulators but are, except perhaps concrete, inferior to steel in the matter of heat resistance. All of them, like aluminium, are worse in strength (for equal sizes) and in elasticity; and the only other material which, like aluminium, is

more easily workable than steel is plastics. What chiefly invest these materials with the capacity to compete with steel in a variety of commercial uses are their lightness and higher corrosion resistance.

These comparative advantages and disadvantages of steel and its alternatives in so far as their physical properties are concerned mark out only the general area of choice. But the determining factors in the actual choice of one material in preference to another are its cost to the user, its repercussions on the over-all cost of the articles to be made, and on amortization and maintenance. Here the picture of relative costs may be summed up as follows: As compared to steel, the price of plastics for equal weight is much higher while the prices of the other three materials are lower; the price for equal volume is higher in the case of plastics while it is much lower in the case of the three others; the processing and installation costs are lower in the case of all the four competing materials and their maintenance costs, except in the case of timber, are also lower. The future trend of their prices as compared to steel prices is a decrease in the case of plastics; a slight decrease in the case of asbestos-cement, no change in the case of concrete and an increase in the case of timber. It is stated in particular that the ratio between steel and plastic prices will narrow to the point of parity with steel in future. Timber, on the other hand, has become steadily more expensive than steel, and this trend is not likely to be reversed. Asbestos-cement and concrete, though less expensive than steel, are, however, more limited in use.

An idea of the extent of competition between steel and the other materials concerned may be had from the production trends in respect of the latter. To take the case of plastics first. Statistics (as of 1955) show that 2.74 million tons of plastics are produced in the main producing countries—France, Western Germany, Italy, United Kingdom and the United States. If an average annual rate of increase of 20 per cent (a conservative figure) is assumed, plastics production is likely to be of the order of 3 million tons in the European countries and an equal quantity in the United States by 1960. As for asbestos-cement and concrete, available statistics cover only a few countries. In the case of concrete alone some idea of its growth of production may be had from the figures of world production of cement. World production of cement (as of 1955) is 214 million metric tons and is increasing quite as fast as steel production. If production of concrete is also taken to be at the same rate and if it tends to be at the expense of structural steel, it should be remembered at the same time that it gives rise to an increased demand for reinforcing rods or high-tensile wire.

Although a quantitative pattern of competition between steel and the four other competing materials cannot be given here as it is not available, the area of competition can be broadly described as follows: Timber, concrete and asbestos-cement in the building and civil-engineering industry; plastics in the motor vehicles industry; timber, concrete and perhaps plastics in the future in the railway industry; plastics in shipbuilding; timber in packaging and containers; plastics, asbestos-cement and concrete in tubes; plastics in engineering and other industries. It is stated that the steel will not increase, since most of the uses in which it does not compete with steel represent branches of the economy that tend to expand faster than over-all production, as for example, the electrical industry, decorative fittings and surfacing, etc. It is also estimated that the proportion of total steel consumption which is exposed to competition from asbestos-cement, concrete and timber will not increase beyond the 9 per cent calculated for 1955 for Europe in view of the

fact that many other sectors of steel consumption are expanding much faster than building construction. The conclusion is obvious: it is that steel will continue to maintain its pre-eminent position in the matter of both production and consumption in the foreseeable future in spite of some competition from its alternatives in a variety of commercial uses. At the present rate of industrial growth in the world, the relatively small quantity of steel likely to be displaced by its alternatives will not be surplus to requirements but will be readily absorbed in other sectors of consumption.

PROGRESS IN STEEL TECHNOLOGY

The UN Economic Commission for Europe has recently assembled a number of technical papers dealing with recent advances in steel technology in all its five branches—raw materials (coke and iron ore), production of pig-iron, production of crude steel, semi-finished and finished articles, and measurement and control. Not all the new techniques have found and control. Not all the new techniques have found practical and economic application in the European steel industry which, by and large, carries on with its conventional steel making processes empirically evolved and perfected over several decades. This slow technological progress is due to the circumstance that the development of new techniques is very costly in an industry like the steel industry which uses plant of extremely large capacity. Again, new techniques evolved by experiments on too small a scale cannot always be successfully introduced into large units where the radiation losses and the influence of walls are different from those in small units. Unless steel research is carried out either in the plant or on a scale

comparable to it, new techniques evolved by such research cannot be easily adopted. But research and tests on such a large scale are very expensive, and so anything like rapid progress in steel technology is normally ruled out from the realm of probability.

These are the considered views of a leading French Steel technologist who further thinks that a new process which is technically possible is of no practical interest unless the cost is at the most equal to that of the conventional methods. As inventors are hardly in a position to evaluate maintenance costs which can be evaluated only by long experience, the industry does not usually take avoidable risks. Again, as scrap which is the richest and often the purest source of iron is available in large quantities and as the narrowest manufacturing bottleneck in nearly all steelworks is still the production of metallurgical coke, any reducing process would have to be extremely cheap if it is to find ready application. Here reference may be made to the production of ferro-coke (a combination of coal carbonization and the sintering of fine ores) described by a West German technologist and to the production of brown coal high-temperature coke described by an East German technologist. The East German experiments have led to the establishment of the first brown-coal (lignite) coking plant in that country. This is of crucial importance to the development of iron metallurgy in a region which contains sufficient brown coal reserves for 70 years. And this experience may well be of value to India in the context of the Nelveli Lignite Project under execution and of a possible steel industry in Madras using the iron ores of Salem district and the high-temperature coke from lignite in the neighbouring South Arcot District.

A Dynamic Industry

IN this Blue Supplement 'The Eastern Economist' deals with India's most dynamic industry. Looked at from the point of view of the rate of growth of production and consumption, cement has some spectacular results to show. Against a production of 593,000 tons in 1932-33, the production in 1956-57 was over 6 million tons. Installed capacity in the last ten years has trebled, being 2,116 million tons in 1947 and 6.3 million tons in the current year. Similarly the capacity utilised in the last five years has steeply risen from 82 per cent in 1950-51 to 93 per cent in 1955-56. Progress judged by any standards reflects great credit on this industry.

In part, of course, the credit for the growth of this industry belongs to the development plans of the country. These developments, particularly the multi-purpose projects and the large construction works—have called forth a steep demand for cement so that at one time it was even felt that heavy imports were necessary. This seems to have been a major error, both because of the high price of imports and of the foreign exchange that was spent on what have turned out to be marginal quantities. The import mania has now abated leaving us, more than ever, dependent on domestic production.

At the present time since domestic production is not equal to supply some process of rationing had inevitably to be introduced. It is difficult to contend that the volume of rationing by the purse—cement prices have steeply risen as shown in another article in this issue described as "Price Paradox"—was a just or good method of rationing. It implies that those industries which have the largest liquid resources are capable of obtaining a significant amount of cement whilst other industries, which might have a higher priority from the national interest are left behind. It

is also difficult to believe that all public sector requirements which are receiving high priority are deserving of the high place they receive. Apart from this problem there is the whole question of distortion of prices by an excise duty which, if paid by the public sector, is really a book transfer of no anti-inflationary consequence. There is every thing to be said for an excise duty on cement, but if consumption is largely by the public sector, who pay it? The receipts from an excise duty on cement may well be deceptive, if public sector is the consumer.

The broad conclusions set out in this Blue Supplement suggest that this dynamic industry is still in good heart. It has, however, its difficulties. What is required at the present time is that full opportunity should be given for the discovery of new limestone deposits which threaten to provide a bottleneck to rapidly rising production. Again, there are administrative problems connected with the building of a cement machinery plant, the negotiations for which are in an advanced state of development. Here, obviously, the Government needs to assist with a substantial loan.

There is also the perennial problem of providing additional transport without which the current rate of rise cannot be maintained. It is vital that this industry should not become as it threatens to do a bone of contention between the private and public sectors. The private sector has proved its worth. It is now for the public sector to overcome its own bottleneck in transport in order to maintain the rate of development of which the nation is rightly proud. The fruits of this industry belong to both sectors. It is essential that we should recognise its national importance and approach all its problems in a national, and not a sectional or competitive spirit.

The Growth Pattern of Cement Production

THE pattern of growth of India's cement industry is best set out in terms of the three tables I, II and III. The first of these relates to the period before and during World War II. Contrary to current belief that the war was a great stimulus to this industry, it will be seen from Table I that the rate of growth was more rapid before the war than during the war period. Thus the industry almost trebled its production from 1933 to 1939 whereas it only went up by about 33 per cent between 1939 and 1945. The reason for this is fairly obvious, that it was difficult to get cement-

making machinery during the war period. After the creation of Pakistan some units dropped out so that in 1947 production was down to 1,448 million tons. It is from this period that the rise has been spectacular, doubling of production having taken place between 1948 and 1951 and again between 1951 and 1957.

Over the very long period, the rate of growth of the cement industry in terms of consumption, has been about 8.3 per cent per year, but in recent years this has been altered to about 15 per cent per year, a trend

Note: In a semi-logarithmic graph, equal vertical distances represent the same ratio (i.e. equal rates of increase) in whatever part of the scale they are taken.

September 27, 1957.

CEMENT INDUSTRY SUPPLEMENT

iii

which looks as though it will continue; so that cement consumption might, if supply is available, double every seven years. Naturally, if this is to happen the price will need to be reasonable, as there are substitutes for the use of cement which come into play when the obvious advantages of cement are compensated by a great disparity in prices. All that can be said at the present time is that construction plans are so vast that the demand for cement shows no sign of abating.

The Pattern of Expansion

THE pressure of demand for cement during the last decade has been a function of the progress of the development projects scattered all over the Indian Union. The encouraging feature of the growth of the cement industry, however, is that the units are scattered almost all over the country except for the States of Assam and West Bengal. Every other State has one or more cement factories. The map on page V gives the State-wise distribution of the cement factories including the one which went into production during 1956. The statistical table below the map gives the location of the factories, the year of commencement of production and the latest installed capacity.

The total installed capacity at 6.4 million tons is currently divided between ACC factories, Dalmia fac-

ories and others in the ratio of 2:1:1. This ratio highlights the fact that ACC factories have nearly half the total installed capacity available in the country. Dalmia factories come next in order of importance with nearly 25 per cent, while others have the rest of the 25 per cent capacity.

The public sector is conspicuous by its fractional share in this industry. Out of the 28 units, only two belong to it—one in U.P. and the other in Mysore. The U.P. cement factory went into production in 1954 and has a rated capacity of 2.1 lakh tons. The Mysore factory has had a longer existence having gone into production in 1938. It has an installed capacity of 1.00 lakh tons. The public sector, therefore, has got under its control an installed capacity of 3.31 lakh tons which

TABLE I
RATED CAPACITY OF CEMENT FACTORIES: 1950-51 AND 1955-56

Hyderabad	..	..	1	380
TOTAL	21	3,282	27	4,931

is hardly 5 per cent of the total installed capacity of cement factories in the Indian Union.

The recent increase in the production of cement has come mainly from the expansion of capacity in the existing units. In 1956, only one new unit was set up in Bihar with a capacity of 2.80 lakh tons. The rest of the increase of nearly 8 lakh tons was obtained by expanding the capacity of 6 units, 4 of which belonged to ACC group. In the first 6 months of the current year, installed capacity of 4 units was increased by 5.31 lakh tons.

The manner in which this industry has grown during the first Five-Year Plan and the projected target for the second Five-Year Plan are shown in Tables I and II. Table I shows that the total rated capacity in 1950-51 of 21 units was 3.28 million tons; by 1955-56 it had risen to 4.93 million tons with 27 units. As has been noted above, since the commencement of the second Plan, only one new unit has been added while the capacity has risen by more than a million tons. Table II shows that by 1960-61 the number of units will increase to 44 and rated capacity will be a little above 12 million tons. It will be seen from this table that the only State which will not have a cement factory even by the end of the second Plan is West Bengal, but it makes little difference to that State because in the neighbouring States of Bihar there would be no less than 7 units with the rated capacity of 2.3 million tons. This will be more than sufficient to meet the normal demand of West Bengal.

The biggest bottleneck in the way of expansion of cement output in the Indian Union is expected to be transport. The Ministry of Railways has planned so far for 9 million tons of cement by rail by 1960-61. In case the targets laid down in the second Plan in regard to the production of cement are realised, the railway system will be subjected to additional strain for which no plans have been chalked out.

State Trading or Intermeddling?

CEMENT is one of the major casualties of the State Trading Corporation. This is a unique instance where no satisfactory explanation has been given so far why the S.T.C. has chosen to encroach upon this field. The record of the cement industry and the distribution trade was unimpeachable. This industry has shown a remarkable capacity for dynamism. Moreover, the industry and trade have remained in recent years under a system of State regulation. In these circumstances, the entry of the S.T.C. has chosen to encroach upon this field. The supply position had become critical and imports were inevitable amounted to nothing short of unwarranted encroachment. An explanation must be demanded what specific trading services the S.T.C. is performing since it assumed for itself the monopoly of import and internal distribution from July 1, 1956. The S.T.C. does not owe its existence to any statute of Parliament and it is, therefore, not subject to Parliament's annual scrutiny of its management and operations as statutory public undertakings are. In the absence of any such obligation, the S.T.C. owes it to the public to render a full explanation of its assumption of the cement trade and how it can sustain its intervention in this trade.

The truth of the situation is that the Associated Cement Companies saw as early as September, 1955, that, in view of the impact of demand generated by expansion programmes which involved consumption of cement, shortage in supply would emerge and imports would be essential. It brought this fact to the notice of the Government but without any effect. The supply situation was allowed

to deteriorate until attention was forced on the issue of imports. It was then that the question was agitated whether imports should be allowed to be made by private trade agencies. The decision of the Government to invest the S.T.C. with absolute monopoly of importing cement and distribution in the home market of the total supplies including domestic output was unwarranted and even now it remains something of a mystery.

The attitude of the industry and the trade towards the critical condition of supply needs to be stated fairly. The industry led by the Associated Cement Companies made a representation to the Government that it would undertake full responsibility for importing the required quantities from competitive markets overseas. What is most significant it offered to evolve a machinery for distribution and pricing whereby imported cement would be delivered to the consumer at cost price. It is pertinent to mention here that the price of imported cement is on an average Rs. 50 per ton higher than the price of home-produced cement. The offer of the trade to sell imported cement on a no-profit and no-loss basis was inspired by a desire not to allow inflation in a wide range of development programmes which require cement as one of their vital materials. Furthermore, the industry and trade undertook to evolve a formula whereby the minimum of strain on transport capacity would be imposed in the movement of cement. In addition, they undertook to accept any scheme which the Government would devise for equalisation of prices of indigenous and imported cement and any pattern of rationalization of transport to economise transport

capacity. This offer which was motivated solely by a desire not to allow the critical supply position to add to inflationary pressures was rejected out of hand by the Government without assigning any reasons whatsoever.

Since the monopoly of the import and internal distribution trade has been vested in the hands of the S.T.C., it is necessary to examine the mechanism which it has adopted for its purpose and also to assess what positive contribution it is making in the distribution of cement at a cheap price. Unless the S.T.C. has a case to prove that it has brought the advantages of efficiency and cheap price into the cement trade, its entry in this field cannot be justified on any reasonable ground. Insofar as the mechanism for distribution is concerned, the S.T.C. has done nothing whatsoever on its own. The same trade agencies which were the wholesale purchasers of the cement manufacturers have been retained on the pretext that the S.T.C. is anxious not to allow any dislocation to be caused in the normal trade channels by reason of its assumption of the trade. If this is the real explanation there was no justification whatsoever for the S.T.C. to enter a sphere where the trade was being managed by private agencies with high standards of efficiency.

The example of A.C.C., which accounts for nearly half the production of cement in the country, will explain how superfluous was the S.T.C.'s assumption of trade functions. The Cement Marketing Company which was A.C.C.'s sole distributor before the advent of the S.T.C., continues to be the latter's wholesale agent. The commission of Rs 1.50 which is paid to the C.M.C. as before still continues to form an element of the ex-factory price allowed to the A.C.C. In respect of the other manufacturers, the former wholesale distributing agencies have been retained. The retail trade is regulated by State Governments in respect of prices. This fundamental feature of the distribution trade since the S.T.C. took over the trade proves one fact beyond doubt. It is that the S.T.C.'s contribution to the organisation of internal distribution is Nil.

The STC has certainly a poor showing in regard to the prices of cement. Here again comparison on the basis of the ACC costs would provide a typical instance. The ex-factory price awarded to the ACC group for naked cement stands at Rs. 54.5 per ton. Packing charges which varied between Rs. 13.5 and Rs. 14.5 per ton on the advent of the STC are subject as before to quarterly revisions. ACC's sale price free of rail-head destination was Rs. 90 per ton. The FOR price charged by the STC after it took over was Rs. 102.5 per ton. Since the excise duty was raised from

Rs. 5 to Rs. 20 per ton, this price is now increased to Rs. 117.5 per ton. In effect it means that the STC's price is higher than the ACC's price by Rs. 12.5 per ton. The different factors which account for this disparity in the two prices need to be scrutinised. In the first place, it must be conceded that this disparity may be fractionally due to the higher prices of manufacturers outside the ACC group. Secondly, a definite element can be attributed to the factor of equalisation of the prices of domestic cement and imported cement. What is actually happening is that imported cement is being sold on a basis of subsidy. The quantum of the subsidy would naturally go to increasing the present sale price of cement above what was charged by the private agencies before imports were thrown into a pool along with home output for equalisation of prices.

When proper allowance is made for the two factors referred to here, a substantial balance is left over. It represents the high magnitude of STC's profit margin. The moot question is: What justification is there for the STC to charge profit and to exploit the situation of cement shortage? This question becomes all the more important when it is remembered that the private trade had unequivocally undertaken to distribute imported cement without profit. The STC certainly owes an explanation to the public and particularly to the consumer how much profit it is making and on what grounds. It is immaterial that the State itself constitutes a major consumer of cement. In the ultimate result, the higher price charged by the STC inclusive of extra profit amounts to additional taxation by the backdoor.

The only trade function which the STC is performing on its own is that of importing cement. Here it would be most relevant to enquire and seek an explanation as to whether imports are being made in the cheapest markets and of the required qualities. Already there are complaints that the qualities imported are not what are intended or required. But even in the sphere of import the STC is performing its trading functions without the normal risks which arise in trade. It has a monopoly of distribution, an assured market and complete insurance against losses because of the scheme of equalisation of prices. When these features of the STC's import trade are considered, there remains very little for which it can claim real credit as a trader.

The whole pattern of trade which the STC has prescribed for the internal distribution of cement would show that its encroachment in a business which has been built up to a high pitch of efficiency by free enterprise is totally unjustified. To the extent that it is earning a profit, it is doing so as a rentier out and out.

The Price Paradox

THE Indian cement industry seems to suffer from a number of paradoxes, which is rather difficult to understand, considering the contribution that the industry has made to India's economy all these years. In the first place, here is an industry which has believed in keeping its prices to the consumer reasonably low, but has been prevented from doing so—at any rate since July 1, 1956—by circumstances beyond its control. Secondly, this industry, which was supposed to be threatened with overproduction only seven years ago, when its production was barely two million tons, finds itself unable to meet all the demand for cement in the country today, although it has increased its capacity to over six million tons. Thirdly, although under the second Five-Year Plan, it is asked to raise the production to 15-16 million tons and it is quite willing to do so, circumstances have developed, and are developing, which make the achievement of the target well-nigh impracticable. There is, however, one saving feature of the situation,

and it is that the men behind this industry—in the private sector—are as alive to these paradoxes as they are alert in facing problems and finding solutions for them.

There is something extraordinary about the rise in cement prices since July 1, 1956. Until then, from the year 1948 onwards, the same price was maintained by the industry. It was on that fateful day that the State Trading Corporation took over the selling of cement, thus lopping off one of the essential functions of those in the cement business for decades. Before that date, cement was available to the consumer at around Rs. 89 per ton (that is the "delivered price" to the A.C.C. which included the addition of the "freight average" of Rs. 15 per ton). But, after the S.T.C. took over the sales (the distribution still continues through all the then existing distributive organisations of the producers, though the Government decided that the "delivered price" of cement

to the consumer should be Rs. 102-8-0 per ton. With the latest increase in excise duty from Rs. 5 to Rs. 20 per ton, this price has further risen to Rs. 117-8-0. This, of course, is exclusive of sales tax and general tax, which is estimated to cost the consumer a further Rs. 7 per ton. It is thus evident that whatever increase there has been has not been dictated, as one would normally suppose, by the laws of supply and demand or by any increase in price actually sanctioned to the producer due to increases in his costs of production. In other words, the Indian cement manufacturer has the unique distinction of being a manufacturer, who, while absorbing in his cost of manufacture not only the increases in Central, State and local taxes but even the increases in the costs of production such as higher coal prices, enhanced freight rates and royalties and increased wages, has been allowing an intruder—the S.T.C.—to appropriate a large share of the price difference of Rs. 13 per ton (on the basis of A.C.C. prices.) It was estimated, sometime ago, that the S.T.C. would make a minimum net profit of about Rs. 4.5 crores on its sale of cement. But this figure is bound to be very much more now, as there is no likelihood of the S.T.C. losing any more on sales of imported cement, thanks to the foreign exchange crisis and the shipping shortage which, between them, have almost eliminated all chances of further imports. (The quantity so far imported is believed to be only a fraction of what was proposed, namely, half a million tons.) It is for the Tariff Commission, which is now engaged in examining the question of revising the prices payable to cement producers, to say what justification there is for the S.T.C. to charge such extortionate prices to the consumer. Is it the price that the Indian consumer has to pay for the luxury of getting the cement he uses sanctified by passing through the magic agency of the S.T.C.?

The increased demand for cement today is only a reflection of the tempo of our economic development. Being an essential building material of modern times, its next in importance only to steel, the demand for it has increased with the pace of our progress in the economic and social spheres. The second Five-Year Plan, by open-

The Course of Cement Prices

DURING the first two years of the Second World War the prices of cement remained almost stable. It was only in the middle of 1942 that price rise began to assert itself and control of prices was found to be necessary. The price was determined on 'cost plus' basis. In 1944, the Government finding its requirements satisfied, agreed to the release of cement for public consumption at considerably high prices. This is indicated in index terms in Table I. The jump was by about 30 per cent in a year. For the next two years the price of cement fluctuated around 1944 level.

In late 1947, A.C.C. and Dalmia Group represented to the Government that the then existing statutory price was not matched to higher manufacturing costs due to the rise in wages, price of coal and gunny bags and railway freights. The Government conceding the justice of their demand agreed to increase the price of cement from Rs. 65 to Rs. 87-8-0 per ton. The price, however, was reduced after six months to Rs. 85 per ton. By the end of 1948, the price was further reduced to Rs. 82-8 per ton which was composed of Rs. 55-8-0 for naked cement, Rs. 11-8-0 and Rs. 15-8-0 on account of packing charges and railway freights, respectively.

Another rise in prices was witnessed in 1951 mainly due to the Korean war. It was caused essentially due to the rise in the cost of packing materials. The Government, instead of allowing Rs. 11-8-0 for packing materials, separated it from the price and allowed

ing up a vast field for constructional engineering in multi-purpose projects, large-scale industrialisation, programmes of housing, etc.; has given a further fillip to this demand. The result is that, in spite of the giant strides taken by the industry to increase its production, there has developed an acute shortage of cement. The problem before the industry today is to raise the production further, even as it is the problem of our Planners and the Government to increase the total supplies of cement.

Now, total cement supplies in the country could be increased in three ways, namely, (i) by expanding the capacity of the existing units, (ii) by installing new units or additional capacity, and (iii) by imports of cement. It has already been found that cement imports must be ruled out, by reason of our foreign exchange shortage. If imports of cement, which cost relatively less in foreign exchange, are themselves to be ruled out, it should not be difficult to imagine how much more difficult it would be to import the more costly cement plant and machinery. Fortunately for the country, and, thanks to the farsightedness of the cement manufacturers (A.C.C.) in embarking on the fabrication of cement machinery in the country itself, it may not be necessary to import cement plants in their entirety. But this would imply greatly expanding the capacity of the A.C.C. machinery-fabricating plant—as is, indeed, being done by the industry itself—so as to meet the combined needs of all the units of the industry, existing and potential. Even assuming this to be possible, before the plan reaches the production stage, we would be at the end of the second Five-Year Plan. This means that, however exhilarating a mental exercise it may be to think and plan big, the cement production target of 15-16 million tons under the second Plan is simply unattainable in practice.

Apart from the difficulty in respect of machinery, the industry has to make sure of coal, limestone and gypsum of the requisite quality in the required quantities. These limitations point perhaps to the need for revising the Plan targets of cement production to more modest proportions.

its actual cost, subject to a maximum of Rs. 26 per ton. In 1953 the prices of packing materials slid down to Rs. 11-14-0 per ton and the overall effect was visible in terms of the index which was substantially lower than the previous year.

The manufacturers were again constrained to ask for an upward revision of prices because the price of raw materials and railway freights and wages had soared up. The Tariff Commission, at the request of the Government, examined the question. The Government of India accepted the principles adopted by the Commission for determining the prices of cement, except the allowance for rehabilitation and expansion. The Government agreed, however, that the units having programmes of rehabilitation and expansion will be allowed Rs. 4 per ton for the purpose. A price of Rs. 67 per ton f.o.r. destination was treated as standard price. Some units which had higher costs were, however, allowed to charge Rs. 5 to Rs. 12 more than the standard price. From 1954 no major change was recorded in the price of cement, until May 1, 1956, when the distribution of cement was taken over by the State Trading Corporation and equal price was prescribed for home produced and imported cement. Due to the higher cost of the latter the equalised price has been fixed much higher than the price of indigenous cement.

It is evident from Table I that after the coming in of the S.T.C. there has been a sharp rise of more than

30 per cent in cement prices. This rise, however, is not fully explicable. First, it has not been caused by the law of demand and supply. Secondly, it is not because the manufacturer has to be paid a higher amount for his rising costs. In fact, he is still getting what was fixed for him about three years ago. He has to absorb increases in the costs of coal, rise in freight and wages. It may be mentioned in parenthesis that labour conditions in Indian cement industry have been gradually improving. Today the amenities that are provided to the Indian cement worker are better than those provided in several Western countries.

TABLE I
WHOLESALE PRICES OF CEMENT

1939=100			
1939	100	1949	234
1940	107	1950	234
1941	107	1951	270
1942	123	1952	272
1943	155	1953	244
1944	182	1954	254
1945	193	1955	262
1946	170	1956	278
1947	181	1957*	314
1948	241	1957 Aug.	342

The base has been adjusted to calendar year 1939 = 100 instead of the base of the official index with base August 1939 = 100. The series has been constructed after various necessary adjustments for earlier years.
* Average of eight months.

The real cause of the recent rise in price is clear from Table II. It will be at once obvious that there is an increase of Rs. 40 per ton, which is equivalent to 75 per cent of producer's price, imposed by the State in one way or the other. It is this increase, which has pushed the price suddenly so high. The S.T.C. raised the price under the pretext of making imported cement available to the consumer at the same price as that charged for home manufactured cement. The whole of this increase is not at all due to price equalisation. It contains a large margin of profit charged by the S.T.C. by virtue of the monopoly it holds in the matter of distribution of cement. In practice, however, due to lack of shipping space and foreign exchange shortage the volume of cement imports has been reduced. The burden of this levy still stays on.

It was proposed by the producers, at the time of its imposition, that a 'price equalisation pool' could be maintained for price equalisation, so that the surplus could be spent for the modernisation and rehabilitation of the industry. It was a just demand but the Government did not concede it. It must be emphasized that while the industry had promised to sell imported cement at cost and no more, the S.T.C. has exploited the situation just to make a profit and tax the consumer.

There is another aspect of the problem. At present the State consumes 75 per cent of the total cement production. Its demand is increasing but it is doing not enough to help the private sector to expand the industry. It is surely not justified to make the consumer pay a higher price only to assist the S.T.C. in compensating for its likely losses in its other trade activities, especially when other levies have been increased beyond proportion, for instance, the excise duty is now raised from Rs 5 per ton to Rs 20 per ton.

The worst facet of cement prices is that the manufacturer is still being paid the costs, at the rates calculated more than three years ago. The costs in respect of coal, petroleum, diesel oil, railway freights and labour have risen substantially. It is only hoped that the Tariff Commission, which is engaged in examining the question of prices payable to cement manufacturers will give full consideration to these factors and remove this price anomaly.

TABLE II
PRICE OF CEMENT FOR THE CONSUMER

	Rs.	Ra.
Price paid to the Manufacturer (ex-works) by the S.T.C.		54.50
Excise Duty	20.00

Av. Railway Freights		15.00
Selling Organisations		2.50
TOTAL		Rs. 124.84

Notes on Cement Industry

CEMENT—AN INDICATOR OF PROGRESS

BY MODERN standards the progress and size of the cement industry in any country is taken as one of the major indicators of the growth of its economy. Where the total demand is satisfied by home production, cement as an indicator of economic progress would mean the development of the cement industry in the country. As it actually happens, several countries satisfy their demand for cement either wholly or in part by imports. Whatever the source of supply of cement, whether it is domestic production or imports or both, cement consumption ought to be taken as a reliable index of utilization of cement. Looked at from this view-point, India ranks very low in the order of consumption of cement. Comparable figures for recent years bear out this fact. Per capita consumption of cement is 740 lbs. in Sweden, 716 in Belgium, 540 lbs. in the United States, 460 lbs. in Denmark, 411 lbs. in the United Kingdom, and 90 lbs. in Japan, whereas in India it is deplorably low at 27 lb.

THE CHANGING PATTERN

CEMENT AND STEEL are classified as basic industries, but steel is far more complicated and far more difficult to develop than cement. It is, therefore, paradoxical that India should have made a start in her steel industry earlier than in the cement industry. The steel industry celebrated its golden jubilee just a few weeks ago this year. The cement industry has to wait for another six years before it reaches this important landmark. It was in the year 1913 that the first successful attempt was made in manufacturing cement in this country. That was done in Porbandar in Saurashtra. It was preceded by an infructuous attempt in Madras in 1904. The Porbandar enterprise was launched at an opportune time, for soon after its establishment World War I suddenly generated a high volume of demand for cement and gave a powerful fillip to this industry. Nearly for one decade after the pioneering enterprise was launched at Porbandar, the cement industry made strides in expansion of output. Between 1913 and 1923 installed capacity rose from 85,000 tons to 5.8 lakh tons per year. But the ratio of actual utilisation of capacity was low.

Then followed a period extending well up to 1936 which was a period of stresses and strains. The industry had to meet recurring difficulties which made it clear that, unless its organisational pattern was changed and consolidation was brought about, the industry would remain feeble and unable to make mentionable headway. In the year 1936, 10 out of the 11 factories then existing amalgamated to form the Associated Cement Companies. The Dalmia Group of cement factories was another wing of the integrated pattern of units which spread its ramifications afterwards. Partition did not affect the cement industry inwards. As many as 18 out of the 23 factories remained in the Indian Union and in terms of capacity 21.15 lakh tons of capacity out of 26 lakh tons per year was retained by the Indian Union as its share.

FROM PORTLAND TO COLOURED CEMENT

WHAT IS popularly known as cement is in fact Portland Cement. Its inventor, Joseph Aspdin, an English mason, gave it the name of Portland Cement because of the resemblance of the product he invented with the well-known stone extracted from the quarries at Portland. Portland cement is a decisive improvement upon the cement which has been known to the civilized world in construction activity through the ages. The raw materials used in the manufacture of modern cement are selected for their

quality of fineness and they are processed before calcining them in furnaces. As Portland Cement came to be reformed in quality, standard specifications also came to be prescribed. These specifications have to conform to definite chemical and engineering requirements. A move is now afoot to evolve an international standard for Portland Cement. India, like all other countries manufacturing cement, has fixed her own standard specifications of Portland Cement. The Indian standard specifications divide cement into three different categories—Ordinary, which is used for common requirements of construction, rapid-hardening, which is used in works where early strength is required, and Low-heat, which is used in massive concrete projects.

Still other varieties of cement are being evolved and India is about to launch their production on sizeable scales. Low-grade coals and lime-stone are practically treated as unsuitable raw materials, nevertheless they can be pressed into service for manufacture of certain types of products like cement. Similarly, certain materials which are practically thrown away as waste, such as calcium carbonate sludge, and slags and coke breeze can be used for manufacturing cement. The products made with the help of these materials will rank as blended cement.

But technological progress in cement is really aiming at the production of fine varieties whose distinctive feature is their attractive colour vitally different from that of ordinary Portland Cement. The ACC has taken in hand the project of manufacturing white cement. In course of time the output of white cement is bound to be expanded as the demand for it increases. White cement is but only the initial stage, since it would prove to be a reliable and most suitable base for the manufacture of coloured cements. This next phase of production of fine coloured cements is now in the making. It will also be possible to produce cement paints.

MANUFACTURE OF CEMENT MACHINERY

THE MANNER in which the ACC has met some part of its requirements of machinery for cement factories and its project for setting up a large-scale plant for the production of cement machinery provides encouraging evidence that the base of accelerated development of cement is being laid on sound lines. During recent years the ACC has been manufacturing some of its equipment and machinery in its own workshops. But the cement industry is to be developed now on such a relatively big scale that equipment manufactured in workshops will satisfy only a fraction of the demand and that too of simple types.

In order to meet the heavy demand which its own factories as well as other cement factories will make from time to time, the ACC is negotiating with Messrs. Vickers-Babcock and Willcox of the United Kingdom for setting up, on a basis of joint participation, a full-fledged large plant for the manufacture of all types of cement-making machinery as well as some ranges of machinery required by other industries, particularly transport industries. Negotiations have now reached an advanced stage and their tenor shows that they will result in a regular agreement to set up the plant. A substantial portion of the investment required in it is contemplated to be shared half and half by the two parties. India's acute shortage of foreign exchange has raised a new and serious difficulty for the ACC to procure its share of the cost of the plant. When the total investment becomes available the project will be started. Indications, however, are that the plant will make a positive contribution to the Indian demand for cement machinery in the third Plan period.

Problems of Private Foreign Investment

ONE of the most impressing changes in the structure of the Indian economic thinking in recent years has been in respect of the desirability of foreign capital. Barely five years ago there was an obstinate refusal to consider that a generous policy to attract foreign capital was either necessary or desirable. Today we have swung to the other extreme and consider that in order to meet the foreign exchange gap we must devise a policy of extreme flexibility on foreign requests for investment in India. There is danger in these swings of opinion that detailed policy to be pursued might suffer from extreme preoccupation with the exigencies of the moment. A policy for foreign investment should be framed over a very long period.

It is still true that the financial element in this case is the dominant one. A central article in this issue deals with the rate of return on investments in the United States and in this country. It is shown that the return on capital in the United States is in practice all industries higher than in this country. In this respect the conditions are substantially different from the 19th century when the great capital exporters—namely Britain and Holland—were assured abroad of far higher returns than they were at home. One of the difficult problems of the 20th century is the divergence that now exists between the political need for the development of the under-developed countries and the attractiveness of investments in countries from which the flow should be outward instead of within. Obviously a first condition of a policy for attracting foreign capital should be an attempt to equate the returns of the private investor in the investing country as in the country chosen for investment.

The purpose of the current Blue Supplement of "The Eastern Economist" is to analyse how this can be done in two respects.

The first of these is to give the investor a return net after taxes at least equal to what he would earn in his own country. The second is to guarantee to managements that make the investments reasonable

conditions for their own nominees so that the rate of personal taxation or the manner in which it is administered do not exclude foreign personnel, which are still considered necessary by foreign investors as a safeguard for their interests. Finally, apart from the problem of the return on capital and the provision of adequate facilities for foreign personnel to reside in this country, there is need for general atmosphere of confidence in the policy of the Government not to nationalize unduly, or, if it nationalizes, to provide not merely adequate but generous compensation.

In recent years, while the necessity to obtain private foreign capital has been realized, the Government largely under the impulse of creating a socialistic pattern of society has created some new intangible obstacles in the minds of foreign investors. If these obstacles had been on paper only, perhaps they would have not had the adverse reactions that have recently been noted. But the translation of the socialistic pattern ideals into steep personal taxation and, more recently, the attempt to finance the plan by impounding company deposits has led to a feeling that Indian policy is designed to inhibit the private sector. Thus it comes about that the recognition that foreign capital is now desirable is by no means enough. The ground lost has to be recovered by a substantial change in policy; some outlines of the changes required are presented in this Blue Supplement.

The existence of a serious foreign exchange crisis and the belief that many foreign investors can do something to allay our difficulties makes this time opportune for a discussion of these problems. "The Eastern Economist" hopes that the Government of India will give to the suggestions made here the consideration which is their due. The Finance Minister, in the United States and elsewhere, has shown himself alive to the extent of the feeling that exists on these matters abroad. The time is opportune for him too to show by deeds that the opportunities for the private sector are real in this country and that his assurances will be carried out without undue qualification.

The Return on Investment: India and the United States

THE central factor in determining the volume of foreign investment is the rate of return, after taxes, on capital in the investing country as compared with the country in which investment takes place. For current purposes the country with which we are most likely to be concerned is the United States, largely because our requirements are of such an exacting character that no country other than the United States can fill the gap in a substantial measure.

For this purpose there is presented, in the tables below and on the adjoining page, a statement showing net profits, after taxes, as per cent of net worth for leading manufacturing corporation between 1950 and 1954 in the United States and between 1950-55 in India. They are both samples of the total universe, the sample being 1,778 companies in the United States and 750 in the Reserve Bank study.

It will be seen that in every single year from 1950 to 1954 the return in the United States is substantially higher than in India. Unless there were some extremely good compensating factors over the long period

operating in India's favour, the requisite inducement to invest in India would appear to be absent. It is difficult to conceive, without powerful tax concessions, how in the normal course and for industry as a whole, the inducement to invest in India can be strong. On the other hand, there are certain industries which have no comparable figures in the United States such as tea and other plantations, where the return is high and of a level greater than the average return in the United States. There seems to be no reason on these facts why United States investment on tea and other plantations should not be acceptable.

It is clear, therefore, that while a general policy of tax concessions will be necessary to divert a general flow of United States investment funds to this country, a particular flow to tea and other plantations stands on a different level. Here, it so happens, the rate of return is one in conformity with the average return on investments in the United States. It is obviously expedient that we should attempt the sale of strong points in our economy from a profit point of view before we attempt selling investment in general.

TABLE I.

PROFITS AFTER TAX AS PERCENTAGE OF NET WORTH

Industry	1950	1951	1952	1953	1954	1955	Average 1951-55
1. Cotton Textiles	6.5	9.6	2.1	3.8	3.8	8.6	5.6

66	Shipbuilding)	12.7	11.8	10.5)	11.9	15.6
	Miscellaneous)					
1,778	Total Manufacturing	12.4	12.7	12.3	14.4	17.1

Note: Net income is taken as reported, after depreciation, interest taxes, and other charges and reserves, but before dividends. Net worth includes book value of outstanding preferred and common stock and surplus account at beginning of each year and is based upon balance sheet book values of assets, which may differ widely from present day values. The percentage rates indicate general earnings trends, but are not strictly comparable over a period of years because of (i) variation in number of available corporate reports included in the different annual tabulations upon which this summary is based and (ii) certain changes in industrial classification during the period.

— Deficit.

The Taxation of Foreign Personnel

It is clear that one of the unsettling factors in regard to private foreign investment is the increasing burden of taxation on foreign personnel. It is natural that investors of a foreign country, who do not understand the character of the country in which investment is taking place, and need to rely upon their own representatives, should demand that their representatives should have a reasonable inducement to stay in the country. Differences of opinion are possible on what constitutes a reasonable opportunity to work in a country. But there can be no doubt that at the present time the consensus of opinion is that India is not very attractive to senior executives.

This is in part the result of growth of personal taxation in the form of income-tax and super-tax. A comparison of the difference between the effective rates of income tax in 1938-39, 1956-57 and 1957-58, shows that, while there are substantial concessions in the very high income groups in 1957-58, the rates of tax have risen steeply since 1938-39. This has, indeed, happened all over the world, but the real difficulty in India arises from the early stage at which special rates apply. Only in the United Kingdom and Japan are personal taxes heavier than in India. So far as the United States is concerned—again the country in which we should be most interested—some details on the approximate tax burden of an individual with an United States \$20,000 income is given in the table below. It will be seen from this table that, except for the United Kingdom and Japan, India presents to a US executive at this level the highest tax burden.

Listed Below is the Approximate Tax Burden of a Hypothetical Individual with a U.S. \$20,000 Income in Various Countries

Country	Income Tax
India	U.S. \$ 10,641.60
United States	5,280.00
United Kingdom	11,577.00
Japan	11,190.00
Indonesia	10,563.00
Australia	8,909.00
France	6,817.00
Canada	6,410.00
Germany	6,142.00
Philippines	5,144.00
Malaya	3,925.00
Egypt	2,567.00
Italy	1,693.00
Saudi Arabia	750.00
Venezuela	337.00

In the result United States executives who have a free choice will tend to go to countries where taxation is lower unless the company compensates them com-

pletely for the severity of taxation. To the extent that the company provides such a compensation, its profits are further diminished. In many cases, however, companies decline to provide this compensation. The officers posted to India would then generally be those who have no other choice. In other words, we will lose in quality and, presumably, as a result of the fall in profits, receipts from taxation will fall. At the same time, the investor will further be prejudiced in this country in his general outlook to invest in India by the lower profits obtained. In addition to taxation, there is the problem of cost of living which in India in the last two years has been steeply rising particularly in respect of that range of goods such as alcoholic drinks and imported foods—which foreign executives choose to consider a virtual necessity.

To some extent the situation has been remedied by the provision that technicians operating in the country for three years should be free from taxation. It is very desirable that the personal reliefs granted to technical personnel should be extended to individuals in managerial and consultancy roles. Similarly, there is the problem of overseas personnel in India who come for temporary assistance, but not necessarily for residence over the longish period. They are frequently classified as "non-resident", and subjected to heavier "non-resident" taxation. Again, the taxation of overseas personnel on the basis of their world income tends to restrict entry to those personnel without substantial income other than their own salaries. This in turn reduces the quality of personnel available to administer investments in India. Similarly, taxation of perquisites in one form or another has been keenly felt. Foreign investors who wish to acquire retirement annuities for their overseas personnel are debarred by the provisions of the Indian tax law. Similarly, the rules in regard to passage money have not dissipated all those who have previously enjoyed substantial privileges for themselves and their family.

It is clear that if most of these objections are to be removed, generous concessions will need to be applied to foreign personnel even if they are not provided to Indian executives. There is justification enough for this discrimination, because foreign personnel have generally to maintain two establishments, and need to make provision for the education of their children. It would be difficult to have a large slab of income exempt, but there should be surely a provision for a reduction of taxation in regard to foreign personnel who have children being educated abroad. This may take the form, for example, of a tax exemption of £40 per month or £480 per year per child, in the case of those who have children abroad subject to a maximum of £1,000. Again, in regard to entertainment expenses inside the country there is room for a larger allowance to be made in the case of foreign personnel who have by custom to entertain according to the standards of the country which generally involves, because of the serving of alcoholic drinks, a larger total figure. This is a matter of administration, but undue curtailment of entertainment allowance of foreign personnel has certainly created a serious incapacity to foreign personnel to live a normal social life. It is not believed that minor concessions given under these heads will affect in any significant way the revenue of the country. These concessions might need to be applied perhaps to a thousand executives in all, and the loss would be trivial compared to the significant gain that would be obtained by making foreign investors feel that their sentiments have been duly appreciated.

The Problems of Corporate Taxation

THERE is now the problem of doing something substantial to equate the net return, after taxes, in India with that prevailing in the main capital exporting countries. It has been pointed out in the article on the Return on Investments that the differential to be covered between India and the United States is substantial. Assuming, as is likely, that the "normal" rate of gross return in India cannot be substantially raised, this reduces itself largely to instituting some concessions so that their return after taxes will be in large measure equivalent to that prevailing in the United States.

This equalising volume of tax concessions does not lend itself at the present time to any precise estimate largely because of the unknown quantities over which concessions apply. The Eastern Economist believes, however, that if those below were instituted there would be a tremendous psychological change which in itself would generate substantial additional investment. If it should prove that one or other of these items was unnecessary or that the concession was excessive, it would be open to the Finance Minister in the Budgets to come to withdraw them gradually. The announcement of concessions on these lines does not preclude the Finance Minister from adjusting his course from year to year. Nevertheless, the understanding should be that the concessions here indicated are intended to endure over a substantial period.

TAX CONCESSIONS REQUIRED

The super-tax on foreign company profits should be reduced to 3 annas in the rupee or 18 per cent. Under the Finance Act (2) of 1957, the effective rate of super-tax on Indian branches of foreign companies has been reduced from 36 per cent to 30 per cent.

The super-tax on the dividend income of foreign companies from Indian companies should be eliminated. Now this tax is 10 per cent for foreign companies as against last year's 20 per cent.

Penalty super-tax on excess dividends should be applied in relation to the total capital rather than paid-up share capital. The Finance Act (2) of 1957 has not changed this position. But the rates of such additional super-tax on excess distribution of dividends over the three levels of 6 per cent, 10 per cent and 18 per cent of the paid-up capital have been lowered from 12½ per cent, 25 per cent and 37½ per cent to 10 per cent, 20 per cent and 30 per cent respectively.

Foreign companies and their subsidiaries should be exempted from sub-sections (2B) and (2C) of section 10 of the Indian Income Tax Act. These sub-sections deal with the compulsory deposit scheme for companies.

Section 23A of the Income Tax Act should be replaced by a new section of more limited application. This Section deals with "power to assess companies to super-tax on undistributed income in certain cases". The Finance Act (2) of 1957 has amended this section partly so as to fix for various categories of companies the percentages of available profits which they should distribute in order to avoid the extra rates of super-tax prescribed in section 23A. The percentage is now 45 per cent in the case of industrial companies as against the previous 60 per cent. Another amendment deletes from the purview of this section companies owned by the Government or in which not less than 40 per cent of the shares are held by the Government; this means that companies which would otherwise be affected because of participation by the Life Insurance Corpora-

tion or the Industrial Credit and Investment Corporation are now exempted from the mischief of the section. The suggestion that there should be a more liberal definition of companies to which the section applies remains, however, to be carried out.

Permission to carry forward unused exemption under section 15C and unused development rebate should be granted. Section 15C dealing with "exemption from tax of newly established industrial undertakings" has not been amended under the Finance Act (2) 1957. Under this section a company which makes less than 6 per cent profits is exempted from tax for a period of 5 years from the year following the year in which it begins to manufacture articles; but such a company, to be entitled to exemption from tax, should have begun to manufacture articles at any time within a period of 13 years from the 1st day of April, 1948. The purpose of the suggested amendment is to enable a company which, though formed within a period of 13 years from April 1948, may not have started actual production within that period, to carry forward the unused exemption.

Advanced assurance should be given to potential investors whether section 15 C and/or section 56A will apply to the contemplated investment. Section 56A deals with "exemption from super-tax of certain dividends". Under this section no super-tax shall be payable by a company on such part of its total income as consists of dividends received from an Indian company formed and registered after the 31st day of March, 1952, if that Indian company is engaged wholly or mainly in the manufacture of 20 specified commodities, like coal, iron and steel, heavy chemicals, heavy machinery, electric machinery, automobiles, locomotives, machine tools, tractors, rolling stock, etc. Of course, if the super-tax on the dividend-income of foreign companies from Indian companies is completely eliminated, the question of exemption of foreign companies from the operation of Section 56A will not arise. If this is not done, a periodic review of specified industries under this section should at least be done so as to expand the list of such industries.

Non-residents selling goods to India should be exempted from tax except when sales are made through a permanent establishment or duly authorised agent. Non-resident companies receiving income in the form of dividend and interest on which tax is deducted at source should not be required to submit returns of total income. Non-residents should be exempted from tax in respect of mere purchase of goods in India. The tax on non-residents on the basis of receipt should be eliminated. Royalty payments to non-resident companies for industrial patents should be exempted from super-tax. It is expected that if these concessions in respect of Corporate taxation are given, Indian tax laws would compare favourably with those of other countries with similar requirements for development.

MORE ON DETERRENTS

Besides, the concept of "business connection" should also be defined and restricted to permanent establishments and authorised agents. The need to amend Section 42 of the Indian Income Tax Act arises from the fact that the system of charging non-residents on the basis of their having "business connection" in India acts as a deterrent both against foreign capital investment in India and against foreigners having trade connections with Indian companies' expansion projects. It may be noted that a tax liability based on "business connection" — an expression which is vague or has a

wide import — ropes in incomes of non-residents in cases where under most tax systems in the world there is no charge on non-residents at all.

The five-year tax holiday under Section 15C of the Income Tax Act could well be longer and the amount exempt from taxation should also be more liberal, for in the first five years the development rebate and the additional depreciation allowances are large enough to exhaust all the profits. In practice, therefore, there is no chargeable profit which is liable to be exempted. If Section 15C is to afford any real relief to a new undertaking, the exemption limit of 6 per cent of the capital should be increased.

As for development rebate, the provision therefor is no doubt an incentive to foreign investment, but its effect is nullified by the provisions regarding compulsory deposits of a portion of current profits and of accumulated earnings with the Government under sanction, in the event of failure to make such deposits, of disallowance of depreciation and development rebates. A foreign investor does not readily accept this position, and hence the suggestion that foreign companies and their subsidiaries should be exempted from sub-sections (2B) and (2C) of Section 10 of the Indian Income Tax Act.

It is not adequately recognised that even if such non-tax factors as the opportunity for profit or for remittance of profits are favourable to the foreign investor, a very heavy tax burden would still deter him from actually making the investment. This is the case in India where the tax burden on an Indian company is 43.44 per cent after the allowable rebates, which is considerably more than in many other countries. This should be clear from the figures in the table at the

end. But this is not the total tax burden. In order that it may not at least exceed this rate of 43.44 per cent, the rebates allowable to a foreign enterprise operating a branch in India would have to be suitably re-adjusted.

Notes: 1. Japan/United States Tax Convention provides for exemption from a 10% Dividend Tax except in cases of a permanent establishment.

2. Canada/United States Tax Convention provides for a reduced Dividend Tax of 5%.

The Industrial Policy Resolution and Private Foreign Investment

THE position of foreign private capital in the light of the Government of India's Industrial Policy Resolution of April 30, 1956, is an important factor which is likely to influence the flow of investment from abroad into this country. The earlier Industrial Policy Resolution of April 6, 1948, had become out-dated in view of important developments which took place in the intervening period. The Constitution came into force on January 26, 1951, and its Directive Principles enjoin that the Government should strive to achieve a Welfare State. This obligation has several broad implications for economic policy. The country had accepted economic planning as the instrument for orderly development. In December 1954, Parliament adopted the socialist pattern of society as the goal of the Government's social and economic policy.

Apart from these important events in the realm of policy, a number of public pronouncements were made by Ministers from time to time which were neither clear and precise nor consistent with one another. The general trend to make sweeping and disparaging statements about the role of private enterprise in the future development of the country only served to create an atmosphere of uncertainty. In spite of some definite pronouncements of policy on private enterprise embodied in the Industrial Policy Resolution of April 1948, the entire position became confused. Uncertainty and confusion were undoubtedly harmful to investors' confidence. It was obvious that when the country was about to launch upon an ambitious programme of development in the second Five-Year Plan, the entire position should be clarified

and private enterprise should be informed how and where it exactly stood in the scheme of things. It was with this purpose in view that the Industrial Policy Resolution of April, 1956, was announced in an elaborate form on the eve of the second Five-Year Plan.

In so far as the role of private enterprise in the development of the economy is concerned, the fundamental principle of policy which must be underlined is that the Government is pledged to non-discrimination in the treatment of foreign private capital and Indian private capital. The text of the Industrial Policy Resolution makes a specific reference to the statement of the Prime Minister in Parliament on April 6, 1949, in which the Government's policy in respect of foreign capital was enunciated. This policy stands unchanged and it is adopted in the original form in the Industrial Policy Resolution. The gist of the Prime Minister's statement was that foreign private capital would be warmly welcomed in India. In fact, it would be essential for the development of this country. No differential treatment was to be accorded to foreign private capital and Indian private capital. Foreign investors would be assured of remittance facilities for the profits they earn in this country and also for the sale proceeds of their concerns. Remittance facilities, of course, would be subject to the foreign exchange control regulations.

In practice, it has not been found difficult even in a single case for the exchange control to refuse remittance facilities to foreign investors. The latest position marks a positive improvement even in the

use of dollar investments. In September last an agreement was entered into between the Government of India and of the United States whereby these facilities of convertibility of rupee profits or rupee proceeds of the sales of American concerns have been guaranteed into dollars. This policy and these positive commitments ensure that foreign private capital has reasonable security granted to it and furthermore they ensure that the Government should strive its utmost to maintain a climate which would be always conducive to the stay of foreign investment in this country.

In their anxiety to clarify the precise nature of their policies, Parliament and the Government have lapsed into a superfluous emphasis on the ideological aspects of these policies. The adoption of the goal of socialism has served to create a good deal of confusion which is not warranted by the policy which Parliament has actually in view and which is intended to be followed by the Government in practical administration. The socialist pattern of society as envisaged by Parliament does not contemplate elimination of private enterprise. What it essentially means is that the State sector should assume much greater responsibilities than ever before in promoting the development of production try. Total ownership of the instruments of production by the State or anything like State capitalism is not the goal as intended in what is described as the socialist pattern of society. Fortunately, there is now an increasing awareness in India as well as abroad that in backward countries private enterprise will not be in a position to provide all the capital that is required for accelerated and all-sided development of the economy. There are real risks that returns may not be forthcoming on investment in certain ventures for a considerable period of time. In view of this prospect, it is inevitable that the State should step into the sphere of investment where the basic needs of the economy so require. What India has in reality adopted is the pattern of mixed economy.

The Industrial Policy Resolution of April, 1956, clarifies this issue. Its classification of industries into three categories (of which the first is reserved for State investment and management, the second for predominant ownership and control by the State and the third as the reserved sphere of private enterprise) is by no stretch of reasoning a water-tight division. The Resolution states in quite express terms that the three-fold classification necessarily overlaps. In theory, Parliament's sovereignty entitles it to nationalise any undertaking if the exigencies of the situation require such a course. But the practical limitations of the State's capacity to enlarge its area of ownership and management have been recognized in the Industrial Policy Resolution. Schedule A to the Resolution enumerates seventeen types of industries which are supposed to be reserved exclusively for the State sector. But Paragraph 8 of the Resolution states in unequivocal terms: "Railways and air transport, arms and ammunition

and atomic energy will, however, be developed as Central Government monopolies." Thus crucial statement should suffice to make it clear to what extent the exclusive reservation of industries for the State is really intended in the absolute sense.

To clarify the position further, the Resolution announces that in the first category of industries, enumerated in Schedule A, (barring the four industries specified above) the co-operation and active participation of private enterprise will be invited wherever Government considers it essential. The establishment of some basic and heavy industries as well as the negotiations now in progress for certain other industries included in the first category which are to be sponsored by the Government, have demonstrated that the Government has followed a practical policy of inviting the participation of foreign capital. The first category of industries as well as the second category where the Government is entitled, in terms of the Industrial Policy Resolution, to assume responsibility for starting new enterprises, India's need for the assistance of foreign capital and technological skills will be very great. It is evident that in the third category of industries which has been earmarked for private enterprise, participation of foreign private investment will be urgently called for in a large number of undertakings. Happily foreign participation, whether along with private enterprise or State enterprise, has actually proved to be of valuable assistance in the recent past. The Industrial Policy Resolution is pledged to a continuance of the same attitude to foreign investment.

To describe the Industrial Policy Resolution as a flexible instrument of policy would not be enough. The heart of the Resolution consists in its pragmatic approach to the problems of industrial development. The text of the Resolution gives ample proof that there cannot be any dogmatism about ownership and management of different industries either by the State sector or the private sector. It is for the sake of broad enunciation of policy that the Resolution has adopted the classification of the Industries into three groups. The latest example of Government's pragmatic approach to industrial development is fully reflected in the significant change it has introduced in the licensing of mining rights. A wide range of minerals and ores which are reserved for exploitation by the State in terms of the Resolution is now thrown open for working by private enterprise. The first one and a half year of the second Plan has brought home the lesson of the limitations on the resources of the State in finance as well as technical and managerial skills. Private enterprise is now receiving increasing recognition of its role. The fact of this recognition applies with equal force to foreign private enterprise; it is likely it will be allowed to mix freely with Indian enterprise in a widening field even beyond the confines of the Industrial Policy Resolution.

Foreign Business Investments in India

ONLY two systematic assessments in regard to foreign business investments in India have so far been made and both of these were made by the Reserve Bank of India. The first of these studies, which was called the Census of India's Foreign Liabilities and Assets, up to the end of June 1948, was published early in 1951. The second study which covered all business investments till December 1953 was published in 1955. Both these surveys were of a detailed nature and analysed the statistical details in regard to foreign liabilities and assets in an exhaustive manner.

The foreign business investments, according to the 1953 survey, up to 30th June, 1948 in India totalled Rs. 287.57 crores. In the next five and a half years, there was a net increase of Rs. 131.75 crores. The total foreign business investments at the end of December 1953, therefore, totalled Rs. 419.32 crores.

The first table on page x shows the country-wide distribution of these investments in 1948 and 1953 and also discloses the increase in the contributions of private investors in the various countries during 1948-53. That

PRIVATE FOREIGN INVESTMENTS SUPPLEMENT

ix

a major share of these investments came from the United Kingdom discounts the fears which had been entertained for a long time in this country that British capital was flying away. Out of nearly Rs. 419.32 crores, business investments from the United Kingdom were as high as Rs. 347.1 crores. This constitutes nearly 83 per cent of the total foreign business investments in the country.

The US business investment at Rs. 30.91 crores in December 1953 was even less than 10 per cent of the total investments made by the United Kingdom. The flow of private business investments from the United States into India has been hesitant while that of the United Kingdom has been at an encouraging pace. During the five years under study, the United Kingdom increased its business investments by Rs. 137.11 crores. During the same period, the investments of the United States increased by Rs. 12.95 crores only. It shows clearly that private foreign investments from the United Kingdom have been at a level which is ten times that of the United States. The only countries whose private business investments in India have declined in a substantial measure are Pakistan, Ceylon and Burma. But the total withdrawals from all these three countries

together are not more than Rs. 11 crores.

The trade-wise break-down given on page viii shows that the highest share of foreign private investment has taken place in manufacturing industry, followed by trading, plantations, utilisations and financial concerns. The increase in business investments in the five-year period between 1948 and 1953 has also taken place mostly in manufacturing, trading and plantations only. Withdrawals have taken place in a sizable measure only in the case of financial and mining concerns.

In regard to foreign business investments after 1953, no definite information is available. The balance of payments statistics are highly misleading in this respect. The published balance of payments statistics for 1948-53 showed, for example, that there was a net disinvestment of foreign capital from the country while the Reserve Bank survey revealed that there was a net increase, as already stated above, of the order of Rs. 132 crores. If the figures of US direct investment in India in 1956 are any guide, it can be safely conjectured that foreign business investments at the end of 1956 were higher by nearly Rs. 100 crores as compared with December 1953.

Notes on Foreign Investment

US DIRECT INVESTMENTS ABROAD
THE PATTERN of US direct investments in both the developed and under-developed countries during the period 1950 to 1956 is set out in the table below:

It shows that, in 1950, India, amongst the under-developed areas, had the lowest direct investment. In 1956 also, though the quantum of investment trebled, India's rank in the order of investment, amongst under-

developed countries, remained unchanged. An important fact which this table brings out very clearly is that the countries in the under-developed areas which have attracted most of the US direct investment are those of Latin America. Amongst the developed areas of the world, Canada tops the list where, within a period of six years, US direct investments have doubled and now stand at an all-time peak of \$7.48 billion. The quantum of investment in developed or industrialised areas is, undoubtedly, large but recently the rate of investment in the under-developed areas has, without doubt, been the same as that of the industrialised areas. Most of the investment has gone in for extractive industries, i.e., mining and petroleum.

OIL INDUSTRY

SEARCHING ECONOMIC studies made concerning the operations of the oil business have brought out sharply the industry's two major characteristics: dynamic growth accompanied by huge reinvestments necessitated by the need to develop new resources and to provide more efficient service. According to an authoritative source, capital expenditure by the entire oil industry in the United States and abroad in 1956 amounted to 9.7 billion dollars — up by 17 per cent from 1955. Gross investment in fixed assets employed by the industry in the free world at the end of 1956 approximated 70 bil-

lion dollars of which 62 per cent was located in the United States and 38 per cent abroad.

A review of operations of 33 oil companies in the United States revealed that, to expand and improve facilities, capital expense of \$4,988 million was required in 1956 as against \$19,139 million for the previous five years. The 1956 outlay exceeded the previous record of \$3,095 million established in 1955 by 28 per cent. Working capital increased to \$6,399 million from \$5,871 million. Borrowed and equity capital employed including reinvested earnings as of December 31, 1956, amounted to \$27,593 million, compared with \$24,467 million at the end of 1955. The gross investment made by the 33 oil companies in property, plant and equipment aggregated \$37,531 million at the end of 1956, against which reserves of \$17,730 million were accumulated, indicating a net value of \$19,801 million as against \$17,345 million at the end of 1955.

Despite the substantial outlay for fixed capital assets and related business, investment under current assets at the close of 1956 amounted to \$6,399 million — an increase of \$528 million as compared with 1955. Increased working capital requirements for accounts receivable, of inventories as well as the high level of capital expenditure in 1956 were financed by funds generated by operations supplemented by \$13,333 million from "external sources" — principally the capital markets. Borrowed and equity capital employed in-

cluding reinvestment earnings on December 31, 1956, amounted to \$27,503 million compared with \$24,467 million at the end of 1955. The ratio of debt to total capital used was 15.2 per cent at the close of 1956.

The petroleum industry's growth has been financed principally by ploughing back into business substantial portion of earnings. Debt financing was used only to a minor extent in accordance with the policy of maintaining a moderate debt ratio. Studies on the expenses concerning the development of new sources also point unerringly to the need for constant supply of capital. According to an authoritative estimate by an inter-

national organisation, on an average \$293 will have to be spent in Western Europe for every ton of new oil that may be found. According to one publication, the expenditure by the oil industry in Canada for the next 25 years is computed at an equivalent of \$985 million per annum. Basing their computation on experiences in other parts of the world but arriving at a moderate estimate, one authority gives out that the total investment required by 1957 to ensure self-sufficiency in oil in India will be of the order of \$6,236 million. In other words, \$126 will have to be spent for every ton of new oil production as compared with the estimated cost of \$293 per ton in Western Europe.

The Cotton Textile Industry

A Critical Industry

IT is the sick that need the physician, not those that are whole. At least in this sense, the cotton textile industry in India at the present time merits a high priority. The accumulation of stocks indicated in the most recent returns displays a critical situation in sales, and, as a consequence, a growing crisis in production. Although no specific information is available on this point, it would appear that some marginal units have already closed down temporarily.

Obviously, the health of the cotton textile industry is central to the whole Indian economy. Apart from clothing the Indian people, this industry is one of our main foreign exchange earners, and its health on the domestic front affects its price flexibility in markets abroad. Again, the cloth excise is the largest single item of revenue in the Indian Budget. Without its contribution the Central Budget would be in serious jeopardy. Finally, cloth is always high politics in the country because of the Ambar Charkha philosophy which has its roots not merely in Gandhian doctrine but also in an all-pervading unemployment problem. For all these reasons, the Indian cotton textile industry is one which needs more attention and critical analysis than any other at this time.

In this Blue Supplement an attempt has been made to trace the historical growth of this industry, and to indicate its present standing largely in terms of its present capacity. At the same time the emphasis has been taken off history to concentrate on the current stock situation. An important article contributed by the Economic Intelligence Unit of the Indian Institute of Public Opinion, which has done some research work on the relation between food prices and cloth, indicates that part of the trouble certainly can be placed at the door of unduly high food prices. This is, of course, not the whole story. The relative stagnation in the per capita income in the last two years, and the rise of indirect taxation have also influenced urban demand. Rural demand, largely because of the absence of wants, has not been able to compensate for the fall in the urban sector. Again, as is indicated in another article

the arrival of rayon fabrics has curtailed demand for cotton textiles; in this respect India is, of course, no exception to a general rule all over the world, and particularly in Japan and the United States. The rate of growth of the rayon industry is far higher than that of the cotton textile industry over any significant period of time. The point needs to be highlighted that the cotton textile industry needs to face severe competition now from substitutes relatively unknown in India five years ago.

In the last analysis, the problems of every industry are financial. Unless the financial components are in good heart, new investment will not take place and, therefore, the industry will not grow. The behaviour of textile profits in the recent past is set out in another article which, it is hoped, will indicate that the widely prevalent idea that textile mill profits are still substantial is wholly untrue.

Some remedial action is proposed. There is a case for reduction in cloth prices in order to assist in the lifting of stocks which consumer resistance has now raised. Much the easiest way would be some reduction of the excise duty though this of itself may not be adequate unless the excise duty is substantially cut. This may not be a practical proposition in view of the budgetary complications which would ensue. Perhaps some solution could be found in greater exports. But an export promotion drive of some magnitude will take time. If the year had been a good one, and agricultural income had risen substantially an act of Providence might have provided a solution where human agencies were unsuccessful. But it would appear that even now a policy for food prices might be most of the answer. The stabilisation of food prices emerges as the central recommendation of this Blue Supplement. It is believed that this recommendation will be acceptable in view of the necessity of stabilising food prices in the interest of the economy in general. It would be a corollary for us to stabilise cloth prices at the same time. Thus the two most important elements in the cost of living might be regulated in a single major stroke of policy.

FOREIGN BUSINESS INVESTMENTS
TRADE-WISE

1,000 million yards was to be exported.

It was originally visualised that the mill industry was to reach its targets of cloth and yarn production with the same number of looms—202,901—as in 1955-56 and with 1.57 million additional spindles. Under the cloth policy, announced in June 1956, the number of additional spindles required was raised from 1.57 million to 2.1 million; at the same time, 14,600 automatic looms were to be permitted to be installed on the twin condition that production from such automatic looms would be earmarked for export and the mills installing automatic looms must continue their usual level of exports. Another feature of the new policy was the proposal to convert 15,000 handlooms into powerlooms in 1956-57 and 20,000 in 1957-58.

A broad picture of production, as far as the mill industry is concerned, in the first two years of the second Plan may now be drawn. This is given in the following table:

	Mill Yarn (In '000 lbs.)	Mill Cloth (In '000 Yards)
Monthly average in 1956-57	143,552	451,774
Total production in 1956-57	1,722,623	5,421,290
Monthly average in 1957-58 (till Aug. for yarn & Oct. for cloth)	146,972	439,271
Total production in 1955-56	1,630,000	5,094,000

It may be seen from the above figures that the monthly average of yarn production in the current year has gone up by just 3.4 million lbs. while the monthly average of cloth production has gone down by 12.5 million yards. Without going into the reasons for the decline in cloth production in the current year, it may be pointed out that this trend does not necessarily indicate any equivalent increase in handloom cloth production. That probably handloom cloth production has not increased to any significant extent may also be inferred from the fact that yarn stocks with the mills have steadily increased from 4.3 million lbs. in August 1956 to 27.2 million lbs. in August 1957. Of course the larger part of the increase in yarn stocks may be accounted for by the decline in mill cloth production itself. At the same time there is no reason to believe that the off-take of mill yarn by the handloom industry has increased significantly. In the matter of exports also, it may be noted that cloth exports in

Cotton Textile Exports

AMONG the limited number of industries that figure prominently in our overseas trade, cotton textiles rank quite high. The annual value of the exports of this industry is about Rs. 65-70 crores, or roughly 12 per cent of the total exports of the country's merchandise today. Impressive though this figure is, it has to be remembered that, to provide external finance for the ambitious industrial projects included in the second Five-Year Plan, the foreign exchange earning capacity of our major industries like jute, tea and cotton textiles has to be increased enormously. It is not surprising, therefore, that this industry has been given a very important place both in the second Five-Year Plan and in the Report of the Export Promotion Committee released recently. The Planning Commission has provided a target of 1,000 million yards of cotton textiles a year, which means calling upon the industry to earn foreign exchange resources to the tune of Rs. 375 crores by the end of the current plan period.

1956-57 have been about 730 million yards only and they have maintained, since April 1957, an annual rate somewhat less than the 1956-57 level.

Assuming that the recent decline in mill cloth production is only a temporary phase, one may figure out that the industry could easily reach a level of annual production of 5,500 million yards (including probably the whole of the reserve production quota of 150 million yards under the June 1956 cloth policy) well before the target-year of 1960-61. But the likelihood of the handloom sector reaching its target of 2,200 million yards of cloth (using mill yarn) cannot be taken for granted in view of the fact that the increase in mill yarn production—an increase that would be determined to the extent of 60 per cent by the off-take of mill yarn by the handloom industry—has been only at about a third of the rate required for the planned expansion of the handloom sector under the cloth policy. As for handloom cloth production out of Ambar yarn, the position is too obscure to be guessed; as for powerloom cloth production, the position in recent months is not known. Even if the expected progress is taking place in either case, it would not materially alter the picture that handloom cloth production had not increased significantly since 1956-57. While the decline in mill cloth production is temporary and may be expected to be arrested sooner or later, the rather slow growth of the handloom sector provides ground for the inference that the target laid down for it is not likely to be reached.

Rated Capacity of Mill Industry:		1955-56	1960-61

			to 3,500
Exports			
Cloth (Million yards)	..	873	1,000
Requirements of Raw Cotton	..		
(Million bales)	..	4.9	6.1

But the attainment of this target (of 1,000 million yards) has become an uphill task for the industry by reason of the steady decline in the world market for cotton textiles generally, the increasingly keen competition in the shrinking international market and the rising domestic consumption. As such, a better understanding and appreciation of the difficulties of the organised industry and a realistic textile policy on the part of Government and much greater efforts than heretofore on the part of the industry are needed to fulfil the planners' expectations.

A casual study of the major developments in the international trade in textiles reveals how competition is becoming keener and keener everyday in the world textile markets and how, at the same time, India's competitive position is becoming weaker and weaker all the while. There has also lately been a remarkable shift of the industry to cotton-growing countries, with

the result that the volume of cloth entering the world trade has been shrinking steadily, if not sharply. Lancashire provides a striking example of this. While Lancashire's exports of cotton textiles were as much as 7,000 million yards annually barely a decade ago, today it is exporting hardly 700 million yards per year! While the volume of world trade in textiles is thus shrinking, there are fresh entrants into the field which makes the competition for even the available markets extremely keen. Take, for example, our next-door neighbour, Pakistan. It is said that, within a period of barely twelve months or so, that country has established a number of textile mills (estimated to be as many as 100!) equipped with the most up-to-date and modern machinery. Further, it is also reported that a number of them are vertical (composite) mills, that is mills having all the processes of manufacturing under the same unit, namely, spinning, weaving, bleaching, dyeing, calendering, mercerising etc. These new Pakistan mills are also reported to be manufacturing grey cloth and to have concluded considerable business with the UK, Canada, and South Africa, apart from exporting yarn to places like Hongkong and the UK. The Government of the country too is said to be giving a good deal of assistance to the industry, by way of generous initial depreciation allowances, namely, at the rate of 50 per cent of capital outlay in the first year and 25 per cent in each of the subsequent years. With generous assistance, coupled with enormous profits, most of the textile plants in Pakistan, it is understood, have already completely written off their capital expenditure.

Among other Asian countries, Japan has again acquired a formidable ascendancy over the world markets. This is because 90 per cent of Japan's looms are automatic and all her equipment is modern. Further, labour in Japan is not against innovations, and, as such, the productivity of the Japanese industry compares favourably with that of even the U.S. Various other factors, such as low rate of interest, favourable taxation policy, and a generally helpful economic policy, have all helped her in exporting as much as 40 per cent of her total production.

The following table shows how the international textile market is being shared by different countries and what place Japan occupies therein:-

Country	Unit	1950	1951	1952	1953	1954	1955	1956
	Million							
U.K.	Sq. Yds.	822	864	711	709	637	555	474
U.S.A.	"	563	811	773	628	614	552	519
Japan	"	1104	1096	762	914	1278	1139	1262
Germany	"	126	233	273	232	231	248	207
Italy	"	354	371	170	144	103	101	96
	Million							
India	Yards	1133	780	586	628	834	735	721

Notwithstanding such keen competition from Japan and a number of other countries, it is noteworthy that the Indian cotton textile industry still hopes to attain the target of 1,000 million yards, but only provided it is encouraged to attain efficiency and economy in production. For then and only then can the Indian textile industry attain the requisite competitive level to trade in the overseas market. Stressing this point, the Export Promotion Committee has said: "A considerable part of the equipment is old and outmoded and, consequently, in the highly competitive export market, our cotton

textiles have had a tendency to lose ground. There is, therefore, no doubt, that, unless our industry also benefits from the use of the latest machines and techniques, our cloth will have to struggle to maintain the markets it has now, let alone increasing exports." Realising this doubtless and with a view to assisting the mills to acquire greater competitive power perhaps, the Government of India has sanctioned the installation of 18,000 additional automatic looms to enable the mills to provide 350 million yards of cloth per year for export. But such are the stringent conditions governing these licences (i.e. licences issued to mills for the installation of these looms) that the implementation of the project has been woefully slow. The clearly suggests that these conditions must be relaxed and that our mills also should be actively assisted to modernise their plant and machinery. For, apart from making Indian cloth competitive in foreign markets, this would relieve the industry from the undue cost inflation from which it is suffering today. Hence the reasonableness and relevance of the two-fold plea of the textile industry: (i) to provide them a production target commensurate with the growing cloth requirements by removing the present restrictive measures and (ii) to allow them to modernise the machinery and plant. If these measures are adopted, together with the various fiscal incentives recommended by the D'souza Committee, and if proper market research is conducted abroad, a direction in which a beginning has yet to be made by our mill industry, as Mr. G. D. Birla pointed out the other day, and if our products are produced to suit the exacting tastes and varying preferences of the foreign buyer, there seems to be no reason why the 1,000 million yards target should not be attained yet.

In the light of the foregoing review, it is possible broadly to discuss the immediate prospects of textile exports, say, during the next twelve months. As should be evident from the above analysis, the industry is suffering from several difficulties, such as cost inflation and instability in the local textile market, not to speak of financial stringency, which of course, it is sharing in common with all other organised industries. Of these, the most important factor, according to leading exporters, is the instability in the local markets caused, by and large, by the high excise duty. If the rate of the duty is not reduced, it is feared, the 1957-58 reports of the cotton mills would present a very disquieting picture. It is high time, therefore, that the Government came to the rescue of the industry by providing ample incentives by way of fiscal and other concessions.

In spite of all these, however, it is noteworthy, some textile circles still feel that the present rate of 750 to 800 million yards would be more or less maintained in the coming year also, in view of all the export promotion measures that are being taken. Given a continuance of this assistance from the State and the wholehearted co-operation of the industry by way of organised research in consumer tastes, maintenance of high quality, scientific standardisation, attractive packing, etc., textile exports should not fall very much below, if these may not equal or exceed, the expectations of the Planning Commission. The most encouraging feature about of our textile exports is that the interests concerned honestly feel that the attainment of the 1,000 million yards target is not impossible.

Must the Excise Duty be Reduced?

IT is unfortunate that the Government of India has decided not to reduce the excise duty on mill cloth. There are many good reasons why it should do so. When the levy was increased in September, 1956, Government made it abundantly clear that it was not

intended as a revenue measure. The duty was enhanced in order to use it as a fiscal brake on consumption which was showing positive signs of outstripping production. The measure was also intended to enable Government to take a share in the so-called

abounding prosperity which the mills and trade were believed to be enjoying.

Thus, the excise duty was raised to meet a particular situation. In view of the vast changes that have taken place during the last fourteen months, it is for serious consideration whether the duty should not be scaled down to suit the altered circumstances. Today there is no dearth of cloth in the country, and the fact that the mills are burdened with large accumulations provides the most effective safeguard against the recurrence of scarcity conditions. Thanks to the relatively low rate of cloth consumption and the sluggish movement of goods to the market, the producers are no longer in a position to make large profits for the Government to claim a share in them. In fact, the sorry plight of many mill companies will be revealed when their balance sheets for the year 1957 become available.

The seriousness of the stock position is best illustrated by the following figures for the month of October since 1949:

Year	Unsold	Sold but delivery not taken	Total
1949	402,653	N.A.	402,653
1950	188,252	"	188,252
1951	320,187	"	320,187
1952	304,976	"	304,976
1953	429,189	115,380	544,569
1954	282,934	133,285	416,219
1955	234,494	N.A.	234,494
1956	257,788	223,039	480,827
1957	391,005	214,521	605,526

The fact that even the great 'Puja' and 'Diwali' festivals, when people are generally inclined to spend freely, have failed to make any appreciable impression on cloth accumulations provides an unmistakable warning against treating the present situation as normal. The need for immediate and effective action to facilitate the flow of goods in a bigger volume will be better appreciated if adequate attention is paid to the monthly figures of unsold cloth lying with mills in the current year:-

(In bales of 1,500 yards)

January	274,596
February	287,486
March	300,238
April	292,154
May	261,308
June	297,277
July	319,062
August	338,585
September	356,114
October	391,005

Caught between the upper stone of high costs and the nether stone of credit squeeze, the industry can ill afford to hold indefinitely such large stocks, which, in terms of money, may be roughly valued at about Rs. 40 crores.

Thus, by any standard of appraisal, the present situation is really bad and is, in fact, worse than what it was in 1953, when Government showed commendable promptitude in remedying it. In his present predicament, the consumer is not in a position to buy as much cloth as he could a little while ago, due to the sharp increase in the cost of living. This is borne out by the index number of wholesale prices of food articles which was 89.4 in January, 1956. It rose to 106.9 in November of that year and, after a slight decline for some months, touched as high a level as 112.1 in August, 1957, although it has come down somewhat in the subsequent

months. More recently, however, the trend seems to have reversed again.

A vivid idea of the extent of the increase in food prices can be obtained by a study of the Consumer Price Index Number for the Working Class in the City of Bombay. Rice constitutes an important item of food of the Bombay worker and thus holds the key to the food index. The following comparative figures relating to the expenditure on rice are significant:

	Index No. for rice	Price per Seer	Requirement of rice per month per person	Total value
August 1956	600	0.47	3 seers	Rs. 3-76nP.
August 1957	658	0.72	3 "	" 5-76nP.

The inevitable consequence of the sharp increase in the prices of food articles and of other essential consumer goods is that the consumer is compelled to spend less on cloth, although it is also an article of necessity. Indeed, he will be hard put to it to maintain even the present low level of consumption, unless both cloth and other simple goods of life are made available to him at relatively cheaper prices.

It has often been suggested that the most effective means of resolving the paradox of cloth hunger in the midst of plenty is to reduce prices. The producers fully realise that India is essentially a price market and have accordingly brought down the prices of their manufactures, in spite of the increase in the cost of production. Last August, Government themselves conceded in Parliament that "on an average, the present prices are about 5 per cent lesser than in September, 1956". This, however, does not present the whole picture. In the case of a number of representative varieties of piecegoods, the prices are, in fact, lower than those that ruled in December, 1955!

In a period of cost inflation, when the price of every article that goes into the production of cloth and yarn has gone up, further substantial reductions in ex-mill prices are impracticable. Cotton and wages largely govern the cost structure of the industry, and both these items have become most expensive. The following table relating to cotton prices is self-explanatory:

Price per candy of 784 lbs.				
Type of cotton	1956		1957	
	April	September	April	September
1. Jarilla	750	775	750	813
2. Kalagin	725	770	770	783
3. Surat	1,065	1,020	1,071	1,075

Similarly, the industry is faced with the problem of wage inflation. To illustrate, the Bombay cotton mills, which were paying Rs. 69-14-0 in 1956 as dearness allowance to their workers, paid Rs. 76-7-0 in the corresponding month of this year. The wage bill of the Bombay mill industry, which has on its rolls some 210,000 workers, has thus increased by as much as Rs. 1.65 crores per annum!

It is true that mills can find relief from the burden of unsold cloth by reducing the number of shifts or by ceasing to work to their full capacity. But reduction of output is a retrograde step and is bad for two reasons: First, it would result in unemployment at a

time when the greatest need of the nation is to absorb the maximum number of persons into productive activity; secondly, since the industry is the mainstay of a large number of enterprises and occupations, reduction of production by mills will have a far-reaching effect on a large sector of the country's economy.

These considerations would, however, be of little avail in curtailing mill production, if no effective steps are taken to disarm consumer resistance. According to a recent official statement in Parliament, fourteen cotton mills have gone out of production since last year, throwing more than 15,000 workers out of employment. It is imperative that the situation should not be allowed to get worse. Apart from the fact that widespread unemployment is most undesirable and dangerous, the industry cannot afford to pay heavy retrenchment compensation, as such would undoubtedly undermine the financial position of many units.

All these considerations lead to the inevitable conclusion that the excise duty on cloth should be substantially scaled down. The circumstances in which it

was increased do not exist any longer. Apart from ministerial pronouncements, the statement of objects and reasons of the Bill that sought to enhance the levy contained the assurance that, "if prices indicate a downward trend, necessary adjustments will be made in the excise duty". What with the unprecedented accumulation of cloth and the stiff consumer resistance, this is the most appropriate time for fulfilling this promise. It is a solemn pledge given both to the Parliament and to the people of the country and its redemption cannot be delayed for any reason, however valid it may appear to be.

It is true that Government are in great need of money for financing the second Five-Year Plan, but the excise was not raised last year for this purpose. In any case, it will not be possible to collect the enormous sum of Rs. 80 crores per annum from this source, if the turnover of the industry is reduced due to the present adverse circumstances. There is, therefore, a sound case for a downward revision of the duty and for keeping it at a reasonable level at least till the present food crisis and the inflationary pressure are overcome.

Current Profits in the Textile Industry

THE following conclusions have been arrived at after a careful study of the results of working of some 28 cotton mills from different parts of the country. Of these, the largest number of companies are those which completed their accounting periods on December 31, 1956, the number precisely being 21; of the remaining 7 mills, one mill closed its accounting period on February 28, 1957, 4 on March 31, 1957, and 2 on June 30, 1957.

It is needless to add that the last two balance sheets reflect the effects of the enhanced excise duty for full nine months, but the others also reflect the effect in varying degrees.

* Average number of spindles at work daily.

† Average number of looms at work daily.

The sorry state of working of the cotton mill industry is strikingly brought out from the fact that, out of these 28 mills studied, there were hardly half a dozen mills which made any provision towards general reserves. On the contrary, nearly as many mills were obliged to transfer funds from their accrued reserves or dividend equalisation funds in order not to pass dividends. It would appear hardly feasible for the mill industry even to maintain the dividends in future years if the existing state of affairs should continue, as the draft from equalisation or dividend and other reserves cannot last indefinitely. Even as it is, it is broadly correct to describe the position in the following words taken out from the Directors' Report of an established and admittedly well managed company:

"At the commencement of the year under review (i.e. the year 1956), textile trading conditions were such that, although increases in production costs and rising prices of raw materials were prominent, an optimistic view could be taken for the immediate future. A serious deterrent, however, was presented by increases in Excise Duty on cloth which took effect from

1st March, 1956 and a further heavy incidence from 1st September, 1956, which, notwithstanding the Company's—the word 'industry's may well be substituted here—willingness to accept a part of the increase on their own account led to widespread disruption of trade and rapid lowering of prices".

According to another Directors' Report of an equally well established company, conditions since 1st September, 1956 have "deteriorated to such an extent that profit margins have been practically wiped off and sales of cloth even at prices below cost have become very difficult".

But perhaps the most eloquent testimony to the deterioration in the textile industry is provided by the comparison of stocks with mills at the beginning of their respective previous accounting periods and those at the end of the latest completed accounting period. In not even one single instance, do the latest year's stock figures register a decline, as compared with those at the end of the previous accounting period!

The table on p. vii gives a synoptic review of the results of working of the 28 cotton mills in question:

Food Grain Prices and Cloth Sales

(Contributed by the Economic Intelligence Unit of the Indian Institute of Public Opinion).

ONE of the most interesting, and perhaps most relevant issues, in cloth consumption is concerned with offtake of cloth when food prices change substantially. The dominant character of cloth consumption in the Indian Union is that per capita consumption in towns is more than double per capita consumption in rural areas. The average consumption of about 18 yards per head is composed of consumption of over 25 yards per head in urban areas against less than 10 yards per head in rural areas. Because of this strange dichotomy in the pattern of consumption, one would expect a rise in food prices to depress cloth sales in urban areas with no fully compensating factor in the rural areas where the larger income is received. This, in fact, has been the case. The Economic Intelligence Unit of the Indian Institute of Public Opinion has approached the problem of correlation between food prices and cloth sales both

over a longish period of 5 years from January 1948 to December 1953 and again from September 1955 to March 1957. The latter terminal has been chosen because with a twelve-month moving average the last six months are, so to speak, subsumed in the average. The table below shows the relation of cotton textile sales and food prices when adjustments are made for seasonal factors in both cases by using a twelve-month moving average.

If a regression equation is fitted to the series of index numbers in both cases, a relation of the order $Y = 0.44 X + 144.3$ is obtained where Y is the index of the cotton cloth sales, and X an index of food prices. The correlation coefficient is of the order of -0.78 and must be deemed fairly good in relation where obviously many other factors such as changes in per capita national income, the distribution of incomes, and competing

elements in sales are necessarily present. The regression equation would suggest that a ten per cent rise in food prices would lead to a four per cent fall in cloth sales.

The graph on page x shows the position in the longer period and is, perhaps, even more suggestive. It will be seen that when food prices have stayed high, particularly in 1950 and 1951 seasonally adjusted cloth sales have fallen and that with food prices low between 1952 and 1953, cloth sales were correspondingly high. There is thus a prima facie indication that the relation between cloth sales and food prices is reciprocal, and that a dominant element in the making of cloth sales over the country in general is the level of food prices.

If this proposition is accepted, namely, that because the dominance of cloth sales in urban areas is substantial, the rise in food prices soon affects cloth sales over the country as a whole, it will be seen that the policy which makes for stabilisation of food prices at reasonable levels is one which also makes for stabilisation of cloth sales. The seasonal element will, of course, apply in both cases and the graph on page x shows how violent these seasonal fluctuations can be. But if one looks at the seasonally adjusted figures, the picture is far less confusing. The argument described has obviously great significance for the stabilisation of the cost of living as a whole. It implies that if one element is controlled, the other is automatically controlled.

The Art Silk Industry

THE problem of growing accumulation of cloth stocks does not appear to be confined to cotton cloth alone. The local mills which are engaged in manufacturing cloth from art silk yarn also have been complaining about the poor offtake of art silk cloth and, as a matter of fact, some of them have been obliged to close down shifts in view of the steadily declining offtake of cloth.

The main reason for this deterioration in the art silk industry and the trade is said to be the liberal rayon yarn import policy of the Government of India. It may be noted here that, in the year 1956-57, when the indigenous industry had made considerable progress, about 60 million pounds of rayon yarn were imported, against only 22 million pounds in 1952-53. During the ten-month period ended October, 1957, imports of rayon yarn into the Bombay Port alone aggregated 30.7 million pounds and, on this basis, it is estimated that the whole year's import into the Bombay Port alone would amount to at least 40 million pounds. If we add to this the total indigenous production of yarn of 30 million pounds a year, we can understand the reason for the present glut both in the art silk yarn and in the art silk cloth markets. The total annual consumption demand for art silk yarn in the country is put at no more than 50 million pounds, or, to express it in terms of cloth, 250 million yards. As against this, in the two years 1956 and 1957, the total availability (i.e. imports plus indigenous production) of yarn could be put at around 175 million pounds or an average of 87.5 million pounds of yarn, or 445.5 million yards of cloth. It is not surprising, therefore, that, with such a glut, the offtake of art silk cloth should have petered down.

It may be asked why, in spite of the present foreign exchange difficulty, the Government of India has not yet deemed it fit to ban all imports of art silk yarn into the country. It is not that nothing has been done, but what has been done so far is not adequate. There is either restriction or complete ban on imports of certain deniers of art silk yarn, but the effects of such a policy are still not being fully felt for the reason that the very liberal licences for imports given in the past continue to

be revalidated and, in some cases, while revalidating, the importers are even allowed to convert their licences into the restricted or banned categories of rayon yarn. This necessarily leads to the increase in clothing supplies of the very types of yarn manufactured by the indigenous industry which is sought to be protected by the Government of India.

Another difficulty that the rayon manufacturing interests would appear to be experiencing lately is the still not inconsiderable abuse of certain actual users who are alleged to be freely hawking the yarn imported by them. While a certain amount of exchange of one type of yarn for another type of yarn as between two importers (actual users) is understandable, as, for instance, when importers come to an understanding and arrange for imports of a particular type individually in sufficiently large scales to get the benefit of imports in economic quantities, it is difficult to appreciate the somewhat indiscriminate sales of imported yarn that are reported to be prevalent today.

As if these troubles were not enough, the industry is now further confronted with the repercussions of the Government's latest decision to give licences up to 100% of the value to exporters of rayon cloth. This is ostensibly justified on the ground that it will lead to more exports. But the question is whether, on balance, this would lead to any extra acquisition of foreign exchange by the country. This does not appear to be the case. While there is thus no distinct advantage on the foreign exchange front, it is possible that the indigenous manufacturing industry would be adversely affected by imports of rayon yarn under the scheme. For to the extent of such imports there must necessarily be a reduction in the offtake of the indigenous rayon yarn.

Surely this is by no means a rosy picture of the state of affairs in India's art silk industry. This industry has saved the country considerable drain in foreign exchange. It is to be hoped, therefore, that the Union Commerce and Industry Ministry would look into the matter and take some prompt and remedial action to restore sound health to this new indigenous industry.
