A Policy for Prices

IN a week which includes the dramatic dismissal of Messrs. Malenkov, Kaganovich and Molotov from high office in the USSR and, at a less dramatic level, the proceedings of the Commonwealth Conference in London, one might perhaps

be tempted to treat the spotlight as residing outside India. This, however, would be an error since it is clear that our domestic economic crisis, whatever happens abroad, must for the next few months absorb all our anxious care.

This week the Reserve Bank of India has made it clear that its monetary policy is no different from what it has always been in times of uncomfortable price rises—an almost blanket directive to restrict bank credit over the whole economic system. *The Eastern Economist* believes that the application of this policy as a remedy for the current inflationary situation is fraught with grave danger to production and, therefore, to prices, particularly if it is—as it always has been—operated in a mechanical and indiscriminate manner. It is essential that the diagnosis of the price situation by the Ministry of Finance and the Reserve Bank of India should be subject to the most careful scrutiny before their policy is applied.

There can be no doubt that the current situation is an inflationary one. There is urgent need for a policy which will control further rises in prices and will assist, if possible, in a fall. This policy needs to be consistent with the hard core of the Plan, and, therefore, has a limitation imposed on it by a minimum volume of developmental expenditure, a substantial amount of which must necessarily be deficit financed over the rest of the year. In other words, the Finance Ministry and the Reserve Bank of India have the task of holding prices even while they deficit finance to an extent probably equal to the actual figure of 1956-57 and this means—however much they may choose to disguise the fact—that they are denied the reduction of total money supply as an element in price policy. All they seem to be allowed are marginal shifts in the direction of credit, not a change in volume. And these marginal shifts cannot hold prices for one strong reason amongst others—namely that these marginal adjustments cannot stop the pressure on the food grain and industrial raw material groups. Can the restriction of credit be an instrument in the reduction of the price level by operation exclusively on the money side of the equation? It is obvious even if one accepts, in its crudest form, the quantity theory of money that a purely monetary approach to the current inflationary situation is doomed to failure because the volume of total money supply does not admit of reduction.

The most cursory examination of Indian price movements in the last fifteen months will show that in the monetised sector of industry additional money supply has not been the cause of any rise in prices. The main rise in prices has been in the food grain group and in the semi-manufactured sector, which reflects the rise in prices of industrial raw materials. To control the volume of money in the manufacturing sector, while leaving the prices of food grains and industrial raw materials, which are not amenable to monetary restrictions, alone is to strain at a gnat and swallow a camel. And, indeed, any restriction in the consumer goods industries might add to inflation by reason of the fact that the fall in consumer goods production might well be more steep than the fall in money supply thereby giving rise not to a deflationary, but an inflationary, impulse. It is obvious on the record that the consumer goods section of Indian industry is now so heavily in need of banking finance that any reduction of bank advances to this section will imply a fall in production. However much the Reserve Bank of India, therefore, might desire stricter credit control in general, it cannot with-

out danger to production restrict credit in these industries. And if it should restrict production in producer goods industries, it might assist the inflationary situation, but to that extent it would also defeat the Plan. One wonders, therefore, what can be accomplished by the restriction of credit in organised industry at this moment.

Particular force attaches to the argument that consumer goods production should not be injured because of the strong bias that exists in the second Five-Year Plan against consumer goods production in competition with producer goods industries. It would appear that consumer goods production has risen only thirty per cent since 1951 while producer goods have risen hundred per cent in terms of an index with base 1946=100. Undoubtedly one of the factors in current price rises is this bias in the structure of Indian production. If a credit squeeze is applied on a blanket basis, it is likely that it will extend, rather than reduce, the bias because most of the producer goods are being supplied against Government payments whilst consumer goods will be starved of current finance. In other words, it is likely that whether the Reserve Bank of India intends this or not, a general restriction of credit will add to inflationary trends.

Obviously a policy for prices must be conceived on the basis of supplies or the physical side of agricultural supplies and not on the monetary side of the equation. *The Eastern Economist* has argued for many months that the first step of a price policy should be clear, namely, that additional imports under P.L. 480 should be sold at a figure about ten per cent below the market price thereby instituting a deflationary movement which might reduce the general index between three to five per cent. Incidentally, the sale of these commodities would provide the Government with much-needed rupee finance thereby also reducing the strictly deficit financing element in current outlays. The withdrawal of this finance is far much more likely to be of success in holding prices than restriction of credit, which cannot conceivably be of anything but fractional dimensions.

The need for a clear understanding of the current economic situation is not less urgent by reason of the fact that P.L. 480 loans admit of our enhancing food supplies in the short period. The need for higher consumer production is now severely underlined by the drastic import control which has been instituted. The Government of India cannot on the one hand call for enhanced production to fill the gap in imports and at the same time restrict credit for consumer goods making it impossible for the gap to be so filled. This, in its barest terms, is the policy the Reserve Bank of India is now pursuing. It is surely time for the Ministry of Commerce and Industry and the Reserve Bank of India to take counsel together as to the manner in which production can assist in the regulation of prices at this time. The confused counsels which are now in operation arise from the fact that the obvious remedy, which is the sale of imported food grains at substantially reduced prices, is not, for political or other reasons, being admitted as the first step in the cutting of the Gordian Knot. If food grain prices are firmly turned back, everything else will fall into line.

The Commonwealth Conference

THOUGH a Conference of the Commonwealth Prime Ministers is now a routine matter, special significance attaches to its current session. The Conference has come at a time when the Commonwealth has passed through the crisis of Suez and the aftermath; both in the world at large and inside the Commonwealth it is one of uneasy calm. India is probably more involved in this Conference than in any other. And, indeed, our link itself has been questioned. In India, which made history by adhering to the Commonwealth without owing allegiance to the British Crown, there are persistent demands for what amounts to a dissolution of the Commonwealth; the demand for withdrawal from it is no more limited to the Communists and fellow-travellers. Among advocates of that cause are men like Mr. C. Rajagopalachari whose influence is not to be exaggerated, because of great offices filled. The opposition to India's continuance in the Commonwealth has sprung from the Suez and Kashmir; but it is below the surface an aim of many misguided politicians who think they know, but do not, the Commonwealth framework. It is to the credit of Prime Minister Nehru, who is curiously enough being maligned and misrepresented by a section of the British Press, that he sees far more clearly and wisely India's long-term interests in this matter. Apart from Indo-Pakistan relations not, it seems, getting any better, there are other indications of *malaise*. The absence of Mr. Bandaranaike of Ceylon, Mr. Strijdom of South Africa and Mr. Holland of New Zealand also is a reflection on the state of political health of the Commonwealth. The Ceylon Premier has not been able to attend the Conference because of the imminent threat of an agitation by the Tamil-speaking section of his countrymen who are of Indian origin. The South African Premier has abstained himself because, being a racist, he himself does not want to sit at the same table with an African, Dr. Nkrumah, the Prime Minister of the youngest member of the Commonwealth, Ghana. The New Zealand Premier did not seem to think this Conference important enough for his personal presence.

This does not, of course, mean that the Commonwealth is losing ground. In spite of differences, the Commonwealth countries are bound together with what Mr. Nehru has called "imponderable values" and with "some commonness of thinking or ideals." Behind the scenes perhaps the British system of representative Government and the British concept of the rule of law are common things binding the Commonwealth together. Doubtless, there are some countries which have yet to go a long way on the path of a democratic government. Pakistan, for instance, has had no popular elections so far. In South Africa, the majority of the people, the Africans, are denied franchise. But the legal system even in those countries is not the plaything of the executive — and this is a hopeful sign. Another hopeful sign is the changing nature of the Commonwealth. It is no longer a British Commonwealth as it was some years ago. The White members of the Commonwealth are becoming a minority. When the Prime Ministers meet again some time next year, Malaya will have become a Dominion and five of the ten members will be non-Whites. In subsequent years the balance is bound to be tilted further with representatives from Nigeria and possibly from the Caribbean.

The present meeting may thus be the last to have a White majority. This in itself is a historic event and, in the eyes of Asians, will greatly improve the Commonwealth bond.

The growing racial variety of the Commonwealth Conference and the uninhibited exchange of ideas made possible by the wide environment and background of its membership are its further merit. As the Conference is not bound down by any specific agenda and as its proceedings are not open to the Press, it becomes a forum for free and frank discussion in a spirit of understanding and sympathy. More important, perhaps, than this "open diplomacy" is the personal contact between the various Prime Ministers which often results in removing misunderstandings and suspicions and in creating an atmosphere free from rancour and animosity. Such an atmosphere is essential for a better appreciation of the policies of different Commonwealth countries. Mr. Nehru, for instance, has met Dr. Nkrumah, Prime Minister of Ghana, and Mr. John Diefenbaker, the Canadian Premier, for the first time, and, if newspaper reports are to be credited, with great and immediate friendship in both cases. Personal contact with the former is important because Dr. Nkrumah is the symbol of resurgent Africa, a development of unbounded significance for the world. Equally important, if not more, are India's relations with Canada which is becoming increasingly important in international affairs due to its powerful economy and its position as a bridge between the United States and Britain.

Press reports indicate that subjects like the European Common Market, disarmament, the Middle East and the sterling balances have been discussed. Each one of the issues, in one form or another, concerns one or more countries of the Commonwealth. The European Common Market, for instance, aiming as it does at lowering tariffs and customs between the various countries of Western Europe, affects the system of preferential treatment obtaining in the Commonwealth. On the question of disarmament, too, the Commonwealth countries are likely to profit from the fact that Britain and Canada, which are represented on the United Nations Disarmament Sub-Committee, currently in session in London, will acquaint the Conference with the latest developments on this thorny problem. The question of the Middle East is important not only to Britain for its essential oil supplies but also to India and Pakistan because if it falls into the clutches of a hostile power, their own independent existence may be threatened.

In addition there is the problem of finding adequate funds for financing the rapidly expanding economies of some of the underdeveloped countries of the Commonwealth. This issue is as important, at least for India, as any other. The least that is to be expected is that discussion of the subject will facilitate India's endeavour to solve her exacting problem of finding the money for her ambitious schemes of economic development. First reports are to the effect that Commonwealth countries, with the exception of Pakistan, have given a friendly hearing to our difficulties. There has been talk — still in the preliminary stage — of a substantial sterling loan. These talks will certainly gain force from the Conference's prevailing mood.

The State of the World

DYNAMISM in the world economy was displayed for still another year in succession and expansion at least made one more stride in 1956. The phase of continuous development was launched at varying periods in different countries, but, broadly, expansion for the third consecutive year in North America and for the fourth year in Western Europe were the major contributory factors in the process. Its distinctive feature lies in the fact that it demonstrates for the first time after World War II expansion of a basically peace-time character.

This assessment at which the United Nations *World Economic Survey*, 1956, has arrived must, however, be interpreted in the relative context. Investment activity in industry constituted the main dynamic force in this expansion. But it could not retain the full vigour of the earlier years of the period. There was a marked decline in the rate of expansion of industrial production which was due to a loss of economic momentum in the sphere of private as well as government policy-making. The rate of increase in industrial production in Western Europe rose to 4 per cent as against 9 per cent in 1955, while in the United States it reached the level of 3 per cent, or approximately one-third of the rate in 1955. Japan constituted the solitary exception where growth of industrial output attained a rate of 20 per cent last year. What may follow will be a cause for some concern. The prospect for the current year is less assuring, as the Survey chooses to put it in negative terms, as one of probably no acceleration nor of any serious recession. It says: "Economic visibility, never of more than limited range, has been disturbingly lower in 1957; from the peaks that have been reached the economic landscape has seemed more than usually veiled".

The policy of economic imbalance which faces India today is not peculiar to under-developed countries alone. In varying degrees it prevails in some of the industrially advanced countries too, although not for identical reasons. Industrial countries were called upon to meet pressures of rising prices and rising wages on a higher scale than in the previous year and the challenge of cost inflation assumed larger dimensions. Economic expansion with internal stability became difficult of achievement. Industrial economies are in constant need to pursue a course of expansion if they are to retain overall balance, while underdeveloped economies have understandably grown impatient in the post-war period for accelerated growth under pressure of mass consciousness. Simultaneous pressures from practically all countries on resources for development, without strict regard to proper balance between import capacity and import demand, has inevitably produced growing strains on international balance.

Two potent factors, however, stand out in this phase of economic stress as forces that have a capacity to help restore stability in balance in the larger global context. The United States enjoys an unrivalled position and wields unparalleled influence on the economies of other countries outside the communist orbit. For all these countries external conditions are of great significance for their foreign balance and developments in the United States constitute the core of those conditions. It is a source of considerable strength to world economy that fluctuations in the United

States economy have been insignificant in the post-war period. Western Europe has regained its capacity in a sufficient measure to take care of its external account on its own — a development which is of vital importance to underdeveloped countries in their search for assistance to narrow down the gap in their external resources for expansion. This position, however, holds good from a broad angle and is subject to one qualification. While Western Europe has achieved considerable viability in its external balance, its equilibrium in the dollar account has not been placed on the plane of normal commercial goods and services. It contains an abnormal element of a non-commercial character since the United States military expenditure abroad forms an important component of the dollar account. This is a transitional factor, which, in the light of the outlook for international security, is unlikely to come to abrupt cessation.

The underdeveloped countries have had varying impacts of external forces on their export products. India belongs to that category, including Egypt and Pakistan, which, owing to the changing pattern of world demand or changing direction of trade, find something like a condition of stagnation for some of their staple exports. Product of domestic consumption also added to the problem of balance of several of the backward countries. Inflexibility of home produced supplies of food has been a recurring headache. India ranks along with Burma, Ceylon, Malaya and Turkey in a group where investment rose much faster than consumption and total product. Nevertheless, inadequacy or ineffectiveness of monetary and fiscal policy, which is a common feature of underdeveloped economies, was responsible for the inability to prevent imbalance in growth. Since higher investment cannot correspondingly be offset by increased domestic production of consumer goods, augmented by imports, the plans of faster economic expansion carry real risks of inflation which in fact has emerged in recent months. The major challenge to the aspirations of backward economies is posed by the marked divergence between import capacity generated by exports and import demand.

India's current crisis of external payment was not germane to this Survey. Nor was it the function of an objective analysis to recommend policies by way of solution. Nevertheless, possible sources from which external assistance can be procured can be spotted. Russia and Czechoslovakia which are mentioned as potential communist sources of capital goods showed different trends in expansion. In 1956 their rate of expansion of these goods was marked by a "significant slackening," while output of consumer goods rose faster. The same trends are planned for the near future. The decline in productivity in these countries implies higher costs. In terms of value, the total share of the communist bloc in world trade was merely 3 per cent, despite a rise last year. The truth of the situation is that international payments present a hard problem. The only country from which assistance on a substantial scale can be obtained by India is the United States which maintains a healthy position in this respect. West Germany and also to some extent the United Kingdom hold out reasonable hope for coming to India's aid. The range of assistance from all these sources is to be judged within the limits of competing claims.

THE WEEK'S NOTES

REVISION OF LAND TAXATION

PROGRESSIVE TAXATION of agricultural income to replace completely the present system of land revenue assessment in the States has always been one of the major planks in the Congress platform. It is appropriate, therefore, that the Union Finance Minister has just come out strongly in its favour. His further suggestion is that owners of small holdings, whose incomes would be below the exemption-limit for agricultural income-tax, should be subjected only to a light levy of quit rent. Quite apart from the soundness or otherwise of these suggestions, there is the question why Mr. T. T. Krishnamachari has chosen to revive interest so suddenly in a possible country-wide system of agricultural income-taxation. Perhaps the Finance Minister who has set his heart on reorganising the country's tax structure is thinking in terms of a uniform exemption-limit for taxation of agricultural income at the same level (Rs. 3,000) as under the General Income-tax and in terms of an aggregation of agricultural and non-agricultural incomes for consolidated assessment. Such aggregation of incomes in the case of a large number of assesseees would mean substantially more tax-yield than if their agricultural and non-agricultural incomes were assessed to tax separately. The constitutional step of State legislatures empowering the Union Government to tax agricultural income should present no difficulty inasmuch as that portion, arising from agricultural income, of the total tax-yield would have to be handed over to the States concerned.

If this is the idea of the Finance Minister, it has to be considered whether a general system of agricultural income-taxation with a possible exemption-limit of Rs. 3,000 would yield more tax revenue than the present land revenue of about Rs. 90 crores (including the yield from agricultural income-taxes in some States in addition to their land revenue) in the country as a whole. This is doubtful because the bigger landholdings are either split up by partition or otherwise under the standing threat of land ceilings or are to be broken up under legislation for such ceilings. If, on the other hand, the exemption-limit were to be fixed at, say, Rs. 1,500, it would mean that a very large number of assesseees would have to be dealt with. These rural assesseees would have to maintain accounts with meticulous care. As most of them would not be able to do so, the decisions of the assessing authorities might have to be arbitrary in very many cases. Such arbitrary decisions, in their turn, would naturally be resented by agricultural assesseees who would be largely medium or small landholders.

The likely difficulties in respect of cultivation accounts and of assessment are such that they cannot be lightly ignored. Even supposing these difficulties can be overcome, a low exemption limit of even Rs. 1,500 would mean that in the prevailing pattern of distribution of land anything up to half of the present land revenue would be lost to the State exchequers. Even the exemption of landowners paying land revenue of less than Rs. 10 apiece (representing a net agricultural income of anything from Rs. 150 to Rs. 200 at current prices) would mean that up to a fifth or a fourth of the present land revenue would be lost. In the circumstances it is unlikely that an agricultural income-tax with the same exemption limit (Rs. 3,000) and slab-rates as under the General Income-Tax would exceed the present land revenue income in the entire country or at least just make up for its loss. If an agricultural income-tax cannot turn out to be a mine of revenue, the only alternative is to keep intact the ryotwari basis of assessment and revise the rates upwards in resettlements so as to increase revenue to at least 12½ per cent of the current net income from land, if not to the full half-net level of original ryotwari assessment. After

all, ryotwari assessment is not materially different from agricultural income-tax because it is also related to net income from land. It has the added merit that it is related to the soil qualities of different lands and has stood the test of time.

HOLD AN INQUIRY

THE PUNJAB GOVERNMENT claims to have finally broken the gold smuggling ring that had emerged in the past ten years on both sides of the India-West Pakistan border. This is the result, we are assured, of intensive police operations against the alleged smugglers. Nearly 120 persons, among them several rich business men, landlords and policemen, have so far been arrested in Amritsar district alone. Many more have been forced to seek cover. The police had sometimes to employ as many as 200 constables in its raids on centres of smuggling. The operations ranged from city to village on the Indo-Pakistan border. Now that the smugglers' ring is claimed to have been broken in Amritsar, the police has extended its operations to the two remaining border districts of Gurdaspur and Fazfarpur.

This story gets a truly international flavour from reports from Karachi to the effect that police has recovered papers, letters and documents revealing illegal trade in gold, to the order of over Rs. 10,000,000. The Persian Gulf countries have been mentioned as the source of gold smuggling for a number of years. The gold smuggled into Pakistan was obviously smuggled in turn to India. During the last six months alone India's customs authorities have confiscated from visitors from Pakistan gold worth Rs. 10,000,000. It is also generally known that gold was being smuggled into India from Pakistan at the rate of 10,000 tolas per day. Because of this unhindered smuggling, gold was till recently being freely sold in the black market at Rs. 10 to Rs. 15 less than its open market price, which too registered a fall of Rs. 5.

Doubtless, the Government deserves credit for scaring away the smugglers for the time being. But there is obviously need for an impartial inquiry, not only because of the magnitude and nature of smuggling, but also because of allegations of partisanship by several high-placed Government officials. That soas and relations of some of the Punjab Ministers are also alleged to have been participants in these nefarious activities lends urgency to this suggestion.

AN ESTIMATES COMMITTEE'S FINDINGS

IT IS difficult to exaggerate the value of the periodical reports of Parliament's Estimates and Public Accounts Committees even in normal circumstances. But they assume still greater importance in the current moves for austerity and economy in administration. Government have recently set up special economy units in different Ministries to suggest ways and means of curtailing expenditure. The success of their performance will obviously depend on the co-operation extended by the various Ministries. However, the reports of Parliament's standing committees abounding in instances of waste and extravagance should serve as valuable guides in any steps taken to effect economy and plug every source of wastage and infructuous expenditure.

An increase of Rs. 50 crores is contemplated over expenditure on defence alone in the current year and consistent with the country's security it must be possible to curtail expenditure even by this Ministry in several directions. For example, the 68th report of the Estimates Committee for 1956-57 dealing with ordnance factories especially in regard to stores, plant and machinery and production, shows how if one goes meticulous-

ly into details, substantial savings can be made in several ways with much benefit to the Exchequer. The Committee has made a number of useful suggestions and one need not go into all of them here. But a few will, however, bear mention if only to show how the Government machinery operates. For example, the Committee, while referring to the delay in the procurement of stores, points out how a Liaison Officer was recently posted in Delhi with the Director-General, Supplies and Disposals, to effect improvement in this direction. It expresses surprise that when it is the clear function of the D. G. S. & D. to arrange for purchases with as much expedition as possible, a Liaison Officer should be appointed to expedite procurement. Similarly, the Committee is concerned that the staff employed on the care and custody of stores should be on the high side when it finds there is scope for reduction in stores keeping establishment even on the basis of present holdings. These are just instances of the indiscriminate multiplication of Government jobs which came in for severe criticism recently in Parliament. This is an aspect to which Government should turn its immediate attention if its professions with regard to effecting economy are to carry conviction with the public.

The Committee's findings will regard to surplus stores are also revealing. The surplus stores with ordnance factories which have accumulated was of the value of Rs. 625 lakhs as on April 1, 1956, and this, it points out, works out to about 16 per cent of the total stockholdings on that date. The report goes on, "Since the holdings of surpluses involve considerable expenditure in the shape of store-keeping charges and deterioration of stores due to prolonged storage, expeditious action may be taken for the declaration and disposal of the surpluses after ensuring that they are really surplus to the requirements." This is yet another direction where prompt action by Government is necessary. An instance of unconscionable delay that the report highlights is with regard to the provision for new plant and machinery. The Committee records that in a typical case concerning the Ordnance Factory, Dehra Dun, the proposal to purchase some machinery for the factory was made in September, 1951, while the need for it was only accepted in September 1952 and actually received only in June 1956. Naturally it holds such delays as "reprehensible" and one cannot but agree with this. In another part of the report, the Committee notes the wasteful processes being followed in the ordnance factories and suggests that stern action should be taken against all those guilty of these practices. It also pleads very rightly for setting up a Statistical Quality Control Section which would secure effective control over production and bring about marked improvements in the quality of products of the ordnance factories. The report of the Estimates Committee is thus at once timely and valuable. It will be an excellent thing if greater powers are vested in these committees and methods devised to implement their suggestions more expeditiously.

CASTE AND THE COMMUNISTS

WHETHER BY design or accident the Kerala Government seems to be making history in several directions. A recent move is indeed 'sui generis'. A report has it that the Special Commissioner for Schedule Castes has received a request from the Communist Government of Kerala for funds to provide separate burial grounds for Schedule Caste Christians. This request is indeed both intriguing and unusual, for it violates the provisions of the Constitution, it is against the precepts of Communism and offends even the teachings of Christianity. It is not known how it came to be sponsored, but what is relevant is that such a request should be forwarded by the Kerala Government which is working within the four corners of the Consti-

tution. Untouchability, it is well-known, has been made a penal offence punishable under the law of the land. In the face of this, it is astounding that the Communist Government of Kerala should append the official stamp of its sanction and forward this request to the Central Government for action. It is a truism to say that law cannot abolish prejudice, but there should at least be a valiant effort on the part of the Kerala Government to enforce the law. Perhaps the Kerala Government is intent on giving its official support to a pernicious caste distinction, because it may prove to be the means of bringing in class war-fare through the back-door. Whatever be the motive, it is a deplorable move on the part of the Kerala Government to give encouragement even indirectly to any type of sectarianism, when the country is fighting a desperate battle against the tragic and wasteful deviations in her society.

THE END OF AN ERA

ON JUNE 21, four days short of the seventh anniversary of the outbreak of the Korean War, the United Nations' Command announced in Panmunjon, that it would replace its outmoded weapons in South Korea with modern ones. This move is in answer to the "complete disregard" by Communist forces for the provisions of the 1953 Armistice Agreement. The Agreement prohibits any change in the 'status quo' of the military forces as it obtained at the time of its signature. By violation of the Agreement, the statement notes, the Communists have "built up a military capability in their area vastly superior to that which they had at the time the Armistice Agreement was signed". Moreover, the United Nations' Command was constrained to take recourse to this extreme step because all procedures established by the Agreement for the settlement of disputes had been "exhausted". In short, if Korea is not to be plunged into another war—which could get out of hand easily and with disastrous consequences—this military deterrent is necessary. The United Nations, which in this particular case means the United States, has announced its impatience with the Communist abrogation of this aspect of the agreement and no longer considers itself bound by the provision which has proved unenforceable.

True, there are doubts about the legal niceties or the moral wisdom of the American decision, exercised in the name of the United Nations Command. But one cannot escape the lesson of modern history. More than once the Communist orbit has demonstrated that it respects only equal or superior force. Further, Americans are still keenly aware of the events immediately preceding the North Korean invasion of 1950. The United States had, in 1953, undertaken substantial withdrawals of its military strength from South Korea, secure in the belief that the area was stabilised and that danger of hostilities was non-existent.

It is true that two wrongs do not make a right. But Communist regimes have not been known to resist the temptation to overpower comparatively weaker neighbours. Force can only be met by force. There is validity in the argument that continued defensive weakness, when one has the capacity to be otherwise, is not only unintelligent but morally wrong. The price of Munich was the dismemberment of Czechoslovakia. Recently in India itself while deploring the prospect of an arms race with Pakistan, we would certainly not like to be militarily weaker.

The tragedy of Korea continues to be its divided status. But the Communist violation of the Agreement detracts from the hope that forces North of the 38th parallel are prepared to negotiate reunification. It is also ironical that Mr. Nehru in Stockholm should have seemingly overlooked Korea when referring to the clash of Communist and non-Communist systems as "your European quarrels".

The importance of banking to the COFFEE INDUSTRY

COMMERCIAL cultivation of coffee in India dates from about 1830, and is still almost entirely confined to South India. The yearly crop varies between 20,000 and 30,000 tons, most of which is consumed in India. When a surplus of Indian coffee is available for export, it finds ready buyers in fastidious foreign markets.

Without banking, the growth of the coffee industry would have been impossible. The availability of ready funds when needed, the collection of dues in any part of the country, and the other facilities and guidance offered by a good bank—these are an integral part of the structure of the coffee industry.

We at Palai are proud that so many leading coffee plantations, and indeed important firms in every field of business and industry in South India, employ the complete banking service we offer.

Current Accounts—Demand Drafts—
Telegraphic Transfers—Investments—
Bill Collection—Letters of Credit—
Deposits—Loans & Overdrafts—
Confidential Credit Reports, etc.

* * *

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI, KERALA STATE

Branches at: Madras, Cochin, Quilon, Trivandrum, Alleppey, Mangalore, Bangalore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

ASSAM OIL COMPANY

WHAT IS WRONG WITH SOCIALISTS?

By

ODYSSEUS

WE TAKE GREAT and justifiable pride in our spiritual heritage, the works of the seers, philosophers, poets, dramatists, artists, sculptors, and others, between them responsible for the Upanishads, for the Sanskrit literature of the Gupta period, for the Chalukyan architecture of the Deccan, the songs of the Tamils, the temples of the Pallavas, the arts and cultures of the empires of Vijayanagar and of the Mughals. Venture any suggestion that denigrates these treasures and you will attract thunderbolts of wrath from all sections and communities of Indians, whether Congress men or Socialists. Very rightly, too. But what needs to be pointed out is that all great art, whether in words, paint, movement, or stone, has, in all countries, at all times, been dependent on the patronage of men of taste.

Now, perhaps the finest periods in Sanskrit literature flourished from 320 A.D., when Chandragupta I, a petty chieftain of Bihar, gained possession of Magadha, and launched the Gupta dynasty, which endured till the empire broke up around 490 A.D. During these 150 years, the 'Mahabharata' was edited and recast, the 'Dharmasastras' were compiled from the earliest Sutras, and the laws of Manu were codified in the form in which we know them. In imaginative literature, the chief developments were the 'Kavya', or court epic, which might be prose or verse, drama, lyric poetry, and prose romances. The galaxy popularly known as the Nine Gems, superb as they were, yet were dwarfed by Kalidas. Only less famous than this towering genius was Bhartrihari, the "Indian Horace", whose Sringara Sataka (Century of Love) is full of poems, cynical and charming. And there were a score of others whose names will readily occur to everybody.

Now, what we need to be clear about is that none of these works were written for "the people." To be appreciated in their full significance, they need a cultured, educated audience—and this they found in the court of the Guptas, who delighted in the role of patrons of the arts. This was nothing exceptional, for throughout Indian history the arts have always been dependent on court patronage. Nor is the dependence of artists on the patronage of wealthy men of taste a uniquely Indian phenomenon. It is universal. If Shakespeare had had to depend for his livelihood on pleasing the uneducated masses, we should never have heard of him.

It is important that Socialists, and all who seek to redistribute wealth by heavy taxation of the "rich" in order to equalise incomes in the interests of "social justice", should reflect over the implications of the previous four paragraphs. If the Guptas, a dynasty of kings who indulged in the most reprehensible practices, such as violence, bloodshed, and wars of aggression, had been prevented by right-minded Socialists from wading through slaughter to control of an empire, and if such wealth as existed in the Gupta empire had been redistributed equally, the cultural heritage of India, and of the world, would have lacked one of its most brilliant lustres.

"Not so," retort the Socialists. "Every Socialist State will set aside sums to patronise literature and

the arts." But, as I said last week, if the argument against unequal incomes is that it allows those "richer" to distort the allocation of productive resources in favour of their whims, then it follows that when all incomes are equalised, it is illogical to upset the ideal distribution so attained by taxing the "equalised" masses in order to allocate resources to the production of literature and the arts—goods and services which they obviously don't want but which the government thinks they ought to want. Does a "whim" become respectable because it is thought up by a group of politicians in power, or bureaucrats in office, instead of by private individuals? "No," retorts the Socialist in outraged accents, "government departments don't have whims! They study the needs of the people." This is argument in a circle, for if the government concerned is a dictatorship of the people, the value of the government decisions taken on artistic matters depends on the degree of cultivated taste attained by the governing clique, and if the government is a genuine democracy, the masses will not be interested in the subtleties of Shakespeare or Kalidas. If you don't believe this statement, compare the select audiences running into tens of thousands who go to Shakespeare plays with the tens of millions who go to artistically valueless popular films, and compare the hundreds of millions of popular trash sold with the limited editions of Kalidas published.

The basic argument in favour of the retention of inequality of incomes is that, on the material and financial side, it keeps investment capital diffused among changing individuals and groups, and makes for an ever-widening variety in the material growth of the nation, while on the ideological, spiritual, and artistic sides, inequality of incomes promotes variety in thought and ideas and the widest possible spread of beauty and culture. In short, inequality of incomes is one of the most important factors in preserving the material and spiritual freedom of the individual. The basic argument against punitive taxation and the redistribution of incomes is that materially and spiritually it diminishes the freedom of the individual and concentrates power on a relatively small group of people who, being but human, have one major interest in common: the retention of power.

I do not for one moment maintain that a society of unequal incomes is perfect and free from all injustices. I do, however, suggest that in the clash of interests and public debate postulated in a free society of unequal incomes, the door is wide open for progress and reform. And I go on to maintain that in any comparison between the imperfections and injustices existing in (a) a society of unequal incomes and in (b) one in which equality is the goal, all history is there to demonstrate that the average man is less unhappy in the unequal free society than in the regimented society enforced in the all-powerful, egalitarian, oligarchic state.

In his "Ethics of Redistribution" (Camb. Univ. Press 1951), Bertrand de Jouvenel points out that the underlying error in Redistributionist reasoning is that incomes are solely a means to consumer-enjoyment and that society is an association for the promotion of consumption. This error is seen when we consider the

arguments widely used for and against re-distribution. It is fair, some say, to equalise satisfactions. It is prudent, others retort, to allow greater rewards to spur production and thereby provide greater means of consumption. Bertrand de Jouvenel recalls the Armenian proverb: The world is a pot and man a spoon in the pot. If so, the argument would be between those who want an expanding pot with unequal spoons and those who accept a static pot with equal spoons. But perhaps the world is not a pot and surely man is not a spoon. The Armenian conception has got clean away from the Greek conception of the "good life" and the "good society". Is the "good life" a buyer's spree in a bargain basement? Is the "good society" one long queue of bargain buyers?

We must therefore conclude that redistributionism is a disastrous fall from Socialism and that Pandit Nehru was perfectly right to reject it the other day and to insist on his rights to the income from the sale of his books which gives him an income above the average. The trouble with Socialism today is that it now identifies itself with state despotism (all right, "enlightened" if you insist, but still a despotism of political cliques and civil administrators) and has forgotten that it was once an ethical social doctrine. It used to look, as the Sarvodayans still look, to a "good society" in which men would feel more kindly to each other. Instead, Socialists now hold out the promise

(fulfilled incidentally by capitalist mercantile society) of increased consuming power. Ethics is left out. The goal of society is increased personal consumption. We laugh at what we regard as the American ideal of bigger and better automobiles and frigidaires for every home, but the only difference between our ideal and theirs is that their free enterprise technique is far more efficient in securing the common goal than our Socialist hodge-podge. No ideal so trivial has ever been held out to mankind before.

What's wrong with Socialists is not that—like the Sarvodayans—they are Utopians out to transform society, but that they have given up their ethical ideals and renounced all hope of transformation. If consumer enjoyment is our goal, then I submit that the Government of India should go in for the mass production and free distribution of bhang. This would produce here and now, painlessly without inflation, without upsets to the balance of payments and without any other expenditures of blood, toil, sweat and tears, the same results as the Five-Year Plan, whose ultimate objective is also consumer enjoyment.

[This is the fourth in a series of five articles on the Ethics of Redistribution. Next week's final article will be, "A Point For Mr. T. T. Krishnamachari"—Ed.]

FOUR YEARS OF THE SCHUMAN POOL

(From Our Special West European Correspondent)

PARIS, June 29.

IN an article on this page two weeks ago ("Europe, Or Little by Little") the working of the Schuman coal and steel pool was briefly reviewed with the object of drawing lessons for the further progress of European unity plans. Since then, several more detailed and authoritative analyses of the pool's work have been published in the Continental capitals with the same purpose: providing the parliaments which during the summer must ratify the Euromarket and Euratom treaties with a specimen case-history in supranational co-operation. From these studies much new and important information emerges, which makes it worthwhile to return to the subject not only because European unification is important in itself but because from these experiments something can be learned about the outlook for international co-operation in general and especially about the hopes for an organised return to free trade. In a later article, I shall examine the working to date of Benelux from the same point of view.

Now the steel and coal pool has been at work for only four years, while the treaty is for a period of 50 years: so we cannot pretend to draw any final conclusions at this stage. Moreover, those four years have been a time of booming expansion (save for a brief recession in 1954), so it is difficult to know what effects should be put down to the existence of the pool and what to the fact of expansion. For example, there has been a general though unequal rise in wages in these industries in all the member-countries. The result is that the unions look on the experiment with some favour, but in fact the rises are almost certainly due to the shortage of coal, steel and manpower, which would have been felt with or without the pool. This inference is supported by the fact that wages in coal and steel have not risen notably more than in other expanding industries. But there has also been a definite trend toward more equal wages in the various member-countries, and this can probably be put down to the fact that the existence of the pool involves co-operation between the unions of the member-countries and constant comparison of costs and prices throughout the region: when Italian workers are included in a theoretically unified market with German workers, they have the incentive and the means to enforce more nearly equal wages.

The pool is able to report considerably increased intra-regional trade in coal and steel, and since this was one of the prime objects of the venture it would appear that to this extent the scheme has succeeded. But the fact that the period has been one of vast expansion in coal and steel, not only in Europe but throughout the world, and that this expansion has taken place at a time when raw materials were in short supply, especially in Europe, might also serve to explain much of this increased trade. More intense trade has not benefited all member-countries equally; West Germany has got much more advantage out of the common market for steel than France. But most important, the increased exchanges have not meant lower prices, far from it. Prices have risen in all member countries, in certain cases very substantially and in all cases coal and steel prices have risen more than other

prices. In West Germany, for instance, coal prices have jumped 27 per cent and in France 20 per cent; while in general steel prices have risen twice as quickly as all other wholesale prices.

This fact is of over-riding importance because one of the main arguments advanced for the pool five years ago, and indeed one of the main arguments for all schemes for a common market, is that the larger market and increased trade must necessarily mean cheaper products. Experience shows the contrary to be true. Defenders of the treaty say that this is a temporary accident, that it is due to the current boom in these industries, and that in any case steel and coal prices have risen elsewhere, in Britain and the USA for example. But these explanations do not suffice, and however paradoxical it may be, there is reason to think that it is precisely the existence of the common market that has caused much of the rise in prices.

The explanation of this paradox is not difficult, and it has general importance. Nowadays prices for all products are more or less controlled within all national economies; even where prices are not fixed by law, no government will allow the prices for certain basic products to gallop ahead of the general price level. But if several of these basic products are then taken out of the sphere of national price control and included in a common market, so that individual governments no longer have control over their prices, all the inflationary pressure built up by contemporary methods of national finance becomes concentrated on them—and they bulge out like a weak spot in a balloon. If all products could be included in a common market, universally and instantly, we would not see this bulge; but that is impossible. Even the more comprehensive Euromarket scheme excludes many agricultural products, and since it is in agriculture that many inflationary pressures are nowadays built up we can expect to see the steam accumulated there escaping in the form of higher industrial prices once these are released from national control.

In fact, the rises in coal and steel prices would have been even more severe had not member-governments, frightened by the High Authority's inability to control them, withdrawn in practice many of the powers they had signed away in the treaty. It is these violations of the pool treaty that have prevented more serious rises; in other words, if the pool had worked "better", the results would have been worse. Apart from the bulge that must show up in any prices removed from national price control, the success of the pool has contributed to price rises in two other ways. The expansion of output and of trade that the common market has helped to cause has led to heavy investment in these industries (heavier than in other industries not benefiting from the bigger common market) and this has absorbed industrial economies without any hope of passing them on as price reductions. Secondly, the wage increases obtained by labour, particularly in the poorer-paid sections that are seeking equal pay with the more prosperous sections, have meant higher prices.

The upshot is that the vast economies that were promised as a consequence of the common market for

BOUND VOLUMES of THE EASTERN ECONOMIST and RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

THE EASTERN ECONOMIST		Rs. 75.00
RECORDS & STATISTICS		Rs. 18.00

coal and steel, and the lower prices which were said to be assured, have proved in practice to be a myth—yet it was precisely these lower prices that were the main case for a supra-national market. It might be argued that these results are temporary because after some years wages would have been equalised over the common market and the various industries would have made the investments necessary to meet their enlarged sale possibilities, and that thereafter price falls would be possible. One cannot deny this a priori; it is true that no judgment on the common market for coal and steel will be reliable until the pool has shown how it works in a period of recession. But an important fact is to be noted: "freedom" has meant freedom for prices to rise out of government control, but it does not limit the ability of individual firms in the various countries to conspire among themselves to prevent awkward price falls in a period of recession. This happened when the steel industry went through a poor patch in 1954. So "freedom" might well work one way, or at least work more one way than the other. Promises of lower prices to result from the organisation of a common market need to be regarded henceforth with some suspicion.

It might be urged that removal of certain prices from national control need not imply their total de-control provided the new supra-national authority that presides over the common market is willing to set limits to price rises. But the working of the coal and steel authority suggests that this is a very slim chance. A new supra-national body obviously lacks the power and authority of the national governments, and moreover as I remarked here two weeks ago, there is no agreement on what sort of policy the supra-national organisation should follow, whether it should be liberal or interventionist. This is why the Continental governments have been withdrawing from the High Authority in Luxembourg the shreds of national sovereignty they surrendered to it in the pool treaty. But there is a more fundamental reason for the supra-national body's inability to replace national governments in the job of controlling prices. It is this: as long as unification is proceeding piecemeal, the advocates of the next stage are anxious to prove that no interference with national policies is resulting from the present stage, and so there is strong pressure on the Luxembourg authority to do nothing that will offend anybody for fear of jeopardising the further progress of unity schemes.

If the High Authority had begun vigorously controlling prices, breaking up the German steel cartels, enforcing rigorously fair rail rates and so on, much of the enthusiasm for further experiments in European unity (particularly among industrialists) would have cooled off. Thus we come back to the point made above: that if unification could take place universally and overnight, it might work well, but as long as it has to go forward in stages, the unity party is too anxious to see the next stage introduced to permit adequate control to be exercised during the current stage. You might think that when the general common market is introduced from 1959, it will not suffer from this disability to the same extent as the coal and steel pool which was always intended to prepare the way for the bigger common market. But after the common market for all industrial goods, the unity party hopes to go further, with political unity in West Europe, so there will be the same pressure on the supra-national controlling organisation to show that unity "works", by not exerting any awkward controls.

In sum then, the lessons of the coal and steel pool for any further experiments in economic unification are that the organised piecemeal return to larger areas of free trade is much more difficult than the "liberals" imagine. We live in an age where all national economies are "globally" controlled and any partial liberation of particular industries from this control is a

retrogression. To set certain producers free of control by their own national governments without placing them under the control of a new and powerful international authority means building up specially favoured interests in which workers and employers conspire to exploit those industries that remain under strict national control. Yet to establish an international authority strong and vigorous enough to control such liberated industries means introducing a measure of international government that the unity party does not yet want to admit is implied in its "liberalisation" plans.

WORLD GRAM

AGRICULTURE

Inter-governmental Group on Grain Problems: The first steps have been taken by the UN Food and Agriculture Organisation to bring better nutrition for the peoples of the world through the control and management of world cereal production. Recently in Rome representatives of 24 major producing and consuming nations, including India, recommended the establishment of an inter-governmental group to deal with economic problems in the world grain economy. Supply and demand position and possible development, improvement of statistical services, collection of information, analysis of national grain policies and their international effects, possible facilitation of international adjustments, marketing problems and regional surpluses are matters proposed for major consideration.

INDUSTRY

Automobile Production in India: The total number of vehicles produced during the year 1956 was 32,138 as against 23,084 in 1955. The production of automobiles has been steadily rising in India since 1953 when the programme of progressive indigenous manufacture of cars and trucks was introduced on the recommendation of the Tariff Commission. The total production in 1953 was 13,926 and in 1954, 14,462. The analysis of this 40 per cent increase in 1956 shows 12,989 cars, 677 station wagons, 4328 jeeps and similar vehicles and 14,144 trucks. There has also been an increased demand for cars and trucks in India. As against 13,813 automobiles sold in 1954, 26,065 were sold in 1955. The sales went up to 31,486 in 1956. By 1960-61 the demand for cars and trucks is expected to rise to 65,000 per year. There was a remarkable increase in the production of motor cycles and scooters in 1956. The total number of motor cycles and scooters produced was 5,622 as compared with 801 during the previous year. 493 auto-rickshaws were also produced in 1956.

China's Machine-Building Industry: China's machine-building industry is now capable of supplying three-fifths of its own demands in machinery and factory equipment according to a Chinese Government communique. It also stated that by the end of 1962, the closing date of the second Five-Year Plan, China will be able to meet 70 per cent of her own needs. Scores of new and remodelled machine-building plants have gone into production since 1953, when the first Five-Year Plan started. They are producing for the first time heavy duty automatic and semi-automatic machine tools, precision meters and instruments, 2000-ton forging presses, sets of equipment for textile industry and sugar refinery steam locomotives, motor vehicles and air planes. The machine building industry also produces equipment for open-hearth furnaces, and with an annual capacity of 100,000 tons of steel; blast furnaces each with an annual capacity of 300,000 tons of pig-iron and equipment for coal mines with up to an annual capacity of 900,000 tons of coal each. Among other machinery and equipment produced are 12,000 kilowatt hydro-power generating units.

Protection to Wood Screw Industry: The Government of India have accepted the Tariff Commission's main recommendation that protection to the wood screw industry should be continued for a further period of three years — till December 1960. Protection will be continued, accordingly, at the existing rates which have recently been rounded off to 35 per cent 'ad

valorem' or 35 naye paise gross, whichever is higher under the Finance (No. 2) Bill 1957.

TRADE

Indo-British Trade: Although India's purchases from Britain in May were lower compared with the same month last year, the total for the first five months of 1957 shows a substantial rise over the same period in 1956, according to returns issued by the Board of Trade in London. Britain's purchases from India during May were £1,000,000 higher than in the same month last year—£16,557,009 compared with £15,088,194. India bought goods worth £77,044,478 in the first five months of this year, compared with £62,747,505 in the same period of 1956. Britain's purchases for the first five months of this year totalled £79,222,211, and in the same period last year they were £70,403,717.

Retail Trade in Soviet Russia: The Soviet Union it is reported, plans to expand her retail trade. Three million people, one and a half per cent of the Soviet's 200 million inhabitants, are now employed in the retail trade. There will be a wider use of packaging and increased supplies of automatic sales machines and self-service stores. To overcome the shortage of canned goods, a "do-it yourself" drive has been launched, and bottling and preserving implements will be retailed in quantities this year. 750,000 TV sets and 3,745,000 radio sets will be offered for sale in the Soviet Union this year. The number of refrigerators, vacuum cleaners and motor cycles on sale this year will be 3,000,000 units in each case. There are no scooters in the market but it has been announced that the production of two Russian designed types will begin in a few months time.

Ghana's Trade: Last year for the first time, Ghana had an unfavourable balance of trade, the value of imports exceeding that of exports. Payments on current accounts showed an unfavourable balance of £17,700,000 against a favourable balance of £3,500,000 in 1955. Last year, the total value of imports increased by nearly £1 million while exports fell by £9 million. The main decline in the value of exports arose from the reduced world price of cocoa.

Future Pattern of World Trade: During the first six months of 1956, the total value of world exports exceeded the annual value of £90,000 million according to the annual report of the General Agreement on Tariffs and Trade. During the last six months, the value reached the unprecedented level of £95,000 million. Taken as a whole, the 1956 level was 11 per cent above 1955 and measured in value, the increase was 9.5 per cent. The report further says, the future development of trade hinges essentially on the growth of economic activity in Western Europe. The second structural change affecting future trade development is a further relative decline in trade between industrial and non-industrial areas. The diagnosis runs contrary to the accepted U.N. doctrine that industrialisation automatically increased the trading capacity of under-developed countries. Checking on eight semi-industrialised countries, Australia, India, South Africa, Argentina, Brazil, Finland, Mexico and Yugoslavia, the GATT holds them responsible for the fact that for the first time in 1956, the trade of the non-industrial areas yielded a deficit of about £1,200 million in contrast

with a surplus of £2,800 million 1950 and nearly even trade balances in 1954 and 1955.

*

Export of Cashewnuts: According to a New York report, cashewnuts are growing into big dollar-earners for India, since they are great favourites at cocktail parties in the United States. India has a virtual monopoly of the cashew trade, and next to tea and black pepper, the cashewnut is the biggest dollar earning cash crop. During 1955-56, India earned about Rs. 135 million in foreign exchange from its cashew crop exports which include the nuts themselves and the cashew shell oil which is needed for making paints and varnishes. Of India's total exports the United States and Britain purchase 70 per cent. India with an annual production of about 60,000 tons, is the world's top producer of raw nuts. It also controls 90 per cent of the international trade in cashew kernels and cashew shell oil. It has, however, to import large quantities of raw cashew nuts from East Africa to keep its factories working at full capacity. India has plans for increasing its cashewnut crop from the present 60,000 tons to 1,06,000 tons a year.

*

Austrian Oil for Russia: Austria has undertaken to send annual shipments of one million tons of crude oil for a period of ten years to the USSR. This is in compensation for the transfer of oil fields from the occupational Soviet administration to national management. The annual value of three shipments is approximately 350 million schillings. Full scale payment from public funds for their shipments will be made from January 1 1960, while part of the deliveries scheduled from the years 1957 to 1959 will be charged against taxes and licence dues. The licence dues will be 15 per cent of the operational proceeds of the Oil Administration.

FINANCE

Pak Agreement on Double Taxation: On June 8, an agreement was signed between the Governments of Pakistan and the United Kingdom for the avoidance of double taxation and the prevention of fiscal evasion with respect to duties on the estates of the deceased persons. Mr. S. Amjad Ali, Minister for Finance, signed on behalf of the Government of Pakistan and Sir Alexander Symon, High Commissioner for the United Kingdom in Pakistan, on behalf of his Government.

*

Central Tax Structure: The total tax revenue of the Government of India (excluding the States' share of income-tax and estate duty) in 1955-56, the last year for which final figures are available, amounted to Rs. 428 crores. The 1956-57 (revised) and 1957-58 (budget) estimates of total tax revenue amount to Rs. 495 crores and Rs. 515 crores respectively. In 1955-56, the tax revenue of the Government of India formed 85 per cent of the total revenue in that year, compared to 89 per cent in 1938-39, 76 per cent in 1944-45 and 87 per cent in 1950-51. An important element in the non-tax revenue is "net contributions of public undertakings" (including the railways, posts and telegraphs, currency and mint and so on) which amounted to Rs. 1.8 crore in 1938-39, Rs. 42.2 crore in 1944-45, Rs. 23 crore in 1950-51 and Rs. 26.7 crore in 1955-56. Of the total tax revenue of Rs. 428 crore in 1955-56 nearly two fifths (Rs. 167 crore) were derived from customs (import and export) duties, about one third (Rs. 145 crore) was derived from Union excise duties and a little over one fourth (Rs. 131 crore) was

derived from income and corporation taxes. These three sources together accounted for 99.4 per cent of the total tax revenue in that year.

Customs duties constituted the most important source of central tax revenue in all these years (1938-39 to 1957-58 budget) excepting in 1944-45 (a war year) when about two-thirds of the tax revenue were derived from income and corporation taxes, and again in 1957-58 (budget) when Union excise takes the lead with 41 per cent of the total tax revenue. The yield from Union excise duties has been increasing steadily from a mere Rs. 9 crore, 12 per cent of total tax revenue in 1938-39, to Rs. 38 crore (15 per cent) in 1944-45, Rs. 68 crore (19 per cent) in 1950-51 and Rs. 145 crore (34 per cent) in 1955-56. In the 1957-58 budget the yield from Union excise is estimated at Rs. 209 crore or 41 per cent of the total tax revenue. The yield from income-tax (including corporation tax) increased more than seven times between 1938-39 (Rs. 16 crore) and 1955-56 (Rs. 113 crore). The yield from income-tax is estimated at Rs. 137 crores (27 per cent of the total revenue) in the 1957-58 budget.

*

Sea and Land Customs Revenue: The total gross sea and land customs revenue collected in the Indian Union during April last amounted to Rs. 1,590 lakhs as compared with Rs. 1,209 lakhs in the corresponding month of the previous year, according to the returns received in the Department of Commercial Intelligence and Statistics. Of the total customs revenue collected, import duties during April last accounted for Rs. 1,439 lakhs as against Rs. 1,043 lakhs during April 1956. Export duties accounted for Rs. 120 lakhs while land customs and miscellaneous Rs. 31 lakhs, as against Rs. 154 lakhs and Rs. 12 lakhs during April last and April 1956 respectively.

GENERAL

Marketing of Coal: The marketing of coal in India will change over to the metric system simultaneously with the commencement of booking of coal by the Railways in metric tons. About 3 million tons of coal are transported by the Railways annually. Weighing of the coal is done by the Railways on railways bridges and therefore, the programme for the adoption of metric system in the coal industry has to be co-ordinated with the programme of the Railways. For some time, the prices will be given on both systems, the metric ton gradually replacing the long ton.

*

Long-Term Foreign Credit for Capital Equipment: It is proposed to exempt from Indian income-tax interest on loans granted by those financial institutions in foreign countries as are approved by the Central Government for this purpose, according to an announcement of the Union Finance Ministry. It says: Import licences for obtaining capital plant and machinery of substantial value are now granted on condition that payment for them is spread over a number of years, or against fresh foreign loans. In some of these cases, interest has to be paid on these and similar transactions to foreign Banks and other lenders and such interest is now subject to Indian income-tax. It is proposed hereafter to exempt from Indian income-tax such interest as may be payable for sufficiently large credits spread over a period ordinarily of not less than five years, as may in each case be approved by the Central Government. Such approval will be given by the Central Government along with the grant of import licence, and, where necessary, the acceptance of deferred payment terms. The exemption will be available only in those cases in which the terms of the loan are specifically approved by Government for the purpose of the exemption.

NEWS IN BRIEF

INDIAN

The time-loss due to industrial disputes during April 1957 increased to 353,245 man-days from 277,013 in the previous month. As compared with the monthly average time-loss of 594,709 during 1956, the time-loss in April was lower by 40.6 per cent. One hundred and forty four disputes were in progress at any time during the month. In March the number of disputes was 116. The average duration of disputes current at any time during April was 6.6 days as compared with 6.8 in the previous month.

EQUALIZATION OF COAL PRICE

(CONTRIBUTED)

THE equalization of the price of coal involves the equalization of the price of a unit of "useful" heat, which is not the same as equalization of the price of coal by weight alone. Unlike iron, steel or cement, coal is a heterogeneous natural substance containing varying degrees of diluents such as mineral matter, moisture, and oxygen. Even minor components such as sulphur and phosphorous, or the quality of some of the components such as the fusibility of the mineral matter or the coking properties of coal or the storage properties of coal, etc., are important and often crucial parameters for the selection of coal for industrial use. Coal is also produced in various sizes and is required for industrial purposes in different size ranges. Thus, there cannot be one price for a ton of coal at any rail head irrespective of the usefulness of the coal. What has to be equalized is the ultimate "useful value" of different qualities of coal at different rail heads of the country and this is a combination of several factors such as size, quality, and transport costs.

The price which the consumers pay for coal at their end includes freight, terminal and handling charges in addition to the pit-head value of coal. This price is termed the "Effective Price" of coal. The "effective price" of coal paid by the consumers between 1950 and 1953 in different regions of India is given in Table I.

TABLE I

"Effective Price" of Coal Per Ton (in Rupees)
(Average Figures for a State)*

States	1950	1951	1952	1953
West Bengal	20.90	20.36	20.62	20.13
Bihar	20.74	20.61	21.53	22.02
Orissa	22.73	21.35	21.37	23.04
Madhya Pradesh	25.22	24.53	25.69	27.18
Assam	33.28	34.20	32.71	37.99
Bombay	33.52	32.54	35.97	37.78
Punjab	29.21	29.51	32.39	28.93
Madras	40.70	37.35	40.44	46.54

It is evident that the States in the eastern zone paid Rs. 20 to Rs. 23 per ton in 1953 as against an average of Rs. 38 at Bombay and even Rs. 47 at Madras. The transport costs to some of the States exceeded the pit-head price of coal. This state of affairs was due mainly to the unbalanced regional production of coal and the transport of the better qualities of coal from the States of West Bengal and Bihar. The regional development of coal areas occurring in Madhya Pradesh, Andhra Pradesh, and the southern States, aided by technological preparation and upgrading of poorer quality of fuels occurring in these areas will largely, though not entirely, eliminate these discrepancies.

We may now examine the levels at which the price can be equalized if this still be the objective. Based on the census of manufactures, the "effective

*The Price of Coal—"The Eastern Economist" Blue Supplement Vol. II. No. 1. July 27, 1956.

all-India prices" paid by the manufacturing industries comprising 28 major industries during 1950-53 were as follows:

TABLE II

Effective All-India Price for Manufacturing Industry

	(Rs. per ton)
1950	24.2
1951	23.9
1952	25.2
1953	26.2

The manufacturing industries considered above consumed approximately 9 million tons of coal in 1953 and their consumption rates have remained more or less static over the last few years, though a general trend towards increase is evident.

The "effective all-India price" paid by the Railways, the largest individual consumer of coal in India (with annual consumption of the order of 12 million tons), was approximately Rs. 31 per ton in 1954-55. Since the price of coal in 1954-55 remained practically the same as in 1953 we may obtain an average all-India price level by combining the consumption of the manufacturing industries and the Railways. These consumers together account for the consumption of 21 million tons of coal per annum or approximately 60 per cent of the country's production. The effective price of coal for these sources can reasonably be taken as a reliable estimate of the overall all-India effective price of coal. Table III below shows that the effective all-India price of coal in 1956 was of the order of Rs. 32 per ton.

TABLE III

1. Manufacturing Industry:

(a) Coal consumption (1953)	9 million tons
(b) Effective price per ton (1953)	Rs. 26.2

2. Railways:

(a) Coal Consumption (1954-55)	11.5 million tons
(b) Effective price per ton (1954-55)	Rs. 30.9

Therefore Average effective price per ton for 1 and 2 combined	„ 29 approx.
Add price increase per ton (1956)	„ 3

Therefore Effective price per ton (1956)	Rs. 32
--	--------

The immediate effect of the equalization of coal price will be that the States lying at greater distances from the coal producing areas will increase their demands for coal resulting in an immediate shift in the pattern of coal consumption. This will automatically increase the transport cost element of the effective

price resulting in the price structure being equalized, say, at approximately Rs. 35 per ton. This price, it must be remembered, represents the average price of all the qualities of coal, the average quality of coal being of Grade II (21 to 24 per cent ash)*.

In order to calculate the price of different qualities of coal to be equalized at all rail-heads in India, we have to base the price of a "useful heat unit" on the price of Rs. 35 per ton of Grade II coal. Table IV below gives the effective price of coal for different qualities of coal.

TABLE IV

Grade	Useful heat units (B.T.U./lb.)	Rs. per ton
Selected — A	12,000	42.00
Selected — B	11,500	40.25
Grade — I	10,850	37.98
Grade — II	10,300	35.00
Grade — III A	9,000	31.50
Grade — III B	7,500	26.50

(Rs. 2.00 extra for washed coal divided by Rs. 1.5 for +1" coal)

It will now be seen that the all-India price for the lowest grades of coal (Grade IIIA and (B)) will be higher than the all-India effective price of coal in 1952-53. The new all-India prices are higher than the average effective prices prevailing for the average supply of coal in all States except Bombay and Madras, which, due to their distance from coalfields, have so far been supplied mainly with better qualities of coal from the producing areas. If the value of the higher grades of coal is taken into consideration, then the equalized prices for the higher grades even for the States of Bombay and Madras are not very different from the effective value of 1953. For all the other States the price of the lowest grade of coal will now be higher than the effective price of coal for an average of all the grades paid in 1953. With the development of the lignite resources of the South, the only State which may derive any benefit at all from this all-India equalized price structure will be the State of Bombay, if it restricts its supplies of coal to inferior grades only from the Madhya Pradesh coalfields.

The immediate effect will be nearly doubling of the effective price of coal in the States producing them. Since the extractive industries and the heavy industries are located mainly in the States producing coal and containing other mineral resources and since even the lowest grades of coal will now be nearly 1½ times as costly and the higher grades (which many of them require, e.g., for the iron and steel industry) will cost twice as much, it will have the immediate effect of considerably increasing the price of iron, steel and cement. The requirements of the Railways are mainly for selected grade fuels (90 per cent) and the 30 per cent increase in fuel costs plus additional haulage of coal will also lead to large increases in freight charges. This, in turn, will again lead to another increase in the equalized price structure of coal and set in motion the spiral of inflation in price structure which will be hard to combat, resulting not only in failure of what we intended to achieve for coal deficit areas, but also in completely upsetting the industrial production in the existing areas. Further, since the coal costs form approximately 50 per cent of the cost of generation of power, many industries (including the transport sector)

will now find it uneconomic to use poorer quality fuels and will instead demand high grade coals or oil.

The Railways are a major consumer of coal at present and will continue to be so for a long time to come and since the equalization of price of coal is primarily linked up with freight charges, the latter component being often higher than the pit-head value of coal, it is interesting to consider the effects of equalized price of coal on Railway economy. It will be observed that the all-India price of coal is not very different from the present effective price of coal for the Railways on an all-India basis. Thus, the freight cost for coal apparently has a direct relationship to the all-India costs. The break-up of the expenditure of the Railways for 1954-55 for coal is given below:

TABLE V

Item	Expenditure (1954-55) (Rs. Crores)
Cost of coal at pits' mouth	16.55
Cost of freight, handling, etc.	19.11
Total cost of coal	35.66
Coal consumption (million tons)	11.5
Therefore Price per ton at pits' mouth	Rs. 14.4
Price per ton (effective) 1954-55	„ 31.0
Present effective price per ton	„ 34.0

The Railways, however, require primarily selected classes of coal as the Railway locomotive is rather inefficient in the use of coal. The penalty for diluents such as ash is not pro-rata, but is of the order of 2.5 times for an increase in every one per cent of ash and moisture. The Railways have so far consumed coking coals of good quality and of high calorific value, but by 1960 they are committed to change over to non-coking coal. The non-coking coals have lower inherent calorific value, and therefore, grade for grade, the Railways will require one grade higher coal than they are receiving at present. In fact, the demand is for at least 90 per cent of selected grade coals.

Since the cost element on freight and handling is more than the pit-head value of coal, the Railways' primary objective in fuel economy is to reduce the lead as well as consumption of coal. The Railway policy to achieve this objective has so far been two-pronged. The first is to achieve regional self-sufficiency in coal, if necessary, by upgrading of coals such as those in the outlying coalfields and secondly, by electrifying the Railways as far as possible so that the haulage of coal is completely eliminated and lower grade coals can be converted, in situ, into energy required for traction. The cost element of coal in power generation is approximately 50 per cent. Thus, reduction in coal-costs will also have an appreciable benefit from the point of view of electrification of tracks and the overall fuel economy for the Railways.

On the basis of 90 per cent requirement of selected grade coal and assuming that 50 per cent of the coal will be washed, the overall effective price of coal under the new and revised structure will be about Rs. 42 per ton as against Rs. 34, in other words, an increase of Rs. 8 per ton, i.e., of the order of 25 per cent increase in fuel costs. As an alternative to this, the Railways will be compelled to suspend any programme for washing of coal or reducing the lead for coal and depend

mainly on supplies of good quality, naturally occurring, coal from the extreme eastern zone. Thus, they will be faced with the dilemma of increased lead and, in fact, will have to subsidize the extra cost of lead by increasing the freight on other goods.

In view of the need for heavy capital investment on the Railways for increased traffic, this will indeed be a retrograde step. The Railway Freight Enquiry Committee has already suggested an overall increase of 20 per cent on all freights. The increase in freight rates will automatically un-balance the equalized price structure of coal on an all-India basis and will set in motion a spiral of increase in freight rates and increase in the price of goods which can only end in chaos.

Above all, one has to remember the physical limitations in the freight-carrying capacity of the rail and

in order to offset this physical handicap, the average lead for haulage of coal has to be reduced at all costs. The transport capacity of the Railways can only be increased by reducing unnecessary haulage of requirements. The Railway policy in this matter is evident from the figures given below for the past five years, which show a decreasing trend.

TABLE VI

Year	Average Lead (miles) for Coal (Railway and Public Combined)
1951-52	252.3
1952-53	234.1
1953-54	242.6
1954-55	236.5
1955-56	224.0

HARIJANS OF UTTAR PRADESH

MAHATMA GANDHI gave the name of 'Harijans' (children of God) to the 'untouchable' castes outside the main Hindu caste system. In spite of nearly four decades of Gandhian dedication to the cause of Harijan welfare they still constitute an economic and social problem of the first magnitude—perhaps more an economic than a social problem. As an economic problem the Harijan problem is, in the main, one of landless agriculturists. Their poverty and backwardness as actual tillers of the soil are matters of general observation. Still a systematic statistical survey of their economic and living conditions would have greatly helped in spotlighting what is a blot on Hindu Society and in stirring the conscience of the upper caste Hindus. Surveys of this kind have been very rare, and this fact, therefore, enhances the value of an enquiry, carried out ably by the J. K. Institute of Sociology and Human Relations, Lucknow University, into the economic and living conditions of Harijans in Uttar Pradesh. This special article is based on the final report of this eminently worth while sociological survey.

The Survey was confined to the rural areas of Meerut and Lucknow districts and the urban areas of Lucknow and Kanpur—covering 13 villages and 2 towns in all and completed by the end of June, 1955. The sample families numbered 625 in all—180 in the rural areas of Lucknow district, 245 in the rural areas of Meerut district and 200 in the towns of Kanpur and Lucknow. The size of the sample may be taken as adequate in view of the circumstance that Harijans are known to be uniformly poor and down-trodden throughout the State of Uttar Pradesh.

The results of the survey are assembled in a nutshell in the tabular statement at the end. Although the statement should speak for itself, some elaboration here and there is necessary. This is done here with reference to the serial number concerned in the first column of the tabular statement. In the case of No. 3 (earning members in average family), it is found that nearly a third of the families in the rural areas of Lucknow and Meerut districts and nearly three-fourths of the families in the cities of Lucknow and Kanpur have only one earning member each and nearly half of the families in the rural areas of the districts concerned and a sixth of the families in the two cities have two members each.

In the case of Nos. 4 and 5 concerned with the age of marriage of males and females, it is found that nearly a fourth of married males in the rural areas

of Lucknow district and the cities of Lucknow and Kanpur and nearly half of married males in the rural areas of Meerut district are in the age-group 10-15 years and nearly half of married males in the rural areas of Lucknow district, about a third in the rural areas of Meerut district and four-fifths in the two cities are in the age-group 15-20 years. This is, for a variety of reasons, a distressing state of affairs. But the position in respect of married females is even more distressing. This position is that 14 per cent, 17 per cent and 25 per cent of married females in the rural areas of Lucknow district, the rural areas of Meerut district and the two cities respectively are in the age-group 5-10 years; 61 per cent, 65 per cent and 50 per cent respectively in the regions concerned are in the age-group 10-15 years; and only 18 per cent, 16 per cent and 19 per cent respectively in the regions concerned are in the age-group 15-20 years.

In the case of No. 6 (number of teetotaler-families), a particular breakdown has led to certain interesting findings. One finding is that regular consumers of liquor represent 56 per cent in the rural areas of Lucknow district but they represent only 19 per cent and 14 per cent of Harijan families respectively in the rural areas of Meerut district and in the two cities. Another finding is that those who drink liquor sometimes constitute 11 per cent, 33 per cent and 51 per cent of the families in the three regions concerned. Yet another finding is that those who consume liquor occasionally represent 25 per cent, 49 per cent and 29 per cent respectively in the three regions.

As regards No. 7 (the average number of meals per family per day), the Survey's finding is that 76 per cent of the families in the rural areas of Lucknow district and 83 per cent in the two cities of Lucknow and Kanpur have each just 2 meals per day while 22 per cent, 100 per cent and 11 per cent respectively in the three regions concerned have each 3 meals per day. An idea of the quantity and quality of food consumed by an average adult may be had from Table 41 of the Survey Report. According to this table, all the families in the rural areas of Lucknow district and the cities of Lucknow and Kanpur consume 18 oz. per adult of bread (chapaties) and all the families in the rural areas of Meerut district consume 20 oz. per adult of chapaties per day. Nearly 46 per cent of families in the rural areas of Lucknow district and all the families in the rural areas of Meerut district consume 3 oz. of pulses per adult per day while all the families in the two cities consume 4 oz. of pulses per day. As for rice, 44 per cent of families in the rural areas of Lucknow district and 20 per cent in the

* Ref: Report of Washeries Committee, Coal Board, 1954.

two cities consume 4 oz. per adult per day. It may be roughly taken that an adult Harijan consumes anything from 21 oz. to 23 oz. of food grains (cereals and pulses) per day. This fairly high consumption of food grains is not surprising because the Harijans, as manual labourers, have necessarily to eat that much particularly in the absence of other protective foodstuffs. The position in respect of these (vegetables, fats, sugar or gur and milk) is also known from the table. As for vegetables, 54 per cent, 52 per cent and 38 per cent respectively of all families in the rural areas of Lucknow and Meerut districts consume 3 oz. to 4 oz. per adult per day. Only about a fourth to a third of all families in the three regions take 1 oz. of fats per adult per day and about a third to half consume 1 oz. of sugar or gur per adult per day. As for milk, only 7 per cent of families in the two cities take 12 oz. per adult per day and no Harijan family in the rural areas takes milk. This is surprising in spite of the fact that nearly two-thirds of Harijan families in the rural areas possess cows or buffaloes. Which, perhaps, means that whatever milk is produced is sold and not consumed by the families.

The findings in respect of No. 9 (average land per family) are most revealing. That an average Harijan family possesses 1.2 acres in Lucknow district and 0.3 acre in Meerut district as against the all-India average of about 7.5 acres per agriculturist family is, by itself, a disquieting fact which explains the acute land hunger on the part of Harijan cultivators. The position in other States, more especially in the South Indian States which have larger concentration of Harijans, is, however, worse than in Uttar Pradesh where agricultural land was always more evenly distributed. Having so little or no land of their own, Harijans have either to work as tenants or wage-labourers. Any permanent improvement in the economic status of Harijans should necessarily involve their rehabilitation on their own land. This, however, is a far cry in spite of the Herculean efforts of Acharya Vinoba Bhave to get at least one acre of land for each Harijan.

As Harijan families have practically no assets other than some cattle and tiny bits of land (wherever they happen to possess it), most of them have to borrow at exorbitant rates of interest for their cultivation and consumption expenses. The figures of average rate of interest paid by them (No. 14 in the tabular statement) do not fully reveal the extent of interest-burden. Table 53 in the Survey Report shows that about 10 per cent of indebted families in Lucknow district and 72 per cent in Meerut district pay interest at the 20-25 per

cent rate and about 40 per cent and 20 per cent respectively in the two regions concerned pay interest at the 30-40 per cent rate. The poor Harijan has to lose both on the swings and on the roundabouts!

The monthly income of an average Harijan family in the respective regions is given as the last item in the tabular statement. The per capita annual income of Harijans would come to Rs. 78 in the rural areas of Lucknow district, Rs. 115 in the rural areas of Meerut district and Rs. 192 in the cities of Lucknow and Kanpur. These figures of per capita income of Harijans may be compared with the 1955-56 per capita national income of Rs. 272 at 1948-49 prices in all-India. This comparison is a better index of the economic poverty of Harijans.

Wallowing in such poverty as the Harijans do, they may be excused if they display here and there some signs of ingratitude even to honest social reformers. The least that they may expect is not to be socially discriminated against. But unfortunately the position in this respect continues to be largely what it has always been. Table 20 in the Survey Report is most revealing in this regard. It is found from this table that no Harijan family in the rural areas of Lucknow district is allowed by the high castes to sit on a common floor, to inter-dine, to enter the kitchen, to touch metal or earthen pots or to come into physical contact; no Harijan family is allowed even by the intermediate and low castes to do any of these things except to exercise the privilege of sitting on a common floor. It is the same story in the rural areas of Meerut district. Even in the cities of Lucknow and Kanpur just under 60 per cent of Harijans are discriminated against in most of the above respects by the high castes. The only redeeming feature in the cities is that only from 10 to 20 per cent of Harijans are discriminated against by the intermediate and low castes in these respects. The findings of the survey in the matter of social discrimination against the Harijans are as disquieting as those regarding their monthly incomes. To continue to practise social discrimination against these poorest of the poor would be to add insult to injury. The economic rehabilitation of the Harijans will inevitably take a fairly long time in view of the general poverty in the country as a whole. These "children of God" are not basically so unreasonable or unwise as to go with the Communists everywhere in India, and the possible total absence of social discrimination against them pending their permanent economic betterment may well be consoling to these souls in (what may be called historically-derived) agony.

POSITION OF HARIJAN FAMILIES IN U.P.

	Rural areas of Lucknow District	Rural areas of Meerut District	The Cities of Lucknow & Kanpur
1. Average size of family (Persons)	5	5.4	4.5
2. Number of illiterates (Per cent)	33.4	89.8	74.8
3. Earning members in average family	1.8	2.03	1.19

Economic Report from the U.S.

DEBATE ON "TIGHT MONEY" POLICY

(By GUY SIMS FITCH)

WASHINGTON, July 2.—Somewhat surprisingly in the midst of prosperity, the financial policies of the United States have become an important public issue. How well do they fulfil the nation's requirements of economic growth and stability? Actually, this issue has been coming to a head for some time. Earlier this year, President Eisenhower suggested that Congress authorise a non-partisan commission "to conduct a broad national inquiry into the nature, performance and adequacy of our financial system."

Such a commission has not been authorised. Instead, an inquiry has been launched by the US Senate's Finance Committee, and it was inevitable that this inquiry would take on political overtones. After all, it is a legislative committee controlled by Democrats that is taking a hard look at policies administered by Republicans. It would be a mistake, however, to view the hearings merely in the terms of a partisan political debate. The fact is that the inquiry, now in its third week, is bringing to public attention questions that have been occupying the thoughts of economists for some time.

Under particular scrutiny is the matter of "tight money". Retiring Treasury Secretary George M. Humphrey, Chief Administration spokesman at the Committee hearings, has strongly backed this policy of the Government. His argument has been that creating more credit and money would only increase the total demand for goods and services in the thriving US economy without adding materially to the supply.

The Committee's most vocal critic of the Humphrey thesis has been Democratic Senator Robert S. Kerr of Oklahoma, himself — as is Secretary Humphrey — a business man of substantial means. Speaking for those who find fault with the "tight money" philosophy, Kerr has described it as harmful and uneven in its impact. According to this view, tight money makes things more difficult for ordinary borrowers and small business men. It adds to the cost of Government by raising interest charges on financing; and it may even force prices higher since interest rates also constitute a cost item in doing business.

This conflict of theories is further complicated by the fact that the current and rather mild US inflation does not appear to be following classical lines of too much money chasing too few goods. True, prices are rising and money is in great demand. But goods in most industries are in adequate supply, and the rate of economic expansion has been slowing down a bit. To some observers, this slowing-down foreshadows an easing of inflationary strains in the wake of the Government's policy of restraint.

It should be noted that Secretary Humphrey is no more irrevocably wedded to tight money than are his

critics to easy money as a national policy. Both have indicated support for a "flexible" policy to be applied as circumstances warrant. Thus, it is entirely possible that in the end this majority of the Committee will find tight money has indeed been the policy to be applied under the prevailing economic conditions. So far, the inquiry is only in its opening phase. It still has many more weeks to go, and many more witnesses will be heard. But even at this early date, it is being likened to the sweeping investigations of 1908 and the 1930's, which led to basic reforms in the nation's financial and banking machinery.

There is, however, a significant difference. Unlike those earlier investigations, the present inquiry is being conducted in a period of sustained prosperity and not as a result of either a financial crisis or depression. Post-war experience has shown the financial structure of the United States to be sturdy and sound. The present inquiry, by subjecting it to close inspection now, will help make sure that no serious trouble-spots appear.

The South East Asian market — a problem ?

Businessmen interested in trade with South East Asia couldn't do better than to consult the Indian Overseas Bank. The bank has extensive experience in trade with South East Asian countries through its chain of branches strategically located all over South East Asia. Before you invest in trade in this area it would be wise to consult the Indian Overseas Bank.

Company Meeting

THE NEW INDIA ASSURANCE CO., LTD.

Speech by Mr. Ambalal Sarabhai at the 38th Annual General Meeting held on 26th June, 1957.

Addressing the Shareholders at the Thirty-Eighth Annual General Meeting of the New India Assurance Company Limited, on 26th June, 1957, Mr. Ambalal Sarabhai said that 1956 had been a very difficult year for the Indian General Insurance business. Nationalisation of Life Assurance gave a rude jolt to the base of every composite company leading to a severe dislocation of the entire organisational set-up. A complete reshuffle of the organisation and realignment of the administrative patterns was an uphill task for all the units, but particularly so for those with a large Life portfolio—like the New India.

Mr. Ambalal Sarabhai observed that in order to explore and utilise the vast potential which existed in the field of General Insurance in India, it was absolutely imperative to have a well-organised and integrated General Insurance Market, composed of strong indigenous units, having high administrative standards and capable of rendering efficient service. The procurement cost had also to be brought down so that premium rates could be made more attractive. The Industry had made vigorous efforts, through self-discipline and self-denial, to eliminate wasteful competition. Till now, reliance was mainly placed on publicity and fear of public criticism but without satisfactory results.

CODE OF CONDUCT

The Executive Committee of the General Insurance Council, therefore, introduced a revised Code of Conduct, earlier this year. Mr. Ambalal Sarabhai thought that if the Code were properly supported by the members and enforced by the Executive Committee, it should put the General Insurance Industry in India on a sound and healthy basis.

The basic idea behind the Code is that rebates should stop, and procurement and administrative costs should be reasonable and within legal limits.

SATISFACTORY PROGRESS

Reviewing the working of the Company, Mr. Ambalal Sarabhai expressed his satisfaction that the Premium income of the Company touched a new high at Rs. 5.64 crores in 1956, representing a marked improvement of about Rs. 66 lakhs over the previous year. This, he felt, was particularly commendable in view of the fact that operations of the Company were adversely affected by the nationalisation of Life business, which completely disrupted its organisational set-up, and other factors like the reduction in premium rates for two consecutive years, and loss of more and more business to the Pool and Syndicates. The Miscellaneous Department played an outstanding part in stepping up the Premium income of the Company in 1956. Its Premium income, at Rs. 1.44 crores, showed a marked rise of Rs. 35 lakhs, as compared to a rise of about Rs. 15 lakhs recorded by both the Fire and Marine Departments.

On the disbursement side, claims increased by 1.7 per cent to 50.6 per cent, while Commission, Expenses and Tax Ratio remained constant at 33.0 per cent. The profits, inclusive of interest earnings of the Departmental Funds, amounted to Rs. 43.9 lakhs, maintaining the level reached in 1955. As a result of the year's operations, the Departmental Funds stood at Rs. 4.45 crores as against Rs. 4.11 crores in the preceding year.

The overall result of the operations in 1956 led to a further strengthening of the financial resources by Rs. 52.9 lakhs. The Capital and Reserves stood at Rs. 7.60 crores.

COMPENSATION

Referring to the compensation available to the Company under the Life Insurance Corporation Act (Rs. 48,72,443) and under the Life Insurance (Emergency Provisions) Act, (Rs. 1,50,983), Mr. Ambalal Sarabhai said that the Company had referred the compensation under the Life Insurance Corporation Act to the Tribunal constituted under the said Act. He felt that the Company was also entitled to higher compensation under the Life Insurance (Emergency Provisions) Act. Regarding the issue of one fully paid-up bonus share of Rs. 15 for every three shares held, he informed the Shareholders that the Directors were pursuing the matter with Government.

Note: This does not purport to be a record of the proceedings of the annual general meeting.

RESERVE BANK AND SELECTIVE CREDIT CONTROL

By
(CROESUS)

IT looks as though the Reserve Bank has chosen not to remain any longer so reserve as heretofore. Exactly three months after assuming office as Governor of the Reserve Bank of India—that is last Monday, to be precise—Mr. H. V. R. Iengar created a new precedent by inviting Press men to tea at the Bank and talking to them about the background of a recent action taken by the Bank, namely, the issue of a directive to all scheduled banks, as also some of the big non-scheduled ones, to withhold finance for excessive holding of stocks of sugar and to bring down their present advances against the commodity. This is nothing new, being only one more of the selective credit controls which the Reserve Bank has been exercising for quite some time now and, it may be added, not without some good effect. A candid talk to Press men occasionally like this is a refreshingly welcome departure. Although one cannot expect the Reserve Bank altogether to shake off its traditional reserve, if only to justify its appellation, one knows one can now approach the authorities of the Bank at times and be assured of reasonable response by way of elucidation of issues or clarification of doubts.

On the present occasion, Mr. Iengar did no more than invite pointed attention to certain already published information, such as the rate of developmental expenditure, the rising price trend, the expansion in bank credit, and the decline in the country's foreign balances, but, by doing so, he helped the Press to understand the significance and implications of all the relevant statistical data. Thus, he was able to impress on the Press men, whose duty it is to disseminate to the public at large accurate information, especially on such vital problems, that the authorities are fully seized of the prevailing economic health of the country and, what is more, also adequately equipped to deal with any unhealthy development that may develop. It was, for instance, reassuring to hear from the head of the Reserve Bank—from the horse's mouth, as it were—that, according to the best judgment of the authorities, the situation today, though not permitting of complacency, is nothing to be alarmed about and that we are certainly not in the beginning of any dangerous inflationary era.

According to Mr. Iengar, while it is true that prices of all commodities taken together have risen over last year this time by 9 per cent and over June, 1955 by over 28 per cent, the rise under manufactures and miscellaneous items has been negligible; indeed, as compared to the June, 1955 prices, prices of miscellaneous commodities actually show a small decline. On the other hand, there has been a sharp rise in the prices of food articles and industrial raw materials, and this despite an increase in production over last year. Notwithstanding this increase, food grain production has been still below the peak of 1954-55, thanks to natural causes, the effect of which, coupled with the increase in population, more than offset such improvement in agricultural production methods and technique and such increase in acreage, in particular under irrigated area, as has taken place. Once again, Providence has proved that Indian agriculture is a gamble in the rains. But the authorities hope that this year's monsoon will not be so erratic as the monsoons of the last two years, and if this hope is not belied, the food price front, they say, should not cause undue anxiety.

Even otherwise—and, this speaks for the robust optimism of the authorities—the position can be faced, thanks to the experience gained in the past and the better preparedness of the authorities today. The administrative machinery, which had not been geared up to face the impact of the large developmental outlay of recent years, is undoubtedly in a better position now to tackle the problem, we are told. Between the first year of the first Plan (1951-52) and the current budget year (1957-58), it may be added here, development expenditure has risen from Rs. 259 crores per year to as much as Rs. 900 crores and, surely, this must have its impact on prices. But what matters more than the extent of a given rise in prices is whether the economy can absorb the rise. The Reserve Bank has an efficient research department which collects and collates all the requisite data to enable the authorities to keep a watchful eye on the economic health of the country at any given time.

It is no doubt this constant vigilance that has prompted the authorities of the Bank to be so concerned about the sharp rise in bank credit in recent years. The whole pattern of bank credit has changed now. Until as late as 1953-54, the normal feature used to be for Bank credit to record an increase during the busy season (November-April) and a corresponding, if not larger, decline in the succeeding slack season. In 1953-54 and in the years that followed, due, of course, to the steadily increasing development expenditure, this trend came to be reversed, while, in the years 1955-56 and 1956-57, instead of a return of the advances to the banks, there was actually an increase in bank credit even during the slack season. The causes for this trend are obvious, and it is imperative to arrest, if not reverse, this trend again to the healthier pattern of past years, if unwholesome consequences are to be prevented. If even in the slack season moneys advanced by banks do not return, the inevitable further expansion during every busy season would have to be on an already expanded credit base of not the preceding busy season but of the immediately preceding slack season, which would result in serious complications eventually. Hence no amount of vigilance in this behalf can be said to be too much. But saying this is not to admit that the latest dose of selective credit control on advances against sugar was quite warranted. In the considered opinion of those who can speak with knowledge and authority on this subject, this decision only reflects undue panic on the part of the Bank.

It is true that advances against sugar have risen and, contrary to the usual seasonal decline, recorded a further rise in the first fortnight of June. It is also true that this has happened in spite of the production of sugar in the current year (1956-57 season) having gone up by about two lakh tons above the previous season's output. But one has to enquire whether there are not other factors which have been operating to offset the effects of increased production and to make for a deviation from the usual trend, before rushing to take any action as the authorities seem to have done now. Personally—and this I make bold to say, after discussing the question with a number of persons, who, though connected with sugar interests, are able to speak without any bias—I feel that sufficient note has not been taken of these factors, the more important of which are as follows:

(i) The usual trend was upset this year by the May Budget. For, fearing a further increase in the excise duty on sugar, until the budget proposals were published, dealings in sugar were naturally put off to avoid post-budget wrangles as to who should bear the increase in duty, which explains why, unlike in May, 1956, there was a fall in the level of bank advances against sugar in May, 1957. But, thereafter, dealings were resumed and prices went on rising seemingly beyond even the point at which these could be said to have wholly absorbed the higher excise duty. At this point, it is necessary to enter a caveat. The comparison now being made is rather misleading, because it is between sugar prices immediately preceding the budget and those following the budget. Immediately prior to the budget, it should be remembered, prices were at very low levels, having declined perceptibly from those prevailing a few months earlier. If the present prices are compared with these latter prices, it would be found that these (the present prices) are not, after all, very much higher than what the increased incidence in the excise duty warrants.

(ii) The crushing season this time was spread over a larger time than usual, as the industry wanted to maximise sugar output and assist the authorities in their export promotion programme. Needless to add, the larger the crushing season, the greater the need of bank credit.

(iii) Sugar supplies are governed by periodical releases by the Government itself. So long as such releases also got priority in regard to rail movement, immediately after the announcement of each release, prices used to settle down to reasonable levels. Apparently the authorities still think this position is unchanged. For purposes of record, if not for their in-

formation I don't think they need my telling them—it may be stated here that sugar interests are neither getting an adequate number of wagons nor a sufficiently high priority for moving sugar. Because of food grain scarcity food movements are naturally given the topmost priority and, in the absence of sufficient wagons, the railways have gone to the extent of even suggesting movement of sugar in open wagons! One thought it was bad enough their suggesting open wagons for cotton movement. Be that as it may, in view of this delay in sugar movement, there is avoidable delay in the receipt of R/Rs. and, until these R/Rs. are received, wholesalers in sugar cannot draw on their clients and repay their banks. The same difficulty operates in respect of exports also, where, until the sugar is loaded and the bill of lading is got, the exporter cannot repay his bankers the advances against sugar that he may have obtained.

But for these abnormal factors, it is highly doubtful if advances against sugar would have stood at the high levels at which they are standing now, after making due allowances for the relatively larger amounts needed to finance the increase in production of about two lakh tons. Surely an increase of Rs. 5 lakhs in the monthly average advances against sugar for the quarter April-June of 1957 over the corresponding quarter of 1956 cannot be regarded so abnormal as to warrant all this ballyhoo. Nevertheless, I feel convinced that, broadly, the authorities have done the right thing in keeping as vigilant an eye on the rising price situation as they are doing and in being adequately armed to deal with any eventuality. This, however, is the least insurance that is expected of the monetary authorities, especially of an underdeveloped country pitted against the impact on its economy of large developmental expenditure.

A Letter to the Editor

EAST GERMAN TRADE WITH INDIA

Sir,

We beg to refer to the statistics in your journal. We have found that incorrect figures have been published as regards trade between India and the German Democratic Republic. We suppose that the figures were derived from Customs Statistics.

We have informed already the Ministry of Commerce and Industry, Government of India, that the cause of these mistakes is the fact that a part of our exports and imports appears in the statistics of West Germany's trade with India since certain consignments of our country to India are despatched through Hamburg.

We take the liberty of giving you the correct figures relating to our trade with India for your information.

I. Export from the G.D.R. to India.

(a) January 1, 1955 to Dec. 31, 1955	Rs. 15,400,000
(b) " " 1956 to " " 1956	" 27,854,000
(c) " " 1957 to March " 1957	" 5,766,000
(d) " " 1956 to " " 1956	" 1,871,000

II. Import from India to G.D.R.

(a) January 1, 1955 to Dec. 31, 1955	Rs. 6,476,400
(b) " " 1956 to " " 1956	" 16,716,000
(c) " " 1957 to March " 1957	" 5,490,000
(d) " " 1956 to " " 1956	" 2,000,000

Yours faithfully,
M. RUDOLPH

Trade Representation of the
German Democratic Republic
in India, New Delhi.

COMPTOMETER — the world's fastest adding-calculating machine — does the work of more than four people!

Speed—floating touch for quick and easy operation.
Accuracy—Three-way control! Through sight, sound and touch.

GROWING ORGANISATIONS NEED COMPTOMETERS

for fast, accurate, efficient accounting

TODAY, every business organisation is growing. Fast, accurate, low-cost accounting is essential to make your business move faster. Experience of progressive establishments throughout the world has proved that Comptometer is the world's fastest, most accurate, lowest-cost accounting machine. Let us prove this in your office, FREE!

P.N. Ganesan & Sons

Sole concessionaires in India for world famous Comptometer, Comptograph, Walther Calculator and Comptometer Dictation Machines hitherto marketed in India by Felt & Tarrant (India) Company

COMPLETE COMPTOMETER SERVICE

P. N. Ganesan & Sons who have taken over the Felt & Tarrant Offices in India are equipped to offer you the same quick, efficient repair and maintenance service as before. You'll get a spare machine when yours is taken for repairs. They'll train your staff free of charge to become skilled Comptometer operators. Every Comptometer you buy carries with it a guarantee, against any manufacturing defect, for one year. Write today to any of our following offices for demonstration:

BUSINESS NOTES

AUSTERITY IMPORTS

THE IMPORT policy announced for the current quarter, July-September 1957 could not be anything other than one of strict austerity. With our sterling balances leaving a nominal margin of hardly Rs. 67 crores above the minimum currency reserve of Rs. 400 crores, Government had no option left but to issue an appeal for tightening the belt. Nevertheless, the wheels of the economy are to be greased in essential particulars. Import requirements of export industries have been given special attention in licensing. Capital goods and raw materials are on the permissible list of import licensing. Care has been taken, however, to emphasize that no general relaxation can be granted in respect of the terms of deferred payment which have been attached to the import of capital goods. Steady progress is being made in setting up institutional arrangements to secure deferred payment facilities and one major principle which will be observed is to ensure that the liability will be discharged when it falls due. All this does not imply that the actual flow of imports during the current quarter will be slender. Outstanding licences are estimated to be worth Rs. 435 crores—Rs. 300 crores for capital goods, Rs. 120 crores for essential goods and Rs. 15 crores for raw materials. Precision is lacking in this estimate of the liability of foreign exchange which has been incurred already. Nevertheless, the quarter's import policy had naturally to take account of the outstanding licences.

In essence, this quarter's import policy is experimental. The period of experiment could be reduced to three months by reason of the fact that a decision has been made to change the six-monthly licensing periods from the calendar year to the financial year in order to bring import policy and procedure into closer alignment with policy on foreign exchange control. Open General Licences have been abolished for the current quarter except in so far as they relate to perishable edibles in the Indo-Pakistan border trade as incorporated in the bilateral agreement between the two countries. Quotas for established importers, too, have been abolished. These radical measures have been taken on the plea that sufficient stocks of necessary commodities and of consumer goods which contained a good element of import exist in the country. These measures are fraught with consequences which will need to be watched with the greatest care. Action has been taken by means of a fresh order to bring more items on the list under the Essential Commodities Act and another order has been issued calling upon distributors to declare stocks of specified commodities as on June 30 last with an additional obligation to make a similar declaration every month. Experience should underline the fact that a gulf usually lies between statutory powers and their enforcement in day-to-day administration. The inflationary risks involved in a policy of austerity imports which puts a virtual ban on consumer goods are happily limited to a short period. But market trends, granting the existence of stocks in hand, will demand careful analysis. All these factors will be weighed when import policy for the next half-yearly period—October 1957 to March 1958—comes to be formulated.

'VIA MEDIA' MADRAS

UNLIKE THE Finance Ministers of Mysore and Bombay who have left the entire deficit of their respective States uncovered, Mr. C. Subramaniam, the Finance Minister of Madras, has come out with a proposal for additional taxation, though only to cover a part of the total deficit of the order of Rs. 4.83 crores. It was hoped fondly as it has since transpired — that the Madras Finance Minister also would follow the example of his

Mysore confrere in regard to Agricultural Income-tax and leave the rates thereof unchanged. Evidently he seems to have preferred to follow a 'via media' course as between the non-Congress Kerala Government, on the one hand, and other State Governments, such as those of Mysore, West Bengal and Assam which are also specially interested in plantation industry, on the other.

The revised budget estimates for 1957-58 presented last week-end to the Madras Legislature put the revenue of the State for the year at Rs. 56.49 crores (at the existing levels of taxation) and the expenditure at Rs. 61.32 crores, thus leaving a deficit of Rs. 4.83 crores. As already stated, the Madras Finance Minister has chosen to cover a portion of this deficit by certain readjustments in the rates of General Sales tax and by raising the level of Agricultural Income-tax on plantations. As a result of the former, Mr. Subramaniam expects an additional revenue of Rs. 170 lakhs over a full year, but only Rs. 125 lakhs in the current year, whereas his second proposal is expected to yield an income of only Rs. 25 lakhs per annum. One wonders whether for just this small amount the Finance Minister was justified in creating the psychological unrest among the plantation circles that he has done.

Even as between both his proposals, Mr. Subramaniam expects to get no more than Rs. 1.50 crores. Thus, if he cared to afford to leave a deficit of as much as Rs. 3.33 crores uncovered, one fails to see the compelling logic of his new imposts which are more or less of a nominal nature with hardly an appreciable fiscal benefit. Anyway, like his Kerala counterpart, Mr. Subramaniam also has singled out for his additional imports plantations — an industry which is already reeling, in all conscience, under the present impact of heavy increases in wages. It must be added, however, that the companies must be thankful for small mercies, inasmuch as no slab system has been incorporated into the Madras scheme, which should benefit especially the larger companies.

CHALLENGE TO TEXTILE MILLS

THE CALL to the Indian Textile Mills to improve their production techniques made by Mr. Neville Wadia, Chairman of the Cotton Textile Export Promotion Council, at the third annual general meeting of that body last week, is as realistic as it is urgent. For, it follows a thorough analysis of the trend of our textile exports over the past three years, vis-a-vis the international trade in cotton textiles. After quoting the relevant figures, (which are produced in the table below) Mr. Wadia posed the question: what is to be learned from these figures? And his answer was: "It is simply this—that our competitive power lies only in the fact that we grow our cotton and that its price is the main factor which helps us to export at all. The coarser we go, the more competitive we become. In fine, we are hardly competitive at all in fine and superfine. Even our processing is comparatively uneconomical, otherwise there would not have been such a marked decline in the export of finished goods. These facts must be faced and our policies and actions must be guided by them".

Now against this background, it is necessary to examine the steps that are required to be taken. Mr. Wadia's suggestion in this behalf was: "Firstly, we must do all in our power to improve our production techniques, both from the point of view of quality and of becoming more economical. All possible steps should, therefore, be taken to install as quickly as possible the 18,000 automatic looms sanctioned for expansion for export. Unfortunately, little progress, if

any, has been made since the announcement over a year ago and I would like to suggest that the Textile Commissioner should sit down with those who have been given licences and settle all the outstanding points without further delay". In this connection, Mr. Wadia was of the opinion that imports of automatic looms and many finishing machines, the production capacity of which is still insufficient to demand, must be allowed and in order to pay the foreign exchange involved, he commended the second of the two alternatives suggested by the Government of India on March 30, 1957 for the import of capital goods.

Proceeding, Mr. Wadia made the interesting disclosure that, if India can improve her production techniques and competitive capacity, she can earn anywhere up to 25 per cent extra foreign exchange. He also holds the view that the fine count mills in our country should make a determined effort to find markets abroad for our cotton textiles. In his opinion, which cannot certainly be brushed aside lightly, the fine counts section of the Indian cotton mill industry has taken comparatively little interest in our export trade so far, and it behoves them, therefore, to come forward and help earn foreign exchange by increased exports of our textiles. This is a time when the country needs the effort of everyone. Mr. Wadia certainly knew what he was talking about when he said: "These mills will be surprised to know to what extent their efforts to expand can be rewarded". In view of this, these mills cannot afford to be complacent any longer. Even from their selfish point of view, they would be failing themselves, let alone in their duty to the country, if they do not make amends for their lapses so far in not having made known to the markets of the world how vastly improved Indian production in fine and superfine cotton goods has become. This is a sporting challenge to them which they must accept in good grace and with all sincerity.

Year	(In Million Yards)		
	International Trade in cotton textile	Exports from India	Percentage of our exports
1954	5,170	898	17.36
1955	4,556	815	17.89
1956	4,400	744	16.91

SMALL INDUSTRIES CORPORATION

THE ADMINISTRATION report of the Small Industries Corporation for 1956-57 is revealing in one or two respects. One of the functions of the Corporation was to give assistance to small units to participate in an increasing measure in the Stores Purchase programme of Government. The idea was since improvement in technique and quality of production in the small industries sector is a gradual process, it can best be sustained by working on assured orders. Hence immediately after its formation, the Corporation set out to negotiate and formulate a working agreement with the D.G.S. & D., the largest purchasing organisation of the Government. The report reveals how in actual practice inadequacy of finance, inefficient methods of production and weak organisation of the small-scale units on the one hand and the rules and regulations in force in the Directorate-General, Supplies and Disposals on the other made the task extremely difficult. After negotiations carried on continuously, a procedure was adopted with the approval of the D.G.S. & D. which allowed a certain amount of relaxation in the rules so far as purchase from small units was concerned. But the procedure again did not prove satisfactory in actual working as seen from the fact that since the introduction of the informal arrangement with the D.G.S. & D. the Corporation dealt with 118 tenders till the end of March 1957 out of which it was successful only in respect of 10 items valued at Rs. 580 lakhs. Another revealing fact was the Corporation was forced in many

cases to compete with small scale units borne on the approved list of D.G.S. & D. which put the Corporation in an embarrassing position vis-a-vis the small scale units borne on the list of D.G.S. & D. The report goes on to point out how after a detailed examination of the position by an American expert, the Government has evolved a new procedure for purchase of stores from small-scale industries. Consequently, the Corporation has set out to reorganise its Government Purchase Division to fit into the pattern of the new procedure and scheme and small scale units desirous of participating in the Government's new purchase procedure have also been required to furnish the necessary particulars. It is to be seen how the procedure is going to work and how far the small industries sector as a whole will ultimately benefit.

The report also brings out the problems to be faced in the export of small-industries' products. It bluntly states that the lack of assurance of quality of their products retards the possibilities of their export despite their prices being extremely competitive. A matter of considerable interest, however, is the development of an Export Section in the Marketing Division which has started operating with an order for three lakh pair of shoes to Russia. The context in which the order was placed and the subsequent developments read like a veritable story. The report points out how the order had been undertaken without having set up the necessary organisation to handle this work and there was no machinery to look after the production, inspection, storage and payment to the small-scale units. The producers of footwear in the country did not seem to have the necessary experience to fabricate footwear to set standards. The first inspection of shoes by the Russian inspector, according to certain standards of the West, proved to be discouraging, resulting in an initial setback to bulk production. The Corporation at a particular stage had to take a spot decision with a view to encouraging the small units to continue to produce, by agreeing to purchase on its own account all that was accepted by their specially recruited inspectors. However, the report records with satisfaction that the Russian inspection has brought up the quality and standard of production of footwear in the country to a considerable extent. Not only that, the effect of the Russian order on the small-scale footwear industry shows that it has resulted in doubling of production of quality shoes in the main producing centres. There has also been a relative increase in both employment of labour and profits of small units in the area. This is good performance indeed.

NEW INDIA TOUCHES ANOTHER PEAK

MR. AMBALAL SARABHAT'S presidential speech at the last annual general meeting of the New India Assurance Company Limited, which appears elsewhere in these columns, gives a gist of the financial working of the company during 1956. The conclusion which easily strikes the reader is that New India has maintained its tradition of sound under-writing policy and progressive working of business.

The premium income of the company touched another new peak in 1956 at Rs. 5.64 crores or Rs. 66 lakhs above the previous year. Considering the upsets caused by nationalisation in the structure of this composite company, this performance is undoubtedly creditable to the management. Of the increase of Rs. 66 lakhs in the premium income registered last year, Rs. 35 lakhs was the contribution of the Miscellaneous Department and Rs. 15 lakhs the contribution of the Fire and Marine Departments. There was an increase of 1.7 per cent under the head of claims pushing the actual percentage to 50.6. Profits including earnings from interest were of the order of Rs. 43.9 lakhs and maintained the level of the previous year. Financial resources were further fortified by Rs. 52.9 lakhs. Capital and Reserves reached Rs. 7.60 crores. The question of the issue of Bonus Shares is under negotiation with the Government.

COMMODITY NEWS AND NOTES

RECORD SUGAR OUTPUT EXPECTED

It is estimated that the total availability of sugar during the year will be 25.8 lakh tons, including, 5.3 lakh tons carried over from the previous year. Sugar production in India in 1956-57 totalled 20.5 lakh tons—a record figure since 1947, according to an official release. Production in 1955-56 was 18.6 lakh tons. The sales made for export up to June 17, 1957 amounted to 1.42 lakh tons of which about 50,000 tons have been shipped so far. It is estimated that the year will close with a carry-over of more than 4 lakh tons, which means that the supply position will continue to be comfortable.

The production and despatches of indigenous sugar amounted to 20.02 and 13.23 lakh tons up to June 15, 1957, in the current season against 18.25 and 10.18 lakh tons respectively in the corresponding period of the last year. The stocks with the factories on June 15, 1957, stood at 12.01 lakh tons, as compared with 12.16 lakh tons last year.

STANDARD SPECIFICATION FOR COIR FIBRE

An Indian Standard specification for coir fibre has been published by the Indian Standards Institution. The Standard takes into account existing trade practices of grading the coir fibre. Of the three characteristics of the coir fibre, namely, colour, percentage of impurities and the length of fibres, colour is considered the most important factor in determining its grade. The standard specification is that the colour of the fibre should be evaluated by comparison in the boxed coir fibre standards. The boxed coir fibre standards, containing nine specimens of fibres, white, bright natural, natural, light red, reddish, greyish, dark red and dark grey standard colours are held in the custody of the Coir Board.

MINIMUM PRICE FOR COCONUT OIL

The Government of India have rejected the Central Coconut Committee's proposal for fixing a minimum price for coconut oil since it has felt that this is not the appropriate time. A special sub-Committee of the Indian Central Coconut Committee had recommended that a minimum price of Rs. 1,425 per ton be fixed for coconut oil and this was forwarded to the Government of India for action.

ALL-INDIA FINAL ESTIMATE OF DRY CHILLIES

The All-India final estimates of dry chillies for 1956-57 puts the current year's area and production at 1,450,000 acres and 354,000 tons, as against the partially revised estimate of 1,490,000 acres and 355,000 tons respectively for 1955-56. This shows a decrease of 40,000 acres or 2.7 per cent in area and 1,000 tons or 0.3 per cent in production over last year. The decrease in area and production has been shared by Andhra Pradesh, Bombay, Mysore, Punjab and Madhya

Pradesh, and has been attributed generally to the unfavourable climatic conditions during the current year as compared to the previous year. This decrease has, however, been offset to some extent by the increases recorded by Bihar, Rajasthan and West Bengal.

EXPORT POLICY FOR MANGANESE ORE

The following concessions and modifications have been announced by the Government with regard to the export of manganese ore: Manganese ore moved to the ports against current quotas up to June 30, 1957 will be permitted to be shipped up to August 31, 1957, on an 'ad hoc' basis, provided that it is provided to the satisfaction of the Export Trade Controller concerned that shipment is to be made against contracts entered into before March 31, 1957. The minimum percentage of low grade ore (42 per cent and below, manganese content) will be reduced from 60 per cent to 40 per cent. This condition will not be insisted upon in the case of small exporters whose quota for the period July 1957—June 1958 works out to 1,500 tons or below. Mineowners, whose quotas during the period July 1956—June 1957 was 3,000 tons and below, will be given the choice to claim their quota for 1957-58 on the basis of 60 per cent of their actual exports in 1955 or 1956 or 75 per cent of their quota during the period July 1956—June 1957.

COCONUT OILCAKE RELEASED FOR EXPORT

The Government of India have reviewed the export policy for coconut oilcake and have decided to release a quota of 5,000 tons for export by all shippers during the half-year July-December, 1957. Detailed licensing procedure is being notified by Export Trade Control authorities at the ports.

OUTPUT OF IRON ORE

The output of iron ore in India during April 1957 was estimated at 392,476 tons. The production in March was 406,816 tons. The returns received by the Chief Inspector of Mines in India from 128 mines during April showed that 285,208 tons were despatched to iron and steel plants and 82,300 tons to the export market. The iron ore stocks at the end of April amounted to 1,410,304 tons.

FINAL ESTIMATE OF TUR, 1956-57

The all-India final estimate of tur, 1956-57, puts the current year's area and production at 5,696,000 acres and 2,047,000 tons, as against the partially revised estimate of 5,637,000 acres and 1,830,000 tons for the last year according to the Directorate of Economics and Statistics. Thus, the current year's estimate shows an increase of 59,000 acres or 10 per cent in area, and 217,000 tons or 11.9 per cent in production over last year.

The Centre and the States

WHEN the Prime Minister returns this month, almost certainly one of his first reproofing letters to the States will deal with "irresponsible" budgeting. It will be remembered that before his departure he spoke publicly in this vein but the States have chosen to discard both his appeal and advice. It now appears that the total deficits in the States might be of the order of Rs. 75 crores. If any political or economic observer wished to indicate the growing independence of the States in the Indian Union he could have found no better illustration. It is a wholly mistaken axiom of Indian politics, accepted uncritically by foreign observers, that the ascendancy of Jawaharlal Nehru at Delhi provides a common bond between policy in the Centre and the Congress States. Ironically, it is the Kerala Government alone that has made common cause with the Centre. On more than one subject — "co-operative" farming is another — the thinking of the Centre and some

of the States is wide apart. When rifts occur, someone gains, while someone loses. It has become increasingly clear that it is the States which are gaining in strength at the Centre's cost.

This is both a political and economic phenomenon of which in many articles note will need to be taken. For the present, one needs, however, to ascertain whether in State budgeting, it is the Centre's view or the States' view which is mistaken. On the volume of Central taxation, *The Eastern Economist* has expressed itself already against the excessive burden imposed. By the same token, it now believes that the virtual absence of additional taxation in the States — induced in large measure by the excessive taxation of the Centre — is something in the right direction.

Thus it is that one can look upon the events that have taken place with no concern or alarm.

and, indeed, with some happy feeling that the Indian political system has a sense of balance and understanding, which will correct the errors of extremism, whether at the Centre or in the States. In this case it happens that the Centre has erred and the States have redressed the balance. In this sense—to use a classical phrase—a new world has been called into Indian political practice to redress the balance of the old.

These general impressions are suggested by the Budgets of the various States (barring Uttar Pradesh) which have by now announced their estimates for 1957-58. It is not entirely fortuitous that all these budgets fall into a uniform pattern of revenue deficits ranging from Rs. 2.3 crores in the case of Kerala to Rs. 25.0 crores in the case of Bihar. The aggregate revenue of the twelve State Governments comes to Rs. 572 crores while their expenditure on revenue account aggregates Rs. 649 crores, leaving a total deficit of Rs. 77 crores. A part of this deficit is accounted for by expenditure on revenue account on Plan schemes and a part by new items of expenditure outside the Plan. The revenue deficits of West Bengal, Orissa, Andhra, Assam, Mysore, Bombay and Madhya Pradesh are left wholly uncovered while those of Bihar, Rajasthan, Punjab and Madras are partly covered by additional taxation. The only State which has converted its revenue deficit into a nominal surplus of Rs. 7 lakhs is Kerala, and this it has done by way of additional taxation. While Kerala is to make up Rs. 2.4 crores by additional taxation, the other four States which propose to cover a part of their deficits (totalling Rs. 35.4 crores) are to raise only Rs. 5.1 crores by new taxes. Besides the revenue deficits, there are some deficits on capital accounts, the total of which is probably not inconsiderable.

On a superficial view, most State Governments have thus recklessly budgeted for deficits in spite of Prime Minister Nehru's warning. There is, however, nothing surprising in this performance of the State Governments after the staggering tax effort of the Central Government this year. If all the State Governments have chosen not to cover their deficits wholly by additional taxation, there is nothing alarming in the situation either. For, it is not unlikely that the revised estimates later on may reveal smaller deficits for the reason that budget revenue estimates are usually under-estimates and budget expenditure estimates are over-estimates. In any case an aggregate deficit of Rs. 72 crores would represent just 11 per cent of the aggregate expenditure of Rs. 649 crores, or one-eighth of the total revenue of Rs. 572 crores and probably not more than one-sixteenth if under-estimates on the revenue side and over-estimates on the expenditure side are taken into account. Even this one-sixteenth may well cease to be there with the likely increases (over and above what the State Budgets have taken into account) in the States' shares of income-tax, additional excise duties and surcharge on railway passenger fares. It is thus inappropriate to level the charge that most States have recklessly budgeted for deficits and, on that basis, to give a gratuitous certificate to Kerala for more than fully covering its revenue deficit. If anything, the State Governments concerned may have to be congratulated on not adding further to the tax-burdens imposed on the people under the recent Central Budget which certainly could never have been matched in the States without producing a revulsion for the Congress which even the Prime Minister's prestige could never have taken.

If, on the other hand, it is assumed that the anticipated deficits in the State Budgets may not be made good in the aforesaid manner, would that mean there may be actual shortfalls in the second-year outlays of the State Plans? This is not unlikely, for the State Budgets take credit both on the revenue and on the capital accounts for about Rs. 275 crores only by way of grants, loans and advances from the Centre. As this assistance for the State plans would represent so much deficit-financing at the Centre, it reduces itself to a question of whether such deficit-financing could be stepped up further to enable the States to execute their second-year schemes fully. This, however, is not likely to happen if the Union Finance Minister strictly adheres to the dose of deficit-financing contemplated at present for 1957-58. If, by any chance, the Centre should resort to a heavier dose of deficit financing of the order of Rs. 350 crores during the year, it has to be considered whether and how its effects will be cushioned off.

The prospects for such cushioning off are brighter now than at any time since the close of 1956, for the adverse effects, if any, of deficit-financing can be countered more or less swiftly by selling imported food grains (to the tune of about 4 million tons under the current as well as the prospective commodity loan agreement with the United States) in the monetised sector of the economy at 10 or 15 per cent less than the market prices. As the marginal shortage of food grains is as much in respect of rice as of wheat, the report is heartening that 800,000 tons of rice too can be had from the United States under the forthcoming food grains deal. With the controlled fall in food grain prices that will follow a relative abundance of supplies in the monetised sector, the general level of prices too will come to be slightly reduced and stabilised, and this will help in keeping the money cost of the Plan schemes at more or less the budgeted level. With the absorption, through food grain sales, of the additional money incomes widely generated by the deficit-financed Plan expenditures, the created money will have found its way back to the government and industrial sectors to start on its second round of useful functions. In this context, therefore, it would appear that the Central and State deficits taken together lose their terror.

This, however, does not mean that there may not be sizable short-falls in the second-year expenditures of the State plans. Elsewhere in this issue it is noted that the actual outlay in the first year of the second Plan at the Centre and in the States has been just 85 per cent of the originally planned outlay for the year and that in view of the greater difficulties in 1957-58 in respect of foreign exchange the planned second-year outlay of about Rs. 960 crores may actually come to just Rs. 770 crores only. If thus the targeted outlays for the year are not reached it will be more because of insufficient foreign exchange resources than because of any paucity of rupee resources. If the possible adverse effects of deficit-financing in the matter of rupee resources can be speedily overcome by the sale of imported food grains, it is not inconceivable that the problem of foreign exchange can also be solved to a large extent by the United States and the World Bank. The outcome, in this connection, of the Union Finance Minister's forthcoming visit to the United States may be watched with more than ordinary interest.

Electricity: Political Fuel?

THE difference — which it would appear from rumours current in the Capital — that exists between the Ministry of Irrigation and Power and the Home Ministry in regard to the future administration of electricity supply in the Delhi area contains a point of principle which has a much wider application, and deserves, as an issue of principle, all-India treatment. The debate on the appropriate instrument for electricity generation administration is an old one. The consensus of expert opinion seems to have come out, as we have hitherto done, in favour of Electricity Boards, generally non-political in outlook and policy. The Ministry of Irrigation and Power has this substantial backing for its view that electricity supply and generation should fit into a large picture, and be governed by less political local pressure than is likely to emerge from a city corporation. There also happens to be in the case of the Bombay Corporation an instance where electricity supply undertakings have been kept out of the purview of the Corporation, notwithstanding its having taken over the Bombay Electric Supply and Tramway Company. This exclusion, as the Minister for Irrigation and Power knows — and his acquaintance of the capacity of the Corporation in Bombay is probably greater than that of any living person — has been for the good of electrical undertakings in that city. If it should happen that Delhi sets an unwise precedent for no better purpose than that it desires to extend the area of local autonomy, the repercussions may be heard almost in every city of India. And this is hardly the time to add fresh fuel to the political fire.

Power development in India has been conditioned by appropriate legislation, the recent example of which is the Electricity (Supply) Act providing for the rationalisation of the production and supply of electricity. Primarily intended to make provisions governing the formation and functioning of Electricity Boards and regulation of Licensees' finances, the 1948 Act transferred the rights and options for purchase of electricity supply undertakings operated by licensees which were under the Indian Electricity Act 1910, vested in the local authorities in the first instance, to Electricity Boards visualised under the enactment. This transfer was based on the framers of the Act holding that it is bodies like Electricity Boards which are likely to be the most suitable organisations for working the grid system on quasi-commercial lines.

It would be appropriate to place emphasis on the words quasi-commercial lines: this pre-supposes the establishment of a healthy balance between earnings and expenditure. This approach has been reinforced by the statute, in that under the Electricity (Supply) Act the State Electricity Board shall not as far as possible carry on its operations under the Act at a loss. Will such a safeguard be provided under the new law seeking to create the Greater Delhi Municipal Corporation. If this is not done the danger of an undertaking now viable being exposed to financial loss cannot be overlooked and should this eventuality result the Delhi community will be no better (since prices of electricity will never be reduced), while the country loses as a whole.

The argument that water supply has been efficiently conducted by local corporations is not an argument at all. For one thing, water supply is intensely a local matter which does not enter into the great ramifications which are involved in the costing of electric power. No industrialist, for example, would be deeply concerned about the water supply rates, which only affect his costs in a marginal manner. On the other hand, electricity rates stand on an entirely different footing, and in particular industries, notably aluminium, they are decisive. From the point of view of the national interest, they should be at a minimum consistent, of course, with covering costs so that industrialisation might proceed as rapidly as possible. Local administration does not make for the cheapest electricity. Apart from the question of price, there is the issue of generating, over the country or at least over a region, some uniform practice so that purely local considerations do not give to the pricing of electricity a factor distorting the placing of new industries. In a particular case, namely, that of the Bombay Municipal Corporation it can be seen at once that embarrassment might arise if electricity policy in that City were left in the hands of the local unit. If, for example, the Corporation chooses, as it well might, to stake everything on the Maharashtra Samiti policy it can, with its majority in that Corporation, defy the Central Government. This is merely one illustration of the danger of allowing local bodies, which may well be adverse to the Centre, to acquire powers which can be used legitimately in defiance of Central policy.

The Electricity Board in a State, apart from conducting operations on its own, is also vested with regulatory powers in relation to licensees, be they company-owned or Local Authority operated. Such regulation of Local Authority undertakings is exercised by the Board through its powers to direct amortization and tariff policies of such authorities and, therefore, even if the Delhi undertaking is to be vested in the new Local Authority there will be need for a Board to control them. Then, again, there are some undertakings operated by licensees in the area which need to be regulated by the Electricity Board. If any change in the organisation concept as visualised in the Electricity (Supply) Act is necessary, it is now important that the law should be changed to make it possible for State Electricity Boards to acquire Local Authority electric supply undertakings. The development in the United Kingdom in this respect is interesting in that in 1947 when the structure of the industry was changed, Area Boards were vested with powers to take over Local Authority undertakings.

There are thus convincing arguments in favour of adhering strictly to the background of the Electricity Supply Act of 1948 on this point. Quite apart from the intrinsic merits of the State Board approach, there is certainly no urgency in a matter of this kind. On the whole it would appear that at a time when legislation is already over-full and greatly indigested (being in part indigestible) the proposal to alter the law again is one which is condemned as much by expediency as by the principles described above. The Home Minister, who has a fine sense of timing in his approach to legislation, will surely appreciate this consideration.

Russia's "Poisonous Weeds"

EVERY change in the Kremlin is, to quote Sir Winston Churchill, from a different context, "a riddle wrapped in a mystery inside an enigma". For contrary to the practice in democratic countries, it represents in Russia culmination of secretive discussions and intrigues. The present shake-up—the third since Stalin's death—is, however, devoid of any such fascinating element. This is so in spite of the fact that the present "purge" is indisputably the most extensive since the notorious purges of the last thirties and not even Stalin himself could have improved upon the methods employed to remove the dissidents. The development merely proves—if ever proof were needed—the sharpening of the struggle for power among Stalin's heirs. This is obvious from the personalities involved. None of those expelled was an insignificant incumbent in the Soviet hierarchy. Nor was any one of them a political upstart, so to say. They were as much part of the Soviet myth as they were the legatees of the Stalin legend. Ordinary political cross-currents were highly unlikely to affect them. Their fate might well adversely affect the course of events in the Soviet Union. While Mr. V. M. Molotov, the sea-green incorruptible of Stalinist orthodoxy and Mr. Lazar Kaganovich, the Soviet heavy industry expert, are pre-October Revolution Bolsheviks, Mr. Georgi Malenkov and Mr. Dimitri Shepilov have had a considerable later history with the Party.

In uninformed but optimistic circles of the non-Communist world, the purge has been interpreted as a prelude to greater "liberalization" in the Soviet Union. In fact, the paradoxical myth that liberal ends can be promoted through totalitarian means, is again being revived. Even Mr. Nehru has rushed to discern in the happenings in Russia "a step towards normalcy". What is normalcy in a totalitarian regime? Can it be that greater concentration of power in one man is more "normal"? One could agree with such impressions — they are no more than that — but for reasons different from those of the Prime Minister and others. A struggle for power cannot be held to be abnormal in the history of totalitarianism. During the period of "collective" rule after Lenin's death, it took Stalin a decade to consolidate his power. Mr. Khrushchev has had but four years and he did not quite enjoy the advantages open to Stalin. But the surprising thing is that in this brief period Mr. Khrushchev has been able to dislodge and humiliate not only Mr. Malenkov, the heir-presumptive to Stalin's throne but veterans like Mr. Molotov and Mr. Kaganovich without whom it would be impossible to think of Soviet Union's diplomatic triumphs abroad and real or imaginary industrial achievements at home.

That the struggle for power has taken a serious turn is also evidenced by the fact that Mr. Khrushchev took the extreme step of disgracing his opponents at a time when apparently he had none of Stalin's trump cards. The present Soviet Communist Party chief cannot play either on the fears or hopes of the Russian people as did Stalin. Russia is no more threatened with capitalist encirclement and in place of the memory of intervention today many in Russia still remember gratefully the quantum of aid and assistance from the West during the last war. Also, according to Mr. Khrushchev's own reasoning, a Socialist world has emerged which can successfully compete with and challenge the non-Communist world

in spheres not necessarily warranting belligerency. He cannot, moreover, blame the kulaks or the capitalists for the Russian people's hardships. That the atomic stalemate is a powerful assurance of peace, even if an uneasy one, is not unknown to the Russian people. It is also not often realized that the entire population of working age in Russia was born and bred after the "Great October Revolution" and is thus comparatively free from xenophobia.

It is perhaps due to these changed circumstances that the familiar charges of "being an agent of imperialism" and "traitor to the cause of world Communism" have not been brought up against the dismissed leaders. On the contrary, the charge against them is that they "were, and still are, captives of old notions and methods"; they have failed to "see new conditions", showed "conservatism" and worked against the liberal policy of de-Stalinization! Aware of the Russian people's mood Mr. Khrushchev and his supporters have sought in the fallen leaders scapegoats for the Russian people's misfortune abroad and the endemic hardship at home.

What is particularly striking about the purge is the denial of the right to its victims by which they so vociferously swear in their propaganda drives. The fallen were given no opportunity to defend themselves within the sight and knowledge of the Russian people. Dissent has been their chief crime. The minority has been unceremoniously dismissed and ruthlessly silenced. In any democratic country the expulsion of such top-ranking leaders from the Party hierarchy could not have been accomplished so suddenly and so silently. In any case, an explanation would be necessary to the people with the right to question its veracity or otherwise. What the world has witnessed is antithetical to all concepts of democratic and liberal practice. And there is little wonder. Totalitarianism is inherent in Communism and no amount of liquidation of the opposition can cure it from what has come to be known as Stalinism. When Mr. Khrushchev confessed that "we are all Stalinists" in resisting the "imperialists and their agents", the Soviet leader in effect acknowledged that Stalinism was inseparable from the Communist system. This incidentally explains the paradox of liquidation of Beria and the present purge being the handiwork of the very man who endlessly denounces the personality cult. This also reinforces our belief that there is nothing in de-Stalinization that can prevent the revival of Stalinism in a new form.

When Mao Tse-tung, the Chinese dictator, recently elaborated on the theme of "contradictions" in Communist society, he could not have possibly suspected that these flourished in a particularly virulent form within the higher ranks of the Soviet hierarchy. These "contradictions" were, no doubt, hidden from the public gaze behind the ideological smokescreen of collective leadership. Perhaps the period of collective leadership has now come to an end. Its utility to the contenders for Stalin's mantle has apparently been exhausted. The potential rivals have been "uncovered" and disposed of. After all, as the Peking's *People's Daily* recently remarked: "We say ... that before 'monsters and serpents' be wiped out they first must be brought into the open, and only by letting the poisonous weeds show themselves above ground can they be uprooted".

The secret of Popular Poplin — Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

"Where now the city stands,
there was once naught but the city's site." OVID

Madras

February 1640. Sailing along the Eastern coast of India Francis Day reached a tiny village of a few scattered huts. In a short time human hands raised a small town of palm-thatched mud houses. In the course of the centuries on this very site has arisen a modern city with well laid-out roads, palatial buildings, a busy port and harbour, and flourishing industries. Thousands of tons of STEEL have helped to bring this great city into being.

THE WEEK'S NOTES

PARALLEL "GOVERNMENT" IN KERALA?

COMPLAINTS HAVE mounted among the Opposition parties in Kerala that the Communist Ministry in the State is establishing an extensive network of "people's committees". These committees are, it is asserted, carrying on the business of the executive outside the normal channels. Already there are committees for the distribution of food through fair price shops. It is further alleged that other committees are to be formed to run parallel with the divisions of the Public Works Department and in other fields of governmental endeavour.

The avowed aim is to have these committees "advise" the government and to act as a channel for the grievances of the people to reach the Ministers. Association of the people with the administration in the solution of their own problems is an essential and worthy political move. But like a pistol, which has no character by itself, but becomes quite a different weapon in the hands of a soldier, a criminal or a sportsman, this "association of the people with the government" has sinister significance. An extensive network of people's committees, organized in monolithic fashion, can be turned effectively into a coercive, enslaving instrument of the party in power. Already the Opposition has raised the cry that a "commissar" system is in the making, as there is sufficient evidence that the "people's committees", despite protestations to the contrary, are being shaped as an instrument of the Communist Party and its Ministry. One of such committees recently issued summons to an "accused" directing him to appear in the Party's election office to defend himself against a complaint lodged with it. There are also reports of "insecurity" due to the aggressive attitude of the Communists and their followers. Police, too, is being used as a tool of the party-in-power.

Whatever the profession or claim, the Kerala people's committees are incipient "Soviets" or "people's democratic committees" which helped the Communists instal and maintain totalitarian regimes in Russia, China, and the satellites. They represent a threat to the nascent Indian democracy.

Strangely enough, Indian politicians and democrats have found it unnecessary to take notice of this development. This is probably due to the fact that every political party in the country, including the Congress, has tended to arrogate wisdom only to itself through some divine mystique; it is their mission to guide and govern rather than represent the people. The development in Kerala, therefore, appears as nothing new on the country's political horizon. Partly this is also due to the fond belief that Kerala Communism is not Communism in the strict sense, but only a slightly modified version of socialism. The Communist Party of India has colluded in this by sedulously fostering this belief. Accustomed to operating on the axiom that only through the acquisition of actual governmental power can their destinies be fulfilled, Indian politicians are unfamiliar with the concept of a political organization out-of-power being of service in the countryside. At the most, they can, it is felt, simply carry on agitational activities in preparation of the next election contest. The Communists work according to a wholly different book.

LIKELY COURSE OF SECOND PLAN

THE FIRST-YEAR results of the second Plan have just been reviewed by the Planning Commission. The progress report which is only provisional records the achievements in physical terms in the spheres of agriculture, irrigation and power, industry and transport. The advance registered has been only modest, and this

is explained by the difficulties caused during the year by the Suez crisis, rise in internal prices shortage of steel and cement and the rapid running down of sterling balances. The results in real terms should have been still lower than the targets partly due to the rise in internal prices and prices of imported capital goods and stores and partly due to the revised lower financial outlays during the year. As against the originally proposed outlay of Rs. 830 crores for 1956-57 the revised outlays have been of the order of Rs. 761 crores only (Rs. 391 crores under the State Plans and Rs. 370 crores under the Central Plan). The revised outlays are made up of Rs. 93 crores for agriculture and community projects, Rs. 179 crores for irrigation and power, Rs. 111 crores for industry and mining, Rs. 233 crores for transport and communications, Rs. 123 crores for social services and Rs. 22 crores under miscellaneous heads.

The financial resources for the revised aggregate outlay of Rs. 761 crores have not been adequate. Domestic budgetary resources (by way of contribution from current revenues, surplus of railways, net receipts from loans, small savings, provident funds and other deposit heads) have accounted for Rs. 427 crores and external assistance for Rs. 63 crores, leaving a gap of Rs. 270 crores in resources. As the Centre's deficit has come to Rs. 216 crores (representing so much deficit-financing), the balance of Rs. 54 crores (Rs. 270 crores 'minus' Rs. 216 crores) might have probably represented a further shortfall of Rs. 54 crores in the State Plans during the year. This means that the actual first-year outlay might have turned out to be Rs. 707 crores instead of Rs. 761 crores of revised outlay.

Thus it turns out that the actual outlay in the first year of the Plan should have been just 85 per cent of the originally planned outlay for the year. In view of the greater difficulties in 1957-58 in respect of foreign exchange the planned second-year outlay of about Rs. 960 crores may actually come to just Rs. 770 crores which, too, will be rendered possible only by a dose of deficit financing of just under Rs. 300 crores. As deficit financing of this magnitude is ruled out by the Finance Minister in each of the remaining three years of the second Five-Year Plan, the actual total outlay in the said three years will probably be round Rs. 2,000 crores only. With the addition of the outlay in the first two years, the total for the entire five-year period will have probably come to Rs. 3,500 crores. This would mean that only two-thirds of the investment targets (in real terms) of the public sector will have been achieved by the end of the second Five-Year Plan period.

POLITICAL PARTIES' FUNDS

AN APPELLATE bench of the Bombay High Court, consisting of Mr. Chief Justice Chagla and Mr. Justice Desai, has upheld the decision of the single bench allowing the Tata Iron and Steel Company to alter its memorandum of association so that it may make contributions to the funds of the political parties. The only condition that their lordships imposed was that the Company should publish at the end of every financial year, in two leading newspapers—one of them from Bombay—a complete statement of all contributions and donations made to any political party or institution. Earlier, Mr. Justice P. B. Mukerji of the Calcutta High Court had delivered a similar judgment on a similar petition by the Indian Iron and Steel Company.

While allowing the petitions, both the appellate bench of the Bombay High Court and the single bench of the Calcutta High Court have made some pertinent observations. "The democracy in this country is a nascent democracy", their lordships observed "and it

is necessary that this democracy should be looked after, tended and nurtured so that it should rise to its full and proper stature". The history of democracy had, they added, proved that in other countries it "had been smothered by big business and money bags playing an important part in the working of the democratic institutions". Therefore, any proposal and suggestion likely to strangle democracy must be viewed not only with considerable hesitation, but also with a great deal of suspicion. Contributions by business and industrial houses to the funds of the political parties are, they fear, likely to contaminate the springs of democracy. In the interest of both commercial and public standards it is, therefore, essential, in their opinion, to have legislation on the subject. Such legislation is necessary for keeping the spring of democracy and administration "reasonably unsullied" and "to control the dangers and mischief inherent in the situation before it is too late".

Doubtless, in a country like India, where partiality for the powers-that-be and sycophancy are second nature, the permission to business houses to contribute to funds of political parties, can be exploited by the ruling party to the serious detriment of democracy. Besides the danger of vested interests tightening their grip over the government cannot be discounted. This last can seriously handicap the opposition parties in their bid to capture power. But while the judges' concern for "nascent democracy" and the possible contaminating effect of financial contributions is well placed and commendable, they appear to have viewed the problem only partially. In suggesting to Parliament the need for legislation, for instance, they restricted themselves to recommending the opening of books by only the business firms. This would seem to miss an essential requirement. Political parties are not required publicly to register their sources of income; nor is there any limit to the amount of money which a political party, as opposed to an individual, can spend in an election campaign. There is no limitation, either, on the size of a donation an individual or corporate entity may make.

The judges' verdict ignores these relevant facts. This is the more regrettable because at least one political party in India makes it an article of faith to disguise its sources of income. It is, of course, not possible to legislate morality. But applying to political parties the same restrictions as have been recommended for business and industrial houses' donations to political funds would ensure even-handed justice and be helpful to democracy. Indeed, the Tata directors are to be commended for their petition. They have placed their action on the public record; their donations should be easily verifiable. This is in contrast with the under-the-counter political financing which has come to be the rule rather than the exception.

A MOHENJO-DARO IN INDIA?

INDIA, ALWAYS proud of the ancient and highly developed civilisation of the Vedic period, thrilled to the discovery early in the twentieth century of an even earlier civilisation dating anywhere from 2500 B.C. to the much earlier 5,000 B.C. This was, of course, the result of the excavations at Mohenjo-Daro and Harappa. With partition in 1947 India was cut off from these valuable research grounds. Recent excavations at Lothal in Ahmedabad district, Bombay, have, however, yielded almost the entire range of objects found at Mohenjo-Daro and Harappa. Realistic representations of animals, delicate gold ornaments, well-finished clay articles all indicate fine tools and artistic workmen. There are the same evidences of intelligent town planning, efficient drainage systems in this recent excavation, all pointing to the civilisation of the Indus Valley.

Mr. K. M. Munshi had propounded the theory long before the Lothal excavation that the Indus Valley

civilisation was not an isolated one but was really an extensive belt covering Rajasthan and Gujerat, even reaching Saurashtra. It seems that his theory is now on the way to being fully proved. This one discovery at Lothal may be just the first of many, and the importance of the discovery need hardly be emphasized. Scholars have made repeated efforts to decipher the language of the seals, and when they do succeed, it will be an exciting story they tell. From all indications the people of the Indus Valley were educated in the arts, had a well-developed civic life and were followers of a definite religion. In fact, it is from the evidence of religion that, eventually, scholars may forge the missing link between the Indus Valley and the Vedic civilizations.

THE FOOD QUESTIONNAIRE

THE ASOKA MEHTA COMMITTEE on Food has promptly started on its work and issued a brief but relevant questionnaire on 22 points. Information is sought, among other things, on the extent to which the rise in food prices is the result of (a) shrinkage in marketed surplus of food grains owing to increased consumption or holding of grain by the producer and (b) growth of demand from urban and other classes of consumers. This is doubtless a very relevant question but unfortunately most difficult to answer. Even the State Governments may not be in a position to supply reliable information on this unless, of course, they have the results of recent sample enquiries, if any, to draw upon. There is also a question on what bearing land reforms have on food output and marketed surplus. Here the Committee may well be surprised to find passionate and contradictory opinions — all of equally plausible validity. It is not likely that the Committee will acquire a reliable picture that can enable it to state confidently that the kind of land reform, implemented or threatened, has contributed or can contribute to higher food production. Reference in this note to these two questions alone should be sufficient to show how the Food Committee has taken on hand a very difficult piece of enquiry.

A Window on the World

A POINT FOR MR T. T. KRISHNAMACHARI

By
ODYSSEUS

THE MISTAKE made by those who want to tax the "rich" heavily in order to redistribute income to the "poor" and to secure equality of income is to believe that income is solely a means to consumer-satisfaction.

Certainly income is a means to consumer-satisfaction and certainly it is also a reward for productive effort—but if you do not agree that it is also much more, then you are arguing, first, that income is a-social. If it is a-social, it is pleasurable to the income holder alone. If so, it is logical not to allow Shri A a bigger income than Shri B, because there is no reason why A should be allowed a bigger dose of selfish indulgence than B. Secondly you are arguing that income is unproductive: why should Shri A be allowed to journey from Delhi to Oxford and not Shri B? Why, indeed, if both are out for mere selfish, unproductive pleasure jaunts? But supposing Shri A is Dr. S. Radhakrishnan and that he wants to go to Oxford to become Spalding Professor of Eastern Religions and Ethics (as he was from 1936 to 1952)? Is there no difference in absolute values between Dr. Radhakrishnan's study and teaching of ethics and Shri B's tour of selfish indulgence?

As Bertrand de Jouvenel, our guide, friend, and philosopher on this subject, points out in his "Ethics of Redistribution" (Camb. Univ. Press, 1951), the notion of income as a means to consumer-enjoyment implies that the citizen, his day's work done, his debt to society discharged, "retires to masticate his income-bone in seclusion, a selfish gastric process, leading nowhere."

But this is nonsense. My admirable predecessor, Aristotle, pointed out in the fourth century B.C. that man is by nature a social animal, and no one has yet contradicted him. Living is a social process: we do not live for ourselves alone. A generous man renders many services to society outside his professional obligations. A professor's tea party may be an opportunity for informal education far better than his lectures, or it may be complementary to them. Individual income, socially consumed, is a means to such services, which are not classified as productive only because they are free. It should never be forgotten that the statistician's picture of the national income is true only as far as it goes. His picture takes into account only assets, services, and goods on which a commercial price is put. He does not tabulate values which are not bought or sold. If we forget artistic, cultural, and spiritual values, we are forgetting the most important "invisible" items on the national balance sheet.

USSR'S INTELLIGENT LEAD

Nor is it true that all consumption is unproductive. Shri B may not be a philosopher like Dr. Radhakrishnan, but he might be an engineer, industrialist, doctor, or a machine minder in a factory. Each of those has a contribution to make to society, and a holiday, whether it be a pleasure trip to Paris or a pilgrimage to Banaras, may refresh him and send him back to his job thrice the citizen and twice the worker that he was before. Note also that the expenditures needed for the holidays of these various people may be very different, so that we cannot argue that every man can give of his best on the same salary.

Consumption is essential to enable a man to continue to offer productive services. It is more expensive to train a doctor than a coolie and there is also difference between the expenses required to maintain a doctor in his imaginative, creative, brain work, and those required to keep up a coolie's brawn and muscle. It follows that strict equalisation of incomes would impair the efficiency of those performing higher functions which require greater individual expenditure. The first people to spot this were those realists, the makers of the revolution in the USSR. After the briefest try out of equality, inequality was re-established, and so markedly that the scale of rewards in the USSR is higher than in the Welfare states of the West.

All this is obvious? Why keep labouring the elementary? Because it is necessary to clear this ground in order to reach one of the most important points made by Bertrand de Jouvenel. Differences in earnings must logically be steepest in countries where product per head is lowest. In comparatively wealthy industrially advanced countries, the national income can easily meet the bare cost of both the higher and the lower talents, and the balance may go to better the lot of the lower. But in poor, undeveloped countries, the national income is inadequate to meet properly, over and above the cost of the lower talents, the cost of a desirable number of higher talents.

The only way to meet the cost of this essential elite is by stinting the masses. This steepens the scale, and contrasts with the generosity towards the unfavoured that tends to flatten the scale in advanced countries.

The more backward a country, insists Mr. de Jouvenel, the greater its need for productive talents, the greater the necessity to pay well for these talents "even at the cost of great hardship to the masses."

All history testifies that what we have of civilisation was bought at enormous cost: the elite from which we inherit our culture were supported by the sweat of the masses.

Asia can only advance if she invests in elites as well as in machines. This is a home truth which those responsible for the financing of the Five-Year Plan do not seem as yet to have grasped clearly.

India can either (a) secure the services of the elite by making the returns to foreign investors in India more attractive than investment elsewhere, and by making conditions of service more attractive to foreign elite technicians than they are offered elsewhere abroad, or (b) if India considers that the price of foreign aid is too great, she must sweat the equivalent out of her masses—from those with the lower, and the lowest, incomes. She must nurse and pamper her elite if she wishes to rise by her own chupli straps.

Nobody can approve of the political purges, the blood baths, the destruction of freedom and of spiritual values in the USSR, but leaving those enormities out of account and narrowing our focus solely on to the Soviet economic effort, it has to be admitted that the USSR has made substantial material progress over the years and that it has been achieved by pampering the

Soviet elite and sweating the masses. If the USSR had allowed the full play of spiritual values and had avoided the inhibitive effects on production of its political persecutions, progress would have been greater still.

A SOCIALIST CURIOSITY

Since men fulfilling higher functions need considerable means and amenities which fit them to render the services of leadership, imagination, and technology, expected of them, one of the curiosities of contemporary Socialist thought is that while it is held to be wrong for an individual to be given a big enough salary to enable him to live comfortably and with all the appropriate amenities, it is right for institutions to spend money lavishly. Socialists do not dream of carping at the impressive laboratories of a public institute, its expensive and comfortably furnished library, its chromium-plated restaurant, smoking room, concert hall, billiard room, and tennis courts, all provided to relax the nerves of the research worker. No Socialist will work out the total cost of all the tools, facilities, and amenities provided and regard to individual income of the research worker as raised by these advantages. The chances are, since the business of an institution is the personal concern of no one but is run by a committee provided with funds from the state's apparently inexhaustible coffers, that the cost per head of all these items will be far greater than would be demanded by an individual if you gave him a free hand and asked him to name his own salary.

On the other hand, a non-official doctor will, as Bertrand de Jouvenel points out, find it difficult to get expenses incurred in keeping abreast of scientific developments accepted by tax authorities as professional costs, and he will be required to attend with his bank statement and accounts and to waste days of his time

in preparing them, and hours in explaining them, to a suspicious inspector of taxes. And if he runs to fine pictures, good food, and tennis courts, the plea that such nerve-soothing amenities are indirect costs will evoke scorn and indignation. Why? Because he is an individual citizen—not a corporation.

Why does no Finance Minister tax public companies at a progressive rate on their gross incomes, as individuals are taxed? Taxation on revenues, regardless of expenditures, would do away with public companies as it has done away with private individuals. The difference is that whereas the fall in efficiency of the individual is less easily discerned, the fall in efficiency of the company would be visibly catastrophic. So the company gets off, while the individual is massacred.

Thus the profit-seeking enterprise has a threefold advantage over the family, which is taxed at progressive rates, not allowed to provide for depreciation of its assets, nor to deduct working expenses.

The firm produces goods. The family produces people. It is puzzling, muses Bertrand de Jouvenel, that the needs of the goods should be so well understood by our law-makers and the needs of the people disregarded.

But you can't have an elite if you bleed them dry by taxation. And without an elite there will be neither material progress nor civilisation, and the lives of the masses will be without hopes for brighter dawn.

[This is the final article in the series on the Ethics of Redistribution, which have appeared in the four consecutive preceding issues.—Ed.]

A BENELUX BALANCE SHEET

(From Our Special West European Correspondent)

PARIS, July 3.

AT the end of 1957 the customs union between Belgium, Holland and Luxembourg will enter on the eleventh and last year of its existence — the eleventh because all tariffs between these three countries were abolished on January 1, 1948; the last because from the beginning of 1959 Benelux will begin to be swallowed up in the European common market formed by its union with France, West Germany and Italy. From Benelux's decade of experience some lessons may be drawn for the future of the larger customs union, lessons that should be read with those drawn from the working of the coal and steel pool reviewed here in two recent articles, "Europe, or Little by Little" and "Four Years of the Schuman Pool". It can be said right away that such pointers as we can obtain from Benelux are considerably more encouraging than the moral we have drawn from the working of the Schuman pool. Benelux has worked, it is an idea that came off. It has worked differently to what was expected, but the participants are content and no outsiders have cause to complain of it. Nothing of its experience can be transferred to the much greater scale of Euromarket, because a tiny laboratory is obviously not the same thing as a big factory. Besides, where the crux of the matter is abolition of customs duties, it must be remembered that the constituents of Benelux were always low-tariff countries.

Much more than Euromarket, Benelux was a jump in the dark. The treaty was signed in London even before the war was over and it began to be implemented during the uncertain era of post-war reconstruction, of which a notable feature was the dismantling of the Dutch empire in Asia. Whereas before the war Dutch wages were 40 per cent higher than Belgian, by 1951 Belgian were 60 per cent higher than Dutch, and this fact suggests the fluidity of the circumstances surrounding the experiment. Customs duties were suppressed at one stroke at the beginning of 1948 and a common tariff opposed to the rest of the world. This left the major task: abolition of import quotas. This has been accomplished, with one interval of retrogression caused by the Korean boom, and today trade in industrial products between the three countries is completely free, although agricultural products remain under a special arrangement. Freedom for capital transfers was attained just three years ago and a common external trade policy is now adopted, Benelux as an entity now signing trade agreements with other countries. (A recent example of this united action was the Benelux combine that undertook the clearing of the Suez Canal).

The removal of all internal restraints on trade has, of course, much increased commerce between the member-countries; the Dutch contribution to total Belgian imports has risen from 12 per cent to 22 per cent and the Belgian contribution to total Dutch imports from 10 per cent to 17 per cent. This tightening of the bonds between the constituents of Benelux has not limited trade with outsiders: Benelux's imports from the rest of the world have doubled during the life of the customs union, while Benelux's exports to outsiders have more than doubled. If the European common market has similar consequences for West Europe's trade with the

rest of the world, most of the outsiders' anxieties will be allayed.

These few facts, then, establish clearly enough that Benelux has worked. Before arguing that Euromarket is a more complicated case, it is time to recall that there were very few reasons to expect that Benelux would in fact work so well — and moreover that most of the reasons for optimism that were advanced ten years ago proved to be mistaken. The considerable difference in wage rates has already been mentioned, and even today Belgian wages are in general 40 per cent higher than Dutch. Population is about stationary in Belgium but is rapidly increasing in Holland. The Dutch economy has always been heavily "controlled", while Belgium's was and is one of the world's freest and most "liberal". Against these grave discrepancies used to be set the complementary nature of their economies, Belgium and Luxembourg being heavily industrialised while Holland was a country of farmers and traders. But in the event this famous complementarity, on which the main hope of union was founded, has been unimportant and, on the contrary, Holland has been increasingly industrialised; she is now for example a steel producer, with an annual output of one million tons.

It would be fair to say that the one certain lesson of Benelux is that what happens in a customs union cannot easily be predicted: "crucial" discrepancies turn out not to matter, "irresistible" equalising forces turn out not to work and in general the upshot is not a foreseeable sum of the constituents but a new product with unexpected characters of its own. Cleverly constructed escape clauses (Euromarket is full of them) can prove to be irrelevant, while developments are at the mercy of outside influences that are no more foreseen than the upsets encountered by national planning boards. Thus, Benelux had a common fund for readapting grossly disturbed industries, but it has never been drawn on; while the major crisis of Benelux was caused by the fact that the Korean boom sent prices up much higher in Belgium than in Holland, a fact no more to be expected than the Korean war itself was.

However, when this reservation has been made, several definite conclusions seem reasonable. Firstly, that when economies with different wage scales are thrown into a common market wages tended to be slowly equalised upwards, not downwards. If this proves of general application, French workers will have less to fear from Italian and West German competition; and that it is not an accident peculiar to Benelux is suggested by the experience of the coal and steel pool, referred to here in earlier articles. Secondly it appears that a high-wage economy competing with low-wage industries in a common market can quite comfortably wait for its competitors to increase their wages provided it concentrates meantime on increasing its own productivity. Despite the discrepancy between Belgian and Dutch wages, Belgian industry has had little difficulty in selling its products in Holland (or anywhere else) because it has kept in the front of technological progress.

The third point is the most interesting: the new division of labour brought about by a customs union goes on, not between industries, but within industries.

A Letter to the Editor

A CORRECTION

Sir,

In the interest of accuracy and in order that "ODYSSEUS" should not go unscathed, may I draw your attention to a misprint in "The Eastern Economist" of June 14, 1957, page 875, para 6, line 6.

The relevant chapter in the Book of Numbers is xxxiii and not xxxviii.

Yours faithfully,

S. H. CARLILL,
K.B.E., C.B., D.S.O.,

Chief of the Naval Staff

Naval Headquarters

New Delhi

June 19, 1957

Thus in Benelux no industry and no major branch of an industry has died out in one country to migrate to another. But within the leather, cotton, wool and paper industries there has occurred specialisation by agreement between firms in various parts of the customs union. In other words, division of labour is brought about not by knock-out competition where all the high-cost leather factories in Belgium go to the wall while Dutch factories expand (this is what old-fashioned liberals understood by competitive division of labour), but on the contrary by agreements between Dutch and Belgian enterprises whereby certain firms concentrate on boots and others on light leathers. If competitive division of labour had gone on the way the liberals picture it, Holland would never have been able to expand steel output from 50,000 tons to one million tons a year in the face of open competition from the old and powerful Belgian and Luxembourg steel plants. Instead, Benelux has seen another sort of division of labour whereby trucks are assembled in Rotterdam (Holland) while motor-cars are assembled in Antwerp (Belgium), while Esso builds one oil refinery at Antwerp and Shell builds another at Rotterdam.

Now this sort of division of labour does not happen by accident, or in response to the anonymous forces of the free market. In fact you do not need to be very clever to see that although we give it names borrowed from liberal theory ("division of labour", "competition", etc), this sort of specialisation is really what

the liberals damn as concentration, cartellisation, trusts, carving up of markets, and so on. The important point about it is that as little as possible is left to the decision of the anonymous market, and as much as possible is done by agreements between firms whose first aim is to keep all existing capital investment safe and all existing plant in business.

This is the most important lesson to be drawn from the experience of Benelux and, applying it to Euro-market, it leads us to expect that the opening up of the common market will not have the effect of wiping out high-cost industries in France unable to stand competition from lower-cost German industries, but rather will produce a series of concentrations and agreements between these two sorts of firms aimed at keeping everyone in business. The experience of the coal and steel pool points in the same direction, for it was shown in the earlier articles that the Schuman pool has seen steady cartellisation and an end to the deconcentration of the Ruhr monopolies. Indeed, drawing the moral in advance, many industries in West Europe have already begun casting about for "specialisation" plans that will enable them to meet the challenge of the common market: the current concentration in the French industries producing automobiles, radios, TV, incandescent lamps and tubes and cotton textiles is part of this process of adaptation. We may conclude that customs unions and common markets can indeed work, but when they do they do not take the form of a simple return to economic liberalism.

Small Man Big Man

The small advertiser, who has limited appropriations, uses only a few publications. The gigantic corporations use a list as long as their budgets. But for all advertisers, THE HINDU is indispensable—and it has been so for decades now.

Why? Because THE HINDU is unrivalled in prestige and influence; because it has the largest circulation in its field; because its rate is economical; because because it has been proved* to exercise influence and pull unique in extent and penetration.

* A copy of THE HINDU READERSHIP SURVEY 1955 which shows the quality and classification of the readership of THE HINDU will be sent free on request.

The **Hindu**

FOR NINETY EIGHTY YEARS THE LEADER

WORLDGRAM

AGRICULTURE

Raising Jute Output: The Union Ministry of Food and Agriculture have prepared blue prints for an intensive campaign to increase jute production because of the country's increasingly precarious foreign exchange position, according to a report. This campaign will follow the pattern set by earlier experiments as in the case of rice and sugar-cane, and will initially concentrate on intensifying yields rather than extending acreage. The campaign will await the fixing of priorities, as it entails considerable expenditure on improved strains of seed, promotion of better cultural practices and improved methods of sowing. There will also be considerable expenditure involved in the purchase and supply of better equipment, and before any substantial increase, it is estimated that at least 30,000 seed drills, 30,000 wheel hoes and 10,000 sprayers will have to be acquired and pressed into service. The target under the second Five-Year Plan aims at achieving a production level of at least 55.4 lakh bales by the end of the Plan. At present internal production of raw jute is far outstripped by the existing mill capacity. Against a requirement of 72 lakh bales of raw jute, India produced 42.21 lakh bales. India's precarious balance of payments permitted an import of only 23.79 lakh bales resulting in the idling of 12.5 per cent of the available mill capacity jute imports annually eat away Rs. 18 crores in foreign exchange. But the finished jute manufactures do provide a valuable source of foreign exchange earnings. In 1956 these amounted to Rs. 118.25 crores. Fulfilling the total demand of 72 lakh bales is still doubtful, but the Plan target of 55.4 lakh bales is considered well within reach.

Checking Erosion, and Soil Survey in India: Soil conservation practices including contour terracing, bunding and afforestation, to check erosion will be carried out in nine States and three Union territories in 1957-58. Sixty-nine such schemes have been approved by the Centre for this purpose. The schemes are estimated to cost Rs. 125.44 lakhs for which Central aid will amount to Rs. 101.92 lakhs, Rs. 70.64 lakhs as loan and Rs. 31.28 lakhs as subsidy.

INDUSTRY

Schemes for Small-Scale Industries: Grants and loans totalling over Rs. 11 lakhs have been sanctioned by the Government of India to the Governments of Uttar Pradesh, Punjab and Jammu and Kashmir for their programme for the development of small-scale industries. Some of these envisage the continuance of the schemes started earlier while under others new schemes will be started. Uttar Pradesh has been sanctioned over Rs. 6 lakhs. The Jammu and Kashmir Government have received about Rs. 3.5 lakhs. Aid has been given to enable the State to continue to run its walnut wood seasoning plant at Srinagar, and the paints and minerals factory at Jammu.

Training Within Industry: About 7,000 supervisors in various industrial undertakings in India have so far benefitted by the scheme of training within industry, which has been adopted by 126 organisations. These aim at developing in supervisory personnel the necessary skill to enable them to make the best use of their staff, equipment and material. A beginning in TWI was made in India in 1953 under the guidance of two ILO experts who have since carried out a number of projects covering various industries in different parts of the country. The main advantages of TWI are the minimum number of persons required at the top to direct and carry out the scheme and the large number

of supervisors who can be trained over a certain period of time at a relatively low cost.

Higher World Tin Output: World mine production of tin in concentrates, according to the International Tin Study Group, totalled 14,300 tons in April against 13,800 tons in March. Production in the first four months was 54,900 tons. In May Indonesia produced 2,079 tons against 1,872 in April, and the Belgian Congo 724 tons, against 1,003. In April Malaya produced 9,963 tons against 5,001 tons, and Bolivia 2,917 tons against 1,736 tons. In the first four months of the year Bolivian exports totalled 8,430 tons. Holland exported 1,703 tons of tin metal in April against 2,048 tons in March, and in May Malaya exported 6,149 tons against 6,348 tons. British exports likewise showed a decline to 578 tons from 863 tons. In May Britain produced 3,564 tons of tin metal, the highest monthly total for many years.

Estates for Small Industries: Twenty-five industrial estates with facilities for the development of small industries are being built in different parts of the country by the National Small Industries Corporation. These estates are estimated to cost Rs. 7.87 crores and so far over Rs. 1.2 crores have been sanctioned by the Government of India. The entire cost of the estates will be financed by the Central Government as a 10-year term loan to the States. Of the 25 estates, five are being set up in Kerala, three each in Madras and U.P., two each in Madhya Pradesh, Bihar and Andhra and one each in West Bengal, Bombay, Mysore, Delhi, Assam, Rajasthan, Orissa and Punjab. The establishment of these estates is for promoting industrial development on a decentralized scale and thus help relieve the existing congestion in big cities. It has also been decided to start 20 small industrial estates during the current financial year and the estimated expenditure on each small state will not exceed 3 to 4 lakhs.

Uranium Ore in America: Ambrosia Lake, in New Mexico state now has more than two thirds of all known uranium reserves in the U.S. Of the 80 million tons of ore reserves reported by the Atomic Energy Commission as at November 1, 1956, 41 million tons are in New Mexico. Uranium ore-mining in the second-half of 1955 came to 840,000 tons. This increased to 1,340,000 tons in the first half of 1956, and to 1,660,000 tons in the second-half. By the end of 1956, 12 mills were in operation capable of handling 8,960 tons of ore daily or about 3.2 million tons a year. From this ore came 6,000 tons of uranium oxide. When all the new mills now contracted for are finished, U.S. production is estimated to increase to 15,000 tons of uranium, indicating 6-7 million tons of ore a year.

TRADE

Indo-Indonesian Trade Pact: Letters exchanged between the Indian Ambassador Mr. G. Parthasarathy on behalf of the Government of India and the Secretary General of the Ministry of Foreign Affairs on behalf of the Government of the Republic and Indonesia extended the validity of the trade agreement between the two countries till December 31, 1957. The principal exports from India to Indonesia are cotton textile and yarn, jute goods, tobacco, linseed oil, hardware, pharmaceuticals and chemicals, tea chests, shellac, sports goods, rubber tyres and tubes, porcelainware, paper and boards, machinery including agricultural implements, Diesel engines, sugar cane crushers, textile machinery, electrical equipment including motors and batteries sewing machines, hurricane lanterns and other household utensils. The major

items listed for export from Indonesia to India are copra and coconut oils, palm kernels and essential oil, spices, timber, tin, rubber, hides and skins, canes and rattans, gums and resins, tanning materials, sisal fibre and tobacco wrappers.

Export of Vanaspati: The Government of India have reviewed the export policy for Vanaspati (vegetable product) kariseed oil and nigerseed oil and have decided to release a quota of 5,000 tons each of these commodities for export for all shippers during the half year July-December 1957.

Britain's Aviation Exports: In Britain, aviation exports during May were, at £10,366,025, the highest of any month during 1957, more than 2.2 million upon the May 1956 figure, and the third highest ever recorded. The total for the first five months of this year amounted to £42,919,350. Sweden was the best customer with £3,973,604 worth of air-craft and parts, then the United States with £3.6 million, India with £2.2 million, Canada with £1.7 million, France with £1.5 million and Australia with £1 million. Exports this year represent so far an annual figure of more than £100 million, about the same as the 1956 record.

Export of Vanaspati: The Government of India have reviewed the export policy for Madras-Mysore silk waste and decided to release a further quota of one lakh lbs. of Madras/Mysore silk waste for export up to the end of September 1957. These exports will be allowed through small stockists and also members of the Charka Silk Dealers Association, and other bodies who participated in export quotas released in 1956 and effected some exports up to the end of 1956, but are not eligible to receive allotments against the earlier release of 2,84,000 lbs.

FINANCE

Advances Against Sugar: A directive issued by the Reserve Bank of India to all scheduled banks under its "Selective Credit Control" policy states that advances against sugar have remained at a high level, and they recorded a rise in the first fortnight of June contrary to the seasonal decline. In spite of the production of sugar being 2 lakh tons, prices increased sharply. Advances against sugar touched a record level of Rs. 60 crores in June this year. The Reserve Bank has asked banks to maintain an aggregate level of credit against sugar in such a way that by July 26, 1957 and in every week thereafter the level shall not be more than 10 per cent above the corresponding week in 1956. The margin requirements have also been raised to 35 per cent.

Ceylon Budget Estimates: From the estimates of revenue and expenditure for the year presented by the Finance Minister, it was seen that the Ceylon Government will have to raise Rs. 200 million to balance the budget for the next financial year beginning on October 1. There is an anticipated revenue of Rs. 1,260 million as against budgeted expenditure of Rs. 1,460 million, including Rs. 300 million to be spent on capital account and Rs. 102 million on items such as the Governor-General's salary.

Gold Reserves: The sterling area's gold and dollar reserves rose by \$36 million, the highest level for eleven months. This increase was achieved after payment during the month of \$16 million to the European Payments Union, representing part of the May debt, together with \$3 million paid to creditors settlements. During June, India drew the last \$72½ million of her credit with the International Monetary Fund. The U.K. has a deficit of £10 million with the European Payments Union during June, which includes nearly £3 million of interest on the accumulated debit

balance with E.P.U. This will be settled this month by payment of 75 per cent in gold and dollars, with the remaining 25 per cent being added to the debt to the Union.

GENERAL

Nuclear Power in Britain: In Britain neither coal nor oil can meet the foreseeable demand for power, and nuclear power alone can bridge the gap says a report on the progress of Industrial Research in Britain. As a result of the vast amount of energy expended on the development of nuclear power, Britain leads the world in this field. She cannot only generate nuclear power for her own needs, but can contract for the erection of nuclear power stations in other countries. On such station is to be built in Japan.

World Economic Growth: World economic activity rose to new high levels in 1956, but costs increased significantly in most countries as the growth in production failed to match the increase in wages. The pressure on existing capacity in certain key industries, notably steel and engineering, has been so intense in most countries, that it has acted as a break on economic growth. While each country must maintain internal balance, international equilibrium depends on the rates of growth in all countries remaining consistent. World demand for primary products has lagged behind that for manufacturers, and as a result many under-developed countries find it difficult to finance their rising demand for imports. In the Communist countries with centrally planned economies, industrial production increased substantially in 1956. Here too the rate of increase was slower than in 1955, though China recorded the exceptionally high rate of 25 per cent.

International Geophysical Year: India is among the 70 countries participating in the International Geophysical Year. The programme for the IGY drawn up by the Indian National Committee includes observations and study in the fields of meteorology, geomagnetism, air-glow and aurora, ionosphere, cosmic rays, latitudes and longitudes, glaciology oceanography, seismology, gravity measurement and solar activity. The Meteorological Department contribute to this study by providing observations daily of winds, temperature and humidity from 12 stations up to heights of about 30 km or about 20 miles by the use of up-to-date electronic equipment. Such stations are already in operation at Allahabad, Jodhpur, Bombay, Calcutta, Gauhati, Port Blair, Madras, Nagpur, New Delhi, and Trivandrum.

Whaling Catch: The International Whaling Commission has decided that the limit on the Antarctic catch in 1957-58 should remain at 14,500 blue whales. In the previous year, 20 factory ships with 225 catches took part in the Antarctic season. The catch by floating factories amounted to 2,097,911 barrels, equivalent to 349,652 tons, of oil, inclusive of sperm oil. Including the land stations, the total catch was 2,245,435 barrels, a decrease of 61,734 on the previous year. Outside the Antarctic, the output in 1956 was about 605,189 barrels, compared with 520,090 in 1955.

Collection of Mineral Statistics in India: Measures to improve methods of collection of Mineral statistics from various states in India have been recommended by the Mineral Advisory Board. The collection of mineral statistics gained importance with the shift in emphasis from agriculture to industry under the second Five-Year Plan. At present the Indian Bureau of Mines has been entrusted with the task of collecting statistics of mineral production, stocks and prices under the Mineral Conservation and Development Rules, 1955. The working of these rules during the last two years revealed that the forms devised by the State Governments for the purpose differed from State to State and lacked uniformity.

NEWS IN BRIEF

INDIAN

Recently India and the US signed an agreement for the provision of \$4 million as developmental assistance for the design, construction and equipment of a 30 mega watt thermal power plant for Delhi. The total cost is estimated at \$6,625,000 and the American assistance will meet foreign exchange costs.

More than Rs. 15 lakhs was sanctioned by the Government of India for the welfare of Schedule Tribes in Manipur during 1956-57, in addition to what had been given in the tribal areas under the general schemes.

Five hundred co-operative farming societies are being set up during this year in the Community Development and National Extension Service areas.

An additional amount of Rs. 14 crores was earned by farmers in India during the 1954-55 season by cultivating improved varieties of cotton.

The Government of India has issued a notification fixing the price of tea for the purpose of determining the export duty, at Rs. 2.43 per lb. as against Rs. 2.47 per lb. in force from June 1, 1957. There is no change in the existing rate of duty of 25 naye paise per lb.

In 1955, India imported from Egypt goods to the value of £E12.861 million, while her exports were valued at £E7.274 million. During 1956 India's imports from Egypt totalled £E8.935 million, while her exports amounted to £E7.986 million.

The East Pakistan Jute Marketing Corporation proposes to dispose from its stocks one and a half lakh kutchas bales to be exported to India. An equal number of pucca bales will be exported to other foreign countries.

The National Chemical Laboratory at Poona has developed a new process for the manufacture of porous rigid filters which can be used for filtration of water in the construction of tube wells and in certain industrial filtration processes. The filters can be prepared in different sizes, shapes and porosities, and are expected to replace similar filters now imported at a much higher price.

A draft Indian Standard specification for ink, stencil, oil base, for marking porous surfaces has been issued by the Indian Standards Institution. Methods of evaluating the various characteristics such as drying time, tiding power, miscibility with mineral spirit, flash point, effect on stencil brushes, freedom from toxic and noxious powers have been prescribed in this standard.

Tata Steel's expansion project to double output to two million tons is more than 52 per cent complete in 56 per cent of the total allotted time of 2½ years. A sum of \$61.24 million (about Rs. 30 crores) has already been expended or committed.

FOREIGN

The World Bank has made a loan equivalent to \$4.8 million for improvement of transport in Ruanda-Urundi, a UN Trust Territory in Central Africa administered by Belgium. The Belgium-American Banking Corporation is participating in the loan without the World Bank's guarantee, to the extent of \$359,000.

Grants to the value of nearly £26,000,000 for development in overseas territories were approved by the British Government in the last financial year. In the last eleven years actual issues from C.D. & W. funds amounted to £136,860,000. Nearly £12,000,000 was spent on research.

The Egyptian Government controlled economic organisation has purchased 52,000 shares in the National Bank from British and French nationals, it was recently announced in Cairo.

The US Steel Corporation has announced an increase in prices of approximately \$6 a ton effective on July 1.

The British Transport Commission made a record loss in 1956. After meeting interest charges and other items, the deficit is £54.4 million for the year, making a total of £124.2 million.

Canada's steel production increased to 1,366,819 tons this quarter from 1,275,063 tons a year ago. Pig-iron production in the quarter rose to 932,347 tons from 846,183 tons last year.

A new process for producing iron coke from a mixture of coal and fine iron ore is being developed experimentally in Germany. This involves the addition of 2-3 per cent of oil to a ground up mixture of Swedish iron ore and long flame gas coal, and finally processing in a coking plant to produce iron coke.

China will reduce her defence expenditure from 20 to 18.85 per cent of her total state expenditure in 1957 it was recently announced. In 1956 China spent nearly six per cent less on defence compared with 1955 while most other sectors of the expenditure showed an increase in expenditure.

The Foreign Affairs Committee of the House of Representatives recently voted to cut \$600 million (about £214 million) from President Eisenhower's proposed \$3,865 million foreign aid programme for 1957-58.

The US will back West Berlin's atomic research programme by providing fissile material. An agreement concluded between the US and the Federal Republic recently will enable West Berlin to lease up to 6 kilogrammes of uranium enriched up to a maximum of 20 per cent with uranium 235, and will be permitted to buy or receive as a gift 100 grammes of pure uranium 235, 10 grammes of plutonium and 10 grammes of uranium 233.

TEA: A BULL POINT

THE Government's approach to the recommendations of the Plantation Inquiry Commission on the tea industry has been informed by a spirit of robust realism which certainly will help to reassure foreign private investors. The Commission's report dealt with a wide field covering multifarious problems of a complex nature. Several of these problems arise out of weaknesses which are undoubtedly injurious to healthy and rapid growth. But it would be impracticable to aim at solving all the problems of a century old key industry in a short span by exercises in academic thinking. Many of the recommendations of the Commission failed to take into account the difficulties inherent in an all-out attack for early, and, in a good many instances, radical cure. The Commission was ill-informed and often obstinate in resisting facts.

Patience and moderation underline the decisions of the Government wherever final decisions have been made on the Commission's recommendations. Interim conclusions have been reached on some, while others are pending consideration. Most of the recommendations which the Government has been unable to accept take on the character of discrimination against the tea industry in policy matters. Some of the suggestions that have been rejected impinge on the mobility of ownership. It was suggested by the Commission, for instance, that the State Governments should assess and recover from the seller undischarged statutory liabilities. A rigid scrutiny, prior to sanctioning new capital issues for tea companies with special reference to conversion of sterling companies into rupee companies was urged. It was turned down on the ground that a system of scrutiny in cases of conversion of sterling companies already prevails and it could be improved upon if necessary.

Compulsory provision for permission of Controller of Capital Issues for capital expansion by new issues or capitalisation of reserves, scrutiny of prices agreed between seller and buyer, certification of reasonableness of revaluation of estates by a nominated authority, local audit of expenditure incurred on gardens and branch offices were among the suggestions which sought to single out this industry for particular treatment. Of a grossly discriminatory nature was the Commission's recommendation that the Tea Board should be armed with powers to investigate cases of excessive remuneration to managing agents or senior officials of companies and exercise its pressure for its reduction. Government has reiterated its policy, in this context, of narrowing down income disparities by taxation or relying on voluntary action by employers. Of a piece was still another recommendation that meticulous rules or principles should be laid down for determination of bonus. This issue has been left properly for negotiation or arbitration.

Certain suggestions made by the Commission, for instance, abolition of the managing agency system (which, of course, now comes under the stringent provisions of the Company Law) and utilisation of the machinery of the Tea Board for packing and retail distribution of packaged tea to the extent of 50 per cent of the internal consumption need not be given undue weight. All this is not to suggest in the least that the report has little valuable contribution to make to the overall problem of rationalisation and development of this leading export industry. One conspicuous recommendation to which the Commission attaches great importance bears emphasis. Since about 40 per

cent of the existing tea bushes are now 50 years old or above and the cost of replanting would be of the order of Rs. 3,000 per acre, the question poses a serious challenge. Internal resources of the companies are utterly inadequate for this purpose. The Commission's scheme of setting up a "Tea Replanting Fund" under the control of the Tea Board offers an effective solution. This proposal is being scrutinised by the Government for its full implications.

Finance is certainly the major issue on which the Government has taken a final decision. The problems of small holders in this industry are analogous to those of their counterpart in agriculture and their financial position is rudely shaken. Government, however, has rejected out of hand the Commission's suggestion that a Land Mortgage Bank should be set up for wiping out their existing liabilities incurred on onerous (and sometimes unconscionable) terms. The reason is that a Land Mortgage Bank investing its resources exclusively in one industry, and then again in the most vulnerable section of that industry, is likely to be involved in serious trouble. Nevertheless, the question of means to liquidate their liabilities specially through the medium of institutional investors is being examined in detail. Among the medium and large-scale estates, however, the main problem of provision of finance has raised a big question mark for Indian-owned companies. In spite of an increase in acreage, the production of 19 Indian companies under Indian managing agents, 43 Indian public limited companies and 3 Indian private limited companies recorded a decline in 1953 as compared to 1946. The trend in sterling companies and the composite sector of rupee companies with Indian and non-Indian ownership was in the other direction. Sterling companies raised their share in total production by a substantial quantity. A few more instructive details will be found in a table in the statistical section of this issue.

The ways and means by which tea companies find resources for working capital has made the pattern of the use of their internal resources very rigid and long-term requirements of capital have suffered in consequence. The following table sums up the overall position of tea companies, irrespective of nationality, in regard to working capital.

RESOURCES OF TEA COMPANIES FOR WORKING CAPITAL

North India (250 Companies)
(Figures show percentages to total working capital, except in the first column)

	Working Capital per lb. (in Rs.)	Loans from Managing Agents	Loans from Banks	Loans from other Sources	Own Resources
1951	1.6	8.9	21.1	—	70.0
1952	1.6	12.8	34.7	.03	52.5
1953	1.5	10.7	31.2	.01	58.1

South India (37 Companies)

	Working Capital per lb. (in Rs.)	Loans from Managing Agents	Loans from Banks	Loans from other Sources	Own Resources
1951	.86	1.3	12.6	—	85.1
1952	.93	2.4	11.9	1.4	84.3
1953	.96	1.7	18.5	.6	79.2

Total working capital for the tea companies in North India for which data were analysed by the Commission fluctuated between Rs. 48 crores and Rs. 53 crores, while fluctuations in respect of companies in the South ranged between Rs. 4.7 crores and Rs. 5.3 crores. Working capital requirements of North India estates, as measured in terms of expenditure per lb. in the table, are higher than those in South India for the reason that production in the North is not continuous throughout the year as in the South. In effect, the issue boils down mainly to one of finding seasonal finance for North India companies.

The broad conclusion to be drawn from the above table is that companies' own resources built up from reserves other than the taxation reserve are being steadily released from being locked up in short-term finance. Managing agents are providing increasing seasonal capital. The most material trend is the progressive and marked accommodation from banks. The dependence of Indian-owned companies on bank advances has risen as high as 65 per cent. This trend has raised fresh problems. The Commission has recorded the fact that Indian banks which make advances predominantly to Indian companies charge interest rates between 4 per cent and 9 per cent together with commission on gross sales of hypothecated tea at the rate of half per cent to one per cent. In some cases guarantee from approved guarantors is also obtained which adds a further charge of their commission. Collateral security of assets like buildings, land and machinery is also insisted upon. All this aggregates to a high total cost of borrowing and immobilises assets other than the crop. The rate charged by exchange banks varies between 4 per cent and 5 per cent according to the Commission's investigation, with hypothecation of tea only without additional security or charge by way of sales commission. Four houses of tea brokers have recently come into the picture with relaxation of the restrictive rules

of their Association in this behalf.

The solution of the present situation is to be found in steady expansion of other institutional credits. The Commission has pleaded, of course, that the current burden of cost of credit should be lightened by the supplying source concerned. But its major emphasis is on the expansion of branch offices of the State Bank of India in tea producing regions. When accommodation is available from the State Bank for seasonal needs in an 'abundant measure', the internal resources of tea companies can be released for the essential purpose of long-term finance. This transition will extend inevitably over a period of time.

Evidence tendered before the Commission on requirements of long-term finance for programmes of renovation or capital expansion cannot be regarded as exhaustive. One-fourth of the non-Indian companies which furnished data maintained that they stood in need of external resources for their long-term programme, while the proportion of such companies in the Indian sector was a little below three-fourths. A major remedy within the control of the companies is to strengthen their reserves by greater restraint on distribution of profits by way of dividend. Its feasibility has its own limitations. But stress ought to be laid now on credit from the Indian Finance Corporation and the State Financial Corporations. The technical doubt as regards the eligibility of tea estates, supposed to be agricultural concerns, if any, has been found to be unwarranted in fact and it is clear that the factory component of the companies entitles them to assistance from these Corporations. This will be a novel field for them. The sources of long-term credit which have been recommended are not claimed to offer a full solution. They will need to be supplemented when the precise programme of rehabilitation and expansion is decided upon.

YUGOSLAVIA AND SOUTH-EAST ASIA

By

V. MESARIC

(Till recently Yugoslav Consul-General in Bombay)

THE systematic development of Yugoslavia's economic relations with the countries of South-East Asia began only after the last war. Before the war her economic contacts with the countries of that area were insignificant, and trade with them was small. The appearance of new states in South-East Asia after their liberation and the uprooting of colonialism, did away with all obstructions to their free social and economic development. Considered from the economic point of view, the uprooting of colonialism in that part of the world proved, in practice, to constitute an expansion of the world market, and enabled an increase in world trade.

It was under the difficult conditions of the last war that Yugoslavia, too, succeeded in winning her full statehood and national independence. This enabled her—in a relatively short period—to overcome her agrarian backwardness and grow into an industrially developed country, with its standards approaching Central European averages.

Accordingly, quite good opportunities for the expansion of economic co-operation with the countries of South-East Asia presented themselves, the more so since Yugoslavia is fighting for full equality in economic relations between all countries and since she respects the international division of labour on the basis of natural and economic conditions, paying due attention to the specific requirements of development in insufficiently developed countries.

Yugoslavia's trade with the countries of that area in 1956 increased particularly in comparison with previous years, as the following table shows (in millions of dinars):

	1954	1955	1956
Exports	100	282	3,279
Imports	406	5,565	4,791
Trade Balance	-306	-4,283	-1,512

The great deficits in this trade were formerly covered by funds earned in other countries. This increased our dependence on other markets, and we were forced to import some goods from South-East Asia through other countries. Our trade with these countries is, however, increasing this year too, and we are already in a position to pay for our imports by direct exports. This is the result of our endeavours to establish direct trade and economic relations with all the countries in this area, and we have already concluded trade agreements with a number of such countries—Pakistan, India, Burma, Ceylon and Indonesia. The structure of our trade with these countries differs greatly from that of the pre-war period, and our exports reflect the changes which have taken place in our economy. As far as exports are concerned, almost every branch of our industry is exporting to some market in South-East Asia. We are now selling to these countries ocean-going ships, hydro-power plant

installations, different kinds of cranes, electro- and diesel-motors, various machine-tools and other finished industrial products. Naturally, we have not expanded our trade equally with all these countries, nor have we succeeded in exporting a great variety of goods to all of them.

Yugoslav economic experts who are working in some of the South-East Asian countries have played an important role in expanding our trade with that area. Our experts there have shown that Yugoslavia is ready to assist the economic development of the countries of that part of the world, and that the Yugoslav economy is actually in a position to do so.

Taken as a whole, the results achieved are significant, and they reveal our possibility of co-operating with these countries in the economic field. These results primarily show that our industry is capable of supplying many products which they need. Similarly, they show that our country is there considered a valuable trading partner. Furthermore, owing to Yugoslavia's peaceful policy and her persistent struggle for the equality of all states and nations, for assistance to insufficiently developed countries in their endeavours to develop their natural resources, people everywhere have come to consider trade with Yugoslavia to be an important contribution to general co-operation between states.

There are, however, many problems in our economic relations with South-East Asian countries which must be solved. First, our exports to these countries could be increased, both in volume and variety. Our machine building and heavy industries, for instance, have not been quick enough to exploit the possibilities of that market. An increase in the exports of these products would enable us to exploit our industrial capacities more profitably and to expand the production of certain factories which still depend on the home market. Our trade with the South-East Asian countries is much smaller than their trade with other European countries, so much smaller, in fact, that it cannot be ascribed to the difference in the economic strength of our country and other European states. This means that other European countries are exploiting their capacities better than we are. Accordingly, we shall have to adjust our production to the requirements of the market, i.e. to expand the capacity of those industries whose exports are increasing, and to increase the variety of goods so as to be able to offer more products to foreign countries.

The insufficiently developed and inadequate network of our agencies abroad is another reason why we cannot go on expanding our trade at a quicker rate. In addition, we encounter the competition of countries which are industrially much stronger than we are. These countries maintain strong trading organizations in South-East Asia, organizations which were developed in the era of colonialism and which still exert a considerable influence on the market there. It is true that the countries of that area are making efforts to enable their home merchants to handle the greatest possible percentage of foreign trade; but this process must be encouraged by finding agents among home merchants and technicians who would work on the marketing of our products, and on the organization of technical services, stores and so on. Another considerable difficulty—also introduced by the former colonial powers—is presented by technical and other standards, many of which have become obsolete, but which are being maintained to prevent the penetration of other countries to the market there. Some progress is, however, being made in this field too. For example, India is introducing the metric system of measurements and currency, and

this will influence other countries as well. Similarly, European technical standards are being applied ever more frequently. But, irrespective of all this, it is essential that we adjust our production to the requirements of the world market as quickly as possible if we are to sell more goods to foreign countries.

To strengthen our economic co-operation with the South-East Asian countries we shall have to modify our banking system and establish closer contacts with banks in other parts of the world, as well as introduce the same facilities in trade as other European countries. In this way our trading enterprises would be able to conduct their business in a more flexible way, and to compete with foreign countries more successfully.

In our economic relations with some South-East Asian countries, including India, Burma and Pakistan, we have reached a satisfactory volume of trade, but the structure of this trade is far from being stable. On the other hand, our trade with another group of countries in that area—Indonesia, Thailand, Ceylon and Malaya—is unsatisfactory, both in volume and in variety. There is yet another group of countries there with which we are just establishing political and economic relations. These are Cambodia, South Vietnam and others.

All this shows that we must act more energetically in our economic relations with these countries. It is sometimes said that we should develop economic relations first with countries nearest to us and then with those further away. This view has, however, been disapproved in practice, for we have already succeeded in developing a mutually useful trade with the countries of South-East Asia, a far-off region. Furthermore, the fact that we still have some insufficiently exploited industrial capacities, and that the South-East Asian countries have started intensive economic development, encourages our attempts to develop trade with all countries in that area. Finally, the income from export of the countries of that area—owing to the changes in the prices of the relatively few articles which they export—varies considerably from year to year, so that the planned volume of their imports is often reduced. Only co-operation with all the countries of the area can, to a certain extent, enable us to export a more or less constant volume of goods, since exchanges with individual countries are bound to vary every year.

Economic co-operation with the countries of that part of the world can be successfully maintained for a long period if it proves to be of mutual interest. We must, therefore, go on importing increasingly greater quantities of goods from them. Naturally, this is a long-term task, but its realization must be approached boldly. Increase in direct purchases in that area must be one of the primary tasks of our economy, for a large part of our imports from there is still coming through other countries. We must buy directly the raw materials we need, such as rubber, copra, tin and so on, and overcome all the difficulties which stand in the way.

In view of what we have already said, we may expect that, during his visit to the countries of South-East Asia, Vice-President Vukmanovic will talk with the responsible leaders there, not only about political problems, but also about economic matters. He will certainly emphasize Yugoslavia's wish to co-operate with them in the economic field as successfully as in the political and other spheres of activity. The tour of our mission in the South-East Asian countries will make it possible to consider, examine and assess all current economic problems. Direct contact with the leaders in the countries of that area will certainly produce favourable results for all concerned.

The search is on...

by Adipocere

(Pronounced 'adi-po-saire')

I am all over the world, but hidden well inside the earth's crust. They keep on looking for my various forms, particularly petroleum...and in fact, at this very moment, a

search is going on in India. In West Bengal, STANVAC are trying to pin-point me in an area of 10,000 square miles. They have been at it for 3 years and their top geologists and scientists have brought along a whole stream of complicated instruments and equipment and are spending enormous sums of money (I overheard, way above me, some talk of their having spent fifteen crores of rupees already). They think they'll find me!

I never went to College, but years and years of experience with these tough oil-men crawling all over has taught me the methods they use to trap me. Broadly speaking, surveys are geological and geophysical. The first is like X-raying the earth below, and the second is an instrumental and scientific method of locating my actual hide-out. Such terms as Seismic, Gravimetric, Magnometric and other jaw-breaking words cover this process and mean a whole lot of highly complex and specialised instruments.

But I am still in hiding and all I say is "Come and get me, if you can!"

Economic Report from the U.S.

THE STATE OF THE ECONOMY

(By GUY SIMS FITCH)

WASHINGTON, July 9.—At the mid-way point of 1957, the United States economy is living up to the expectations voiced by most experts when the year began. The pace of expansion has slowed somewhat. But the economy seems well on its way to another record year, its third in a row. The total value of goods and services produced — the gross national product — has been rising steadily, and is out-distancing the record rate of 1956.

Also at peak levels are personal income, consumer spending, retail sales and business investment in new plant and equipment; employment exceeds 65 million, and unemployment comes to no more than 4 per cent of the total labour force. Continuing strength in these and other vital sectors has more than offset the publicized dips in some areas of industrial production and in inventory buying. What is more, this overall strength persists in the face of the tightest money market in a quarter of a century.

In any mid-year appraisal, however, it is important to see where the economy is going as well as where it has been. This is particularly true when, as a new number of cross-currents show up, some segments of the economy have been rising and others falling.

Most economists concede that there will be the usual summer-time dip in business activity this year — a normal enough development, except in periods of unrelieved boom. They expect that the summer lull will be followed by the usual Fall upswing — also normal except in periods of general slump. But since the American economy is a free and dynamic rather than a static entity its achievements cannot easily be measured by assessing short spans of time. Hence, economists tend to look into 1958 for a better perspective on its direction and potential.

In this longer-range view, a decidedly optimistic tone prevails. One noted economic writer — J. A. Livingston — reports that 52 of 57 economists he polled see a distinct upswing in the latter part of 1957 continuing into 1958. They expect business investment to maintain its pace; housing to start to climb substantially; consumer income and spending to continue their rise, and industrial production to recover significantly.

In the same vein, 'Fortune' magazine, a highly respected business journal, flatly predicts in its semi-annual forecast that 1958 will be the "fourth successive best year ever" for the U.S. economy. It sees the gross national product rising two per cent this year and another three to four per cent next year — measured not in "inflated" dollars, but in constant 1956 prices. It sees similar increases in the physical volume of industrial production. Not that 'Fortune'

necessarily expects 1958 to be "a year of unrelieved good news from start to finish,"; some new readjustments may have to be faced. But the magazine does not anticipate that they will seriously impede — any more than in the past two years — the general upward movement of the economy. Thus, while the old and recurrent problem of the business cycle may not have been entirely eliminated in the modern American economy, it has at least been moderated to a considerable degree. Certainly, the economy has demonstrated a marked ability to contain within itself divergent internal influences and yet sustain a high level of prosperity.

INDUSTRY EVERYWHERE

**THE INDIAN OXYGEN
& ACETYLENE CO., LTD.**

Even the North Pole is getting warmer!

The comforts of life are spreading. And that is good news for everyone.

Rising standards of living are finding their way into the back of beyond and are coming within the reach of people with quite modest means.

Playing a big part in this welcome development is *kerosine*, a product from petroleum. Thanks to *kerosine*, light and power have come to the humblest home in the remotest Indian village. Thanks to *kerosine*, people with slender purses can enjoy good light, good warmth and good cooking, wherever they may live. *Kerosine* is one of the cheapest, most convenient and most readily

available fuels of which the modern appliance manufacturer is taking full advantage. Well-designed cookers, stoves and heaters are being produced which are completely self-contained and ready for instant use anywhere. Even when alternative fuels are available, *kerosine* is a valuable supplement.

The population of the world increases rapidly. People must be fed, housed and—in colder climates—kept warm. They must all be able to enjoy the good things of life. *Kerosine*, marketed by Burmah-Shell, is one of the many products helping the good work along in this country.

STATE FINANCIAL CORPORATIONS

By
(CROESUS)

OF the 10 State Financial Corporations, the results of working of which have been published, the performance of the Kerala Financial Corporation stands foremost, and it is not an unjustified claim that Mr. P. K. K. Menon, Chairman of the K.F.C. made a few days ago (28-6-57), when he declared: "After going through the annual reports of the various Financial Corporations in India, I am happy to mention that our very high record for maximum utilisation of funds, economy, and efficiency in administration has not only been maintained during this year (year ended March 31, 1957) but it has also definitely improved". But these achievements have brought in their wake fresh problems for the K.F.C., one of which, perhaps the most urgent, is that of raising additional working funds. Out of its initial capital of Rs. 1 crore, the K.F.C. has already advanced nearly Rs. 84 lakhs or as much as 83.9 per cent. This percentage is higher than that of even the Bombay State Financial Corporation (75.5 per cent). Only one other State Financial Corporation—the Punjab Corporation—has advanced more than 50 per cent (56.8 per cent to be precise) of its initial capital. In a few years, doubtless, the percentage of advances to initial capital of the other State Corporations also is bound to go up, giving rise, in turn, to the problem of finding additional capital for those Corporations as well.

The raising of the initial capital of these Corporations when they first started did not present much difficulty, because the State Government concerned, the Reserve Bank and the several financial institutions, such as insurance companies and banks, absorbed a major share of this capital, the general public coming in only in a very very small way. With a view to giving the Corporations a good start, the State Governments not only contributed 50 per cent of their share capital but guaranteed a minimum dividend (3 per cent in the case of the Punjab and 3½ per cent in all other cases) to all subscribers to the initial capital. But will State Governments agree to take more shares on the same basis now? As Mr. Menon observed, "issue of shares with the guarantee of minimum dividend is an indirect burden by way of subvention on the State Governments who are themselves finding it difficult to balance their budgets (even revenue budgets, let alone overall budgets) and to find resources for meeting their Plan commitments. Hence any proposal for issue of new shares for raising capital will naturally be resisted by the State Governments who will not only have to take a major portion of the shares so issued but also will have to bear the brunt of additional subvention". To the suggestion whether funds could not be raised by issuing bonds or debentures also, Mr. Menon gave a pertinent, albeit disappointing, reply. "The issue of debentures or bonds duly guaranteed by the State Government", he said, "is not likely to have sufficient response, unless a very high rate of interest is offered". The Corporations cannot afford to do so, unless their own lending rate also is raised, but, if this is done, medium and small sized industries may not find the rates attractive enough to approach the Corporations.

There is a third way open to some of these Corporations for augmenting their resources, namely by disposing of their holdings in Government Securities. But doing so, especially at the present time, will not

only further depress Gilt-edged prices but also entail a substantial loss by way of capital depreciation which luxury, the Corporation can hardly afford.

Finally, there is the K.F.C. Chief's suggestion that the Financial Corporations Act itself must be suitably amended so as to enable the Corporations to borrow money not only against Gilt-edged investments but against other securities as well and this for a longer period than is permissible now. Under the Act as at present, borrowings can only be from the Reserve Bank against Gilt-edged Securities and even then only for 90 days. As this process of amendment involves time, Mr. Menon appealed for fixed deposits from the public on a 4½ per cent interest basis and wanted the Government of India to ask the Life Insurance Corporation and State Insurance Departments, wherever these exist, to put some of their moneys in these fixed deposits.

It may be mentioned, in passing, here that the State Corporations may also augment their resources, to some extent, by agreeing to act as the agents of the Central or the State Governments for disbursing finance to industries under the concessional scheme of aid to small-scale industries, as recommended by the recent conference of representatives of these Corporations themselves. One only hopes that they may not be asked to do this work on an honorary basis.

That the problem of finding additional resources for these Corporations brooks no delay is obvious from the fact that more and more industries, both old and new, have now begun to turn to these Corporations. Hitherto, the Stock Exchanges constituted the most important pool for supply of fixed capital, but, thanks to the latest tax proposals, they are finding it extremely difficult to absorb any new floatations. The investing class is steadily diminishing and, in the new set up of things, has also become shy. In this connection, it may not be out of place to quote what Mr. Menon said about the effect of the latest tax proposals. He said:

"The impact of the tax proposals envisaged in the new budget of the Central and State Governments however gives very little encouragement for investing private capital in new industries, as it is proposed to tax at a high rate not only income from productive investment, but even the equity capital possessed by producers. The prospects of raising equity capital have thus deteriorated to such an extent that proposals have been examined by a Committee appointed by the representatives of the various Financial Corporations in India whether Financial Corporations should not be encouraged in the business of under-writing of shares and participating in equity capital."

In view of this added responsibility, the need to make more funds available to State Corporations becomes all the more urgent. It remains to be seen what novel brainwave the official world will have to solve this problem.

Meanwhile, the question of economising their expenses is as important to these Corporations as that of raising funds. The latest results of working of these

Corporations indicate that the percentage of administrative expenditure to gross profit ranges between 10.6 (Kerala) and 46.8 (Bihar). But this is an item in respect of which there is not considerable scope for economy and to a certain extent, the percentage figure is deceptive, in that, so long as it is determined by the total volume of business, backward States like Rajasthan and Assam, which have not advanced much, may appear to be faring better than West Bengal and Bihar. Where, however, the Corporations can effect substantial savings, which will incidentally be available to them for their work of financing industries, is in regard to taxation. With the raising of the income-tax for companies in the latest budget, the position of the Financial Corporations has been worsened, and, to the extent that these Corporations are called upon to pay more taxes, the amount of subvention to these Corporations that the concerned State Governments will have to pay will also increase. An undoubted anomaly is that the State Corporations are not allowed to pay tax after earmarking the amount required for the inevitable payment of the minimum guaranteed dividend. It is rather curious that, for faithfully and promptly carrying out the

directives of the Union Government in regard both to taking shares in the Corporations and to guaranteeing payment of a minimum dividend on the initial capital, the State Governments should be penalised by perpetuating the burden of subventions, which is what it will amount to if the rates of tax go on increasing and the Corporations' prayer that they be taxed only on such portion of their profits as are in excess of the amounts actually required to pay the minimum dividend guaranteed by the State Governments is not granted. However, one should consider this a modest enough request, for it was at least open to Mr. Menon and his confreres on other State Corporations to request the Union Government to exempt the profits of these Corporations from taxes altogether. Not that this would have had any chance of acceptance, especially when the amount involved runs into lakhs of rupees. The combined provision by these Corporations for income-tax and reserves, which constitute only 5 per cent of the corporate profits, for the year ended March, 1957 amounted to over Rs. 18 lakhs. As yet fortunately, the Union Finance Minister has not been requested to exempt State Finance Corporations from taxes, but, sooner or later, it seems, such a demand will arise.

COMPANY CONTRIBUTIONS TO PARTY COFFERS

By
(CROESUS)

THE question of contribution to political parties continues to be an interesting subject of conversation, especially in intellectual circles. Already there have been two judgments by the High Courts of Bombay and Calcutta and, more recently, a judgment of the Appellate Bench of the Bombay High Court upholding an earlier judgment of the Bombay High Court on the same subject. The legality of the matter, however, is not the point at issue. For it is clear, as the law of the land stands today, the courts cannot possibly refuse applications for amendments to the Memoranda of Associations of companies to enable them to contribute monies to whatever political parties whom they may wish to support. But, even here, because of a number of new companies which have got incorporated in their Memoranda of Associations such powers, it would seem the courts themselves are not clear in their own minds as to whether, in the event of their refusing to alter the Memorandum of Association of an applicant existing company, there would not arise a legitimate issue of discrimination as between one company and another. Discerning all these implications, no doubt, the learned judges of the Bombay and the Calcutta High Courts have confirmed the proposed alterations in the Memoranda of Associations of the Tata Iron and Steel Co., Ltd. and the Indian Iron and Steel Co., Ltd. But, in doing so, they have clearly pointed out that the High Courts can, while confirming the alterations, also impose certain terms and conditions. Actually, in the case of the Indian Iron and Steel Co., the Calcutta High Court has not only made it obligatory on the part of the IISCO to publish in its accounts the precise contributions that it may make to political parties but also to approach the court again after a period of six years, unless this period is extended in the meanwhile by the court. The Bombay High Court, however, has contented itself by insisting on the IISCO to publish complete statements of donations by it to political parties in two leading newspapers at the end of every financial year.

This is in so far as the immediate purpose of the alterations of the Memoranda of Associations of companies as concerned. But there is something more far-reaching involved in this permission to subscribe to the funds of political parties. The various authorities cited by the learned counsels on either side show how sharply opinions are divided on this issue. Even so, it is

clear that there is a lurking fear in the mind of everyone that this power may be abused and democracy made a complete mockery. It is because of this that Mr. Justice P. B. Mukherji remarked that "having regard to the dangers of power of money to purchase views, it will be highly undesirable to encourage any kind of secrecy in respect of such payments".

It is also significant that both the High Courts have expressed concern at the growing number of applications under Section 17 of the Companies Act, 1956, by which companies are seeking to divert commercial funds to political purposes, and have, therefore, thought it fit to draw the attention of the authorities to the possible evil attendant upon the powers exercised by companies in this behalf and to impress upon the Government the necessity of remedial measures to curb and control them. It would, therefore, be just as well to conclude this with an extract from the dictum of the Calcutta High Court on the subject ".....It is essentially in the interest of both commercial and public standards to have immediately some legislation on the subject, to keep the springs of democracy and administration reasonably pure and unsullied and, before it is too late, to control the dangers and mischiefs inherent in the situation".

RECORDS & STATISTICS (QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

BOUND VOLUMES
of
THE EASTERN ECONOMIST
and
RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

BUSINESS NOTES

A GENUINE GRIEVANCE

IT IS not clear whether the disability in the Wealth Tax and the Expenditure Tax Bills attaching to one of the three categories of professional people who generally appear on behalf of their clients, namely income-tax practitioners, (the other two being lawyers and chartered accountants) is specifically intended or inadvertently put in, but the fact remains that, as the new measures stand now, income-tax practitioners will not be able to represent their clients for the purposes of the two new measures. In respect of income-tax, Section 61 of the relevant Act provides for this category of persons also to represent their clients. It is only logical, therefore, to assume that those who are permitted to appear for their clients in income-tax cases would be allowed to do so in cases relating to the Wealth and the Expenditure Taxes also. For there is so much common to all the three levies and it is to the advantage of both the authorities and the client if the same representative handles all the cases, especially as, in many cases, the authorities dealing with them also may happen to be the same. This would make too for a clearer understanding of the clients' position, as also for expeditious disposal of cases.

This, in short, is the gist of a representation which the Chamber of Income-tax Consultants, Bombay, has made to the Union Minister for Finance, and it is understood that a small deputation of the Chamber also will be shortly proceeding to New Delhi to place the Chamber's point of view before the Union Finance Minister and the members of the Select Committee if need be. All these should not have been necessary if the omission were just a drafting mistake. If, unfortunately, this is not the case and there are any compelling considerations prompting the authorities to exclude income-tax consultants from appearing on behalf of their clients in Wealth Tax and Expenditure Tax cases, it behoves the authorities, in fairness to the practitioners, to make them public. The practitioners are naturally greatly worried at the omission, as this would not only deprive them of utilising their talents in a new field that has fortuitously unfolded itself, but it might provide an excuse for their clients to elbow them out and engage the services of only lawyers or chartered accountants, if only for reasons of economy. So, both from a professional point of view and from the point of view of human considerations, the income-tax practitioners have a good case, a case which, we are sure, the Union Finance Minister will be quite quick to grasp and also to proceed to set right straightway. And the fact that these Bills are to go before the Select Committee offers a ready means of redressing the genuine grievance of the practitioners.

SMALL AND VILLAGE INDUSTRIES

IT DID not take the authorities and the country long to realise that the planners were mistaken in leaning heavily on small and village industries to provide increased employment as well as consumer goods for the internal market. Nevertheless it needs to be remembered that the failure of these industries has not been entirely of their own making. In both cases, the largest single factor making for slow progress has been the absence of adequate credit facilities. Another important handicap for the small industries' entrepreneurs has been the lengthy and tiresome procedure in the supply of machinery on hire-purchase basis. Even where such machinery has been made available, instances are not few when it could not be put into commission for lack of necessary motive power. Obviously,

this is a case of insufficient co-ordination whose prolongation is inexcusable. That the authorities are recognising this state of the small industries' affairs is, therefore, welcome. Recently, the Union Minister for Industries, Mr. Manubhai Shah, reiterated before a meeting of the State Directors of Industries in Delhi that some small industries could be developed as ancillaries to large organised industries. This is what already prevails in other industrial countries and calls for immediate and active attention in the Indian setting.

Around the same time, the problems of village and Khadi industries came up before a special meeting, in Bombay, of representatives drawn from State apex co-operative banks throughout the country. Here, as elsewhere, the credit programme is far too timid in relation to the requirements which may in part be attributable to the peculiar nature of the rural economy. For instance, loans are generally sanctioned to a co-operative on the basis of its creditworthiness which is measured by its paid-up share capital and other properties that it may be owning. In the prevailing circumstances, when the membership of co-operatives is generally composed of backward and poor people, hardly can any co-operative with thin resources qualify for a sizable loan. If solid progress is to be achieved the criteria will need to be revised and relaxed considerably. While the rural co-operatives may be expected to marshal their own resources to the full, the State financing agencies should be bold, though vigilant, in providing the necessary finance. Indeed, those industries which have proven potentialities must be given priority over new ones which are still in experimental stage and may only cause dissipation of the country's limited resources on projects of doubtful value. Other formidable problems have a wide spread from the supply of raw materials, technical assistance and managerial guidance to processing, storing and marketing. All this calls for devising a new organisational pattern, on various levels, in order to afford a stable base to village industries.

ANDHRA FINANCES

THE FINANCIAL picture of Andhra Pradesh, as depicted by the State's Finance Minister, Mr. Gopala Reddi, in what he himself called a "very unconventional" budget speech, clearly indicates that the financial house of the State is not in order. Ever since 1954-55, the State has been having revenue deficits of around Rs. 5 crores, if not more, every year successively. The precise revenue deficits of the State since 1954 are as under:

Andhra Telengana Total

	(Rs. in crores)		
1954-55 Accounts	5.18	0.51	5.69
1955-56 "	5.29	1.70	6.99
1956-57 Revised Estimates	2.43	2.25	4.68
1957-58 Budget Estimates	2.43	3.05	5.48

This shows, apart from the known financial consequences of the merger of Andhra and Telengana, the gravity of the situation and should be a pointer to the authorities not to remain complacent any more. An immediate improvement in the structure and collecting machinery of taxation and small savings is called for to rescue Andhra's finances from its difficult state.

The budget estimates for 1957-58, presented last week to the State legislature, put the total revenue receipts for the year at Rs. 53.14 crores and revenue

expenditure at Rs. 58.62 crores, leaving a revenue deficit of Rs. 5.48 crores. Following Mysore and Bombay, Mr. Reddi also has left the entire deficit of his state uncovered, making not even a pretext to impose fresh taxation. On the other hand, Mr. Reddy has proposed to adopt a novel technique. For he has indicated that, after watching the reactions and listening to the suggestions from various sections of the House, something positive would be done "to improve our financial position". In other words, instead of making any tax proposal himself, he wants the members of the legislature to offer suggestions. This is quite unconventional and is also not without its merit, in that, when the members themselves put forward suggestions or tax proposals to cover the deficit, there can be no question of any opposition from the House. And a public debate like this on tax proposals must also rid the Stock markets of the customary budget shocks.

A careful study of the revenue and the expenditure of the State reveals that one of the disconcerting elements, on the expenditure side, is the mounting bill of interest charges. Andhra's public debt amounts to Rs. 142 crores and the interest charges thereon alone come to Rs. 5 crores a year. The burden of the public debt of Andhra, like that of Mysore, will be mitigated only after a time, that is, when the projects which are financed by this debt begin to yield returns.

Regarding loan flotation, Mr. Reddi has wisely decided not to come to the market in view of the prevailing market conditions and to adhere to the advice of the Union Finance Minister and the Reserve Bank of India. He has chosen this course deliberately, because, if Andhra enters the open market in spite of this advice, its share of the collection of small savings will be only one-third instead of two-thirds. Inasmuch as he has decided to bank more on savings, which is all to the good, he wants to set up an elaborate machinery to mop up rural savings in the shape of National Savings Certificates and take for his State the full share of 66-2/3 per cent to which it would be entitled. If earnest efforts are made and if the agricultural prosperity of the State is maintained, the results of the small savings drive should not be disappointing.

A FOOD ZONE FOR THE SOUTH

THE DECISION taken at the recent Food Ministers' Conference at Hyderabad to constitute a Southern Food Zone, consisting of the four States — Andhra Pradesh, Kerala, Madras and Mysore — is perhaps all that could be done to bring about some semblance of agreement among these States with their respective food positions differing from that of others. Thus, foodwise, while Kerala is a deficit State, Andhra is a surplus State. As such the latter is naturally interested in trans-zonal rice sales. The other two States, namely Mysore and Madras, have to make up only small amounts, their individual deficits being negligible. On the face of it, therefore, it is difficult to see how these States, with their differing problems, qualitatively and quantitatively, can agree to work together without mental reservations. So one must await the actual working of the proposed zonal system in this regard before pronouncing any view on the subject. Any good-intentioned effort must be assured at least a fair trial. Meanwhile the Union Food Ministry is keen on these zonal arrangements and it is to issue shortly a notification setting out, in detail, the arrangements in connection with the functioning of the Southern Zonal system and regulation of movement to places outside the Zone, as also for maintaining reasonable prices within the Zone. The contemplated zonal system, one

gathers, is in the main a quantitative arrangement cancelling out the large surplus of one State by the big deficit of another within the same zone. By this arrangement all that may be expected to happen is a strict limitation on trans-zonal sales. Since, one of the constituent units, namely Andhra, is particularly interested in trans-zonal sales, it is doubtful whether the arrangement as proposed will, in actual practice, work without any hitch. A more satisfactory solution, in our opinion, would be to improve the rice position, in the area by ensuring the availability of all the supplies of the only surplus State in the zone — Andhra — at fair prices by making it difficult and unprofitable for millers and cultivators in the region to withhold supplies in anticipation of higher prices. Of course, these fair prices should bear some relation to the prices that the Andhra State would have got if it had been allowed inter-zonal sales. In order to help its neighbour in distress, the Andhra State may no doubt be asked, and it may also be willing, to divert its supplies, but in insisting on it to do so, there is an implied obligation on the authority doing so to ensure for the State at least a reasonably fair price. On its part, the surplus State also has an obligation to see that the rice interests in the State do not exploit the scarcity situation in other parts of the country to extract any price. If the Southern Zonal system can take care of this much, it will have effectively served the purpose for which it seems to have been devised.

METAL BOX CO. OF INDIA

IT IS creditable for the Metal Box Co. to have succeeded in maintaining profits at the previous year's level in the face of rising costs, mainly by an increased turnover of the order of Rs. 72 lakhs over the preceding year's total of Rs. 495 lakhs. The rise in costs was the result of a combination of various factors, the more important of which were increased freight charges following the closure of the Suez Canal, enhanced customs duties and higher prices of raw materials as a result of shortages of supply. With the order book filled to a record, the current financial year of the Company promises to be another successful year of operations, provided raw materials are available in sufficient quantities. This, however, is a matter not entirely free from anxiety. It is true that considerable progress has been achieved in the expansion of production of tinplate—though, because of labour trouble, output did not record any increase over the previous year—and other indigenous raw materials. But there continues to be some dependence on imported materials, largely in the interests of maintaining high quality. For that reason it will be desirable, as pleaded by Mr. H. Chiswell Jones the Company's Chairman, not to cut down imports below the essential minimum, which would be seemingly necessary to conserve foreign exchange or encourage local enterprise.

Again, it is of significance that the Company's products are an exchange earner inasmuch as the value of export goods packed in the containers of their manufacture during the year ended March 1957 was Rs. 4 crores. Demand, both for internal and external trade, is increasing. The Company has been trying to exploit new potential markets, particularly in South-East Asia, and has already recorded initial success. Side by side with sales promotion, it has embarked on projects of expansion and improvement in production. The schemes are designed, among other things, to cut down the present high percentage of wastage in the processed food industry. With the advice and training facilities available to the Company from the Metal Box Co., London, and some encouragement from the Government, it is bound to make good progress in the coming years.

Company Meeting

THE METAL BOX COMPANY OF INDIA LIMITED

Review by the Chairman—H. Chiswell Jones, O.B.E.

The Twenty-fourth Annual General Meeting of The Metal Box Company of India Limited will be held on Thursday, July 18, at 59C, Chowringhee Road, Calcutta. The following is a copy of the Review by the Chairman, Mr. H. Chiswell Jones, O.B.E., which has already been circulated to members.

SALES

Sales for the year were a record at Rs. 567 lakhs compared with Rs. 495 lakhs last year. All Branches showed commendable initiative in attracting and meeting the increased volume. Government spending continued at a high level and not unnaturally as the economy expanded considerable strains appeared; the prices of consumer goods advanced over a wide front and the foreign exchange situation deteriorated sharply. In fact, the last quarter of the year was dominated by foreign exchange considerations affecting the fortunes of our customers as well as our own raw material supply. Restrictions were imposed in January on the import of a variety of consumer goods calculated to save many crores of rupees in foreign exchange, creating a gap in the internal supply of packed consumer goods which must be bridged by increased local production. This is a challenge which your Company and its customers can readily meet provided sufficient raw materials particularly tinplate, are available.

We recently explored the more promising of the South-East Asia markets and secured initial orders worth some Rs. 2½ lakhs. Substantial exports to these markets in the face of keen competition from U.S.A., Japan, Hong Kong and Europe could be realised through intensive sales promotion provided that a special allocation of tinplate for export was made available.

Also on the export front, goods packed in our containers are making an impressive showing. In the year to March, 1957, goods to the value of Rs. 4 crores were exported in containers of our manufacture, the quality of which was, in every case, an important selling point. Prepared spices, cashews, edible oils, paint, pharmaceuticals, foodstuffs and toilet goods went to all five continents and there is still scope for a considerable expansion of these exports. Additionally there is the opportunity to increase the value of exports of products which at present are exported mainly in bulk. India is well equipped to supply consumer-packed goods of the highest quality and it is the export of these that should be officially encouraged so that this potential can be fully exploited with benefit to the foreign exchange position.

PROFIT

In my last Review, I said that despite rising costs we hoped to maintain profits by increasing sales. Our efforts were successful and profits were held at the level of the previous year on a turnover increased by Rs. 72 lakhs. We began this financial year with a record order book and if we are not deprived of raw materials we should earn satisfactory profits.

RAW MATERIALS

For most of the past financial year we were free from major anxieties in the supply of raw materials, though steadily rising costs and the necessity to keep an adequate stock level have produced their own financing problems. The value of our stock policy in these days of international anxiety and crisis may be judged against

the American Steel Mill strike of two months last year — the Suez Canal closure with consequent disorganisation and delay in shipping schedules — and now import cuts here. Our stocks saw us safely through the 1956 crises. Our later performance will be determined by Government's import policy.

The production capacity of indigenous tinplate was expanded towards the end of the year by one additional rolling mill. Output, unfortunately restricted by labour trouble, was almost unchanged from the previous year and provided us with about 60 per cent of our total needs — the balance came from imports. Further success has attended our efforts to achieve local production of other raw materials hitherto imported, and our dependence on imports is now near the irreducible minimum. Desirable as it is to conserve foreign exchange and support local enterprise, it is to be hoped that the policy will not be pressed to a point where quality and efficiency will suffer, as well they may, if consumers are forced to accept local substitutes without regard to quality or performance.

The past year has seen further substantial price advances in almost every raw material we use, either on account of higher manufacturing costs or increased freight charges following the Canal closure. Enhanced customs duties, and price increases through shortage of supplies resulting from import restrictions, have also contributed to raising our cost of production.

EMPLOYEE RELATIONS

The clamour during the reorganisation of the States and more recently, the General Elections, had an unsettling effect upon labour. Despite this, we have had another year of industrial peace at all factories. There was a steady increase in the consumer price index throughout the year, and adjustments were made in the emoluments of our employees.

Training in all its aspects, and at every level, continues to receive a great deal of our attention. Qualified T.W.I. instructors are working at our two largest factories, and the continuous training classes there will shortly be extended to the other factories. Members of our staff have taken courses in scientific management at local Universities and the Company is working closely with Management Associations in four States. Our U.K. consultants, The Metal Box Company Limited, afford unique training facilities for our young Indian managerial, technical and scientific staff. More than thirty have now received training in this way, and many more are planned for the next few years. We have special apprenticeship schemes covering all skilled operations in our factories, and we have recently offered to train a number of skilled artisans for the Government Steel Plants.

All this adds up to an expression of our belief and faith, that given education, training and opportunity, workers will through their own efforts and initiative demonstrate their fitness to play an increasing part in management. All our full-time Directors, and the

majority of our senior executives and technicians began their careers with us in junior positions. We are proud of their success and we believe it is a major factor in our good employee relations, and in the high level of production in our factories.

Last year we introduced a Long Service Award for employees who have completed twenty years continuous service with the Company. On the occasion of the first presentation no less than thirty-two employees received a Rolex watch and certificate. To all employees whatever their length of service, I send my thanks for another year of sustained effort.

DEVELOPMENT AND NEW PROJECTS

We made progress with our development items during the year. Our industrial component section was improved with the opening of a new self-contained manufacturing department. In Calcutta equipment was installed for the manufacture of aluminium tubes and we have recently commenced the extrusion of aluminium components for the radio industry.

To meet the demand for quality printed polyethylene bags a new three colour printing machine was installed and further equipment for producing pouches from laminated materials is due to arrive shortly.

The R.S. or Roll Seal Pilferproof and Non-pilferproof Closures continue to gain popularity and are now generally accepted as attractive, easily-applied and, in the case of the former, effectively tamper-proof seals. Our Technical Development Section have designed and produced two new closing machines with rotating heads which keep the bottle or can stationary to avoid spilling

during the sealing operation. They are already popular with customers and in considerable demand.

In pursuance of our efforts to foster the canning industry we have engaged an expert from the U.K. who will assist in the solution of the problems of the industry. His services will also be available to those government organisations pursuing processed foodstuffs development. We have presented to the Central Food Technological Research Institute a mobile demonstration van in connection with a pilot scheme aimed at educating the urban population on the wholesomeness and use of canned foods. Government have been examining a proposal to subsidise the cost of cans for the processed food industry, to the extent of one-third of the cost of the tinplate used. This scheme aims at saving a considerable proportion of the present wastage of fruits and vegetables, estimated at between 15 per cent and 20 per cent of the total crop, stimulating horticultural production and providing the public with a round-the-year supply of fruits and vegetables at reasonable prices.

Our Research Division has made good progress in the task of improving finishes and developing indigenous materials to replace products hitherto imported.

CONSULTANTS

During the last year our consultants, The Metal Box Company Limited, London, have made available to us the services of a number of their Directors and senior staff in connection with revaluation of assets, training of staff in the U.K., research and the overhauling and recalibrating of all our printing ovens. I take this opportunity to express to them our appreciation of their continued valuable services.

COMMODITY NEWS AND NOTES

FRUIT CULTIVATION IN COMMUNITY DEVELOPMENT AREAS

The Programme of additional fruit and vegetable cultivation in C.D. and N.E.S. Blocks is making steady progress. On an average about 192 additional acres of land per block have been brought under fruit cultivation during the period from October 1952 to December 31, 1956. The total additional area under fruit cultivation in the C.D. and N.E.S. areas in December 1956 stood at 243,000 acres, as against 135,000 acres at the end of December, 1955. Additional area brought under vegetable cultivation in the C.D. and N.E.S. Blocks at the end of December 31, 1956, totalled 596,000 acres.

OIL IN THE MIDDLE EAST

Production in the Middle East has taken a considerable stride forward following the reopening of the Suez. Iraq alone among the major producers remains well below the pre-Suez levels, since the trans-Syrian pipelines are still only operating at 40 per cent of their capacity. In Iran output in May reached a new peak of 2.9 million tons. So far this year the Iranian Consortium has produced an annual rate of 33 million tons—over a quarter up on 1956. Saudi Arabia has also recovered sharply, with production from the first offshore field in the Gulf having started in April. The US owned Aramco produced 4.5 million tons of Arabian oil in May—well up to the pre-Suez average. Kuwait continues to be the largest Middle East producer at 4.8 million tons in May. There is an expansion project that will raise tanker loading capacity to 75 million tons a year, over 25 per cent up on the previous highest annual output.

IRON ORE OUTPUT

Output of iron ore in India during April 1957 was estimated at 392,476 tons. Production in March was 406,816 tons. Returns received by the Chief Inspector of Mines from 128 mines during April showed that 235,208 tons were despatched to iron and steel plants and 82,300 tons to the export market. Iron ore stocks at the end of April amounted to 1,410,304 tons.

LOWER RUBBER PRODUCTION

Production and consumption of raw rubber in India during May 1957 fell to 1,645 and 2,573 tons from 2,072 tons and 2,907 tons respectively in the previous month according to official figures. Stocks of raw rubber at the end of last month improved to 6,760 tons from 6,189 tons at the end of April, due to larger imports which totalled 1,499 tons last month as against 649 tons in April, 1957. Out of the total stocks at the end of May 1957, estates and dealers accounted for 3,878 tons and manufacturers for 2,882 tons. There was also a stock of 1,324 tons of synthetic rubber in the country at the end of May, 1957.

RAPID TANNAGE OF SOLE LEATHERS

Methods have been developed for the rapid tannage of sole leather used for shoes and chappals. The process of tanning in use at present for the manufacture of vegetable tanned sole leather is too lengthy and takes three to four months for completion. The rapid process developed at the Leather Research Institute at Madras, takes only three to four weeks, thereby reducing the cost of production and the necessary blocking up of the invested capital. The process is applicable

both to small-scale and large-scale industries working with or without the aid of power driven machinery. The leather produced is as good as that obtained by the traditional process in yield, colour and quality. For demonstration purposes about 2,000 lbs. of sole leather are manufactured every month at the Institute by the new process and has a firm sale in the Madras market.

PRESERVATION QUALITIES OF MANGOES

Recent scientific researches on the preservation of canned mangoes have shown that the Himsagar variety of West Bengal gives the best canned product. These experiments were carried out on three different varieties, namely Fazli, Langra and Himsagar. Flavour and colour of the Himsagar variety, even after six months' storage at room temperature were found to be similar to those of fresh fruits. Canning with 50 per cent cane sugar syrup brought about best storage life. In the case of Langra, the colour was fairly well-preserved, but the flavour was greatly lost and most of the fruit became off-flavour. The natural flavour of Fazli mangoes in canning was greatly lost and a syrupy flavour was increasingly prominent during storage. The colour also faded slightly. Slices of canned Fazli mangoes, however, retained their shape very well even after six months' storage at room temperature.

Specially produced for Industry...

WHEEL BRAND

Industrial Glycerine

Wheel Brand Industrial Glycerine conforms to the highest standards of quality—quality that has been proved by use in many industries. Guaranteed to contain not less than 98% glycerol.

COMPANY AFFAIRS

THE TATA POWER COMPANY LTD.

The first report of the Tata Power Co., Ltd., made up to the end of March 31, as every electricity undertaking is required to do under the Indian Electricity Rules, 1956, has just been published. Since the last report of the Company, was for the period ended June 30, 1955, the present report covers only 9 months. During this period the Company has made a profit of Rs. 61.86 lakhs as against Rs. 49.51 lakhs for the corresponding 9-month period of 1955-56. The profit is, of course, after Providing for Taxes, (2.2 lakhs) Managing Agents remuneration, (Rs. 21.22 lakhs) and Depreciation (Rs. 13.52 lakhs). After certain minor adjustments, the amount available for disposal amounts to Rs. 63.29 lakhs. Among the appropriations made by the Directors, particular mention must be made of the Wealth Tax at 3.78 lakhs. The proposed dividends (7½ per cent on preference shares and Rs. 56.25 per share on ordinary shares) will absorb Rs. 29.38 lakhs. Actually, if account were also taken of the interest payable out of capital, at 4 per cent per annum, on the new shares of the Company during the construction period the total distribution to shareholders would amount to Rs. 33.88 lakhs.

During the year under report, the total revenues of the Company aggregated Rs. 181.89 lakhs, as against Rs. 169.71 lakhs for the corresponding period of the previous year. The improvement was solely due to the increase in the energy sales of the Company, which accounted for an improvement of Rs. 12.76 lakhs in revenue. There was also an increase in the total expenses, exclusive of taxes, the main item accounting for the increase being fuel; due to the coming into the operation of the first Thermal unit at Bombay. (This amounted to Rs. 12.58 lakhs). Under the head taxation, there has been a notable decline of this 14.37 lakhs by reason of the assessable income being substantially reduced by development rebate and depreciation allowances on the first unit of Trombay. By the way, the Trombay Thermal Station was finally opened on December 15, 1956 the second unit at Trombay was started on trial from April 15. The Company has since got permission to extend the Thermal Station by installing yet another unit and it is expected that the capital cost of this third unit will be about Rs. 6.50 crores. As the foreign exchange component involved in this is about Rs. 4½ crores, the Company approached the World Bank and the application was also sponsored by the Government of India. After examining the proposal, the World Bank has agreed to make a further loan to the Company to this extent; the relevant agreement also has been executed (on May 29, 1957 at Washington). If all goes well and the delivery schedules of equipment are kept up, the third unit should go into operation sometime in April 1, 1960.

With effect from April 1, 1957 the Government of Bombay has started operating the Power Pool, which, until then, was being operated by the Hydro Cos. From the same date, the rate charged from consumers for energy supplied from the Pool has been fixed at the standard tariff rate plus half an anna Pool surcharge, as against 2½ annas per K.W.H. before. For the 9-month period ended March 31, 1957, the total units generated by the Pool amounted to 5.2 million units.

THE TATA OIL MILLS LTD.

The Directors of the Tata Oil Mills Company, Limited, have decided to recommend a dividend at the rate of Rs. 4.50, less tax, per cumulative preference share and a tax-free dividend of Rs. 2.50 per ordinary share, for the year ended March 31, 1957.

THE TRAVANCORE RAYONS LTD.

With peak production, sales and profits during the year ended December 31, 1956, the Company seems to be making steady improvement. The net profit for the year is Rs. 32,49,919 after writing off depreciation of Rs. 34,29,465. An amount of Rs. 2,63,771 has been brought forward from the previous year. Out of this amount a sum of Rs. 20 lakhs has been transferred to General Reserve account and the directors have recommended a dividend at 5 per cent per annum on the Cumulative Preference Shares and at 10 per cent per annum on Ordinary Shares. Dividend absorbs a sum of Rs. 12,50,000 and the balance of Rs. 2,63,690 is being carried forward to the next year.

In the case of Trayophane film both the cellulose film machines were in operation during the first half of the year. In the second half, however, slackness in demand for the film was felt. The increased production, together with the floating stocks, aided further by the imports allowed, created a glut in the market. The situation however took a turn for the better by the end of the year. The full complement of the spinning machines for rayon yarn were in operation almost throughout the year, registering an increase of about 30 per cent in production over that of 1955. But during December 1956, production had to be slowed down owing to accumulation of stocks. Now, the market is improving.

Six more new Butterworth rayon spinning machines are expected to be put into operation by the end of this year, raising the total installed capacity for rayon to 8.6 tons a day. Further expansion on the rayon side is receiving attention. On the cellulose film side company has succeeded in producing moistureproof heatsealing anchored film of standard quality and if the present trend is a reliable guide, further expansion in this line also may not be far off.

The Silver Lining

IF the clouds are gathering over the economic scene, one can at least this week discern a silver lining. The Central Cabinet, which has been in deep deliberation for the last two days, has now recognised that economic policy must take precedence over every other aspect of Government work. It is recorded significantly that the Minister did not choose to make any public reference to his foreign tour at the next meeting on his return. There has been both before and behind the scenes, in the government and implementation of financial and economic policy.

The Labour Conference

mercial policy. Mr. Morarji Desai's address at the Central Advisory Council of Industries meeting this week presented a precise and clear analysis on the vexed issue of the cutting of consumption as a means of financing the Plan. So clear was it in its rejection of austerity as a solution of our current problems, and so definite on the need for increasing production, even if it meant injecting new money into the system, that one must admit that the differences between the Government and its well-informed critics have almost disappeared. The economic crisis remains, but one can certainly say that issues are now being more clearly seen, and more firmly resolved.

Not too little should, of course, be made of the large breakers ahead. Quite apart from the threat of strikes following the notice first given by the Post and Telegraph workers for general strike on August 8, there is a general malaise because of the uncertainty in regard to taxation—the Wealth and Expenditure Tax Bills have just been referred to Select Committees—and in regard to the volume of Government orders following the drastic cutting of Plan outlay because of the shortage of foreign exchange. The failure of imports is not merely a matter of the deteriorating foreign exchange position which was expected; it has taken on a new, and quite fearful, aspect because of the failure of the Port administrations to deal promptly with the numerous ships bringing in both food and capital goods at Bombay, Madras, Calcutta and Cochin. The problem now is more one of inefficient administration than of the sharpness in the increase in the volume of our imports. It, therefore, admits of no easy solution, unless the Government of India does what it obviously should do—which is to place all the ports completely on a war-footing, if necessary under complete military control. The civilian administration in the ports has proved itself so unworthy of support and so incapable of improvisation that it is unlikely that mere directives from Delhi will produce any immediate results. There is no doubt that our difficulties are greater than a month ago; but for the fact that the Central Government's outlook seems to have become more resilient and effective, the outlook might well have been worse.

Examples of resilience which have been shown were not only to be found in Mr. Morarji Desai's speech at the Central Advisory Council of Industries and his able management of the proceedings at that conference. Another example is to be found in mill-textile policy. The exports of mill-cloth have now been raised by 350 million yards with an option of an enhanced excise duty on certain sales within the country. Thus, the conference held in Delhi last Sunday by the Federation of Indian Chambers of Commerce and Industry has been partially rewarded, although Mr. Desai made it clear—in language which was good because it was so free of ambiguity—that no major departure of textile policy is contemplated. Again, the emphasis on the production of consumer goods is now being properly placed. In particular, it would appear that the Reserve Bank authorities have not, as was feared a fortnight ago, taken any steps to restrict supply of finance for production in these industries. The case of sugar was a special one, and our Bombay representative has drawn our atten-

tion to an error in fact in regard to the Reserve Bank's monetary policy which appeared in a leading article "A Policy for Prices" in the issue of *The Eastern Economist* dated July 5. In that article, based on unofficial information received, it was suggested that an almost blanket directive to restrict bank credit over the economic system was likely to be issued. No such blanket directive has been issued, and as far as it can be now determined, it is not contemplated to restrict credit except, as in sugar, where it is obviously in excess of current needs. If this is a correct statement of thinking of the Finance Ministry and the Reserve Bank of India at this time, the argument of that article will need, to this extent, to be modified. In any case, one might hope that this gives an additional proof of the resilience of Central Government policy.

These are powerful gains to be set against two major pressures. The first of these has been the pressure on the price level, which is slowly creeping up on the evidence of the last two weeks for which figures are available. It is vital, now that the Government has decided to have an investigation into pay scales similar in principle to that of the Pay Commission, that the country should not be led to believe that the appointment of a commission of enquiry implies that price restraint is not desperately necessary. If the economy is to be in equilibrium now or in the future, food prices need to be checked whether or not compensation for existing or future rises is to be given in order to maintain industrial peace.

It is essential that the forceful character of Government decisions at Cabinet level should now pervade every Ministry. The cutting of Plan outlay must not be allowed to be resisted by any particular Ministry, and the Ministry of Transport must be finally directed either to deal with the ports at Bombay, Madras, Calcutta and Cochin in a summary manner which will prevent the loss of our international trade or to surrender that portion of administration to the Economic Committee of the Cabinet, which can deal with it as a consistent whole, if necessary with Defence personnel in replacement of the civilian officers who have totally failed. A sense of crisis must be imparted into the weak points in the economy. Unless there is some ruthless replacement of inefficient managers, the task will never be done.

If firm action is taken and ruthlessly pursued, there will be a tremendous psychological gain to be set against the new challenges which have arisen. We will need the assistance of our friends abroad, but it is still true that much the greater effort to finance the Plan has to be made within. Bereft of nice arithmetical calculations, this really means considerably harder work, and more imaginative work from the point of view of production all round. To that cause it is essential that we should immediately set our minds and hearts, even more than our hands. What is needed is not more manual labour, but an uplifting of the spirit, so that the foolish waste of energy, in wrong policies and petty differences, is submerged in a great passion for the nation's good.

LABOUR is again on the war-path after a period of suspended animation. It could not have chosen a more critical and inappropriate time for pressing its demands some of which, because of the rising cost of living, would otherwise have been quite justified. This time, however, it is white-collared labour in the public sector that is more restive. Central Government employees belonging to Class III and IV as well as those of the Posts and Telegraphs Department have demanded the appointment of a second Pay Commission for revision of their wage structure. Employees of the Posts and Telegraphs Department have also demanded, among other things, dearness allowance according to the recommendations of the Central Pay Commission and merger of full amount of dearness allowance with pay. The P & T employees have gone so far as to serve a notice on the Central Government affirming their decision to go on a country-wide general strike on August 8 if their demands are not conceded by the 1st of August. A general strike in a public utility of the importance and dimensions of the Posts and Telegraphs Department should not be permitted and since the cost of living remains a cruel fact, it can only be averted by an assurance that the price level will be halted, if it cannot be turned back.

This background of mounting tension on the labour front was not unknown to the latest session of the Indian Labour Conference, and yet it is strange it has chosen not to give a healthy lead in the matter of labour's current demand for higher wages. The conference, again, has expressed no opinion on the strike threat by the P & T employees. In avoiding reference to the more pressing and immediate problems, the conference has not acted wisely; in trying to reach some vague agreement on distant things, it has forgotten that industrial peace in the present is much more important than industrial peace in the future. That the conference has not heeded the Union Labour Minister's call to consider the menacing situation caused by strike threats and current demands for higher wages and give a positive lead, is thus unfortunate.

The conference, however, was notable for Mr. Gulzarilal Nanda's opening address which was replete with responsible advice for labour. He was emphatic on the point that only higher productivity levels can create the requisite surpluses for larger investments as well as higher standards of living. While Mr. Nanda was not in favour of a wage freeze probably because it would involve price controls, he also expressed himself strongly against any demand for a general rise in wages irrespective of its feasibility in particular conditions. As a general rise in wages would only lead to a further rise in prices, further gaps in resources for the second Plan would manifest themselves. Mr. Nanda also laid particular stress on the immediate relevance in the present economic context of the capacity of the industry to pay, the inter-relation of remuneration and output and the interests of the consumers. In the case of bonus, the Union Labour Minister urged, systematic links must be developed with the profits of the enterprise on the one side and the efforts of the workers in terms of output on the other.

It cannot be said that the conference has wholly endorsed this realistic stand of the Labour Minister. In laying down the norms for minimum wages and recommending wage boards

for fixing fair wages in respect of each industry, the conference might have thought it was pouring oil on troubled waters and scotching possibilities of industrial strife pending determination of minimum and fair wages. Actually, however, the recommendation is more likely to rouse exaggerated hopes in the mind of labour and lead to extravagant demands by it in the immediate future. This may happen because minimum wages or fair wages for each industry cannot be determined overnight without extensive surveys to determine which units have the capacity to pay and which do not. Although the preliminary process of determining whether a particular unit falls in the marginal category or not is of the utmost importance, it is surprising that the Labour Conference has not taken note, in this connection, of the suggestions contained in the second Plan document. Elsewhere in this issue a note on the wage question deals with this aspect in its criticism of the theoretical and impractical character of the suggestions made by the Planning Commission's study group in regard to minimum and fair wages.

What, incidentally, are these wage boards by which so much store is laid? The Labour Conference has laid down that the wage board should be a tripartite machinery similar to the one already set up for the cotton textile industry. With equal representatives of employers and employees on it, such a wage board, it is not inconceivable, may get evenly divided (as in the case of the wage board for working journalists), leaving the independent chairman (nominated by the Government) to tilt the balance against either side. The award of the Board, in such a circumstance, may not have the virtue of unanimity or acceptability to both sides. Where either party does not reconcile itself to the award the psychological base for industrial peace and harmony (which is the proclaimed aim of the wage board concerned) will have been undermined. Whether the contemplated wage boards for different industries will, by themselves, be able to lay a solid foundation for industrial peace, is thus rather doubtful. In any case, the wisdom of piecemeal revision of wages in a few industries in the absence of a comprehensive wage policy for the entire industrial sector is open to question. To have an idea of the kind of problems facing such wage boards, the reader may well refer to a special article on the wage board for the textile industry in *The Eastern Economist* issue of May 31 last.

As it would be physically impossible to set up wage boards for all or most industries more or less simultaneously, the publication of an award in the case of one industry is likely to create friction and discord in some other industry or industries. Such a possible situation can be avoided if the wage census and the extensive surveys (to determine what units are marginal or sub-marginal) recommended in the second Plan document are taken on hand and followed by the appointment of a Wage Commission as proposed by the Planning Commission. Till this Wage Commission reports, half-measures or quarter-measures which may worsen industrial relations would have to be avoided. A period of industrial truce when there will be no demand for a general rise in wages, is called for pending the possible Wage Commission's report. This period of industrial peace is also necessary if the second Plan is not to run up against further difficulties.

The World Bank Loan

THE announcement of the World Bank's loan to finance part of the investment programme of the railways should certainly bring some relief in an atmosphere surcharged with the crisis of foreign exchange. It was, of course, expected in informed quarters that this relief would be forthcoming, but suspense was created by the delay in concluding the formal agreement about the loan. This suspense heightened the feeling of anxiety over the size of the loan amount. The outlook for the railway import programme for the next twelve months is now clear. We know the volume of assistance which will be available from the Bank and the effort which we will have to make to raise the balance of foreign exchange by other means, which, in this context, mean our current earnings. The partial stalemate which was created in the import programme of railway equipment has been ended and the green light has been shown.

This loan cannot obviously create a full sense of security that the railway import programme will be carried out according to schedule. It is of the utmost importance that the schedule as prescribed in the Plan must be adhered to for the simple reason that on its timely implementation depends the expectation, in a true measure, of the execution of the projects and programmes which form the bulk of the Plan. This loan and the fore-knowledge which it gives of the probable total size of the assistance the Bank is likely to extend in the Plan period must provoke hard thinking on the question of finding resources for the import programme of the railways. Indications available so far do not give the assurance that this question is being faced in a forthright manner. The Budget Speech of the Railway Minister of May last announced a bold policy decision to close the gap in railway freight carrying capacity to meet the additional volume of traffic. But the problems of financial planning which the expansion programme has raised have not been answered adequately. The Bank loan is a reminder that procrastination on this vital issue must cease.

The nature of the initial loan of \$90 million granted for the railway expansion programme in the second Plan must be judged in relation to the loan policy of the Bank and its lending operations in general. It would be a great error to allow our judgment to be coloured by the critical turn which our foreign reserves have assumed for the present. Transport has always had top priority, next only to the development of electric power, in the overall loan policy of the Bank and railways took more than half the allocation of credit for transport. This large loan for India's second Plan is in consonance with the Bank's policy of extending assistance for building basic resources of development in the first instance. It is easily the single largest loan granted to any country for financing its railway investment programme in the entire history of the Bank's lending operations. Its magnitude is to be compared with the aggregate loan of \$127 million awarded to the whole of the Western Hemisphere and \$117 million awarded to the borrowing countries of Africa over the first decade of the Bank's operations ended in June 1955. The total share of railway expansion in Asia and the Middle East during the decade was \$80 million only and it is significant that India got as much as 42.5 per cent out of this sum. The present credit extended to India

may very likely amount to about 30 per cent of the total loans planned by the Bank for development aid during its current accounting year July 1957 to June 1958. Steel, ports, shipping and electric power are other candidates from India whose approach to the Bank for aid promises to meet with a good response in the immediate future.

This loan of Rs. 43.75 crores is estimated to cover half the cost of imports during the year 1957-58 and since the import programme includes strategic rolling stock and equipment like locomotives, goods wagons, underframes, wheel sets, rails, and so forth, the balance of half the expenditure will be found by the Exchequer. India cannot allow the priority rail projects, and particularly the build-up of transport capacity in the coal and steel belt, to lag behind a time-table which has been drawn up on a near-austerity scale. It is reasonable to assume from this outcome of the negotiations between the Bank and the Railway Board that assistance will be accorded to Indian railways at the same rate in the remaining three years. The minimum total Bank loans for the railways may be of the order of Rs. 175 crores.

Having arrived at a firm conclusion about the critical nature which the transport bottleneck may threaten to assume unless adequate capacity was created and having also been satisfied in a fair degree about the pressing need for the railway expansion programme, the Bank authorities could have taken a most helpful attitude in making an overall grant of loan for the railways during the second Plan period. It is true that they have been convinced about the lack of proper co-ordination in the development plans for different sectors of surface transport. This, however, was hardly a cogent reason for postponing financial assistance to railways and placing it on an ad hoc year-to-year basis. Such a basis is quite out of tune with the railway expansion plan which depends heavily on accelerated peak imports in the third and fourth years with only a marginal residue in the final year of the Plan.

The major question which now confronts the Railway Ministry is to plan ahead for the procurement of the foreign exchange resources that the railway programme requires. What the railways have planned is the irreducible minimum. The foreign exchange component of the outlay on railway development as originally estimated is Rs. 425 crores. Since then prices of imported equipment have continued to move up. The increase in the total outlay of Rs. 1,125 crores due to price inflation has been estimated at Rs. 100 crores. The cost of additional goods transport capacity of approximately 20 million tons has been placed at Rs. 100 crores. This capacity still falls short of the revised estimate of increase in the volume of traffic by 10 million tons. The basis of the Railway Ministry's assessment of the additional outlay of Rs. 200 crores on these two counts has not been explained anywhere and it is not at all clear what will be the proportion of expenditure of foreign exchange in this outlay. It is not unreasonable to assume that a good portion of the Bank's assistance may be eaten away by this new element. Since the railway plan cannot be cut down, an early decision will have to be made on diversion of foreign exchange outlay from specific projects of low priority to provide resources for the railways.

400 years ago

Red Fort

The Sawan and Bhado Pavilions are all that remain of the once enchanting Hyat Baksh Gardens at the Red Fort. The fragrant and colourful flowers are gone. Gone are the playful fountains and cascades. Gone too are the craftsmen who designed and installed underground pipes so long ago to drain and beautify the gardens. But the pipes themselves remain as testimony to their skill.

We do business with the nicest people...

And we are deeply interested in these nice people: in you! That's why we have a special Market Research Department that devotes itself to finding out what you like and don't like, why you buy—or don't buy.

Our teams of interviewers travel all over the country, calling on families in city, town and village, and noting your growing needs and changing preferences. This fact-finding process enables us to introduce new products like Rinso, or change a familiar one in some way—the perfume of Lux Toilet Soap, for instance.

Many of our products are, perhaps, already your household friends, and you appear on the charts and reports compiled by our interviewers. But you are more, much more, to us than facts and figures... you are the very people we do business with. We spare no trouble in trying to meet your needs, in offering you the very best value for your money.

THE WEEK'S NOTES

INDIA AND THE MIDDLE EAST

MR. NEHRU stopped in the Middle East both on his way to and return from Europe. He visited Syria, Egypt and Sudan. The news reports expectedly described the visit as "triumphant" and "successful".

Dependent on Mr. Nehru's talents as an effective roving ambassador, we in India have nevertheless failed to analyse the country's policy 'vis-a-vis' the Middle East. In contrast with what it once was, the balance sheet of India's effectiveness and influence is strikingly lower at the present moment. We have comparatively less influence in Jordan, Iraq, Saudi Arabia, the Lebanon and Israel. This disturbing development is a consequence of India's intimate relations with Egypt and Syria, who are fast losing the leadership of the Arab world.

Doubtless, India has every desire to be friendly to all nations. But others have begun to distrust the "friend" of their "enemy". Jordan recently expelled the Egyptian Military Attache; Egypt retaliated by expelling the Jordanian Ambassador. Egyptian Military Attaches have also been expelled from Libya and Ethiopia, among other countries, in recent months. Radio Cairo and the controlled Egyptian Press have been strident in their hostility towards immediate neighbours. The joint refusal by Egypt and Syria to pay their self-assumed share of the former British subsidy to Jordan is hardly distinguishable from economic strangling for political purposes. More significant perhaps is the complete alienation between King Saud and President Nasser. The estrangement—indeed, the suppressed hostility—came about when King Saud found President Nasser biting the hand which was feeding him. For, it was Saudi Arabia's King who was the financial mainstay of the Arab League. He naturally did not relish President Nasser's openly expressed anti-monarchical views.

While in no sense a reflection on Indian motives, the sad fact is that this country's Middle East Policy has failed. India had an ambition to be the honest broker, but she finds herself acceptable only to a minority of the Middle Eastern countries, and to none of the major world powers interested in the area. The test of a successful policy is finally in its achievements. Does not India consider America's policy towards Communist China unsuccessful because it is unacceptable to a majority of the Asian nations?

The basic reason for the failure of Indian policy in the Middle East is the refusal of the policy-makers to appreciate two new developments in the region. First, there has been created a power vacuum in the region after last October's Anglo-French aggression in Egypt. Secondly, the balance of power has been disturbed because of unrestricted supply of arms to Syria and Egypt from the Russian bloc. To assume that Soviet infiltration is altruistic would be tantamount to ignoring traditional Russian territorial interests in the area.

COMMUNIST TACTICS IN KASHMIR

THOUGH THE news report mentioning the possibility of the Communist Party of India establishing openly a branch in Kashmir has been denied, it is not unreasonable to suppose that the mind of the Communist Party has been working in that direction. It is no more in question that the Communist Party has links with leading personalities in the Kashmir administration. What is intriguing is that among its links are mentioned men like Mr. Mohammed Sadiq, Mr. Mir

Qasim and Mr. D. P. Dhar, three important figures of Bakshi Ghulam Mohammed's cabinet.

Whether or not it was to forestall Bakshi Ghulam Mohammed, Mr. Sadiq was reported to have written to him three letters containing grave allegations against the Kashmir Prime Minister personally and also against the administration. This is obviously the standard Communist technique to float an opposition party.

The Communists pretend that even if they form an opposition party in Kashmir they will remain loyal to India. What however actually leads them to think of this course remains anybody's guess. Nevertheless, it is well-known that relations between the Kashmir Prime Minister and Mr. Sadiq have been far from happy. Whether this too was due to any personal reasons or in pursuance of ideologies is also not clear. But one can safely say that the Communists would not allow personal reasons to sway their attitude were they convinced that subordination to Bakshi Ghulam Mohammed was the best policy for them to follow in that trouble-infested State. Is then the reason for their thinking along those lines by any chance a new twist to Communist policy in Kashmir? Bakshi Ghulam Mohammed's loyalty to India is above board.

To change from unexpected Communists in key positions to exposed allies or members of the Communist Party, with the risk of being thrown out of power, would be for the Indian Communists a major development. In the present political situation in the State, it is perhaps both politically and tactically advantageous for the Communists to work openly, while retaining hidden channels to various levels of the administration. As a Left opposition party the Communists perhaps expect to become the rallying point of the mass of the people who are bound to have grievances against the Government. Moreover, the Government of India's half-hearted measures which have encouraged, rather than rooted out, corruption and bribery, give plausibility to any claims by irresponsible elements. The Communist Party, planning on an all-India canvas, can perhaps no longer afford anonymous association with an administration whose main policy decisions they cannot determine.

The development will have a sinister import for this country. With Kerala in the south, Kashmir in the north may well provide to the Communists another arm of the gigantic pincer which they must forge if they have any serious intentions about this country. What is amazing is that not only has the Indian Press glossed over the dreadful possibilities but even the Government of India should have overlooked all these years the mischief brewing there. We had all along been under the impression that the Kashmir Government was a homogeneous team and that its adherence to New Delhi was to be taken for granted.

THE WAGE QUESTION

THE GOVERNMENT are still groping in the dark for a sensible policy for wages as for prices during the second Plan period. It is admitted in the Plan document that a major difficulty in the matter of implementing the principle of 'fair wage' is the 'drag' exercised by marginal units. These units cannot possibly be forced to close down on account of their incapacity to pay, for such closure would mean some addition to existing unemployment. And so, according to the planners, the working of marginal units would have to be improved by their amalgamation into larger units, voluntarily if possible, or compulsorily if need be. The planners have, therefore, arrived at the intelligible

conclusion that extensive surveys require to be undertaken before it can be determined whether a unit falls in the marginal category or not.

A 'fair wage', however, is defined by the Planning Commission's study group in its note to the recent All-India Labour Conference as something more than a 'minimum wage' which is only the floor and which is based on 'need' and not on the capacity of the industry to pay. The ceiling to the 'fair wage', however, would be set by the capacity of the industry to pay. The 'minimum wage', in its turn, is defined as covering 3 consumption units for an earner (1 unit for the worker, 0.8 for his wife and 1.2 for two children) with no deduction on account of the earnings of the worker's wife and/or children. A consumption unit would involve a net daily intake of 2,700 calories of food, 18 yards of cloth per annum, and housing according to standards laid down by the industrial housing sub-committee of the Standing Labour Committee; 20 per cent of the total wage would be for miscellaneous needs like fuel and lighting, medical requirements, etc.

This theoretical discussion of the concept and content of a 'fair wage' or a 'minimum wage' cannot take us far, for a number of marginal units or sub-marginal units would not have the capacity to pay even the 'minimum wage'. If extensive surveys are considered necessary, in connection with the applicability of a 'fair wage', to determine whether a unit falls in the marginal category or not, there is no reason why such surveys should not also examine the capacity of different units to pay the 'minimum wage' also. After all, a bigger and more prosperous unit may even now be paying what amounts to a 'fair wage' while a marginal unit may not have the capacity to pay even the 'minimum wage'. If low-wage Khadi and other cottage industries are to be consistently encouraged for providing as much employment as possible, there is no reason why an approach different from that of a 'minimum wage' should not be adopted in the case of marginal or sub-marginal units which are proved, in possible surveys suggested by the Planning Commission, to have no capacity to pay even the 'minimum wage' as defined by the study group, if employment is to be maintained at as high a level as possible. Pending such studies in respect of every industry, it would be prudent not to talk of 'fair' or 'minimum' wages and the like and create exaggerated hopes in the mind of labour — hopes which can only lead to extravagant demands for wage increases at a time when the price line has to be held if the second Plan is not to disappoint to a greater extent than it already threatens to do on account of difficulties on the resources front.

LAW'S DELAYS

LAST WEEK'S judgment in the "Ghee Fraud Case" after prolonged proceedings stretching to nearly ten years is the latest reminder that it is by no means an uncommon occurrence for final judgment to be delivered long after the petition had been filed. There are instances on record of much longer delays. Since independence such delays have been the rule rather than exceptions. And this despite the fact that the judiciary in this country has generally been alive to the hoary but still valid dictum, that justice delayed is justice denied.

It would be easy to blame the delay in the dispensation of justice on the natural penchant for litigation obtaining among Indians as a rule. But it is no use ignoring that the tremendous increase in the number of laws put on the statute book since independence has resulted to no small extent in a corresponding increase in the number of cases filed for disposal. Besides, as the Union Home Minister, Pandit Pant succinctly observed, the increasing and injudicious association of the members of the bench with "non-judicial activities" often makes for accumulation of cases. High Court

judges are often required for a number of other inquiries, investigations and tribunals. Additionally, arrears pile up because, thanks to disagreements between the Chief Justices of the High Courts and the Chief Ministers of the States, there are long and continuing vacancies on the benches. The accumulative effect of these is that while the work of the judges has increased both in volume and in nature, there has been no corresponding increase in the number of judges who are called upon to deal with it. Most judges are over-worked, and much as they desire to clear the desk, they simply cannot.

Apart from the frustration and suffering which is caused by unconscionable delay in dispensing of justice, this state of affairs is fraught with grave dangers because it brings the judicial administration itself into serious disrepute. For the nascent Indian democracy this is a major deterrent. It is, therefore, gratifying to learn that the Union Home Ministry contemplates taking steps for speeding up the disposal of the cases by the High Courts. It is to be hoped the Law Commission, which is currently conducting an inquiry into the legal system of this country, will suggest measures for curtailing the length of legal procedures and for the disposal of a vast majority of the petty cases at the first appellate court. Measures for limiting the excessive number of adjournments — now liberally demanded and generously granted — are also clearly indicated. With a view to expediting the filling of the vacancies at the bench, it would at the same time appear advisable to give the Chief Justices of the High Courts the authority to select the judges with the approval of the Chief Justice of India. The present procedure necessitating agreement between the Chief Justice of a High Court and the Chief Minister of a State has been tried and found wanting.

THE AGHA KHAN

IN ONE of her lavish moods Nature endowed the Muslim world with Agha Khan III. Being in the direct line of descent from Fatima, daughter of the Prophet Mohammed, he was the spiritual head of the Ismaili Muslim sects scattered throughout Asia and Africa. Inheriting a rich and worthy tradition the late Agha Khan enriched it abundantly as the role of a prelate was, only one of the many he played in a fabulous and constructive career. He was equally at home in the League of Nations, the Turf and an assembly of his devout followers. He was a renowned linguist, a versatile speaker, and a keen student of Muslim theology.

Agha Khan III was a benefactor of the Indian Muslim community. The outstanding monument is the Aligarh Muslim University of which he was one of the founders. He was a member of the Muslim delegation which waited on Lord Minto to demand separate electorates. Later, when the All-India Muslim League was formed to agitate for this issue, he was elected its chairman. His personal efforts and beneficence helped provide educational facilities for the Muslims, particularly the Ismailis, throughout Asia and Africa. The joyous occasions on which he distributed his weight in gold, diamonds and platinum to his followers were in keeping with the tone of his fabulous life.

There are but a few of the many occasions when he was called upon to use his administrative talent and his flair for leadership. He was the youngest member of the Viceroy's Executive Council from 1902-1904. His book "India in Transition" was responsible, to some extent, for the final shape of the Montagu Chelmsford Reforms of 1919. He represented India at the world disarmament conference in Geneva and led the Indian delegation to the League of Nations Assembly on five occasions. He was elected president of the League of Nations in 1937—the first Indian to hold that office.

Truly, the world stage is the poorer without him.

That swinging lamp...

...may have started Galileo thinking—
but it took years of technical work
and research to perfect the pendulum.
So too, MOBIL products started in a
small way—but have grown to leadership
through 91 years of research and experience
in the field of industrial lubrication.

WEST GERMANY AS A FOREIGN INVESTOR

(From Our Special West European Correspondent)

PARIS, July 13.

THE West German boom has now been going on for five years, and in fact every year since the currency reform of 1948 there has been an increase in production, consumption and investment. The transformation that this has wrought in the domestic scene in that country has been sufficiently well advertised under the label "the West German miracle". What is to be considered here, rather, is the consequence of this vast prosperity for foreign investment. The German boom, unlike the later (and in some ways equally spectacular) French boom, has been accompanied by consistent foreign trade surpluses, so the country has been well placed to undertake investment abroad. West German industry, with State encouragement and backing, has undertaken several well publicised projects in India and Pakistan, and so the opinion is common in those countries that West Germany is now-a-days a leading supplier of foreign capital and, moreover, that Asia has a special place in the interests of West German investors. The facts are quite different—not that we propose to make any polemical point of it. There are good reasons for the limited performance of West Germany to date as a foreign investor. The only polemical point that might be made in such a discussion can be stated, and laid aside, from the beginning: namely, that in the matter of foreign investment, especially in the capital-hungry undeveloped regions, the palm still belongs to those two dear old bankrupts, Britain and France, whose record in the matter far outshines all their more affluent competitors put together.

The mark has been to all intents and purposes freely convertible for some time; capital transfers are free but some control is still exercised over investments abroad. Government policy has been no discouragement to the placing of German savings abroad, but neither has it been any special encouragement. In other words, foreign investment is almost totally a private matter in West Germany; it is private savings that are invested, and they are free to choose their direction and degree. This contrasts with the position in the "imperialist" countries where investment in allied, friendly or dependent countries is naturally a political matter—almost all the immense French foreign investment is undertaken by the State, and the question is well within the range of Government interest in Britain. This point is worth digesting, because when we find that politically guided investment from Britain flows in substantial measure to India whereas free private investment from West Germany leaves India almost ignored, we learn something about the connection between politics and economics.

Granted then that investment is mostly a private concern in West Germany, the three questions we need to ask are: how much do the Germans save and invest, how much of that do they invest abroad as compared with investment at home, and what countries do they choose for their foreign investments? To anticipate what follows, the brief answers to these three questions are: the Germans save and invest a great deal; but most of it at home and very little abroad; and of what they place abroad only insignificant amounts go to Asia and the Middle East.

Last year West Germany invested 26 per cent of the gross national product; it was 27 per cent in 1955. This is a higher rate of investment than in any other West European country. The Germans live more abstemiously and save more than their French neighbours for example; their average annual fixed investment per head is 189 American dollars against only \$140 in France, while their average consumption annually per head was only \$591 against the high-living Frenchman's \$639. Naturally, while reconstruction and expansion were going on at home, far and away most of this investment went to industry and housing in West Germany, and only the tiniest trickle found its way abroad. A nation without colonies or even (what is much more expensive and demanding!) recently liberated ex-colonies, West Germany could afford to plough back its savings into its own fields while the British and French were stinting to find capital for abroad.

But by 1956 equipment and expansion within West Germany had reached very high levels, while West German exports began to encounter some resistance abroad. Not surprisingly, industry thereupon began to consider more earnestly the need to build plant abroad, in the consuming countries, rather than at home in West Germany. There ensued a notable expansion of foreign investment during the course of 1956, and all the figures quoted hereafter refer to this very favourable period for West German investment. That point is to be noted, because those figures are not in the event very impressive.

West Germany's foreign investments last year totalled 1,313 million marks, or 312 million American dollars. This represented only 2.8 per cent of total investment; that is, the other 97.2 per cent was invested in West Germany. Moreover, it represented only 0.7 per cent of the gross national product. It had no effect on consumption which increased during the same year by about 12 per cent. This figure for foreign investment is modest also if we compare it with the extraordinarily high favourable balance of payments, which increased by 55 per cent over 1955 to reach the fantastic level of 5,600 million marks. Thus, foreign investment in 1956 was less than a quarter of the current foreign exchange surplus that West Germany achieved in her trade with other countries. Most of this \$312 million was sent abroad by the big industrial combines, and if they did not send more it is because West German industrialists take the view that, even when investment opportunities contract at home, foreign investment is still not sufficiently secure or attractive. The West German Government might be expected to frame its views on political, rather than such reasonable economic, considerations, but in fact its performance was extremely modest: the Federal budget for 1956-57 contained an allocation of only 50 million marks for investment in under-developed countries, and in the event only a small part of this sum was actually lent up to the time of latest information.

Where did West German foreign investment, such as it was, go? The table overleaf shows that.

This interesting list shows that Brazil got 23 per cent of all the West German capital lent abroad (\$71 million out of \$312 million.) India is the only Asian country

represented in the list of countries whose share was worth reporting, but the amount of capital received by India was very small. Not only is Asia neglected, but the Middle East got very little German capital, although this region used once to be one of the main fields of German enterprise. The countries belonging to the European Payments Union received only 492 million marks as actual investment but of course they received very much more substantial loans from West Germany by virtue of the fact that that country is a heavy creditor in EPU. The sum of 121 million marks shown for France includes West German investments in the French African colonies and in other members of the franc zone. It is this very small amount that the French hope to see increased when the overseas territories are included in the European Common Market. To interest German industry in this prospect the French have consented in the common market treaty to open their dependent territories to West German commerce on an equal footing with French, but in return for this the West Germans have not promised to make any startling contribution to capital investment in those regions.

In sum, despite a long period of expansion and prosperity, a high rate of saving and a low level of consumption, and an embarrassing abundance of foreign currencies, the liberal West German economy has not ventured far into the field of foreign investment. The question of a more ambitious German contribution in this department is keenly debated in the Federal Republic. There are a number of plans to make foreign investment more attractive, and of course one of them is devised by the ever-ingenious Dr. Schacht. Dr. Schacht's proposal, like the plan put up by Vice-Chancellor Blucher, is that the monetary authorities make substantial sums available to West German exporters to help them intensify their activity in the under-developed countries. But, as is not uncommon, the grandiose plans for foreign investment are put up by people who have nothing of their own to risk, while the owners of capital are reserved, prudent or openly hostile; the criticism of such proposals comes especially from the directors of the leading banks.

The reluctance to venture capital abroad, and especially in the under-developed countries, is understandable in view of recent events. The disaffection of German capital for the Middle East, despite traditional connections, is eloquent as to the motives of this prudence. The shyness of capital to emigrate is especially notable in the case of West Germany simply because investment is free and private there, and investment abroad is not subjected to political considerations. We are in no position to rouse at the West Germans about this if when we meet such favourable political considerations in other countries we denounce them as imperialism, exploitation or dollar diplomacy.

WORLDGRAM

AGRICULTURE

Minimum Price for Food Grains: 130 lakh tons more food grains had been produced in India during the first Five-Year Plan, resulting in the saving of Rs. 530 crores on imported food grains, Mr. P. S. Deshmukh, Union Minister for Agriculture said recently. He said that the Government of India would shortly fix the minimum price for food grains, taking care that the farmer is not adversely affected.

Heavy Chemicals for Fertilizers: The importance of increasing production and consumption of fertilizers for stepping up production of food grains in India was stressed by the Union Deputy Minister for Commerce and Industry, Mr. Satish Chandra. With the increasing popularity of fertilizers it became necessary to supplement indigenous production of 86,000 tons nitrogen by import of 40,000 tons of nitrogenous fertilizers. Plans are under way for the production of ammonium sulphate, double salt of ammonium nitrate and ammonium phosphate, at Sindri, Nangal Rourkela, Naiveli and Alwaye. A target of 10,00,000 tons of nitrogen may be required for 1965-66.

British Sugar Corporation's Beet Crop: The beet crop of the British Sugar Corporation of 5,169,421 tons in the year to March 31, 1957, was the third highest in its history, although, due to weather conditions, the sugar content of 16.12 per cent was below the average of the past five years. In spite of difficult harvesting and processing conditions all factories were able to maintain their high level of efficiency. The demand for sugar increased during the year, and this trend is expected to continue. As reported in June, the net profit is £1,143,278.

US Cotton Acreage: This year America's cotton crop is likely to be produced from the smallest area under cultivation for about 80 years. The US Department of Agriculture said that the anticipated acreage was 14,224,000 compared with 16,962,000 under cultivation at this time last year. This reduction was anticipated in view of the American Government's policy of curtailing the embarrassing abundance of cotton, and the inducement offered to farmers and to reduce their acreage under the Soil Bank programme by giving compensation for not cultivating land. Last year's seasonal original crop estimate was reduced in November to 15,657,000 acres, but the farmers produced a large yield of 409 lbs. per acre and the crop was 13,310,000 bales. The growers will again do their best to use the most suitable land, and the better harvesting methods now being widely adopted should again bring a high yield.

INDUSTRY

Sodium Sulphate Manufacture: A pilot plant for the manufacture of anhydrous sodium sulphate from lime will soon be established in the salt producing vicinity of Deedwana town in Rajasthan. The plant to be installed at an estimated cost of Rs. 5,00,000 will have a capacity of manufacturing approximately 5,000 tons a year. The sodium sulphate produced will be the property of the Government which will take over the plant at the end of six months or even sooner. Sodium sulphate in considerable quantities is required in the paper industry and its derivatives are used in industry such as tanning or preparation of sulphur colours. India's annual requirements of sodium sulphate are estimated at 40,000 tons.

Electricity Output: During March 1957, 769 public electricity supply undertakings generated 872.7 million kilowatt hours of which 716.5 million kwh. were sold to ultimate consumers. This shows an increase of 63.5 million kwh. over the output in February 1957. New additions were new generating undertakings at Manipuri and Pipri in Uttar Pradesh. The figures of output and sale of power during March, 1957, were 798.5 million kwh. and 651.0 million kwh. and during March, 1956, 798.5 million kwh. and 651.0 million kwh. and during March, 1955, 798.5 million kwh. and 651.0 million kwh. respectively.

Production of Mill Cloth: Both production and export of mill-made cotton textiles from India have shown an upward trend during the first five months of the current year. According to official figures the January-May production totalled 2,285 million yards as compared with about 2,131 million yards during the corresponding period last year. The output in January, nearly 484 million yards, was the highest for any single month in recent years. As regards exports, a total of about 402.5 million yards of cloth was passed for shipment during the period, an increase of about 71 million yards over the total passed for shipment during the corresponding period last year. There has also been an increase in the production of yarn—752 million lbs. as against 665 million lbs. in the corresponding period last year.

Indonesian Coke: German engineers have now succeeded in converting Indonesian low grade coal into a quality coke, through a cheap process, according to the Trans European Press. This invention, will create new possibilities for the establishment of the Indonesian iron and steel industries, while the production of adequate gas from the good quality coke will fulfil the basic condition for the establishment of chemical works. Indonesia has large deposits of coal and oil, but the coal produced in Sumatra and Kalimantan is generally considered of such a low quality that its mining was not regarded economic. Indonesia imports annually 100,000 tons of coal and 50,000 tons of coke from the Netherlands and the USA.

Industrial Output in India: Industrial output in India in the first four months of 1957 has shown an upward trend according to a report. The increase is most significant in engineering goods, metal products, machinery, electrical appliances and apparatus and transport equipment. Significant improvement has also been achieved in cement, sugar, glass and textile industries. Cement production in the first four months of the year was 1,834,000 tons. If the present production rate is maintained, cement, production during the year should be 5,504,000 tons—an increase of 576,000 tons over last year's figure. Cotton textile production during the first four months was 1,835 million yards and at the present rate of production during the current year it should reach 5,507 million yards, an increase of 200 million yards over last year.

Nickel Supplies: In contrast to the weaknesses besetting other non-precious metals, nickel has remained a firm exception. Ordinary consumers in all parts have been finding it difficult to obtain adequate supplies. In its annual report in March, International Nickel stressed the anxiety which producers were feeling about the possible effects of this long-term shortage. Until very recently nickel as a metal has been genuinely scarce. Defence and stock piling demands in the US account for anything up to 40 per cent of the free world's supply of the metal. Canadian sources regard the market in the metal as "very strong" in contrast

to copper, lead and zinc. There is also currently a diversion of metal from the US stockpile destinations to an increasing number of US consumers. There is no danger of over supply. International Nickel on the strength of this has a new nickel project in Northern Manitoba. This is a \$175 million venture which aims at a milling and smelting rate of up to 12,000 tons a day. Canada has been the world's pre-eminent producer of nickel since 1905. This fact has depended on the Sudbury sulphide ores which are easily amenable of treatment. Outside of Canada there are abundant supplies of laterite nickel which till recently have been impossible of treatment. Modern metallurgy is putting this right.

TRADE

Pepper Exports: Exports of black pepper during the first six months of the current season from the major ports of India stood at 1,99,177 cwts. compared with 1,74,091 cwts. during the corresponding period last season, recording a rise of 25,086 cwts. Actual exports during April totalled 22,914 cwts. against 45,266 cwts. in March and only 7,568 cwts. during the corresponding month of 1956. An analysis of exports shows that a substantial quantity was shipped from Cochin which accounted for 13,433 cwts. and Allepey which exported as much as 6,843 cwts. The major consumer was the USA whose offtake has been estimated at 9,451 cwts., while Germany absorbed 4,620 cwts. during the month.

Egyptian Cotton: According to the latest indications, the quantity of Egyptian cotton licensed under the Special Payments Agreement has been progressing very well. The licensed quantity to date is about 16,555 bales. This leaves only 3,445 bales to reach the ceiling fixed. Egyptian reports show that spinner interest in Egyptian cotton is slowly expanding. The UK and France are likely to enter the market shortly. Inquiries from India and Japan are substantial, but the prices offered are said to be below the Egyptian market prices by shippers there. The statistical position of cotton supplies from Egypt is a little less comfortable. The total supply position with the carry over of 127,735 bales and the final crop estimate which is reckoned 990,440 is 1,118,189 bales. As against this consumption up to the end of June 1957 totals 218,080 bales, while exports account for 543,977 bales leaving a balance of 356,127 bales.

Australia-Japan Trade Pact: Under the trade agreement signed recently in Tokyo, Australia is likely to increase her purchases from Japan from £14 million to between £20 million and £25 million a year. The agreement will safeguard Australia's wool trade with Japan and develop a potentially valuable market for wheat, barley and other primary products. The agreement guarantees: duty-free entry of Australian wool for the next three years with up to 90 per cent of Japan's wool purchasing power available to Australia; competitive access to the Japanese market for Australian hard wheat and a new potentially great market for Australian soft wheat; Japan is placed on the normal trading basis which all other countries enjoy in Australia in import licensing, and which almost all countries enjoy in tariff treatment. Trade officials expressed the belief that despite the increased opportunities now given to Japan the imbalance in trade between the two countries would remain heavily in favour of Australia.

FINANCE

Income Tax Yield: The net collections of income-tax during 1956-57 exceeded the Budget estimates for the year by Rs. 6.1 crores. The actual net collection came to Rs. 195.7 crores as against the Budget estimates of Rs. 189.6 crores. Of this it was estimated that about Rs. 60 crores would represent the share payable

to the States, and the balance of Rs. 135.7 crores would be retained by the Centre. About 9,28,000 assessments were completed during the year as against 8,91,000 during 1955-56. In addition about 74,000 refund applications were disposed of. Intensive survey by the Department brought 92,707 new assessee to the register.

Smaller Loans from the I.M.F.: The International Monetary Fund is closing the most active year in history, but indications are that it will make fewer and smaller loans in the months immediately ahead. This is partly because the I.M.F. has already helped the gravest cases, and partly because its own resources, though large are not unlimited. Week before last the I.M.F. announced credits of \$125 million for Japan and \$34 million for Denmark, and these are expected to be the last relatively large loans for sometime. The cut back in I.M.F. credit activities has special significance for the sterling area and other dollar hungry parts of the world, for it means that the substantial flow of dollars which helped to offset the decline in the free-world's reserves is drying up. However, the reduction is not permanent. The I.M.F. loans are repayable in three to five years. The return flow of currency will enhance the I.M.F.'s capacity for lending and restore the creditworthiness of would-be borrowers.

Barter Agreements with East-European Countries: The State Trading Corporation is reported to have successfully concluded what may be the first of a series of barter agreement with East European countries, including Russia. The 25-lakh agreement for the import from East Germany of textile machinery against similar exports of tea, jute and leather manufactures is part of a dual purpose drive to expand the country's foreign trade and conserve valuable foreign exchange to be expended for hard currency areas, not amenable to other agreements. Discussions on similar agreements with other East European countries are in progress, and while the precise total value of these agreements is not known, they are considered sufficiently large to effect considerable savings on foreign exchange consumed on imports of heavy and other industrial machinery, and also to register a sizable increase in volume of exports. This is considered easy to achieve in view of the ready availability in Eastern European countries of a considerable variety of machinery urgently needed in India's second Five-Year Plan and of an equal surplus in India of items needed by East European countries. The private sector has already entered into credit supply agreements valued at 20 crores. At present West Germany, Italy, the UK, Switzerland and Sweden are the five principal suppliers of machinery to India. Most of these agreements have been arrived at with Government assistance. With the successful piloting of its current plans, the State Trading Corporation might well hope to achieve a record figure of Rs. 100 crores in volume of trade canalization through it. As it is, current figures are approximately Rs. 40 crores.

GENERAL

Jet Airliners for Scandinavia: Six Caravelle from jet, medium range airliners have been ordered by the Scandinavian Airlines System from Sud-Aviation of France. Delivery of the turbojets will begin early in 1959 and be completed by October of the same year. The swept-back wing gives the Caravelle the characteristic silhouette of the jet age. A distinctive feature is the location of the jet engines—Rolls Royce "Avons" with a thrust of 11,000 lbs. each — on the fuselage aft of the passenger cabin. This makes for a clean wing, which is aerodynamically advantageous and increases safety. Also, there is practically no noise inside the vibration free cabin. The Caravelle produces no more noise than a big piston engine aircraft. For this reason it was the first jet transport to be permitted to operate regularly in and out of New York's Idlewild Airport.

NEWS IN BRIEF

INDIAN

The Minister for Commerce, Shri Nityanand Kanungo, said recently that Indian exports of lemon-grass oil to the United States of America had been increasing. The value of these exports had gone up from about Rs. 9,91,852 in 1952-53 to nearly Rs. 46,25,770 in 1955-56. During the first eleven months of 1956-57 the exports had further gone up to over Rs. 51 lakhs.

The 2-crore Umtru hydro-electric system near Gauhati will soon be inaugurated. It has been completed with Canadian assistance under the Colombo Plan. The project used Canadian electrical equipment to the value of \$1 million. The local costs \$2.2 million came from money realized by sale of Canadian aluminium to the Indian Cable Industry supplied under the Colombo Plan.

3.19 million additional acres had been brought under irrigation in C.D. and N.E.S. areas by December 31, 1956. The total expenditure out of the budget for the programme amounted to Rs. 8.83 crores.

An Air-India International Constellation plane left Accra recently on its way back after inaugurating the first direct air service between Ghana and India. The flight of 5,200 miles takes 19 flying hours and the plane makes short stops at Sagos, Kano, Khartoum and Aden.

Negotiations with the World Bank for a loan to finance the foreign exchange needs of India's railway expansion programme under the second Five Year Plan have been successfully concluded. The Bank is advancing 90 million dollars during the current year, the loan is to bear the usual 5-½ per cent interest, and is repayable in 15 years.

New rules for the issue of permits to persons buying alcoholic drinks have been issued by the Government of Orissa. The necessity for a medical certificate has been eliminated, a declaration by the applicant that the quota asked for is required in the interest of his health is sufficient.

The Tungabhadra High Canal Project to be started soon will cost Rs. 25.35 crores, and an acreage of nearly 2,75,00 will be benefited by it. A tentative provision of Rs. 45 lakhs had been made in the budget estimates of 1957-58 since the principles of the scheme had been approved by the Planning Commission.

The aggregate value of the seaborne trade that passed through the minor ports in Andhra during 1955-56 was Rs. 10,77,20,174 as against 7,35,14,305 in the previous year. The total collection of port dues amounted to Rs. 1,21,538 as against Rs. 1,17,036 during the previous year.

The delay in shipments following the go-slow policy adopted by the dock workers is fully reflected in the latest stock figures of jute goods. Stocks with the mills have shown a sharp rise of 6,500 tons at the end of June as compared with the May-end figure, the rise in sackings being more pronounced.

FOREIGN

People in the U.K. last year consumed more butter and fats, sugar and syrups, meat, milk, poultry, fish and vegetables, and drank more tea. Consumption of potatoes, fruit and grain products showed a reduction according to a report. A table giving the nutrient equivalent of the foodstuffs consumed, shows that the energy value in calories, of food consumed last year was 3,140 per head per day, compared with 3,120 in 1955 and 1954 and 3,000 pre-war.

Pakistan has entered into an agreement with Burma for the purchase of 75,000 tons of rice. Together with what Pakistan had previously contracted to buy from Burma, the total quantity is now 1,50,000 tons.

The Bell Telephone Laboratories in the United States have a new message-transmitting machine which can send printed information to distant points at a speed of 1,000 words a minute—16 times faster than the speed of the tele-typewriter systems now in common use.

The National Assembly recently committed France to enter a Customs Union with "Little Europe"—West Germany, Italy, Holland, Belgium and Luxemburg—and also to share its atomic energy resources, knowledge and raw materials with the other five.

France has agreed to lend Israel another \$15 million (about £5,357,000) in addition to the \$30 million (about £10,714,000) loan already agreed on, according to a report. This will implement plans to construct the ports at Eilat on the Gulf of Aqaba and at Ashdod on the Mediterranean, and to build a railway line from Eilat to Beersheba.

France will receive Egyptian cotton worth £12,300,000 under a barter agreement concluded between the Egyptian National Bank and a Swiss Bank. France has agreed to open an account for Egypt to make purchases from the dollar area. Egypt plans to buy wool, fertilizers flour, tin, machinery and coal.

The industrial activity in Canada in 1956 pushed production of chemicals and allied products to new record levels. Factory shipments at \$1,112,600,000 were \$68,500,000 or 6.6 per cent over the 1955 total of \$1,044,100,000.

Africa replaced the United States as the leading market for Japanese green tea last year, accounting for 49 per cent of Japan's total tea exports which amounted to 22,578,568 pounds. Tea production totalled 156 million pounds.

A new chemical element—102—"Nobellium" produced by bombarding curium, which is element 96, with carbon ions accelerated in the cyclotron at the Nobel Institute by scientists from the UK, Sweden and the USA. The element was recognized by its unique nuclear properties, half life and radiations, and by its chemical properties.

The Toyota Motor Sales Company, a Japanese car distributing concern, expects to export to the USA small cars which will be four seaters with speeds of 60 m.p.h. and higher gear ratios. The estimated price will be between \$1,000 and \$1,200.

CAPTAIN LUCIEN GAMBADA

A Senior Air France Captain

**MORE THAN 858 DAYS AND
NIGHTS ALOFT!**

Almost two and a half years is a sizable segment of a lifetime. This is the time Captain Gambada has spent aloft for Air France, flying the rugged routes of Africa, the Near and Far East. Decorated repeatedly by France and other countries for his services to aviation, he is typical of the type of man who has helped build Air France's 38-year record of dependable service to the peoples of 73 countries.

THE BOMBAY COTTON MILL WORKER

THE week has witnessed great commotion on the labour front. There are signs of pressure allround. Labour leaders are labouring to educate the public about the continuing hardship experienced by the labour. The appearance of the report 'The Bombay Cotton Mill Worker' by the Millowners' Association is thus timely. The report sets out a statistical comparison of the economic conditions of labour as they obtained in 1955 with that of 1940. An important conclusion to be drawn from the analysis of data is that the wages of the cotton mill workers have been consistently rising over the last one decade. This is in addition to several benefits and improvements in working conditions of textile labour. The data used have been collected from the service records of workers. A limited interviewing and observation on the spot was also made.

Service records can prove a mine of information to base a detailed study of labour problems. The report provides information on age distribution of workers, their length of service in the mill and in the industry, literacy, departmental distribution, place of origin, sex distribution, absenteeism, average earnings etc. It also presents simple statistical data on different aspects of life and work of the textile worker. The outstanding feature of this book is that it gives the statistical material without drawing any conclusions. The Mill Owners' Association has adopted a wise course in refraining from deducing any particular conclusions and adhering strictly to an objective analysis.

The total number of workers whose service records were tabulated in 1940 amounted to about 37,500. In the 1955 enquiry, the total number of workers covered amounts to nearly twice as much, i.e., about 74,700. The data collected for the present enquiry relate to over 33 per cent of the entire labour employed in the Bombay cotton mills. The number of mills covered in the 1940 enquiry was 19, it was 20 in 1955. The mills were selected from different areas. The sample in both the cases was quite large and representative of the cotton textile industry of Bombay.

Maximum interest attaches to the topic of wages, dearness allowances and bonus. The average monthly wage inclusive of dearness allowance amounted to Rs. 44 as. 13 in 1942. It increased to Rs. 97 as. 6 by 1950 and was Rs. 112 as. 4 in 1955. It is essential to translate this increase in real terms. Read alongside average Bombay Working Class Cost of Living Index, the real earnings of the workers have advanced by 16.5 per cent in the period 1942-55. The following table puts the real trend in the correct perspective:

Year	Average Bombay Working Class Cost of Living Index (Average Prices from July 1933 to June 1934=100)	Total Wages (Basic Wages + D.F.A.) (26 Days)	Real* Wages (In Rupees)
1951	330	102.9	31.2
1952	337	106.3	31.5
1953	363	117.6	32.4
1954	359	119.2	33.2
1955	338	112.3	33.2
1956	353	118.6	33.6

* Wages at 1933-34 prices.

It will be seen from the preceding table that real wages have adequately shared the general per capita rise in incomes of about 8 per cent during the five years. The real monthly wages per worker are calculated at Rs. 31.2 for the year 1951; they rose by about 1 per cent during 1952 and another 3 per cent the year next. The monthly real wages were stable at Rs. 33.2 during 1954 and 1955. In 1956 earnings again started rising, the rise being of the order of 1.2 per cent over 1955. In addition to the salary (basic wage plus dearness allowance) workers are paid bonus. In the year 1942, Rs. 65.4 were paid as bonus; in 1951 similar payment amounted to Rs. 136.8, a rise of over 109 per cent. In the year 1956 the Bombay cotton mill worker on an average was getting a basic wage of Rs. 47.48, a dearness allowance of Rs. 68.70 and an annual bonus varying from Rs. 28 to Rs. 144. As far as his indirect monetary benefits are concerned he gets about Rs. 7.25 by way of contribution to the Employees' Provident Fund Scheme and Rs. 3.50 to Rs. 3.75 to the Employees State Insurance per month per worker.

These days child labour is no problem. But interest attaches to female employment. The enquiry has revealed that whereas the total employment in textile industry has doubled in fifteen years (1941-55), female workers seeking jobs have diminished by more than one-half. Female workers constituted 7 per cent of the labour force in 1955, as compared to 16 per cent in 1940. No statistics are available regarding the number of earning members in the family. But still a lower percentage of female workers in employment suggests that the average worker's family can now do without sending its female members for work outside. This change is significant from the social viewpoint of the life of the working class. The diminishing rate of new employment amongst women workers in cotton textile industry is reflected in their age distribution. There are very few women who joined the industry during the last 15 years, and therefore, we have today relatively more aged women workers in the industry than in 1940. 39.2 per cent of women workers in 1940 were below the age of 30. The percentage dropped to 10.3 in 1955. As against this, 54.7 per cent of women workers in the year 1955 were above 40 years of age; similar figure for 1940 was 22.3 per cent. The department that provides maximum employment to women is 'winding and reeling'. The report does not provide wage rate for different types of jobs in a cotton mill. But, it is expected that the average earnings of female workers will be lower than of male workers, engaged as they are in comparatively unskilled jobs.

Thanks to the literacy classes conducted by member mills, the percentage literacy amongst workers has been increasing. In 1940 general percentage literacy was of the order of 29.7. And in 1955, the percentage rose to 42.5. The report has brought out an important fact which may not be generally known that the percentage of literacy amongst the male cotton mill workers is higher than the general percentage of literacy in the city of Bombay. In general there has been a significant rise in the age of workers seeking employment. The reason for this is perhaps in larger school-going amongst labour families. In 1940, 20.4 per cent of the workers in cotton mills were of 25 years or below. In 1955, similar figure slumped down to 6.4. The number of workers employed beyond the age group 46-50 increas-

ed substantially. It was 3.1 per cent of the total in 1940 and a little less than four times of that figure in 1955. One-third of the men and more than half of the women workers in the year 1955 were over 40 years old.

Information is provided about the place of origin of workers. There is a small rise in the number of workers hailing from areas outside Bombay; a healthy sign from the point of mobility of labour. One-fourth of the total workers in the year 1955 as compared to one-fifth of them in 1940 were drawn from areas other than Bombay city. Uttar Pradesh stands third as regards supply of labour to the Bombay textile industry; the first two being Konkan (Bombay, Bombay suburban, Thana, Colaba and Ratnagiri) and Deccan (Poona, Satara, Kolapur, S.M. States, Nasik, W. Khandesh, E. Khandesh, Ahmednagar and Sholapur). Departments staffed by the labour coming mostly from North and East India are 'Mixing' 'Blow Room and Card' and 'Speed Frame'. The departments of Warping, 'Drawing-in and Sizing' and 'Winding and Reeling' mostly employ local labour from Konkan, the actual percentage in each of these departments being more than 66.

An interesting feature of the report is in statistics relating to the length of service on the part of workers. Such statistics are available separately for service in the mill and in the industry. A little less than 50 per cent of the labour in the year 1955 had put in more than 10 years of service in the mill they were employed. One-third of them had worked in the same mill for 11 to 20 years. Comparative figures of percentage employees with the two periods of service for the year 1940 are 41 and 31 per cent respectively. The figures definitely indicate that the average length of service has been longer in 1955 than in 1940. As regards employment in the industry 43.7 per cent of the workers have worked in the cotton textile industry for 10 years. And since 52.4 per cent of them have worked in the same mill and for the same period inter-industrial immobility is indicated.

The Mill-owners' Association has been collecting absenteeism statistics during the past 10 years, particularly with a view to finding out as to how the "Badli Control System" introduced by the Association in 1938 has been working. The system has since been replaced by the Textile Employment (Decasualisation) Scheme, which was brought into force in 1950. The decasualisation scheme in other words, is "Central Badli Control" and workers required by any member mill are supplied through this scheme from amongst those workers who have previously worked in the industry and who are unemployed. In 1955, 1378 workers sought registration, there was demand for 3,984; 5,007 were submitted and about half of it were absorbed. On an average 40 to 50 per cent of the candidates submitted by the scheme find absorption. There has been a downward trend in the percentage absenteeism during the last four years, the actual figures being 12.70 in 1952 and 8.15 in 1955.

The report also gives an account of other welfare services provided to the mill worker. Post-employment training classes have been there for long, now pre-employment training classes have also been started. Grain shops are run at cost price basis for the benefit of workers. Steady progress has been made by the Credit Co-operative Societies. For recreation the Millowners' Association has been conducting Inter-Mill Sports Tournament since 1941.

ACC HONOURS THE CODE

1

"Producers and distributors owe it to the consumers of their products that they shall always be of the highest quality and available at a reasonable cost."

Code of conduct—FORUM OF
FREE ENTERPRISE

Indian cement is required to pass the high standards laid down by the Indian Standards Institution. It is tested against these standards both in the laboratories of the producing factories as also at the Government Test House, Alipore. ACC cement passes these standards with a substantial margin of safety and is comparable in QUALITY with the best cement produced elsewhere in the world.

Since 1944, the selling price of cement has been fixed by the Government of India. Twice, in the past, the Company has voluntarily reduced the price of its cement. The price which the Company receives has remained unchanged since 1948. The current higher cost to the consumer is due to excise duty and the price equalisation surcharge levied by Government to subsidise imports through the State Trading Corporation.

Honesty, hard work, courtesy, continuous initiative and service to the community are the foundations on which the edifice of Free Enterprise rests. These are also the sure foundations on which the ACC edifice has been built to last.

Economic Report from the U.S.

COMPARISONS AND CONTRASTS

(By GUY SIMS FITCH)

WASHINGTON, July 16.—Economists generally are wary of attempts to compare rates of growth between different nations. They are particularly cautious in approaching a comparison between the US and the Soviet Union. For one thing, there is the paucity and inadequacy of Soviet statistical data, in contrast to the copious information about the American economy. For another, the economic structures are so different that it is difficult to agree even on basic definitions—for instance, what makes up a nation's total output of goods and services?

Nevertheless, Soviet leaders often have made it a point to indulge in just such comparisons. Especially of late, they have over and over proclaimed their intent to "catch up" with American economic achievements—itsself a kind of tribute to the US way of doing things. Inevitably, American economists find themselves drawn into this game of comparisons. So from time to time, they try to take a realistic look at the two economies in juxtaposition. The latest results of just such a look were published here last week in a special report by the Joint Economic Committee of the US Congress. The Report's principal conclusion, supported by 149 pages of carefully compiled statistical tables and explanatory text, is essentially the same as previously arrived at in a similar study a few years ago.

The conclusion is simply this: over the years, the Soviet economy has been growing at a faster percentage rate than has the American economy, but the "absolute gap" between the two—the difference in the production of goods and services measured in actual figures—has continued to widen in favour of the United States. The reason is fairly obvious. The Soviet economy is about one-third the size of the American economy. This means that a two or three per cent annual expansion of the US economy represents a larger volume increase than does a six or seven per cent expansion of the Soviet economy. Put another way, the Soviet economy seems to be where the US economy was about 40 years ago. But, argue the Soviet experts, we are compressing in a few decades what it took the US a century to accomplish.

This may well be true. But, in any case, it has little to do with the Soviet system as such. The fact is, as the Congressional report notes, that the industrial trail-blazing of the past 100 years had already gone far in the more advanced nations by the time the Soviet managers started their own industrialization plans. Thus, they were able to make use of the prior achievements of the US and other free nations. Even today, they evidence considerable interest in US technical innovations. In fact, say many economists, it is quite conceivable that the Soviet Union could have advanced even more rapidly under a somewhat freer socio-economic system.

Instead, Soviet leaders have been bent on maintaining a centrally controlled economy, with priority given to heavy industry and military production at the expense of both consumer goods and agriculture. The average Soviet citizen has paid the price for this in low living standards and a lack of personal freedom, economic and otherwise.

This is where the chief difficulty of any US-USSR comparison enters. For the values upon which the two systems rest are in a very real sense worlds apart. In contrast to the Soviet pattern of strict State control, advances in the free US economy depend largely on private initiative and the satisfaction of exactly those human needs and wants so determinedly neglected by the Soviet dictatorship. In the United States, it is the average citizen, with his steadily rising "discretionary" purchasing power, who most effectively charts the path of economic development.

A TOWER OF STRENGTH

in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

BOOK REVIEWS

CHARACTER BEYOND OFFICE

Fullness of Days: Lord Halifax: (Collins, London, 1957: Price 25s.)

By C. S. Venkatachar, I.C.S.

Lord Halifax records that when he returned to England after his Indian viceroyalty, he was like the "proverbial red rag to many of the more right-wing Conservatives." When he went to the United States as Britain's Ambassador he admits he was somewhat suspect for his complicity in his capacity as Foreign Secretary in Chamberlain's policy of appeasement which had permitted Munich. In Washington he was naturally overshadowed by the war-time figure of Churchill. Were the twin attributes of strength of prayer and of simple goodness by themselves sufficient to make him great in these high offices? These pages reveal that the real greatness of the man appears to lie in the triumph of character over the offices which he adorned.

Of this no one was better aware than his friend Stanley Baldwin. Baldwin had the courage to tell the Conservatives, angry about the India Bill, that if at any time the Party he led could not find a place for a person of the character of Edward Wood, he (Baldwin) would have nothing to do with his Party any more.

Halifax tried his modest bit to construct a bridge of understanding between Britain and India but the strong political currents then flowing on either side were against it. He saw more penetratingly in the thirties than any other British statesman that the choice "lay between power which had served from the days of Clive, and influence which, if he could use it aright in the changed conditions of the twentieth century, would serve us better. . . . Of the two, influence was more securely founded and the more enduring." Wise words to remember, with the passing away of Britain's imperial power.

Lord Halifax quotes approvingly a dictum of Augustine Birrell that anything a man speaks of himself is still too much. What little he has chosen to speak of himself, his friends and contemporaries, of men and events in general, he writes with grace, dignity, and a charity of judgment born out of deep reflection on life. One gathers the impression that the divergencies in outlook between him and Churchill were clearly marked but they do not cloud the judgment of Halifax in his sincere tribute to Churchill: "Whatever might be Winston's faults they have been dust in the balance compared to the great debt we all owed to him."

To be detached and yet remain active in the centre of public life is a difficult art. Once mastered, public life can be viewed with the dispassionate judgment of an elder statesman. Lord Halifax frankly records that he had no particular regret in leaving the House of Commons, since he "found unsatisfying the Party exaggeration and one-sided statement of case which so often did duty in debates." When Chamberlain's Government fell in the summer of 1940, Halifax declined to be "the honorary Prime Minister living in a kind of twilight just outside the things that really matter." His advice was accepted "by the Prime Minister reluctantly and Churchill evidently with much less reluctance."

The irresistible impression left by this delightful and charming book is that in the public life of a great democratic society, character comes first; then the accomplishments in office.

THE FORD FOUNDATION ANNUAL REPORT, 1956

The Ford Foundation Annual Report 1956 contains a report of activities which would do credit to a Government. Indeed, the Ford Foundation now deals with practically every aspect of Government activities all over the world. Two paragraphs from the President's review at the beginning of the report give the key to the uniqueness of the Ford effort. "The impulse of philanthropy is as old as men's awareness of the need to join efforts within the civilising framework of a society. Organised philanthropy as now known in the United States is a recent phenomenon, however. The first foundations were established for limited and specific purposes. Only in this century have there emerged general purpose foundations — such as the Ford Foundation — dedicated to the improvement of man's lot on a broad scale."

Firstly, then the Foundation concept is relatively new, even in the United States. Secondly, the Ford Foundation happens to be at the top of the walk. The President says elsewhere:

"The Ford Foundation, it happens, is the largest single philanthropic foundation in the world. This is, and has been, a fact of our corporate existence and actions. Because the Foundation is large it has unparalleled opportunities for service. Because the Foundation has sought to realise those opportunities, it has grown in experience. Inevitably the Foundation's fiscal size has had to be a part of many of the trustees' contributions."

In nearly 300 pages there is explained in detail what one year's working involves. It certainly is an exciting record. On page 108 will be found details of the overseas development programme in graphs. India heads the list with 16,224,926 dollars for total grants and projects, from October 1951 to September 1956. This is a momentous contribution from a friendly Foundation, whose work is to be measured not only in terms of volume but also in quality supplying — as in small-scale industries or in the National Council of Applied Economic Research — what might be called a catalytic agent for the creation of new ideas. To Dr. Douglas Enslinger and his staff in India a warm tribute needs to be paid.

The Business World

THE DOCK STRIKE AND AFTER

By
(CROESUS)

EVERYONE is agreed that a major disaster has been averted with the prompt settlement of the Bombay Dock Workers' dispute. A strike anywhere in the country today will do enough damage to our economy, but a strike in the docks, the starting point and the terminus of the country's foreign trade, will inflict irreparable damage, and it is just as well, therefore, that the Government of India did not stand on any prestige but took hold of the situation itself and resolved the dispute. This, however, is the third occasion on which the Union Government has had to intervene to prevent a major breakdown, which has set some people thinking as to whether it is not time that the Government of India told the workers that it is in their own interests to settle its disputes in Bombay itself and with the authorities stationed here. One can understand the intervention of the Centre in regard to disputes involving all-India issues but, by allowing itself to be hustled into intervening even in small disputes of a purely local nature, I am afraid, it has unwittingly deprived the men on the spot of all initiative. A degree of decentralisation in such matters is good alike for the Central Government and for the workers' organisation.

This abortive strike of Bombay Dock Workers has brought to light a new aspect of the workers' bargaining power. It is the great accretion of strength to their organisation consequent on its being a member of the All-India Port and Dock Workers' Association, and, judging from the preparedness of workers in other ports also to follow suit—if their Bombay confreres went on strike in the event of their demands not being conceded, it is obvious that the A.I.P.D.W.A. can hold the country to ransom any time. That the Federation should have chosen to throw in its weight on the side of the Bombay dock workers for threatening to go on strike on a flimsy issue like the demand for payment of wages a few days earlier than normally seems to suggest that this all-India body may not be averse to adopting steam-roller tactics, throwing to the winds all caution and concern for the country's wider interests. This is a dangerous symptom. Organised labour and, more so, those at the helm of organised labour have a very great responsibility today, because they are a force to reckon with and, because of this, they can ill afford to be irresponsible.

The immediate cause of the threatened strike, it would appear, was the refusal of the employers of dock workers to concede to the request of the daily rated workers that they be paid their wages for June on July 7, instead of on the 10th as has been the practice every month ever since the introduction of the piece-rate scheme. Except for the fact that this was statutorily improper as contended, one fails to see why the employers did not see their way to comply with the request especially when it is believed they readily offered advances of anywhere between Rs. 50 and Rs. 75 to each worker depending on his monthly earnings. Moreover, the workers did not seem to want a permanent change to this effect but only wanted it to enable a section among them to celebrate Id.

Be that as it may, it is evident that for the workers this was only an ostensible grievance, coming on the top of a number of others one of which was the proposed cut of Rs. 1.32 lakhs from the total

quantum of bonus due to them of Rs. 4.5 lakhs for 1956-57 because of overpayment in the previous year. Any such adjustment, I understand, is duly covered in the Five-Year Agreement between the Stevedores' Association and the Transport and Dockworkers' Union, but the workers apparently doubt the accuracy of the calculations involved. Another complaint — perhaps a very legitimate one — seems to be the inordinate delay in the settling of disputes, even where no delay is called for. For instance, the time still being taken by the Special Officer appointed by the Government of India to inquire into the conditions of work in the major ports and their labour problems and to make recommendations is unconscionable, in all conscience. It is to be hoped that, at least now, following the Government's undertaking to see the report published in about a month, it will see the light of day and help alleviate the avoidable sufferings of workers. Coming on the top of these, even the latest innocuous demand acted as a lighted match to a keg of dry gun powder. Fortunately the resulting explosion has been effectively handled and not allowed to spread.

Since the calling off of the strike of some 40,000 dock workers of Bombay last Friday, the Ministry of Transport has sent a communication to the workers' representatives setting out the terms of the settlement. It is noteworthy that although this settlement refers in the main, to the dispute of Bombay dock workers, the terms thereof have been deliberately worded in a manner as would permit of their application to workers in other ports in the country as well. This means that, at least in respect of the issues covered by this settlement, dock workers in other ports need not resort to a fresh dispute.

Now that the workers have resumed duty, it must not be supposed that all would be well hereafter. Apart from the financial effects of the settlement on the employers and the users of the docks, to which I shall presently refer, there still continues the almost intractable problem of congestion of ships. Presently nearly 40 ships, at least a fourth of which are ships carrying food grains, are waiting for berths. A layman like me would think that, since the boys have come back to work satisfied, they would surely expedite the unloading and loading operations on the berthed vessels and thereby help clear the berths for the ships still anchored. But I am told the position is not that simple. Informed quarters say that, short of placing the work in the ports on a war-time footing, the problem defies solution. All means, not excluding the use of the two mechanical cranes installed by the Union Food Ministry, they add, must be employed, while the Customs and Post Offices should work round the clock even on Sundays, at least until the congestion disappears.

As a result of last week's Delhi settlement, it is feared, the Bombay Dock Labour Board may increase its levy on shipping companies. This levy, by the way, is intended to provide for the administration of the decentralisation scheme and amenities and welfare schemes for workers, and was raised only in May last to 75 per cent of the daily time-rated wage of a stevedore worker. It is likely to be raised further to almost a 100 per cent thereof, it is stated. Surely shipping companies

cannot go on absorbing these increases in the levy indefinitely without passing them on to their customers and they, in turn, to their customers, each adding his own quota, however negligible, to the rising cost structure. It is not my purpose, nor does it seem proper, to

single out any of these and blame them for intensifying the inflation in the country, but the facts must be noted. Whoever may be responsible and, however insignificant one's own quota, the relentless law of inflation does not fail to operate.

TIME TO RECONSIDER TAX PROPOSALS

By
(CROESUS)

NOW that Parliament is again in session and the controversial budget proposals of May last are to be further scrutinised by Select Committees, debated upon by the two Houses and finalised, the tempo of protests against the proposals may be said to have reached a crescendo. Apart from lengthy memoranda on specific tax proposals by leaders of the business community who recently waited in deputations on the Union Finance Minister in Bombay and Calcutta, public meetings have been organised all over the country, in particular in Madras and Bombay, to criticise the Centre's tax proposals. A common feature of all these protests, whether in papers and periodicals or at public meetings, is the appreciation of the Union Finance Minister's helplessness, more or less, in a situation of the kind he finds himself placed in. But that is the beginning and the end of all public sympathy for the Finance Minister in relation to his tax proposals. While nearly everyone appreciates the need to raise the low standard of living of our people and levy taxes to finance the Development Plan, what many people do not appreciate is the wide range and novelty of his latest tax proposals. It is true nobody has suggested any alternative proposals to raise a corresponding amount of revenue, as Mr. Krishnamachari has declared, but this is because most people are now convinced that the second Five-Year Plan is much too ambitious 'vis-a-vis' our resources, existing and expected alike, and that, therefore, it is no use viewing the Plan any more as something sacrosanct and toying with the idea of going the whole hog with the Plan or not at all. This 'ipso facto' means a reduction in the total outlay which, in turn, should help reduce the amount to be raised by fresh taxes.

It has been said with a passable air of plausibility that, inasmuch as the political party in power today has been returned mainly on the strength of its undertaking to the people to implement in full the second Five-Year Plan, there might be a public revolt if either the size of the Plan is pruned or the period of the Plan is elongated. This is an unwarranted fear. As a matter of fact, almost all sections of the public are today demanding a reduction in the size of the Plan to more manageable proportions, and this must be considered by the Government as a God-send, in that such provides it with a justification, in the form of popular demand, for reducing the size of the Plan. If, for any reason, this opportunity is missed and the Government decides to push through the Plan willy-nilly, undeterred by all the public criticism so far, the chances are that there will be greater frustration and resentment towards the Government at the end of the period of the Plan, what with its several unfulfilled targets. Psychologically that is a more explosive situation which might precipitate popular revolt. The most sensible thing to do now, therefore, is for the Government to take the people into confidence, tell them what the Government wants to do over a period, how, because of unavoidable limitations, it is humanly impossible to keep to the original schedule of the second Plan and why it is necessary for the people to submit themselves to a degree of austerity even to raise our standard of living slightly. Since people know only too well that the

time-table for the implementation of the Plan has been upset by some unforeseen odds, such as, for instance, the failure of the monsoons and the Suez episode, the present affords an excellent opportunity for the Prime Minister and the Finance Minister to tell the people about the inevitable cut in the second Plan. The ex-Finance Minister, Sir Chintaman Deshmukh, who, in fact, initiated this Plan, has done so already, thereby preparing the way, as it were, for them.

If it is thus accepted by the Government that the size of the Plan must be cut for reasons beyond the control of the powers-that-be, the demand for tax reliefs will naturally become intensified. It would be difficult for any Finance Minister to resist this demand and, much more so—if he should consent to do so—to give concrete shape to the reliefs, what with the convincing but conflicting claims of the common man and the business community, the former claiming relief under indirect taxes and the latter wanting relief in direct taxes. If he is to please all sections, however, the Finance Minister must reduce, if not withdraw, some excise duty, say on sugar or paper (these could be held in reserve for the budgets to come in future years) on the one hand, and do away altogether with the Wealth Tax on companies and the Expenditure Tax. While criticism against the latter is both because of its novelty and because of the fear of the inquisitorial form its strict enforcement may entail, criticism against the former, that is Wealth Tax on companies, is motivated by a genuine apprehension of its erosional effects on capital formation. Here are two considered opinions by people who are eminently fitted to express an opinion on this impost which has been aptly described as a "crippling blow".

Writing in the latest issue of 'Transport', Mr. M. A. Master says: "...we strongly hold the view that there can be no justification of a Wealth Tax on productive assets like those of organised industries, either on the ground of capacity to pay or on the plea of removing inequalities of wealth or for preventing ostentatious display of wealth..."

Remarking that Wealth Tax on companies leads to shattering of confidence, Mr. N. Dandekar, I.C.S. (Retd.) writes in the "The Hindu" of 13-7-57, the Wealth Tax on companies "is a clear departure even from socialistic principles; egalitarian arguments do not apply to companies, which must build up their wealth if they are to develop, but only to their shareholders."

Other and more elaborately framed arguments are sure to be placed before the Select Committees on these bills. What has been stated above is only to illustrate the strength of considered public opinion against the two new imposts in particular. It is to be hoped that, when all the implications of his proposals are placed before him in a comprehensive and objective manner, the Union Finance Minister will not insist on just "marginal adjustments", as he has been saying all along, but see his way to accommodate his critics in a more liberal measure.

BUSINESS NOTES

CONFERENCE ON COTTON TEXTILES

THE CONFERENCE on the cotton textile industry and trade held here on July 14 last, under the auspices of the Federation of Indian Chambers of Commerce and Industry was convened as much for the purpose of examining the problems of the industry and Government's policy on it as for carrying out self-examination with a genuine desire to set its own house in order. Industry and trade in the sphere of the same product usually find it hard to see eye to eye with each other in all questions and there is sometimes the unavoidable conflict of interests. This conference adopted a bold move in bringing the two classes of interests together. Its example is worthy of emulation. There was restrained but firm ventilation of grievances whenever the interests of the two involved divergence. But the discussion or criticism was free from bitterness or recrimination. For instance, the criticism of decline in quality and the encroachment of the manufacturing sector on the field of distribution trade was conducted in this frank spirit. The same atmosphere prevailed when the problems of mills situated in the regions labouring under comparative handicaps were discussed. One outstanding gain of the discussions at the conference was frank and unanimous recognition of the fact that the decline in quality must be reversed and attention concentrated on positive improvement if exports were to gain the ground lost.

In so far as the Government's policy on the industry was concerned, Mr. Morarji Desai explained certain issues on which Government was performing its part of the joint effort. His reference to the slow rate of installation of spindles—1.2 million have been installed so far out of a total of 3 million actually licenced—is a case in point. He referred to the closure of mills and to the contemplated closures. The conference urged, after consideration of this question, that uncoordinated units should raise themselves to the level accepted by the Planning Commission. The heart of the textile problem consists in reduction of costs to enable the industry to recapture its competitive strength. Rationalisation with emphasis on auto looms is a major solution to this question. The difficulties attending it were discussed exhaustively and one important aspect which emerged was that allotment of automatic looms should be, to the extent practicable, on an economic basis to make it really worth while. One hundred looms per unit was suggested as the economic level. The discussions also touched vital issues of taxation but it would be wishful to infer that it brought the solution any nearer. On the question of maldistribution of targets of increased production as between the organised and decentralised sectors Government is still unrelenting in its rigid and patently erroneous policy.

ANOMALY OF UNIFORM SALES TAX

THE PROPOSALS adumbrated in the Mysore Sales Tax Bill introduced in the recent session of the legislative assembly with a view to ensuring uniformity in sales tax in the New Mysore State are believed to act very regressively upon the commercial community of the State. In a comprehensive memorandum submitted to the State's Finance Minister, Mr. T. Mariappa, the Mysore Chamber of Commerce has accordingly preferred a clause-by-clause analysis of the Bill.

The memorandum begins by characterising the present Sales Tax Bill as containing the "evil of both the single-point and the multi-point systems". The Government of Mysore in trying to strike uniformity in the various sales tax laws now existing in the State, has evolved a pattern of taxation which, in the opinion of the Chamber, is a "remedy worse than the disease". The memorandum then goes on to say that some of the novel features of the Bill would, apart from paralys-

ing the business community, lead to inflationary conditions by raising the price level.

Among the several points raised by the Chamber, two points, though of a general nature, are of particular significance and deserve careful consideration, if the State of Mysore is to be assured of economic prosperity. The first one relates to the "Minimum Turnover". In the Bill, the minimum turnover of a dealer has been reduced from Rs. 7,500 to Rs. 5,000. This is the most retrograde feature of the Bill, inasmuch as every trader, however meagre his business may be, will be affected. There is every justification for the demand of the Chamber that the Government should raise this minimum turnover to Rs. 10,000. Another feature, which is also equally objectionable, is the imposition of a compulsory turnover tax of 2 per cent payable by all registered dealers. This involves double taxation and is opposed to all canons of equity and justice. The trade is already under an obligation, from the beginning of the month, to pay a sales tax of one per cent, as the Central Inter-State Sales Tax has come into force. A further turnover tax of 2 per cent on the top of this, it is feared, will not only take away all the profits from the traders, but "compel them to pay from their pockets". This also increases prices and affects adversely the much-talked of common man. The Chamber feels the existing system might be continued as the lesser of the two evils.

REVOLUTION IN AVIATION

PROBABLY FOR the first time has it been reported — in the July issue of "Oil Progress," published by the Caltex Group,—that the world demand for aircraft jet fuel is now higher than that for aviation gasoline. The position over time is graphically illustrated below. While jet fuel consumption was only slightly more than the demand for aviation gasoline in 1956, the trend in the future pattern indicates a sharp increase in the demand for jet fuels, reaching some 270 million barrels in nine years from now. As against this, the demand for aviation gasoline is expected to be nearly static and may even start declining around that time.

World Wide Demand for Aviation Fuel

A break-up into civil and military requirements reveals that the vast bulk of the increase in jet fuel demand — 95 per cent — has come from military services whereas the rise in aviation gasoline was about equally shared between the two. This leads to the conclusion that the character of military aviation is fast changing from the conventional to the jet.

In civil aviation also, long strides are under way to help airlines to make all the world one neighbourhood. It has been estimated that, by 1962, some 800 turbo-engine transports will be in operation. A remarkable characteristic of the engines, in most cases, is that

these can be operated equally efficiently with such fuels as kerosene, aviation gasoline and even light diesel oil, though there exist limiting elements to their general use. Calculations have also shown that "a four-engine jet transport is the equivalent of a modern ocean-liner in terms of passenger-miles per year", which lends the right perspective to the cost of the 800 turbo-engines at the enormous figure of two billion dollars.

CRITICAL CONDITIONS AT MAJOR PORTS

DISQUIETING REPORTS are current that the acute congestion at docks has led shipping conference lines to think of levying a surcharge of as high as 25 per cent in regard to both incoming and outgoing cargoes from India. By and large, this has taken away the relief that was felt throughout the country when the impending strike was called off recently by the dock workers, literally at the eleventh hour. If the threatened surcharge is actually levied, the prices of our imports as well as exports will inevitably go up by a substantial percentage, which would create another unforeseen complication in an already critical economic situation, particularly in foreign exchange and food grain prices. The lack of adequate facilities at the ports has been a major handicap in the country's development programmes. Mr. B. M. Chinai, President FICCI, has laid pertinent stress on the fact that it takes a long time at the docks to unload imported machinery and, after unloading, to be transported inland. Export cargo is facing the difficulties of finding space and it has been noticed that many foreign orders could not be executed for reasons of non-availability of shipping facilities.

A similar grievance has been voiced by the President of the Associated Chambers of Commerce, Mr. W. H. S. Michelmores. The serious nature of the problem can be imagined when it is known that within two months, the number of vessels waiting for berths inside or outside the four major ports of Calcutta, Bombay, Madras and Visakhapatnam had multiplied six-fold from 14 to 81 at the beginning of July. The waiting period for ships carrying steel imports to Visakhapatnam is of the order of 30 to 40 days. The pressure will continue to rise with the increasing imports of capital equipment for steel plants, etc., as well as food grains. While such imports cannot conceivably be reduced, they will have to be matched by ever larger exports. It will be unfortunate if docks fail to measure up to the requirements of the country.

However, the answer to the problem, at the present time, is not so much in embarking on long-term schemes as in imaginative, quick action to make optimum use of the existing facilities at the major ports and improvised use of lighters. The steps that have been suggested, like provision of more mechanised berths and better utilisation of minor ports, if implemented, should prove helpful in relieving part of the pressure. Labour has its own responsibilities, and now that its demands have been largely conceded, the country should expect its ungrudging co-operation which is the largest single factor that may go to relieve the pressure.

ADDITIONAL ENERGY FOR ASSAM

TO ASSAM, the home of many untamed rivers, the putting into commission recently of the Umtru hydro-electric project has brought new light and hope. This Rs. 2-crore project, situated 17 miles south of Gauhati, harnesses a 170-foot fall of the river Kollong's tributary from which the project derives its name. Built with Canadian financial as well as some technical assistance under the Colombo Plan, the project will increase Assam's electric energy by 8,400 kw of installed capacity. Read alongside the enormous figures of power potential of other Assam rivers, the present achievement may appear to be modest. For example, between them, the Dehang and Manas rivers are said to possess a potential of some 3.25 million kw. Those

rivers alone which have already been taken up for observation and investigation by the Central River Investigation Circle are estimated to produce as much as 2 million kw. Yet, the successful execution of the Umtru project cannot be over-emphasised inasmuch as it is the first scheme of this type to be taken up and completed by the State Government in the comparatively short period of some four years. The rapid pace with which success was achieved gains added significance when it is unknown that in 1952, when the project was first conceived, the Assam State had nothing beyond an Inspectorate of Electricity to draw upon.

It is an irony that with so much energy lying latent in Assam, the State's installed capacity and therefore per capita consumption of electricity are perhaps the lowest in India. Even a backward State like Orissa can boast of a capacity of 18.33 kw per thousand of population, against as little as 4.52 kw in Assam, at the end of the second Plan. In consumption, Assam's 5 kwh per capita in 1961 will be a mere 10 per cent of the figure for India as a whole. The peculiar geographical position of Assam, linked as it is to the mainland of India by a narrow stretch of difficult hilly tract, renders it almost impossible for the State to march abreast of the rest of the country in industrial progress. All this heavily underlines the necessity for the State to exploit fully its hidden electric energy which alone is one important resource that Assam can conceivably sell to the neighbouring States to mutual benefit. It is to the credit of the State authorities that substantial progress has already been made in regard to expansion of health, education and road transport facilities. Again, the Dibrugarh protection works is one of the major engineering projects executed with skill. With the completion of Umtru, the State's economic development has reached a stage when the Assamese people can derive benefits in physical terms. It is to be hoped that, with the passage of time, Umtru will prove to be only the first project in a chain of larger and multipurpose ones to follow.

A WARNING FOR CO-OPERATIVES

AT A time when it is generally pleaded in all quarters, and quite reasonably, that co-operative banks should be permitted to be bolder in advances, an audit report has come of the working of such a bank in Assam which leaves a chilling effect. The auditors have found not only that the bank had advanced money, in certain cases, without taking any collateral security which ultimately turned out to be bad debts, but also that there have been some gross irregularities on the part of some officials of the bank. As regards bad debts, it is reported that the bank advanced loans under directions of the State Government which holds a predominating interest in its share capital. In some other instances also, loans were given against little or inadequate securities.

It is neither important nor necessary to apportion responsibility between the State Government and the bank authorities in the present case. What is relevant constantly to remember is that so long as the participants in the activities of a co-operative bank do not have a sufficient stake in it, the results may often be disappointing. There is no doubt that in the peculiar conditions of India's backward economy, particularly in the rural sector, State assistance and guidance in setting up such societies is imperative. But once a co-operative bank comes into operation, the State should withdraw its invisible hand from directing the day-to-day affairs of the bank. The Assam case provides a timely warning for co-operative banks throughout the country. This, however, should not lead them to be very strict in demanding high securities in all cases. Such a course would defeat the purpose for which the banks have been conceived. For better results, vigilance may prove to be helpful more than strict criteria for advancing credit.

COMPANY AFFAIRS

TEXTILE MACHINERY CORPORATION

For the Textile Machinery Corporation Ltd., the year 1956 has turned out to be one of remarkable general improvement in working over the past, more particularly in the cotton textile machinery division where production as well as sales show a distinct rise. In total terms, the sales have sharply increased from Rs. 2.34 crores in 1955 to Rs. 3.57 crores in the year under review. While production of ring frames touched peak levels, the manufacture and assembly of cards commenced during the year under report. Substantial orders have been booked for carding engines and production in collaboration with a Japanese company has been progressing satisfactorily. The Directors feel that there is sufficient scope for still better results in the current year if demand for the Company's products increases. That, however, is possible only if the Government permits liberal expansion in the cotton textile industry. The rate of production of one locomotive boiler a month indicates that in the boiler and heavy engineering division also progress has been good.

Among other items, wagon production recorded improvement and with the completion of the shop extension, it is expected to improve further. A good proportion of the Company's output of steel castings is used in its own manufacture of wagons. Here also considerable progress has been achieved and steps are being taken to step up production in order to meet the increasing demand from various industries. The Jute Machinery division was, however, not able to produce to installed capacity which the Directors attribute to paucity of orders.

In the new schemes under implementation are included the manufacture of water tube boilers and sugar mill machinery in collaboration with two foreign firms of the USA and Holland respectively. Orders are already being booked in both items and the Company proposes to execute them on part-manufacture basis in co-operation with the collaborators during the initial "build-up" period. An Austrian firm is another collaborator in the fabrication of radical crest gates and the work has been taken on hand under contract with the Damodar Valley Corporation.

The financial working for the year shows a surplus of Rs. 72.15 lakhs. Provision for depreciation has been stepped up from Rs. 20 lakhs in 1955 to Rs. 21.21 lakhs in the year under review. In the case of reserve for development, an amount of Rs. 11 lakhs has been set apart which is very considerable when compared to no provision under this head in the previous year. For taxation, Rs. 20 lakhs has been provided, which makes the total provision under the three heads amount to Rs. 52.21 lakhs. That leaves a surplus balance of Rs. 19.95 lakhs, which, together with the balance brought forward and the previous year's provisions, goes up to Rs. 21.42 lakhs. From this written back, the Directors have recommended the following amount, the Directors have recommended the following dividends: on 15 lakh ordinary shares of Rs. 10 each at Rs. 1-4 per share free of income-tax (Rs. 18.75 lakhs); on 10,000 cumulative preference shares (tax-free) of Rs. 100 each at 5½ per cent per annum (Rs. 55,000); and on 30,000 redeemable preference shares (subject to tax) of Rs. 100 each, also at 5½ per cent per annum, less tax (Rs. 1,13,025). All together, these amount to Rs. 20,43,025 leaving Rs. 98,732 to be carried forward.

THE TATA OIL MILLS CO., LTD.

There has been a setback in the results of working of the Tata Oil Mills Co., Ltd. for the year ended

March 31, 1957. Thus, although the gross revenues for the year were higher by over a crore of rupees than in the previous year, thanks to substantially large sales of imported chemicals, the bigger turnover did not yield improved profits; prior to depreciation, managing agency commission, taxes and reserves, these (profits) were lower by about Rs. 12.80 lakhs. After providing for these items, the disposable amount stood at only Rs. 8.10 lakhs, as compared to Rs. 9.52 lakhs for the previous year. The reduced profits are reflected in the dividend recommended, which is only Rs. 2.50 per share, as against Rs. 3 per share for the last year.

Explaining the reasons for the setback, the Directors state that this was due to a rise in the price of oils, particularly groundnut oil, the upward revision of customs duty on all perfumery materials, lower sales of soap, an increase in the wage bill and the levy of excise duty of as much as Rs. 70 per ton on vegetable oils from March 1956. The effect of one of these, namely the extent of the increased incidence of the excise duty, alone is evident from the fact that the Company was required to pay a total sum of Rs. 33 lakhs on this account during the year under review. Despite the increase in costs of production as a result of this, the Company could not increase the prices of its products anywhere near to a corresponding extent (and that too only in February), by reason of the "severe competition from inferior soaps produced by cottage and small-scale industries which enjoy preferential treatment in respect of excise duties". The profits were also adversely affected by the upward revision in the rates of Income-tax and Corporation Tax and now by the introduction of Wealth Tax on companies as well.

The Directors report that the Government of India did not give the Company permission to issue 56,086 new Ordinary Shares of Rs. 25 each by capitalising Rs. 14 lakhs from the share premium account, on the ground that, after such capitalisation, the free reserves of the Company would be below 20 per cent of the increased paid-up capital. This now seems to be broadly the formula that the Government of India adopts in all such cases.

The sales performance of the Company was not uniformly good, although the output of all the Company's products, namely soap, glycerine, and vanaspati, was maintained. In fact, Tomco's vanaspati production was higher while the output of the entire industry was lower than in the previous year. Whereas sales of glycerine and vanaspati were higher, the latter by as much as 80 per cent, sales of soap were somewhat lower. But sales of Tata Chemicals' products, of which Tomco's are the Selling Agents (by the way, this sales agency agreement has been renewed for an additional period of 2 years), showed an improvement. Although the State Trading Corporation started handling imports of heavy chemicals, it is significant the Company was allowed to continue to distribute Soda Ash and Caustic Soda throughout the country, albeit on behalf of the S.T.C.

Except for the extension of the Hydro-generation Plant godown and the erection of another godown for storing seeds in Bombay, there was no major construction work during the year under review. The small soap factory at Calcutta acquired by the Company last year commenced production of laundry soap from September last.

COMMODITY NEWS AND NOTES

INCREASED OUTPUT OF COMMODITIES

Significant progress has been made in respect of production by village industries. In hand pounding of paddy, the production has increased from 359,000 maunds in 1953-54 to 1,348,000 maunds in 1956-57. Production of oil by crushing oil seeds in ghanies is now about 100,000 maunds as compared with a negligible quantity in 1953-54. The manufacture of soap has risen almost six times in the past four years. The production of hand-made paper rose from 127 tons in 1953-54 to 610 tons in 1956-57, and that of palm gur from 1,442,000 maunds to 2,300,000 maunds.

PRICE OF COAL INCREASED

A uniform increase of Rs. 1-8 per ton in the price of coal was announced by the Government of India. Also the by-products of hard coke and beehive hard coke by Rs. 2-8 and Rs. 1-8 per tons respectively. The prices of soft coke continue to be unaffected by the increase.

GROW-MORE-FOOD SCHEMES FOR BOMBAY

Fifty-eight schemes have been sanctioned by the Government of India under the "grow-more-food" programme in 1957-58. Of these 25 are for the development of fish cultivation and 11 for improvement and extension of irrigation facilities, for which the Centre has sanctioned loans of Rs. 76.92 lakhs and grants of Rs. 6.23 lakhs. Other schemes relate to distribution of improved varieties of seeds and fertilisers, protection of plants, reclamation of land and composting of refuse, for which Central aid will amount to Rs. 12.61 lakhs—Rs. 2.69 lakhs as loan and Rs. 9.92 lakhs as subsidy.

WORLD SUGAR PRICE

The International Sugar Council has set up a Committee to consider the world market price of sugar and to make such recommendations as it thinks necessary. Since the middle of February the New York spot price of raw Cuban sugar, has rarely been less than 6.00 cents a pound. Yet under the International Sugar Agreement the price at which there may be no quotas or limitations on exports is 4.00 cents. The main reason for high prices is that the Cuban surplus has been steadily run down in the past few years, but the available supplies were also limited by the small size of the European beet crop. Even the abandoning of quotas has not prevented prices from staying high. The Council revised its estimate of free market requirements for 1957 from 5.65 million metric tons to 6.21 million metric tons. But it stated that supplies had also increased for the year as a whole and would be ample to meet the demand.

CEYLON'S TEA OUTPUT

The total area under tea in Ceylon increased by 3,351 acres from the end of 1953 to December 13, 1956, according to the administration report of the Tea Controller for 1956. At the end of 1956, the total area under tea was 56,460 acres. During the year 3,482 acres were newly planted with tea, while 131 acres of old tea were uprooted and replanted with other crops. 51 per cent of the total area under tea was in large holdings—339 estates of 500 acres and above; and 13 per cent were small holdings, below ten acres; 8 per cent of the estates between 10 and 100 acres; and 28 per cent between 100 and 300 acres. Of the total

acreage, 34 per cent was under high grown tea cultivation, 42 per cent under medium grown, and 24 per cent under low grown tea cultivation.

INCREASED PRODUCTION OF KYANITE IN INDIA

The production of kyanite in India during 1956 increased to 14,870 tons as against 11,741 in the preceding year according to the Indian Bureau of Mines. Kyanite is used in refractory industry, such as furnace linings exposed to the action of products of combustion. It is also used in pillars required to support heavy loads at high temperatures or that are liable to shocks.

The amount of kyanite exported during 1956 was 26564 tons at a value of Rs. 76,85,000. Only a small percentage of the kyanite produced is sold to users in the conditions as mined. Usually, it is dressed, calcined and graded to size.

STANDARDISATION OF ACTIVATED CALCIUM CARBONATE

A draft Indian standard specification for activated calcium carbonate suitable for the rubber industry has been issued by the Indian Standards Institution. The rubber industry uses about 1,000 tons of activated calcium carbonate every year. This standard, which prescribes requirements and methods of sampling and testing the material suitable for the indigenous industry, is expected to help it in the supply of suitable quality rubber to the consumers. Calcium carbonate suitable for other industries, such as for dental preparations, tissue papers, etc., will be covered by other draft standards which will be circulated in the near future.

PRODUCTION AND USAGE OF ALUMINIUM IN INDIA

The production of aluminium in India reached a record figure during 1955-56. The production during 1955 was 7,225 tons, while the figure for the first half of 1956 was 3,449 tons. The annual consumption of aluminium in India has been estimated at 35,000 tons by the end of 1956. The total consumption of metal in India during 1955 was 22,765 tons. The Planning Commission has provided for an installed annual capacity of 40,000 tons by 1961. The consumption of the metal has been confined mainly to utensil manufacturing, but uses of aluminium have now been found in the manufacture of various articles from pins to planes. It is estimated that the consumption of the metal will increase to a much greater extent because of the increasing percentage of its use in industries.

SOUTHERN ZONE FOR RICE

The Government of India has created a rice zone in the South, comprising the States of Andhra Pradesh, Madras, Mysore and Kerala. Rice will now move freely within the zone but export from or import into it will be restricted. It is estimated that Andhra Pradesh has a surplus of about 6 lakh tons, while the deficit of the other three States is of the order of 4 lakh tons. Thus, there will be a net surplus of about 2 lakh tons of rice in the zone. Arrangement is therefore being made to allot suitable export quotas from Andhra Pradesh to Bombay and West Bengal to enable sale of superior varieties of rice in these principal consuming markets.

Mid-Monsoon Review

THE rains have come, but happily not gone. The first indications are that the monsoon is very favourable. Our economic condition is still as much a gamble in the rains as it ever was. If the rains had failed this year, inflationary movements, notwithstanding generous P.L. 480 loans, would have been irresistible. At the present time, if one views the weather reports as a whole, one might say that this dire misfortune cannot take us. The fact that Cherrapunji and Assam are going short will not be a source of concern; the shortages will probably be accepted with resignation by residents in those areas. There is, it is true, also been abundance in the wrong places. There are certain portions of Bihar which are already threatened with floods. What seems to be a new development is the severity of the recent floods in East Rajasthan. It looks as though the difficulties of the present are not from shortage of rain but from excessive supply.

One might reasonably conclude from reports over the country that the agricultural situation which, in the last analysis is the prime mover in Indian prices, will not of itself initiate an inflationary spell. On the other hand, the difference between a good year and one just about normal is not so much that a severe fall in prices is possible. The belief sometimes entertained in the Indian Food Ministry that a crash in prices is possible is wholly unreal. Therefore nothing would be more disastrous than if a prospect of a good agricultural season changed the elements of Indian price policy. This must remain, as before, a reduction of food grain prices with the object of holding the price line in cereals. It has already been indicated that this must arise from the sale of P.L. 480 supplies as quickly as possible at a rate significantly below current prices.

While the inflationary situation might, in these circumstances, be deemed to have become

THE WEEK'S NOTES

CRISIS IN NEPAL

THE RESIGNATION of Mr. Tanka Prasad Acharya's eighteen-month old Cabinet has plunged the Himalayan Kingdom of Nepal into yet another ministerial crisis. Mr. Acharya took this extreme step in accordance with the mandate of his party, the Praja Parishad, which had enjoined upon him to resign if the King rejected the suggestion to reconstitute the Cabinet in order "to achieve homogeneity". That this demand should have been made after eighteen months of office clearly indicates that it was not the principle of a homogeneous cabinet that weighed so much with the Praja Parishad as its desire to get rid of the inconvenient Independent Ministers and to enjoy the monopoly of power. This suspicion is reinforced by the King's proclamation calling upon Dr. K. I. Singh to form a coalition. The King has clearly stated that Mr. Acharya's resignation was accepted after he "explicitly informed me of his inability to hold the general elections in October this year as previously proclaimed by me."

Although India's policy is one of strict non-interference in the internal politics of any country, there is seemingly evidence of growing uneasiness in New Delhi over Nepal's endemic political instability. No less than five "popular" Governments have fallen since the overthrow of the Rana regime, some seven years ago. This frequency of change in Governments would be disquieting for any country, more so for a backward country living under the lengthening shadow of a none-too-platonic neighbour of Red China's dimensions and designs. The principal cause of ministerial instability has been the absence of full-fledged political parties; the democratic political institutions are so new to that country. This has largely contributed to the failure or incapacity of the Nepali politicians to find a viable coalition interim Government consisting of different groups until the general elections whenever they are held. Neither direct rule nor endlessly shifting coalitions of the parties without any popular mandate can be a substitute for popular representative Government. Consequently, the Kingdom is faced with the paradox of a popular King striving hard to quicken the processes of democratization and the politicians fighting shy of the ways of democracy. It will be truism to say that monarchy alone is capable, at least at this stage, of giving stability to Nepal and leading the Nepalis on the road of democracy.

King Mahendra's invitation to Dr. Singh has generally been welcomed in India. Besides being the most popular figure, with an almost legendary reputation, Dr. Singh has ever since his return from a three-year exile in China, been consistently campaigning for Nepal's closer ties with India. During his visit to this country last winter, he unequivocally stated that "we cannot pull on without India: just look at Nepal's geographical position". On the other hand, his opposition to China and Russia has been unambiguous. His forced stay in China seems to have disillusioned him of Communism. This seems to have occasioned in him heart-searching and rethinking on the position and prospects of his country. He strongly denounced not only the acceptance of the Chinese economic aid worth about Rs. 60,000,000, but also condemned Mr. Acharya's visit to Peking in winter last. An eloquent expression of his current thinking was his cryptic remark that "Rs. 60,000,000 is not the price of Nepal." In order to save his country from becoming the hot-bed of international intrigue, he is opposed to the opening of any new foreign diplomatic missions in Kathmandu, including Chinese and Russian, and is in favour of routing Nepal's foreign contacts through its embassy in New Delhi. He also wants to preserve constitutional monarchy for "securing the progress and prosperity of the

people of Nepal," on the pattern of British or Japanese monarchy.

But whether Dr. Singh is able to form a care-taker Government or not, it is obvious that the best course for Nepal's political progress lies through general elections as early as possible. This will resolve, in democratic terms, not only the uncertainties of the day but will also assure to the people the Government they deserve.

BHOODAN AND GOVERNMENT

SINCE ITS inception in 1951 the Bhoodan movement has collected a little over 5 million acres of land against a target of 50 million acres by the end of 1958 in all-India. As there is reason to believe that the movement has passed its peak, the utmost quantity of land that will have been collected by the target date may not exceed 6 million acres. Of these 5 million acres of donated land, not even a fifth has been distributed so far to the landless poor who are actual tillers of the soil. If the pace of collection has been slow, the pace of distribution has thus been slower still. If all this land is not expeditiously distributed, it would do no credit to a movement, the proclaimed purpose of which is to rehabilitate rapidly as many Harijan tillers of the soil as possible on their own lands. And this in spite of statutory arrangements in most States for the distribution of Bhoodan lands! This is a distressing state of affairs which calls for immediate remedy. The State Governments which have virtually no achievement to their credit by way of acquisition of surplus lands (above a certain ceiling) should at least bestir themselves in the matter of distributing the Bhoodan lands.

The Bhoodan movement has also in recent years collected more than 2,500 entire villages as donations. These 'Gramdan' villages have been marked out for collective ownership. Here, too, the pace of development has been unsatisfactory. There have arisen unexpected difficulties in this regard. Acharya Vinoba Bhave himself spoke sadly of this at the recent Sarvodaya Samelan at Kaladi: "When an entire village is donated, the money lenders go to that village and warn the inhabitants that they would not get any loans and that they must return the previous loans without loss of time. Thus the trouble starts from the day the village is donated and Bhoodan workers are worried about the future of the donated village and its progress. In fact some of them are already losing heart. One worker went to the extent of saying that it is a sin to plead for Gramdan, to ask people to give up their ownership in land, unless we are prepared to take up the responsibility for the development of the donated village and land. In Koraput (in Orissa State), only in 200 to 300 villages out of 1,500 Gramdan villages, development work is in progress. Inhabitants of the other villages naturally protest. It is suggested that this will impede progress and affect the Gramdan movement. In these circumstances, it becomes the duty of all to decide whether the tendency to give up ownership in land is in the interests of the nation. We would be happy to help in the development, but we refuse to consider that as our responsibility."

The responsibility, by implication, is that of the Government. It may be a fall for the Gandhians of the Bhoodan movement to invite the help of the State in a field which, they have all along thought, should be free from its intervention. But this fall is understandable for even the Gandhians cannot bite more than they can chew. The admission that the Bhoodan movement is not capable of distributing lands speedily or of developing the Gramdan villages is significant, and the Government might have to come into the field in a more active and massive way.

ESPIONAGE IN THE UNITED NATIONS

LAST WEEK the Prime Minister of Ceylon, Mr. Bandaranaike took occasion to deny publicly the truth of certain news reports that a Ceylonese employee of the United Nations was guilty of espionage. The specific allegation made was that he removed certain documents from the office of his country's delegation and passed them on temporarily to the Soviet delegation at the United Nations. The Greek and Ceylonese newspapers, which have carried the reports, have indicated that the alleged theft of classified documents was connected with the United Nations' Sub-Committee on Hungary, of which Mr. Gunawardene of Ceylon was a member. The matter is reportedly under investigation by the United Nations Secretariat itself.

In spite of Mr. Bandaranaike's denial there are certain curious ancillary circumstances of the case which need to be examined. The Russian concerned was declared 'persona non grata' and left New York in early April. There seems to have been no protest over this on the part of the Russian delegation—a procedure not quite normal if the basis for expulsion were untrue. Since any public protest could well have provoked publicity of the charges, to its embarrassment, the Soviet Union seems to have preferred to let the episode pass quietly.

Assuming that the newspaper stories are true—and the denials have been unconvincing thus far—one needs to consider why the Russians should be so interested in acquiring material which, following the United Nations' procedure, was bound to become public within a few weeks? It is possible that pressure on Mr. Gunawardene was one objective—and there have been indications that pressure was exerted on him from other quarters also to make him desist from signing the report. It is possible that the aim was to acquire information sufficiently in advance to prepare effective counterpropaganda. Regardless of the reason for it, it is significant that the Russians apparently considered the objective important enough to risk expulsion of a diplomat and not to object when that expulsion did take place. A countervailing question concerns the action of the United States Government which declared the diplomat 'persona non grata'. Within the purview of American law, espionage against any power is illegal. But in weighing responsibility for move and countermove in the cold war, one must account for why even the United States apparently has chosen not to publicize the matter. Such publicity would seem to have been natural if Washington were really engaged in cold war as is generally assumed in the country.

THE BOOMERANG

RECENTLY THE 'New York Times' published a letter from a Russian mother who had challenged the newspaper to publish it. Mme. Kopytskaya, describing the horrors of the last war and the devastation of human life, particularly of the helpless infants, appealed to the American mothers, to agitate against their "capitalistic" Government who were promoting a new atomic war. "They want dollars, they want profits, they want to drown mankind in a sea of blood". The Russian Government, according to her, is interested solely in the welfare of its people and has benefited them enormously.

The 'New York Times' published her letter verbatim, and wrote a lucid and reasonable editorial in reply to the Russian mother. Admitting the presence of dreadful atomic weapons, the 'New York Times' referred her to the Communist aggression in Finland, Korea and Hungary. In subsequent issues it carried the replies to Mme. Kopytskaya from many American mothers, including Mrs. Roosevelt. In her reply to these, which was published in the 'New York Times', Mme. Kopytskaya said, "I wrote my letter for all American women. Thank you for your publication. I do not consider personal meetings or contacts necessary".

Evidently, what started as possible propaganda for Russia has boomeranged. The very fact that Mme. Kopytskaya felt it necessary to "dare" the American paper to publish her letter is indicative of the colossal ignorance about the outside world in Russia. 'Pravda', which had featured Mme. Kopytskaya's letter to the 'New York Times', did not dare publish that newspaper's reply. It obviously thought it was "not good" for the Russians to hear the truth about democratic America.

Two American reporters in Russia later on tried and failed to contact Mme. Kopytskaya. This was extraordinary, if only because she had been anxious in the first instance to contact America. Evidently, she is not free to choose the people she would like to meet—not even in the post-Stalin 'liberal' era. Perhaps the Russian mother suspects, under the influence of her Government's strangle-hold on thought and expression, that contact with the West will pollute her Socialist purity. Of course, the possibility is difficult to rule out that Mme. Kopytskaya is no more than a set of efficient worker in the Russian Government's propaganda department.

A Window on the World

ODYSSEUS IN GERMANY

THREE OUTSTANDING DEVELOPMENTS have launched a grand debate in Europe on the future of NATO — the North Atlantic Treaty Organisation, with its fifteen member countries the USA, the UK, Canada, Iceland, Norway, Denmark, West Germany, Belgium, Holland, Luxemburg, France, Italy, Portugal, Greece, and Turkey. These developments are, first, the British White Paper of last April, which said in effect that if the UK was to be a strong and reliable NATO partner, its economy must be prosperous; a military effort which strains the economy is of no value. The UK government therefore proposes certain reapportionments in military expenditure, combined with reduction in numbers of men and reliance on more powerful weapons and a new-look in strategy. Secondly, the Disarmament Conference in London has raised hopes and fears. Thirdly, the forthcoming German elections have attached something of a question mark to Germany's position in NATO.

These were the problems that I had most in mind in the course of a three weeks tour which took me from NATO headquarters in Paris to Bonn, capital of the West German republic, and to Dusseldorf, Hanover, Berlin, Hamburg, Kiel, Munich, Mittelwald, Frankfurt, and back to Paris.

In the next week or two I propose to render some account of the conversations that I was able to have with government officials, politicians, officers and men in the French, British, American, German, and other armed forces of the NATO countries, journalists, radio commentators, foreign correspondents, university students, professors, policemen and, for good measure, three ambassadors.

In Bonn, I attended a press conference given by Dr Rust, Secretary of the Ministry of Defence, and General de Maiziere, Director of Training to the German army, to a group of correspondents from NATO countries.

The basic point made by these official spokesmen was that the new German army is being re-constituted as a contribution to the common defence of the NATO countries and not primarily as a German weapon for Germany's national defence. The size and structure of the German army were conditioned by NATO's requirements. It was emphasised by these spokesmen, as by many other Germans, that defeat in two world wars had brought home to the German people that they could not defend themselves alone; they could hope to survive only as one of a group of allies. They dismissed self-sufficiency in armaments manufacture as an impossible ideal, placing too heavy a burden on the German economy. They were ready to buy in France, in Italy, in the UK, or wherever might be convenient, those armaments which Germany did not manufacture herself and they regarded this not merely as a common-sense easing of the burden on Germany but as a contribution to the integration of Europe's economy, a step towards the European common market, in the promotion of which Germany has played a leading part.

15 NATO FACE 240 COMMUNIST DIVISIONS

In conventional weapons and forces, the strength of the Soviets, and their satellites, towers over that of the free countries. There are 175 Soviet and 65 satellite divisions with the colours compared with less than 15 NATO divisions — a comparison which provides its

own comment on Soviet allegations of Western aggressiveness. What redresses the balance and prevents the USSR from exploiting its overwhelming "conventional" superiority is the deterrent of the H bomb. Nevertheless, NATO's military advisers consider that there should be 30 NATO "conventional" divisions available in Europe to guard against the risk of local or regional incursions. Without this NATO shield, the USSR might extend its influence by a series of regional accomplished facts, gambling on the reluctance of the NATO countries to turn a local war into a global war by recourse to the H bomb in the absence of adequate conventional forces.

The German Government has agreed that, providing US, British and other NATO forces are retained in Germany, it will contribute 12 divisions towards the required 30. These promised German divisions cause heart searching among several NATO countries. The French, Belgians, Dutch, Norwegians, and Danes find it hard to forget their sufferings under German domination in World War II, and while they recognise the necessity for a German contribution to NATO, they argue that if it is insisted that Germany should produce 12 divisions, she would have the most powerful land force in free Europe and be in a correspondingly strong position to dominate Western Europe. If the UK were to remain outside the European common market, Germany's domination, would be economically, as well as politically, complete.

The German reply to such fears is to insist, first, that they are not building a self-sufficient national defence but are integrating their armed forces to NATO requirements and relying on the whole of Europe's economy for their armament and maintenance, and secondly, that they would welcome the extension of the European common market to include the UK and as many other countries as wish to join.

This reply is convincing as far as it goes, but the fact remains that the Germans are a capable and hard working people who have the most flourishing economy in Europe because they have not handicapped themselves by socialist, state control, but have given free play to enterprise and initiative, and that, barring some unforeseen disaster, Germany cannot fail to play a dominant role in Europe. This is one of the facts of life that the French need to digest. If the French had ratified the plan for western European defence in 1954, Germans would today be forming part of the common European army and there would be no national armies, German or other, at all. But that historic bus was well and truly missed once and for all.

"COMPARABLE PROPORTIONATE EFFORTS"

That Germany will, however, raise all of the promised 12 divisions is not beyond doubt because, as General de Maiziere told us in Bonn, Germany is ready to make her "fair contribution, proportionate to the comparable efforts of her allies", and the divisions were promised before the British White Paper's proposals for reductions in Britain's contribution were announced. The British viewpoint is that their contribution to the defence of freedom, not only in NATO, but outside in the Commonwealth, has been proportionately greater than that of any other free country, and that the British balance of payments shows that they cannot keep this pace up and remain of any use to the alliance. Therefore a cut is necessary, but that does not mean

Profiteering

The desire to earn a fair wage or to make a legitimate profit is necessary and healthy, and is in sharp distinction to profiteering which is anti-social and evil.

Forum of Free Enterprise earnestly appeals to all to desist from profiteering.

Forum equally appeals to the Union Government to give a lead by eliminating profiteering by the State Trading Corporation, for example in cement.

Forum of Free Enterprise

235, Dr. Dadabhai Naoroji Road, Bombay 1

A non-political organisation to educate public opinion on Free Enterprise.

F-1

that this is a precedent for Germany or any other country which is not as yet making its full proportionate effort.

Now, most observers with whom I talked in Germany thought that the forthcoming German elections would show that Adenauer's policy of defending Germany through the NATO alliance commands but a bare majority of the German people. In such a "touch and go" position, the German government may well wish to seize any excuse to slow down re-armament in order to capture the marginal voters. Many observers believed that the German government is ready to take advantage of the many practical difficulties that impede the constitution of the German army.

When, just over two years ago in May, 1955, Germany entered NATO, she had no armed forces whatsoever. Now, to build up an army, navy, and air force, from scratch, you need experienced officers and NCO's. At first sight it seems extraordinary that in a nation with Germany's military record, there should be an extreme scarcity of officers. But the war ended 12 years ago, and assuming that an "experienced" officer should have had, say, a minimum of two years with the colours and actual experience of command in battle, that would mean that he would today be at least 32 years old. But Germany is not anxious to recruit a middle-aged army.

A second difficulty arises because after the war there was a tendency on the part of the victorious allies to regard all German officers as potential war criminals, a suspicion which the mass of the German people—painfully conscious of their defeats in two successive world wars provoked by "German militarism"—found easy to accept. Consequently German ex-officers have found it difficult to get employment since the war—except as porters, night watchmen, garage hands, and in other similar jobs. From this it follows that, on the one hand, among a substantial section of German public opinion, service in the armed forces, far from

carrying any prestige, has some stigma attached to it, while, on the other, it was to be expected that all those German ex-officers who had failed to overcome the difficulties of making good as civilians would jump at the chance of returning to the life of "an officer and a gentleman."

But the German authorities do not want armed forces officered by cast-offs from civilian life — people who might be expected to have a grudge against the new German democracy. So the army accepts only those who have made good — like the captain I met who had risen from garage hand to motor car sales manager.

This selective policy explains why all the German officers and NCO's with whom I talked were men of outstanding guts and character, men who had given up a good job in civil life, and were ready to brave social stigma, for the sake of service in the armed forces.

But the net result is a serious shortage — particularly of junior officers and of NCO's, the ratio of whom to the troops is far below that in the British and American armies.

The widespread antagonism in Germany to the revival of "Prussianism" in the army adds to training difficulties and slows progress down. Knowing that popular feeling is behind them, the men are sometimes difficult to discipline. It can, for example, happen in any army that three of four young men who are off duty take a couple of drinks too many and proceed to beat the town up. But the German commanding officer of today hesitates to punish such behaviour in the manner normal to all armies — for fear that the men may write to the newspapers or complain to a member of parliament that they have been victims of old-time Prussian drill-sergeant bullying. Today's commanding officer in Germany has to jolly his men along and feel his way towards raising standards of discipline.

IN GERMANY—WEST AND EAST

By

ODYSSEUS

I CONTINUE to render you account of what I saw in the course of a three weeks tour of Germany and France. Last week I reported that official spokesmen in Bonn explained that the German Government's foreign policy was based on the recognition that the defeat of Germany in two world wars proved that Germany could not defend herself alone and could only survive henceforth as a member of a coalition of allies. This, you will observe, is the traditional basis of Britain's foreign policy. It is a policy which has at least one re-assuring point for the rest of the world, namely, that Britain's (and now Germany's) first aim must be to fashion her policy in such a way that her interests coincide with those of a majority of other countries and do not provoke a coalition against her. The fundamental condemnation of Britain's participation in the Anglo-French Suez canal adventure was that it provoked a coalition of virtually the whole world against her and was therefore directly opposed to Britain's interests.

The official spokesmen at Bonn went on to explain that the structure and numbers of the German army that was being reconstituted would be conditioned by NATO requirements and would henceforth form an integral part of NATO's common forces for the defence of Europe, and would therefore not be equipped for separate nationalist action. General Maiziere, Director

of Military Training, stressed that from the economic viewpoint, Germany's armed forces would be dependent on imports of heavy equipment from other European countries. This should re-assure those many countries which fear a revival of German chauvinism.

Dr. Rust, Secretary General of the Ministry of Defence, emphasised that the basis of German policy since 1948 had been to promote the economic integration of Europe, as a pre-requisite to political integration, and he pointed out that the manufacture of armaments provided an exceptionally good opportunity of carrying out this policy because if Germany tried to manufacture all her defence requirements she would overburden her economy, and Dr. Rust attached significance to the fact that before taking over his present appointment he had spent four years as chief German delegate to the European Iron and Steel Council.

OPPOSITION TO NATO

Later I attended a press conference given in the parliament house at Bonn by a spokesman of the official opposition, the German Democratic Socialist Party. He said that the party opposed Germany's participation in NATO. The basic question was: Will NATO bring nearer the re-unification of East and West Germany? Since the signature of the NATO treaty on April 4,

1949, the re-unification of Germany had not advanced one inch.

In the course of the question period, I asked the Opposition spokesman:

(1) Do you recall that between the end of the war in 1945 and Jan Masaryk's suicide in Prague on March 10, 1948, the USSR had absorbed Lithuania, Estonia, Latvia, Eastern Poland, Bessarabia and Northern Bukovina, part of Finland, East Prussia, and Ruthenia — a total of 192,000 sq. miles and a population of 24,000,000?

(2) That the USSR had inaugurated puppet governments in, and made satellite states out of, Albania, Bulgaria, Czechoslovakia, Hungary, Poland, Rumania, and East Germany — a total of 400,000 sq. miles with a population of 87,000,000?

(3) That in August, 1948, the USSR decided to isolate the allied sectors of Berlin and, by starving the inhabitants, to force the Americans, British and French to abandon Berlin to Soviet domination?

(4) Do you regard it as of no significance that since the formation of NATO, the USSR has absorbed no further free territory in Europe?

(5) Would you agree that, if NATO had not been formed, the re-unification of Germany would have taken place behind the Iron Curtain?

To these questions, the spokesman of the German Democratic Socialist party replied: "Our party does not stand for re-unification without freedom. We recognise that NATO was created in direct reply to the aggressive policies of the USSR, that it has succeeded in preventing further Soviet expansion, and that without NATO, Germany would have by now been re-united as a Communist satellite" — admissions which were as startlingly frank as they were honest. The Opposition spokesman went on to explain his party's future policy in the event that they were to win the German general elections due in September. He said that their criticism of NATO policy was not that it had failed but that it had grown static and negative. It created a deadlock whereby the re-unification of Germany would be followed either by the advance of American and British tanks to the Soviet border or by the advance of Soviet tanks to Germany's frontiers with her Western neighbours. The first solution was unacceptable to the USSR; the second to the West.

In the view of the German Democratic Socialists, the way out of this deadlock is a general settlement between East and West of which the re-unification of Germany would be an essential condition. Germany's neutrality would then be guaranteed by the USSR and the USA. To this, Western observers reply that whereas since World War II, the West has absorbed not one square inch of Eastern territory, the USSR has absorbed all the Western territories listed earlier in this article, a record which suggests that whereas Germany runs no risk from the West, she does from the USSR. So that a guarantee of German neutrality would in effect be an American and Western guarantee to defend Germany against the USSR. Western spokesmen observe that while the other NATO countries are ready to spring to Germany's aid if she makes her contribution to Western defence, they do not see why they should if she does not. The German Democratic Socialist insistence that the deadlock allegedly created by NATO should be ended by means of a general settlement between East and West was precisely the point on which the Four Power Conference held in Berlin in January, 1954, broke down. The USSR refused any settlement which entailed the withdrawal of Soviet troops from their forward positions in East Germany.

I eventually left Germany with the impression that a majority of Germans support the NATO alliance and

that the substantial minority who are critical of it have no clearly thought out policy to offer in its place. If the Opposition were to win the elections, I expect a modification of emphasis in German foreign policy rather than any spectacular departure in a new direction.

WHAT I SAW IN EAST BERLIN

The contrast between East and West Berlin was striking. Whereas the streets of West Berlin bustle with traffic and the cafes are full of reasonably well-dressed people, there was scarcely any traffic in East Berlin. Outside food shops there were queues for sugar, fats, meat, and vegetables — a sight not seen in any country of free Europe since the war. The cafes were sparsely patronised and the people not nearly so well-dressed. So-called elections were being held for the East German Government, and although the walls were well plastered with official slogans and election advertisements, the comparative rarity of any display of red flags on private houses was remarkable, suggesting a very small membership of the Communist Party.

You will remember that the workers of East Berlin rose in revolt against the Communist regime on June 17, 1953, and were put down, as were the Hungarians last year, with the aid of Soviet tanks. Fighting occurred (among many other places) on the Potsdamer Platz. In the course of my tour, we visited this Platz where we encountered a commandant of the East German Police. We introduced ourselves as a group of Western journalist, and the following conversation ensued:

Question: "Where were you on June 17, 1953?"

The East German Police Commandant: "I was on duty here in the Potsdamer Platz."

Question: "Did anything happen here?"

Commandant: "Some juvenile delinquents got out of hand, and encouraged by anti-Communists from West Berlin, tried to delay the reconstruction of Berlin by drawing the workers away from their jobs."

Question: "Were there any tanks here?"

Commandant: "Yes."

Question: "What kind of tanks?"

Commandant: "Soviet tanks."

Question: "What were they doing?"

Commandant: "Helping the police to restore order among the delinquent youths." And the Commandant added spontaneously: "It took quite a time to get things quiet."

Question: "Do you think such a rising could happen again?"

Commandant: "No. All the delinquent youths have been educated in the proper way to Socialism. They are all hard at work increasing production now."

Question: "East Germany is called a democracy. Is there an opposition party here?"

Commandant: "Of course. We have seven Opposition parties here — all united under the National Front."

Question: "But is there no opposition to the National Front?"

Commandant: "If there is, they are enemies of the German people and should be in gaol."

The Police Commandant, a man of 50 or 55, spoke throughout in a low monotone. He created the impression of one who was reciting all the correct answers learned by heart from a party catechism. His hand trembled slightly as he spoke of the June 17, 1953, killings.

A German who had escaped from East Germany described to me what he had seen at a polling booth. "The Polling Officer asked each voter 'Are you for peace? If so, I'll put your vote in this box. If you're for war, you can put your vote in that other box for yourself.'"

ACC HONOURS THE CODE

1

"Producers and distributors owe it to the consumers of their products that they shall always be of the highest quality and available at a reasonable cost."

Code of conduct—FORUM OF
FREE ENTERPRISE

Indian cement is required to pass the high standards laid down by the Indian Standards Institution. It is tested against these standards both in the laboratories of the producing factories as also at the Government Test House, Alipore. ACC cement passes these standards with a substantial margin of safety and is comparable in **QUALITY** with the best cement produced elsewhere in the world.

Since 1944, the selling price of cement has been fixed by the Government of India. Twice, in the past, the Company has voluntarily reduced the price of its cement. The price which the Company receives has remained unchanged since 1948. The current higher cost to the consumer is due to excise duty and the price equalisation surcharge levied by Government to subsidise imports through the State Trading Corporation.

Honesty, hard work, courtesy, continuous initiative and service to the community are the foundations on which the edifice of Free Enterprise rests. These are also the sure foundations on which the ACC edifice has been built to last.

THE ALGERIAN BOOM

(From Our Special West European Correspondent)

PARIS, July 20.

THAT after more than two years of frightful warfare and sabotage Algeria should be enjoying a wave of economic prosperity that deserves to be called a boom is a fact of sufficient interest in itself. But it also has political implications: obviously the terrorist minority will find it harder to shoot its way to power when the European eighth of the population is making more money than ever before, when the mass of the Muslim population is benefiting from general prosperity and when metropolitan France sees in its Algerian provinces the promise of greater prosperity to come. It is true that all these groups are taking a short-term view, because the economic progress of Algeria is not great enough (and never could be) to support the only new dispensation that could make a conclusion to the war possible, namely an end to all racial discrimination, equal status for all communities and sufficient investment to cope with the rapidly increasing Muslim population. But in politics it is short-term views that matter. In the long run, Algeria must prove a dead loss to France, and she would save money by shipping a million and a half Europeans back to the Continent and leaving the multiplying Algerians to manage as they could on the fringe of the desert. But, in the short term, business is flourishing despite the war and so "defeatist" talk (i.e. suggestions for recognition of Algerian independence) gets no hearing whatsoever.

The Algerian boom is one of the reasons for the discrepancy in viewpoints of the local population and the metropolitan French. In Paris the commonest picture of Algeria is of a war-ravaged country where an insecurity reigns that must make work almost impossible and where capital equipment is being destroyed by organised terrorism; it is only a step from this picture to the conclusion that the best thing to do is quit Algeria. But in Algeria the war seems to be a series of incidents in the course of a steady boom — admittedly, pretty ghastly incidents when a bomb goes off in your bus or when your neighbour's farm is sacked, but the more horrible the incident the stronger the determination not to sacrifice a future that can be summed up in the magic word "petrol".

Some of the causes of the boom are factitious and temporary, but most are not. In two years retail sales have increased 50 per cent and savings deposits have risen faster than in France itself. There has never been so much work or so much money in the country. Of course, one of the principal reasons for this expansion is the presence in Algeria of 400,000 troops. Before 1954, military expenditure in Algeria used to be around £100 million a year, but last year it totalled £250 million, which represents an immense stimulus to a country whose total annual output is usually valued at around £600 million. This stimulus can only last as long as the war itself; it consists in spending by the troops, and public outlay on anti-terrorist protection, military buildings and repair of war damages. So all this element in Algerian prosperity is a factitious war-boom made possible by the diversion of tax revenues from metropolitan France. But that does not mean it is merely temporary, because as long as the French stay in Algeria they will be either spending equivalent sums on the war against terrorism or else spending even greater sums on the social and economic reforms and investments required to satisfy native Algerian aspirations. I have said above that the Alge-

rian economy could never support by itself the level of expenditure required, but France could — at great cost naturally to the metropolitan tax-payer. From the point of view of the European community in Algeria, the economic future is assured because France must continue to subsidise the colony either by war spending or by peace-time investment on a massive scale. In these circumstances, nothing is further from their minds than to capitulate to the nationalists and quit Algeria.

Another cause of present prosperity is the record output of Algerian agriculture, which far from being associated with the war has occurred in spite of it. Tobacco and cork, being produced in regions made insecure by terrorism, have been grown in smaller quantities, but the output of cereals, wine and citrus fruit in 1956 had never been surpassed. The total value of the last crops harvested was about £200 million. It is not only agriculture that has benefited; infant Algerian industry too is more active than ever. The inflationary boom in metropolitan France is absorbing most of the output of French industry, which is thus exporting less across the Mediterranean. Further, the general impression in France that Algeria is too insecure for business, or even that the days of French power there are numbered, disinclines French industry to take any interest in the expanding Algerian market, much less to invest in consumer industry there. The result is that native industry is benefiting from virtual protection just when its market is most favourable. This industry is, no doubt, small and the money value of its current expansion is moderate, but the psychological effects are considerable: the million and a half Europeans who control the greater part of the Algerian economy are confident of their future, especially as long as the metropolitan tax-payer bears the burden of fighting terrorism.

But it is the exploitation of the Sahara petrol that is providing the most powerful psychological stimulus to the Algerian economy. The oil companies have invested in the first half of this year £20 million, three-quarters in Algeria itself. This sum is not immense, but it is expected that within a few years the outlay on prospecting will have doubled, while expenditure on raising and transporting oil will rise rapidly. The oil companies are patronising local industry in preference to importing equipment, and consequently Algerian engineering firms are fully employed while road and air transport cannot meet the demand. Not only will subsidiary industries mushroom up in the shadow of the oil wells, but the supply of natural gas and local petrol will assure this industry, within two or four years, of cheap power — and of course, it is the cost of power that has limited the growth of industry in the coalless desert countries of North Africa. Besides, where oil is concerned the economist has to recognise that facts and figures are of less importance than the immense optimism that the spectacle of oil derricks has inspired everywhere black gold has been struck.

Quite apart from the war and from whatever extra investments will be required when the war ends, the French tax-payer is providing Algeria (as all the other French territories in Africa) with a steady flow of investment capital. This year this supply will reach £90 million and within a few years it will attain £150 million annually. A research group is now at work in Algiers drawing up a plan for long-term economic development, to be financed by the metropole. Plainly,

this prospect does not discourage Algerian commerce and industry already riding the wave of a boom.

It is not being suggested here that, even if oil revenues exceed all present expectations and if the Algerian economy continues to boom, the country can be converted from a backward desert with a fertile coastal fringe into a prosperous colony capable of providing equal status for all its rapidly multiplying population. Algeria is and will remain as far ahead as one can see a poor territory dependent on the metropole for finance; Algeria is and will remain a heavy liability for France and this liability will increase as long as the Muslim population continues to rise at its present staggering rate. But that is not the political problem. The political problem is the fate of a large European minority whose standard of living for a century past has been markedly lower than in France but who now are experiencing a vast prosperity which they hope will increase even further if the French Army can stem terrorism until the oil begins to flow from the Sahara Desert. In this frame of mind, the Algerian Europeans might be disposed to make some concessions to nationalist feeling, especially if this were presented as a guarantee of continued economic progress, e.g. certain political concessions capable of pacifying the country so that oil pipelines can function safely. But they

will not be disposed to sacrifice their stake in the country by permitting the metropole to recognise Algerian independence; even less will they be willing to quit Algeria or agree to its partition.

In September France will once again be called on by the United Nations to account for the failure of her army to restore peace in Algeria. Though there is much talk here of the need to have some liberal proposal ready to present the U.N., in order to gain a further extension of time, in fact no such proposal has yet come to light and the present Government does not seem likely to devise one. So it is quite probable that France will be arraigned in September with nothing to show for the reprieve that the U.N. granted her earlier this year, and this time it is less likely that the USA will be so anxious to protect her ally from the wrath of the smaller nations. A severe censure on French policy is thus to be expected, if not a plan for internationalisation of the conflict. The confidence and determination of the Algerian Europeans is such, and their influence over metropolitan politics so great, that this situation would probably be met by a drastic French reaction, possibly even open defiance of or resignation from the United Nations. Anyone who expects a French retreat in Algeria is reckoning without the tonic effect of the Algerian boom.

WORLDGRAM

AGRICULTURE

Community Development Progress: There were 1,814 Blocks in operation throughout the country covering 234,910 villages by March 31, 1957. Of this coverage 41 per cent were under the intensive development phase and the rest under the N.E.S. programme. The people's voluntary contribution in cash, kind and labour rose to Rs. 36.31 crores, as against the total governmental expenditure of 60.04 crores. The people's contribution thus accounted for about 60 per cent of the government's expenditure. The adoption of better methods and improved techniques of crop production have led to an increase of about 20 to 25 per cent in the yields of principal crops in the N.E.S. and C.D. areas. By the end of December 1956, 26,28,000 demonstrations were organised on farmers' fields; 74,90,000 maunds of improved seeds and 1,69,93,000 maunds of chemical fertilisers were distributed. A total area of 18,19,000 acres of land has been reclaimed.

A New Dam for Thailand: With World Bank assistance assured, Thailand has decided to build a second irrigation-cum-hydro-electric dam in Yarnhee, north-west Thailand. The first such project in Chainat, Central Thailand was opened early this year. The estimated cost of the new project is 2,000,000,000 ticals (\$100,000,000). It will take six years to build. The World Bank has approved in principle, the grant of a loan of \$66,500,000 for the project, repayable in 30 years. The new project will be bigger than the Chainat dam. It will be 154 meters high and 345 meters in length. The dam will generate 560,000 kilowatts of electricity. The Yarnhee project when completed will solve the growing power needs of the whole country.

Fertiliser for Yugoslavia: The Yugoslavia Parliament has adopted a plan according to which the use of artificial fertiliser will rise during the next five years to 2.2 million tons as against only 540,000 tons in 1956. This increase will be realised by larger imports and increasing domestic production. The construction of new plants and the expansion of existing facilities are planned. Three new factories were to have been built with Soviet credits but the terms were unacceptable. Now it seems possible that the credits will be forthcoming. With these plants it is hoped to produce 1.7 million tons of fertilisers.

INDUSTRY

Over-Production of Zinc in the U.S.: A report from the American Zinc Institute shows substantial over-production of zinc. Stocks at the end of June reached the highest level for over three and a half years, and deliveries to industries were the smallest for twelve months. Also, deliveries to Government stock-piles declined sharply during June. Stocks at the end of June were 133,455 tons, the highest level since November, 1954, while the deliveries of 69,957 tons were the lowest since July 1956. At that time the steel strike reduced supplies to galvanisers, thus cutting zinc consumption.

Steel Output in the U.K.: Steel production in the first half of the year was 5.1 per cent higher than in the same period last year. Total production this year is expected to exceed 22 million tons, compared with last year's record figure of 20.66 million tons. In all, 11.44 million tons were produced in the first six months of 1957, compared with 10.6 million tons in the first half of last year, when output was hit by the maintenance

of craftsmen's ban on overtime. In the first five months of the year the UK steel industry had a net surplus of exports over imports of £15.3 million, compared with a net deficit in the same period last year of £26.1 million. Pig-iron production increased by 7.2 per cent in the first half of this year, the output figure being 7.1 million tons.

Tinplate Output in Australia: A new mill established at Port Kembla in New South Wales for the production of tinplate will help Australia close its last major gap in the steel industry. This will carry Australia a step further towards self-sufficiency in steel which in 1955-56 cost £A46 million in imports to supplement local production. Steel is the fastest growing industry in a rapidly increasing population and the growing industrialisation which has lifted per capita usage from 325 lbs. to 675 lbs. in the past 30 years. In the space of six years production of steel has been doubled and with an output of nearly 3 million ingot tons, Australia ranks sixteenth as world producer and has the third place in the British Commonwealth.

Development of Heavy Machine Industry: The Government of India has decided in principle to develop the heavy machine building industry. The five major heavy industry projects to be taken first in hand are a heavy machine building plant, a foundry and forge shop, a heavy machine tool factory, a heavy structural works and plate and vessels works and a coal mining machinery and equipment factory. In 1954 indigenous production of machinery valued 19 crores, while 1954-55 imports were 83 crores; in 1955 indigenous production was 23 crores and 1955-56 imports 118 crores; in 1956 indigenous production was 30 crores and imports from April to December 1956-57 was 114 crores. It is estimated that India's requirements by 1960-61 will be of the order of 250 to 300 crores per annum and anticipated production in 1960-61, taking into account schemes already sanctioned in the private sector and schemes in production in the public sector, Rs. 90 to Rs. 100 crores per annum. Thus, there is still a gap of 150 to 200 crores, which has to be bridged.

TRADE

More Coffee for Export: The total coffee crop for 1956-57 is placed at 42,200 tons, and the blossom shower estimate of 35,750 tons for 1957-58 stands. The total quantity sold for export out of 1956-57 crop till the end of June 1957, including a quantity of 725 tons sold to Russia, comes to 7,980 tons, consisting of 7,629 tons plantations and 357 tons Arabica Cherry. The people of Bulgaria and Hungary are also going to taste Indian Coffee. The two countries have been added to the list of countries for which export quotas have been fixed during the current year. Bulgaria has been allotted 500 tons Plantation, and 300 tons Arabica Cherry, and Hungary, 200 tons Plantation and 100 tons Arabica Cherry. The release of coffee for internal consumption for the half year ending June 1957 were 12,467 tons as against 11,433 tons for the corresponding period last year, showing an improvement of over 1,000 tons. Of the total quantity of 1,994 tons offered to the trade through Pool Sales and local sales in June 1957, the actual off-take was 1,760 tons.

Payments on East German Imports: An agreement has been signed by representatives of the Union Ministry of Commerce and Industry and of East Germany, providing for imports from East Germany on a deferred payments basis. The agreement is designed

to encourage the volume of trade between the two countries without straining India's foreign exchange reserves. This is the first of the series which the Government is attempting to negotiate with East European countries and the Soviet Union. The Deutsche Notenbank of East Germany is to open an account with the State Bank of India. The rupee proceeds of contracts for the import of essential machinery and industrial raw materials from East Germany will be credited to this account.

*

Record British Exports: Britain's total exports in the first half-year reached a new peak of £1,756.3 million, but fell short of imports of £2,100.3 million by £344 million compared with a trade gap of £305.4 million in the first half of last year. Part of the explanation for the higher adverse balance this year is to be found in the Suez crisis, which delayed arrivals in the British ports at the close of 1956 and led to a rise of about 6 per cent in the first half-year import. Exports to many different markets have improved this year, and overall they were about 5 per cent higher in the first six months compared with the same period of 1956. Among export commodities, engineering goods were not so buoyant, although metals and chemicals have expanded rapidly. Re-exports during June amounted to £10.1 million bringing the average for the first half-year to £11.5 million a month, 14 per cent less than a year ago.

*

Yugoslavia's Trade with Asia: The Vice-President of Yugoslavia is to make an extensive tour of South Asia and Japan, to help increase economic co-operation between Yugoslavia and these countries. South Asian markets should provide ample opportunities for Yugoslav industrial exports. In return for exports of various industrial, agricultural and semi-finished products, Yugoslavia would import chiefly cotton, phosphates, iron ore, spices, rice, rubber and fruit. Exports to South-East Asian countries in 1956 showed a great increase. Including China and Japan, total exports to eleven countries of the area were about \$21 million, against less than \$1 million in 1955. The first place was taken by China, followed by India, Burma, Pakistan, Indonesia and Ceylon. Imports from these countries last year were \$16 million against \$19 million in 1955.

FINANCE

The World Bank: The International Bank for Reconstruction and Development has arranged to borrow \$100 million in U.S. dollars from outside the United States. As evidence of its indebtedness the World Bank will issue 4½ per cent notes dated July 11, 1957, and maturing as follows: \$40 million on July 11, 1958; \$30 million on July 11, 1959; and \$30 million on July 11, 1960. The notes which will be denominated in United States dollars, are being privately placed with the Bank Deutscher Laender of Frankfurt-am-Main. Interest on the notes will be payable semi-annually on January 11, and July 11 of each year, with the first payment coming due on January 11, 1958. Payments of interest and principal will be made at the Federal Reserve Bank of New York. The total outstanding obligations of the Bank, giving effect to the present loan, will amount to about \$1,135,000,000 and will consist of \$935,000,000 of United States dollar bonds and the equivalent of \$200,000,000 of bonds denominated in Swiss francs, Canadian dollars, sterling and Netherlands guilders.

*

New Bonds: With the introduction of the 12-year National Plan Savings Certificates which offer 5.41 per cent simple interest or 4.25 per cent compound interest per year, many investors are planning to cash their holdings of 12 and 10 year certificates and switch over to the

new ones. In fact a large conversion business is reported to have taken place during the past six weeks as the new certificates are considered more remunerative. A comparative study of yields on Rs. 100 shows that the surrender value of new 12-year certificates comes to Rs. 165 against Rs. 150 in the old 12-year series and 145 in the old 10-year certificates. The individual limit of holding has been raised to Rs. 25,000 in the new series and the yield is calculated on the basis of compound interest. The yield at maturity for treasury savings deposit certificates has also been raised by ½ per cent to 4 per cent.

*

Sales Tax Difficulties: Inter-State business all over the country has come to a temporary halt as a sequel to the Central Sales Tax becoming operative from July 1, according to a report. Business men have not understood the implications of the new levy and many have yet to secure the necessary registration certificates. Consequently, traders have postponed execution of inter-state orders. Under the Central Sales Tax Act 1956, New Delhi will charge one per cent sales tax on all inter-State dealings in all commodities. The Government has, however, notified coal, cotton, hides and skins, iron and steel, jute, oilseeds and cotton yarn as declared goods and has asked the States not to levy more than 2 per cent sales tax on these items inside their territories.

GENERAL

Expansion of Technical Education: The All-India Council for Technical Education has approved the proposals of the State Governments to open 5 engineering colleges, 22 polytechnics and 61 junior technical schools during the second Five-Year Plan. The estimated cost of these schemes as provided for the States in their respective Plans was Rs. 195.83 lakhs for engineering colleges, Rs. 477.89 lakhs for polytechnics and Rs. 339.45 lakhs for junior technical schools. The five new colleges would be opened in Andhra Pradesh, Assam, Madhya Pradesh, Orissa and Punjab. These schemes had been formulated by the States and included in their Plans, therefore, there would be no question of the States sharing the cost. The Central Government will give financial assistance to the States to implement the schemes. The question of location and other policy matters would be decided by the State Governments in consultation with the Central Government.

*

Development of Fisheries: The F.A.O. is organising a training centre in fishery co-operatives and administration in Australia. The Centre will be held from December 16, 1957, to January 25, 1958, according to Mr. Colin Beevan, F.A.O. Fishery Economist. They expect to have 25 participants from Indo-Pacific countries, apart from those nominated by the Australian Government. The course will provide intensive practical instructions and demonstrations specifically directed towards dealing with the particular problems of organisation and methods in fishery co-operatives.

*

Super High Pressure Water Jets: A stream of water ejected by a fire hose at 4.5 atmospheres can break a stick as if it had been hit by iron. With the help of a water jet from a monitor, coal is being extracted in pits. A wall of black shiny stone instantaneously recedes under the impact of a water jet. Soviet scientists have conducted experiments with a hydraulic compressor which produced one ton of water of a pressure of 2,000 atmospheres per hour. The jet leaving the nozzle at super-high pressure does not turn into a cloud of drops, but preserves its shape. The higher the pressure, the more compact shape the jet assumed. When a knife blade was put in its way, a hole was bored through its 2 millimetre thick steel plate.

July 26, 1957.

NEWS IN BRIEF

INDIAN

The production of copper ore during the quarter ending March, 1957 was 102,192 tons. Compared with the corresponding quarter of 1956 the production registered a marked increase of 11,831 tons. The entire output of copper ore is from the Singhbhum district of Bihar State.

*

According to the new "marking system" to be adopted for future elections, the ballot paper will contain the name of all the contesting candidates along with the facsimiles of their respective symbols. A person will record his vote by placing a mark against the name of the candidate he prefers, in secret, and insert the ballot paper into the ballot box placed within view of everyone in the Polling Station.

*

It has been found that there is inordinately heavy concentration of displaced persons from East Pakistan in the States of West Bengal, Assam, Tripura. The Government of India have, therefore, decided that new immigrants will not be admitted into these states, but rehabilitation benefits will be extended to those who are eligible and willing to be resettled in other states.

*

An estimated reserve of 47.5 million tons of iron ore had been reported to occur in Starur Taluk, Salem District of Madras State. Mr. K. D. Malaviya, Union Minister for Mines and Oil told the Lok Sabha recently.

*

Under the second Five-Year Plan of the Andaman and Nicobar Islands, the allocation for cottage and small-scale industries has been raised from Rs. 5 to Rs. 11 lakhs. Rs. 5 lakhs would be spent on small-scale industries, Rs. 2 lakhs on handicrafts and an equal amount on village industries general schemes.

*

The Union Minister for Food and Agriculture said recently that the total number of fair price shops functioning in different States in the country was 28,739. Of these Kerala has 5,953 (including 212 wholesale shops), Bombay 5,900, West Bengal 5,433 and Bihar 5,377.

*

The factory for manufacturing pozzolon set up near the Bhakra Dam has started functioning. The present production is 1,000 tons per month, while the target contemplated was 3,000 tons per month. It was expected that 75,000 tons of cement would be saved by the use of pozzolon.

*

The Union Government has allotted 1,37,000 tons of wheat for the State of Bihar. About 50,000 tons of wheat have already arrived in the State, and over 4,000 fair price shops are functioning in distressed areas. About Rs. 1,40,000 have been distributed by the Government toward improvement loans of various kinds.

*

The production of cement in India during 1956-57 totalled 6,003,500 tons. The actual production represented about 90 to 95 per cent of the capacity of the industry. During the same period, 1,81,119 tons of cement were imported from foreign countries.

*

An agreement was signed between the Managing Director of the State Trading Corporation of India and the Commercial Attache of North Viet-Nam, providing for the export of 1.5 million gunny bags from India for the export of 1.5 million metric tons of rice to North Viet-Nam. The value of the contract is about Rs. 18 lakhs. A contract was recently concluded between the Corporation and North Viet-Nam for the import by India of 7000 metric tons of rice.

FOREIGN

The Government of Yugoslavia has offered three scholarships to Indian nationals for specialisation in Agriculture, Architecture, Art (Painting or Sculpture), Medicine or Technology (Metallurgy, Fuel Technology or Fuel Research) during the year 1957-58.

*

Chile wants to borrow about \$40 million from the US Export Import Bank to meet balance of payment difficulties. Chile is short of dollars because of the persistent sharp decline in the price of copper. It is estimated that Chile loses \$6.5 million of foreign exchange a year every time the copper price drops by one cent.

*

An increase in British coal exports to the European Pool from 750,000 to 900,000 tons per quarter was agreed upon recently. British deliveries to the Pool were cut successively from 5.3 million tons in 1954 to 3.6 million tons last year. Pool imports from the US rose from 6 million tons in 1954 to over 30 million tons last year.

*

South Africa's coal production last year of 37 million tons exceeded local consumption by 2 million tons, therefore opening up the possibility of the Union resuming substantial exports. At £20 million the Union value of coal output is exceeded only by gold and uranium among minerals.

*

A serious fall in Belgian steel production is expected this month on account of the metal workers strike. This together with the effect of the Whitsun holiday, accounted for the 18½ per cent fall in production in June compared with May. Compared with June 1956 the fall was over 120,000 tons or nearly 21 per cent.

*

Russia has ordered nearly 6 million feet of transmission belting worth about £200,000 from a British Asbestos company. The belting will be used for combined harvesters and other farm machinery in connection with the new Russian agricultural development plan announced recently.

*

Out of a total of 1,432 cars and taxis registered in Norway during the first quarter of this year, 483 or 33.7 per cent, were West German makes. Russian cars came second, with 367 units registered, 146 came from Czechoslovakia, 142 from East Germany and 124 from the UK.

*

US Contractors have placed orders for cement from Canada, Western Europe and the Dominican Republic as supplies shrink under the impact of the cement workers strike. One major company has reached a settlement for its eleven plants, but about half the nation's 170 mills with 16,000 workers remain idle.

*

A trade agreement between Tunisia and the Soviet Union signed recently in Tunis provided for an exchange to the value of Frs. 650 million (about £650,000). Tunisia will export cork, citrus fruits, olive oil, wool, dates, and local craft products in exchange for timber, paper and cardboard, petrol and fuel oil and ferrous metals.

*

Two UK ships start work this week laying the world's longest underwater cable, 2,400 miles, for American Telephone and Telegraphs. The \$37 million project will provide a telephone connection from Point Arena, north of San Francisco, to the island of Oahu in the Hawaii group.

**Economic Report from the U. S.****TOWARDS NORMAL TRADE BALANCE**

(By GUY SIMS FITCH)

WASHINGTON, July 23.—If the projections by foreign trade experts hold true, a number of countries this year will again add to their gold and dollar holdings as a result of their transactions with the US. The addition may not be large but it will continue the trend began early in 1952. Here is the way the National Foreign Trade Council, an organization of American companies engaged in foreign commerce, sees the situation. US exports this year will total a record \$19,000 million, some 10 per cent more than last year. This estimate does not include military goods sent to other countries under the US Mutual Assistance Programme: US imports this year will total a record \$13,000 million, about 3 per cent over the 1956 figure. This means that, in the aggregate, other countries will have a merchandise trade deficit with the US of about \$6,000 million.

But this deficit will be offset by other balance-of-payment elements. All told, the US will make some \$26,500 million available to other nations through purchase of goods and services. In addition to merchandise imports, this includes payments for transportation, travel, private investments, foreign aid, and other fund transfers. Other countries, meanwhile, will be using about \$25,700 million for similar payments to the US. This will leave them an \$800 million surplus, presumably to be added to their gold and dollar reserves. Even if these calculations should be off by as much as \$500 or \$600 million, other countries still stand to gain this year.

Even a small gain could be considered a heartening development, in view of the adverse factors operating earlier this year. Largely because of the Suez situation and last year's poor harvests in Europe and some

other areas, the US, during the first quarter of the year, shipped abroad abnormally large quantities of oil and agricultural products. The effects began to show up during the fourth quarter of 1956, when other countries, in the aggregate, drew down their gold and dollar holdings by about \$90 million to cover increased shipments from the US. The full impact came in the first quarter of 1957, when their reserves diminished by some \$450 million.

It is worth noting that the gold and dollar assets built up in the previous years, plus the loan activities of the International Monetary Fund and the US Export-Import Bank, helped other countries purchase the goods they needed from the US despite the temporarily adverse situation. But with the abnormal factors now largely at an end, the experts see US commercial exports receding to more normal levels. While US imports continue to maintain a steady record pace.

After hitherto high of more than \$2,000 million in March, US commercial exports declined to \$1,760 million in April and \$1,694 million in May, the latest month for which data are available. US monthly imports, meanwhile, have generally been running one to 4 per cent above the 1956 rate. Actual trade trends thus seem to be bearing out the experts.

Head Office: Delhi

Mr. A. M. Walker—General Manager

concerned estate ventured to take the injured workers to a hospital in his car for treatment, he found the road effectively blocked when he returned. When he got off the car to remove the impediment, other missiles greeted him to send him running back again to the hospital, this time for his own treatment.

Even cases where managers have been pulled out of their cars by hooligans and made to sign papers on the dotted line are not wanting. However, one of them, it is reported, was able to outwit the unruly elements once by signing and adding the words "under duress" afterwards.

Perhaps when one gets political power, one's range of knowledge of methods of harassment also widens. The Communist workers in Kerala have now learnt to enhance the nuisance value of their demonstrations by using the novel method of making the workers' children use offices of factories and factory managers' residences as their unofficial reading rooms on occasions. Of course, the children are made to read at the top of their sweet voices for the edification of the oppressed managers and their depressed household. So children have come to be in demand for more wonderful uses than just to line the roads of our cities when great leaders visit out country?

Thanks to the Kerala Government, workers may now even wrongly occupy estate quarters without any

fear of being challenged. For being impertinent enough to do so, the Manager of one estate had a good beating, not amounting to violence, of course. It is no longer the rule to tackle the Manager or other estate office people in the office premises only. Workers have the right of access even to the 'sanctum sanctorum' of any of these officers in the estates to voice their grievances in exercise of their right and to demand instantaneous enforcement of whatever solution they feel proper. This might be hooliganism or indecent behaviour, but it is not violence according to the Communist Government of Kerala. In one estate alone, within an interval of 30 days, the cases of such intimidations, threat and obstruction numbered nine, but the Police had helplessly to hold back, it seems, except on one occasion when it had reluctantly to restore to the estate a lorry carrying tea leaves that had been seized by a mob. Out of nearly 50 appeals for police help, it would appear, only ineffective help was forthcoming in some seven cases. Oddly enough, in all other cases, the police officers were either not on duty or they did not feel called upon to intervene. Any coercive move is glorified as "satyagraha" and the Police are automatically eliminated. This is the way that Communist trade unionism in Kerala is behaving to usher in a new order, but one feels seriously concerned that what will ensue will not be any new order but disorder, if not disaster.

A Letter to the Editor

SOME CORRECTIONS

Sir,

May we draw your attention to a number of errors of printing and arithmetical calculation in the statement entitled "Ten Years of Indian Agriculture" in "The Eastern Economist" dated June 28, 1957, pages 970, 971. Some of these are described below:

Page 970, Col. 8: Against 'Other Pulses' the averages of production and yield work out to 3036 and 304 instead of 3307 and 394, respectively.

Page 971, Col. 16: The average production ('000 tons) of wheat for quinquennium ended 1956-57 is shown as 3203 which is a misprint for 8203.

The "Total Cereals" figures in columns 14 and 15 should be 54,639 and 55,249 instead of 54,649 and 56,249. The "Total Food Grains" figures for all the years have been wrongly added. The figures in Columns 11, 12, 13, 14, and 15 add up to 58,266, 68,718, 66,604, 64,826 and 65,178 respectively.

In the interests of accuracy, you would perhaps publish a corrected statement in your next issue.

Yours faithfully,
H. N. MEHROTRA.

[The statistical tables, after correction, are reproduced in this issue on pages 141 and 142. The errors are regretted.—Ed.]

"Help—let me out!"

Many motorists may have wondered, seeing the rather technical look of some petrol advertisements, just what it's all about. Perhaps, blinded by science they even wonder whether there is very much in it after all.

This is a pity, for things have been happening to petrol. It is better—and different. Modern petrol is no longer obtained by simple distillation. First-class high power petrols—such as SHELL and B.O.C.—are produced by advanced refinery processes that lead to better fuels at an economic cost. But refining is only half the story. Additives play an increasing part in giving motorists the higher performance they need. You probably remember the first important additive—tetraethyl lead—which in 1922 sensationally reduced petrol 'knock'. The latest, and most important since tetraethyl, is I.C.A.—the ignition control additive—which, incorporating tricresyl phosphate, was developed by Shell Research to overcome problems of power loss through engine deposits. These deposits interfere with normal firing of the mixture, particularly in high compression engines, and were a serious brake on engine design. I.C.A. has proved the complete answer. It is a triumph of fundamental research as far removed as can be from an advertising 'stunt'. It is by products such as SHELL and B.O.C. petrol with I.C.A., available at Burmah-Shell sales points, that motoring becomes better, smoother and more economical.

BURMAH-SHELL... in India's life and part of it

BUSINESS NOTES

MORE CLOTH FOR EXPORT

THE COTTON FABRICS (Additional Excise Duty) Bill, 1957, introduced in Lok Sabha recently, is more than a formal piece of legislation. By recognising the need of increasing mill cloth production by 350 million yards beyond the targeted figure, the authorities have shown another indication of flexibility in some directions which has been in evidence for the past few weeks. The step, however, is not entirely free from limitations inasmuch as the increased production is meant for export and may be available in the internal market only with penalty to be imposed in the form of extra excise duty at different rates as laid down in the Bill. The concern of the Government to step up cloth exports as much as possible is not only understandable but is equally shared by all. But it is not without doubt that Indian piecegoods would find ready reception in the world markets. If past experience is any guide, the prospects are not such as to lull the country into complacency. Since 1950, when India ranked first in the world textile trade with an export of over 1130 million yards, the trend has been towards decline. Even conceding that this abnormal peak was achieved at the cost of the domestic consumer who was put to great hardship, the decline has been disturbing over the last three or four years. According to authoritative estimates of industry and trade, the actual exports of cotton textiles from India were 834 million yards in 1954. A year later, the figure had slumped by nearly 100 million yards to 735 million yards, which further dropped to 721 million yards in 1956.

Nevertheless, it is a matter of satisfaction that export performance during the first half of the current year has been far better. According to official figures now available, cloth exports during January-April are estimated at 339 million yards. Converted into annual terms, these would show a rate running at a little over 1,000 million yards. Whether or not this level will be achieved and maintained is more than can be stated with any definiteness at the present time. The possibility of foreign demand tending to subdue in the coming months cannot be ruled out altogether. However, it needs no emphasis that much depends on the behaviour of costs. If till now Indian cloth has not found its way into the foreign markets to the extent that the country aims at, it is not only because of the rising internal demand outpacing production by a substantial margin, but also because India's advantageous position in cotton manufacture has been weakening in the face of acute foreign competition, in shrinking markets, particularly from low-cost Japanese production. Till that competitive position is regained, which is not a short-term affair, India will have to struggle hard to attain the Plan target of 1,000 million yards per year. In such a situation, it seems proper for the Government to reconsider its policy of cloth excises, which are now turning out to be overburdening for the Indian consumer, so that he may find it less difficult to consume a little more of this basic necessity.

THE RAILWAY DEBATE

THE LOK SABHA debate on the Railway Ministry's demands for grants indicated that the House was in no mood to accept the policy of the Ministry and the working of the railways without a searching and critical examination. Criticism was offered no less vehemently from the Congress benches than from the Opposition. A pressing claim for more comprehensive amenities for third class travellers who sustain the passenger sector of the railways has now become a hardy annual. It must be recorded in fairness to the railway administrations that they are making earnest efforts to provide increasing amenities. But the problem of over-crowding poses a challenge to which no

effective solution is in sight. This menace and the hardship which it causes to the generality of railway passengers are assuming greater dimensions in recent months. Standing accommodation may be a workable solution on the suburban lines where distances travelled are short and passengers are unencumbered with luggage. But it is out of the question even for short journeys on the regular or through lines. Nor can any relief worth the name come from reducing the number of air-conditioned coaches. The real answer is increasing the number of passenger train services. This is a matter of investment in coaches, locomotives, other equipment and traffic operating services. The limited allocation of funds to the railways does not allow it on anything but a narrow scale.

For the rest, the debate mostly centred round regional claims and grievances. The demand for new lines was pressed with particular emphasis probably in the belief that such lines have an undoubted priority in the expansion plan. The Railway Minister had an easy escape in pointing out that he could undertake construction of new lines, some of which are really needed, provided the Planning Commission gave him the requisite funds. It is indeed unfortunate and surprising that in spite of the tight position of foreign exchange as well as, in some measure, of rupee resources for the inflated outlay on railway development, the case for new lines should have been argued in real earnest. It is not at all difficult to appreciate that goods transport capacity constitutes the hard core of the railway plan and it is here that genuine shortfalls are threatened. But this aspect of railway operations was hardly touched in the discussion. It is perhaps a legacy of our pre-freedom critical attitude towards the neglect of third class travel conditions that they still dominate our minds, while the question of freight capacity which is so critical to development activity is relegated to the back place.

A FORWARD POLICY FOR COTTON

IN VIEW of the steadily increasing 'per capita' consumption of cloth, the change in the psychology of our people, even among the lower middle classes who have become more and more cloth-conscious, and the urgent need to increase our exports to earn valuable foreign exchange, the call from Mr. Madanmohan R. Ruia, President of the Cotton Buyers' Association, whilst addressing the Twentieth Annual General Meeting of that body, to augment domestic cotton production "with the utmost speed and with all the resources at our command" is both appropriate and timely. Since the commencement of the Five-Year Plan, the consumption pattern of the people in our country may be said to have changed considerably. In an underdeveloped country such as ours, where the propensity to consume is generally high even as it is, whenever large sums of money are injected into the economy through developmental expenditure, the greater portion thereof naturally tends to be spent on food and clothing. Accordingly, an increase in the production of consumer goods, especially of food grains and cloth, becomes very essential as much to combat the resultant inflation as to ensure the successful implementation of the Plan.

In this context, Mr. Ruia's assessment of the statistical position of Indian cotton becomes noteworthy. According to him, the total supplies of Indian cotton for the 1956-57 season amount to no more than 66.80 lakh bales, including a carry-over of 19.30 lakh bales. After deducting the total distribution of Indian cotton of about 50 lakh bales, the carry-over to the 1957-58 season is not expected to exceed 17 lakh bales, that is, it would actually be lower by more than two lakhs, as compared to the position at the beginning of the current

season. But it was not the C.B.A. Chief's intention to strike any note of pessimism; on the other hand, he held out really good prospects for Indian cotton, when he said: "...with the steadily rising standards of living and the consequent prosperity which our Nation will gain in the second Five-Year Plan and the substantial increase in textile production that this is sure to bring about, we might reasonably look forward to an era of a greatly expanded activity in, and a more cheerful outlook for, cotton in the years ahead".

After reviewing the supply and distribution of Indian cotton thus, Mr. Ruia turned to the export problem and rightly described it as being somewhat delicate. "With our production still only approximating consumption and with no improvement in surplus stocks", he declared, "prospects for cotton exports have become rather uncertain for the next season".

Proceeding, Mr. Ruia emphasised the need for the utmost care being exercised whilst issuing quotas for the next season, especially in regard to the manner in which these quotas are allocated. He further suggested that "pooling of quotas" should be allowed by the Government. With regard to imports, he commended the Government's recent agreement with its counterpart in Egypt to obtain 40,000 bales of Egyptian cotton, against payment in rupees. He also urged the Government to explore the prospects of entering into a similar payments arrangement with Sudan.

SPECIAL PAYMENTS PROCEDURE: INDIA—EAST GERMANY

ON JULY 16 last an arrangement was concluded and formal letters were exchanged between the Governments of India and the German Democratic Republic for a special procedure in respect of payments for certain goods to be exchanged in the course of trade between the two countries. This is no new or separate agreement for trade, but it amounts to a procedure of convenience for payments in respect of specified transactions and in fact it will continue to be governed by the terms of the trade agreement entered into between the two parties on October 8, 1956. The central feature of the payments procedure is that the Deutsche Notenbank of the German Democratic Republic will open a special account with the State Bank of India under the style of the Special Trade Development Account of the German Democratic Republic. To this account will be credited the rupee proceeds of all contracts of imports from the German Democratic Republic which will be concluded either directly with the State Trading Corporation of India or through the Corporation with other parties in this country. India, in return, will export a range of goods to the German Democratic Republic which will be paid for out of the funds lying to the latter's credit in the Special Account with the State Bank of India.

The Government Press Note announcing the conclusion of this payments arrangement underlines the important point that contracts for imports from the German Democratic Republic for machinery are expected to be made on deferred payments basis. This arrangement is to be welcomed so far as it goes. How far it will go to assist and increase the trade can be evident in the course of time. The nature of the deferred payments facility will be assessed with reference to the actual conditions agreed to. Considering the critical requirements of our foreign trade—import as well as export—this payments arrangement promises to prove a forward step.

INDIAN BANK—GOLDEN JUBILEE

OVER THE years since its inception in 1907, the Indian Bank, which started with a modest capital of less than Rs. 8 lakhs, has grown into a national institution. Today its capital stands multiplied eightfold with reserves and other funds amounting to over Rs. 90 lakhs. In its

working funds totalling some Rs. 50 crores, the bank's deposit figure exceeds Rs. 32 crores, which gives it an important place in a family of less than half a dozen banks in the country whose deposits are over Rs. 20 crores.

The story of the Indian Bank through the fifty years of its existence is one of remarkable initiative and perseverance. The bank's early years were marked by slow but steady progress. By the time of the arrival of the banking crisis of 1913-14, it had grown sufficiently strong to survive the storm. World War I created a new situation to which the bank reacted quickly. However, conservatism, prudence and economy being always the key-notes of its working, the bank had expanded into not more than 15 branches at the time of its Silver Jubilee in 1932. World War II and the coming of independence in 1947 brought to it new responsibilities which it has taken on readily. The bank's expansion during the 25 years between its Silver Jubilee and now has been rapid, and in this year of its Golden Jubilee, 109 branches spread over seven States of the Indian Union, plus four in Malaya and one in Ceylon, are participating in the celebrations.

Among its more significant activities, mention must be made of two. The bank has been a supporter, since 1947, of the Madras Government's loans both by direct subscriptions and by advances to intending subscribers. The other useful feature of the bank's activities has been its policy of making sizable funds available to smaller banks in South India to help them meet the demands for credit.

Specially produced for Industry...

WHEEL BRAND Industrial Glycerine

Wheel Brand Industrial Glycerine conforms to the highest standards of quality — quality that has been proved by use in many industries. Guaranteed to contain not less than 98% glycerol.

MADE BY HINDUSTAN LEVER LIMITED,

"Doctor, come quickly"...and his Royal Enfield Motor-cycle takes him there within minutes! Its low petrol consumption helps save money as well as time, too!

When every minute counts

—there's nothing like a **ROYAL ENFIELD** ENSIGN 150

TRAVEL AROUND on your own ROYAL ENFIELD Motor-cycle! It's the way to save time—no delays waiting for crowded trains and buses, no fear of missed appointments. You save money, too... ROYAL ENFIELD ENSIGN 150 gives you as much as 130 miles to the gallon!

And look at all the advantages a real, full-sized motor-cycle brings you: greater sturdiness, smoother pick-up, better shock absorption, higher road clearance, larger wheels for better manoeuvrability, better traction, more efficient braking...and a far, far higher resale value!

You'll agree that for a man who wants to go places there's nothing like a ROYAL ENFIELD ENSIGN 150.

ROYAL ENFIELD takes fatigue out of travel

Progressively manufactured by:

THE ENFIELD INDIA LTD.
Madras-19.

Sole Selling Agents:
THE MADRAS MOTORS' PRIVATE LTD.
Madras — Bangalore — Delhi

Large wheels give you greater stability, manoeuvrability and make riding a pleasure.

Self-lubricating telescopic fork with new high rated springs, makes riding on any surface comfortable and safe.

Finding me is costly business

says Adipocere (Pronounced 'adi-po-saire')

Finding oil—that's me in one form or another—is an expensive business. Shall I stagger you with figures? I am afraid I shall have to, so here goes...

On an average, and the West Bengal Basin is on the other side of hopeful averages, an exploration venture costs per month

1 Geological party.....Rs. 35,000
1 Gravity partyRs. 80,000
1 Seismic partyRs. 3,25,000
1 Drilling partyRs. 6,00,000
making the impressive total of Rs. 10,40,000 per month.

Add to this a whole line of other

expenses and you can imagine what it costs to find me. In the Barco Concession of Columbia it took 17 years and Rs. 10,50,00,000 to make the first discovery; in Iraq ten years went by along with Rs. 31,00,00,000 before the first oil was marketed. And what's more—the search for oil is one of the world's riskiest businesses! In areas where oil has not been found before, as in West Bengal, only 1 out of 10 wells drilled ever produced oil. The other 9 are costly dry holes. See what I mean when I say that finding me is a costly business?

STANVAC—the name that stands for progress

COMPANY AFFAIRS

TATA HYDRO-ELECTRIC

The latest annual reports of two more units of Tata Hydro-Electric group, namely, the Tata Hydro-Electric Power Supply Co., Ltd. and the Andhra Valley Power Supply Co., Ltd., have since been published. As in the case of Tata Power, the gross revenues of both these companies also showed an improvement due to increased sales of energy and also higher revenues from other sources. Thus, the total gross revenue of Tata Hydro increased from Rs. 69.64 lakhs for the nine months of 1955-56 to Rs. 77.94 lakhs for the year 1956-57. In the case of Andhra Valley, the total gross revenue increased from Rs. 100.02 lakhs for the nine months of 1955-56 to Rs. 107.77 lakhs for the whole of 1956-57. In the case of both companies, there were also an increase in the total expenses due to the coming into operation of the first Unit at Trombay, and increases in repairs, maintenance, depreciation, etc. But in both cases the provision for taxes had decreased appreciably; the reduction in Tata Hydro amounts to Rs. 4.87 lakhs, while in the case of Andhra Valley this amounts to Rs. 9.83 lakhs. In either case, reduction is the result of Development Rebate and depreciation allowances on the first Unit at Trombay.

Comparing the net profits for the 9-month period of 1955-56 with the corresponding period for the year under review, the results of working showed an increase in net profit of 31.2 per cent in the case of Tata Hydro and 32.5 per cent in the case of Andhra Valley. But satisfaction on this account is hampered by the provision of a reserve, which the new taxes under the Finance and Wealth Tax Bills, 1957, have necessitated.

TATA LOCOMOTIVE AND ENGINEERING CO. LTD.

The Directors of the Tata Locomotive and Engineering Co., Ltd., have decided to recommend a dividend at 8 per cent per annum on the Ordinary Shares of the Company for the year ended March 31, 1957.

THE PUNJAB NATIONAL BANK LTD.

The working of the Punjab National Bank Ltd. for the half year ended June 30, 1957 shows that the Bank has made satisfactory progress in its deposits, working and profits during this half year. Deposits of the Bank as on June 30, 1957, exceed Rs. 117 crores showing an increase of Rs. 11 crores. The total working of the Bank exceeds Rs. 152 crores as against Rs. 141 crores on December 31, 1956.

Subject to audit, the net profits of the Bank for the half year after providing for contingencies, amount to Rs. 62.92 lakhs including Rs. 6.20 lakhs brought forward from previous year's account, as against Rs. 49.23 lakhs (which included Rs. 2.35 lakhs brought forward) for the corresponding half year in 1956. The Directors have decided to declare an 'ad-interim' dividend of Rs. 2.50 per share, free of income-tax, as against Rs. 2 for the corresponding period last year.

THE SHREE NIWAS COTTON MILLS LTD.

The net profit of the Shree Niwas Cotton Mills Ltd., Bombay, for the year ended December 31, 1956 showed a sharp rise over the profit of the previous year, being Rs. 15.22 lakhs as against only Rs. 9.73 lakhs. It may be noted, however, that the net profit has been arrived at after deducting over Rs. 8 lakhs for depreciation as against Rs. 6.24 lakhs in the previous year and providing Rs. 6 lakhs for taxation, which compares with a much higher figure of the previous year, namely Rs. 14 lakhs. No provision has been made in the accounts in respect of gratuity to mill operatives under the 110-

vember, 1956 award of the Industrial Court, because, according to the report, the liability of the Company under the said award has not been assessed.

The results of working would doubtless have been more favourable but for the heavy increase in excise duty from September, 1956. As a result of this, the Directors state: "the cloth stocks since then have continued to accumulate and the industry has had to face a difficult situation". This is fully borne out by the accounts, which show that, at the end of December, 1956, stocks of yarn and cloth, including goods in process, amounted to as much as Rs. 89.12 lakhs, as against Rs. 49.55 lakhs at the beginning of the year under report.

The Directors' report also refers to the results of working of its two subsidiaries, namely the Shree Madhusudan Mills, Bombay, and the Shree Gopal Industries, Ltd., Kotah. Neither of these has as yet any profits to show. Efforts are, however, being made to make the Kotah unit an economic one.

Reference is also made in the Directors' report to the renewal of the managing agency agreement between the Company and the Marwar Textiles (Agency) Private Ltd. for a further period of ten years, from January 15, 1957 on a remuneration of 10 per cent on the net profits earned by the Company. The Directors have recommended a dividend of Rs. 12 per Ordinary Share (without deduction of income-tax).

INDIAN OXYGEN is playing

a vital role in building a more powerful and self-sufficient India in the Second Five-Year Plan.

From transport to electric power, from the steel works to the oil refinery—every day our technical service is keeping the nation up-to-date with the most modern methods of metal fabrication.

The door is open to greater prosperity

COMMODITY NEWS AND NOTES

INCREASE IN SALT PRODUCTION ENVISAGED

Salt production in 1957 is forecast at 96.3 million maunds compared with the actual output of 88.9 million maunds in 1956 and 81.1 million maunds in 1955. The forecast of production during the current year in some important regions is as follows: Rajasthan 90.4 lakh maunds; Bombay 264.09 lakh maunds; Saurashtra 230.51 lakh maunds; Kutch 63.71 lakh maunds; Madras 159.06 lakh maunds and Andhra 56.05 lakh maunds. It is expected that the production figure for 1956 will be the highest ever achieved.

INCREASE IN WHEAT PRODUCTION

The all-India final estimate for wheat for 1956-57 puts the current year's area and production of the crop at 32,891,000 acres and 9,068,000 tons respectively, as against the partially revised estimate for 1955-56, of 30,386,000 acres and 8,569,000 tons. It shows an increase of 2,505,000 acres or 8.2 per cent in area and 499,000 tons or 5.8 per cent in production of wheat during the current year. The increase has been shared by all the principal wheat producing States, particularly Rajasthan, Madhya Pradesh, Punjab, Bihar and Bombay. The increase in production during the current year has been shared mainly by Punjab and Rajasthan and to lesser extent by Uttar Pradesh and Madhya Pradesh.

SUGAR PRICES

The Union Finance Minister's statement recently that the Government were considering measures to bring sugar prices under check has been effective. Sugar prices in Bombay city as in other markets have eased by half a rupee per bag. This fall though small is significant in view of the statistical position. The stock position in Bombay, due to the reluctance of the mills to sell and the difficult wagon supply position, is said to be unsatisfactory. Daily arrivals have dwindled. The floating stock at the end of the week was 32,000 bags compared to 36,000 bags a week ago. But the off-take has been satisfactory. In Madras arrivals amounted to 400 bags only, while the off-take was 2,200 bags. Unless speedy measures are taken to improve the stock position, traders apprehend an inevitable spurt in prices.

INCREASE IN SUGARCANE PRODUCTION

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of sugarcane, 1956-57, puts the current year's area and production at 5,019,000 acres and 66,890,000 tons of cane as against the partially revised estimate of 4,564,000 acres and 59,317,000 tons for 1955-56.

This shows an increase of 455,000 acres or 10.0 per cent in area and 7,573,000 tons of cane or 12.8 per cent in production over last year.

Expressed in terms of gur, the current year's production is placed at 6,745,000 tons, as against 5,982,000 tons for 1955-56.

FINAL ESTIMATE OF SMALL MILLETS FOR 1956-57

The all-India final estimate of small millets for 1956-57 puts the current year's area and production at 12,209,000 acres and 2,010,000 tons respectively, as against the partially revised estimates of 12,713,060 acres and 1,937,000 tons for 1955-56 according to the Ministry of Food and Agriculture. There is, thus, an increase of 73,000 tons or 3.8 per cent in production during the current year, even though the acreage under small millets has declined by 504,000 acres or 4.0 per

cent over last year. The decrease in area is attributable largely to unfavourable seasonal conditions at the time of sowing. Despite decrease in area, the production of small millets during the current year shows an increase over last year. The increase in production is shared mainly by Uttar Pradesh, Andhra Pradesh and Madras and is due to favourable climatic conditions during the growing period of the crops.

INVESTORS ENCYCLOPAEDIA

1956—57 EDITION

SOME SPECIAL FEATURES

1. Almost all public companies floated till 31st March, 1957, are included.
2. All sections are arranged in alphabetical order.
3. Sectional reviews completely re-written and a large number of new industries now included.
4. Details about Second Five-Year Plan both in public and private sectors elaborately dealt with, and appropriate visual graphs and charts are given alongside.
5. Map of India with the states formed under the S. R. C. Report. Details of about Company Law. Formation of Joint Companies, Income tax and Super Tax, Estate Duty, Securities Control Act, State Enterprises, Control of Capital Issues, Industries (Development and Regulation) Act. In fact all details as to how to set up a new industry.
6. Details of Port Trust, Improvement Trust, Municipal and Government Loans, Agricultural Income Tax, Debenture issues of various public institutions, incorporated.
7. Abstract of rules of the Stock Exchanges in India.
8. All company matters re-written and brought up-to-date.
9. For almost all sections, maps have been drawn showing the location of various industries.
10. Provision of thumb makes reference easy.
11. Balance Sheets received after set up of main body, incorporated in a separate section at the end of the book.

Note: First edition in 1936 had only 168 companies and 369 pages. Now this book gives details of 1,560 companies in 2,329 pages.

The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co., Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

SANFORIZED
on the label

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

Avert the Strike

ZERO hour is fast approaching in the threatened crisis of the strike of the P & T employees. But between now and the midnight of August 3-9, there is a precious span of six days. It provides opportunity to strain every nerve in an earnest effort to reach a compromise. The strike must be averted and failure must not be admitted on any account. The strike of the P & T employees, if it is allowed to materialise, will undoubtedly produce very serious and far-reaching repercussions on the economy. This strike cannot be considered in isolation. At this critical juncture, when pressing and acute problems of warding off inflation and breaking the stalemate in the Plan call for concentrated attention dark clouds are about to gather fast. Over a wide range of government employment there are threats of strike held out by the staff. Besides the P & T Department, Civil Aviation, Income-tax, Audit and Accounts, Customs, Mint and a few others are on the list of direct action if demands of employees are not conceded. It could not be by accident that these notices of strikes have been

issued in close proximity. Central Government employees need to ponder over this coincidence.

The P & T strike needs to be interpreted and settled in the larger context of the repercussions which it is bound to produce in other government spheres. Prolonged efforts have gone in recent weeks into arriving at a reasonable settlement. If these efforts have not borne fruit up to the present moment, there is no need to accept defeat. Indeed, defeat can never be accepted in a supreme endeavour to avert a crisis of a great economic magnitude. Negotiations leave no ground for doubt that a sincere desire to arrive at a compromise has been shown by both the parties. It is obvious from the course of negotiations up to the present time that the area of dispute has been narrowed down. This is no small achievement. In one sense it offers strong ground for a determined effort to eliminate what now appears to be an area of irreconcilable issues. The fact that the Government has adopted an attitude of sympathetic understanding to give redress where it could

be given on the merits of the exclusive grievances of the P & T staff should invoke a similar response from it. On the P & T staff rests the responsibility to take a correct view of the issues involved in the dispute and to desist from any course of action which will precipitate a chain reaction and add to the challenging problems in the current economic situation.

The charter of demands presented by the P & T staff is not restricted in its consequences to the pay and service conditions of that department alone. The demands, in reality, can be split up into two categories. The more important of the two has a direct and immediate bearing not only on the employees of the Central Government but also on the employees of the State Governments. This set of demands cannot be considered in isolation. The other class of demands concerns the P & T staff exclusively and it is here that the differences have been bridged to an appreciable extent. This is a vindication at once of the justice of the grievances of the staff as much as of the earnest desire of the Government to do justice where it is unquestionably required. It should augur well for an attitude on both sides for a determined effort to obviate direct action.

The P & T staff has certainly won a substantial part of the demands which relate exclusively to their department. The distinction between Class III and Class IV employees in respect of leave rules, leave reserve and benefits in the nature of medical attendance has been wiped out and parity of treatment has been established. A similar gain has been scored by the staff on another demand. The distinction in regard to pension rules in their application to Class III and Class IV employees has been removed. What is more significant, pension rules have been liberalised in a general way for both the classes. Over a wide area of grades of employment promotion opportunities have been enlarged. The particular grievance of P & T staff posted in Assam in respect of a compensatory allowance has caused more bitterness than any other issue of a purely departmental nature. Tentative conclusions have been reached on this question pending consultation with the Assam Government. The rest of the demands of the staff are by no means of great significance when considered in the light of the demands that have been granted. A Standing Committee has been appointed to provide a departmental machinery for speedy negotiations of disputes. The remaining grievances can be settled through the medium of this machinery. Any claim that a strike is necessary for their redress will hardly carry conviction.

The crux of the P & T dispute consists of three demands in which any other segment of Central Government employment is vitally concerned. It is inevitable that they must be judged and decided against the comprehensive background of the interest which other Central Government employees (as well as State Government employees) have in them. These demands relate to immediate increase in the dearness allowance in accordance with the Central Pay Commission's recommendations, grant of interim relief and merger of the entire quantum of dearness allowance in the basic pay. The Prime Minister, the Finance Minister and the Communications Minister have been candid throughout the negotiations in expressing their view that, in the context of the change in the level of cost of living, a comprehensive enquiry into the pay structure and allowances and allied questions was called for.

But a decision on instituting an organisation for such an enquiry has to be taken after full consideration of its far-reaching implications. The vague description of this organisation as some sort of enquiry body could not enthuse the National Federation of the P & T Employees and doubts lingered in its mind about the real status and authority of this body. The Prime Minister has been forthright in conceding that the Government will have no objection to describe the investigating organisation as a Pay Commission. The Federal Council of the Federation on its part has conceded that the Pay Commission should consider the entire question in the light of the economic situation and the pay scales prevailing in the various departments under the State Governments.

Mr. T. T. Krishnamachari's spirited statement of the Government's attitude should convince the P & T staff that, while the Government is prepared to go the farthest limit of reasonable acceptance of demands, it cannot overlook the financial responsibilities which it would consciously undertake. He has placed the estimate of immediate grant of an increased dearness allowance at the rate of Rs. 15 per head per month at an aggregate of Rs. 30 crores a year for all Central Government employees. To this must be added the burden on State Governments. There is considerable disparity between the scales of allowance granted by the Centre and those granted by the State Governments even in cases where the load and quality of jobs done are the same. It needs to be recalled that in spite of the Central Government's offer made a few months back to share half the burden of the additional dearness allowance to State Government employees drawing salaries of Rs. 60 and below, six State Governments have been unable to accept it so far. The total bill of additional dearness allowance for Central and State Government employees at the above rate would be much higher than Rs. 30 crores per annum. No one can ignore the immediate repercussions of the additional bill on the exchequers. It is a liability which needs to be analysed and carefully scrutinised for its effects on the country's inflationary situation.

The deadlock over the three issues of increase in dearness allowance, interim relief and merger of D.A. with basic pay must be resolved from a broader angle. The P & T staff has shown patience over the last year and a half in negotiating a settlement of its grievances. Surely it stands to lose nothing by showing the same commendable patience for some time more. It should find adequate assurance in Mr. Krishnamachari's significant statement in the Lok Sabha on July 26 last that justice will be done to it. He announced with candour: "The level of all prices is such and the cost of living is such that it is undoubtedly a case of setting right many of these (P & T staff) grievances." This statement made with the fullest realisation of its implications must be taken at face value. Compromise can be reached even at this late stage and the strike averted, if the personnel and the terms of reference of the Pay Commission are announced immediately and a reasonable deadline is prescribed for the Commission to make interim recommendations. Interim relief should suffice to relieve the staff from its pressing hardships. As employees of a strategic public utility, the P & T staff owe it to the community that its normal life will not be allowed to be paralysed when the use of the extreme weapon can be avoided.

Progress without Strain

THE Planning Commission's review of the progress of the first Five-Year Plan is of greater value than a mere post-mortem. It is true that the first Plan was in essence an endeavour to co-ordinate development programmes which were already under way and to integrate these into a broad frame-work. The valuable effort which had gone into the preparation of these programmes would have probably helped to achieve the task of co-ordination and integration in an effective manner but for the intervention of a major disturbing factor. Partition caused a serious disequilibrium in the economy particularly in its agricultural sector and correction of this disequilibrium demanded the highest attention. Even so, there was some room undoubtedly left for drawing up a scheme of priorities in the light of the available resources and urgent requirements of the community. This was not neglected. The verdict that must be given is that the twin objectives of rectifying the imbalance and initiating a pattern of planned development were achieved in a remarkable degree during the first Plan period.

The programme of outlay in the Plan was carried through with a shortfall of about 15 per cent in the public sector. The original allocation of Rs. 2,069 crores was revised upwards to Rs. 2,378 crores. The shortfall is to be computed in relation to the revised allocation. A break-up of the allocations indicates that as against the Centre's share of Rs. 1,390 crores in the revised allocation, the States were allotted a combined share of Rs. 988 crores. The size of the shortfall in the outlay allocated to the Centre is relatively large and is of the order of 19.8 per cent. This is explained mostly on the ground of difficulties of availability of material resources and delays in preparing the individual schemes at various levels. Actual outlays on transport and communications, irrigation and power, and agriculture and community development showed comparatively small deficiencies as against the Plan allocations. The additional outlay of over Rs. 300 crores was made in order to allow adjustments to be made to raise the size of the Plan for the express purpose of minimising unemployment. The chief failure of the first Plan is to be seen in its inability to reduce unemployment.

The performance of the first Plan in so far as the increase in the national income is concerned was certainly impressive. The original expectation of increase in the national income over the five-year period was pitched at about 12 per cent. The actual increase achieved was about 17.5 per cent. Its pace could not be expected to be steady, but the total achievement can surely be regarded as satisfactory. The rise in the national income gives an annual rate of increase of 3½ per cent which has emboldened the planners in fixing a target of 5 per cent per annum for the second Plan. During the first Plan per capita income rose by 10.5 per cent. If allowance is made for allocations for capital development, the improvement in the consumption standards of the people amounts to a little less than 2 per cent per annum. This can reasonably be regarded as a substantial achievement in a backward economy sufficient to give it a dynamic impulse.

Agriculture which accounts for over 50 per cent of the national income showed quite distinct improvement. From 1953-54 until the end of the

first Plan there was a succession of favourable monsoons. Peak production of food grains was reached in 1953-54 at the level of 68.8 million tons. Although there was a relative decline in the subsequent two years, output in 1955-56 stood at 64.8 million tons. At this figure it was 11 million tons above the level of 1949-50 which was the base year for the first Plan targets. The spectacular improvement in agricultural production set in motion a bold policy of decontrol which was a powerful factor in pushing up production all round. Although the share of irrigation, Japanese method of rice cultivation, improved seeds and extensive use of fertilizers in improving productivity cannot be denied, the basic fact remains unchanged that unduly favourable seasons played a decisive part in agricultural prosperity. The elements of instability in agriculture persist and it cannot be claimed that they have been eliminated on any appreciable scale.

Industry and mining were allocated a small share of 7 per cent in the total outlay fixed for the public sector. The public sector's performance in this sphere was far from satisfactory. Actual outlay on industries and mining incurred in this sector was Rs. 100 crores as against the Plan allocation of Rs. 188 crores. It is safe to assume that a substantial proportion of this shortfall of Rs. 88 crores is to be attributed to industries. Fixed investment in the manufacturing industries in the public sector was Rs. 60 crores. As against this, fixed investment in this group of industries in the private sector was of the order of Rs. 233 crores. A major part of the increase of 38 per cent in industrial production which was registered in the first Plan was contributed by free enterprise. Practically over the whole sphere of industry the targets fixed for the private sector were fulfilled and in key industries like cotton textiles they were exceeded by a good margin. The inadequate emphasis placed on the organised sector of private industries in the second Plan ignores the strategic role of this sector. By contrast, the accent that is placed on small and village industries is quite unwarranted by their failure to measure up to the modest targets assigned to them in the first Plan.

The success which was achieved in fulfilling the targets of the first Plan has undoubtedly created among the masses a confidence in the technique of planning as an instrument for securing improvement in their standards of living. But it needs to be answered how far scientific techniques of planning were tried and tested in the first Plan. Essentially, it was the spectacular improvement in agricultural production in the last three years of the Plan which gave a healthy tone to the economy. The marked improvement in the balance of payments was sustained primarily by higher output in agriculture. The import programme was restricted within moderate limits and foreign aid which was available to the tune of Rs. 300 crores was not used to the extent of 33 per cent. The programme of investment was conceived on a modest scale which did not create any serious problems usually associated with the task of mobilising the resources. It was only in the last year of the Plan that the economy began to show signs of stretching out. The second Plan with a bold size and a distinct accent on industry, particularly heavy industry, invites the real problems of resources mobilisation and severe strains attendant upon it.

Congestion at Ports

A MINISTERIAL statement in the Lok Sabha on Monday has highlighted the problem of clearance of congestion at India's major ports. At least four ports — Calcutta, Bombay, Madras and Visakhapatnam — are now overflowing with commerce and shipping. This phenomenon which is an index at once of the high tempo of development and of its difficulties under planning is by no means new or sudden. In fact congestion at ports causing shipping delays has been endemic for some years now. The latest congestion, however, is of an unprecedented magnitude, and this is attributed to certain unusual factors. The simultaneous arrival of ships in large numbers both from the Cape route and from the Suez Canal route after the reopening of the Canal is one of them. The increased availability of shipping for the back-log of cargo held up during the Suez crisis is another. And the inevitable increase in the import of food grains is yet another. These three factors, besides some others, have aggravated the present congestion in spite of the fact, according to the Secretary of the Transport Department, that the cargo handled during the first five months of 1957 was substantially more than the quantity handled in the corresponding period of last year at every one of India's ports. According to one estimate, over Rs. 130 crores worth of cargo in the ports has now to be cleared with expedition.

There are other figures which tell their own story in this connection. The five major ports (including Cochin), it may be recalled here, handled about 20 million tons of traffic a year at the beginning of the first Plan. This was their maximum capacity at the time. In 1955-56 these ports together with Kandla (a new entrant with a limited initial capacity) handled about 24 million tons of cargo; in 1956-57 the quantity of cargo handled by all the six ports went up to 28 million tons which was perhaps above their capacity. In 1957-58 this is expected to exceed 30 million tons, with Bombay alone accounting for not less than 13 million tons. But the increase in handling capacity has so far not been commensurate with the increase in traffic. The development programme costing Rs. 62 crores was finalised late in the first Plan, and only half the estimated expenditure was incurred by the end of the Plan so as to raise the total handling capacity of the major ports to about 25 million tons of traffic a year. Works started or to be started under the second Plan, are expected to cost in all Rs. 76 crores and to expand the handling capacity further and modernise the docks.

With the completion of the second Plan's port development programme, the total handling capacity of the major ports may well provide for all the additional needs arising from the economic development of the country. Currently, however, there is an emergency which has to be dealt with as such even if there is to be no formal declaration of emergency (as suggested by the shipping interests at the recent meeting of the Overseas Shipowners' Consultative Committee) putting port and dock clearance on a "war footing". As there are legal difficulties in the way of declaring a state of emergency at the ports, some constructive suggestions advanced by shipping interests

would bear consideration. One of these is that the system of wage payment be modified to provide an inducement to higher labour efficiency. Another suggestion is that the railways should provide more wagons to move out from the dock-side cargoes which are lying idle and obstructing the discharge of further cargoes. A third one is that the practice of allowing consignees to keep, in certain circumstances, goods either in the sheds or in the open in the docks without demurrage should be discontinued. And there is also the suggestion that food cargo should be diverted to other less crowded ports (minor ports) as unloading of such ships does not require any special knowledge or equipment not obtainable in such ports. The Consultative Committee appears to have considered these suggestions among others and has agreed on some incentive schemes for workers calculated to ease off congestion in about two months' time.

These incentive schemes are of immediate urgency for it is mostly human labour that has to do the job now. There is already in operation a piece-rate payment scheme at the Bombay port, and a similar scheme is to be brought into effect at the Calcutta port on an interim basis pending the finalisation of a regular scheme. The shipping lines can also employ additional labour on a casual basis if the dock labour unions agree to workers being secured for temporary periods of one or two months. But they are reluctant to do so because the conditions governing employment are such that once labourers are employed for three months, the employers would be obliged to decasualise them. As this is a discouraging prospect for the shipping lines, they might have to get the co-operation of dock labour unions in this regard. The contention of the shipping lines that it is not financially feasible for all companies to employ additional hands cannot be seriously questioned. In a contingency like the present they can, if at all, employ additional labour only on a temporary basis.

If the labour unions rise to the occasion in a spirit of patriotism at this hour of emergency, employment of additional hands on a purely temporary basis and increasing of labour efficiency will become possible. As dock labour may be expected to be reasonable and co-operative with the institution of special incentive schemes, there is now the certain prospect of congestion at the ports being overcome in two months' time. In the circumstance the shipping conference lines have done well to postpone for the time being any surcharge on freight to and from Indian ports, even though it may seem justified by loading and unloading delays. Such accommodation has been shown to ports in other countries under similar, if not worse, conditions of congestion. As far as India is concerned, any such surcharge, if imposed, would only raise the cost structure of imported goods and adversely affect the export trade at a time when the second Plan has run up against unexpected difficulties of which the present congestion at ports is one. Responsibility rests squarely on port trust authorities and dock labour not to provide any justification for a possible freight surcharge.

THE WEEK'S NOTES

NEW APPROACH TO THE NAGA PROBLEM

IN HIS reply to the debate on the External Affairs Ministry's demands in Parliament, Mr. Nehru has indicated his Government's willingness to amend by "mutual consultation" the Sixth Schedule of the Indian Constitution so as to ensure "as much autonomy to the Nagas as possible." Together with his statement that it may be possible sometime to bring all the tribal areas under one administration, this gives the best hope for a final settlement of the problem. These statements are welcome. They are, however, also an admission of the failure of the six-year old policy of enforcing of the failure of "police action" of the Indian army. It is unity through "police action" that the tribal people to New Delhi. In truth, even those of the Nagas, who do not subscribe to the extremist views and violent methods of Mr. A. Z. Phizo have not been very happy with the administration of the area since 1951-52 when, for the first time, the exclusiveness of the "excluded area" was ended.

Precipitate somewhat as this action was, the Government of India could, perhaps privately, seek justification for it in its acute concern over the possible military consequences of the Chinese Communist occupation of neighbouring Tibet. The Government of India thus found itself inheriting a new frontier, strategic but wild and ill-defined. India's military outposts were pushed up to the internationally recognized McMahon Line since 1914. But the Chinese maps have always showed the border as running much farther south, and the Chinese Communists, despite their protestations of friendship for India, have shown no sign of changing these maps. This may have further confirmed the suspicions and fears of the Government of India.

The end of the exclusiveness of the "excluded areas", in turn, resulted in the influx of merchants and usurers from the plains, and the consequential alienation of land from Nagas to non-Nagas. This is being interpreted—and not unreasonably—by the former as "a grave danger to their freedom, way of life and livelihood". The situation was made worse by the introduction of cheap cloth, which caused detriment to the indigenous cottage industry. The tragic situation that followed was described in sombre words by the Council of Naga Elders (Kilonsers) in a letter to the President of India, in September 1954: "The Indians treat the free Nagas as their subjects.... The free Naga people have no more patience left...." It is a pity the letter was not considered as sympathetically as it should have, coming as it did from a simple, elemental folk given to extreme conclusions. And the incidents of loot and arson which followed occasioned large scale operations by our armed forces.

Though it is preposterous to draw a parallel between the British onslaught on the Afridis and Indian army's action against the Nagas—as a member of Parliament attempted to do—it is hard to deny that the policy-makers or its executors, or both, have failed to appreciate that the first prerequisite of lasting peace in Nagaland is a sympathetic understanding of the fears and aspirations of the hill tribes. As it is, even after seven years, the Government of India has not been able to make much headway. The problem is, as the Prime Minister now seems to have realized, political and calls for political action rather than unthinking and exercise of brute force. Moreover, a problem like the Nagas' weakens India's stand abroad. When we pursue a policy of military operations against our "own people", with what face can we advocate a policy of peace among the nations of the world?

THE SECOND "SUEZ"

THE FLARE up in the small Arab States of Muscat and Oman has hit the headlines on this side of Suez. While the British Government is giving another demonstration of "getting tough" by ordering troops and air force movements to quell the revolt of the Imam of Oman against the Sultan of Muscat, the initial sweeping victories won by the former show that the insurgents are not without powerful friends and a mass base. The British intervention lacks legal justification. Britain's treaty of friendship with Oman does not impose on it any responsibility to intervene in the internal affairs of the latter. Presumably political considerations have prompted the British Government to take the present precipitate action. Its view is that if Britain did not stand by the Sultan now and helped him to stay in power, British prestige would collapse throughout the oil rich and strategic Persian Gulf area. The British Government also probably hopes by acting swiftly, firmly and decisively to regain some of the prestige and influence it has lost in the Middle East. But what it seems to have glossed over is the emotional hysteria which its action could not but generate in Asian countries. The episode may well turn into another "Suez". Even otherwise, it needs to be asked whether foreign military intervention is justified on the basis of "loyalty" to a "staunch friend". If conceded, the argument would imply that the Soviet Union had a cause for intervention in Hungary, and further, that possible future Soviet action in the Middle East could be defended as action in support of a friendly Government. Thus the British action in Oman would seem to be not only highly regrettable and wholly unjustified but also utterly impolitic.

Many newspapers and politicians in this country have seen Anglo-American rivalry behind the trouble in Oman. Their argument is simple—and rather facile. America wants to push Britain out of the oil region of the Persian Gulf. What these newspapers and politicians forget, however, is that in spite of several years of oil prospecting no oil reserves have been found so far in Muscat. Besides the Iraq Petroleum Company, whose shares are jointly held, among others, by Britain and America, there are other concerns operating in the region. It is also unbelievable that the United States would permit the safety of the Middle East and its oil resources to be jeopardized by an armadeggon which might transcend national boundaries. The British Press has been emphasizing in recent weeks that misunderstanding with America would be dangerous.

There does not appear to be any particular reason either to believe that the separatist movement sponsored by the Imam of Oman has anything to do with "nationalism". In point of fact indications are that it is related to Saudi Arabia's oil and territorial ambitions. Imam Ghalib bin Ali who, on his return home, has assumed the leadership of the insurrection, spent his three years of exile in Saudi Arabia. One of the two fronts of the assault is Nizwa which lies to the south of the Buraimi Oasis, the oil rich region, which, it may be remembered, is a serious bone of contention between Britain and Saudi Arabia. Finally, the tribesmen are found to be using such complicated modern military devices as land mines with remarkable success.

NEW MOVE FOR VIETNAM ELECTIONS

PEOPLE IN India are apt to get considerably worked up at even the mention of Portugal's stand in respect of Goa, and the fact that the future of the territory, geographically and historically a part of India, was decided upon by Britain and Portugal. Their sensitivity on the point is understandable. This makes it the more surprising that they should apparently remain unmoved at the position into which the Republic of

Vietnam has been pushed as a consequence of the Geneva Agreement of 1954. Vietnam's position is made relevant now by a report which says that Mr. T. N. Kaul, Chairman of the International Armistice Commission in Indo-China, has unofficially suggested to the British and United States embassies in Saigon that the time was ripe for holding the general elections.

It is questionable whether the Republic of Vietnam is obliged to recognize the Geneva Agreement and adhere to its stipulations. It may be remembered that the Agreement was concluded with the Vietminh insurgents after a conference in which the principal participants were Russia, the People's Republic of China, Britain and France. The United States was present as an observer. The delegates from Vietnam lodged a strong protest. They protested, because the Vietminh had no recognizable status: the sovereignty which Vietnam had been forced to yield when conquered by France reverted to it under a solemn treaty signed with the French in the early 1950's. But that treaty was disregarded at Geneva, and Vietnam was partitioned.

Apart from this, it would be interesting to know how far the Armistice Control Commission is in a position to ensure fair elections. Is Mr. Kaul convinced that his vigilance will cover every polling booth? Has the Control Commission been sanctioned the power to enforce freedom of choice and secrecy if these were threatened? It would also be interesting to know if Mr. Kaul has come across this passage in an article by a Vietnamese writer, Sy-Ngoc, in 'Nhan-Van' of October 15, 1956, "If somebody tells me to keep my mouth shut in case the Americans and Diem should make capital of what I say, I reply: Diem has a very good case when he refuses to hold joint consultations with us on the ground that there is no freedom in North Vietnam." As if to prove the truth of these words, the Communist rulers of North Vietnam swooped upon the journal and suppressed it in December, 1956, on the plea that "it deformed the truth." In the face of all this, Mr. Kaul would have the world to believe that time is ripe for holding elections in Vietnam!

ALL INDIA RADIO: THIRTY YEARS OLD

THIRTY YEARS ago, broadcasting stations began to function at Calcutta and Bombay. The Government of India had granted a licence to the Indian Broadcasting Company to set up stations at Calcutta and Bombay, operating on the medium wave-band. They started broadcasting on July 23 and August 26, 1927 respectively. The Government of India assumed direct responsibility for broadcasting nearly three years later. After thirty years of interesting and profitable experience, All India Radio has 27 stations in the country, covering all the important linguistic areas. It ranks third among the users of broadcasting frequencies in the world.

All India Radio has successfully planned programmes to reach all levels of taste and understanding. They are usually stimulating and educative. Much thought and much time is evidently spent on them; broadcasting is an art, and in any art much hard work and polish is necessary before it is worthy of presentation. All India Radio may congratulate itself; it cannot afford to rest on its laurels. India's constantly changing needs, and her population, as it grows mentally, demands an appropriately increasing standard. Discrepancies and biases will be less and less tolerated. Instances may be cited of the disproportionate length of time devoted to the speeches of various ministers on celebrations like Buddha Jayanti which was overdone.

Bias against film music is also hardly reasonable. Music that has been passed by film censors must surely be good enough for A.I.R. listeners. This is perhaps the reason why Radio Goa and Radio Ceylon are most often tuned in to, rather than All India Radio. A.I.R. must, in short, look to growth and expansion in addition

to a good deal of pruning. The flowers bloom only when the weeds have been removed.

THE STATE OF THE ECONOMY

THE REPORT on Currency and Finance for 1956-57 is of special significance because it provides a comprehensive survey of the economy for the first year of the second Five-Year Plan. While the year 1956-57 saw a marked stepping up of the development effort in the economy, it was accompanied by a considerable degree of strain which was evident in more than one sphere. Outlay in the Plan in the public sector was estimated to have gone up from Rs. 625 crores in 1955-56 to Rs. 761 crores in 1956-57. The private sector also saw a sharp rise in investment, but appropriate estimation at this stage is not available. Industrial output went up by 9 per cent in 1956 and agricultural production also improved considerably.

An overall budgetary deficit of about Rs. 250 crores, about Rs. 100 crores larger than in the previous year, has sown the seeds of inflation. A rise in the wholesale price index by 8 per cent on top of a rise of 12 per cent last year certainly pointed towards an impending strain. There was a loss of reserves to the extent of Rs. 219 crores, even after taking credit for Rs. 55 crores of foreign exchange from the I.M.F. Efforts were, however, made to correct the imbalance by more foreign assistance and drastic restriction of imports.

According to the Report, scheduled bank credit recorded an expansion of 18 per cent following a rise of 22 per cent in 1955-56. The expansion of money supply was, however, moderate at 5.9 per cent against 13.7 per cent in 1955-56. The economy continues to be in the grip of acute financial stringency due to increase in demand in every sphere. The issue market had a setback with a fall in share prices by about 9 per cent against 6 per cent rise during the previous year. The year under survey was undoubtedly noteworthy for the impetus which expansion programmes got. But it has revealed severe strains on resources at various levels. The second year of the Plan which has been launched under this stress is witnessing a greater severity which will put the country's capacity to test. Upon the experience of the current year will depend the answer whether and to what extent the goals ought to be modified to suit available resources.

THE FAIR CRUSADER

IT HAS been said that culture is the gift of feudalism to a bourgeoisie in too much of a hurry to spare time for the refinement we associate with culture. A recent incident would seem to illustrate the truth of this.

In the House of Lords the debate was moving slowly, with the dignity associated traditionally with that great institution. Suddenly there was a stir, then hushed silence. A visitor had interrupted the proceedings—a thing unheard of. The interruption came from Vivien Leigh, and it came in support of culture threatened by expanding Big Business. The subject of the debate was the demolition of the nearly 200 years old St. James theatre, because a group of business men wished to erect an office building at the site.

The gracious and versatile lady of the stage and the screen became the object of "icy glances" from the peers, and was escorted out by the Gentleman Usher.

Great though the need is for offices in the growing industrialisation of our age, it would be veritably blasphemous to destroy a theatre made precious with associations. Support for the cause of culture has now come from an unexpected quarter. Sir Winston Churchill expressed his sympathy in a letter which was read to a mass meeting of British show-people by Vivien Leigh. Sir Winston has promised to contribute £500 towards a public subscription fund for the theatre. Lovers of the stage the world over will appreciate his gesture. Perhaps, Vivien Leigh has not dared the anger of the peers in vain.

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

ACC HONOURS THE CODE

2

"Customers are entitled to courtesy, promptness and good service, and every endeavour shall be made to see that they receive them."

Code of conduct—FORUM OF
FREE ENTERPRISE

The ACC distributes cement through an organization which reaches down to the small consumer, and in accordance with the over-all allotments made by Government. Every mode of transport is pressed into service—rail, road, river, canal, sea—to see that the cement is delivered to the customers with promptness and courtesy.

This is not all. The ACC does not remain content with delivering a high quality product to the entire satisfaction of its customers. It also provides through its technical department, the Concrete Association of India, free technical service and information to cement users throughout the country.

This is Free Enterprise at its best,
honouring the Code both in letter
and spirit.

A Window on the World

HAS THE GERMAN OPPOSITION AN ALTERNATIVE TO N.A.T.O.?

By
ODYSSEUS

MAY I ASSUME that no thoughtful reader would agree that because India's foreign policy has committed her to neither power bloc, she has, therefore, contracted out of the world's problems and is destined to live by herself happily ever after?

Apart from the fact that the outbreak of a war in Europe could not be kept local in this hydrogenic age, one of India's interests in the unity of Europe is her need of foreign capital and of prosperous foreign buyers for her exports.

I therefore make no apology for reverting to the attempt to explain (1) why the German Opposition, the Social Democratic Party (which I miscalled the Democratic Socialist Party last week), object to Dr. Adenauer's policy in support of the alliance of the North Atlantic Treaty Organisation, and (2) the apparent alternative that they propose. That I am not alone in finding the policy of the Social Democrats difficult to grasp is suggested by the interesting fact that in their respective messages from Bonn published on July 15, the correspondents of the 'Manchester Guardian' and of 'The Times' interpreted in opposite ways a new policy declaration made by the party.

The 'Manchester Guardian' reported that "the Social Democratic Party has restated, in terms so blunt as to be significant, its intended foreign policy if it comes to power at the Federal election in September. It will begin at once to negotiate the withdrawal of the Federal Republic from NATO. It will abolish conscription. Finally, it will take the initiative in seeking a means of re-unifying Germany and creating a system of European security. The Social Democrats have nailed their colours to the mast and this declaration—authorised by the Party Executive and officially emanating from the party group—leaves no room for doubt..."

On the other hand, according to 'The Times' Bonn correspondent:

"...Their policy remains consistent and it is difficult to see why it should lead to the end of Germany, NATO, western Europe and indeed the entire civilised world as the apocalyptic speeches of Dr. Adenauer would have it.

"The spokesman of the Social Democratic parliamentary party said yesterday that they would invoke Article VII, paragraph ii, of the Bonn treaty to request the western Powers to examine the situation in regard to the reunification of Germany. The western Powers should consider whether the Federal Republic could not leave NATO to permit a reunited Germany to become a member of a European security system. At the same time a Social Democratic Government would submit for examination its reunification programme and plan for the establishment of a security system.

"Article VII, paragraph ii, of the Bonn treaty allows, pending a peace settlement, for the signatories to co-operate in the achievement by peaceful means of their common aim of a re-united Germany enjoying a liberal democratic constitution, like that of the Federal

Republic, and integrated in the European community. A Social Democratic Government would therefore merely be exerting a treaty right in asking the western Powers to review the situation in regard to reunification.

WHAT IS A "EUROPEAN SECURITY SYSTEM"?

"The Social Democrats have rejected neutralisation, and have already stated that a European security system, guaranteed by the United States and the Soviet Union, in which a reunited Germany was an equal member, would be necessary because neither East nor West would agree to the alignment of a reunited Germany with the other side.

"As an exercise in political possibilities it has its points; indeed, the idea was provided by Sir Winston Churchill at Aachen 15 months ago. As it stands, it is properly cautious, in that the Federal Republic would withdraw from NATO only when Germany joined a security system guaranteed by the United States and the Soviet Union."

At first sight the contradiction between "The Times" soothing rejection of, and the "Manchester Guardian's" gloomy acceptance of, the apocalypse seems complete. But as a result of my own conversations with both government and opposition spokesmen, I believe that I can disentangle these two distinguished correspondents from their deadlock.

The first clue is provided by 'The Times' correspondent's mild reproach to Dr. Adenauer for trying to create the impression that the end of the world will come if his opponents win. This reminds us that we are listening to rival politicians bidding for votes in an electoral campaign. If Dr. Adenauer apparently feels it electorally necessary to overstate his case, so do the Social Democrats. It was my impression that a majority of Germans support Dr. Adenauer's NATO policy because they see no alternative to it other than a unilateral disarmament in the face of the 175 divisions of the Soviets and their satellites, which would be suicidal. On the other hand, it cannot be denied that the NATO policy seems to imply the maintenance of the international status quo—the armed truce of the Cold War—for an indefinite number of decades to come and that with each passing decade East and West Germany must drift further apart in experience and outlook, and reunification so passionately desired by most Germans must become more and more unlikely. It is to cash in electorally on these misgivings that the Social Democrats proclaim far and wide that they have an alternative policy to NATO.

NO RE-UNIFICATION WITHOUT FREEDOM

But have they? The difficulty of understanding 'The Times' correspondent's interpretation arises, I suggest, from the concision forced on him by considerations of space in a daily newspaper. "The Western powers should," he reports, "consider whether the Federal Republic could not leave NATO to permit a re-united Germany to become a member of a European security system." True, but it was stressed to me by

Social Democrat spokesmen that their party does not stand for re-unification at any price. "We do not seek re-unification without freedom," i.e. they would not withdraw West Germany from NATO until after agreement with the Soviets had been reached on the conditions necessary to ensure genuinely free elections for a new government of re-united Germany, and it would be for that government subsequently to negotiate the withdrawal of all Germany from the NATO alliance. Moreover, they specify that the NATO countries would be kept fully informed of the progress of all negotiations between East and West Germany and the USSR.

But the difficulties and delays in attaining even this prior step to a European security system could be substantial and prolonged. Would the Soviets be prepared to allow genuinely free elections in East Germany? This was one of the points on which the Four Power Conference in Berlin broke down in January, 1954. All this suggests that the Opposition's loud electioneering bark will culminate in a very mild bite if they win.

The Social Democrats (a) reject "neutralisation" and (b) seek a European security system guaranteed by the USA and the USSR. But what is the difference between (a) and (b)? Essentially only of words. "Neutralisation" is not a good word in internal German politics, I gather. It is not in keeping with a great nation like the Germans to have its neutrality guaranteed as if they constituted an "insignificant" country. So instead of the USA and the USSR guaranteeing Germany's neutrality they are to join in a guarantee whereby all the states of Europe undertake to combine against an aggressor. If the USA were to violate the neutrality of any European state, the USSR and the

rest of Europe would combine against the USA, and vice versa.

But if it is probable that the Soviets would be reluctant to agree to free elections in East Germany, it is also probable that the Americans, and the rest of the NATO allies, would in their turn be reluctant to guarantee a European security system to which Germany would, ex hypothesi, make no contribution. NATO observers point out that the history of post-war Europe is not one of Western aggression against the USSR. It is not the free West which has absorbed or "satellite-ised" 592,000 sq. miles of Europe with a population of 111,000,000. It is not the free West which has kept 5,000,000 men and 20,000 planes on a war footing. By May, 1946, the forces of the West had, on the contrary, fallen from over 5,000,000 to less than 900,000, and today NATO has fewer than 15 of the 30 divisions that its military leaders consider necessary to police Europe.

In view of all this, NATO observers point out, the risk is not that German neutrality would be threatened from the West but from the East, and while the USA and her NATO allies are ready to spring to the aid of a Germany which is bearing its fair share of the burden of common defence they see no reason why they should rescue a Germany which is not.

These considerations give point and emphasis to "The Times" correspondent's otherwise somewhat cryptic final paragraph quoted above, and which led me to observe here last week that if the Opposition wins the September elections in Germany, I would expect a modification of emphasis in German foreign policy rather than any spectacular departure in a new direction.

THE POOR MAN OF EUROPE

(From Our Special West European Correspondent)

MILAN, July, 27.

WITH the progressive ratification of the Common Market treaty by the Continental parliaments, the economic future of West Europe is henceforth officially held to be determined by the terms and dispensations of that complicated pact. Here in the capital city of Italian commerce and industry the prospects of the Common Market are seen in a very different light from that of the more prosperous North European centres. Not that, on balance, Italian industry is more anxious or more confident than the Northerners. But the sum of prudent optimism that everywhere has permitted ratification of the treaty is arrived at here by adding up a different mixture of hopes and fears.

The first and most evident reason for this is that Italy is the poor man of West Europe, and as the weakest partner in the customs union she naturally has different advantages to seek and different dangers to avoid in the Common Market. The following figures for per capita gross income in 1955 (in dollars) will show as clearly as any other index Italy's weakness:

Belgium and Luxembourg	.. . 1,132
France	.. . 1,076
West Germany	.. . 779
Holland	.. . 711
Italy	.. . 451

Regarding what happens when a poor region is united in a Common Market with more industrialised regions, an example drawn from Italian history has been much canvassed in West Europe generally, notably by M. Mendes-France, and of course this example is much more in the minds of the Italians: this concerns the fate of Southern Italy after the unification of the kingdom in the last century. Unification was followed by relative impoverishment of the backward South, and by a much more rapid advance in the more prosperous parts of Northern and Central Italy. It is this increasing imbalance that is nowadays sought to be rectified by the ambitious agricultural and multi-purpose plans for Southern Italy. (Indians will know that similar fears are seldom far from the minds of South Indians.) Italians, even here in the industrialised North, fear that this process might now be repeated in the Common Market, with backward Italy playing the role of the impoverished South.

This danger would be regarded with less apprehension if within the Common Market, as within unified Italy, labour could migrate freely from areas of unemployment to busier centres, and if capital could move equally freely toward low-wage areas, i.e. if the imbalance could be rectified as it is slowly being in the United States where Southern labour drifts North while Northern capital invests in the South. But this is not likely to happen within the European Common Market. This is because, while the treaty is very explicit about abolition of trade restrictions, it is less precise about the need for a free migration of labour, and quite vague about the free movement of capital. It is feared in Italy that such increased movement of labour as occurs inside the Common Market will not relieve Italy's vast surplus of untrained workers but will mean the migration of scarce Italian specialists and technicians toward more active centres in the North; and that moreover the inclusion of the overseas colonies of France in the Common Market will mean that cheap untrained labour

will be drawn not from Italy but from such regions as Algeria.

Inadequate movement of labour within the Common Market will not be compensated for, in the Italian view, by an adequate movement of investment capital. The view here, in a capital-hungry country, is naturally that the Common Market will never really work until capital movements across the borders of the six countries are virtually free, as they have been for the past three years within Benelux. The Italians think (and here critical French opinion agrees) that the European Social Fund and the European Investment Bank set up under the treaty will not be able to supply anything like enough capital to safeguard the progress of the undeveloped regions of Europe, namely Southern France below the Loire and Italy. The European Bank will have a capital of only £40 millions, though of course it will be able to borrow and thus lend much larger sums.

Finally, on the adverse side of the account, there is keen awareness here of the dangers of cartellisation and market-splitting agreements between firms in the various countries, designed to protect them against the "beneficial" effects of competition in a unified market. No doubt, the text of the treaty explicitly forbids international cartels, but it also mentions numerous exceptions to this ban for cases where such agreements will increase output. It is thought that these escape clauses will be abused, to protect invested capital at the expense of the West European consumer, and indeed it is common knowledge that leading firms, especially in France and West Germany, are already negotiating "specialisation" pacts between themselves against the day when competition in the Common Market might prove inconvenient. In other words, big industry is already taking out secret insurance policies just in case liberalism works. It was shown on this page lately ("A Benelux Balance Sheet", July 12) that it was by means of such specialisation and market-splitting that Dutch and Belgian industry solved the problems of free trade within Benelux. Still, it is recognised here that it would be innocent to expect West European industry to accept a genuine return to free trade, and that specialisation pacts are the price the consumer must pay for the other advantages of the Common Market.

Now against these specifically Italian fears must be set the hopes Italy places in the Common Market. There are of course all the generally accepted arguments in favour of the experiment, but here we are concerned only with the special advantages the Italians hope to gain. The first is that Italy has already gone further than any of her partners in liberalising imports. This courageous policy has not produced any shocks for Italian industry and so there is a willingness to press liberal trade policy further. But it is realised here that it would be very difficult to obtain any further measures of liberalisation from Italy's partners, such as would guarantee an increased offtake of Italian exports, unless the Common Market is introduced. In other words, the Italian economy has reached a point in liberalisation where it is better to go forward than backward, and the Common Market is the only hope of advance. Not only that, but it would be uncomfortable for Italy to stand still: because she has liberalised her imports more than the five other countries have increased their imports of Italian goods, Italy is paying the price of this boldness in unfavourable trade. Thus in 1955, because of

MONTHLY BULLETIN OF STATISTICS

The foremost source of current, official statistics on world economic and social conditions. Each issue contains information from more than 130 countries and territories on over 60 subjects, including manpower, industrial production, mining, building materials, transport, trade, and national income.

unequal liberalisation of imports, Italy bought 14.1 per cent of the total exports of her five partners, but provided only 9.3 per cent of their total imports. Therefore, any further freeing of trade induced by the Common Market treaty must benefit Italy more than the others, who have hitherto been less enterprising in freeing imports.

Italian industrialists see another advantage in the Common Market which, if it materialises, will be peculiar to their own case. Italy is by far the most over-controlled of the six Continental economies; Italian business feels the strait-jacket of Government planning and restriction much more than German or even French business. Now, Italian business men hope that the Common Market, no matter whether it takes a "liberal" or "regional protectionist" turn, will surely break up the internal controls that bind the Italian economy. If the Common Market turns out to be a liberal, old-style, free-trade institution, this unfreezing of the Italian internal economy will certainly be produced. But even if, as many people fear, the Common Market comes to mean protection on a bigger scale (where West Europe and not any single country is the area to be protected), the Italian Government will still have to surrender many of the chains by which it now binds domestic trade and industry. Supra-national protectionism (a prospect regarded with distaste by Belgian business men who already live in one of the world's freest and most liberal economic regimes) would be

welcomed by Italian business men as a lighter burden than the heavy hand of the Government in Rome.

In France, critics and detractors of the Common Market usually meet the lyrical arguments of supporters by pointing out that most of the advertised advantages of the treaty would in any case accrue to the French economy with or without the treaty, because that is just the way economic events are tending. For instance, it is no argument in favour of Euramarket to say that it will oblige French industry to modernise, because French industry will just have to modernise anyhow, if France signs the treaty or not. Here in Italy, on the other hand, supporters of the Common Market usually meet the gloomy prophecies of detractors by pointing out that the advertised dangers of the pact would be encountered by Italy whether or not she joined the Common Market. It is no argument against the treaty that it will present Italy with capital and labour problems, because she would face increasing difficulties on these scores even if she declined to join her partners. Probably both sides are in the right: the Common Market will not after all call up dangers that could otherwise have been avoided, and no more will it present advantages that would otherwise have been missed, by the nations of West Europe acting individually. But it will constitute a stimulus and an encouragement for reluctant Governments to do the inevitable, to do today what they would have had to do tomorrow in any event.

WORLDGRAM

AGRICULTURE

World Record Grain Production: More grain was produced in the world last year than ever before in history—a total of 465 million tons—according to an official review. India and Pakistan ranked second to the United States as world producers. The US was the top producer with 130,100,000 tons followed by India and Pakistan with 55 million tons and Canada 29,300,000 tons. The Commonwealth Economic Committee, surveying the production, trade and consumption of wheat, wheat flour, maize, barley, oats, rye, rice for the present year, said the record production of grains was a fifth higher than before the war. The figures exclude the Soviet Union and China. Barley production of 55 million tons was a record as a result of heavy crops in Western Europe. The recovery of Asian production was reflected in the large world output of rice estimated at 85 million tons. Commonwealth countries supplied a quarter of the wheat produced outside Russia and China and over 40 per cent of the rice.

Need for Raising Cotton Output: The President of the Cotton Buyers' Association emphasised the need for increasing domestic production of cotton with utmost speed in view of rising internal consumption, at the recent annual meeting. The 1956-57 cotton crop, was estimated at 47.5 lakh bales, the domestic consumption was running at a record level of more than 47 lakh bales during the season on the basis of the current monthly average consumption of 393,000 bales. He predicted that the total carryover for the new season would be lower as compared with that at the beginning of the season. Prospects for export next season had become uncertain on account of lack of improvement in surplus stocks. The President stressed the need for imports of superior long-staple cotton in view of the insufficient domestic output and suggested that the problem of foreign exchange for the purpose could be solved by entering into arrangements in rupee, like the one made with Egypt. Prospects should be explored for such arrangements with the Sudan and East Africa.

INDUSTRY

Lead and Zinc Ores in India: The production of lead and zinc ores in India during the quarter ending March 1957, was 25,242 tons as against 22,241 tons in the quarter ending December 1956, according to the Indian Bureau of Mines. The production reached an appreciable increase of 6,866 tons as compared to the corresponding quarter of 1956. The entire production is reported from the Zawar Mines of Rajasthan. The lead and zinc concentrates recovered from the ores during the first quarter of 1957 totalled, 1,143 and 2,255 tons respectively as compared to 1,069 and 1,815 tons in the preceding quarter. The lead concentrates are sent to the smelting plant in Bihar.

Engineering Units: At the annual meeting of the Textile Machinery Corporation Ltd., the chairman Mr. K. K. Birla pointed out spectacular increase in output in certain engineering industries since 1950-51. The efforts to produce various types of machinery and machine tools in collaboration with foreign interests is specially important from the national angle. There is considerable scope for further expansion as the value of indigenous products is still only a fraction of the value of imported engineering goods. The Tata Locomotive and Engineering Company Ltd., has done well

in the manufacture of locomotives, diesel engines and road rollers. In the year ended March 1957, the sale of products and services amounted to Rs. 21.45 crores against Rs. 11.98 crores in 1955-56. There was an increase in the output of locomotives and boilers by 30 per cent over the previous year. Against the scheduled output of 50 complete locomotives and 50 spare boilers, the actual 1956-57 output was 67 complete locomotives and 44 additional boilers. The indigenous content of each unit produced was well over the figure of 75 per cent stipulated by the Railway Board. In the automobile division the output of Tata Mercedes-Benz vehicles exceeded the target of 6,000 units, while the progress of indigenous manufacture was strictly maintained.

The Caltex Refinery: The Caltex Oil Refinery at Visakhapatnam is now in full operation. Since the last unit went on stream on July 14, tests confirm that the entire refinery is operating satisfactorily and will be able to maintain its designed capacity. Costing Rs. 15 crores, the Caltex Refinery, an offspring of India's second Five-Year Plan, took approximately two years to build. It is situated on a site of 515 acres leased from the Visakhapatnam Port. At the peak of construction there were 9,000 Indians on the job. There are now about 500 employees on the operating staff. The Caltex Refinery's yearly output of quality products is 74,000,000 gallons of petrol, 21,257,000 gallons of superior kerosene, 8,177,300 gallons of inferior kerosene, 31,631,000 gallons of diesel oils and 26,495,000 gallons of fuel oils.

TRADE

Export of Ores from Mysore: The State Trading Corporation proposes to export 50,000 tons of iron ore and 30,000 tons of manganese ore from the port of Cochin, during July 1957 to June 1958, Mr. Satish Chandra, Deputy Minister for Commerce and Industry told the Lok Sabha recently. The S.T.C. had come to the conclusion that it would be a practicable proposition to use the Cochin port for shipment of iron and manganese ores. Madras, Musulipatam, Kakinada, Vizagapatam, and Bombay are the other ports which are being used at present for export of these ores from Mysore State.

Scope for Trade with Ghana: Reports from Trade Representatives abroad suggest that the new Republic of Ghana offers a potential market for a variety of Indian goods generally, and engineering and textile goods in particular. Items such as printed cotton piece-goods, rayon fabrics, cotton hosiery, bicycles, cement, trucks and automobiles, corrugated sheets, certain types of perfumery and household articles, could establish a good market. Ghana is said to produce 420,000 tons of cocoa and needs packing materials to the extent of 5,500,000 new jute bags and 250,000 used jute bags annually. Besides palm kernels, cocoa kernels and other farm products require 2,15,000 jute bags for packing. The customs tariff in Ghana is relatively low, but it is rather high for deluxe products such as perfumery cosmetics, wines and alcohol. The monetary unit in Ghana is West African pound, but commercial money is pound sterling (980 francs).

Industry and Trade: Maintenance of the upward trend in industrial production and an increase of more

than 11 per cent in foreign trade, accounted for by a sharp rise in the price of imports, were two broad features of Indian economy in 1956. A report of the Ministry of Commerce and Industry said a remarkable quickening in the tempo of the country's economic development since the beginning of the year, and the emergence of a seller's market in capital goods and machinery, resulting in an increase in the value of these goods, affected the pattern of India's foreign trade during 1956. Imports in India valued Rs. 808 crores as compared with Rs. 649 crores in 1955, while the value of exports amounted to Rs. 606 crores against Rs. 602 crores in 1955. The trade deficit increased to Rs. 193 crores from Rs. 40 crores in the preceding year. Increases in imports were "significant" in the case of metals, machinery and vehicles and "notable" in respect of chemicals, drugs and medicines, instruments and appliances, hardware, art silk yarn, provisions and oil man's stores.

FINANCE

Foreign Exchange Spent on Lubricating Oils: Mr. K. D. Malaviya, Union Minister for Mines and Oil recently gave the Lok Sabha the figures of foreign exchange, involved in India's annual import of lubricating oils for each of the last three years. The figures which were based on an extract from the publication "Accounts relating to the foreign (Sea, Air and Land) Trade and Navigation of India" were:

Year	U.S.A.	U.K.	Other Countries
1954	Rs. 3,69,61,072	2,01,47,665	2,51,73,746
1955	Rs. 3,03,34,378	2,56,29,225	2,23,12,913
1956	Rs. 2,85,39,077	3,44,47,613	2,52,00,242

Valuation of Property: In order to assess the value of different kinds of properties for purposes of the Estate Duty Act, the Government of India propose to appoint qualified persons as valuers. Property for valuation may be divided into eight broad categories and experts will be selected for each of them. Valuers will be drawn from Surveyors, Engineers, Mining Engineers, Architects, Specialists in Agriculture and Farm valuation, Specialists in Works of Art, in jewellery in precious stones and ornaments, Accountants and Actuaries. Scales of remuneration of valuers have been fixed by the Government. For any property up to Rs. 50,000 the scale of charges is $\frac{1}{4}$ per cent, on value of property exceeding Rs. 50,000 but not exceeding Rs. $\frac{1}{2}$ lakhs, $\frac{1}{4}$ per cent, and on the balance $\frac{1}{8}$ per cent.

New Currency Bill in West Germany: Resident convertibility in Germany will be almost complete under the new German currency and foreign trade bill drafted by the Ministry of Economic Affairs. Four liberalisation moves are foreseen in the field of transfer of money abroad. There will be unlimited and permit-free purchase of participations abroad in all currencies including dollars. The DM 3 million ceiling is being abolished. Unlimited purchase of real estate also in dollars, and unlimited transfer abroad of gifts and donations including dollar transfers, will be possible. The last move is an allowance of unlimited money for travelling purposes including dollars, with a limitation that in the case of dollars the country to be visited must be stated. The last three moves will have to wait for the Bill to be passed. Together with the freedom to buy foreign shares and securities granted last year, they will enable any German citizen to transfer his assets to any country this side of the iron curtain.

Compromise on the U.S. Aid Bill: President Eisenhower will receive a smaller foreign aid authorisation than he asked for, but a larger one than the House of Representative has voted to provide. The result seems assured because the Bill that will go to the White House will represent a compromise between a \$3,116.8 million measure that passed to the House of Representatives and the \$3,617.3 million Bill that won Senate approval last month. President Eisenhower had asked for \$3,864.4 million of new foreign aid funds for the fiscal year that began on July 1. The House Bill authorised \$1,500 million for military aid, a reduction of \$400 million from Mr. Eisenhower's request, \$250 million for the President's special assistance fund, a reduction of \$50 million, and \$15.9 million for Point Four technical aid, the amount that President Eisenhower asked for.

GENERAL

Fish Boat Construction: The government of India has opened a training centre in fish boat construction for nominees of maritime State Governments. The first centre of its kind in South and South-East Asia, it will speed up mechanisation of fishing in the country. The object of the course, which is of six months duration, is to train fisheries officers of State Governments in marine engineering, naval architecture, boatyard and mechanical workshop practices and fishing gear. Practical training will also be imparted to candidates in work relating to engines, boat-building and electronic equipment. Each State Government will depute two candidates for training at the centre.

The Metric System: Mr. Morarji Desai inaugurating the inter-States conference on the metric system said that the Government has taken two main decisions—to standardise weights and measures throughout the country, and to establish the metric system. Weights and measures in use vary from state to state, and even in the same place from one trade to another in our present system. Units like the seer and the maund do not have the same magnitudes everywhere. The metric system obviates these discrepancies. It is almost a world wide system recognised by law in the USA, UK, and several other countries. A reform of this kind must be gradual. Parliament has, therefore provided a transitional period of 10 years. On April 1, 1958, it is proposed to introduce the metric weights and measures over a limited field. It will be extended gradually so that by 1966, or if possible earlier, the metric system is fully established in the country in all branches of trade and industry.

Newspapers in India: There are 6,750 newspapers including periodicals in the country according to the first report of the Registrar of Newspapers for India. There are two lists of newspapers. In list "A" are included 4,569 newspapers about which the Press Registrar has received particulars. In list "B" there are 2,001 newspapers about which no information has been received, but the States vouch for their existence. The report which covers the period from July 1 to December 31, 1956 shows that Hindi, with 1,254 dailies and periodicals has the largest number of newspapers. The study of circulation and ownership has been confined to about 2,400 newspapers in respect of which detailed information has been received. These include practically all important newspapers of different categories and their circulation in the country comes to 94.0 lakhs—78.2 lakhs sold and 15.8 lakhs distributed free.

NEWS IN BRIEF

INDIAN

The Government of India Resolution on the Tariff Commission's Report (1957) on the continuance of protection to the Piston Assembly Industry, recently published, reports that the government have accepted the main recommendation that protection should be continued till December 30, 1960 at the existing rates of duty.

Seven States have been sanctioned financial assistance by the Government of India for the schemes for preserving and reviving the Indian traditional craft of toy-making and developing it on modern lines.

The Government of India have approved the slum clearance projects of the Madras Government, and have sanctioned a sum of Rs. 16,25,985. The schemes pertain to the areas of Meenambal Sivarajnagar, Thiruvengadapuram, Mallikuppam, Lock Nagar and a housing plan for pavement dwellers.

Sixteen sugar factories are lying idle. Of these the machinery of ten were so worn out that it was no use rehabilitating them. The remaining six, with an annual production capacity of about 30,000 tons were idle due to reasons such as financial disputes and the plant being of an uneconomic size.

India's largest sheet glass factory—a joint enterprise of Japan and India in Bihar was formally switched on to production by the Japanese ambassador in India. About 30 Japanese technicians are helping to run the concern which aims at making India self-sufficient in glass requirements.

The Government of India have announced the simultaneous issue of two loans for a total sum of Rs. 100 crores. Interest on the loans is payable half yearly on February 1, and August 1, and will be subject to income-tax.

Rupees 3,29,92,940 was sanctioned during 1956-57 to various State Governments for Primary Education, out of which Rs. 2,19,13,177 was utilised. Rs. 77.155 lakhs were sanctioned towards increase in salaries of Primary School Teachers.

As on January 1, 1957, of the 28,746 foreign citizens in India, 22,190 were traders, 1,663 students and 4,893 were missionaries. The nationals of Commonwealth countries are not subject to registration and therefore not included in these figures.

The Employment Exchanges in the country registered 4,520 displaced persons and secured placements for 775 during May 1957. In the previous month, the number of registrations was 4,330 and placements 683. Of those placed during May, 380 were immigrants from East Pakistan and 395 from West Pakistan.

The Indian and Eastern Newspaper Society have offered a voluntary cut in import licenses for newsprint up to a maximum of 15 per cent in either of their licensing periods January-June 1956 or July-December 1956, as an effective contribution to curtailing of imports in view of the tight foreign exchange position.

FOREIGN

In Britain 100,000 company-employed provincial busmen are on strike. If it proves fully effective, some 27,000 buses, or more than half of those operating outside London, will be off the roads.

A special committee of the West German Defence Ministry is at present studying British, Canadian, US, French and Italian jet fighters to determine which model the new German airforce should purchase.

The US Treasury is offering a 4 per cent interest rate, the highest since the depression years, on a \$24,000 million issue of Government securities.

West Germany and Canada have talked about Canadian Uranium exports to begin on January 1, 1958. Germany plans to buy from Canadian uranium concentrates and metallic uranium corresponding to a quantity of 100 tons of uranium metal annually for five years.

Rocks and stone sculptures worth about 3,500,000 yen were shipped recently to France for the purpose of making a Japanese garden in the compounds of the UNESCO Headquarters in Paris. A modern Y shaped building is now being constructed on Place Fontenay donated by the French Government.

Brazil's crude oils production rose to record levels in the first half of 1957. It is predicted that 1957 production would be almost 10,000,000 barrels, more than double last year's. It is estimated however, that increase in consumption will match this increase in production.

With orders for over 2.7 million gross registered tons on their books French shipyards are very busy. Activity seems certain to grow until by 1960 the yards which delivered just under 300,000 gross registered tons in 1956 will complete 500,000 gross registered tons of shipping.

The UK motor industry exported nearly 205,000 cars in the first six months of this year—24,500 more than the same period last year. Export to the US in June with a record total of 8,300 brought the first half year's exports to the US to 43,000, three times the figure for last years.

The Pakistan Finance Minister said recently that he had failed to negotiate a long-term surplus commodities agreement with the US, but he had secured supplies of 800,000 tons of US surplus wheat and rice for the current year. A loan of \$2.5 million for the proposed Investment Corporation and another loan of \$32 million for Pakistan's railways would be finalised in August.

Directors of Egyptian concerns are to be subjected to a progressive tax ranging from 10 per cent on £E2,000 to £E3,000, up to 80 per cent on sums over £E10,000 per annum. This new sliding scale is in addition to normal taxation.

NEW BASES FOR PRICE INDICES

HITHERTO the Economic Adviser's Index Number of Wholesale Prices (Base: Year ended August 1939 = 100) has been the sole indicator of changes in the general price level and movements in the purchasing power of the rupee. Recently a new price series with much wider coverage and 1952-53 as base has been released. The new series is intended to replace the old one, though obviously both the series must remain concurrently in use for some time. In a similar manner, the base periods of the Working Class Consumer Price Indices (popularly known as the cost of living indices) have been shifted to 1949. It is the object of this article to analyse the implications of these changes in the price indices.

The old series of wholesale prices suffered from a number of imperfections. Its narrow coverage represented by only 78 commodities, 30 marketing centres and 222 price quotations revealed its non-representative character for a country of the vastness of the Indian Union. Significant structural changes in the economy brought about by the war and partition of the sub-continent altered the relative importance of different commodities in the index, necessitating a change in the "weights" of commodities according to their latest importance. In view of these defects in the old series the new series needs to be welcomed because it eliminates some of the major shortcomings of the old series. Moreover, the new series has been brought out after incorporating most of the strong points made in the severe criticism to which the old series was subjected during the last decade.

The revised series of wholesale prices covers no less than 129 commodities and 555 quotations which clearly shows that coverage has more than quadrupled. From this angle, the base of the revised series is ideal and comprehensive. There is another cogent factor which goes in favour of the revised series. The base year 1952-53 can easily be accepted as a representative and normal one because it did not register any violent fluctuations in prices. Another important characteristic of this year is that it was the year in which price controls were dismantled, thereby leaving the determination of prices to the operation of the normal market forces of supply and demand. No doubt, it would have been better to take average prices for three consecutive years for the base, but it seems that the violent fluctuations in prices consequent upon partition of the country and the Korean War stood in the way.

The revised index of wholesale prices which was expected to untie some old knots has, however, added

one more. It is the large divergence as disclosed between the price changes in the two series during the last twelve months. Table I below sets out wholesale prices for food articles and the general index for both the old series and the revised series. It will be seen that the old series shows a rise of 18.4 per cent in food prices during the last one year while the revised series shows a rise of 10.4 per cent only. Similarly, the over-all rise in prices, as represented by the general index, according to the old series works out to be 10.6 per cent as against a rise of 8.3 per cent according to the revised series. The revised series, therefore, has shown a slower rate of rise in prices in the recent past as compared with the old series. In the current inflationary spell, it certainly makes a considerable difference if the official indicator of price changes reduces the price rise by forty to fifty per cent. It has created misgivings in certain quarters about the purpose behind the issuance of the revised series.

The explanation for these differences is not far to seek. Since the coverage of the new index and the relative importance of the various commodities are materially different from the old index, the discrepancies are natural. Moreover, the base of the old index was undoubtedly remote and therefore had become outdated. The only precaution needed for the time being is that the old series should not be stopped. It should be allowed to continue till the appearance of the next deflationary cycle in the Indian economy. At that time, the old series, in all probability, will show a steeper fall, than the new series. After having demonstrated the comparative stability of the revised series in periods of rising and falling prices, the Economic Adviser could safely withdraw the old series without creating any scepticism in the mind of the public.

It will be interesting, however, if the Economic Adviser in the meantime devised a suitable linking factor between the old and the new series. It will be a tough task because week-to-week movements in the two series do not seem to show any correlation.

In the case of consumer price indices, where the base period has uniformly been changed to 1949 for all the industrial centres, there seems to be no scientific basis for conversion. As a matter of fact this type of shift is absolutely unnecessary. It is unscientific since it is not based upon any new consumer surveys. The change, therefore, is arithmetical, designed only to hide the highly fluctuating character of the old series based upon pre-war prices and consumption habits. Except that this conversion is a matter of convenience, it cannot be justified on any other ground. For lack of scientific approach, this move to 1949 lays itself bare to criticism

TABLE I

WHOLESALE PRICES

(A Comparison of the Two Series:)

	Base: 1952-53 = 100			Base: Year ended August 1939 = 100		
	(1)	(2)	(3)	(4)	(5)	(6)
	June 1956	June 1957	Percentage Change of (2) over (1)	June 1956	June 1957	Percentage change of (5) over (4)
General Index	102.1	110.6	+ 8.3	397.9	439.2	+10.6
Food Articles	99.0	109.3	+10.4	366.2	433.4	+18.4

and doubts. The new change is also unnecessary, not only because it adds to confusion but because it is of no practical value. The dearness allowance of the working classes in all industrial towns is linked with indices either with the pre-war or 1944 base. Even recently no agreement between management and labour has been signed which has 1949 as a base in the computation of dearness allowance. In the latest decision of the Wage Board for Working Journalists, the dearness allowance has been linked with 1944 and not 1949. The utility of the new series of consumer price indices with 1949 as base can hardly be vindicated. A shift to 1949 seems to have been made only on psychological grounds. Table II compares the consumer price index for working classes in Bombay with regard to the new and the old bases, for the year 1956. It will be found that between January and December, the old series with 1933-34 as base shows a rise of 21 points, whereas the new series with 1949 as base shows a rise of 7 points only. That the fluctuation in the new series is 1/3 of that in the old series is the only consolation.

As a matter of fact, the proper course would be to organise fresh consumer surveys in all the important industrial centres in 1960-61 — the last year of the

second Five-Year Plan — and then link allowances and salaries with the new indices.

TABLE II
CONSUMER PRICE INDEX: BOMBAY

1956	1933-34 = 100	1949 = 100
January	334	109

MORE MUDDLING IN MANGANESE

By
CROESUS

SINCE I wrote on this subject in mid-May (vide "The Eastern Economist" dated May 17, 1957 — Pp. 751-2), there has been more muddling still — and not less as I had hoped — in this business of manganese exports. When the subject figured prominently in Parliamentary discussions recently, I must say, the State Trading Corporation managed to produce an impressive catalogue of its export and import contracts up to May 1957, and got away with it. Surely export contracts of an aggregate value of Rs. 2,447.74 lakhs and import contracts worth Rs. 1,235.61 lakhs could not fail to impress anyone, not excluding some of the severest critics even of the S.T.C., but it would be interesting to know to what extent these contracts have actually materialised. In so far as manganese exports were concerned, it may be noted, the S.T.C. claimed it had contracts on hand to the tune of 365,642 tons, which were supposed to bring in over Rs. 7 crores of valuable foreign exchange. What a timely and magnificent contribution the S.T.C. would have made to our balance of payments accounts, had it fulfilled all these contracts? But I maintain, with all the emphasis and responsibility at my command, that not all these contracts — nor even a major part thereof — have fructified yet. I am also in a position to state, as a result of my exhaustive enquiries, that, out of about 4½ lakh tons of manganese exported from this country up to the end of June last, the actual share of the S.T.C. was only about a lakh of tons or less than 25 per cent of the country's total exports of manganese!

The one reason for this is the known unwillingness of the S.T.C. to listen to the advice of even those in the Private Sector who, looking to the larger interests of the country, have offered wholeheartedly to co-operate with the S.T.C. in making a success of the S.T.C. Expectedly, the result has been that, instead of getting all the co-operation of miners and shippers for which it so fervently appealed, the S.T.C. has been alienating more and more of its erstwhile friends. Only last month, the representative of the Western India Minerals' Association was withdrawn from the Liaison Committee appointed by the Union Ministry of Commerce and Industry as a protest against this Committee's refusal even to listen to, let alone accept, the views of the Association.

I would not regard even this attitude as serious, unfortunate though it certainly is, but, when an officially-sponsored body like the S.T.C., which claims to, and ought to, serve as a model to the others, resorts to unworthy tactics just to absolve itself of its liability or responsibility on the flimsiest of pretexts, I feel, the public must take up cudgels. If all the allegations I have heard against the S.T.C. are true, I would be satisfied with nothing less than a public inquiry into these allegations. Meanwhile, it is for the authorities to ascertain the correct state of affairs. If only to provoke them to this action, as much as to focus public attention on these alleged shortcomings of the S.T.C., let me cite a few that I have heard.

In the first place, adequate stocks of manganese are not ready at the port of loading on the dates indicated to the parties. It is an accepted trade practice that it is the buyer's right, especially when the seller does not undertake the responsibility of chartering the carrying

vessel, to insist on the contracted stocks being ready at the port of loading on the stipulated date. But, because of failure to keep to the schedule thus, it would appear, frantic efforts are made by the S.T.C. at the eleventh hour to persuade the parties concerned to arrange for loading at some other ports, where too, eventually, it is believed, stocks of the requisite quality are found to be not forthcoming, but the parties are bamboozled nevertheless, into accepting whatever is available. Even after accommodating the S.T.C. in all these ways, it seems, there is wrangling in regard to settlement of claims for consequent losses, additional expenses, etc. after specific assurances are made earlier to meet all these. All these only suggest that there is a woeful lack of appreciation of how serious a matter it is to get a party to charter a vessel on solemn assurances of delivery on a given date even when the supply of the required stocks are not there. Secondly, when parties express a wish to let the contracts lapse rather than agree to all such impossible demands, a sizeable price reduction is offered (In one case, the shipment involved was about 20,000 tons, I learn) as a bait.

The third allegation — and this is most reprehensible — is that false pleas are made to shift the responsibility for the delay, thereby involving others, with or without their knowledge (if with their knowledge, I should use the term "connivance", but let me give the benefit of doubt). On one occasion, I am told, the delay was explained away by saying that the stocks of manganese could not be moved from the depot alongside the waiting vessel owing to lack of sufficient water to the Bombay Port Trust Locomotives! I did not know this was one more contributory factor to the present congestion in the Bombay docks, but, if this is so, a part at least of the blame for the congestion must, in fairness, devolve on the Municipal Corporation of Greater Bombay.

A much more serious "frivolity" than this happened on another occasion, when, it is alleged, because the stocks were not there, some persons connected with the S.T.C. tried to use their influence with the concerned Port Trust staff to delay giving berth to the vessel that was scheduled to take a consignment of manganese negotiated by the S.T.C.! Unfortunately for the S.T.C., the vessel in question was carrying food to this country and its top priority for berth evidently prevented the concerned Port Trust people — even if they had been inclined that way — from obliging the S.T.C. men.

Fourthly, the S.T.C. does not seem to countenance shippers entering into deals with any country they like and if, in spite of the S.T.C., any deals are entered into by them with some countries which it wants to monopolise perhaps, the shippers are compelled not to quote below a given price. It is hardly necessary to add that, more often than not, such a price bears no relation to realities, with results which anyone can guess.

Hearing all this sordid tale, I feel like repeating what a fellow columnist wrote in a Bombay contemporary about another Corporation a few days ago: "Those clever men who think they are having the best of both worlds — some politicians, some officials — seem unaware that the advantages are transient and adventitious".

CONSUMER AND NATIONAL INTERESTS ABOVE PROFITS

By
CROESUS

IT may appear strange that profits of industry should tend to diminish rather than rise during a period of inflation. But this bids fair to be the pattern of industry after industry hereafter. Lest ardent advocates of the Socialistic Pattern of Society should hasten to claim this as an achievement to their credit, it must be straightaway pointed out that this is rather the outcome of the recognition by the more responsible of our manufacturers that it is their duty to keep in mind consumer and national interests.

Indeed, this is what Mr. J. R. D. Tata said in explanation of the less satisfactory profits of the Tata Oil Mills Co., Ltd. for the year ended March 31, 1957 as compared to its profits for the previous year. This happened, despite larger revenue, as Mr. Tata explained at the annual general meeting of the Company last Monday, because of (i) the steep rise in the cost of vegetable oils — the average rise in groundnut oil, for example, being as much as 45 per cent — and (ii) the mounting labour costs — the rise in salary and wage bill during the year being as much as Rs. 4.35 lakhs. Normally, any industry may be expected to compensate itself for these rises by raising the selling prices of its products to a corresponding extent. In the case of the soap industry, however, this does not seem to be possible — apart from the sense of responsibility consideration referred to above — partly because the market price of soap is not determined by the units of the industry concerned and partly because of the highly competitive nature of the soap industry.

Oddly enough, the competition in the soap industry that the organised section complains of is that of the non-power-operated section of the industry — the small units. For there is a very much higher excise duty on the organised sector of the industry than on the non-power-operated sector, and this is in addition to the enhanced import duty on perfumery materials and coconut oil and the latest increases in excise duty on all vegetable non-essential oils, from which the non-power-operated units are exempt. Referring to this, Mr. Tata said:

"Such discriminatory treatment has proved a great disincentive to the sound development of the soap industry. The total soap production of the organised sector in 1956 was a little under 110,000 tons, against the target of 200,000 tons set by the Planning Commission under the second Five-Year Plan. It is becoming increasingly apparent that the organised industry will not be able to attain the target allotted to it even though the estimated 'per capita' consumption of soap in India stands at the woefully low figure of 1.5 lbs. per annum, which is about the lowest in the world."

At the same time, Mr. Tata made it clear that he was not opposed to the Government's desire to assist and promote cottage industries, in order to relieve unemployment in the rural areas and he added he did not even mind some loss of market to the organised sector of the industry on this score, but he strongly felt that "some of the Government's policies in this direction have obviously gone too far and become wholly unrealistic." Explaining why he thought so, Mr. Tata observed:

"These policies protect and bolster up not so much the real cottage industries, for whose benefit they are primarily intended, but the small-scale soap makers in big cities like Bombay, whose activities and growth at the expense of the organised industry are of no real benefit to the country. In order to secure total or partial exemption from excise and other duties, they split up their operations into small, uneconomically sized units; they provide their labour neither with good wages nor with good working conditions, nor with the many fringe benefits which the organised industry provides; they make inferior soap, spend no money on research and, in effect, contribute little or nothing to the industrial development of the country".

In the result, as Mr. Tata remarked, the Government is causing great harm to the organised power-operated sector of the industry. Several units of this sector, potentially valuable producers of wealth of the country, operate at a fraction of their capacity — and are on the verge of extinction. It is time, therefore, that the Government recognised the realities of the situation and reorientated its policy in such a way that "while protecting, to the extent required, the cottage and small-scale industries in rural parts it would also permit the organised sector to play its due and practicable role in the national development."

Economic Report from the U. S.

GLOBAL MOVEMENT OF PRIVATE FUNDS

(By GUY SIMS FITCH)

WASHINGTON, July 30.—The flow of private capital around the world reached record proportions in 1956. This is the gist of a report prepared at the United Nations headquarters in New York for the UN Economic and Social Council's meeting in Geneva. Among the large contributions to the increased global movement of funds last year were the United Kingdom and West Germany. But, as has been the case throughout the post-war period, the chief impetus came from capital exports from the United States.

One reason, of course, is the availability of capital in the United States. But, beyond that, the price of US capital still is below that prevailing in most other countries despite the recent rise in US interest rates. In all, the net outlay of long-term capital from the United States nearly doubled in 1956, reaching a record total of about \$3,000 million. Most of these funds went to Canada, Latin America and the world's newly developing lands. But there also was a perceptible rise in US investments in the more advanced countries of Western Europe.

The Latin American experience provides an interesting example of the importance of outside capital investment. Foreign funds have traditionally laid a large part in Latin America's capital formation. Rising 50 per cent in 1956, they represented 9 per cent of the region's total investment, including public funds. To be more specific, take Venezuela, a country that historically has encouraged private foreign investment. This type of investment has been instrumental in the development of petroleum, Venezuela's principal industry. Already turning out three million barrels of oil a day, Venezuela last year earned nearly \$250 million from the sale of new petrol. It is estimated that some 73 per cent of the Venezuelan Government's income in 1956 came from oil. With its earnings augmented, the Venezuelan Government is helping to expand the country's steel production including a petrochemical industry.

Among other countries whose development is being speeded by private foreign funds are Bolivia, Costa Rica, Guatemala, Peru, Israel and Turkey, the UN report notes. The report attributes their development pace largely to the enactment of liberalized investment legislation in recent years. Experience also shows that foreign private investment can contribute importantly to economic stability as well as to economic development. As many countries with balance-of-payments problems have discovered, private capital from the United States has helped to bolster their dollar supplies.

It is encouraging, then, to find the UN report predicting a continued high level of US foreign investments

in 1957, particularly of long-term direct investments in productive facilities. The US Department of Commerce estimates that the net capital outflow from the United States in the first quarter of 1957 was substantially larger than in the same quarter of any other post-war year. Significant, too, was the relatively large outflow of short-term US capital—largely private bank loans—during the first quarter of this year. With few exceptions, as the Commerce Department notes, the short-term funds went to countries that had balance-of-payments difficulties, and reduced their need to draw on reserves or lower their foreign expenditures.

BUSINESS NOTES

NEW TYPE OF ASSISTANCE FROM THE IFC

IN SPITE of the welcome arrival of more resourceful industrial finance institutions in this country in the recent past, the field for assistance which the Industrial Finance Corporation of India can provide will in no way suffer from any diminution. This is for the obvious reason that the demands for industrial credit are growing much faster than the existing resources of the various industrial finance agencies can cope with. For some time past reports had emanated from informed circles that the functions of the Industrial Finance Corporation of India are to be made more broad-based than heretofore. These reports have now been confirmed.

On July 29 last, the Deputy Finance Minister introduced in the Lok Sabha the Industrial Finance Corporation (Amendment) Bill which aims at widening the IFC's area of operation and its powers to acquire funds. The principal amendment is to the effect that the IFC will be authorised to enter into contracts of guarantees with foreign exporting firms in respect of the payment of the value of capital goods which those exporting firms undertake to supply to importing industrial concerns in India on deferred payment. Since the question of exploring the possibilities of imports of capital goods on deferred payment took an acute form, it became clear that one of the basic requirements to facilitate imports on this basis was lacking. This was the necessity of an institutional agency which would undertake to guarantee performance of deferred payments contracts. In fact foreign suppliers expressly mentioned this point. It is to meet this inadequacy partly that the IFC is being clothed with legal authority to undertake the business of guarantee.

In his address at the last annual general meeting of the IFC, the Chairman had made a strong point that considering the rising tempo of the IFC's lending operations and the growing volume of demand for loans which must be expected during the second Plan period, it was urgent that the IFC's lending resources should be augmented. The Amendment Bill contains a clause which doubles the borrowing powers of the IFC. At present it can borrow from the public, the Reserve Bank and the Central Government amounts totalling up to a maximum of five times the paid-up capital plus the reserve fund. This power to borrow from the three sources mentioned will be raised by the Amendment Bill to ten times the value of the paid-up capital and the reserve fund. Another amendment deserves to be noted. Under the existing Act all risks arising out of fluctuations in the exchange rate of the rupee in terms of foreign currencies is to be borne by the Central Government. It is plain that the high magnitude of transactions in foreign exchange will raise the size of this risk. The amendment provides that the risk concerned should be borne by the industrial concerns on whose account the foreign exchange transactions are concluded.

OMINOUS OBSERVATIONS

SOME OF the observations made by the Union Minister for Commerce and Industry at a reception held in his honour last week-end by the Bombay Yarn Merchants' Association and Exchange are bound to give rise to a first-rate controversy on forward trading in this country. From what Mr. Morarji Desai said on the occasion, it would seem that the Government of India, at any rate the Union Minister for Commerce and Industry, is perhaps having second thoughts on the utility not only of forward trading but even of the Forward Markets

Commission itself. Whether or no there should be forward trading in cotton yarn may be a debatable issue, but one thought that the Government of India had been fully converted to the view that forward trading is an indispensable adjunct of the present-day economic mechanism. It is, therefore, difficult to appreciate the significance of the Minister's sweeping statement that "the element of covering one's risks by resorting to forward trading has largely disappeared and forward business has assumed the proportion of large-scale gambling." Although it is true that forward trading in any commodity may tend to, and at times does, degenerate into rank gambling, this cannot be put forward as an argument to condemn the entire institution of forward trading as such or to give it a bad name perhaps as a preliminary to finishing it. Whether this is the intention or not, the Union Minister's observations are regarded as ominous and have caused considerable misgivings not only among yarn interests but among a much wider circle.

Again, a new dichotomy in forward trading was introduced by Mr. Morarji Desai when he sought to distinguish between forward trading in commodities produced seasonally and those produced all the year round. In respect of the former, especially basic raw materials, however, he seemed to concede that forward trading was necessary and workable. He even went so far as to say that, because these happened to be seasonal commodities, it was advisable to provide facilities to traders to cover their risks and maintain stability in prices. If this definition is applied strictly, perhaps only primary or agricultural commodities would fall within the category of goods in respect of which forward trading is held to be permissible by the Union Minister. But there are commodities other than agricultural commodities which are not necessarily seasonal, such as, for instance bullion, which enjoy the benefits of forward trading already. Does the Minister suggest then that there should be no forward trading in bullion? Again, a particular raw material may be neither agricultural nor be produced only seasonally, such as, for example, cotton yarn, but, for this reason, it does not cease to be a raw material for the textile industry and if it is thus accepted to be a raw material, even according to the tenets enjoined by Mr. Desai himself, it becomes entitled to the benefit of forward trading.

Forward trading, as Mr. Desai's own observations clearly denote, is necessary because it serves two useful and essential purposes. Firstly, it provides facilities to trade and industry to cover risks. Thus, it is customary for a cotton mill to cover its sale of finished goods by purchase of raw cotton simultaneously, so as to keep its production going. Secondly, it makes for stable prices, hedging operations serving as a cushion, as it were, to offset the otherwise disturbing effects of either a sudden rise or fall in demand or a surfeit or shortfall in supply. There is as much need of these twin purposes for non-seasonal and finished goods as for seasonal goods and primary commodities.

THE NEW LOANS

THE TWO new Central medium- and long-dated loans opening on Monday next will be fully subscribed or very likely they may even be over-subscribed. For one thing, the amount of Rs. 100 crores fixed as the aggregate of both the loans, with individual figures for each left to the market preference, is comparatively modest, particularly in view of the fact that the State Governments, with the probable exception of Bombay, are to keep away from the money market. During the

previous year the borrowing of the Centre alone was a little under Rs. 158 crores on a cash-cum-conversion basis; in addition 15 State Governments borrowed well over Rs. 68 crores almost entirely in cash. For another, the terms offered are attractive both in regard to the interest rates and the issue prices. Again, with a proviso that the unredeemed portion of the 1957 loan as well as 1958 loan, which between them account for about Rs. 82 crores, can be converted into the present flotation leaves, theoretically, only a cash subscription as low as Rs. 18 crores for both the loans. It is relevant to recall here that the Reserve Bank holds a high proportion of the 1958 loan.

Against this background, it is not surprising that both the 10-year 3½ per cent (issue price Rs. 99.5) and the 15-year 4 per cent (issue price Rs. 100) loans are open for a short duration of four days from August 5 to August 8. It is easy to appreciate that the Government will choose to accept substantial cash subscriptions and only the balance by way of conversion offered either by the public or the Reserve Bank. In addition, the Government retains the right to accept 10 per cent subscriptions in excess of the stipulated figure. The cash subscriptions are expected to account for something like three-fourths of the total offer. It would appear that the prevailing tight condition in the money market, coupled with the high tax proposals for the year, have influenced the decision in regard to the loan figures. It may be safe to assume that the issuance of the two loans will not disturb the existing pattern of yields on other securities.

SAVINGS THROUGH "PEOPLE'S SHARES"

AUSTRALIA HAS hit upon a new form of savings for investment which may provide the urgently needed capital for developmental measures as well as obtain the common man's participation in the economic progress of the country. Low denomination "people's shares" are offered by the State to the general public on attractive terms which have evoked an extraordinary interest in the broad masses of the population for direct association in what may eventually turn out to be a "people's capitalism". Following the amendment of the Nationalisation Act of 1946, the issue, for the time, of such shares of two major nationalised banks has evoked over-enthusiastic response inasmuch as the issue was oversubscribed by some 80 per cent. For the widest possible accommodation, therefore, the authorities had to cut down the maximum value of orders specifying higher nominal values to more manageable levels. It is understandable that a wide sweep of this magnitude would be too unwieldy for voting purposes, which explains the retention, by means of issuing non-voting preference shares, of as much as 87 per cent of the voting stock with the State which owns some 60 per cent of the share capital of the banks. At the same time, a novel structure of nationalised enterprises has come into being in that they include direct private investment.

This new scheme is not confined to one country but has caught attention in some others as well where need is felt for making savings attractive in order to find more and more investible funds. In West Germany, for example, the shares of a large concern, run on behalf of the Government, would be offered for sale, specially in small denominations, and the idea is being projected to stock companies owned by the Government. The scheme, of course, has its inevitable difficulties like the problem of adequate representation of the shareholders, the proper utilisation in productive investment of the sale proceeds, and so on. Whatever the problems may be, they are obviously of secondary importance in the overall picture. The primary objective is of increasing capital formation, which seems to be realisable. For India, all the time groping for financial resources, the scheme holds out the prospect of succeed-

ing to a large extent in tapping potential sources of this type of investment. Perhaps, in course of time, the present high levels of taxation would be rendered unnecessary, without in any way making for a diminution in investments. Indeed, not only would it relieve pressure on this front, but almost certainly it would generate in the people a real feeling of participation in the enterprise of construction, which the leaders of the country cherish so much. Nobody can, however, suggest a large-scale switch-over to the "people's shares". But a modest beginning is worth while, at least in the extension or launching of new ventures.

NEW GREAT INSURANCE COMPANY

IN HIS presidential address at the last annual general meeting of the New Great Insurance Company of India Ltd., Mr. Tulsidas Kilachand has touched upon some of the problems facing general insurance concerns. Among the more important ones is the necessity of a substantial increase in the share of the Indian Insurance Companies' Association Pool in the Government insurance business. This is a genuine demand and deserves a sympathetic consideration and early concrete action. As regards the working of the New Great, the results for 1956 are satisfactory. Except for the Marine department, premium incomes have advanced; the aggregate balance of Rs. 3.40 lakhs at the end of the year shows an impressive increase over the previous year's figure of some Rs. 2.66 lakhs.

After the nationalisation of life insurance in India, insurers have had to confine their business in a relatively much narrower sphere. The altered circumstances, therefore, underline heavily the necessity for general insurance interests to extend their activity both within the country and, beyond its frontiers, in the neighbouring countries. In this context, the revised Code of Conduct is of special significance in developing insurance mindedness. It is a matter of satisfaction that general insurers are largely conscious of their problems as well as responsibilities and are trying to evolve a new pattern suited to the prevailing conditions and needs of the country. For example, the setting up of the India Reinsurance Corporation is an important step towards improving the position of foreign exchange.

FUTURE OF GENERAL INSURANCE

THE CHAIRMAN of the Indian Insurance Companies' Association, Mr. R. M. Desai, in the course of his address at the 29th annual general meeting of the Association, has outlined the details of the possibilities of the expansion of general insurance vis-a-vis India's developing economy, with its inevitable stresses and strains. The primary need of the present time is to earn foreign exchange and Mr. Desai is hopeful about the Indian insurance companies' scope in this direction. Already, the revised Code of Conduct, which came into effect at the beginning of the current year, is expected to be a determined effort to improve general insurance operations. Indeed, the Code will prove fruitful only if it receives the "earnest support of all those who wish that this important business should continue as a free enterprise in the private sector."

One disquieting element, however, for general insurance today is the impending termination, at the end of the current month, of the institution of principal agents. Representations for the continuance of the existing system have been made. In view of the useful link that the principal agents provide between the insurer and the insured, and the peculiar conditions prevailing at the present time, the Government may reconsider its decision and permit the continuance of the principal agency system. This has particular relevance at a time when the future growth and expansion of general insurance, bound as it is with the progress of industrialisation, demands strong units with well trained personnel both in the field and the office.

NEW WINGS TO SERVE INDIA!

Smoother, faster, quieter, so much more comfortable—a whole new experience of air travel awaits you, as Indian Airlines Corporation brings you...the Vickers VISCOUNT!

INDIAN AIRLINES CORPORATION ADDS TURBO-PROP VICKERS **VISCOUNTS** TO ITS FLEET

ABOVE-THE-WEATHER SMOOTHNESS: Powered by four mighty Rolls-Royce turbo-prop engines, the Viscount flies above the weather at 20,000 feet...while you relax in the fully-pressurised cabin as comfortably as in your own home. The swiftest, smoothest flying you've ever known!

A PERFECT VIEW FOR EVERYONE: There's no vibration, no noise in a Viscount flight. You can speak softly, be heard clearly. Luxurious, adjustable armchair seats invite you to r-e-l-a-x; and the world's largest air windows ensure you a perfect view...no matter where you sit!

THE FIRST—AND THE FINEST: Makers of the world's first turbo-prop airliners, Vickers are proud to be supplying India with new wings to fly in her service. Fly by Viscount—and join the thousands all over the world who've discovered how wonderful air travel is!

Company Meeting

THE NEW GREAT INSURANCE COMPANY OF INDIA LIMITED

Speech of the Chairman, Mr. Tulsidas Kilachand at the Fourteenth Annual General Meeting of The New Great Insurance Company of India Limited at Baroda on July 27, 1957.

PRESIDING over the Fourteenth Annual General Meeting of the Shareholders of the Company held at Baroda on the 27th July, 1957, and in moving the adoption of the Directors' Report and Accounts, Mr. Tulsidas Kilachand, the Chairman of the Company, made a brief survey of the existing economic situation. Speaking in particular on the second Five-Year Plan, Mr. Tulsidas felt that the success of the Plan depended, in the ultimate, on the mobilisation of active support and co-operation of all sections of our society. People, high and low, should be enthused into undertaking voluntary sacrifices and accepting certain compulsions. Past experience, however, showed that rigid controls on different aspects of economic life hardly promoted expansion of productive activities, and in this context, the Chairman deprecated the growing tendency on the part of the State to assume ever-increasing functions through a series of legislative enactments and other measures.

In the sphere of finance, Mr. Tulsidas added, the tendency towards over-centralisation manifested itself in the mobilisation of the bulk of the financial resources of the community by the Government through taxes, borrowings etc., a major portion of which was first earmarked for programmes sponsored by the Government, thus placing the non-Governmental Sector at a serious financial disadvantage.

The Chairman also expressed concern at the mounting non-developmental expenditure of the Government and opined that it was essential that the Government should better focus their energies on getting rid of wastage in expenditure through inefficiency. If this was achieved, it was likely that additional imposts for financing the second Plan might not be necessary or at least might be lessened.

Dealing next with the problems facing General Insurers, the Chairman expressed the hope that the revised Code of Conduct would enable most of the Insurers who had yet to develop fully to take advantage of the industrialisation of the country and to extend their activities, both in the Acme market and in neighbouring countries. He also took the opportunity to plead for a substantial increase in the share of the Indian Insurance Companies' Association Pool in the Government Insurance Business.

Before concluding his general observations, Mr. Tulsidas referred to the setting up of the Indian Re-insurance Corporation, financed and managed by General Insurers, and hoped that the successful functioning of the Corporation would be of considerable assistance to the country, not only in reducing the drain on the foreign exchange but also in contributing, in course of time, to the country's foreign earnings.

Dealing with the departmental accounts, Mr. Tulsidas stated that the gross income for the year 1956 was Rs. 64,75,988 in Fire, Rs. 26,63,959 in Miscellaneous Insurance and Rs. 45,60,403 in Marine, whilst the net premiums were Rs. 31,00,407, Rs. 20,68,855 and Rs. 15,34,009, respectively. After providing for losses and expenses, and reserve at 50 per cent in respect of Fire, a sum of Rs. 4,35,426 was transferred to the Profit and Loss Account. The Chairman, also added

that Rs. 1,96,273 and Rs. 1,16,242 respectively were transferred from the Profit and Loss Account to the Miscellaneous and Marine Revenue Accounts.

In the Profit and Loss Account, after providing for the necessary outgo, the balance left over amounted to Rs. 3,40,257. The Directors proposed to transfer to Taxation Reserve Rs. 1,00,000, to Staff Gratuity Account Rs. 40,000, and to pay Eighth Dividend on Ordinary Shares at Rs. 1.50 per share free of income-tax, amounting to Rs. 1,50,000 being at the same rate as last year.

The Chairman also took the opportunity to thank the Company's Agents, fieldworkers, officers and staff for the splendid work that they had done last year.

The resolutions relating to the adoption of the accounts and the re-election of the Directors, Messrs. Gulabchand Hirachand, Ambalal Kilachand, Lalitkumar M. Khatau, Anandlal H. Sheth, Vrajilal Chhotalal, and Mohanlal L. Shah, and the declaration of dividend were carried unanimously. The appointment of Messrs. Dalal and Shah as the Company's Auditors for 1957 was duly approved by the Shareholders.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

Company Meeting

INDIAN INSURANCE COMPANIES' ASSOCIATION

General Insurers Urged to Tap Vast Potential Market

THE view that the progressive implementation of schemes for the economic development of the country was bound to result in a gradual improvement in the general living standards of the people, thereby providing ample opportunities for insurers to add to their premium income, develop new lines of business and improve further the lines they were engaged in was expressed by Shri R. M. Desai, Chairman of the Indian Insurance Companies' Association, while presiding over the 29th Annual General Meeting of the Association, held on Tuesday, the 23rd July, at Bombay. Shri Desai emphasised that in order to explore and utilise the vast potential market, they required strong indigenous units with high administrative standards, capable of rendering efficient service.

Shri Desai stated that a disquieting feature of the national economy was the decline in foreign exchange resources, necessitating the imposition of severe restrictions on imports etc. It would be necessary to step up our exports—both visible and invisible—if this problem was to be tackled effectively and on a long-term basis. In this connection, he mentioned that Indian insurance companies, through their operations abroad, had proved a valuable source of foreign exchange earnings. He added: "There is an excellent scope for our companies to extend their activities still further....and help materially in augmenting our foreign exchange earnings." Referring to the recently set-up India Reinsurance Corporation Ltd., he remarked that it was a happy augury that Indian and other insurers were co-operating in a joint venture which was intended to meet a long-felt want for providing adequate reinsurance facilities to the trade.

Referring to the imminent termination of the principal agency system Shri Desai remarked: "Discontinuation of Principal Agents would have far-reaching repercussions and should be deemed particularly unfortunate at the present juncture when major efforts are under way to put the insurance business on a sound and healthy footing."

The Chairman next recalled how a Code of Conduct was evolved in 1952 with a view to setting up standards and sound practices for conducting the business and an administrative machinery was also created to ensure proper observance of the Code. He said: "...there is an inherent advantage of a certain degree of flexibility in operation under the Code, which a legislative enactment....cannot possess".

Emphasising that the stabilisation of the market on the basis of new standards would imply avoidance of competition among insurers for securing one another's business, for a period of two or three years, the Chairman observed that such a course would create the confidence that no company would lose through adherence to the Code. He urged that at least top Indian units should, besides conserving their business, devote their

energies entirely to creating new business. This would not only reduce wasteful competition, but also help in exploration of new lines of business.

The future growth of general insurance, said Shri Desai, was bound up with the progress of industrialisation and the diffusion of insurance consciousness among the mass of the people. Implementation of economic development schemes would result in a gradual improvement in living standards. This should give "ample opportunities to insurance companies to add to their premium income by developing new lines of business as well as by improving further the lines in which they are already engaged". In this connection, he emphasised the need for a well-organised and integrated market formed of strong indigenous units, with high administrative standards, capable of rendering efficient service.

The Chairman pointed out that with the expanding scope of insurance in India, there would be a growing demand for trained personnel, both in the Office and on the Field, qualified to give efficient service to the insuring public. He said it was very heartening to note that the Insurance Institutes in India were providing the requisite training facilities to insurance personnel and he hoped that the insurance staff would take full advantage of the facilities available. Finally, Shri Desai felt another matter which deserved their earnest consideration was proper publicity designed to spread the "gospel of general insurance" among the people.

COMMODITY NEWS AND NOTES

GROUNDNUTS ARRIVALS IN MADRAS

Summer crop arrivals increased appreciably in South Arcot recently, Villipuram alone reporting about 100 tons of kernels daily. Pucca prices worked out at Rs. 169 to Rs. 170 per candy, (531 lbs.) Daily arrivals in Madras of old winter and new summer kernels averaged 500 bags and prices ruled firm around Rs. 170 to Rs. 172 per candy for summer and at Rs. 165 to Rs. 166 for old winter normal Madras bazar terms. Calcutta interest were actively buying oil for ready and July third week deliveries in Madras and outstations in South Arcot and Tirvannamalia, the total offtake being about 3,000 candies.

PRODUCTION OF INDIGENOUS SUGAR

The production of indigenous sugar amounted to 20.18 lakh tons up to July 15, 1957 in the current season as against 18.53 lakh tons in the corresponding period of last year. The total offtake including quantities despatched for export was 14.93 lakh tons. Stocks with the factories on July 15, 1957 stood at 10.49 lakh tons according to the Ministry of Food and Agriculture, Directorate of Sugar and Vanaspati.

SUPPLY OF WHEAT PRODUCTS TO SOUTHERN STATES

In order to ensure adequate supply of 'maida' and 'suji' to the States of Andhra Pradesh, Madras, Mysore and Kerala, the Government of India has decided to meet the entire requirements of the roller flour mills in these States from imported stocks. As the milling capacity in the four Southern States is somewhat inadequate, the Government of India has further decided to permit roller flour mills in the three wheat zones—namely, the Punjab, Himachal Pradesh, and Delhi, Madhya Pradesh, Rajasthan and Bombay, and Uttar Pradesh—to export 'maida' and 'suji' to the States of Andhra Pradesh, Madras, Mysore and Kerala. The Bombay Government has been advised to fix suitable monthly export quotas for mills in Bombay city for export of wheat products to other parts of the Bombay State and the southern region, after taking into account the requirements of the Bombay city. The Bihar mills are being supplied with wheat from Government stocks, and it is expected that these mills will be able to meet the requirements of Bihar. Assam, Orissa and West Bengal districts will continue to receive supplies of wheat products from flour mills in Calcutta.

TEA IN 1956

Mainly because of voluntary crop regulation in Northern India, and unfavourable weather in Ceylon, World tea production in 1956 (excl. China and the USSR) was 677,000 metric tons. It was just equal to the previous year's output. Production in India, the leading producer, was 301,000 metric tons. The second place was held by Ceylon with 170,400 metric tons. Japan and Indonesia produced 70,700 metric tons and 42,500 metric tons respectively. At 33,000 metric tons, output in Africa increased by 3,000 metric tons due to newly planted areas, and this rise has offset the slight decline in the output of Asian countries.

Sustained demand from overseas markets and expanding domestic consumption facilitated the marketing of crops, though prices at the Far Eastern auctions were generally lower. Exports from producing countries (excl. China) reached an all time record with more than 490,000 metric tons, or 20 per cent above 1955. India, with an increase of 70,000 metric tons over 1955, had the largest share (88 per cent) of the rise in total

1956 exports, although the unit export value declined by 22 per cent. Ceylon exported 162,300 metric tons; 1,400 metric tons less than the previous year. Indonesia and Africa improved their exports at 34,500 metric tons and 28,000 metric tons respectively.

On the importing side, the United Kingdom registered an increase of 3 per cent in net imports at 229,600 metric tons. The continental European countries, Canada, the Union of South Africa and New Zealand all imported more tea than in the previous year, and after an absence of several years from world markets, the USSR bought 4,600 tons from India in 1956. Purchases continued in 1957 and totaled 7,700 tons at the end of March. On the other hand, imports into the United States continued to decline for the second successive year. The main Near Eastern and North African markets—Iraq, Egypt, Sudan, Morocco—had to curtail their tea imports under the impact of the Suez Canal crisis.

INCREASED COAL OUTPUT DURING APRIL

Coal output in the country increased from 3,656,896 tons in March to 3,726,106 tons in April this year, according to information received from the Chief Inspector of Mines in India. Despatches of coal during April were 3,184,079 tons as compared with 3,248,079 tons in the previous month. Coal stocks at pitheads at the end of April were 3,086,772 tons as against 3,004,205 tons at the beginning of the month. During April, 830 collieries were reported to be working with an average daily employment of 352,369 workers. Output per man-shift was estimated at 1.13 tons for miners and loaders, 0.61 ton for all workers underground and in open-workings and 0.41 ton for all persons employed including surface workers. The percentage of absenteeism was 13.70. Nine coke plants at collieries elsewhere produced 376,660 tons of hard, soft and other kinds of coke during the month, and despatched 202,802 tons.

INVESTORS ENCYCLOPAEDIA

1956-57 EDITION

SOME SPECIAL FEATURES

1. Almost all public companies floated till 31st March, 1957, are included.
2. All sections are arranged in alphabetical order.
3. Sectional reviews completely re-written and a large number of new industries now included.
4. Details about Second Five-Year Plan both in public and private sectors elaborately dealt with, and appropriate visual graphs and charts are given alongside.
5. Map of India with the states formed under the S. R. C. Report. Details of about Company Law, Formation of Joint Companies, Income tax and Super Tax, Estate Duty, Securities Control Act, State Enterprises, Control of Capital Issues, Industries (Development and Regulation) Act. In fact all details as to how to set up a new industry.
6. Details of Port Trust, Improvement Trust, Municipal and Government Loans, Agricultural Income Tax, Debenture issues of various public institutions, incorporated.
7. Abstract of rules of the Stock Exchanges in India.
8. All company matters re-written and brought up-to-date.
9. For almost all sections, maps have been drawn showing the location of various industries.
10. Provision of thumb makes reference easy.
11. Balance Sheets received after set up of main body, incorporated in a separate section at the end of the book.

Note: First edition in 1936 had only 168 companies and 369 pages. Now this book gives details of 1,560 companies in 2,329 pages.

BOUND VOLUMES of THE EASTERN ECONOMIST and RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

THE EASTERN ECONOMIST Rs. 75.00

RECORDS & STATISTICS Rs. 18.00

Another D-Day in Delhi

AUGUST 9 or, rather mid-night of August 8-9, is another D-Day in Delhi. At the time of writing, it would appear that the Action Committee of the Posts and Telegraphs Workers' National Federation will launch a strike which, undoubtedly, will affect a large section of the postal and telegraph network in the country. Already there has been a slowing down in that registered articles have not been accepted from August 5. The dislocation will be

severe in many areas. It is not, however, the mere fact of dislocation and the serious waste of energy and effort at a critical time which is at this moment important. There are times when it is necessary to turn away from the event of the moment in order to concentrate on the philosophy and the character of the minds which have made the thought which has made the event. The magnificent unity of the Indian people in these matters is being disrupted; the reasons for this call for a probe more

deep than the acrimonious and inconclusive debate in Parliament in the last week has been able to do. There remains, at the present time, some considerable uncertainty in the public mind as to the rights and wrongs of the present dispute. It is essential that the public, before it throws its weight on one side or the other, should know precisely what is at stake.

In the first place, it must be admitted that most of the members of the P. & T. Department are seriously underpaid in the sense that it is not possible, at the current cost of living, to meet what might be described as their minimum needs. This might look as though it is justification enough for the interim relief which the leaders of the movement have claimed. But, surely, if the principle is accepted that all those whose standards of living are deplorably low must have an increase in real income, relief would need to be granted much more urgently to many others outside the P. & T. Department and, indeed, outside Central Government employees. Central Government employees remain, by and large, the best paid of all Government employees in the country. There are, before their claim can be conceded, other claims of higher priority also to be considered at least on the plane of social justice alone. Again, the admission that standards of living are deplorably low does not give us the resources wherewith to raise them. Those resources must be organized, and then must be augmented by hard work and not by lesser effort such as a general strike necessarily involves. The method by which pressure is being brought to bear on a country inadequately equipped to supply these wants is one designed to lower further our capacity to remedy the disease. Thus it comes about that, though the needs of the men are great and social justice would require some effort to meet these needs, the method of a general strike cannot, even on the proved admission of the necessity to relief, be approved by those who wish to approach this problem in a constructive spirit.

This issue is different from the one which was raised in the House on both sides and, particularly, by amendments suggested by Mr Frank Anthony and Mr M. R. Masani on the Essential Services Bill passed by the Lok Sabha. The point that the theoretical right to strike in a democratic society should not be undermined is admitted; but every strike, like every other action in a society, whose cohesion has to be maintained at any price, must be limited by the breaking tensions of the particular case. There is no fundamental right either to strike or to lock-out. The issues are not merely legal. They are fundamentally moral, and it is immoral for a legal right to be exercised to the detriment of the good of the community. It is always difficult to determine what the good of the community is. But it is broadly recognized that when a small sectional interest is given the right to strike, the admission of the liberty involved contains a spiritual gain against which there can be set the material national loss, leaving possibly a net gain to the community. A general strike stands on a different footing for the theoretical right to strike, which, because of the liberty given, is a spiritual gain, is offset by so tremendous a material loss that the balance-sheet assumes a different aspect. A general strike also curtails the liberty of other members of the community so severely that one can well wonder whether, on balance, liberty is gained or lost in the process. It is wholly wrong to argue on the basis of the fundamental right of freedom of association and of withholding of work that there are no limits

beyond which exercise of such freedoms is reprehensible. A general strike and a minor withholding of labour stand on different ground.

Nor is it possible to support the apparently sound point that Mr Masani made that recourse to the Essential Services Act should only be had if conciliation proceedings had previously been conducted and failed. Since the strike notice precedes the strike by only 14 days, the acceptance of this amendment would have implied that all conciliation proceedings for the purpose of admitting the Essential Services Act might have to be completed within fourteen days. This is an unreal condition to impose in the practical affairs of a large national dispute. The Government was perfectly right to reject this as well as other amendments, and to place on the Statute Book a comprehensive, if severe, measure to protect the community against the general, or totalitarian, strike.

This is by no means derogatory to the fundamental principles of democratic liberty. There is a totalitarian character in the Essential Services Act, but it arises from the emergency; emergencies are essentially things which justify a restriction of democratic liberty particularly in the face of a totalitarian threat. The emergency in the present case, in view of the inflationary character of the present situation, is great enough, in the opinion of *The Eastern Economist*, to justify the action the Government has taken. Indeed, there are many who would hold the view that the Government should have taken this action earlier. There is in the common law of other countries—particularly in the United Kingdom as Sir John Simon showed clearly enough in 1926—a tenor of legislation on this matter not different in principle from the Essential Services Act which has now been put on our Statute Book. A general strike is by its very nature so restrictive of the conveniences of the community and of the fundamental rights of normal citizens to pursue their lawful vocations that it is generally ruled illegal. Thus most democratic countries have argued that a general strike involves a restriction of the liberty of the community so great that democratic principles cannot uphold its validity. There is no reason why in India we should take a different view. In the last analysis, as Bernard Shaw put it admirably in his preface to *St. Joan*, “the degree of toleration attainable in any society is directly proportional to the strain under which it is preserving its cohesion.” Anyone with eyes to see will not underestimate our strain at this time.

Thus it comes about that the public at this moment can be in a single mind as to the manner in which to meet the challenge which has been raised against its convenience and, in a larger sense, against its basic liberties. Now that a Pay Commission has been appointed empowered to deal, if necessary, with interim relief, the issue might be said to have been placed in safe hands. It is true that Government has the technical right to reject the report, but every one knows in fact that public opinion as well as political pressure will compel acceptance of much the greater part of it. In the critical situation in which the country finds itself today there can be no quarrel with the final voice of the executive government which, after all, is responsible both for staying inflation and increasing our production so that our exports can continue to develop without being priced out of international markets. Against the hard facts of our economic life, the nice legal and philosophical argument presented in the debate by the Opposi-

tion on the Essential Service Bill look somewhat thin.

All that is left for us now is to endure stoically the tribulation brought upon us. Whichever way the strike goes, it should be an instrument of dedication and experience to those who feel that this nation, which attained Independence after suffering almost ten years ago, needs yet more

Dialectics in Kerala

THE peaceful professions of the Communist Government of Kerala are just being tested on the touchstone of law-and-order maintenance as disquieting, if not alarming, reports of lawlessness in the State's plantations and factories are coming in. The Chief Minister, Mr. Sankaran Namboodiripad, has denied that a state of anarchy has emerged in recent weeks. In the same breath, however, he has admitted that “the Government have had reports that, in certain instances, direct action (by workers) has gone beyond these (peaceful) limits, satyagraha in front of a factory or a plantation or other institutions has, sometimes, gone to the extent of surrounding the houses of the employer or his staff members, preventing them and even their family members from going into or out of their houses for their normal, daily, peaceful life.” In the light of this admission by the Chief Minister himself, the reports given by others may have to be taken as substantially true after allowing for an element of inevitable exaggeration in them. That this manifest lawlessness is probably due, in some cases, to the aggressive attitude (in the context of existence of a Communist government) of Communist labour unions towards the rival trade unions on a particular plantation or factory, may also be inferred from a reliable report from Kerala. This deterioration in the law-and-order situation appears to have flowed from the State Government's policy regarding the role of the Police in what is prematurely thought of as “the new order of things”.

This is the background against which the Chief Minister's recent law-and-order statement has to be examined. The long statement does not sound like a laboured apologia; if anything, it is a bold and frank re-affirmation of his Government's policy regarding the role of the Police in the maintenance of law and order. This much credit is due to Mr. Sankaran Namboodiripad although none is due to him for the policy itself which is at the bottom of the mischief. In spelling out the details of this policy, the Chief Minister has distinguished the role of the Police in tracking down crimes from its role, since Independence, in restricting the activities of “certain democratic parties”, particularly the Communist Party. It is not difficult to see the specious logic behind his implied contention that the violent, insurrectionary activities of the C.P.I. following its Calcutta Congress of 1948 were ‘legitimate’ and ‘democratic’. If this logic is applied to the proclaimed determination of the Chief Minister to change the rules and practices so that “the Police will not be allowed to use the provisions of law and the duties of maintaining law and order in such a way as to suppress or restrict the democratic activities of any political party,” it is again not difficult to see that the Communist Party in Kerala has the greenlight to engage itself in activities which are ‘violent’ or ‘coercive’ or ‘undemocratic’ only by ‘bourgeois’ standards. This

trial and tribulation out of the national discipline and subordination of self to the good of all can grow. Perhaps, in the wisdom of Providence, this has come upon us because the national character is unworthy at this moment of facing the destiny which was assigned to us in the great chapter of the Gandhian Age. We will have to find ourselves anew; perhaps this is the way.

is not an insignificant inference to draw from the Chief Minister's policy statement.

An even more significant inference could well be drawn from those elements of policy concerned with the role of Police in “such things as strikes of workers, peasants' struggle, students' agitation and such other people's movements.” While recognising that “the right of toiling classes to resort to collective bargaining” should not involve “violence either to the person or property of the individuals and families of the owning classes”, the Chief Minister has given the assurance that the Police will be ordered to intervene if direct action should go beyond peaceful limits. In other words, the Police will intervene only after violence and intimidation have had their intended effect. To prevent violence from taking place is one thing; to appear to deal with it after it has taken place quite another—like the locking of the stable door after the horse has been stolen. In denying protection to the ‘owning’ classes so as to prevent violence to their person and property, the Chief Minister has advanced the plausible plea that the Police force might be used by them “to suppress the activities and movements of the toiling people.” The employers cannot expect Police help, continues the policy statement, in working a factory, or plantation, or other institution against the declared will of the workers, who have resorted to collective bargaining, and to strike and other forms of direct action.

On the other hand, they are expected “to adopt a policy of recognising the unions, carrying on collective bargaining and settling all industrial disputes through them.” In the context of intimidation to which rival trade unions are being subjected by the Communist unions—an intimidation that cannot be prevented by the Police in view of the ‘neutral’ role assigned to it—the expected recognition of trade unions by employers would, in effect, mean recognition of Communist unions to the exclusion of others. In the light of the first inference concerning “the democratic activities” of the Communist Party, the real aim of that Party in Kerala appears to be to eliminate the influence of moderate and thus genuinely democratic parties in the trade union field with the connivance of the Government. The two most significant inferences drawn here from the Kerala Chief Minister's law-and-order policy statement should be sufficient to convince anybody that the Communists are not playing cricket. But the public, cricket-loving or otherwise, will not be deceived. If “normal” protection of life and property is not maintained, enterprise, private or public, will disappear. Will the Central Government acquiesce in this philosophy or in the dialectics on which it is sought to be justified?

The Industrial Mission

A DELEGATION of leading industrialists from this country is visiting Europe and America on an important mission at a juncture which is certainly critical for us. Because the mission is of vital national importance its progress is bound to be followed with keen interest. The domestic economic situation has gone on changing with such speed in the course of at least the last three quarters of the year or perhaps more that it could not but produce a chastening effect on the mood of the people. A realistic attitude towards the second Plan is now being adopted. The country has run into foreign exchange difficulties which have put a brake on the pace of the development programmes. The acute turn which the foreign exchange problem has assumed has probably taken the country unawares. Nevertheless, its impact on our progress has caused much sound rethinking on the question of resources for the Plan and its size. There is now much greater and more frank appreciation than ever before of foreign collaboration and assistance in the execution of several important projects in the Plan. The bias regarding foreign investment is disappearing and a healthy outlook on mutually beneficial co-operation is being readily accepted. This augurs well for the delegation since the new attitudes give it the moral support of the country.

The Mission is going abroad undoubtedly for the purpose of building as well as renewing industrial contacts in order to create a broader base for economic co-operation between India and other friendly countries. But in a sense an important part of its functions will be to perform the job of public relations. Much water has flowed down the bridge in recent months and the necessity has arisen to interpret the economic situation in this country in an objective manner. This task has become all the more urgent inasmuch as the change in the foreign exchange situation has given rise to a variety of impressions not least among which identifies it with a situation of crisis. This picture has been overdrawn and the delegation will need to explain the position with reference to similar situations in recent times in some other countries. Not a little persuasion will be needed to convince other countries of the firm and drastic steps which the Government of India has taken to correct the situation. These measures ought to suffice to show that this country is prepared to accept its own responsibilities before it seeks assistance from outside.

The non-official character of the delegation gives it complete authority to act as a free spokesman of the private sector. The object of the delegation's visit is to acquire first-hand knowledge of the latest conditions of the international markets, both in relation to imports and exports, in order to assess what adjustments India needs to make in her own dealings with them. But of greater significance than this object will be its function of seeking collaboration from private enterprise in foreign countries in the execution of individual industrial projects. This collaboration will obviously take the form of direct private financial assistance as well as supply of technical know-how. Both are vital for the sound growth of Indian industry, but in the current context the need for financial assistance is

greater. More specifically, the pressing problem at the present time is one of securing imports on the basis of deferred payments. It involves different considerations all of which are not necessarily within the control of private enterprise in this country to satisfy. In part, they depend upon such incentives and policy measures as the Government can provide.

Mr. G. D. Birla, leader of the delegation, has uttered a word of caution against too much optimism regarding the outcome of the delegation. Mr. Birla's attitude of caution is not difficult to appreciate. In a sense, the function which the delegation will be called upon to perform will be one of arguing the approval and acceptability of the Plan in the context of the economic policies pursued by the Government. This is by no test an easy task. The obstacles that will need to be surmounted are now fairly well known. The central objective of the Plan to double the national income on the basis of 1950-51 by 1967-68 and to double the per capita income on the same basis by 1973-74 is accepted by informed critics as not ambitious. What is objected to is the profound bias of the Plan for heavy and producer goods industries at a great cost of consumer goods industries. In the short run, the strain on domestic investment will be very severe and very acute problems of foreign currency would have to be confronted. This prospect, in the opinion of expert critics, is one which India can hardly afford to stand up against. A democratic framework of government rules out the possibility of imposing severe self-denial on the masses of the people whose living standards are already low.

In so far as the economic policy of the Government is concerned, the main criticism is directed against taxation policy which would act as a disincentive to the foreign investor. Besides this central obstacle, the trend of the entire recent economic legislation is viewed abroad as aiming against free operation of the private sector — free in the reasonably accepted view. Regulation of private enterprise as embodied in the Industries (Development and Regulation) Act, the Companies Act, and so forth, is considered as unwarranted intervention in normal operation. Critics have emphasised that assurances of flexible interpretation and application of the laws would be of little avail. Their contention is that since they have to take a long view of their investments, under a changed set-up the same laws might be used to stultify free enterprise carries force.

A large number of the countries to which India looks for supply of credit or direct export of capital are themselves called upon to face new and emerging situations of balance of payments difficulties and inflationary pressures within. Restraints are being applied to bank credit involving a steepening of interest rates. This makes suppliers' credit costlier than we would expect. Although some European countries including West Germany may be inclined to assist India with export credit, our main hope for securing credit centres upon the United States which alone has a potential surplus to spare. Expectations of success in the endeavours of the delegation should be pitched at a moderate level; there is no reason why pessimism here, as elsewhere, should hold the ground.

I'm in harness

by Adipocere

(Pronounced 'adi-po-saire')

They tell me that once I have been found, it takes 30 years for those who have spent their time, money

and energy to equate their investment. What an important person I appear to be!

An enormous structure, called a Drilling Rig is now the centre of all attention, and the operation of drilling commences. They say that drilling oil wells is a highly technical business requiring complex expensive machinery and men of specialised skills.

Day by day, and hour by hour the oil-finders come near me, until at last I gush out and make a lot of noise at the taste of fresh air and try to escape... but these men are persevering and I am channelled into a maze of pipe-lines as they feel that I should now be "Refined," in other words, become a Gentleman. So, I undertake a journey to a huge gigantic structure called an Oil Refinery.

STANVAC — the name that stands for progress

PSSVOC-47/57

You couldn't be in better hands!

I.A.C. gives its staff an extensive and carefully planned training so that you may enjoy air travel to the utmost!

The Hostess who looks after you is a perfect example of I.A.C.'s excellent service to air travellers. Noted for her charm and willingness to be of service, she always has a pleasant smile, a friendly and reassuring manner which puts you at ease immediately. Her training teaches her to be highly proficient in an unobtrusive way; and while she is willing to participate in passengers' conversations, she never intrudes.

The I.A.C. Hostess works efficiently and cheerfully. She is taught to serve food with finesse for five or forty-five. And wherever her duties with I.A.C. take her, she is at all times, in all places — helpful, knowledgeable and completely at your service.

She is typical of the staff of I.A.C.

You couldn't be in better hands.

DEVADAS GANDHI

THE SUDDEN demise, following an attack of coronary thrombosis, of Devadas Gandhi, the youngest son of the Mahatma, removes from Indian journalism one of its most powerful leaders and, from the public life of the country, an unstinted worker in many fields. Devadas Gandhi was known to be in ill-health for some years, but he continued to drive his emaciated frame to accomplish the numerous tasks to which he had set his hands. Offices he has held, sometimes more than once, included the Presidentship of the All-India Newspaper Editors' Conference, the Chairmanship of the Press Trust of India, and of the Indian and Eastern Newspaper Society. He was also the Managing Editor of "The Hindustan Times" since 1940, and it is here that his monument has been well and truly laid. Under his guidance "The Hindustan Times" in the last twenty years, has made itself the leading paper of North India and with "Hindustan," its Hindi version, has acquired great influence, particularly in Congress ranks over the whole country.

Few of those who have known Devadas Gandhi have been unaffected by his charm of manner and his singular devotion to duty. His passing has evoked profound tributes which are well deserved. Indian journalism, which has not been very successful in creating leaders of his stature, will deeply feel the loss. "The Eastern Economist," of which he was Managing Director since the formation of the Company, also owes him a deep debt of gratitude.

CRISIS OF COMMUNITY DEVELOPMENT

THE COMMUNITY development programme is yet to become a real "people's programme". This much is clear from Mr. S. K. Dey's refreshingly frank speech in the Lok Sabha. The Minister for Community Development has made the candid admission that "efforts to interest the people at large actively in community development have failed." "Without the co-operation of the people", he continued, "the government might be able to push ahead development but it would not be community development." The hope expressed by Mr. M. L. Wilson (Ford Foundation Consultant) last year that community development as an 'administered government programme' might well become a real 'people's programme' is yet to be fulfilled. It may yet become a full-fledged people's programme because, in the words of Mr. M. L. Wilson, "any government that is so forward looking as to have a continuous evaluation process going on outside of the legislative and administrative functions is most likely to succeed in its objectives." Mr. Dey's own remark that "his Ministry is constantly engaged in a merciless and ruthless criticism of itself" augurs well for the future of community development as a 'people's programme'.

Mr. Dey has tried to explain why it has not been possible to enlist people's participation or co-operation to the desired extent. The Union Ministry of Community Development is helpless in the matter of implementing even those schemes the cost of which is shared by it and the State Governments because the latter "have no tradition of working through the people". The Ministry has also "found difficulties in people's institutions" like panchayats and co-operatives. Here Mr. Dey's seems to be an under-statement in deference to the sensitivity of Congress leaders who have a touching faith in panchayats. He has, however, made the significant point that "it is not possible to establish

THE WEEK'S NOTES

healthy panchayats and co-operatives unless land reforms are effectively implemented". But how are these land reforms, in their turn, to be implemented? The second Plan which has formulated a formidable land reform programme has also assigned a crucial role to panchayats and co-operatives in the enforcement of land reform measures. These measures are so controversial and disruptive of agrarian harmony that they, in their turn, are bound to produce local frictions which, again, will get reflected in the panchayats and co-operatives. These people's institutions will thus have their class squabbles, besides the traditional local feuds caused by caste differences, and these will render them largely ineffective in the matter of constructive pursuits connected with community development and the like. Mr. Dey's expectation that healthy panchayats will result from land reforms may not, after all, be fulfilled. If anything, they may become still more unhealthy and confirm afresh Dr. Daniel Thorner's finding that "to approach the goal of rural economic development through the agency of the existing Village Panchayats would appear to be an exercise in frustration." The Community Projects Administration might have to evolve its own popular institutions by trial and error without relying on the Panchayats which "are not today tried and tested instruments for furthering India's economic development."

LIGHT ON SOVIET INDUSTRY

ABSOLUTE FIGURES of Soviet industrial production which, in some ways, has been something of a mystery so far are available for the first time in an official statistical publication — "Industry of the U.S.S.R. — Statistical Abstract", Moscow 1957. Some key statistics of Russian Industry, just available in Delhi, pertain to the years 1928, 1940, 1950 and 1955 and cover different groups of industries. These groups are fuel and power, iron and steel, chemicals and fertilisers, building materials, agricultural machinery, electrical equipment, general engineering, vehicles, earth-moving equipment and consumer goods. Figures for 20 selected industries are given below to bring out the relative progress registered between 1928 and 1955 by consumer goods and other industries:

Industry	Units	1928	1955
Cotton Fabrics	mn. metres	2,678	5,904
Wool	"	86.8	251.0
Footwear	mn. Pairs	94.3	405.6
Soap	'000 tons	311	1,075
Coal & Lignite	mn. tons	35.5	391.0
Crude Oil	"	11.6	70.8
Electric Power	'000 Mn. Kwh	5.0	170.1
Pig Iron	mn. tons	3.3	33.3
Crude Steel	"	4.3	45.3
Fertilisers	'000 tons	135	9,629
Caustic Soda	"	58.6	563.4
Cement	mn. tons	1.8	22.5
Turbines	'000 KW	44.1	5,561
Generators	"	75.0	4,526
Ball bearings	million	"	218.0
Machine tools	'000s	2.0	117.1
Motor Vehicles	"	0.7	445.3
Tractors	"	1.8	321.8
Excavators	number	"	5,250
Bulldozers	"	"	7,511

mn — million. Tons are metric tons.

It may be seen from the above figures that production of such articles of universal consumption as cotton and woollen fabrics, and footwear and soap had

increased by two to five times since 1928 whereas other industries (heavy or producer goods) have increased their production by more than 10 times. This phenomenal progress of industries other than consumer goods explains the present lack of balance between heavy, light and consumer goods industries in the Soviet Union.

It may be recalled that the question of consumer goods production which alone is of relevance to the real standard of living of the Soviet people had figured prominently in the struggle for power among the top Communist leaders since Stalin's death. One wonders what type of consumer goods Mr. Malenkov had in mind. If it was the group of essential consumer goods like cotton, linen and woollen fabrics, stockings and socks, leather and rubber footwear, paper and soap, there was certainly a pressing case for increasing their production. If it was the group of luxury consumer goods, there was, it appears from the figures, no case for increasing their production at the expense of the essential needs of the agricultural and industrial proletariat of the Soviet Union.

Statistics of production of luxury consumer goods bring to light in this connection a lack of balance between the growth of production of such goods and of the more essential consumer goods. The production of silk fabrics, for example, has increased from 9.6 million metres in 1928 to 525.7 million metres in 1955; clocks and watches from 0.9 million in 1928 to 19.7 million; radio and television receivers from 161,000 in 1940 to 4,024,000; domestic refrigerators from 3,500 in 1940 to 151,400; domestic washing machines from 300 in 1950 to 87,000; domestic sewing machines from 286,000 in 1928 to 1,611,000; and cameras from 355,200 in 1940 to 1,022,500. Although the increase in production of these luxury consumer goods has been spectacular, it is perhaps not sufficient to cater to the needs of the entire privileged class in the Soviet Union. At this rate, how many five-year plans will be required to make these goods available to the under-privileged classes in the land of Socialism?

PRODUCER GOODS Vs. CONSUMER GOODS

THAT THE first Plan gave progress without strain is a matter of great satisfaction. The usual tears accompanying planning are greatly an outcome of shift in emphasis upon different sectors of the economy consistent with plan priorities. For the purpose of building a sound base for economic development, the producer goods sector receives greater attention in comparison with consumer goods. It will be of interest to have a comparative appraisal of the progress made by industries in these two sectors in the course of the first Five-Year Plan. According to the progress report of the first Five-Year Plan the production of capital goods increased by about 70 per cent. The production of intermediate goods, mainly industrial raw materials, increased by 34 per cent. And so did the consumer goods. The overall increase in industrial production amounted to 38 per cent. In the context of the importance of different industries in the economy of the country the higher rise in the case of capital goods appears deceptive. Capital goods are assigned with a weight of only 7.46, as compared to 43.81 for intermediate goods and 48.73 for consumer goods. In this connection a detailed study of the progress in industrial production made during the five-year period will be enlightening.

The production of mill-made cloth increased by about 37 per cent, from 3,718 million yards in 1950-51 to 5,102 million yards in 1955-56. In this case the plan target was exceeded by about 400 million yards. The production of sugar which stood at 14.94 lakh tons in

1951-52 rose to 18.56 lakh tons in 1955-56, showing a rise of 24 per cent. Paper and paper board, another consumer goods industry, recorded a rise of over 40 per cent during the Plan period. The progress made in producer goods, although impressive in percentage terms, is, however, slower in comparison. The production of aluminium, for example, which stood at 3,848 tons in 1951 arose to 7225 tons in 1955. Finished steel showed an increase of 184 thousand tons, from 1,076 thousand tons in 1951 to 1,260 thousand tons in 1955. Cement of all the producer goods, recorded an impressive rise from 3,196 thousand tons in 1951 to 4,487 thousand tons in 1955. The production of coal rose by about 11 per cent in the course of 1951-1955. In the private sector, in some of the producer goods industries, progress in the establishment of additional capacity fell short of anticipations in the plan. This was markedly so in the case of iron and steel, aluminium and nitrogenous fertilisers. The progress of modernisation and replacement of plant and machinery, an economic over-head according to Mrs. Ursula Hicks, has been slower than was expected, the expenditure on this account being estimated at Rs. 110 crores as compared to the plan estimate of Rs. 150 crores.

In the light of this study the first Five-Year Plan was rather on the cautious side as regards shift in emphasis from Consumer goods to producer goods industries. And that precisely explains the circumstances in which the economy was not stretched out. The second Five-Year Plan, on the other hand, has decreed a bias in favour of producer goods industries. The effects of this are being felt in the very second year of its working. The recent pressure on the price line holds testimony to the altered circumstances.

A Window on the World

HELL

By

ODYSSEUS

I HAD A NIGHTMARE last night in which it was revealed to me that the Satanic authorities have long ago discarded flames and boiling oil. Today eternal damnation is more subtle. For his sins, the individual is condemned to study the particular problems of this world that interested him in life. He is not permitted the national prejudices and human emotions that confused his study in life, but is compelled to apply cold logic. That this is the refinement of torture will be appreciated by anyone who reflects what a painful operation it is to strip from an average man the popular illusions which he has absorbed from childhood upwards in a particular era and place.

In my nightmare I was sentenced to join the Standing Hellish Committee which concerns itself with international relations as they affect India. I found its members engaged in a debate on Muscat and Oman.

The chairman fixed me with a steely eye and said: "what are India's interests in Muscat? What is the Muscat problem? How would you solve it?" I replied: "India has no interest in Muscat, save her general interest in peace everywhere. The problem arises because the British have illegally interfered in the domestic affairs of the Sultanate. The solution is for the Arab peoples to get together to decide on a common attitude towards the Sultan and the British." I was pleased with this reply which seemed to me neatly to sum up what I had read in the press. My words were, however, greeted with laughter. In the course of the next twenty minutes the hellish viewpoint on India and Muscat was driven into my quivering soul. Here it is:

History has shown that India is liable to invasion by land over the Burma frontier on the North East and over the old North Western frontier (in the safety of which India retains the same stake even though political control is now with Pakistan). History has also shown that whatever power controls the Indian Ocean (and the approaches thereto around Indonesia in the East, and the Suez Canal, Red Sea, and Persian Gulf in the West) has in the first instance India's seaborne trade at its mercy and, in the second India's very independence itself. The Aryan speaking peoples, and the various Mughal and Pathan waves, broke over the North-West, while the Japanese attempted the North-East and were blocked there in World War II. Among the factors leading to the break-up of the Mughal Empire and to the inability of the Hindu successor states to fill the power vacuum thus created (remember we are in hell where they compel us to use these horrible terms) was their failure to develop sea power to prevent the Portuguese, Dutch, and finally the British, from monopolising India's maritime commerce and eventually from conquering the sub-continent from the sea.

By the early nineteenth century, the British had established themselves in India. By land, between them and the Russians, the major power capable of threatening India, lay a vast, sparsely populated, loosely and locally ruled no-man's-land, stretching from Mongolia in the East, through Tartary in central Asia, to Persia in the West. Some people today profess to dismiss Britain's nineteenth century apprehensions of Russia as an unfounded obsession. This overlooks the historical

facts that in a series of pushes Southwards and Eastwards from 1734 to 1896, the Russians conquered an enormous colonial land empire. Kazakhstan, Uzbekistan, Tajikistan, Kirghizia and Turkmenia — to name but the central Asian conquests alone — cover an area bigger than India before partition. From about the middle of the nineteenth century, the broad policy of the Indian government was to stabilise the eastern frontiers, and to safeguard the continued independence of Iran and Afghanistan against Russian expansion.

To seaward, the Indian government found it necessary to suppress piracy and slave-trading in the Indian ocean, especially along the coast of Arabia from Aden, along the Hadramaut, Oman, Muscat, and into the Persian Gulf, and to promote stability in Arabia against the southward expansion of the Turkish Empire.

The success of the British in attaining these objectives ensured the peace and security which prevailed in the huge area from Aden to Singapore for over a century. One result of this was to condition the average Indian to the comforting illusion that India's freedom from foreign invasion, the stability of her frontiers and of her far-flung bastions in southern Arabia on the West and Malaya on the East, are parts of the natural order, as solidly and eternally established as the Himalayas. The truth is that now the British have left India, the responsibility for suppressing piracy and slave-trading, and for bolstering the stability of neighbouring states in areas essential to India's political freedom and economic prosperity, has devolved on India. And since for decades to come India will not be strong enough to police this area by herself, she will not keep her independence unless she seeks to collaborate with other powers whose interests in these areas coincide with hers.

There are still too many people who believe that the threat to India from Russia in the nineteenth century arose because Britain was an imperialist power seeking to protect her Indian Empire and that now that British imperialism has been removed from India, the threat from Russia automatically disappears because independent India is peacefully minded and free from imperialist provocation. This (the Standing Committee in Hell pointed out to me) is nonsense. Russian imperialism was not attracted southwards by desire for battle with British imperialism, but because that was the direction in which it found peoples too weak to defend themselves and without powerful friends ready to come to their aid. The Russian expansion ceased only when it came up against a power strong enough to halt it. Whether that power was British as in the nineteenth century, or is to be Indian today, is immaterial provided it is strong enough to defend its frontiers, with or without allies, against encroachment.

The British are friendly to India for many reasons, one of which is that, like India, they are a great sea-trading nation, and they have a common interest with India in ensuring that their ships traverse the Indian Ocean unmolested. But British power in the Far East, the Indian Ocean, and the Middle East has declined and since, so far, the withdrawal of British power has been viewed with equanimity by India, the net result has been increasing restlessness on all India's outposts from

Indonesia to Arabia. What is not realised (they pointed out acidly to me in my hellish nightmare) is that as British influence in these areas is undermined, so is India's safety. The departure of the British from Suez may be a slap in the face for the British, but it is also one in the pants for India's political freedom and economic interests. If anyone thinks that Nasser thinks that he has a vested interest in a free and prosperous India, they will not have to wait more than a few years (at most) to find out their error.

A remarkable fact which has passed without audible expression of indignation in the free world is that now that the British navy has been forced to abandon its practice of inspecting suspect ships in Arabian waters in order to prevent the slave trade, this cruelty of man to man has re-emerged for the first time in a hundred years.

I have not the space to expound in detail the premisses on which these hellish arguments are based, but the Standing Committee suggested that when I returned to this world, I should read "India and the Indian Ocean — An Essay on the influence of Sea Power on Indian History" by K. M. Panikkar (Allen and Unwin, 1945), "Soviet Empire" by Olaf Caroe (Macmillan, 1953), and "The Foundations of India's Foreign Policy: 1860/1882" by Bisheshwar Prasad (Orient Longmans, 1955). Although Mr. Prasad sometimes creates the impression that there would have been a vast difference in India's foreign policy if it had been in Indian, instead of British, hands in 1860/1882, that was not the view taken in Hell, where they insisted that whoever had been in charge in the nineteenth century would (or should) have sought to halt Russia's advance and to secure peaceful passage in the Indian Ocean. The point becomes clearer if, for example, wherever Mr. Prasad writes that the object of policy was to protect "British commerce", we substitute "Indo-British" in the nineteenth cen-

tury and "Indian" at the present time.

Hell's authorities declared that it confuses the contemporary issue to assert that there is no threat of a communist invasion in the Middle East, that communism as a crusading creed has lost its vigour, that economically and socially many Middle East countries are not advanced enough for the spread of communist ideas. The basic danger is not the existence of communism but of a power vacuum into which an outside power will inevitably percolate. Its ideology is irrelevant. What is relevant is (a) its power and (b) the local people's weakness in relation to it, and above all (c) to ensure that this power is friendly to India.

It was not the contention of the Hellish Committee that the moral of all this is that Britain has a special right to keep armed forces in the Middle East with a view to maintaining the political and economic status quo for ever. History never stands still. Powers rise and fall as best they can. No nation which shows itself incapable of maintaining its position in the struggle for survival has a right to survive. No, the moral is that all those interested in the prosperity of a given area must join their political and economic forces together to try to ensure that changes come about gradually, peacefully and with the most benefit for all concerned, as opposed to brutally and catastrophically. A country which fails to recognise its international responsibilities and tries to contract out of making its contribution to upholding, with the help of its friends, its overseas interests, and likewise of rendering its share of aid to those with similar interests, will see the old familiar and re-assuring frontiers disappear one by one, until it wakes up to find — at this point I myself woke up. My nightmare was over. I returned to this carefree India and saw how absurd these arguments are. I may be an ostrich but it is cool and pleasant to have one's head in the sand in these hot days and troubled times.

THE WEST GERMAN ELECTIONS

(From Our Special West European Correspondent)

PARIS, August 3.

THE elections to the West German Bundestag are to take place on September 15 but so far the campaign has not aroused much popular interest. It is summertime, everyone in the Federal Republic is prosperous and can afford holidays, most people feel that, whatever happens, Konrad Adenauer is bound to be Chancellor again after September 15; so one has to be fanatical about politics to bother attending a meeting. The campaign slogans are scarcely inspirational: "Peace, Unity and Prosperity", says the Chancellor's Christian Democratic party, and one feels that the first two abstractions were just thrown in to make the third very solid reality seem more respectable; "Against Atomic War", says Ollenhauer's Social Democrat party, and this is not political because no one disagrees with it; "Vote Right to Maintain the Balance", says the extreme-Right German Party, and this is political enough but rather obscure.

Foreign governments are seeking to intervene in the campaign by making supposedly spectacular pronouncements on the future of German unity. Ten days ago the East German Communist Premier, Herr Grotewohl, produced a half-baked plan for a federation between the two German republics, a Moscow-inspired political stunt that was so patently insincere and impractical that it failed to have any propaganda effect. A week ago, the Western Powers issued a "solemn declaration" on reunification which just re-hashed the familiar Western case for doing nothing about it. And in the next few days the Bulganin-Khrushchev circus is to make a brief stand in East Berlin, when no doubt the Russians will again seek to disguise their intention to maintain the status quo by making obviously impossible suggestions for changing it. None of these interventions will have any effect because reunification is not a live issue in these elections and probably will not become so in the four-year life of the parliament shortly to be elected.

The West Germans are now reconciled to the fact that the country is to stay divided indefinitely. The main reason for this is that the Russians are well content with the present situation, for they have resigned themselves to accepting West Germany's membership of NATO, which has plainly done nothing to increase the insecurity of the Communist bloc, whereas reunification and the liquidation of the East German republic would involve total reorganisation of the much shaken Warsaw alliance. While continuing to pretend to seek German unity, it is better for the Communists to leave matters as they are, and the limit of Russian ambitions is now to secure the recognition of the puppet regime in Potsdam as the equal of the Bonn Republic. Once the Russians have taken this line, there is nothing any power on earth can do to promote German reunification, so the question just fades out of the field of practical politics. Moreover, in West Germany itself it is increasingly common not even to wish verbally for reunification: the country is economically prosperous and politically stable, and the entry of 18 million "lost brothers" from the Communist state would throw all of this in doubt. So to many West German electors, reunification appears not only impossible but not especially desirable.

Foreign affairs being thus ruled out, the election issues are narrowed down to internal social questions. And here the Adenauer regime has the immense ad-

vantage of the continuing boom. A Government that has made West Germany the richest country in Europe, that has secured a persistent 12-16 per cent yearly increase in output, that has given all classes better housing than in 1939, that has filled the shops with goods at stable prices and that has obtained a modest but steady rise in the workers' living standards should have little to fear from a confrontation at the polls.

True, the Gallup pollsters predict that the Social Democrats will obtain about the same proportion of votes (40 per cent) as the Christian Democrats. But the remaining votes will go to smaller Right-wing parties with whose purchased co-operation Dr. Adenauer can manage to form the new Government even if his own party fails to get an absolute majority. And once Adenauer is Chancellor, the course of West German politics is set, for the Chancellor has shown that he can pursue the same sort of policy with variously constituted majorities. Dr. Adenauer is now aged 81, but if he has to pass over the reins of power during the life of the new parliament they will probably pass to his present Finance Minister, Fritz Schaeffer, whereupon no notable change would occur in the Republic's domestic policy.

The Social Democrats, despite their considerable support in the electorate, lack dynamic leaders and an original policy such as could woo votes away from the Government coalition in the middle of a boom. The most they can hope for is that the clarification of the political scene and the rising cost of election campaigns will this time wipe out the smaller parties and leave West Germany in the position of Britain and the United States, with two and only two serious political parties. In these circumstances four years' of service as King Konrad's Loyal Opposition might prepare them for victory in 1961. These limited prospects are an interesting reflection on the German political temperament, because the economic prosperity of the Republic does contain features that would certainly be exploited by a Leftist party in most other countries.

The chief of these is that West Germany's boom has undoubtedly benefitted the workers less than the owners of capital, so that although the workers are better off absolutely they are not so relatively. Since 1950 the number of wage-earners has increased from 17 to 20 millions, but their share of the national cake (admittedly an expanding cake) has fallen from 36 per cent to 32.5 per cent. You might think that as long as the workers are better off in absolute terms, they should not worry about the disproportionate gains of employers, especially since these gains are devoted to re-investment and not to socially offensive conspicuous consumption. Jealousy about relative gains when everyone is admittedly getting richer seems to be the sort of low consideration we could leave to British socialists. But this disproportion is a serious matter, envy quite apart, and indeed it lies at the base of West Europe's present economic unbalance.

This is because, while West Germany is producing more than her neighbours, her workers — who naturally are the bulk of the population — are consuming less than their neighbours. This is reflected in West Germany's astronomically favourable trade balances, which have filled the German banks with gold, dollars and every sort of European currency while EOEC and the French Republic have to come cadging loans so that they can go on buying West German exports. The

FLY TWA SUPER-G

FIRST CLASS

Ambassador Service

TWA/6189

origin of this situation, which could soon become critical for all West Europe including West Germany herself, is that in the Federal Republic only 56 per cent of the national product goes to private consumption, against an average of 67 per cent in the rest of Europe. Average annual private expenditure by the West German is only 1,543 marks, against 2,605 for the Frenchman and 2,564 for the Briton. Although the West German works harder (a 47-hour week), he gets paid less; West Germany has only one fourth as many TV sets as Britain and only one third as many motor-cars. (This last-named deficiency does not stop the Germans having more road accidents than any other people in the world, mainly because the road network has hardly been developed since Hitler's days).

Thus because of under-consumption in relation to their output and in relation to their neighbours' habits, the West Germans are finding their way back to the traditional German economic system, and to the economist this is not so different from the Hitlerite economy. Heavy industry (heavily cartelised, as always in Germany) has expanded 2.4 times in seven years, while consumer goods industries have expanded only 1.7 times. The economy thus becomes bottom-heavy, with heavy industry producing a greater value of goods than

all other industries combined and being obliged, because of inadequate consumption within the country, to export 60 per cent of its output. German industries thus secure a dominating position in foreign markets, especially in West Europe, they drift toward tighter concentration and continue to pay low wages.

A Social Democrats party less dazzled by the financial and technical skill of the capitalists, and less servile than the German working class, would find here matter for agitation, and they would be supported by all of West Germany's neighbours. The healthiest thing for the West German economy and for the country's trading partners would be higher wages at home, more emphasis on consumer industries and imports, some emulation of the French taste for high living and even of the British worker's class envy. The loans that the Federal Republic is now negotiating (£90 million to the French and a £350 million credit to EOEC) will alleviate but not resolve the difficulty. It is as urgent for the Germans to learn to live up to their means as it is for the French to learn to live within theirs. But this consideration does not seem likely to play any part in the current West German election campaign.

A TOWER OF STRENGTH

in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

B.O.A.C. PROUDLY PRESENTS THE

Britannia

JET-PROP AIRLINER

NOW IN SERVICE!**TO THE U.K., FAR EAST
AND AUSTRALIA****Fastest, smoothest, most spacious
jet-prop airliner in the world**

Meet the *Britannia*—the spaciousness and size of this magnificent jet-prop airliner will astonish you. It's so smooth in flight at over 6 miles a minute, you'll find it hard to believe you're moving at all. B.O.A.C. *Britannias* are radar equipped to ensure fair weather flying all the way. De Luxe First Class or economical Tourist services. **BOOK EARLY!**

For information and bookings consult your local Travel Agent or any office of B.O.A.C. at Bombay, Calcutta, Delhi and Madras.

WORLDGRAM

AGRICULTURE

Raising Jowar and Wheat in Rotation: Two high-yielding crops — 'jowar' followed by wheat — have been successfully raised in rotation within a year on a plot of land, after adequate use of fertilizers, in the Indian Agricultural Research Institute, New Delhi. An important method of increasing per capita and per-acre agricultural production, double cropping is at present limited to 15 per cent of the entire cropped area, the two crops usually grown being paddy and pulses in the southern and eastern parts, and bajra and gram or wheat and maize in the northern and western parts of the country. But the yields in double-cropping have so far been low. During the last three years practical experiments have been conducted by the I.A.R.I. to raise two crops in a year in exhaustive rotation of 'jowar' and wheat. The 'jowar' crop, sown in July, gave a normal yield of about 275 maunds of green fodder. In early November wheat was sown on the same plot of land, after applying graded doses of 1½ maunds and 2½ maunds of ammonium sulphate per acre. When the smaller dose of ammonium sulphate was applied to wheat following 'jowar', the additional wheat production was 4 maunds per acre. As a result of the larger dose of this fertilizer, the additional production rose to 7 maunds per acre. In addition, the production of 'bhusa' was 8 maunds and 14 maunds respectively. This indicates that ammonium sulphate supplied to the soil for wheat crop restored all the nitrogenous plant food used up by the preceding 'jowar' crop. It was also found that the wheat crop required one extra irrigation to restore water consumed by the 'jowar' crop. If the method of double-cropping with adequate application of fertilizers is extended, effective use of labour and land could be ensured.

Cotton Development Schemes: Forty-four research schemes on cotton were in operation during 1955-56 and as a result, 11 improved strains were evolved, Mr. A. P. Jain reported to the Lok Sabha recently. Of these 11 strains, 4 had been recommended for general cultivation. There are 24 seed multiplication and distribution schemes in operation and the area under the improved varieties increased from 11.7 million acres in 1954-55 to 13.6 million acres during the year 1955-56 showing an increase of 16 per cent. The total extra income earned by the growers of improved varieties was estimated at Rs. 14.4 crores. The total expenditure during the year 1955-56 on the various schemes amounted to Rs. 12.56 lakhs including Rs. 10.65 lakhs on cotton research, Rs. 1.70 lakhs on seed and multiplication and distribution schemes and Rs. 0.21 lakhs on marketing and crop surveys.

INDUSTRY

British Steel Output: Britain's steel industry has announced plans for stepping up production. A Five-Year Plan costing a total of £600,000,000 envisages an increase in the country's output from 23,500,000 tons in 1958 to 29,000,000 tons by 1962. The Iron and Steel Board estimate that the demand for steel in 1962 is likely to be in the neighbourhood of 24,000,000 ingot tons for home consumption and 5,000,000 ingot tons for direct export. The board does not envisage a large scale application of nuclear energy to steel-making, but points out that if the electricity is reduced by the use of nuclear reactors, this may lead to the greater use of electric furnaces in the industry.

Coal Deposits in Darjeeling District: A reserve of five and a half million tons of coal seams in the Kalim-

pong sub-division of Darjeeling District in West Bengal has been estimated by the Geological Survey of India. The Department carried out a survey which reported that coal is present in the Lethi, Noam and Ramthi Blocks in the Chel Reserve Forest of the District. The reserves are more than five feet thick up to a depth of one thousand feet from the surface with less than 22 per cent ash content. The deposits occurring in the foot hills of the Darjeeling District, are powdery, low in moisture and require a good draught for burning. Although the quality is inferior to the coal obtained in the Raniganj and Jharia fields, it can be successfully utilised after suitable treatment for generation of power, especially for the Railways, brickfields and tea-gardens.

TRADE

Export of Roofing Tiles to Ceylon: Scope for developing India's exports of roofing tiles to Ceylon is indicated in a Report received from the Commercial Secretary of the Indian High Commission in Colombo. The annual requirement of tiles in Ceylon is about 20 million. This is likely to go up considerably with the implementation of the national housing policy designed to provide more and better homes. Wood and timber being plentiful in Ceylon, roofs are generally made of wooden frames and tiles. India is already the chief supplier of roofing tiles to Ceylon. Exports of Indian tiles were valued at about Rs. 30 lakhs in 1954 and 1955. The exports in the first ten months of 1956 were worth nearly Rs. 25 lakhs. The local manufacturing industry is also expanding its output. The requirements of Ceylon cannot be fully met with the present capacity of about 3 lakhs tiles per month.

Export Risks Insurance Corporation Ltd: A Corporation to provide protection to exporters against risks arising in export trade, has been constituted by the Government of India, as a measure for stimulating the country's exports. Known as the Exports Risks Insurance Corporation of India (Private) Ltd., the Corporation was registered recently under the Companies Act, 1956 with headquarters at Bombay. The Corporation will have an authorised capital of Rs. 5 crores to be entirely subscribed by the Government of India. Its principal function will be to insure the risk involved in the export of goods from India, on credit basis, which are not wholly covered by commercial insurers. The main risks which will be covered are diversion risk, import and export risk, war and civil war risks, transfer risk and any other which is caused by factors outside the control of the exporter or buyer which arises from events occurring outside the exporter's country.

U.S. Aircraft Exports: U.S. exports of aircraft have been rising sharply in 1957. Deliveries during the quarter were about 25 per cent higher than in the same quarter of 1956, according to recent Bureau of the Census figures. Aircraft exports for the full year 1956, were more than 43 per cent higher than in 1955, so that in the past 15 months deliveries have risen substantially. The increase over last year has been continued in the second quarter of this year. Exports of commercial aircraft have shown an increase this year over last, especially those with air frame weight of 3,000 lbs., or over. In the first quarter of this year, 48 such aircraft were exported compared with 26 in the same period of 1956. Such exports aggregated some \$36.9 million in the first quarter of 1957, against \$30.7 million in the same quarter of 1956, 267 were

exported in the first quarter of this year, compared with 221, valued at \$2.2 million in the first quarter of 1956. About 100 rebuilt aircraft and 10 helicopters also were exported.

*

Japan's Trade in 1956: Japan's exports in 1956 registered a high record of \$2,500 million according to the customs statistics. This was a rise of \$490 million, or 24 per cent, over the previous year. Exports continued to rise, from \$1,270 million in 1953 to \$1,630 million in 1954, and \$2,010 million in 1955, and finally reached a level twice the 1953 record. Imports in 1956 rose higher than exports by \$760 million, or 31 per cent, to reach the record of \$3,230 million. Imports which had been more or less stagnant since 1953 at the level of \$2,400 million suddenly shot up to the highest level in Japan's history. In the foreign exchange account, receipts by export increased by \$450 million or 23 per cent, to \$2,400 million; payments amounted to \$2,740 million, \$620 million or 34 per cent over 1955. The trade balance which was \$110 million in the positive in 1955 tumbled down to a deficit of \$70 million.

FINANCE

The U.S. Raises Duty on Wool Fabrics: The U.S. Customs Bureau has raised tariff rates on woollen and worsted fabrics to 45 per cent ad valorem from the standard rate of 25 per cent. Customs officials say the quota limit for imports at the standard rate has now been reached. An executive order issued by President Eisenhower in May 24, specified that imports in excess of 14 million pounds of fabric this year would be dutiable at the higher rate. The rate will now stay in effect for the rest of 1957. The application of the higher rate of duty had been expected by wool fabric exporters since mid-August. It has been usual for the U.S. customs to fix an import limit up to which wool fabrics are admitted at a duty of 37½ cents per pound ad valorem. When the limit has been reached, the remainder of imports until December 31 of that particular year qualify for an ad valorem duty of 45 per cent instead of 25 per cent.

*

Jordan's Prospects: A 10 year investment programme costing \$118 million is recommended for Jordan in the report of a World Bank survey mission on the country's economic development. The mission which spent the second quarter of 1955 in Jordan believes that about half the cost could be financed out of the Government's revenue if foreign aid did not fall below the 1955-56 level. The programme together with the increased private investment it would make possible, could be expected to lead to an increase in total production of about 4 per cent a year. This would not be sufficient to reduce unemployment among the refugee population which would continue to need international aid after 1955. Agriculture should receive priority. Over a ten-year period 15,000 acres a year should be brought under cultivation producing olives, figs, apricots and grapes for raisins. A revival of Jordan's potash industry would be profitable, and expansion of the phosphate mining. Technical assistance could raise phosphate production from 250,000 to 1 million tons in 1965.

GENERAL

Training of Engineers for Steel Plants: The first batch of 115 out of 1,000 engineers to be trained in steel works in the U.S. left India recently. India has received international co-operation in her programme of training about 2,000 engineers required to run the three new million steel plants at Rourkela, Bhilai and Durgapur. In addition to 1,000 engineers to be trained in steel works in the U.S., the U.S.S.R. Government has offered training facilities for about 600 steel engineers. The

U.K. Government has agreed to train 300 engineers under the Colombo Plan. West Germany has offered to train 50 engineers in addition to 80 who are already there. Canada and Australia are willing to train 14 and 12 respectively. One hundred and thirty-five Indian steel engineers are already under training in the three modern steel works in the Ukraine Province of the U.S.S.R.

*

Import of Books and Periodicals: The cancellation of Open General Licenses is the cause of difficulties for importers and users of books and periodicals in maintaining a steady supply and in clearing consignments in transit. The Government of India are keen to ensure adequate facilities for the import of these items and have accordingly instructed licensing authorities to dispense with the usual formalities and to grant licenses speedily and liberally. Prospective importers need not submit income tax verification certificates, nor give detailed information in regard to past imports. Licenses will be issued against orders placed by them with suppliers abroad. Collector of customs have also been asked to release consignments of magazines and periodicals held up in foreign post offices for want of licenses.

*

Diamond Industry in Russia: Soviet economist predict that the increasing use of diamonds in Soviet industry will bring about marked changes in technology and greatly raise productivity. They recommend that a diamond cutting and processing industry be built up as soon as possible in eastern Siberia to utilise the vast resources of the virgin Yakutia fields. A recent Soviet publication said that the scarcity of diamonds for technology has retarded the development of Soviet industry, particularly machine building and produced goods of a quality lower than was desirable. The first hints of diamond wealth in Yakutia came in 1949. Five years later in 1954-55, the discoveries of the great fields of unknown limits were made. It is assumed that two of the six diamond fields known to exist in this area will yield millions of carats, enough to satisfy the demands of Soviet industry for some years to come.

*

Record Kuwait Oil Output: Kuwait oil output set a new record in June at 5.6 million tons. Announcing this recently, the Kuwait Oil Company, jointly owned by British Petroleum and Gulf Oil, stated that production for the first half year was 25.2 million tons.

During most of the period, however, output was held down as a result of the post-Suez diversion of tankers. The total for the first six months is therefore about 3.6 million tons lower than in the same period of 1956.

But the June production was almost 1 million tons higher than in June last year and was also nearly 1 million tons above the figure for May, when output was affected by the tanker shortage until half-way through the month. At the present rate of output, Kuwait should be little behind last year's total for the first three quarters of the year. In September, new tanker loading facilities should be available at Mina-al-Ahmadi, which will make a further large rise in exports possible. Other Middle East countries have also recovered strongly since the reopening of Suez to British and U.S. tankers. The exception is Iraq, where the sabotage of the Iraq Petroleum Company's pipelines across Syria has continued to hold down output. Exports from Southern Iraq, which is not connected with the pipeline system, continued at a high level. This together with the partial flow through the pipelines from Northern Iraq, brought the country's total production for June to 1.7 million tons, compared with 2.8 million tons in June last year. The total for the first half-year — 8 million tons — compares with 16.7 million tons for the same period of 1956.

NEWS IN BRIEF

INDIAN

Internal consumption of tea in India rose to approximately 213,220,000 lbs. in 1955-56, from 167,190,000 lbs. in the previous year. Despite the increase in population from 371,000,000 in 1955, to 374,600,000 last year, the consumption of tea per 100,000 of population during the year under review was higher at 56,920 lbs. against 45,065 lbs. in 1954-55.

*

Madras and Kanpur have been selected for the location of Southern and Northern Higher Technological Institutes. A sum of Rs. 2 crores has been provided for each Institute during the Plan period. An Institute in the Eastern region has already been established at Kharagpur, and the Western Institute is in the course of establishment in Bombay.

*

The Industrial Finance Corporation of India advanced a total amount of Rs. 1,98,00,000 to twelve units of the textile industry in six states during the period July 1, 1956 to June 30, 1957. The total amount of loans due from the textile industry and allied units is Rs. 1,43,00,000 as on April 1, 1957.

*

During January-March 1957, there was a deficit of Rs. 82 crores on current account. A rough indication of the trend in the balance of payments position during the second quarter of 1957 was provided by the net drawal of Rs. 109 crores from the sterling balances over this period.

*

The Government of India have accepted the Tariff Commission's recommendations that the present protective duty of 25 per cent ad valorem, to the grinding wheel's industry be continued and the period of protection extended up to December 31, 1959. Also protection to the sago industry will be continued till the end of 1959.

*

Mr. Kanungo, the Minister for Commerce told the Lok Sabha recently that India has supplied 21,356 tons of cement to East Pakistan by the end of June 1957. During the same period India had received in exchange for this quantity of cement, 11,648 tons from West Pakistan.

*

The Bhakra Dam has risen to a height of about 260 feet above the foundation, more than one-third its total height of 760 feet. The quantity of concrete placed during June was 1,32,527 cubic yards, bringing to total to date to 16,27,745 cubic yards, about one-third the total concrete required to complete the Dam.

*

In order to ensure supplies of wheat and wheat products to Jammu and Kashmir, the Government of India has now modified the order of June 31, 1957 setting up three wheat zones. A notification issued by the Ministry of Food and Agriculture has the effect of permitting the export of wheat and wheat products from Punjab to Jammu and Kashmir.

*

The quantity of steel that will be imported into the country during 1957-58 both against Government contracts and commercial licences will be about 1.5 million tons. The foreign exchange to be spent during 1957 would be about Rs. 120 crores.

*

The Government of India have issued a notification fixing the price of tea for the purpose of determining the export duty, at Rs. 2.55 per pound as against Rs. 2.43 per pound in force from July 1, 1957. The export duty at this price will be 38 naye paise per pound, as against 25 naye paise per pound in force hitherto.

FOREIGN

The G.E.E.C. Ministerial Committee for agriculture and food met recently in Paris. The agricultural Ministers of many European countries including France and West Germany attended.

*

Total output in the U.K. in the first three months of this year at £4,546 million was the highest ever achieved in any first quarter. The increase over the first quarter of 1956 was 6 per cent, but of this only one third represented a rise in volume, the remaining two-thirds being due to higher prices.

*

U.S. construction concerns completed overseas contracts estimated at between \$750 million and \$1,000 million in 1956 and are currently engaged on major projects in over 30 countries. According to a recent survey most of this activity is on account of foreign Governments or private interests with only 10 per cent representing contracts for the U.S. Government.

*

West European countries, including Britain, will send Communist China precision instruments, stainless steel tubes, spare parts for cars and lorries and other goods under new agreements following the relaxation of trade controls with China. Under these contracts British, French, West German and Belgium concerns would ship the goods to Tientsin starting from the fourth quarter of this year.

*

The drive to redesign Soviet industrial management entered its second phase early this month when 105 newly created economic councils throughout the U.S.S.R. began wrestling with the day-to-day problems of this mushrooming economy. The councils are charged with organising and supervising production in most of the Soviet Union's 200,000 plants and factories.

*

Total world mine production of tin in May amounted to 13,600 tons, against 14,100 in April. This does not include output in the Soviet Union. Exports of tin metal in June totalled 5,128 tons, and in the first half of the year 36,220 tons (36,885 tons).

*

The Indian State Railways recently invited tenders from Yugoslav enterprises for the delivery of another 13 bridges with a cumulative weight of 845 tons. This request of the Indian Railways followed the conclusion of contracts with a group of Yugoslav factories on the delivery of 55 railway bridges.

*

The Government of France has decided to raise the guaranteed minimum wage of French workers by 5½ per cent. The new figure made up of a basic figure and a bonus 133 francs (about 2s. 8½d).

*

The sterling areas gold and dollar reserves fell by \$14 million during July. The total reserves — an indication of Britain's economic health — stood at \$2,367 million on July 31.

*

It is reported People's China's industrial output increased by nearly one-third in one year (1956). A communique by the Chinese State Statistical Bureau, distributed in Hong Kong recently said 1956 had shown "a decisive victory" in the transformation of the national economy from capitalism to socialism.

Special Article**SOIL DEPLETION AND FERTILIZER TARGETS**

By

C. R. RANGANATHAN

[This is the first of a series of four articles on fertilizers by a former Chief Conservator of Forests, Government of India and now Executive Director, The Fertilizer Association of India.]

EXCEPT for deltaic soils and soils subject to periodic inundation by floods, which are rejuvenated by silt deposits, Indian soils have in general been depleted of plant nutrients by continuous cropping, the replacement of nutrients being at best partial and often negligible. It is not realised as widely as it should be that one reaps not only as one sows but as one manures, weeds, cultivates and; when possible, irrigates; that one cannot harvest indefinitely from the soil more than one has put into it by way of nutrients. The amazing feature of Indian soils is not that their yields are low, but that they are as good as they are, considering the low standards of manuring and the generally poor husbandry. There are, evidently, natural causes which help to restore a minimum of fertility to the soil, since it is unusual in India for lands to be retired from cultivation on the score of low returns.

A BALANCE SHEET FOR NUTRIENTS IN INDIAN SOILS

An interesting balance sheet showing the plant nutrients removed by crops in India and restored by manuring as well as the resulting drain on the soil was worked out for the year 1955-56 in a recent issue of the 'Fertiliser News'. The figures are:-

	(In tons)		
	N	P2O5	K2O
Estimate of plant nutrients removed from the soil in harvests: . . .	2,742,000	1,559,000	3,614,000
Estimate of plant nutrients restored to the soil by manures, composts, oilcakes and fertilizers: . . .	649,000	312,000	699,000
Drain: . . .	2,093,000	1,247,000	2,915,000

The above estimate took no account of losses of nutrients through leaching and soil erosion. It was assumed that the losses were balanced by accessions due to weathering, ammonia in rain and nitrification by bacteria. Whatever may be the validity of these assumptions and the accuracy of the estimates, the figures are suggestive of the magnitude of the net annual drain of nutrients from the soil under current agricultural practices. They point to the master factor in the group of agnomic factors responsible for the low yields — namely, depletion of plant nutrients in the soil. They point equally to the master remedy — the use of fertilizers and manures.

FERTILIZERS TO THE RESCUE

The prospects for extension of cultivation being negligible, increased production has to be sought through the extension of irrigation and through the intensification of cultivation, that is to say, through the application of science to farming techniques. Accord-

ing to the second Five-Year Plan the following development programmes were expected to contribute to the increased production in the proportions shown against each:

Major Irrigation:	24%
Minor Irrigation:	18%
Fertilisers and Manures:	25%
Improved Seeds:	10%
Land Reclamation:	8%
General Improvements in Agricultural Practices:	15%

It will thus be seen that the biggest contribution to increased production was expected to be made through the use of fertilizers and manures. Expressed as a percentage of the total annual yield of food grains the increase ascribable to fertilizers works out to less than 4 per cent. There are good reasons for supposing that if fertilizers are made available in adequate quantities the percentage increase in yield is likely to be considerably higher.

TARGETS OF FERTILIZERS CONSUMPTION AND PRODUCTION

The targets of agricultural production first adopted in the second Five-Year Plan were revised in an upward direction after the Conference of Agriculture Ministers at Mussoorie in 1956. The target for food grains was first fixed at 75 million tons and then raised to 80.4 million tons, against the estimated production of 85 million tons in 1955-56, the last year of the first Plan. But it does not appear that a corresponding formal revision in fertilizer targets of consumption has yet been made. The original targets of consumption for the year 1960-61 were 373,000 tons of nitrogen, 120,000 tons of P2O5 and 30,000 tons of K2O. According to Dr. S. P. Deshmukh (Circular Letters Nos. XXXV and XXXVI, Part XIX), it was proposed, as a result of the Mussoorie Conference, to raise the nitrogen target to 484,000 tons, but no mention was made of P2O5 and K2O.

This question has been examined by the Fertilizer Association of India. Estimates arrived at by three different methods, which agreed fairly well, indicate the following revised targets of consumption securing the direct targets of agricultural production:

	(Targets in tons)		
Year	N	P2O5	K2O
1957-58: . . .	240,000	60,000	20,000
1958-59: . . .	350,000	90,000	29,000
1959-60: . . .	480,000	130,000	39,000
1960-61: . . .	650,000	195,000	50,000

As against these estimates of consumption, the present productive capacity is as follows:

N — 88,000 tons (corresponding to 430,000 tons of Ammonium Sulphate).

P2O5 — 49,600 tons (corresponding to 310,000 tons of Superphosphate).

The proposed new fertilizer production units are shown below:

Place	Product	Quantity in tons	% N content	Production in terms of N-Tons
1. Sindri	Urea	24,000	45	10,800
	Ammonium Sulphate-Nitrate	148,000	26	38,480
2. Nangal	Calcium Ammonium Nitrate	340,000	20.5	69,700
3. Neyveli	Urea	40,000	45	18,000
	Ammonium Sulphate-Nitrate	200,000	26	52,000
4. Rourkela	Calcium Ammonium Nitrate	442,000	20.5	90,610
				<u>279,590</u>

In addition to the above, factories are proposed to be set up in Bombay, making use of refinery gases, for the production of Urea, Ammonium Sulphate-Nitrate, and Calcium Ammonium Nitrate. But their capacity is not known and it is doubtful whether they will come into being before the end of the second Plan. Not taking these proposed Bombay factories into account, the total installed capacity in 1961 will be under 370,000 tons and the actual production may not exceed 300,000 tons.

A target of 120,000 tons of P2O5 has been prescribed for 1960-61 in the private sector.

As far as potassic fertilizers are concerned, indigenous production is of the order of a few thousand tons and is not likely to rise substantially during the period of the Plan.

If the targets proposed above are accepted, the gap between them and the actual indigenous production will have to be met by imports. It must be clearly recognised that the use of fertilizers to the extent of the annual targets indicated cannot be made to wait on indigenous production, if the food targets are to be fulfilled.

BOUND VOLUMES of THE EASTERN ECONOMIST and RECORDS & STATISTICS

The Eastern Economist is offering, for its special clients bound volumes of *The Eastern Economist* weeklies (including Special Numbers) from the year 1951 to 1956 and the *Records and Statistics* from vol. I (1949-50) to vol. VII (1955-56).

The binding is in superior quality leather, with two-colour gold and red printing.

These volumes will be of great help, particularly to the libraries, educational institutions and research departments of commercial and government organizations; to fill the gaps of missing volumes and to provide a ready guide of reference.

PRICE (For full year volume)

THE EASTERN ECONOMIST Rs. 75.00

RECORDS & STATISTICS Rs. 18.00

The Business World**PROMOTING RAYON EXPORTS**

By
CROESUS

AFTER examining the broad features, of India's balance of payments during 1956-57, the July, 1957 issue of the Reserve Bank of India Bulletin appropriately stresses the important role of export promotion and urges the stepping up of exports, especially of commodities in which this country enjoys a comparative cost advantage. Although it cannot be claimed that India's rayon and silk goods enjoy such an advantage, their export potentialities cannot be underrated. According to Mr. D. N. Shroff, Chairman of the Silk and Rayon Textiles Export Promotion Council (S.R.T.E.P.C.) "our 1956 performance, both in regard to silk and rayon trade, has shown a welcome change for the better and the export curve has started looking up. A small increase in the rayon exports of 13 per cent nearly and 26,000 yards over the 1955 figures and of 7 per cent nearly and 201,000 yards in silk exports have been registered during 1956". Since then also, as Mr. Shroff observed, these exports have tended to rise further, the value of all types of rayon textiles during January and February, 1957 alone being about Rs. 5.26 lakhs. But this is exclusive of the value of exports by post-parcel, which, it would appear, comprise more than 75 per cent of our total exports of rayon and silk textiles.

What is necessary to bear in mind in judging the export performance of India's rayon and silk textiles is the extremely keen competition of Japan. Lately Japan has re-emerged as one of the leading producers and exporters of rayon fabrics (both filament and staple fibre). In 1956, Japan's total output of rayon yarn amounted to 920 million sq. yards, which represented an increase of 19 per cent, while her exports aggregated 440 million sq. yards — nearly half her total output — which represented an increase of nearly 50 per cent, both over the corresponding figures of 1955. In regard to exports of silks also, Japan improved her position over 1955 by over 16 million sq. yards or by as much as 80 per cent compared to 1954, the outlets being Canada, West Germany, France and the U.S.A. It is not just this predominant position as producer and exporter of rayon and silk textiles generally that India has to reckon with in respect of Japan but it is her place as the most dominant participant in the markets of the Asian-African region which are what may be described as the natural markets for Indian rayon and silk.

Accordingly, the S.R.T.E.P.C. Chairman dwelt on the need for active export promotion and also on the need for more production, the latter necessarily being an essential prerequisite to the former. In this connection, it is necessary to point to the impression in certain quarters that, because there is need to import

raw materials for manufacturing rayon textiles, and also because India managed in the past without rayon fabrics, there can be no harm in imposing a ban on all further imports of rayon pulp until our foreign exchange position improves. This view, however, ignores two vital aspects of the question, namely the employment potential of the industry internally and its export potential externally. An increase in the production of rayon goods is necessary not only to maintain, if not increase, employment in the industry at home but also to push our exports of rayon goods and earn valuable foreign exchange, especially as there is found to be an obvious potential in the export markets for both rayon and silk textiles. "Only an effort is required on the part of Indian manufacturers — especially to produce export qualities". It is here that the task of the Export Promotion Council comes in or begins, and the Council, one is glad to note, has already bestirred itself in this behalf. The activities of the Council during the brief period of its existence referred to by Mr. Shroff do credit to the organisation. In this connection, particular mention must be made of the Chairman's suggestion that the industry should take advantage of several favourable factors in so far as this country is concerned, such as the large number of Indians residing overseas, most of whom belong essentially to the commercial community, and the existence of firms, associations or branches of the Council's export-members in these markets. These are in a position to place at the disposal of the Council all available information relating to their markets, so that the latter (the Council) may know the precise requirements of these markets and arrange for production of the same by the industry at home. The representative of the industry on the Government of India Delegation, which will be leaving this month for West Germany, among other places, also should bring back with him valuable information to stimulate our exports of rayon and silk fabrics to the countries he visits. The same purpose should be served by the Council's participation in international exhibitions, the appointment of correspondents in some important markets like East Africa, Aden and Ceylon, and the publicity campaign — newspaper advertisements and exhibition of cinema slides — in these and also other markets, including Singapore, Burma and Fiji. If, along with these well-conceived and well-directed export promotional efforts, the Government's assistance also is forth-coming, as, for instance, by way of special import licences for raw materials against exports of finished products, drawbacks in customs duty, etc., there is no reason why our rayon and silk industries should not make quite a handsome contribution to the country's earnings of foreign exchange.

PROGRESS OF BANKING : 1956

By
CROESUS

THE Publications of the Reserve Bank of India always provide the reader with a wealth of authentic statistical information and throw considerable light on the state of India's economy. This week, it has published two of its annual Publications — "Trend and Progress of Banking in India during the year 1956" and "Statistical Tables Relating to Banks, 1956". While the former discusses problems like economic and banking develop-

ments in 1956, banking organisation and control, "the task before the banking system", etc. the latter provides a fund of information pertaining to individual banks and the banking system of India as a whole, based on the annual balance sheets of banks.

After discussing the "Monetary and Banking trends abroad", as usual, the Report turns to developments in

India in 1956. Naturally enough, it makes a special mention of the acute financial stringency which the money market experienced throughout last year and says that this was due to the "mounting demand" for credit by trade and industry, unaccompanied by a commensurate expansion in its resources. Consequently, according to it, a financial stringency analogous to the experience in 1951 emerged during 1956. Advances of the banks, increased on account of growing developmental activity without there being, at the same time, a corresponding accretion to the deposit resources of the banks. In fact, says the Report, the pace of deposit expansion actually slowed down in 1956. The increased demand for bank credit naturally enough compelled the banking system to have larger recourse to the Reserve Bank — the bankers' bank — thus leading to an increase in the total outstanding borrowings of the banks under Section 17(4)(a) and 17(4)(c) of the Reserve Bank of India Act by Rs. 56 crores, as compared with no more than Rs. 20 crores in 1955.

With regard to investments, the Report says that the total of bank investments declined in 1956 by Rs. 18 crores, the ratio of their net deposits also recording thereby a fall from 42.3 per cent to 37.5 per cent. This decline is attributed to the unloading by banks of their investments in Government securities to meet the demands of trade and industry.

In the last chapter — "The task before the banking system" — the Report observes that, in view of the rising investment, particularly in the Private Sector, banks may also be required to meet "a part of the medium-term credit needs of industry; subject to proper safeguards and the availability of medium-term funds". This, it is significant, makes a refreshing departure in the policy of the Reserve Bank which until only the other day used to frown on any such suggestion. It may be recalled that the Bank fully endorsed the view of Sir J. R. Raisman, a pre-independence Finance Member of the Government of India, expressed at a Press interview that, like the bankers in the U.K., he too was not in favour of mixed banking. Be that as it may, it is gratifying to note that the publication approvingly refers to the proposal to set up a Re-finance Corporation to help augment the resources available with the banking system for the use of medium-sized industrial units in the Private Sector. With a view to meeting the rising demand for bank credit of the Private Sector under the second Five-Year Plan, the Report emphasises the need for extensive branch expansion.

The Statistical Tables cover the operations of the banks in India and outside. It shows that the total deposits of all reporting joint-stock banks rose by Rs. 80 crores during 1956, as compared to a rise of Rs. 92 crores in 1955. The Tables further show that, while total deposits of Indian scheduled banks rose by Rs. 84 crores, those of foreign-scheduled banks declined by Rs. 7 crores. The total credit extended by joint-stock banks, however, rose by Rs. 158 crores in 1956, as against Rs. 92 crores in 1955. Their investments, on the other hand, declined in gilt-edged securities by Rs. 18 crores, while "other investments" increased by Rs. 3 crores.

According to the Statistical Tables, the operating earnings improved by Rs. 8 crores in the case of Indian scheduled banks; their expenses also rose by Rs. 5 crores, leaving only Rs. 3 crores as net profit before taxes.

...ACC CEMENT

BETWEEN 1948 and 1955, the A.C.C. has doubled its production of cement...and its output continues to grow. Widely used for the mighty projects of the first Five-Year Plan, ACC cement is now playing a great part in the second Plan—helping to build today the India of tomorrow!

ACC

THE ASSOCIATED CEMENT COMPANIES LIMITED. The Cement Marketing Company of India Private Limited.

Delays in your accounts department can
slow down your organisation — hinder its growth

COMPTOMETER — the world's fastest, most accurate Adding - Calculating Machine — can handle all your figure work most efficiently!

WHATEVER THE SIZE OF YOUR ORGANISATION, an efficient accounts department is the nerve-centre of your business. Backlogs or bottlenecks will be reflected in poorer turnover, slow growth of your business. That is why progressive organisations everywhere employ Comptometers for fast, efficient, accurate accounting. Why not ask us for a FREE demonstration today?

Here's what Brooke Bond India Private Limited has to say about Comptometers:

"We have used your Comptometers for over 34 years and find them an invaluable part of our accounting system. We have now 22 Comptometers which give us entire satisfaction."

Calcutta, 11th July 1957

COMPTOMETER:
You can count on it for speedy, easy, accurate operation. An automatic control key prevents erroneous operations.

COMPLETE COMPTOMETER SERVICE

P. N. Ganesan & Sons who have taken over the Felt & Tarrant Offices in India are equipped to offer you the same quick, efficient repair and maintenance service as before. You'll get a spare machine when yours is taken for repairs. They'll train your staff free of charge to become skilled Comptometer operators. Every Comptometer you buy carries with it a guarantee, against any manufacturing defect, for one year. Write today to any of our offices for demonstration:

Sole concessionaires in India for world famous Comptometer, Comptograph, Walther Calculator and Comptometer Dictation Machines
hitherto marketed in India by Felt & Tarrant (India) Company

COMPTOGRAPH

It records as it calculates. It's the fastest machine in its class, and yet so moderately priced. Anybody can work it.

COMPTOMETER DICTATION MACHINE

Dictate, listen, transcribe, erase and re-use... it enables you to get through your correspondence in half the time.

WALTHER CALCULATOR

Multi-purpose calculator that can calculate anything... cubic contents, percentages, area, volumes!

BUSINESS NOTES

THE BALANCE OF PAYMENTS, 1956-57

THE OFFICIAL analysis of our balance of payments in the first year of the second Plan comes at a time when attention is focused on the big size of the deficit and the serious draft on our foreign exchange reserves. The analysis released in the July issue of the Reserve Bank Bulletin will surely be of value in trying to tackle the problem of the heavy deficit. During 1956-57 the deficit on current account rose steeply to Rs. 292 crores from the nominal surplus of Rs. 16 crores in the previous year. This adverse turn in the payments account was not due to trends in exports which remained just fractionally lower than in 1955-56 at Rs. 637 crores. If, however, it was an absolute certainty that the volume of imports was going to be increased at a fast rate, it should be clear that the performance regarding export promotion was much below anticipations. Imports rose by Rs. 325 crores to Rs. 1,076 crores in 1956-57. They were obviously the main cause of the large gap in payments. The imports on Government account increased from Rs. 138 crores to Rs. 280 crores, while imports on private account increased from Rs. 611 crores to Rs. 795 crores. It will thus be seen that in both the sectors there was an increase of 30 per cent in imports last year.

Deficit of this magnitude was met by withdrawal of Rs. 220 crores from the official foreign exchange reserves and by a loan of Rs. 61 crores from the IMF. It is now common knowledge that these heavy imports which aggravated the payments gap rose from two sources. In the first place food imports went up to Rs. 102 crores as against the Plan average of Rs. 48 crores. The official analysis says that although heavy food imports were incurred because they were available under PL 480, it must not be overlooked that these imports were urgently required to check the upward movement in food prices. The second factor which contributed to the high rate of imports was the intake of machinery, iron and steel and other metals. Expenditure of import on raw materials was in keeping with the expected average envisaged in the Plan. What is not quite well known and what has been appropriately emphasized in the analysis is the expenditure of foreign currency on manufactured articles which was much in excess of the Plan programme.

The steep increase in last year's import bill is ascribed to different factors. Part of it is the result of under-estimation of the requirements of imports of a current nature, part is due to building up a reserve of inventories, some portion must have gone to satisfy the higher requirements of defence, and 'a fair share' must have been swallowed up by the rising demand for consumption. Now that we have come up against a real crisis in foreign exchange great vigilance is being exercised on the issue of licences. But last year licences were issued on a scale which could be characterised as liberal in the given situation. The analysis uses the language of caution and states that the effect of these licences is 'likely to extend' beyond the year under review. It is now known that licences of about Rs. 435 crores are outstanding, a substantial part of which is due to the heavy rate of issue of licences. The only way out of this situation is foreign assistance in the form of deferred payments and other conventional modes.

SUCCESS IN THE LOAN PROGRAMME

IT IS heartening to note from the Press Communique, issued this evening (6-8-1957) by the Reserve Bank of India, that the subscription lists for the 3½ per cent National Plan Bonds — Fourth Series (3½ per cent 1967) and 4 per cent loan 1972 have been closed as the noti-

fied amount has been subscribed fully. This was not unexpected. In fact, the success of these loans was a foregone conclusion in the market circles. But it must be said, in all fairness, that the success of these loans within such a short time was due, by and large, to the realistic way in which the Government of India's borrowing programme for the current financial year was framed. This year Government floated, unlike the previous year, two loans simultaneously: (i) 3½ National Plan Bonds, Fourth Series, redeemable at par on August 1, 1967, and (ii) 4 per cent loan, redeemable at par on August 1, 1972 for an aggregate sum of Rs. 100 crores. Two good features of the present borrowing policy — a reasonable rate of interest fixed realistically and the moderate amount to be borrowed — were perhaps responsible, in the main, for the ready response which the loans had.

Details as to how these were subscribed are not known yet. But it may be said that a considerable percentage might have been realised through the conversion of 3 per cent. Victory Loan of 1957 and 3 per cent loan of 1958 at 100 per cent and 99.70 per cent respectively. Final judgment on the loans ought to be postponed until information about subscriptions in the two components — cash and conversion — is made available.

HASTE AND CONFUSION OVER SUGAR

TWO SPECIFIC points in the Government's recently changed policy on the sugar industry have proved that there had been much haste and some confusion in coming to the decisions which the Government and the Reserve Bank took. The directive given by the Reserve Bank to the scheduled banks a few weeks ago to restrict advances against sugar was influenced by the view accepted by the former that the large size of advances was not justified by genuine requirements of trade but that it contained a good element of speculation. The pros and cons of this view were discussed in this journal at the time the curb was applied to advances and the same ground need not be covered here again. The fears about use of bank credit for speculative purposes have proved substantially wrong. The original directive has been modified now and stocks held by mills have been exempted from it.

This leads to a probe into the reason for the slow movement of stocks from the mills and their comparative immobilisation at the source of production. The main explanation is to be found in the depressed demand from overseas. The question of export of sugar cropped up in the Lok Sabha last week. Mr A. P. Jain's answers during question time reveal how brittle is the base of our sugar export trade. A few months back high hopes were pinned on the export trade and it could hardly have been expected then that they would be so short-lived. Mr. Jain stated that the global prices of sugar were declining in such a manner that there was now a slender chance of exporting Indian sugar. It will be recalled that the excise duty on sugar was increased from Rs. 5.62 per cwt. to Rs. 11.25 per cwt. on two grounds, namely, that it would produce a disinflationary effect by reducing home consumption and encourage export. The prospect of encouraging export is dim. When asked how far the higher excise had discouraged consumption, Mr Jain promptly stated that the intervening time was too short to enable this assessment to be made. But — this is significant — another reason behind the excise was avowedly emphasized. Mr. Jain admitted that more important than its potential as an incentive to export the object of the excise was to earn higher revenue.

REPORT ON MACHINE TOOLS

THE TEAM of American experts on machine tools which examined the problems of the Indian industry during its stay of one month here left this country recently. Due weight attaches to the report of this team in view of the fact that it was sponsored by the US department of Commerce and International Co-operation Administration. Presumably the team has tendered an interim report to the Government of India and what has appeared in the Press relates to this interim report. The final report which would give a picture of the detailed views and judgment of the team is to be submitted after some time to the US Government. It is some satisfaction to know that technical assistance can be available from America for the development of the Indian machine tool industry. The likelihood is that it could be procured on a government level through the Technical Co-operation Mission for specific objects like designing, maintenance, tool engineering, and so forth. It appears that the team has emphasized the necessity of the Indian industry evolving its own indigenous designs. This is important from the strategic view-point. Moreover, India's present requirements and requirements in the near future were mostly limited to simple designs and did not cover high-precision, costly instruments which were in high demand in Western countries. Moreover, the possibilities are that India would develop an export market for simple type of tools for which the demand is expected to grow in the neighbouring countries of South-East Asia. The Hindustan Machine Tools factory would serve this purpose of developing designs in an appropriate manner.

Mr. Merryweather, leader of the team, has given some home-truths which should make us ponder seriously over the points raised. When specifically asked about the prospect of American investment in India's machine tools industry, he frankly replied that one major hurdle was the tax policy of the Government of India. The team has explained to the Government that if American investment was to flow the tax structure ought to permit the investor to make profits which he reasonably expects in the international market in the current situation. The manufacturing potential of the indigenous industry can be raised provided sizable orders were placed on the plants. There was also need of improved types of equipment. The system of pooling of orders was recommended for the purpose of enabling medium manufacturers to undertake continuous programmes of production. If purchases did not materialise, the Government would have to come in the picture to buy the products in the meantime. The conditions of a small sector of the industry in Punjab was unsatisfactory. Mr. Merryweather's remarks in this behalf suggest that quality leaves considerable room for improvement and about half the production capacity is now lying idle which makes the problem of production costs still more difficult. Government assistance by way of loans has been urged. All in all, the report suggests that notwithstanding its present weaknesses the Indian machine tool industry can be strengthened and a healthy structure build up in the near future.

THE RAILWAY PROGRAMME

THE CLARIFICATION which was given by Mr. K. B. Mathur, Member (Transportation) of the Railway Board, in his Press conference on August 1 last about the import programme of the railways gives assurance that there is a reasonable certainty that the railway expansion programme will not encounter any further difficulties for the present—until deliveries under the outstanding orders are made this year or so. But it does not give the same degree of assurance that the railway foreign exchange problem will be solved without difficulty and disturbance in the third and fourth years

of the Plan which will mark the period of peak pressure of expansion activity. It need not be emphasized that a set-back to the import and development schedules in these two years will extend the railway plan beyond March 1961 and create shortages of freight capacity, bringing in their wake bottlenecks in industrial and agricultural programmes.

One estimate of expenditure of foreign exchange actually spent since the second Plan was started puts it around Rs. 75 crores. The latest loan of \$ 90 million from the World Bank is expected to meet, it is said, a substantial part of the \$ 110 million expenditure on orders placed between 1955 and July 1957. This seems to be incorrect because the explanation attached to the announcement of the World Bank's loan last month stated that the loan amount would suffice to defray half of the expenditure in this year. A mission has been deputed to Europe under the leadership of Mr K. P. Mushran, Member of the Railway Board, for purchase of steel and other equipment. In effect, the actual expenditure of foreign currency for the railway plan up to the end of the third year of the Plan would be Rs. 75 crores spent so far, Rs. 45 crores World Bank loan, Rs. 45 crores India's contribution to supplement the loan and Rs. 55 crores to be spent till March 1959, or a total of Rs. 225 crores. Expenditure of Rs. 200 crores will be left over to the last two years of the Plan to which must be added the element of price increase and the element of increase in the size of the railway plan estimated at Rs. 100 crores. Part of this cost is expected to be met by more World Bank loans. The balance which is to be met mostly from our own resources needs to be planned ahead.

AIDS TO INDUSTRY

INDUSTRIAL EXPANSION requires, besides trained technicians, adequate capital and abundant raw materials, also an understanding between the Government and the mercantile community engaged in industrial activities. This helps, to a great extent, in clearing the psychological apprehensions lurking in the minds of the business people, on the one hand, and, on the other, in preventing our policy-makers from taking hasty policy decisions, sometimes, running counter even to their own intentions. Frequent meetings of the leaders of the commercial community and official spokesmen are, therefore, in the best interest of the country's development. A few days back there was one such occasion, when Mr. Y. B. Chavan, the Chief Minister of Bombay, and the members of the All-India Manufacturers' Organisation met during the first quarterly meeting of the Central Committee of the A.-I.M.O.

While Mr. Chavan appealed for the co-operation of the private sector and asked the entrepreneurs to locate new units outside big cities like Bombay and Ahmedabad, in his inaugural address — by the way, this was his reply to the A.-I.M.O. spokesmen's request that the State Government should not insist on all new industries in these places providing 100 per cent housing to their workers — Mr. S. N. Haji, Chairman of the A.-I.M.O. dwelt at length on the financial needs — external and internal — of the second Five-Year Plan. The A.-I.M.O. Chief repeated his Organisation's recommendations, namely using the huge wealth now lying unutilised and a greater collaboration between Government and the people in public enterprises. The Committee adopted a resolution urging the Government to facilitate the flow of foreign capital into the country by eliminating obstacles such as double taxation, etc. The resolution further asked the Government to promote exports, to encourage capital formation in the private sector to intensify rural savings to place greater reliance for resources on sources other than taxation and to keep the non-Plan expenditure to the minimum.

This may shrink

This will not shrink

That's why people look for 'Sanforized' on the label!

The Trade Mark 'Sanforized' inspires such confidence that people all over the world pick fabrics trade marked 'Sanforized' — knowing they bear this assurance: *This garment will not shrink out of fit — even after many, many washings!*

It adds value and prestige to your own label — enables you to sell with confidence — and assures the public that you take trouble to give them value.

People rely on you to serve them well — so serve them cloth labelled 'Sanforized'.

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements

Economic Report from the U. S.

GROWTH OF "BIG BUSINESS"

(By GUY SIMS FITCH)

WASHINGTON, Aug. 6.—With all the talk these days about the alleged growth of "Big Business," it is refreshing to note that the total number of operating concerns in the U.S. continues to increase at a respectable rate. The latest tabulations by the U.S. Department of Commerce show that the nation's business population totalled 4.3 million active companies at the beginning of 1957 — the vast majority of them small enterprises. This indicates a net increase of more than 50,000 companies during 1956, a rise about equal to the 1955 gain and in line with the long-term trend.

In fact, as 1957 began, all major U.S. industries, with the exception of manufacturing and construction, were operating with the largest number of firms on record. As was to be expected in a large and active economy, there was a good deal of business "turnover" last year. Some 381,000 new companies were successfully established, while 327,000 were discontinued. Also indicative of the active economic pace, another 327,000 changed hands during the year. Most of last year's 54,000 business additions — "births" less "deaths" — occurred in the first half of the year. It should be noted, however, that the business population is usually high at mid-year; on a seasonally adjusted basis, growth — though slowed somewhat — continued through the second half as well.

It also should be noted that the term "discontinued business" pertains to all closures regardless of the reason. This includes firms liquidated because of the death or retirement of the owner or to realize a profit, as well as those shut down because of inability to keep up with the competition. The pattern of changes in the business population last year was generally similar to that of 1955. The number of manufacturing companies declined slightly, continuing the moderate reduction that began in 1952. But all other business classifications registered increases, with the gains in retail trade and service industries — where small companies abound — exceeding those of 1955.

THE Manager,

THE EASTERN ECONOMIST LTD.,

52, JAN PATH,

NEW DELHI.

The 110,000 business additions in 1955 and 1956 represented a higher two-year total than at any time since the surge of civilian business expansion that marked the early post-war years. All told, there are 317,000 more operating companies in the U.S. today than there were at the end of 1948, and 1,025,000 more than at the end of pre-war 1940. This remarkable growth helps put into perspective a reported rise in industrial and commercial failures in the early part of 1957; in absolute numbers they are the same as in 1940 and higher than in any intervening year. But this does not take into account the number of new businesses started for which no definitive data are yet available. Moreover, since the number of firms doing business in the U.S. today is the highest on record, the current failure rate of about 50 per 10,000 companies is substantially lower than the 1940 rate of 66 per 10,000. Even in the prosperous 1920's when the U.S. economy was much smaller than it is today, the typical failure rate, was about 100 companies per 10,000. This seems to confirm the view that the U.S. economy is not only larger than it used to be, but also more stable.

COMPANY AFFAIRS

TATA LOCOMOTIVE AND ENGINEERING CO., LTD.

Although the net profit of Tata Locomotive and Engineering Co. Ltd. (TELCO) for the year ended March 31, 1957 at Rs. 89.15 lakhs was lower than the previous year's profits of Rs. 92.73 lakhs, the year's results must be regarded as satisfactory, considering that the previous year's profit also included profits for a period of two years of the Company's Locomotive Division. Notwithstanding the substantial improvement the amount available for final disposal at Rs. 90.45 lakhs was lower than the previous year's corresponding amount of Rs. 93.24 lakhs. But the amount available for purposes of distribution to shareholders after making the appropriations to development reserves (Rs. 14.99 lakhs) and the general reserves (Rs. 20 lakhs) and reserves for taxation of about Rs. 10 lakhs, thanks to the increase in taxation and the additional taxes on dividends was nearly Rs. 15 lakhs lower at Rs. 44.28 lakhs as against over Rs. 59 lakhs in the previous year. Yet, it must be noted here that the liquidation of all arrears of dividends on Preference Shares last year has made it possible for the Directors to recommend a dividend on Ordinary Shares at the rate of 8 per cent as against only 6 per cent for the year ended March 31, 1956. The Directors expect that in addition to further working capital that would be necessary for carrying on the Company's growing business funds for further capital expenditure also would be needed. The means by which these funds can be raised is receiving their attention.

The Company's total business during the year of report was almost twice that of the previous year in value. There was an increase of 30 per cent over the previous year in the output of locomotives and boilers. In other words, this exceeded even the targets set by the Tariff Commission of 50 complete locomotives and 50 spare boilers in 1956-57, the actual output being 67 complete locomotives and 44 additional boilers. The Directors claim that the indigenous content of each of these unit was well over the figure of 75 per cent stipulated by the Railway Board.

In the Automobile Division also, according to the report, excellent progress was made during the year. Here again the total output of vehicles exceeded the target of 6,000 units. In this sphere the Directors say "the progress of indigenous manufacture was maintained strictly according to schedule." It may be added here that with further progress in indigenous manufacture, contrary to popular belief, the margin of profit would appear to decline; if the experience of other automobile manufacturers in India is any proof. It is, however, noteworthy that this has not come in the way of the Company going ahead with the third and fourth stages of its manufacturing programme; despite the deterioration in the foreign exchange situation and the resulting delay in ordering out for the plant and equipment required. The Company has made good progress with the erection of the Steel Foundry which is almost complete as also the construction of the Alloy Iron Foundry. There is a reference in the report to the findings of the Tariff Commission regarding the efficiency of the Company's workers in the Locomotive Division vis-a-vis those of Chittaranjan and it is stated that some improvement was achieved in labour productivity.

THE INDIA UNITED MILLS, LIMITED

The results of working of the India United Mills, Ltd., for the year ended December 31, 1956 show that the Company has earned a profit of Rs. 76.18 lakhs after providing for all working expenses. Among the provisions made out of the profits, the Managing Agents'

Commission claimed Rs. 5.19 lakhs, depreciation Rs. 15 lakhs and taxation Rs. 10 lakhs. With a further provision of Rs. 7 lakhs made towards Bonus payable for the year, there was a net balance of Rs. 38.99 lakhs, which, together with the surplus of last year's Account of Rs. 1.90 lakhs, left an amount of Rs. 40.90 lakhs for distribution. The Directors have recommended a final dividend of 30 nP for Ordinary Shares and 12 nP for Deferred Shares.

Although the year's results of working were satisfactory, the Directors report that market conditions in the latter part of the year, especially since September, were depressing. The upward revision of the Excise Duty on all varieties of cloth twice in the year 1956, it is stated, brought about a condition of stalemate in the cloth market and, as a result, large stocks have had to be carried forward. Consequent on the additional Excise Duty levied in September, 50 per cent of which had to be borne by the Company itself the loss suffered by the Company has been put at Rs. 9.60 lakhs. This would be very much more for the current year (1957).

THE ALEMBIC CHEMICAL WORKS CO., LTD.

The latest Report of the Directors of the Alembic Chemical Works Co., Ltd., is the fiftieth Report and thus marks the completion of 50 years by this leading Indian Chemical Company. The net profit of the Company during the Golden Jubilee Year, after providing for depreciation, amounted to Rs. 10.70 lakhs. Over 50 per cent of this, namely Rs. 5.40 lakhs, has had to be set apart for taxation. The dividend of 10 per cent on Ordinary Shares and the dividends on the three kinds of Preference Shares bearing different rates of interest together absorbed Rs. 4.14 lakhs, leaving a little less than Rs. 98,000 to be carried forward to the 1957 account. According to the Directors, the sales of the Company are on the increase and the working results of both the parent Company and its subsidiaries have been quite satisfactory.

We do business with the nicest people...

And we are deeply interested in these nice people: in you! That's why we have a special Market Research Department that devotes itself to finding out what you like and don't like, why you buy—or don't buy.

Our teams of interviewers travel all over the country, calling on families in city, town and village, and noting your growing needs and changing preferences. This fact-finding process enables us to introduce new products like Rinso, or change a familiar one in some way—the perfume of Lux Toilet Soap, for instance.

Many of our products are, perhaps, already your household friends, and you appear on the charts and reports compiled by our interviewers. But you are more, much more, to us than facts and figures... you are the very people we do business with. We spare no trouble in trying to meet your needs, in offering you the very best value for your money.

COMMODITY NEWS AND NOTES

INDIGENOUS SUGAR PRODUCTION

The production of indigenous sugar amounted to 20.18 lakh tons up to July 15 in the current season as against 18.53 lakh tons in the corresponding period of last year. The total offtake, including quantities dispatched for export, was 14.93 lakh tons. Stocks with factories on July 15, 1957, stood at 10.49 lakh tons.

COFFEE EXPORT

The Coffee Board has released 956 tons of coffee for export from the 1956-57 crop, consisting of the following: Plantation 'A' 253 tons; Plantation 'B' 189 tons; Plantation Triage 105 tons; Arabica Cherry Flats 15 tons; Arabica Gleanings Flat 6 tons; Robusta Parchment 'A' 111 tons; Robusta Cherry 'A' 277 tons.

The last date for tenders will be August 14.

SCHEME TO IMPROVE GROUNDNUT SEED

A research project on "radiation mutations and improvement of groundnuts" is among a number of schemes sanctioned by the Agricultural Sub-Committee of the Indian Central Oilseeds Committee.

The Bose Institute, Calcutta, has been commissioned by the Committee to carry out this project.

The cost of this scheme as well as various other schemes relating to the breeding of groundnut and other oilseeds and schemes aiming at reaching the target production of 75,00,000 tons of oilseeds by 1960-61 fixed by the Planning Commission will be borne entirely by the Indian Central Oilseeds Committee.

INCREASE IN WORLD TEA CONSUMPTION

World supply of tea exceeded absorption continuously for the third year in 1956, according to a report quoting the International Tea Committee, published in the Plantation and Commerce, a plantation journal.

The surplus, however, was very negligible, of the order of 6 million lb. in 1956, compared to 28 million lb. in the previous year and 70 million lb. in 1954, the report said. The balance between supply and demand was achieved mainly by an increase in consumption, though reduction in supplies was to a lesser extent a contributory factor, the report added.

According to the report of the Committee, the consumption of tea in the world rose gradually from 1,278 million lb. in 1954 to 1,320 million lb. in 1955 and 1,339 million lb. last year. Supplies on the other hand were lower at 1,345 million lb. in 1956 as against 1,358 million lb. in the previous year and 1,343 million lb. in 1954.

GOLD AND SILVER PRODUCTION

Both gold and silver production in India recorded further decline in 1956, according to the Reserve Bank of India Report on Currency and Finance for 1956-57.

The production of gold in India in 1956 is estimated at 209,000 fine ounces, which is one per cent less than that in the previous year. The world production (excluding the Soviet Union) of gold during the year rose by 3.6 per cent to 23 million fine ounces, 105,000 ounces, which is 20.5 per cent less than that in

India's production of silver in 1956 is placed at the previous year. The world production of silver during the year rose by 3.8 per cent to 230 million ounces.

PRODUCTION OF OILSEEDS

The Technological Research Sub-Committee of the Indian Central Oilseeds Committee which also concluded its deliberation recently, recommended for sanction six new schemes and extension of four current schemes at an estimated cost of Rs. 2,68,000.

The new schemes sanctioned included the setting up of an organisation for survey, collection and utilisation of non-edible oilseeds with the object of setting up a pilot project for actual collection of non-edible oilseeds available in the forest areas of Mysore State.

The allocation of funds for the various States are: Andhra Pradesh Rs. 2,61,885. Bombay Rs. 3,01,364, Madras Rs. 3,52,075, Orissa Rs. 1,87,524, Uttar Pradesh Rs. 6,93,260, Assam Rs. 1,90,816, Mysore Rs. 2,64,924. Punjab Rs. 1,73,870, West Bengal Rs. 1,83,498, and Himachal Pradesh Rs. 84,810.

STEEL OUTPUT

U.S. steel production in the first half of 1957 reached the second highest level for any first half-year, being exceeded only in the first six months of 1956. Output this year was some 60.58 million net tons, compared with some 62.6 million tons a year ago, according to the American Iron and Steel Institute.

The decline this year compared with last took place in the second quarter, industry statistics indicate. In the quarter which ended June 30, a little over 29 million tons of ingots and castings were produced which compared with some 31.58 million tons in the first quarter of this year, and some 30.7 million net tons in the second quarter of 1956.

In the second quarter of this year output was consistently less than 10 million net tons a month, whereas in the same quarter a year ago, in both April and May the industry poured around 10.5 million net tons of steel. In the second quarter of last year, however, customers were building up steel stocks in anticipation of the summer strike.

This year no strike was anticipated because of the three-year contract signed with the United Steelworkers in 1956. An anticipated rise in steel prices caused no sharp increase in buying, in the face of reduced demand from certain leading steel consumers, such as the motor and home appliance industries.

At the present time output in the steel industry is at the rate of about 80 per cent of capacity. No comparison with a year ago is possible because of the strike in the summer of 1956.

WORLD USE OF RUBBER

There was a sharp fall in world production and consumption of natural rubber in May, according to figures released by the International Rubber Study Group. Output fell by 12,500 to 137,500 tons and usage by 10,000 to 155,000 tons. Imports into the USSR and China in May were 13,000 tons lower than in April, so that consumption outside these countries increased slightly. Usage in the UK increased by 1,000 tons and in the US by 1,300 tons. In the first five months of this year, however, consumption outside Russia and China fell from 719,000 to 715,650 tons. The drop in rubber production in May was made up of a decline of 12,000 tons in Indonesian exports, a 3,500 ton-decline in Malayan output and a small rise outside these areas. World production in the first five months of this year showed an increase of 15,000 to 732,500 tons.

Promise and Performance in China

IT is now nearly two months since Chairman Mao Tse-tung's famous February speech—probably to be known in history as "The Hundred Flowers Speech"—was given to the world press. The initial general reaction was that he had infused a new liberalism in Marxist doctrine. But all such interpretations have been belied by the new purge, the like of which has perhaps not been known in the history of the Chinese Communist Party. The Communist Government has announced that 175,000 government

officials in 61 departments are engaged in a gigantic check on "non-conformists." More than 1,300,000 "counter-revolutionaries" have been discovered. This number includes only those who have made a "clean breast" of their past or present "anti-people" affiliations—such as having participated in "reactionary" organizations or harboured "anti-Communist" thoughts—and have been convicted. The attack on the intellectuals and students is on a wide front; the basic charge is that they are restive against Communist dic-

tatorship. They refuse to be 'guided' by the leadership of the Communist Party and 'supervised' by the masses. Afraid of having "a Hungarian affair in China", to borrow a phrase from Mr. Lu Ting-yi, head of the Propaganda Department of the Chinese Communist Party. They have not even spared the world-famous Chinese woman novelist, Ting Ling. She has been denounced as having been "an agent of the Anglo-American imperialists and war-mongers" since 1930.

The growing internal opposition is not confined to the intellectuals and students. It is more wide-spread in the country-side. Chinese newspapers are replete with reports of the activities of the "counter-revolutionaries" in places as far apart as Shanghai and Shantung provinces on the eastern sea-board and Yunnan on the far south-west. Other plots were officially reported to have been uncovered in the provinces of Tsinghai, Szechuan, Kwantung and Kwangsi. As we go to the Press, the Chinese newspapers have reported that three "counter-revolutionary" groups have been discovered in Anhwei. Earlier, a similar group had been exposed in Tsingtao.

Critics of the regime will be punished or have already been punished under decrees issued recently to put a stop to anti-Communist sentiment that had grown, and was daily growing, since Chairman Mao's speech. Instead of singling out operational weaknesses in Chinese Communism, "non-conformists" had struck at Communism itself and rashly asked for an overthrow of the Party leadership in May and early June. The Chinese Vice-Premier, Mr. Po I-po, admitted that the main reasons for the ever-increasing internal opposition were the failure of agricultural production to meet the demands of the national economy and of the production of raw materials to keep pace with the needs of industries.

The liberalistic interpretation of Chairman Mao's speech was partly due to the wishful thinking of the people of China and the political commentators of the non-Communist world. But it was due in the main to ignorance of Marxist semantics. To non-Communists the word "people" has a constant meaning, and "people" are "people" everywhere. For instance, the "people of India" would mean the inhabitants or citizens of this country. In other words, there is a constant yardstick, impersonal and not subject to change, for determining in this context, who belong to the "people of India." But when Chairman Mao uses the phrase "those belonging to the Chinese people," he has no such static or stable demographic concept in mind. His yardstick is political; hence the term "people" is variable. Thus, according to Mr. Mao, the "Chinese people" are only those who support Socialism (synonymous with the programme of the Communist Party of China); and those who do not support the Chinese Communists do not form a part of the "Chinese people." Writing in *China's New Democracy* as early as 1937, Chairman Mao had observed: "Bourgeois elements are accustomed to conceal the truth about class status, and resort to the term 'people' or 'nation' to camouflage the actuality of one-class dictatorship. Such concealment gives no benefit to the revolutionary people, and therefore should be clearly exposed. The term 'people' or 'nation', according to Marxism, does not include the traitors and counter-revolutionary elements. It means a dictatorship of all the revolutionary people and revolutionary classes over the traitors and counter-revolution-

aries". The parallel in India would be Mr. Nehru's charging all those who do not support him or his Congress party with being disloyal to the country and liquidating them.

This is not a polemic or unsubstantiated view. The Communist regime in China has not only provided ample evidence to support this, but has made clear that this is exactly what it means. The speech, and the presumed new freedom, stimulated considerable discussion in China and brought forth a large measure of criticism. But by mid-June, the critics were themselves being publicly denounced. Most of them publicly recanted. Mr. Lo Lung-chi, Minister for Timber Industry, had publicly stated that a committee should be appointed to examine abuses committed during the San-Fan, Wu-Fan and Su-Fan purges carried out since 1949. Mr. Lo has been publicly damned. Mr. Chang Nai-Ch'i, Minister for Food, was severely critical of bureaucratism and the efficiency of the public-private enterprises. Mr. Chang resisted the mounting criticism until on June 19 his own party (not the Chinese Communist Party) relieved him of all party offices and ordered him to confess. These two Ministers, along with Mr. Chang Pu-chun, Minister for Communications and a Vice-President of the China's Democratic League, are charged with "planning to develop the strength of the League to rival that of the Chinese Communist Party." Chinese newspapers have been publishing for weeks long lists of the accusations, with even greater space devoted to the denunciations of the critics. And the purge has been on since about June 9. The Communist papers themselves have been explicit in using this term. The signal for the change seems to have been an editorial in the *People's Daily* of that date entitled "Counter-Criticism." Since then the short-lived geniality of the administration has given way to unbridled ferocity.

Thus, we have at least one aftermath of Mr. Mao's speech worthy of examination. The speech was released to the world on June 18 but already, nine days earlier, the counter-attack against critics of the regime had begun. So while the non-Communist world was considering the "liberalism" of Mr. Mao, his critics at home had already begun to experience the purge. And if anyone had doubts that the tide had turned, Mr. Chou En-lai, in his *Report on the Work of the Government* delivered at the fourth session of the first National People's Conference of the People's Republic of China, laid such doubts to rest when, among other things, he justified the institution of political purge, and gave not the numbers but the percentages of those purged in previous years. Thus the ideological position of the present rulers of China becomes progressively more suspect. Mr. Mao's original statement received even more sympathetic analysis than did Mr. Khrushchev's at the 20th Congress of the Communist Party of the Soviet Union. The latest developments make it difficult to distinguish Mr. Mao's speech from a police trap. This is not an unfounded insinuation. Mr. Lu Ting-yi has admitted in a recent statement that "the debate over Chairman Mao's speech has helped to insulate the Rightists completely". In short, the People's Government of China's does not seem to enjoy the support of the mass of the people any more. Otherwise there was surely no need for it to resort either to such shady tactics or to a reign of terror.

Policy for Air Transport

WITHIN three years of full assumption of the ownership and management of air transport, the Government has come out with a frank admission that nationalisation cannot provide a cure for the ills of this industry. Mr. Humayun Kabir, Minister for Civil Aviation, made a significant policy statement in the Lok Sabha last week in the course of the debate on the Communications Ministry's demands for grants. The Minister stated, in effect, that it was beyond the resources of the Indian Airlines Corporation to develop the air transport potential of the country at the present time. This conclusion has influenced the Government to modify its policy on domestic air services.

What is really striking about the pronouncement made by Mr. Kabir is the invitation he has extended to private operators to undertake operation of services on new routes over which the IAC is not in a position to function. The explanation why the IAC pleads its inability to develop these routes is not far to seek. It does not lie, as has been made to appear, in the fact that participation by private operators will accelerate development of domestic civil aviation. The truth of the situation is that for several years more the IAC cannot acquire enough strength and vitality to develop this potential. Here lies cogent proof that the much-publicised claim advanced as a vital ground for nationalisation was devoid of real basis.

The Minister's statement on private participation was more vague than it was brief. No clue has been given to the terms and conditions on which private operators are being invited to undertake the exploratory work of development. Under the Air Corporations Act, private enterprise can at best function in this industry with the status of an associate. What precisely are the attributes of this status is not clear. But one thing is clear and it is that only a minor field will be allocated to private operators. In terms of the Industrial Policy Resolution air transport has been reserved for exclusive operation by the State. Appropriate modification of the Resolution and suitable amendment to the Air Corporations Act will be necessary if private enterprise is to be enabled to respond to the new call on its resources.

The statement needs amplification for obvious reasons. The conditions on which private operators will be called upon to develop new routes must be clarified in elaborate detail. Three years of operation of domestic airlines have shown that financial viability is still a distant goal for the IAC. During 1955-56, Government had to advance a loan of Rs. 2.77 crores to the IAC partly to reimburse the previous year's loss of Rs. 90 lakhs but mostly to provide working capital. It is a pet argument with the spokesmen of the Corporation that withdrawal of the rebate on petrol after nationalisation has made a dent in the finances of internal services. Mr. Kabir asserted in the Lok Sabha that in case the rebate is restored the IAC would present a rosy picture next year. This optimism hardly finds any corroboration whatsoever in hard facts. On the assumption that rebate of Rs. 35 lakhs was granted for consumption of one crore gallons of petrol, the Corporation's loss in 1955-56 would still be of the order of Rs. 81 lakhs. It is true that terms of salaries and conditions of service

have been liberalised and a programme of capital expansion has been launched. But these two factors do not explain the high magnitude of loss. The offer of operating relatively uneconomic routes is in itself unattractive. But if the co-operation of private enterprise is to be enlisted for rapid development of civil aviation, it hardly needs any plea that financial assistance must be extended to it.

The role which private participation will play in the development of air transport will be secondary. Assuming that this participation is forthcoming, it will touch only the fringe of the problem of air transport. The hard core of that problem which consists in the weakness of the financial and operational structure of the IAC will have to be tackled on its own. The real issue which demands effective solution is the problem of injecting vitality and dynamism in the industry. In fairness it ought to be conceded that the growing losses of the Corporation during the first three years are to be attributed to rationalisation and expansion of the fleet and other equipment, apart from improvement of wages and salaries. When this allowance is made, it cannot be denied that the Corporation has been unable to render satisfactory account of its management.

There are positive directions in which rationalisation of operating methods and administrative organisation can certainly assist in raising its standards of performance. It is, indeed, somewhat surprising that the Lok Sabha debate virtually overlooked the constructive criticism of the Corporation's operations made by the Estimates Committee in a recent report and omitted to elicit explanation how for it was acted upon. The route pattern of the IAC remains practically unchanged. In brief, the drawbacks of the present network of routes are that only 6 out of 37 routes operated for scheduled passenger services are run with profit. Eleven routes involve loss of a high magnitude ranging between 25 per cent and 75 per cent of the costs. The night airmail services for which Skymasters have been employed entailed a loss of Rs. 19 lakhs in the third year. This state of affairs demands a searching analysis of the whole problem of an improved pattern of routes. It is essentially a technical task. The administrative set-up of the IAC at the top contains many of the handicaps which are the usual concomitants of government-managed undertakings. If Air India International's organisational model has any lesson for the IAC, it is that its Board ought to be strengthened at the technical level. Curiously enough, the Air Transport Enquiry Committee's strongly argued suggestion to insist upon the criteria of business acumen and intimate knowledge of the industry in the selection of the Chairman of the Corporation has been brushed aside.

Still another major issue needs to be faced squarely. Passenger fares and freight rates on domestic airlines in India are the second lowest in the world. They do not bear a real relation to the costs of service. When the report of the enquiry committee on the revision of fares and rates is tendered, a bold decision will have to be made to bring freights and fares into closer alignment with costs. Besides, there ought to be an equitable distribution of the burden between the transport user and the tax-payer.

Distinction without a Difference?

MR. U. N. DHEBAR, President of the Indian National Congress, has just done a 'post-election heart-searching'. This is in the form of a tortuously long letter to the Youth Congress and its branches all over the country. Although it resembles a Communist policy thesis in its verbosity and repetitive character, it is a document that compels consideration for the reason that it has the *imprimatur* of the Congress President. The long and short of Mr. Dhebar's thesis, in the context of a post-election ideological challenge from Kerala, is that the Congress brand of Socialism is superior to the Communist brand.

In spelling out the 'fundamental differences' between the Congress and the Communist approaches, Mr. Dhebar lays down the dictum that "Socialism is not something which can be imposed from above." Congress Socialism is thus presented as 'democratic socialism' as opposed to the 'authoritarian socialism' of Communists. This democratic socialism cannot come to India "because of the execution of successive plans of development." Can this unwitting admission be taken to mean that some undemocratic kind of Socialism may result from successive Plans? In the context of what Mr. Dhebar has to say on the question of nationalisation it is not difficult to see that the Congress brand of Socialism can, in certain circumstances, slide into the Communist brand.

The Congress approach to nationalisation is that it is to be resorted to in some specific sectors, while control and regulation is to be established in other sectors. What are the specific sectors marked out for nationalisation? According to Mr. Dhebar, heavy or key industries may be nationalised "to protect the nerve centres of the economy"; the State may also nationalise industries to increase production, or to increase efficiency, or to set up a pattern for labour-management relationships. It is confidently stated that "the picture of Indian economy that the Congress has in mind" would mean that "key industries and industries of the nature described above will largely be nationalised." This would, again, mean that most industries in the private sector may be nationalised on one ground or another. One wonders if this is the accepted policy of the Congress Party.

At any rate, it surely is not that of the Congress-run Government of India. The second Plan document merely says that "the public sector has to expand rapidly" by initiating "development which the private sector is either unwilling or unable to undertake". It continues that "the responsibility for new development in these fields (minerals and basic and capital goods industries) must be undertaken in the main by the State." The Industrial Policy Resolution of 1956 also reserves the future development of basic and strategic industries and of some public utility services for the public sector. This, however, does not rule out the expansion of the existing privately owned units, or the possibility of the State securing the co-operation of private enterprise in the establishment of new units. The future development of a second set of industries (of a more or less basic character) is to be initiated by the State and supplemented by the private sector. The future development of all other industries is, in general, left to the initiative and enterprise of the private sector although it is open to the State to start any new industry in this field

also. It may thus be seen that nowhere is it laid down as a matter of policy that any existing privately owned industry in any of the three categories is liable to be nationalised. Talk of nationalisation has no meaning except in the context of take-over, with compensation, of existing privately owned units. The establishment of entirely new State-owned units does not involve any nationalisation as such although they will belong to the public (or the nationalised) sector. Eminent Congressmen at the non-official level, who talk loosely of nationalisation of industries have to be reminded of all this at the risk of bore-some reiteration. This reminder is also called for if the country's investment climate, which is already unattractive to foreign capital on the score of tax policies and of excessive State intervention in the operation of private enterprises, is not to be rendered still more uncongenial on account of nationalisation fears.

The Congress President, in not referring to an official policy which has been solemnly approved by Parliament and the Congress Party itself, appears to formulate a more far-reaching policy involving nationalisation of the larger part of the private industrial sector, fiscal and legislative measures to prevent concentration of wealth, collective bargaining and labour participation in management, creation of trade associations and co-operatives in the sphere of internal trade and greater State trading in the sphere of import and export trades. Or, perhaps, he merely threatens a more sweeping policy with the idea of persuading the private sector to accept "an industrial democracy in which an ever-increasing share of the responsibility for the development of the industrial economy will devolve on labour" and to take quickly to the principle of Trusteeship as the best antidote to the fear of bureaucratisation and State Capitalism. If the private sector cannot be persuaded into such an unrealistic and impractical course, what will happen to it? In the scheme of things visualised by Mr. Dhebar, 'recalcitrant' industrial enterprises would be nationalised "to set up a pattern for labour-management relationships."

The implications of the policy proposed by the Congress President are too grave to be ignored. The major implication is that increasing public ownership of industries is inevitable in a socialist pattern of society, although the idea of more and ever more nationalisation as an inseparable component of Socialism is being discarded in current Western Socialist thought. If increasing public ownership is conceded as essential for Socialism, the very bureaucratisation and State Capitalism that Mr. Dhebar does not quite relish will become inevitable. If this is the picture of Indian economy that the Congress has "in mind" according to the interpretation of Mr. Dhebar, it should be either described in detail and placed on record in a definitive policy resolution or rejected so as to avoid confusion in the public mind. If the Congress Party should ever approve the policy canvassed by its President either because it wants to take the wind out of the Communists' sails or because it is hustled into radical pronouncements by the Reds' slogans and doings in Kerala, it would be most unfortunate. It may well be, then, a case of distinction without a difference between the Congress brand of Socialism and the Communist brand.

"Additives, Sir,
are things
that are added
to things . . ."

the boy's a genius

It sounds simple enough. To add special qualities to a motor oil, you just...well...add things to it.

Simple? It was revolutionary! When SHELL X-100 MOTOR OIL was first introduced, eyebrows were raised in query. Here was a new kind of oil altogether, an additive oil, claiming to do things no motor oil could do before and completely refuting existing ideas on engine wear.

It's not friction, we said, which causes most wear in engines. It is corrosion from acid products of combustion. Research has proved it. A modern oil must therefore be able to fight acid action. Again, conventional lubrication is no longer enough. A modern oil must have a detergent action, to keep working parts clean and free from clogging deposits. Again, standards of stability must be raised to resist the higher temperatures and pressures of modern engines. How could these things be achieved? Shell research found the answer... by remarkable chemical additives. SHELL X-100 MOTOR OIL, with its three special forms of protection, was a major advance in car lubrication. Its success was immediate. To-day it is the leader amongst detergent oils whose superiority is now universally recognised. It is yet another instance of how Burmah-Shell are continually distributing the better products which a changing situation demands.

BURMAH-SHELL... in India's life and part of it

THE WEEK'S NOTES

CLOUD OVER KASHMIR

LED BY Mr. Ghulam Mohammed Sadiq, Minister for Education in Kashmir State's outgoing Cabinet and the former Vice-President of the Kashmir National Conference, the Communists and fellow-travellers in that State have decided to float a parallel organization, the Awami Conference. They took this extreme step when their efforts to dominate both the Kashmir Government and the National Conference failed and Bakshi Ghulam Mohammed, the Prime Minister of Kashmir and the President of the National Conference, emerged as virtually the undisputed leader of Kashmir. The dissidents showed too marked keenness to have Bakshi Ghulam Mohammed accommodate their entire group in the State Cabinet, obviously with a view to reducing him to an impotent minority. They would also have Mr. Sadiq become President of the National Conference in place of Bakshi Ghulam Mohammed and set up two committees to guide and watch the work of the two provincial units of the National Conference. In short, their intention was to gain control of the party machinery, with a view to gerrymandering the next party elections.

However, Bakshi Ghulam Mohammed, saw through the game. Addressing a press conference, he said that the Sadiq-led Leftist group, though in a minority in the working committee and the party, wanted "in the name of democracy" to dominate "the whole structure of the National Conference." He accused the group of "using back-door methods to destroy the main fibre of the National Conference by dominating it for their personal purposes." Mr. Sadiq has himself implicitly pleaded "guilty" to the charge that he and his Leftist colleagues wanted to grind their own axe when he remarked that "his group still believes in the ideals of the National Conference." But this admission is but a part of truth. The Communists and fellow-travellers never act for wholly "personal reasons." Their thinking and actions are nearly always subservient to the Cause and the Party. This impression is reinforced by the standard Communist technique Mr. Sadiq and his friends have adopted to float an opposition party. They began by writing to the Kashmir Prime Minister letters containing allegations of inefficiency, bureaucratization and corruption. Then they organized a deliberate leak in the Press, and sought to arouse public opinion in their favour. With this technique of near-blackmail, they strove to bargain for more power in the organization of the National Conference. Luckily, their tactics boomeranged. Overplaying their hand they were left with no other alternative but to quit the National Conference, leaving a malodorous trial behind them.

As noted in these columns before, the loyalty of Mr. Sadiq's group is not strictly territorial. It is an open secret that after partition, Mr. Sadiq visited Pakistan to negotiate a deal with the late Mr. Mohammed Ali Jinnah on the question of accession of Kashmir. Now when their former friend and comrade, ex-Major-General Akbar Khan has begun a tearing and raging campaign against India, these so-called friends of the country are not only eloquently mum but have launched as it were a complementary campaign against the Kashmir Government. It is a remarkable coincidence that the dangerous and difficult situation created by saboteurs in Kashmir should find these people running down the very organization which has kept the State of Jammu and Kashmir together as an integral part of India.

THE NATIONAL BOOK TRUST

THE NATIONAL BOOK TRUST was inaugurated by Dr. Radhakrishnan in New Delhi recently. The Book Trust's main concern will be the production of mode-

rately priced translations of the Indian classics in the principal regional languages. This is timely. As things stand today most of us know more about books in the European languages than about many notable works in the Indian languages. Moreover, it is necessary that the habit of reading generally should be inculcated in as many of our people as possible. Democracy without education is hardly possible.

Criticism of the establishment of the Book Trust has come from both writers and publishers. Some writers, who met at a seminar in Allahabad a few months ago, were not very much in favour of a State publishing house. They felt that it would very likely become "monopolistic, leading to authoritarianism and thought control". Not only might the Book Trust be made to conform to the opinions of the party in power, but authors, keen on winning the Book Trust's patronage, might choose the easy path of writing only what was acceptable to it. Publishers tend to look upon the Book Trust as a formidable rival which could push them out of business. But if one were to look with an objective eye, one would probably conclude the amount of publishing done in the country did not warrant this fear. Most Indian publishers produce only text-books, quasi-text-books, and help books for students. No more than a microscopic minority of publishers prints classics — and of them only those of whose demand they are certain. For, as Chesterton once remarked, classics are admired by everyone and read by few. Let us not, in dismissing the cleverness, overlook the truth of this.

The Book Trust will have sufficient finance at its disposal to be able to invest it in publishing books which private publishers have hesitated to bring out because of inadequacy of enterprise and resources. If it organizes its work well, it should be possible for the Book Trust to publish one thousand titles in ten years. With a hundred titles each year and a subsidy of five to ten thousand rupees per book, it should be able to manage with an annual budget of less than a million rupees. This is certainly not too much to pay for educating the people.

There is, it must be emphasised, a real danger that this hope might be misplaced. The provisional list of titles circulated to the Trustees — presumably for their approval — seems to betray a lack of sense of priorities. We are not a rich country by any standards. We can ill afford over-lapping or duplication of efforts. The Book Trust must, therefore, see to it that it does not encroach upon the preserve of the Sahitya, the Sangeet and the Lalit Kala Akademies, or duplicate the work which is being done at universities and other institutions. The provisional list also betrays a tendency to extend patronage in a way that smacks of favouritism.

COMMUNISTS AND THE ABANDONED STRIKE

THE DECISION of the National Federation of the Post and Telegraph Employees to withdraw the strike notice will give relief to every one having the good of the country at heart. If the threatened strike had materialised the country might well have been plunged into confusion and its already strained economy put out of gear. Both the Government and the employees, therefore, deserve the gratitude of the nation for the wise decision — but each for a different reason. While the Government deserves credit for meeting the grave situation with sympathy, firmness and determination the employees earn it for showing commendable restraint. We feel that if the Government had from the beginning been firm, forthright and unambiguous in explaining its position and been responsive to the demands of the employees, the country would have been spared the agony of suspense. After all, the employees had

SERVING THE NATION

In the new India of today, I.A.C. is playing a vital role — providing the swiftest, most convenient means of transportation, and seeing that you get the finest service!

I.A.C.'S TURBO-PROP

VICKERS **VISCOUNTS**

ushers in a new age of air travel

NEW VISCOUNTS for I.A.C. mean the finest in speed and luxury for you. Powered by four Rolls-Royce turbo-prop engines, the Vickers VISCOUNT flies *above the weather*... while you relax in armchair comfort in the fully-pressurised cabin. The swiftest, smoothest flying you've ever known! The new Vickers VISCOUNTS will soon be introduced on all I.A.C. trunk routes.

YESTERDAY AND TODAY

Over the years, I.A.C. has rapidly improved and extended its services — and today, its large fleet of planes links towns and cities throughout the country. Only a few decades ago, air travel was a rich man's luxury — now, you can fly to almost anywhere in India at comparatively little cost.

COMFORT FIRST AND FOREMOST

With I.A.C., passenger-comfort is of paramount importance. Trained hostesses take excellent care of you throughout the flight; you get free transport to and from the airport, free baggage allowance, and meals are served en route!

FLYING IN THE FOREFRONT OF THE NATION'S PROGRESS

INDIAN AIRLINES CORPORATION

been demanding redress for their grievances for more than a year, seemingly without effect. This indifference forced them to adopt a militant policy. The fact that a militant policy has succeeded where other methods apparently did not, will surely confirm the impression held in many friendly quarters that the Government will not act save under threat of coercion. The growth of such a belief is surely not conducive to the well-being of a country. Statesmanship demands that the discontent among State employees should not be permitted to grow. It should be either nipped in the bud or met with grace and without delay. This is all the more essential because in this country the State is the biggest employer. It has, as such, to submit to the discipline which it prescribes for private employers, even if it cannot be an ideal example for them.

This appreciation of the abandoned strike will be somewhat inadequate and unreal if the dual role of the Communists is not taken note of. Having sponsored the strike notice, and openly opposing the Essential Services Maintenance Bill in Parliament, they worked strenuously behind the scene for the withdrawal of the strike notice. Why they behaved as they did calls for investigation. Their behaviour has generally been attributed to the needs of political consolidation in Kerala. These demands more responsibility and restraint on their part. Some commentators have even suggested that due to their greater experience and professional competence as strike organisers, they were quick to realise that the game was against the strikers, especially after the appointment of a Pay Commission, empowered to suggest interim relief with retrospective effect. The real reason for the policy of "heads-I-win, tail-you-lose" was, however, the Communists' desire to consolidate their newly won gain — the formation of the composite trade union organisation of all the Post and Telegraph workers. They did not want to lose a foothold which could be used to infiltrate one of the country's life-lines. Already, they seem to have gained a considerable hold over the organisation. This is indicated by the fact they were able to influence the deliberations and decisions of the present motley crowd of the Federation's leaders.

SOCIO-ECONOMIC SURVEY OF HYDERABAD

THE RESEARCH Programme Committee initiated surveys of 21 cities and towns with the object of studying rural-urban migration and employment opportunities associated with rapid urbanisation. A Socio-Economic Survey of Hyderabad-Secunderabad City, the report for which is now available, was accordingly undertaken by the Indian Institute of Economics, Hyderabad. The scope of the enquiry was wider than what is ordinarily prescribed by the Research Programme Committee. The present survey also covered items such as the extent of prevalence of the joint family system or its sense, inter-relations as among incomes, assets and liabilities, linguism, literacy and education.

The enquiry has revealed that in spite of the areas being a meeting place of the South and the North there has not been considerable immigration (16.5 per cent since 1939) during the last two decades, particularly from outside the Hyderabad State. The chief causes of immigration are unemployment, insufficient income and lack of educational facilities. As was to be expected, age-group-wise distribution of immigrants shows that older persons are less inclined to migrate. More than 50 per cent of the immigrants take less than six months to find employment. Those engaged in subordinate technical services and seeking employment in their previous occupation are fortunate in finding jobs early.

The survey highlights the continuing vitality of some traditional systems of social and family organisation. The joint family system and the joint family psychology still prevail widely. The size of the average

family is larger (6.56) than the Indian average (5.4) and ideas of family planning are largely unknown. The economic problems of the citizens as they emerge from the survey are mainly subsumed under the familiar heads, under-employment and inadequate housing. In respect of credit facilities and growth of co-operatives, rural areas appear to be better provided with than the urban. The Income and Net Assets ratio works out at 1:62 (income is the unit). This means that as per capita income is Rs. 302 per annum, per capita assets are valued at about Rs. 18,750. Incomes are higher in rural areas compared to assets, as revealed in the 1952 Tenancy Enquiry in the State. This is on account of agricultural prices being higher than industrial prices. The facts will be of use in making comparative studies of economic conditions amongst different sections of the society.

AMERICAN AID TO INDIA

AMERICAN ECONOMIC participation in India's development efforts during the first ten years of independence now totals more than one billion dollars or Rs. 476 crores. This aid, as pointed out in a recently published report by the Union Ministry of Finance, has been "by far the largest contribution to India's economic development under the Five-Year Plan." The aid includes both public and private assistance in loans and grants. Nearly 400 million dollars (Rs. 190 crores) have come through the United States Technical Co-operation Mission since 1952. The remainder has come through other Governmental grants or loans in commodities, in voluntary contributions by American private organisations, and in assistance made available through Foundations.

American aid has been, and is being, extended to India as a result of two agreements between the two countries. A general bilateral agreement was signed on December 28, 1950 for technical assistance under the Point Four Programme. This called for interchange of technical skill. A further agreement was signed on January 5, 1952, contemplating an extended programme, with joint projects tied up with the Five-Year Plans for promoting India's economic growth. At the outset the emphasis in these agreements was on increasing the production of food. During the first two fiscal years—1951 and 1952—a total of 88.5 million dollars (over Rs. 42 crores) were allocated by the United States Government for such purposes as import of fertilizers, iron and steel for agricultural equipment, and for Community Development Projects. In the second Five-Year Plan the emphasis has shifted to industrial development. The Ford Foundation and the Iron and Steel Industry has offered to train between 900 and 1,000 graduates in iron and steel industry technology in the United States. Thirty million dollars have been spent on this since 1952—to bring American technicians to India, and to send Indians for technical training either to the United States or to other countries. Till June 30, 1957, 642 Indians had taken part in this programme, with the largest number—231—receiving technical training in agriculture and natural resources. In addition to the Technical Co-operation Mission assistance, there has been forthcoming assistance from other United States' sources towards India's development programme. For instance, India received nearly 190 million dollars under the Wheat Loan of 1950-51; 12 million dollars under Milo assistance; 6 million dollars for food relief; 2.3 million dollars under Fulbright and Smith-Mundit Grants; and 3 million dollars for ocean freight assistance. Since 1951, American voluntary agencies have sent aid to India valued at 50.7 million dollars. Additional assistance came to India in the form of Foundation grants, notably from the Rockefeller and Ford Foundations. Up to the end of last year Ford grants totalled 15.6 million dollars and Rockefeller grants 5.3 million dollars. Both totals have increased since.

A Window on the World

CAN AHIMSA DEFEAT A NUCLEAR ATTACK?

By

ODYSSEUS

ELFIN, DOUGHTY, original, shrewd, sparkling—such are the adjectives that spring to mind when contemplating Commander Sir Stephen King-Hall, R.N. retired, founder of the "National News Letter" (162 Buckingham Palace Road, London, S.W.1.) which has let off an intellectual rocket every week since 1936. Sir Stephen has now fired a carefully aimed war-head into the centre of the controversy let loose by the British White Paper on defence, not only in the U.K. but in the U.S.A., the countries of N.A.T.O. and of the Commonwealth, and which is gathering rather than losing momentum. Sir Stephen's views are of interest to India because he advocates a Royal Commission to decide whether Britain and democracy could be defended not by military forces but by passive resistance. The difference between Sir Stephen's and the Indian approach is important, for whereas Gandhiji and his followers used moral arguments in support of ahimsa, Sir Stephen looks at the problem from the practical viewpoint of a former student of the Staff College at Camberley.

Regular frequenters of this column know that we have never been able to accept Gandhiji's application of non-violence to problems of national defence and are also critical of certain (though by no means all) aspects of India's policy of so-called "neutrality." But they also, I hope, know that we have never fought shy of debate with those with whom we disagree and indeed that we try to ascertain what elements of truth can be extracted from their experience. Sir Stephen King-Hall's record, as a fighting officer and as a publicist, is such that his views cannot be disregarded without risk to the service of truth.

Let us therefore recall briefly the main points of the British White Papers ("Defence: Outline of Future Policy," H.M.S.O. Comnd. 124, price 9d; and "Defence Statistics 1957-58, Comnd. 130, price 6d, published on April 4, 1957), announcing plans for a radical reorganisation of Britain's defence forces which were rightly described as involving "the biggest change in military policy ever made in normal times."

The White Paper's point of departure is that Britain's influence in the world depends first and foremost on the health of her internal economy and the success of her export trade. Without these, military power cannot in the long run be supported. Over the past five years, defence has, on average, absorbed 10 per cent of Britain's gross national product. Some 7 per cent of the working population are either in the services or supporting them. One-eighth of the output of the metal-using industries is used on defence. An undue proportion of scientists and engineers are engaged on military work. The upkeep of large British forces abroad strains the balance of payments. Britain's armed forces must be capable (1) of playing their part with the forces of Allied countries in deterring and resisting aggression, and (2) of defending Britain's overseas territories against local attack.

THE POINTS OF THE CONTROVERSY

The White Paper then reaches the points which have touched off controversy throughout the world:

(a) It must be recognised that there is, at present, no means of providing adequate protection against nuclear attack on the U.K.

(b) Military planning must therefore aim to prevent war rather than to prepare for it.

(c) Resources must therefore be devoted primarily to developing deterrent weapons.

These weapons include atomic weapons, already in steady production; a British megaton (thermonuclear) weapon; and the V class bombers which at present provide the means of delivering these weapons and which will in due course be supplemented by ballistic rockets. Fighter aircraft will eventually be replaced by ground to air defensive missiles.

Sir Stephen's point of departure is that what the British are seeking ultimately to defend is the free democratic way of life. It has, he says, hitherto been assumed that we can enjoy freedom only if we enjoy national sovereignty and that if we were obliged to accept an alien government we should lose our liberties. This was true in the past when conquerors could enslave the whole population or else slaughtered the defeated and retreated (like Nadir Shah from Delhi) with tangible booty such as women, cattle and treasure.

World Wars I and II have, however, proved that the losers emerge materially stronger than the victors, who find themselves in the absurd position, for reasons which appear to be in their direct interests, of having to finance the recovery of the vanquished.

Another new factor is the success of civil resistance in overcoming regular forces. Sir Stephen cites Gandhiji in India; the German passive resistance which defeated the French in the Ruhr in the 1920's; the Sinn Fein nationally supported terrorist campaign; the Israel victory over the British mandatory administration; the Algerian struggle, the Eoka movement in Cyprus; and the resistance movements against the Nazis in France.

To Sir Stephen, it is significant that all these civilian resistances were in defence of an idea or a way of life. He concludes that (1) there are grounds for believing that an idea can prevail even when its opponents are physically superior and able to occupy the territory of those defending the idea, and (2) if military victory was not economically profitable after World Wars I and II, still less would it be after the mutual devastation of a nuclear war.

IS THE "DETERRENT" ARGUMENT TENABLE?

Sir Stephen contends that it is insufficiently appreciated that Britain's defence strategy is now based on the hope that the following idea will be effective: "Nuclear war would be mutual suicide. It is not rational to be suicidal. You—the aggressor—can destroy us but your own destruction will be partially coincidental."

But he goes on to argue that this argument may not be wholly valid in the circumstances of the free world versus the U.S.S.R. because (1) Is the vulnerability of the U.K.-U.S.A.—Western Europe target not greater than that of the U.S.S.R. target? Ten H megaton bombs would reduce the U.K. to chaos with millions of casualties. Could the same result be produced in the huge areas of the U.S.S.R.? The principal cities and industrial areas, including the oil fields, could be smashed, but this would not obliterate the Russian state. A peasant economy would survive, (2) One of the handicaps of the free countries is that owing to the influence of public opinion and their democratic systems of government, they cannot be the first to launch a nuclear attack. (3) Might the Soviets not therefore gamble on the chance that if they launched an attack its devastating consequences would cripple a counter-attack? At best, a small number of persons—the government and the guided missile forces 70 feet underground—would after the Soviet attack be the only organised part of the nation. If they launched the counter-attack they would inflict fearful damage on the U.S.S.R., but how would that benefit the dead millions in Britain?

Sir Stephen therefore envisages the possibilities that (a) the U.K. is devastated but the U.S.S.R. is not because, for whatever reason, the British counter-attack is not launched, or (b) the U.K. and the U.S.S.R. are both devastated, and he asks whether in terms of the future of the human race (b) is preferable to (a).

If the deterrent idea works, says Sir Stephen, then we have not got rid of conventional warfare. He shrewdly compares the deterrent idea with gas and bacteriological warfare which were not used in World War II because neither side could see how to do so advantageously. But just as the discarding of gas did not mean no war, so the discarding of the hydrogen bomb does not mean no war but a continuance of conventional weapons—in which case, Sir Stephen points out, the Soviet forces are overwhelmingly superior to

N.A.T.O. and likely to remain so. To make up for this disparity, the N.A.T.O. armies are to use nuclear weapons tactically, but here the risk is obvious that the side that seemed about to lose the war would have recourse to strategic nuclear weapons to prevent its defeat.

It needs also to be remembered that Communist aggression can be political as well as military. Para 27 of the White Paper refers to British responsibilities under the Baghdad pact to prevent Communist infiltration and refers to bomber squadrons based in Cyprus capable of delivering nuclear attacks. On this, Sir Stephen comments that the value of nuclear bombardment as a means of preventing a Communist coup d'etat in (say) Iran is not clear.

From all this Sir Stephen draws the conclusion that the time-honoured theory that defence against physical aggression can only be by physical means has worn thin. He next proceeds to an interesting gloss on this theory. Certainly it is, he says, an established principle that to every form of attack there must exist a means of defence. We have, however, now reached a stage in the development of the attack which secures total destruction and as it is impossible to put the whole U.K. social and economic system and population 100 feet below ground, it might seem that the principle has broken down. But, says Sir Stephen, the principle does not say that the answer to an attack must be of the same order of things as the attack. If the answer to a nuclear attack which creates total destruction is merely to enlarge the area of destruction, nothing of value has been achieved. If, however, having reached the last word in physical attack, we realise that we have not simultaneously reached the frontiers of human thought, we can move from the physical into the psychological sphere.

Next week we will complete Sir Stephen King-Hall's contention that the answer to the H bomb is passive resistance and will consider some objections that suggest themselves.

THE EUROPEAN MOTOR CAR INDUSTRY

(From Our Special West European Correspondent)

PARIS, August 10.

THE motor car industry is one of the "pilots" of the economy in West European countries; variations in its activity are immediately reflected in many other sections of industry in France, Britain, West Germany, Italy and now-a-days even Spain. Not only is each national automobile industry vital for the domestic economy, as in the United States, but in Europe each national automobile industry is heavily relied upon to earn foreign exchange, especially, in recent years, hard currencies. Apart from foreign exchange earnings, the export market is of particular importance to these industries because the domestic market in all West European countries is too small to support the scale of operations necessary for the economic manufacture of automobiles. This combination of circumstances gives each national automobile industry a privileged position within the domestic economy, and these privileges are reinforced by the fact that the State itself is in some countries the chief producer of cars (Renault in France, Volkswagen in West Germany and Seat in Spain are all nationalised).

Now when five neighbouring economies have thus built up a privileged industry, based on an inadequate domestic market compensated for by a mass of special dispensations and by reliance on the export market, the scene is set for some curious forms of competition. It is some of the aspects of this competition, and the results it is likely to have in the near future, that we propose to examine here. There are three facets to this competition: the struggle within West Europe between the rival industries, the struggle in overseas markets between the same industries, and the struggle both in Europe and abroad between the European light-car industry and the giant American corporations marketing bigger vehicles.

To date, competition within West Europe has naturally been limited by the protection each national industry enjoys, but this situation will be ended at least for the Italian, French and German industries if the European Common Market becomes a reality. These three industries will then have to meet each other in an open market, despite differences in their present costs of production. Their first thought will naturally be to combine to exclude competition from outside producers, so that they can more comfortably proceed to deal with the problems raised by their own rivalry, and since American cars are already subject to discriminatory import duties, this means that the alliance will be directed against the British light-car producers. Secondly, within each of these three countries there will occur further concentration of automobile producers; this has already gone a long way (as in the United States itself, for that matter) and the French industry for example is now heavily concentrated. This process will be hastened by the rigorous competition in a common European market. Thus the chief of Renault, M. Pierre Dreyfus, said the other day, "I think the Common Market will still further improve relations between the French automobile firms", which is a polite way of saying that cartellisation will be promoted.

Thirdly, concentration disguised as "specialisation agreements" will occur between the French, Italian and German industries because intra-national cartellisation will not be adequate to protect the national

industries from open-market competition in West Europe. There is reason to believe that negotiations have already been opened between these three national groups to avoid some of the inconveniences of Common Market competition. The advantage the Italian industry will enjoy in the ten or twelve year preliminary period while the Common Market is gradually being introduced is especially worrying the French and West German industries, because the Italians will start out with a much higher level of customs duty protection. In this preliminary period, the Italians will probably be the biggest relative gainers within the European market.

A fourth problem raised by the Common Market concerns the competition the French, Italian and West German industries will meet within West Europe from the affiliates of the American corporations, which produce light cars in these three countries (for instance, Opel in West Germany which is an affiliate of General Motors, and the Ford affiliates in France). These American firms are now making very substantial new investments, especially in West Germany, presumably in the hope that even if Euromarket takes a heavily protectionist line the American industry will still preserve a foothold within the fort. The "national" industries propose to limit this awkward competition by invoking Article 86 of the Common Market treaty which is designed to prevent one or a few big enterprises "abusively exploiting a dominant position within the Common Market or within a part of it". This is vague enough to permit quite effective action, and when you recall that the "national" industries are partly State-owned and will become more concentrated in the near future, you will not doubt that this action will be indeed effective.

Competition between the West European industries in overseas markets is already severe, especially between the British and German producers. Volkswagen produces 500,000 vehicles a year, and sells about 240,000 of them outside West Germany, so plainly this overseas market is crucial. Volkswagen have assembly plant in Australia, Ireland and South Africa, while their factory near Sao Paulo in Brazil will shortly begin to manufacture parts for trucks. The French firms similarly have assembly plant abroad (e.g. in Australia and Spain), and the British have an even longer list. If the Continental manufacturers come to co-operation agreements within the Common Market, they will no doubt seek to "rationalise" their competition abroad, and in the first instance this will again be directed primarily at the British rivals.

The keenest competition is in the United States, where there are hard currencies to be earned and where the exclusive concentration of the American firms on big cars has left the light-car market open to the Europeans. This market is small by American standards but is important to the Europeans. It consists almost entirely of people who already own one big American car and want another smaller vehicle for the wife to use when doing her shopping in crowded city centres where parking a drawing-room-on-wheels is difficult. The light-car market has rapidly expanded in the United States in the last year: against 100,000 foreign cars bought last year, it is expected

that Americans will buy 200,000 this year. Until lately, the European national industries had this field to themselves because the American companies that produced light cars through their affiliates in West Europe did not seek to market them in the United States. Thus, the leading foreign car sold in the USA was Volkswagen, which took two-fifths of the market early this year. The Rootes Group's Hillman and, latterly, Renault's Dauphine have been making rapid gains, and even the Italian Isetta, which the Americans took at first for a fantastic toy, has been finding more buyers. (We are leaving aside of course the superb craftsman cars, like the Jaguar, MG, Triumph and Alfa-Romeo, which always could and always will be able to sell as many cars as they can ship to the USA).

This expansion of the US light-car market did not seem likely to worry the big American corporations, even in a period when their own sales were disappointing, for it does not exceed 4 per cent of the 6-million new cars sold in the USA each year. It is, and will remain, quite improbable that General Motors and Ford would ever set up plant to produce light cars in the USA because the market is too small and because manpower costs are as high in a light car as in a big one and it is manpower costs that are pushing up American prices. But the American firms have moved to meet this competition, nevertheless, and in a way that is seriously worrying the West European producers: they have broken with the policy of not selling the light cars produced by their European affiliates and are now offering these cars in their US showrooms alongside the home-produced models.

The American Ford Company led the way by marketing in the USA the English Fords manufactured

at Dagenham and in the course of this year they have launched a vigorous campaign in favour of the English cars designed on American lines, the Consul and Zephyr. The result is that the English Ford has made rapid gains in the USA and is second after the Volkswagen among foreign cars sold. General Motors have quite recently followed suit and are selling in the USA the Vauxhall produced by their affiliate in Britain and the Opel manufactured by their West German affiliate.

This form of competition sets a formidable problem for the West European "national" industries, because the most expensive part of marketing a car abroad is the sales and servicing organisation that has to be built up. The cars produced by American affiliates in Europe find in the USA this sales organisation ready-made: the 4,000 Pontiac agents throughout the USA handle the Vauxhall and the 3,500 Buick salesrooms sell the West German Opel. Plainly, European firms like Renault, Citroen, Fiat and Volkswagen will henceforth have to face formidable competition in the very overseas market that up to now was producing the best returns.

For these latter firms, the tendency will be to eliminate competition between themselves the better to be able to meet the competition of American-connected manufacturers, both in West Europe and in the US market. The European motor-car industry seems to have before it a period of extensive reorganisation, and despite all the protestations of economic liberalism that are written into the Common Market treaty we can expect that the Continental industry, in which State influence and ownership already dominate, will take a cautious protectionist line.

WORLDGRAM

AGRICULTURE

Import of Food Grains: Shri Ajit Prasad Jain, Union Minister for Food and Agriculture, told Shri Shree Narayan Das in a written reply in the Lok Sabha recently that 13,45,700 tons of wheat and 5,75,300 tons of rice had been received on Government account from January 1, to July 20, 1957. In a statement placed on the table of the House, the Minister said that the wheat was received from the U.S.A. and Australia and rice from the U.S.A., Burma, China, Viet Nam and Pakistan (return of loan). The Minister further added that about 6,30,000 tons of wheat and rice were now on way to India from the U.S.A. and Burma.

*

Protection to Fruit Industry to be Discontinued: The Government of India's resolution on the Tariff Commission's Report (1957) on the continuance of protection to the Preserved Fruit Industry has been published in a Gazette of India Extraordinary. Government have accepted the Tariff Commission's main recommendation that protection to the industry need not be continued beyond December 31, 1957. Government have taken note of certain other recommendations of the Commission for assistance to the industry and will take suitable steps to implement them as far as possible. In the resolution, attention of the preserved fruits industry has been invited to the Commission's recommendation that they should try to use sugar manufactured by the carbonation process in order to find out whether the blackening and feathering of containers can be avoided by its use. The attention of the Metal Box Co. of India has also been invited to the Commission's recommendations that they should reduce the price of open top sanitary cans to the maximum extent possible and that they should give as long a notice as possible to Government, of any variation of their prices so that if the change proposed is, 'prima facie', unreasonable, Government may intervene in the matter.

*

Development of Fisheries: A sum of Rs. 8.05 lakhs has been allotted for the development of fisheries, both inland and marine, in Mysore State for 1957-58. A scheme for the development of fishing harbours costing Rs. 45,000 had been received and was under consideration. Grants and loans sanctioned to the Andhra Pradesh for the development of fisheries amounted to Rs. 6.18 lakhs and Rs. 23,000 respectively in the first Five-Year Plan and Rs. 4.46 lakhs and Rs. 2 lakhs respectively in the second Five-Year Plan (up to July 25, 1957). While no specific amount was allotted for the first Plan, the amount provided for the second Plan was Rs. 60.17 lakhs in respect of fisheries development schemes under Grow More Food (including State's share of expenditure).

INDUSTRY

Draft Specification for Gear Lubricant: The Indian Standards Institution has issued, for eliciting comments, a draft specification for gear lubricant, regular. This specification prescribes the requirements and methods of test for gear lubricant for five viscosity grades, namely, SAE 80, SAE 90, SAE 140, SAE 250 and special. The first four grades are primarily intended for use in automotive transmissions of non-automatic type and in most spiral-level and worn-gear differentials, where the tooth pressure and revolving velocities are low enough so that the gears could be satisfactorily lubricated with straight mineral oil. The lubricants of special grade are primarily intended for lubrication of large open gears and wire ropes.

Development of Silk Industry: A number of schemes, designed to encourage production of quality silk and reduce the cost of production, have been approved by the Central Government. About Rs. 20.5 lakhs have been sanctioned to State Governments for implementing the schemes. For modernisation of the Government Silk Filature at Kanakapura, Mysore State has been given a grant of Rs. 68,750 and an equal amount as loan. For the replacement of country char-khas by domestic besins, the State gets a sum of Rs. 1.5 lakhs, half of which will be treated as grant and half as loan. The other schemes, which Mysore will implement during the year, are for sinking wells in rain-fed and seed areas, for the establishment of a cocoon market and grafts nursery and for the maintenance of the two hill rearing stations at K.R. and B. R. Hills. Financial aid has also been provided for the construction of a silk conditioning and testing house.

*

Manufacture of Iron and Steel Castings: In a notification published in the 'Gazette of India' of July 6, 1957, the Government of India made it clear that iron and steel castings manufactured with the aid of power for sale to the public would alone be covered by the registration and licensing provisions of the Industries (Development and Regulation) Act, 1951. As a result, only those industrial undertakings, which employ 50 or more workers, use power and make iron and steel castings for sale to the public, need apply for registration or licence as the case may be. And undertaking which makes iron and steel castings for the production of articles for which it is already registered or licensed under the Industries Act need not apply for registration or licence unless its casting capacity is such as would enable it to effect sale of castings to the public, in addition to meeting its own requirements.

TRADE

Exports of Coir Mats and Woollen Carpets to Canada: Prospects for the exports of Indian coir mats and matings and woollen carpets to Canada are good according to a Market Report received from the Commercial Secretary of the Indian High Commission in Ottawa. According to the Report, the quality of Indian coir mats is considered good by the Canadian trade. The Report says the competition from Canadian mats has now almost completely disappeared as a result of high labour costs in that country. Plain coir matting, the Report says has a bright future but coloured coir matting requires immediate changes for survival. Serious efforts should be made to introduce some fundamental innovations in coir matting manufacture so as to make these more attractive and soft. About coir yarn, the Report says, the entire quantity of coir yarn used in Canada is imported from India. The demand for floor covering generally is expected to continue to increase in Canada. In view of the recognised quality, style and colours, the prospects for Indian carpets in the Canadian market appear bright. The Report suggests a review of prices in order to keep Indian carpets more keenly competitive.

*

Protection to Hand Tyre Inflator Industry Extended: The Government of India's Resolution on the Tariff Commission's Report (1957) on the continuance of protection to the Automobile Hand Tyre Inflator Industry has been published in a 'Gazette of India' Extraordinary. The Tariff Commission has recommended that a protective duty of 25 per cent 'ad valorem' should be adequate and protection to the duty should be continued till December 31, 1960. As regards the rate of protective duty, while it is agreed that a duty of 25

per cent 'ad valorem' would be adequate to protect the industry against foreign competition, Government have decided in consultation with the Commission, that having regard to the existing structure of the revenue tariff, the protective duty should be continued at the present level of 45 per cent 'ad-valorem'. The attention of the industry has been invited in the Resolution to the Commission's suggestion that it will be advisable for the manufacturers who produce hand tyre inflators (pumps) out of welded tubes, to use seamless tubes for the manufacture of these pumps.

*

Stocks and Export of Cotton Yarn: Shri Morarji Desai, Minister for Commerce and Industry, said in a written reply to a question by Shrimati Tarkeshwari Sinha in the Lok Sabha recently that there had been no large accumulation of stocks of cotton yarn with the mills. The stocks constituted only about five days' production or 15 days' supply for the decentralised sectors such as handlooms and powerlooms. Shri Desai said the stocks of cotton yarn pending sale with the mills on July 13, 1957, was 56,275 bales. An annual quota of about 54,000 bales of yarn had been earmarked for export exclusively by the mills. Besides, 17,500 bales had been released for free licensing during the period July-December 1957 from the quantity remaining up-shipped by the mills or their nominees out of the allotments made in their favour in the last quarter.

FINANCE

Foreign Assistance for Railways: Replying to a question in the Lok Sabha by Sarvashri Harish Chandra Mathur, Narayan Das and Raghunath Singh the Deputy Minister for Railways, Shri Shah Nawaz Khan, placed a statement on the table of the House giving details of the foreign assistance received for the development of the Indian Railways. According to the statement, the Indian Railways have received in all \$40,164,282 under the Technical Co-operation Aid Programme (U.S.A.) and under the Colombo Plan Aid Programme from Australia aid equivalent to \$8,064,000. The World Bank loan of 90 million dollars recently secured for the Railways' second Five-Year Plan is not part of this "foreign assistance".

*

Credit From Soviet Union: Sardar Swaran Singh, Union Minister for Steel Mines and Fuel disclosed that the Russians had agreed to negotiate with the Government of India on 5 schemes, to be financed out of the 500 million rubles credit in 1959-61. The schemes were (i) Heavy Machine Building Works; (ii) Mining Machinery Plant; (iii) Power Station at Neyveli; (iv) Optical Glass Factory; and (v) Development of Korba Coalfields — Coal Mines, Quarry, Coal Beneficiation Plant, Repairing Shops.

*

Salary Bill of Employees: Stating that there were about 17 lakh civil servants under the Central Government, the Home Minister said that of these 9.14 lakhs got pay less than Rs. 51 per month, 4.62 lakhs between Rs. 51 and 101, 2.04 lakhs between Rs. 101 and Rs. 251 and 29,101 between Rs. 251 and Rs. 501. About 10,000 persons drew salaries above Rs. 500 and 2,341 persons above Rs. 1,000.

*

Central Assistance for Development of Small-Scale Industries: Financial assistance totalling over Rs. 19.3 lakhs has been sanctioned by the Government of India to Bihar, West Bengal and Tripura for implementing a number of schemes for the development of small scale industries. In Bihar, two new schemes one for the manufacture of footwear and another for the establishment of a small leather goods factory for the production

of hand bags, purses etc., have been sanctioned. For the continuance of four development schemes, West Bengal has been sanctioned loans of over Rs. 6.4 lakhs and grants of about Rs. 22,000. These are the two training-cum-production centres, one for mechanical toys at Hoogly, and another for the production of baby shoes and the centres for providing training in braiding of tapes, shoe laces, cords etc., and for the development of the cutlery industry at Kanchannagar and Ghoom. In the industrial estate at Arundatinagar in Tripura the model carpentry and blacksmithy units are to be continued. The model blacksmithy unit at Dharmanagar will also be continued. For these, an expenditure of over Rs. 2.16 lakhs has been sanctioned.

GENERAL

Development of Cane and Bamboo Crafts: A number of pilot centres are to be set up in different States, for providing training to artisans and promoting the production of cane and bamboo articles and mats. The States are: Kerala, Bihar, West Bengal, Assam, Rajasthan and Jammu and Kashmir. The Government of India, on the recommendations of the All India Handicrafts Board, have sanctioned grants and loans totalling about Rs. 1.54 lakhs to these States for the purpose.

*

Traffic Handled at Visakhapatnam Port: The total traffic handled by Visakhapatnam port during the fortnight ended July 15, 1957, amounted to 82,849 tons, of which ore exports totalled 36,853 tons as compared with 31,112 tons during the previous fortnight. Imports totalled 36,343 tons, of which food grains accounted for 12,024 tons Bhilai Steel Project material, 2,360 tons, and general cargo, 1,700 tons. Nineteen steamers entered the harbour during the period as compared with the eighteen during the previous fortnight.

*

World Electric Standards Body to Meet in India: The International Electrotechnical Commission, which co-ordinates standardisation of electrical equipment in the international field, has accepted India's invitation to hold its annual meeting in India. According to information just received in New Delhi, the Commission at its annual meeting in Moscow agreed that its annual general conference in 1959 or 1960 should be held in Delhi. The conference will be held in the autumn or winter of either year. At the Moscow session, the Commission set up, at India's instance, a new Technical Committee for the preparation of international standards on household and industrial fans and ventilating devices. The Secretariat of this new Technical Committee will be located in India and the Indian Standards Institution will look after its work.

*

Traffic At Madras and Bombay Ports: The tonnage of imports and exports handled by the ports of Madras and Bombay during the last three years were given in a written reply to Shri D. C. Sharma, in Lok Sabha, recently, by Shri Raj Bahadur, Minister of Shipping. The traffic handled by Madras port during 1954-55, 1955-56 and 1956-57, were 2,201,370 tons, 2,461,601 tons and 2,401,343 tons, respectively. The corresponding figures for Bombay port were 7,050,600 tons, 9,570,100 tons, and 12,274,434 tons respectively. In 1957, up to June 30, Madras had handled 627,322 tons and Bombay, 3,388,034 tons respectively. Imports at Madras included coal, food grains, fertilizers, and hardware, and exports iron ore, manganese ore, vegetable oil and textiles. Building materials, food grains, iron and steel, chemicals, machinery, boilers and railway materials were among the imports handled by Bombay port. Exported from Bombay were fuel oil and other oils, manganese ore, other ores and piece goods.

NEWS IN BRIEF

INDIAN

The Union Finance Minister, Mr. T. T. Krishnamachari has stated that the Government of India was contemplating to amend Section 38 of the Indian Income Tax Act.

*

India's export trade with Russia was expected to go up during 1957-58 to about Rs. 30 crores.

*

It is reported that the abolition of zamindari and other intermediary rights in land which were achieved during the first Plan period are estimated to cost Rs. 615 crores in terms of compensation.

*

A list of industries, both in the public and private sectors, where the scheme of labour participation in management is to be introduced, has been approved.

*

The Tata Iron and Steel Company reported that the total approximate production of iron and steel at their steel works at Jamshedpur during July 1957 was 38,300 tons of pig iron, 88,300 tons of steel ingots and 66,600 tons of saleable steel comprising 19,700 tons semis and 46,900 tons finished.

*

The Government of India has decided to release a limited quantity of maize gluten only for export during the period August-December 1957 or till the ceiling is reached, whichever is earlier, by all shippers to all permissible destinations.

*

The Government of India have extended the last date for the receipt of suggestions and comments on the draft rules under the Coir Industry Act until August 31, 1957.

*

According to the press communique of the Reserve Bank subscription lists for the 3½ per cent (1967) National Plan Bonds — Fourth Series and 4 per cent (1972) were closed on August 6 as the notified amount had been fully subscribed.

*

It is reported the details of the proposed prototype and training workshop for small-scale industries will be finalised by a four-man Indian official delegation which is leaving for West Germany on August 14, for discussions with the representatives of the Federal German Republic.

*

The Coffee Board has released for export 458 tons of Robusta cherry "A" coffee seeds out of the 1956-57 crop.

*

Prospects for the export of Indian coir mats and matings and woollen carpets to Canada are reported to be good, according to a market report received from the Commercial Secretary of the Indian High Commission in Ottawa.

FOREIGN

The Italian Government and the World Bank have agreed to sponsor a study leading to the construction of a large nuclear power station in Southern Italy. The U.K. Atomic Energy Authority will undertake a technical review of tenders for gas-cooled natural uranium reactors.

*

South Africa's gold and foreign assets in the week ended July 26 totalled £117,265,000 compared with £117,093,000 a week earlier. The latest total comprised £81,895,000 in gold coin and bullion, £24,736,000 in foreign bills, £7,048,000 in foreign securities and £3,586,000 in other foreign assets.

*

Germany's surplus with the European payments Union in July amounted to \$180.3 million exceeding the previous record of \$138.6 million reached last May.

*

It is reported a new Japanese atomic power development corporation will be formed to import and operate Japan's first commercial atomic reactor.

*

Net income of the United States Steel Corporation totalled \$231.42 million in the six months ended June 30 last equal to \$4.07 per common share. The net balance in the first half of 1956 was \$208.55 million equal to \$3.66 per share.

*

Canadian Industries group sales in the first six months this year totalled \$75.20 million — up 11 per cent on the \$67.70 million of the same period a year ago. Earnings amounted to \$5.07 million or 58 per cent per common share composed with 55 per cent a year ago.

*

It is reported that the Greek shipowner Mr. Onassis contemplated the building of a big ship yard on the New Waterway between Rotterdam and the Hook of Holland. The costs would amount to no less than \$70 million.

*

The Pakistan Jute Mills Association has called upon the Government to give relief to this industry in the form of a subsidy to the extent of at least one rupee per ton.

*

It is reported the German textile industry, after several years depression, is now reporting improved prospects on all counts — prices, output and exports.

*

A U.S. trade mission which recently toured South Africa said in its final report to the U.S. Department of Commerce that it found the Union provided a considerable potential market for private investments not only domestically but as a catalyst for the impending industrialization of neighbouring Africa.

*

Dutch private banks loans to industry and trade rose from Fls 3,102 million to Fls 3,113 million during June.

*

Man-made fibre output in Britain in June showed a substantial fall from the record May production and was a little less than in June last year.

Special Articles

ENERGY REQUIREMENTS IN 1975

AN assessment of the future demand of energy in the Indian Union has assumed great importance in view of the rapid strides that industrialisation is expected to take in the next twenty years. Far too little attention has hitherto been paid to this crucial problem. In March 1956, the Economic Department of one of the oil companies made a serious attempt to forecast the energy requirements of India in 1960-61. The Eastern Economist's Annual Number, 1956, attempted a longer-period projection to 1975. Realising the importance of the subject, the Coal Council set up, early this year, a special committee to study the present pattern of energy utilisation and to examine probable demands during the next two decades. In addition to coal, the committee was commissioned to examine the probable demands of other sources of energy as well. It has increasingly been felt that petroleum, electricity and nuclear energy will also grow in importance in the future.

Despite scepticism shown in certain quarters in regard to the utility of such studies, attempts rightly continue to be made for predicting probable future trends. Such attempts have been made in the past in the U.S.A., the U.K., and other industrially advanced countries. The Paley Commission Report in 1952 studied the materials problem in the United States and estimated probable demands of all the important commodities till 1975. The National Coal Board in the U.K. prepared a plan in 1950, which estimated the level of output of coal in 1961-65. Recently, the O.E.E.C. has brought out a report on energy requirements of Europe projected to 1975. All these studies need to be examined carefully for appreciating the technique of projection as applied in other countries.

The O.E.E.C. report on energy requirements succeeded in evolving mathematical laws which governed the demand of energy in the past in some of the countries. Invariably it was observed that the consumption of commercial energy was a function of industrial production.

In India, industrial production has always outpaced the production of coal which is the predominant source of energy. As the table below shows, the rate of growth in industrial production during 1951-56 was nearly three times the rate of growth in coal output:

INDEX NUMBERS OF INDUSTRIAL PRODUCTION AND COAL PRODUCTION

(Base: 1951= 100)

	Industrial Production	Coal Production
1952	103.6	105.6
1953	105.6	104.5
1954	112.9	107.2
1955	122.1	111.4
1956	142.8	114.9

The case of electricity, however, is different. The consumption of electricity in Indian industry races ahead of industrial production. The Economic Intelligence Unit of the Indian Institute of Public Opinion estimated, in one of its recent studies, that every 10 per cent rise in industrial output (in the organised sector) is accompanied by 16 per cent rise in the consumption of electricity. If petroleum consumption is also

included, it is found that the total consumption of energy in 1951-56 rose at a slower pace than industrial production. The following table shows that industrial output in 1951-56 rose at 7.5 per cent per annum (compound) as against a rate of 6 per cent in energy consumption.

RATES OF GROWTH

	1951	1956	Percentage Change	Rate of Growth (Compound)
Index of Industrial Production	100.0	142.8	+42.8	7.5
Consumption of Commercial Energy† (Millions of tons of coal equivalent)	33.6	44.5*	+32.5	6.0

† Includes coal, power, oil and power alcohol.

* Estimated.

The second Five-Year Plan has fixed the target of raising industrial production by 50 per cent which works at 8 per cent per annum (compound). It may be recalled here that the first Plan registered a rise of 7.5 per cent per annum (compound). If it is assumed that the rate of growth in the organised industrial sector in the third, fourth and fifth Five-Year Plan would be 8.5, 9 and 9.5 per cent per annum (compound) and that the demand of commercial energy, which has hitherto advanced at a slower rate than industrial production, would also rise in a similar manner, the total requirements of commercial energy in 1975 would be 214 million tons of coal equivalent as against 40 million tons of coal equivalent in 1955. The estimated demand of energy in 1960, 1965 and 1975 is set out in the following table:

FUTURE DEMANDS OF COMMERCIAL ENERGY 1955-75

(In million tons of coal equivalent)

1955	40
1960	59
1965	88
1970	136
1975	214

Another method of computing probable future demand of commercial energy consists in assessing the trend of requirements of each of the major consumers. The chief consumers of coal in 1955 were the railways, the electric companies, iron and steel plants, brick and cement factories, households and a number of miscellaneous industries. In case the probable levels of output of each of these industries during the next twenty years were estimated, the task of estimation of demands of energy would be very easy. The targets of output in each of these industries can be anybody's guess. Steel output in 1975 can be put anywhere between 20 and 40 million tons. Similar is the case with cement, cotton textiles, etc. On certain rough assumptions, the table next page sets out the pro-

Saved for the nation

by this factory in 14 weeks this year
-Rs. 1 crore in Foreign Exchange.

Our second mill has now gone into production and we are installing further plant to meet the whole national demand for steel tubes up to 6.5, 8" outside diameter.

Indian Tube

The Indian Tube Company (1953) Limited
A Tata-Stewarts & Lloyds Enterprise
41, Chowringhee Road, Calcutta-16

bable requirement of coal in 1975 as compared with 1955:

PROBABLE REQUIREMENTS OF COAL: 1955 — 1975

(In millions of tons)		
1. Iron and Steel Industry . . .	3.5	35
2. Railways	12.5	25
3. Brick and Cement Factories . .	4.0	20
4. Domestic Consumption . . .	2.5	20
5. Electric Companies	3.0	20
6. Miscellaneous	11.1	19
TOTAL	36.6	146

It is shown that the demand for coal will rise more than three-fold from 36.6 million tons in 1955 to 146 million tons in 1975. The major consumers would be the iron and steel industry, the railways, the brick and cement factories, and the electric companies. The domestic demand is expected to gallop from 2.5 million tons to 20 million tons.

The non-coal suppliers of commercial energy are estimated to satisfy nearly one-third of the total demand in 1975. The demand for oil, in terms of coal equivalent, is estimated to rise from 5.5 million tons of coal equivalent in 1955 to 44 million tons of coal equivalent in 1975. Hydro Power, similarly, is expected

to rise to 20 million tons of coal equivalent. Nuclear energy has also been estimated to contribute its share of 4 million tons of coal equivalent. The table below summarises these results:

SUPPLIERS OF COMMERCIAL ENERGY: 1955-75

(In million tons of coal equivalent)		
	1955	1975
Coal	32.5*	146
Oil	5.5	44
Hydro Power	2.0	20
Nuclear Energy	—	4
TOTAL	40.0	214

Forecasting is a valuable technique to which attention needs to be directed more and more. It cannot be expected that any two forecasts would agree in their conclusions. The crux of forecasting is the assumptions on which it is based. The foregoing analysis is an attempt based on assumptions which steer clear of exaggerated expectations.

* Estimated internal consumption of coal including electricity generated by steam.

FERTILIZERS: THE NEED FOR A CLEAR-CUT POLICY—II

By C. R. RANGANATHAN

AN attempt was made in the previous article to show that the food problem of India cannot be solved without making the fullest use of fertilizers. The difficulties in the way of securing this objective are immense and reference will be made to the major ones in the following paragraphs. But the primary obstacle is the absence of a clear-cut statement of policy by the Government of India in respect of fertilizer use. The approach of the Government to this question seems to be hesitant, half-hearted and ambiguous. The All-India Congress Committee, one of the chief organs of the ruling political party, recently adopted a resolution which contains the following:

“While fertilizers should be used, it must be remembered that too much reliance on artificial fertilizers is not good for the soil in the long run. Therefore, it is essential that greater reliance should be placed on green and natural manures.”

Comparative analytical studies carried out at the Madras Agricultural College and Research Institute in fields which had been fertilised with fertilizers and manured with natural manures over a period of 40 years have failed to disclose any deterioration in the soil as a result of continual fertilizer use. The soils of Holland, which is the largest user of fertilizers in the world, continue to be as productive as ever, despite decades of very intensive fertilization. The same is generally true of West European countries, the U.S.A., and Japan. Fertilizer is used intensively in the U.S.S.R. The overwhelming weight of world experience is in favour of regular, intensive use of fertilizers.

It is not known on what technical advice the A.-I.C.C. based its resolution, or indeed whether it is

based on any technical advice. To suggest as it does that greater reliance should be placed on green and natural manures than on artificial fertilizers is to accept a low level of plant nutrient restoration to the soil and consequently crop yields well below the productive potentials of the soils of the country. The following statement shows the contribution of nutrients made by various manures and fertilizers, expressed as a percentage of their own weight:

Kind of Manure or Fertilizer	Percentage of Nutrients Contributed		
	N	P2O5	K2O
Natural Manures:			
Green manure . . .	0.5 — 0.7	0.1 — 0.2	0.6 — 0.8
Oil Cake (groundnut)	7.3	1.5	1.3
Farm Yard Manure .	0.5 — 1.5	0.4 — 0.8	0.5 — 1.9
Town Compost . . .	1.0 — 2.0	1.0	—
Bonemeal	1.0 — 3.0	25.0 — 30.0	—
Artificial Manures:			
Ammonium Sulphate	20.6	—	—
Ammonium Sulphate-nitrate	26.0	—	—
Urea	46.0	—	—
Superphosphate	—	16.0	—
Muriate of Potash	—	—	50.0 — 60.0

Owing to the bulkiness of natural manures their range of movement is limited: consequently every farm or every village must produce all the manure it requires. So far as farm yard manure is concerned this puts a premium on the keeping of vast herds of cattle which gives rise to a separate intractable problem of national

dimensions. In view of the known drain of plant nutrients by cropping, it is not possible for a farmer relying solely or even mainly on natural manures to do more than partially replace the lost nutrients, and to produce high yields, unless he resorts to fallowing. The recommendation of the A.-I.C.C. is clearly a retrograde one.

It is not the purpose of this article to decry the use of natural manures. They have a favourable effect on the physical properties of the soil. Organic matter added to the soil improves its water holding capacity and promotes bacterial life, both of which are beneficial. The fullest use of local manurial resources should

always be made for these reasons and especially now because there is not fertilizer enough to go round.

Nor is it contended that fertilizers have no secondary effects, especially as regards soil acidity and alkalinity which may have cumulatively adverse effects unless corrected by appropriate measures. The point, however, is that they can be readily corrected, without causing any impairment of the fertility factors of the soil. This is not the place for pursuing this controversy. The resolution of the A.-I.C.C. has underlined the need for a clear statement of Government policy as regards fertilizers in the interests of maximising food production.

BOOK REVIEWS

FREEDOM MOVEMENT

The History of the Freedom Movement in Madhya Pradesh: Editor-in-Chief Dr. Dwarka Prasad Mishra: Published by Nagpur Government Printing, Madhya Pradesh: 1956.

This book is a refreshing experience. It reads so smoothly that it is hard to believe there were four writers. The weaving together of the different strands by the editor and his assistant has been done very skilfully. This is a history book with a difference. It records the minutest details, but they are made interesting enough for even one who is not a reader of history to follow with appreciation. Beginning with the young freedom-loving Appa Sahib in the early nineteenth century, the story brings to life for us one after another the men who longed to be free, and the loyal soldiers and peasants who were incorruptible in their patriotism and faithfulness. It depicts with vividness the proud and beautiful Mahratta women, the heroic Rani of Jhansi, and others. However, the book is by no means a mere eulogy of patriots. There is plenty of other material for thought. The famous policies of British administration like the subsidiary alliances, the policy of “divide and rule”, and the ‘reforms’ are all presented in a new light.

The quiet strength and wisdom of Gandhiji dominates the fascinating story of the growth of Congress from a body that passed resolutions to one that acted, in the last chapters of the book. Motilal Nehru, Tej Bahadur Sapru and the inimitable Mohammed Ali Jinnah with their differences and their common high purpose are a few of the many giants of our freedom struggle whose struggles and sacrifices we re-live. The book is a monument as much to the Mahatma who directed the civil disobedience and non-co-operation movements as to the thousands who suffered incarceration and the 144 martyrs who laid down their lives in Madhya Pradesh so that India might be free.

THE ECONOMIC WEEKLY

The Economic Weekly — Special Number (July 6, 1957): 15, Tamarind Lane, Fort, Bombay: Price Rs. 2.50.

This praiseworthy Special Number of our Bombay contemporary, containing a number of thought-provoking articles, deals mainly with the stresses and strains to which the Indian economy has been subjected of late and examines the first-year progress of the second Plan. One of these ‘stresses and strains’ concerns

foreign exchange, and the editorial begins with the judgment that the Ministry of Commerce and Industry had not been squandering foreign exchange. The import policy, in the opinion of the Editor, has been unexceptionable, for it has been a policy of industrialisation. In the same breath as the Commerce and Industry Ministry is congratulated on its performance the private sector is criticised for going too fast with its investment programme. Here the Editor quotes his Delhi correspondent's estimate that the investment made or committed for development of industries in the private sector in the first fifteen months of the second Plan is of the order of Rs. 760 crores. This is compared to the target of Rs. 570 crores set for the private sector (other than mining, electric power generation and distribution, plantation and small-scale industries) for the whole of the second Plan period. The logical inference is that the private sector has not acted in terms of spreading out its new investment over the entire five-year period but has rushed (and is rushing) through its programme in the first two years of the Plan. In the words of the Editor, “the import content of this development for which the country has to pay, it had not bargained for. Much of the withdrawals from the foreign exchange resources which have already taken place and the further calls on such resources which have to be honoured are unauthorised withdrawals..... If the above figures meant that the private sector had already met the bulk of its import requirements, this would indeed be a silver lining in the cloud..... Unfortunately, so optimistic an interpretation would hardly be warranted, in the absence of some definite knowledge about the actual allocation of these resources. On the contrary, there is evidence in plenty, advanced and elaborated by several contributors in this issue, that a part of it represents investments outside the Plan..... The conclusion is inescapable that the development that has taken place is not of the type intended in the Plan, which had been approved by Parliament and solemnly accepted both by the Congress Party and the Government.”

What, in short, is the evidence on which this conclusion is based? There is, firstly, the statement of the Delhi correspondent of the journal that “in the sphere of industry, the Government has failed to balance investment and consumption in the context of the country's foreign exchange resources; it has not even tried to apportion foreign exchange between public and private sectors or between development that is planned, necessary complement to it or wholly outside it”. The writer of an article, ‘The Plan and the Budget’ in the special number refers to the “clear evidence of increasing over-all investment activity in

the private sector" as also to the evidence of the volume of private investment being much too large in relation to the volume of corporate savings. A contributor on 'National Income, Consumption and Saving' estimates total private investment in 1956-57 at Rs. 650 crores (including Rs. 200 crores of investment in inventories) and total Government investment at Rs. 600 crores. According to his estimates, the marginal rate of savings in 1956-57 was too low to sustain the spurt in investment activity and private investment in that year was rather high, especially in relation to past trends (Rs. 400 crores in 1955-56). Whether all this is slender or solid evidence, is a matter for more intensive investigation. Whether this evidence is sufficient to substantiate the conclusion of the leading article, is also a matter for more careful examination.

HEAVY INDUSTRIES

A Survey of Heavy Industries in India; Supplement to "Capital" (of June 27, 1957): 5, Mission Row, Calcutta: Acting Editor: Dinesh Bahl: Price Rs. 5/-.

The problem of striking a balance between heavy and light industries is important for any developing economy. In its leading article the supplement under review discusses the heavy-versus-light industries dilemma that engages the attention of both politicians and economists. No patent formula that might suit all countries can be evolved in this connection. The

hard economic realities should be the determining factors. Light and heavy industries cannot be put in contradiction as is done in certain quarters. In the matter of heavy industrialisation the journal subscribes to an empirical approach which would depend on available resources and potential markets and defence considerations. In its 23 articles the role of important industries along with surveys of their development is described. The vital importance of machine tools in the economy of the country and plans for expanding their production are ably discussed by Mr. M. K. Mathulla. In view of the circumstances in which the industry came to be established, and its initial handicaps, much of the criticism regarding arrested growth and too-high precision standards can rightly be explained. The possibility of meeting some of the demand for machine tools from small-scale units, as in Punjab, is however not examined. The article on 'Programme to Expand Capacity for Steel-Making' portrays the problems the industry will have to face in the near future. The treatment, on the whole, is of an enlightening nature. The demands that the industry is likely to make on the transport system are formidable. For a long time it will be advisable to make allocations of steel on a strict priority basis. Other industries covered in the supplement are cement, aluminium, copper mining, petroleum refining, chemicals, chemical fertilisers, locomotives, wagon manufacture, aircraft, commercial vehicles, diesel engines, and electrical equipment. The surveys of progress made by these industries are up-to-date and should be valuable for reference.

What's the job going to cost!

Before you buy your earthmoving equipment find out the job-costs

It's the *total job cost* that should be considered and not *only the purchase price* of equipment. Get the best for your job—buy "Caterpillar" earthmoving machines. You will have less downtime, lower operating costs, better service and ready supply of parts.

Pushing, pulling or carrying, on tracks or rubber, "Caterpillar" will move more earth in less time at less cost per cubic yard than any other machine. The high efficiency of Caterpillar performance more than offsets the initial costs.

UNREST OVER UNREST

By
CROESUS

FORTUNATELY for all concerned, the Post and Telegraph Employees' strike was called off albeit at almost the eleventh hour. Had this been done earlier, say immediately after the appeal of the Prime Minister, and before the promulgation of the ordinance it would have been graceful. But Providence perhaps willed that things should happen only in the way in which they did; otherwise, some of our labour leaders and also workers, would never have realised that only up to a point the community could be expected to sympathise with and back them. This is not to say that the community has failed to sympathise with the reasonable and legitimate demands of employees, whether they belong to the essential services or not. In any case, the latter (employees) have no right to expect the public to endorse all that they do, especially when their action threatens to disrupt the normal working of the life of the community at a critical phase of the second Five-Year Plan. As a matter of fact, the public became so agitated about the P & T Employees strike, the more so as they had a foretaste of the strike-to-be days ahead of the D-day and the zero hour. Despite a good case for an increase in emoluments — who has not a case in these days of rising prices? — the P & T workers did not know where and when to stop in their negotiations even when they had to deal directly with the Prime Minister himself. This is not the stray view of a columnist, but it is the considered view of all thinking men and women, including many P & T employees themselves.

The P & T strike has since been called off. The Presidential ordinance it gave rise to also has been revoked. A Pay Commission too has been appointed to go into all the demands including the demand for interim relief, of the P & T workers. It is even possible that the Pay Commission will recommend some relief, although it is difficult to anticipate what measure of relief the Pay Commission will recommend, but whatever recommendations it will necessarily have to bear some relief to the large number of workers involved, some 17 lakhs or so, as also the present financial difficulties of the Government.

Meanwhile, it is significant that the threatened P & T workers' strike has provoked some heart-searching and led a few of our politicians to give expression to their views on the all important question of whether trade unions should be permitted to function in Government services. Mr. K. K. Shah, the President of the Bombay Pradesh Congress Committee, stated at a press conference a few days ago, that the question before the public was not merely one of strikes on essential services but the more fundamental one of whether trade unions could at all be permitted in Government services. Formation of a trade union in services according to him, meant the acceptance of the principle of collective bargaining against the government which after all represents the voice of the people. "Can the voice of the people, which includes the services", he asked "be challenged by a section of the population?" Answering the poser himself, Mr. Shah observed that in a democracy, ultimately, the Government was the cumulative wisdom of the people and as such to go on strike against it was to challenge the cumulative wisdom of the people. Continuing in the same strain, the B.P.C.C. President averred that it had

been the endeavour of leaders of all parties to keep the services away from party politics. One is not sure that this endeavour has always been honestly translated into practice. Be that as it may, one must concede that, if the stability of the country is not to be endangered, no political party can be allowed to form trade unions in the services and thereby be tempted to have the opportunity of fighting the popular vote by asking the services to go on strike.

On the place of collective bargaining, the private and the public sectors, Mr. Shah sought to explain why in the private sector this was necessary and also why in the public sector it had hardly any place. In the former, he said, the acceptance of this principle was based on the recognition that the interest of a large number could not be subordinated to the interest of the few, whereas in the latter, there was no such need inasmuch as the government represented the interest of the entire country. One can appreciate this reasoning, but only so long as it is not made an excuse to favour the public sector at the cost of the private sector, as is unfortunately being done in certain spheres. For such, it should be noted, militates against the very basis of the mixed economy concept which has been accepted by the Government.

More or less a similar view was vouched by Mr. V. V. Giri Governor of U.P. when he addressed the annual convention of teachers of the Lucknow and the Allahabad universities which is but a sector of Government. Being himself a trade unionist for about four decades, his views command the highest respect everywhere especially in trade union circles. It is noteworthy that Mr. Giri was not opposed to teachers (and this may extend to all government servants) organising themselves in trade unions, but he strictly enjoined on them to regard their duties and responsibilities above all other considerations, greater and more important than even organising into trade unions. Like Mr. Shah, he also did not want the teachers to join any political group. Indeed, he disclosed that during the whole of his public career he had not allowed even his own political views or ideologies to be pumped into trade unionism. This is, of course, an ideal to keep in mind and achieve, and perhaps possible of implementation by only a few stalwarts like Mr. Giri, but, in practice is this being followed today? The P & T worker's strike, the recent strike of workers in Jamshedpur (Telco) and the labour situation in Kerala all demonstrate that more and more politics is being imported into trade unionism. Obviously this cannot be avoided always. So the voice would appear to be whether to all people in the services (government) to organise themselves into trade unions and risk the danger, or not to allow them the right at all.

An interesting point to note while on this subject is that, among some P & T employees and also among others (certain Ministers in Madras) doubts have arisen about the danger of having large federations of workers. Their inclination seems to be towards local or regional unions or unions of employees belonging to units in one industry of only a given state. Their fear evidently is that not only do Federation become unwieldy and, therefore, tend to lose touch with the

rank and file of workers, but they also permit the office bearers at a given time if they choose to be irresponsible, to take extreme course of action and do more harm than good both to the workers and to the country.

RAW COTTON EXPORTS

By

CROESUS

THE pattern of international trade in raw cotton has changed considerably. International competition has become more and more acute and it is more in favour of buyers than of sellers. India, though one of the premier countries engaged in the export of raw cotton, does not enjoy today a monopoly position. Countries such as Pakistan and Burma have been keen competitors in our exportable varieties; these countries enjoy another advantage in that they have no export restriction. Whilst formulating export policy, particularly of raw cotton and cotton textiles, therefore, all these peculiar problems of this trade should be borne in mind by the powers-that-be.

The policy hitherto pursued by the government, with regard to cotton export, however, has, according to trade circles, not been satisfactory on any count, whether it be the announcement of the export duty or export quotas, or the quantum of export or the varieties permitted or the allocation of export quotas to established shippers and newcomers and finally customs procedure and letter of credit regulations with Far Eastern countries. A clear and stabler export policy giving due regard to each of these factors is very urgent; frequent changes in the policy of the government will harm the country's export trade. Only a regular supply to the consumer will keep the trade flourishing. If our supplies are not maintained regularly it is natural that he should want to turn to other countries.

At least to maintain our position as raw cotton ex-

All these are manifestations of a visible unrest over recent labour unrests and if labour fails to take serious note of this unmistakable changes in public attitude, especially in the prevailing condition of economic uncertainty, it will be doing so at its own peril.

porters, if not to increase our cotton exports, a few suggestions are made by those engaged in this business for years. Among others, they suggest that the government should announce the first export quota covering Bengals and Oomras Dholleras (to the extent of two lakh bales) every year in August or as early as possible, announcing simultaneously the export duty leviable, which should not be liable for revision upwards during the validity of the licences. Supplementary quotas, if necessary, may be announced in December or January. Such a policy it is claimed will enable India to retain goodwill in the world market. Another suggestion deals with the licensing policy of the government. It is said that the government issues licenses for 5, 10, 20 and 50 bales units to a large number of traders. It is doubtful whether such small licences can establish our export trade in raw cotton. Moreover, granting licences to newcomers who cannot be expected to have full knowledge of this complicated trade will only jeopardise our foreign trade, thereby causing immense damage. Accordingly, it has been suggested that the government should be more liberal to established exporters in their licensing policy and accept only such newcomers as can satisfy the government about their ability to establish export trade. The authorities in their enthusiasm to win the favour of all and sundry are, unfortunately, pursuing a policy that hinders the exports of a commodity, which is the major earner of precious and much-needed foreign exchange.

TELCO ON THE MARCH

TELCO'S latest working year has turned out to be one of striking progress in all directions. This is reflected in its stepping up the dividend to 8 per cent. As time moves on and the investments made and expenditures incurred commence to yield fruit, still better results are bound to come. But equally progressively will the Company's financial needs mount. Already, the inescapable stocking of essential raw materials, etc., has led the Company to borrow considerable amounts. Projects on hand and the expansion programmes over the next few years will mean increasing demands for funds. To meet these heavy needs, it is obvious that the Company's own various reserves, even though substantially, strengthened during the past few years, will be far too insufficient. It is in this context that its proposal possibly to expand the share capital is justified, notwithstanding that the shareholders have had to wait for reasonable returns all these years.

A matter of particular satisfaction for the Telco is the new price trend that is emerging out of the gloomy past of dropping demand. The continuous decline in the price of steam locomotives seems to be in check now as a result of economic forces consequent on the gradual contraction in the production capacity of some countries. That the output target of locomotives and boilers has been exceeded by as much as 30 per cent is, therefore, doubly welcome. Again, costs have been cut down by combining improvement in efficiency with the utilisation of unused capacity, despite the unfavourable price position of steel and the rising

cost of other materials and wages. In course of time, however, India, in line with other countries, will need to change over to diesel and other similar traction, as more oil is discovered in the country. Telco has not much to fear from it since it is adequately equipped to switch over to the production of diesel engines with inconsiderable difficulty.

In the automobile industry, progress is encouraging. The Government has adopted a helpful attitude in that it has left the industry free to fix prices within specific limits. On the recommendations of the Tariff Commission again, protection has been granted to the industry for ten years. These are incentives for the growth of the industry and it is likely that at the end of the period, it will have grown sufficiently strong to be able to stand up against competition from abroad. Both in the case of locomotives and automobiles, the authorities of the Company are conscious of their shortcomings. This in itself is a healthy sign. It can, therefore, reasonably be hoped that in course of time standards of productivity will be appreciably improved.

The critical foreign exchange position has meant anxiety for the Telco as much as for other industries. Nevertheless, the Government has appreciated the need of the Company to import plant and equipment. It has accordingly agreed to allow for reasonable requirements of foreign exchange in order to help the company to achieve rapid development in its production.

BUSINESS NOTES

FINANCE FOR SHIPPING

MR. LAL BAHADUR SHASTRI's speech during the discussion in the Lok Sabha on the Transport and Communications Ministry's demands for grants has raised optimism that Government will take firm steps to break the threatened deadlock in the programme of expansion of shipping. It will be recalled that the whole of the tentative allocation of Rs. 37 crores specifically provided as the loan capital to be supplied by the Government for the development of shipping in the second Plan was exhausted in orders which were placed for the construction of 170,000 G.R.T. The balance of about 220,000 G.R.T. including 90,000 G.R.T. required for replacements still remains to be provided for. This heavy balance is left at the present time virtually without any financial provision. Mr. Shastri announced in the Lok Sabha that he was urging upon the Finance Minister to set up a special fund to finance the acquisition of the balance of tonnage. He even went a step further and indicated that the shipping target may be raised by 1,00,000 tons. The upward revision of this order would make the total tonnage only 50 per cent of what the Shipping Policy Committee had strongly pressed for achievement by 1954 at least. Mr. Shastri's plan envisages provision of Rs. 10 to 12 crores per year making a total of Rs. 50 crores during the remaining four years of the present Plan for additional tonnage.

Such a credit fund of the order of Rs. 50 crores would be adequate for the purchase of the remaining tonnage and probably the increased target of 1,00,000 tons. Partly the contribution which the shipping companies have to make for purchases of ships would supplement whatever gap remains in the financial resources. The real difficulty about finance for shipping cannot be assessed in terms of the mere size of the fund required. It must be remembered that the capacity of the Vishakhapatnam yard has been booked for the period of the second Five-Year Plan. Any orders to be placed for shipping will inevitably require expenditure of foreign currency. In plain words it would mean that Mr. Shastri is asking the Finance Minister to provide extra foreign exchange of the order of Rs. 50 crores. Our foreign exchange position being what it is, it would be unrealistic to expect that the Finance Minister would be in a position to accede to this request readily. But considering the fact that a World Bank loan is likely to be available for the acquisition of tonnage, the Finance Minister should try to give high priority to this new demand on him.

What Mr. Shastri said about the rate of interest charged by the Government on loans to shipping companies for the purchase of tonnage has not clarified the position at all. On the other hand it has created greater confusion. There are very heavy arrears in the purchase of ships for the coastal trade. Shipping companies are hesitating to approach the Government for loans for coastal vessels because the rate of interest charged is as high as 4½ per cent. In contrast the rate charged for loans for overseas shipping vessels is fixed at the moderate level of 2½ per cent. It is the request of the companies that the rate for coastal shipping loans should be reduced. They are not interested in technical parity between the rates for the two types of loans. Mr. Shastri has made confusion worse confounded by saying that one of the alternatives before the Government at the present time is to raise the rate of loans for overseas shipping to the same level as the rate on coastal loans. If this alternative were accepted it would worsen the matters. It would give no relief to prospective applicants for loans for coastal

shipping and on the contrary it would discourage the companies which are now planning to obtain loans for overseas tonnage. In view of rising interest rates a golden mean may have to be struck.

THE RATIONALE OF RESERVES

AMONG THE various measures that have been or are to be adopted to tide over the crisis in foreign exchange, the one that has caused most controversy is the suspension of requirements of foreign reserve as a backing for currency. The Reserve Bank Amendment Act of 1956, in Clause 4, empowers the Bank, in effect, to reduce the sterling balances from the normal statutory requirement of Rs. 400 crores to Rs. 300 crores, but only in very special situations. The adoption of such a course is, in fact, conceived to be only short-term, inasmuch as previous sanction has to be obtained from the Government which is valid for six months in the first instance. Such sanction has been granted to the Reserve Bank just recently. Extreme suggestions are being made that it may not be necessary to keep any foreign reserves at all. Apart from whether or not it is essential to maintain a specific level of foreign securities, it seems improbable that India's current reserve, which has already gone perilously below the limit of Rs. 400 crores, even if depleted further, would satisfy the country's growing hunger for foreign exchange. At the rate of draft that has continued for some months now, the reserves would be exhausted before the year is out. Unless they are replenished by earnings or borrowings.

If a firm assurance were available that the balance of payments could cease to be unfavourable henceforth, perhaps the need for a reserve would diminish and India could fall in line with countries which have dispensed with reserves. But this controversy is only of an academic nature now. Such an assumption cannot but prove incorrect in the circumstances of today, with large development projects mainly dependent on imports. The deferred payments scheme is turning out to be less feasible to the several supplying countries than was imagined in India some time back. It is, therefore, more than likely that, in the process of utilising the exchange reserves, grave damage will have been done to the value of the rupee both within and outside the country.

The virtue of the current crisis is that it holds a lesson for the country that for planning to be successful, it must be accompanied by an elaborate machinery to check and repair the damage to the limited fabric of resources, while it is being stretched to cover projections. Yet this is only a part of the problem. The crisis is the result of a combination of various forces like the general inflationary trends in many countries that are India's suppliers, the Suez imbroglio and the large purchases by India of raw material supplies before schedule and not least of all the generous policy of imports pursued without full appreciation of its likely effects. Thus the crisis was invited before it would have come. The obvious solution is not in reducing the reserves—this is a mere palliative. It lies in reducing expenditure in all areas save those which are directly relevant to increasing production, saving foreign exchange and what is still more important—earning foreign exchange.

TOWARDS BETTER BALANCE?

THE PROVISIONAL foreign trade figures for May, which have now become available, indicate a small but happy turn in a long-continuing gloomy trend. The trade deficit during the month was reduced by nearly Rs. 10 crores from the previous month's Rs. 42.5 crores.

It needs no emphasis that one month's data can hardly form the basis for making any generalisations. What may, however, be said at the present time is that, perhaps, the efforts at checking the large-scale drain on foreign exchange, which has been causing grave concern in all quarters, have started to yield results. It is patent that the results cannot be anything but modest in the initial stages. Impressive results can only follow in due course of time. To say this is not to suggest that what is now being done on the import front will not lead to partial relief. Nevertheless, drastically to slash imports can only be a temporary measure to relieve a serious situation. Imports on an enormous scale, particularly of capital equipment are written deep in the second Plan and if the situation so demands sizable reduction will have to be obtained by pruning import-intensive targets. One important means to arrest the widening of the gap lies in expansion of exports but this is hardly a short-term remedy if it is to yield substantial results.

If higher exports is a helpful solution, then the May figures are not encouraging when compared to the previous month. At Rs. 52.8 crores, the May exports have declined by some Rs. 5 crores from those of April. Looking further back, however, they compare favourably with Rs. 45 crores worth of exports during May, 1956, and with the average monthly exports of Rs. 50 crores during 1956-57. This obviously is considerably lower than what is possible to attain. For example, export earnings touched the high figure of Rs. 56 crores in November last year. In the case of imports, the reduction was again of Rs. 5 crores from the April figure of over Rs. 90 crores to Rs. 85.4 crores. Even so, the import bill was nearly a crore more than the highest level of Rs. 84.2 crores reached in September 1956, as against a monthly average of Rs. 70 crores in the same year. The May figures—and for that matter trade figures for some months more—cannot give a clue to how the policy of austerity licensing in imports is producing results in the desired direction for the simple reason that the heavy accumulation of outstanding licences will necessarily take time to be cleared.

NATIONAL INDUSTRIAL DEVELOPMENT CORPORATION

THE PROGRESS report of the National Industrial Development Corporation for the third year just released is revealing in many respects. Although the progress cannot be considered spectacular, the National Industrial Development Corporation has no doubt made a good start. Not only has the Corporation helped in the promotion and development of new industries in the country, but has also maintained a balance in its provision of finance for industries in both the public and private sectors. During 1956, the Corporation completed its examination of a large number of industrial projects which had been selected for technical and economic study. The projects had been chosen primarily with a view to developing new lines of production in fields where the country is exclusively or mainly dependent upon imports.

The Corporation proposes to concentrate on projects relating to (a) the manufacture of industrial machinery in the field of heavy engineering, (b) the production of primary intermediates required by the organic chemical industries like drugs, dye stuffs and plastics and (c) some crucial raw materials like aluminium and synthetic rubber.

For developing capacity in the country for the manufacture of heavy industrial plant and machinery, the N.I.D.C. has done considerable spade work. The scrutiny of reports of foreign experts in this regard has been fully completed, though it is not definite that all the schemes would be put through during the second

Five-Year Plan. As regards the organic chemical industries—drugs, dyestuffs plastics etc., the Corporation arranged for a technical team of experts from Italy to come to India and prepare a report on the scope and pattern of developing the manufacture of intermediates taking into account the future development of the dyestuffs industry. Based on this and other reports from West Germany and the USSR a project for the manufacture of the more important intermediates including, but not confined to the primary intermediates, has been drawn up. In the field of the aluminium industry the NIDC arranged for experts from the USA to study the economic and technical aspects for setting up of units of 10,000 tons annual output with scope to expand to 20,000 tons. So far as the production of synthetic rubber is concerned, the Corporation invited a team of experts drawn from the consortium of four well-known US companies to study and work out a preliminary project for making 20,000 tons of synthetic rubber yearly. Negotiations are in progress with firms interested in collaboration in this field, and it is gathered that a synthetic rubber plant will be established at Bareilly. Proposals have also been worked out for the making of newsprint and for converting indigenous pyrites into sulphur.

In the spheres of assistance for modernization of cotton and jute mills, the Corporation's achievement is, however, not satisfactory. The loans so far sanctioned for rehabilitation and modernization have been no more than Rs. 1.95 crores in respect of cotton textile industry and a mere Rs. 55 lakhs in the case of jute mills as against Rs. 17 crores and Rs. 6.36 crores applied for by the two industries respectively. The Corporation ought to rationalise its procedure for finalising loan transactions and although it is understandable that full scrutiny of prospective borrowers' title to property is a time-consuming process, it can hardly be disputed that delays can be cut down and preliminaries expedited.

COMPANY AFFAIRS

THE BURMAH OIL CO. LTD.

For the Burmah Oil Company, 1956 has turned out to be yet another year of continuing trade expansion. The net profit is £7,123,896 which shows an increase of £1,133,443 over the corresponding figure for 1955. Together with the balance brought forward, the amount available for distribution totals £7,764,382. From this, however, is to be deducted the interim dividend of 5 per cent, paid on ordinary stock in November, 1956, as well as the dividends on the preference stocks. There thus remains a balance of £6,407,108 of which £1,650,000 has been appropriated to the General Reserve. The Directors' recommendations provide for a 17½ per cent final dividend on the ordinary stock which absorbs £1,146,710, leaving £610,398 to be carried forward.

Depreciation at £1,243,080 is rather less than that for 1955, in which year there was an exceptionally high charge mainly in respect of the new seaboard installations in East Pakistan.

In the year, the Group's sales increased by 7 per cent in India as against 12 per cent in Burma and 2 per cent in Pakistan. In Assam, which is Digboi's main supply area, there was a satisfactory expansion of trade. In the rest of India, the distribution of petroleum products was affected by a continuing shortage of tankwagons, but the most marked feature of trade was an increase in sales of diesel oil for automotive use alongside an almost negligible increase in motor spirit. The increases in the Group's sales of these two products were 31 per cent and 1 per cent respectively. The increased demand for diesel oil is in keeping with the encouragement given by the Indian Government to the production of diesel engine vehicles. Imports of petrol driven cars were restricted in favour of cars assembled in India. However, the Directors feel that, perhaps in India, the petroleum products trade is a "growth industry."

For expansion of the oil industry, the finance is to be found largely within the industry. The Government partly appreciates the position and has granted development allowances under its taxation laws. In view of the Industrial Policy Resolution, which requires that prospecting of petroleum should be undertaken only by means of a rupee company, with Government majority shareholding, the Board of Directors of the Group have not been able to recommend any further expenditure on prospecting in India.

During the year under review, out of eleven wells drilled in the Assam Oil Company's new fields consisting of some contiguous areas near Nahorkatiya, nine were oil producers, one a gas producer and one a dry hole. All the areas have now been proved and the production target has been stepped up from one million tons a year to 2½ million tons.

TATA POWER CO. LTD.

"A most important development in the history of the Hydro Companies achieved during the year under report", observed Mr. J. R. D. Tata, speaking at the Annual General Meeting of the Tata Power Company Limited, on July 31, 1957, "was the completion of the thermal generating station at Trombay, three years from the date of the work being started, commencing with the reclamation of acres of marshy land. The Station was formally opened by the Chief Minister of the State of Bombay on December 15, 1956. The construction of No. 2 Unit was then in its last stages and that Unit was started on April 15, 1957. The cost of the Station, exclusive of the staff colony, was Rs. 10.44 crores, for an increase in capacity of 125,000 kW. The

total installed capacity of the Tata System of combined hydro and thermal generating stations is nearly 400,000 kW".

Mr. Tata also disclosed that the Tata Electric System was successful in obtaining a loan amounting to about Rs. 4.75 crores from the World Bank, for the installation of a third Unit at the Trombay Thermal Power Station. While this loan would cover only foreign exchange commitments, he said, a further Rs. 180 lakhs would still be needed to complete the job. Fortunately, a provision in the Electricity (Supply) Amendment Act permitted appropriation to a Development Reserve annually of an amount representing the tax saved at current rates on the Development Rebate in the year. This, he said, would place at the disposal of the Company for the next three years approximately Rs. 150 lakhs in the Development Reserve, which it was proposed to utilise for Trombay-3 project, thus eliminating the need to raise additional equity capital. He added that the third unit at Trombay would be commissioned by about mid-1960 and not by the end of 1959, due to the deliveries of equipment being much later than had been anticipated.

Referring to the new tariffs proposed, about which there is some controversy, Mr. Tata said: "We propose to introduce the new tariffs as soon as possible and to leave them undisturbed for at least the next three years, unless we are faced, in the meantime, with new taxation or heavy expenditure which cannot be foreseen at present. The new rates, which eliminate the various surcharges imposed in the past, represent, on the average, an increase of about 9 per cent over our present rates for energy in bulk". Continuing, he added: "After a full examination of all the various factors, we have drawn up new tariffs for distributing licensees and other consumers to whom we give direct bulk supplies. The tariffs have been designed to enable the Hydro companies to earn clear profits in line with the "Reasonable Return" permissible under the Act. This is essential from our point of view in order that we may be able to service the World Bank loans and meet our other financial obligations".

COMMODITY NEWS AND NOTES

INCREASE IN COTTON PRODUCTION FINAL ESTIMATE FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India final estimate of cotton, 1956-57, puts the current year's area and production at 19,843,000 acres and 4,723,000 bales (of 392 lbs. each) of cotton lint, as against the partially revised estimate of 19,978,000 acres and 4,001,000 bales respectively for 1955-56. This shows an increase of 722,000 bales or 18.0 per cent in production during the current year, despite a small decrease of 135,000 acres or 0.7 per cent in area. During 1956-57 the production of cottonseed is estimated at 1,653,000 tons, as against the partially revised estimate of 1,400,000 tons for 1955-56, thereby showing an increase of 253,000 tons or 18.1 per cent over last year. The overall decrease in acreage during the current year has been shared mainly by Madhya Pradesh and Rajasthan and has been attributed largely to unfavourable weather conditions at the time of sowing. The decrease in acreage has, however, been offset to some extent by the increases registered mainly in Punjab and Madras. Despite decrease in area, there has been a substantial increase in production during the current year. The increase in production is shared mainly by Bombay, Madhya Pradesh and Punjab and is attributed largely to better seasonal conditions prevailing during the growing period of the crop as compared to last year.

INCREASE IN TOBACCO PRODUCTION

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India third estimate of tobacco, 1956-57, puts the current year's area and production at 1,007,000 acres and 300,000 tons, as against the adjusted third estimate of 997,000 acres and 287,000 tons for 1955-56. This shows an increase of 10,000 acres or 1.0 per cent in area, and 13,000 tons or 4.5 per cent in production during the current year over last year. The nominal increase in area during the current year has been shared by Bihar, Madras, Uttar Pradesh and Mysore States, and has been attributed to favourable climatic conditions at the time of sowing. The increase in production during the current year has been reported by almost all the major tobacco-growing States except West Bengal. This increase in production is partly due to increase in area and partly to favourable weather during the growing period of the crop. This estimate does not contain information in respect of the late variety of the crop growing in U.P. It also does not give information about the final position of the crop in the case of Punjab, Kerala, Rajasthan, Delhi, Himachal Pradesh and Tripura. The final position in respect of these States will be included in the final estimate. Past experience has shown that the final estimate figures are slightly higher than those of the third estimate.

IMPORT OF EGYPTIAN COTTON

The Government of India have decided to permit the import, with immediate effect, of a further quantity of 10,000 bales of Egyptian cotton of staple length over 1-3/16" against the special payments procedure. The method of licensing and other procedural details will be the same as for the 20,000 bales of Egyptian cotton recently permitted for import.

IMPORT OF EAST AFRICAN COTTON

Nine additional varieties of Tanganyika cotton of the staple length one to 1-1/16 inches have been included in the list of East African raw cotton, import of which was permitted by the Government of India under an announcement made on July 19. According to a trade notice issued by the Joint Chief Controller of Imports, Bombay, the additional varieties are

M-owere, Legologe, Msorneni, Morogoro, Malini, Moshi, Kilmani, Korogwe and Duthomi. Under the July 19 announcement, the Government permitted the import of raw cotton of the staple length 1-1/16 inches within a ceiling of 50,000 bales and stated that the licenses issued would be valid up to September 30, 1957.

IRON ORE OUTPUT

Output of iron ore in India during May 1957 was 417,207 tons. This was 26,600 tons more than the production in the previous months. Returns received by the Chief Inspector of Mines in India from 117 mines during May showed that 289,657 tons were despatched to iron and steel plants and 80,437 tons to the export market.

U.S.A.'S COTTON PRODUCTION

The Crop Reporting Board of the Department of Agriculture estimated production of the 1957 cotton crop as on August 1, at 11,897,000 bales (of 500 lb.) as against last seasons final output of 13,310,000 bales. Conditions of the crop, as on August 1, is put at 31 per cent compared with 83 per cent on the corresponding date last season. The Agriculture Department also announced the export sale of 988 bales of 1954-crop U.S. Government owned cotton and also the sale of 61,106 bales of 1955-crop cotton.

CANADA'S OIL PRODUCTION

It is reported Canadian oil wells, which supplied only one-tenth of Canada's petroleum needs 10 years ago, now supply nearly two-thirds of this demand. In 1946, Canada imported 90 per cent of its oil requirements, but only 35 per cent was being currently imported despite a three fold growth in domestic demand. Daily average oil production last year of 407,000 barrels was almost 25 times greater than in 1946. With daily consumption last year at nearly 770,000 barrels, the report shows that Canada is now the World's third largest consumer of petroleum.

Hasten Slowly

THE Report of the Official Language Commission brings a deal of posthumous credit to Mr B. G. Khar, its distinguished Chairman. It appropriately concludes with these wise observations: "It is not language but education that is aimed at in the schools; it is not language but good government that is aimed at in the field of public administration; it is not language but justice that is sought in the law courts. That which lends itself to the most convenience is the correct solution of the language problem in the various fields. Surely there does not have to be heat and passion over the issue of Language, ever the instrumentality and not the substance!" No wiser words could have concluded a reasonably moderate report.

It should be obvious "that which lends itself to the most convenience in the various fields," in the context of adult franchise and of compulsory education aimed at "for all children until they complete the age of fourteen years," is Hindi or the regional language as the case may be. For, as far as English is concerned, the number of persons (as

of 1951) with some degree of knowledge of that language (as indicated by the passing of School Leaving Certificate or higher secondary examination) was just 3.8 million out of 59.2 million literates in the country as a whole. Incidentally, in equating literacy in Indian languages with the linguistic ability in English (which is not easy to learn) commonly to be associated with the educational attainment of S.L.C. standard, the Commission appears to be on solid ground for, "if a comparison were to be made in point of linguistic expression, oral and even written, between an average S.L.C. student writing in English and a person of a fairly moderate or even low education writing in his own mother-tongue, the standard of the former is likely to be found inferior to that of the latter." This in no way detracts from the utility of learning English which "is unquestionably the foremost language of international communication," and the most essential one for scientific advance and research. Surely this pre-eminent position of English can well be retained in India by using it as a compulsory or optional second language

in her educational system. In fact it is already being used as the first compulsory second language in many countries of the world.

It may also be noted that Hindi, bracketed with Urdu, Hindustani and Punjabi, is spoken by 42 per cent of the total population of India. As it is closely related to Marathi, Gujarati, Oriya, Bengali and Assamese, Hindi is to a further considerable population a language relatively easy to acquire. Incidentally it would also be relevant to recall that the largest number of newspapers (54 per cent) is published in Hindi and other related languages while the number of newspapers published in English constitutes only 17 per cent of the total in the country as a whole. And their combined circulation is 46 per cent of the total number of copies as against the 26 per cent in the case of English newspapers. As the pre-eminent position occupied by Hindi is thus a fact which cannot be conjured away, one may have to recognise the feasibility of its becoming by, say, 1980, the sole medium of inter-communication at Pan-Indian levels, or the *lingua franca*, of two-thirds of the population of India. And it can well become, in more or less the same period, the *lingua franca* of the remaining third of the population speaking the Indo-Dravidian languages of Telugu, Tamil, Kannada and Malayalam (which draw upon a common literary tradition in Sanskrit and whose scripts and alphabets are variant expressions of a common Indian phonetical system) and other unspecified languages. As unfettered development of regional languages is ordained by the Constitution and as the State Governments concerned in the non-Hindi-speaking areas have generally made their respective regional languages media of instruction and compulsory subjects of study till the high school stage, there is no reason why they should not uniformly have Hindi as a compulsory second language.

It is here that non-Hindi-speaking areas may reasonably expect some more time (say, up to 1980) to catch up with the Hindi-speaking areas. An extended period of transition may also be necessary if there is to be a smooth and complete change-over to Hindi in the matter of public administration at the Union level, inter-communication amongst States *inter se* and with the Union, legislation, legal proceedings and judgments, and public service examinations. The Kher Commission itself does not appear to think that the target date of 1965 laid down in the Constitution may not have to be extended if its detailed recommendations (not examined here) for the change-over are to be implemented without all-round confusion. This can only be inferred by implication from the Commission's review of the virtual lack of progress in the said spheres in the first five years from the promulgation of the Constitution. Which, perhaps, also explains why the Commission, in spite of its having been asked in one of the terms of reference "to make recommendations as to restrictions on the use of the English language for all or any of the official purposes of the Union," has refrained from recommending any such restrictions "for the present." Similarly, in regard to another term of reference pertaining to "the preparation of a time-schedule according to which and the manner in which Hindi may gradually replace English as the official language of the Union and as a language for communication between the Union and State Governments and between one State Gov-

ernment and another", the Commission has expressed its inability "to furnish a regular timetable by dates and stages as to how Hindi should be introduced into the business of the Union so as to accomplish the general change-over within the period fixed by the Constitution." Again, in regard to yet another term of reference pertaining to "the form of numerals to be used for any one or more specified purposes of the Union," the Commission has not recommended "the issue of directions by the President for the use of the Devanagari from the numerals."

That the Commission has not chosen to make any recommendations as to three out of the five terms of reference shows by implication that the 15-year period of transition is recognised as not sufficient. The next Commission which is to be appointed in 1960, under Article 344 of the Constitution, may well find that the progress in the direction of change-over to Hindi has not been satisfactory, and, therefore, recommend the amendment of the Constitution so as to extend the transition period. It should be noted here that it was not within the competence of the Kher Commission to recommend any change in the target date. While it is undoubtedly true that the process of change-over bristles with innumerable difficulties (especially in the matter of evolving apt Hindi terminology for translating law including case law), it cannot be denied that some of the States are far too slow in the matter of falling in line even in the spheres marked out for them.

As for the Union Government, they have failed to evolve even a provisional 'plan of action' covering all the Ministries and Departments for progressive introduction of Hindi into their business. Such a 'plan of action' is, of course, not easy to evolve in view of the difficulties in the matter of estimating work-loads of basic preparatory work, present linguistic capacity of all the Government staff and approximate dates by which they could be trained in the new linguistic medium, etc. This is one more powerful reason why the period of transition ought to be extended by another 15 years at the least. The prerequisites and the various steps for change-over recommended by the Kher Commission cannot be realised, with the best will in the world, in eight years from now. If the Commission has not chosen to recommend a time-schedule in this regard, it has also wisely refrained from recommending a rigid time-table for the change-over to Hindi in the field of law and jurisprudence. As regards the latter field in particular, it has displayed full awareness of the need for certainty and precision in the matter of terminology although the intrinsic difficulties here are not greater than in the field of advanced technology or research in the natural sciences.

It is, however, one thing to recommend a time-schedule for the period up to 1965 and quite another to plead (as Dr. Subbarayan has done in his minute of dissent) for an indefinite prolongation of the period of change-over. As for Dr. S. K. Chatterji who has drawn up a minority report, he has not reconciled himself to the fact that the country is committed, after the fullest consideration of the issue, to a change in the linguistic medium in the relevant fields. This is an extreme view which need not be considered. What is noteworthy here is that the Commission's Report itself provides an implicit case for hastening slowly in the matter of total change-over to Hindi.

Regional Disparities

REGIONAL disparities in the levels of economic development and the contrast which they generate in the distribution of prosperity have always posed problems of no minor magnitude in most countries. Whether economic progress is sought to be achieved on the principle of planning or not, aspirations and grievances of underdeveloped regions in any country have often raised important issues of reconciliation. Where, however, economic development proceeds on the basis of planning, the scope for pressing claims of weightage in the allocation of resources has been wider than would be the case otherwise. The real consideration which the issue raises is not whether such weightage should or should not be given. Its equity and desirability in the interest of national harmony are beyond doubt. But the main consideration relates to the appropriate stage in national development when the claim should be conceded.

Last week's non-official resolution in the Lok Sabha calling upon the Government to appoint a committee for investigation into the problem of regional disparities in development and suggesting a policy for their elimination did not come as a surprise. The tenor of the debate revealed the intensity of feeling of members of all parties on this question. This problem touches the root of political stability which is the pre-condition of all progress. It is easy to appreciate that unless there is tangible proof that the fruits of development outlay are being shared by all, it can hardly be claimed that a genuine sense of achievement can be created. The feeling of such achievement and pride in it are essential to sustain voluntary and active participation in the great adventure of building a New India. All this is no new knowledge. It is recognized in principle in our planning. Where the resolution erred was the demand it made for raising the level of development in backward regions to a status of equality with advanced regions without regard to their capacity in terms of resources. Its emphasis on parity was misconceived. It needs no argument to prove that this sort of parity cannot be achieved for the simple reason that natural resources are not evenly distributed and the iron laws of economic growth cannot be flouted except at a great cost to the economy. If the House rejected the resolution, the verdict implies refusal to accept this extreme position. What is equally important, it implies that misconceived priority ought not to be allowed to raise avoidable complications and retard general progress.

The right approach to this problem cannot be based merely on grouping the states into two categories, one comprising advanced states and the other under-developed ones. Such a bifurcation would amount to oversimplification of a complex issue inasmuch as intra-regional disparities cannot be overlooked. This factor is easily demonstrated by the concentration of industry and trade in particular areas in advanced states, while the obvious differences in the levels economic progress between the eastern and western districts of Uttar Pradesh provide a striking illustration whose moral cannot be

missed. The per capita income of different States is a reliable indicator of disparities in the levels of progress; but it fails to reveal the disparities existing between different parts of the same state. Once the principle of allocating resources for levelling up backward regions is accepted, it may be stretched to the extreme. It is, however, obvious that the application of this principle may be extended without detriment to the main objective of maximising national income. But by and large per capita income according to states would constitute the major determinant of weightage in allocation of development resources. It is important that comprehensive research essential for formulating a policy for reduction of regional disparities should be undertaken. In fact, Mr Gulzarilal Nanda disclosed that the Planning Commission is undertaking evaluation on these lines.

This is not to argue that the process of reducing regional disparities must be postponed in toto until national development has reached a definite level. Pockets and areas of under-development constitute a fertile breeding ground for discontent which may provide fuel for disruptive activity or create a sense of frustration. In either case it is a positive danger to the general march of progress. It seems an established thesis that the first Five-Year Plan has resulted in an accentuation of regional disparities. And the process may not be halted by the pattern of investment in the second Plan. Punjab, Bombay and Madhya Pradesh have emerged as the large beneficiaries in the present Plan. Reorganisation of states, which, in the final analysis, was dominated by the language factor, has gone to aggravate this problem in some measures as a result of the transfer of certain areas. The moral which all these developments underscore is to launch an early attack in the sectors where inequalities are too glaring to tax patience. Industry has undoubtedly the greatest potential to raise incomes. Bombay, West Bengal, Punjab, parts of Madras and the mineral belt of Bihar account between them for a substantial share of the industrial and mineral wealth of the country. Industrialisation either in the organised or small sector, has been concentrated largely in these regions. Some at least of the public sector projects need to be set up in the vulnerable regions in the short run in cases in which no gross violence will be done to the exacting criterion of proper location.

The accumulated neglect of the past in the development of backward regions cannot be remedied in the short period since the entire country is in an underdeveloped state and resources for investment are too limited to meet diverse competing claims. Mr Gulzarilal Nanda was right in emphasizing that adequate basic resources for development which would ensure stable progress of the country must be created first. It will then be an opportune stage to give a regional bias to planning to redress the disparities. Real redress cannot be achieved by isolated projects like an oil refinery, or a steel, synthetic rubber or fertilizer plant. It is a function of planned investment spread over a period of years.

The New Class and the Old Tyranny

YUGOSLAVIA'S former Vice-President and Marshal Tito's one-time friend, Mr. Milovan Djilas, in prison since December last, has written a new book which has been published in the United States. The new book, entitled *The New Class: An Analysis of the Communist System* is the most searching and most damning description of Communism by one who had himself played no mean part in fostering and strengthening it in at least one country—in whose prison he is languishing. The book is bound to make even those sit up who take to that creed for ideological reasons. It is an indictment of Communism both as a philosophy and as political practice. Mr. Djilas uses the Marxist methodology of dialectical materialism and avoids rhetoric. He seizes the major premises and conclusions not only of today's Communist dictators but also of the giants of the past—Marx, Engels and Lenin. In a detached, step-by-step process he shatters them. After he has dealt with them, they are found to be grave errors. Forty years of tyranny and power-ambition have been held up to view. Not to take note of what he shows would be a serious lapse.

Communist "revolution," says Mr. Djilas, differs in two respects from others. First, unlike in any other revolution, the Communists and their allies—the "authority-wielding group"—always survive. This creates in them, and in the broader echelon, the conviction that they have the right—now that they have the authority—to "guide" and "supervise" the development of the country and the people on the "revolutionary" lines. How can they ever betray the revolution? Secondly, while in all earlier revolutions the revolutionary classes captured power after they had "matured" in the womb of the old society, the case is reverse in the Communist "revolution." The Communist Party bureaucrats are called into being after the revolution to industrialize backward and agrarian countries. Socialism is thus sought to be established deliberately—as it were—by organized compulsion in the economy of the country. This "total and deliberate planning" must lead to a jealous guarding of the regime's monolithic structure, and the attempt to mould and control life at all levels, private as well as public. It was inevitable that Lenin's dictum, that politics is "concentrated economy," should be perverted. Under the Communist system, economy becomes "concentrated politics," that is, politics comes to play a decisive role in the economy of a Communist country. It is partly because of this perversion of Lenin's concept that the doctrine of the dictatorship of the proletariat—that theoretical interregnum between Communist "revolution" and the "withering away of the State"—has proved to be but a step in the process towards personal dictatorship or rule by a group of oligarchs. Essentially, a dictatorship is dictatorship, with all the accompanying evils, no matter what words are used to make it seem palatable. No dictator can rule guiltlessly.

In the name of dictatorship of the proletariat, which is really the dictatorship of the Politburo of the Communist Party, the fruits of society's labour are shared by the new ruling caste. The good that the members of the caste do to themselves is, in their belief, good done to the country: the "revolution" did not devour them, and they have not betrayed the "revolu-

tion." Challenge to their authority is treason, because it is deemed to be a challenge to the country. Patriotism is reverence for the "revolution", ushered in by them. All that belongs to the State belongs to them. All that they do is justified by the ultimate ideal; immediate ends are means to the ideal, and necessary, though they may involve cruelty, hunger and misery. This makes it impossible for any thought but their own to prevail. The power of this "new class of owners and exploiters" has penetrated, according to Mr. Djilas, into the "pores of society". This, in turn, forces the class to become "ingrown and exclusive". After attaining power "the new class can do nothing more than strengthen its brute force and pillage the people". The only thing that remains is "for itself to justify itself". But beneath the ideological jingoism, can there be any doubt that the question is of personal interests? That is history's lesson—perhaps its only unambiguous lesson.

Mr. Djilas believes that Communism is strong today, but only apparently. "At the bottom of the Communist pyramid . . . among those children of starvation, the wretched of the earth, in whose name the party has professed to speak—there is nothing but despair and hatred, hatred especially of the party and hierophants; so the plain inference is that the very same forces which, according to Marx and Engels, predestined the triumph of Communism . . . also predestined its death and destruction." The fact that Stalin's collective successors have begun indulging in talk about "liberalism" and "democracy" and have come out with diatribes against the "cult of the individual" indicates that restiveness exists among the people and that they are heading towards an "open class war." Public discontent, Mr. Djilas is convinced, will surely nail the Communists "to the most shameful cross in history".

Two other points are made by Mr. Djilas, relevant to the state of Communism. First, he says, there is the birth of national Communism. There was a time when Moscow was World Communism's Mecca and when every pronouncement ensuing therefrom was central to the creed. Today, that religion has three centres, and three apostles, each with a substantial following. The new centres are at Moscow, Peking and Belgrade and Communism's apostles are Nikita Khrushchev, Mao Tse-tung and Marshall Tito. Nothing could more positively speak of the disintegration of the creed and fossilization of mind. Secondly, since Marx himself said that society would advance to Communism through internal contradictions, why, asks Mr. Djilas, must the historic process end after the Communist Party has come into power? Mankind's onward march knows no finality.

The New Class will, it is to be hoped, profoundly affect developments in Eastern Europe where unrest has already manifested itself. The Poznan riots, the Warsaw trouble, and the Hungarian revolt were neither accidents nor results of imperialist "machinations". The "revisionists"—those among Communists who want to revise Marxism according to the realities of today—will find in Mr. Djilas's book inspiration even though ultimately they may have to denounce the very shrine they have worshipped at so far.

The Teahouse of the December Moon

IT should have opened in August, but the tea didn't get there! You've heard about a slow boat to China; but there are some pretty slow ones from India, too. There's no future in a tea party without any tea, so the whole thing rather went to pot as you might say.

If only they had sent the tea as CARGO BY AIR! It's the fast, economical and sensible way of getting things where you want them, when you want them!

And A-I.I. flies twice a week to Tokyo, via Bangkok and Hong Kong; with immediate connections to cities all over the world.

So why have a storm in your teacup, since you can fly your goods by A-I.I.

THE WEEK'S NOTES

DR. CHHEDI JAGAN'S RETURN

ONCE AGAIN Dr. Chhedi Jagan, leader of the People's Progressive Party of British Guiana, has won a landslide victory. He has captured nine of the fourteen elected seats in the Colony's Legislative Council, thus demonstrating that his electoral victory in 1953 was no accident. This belies the British propaganda that he and his partymen are a "relentless and unscrupulous" bunch determined to subvert the authority of the Government. Neither that calumny, nor the lapse of time, nor even a split in the party seems to have affected adversely Dr. Jagan's popularity. Even the efforts of the British Trade Union Congress, which devoted almost a third of its total colonial funds in an effort to strengthen the position of the unions opposed to him, have been of little avail. The nationalist-minded workers' organizations seem to have solidly supported him. The International Confederation of Free Trade Unions has also apparently failed to discourage the unions from "meddling in politics." The colonial administration's gerrymandering and diversion of the entire Colonial Development Corporation loans, reserved for the Caribbeans to British Guiana, also have not been able to stop Dr. Jagan from being swept back into power.

The question that naturally arises, therefore, is—will Britain now bow to the will of the people, and allow the formation of a popular Ministry or will it repeat its unenviable performance of 1953 when military and naval units were despatched and Dr. Jagan's Ministry was dismissed with dubious constitutional propriety. The issue will perhaps be decided on the question of nominations to the Legislative Council. Doubtless, under the Constitution, it is the Governor who has the discretionary power to nominate 14 members to the Legislative Council. But in order to give Dr. Jagan, a duly chosen popular leader, a working majority in the Council, the Governor ought to follow his advice. It should not be difficult to make this concession, now that Dr. Jagan seems to have mellowed down somewhat after remaining in political wilderness and oblivion for four years. In his first public statement since the elections, he extended his hand of friendship and co-operation. He has said that he is prepared to work under the present Constitution provided the Governor's discretionary powers are used to enable him to have stable support in the legislature. If there were any misgivings about Dr. Jagan's political affiliations or doubts about his territorial loyalty, they should now be buried fathoms deep, and for ever. He has unequivocally stated that "British Guiana must remain in the British Commonwealth even if the Colony eventually achieved complete independence." He is also not averse to the British proposal of the West Indian Federation, inclusive of British Guiana. He only wants that a plebiscite similar to the one held in Togoland and Malta be held to decide the issue. The only demand, he reiterates, and rightly, is that of independence for the Colony. The British Government should not be afraid of taking steps to meet this demand. After all, such a policy in India, Pakistan, and recently in Ghana, has been more fruitful than France's policy towards Algeria. And recently Malaya has not been kept from her national aspirations even though a guerilla war has been going on in that country for the last 12 years. Any other course will only deepen the four-year-old political crisis.

AMENDMENTS TO THE SOVIET LAW

SOME BASIC amendments to the Soviet criminal law have been foreshadowed in a recent issue of "Izves-

tia." In an article, Prof. P. Romashkin, a Russian doctor to juridical science, has pleaded for the amendment to the law of June 1934—the year when the notorious purge was getting under way. Under that law all those who live with or are dependent upon the "traitor" have a criminal liability. They can be tried and sentenced to long terms of imprisonment, for being "acquainted with or dependent upon" the alleged criminal. Alibis were unacceptable to Soviet concept of justice under Stalin. Mere acquaintance with the "traitor" was enough proof of one's complicity in the crime. Prof. Romashkin has also pleaded for the exclusion of the possibility in future codification of sentencing a person if he is not "actually guilty."

This clearly supports the universally-held belief in the free world that there is no rule of law as we know it or protection for the individual against the tyranny of the Party or the Government. To rise against the Russian Government thus means not only to die alone in an unequal struggle, but to put one's entire family and all friends as hostages. Those who are miraculously saved from the long hand of this peculiar law they get branded as "undesirables" and are virtually excommunicated from the society. As Communists settle accounts with their opponents not because they have committed a crime, but because they are political dangerous to them, the man in the street cannot raise his voice against the man in power. Moreover, the late Mr. Andrei Vyshinsky, who is correctly described as the "father of the Soviet legal system," has laid down in his book, "The Penal Procedure," that "the Soviet judge, in case of any conflict between the law and the general party line, must unhesitatingly reject application of law . . . in order to give absolute obedience to the party directions, which represent for him the supreme law." In short, the function of the Soviet law and the Soviet courts is to further the purposes of the Party in power and not to protect the people from its oppression. How Stalin's collective successors will be able to ensure the rule of law while maintaining their undemocratic rule is hard to guess? But perhaps they seek no more than a talking point for their propagandists abroad in their attempt to show how delightfully different they are from their dead master.

MOVE TOWARDS SOCIALIST UNITY

MR. JAYAPRAKASH NARAYAN, the Praja-Socialist Party leader, and Dr. Rammanohar Lohia, leader of the Socialist Party, have exchanged letters and met once to explore the possibilities of a merger of their parties. During their talks, held at Lucknow, both the leaders commended the idea of "one party of Socialist movement." They seemed to visualize a purely ideological and not merely organizational union. So far there is only Dr. Lohia who has publicly stated that merger is possible. Apart from this there is little evidence to sustain the hope of an eventual reunion of these parties. Dr. Lohia may have received encouraging response from Mr. Jayaprakash Narayan. It cannot, however, be denied that most of the Praja-Socialist leaders have maintained a studied silence. The silence is meaningful; this is the first time that they have not echoed and endorsed Mr. Narayan's move. This may be because the conditions that Dr. Lohia has laid down for the reunion are hardly possible of fulfilment. He has demanded the veritable dissolution of the Praja-Socialist Party by making it a precondition that it should accept the programme of the Socialist Party unreservedly. Does he not realize that such impossible conditions will defeat

the very object that he has in view? We would suggest Dr. Lohia to be less doctrinaire and less rigid in his approach. The merger would undoubtedly change the political pattern in the country. The united party would play a vital role in the politics of the country by providing a democratic alternative to the ruling Congress Party.

The fact that in spite of the Congress declaration in favour of a Socialist pattern of society, the Communists have in successive elections emerged stronger is an indication that a considerable section of the Indian people wants to go further than the Congress programme. The Socialists should not allow themselves to fail to avail of this mood of an ever-increasing number of our people. The basic problem for them is, therefore, not merely to emerge as a unified party, but also to formulate a programme which is radical enough to appeal to the masses, and yet distinguishable from Communist brand of Socialism. Politics is said to be the art of practising the next to the ideal. Let it not be said that Indian Socialism failed for refusal to accept realism where there was possibility of the ideal materializing in the immediate future.

POOR PERFORMANCE IN LIFE INSURANCE

THE INTERIM report on the activities of the Life Insurance Corporation of India makes sad reading. The new business for 1956 at Rs. 200 crores has recorded a fall of nearly Rs. 60 crores, total new business under-written in 1955 both in India and outside India being nearly Rs. 259 crores. The business up to August 31, 1956, was however not very discouraging because at that time, it totalled nearly Rs. 140 crores. It was after September 1, 1956, when the Life Insurance Corporation of India came into existence, that a sudden drop in new business was noted. In the quarter ending November, 1956, total new business was Rs. 14 crores—a little less than the average business under-written in a month in 1955. The last month of the year could not make up for the loss in the previous quarter. The chief reason advanced in favour of this fall is that the substantial reduction initiated by rates in 1954 and staff insurance schemes initiated by some leading insurers in 1954 and 1955 had almost starved the market for fresh business. Are we then to come to the dismal conclusion that the Corporation does not expect to do better in 1957 as well? The working results for the half year ending June, 1957 corroborate this thesis. Total business completed upto June was Rs. 75 crores only and it may safely be conjectured that during the second half the business would be Rs. 125 crores only, reaching the level attained in 1956.

At the time of nationalisation, it was feared that there would be a surplus of man-power which would be hard to absorb in the Corporation. On the other hand, demand for staff has increased after nationalisation, and sufficient number of trained people cannot be had for posting in some of the places where the offices run by the private insurers lacked competent staff. The new staff would take some time to get trained. This was also a major factor in the halting rate of growth of insurance business since nationalisation.

The business under-written outside India has also dropped significantly. In 1956, it was Rs. 12.59 crores only—lowest for the last five years. The countries in which the Corporation continues to under-write business are: Kenya, Uganda, Tanganyika, Zanzibar, Mauritius, Aden, Federation of Malaya, Colony of Singapore, Hongkong, Fiji and Nyasaland. Under-writing of fresh business has been stopped in Burma, Ceylon and Pakistan, though arrangements in these countries exist for serving the old policy-holders.

TEXTILE MILLS COST STRUCTURE

IN ITS report submitted to the U.P. Government, the Kanpur Textile Mills Rationalisation Enquiry Committee has asserted that there is no justifiable reason for any wide disparity between the wages of Kanpur and Bombay. According to the Committee the contention of the employers' association that Kanpur is badly placed in competition with Bombay, and for that reason should not be saddled with the same wage rate, is not tenable. Labour, quite naturally endorses the opinions of the Committee in this matter. Lest this controversy becomes a cause of bad blood between the parties it will be only desirable if this dispute is set at rest for all time.

Employers have disputed the comparison of Bombay with Kanpur as regards the cost structure in textile mills. In answer, the Committee has explained that since, of all the textile centres in the country, only in Bombay and Ahmedabad has rationalisation made significant headway, such comparison is only valid. Regarding different cost structures at the two centres, the Committee has believed that, advantages available to these two places being exclusive in nature, they balance against each other. Such a view of the Committee obviously, besides ignoring the facts of different stages in rationalisation as reached in these two centres, disregards the whole theory of localisation of industries. Bombay has many advantages as regards production of textiles. It is one place where the industry had an early start and has consequently advantages in higher skill of the labour. It has the benefit of being nearer to the landing station in exports. Proximity to the raw material supplying centres is another factor. As against it, Kanpur has to bear higher freight charges in getting raw materials and in arranging exports of finished material. Kanpur mills are in distinct disadvantage in regard to electricity rates. They work on higher overhead expenses due to the lower number of working days. The variety of cloth produced at the two centres is another point worth considering. Whereas Kanpur mills primarily produce medium varieties, Bombay specialises in fine and super fine yardage. And since the percentage profit margin on the first is lower Kanpur mills are at a disadvantage. Textile mills in Kanpur are less modernised as regards machinery. Even the rationalisation proposed will be operative only in three categories as compared to a higher stage reached in Bombay. In view of all these, cost structures at the two centres cannot be equated. In this connection attention is drawn to the recommendations of the Kanpur Labour Enquiry Committee in what is commonly known as Nimbkar report. There is force in the demand of the employers that rates of wages proposed in the Nimbkar report should be applied to rationalised categories of jobs in Kanpur textile mills.

BANK ADVANCES AND FOOD PRICES

THE RECENT strike notices by the Central Government employees and workers in the private sector have focused attention on rising cost of living the root cause of which is the high level of prices of food grains. It is believed that the directive of the Reserve Bank of India to banks for reducing the advances against food grains has failed to produce any appreciable effect. The level of advances on August 9 was as high as Rs. 882 crores. In the next busy season the banks would be in need of nearly Rs. 200 crores more; unless appropriate steps were taken by the banks to keep advances against food grains within proper limits, the inflationary spiral would without doubt gather further momentum. Mr. H. V. R. Iyengar, Governor of the Reserve Bank, has been summoned for discussions to New Delhi in order to evolve measures to be taken for relieving the pressure of bank money on food prices.

A Window on the World

PSYCHOLOGICAL PEACEFARE

By
ODYSSEUS

THAT BRITAIN should disarm unilaterally and adopt a carefully thought out policy of non-violent civil resistance as the best defence of freedom and the democratic way of life in this nuclear age is the suggestion made by Commander Sir Stephen King-Hall in his well-known "News Letter" (published at, 162 Buckingham Palace Road, London, S.W.1).

Last week we outlined the radical changes in defence policy proposed by the British White Paper of April 4, in which, recognising that there is at present no means of providing adequate protection against nuclear attack on the U.K., the British Government lay it down that military planning must therefore aim to prevent war, and that in consequence Britain's resources must be devoted primarily to developing deterrent nuclear weapons. This, in turn, means that a substantial reduction in Britain's conventional forces can be made from their present total of 690,000 (in all three Services) to 375,000 by 1962. Nuclear weapons are called "deterrents" because it is argued that neither the free countries nor the U.S.S.R. will dare to let loose nuclear war since this would lead to total mutual destruction.

But Sir Stephen King-Hall asks whether the vulnerability of the U.S.A.-U.K.-West Europe target is not greater than that of the U.S.S.R. Ten megaton bombs could reduce the U.K. to chaos with millions of casualties, whereas (Sir Stephen argues) although the principal cities and industrial areas, and the oilfields, of the U.S.S.R. could be smashed, this would not obliterate the physically vast Russian State, as it would tiny Britain. Knowing that public opinion in the democracies prevents the free world from launching a "preventive" attack, might the U.S.S.R. not gamble on the chance that if they struck first, the devastation caused would cripple any counter-attack and leave them the victors?

Sir Stephen therefore suggests that the possibilities of defence by non-violent passive resistance should be exhaustively examined by a Royal Commission. He lifts the debate from the military to the psychological plane. The free way of life is menaced by the actions and threats of the Communist powers. Why do the Communists wish to destroy the democracies? Among the possible reasons, Sir Stephen lists:

(1) Fear that the long-term objective of the Western powers is to overthrow the U.S.S.R. government by force. Linked to this may be fear that the Germans will wish to re-conquer the territories stolen from them by the Soviets.

(2) A missionary urge to spread Communism. Sir Stephen is at one with Pandit Nehru's recent pronouncement in doubting this. It seems more likely that the Communist creed is today a convenient weapon in the national armoury of Russian power politics.

(3) Fear that the principles and practices of the free world will subvert the loyalty of the Russian people to the Communist regime.

Sir Stephen observes that these are but guesses and emphasises the importance to the new theory of defence that he is advocating that the Royal Commission should make every effort to ascertain accurately the psychological reasons for the hostility of the Russian ruling class to the free world.

However, in default of the existence of better information which could probably be obtained if a substantial effort was made by the free world, Sir Stephen asks us to suppose that the three reasons given above contain at any rate some of the truth. Now the object of the new strategy of defence is to change the minds of the men in the Kremlin. To those who argue that this is impossible Sir Stephen replies:

"(a) They are human beings, and they have for one reason or another changed their minds on several occasions since 1945.

"(b) Through the policy of the nuclear deterrent we hope—and some people believe—we are already operating on their minds and influencing their thoughts. If we are not, the deterrent idea has failed."

If British strategy is to change the minds of the men in the Kremlin, how is this to be achieved tactically? Sir Stephen suggests two broad lines of approach; the direct and the indirect. The direct would be to do things which might make an immediate impact on the minds of the Soviet rulers; the indirect would be to adopt policies designed to influence the minds of the masses in the Communist controlled countries.

A FULLY PACIFIST POLICY

"The Manchester Guardian" wrote on April 15 that "Dependence on the ultimate deterrent is inevitable." It went on to say that the alternative was "Conventional forces on a massive scale" or "a fully pacifist policy." If the British succeed in producing some form of stand-still in development of nuclear weapons but do not succeed in making progress with disarmament in conventional weapons, are they likely (asks Sir Stephen) to be able to persuade the people of the West to stand the racket of "conventional forces on a massive scale"?

What about a fully pacifist policy? Sir Stephen rightly says that this possibility has never been thoroughly examined from a strictly political-strategical angle. The "pacifist" policy has usually been defended from a moral point of view, but he is thinking of a policy which it would be more accurate to call "defence by non-violent resistance."

Sir Stephen is careful to point out that he is not saying that it would work. He is asserting that no one has thoroughly studied its possibilities in the light of the novel and unprecedented defence problem which now faces the U.K., Western Europe and to a lesser extent the U.S.A.

In order to ventilate the problem thoroughly, Sir Stephen urges that a Royal Commission should be

established with the task of expressing an opinion as to whether the free, democratic way of life could be defended by passive resistance and if so what the plan should be.

Sir Stephen draws attention to the blunt statement in the British White Paper that the U.K. cannot afford its present expenditure on defence. The government has therefore made heavy cuts in Britain's conventional forces and has transferred its faith to nuclear weapons, with all the imponderables and unknowns which go with them. In this connection, Sir Stephen reports that he remarked to a well-known M.P.: "Suppose Great Britain only had three air-borne divisions, a few tactical aircraft and a very small navy, what would happen apart from the obvious and immense gain to our economy?" The M.P. replied: "My first reflection is that our influence in the world would at once decline"—he paused and added—"at least I suppose it would."

But, asks Sir Stephen, is this certain? Gandhi's influence rose with the rise of passive resistance; so did that of the African bus boycotters. Can it be proved that a U.K. with an intelligent and sophisticated population educated to regard a national plan of passive resistance as the national defence policy would lose influence?

FOURTEEN QUESTIONS

Sir Stephen points out that because the enquiry that he suggests would be exploring unknown territory, a great deal of thought would be essential in order to determine how the exploration had best be made. In order to indicate the nature of the problem, he has drawn up the following fourteen questions:

(a) What exactly do we mean by non-violent resistance?

(b) Do we visualise the complete abolition of all armed forces controlled by the state?

(c) Or is it possible that there are two questions? One: relating to the use of armed force as a means of defence against aggressors in a large-scale war. The other: the role of armed forces in smaller operations of a semi-police force nature, such as—for example—against raids by Yemen tribesmen across the Aden border.

(d) What political conditions would have to exist in Britain before the abandonment of armed force as the chief means of defence could become practical politics?

(e) If it were decided to adopt a new policy, how long would it take to implement it?

(f) Could such a policy be carried out irrespective of our allies? How would it affect Commonwealth arrangements?

(g) What would be the economic effects of a non-violent policy?

(h) If a policy of having no large-scale armed forces were adopted, how would this effect British diplomacy?

(i) If such a policy meant that Britain would have to accept "enemy occupation," what does non-violent resistance mean in terms of the behaviour of the population? What may they, or should they, do or not do?

(j) Having decided what might be the correct tactics vis-a-vis the enemy-occupiers of a non-violent-resisting population, what training must the population be given in schools and elsewhere for its role in such a war?

(k) What lessons, if any, are to be learnt from recent historical examples of non-violent or partially non-violent resistance movements?

(l) What are the political, economic and social problems which confront an occupying power faced with a non-violent-resistant population?

(m) To what extent should a non-violent-resistant population collaborate with the occupying power to maintain the economic life of the country?

(n) At what point and for what purposes should a well-disciplined N-V-R population refuse, even at the risk of death, to obey orders issued by the occupying power?

These questions are as pertinent in India as they are in Britain. I leave you to ponder them until next week when I shall attempt to rough in a few answers.

(This is the second in a series discussing non-violent resistance and national defence policy. Last week's article was "Can Ahimsa Defeat Nuclear Attack?" Next week: "Non-violence Against A Dictatorship." Each article is complete in itself but a collected reading will bring out the continuity in the argument.—Ed.)

THE INDIAN OVERSEAS BANK LTD.
MADRAS

We'll help you solve your trading problems

The Indian Overseas Bank can handle your overseas trading problems 'on the spot'. With branches located strategically all over South East Asia, the Bank is in a position to offer Indian businessmen expert personalized service on all matters concerning foreign trade. If you are planning to develop your trade in this area of growing commercial importance you couldn't do better than to consult the Indian Overseas Bank.

THE FUTURE OF EUROPEAN EXCHANGE RATES

(From Our Special West European Correspondent)

PARIS, August 17.

THE pseudo-devaluation of the French franc that took place last week-end is the symptom of the general unbalance of West European exchange rates, and it may be the prelude to a wholesale reorganisation of currency values later in the year. The rigidly fixed exchange parities demanded by postwar practice have once again demonstrated their inconvenience. If the economic conditions that have caused the changes in currency values had been allowed to operate continuously and gradually, the present unbalance could not have arisen to anything like the present extent, and there would accordingly have been less need for the brutal readjustments now in course. There is much acrimonious dispute between the newspapers of the various capitals about which country is primarily responsible for the piling up of currencies in Germany and the growing indebtedness of France and Britain. But this is one of those disputes that have no end, exactly similar to the debate about who was responsible for the dollar shortage.

In fact, in such arguments there is right on both sides. This is because exchange rates, being the prices of currencies in the international currency market, are the measure of two quite separate things: the internal rates of inflation in various economies as measured between themselves, and the external trade, credit and investment policies of these economies (but especially of the creditors, since by definition it is they who have the money to trade, lend and invest). So we can look at the present situation in West Europe from one point of view and argue that it is the result of inflation in France and to a lesser extent in Britain, an inflation that is made serious by the relative deflation in West Germany. This is the view taken in Bonn and Hamburg, where the conclusion is drawn that therefore the remedy lies wholly with the French, who must stem their internal inflation (e.g. by stopping the war in Algeria) and then devalue fully and formally.

Alternatively, we can look at the same situation from another point of view and claim that it is the result of the bad-creditor policies of West Germany and that therefore the remedy must come from Bonn, in the shape of decisions to up-value the Deutsch Mark, virtually abolish all import duties, repay all foreign loans and begin investing in a more ambitious scale. This is the opinion held in Paris and London, in which latter capital it has been defended in recent months by the Press with some asperity. The British feel especially virtuous because they have not been inflating to the outrageous extent of the French and yet have been trading and investing more liberally than the Germans, from which they jump (rather hastily) to the conclusion that they are the only ones in step, that the pound sterling is the only currency that is correctly valued in terms of the dollar and that therefore the Mark must be up-valued and the franc devalued till they are in line with sterling.

That there is force in all the arguments presented on both sides can be seen by looking back to articles printed on this page in recent months and which were written without special reference to the question of currency values. The origins of the excessive inflation

charged against the French can be seen in despatches on the cost of the Algerian war, the consequences of the Suez expedition, the insecure foundations of the impressive French industrial boom, and the level of French investments in the colonial empire in Africa. On the other hand the justice of complaints about West German economic policies can be seen in despatches dealing with that country's very poor record as a foreign investor and with the totally unenterprising social programme of the West German Social Democrat Party. But in a debate which has aroused so much international friction it is necessary to get rid of two popular and contradictory prejudices: first, that inflation is automatically "bad" and sound money "good"; and second, that deflation (i.e. the perjorative name for sound money) is "bad" and massive investment "good."

The first judgment should not be accepted without recalling that one of the major causes of the inflation that the West Germans regard as so sinful in their neighbours has nothing to do with dirty wars in Algeria and Suez but is rather the very honourable fact that Britain and France are investing more than the rest of the world put together in the backward territories. These backward territories are not only their colonies, where such investment might be regarded as the price of political hegemony, but equally their ex-colonies and weaker allies. If this effort is straining their own metropolitan economies, that is to their credit and is no mark of recklessness or mismanagement. Similarly, the rate of domestic investment in France, which can at the moment be criticised as too high, is part of a commendable effort to bring this old economy into the 20th Century and will, within a very few years, begin to pay off in ways that will be of benefit to the whole of Europe.

On the other hand, to scold the West Germans for their deflation, as the London Press does, is to forget that the Germans, unlike the British, have had only too much experience of extreme inflation. The West German worker is ready to suffer some of the inconveniences of too-sound money because he well remembers the days when it took a pocket-full of notes to buy a loaf of bread at midday and two pockets full at tea-time.

So the unbalance of West European exchange rates is not going to be settled by unilateral action or multi-lateral abuse. The French pseudo-devaluation by itself settles nothing, and would not even if it were followed by all the West European countries now heavily indebted in EPU, because the disturbing force of West Germany's bad-creditor policies would persist unabated. On the other hand, unilateral German action would settle no more, as long as inflation is unchecked elsewhere; if the Germans repay foreign debt they will lighten their payments balance, if they invest more abroad they will lighten it further and will moreover stimulate their export trade, while the mere liberalisation of their imports would strengthen their competitive position.

Thus the present situation has to be resolved by joint action between all the members of EPU. This does not necessarily mean that the only joint action open to them is an agreement on new currency pari-

August 23, 1957.

ties: it could take the form of setting currency values free to fluctuate, either permanently (this is unlikely) or temporarily till they found a healthier and more natural level. This last-named solution is openly favoured by the Bonn Government. It might seem curious to propose a temporary freedom for exchange rates: if it is good why not do it permanently and if it is bad why do it at all? But it would be a sound method of ensuring that the European Common Market is launched at the end of next year on the basis of realistic currency values. Public opinion in full-employment socialist democracies will not tolerate permanently fluctuating exchanges (any more than it will tolerate the gold-standard and for the same reasons), but it would be fatal to enter the Common Market with the present false and disputed currency parities.

But if a period of exchange rate freedom is unacceptable, the alternative is an international monetary conference where new parities can be devised by agreement and bargaining. It is appearing more and more likely that we will have something like this before the year is out. The partial devaluation of the French franc this week has brought this prospect nearer in the following ways:—

(i) The lowering of the value of the franc for most transactions gives the French the moral right to insist that the West Germans now do something from their side to restore equilibrium, especially since the

French are accompanying this devaluation by a genuine effort to reduce the inflationary pressure at home.

(ii) The chain-reaction effects of the French devaluation bring up the exchange question in a more acute form for many of her neighbours. It strikes a blow especially at the foreign trade of Italy, Holland and Belgium; it has already made more likely a devaluation of the Finnish Mark.

(iii) Although it does not affect in the same way the pound sterling, it has encouraged psychological pressure on sterling; Britain being the next heaviest debtor after France in EPU, people get the feeling rightly or wrongly that the next move is up to London.

(iv) Above all it encourages speculation. The gamblers are already to the fore in the exchange markets and every mention of a possible realignment of currencies strengthens their hand, and by the same token makes that realignment more necessary.

The patently makeshift nature of the French emergency adjustment proclaims the need and the probability of an international monetary conference in the autumn. Nothing can be done before the West German elections in mid-September but there is to be a meeting of the International Monetary Fund on September 23, and a meeting of OEEC in October, and at these gatherings the future of all the European exchanges will be near the top of the agenda.

From a Neighbour •

If there is a lot of comings and goings between Jamshedpur and Rourkela, that is only as it should be. Of all the steel plants, the one coming up at Rourkela is closest to Jamshedpur, India's first steel city.

If these comings and goings lead to an useful exchange of experience and ideas, that is again as it should be for Jamshedpur has been making steel these 50 years. And it is very happy to lend a hand with the training of engineers

and technicians for Rourkela. There are nearly 150 of them at Jamshedpur—from key personnel to artisans.

*Good Wishes
to Rourkela*

Strengthening these ties of friendship are the surprisingly large number of old Jamshedpur faces that one sees at Rourkela. To them and their colleagues, Jamshedpur sends neighbourly greetings and good wishes.

Oil from abroad costs valuable foreign exchange.
Oil from inside India saves it. And we must
have ever-increasing quantities to cope with the
expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil
industry working at full pressure to produce as
much oil as possible from our own oilfields. Additional
wells are constantly being drilled, yet even in an
established area they are not always productive; in spite
of modern knowledge and equipment, successful
drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the
fuel, lubricants and by-products which are so vital
to the progress and prosperity of India.

WORLDGRAM

AGRICULTURE

Food Production Target Exceeded in 1956-57: Shri M. V. Krishnappa, Deputy Minister for Agriculture, told Shrimati Tarkeshwari Sinha during question time in the Lok Sabha that the target of food production during 1956-57 had been exceeded by 2.27 million tons. The target of additional production of food grains had been fixed at 1.37 million tons — 1 million tons under the Grow-More-Food programme and .37 million tons under major irrigation. The actual increase was estimated at 3.64 million tons.

Grading of Fruits: Grading of various kinds of fruits, namely mangoes, citrus fruits, pineapples, grapes, chikoos, apples and William pears, is being done under the Agricultural Produce (Grading and Marketing) Act, 1937 by a large number of producers. Fruits graded under this Act are marketed under 'Agmark', a symbol of quality. Standards laid down for determining the grades of different varieties of fruits are quality, size, and weight. A pamphlet giving grade specifications of a number of fruits and other relevant information helpful to persons wishing to grade fruits under the Agmark Scheme has been published by the Directorate of Marketing and Inspection of the Union Ministry of Food and Agriculture. The pamphlet can be obtained by fruit producers and sellers, desirous of grading the fruits, from the Directorate of Marketing and Inspection, 'P' Block, New Delhi.

Madras Irrigation Schemes in Second Plan: Four irrigation schemes, which will benefit an area of about 3.66 lakh acres in the reorganised Madras State, have been included in the second Plan. The total cost of the irrigation schemes, some of which will be completed in the third Plan period, is estimated at about Rs. 35.6 crores. Of this amount, Rs. 3.48 crores will be spent during the second Plan period. Nearly 0.27 lakh acres will receive irrigation benefits during the period. The Rs. 1.57-crore New Kattalai High level canal in Tanjore and Tiruchi districts is expected to irrigate 0.12 lakh acres during the second Plan period. The project will ultimately benefit nearly 0.21 lakh acres. The Pullambady Canal Scheme, which will cost about Rs. 1.42 crores will irrigate nearly 0.22 lakh acres in Tiruchi district. About 0.5 lakh acres will be benefited in the second Plan period. The project envisages a head sluice with five vents near the head of the existing Peruvilai canal from Cauvery, a 74-mile long canal and the building of eight new tanks and improvement to 29 tanks. The multi-purpose scheme to divert the west flowing rivers to the East-Parambikulam-Sholayar-Aliyar project, estimated to cost Rs. 32 crores, is expected to benefit 3.20 lakh acres in Coimbatore district and generate 1.24 lakh kw. of power.

INDUSTRY

Higher Industrial Output in First Quarter of 1957: Industrial production in India during the first quarter of 1957 was appreciably higher than the output during the preceding three months as well as the corresponding quarter of 1956. This increase was reflected in the Index of industrial production (1951=100) which during the period was appreciably higher than the index for the whole of 1956 and for the corresponding period of the year. The industries which recorded higher outputs included coal, finished steel, cement, aluminium, automobiles, sewing machines, cotton textiles and yarn,

electrical goods, jute manufactures, superphosphates, tyres and tubes, salt, sugar, vanaspati, paper and paper boards, plywood, tanned hides and leather footwear and razor blades. During the quarter, a number of new factories went into production and some of the existing units expanded their capacity under schemes approved under the Industries Act. These cover the manufacture of rayon, soda ash and caustic soda, zinc strips, dyestuffs, automobile parts, drugs and medicines, glass tubes and mineral wool.

Specifications for Knives and Forks: The Indian Standards Institution has published three Indian standard specifications. One of these covers table knives, dessert knives and fruit knives (IS: 992-1957), the other fish knives and butter knives (IS: 944-1957), and the third deals with table, fish and serving forks (IS: 995-1957). These specifications relate only to the commonly used types of knives and forks. They include requirements of materials to be used in manufacture, the more important dimensions and other features to guide manufacture and purchase of these cutlery items.

Wrought Aluminium and Aluminium Alloy Tubes. The Indian Standards Institution has published the specification for wrought aluminium and aluminium alloys, tube for general engineering purposes (IS: 738-1956). This standard, forms part of a comprehensive series of Indian standards for wrought aluminium and aluminium alloys in various forms for general engineering purposes. It covers requirements for drawn tubes made from three grades of aluminium and from ten aluminium alloys in various conditions. The standard prescribes the general requirements of the material and the specific requirements such as chemical composition, condition and mechanical properties applicable to each grade.

Development of Handloom Industry: The Government of India have just sanctioned over Rs. 37 lakhs as grants and loans to State Governments for implementing schemes for the development of the handloom industry. The schemes envisage, among other things, the setting up of 16 more dye-houses, training of weavers in pattern-making factories, participation in the share capital of a co-operative spinning mill in Bombay, establishment of an employment centre for adivasis in Madhya Pradesh and sales promotion of handloom cloth.

Foundry Forge Project: Replying to a question by Shrimati Tarkeshwari Sinha in the Lok Sabha, the Minister for Industry, Shri Manubhai Shah said that revised offers for collaboration in the foundry forge project from firms concerned were under consideration. Shri Shah said that it had become necessary to entertain revised offers from the firms in view of decision to revise and expand this project to meet the requirements of the heavy machine building plant to be set up with the collaboration of the Soviet Union.

TRADE

Business Transacted by S.T.C.: The Deputy Minister for Commerce and Industry, Shri Satish Chandra, stated in the Rajya Sabha recently that the State Trading Corporation of India had transacted by the end of June 1957, business amounting to Rs. 27.14 crores for exports of Indian goods. During the same period the business transacted for imports of different commodities totalled Rs. 15.15 crores. During the 12 months July 1956-June 1957, the Corpe-

ration purchased indigenous cement worth nearly Rs. 54.55 crores. The Deputy Minister said that the amount of expenditure incurred by the Corporation so far had not yet been finally assessed.

*

Import and Manufacture of Stainless Steel: India imported 6,311 tons of stainless steel of the value of Rs. 3,93,19,635 during 1956-57, said Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, in the Lok Sabha. The Minister further stated that there was no factory manufacturing stainless steel in the country at present.

*

Import of Steel: Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, revealed that the total tonnage of imported steel received in Indian ports during 1956-57 was 1,914,476 tons. The Minister who was replying to Shri H. N. Mukerjee in the Lok Sabha added that approximately 25,000 tons of the quantity was not accepted by certain Government departments because of late arrival and change in design. At a later stage, further stated Sardar Swaran Singh, that quantity of steel was given over for free sale by the Iron and Steel Controller at Calcutta but the Government did not suffer any loss.

*

Export of Diesel Engines and Pumps: The Deputy Minister for Commerce and Industry, Shri Satish Chandra stated in the Lok Sabha that it was proposed to conduct intensive activities for promoting the exports of diesel engines in two or three countries. These countries would be selected on the basis of replies to a questionnaire sent to some of the Indian Government representatives abroad to ascertain marketing possibilities for Indian diesel engines.

*

Import of Automatic Looms: Shri Morarji Desai, Minister for Commerce and Industry informed the Lok Sabha that Government proposed to allow the import of automatic looms on deferred payment basis. In a written reply to a question by Shrimati Tarkeshwari Sinha, Shri Desai said the imports would be permitted from any country which would accept deferred payment on terms acceptable to Government. As indigenous production was low, a good proportion of the total number of 18,000 looms to be installed in the near future would have to be imported.

FINANCE

Customs and Excise Revenue Collected in Indian Union for May 1957: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during the month of May 1957, amounted to Rs. 15.30 crores as compared with Rs. 13.74 crores in the corresponding month of the previous year. The comparison in the subsequent paras should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 13.66 crores as against Rs. 11.51 crores, export duties for Rs. 1.26 crores as against Rs. 1.92 crores, and land customs and miscellaneous Rs. 38 lakhs as against Rs. 31 lakhs. The total gross collection of Union excise duties amounted to Rs. 21.53 crores as compared with Rs. 14.37 crores. During the two months, April and May 1957 the grand total of gross customs and Union excise revenue realised Rs. 69.39 crores as compared with Rs. 52.30 crores during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 28.05 crores as against Rs. 21.94 crores, export duties for Rs. 2.53 crores as against Rs. 3.64 crores, land customs and miscellaneous for Rs. 68 lakhs as against Rs. 43

lakhs and Union excise duties for Rs. 38.13 crores as against Rs. 26.29 crores.

*

Discharge of 3 Per Cent Victory Loan — 1957: The outstanding balance of the 3 per cent Victory Loan, 1957, is repayable on September 1, 1957, and no interest will accrue thereon from that date. As, however, September 1, 1957, falls on a Sunday, the discharge value will be paid on the preceding working day viz. August 31, 1957. To facilitate discharge of the loan on the due date, holders may tender their securities at the Public Debt Office, Treasury or Branch of the State Bank of India at which they are encased/registered for payment of interest on or after August 21, 1957. Full details of the procedure for obtaining discharge value can be obtained on application at any of the above offices.

*

Low Income Group Housing Grants: In a written reply to a question by Pandit D. N. Tiwary, Shri Anil K. Chanda, Deputy Minister of Works, Housing and Supply, revealed in the Lok Sabha that against the allocated amount of Rs. 6.78 crores for the Low-Income Group Housing Scheme for 1956-57, a sum of Rs. 6.33 crores was actually drawn by various States/Union territories. Andhra Pradesh, Bihar, Bombay, Kerala, Madhya Pradesh, West Bengal and certain Union territories did not fully utilise the allocated amounts.

*

Rebate on Excise Duty: The procedure for export out of India of articles under claim of rebate of duty on excisable goods used in their manufacture has been extended to chaddars, pillows cases and table covers as well. It is already applicable to ready-made apparel, tents, sugar products including biscuits and preserved fruits, cotton bags and umbrella cloth. Manufacturers of chaddars pillow cases and table covers who wish to export them out of India under this procedure may contact the Collector of Central Excise in whose jurisdiction their factory is situated for further detailed information.

GENERAL

Schemes for Manufacture of Vitamins: A number of schemes for the manufacture of vitamins have been approved by the Government of India. Two of the schemes are for the manufacture of synthetic vitamin 'A' from lemongrass oil which is available in the country. Each of these schemes envisages an annual production of 10 million mega units of vitamin 'A' of the value of Rs. 50 lakhs.

*

Employees' Provident Fund Act to be Extended to Mine Workers: The Government of India propose to extend the provisions of the Employees' Provident Fund Act, 1952, to workers in the iron ore and gold mines from November 30, 1957, said the Union Deputy Minister for Labour, Shri M. Abid Ali in a written reply to a question by Shri T. B. Vittal Rao in Lok Sabha recently.

*

Coal Mines Labour Welfare Fund: The balance in the Coal Mines Labour Welfare Fund on March 31, 1957, was Rs. 5,91,77,435, said Shri M. Abid Ali, Union Deputy Minister for Labour, in a written reply to a question by Shri Matin in Lok Sabha recently. The Deputy Minister also gave the receipt and expenditure figures relating to the Fund during the last three years. In 1954-55 receipts amounted to Rs. 96,85,563 and expenditure Rs. 68,58,660. In the following years the figures were Rs. 1,38,43,402 and Rs. 66,47,272 respectively. In 1956-57 receipts were Rs. 96,79,587 and expenditure Rs. 59,34,860.

NEWS IN BRIEF

INDIAN

The Joint Chief Controller of Imports, Bombay has announced that quota licenses issued for January-June 1957; licensing period with a validity of six months would be allowed to be extended even if they are offered for conversion.

*

Arrangements have been made by the State Trading Corporation of India (Private) Ltd. to import 5,000 tons of skimmed milk powder from the U.S.A.

*

The production of indigenous sugar amounted to 26.19 lakh tons up to July 31 in the current season, as against 18.53 lakh tons in the corresponding period of the last year.

*

Production of cloth and yarn by cotton textile mills during the first seven months of this year increased by 119 million yards and 95 million yards respectively, over production for the same period last year.

*

India exported over 26 lakh cwts of mica worth about Rs. 6.7 crores last year through the port of Calcutta, according to the Annual report of the Indian Mica Miners and Dealers Association.

*

In exercise of its powers under the Essential Commodities Act, the Government of India have issued a notification prohibiting the export of gram including split gram from Shri Ganganagar district of Rajasthan.

*

Production of several toilet goods in India recorded a considerable increase in 1956, compared with that of 1955, according to official figures.

*

India's sulphuric acid production recorded a slight decrease from 166,200 tons in 1955 to 165,215 tons in 1956.

*

The State Trading Corporation of India had transacted by the end of June 1957, business amounting to Rs. 27.14 crores for exports of Indian goods. During the same period the business transacted for imports of different commodities totalled Rs. 15.15 crores.

*

The Indian standards Institution has published an Indian Standard Specification for leather pump buckles made from vegetable tanned leather.

*

Shrimati Violet Alva stated in the Lok Sabha recently that the Government of India gave grants-in-aid to the State Governments totalling Rs. 7.18 crores during 1956-57 to improve the lot of tribals and scheduled castes in the country.

*

Eastern Shipping Corporation has planned to increase its participation in the India-East Asia and India-Australia runs and for this purpose has placed orders on the Hindustan Shipyard for the construction of four cargo vessels aggregating about 25,000 G.R.T. at a total estimated cost of Rs. 5.5 crores.

FOREIGN

The World Bank has granted a \$7m. loan to help finance an irrigation, water-supply and power programme in the Aichi region of Central Japan. The advance was made to the Aichi Irrigation Public Corporation a government agency formed to plan and execute the \$100m. project which is expected to take four years to complete.

*

The Argentine Government has issued a decree authorising the payment of 80m. pesos (nearly £100,000) to foreign and Argentine meat packing enterprises in final settlement of claims for "compensation payments" covering the 1946-54 period.

*

Restrictions on exports of high and mid-grown teas to the London market are proposed in a new Tea Control Bill recommended to the Ceylon Cabinet by the Minister of Food and Agriculture, according to the 'Times' of Ceylon.

*

It is reported West German coal miners have lodged a claim for a five-day 37½ hour week as from January, 1959.

*

Total private foreign investment in Brazil in 1956 amounted to the equivalent of £55.7 m. Of this, three quarters came from the U.S. and Germany (£24.3m. and \$17.3m, respectively) which are now Brazil's two main markets.

*

The German Finance Ministry has agreed to release all £75 m. which the Deutsche Bundesbank is to deposit with the Bank of England under the agreement concluded last spring.

*

Ireland has become a member of the International Monetary Fund and of the World Bank. Ireland's quota in the IMF is \$30m. and its subscription to the capital stock of the Bank is 300 shares with a total par value of \$30m.

*

West Germany has cut most of its industrial tariffs by 25 per cent for the period from August 20, to December 31, 1957, when the position will be reviewed. All foodstuffs coal, steel, and 40 groups of industrial items were, however, exempted from the tariff cuts.

*

Industrial production in Britain has been rising sharply in the last few months, after a standstill of over a year. In May it was already almost at the peak levels of the last quarter of 1955—some 40 per cent higher than in 1948.

*

France has notified the European Coal and Steel Community of a 4½ per cent increase in the price of French Steel with effect from August 3. The price of pig iron has also gone up, by an average of 4.7 per cent, and that of certain special alloys by a maximum of 4½ per cent.

*

It is reported the present trade agreement between Japan and Britain is likely to be extended with minor modifications for six months after October 1, this year.

The secret of Popular Poplin — Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete *reliability* of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

Special Articles

INDIA'S BALANCE OF PAYMENTS IN 1956-57

THE severe pressure on India's foreign exchange reserves, caused by the wide gap in the balance of payments in 1956-57, necessitated withdrawals of nearly Rs. 220 crores in one year. Since April 1956, the reserves have been run down by nearly Rs. 356 crores till August 16 last. It is the object of this article to analyse the underlying causes of this fall in reserves.

The following table compares the balance of payments of 1956-57 with 1955-56 and brings out clearly the essential points of difference between the two years. It illustrates the sudden jump which India's imports in 1956-57 took both on private and Government account. As against imports valued at Rs. 750.6 crores in 1955-56, total imports for 1956-57 at Rs. 1,076.5 crores were higher by nearly 43 per cent. Exports, on the other hand, recorded a marginal fall of Rs. 4.1 crores. The unfavourable balance of trade, therefore, galloped from Rs. 109.5 crores in 1955-56 to Rs. 439.5 crores, registering a rise of nearly 300 per cent. Whereas the invisible earnings and official donations more than made up the imbalance in trade and created a favourable balance of payments of Rs. 16.9 crores in 1955-56, the gap in 1956-57 could be covered only in part and the current account (net) deficit remained as high as Rs. 292.5 crores.

TABLE I

INDIA'S BALANCE OF PAYMENTS

	(In Crores of Rupees)	
	1955-56	1956-57
Imports	750.6	1,076.5
Exports	641.1	637.0
Trade Balance	—109.5	— 439.5
Official Donations	+ 42.0	+ 39.8
Invisibles (Net)	+ 84.4	+ 107.2
Current Account (Net)	+ 16.9	— 292.5

The urge to quicken the tempo of industrialisation by importing capital goods at a fast rate seems to be the root cause of the crisis in payments. Table III on the next page sets out the index numbers of imports and exports both with regard to volume and price. It shows that the volume of India's imports has risen steadily since 1953-54 and that the rise in the volume of imports of manufactured articles, in particular, has been spectacular, mostly in the last two years. The index of volume of imports of manufactured articles (Base: 1952-53 = 100) which stood at 113 in 1953-54, rose to 130 in 1954-55, 180 in 1955-56 and 234 in 1956-57. The price index for manufactured articles, on the other hand, stood between 85 and 87 during the last four years. The conclusion is irresistible that the strain on payments has been caused by the increased volume of imports, and not because of any significant rise in international prices of manufactured articles. It may, however, be pointed out here that any increase in payments due to higher freight rates is not taken into account while computing these index numbers.

The volume index of imports for "Food, Drink and Tobacco" in 1956-57 (April-December) stood at 25 with 1952-53 as base. The reduction of imports under this head to one-fourth the 1952-53 level is a welcome sign but it needs to be remembered that imports of food in 1952-53 were very high. Even such a steep fall in the volume of imports has reduced the value of imports of food in 1956-57 to Rs. 102 crores only. It must be conceded that the imports of food grains in 1956-57 were absolutely necessary because they were instrumental in suppressing price inflation which would otherwise have taken a runaway course. In the next four years of the Plan also, when huge capital investment is expected to be made, the availability of food grains inside the country will need to be augmented by imports in case the domestic crops fall short of the internal demand.

The latest Reserve Bank of India Monthly Bulletin, while discussing the balance of payments in 1956-57, has tried to argue that the imports of machinery, iron and steel etc. were not excessive in the first year of the second Plan. If support of this contention, the Bulletin has thought it fit to compare the actual imports of 1956-57 with the average for the second Plan. But such a comparison seems to be unjustified in view of the fact that the second Plan estimated the pattern of foreign trade (as well as of balance of payments) for every year of the second Plan. What is important for this purpose is to see how far the actuals in 1956-57 have deviated significantly from the estimates made in the Plan for this year. It is clear from the Table II below that the structure of foreign trade in the first year of the second Plan did not follow the pattern set out in the Plan. The volume of imports was anticipated to rise gradually upto the third year, and was estimated to fall in the last two years of the Plan. The jump in imports was to appear in the third and not in the first year. But the actual imports in 1956-57 at Rs. 1,076.5 crores exceeded the estimated imports in the Plan by Rs. 293.5 crores. Even the highest estimated imports in third year of the Plan fall short of the actuals in 1956-57 by Rs. 86.5 crores. It has been demonstrated in the foregoing analysis that

TABLE II

INDIA'S BALANCE OF PAYMENTS (CURRENT ACCOUNT)

1956-57 — 1960-61

	Exports (f.o.b.)	Imports (c.i.f.)	Trade Balance	Invisibles	Total current account balance
1956-57	573	783	—210	+62	—148
1957-58	583	886	—303	+55	—248
1958-59	592	990	—398	+51	—347
1959-60	602	895	—293	+46	—247
1960-61	615	786	—171	+41	—130
Average for five years	593	868	—275	+51	—224

the volume of imports has registered spectacular rise only in the case of the manufactured articles; it is therefore, patent that the imports of machinery, iron and steel, etc., were excessive in 1956-57, and that the heavy imports of capital goods alone was the chief cause of the pressure on foreign exchange. The Reserve Bank's thesis couched in terms of Plan period average cannot refute this important fact.

Whatever the implications of accelerating the rate of imports particularly of capital goods in the first year of the present Plan, necessary action has already been taken by the Government to meet the difficulties created by the strain on our foreign reserves. Austere cuts in

imports are expected to ease the pressure on foreign exchange. This is in so far as imports ordered after the new policy was enforced are concerned. But our commitments on out-standing import licenses will be honoured, as they must be. And for this purpose defensive action has been taken by the Government by allowing the Reserve Bank to reduce foreign securities to Rs. 300 crores, if need be. If the true character of these remedies as defensive measures is appreciated in the right perspective, there should be no cause for alarm. Meanwhile concentrated efforts to improve the foreign exchange position with added accent on exports will surely see the crisis through.

THE USE OF 'BALANCED' FERTILIZERS—III

By

C. R. RANGANATHAN

FERTILISER is a blanket word which describes a large group of chemical substances, each of which may contain no more than one or at best two of the major plant nutrients, namely, nitrogen, phosphorus, and potassium. Of these, nitrogen in the soil is almost entirely derived from the activity of soil organisms, the excreta of animals and the decay of organic matter. Except for small quantities of ammoniacal nitrogen brought down by rain, it would be generally true to say that all nitrogen in the soil is of organic origin. Nitrogen replenishment cannot take place as a result of weathering as it does in the case of phosphorus, potassium and other nutrients. Hence the importance of providing organic matter by leaving crop residues, green manure, etc. and of supplementing it with nitrogenous fertiliser. Building up the nitrogen level is particularly important in tropical soils, which are as a rule deficient in soil nitrogen. The response to added nitrogen is usually dramatic in the initial period and this fact raises the temptation to limit fertiliser application to nitrogenous fertilisers.

This would, however, be a misguided policy in the long run and often in the short run. The boost in vegetative growth and general metabolic activity caused by adding nitrogen cannot take place without a concomitant increase in the uptake of other nutrients,

notably phosphorus and potassium. The reserves of these nutrients in the soil tend to get used up at a faster rate than they are replenished in the natural course and must sooner or later result in retardation of growth. The continued use of "straight" nitrogenous fertiliser thus does not help to build up soil fertility, but is, on the other hand, rather like the use of a drug which causes temporary stimulation followed inevitably by depression.

Although the effects on crop yields of phosphatic and potassic fertilisers applied separately are in themselves not comparable with those of nitrogenous fertilisers, their combined effect is to increase yields by a margin which cannot be achieved by the increased use of nitrogenous fertiliser except at higher cost. In the words of Prof. K. A. Bondorff (Chief of the State Laboratory on Soils, Lyngby, Denmark), the use of potash salt and superphosphate is a relatively cheap measure and that of a sufficient supply of potash and phosphoric acid is necessary to obtain the full effect of the more expensive nitrogenous fertilizers, the full effect of expensive seed of new varieties and the full effect of still more expensive measures as lining and drainage. The advice can also be formulated thus: It is not profitable to let potash and phosphoric acid be the limiting factors."

PROPAGANDA FOR THE USE OF BALANCED FERTILISERS

It should therefore be an object of State policy to encourage the use of balanced fertilisers. In order to get the farmer to use balanced fertilisers, several conditions should be satisfied. First, the farmer should be made aware of the need for balanced fertilisers and their value in building up the fertility of his soil through demonstrations, advice, cinema films, in short, by making full use of the apparatus of propaganda. He no longer needs persuasion to use nitrogenous fertiliser and the stress should therefore be on his using phosphoric acid and potash along with nitrogen. This is the work which falls within the sphere of the Community Projects and the N.E.S., but its prestige value would be increased by Universities, Scientific bodies and public men sharing in it.

SUBSIDIES FOR NON-NITROGENOUS FERTILISERS

Secondly, monetary inducements in the shape of subsidies have to be offered to the farmer in order to persuade him to use balanced fertilisers. Two points of view have to be recognised in this connection. One is that of the farmer who will not make a change in his traditional agricultural practices, unless he is assured of an immediate profit. In the case of nitrogenous fertiliser (Ammonium Sulphate), the profitability has been amply demonstrated and the problem is not to secure its wide use but to meet the rapidly growing demand. But with phosphoric acid (and more

so with potash) the effects on the yields are less impressive and arguments based on improved quality, robustness, disease resistance, residual effect, soil fertility conservation, etc., do not make any serious impression. In contrast to this, the second point of view, that of the State, is (or should be) concerned primarily with the preservation and building up of the fertility factors of the soil which is the principal productive capital of the country. The securing of the deferred and often intangible benefits of proper soil management—and the correct use of fertiliser is an important aspect of soil management—is a matter of import to the State. When the short-term economics of individual farmers lead to practices which do not conform to the principles of soil fertility conservation or threaten to endanger the soil, the State, which represents the community as a whole, has a clear duty to regulate and control such practices. This can be done either by compulsion or by a system of subsidies. The latter is much the better course.

The case for granting subsidies for encouraging the use of phosphatic and potassic fertilisers rests on considerations like those outlined above. A subsidy scheme for superphosphate is in force, under which a concession of 25% of the price is allowed to the farmer, of which half is to be met by the Central Government 'provided' the other half is met by the State Government. This proviso of a matching grant from State Governments, many of which are unable to find funds for it, has made the scheme inoperative in many States. The question of subsidy needs re-thinking.

BOOK REVIEW

INDIAN INDEPENDENCE

The First Decade: A Symposium commemorating the Tenth Anniversary of Indian Independence. Edited by Clifford Manshardt. Published by the United States Information Service, New Delhi. Pages 194.

The sympathetic interest taken by the United States before 1947 in the cause of India's freedom and the generous help she has rendered since to strengthen and stabilise this country's independence and democracy are substantial factors in Indo-American understanding. It is, therefore, not fortuitous that the bright idea of the United States Information Service to commemorate the Tenth Anniversary of Indian Independence has taken concrete shape in this sweet and solid publication. It is also appropriate that this has taken the form of a symposium consisting of lucid and learned contributions from some eminent Indians. The only regret one may have is that some American scholars who have closely studied the social and economic life of this country in recent years are not among the contributors. For, what Americans may say about India will be no less essential for stable Indo-American understanding than what Indians may say about their own country. As this commemoration symposium bids fair to be popular both in India and in the United States, it is to be hoped it will become an annual feature and eminent contributors will be drawn from both the countries.

As for the contributions themselves, it is needless to say they are of the choicest kind. Mr. R. R. Diwakar's brilliant article on "Gandhi's Ideas in post-Independent India" contains an "objective assessment

which belies the comment of some people that Gandhi's ideas are no longer influencing the mind of the people or of the administrators of India." In his masterly analysis of "Linguistic and Literary Trends in Modern India," Mr. K. M. Munshi has some sharp remarks to make on the emergence of "progressive" literature, fostered under Marxian influence, and on "the sinister influence of the hedonistic mass culture, represented by a section of Hollywood." About the former he says "it is dominated by an inverted romanticism which revels in the ugliness of life, the ruthlessness of nature, the wickedness of human institutions, flaunting morbid pessimism, and denying hope." About the latter he says it is a cult, also adopted by the film-world of India, "which caters to the baser instincts by glorifying violence, crime and indiscriminate sex-relations"

Planning and Progress in agriculture and in industry are succinctly and authoritatively dealt with in Chapters III, IV, and V. Mr. Gulzarilal Nanda and Dr. Punjabrao S. Deshmukh write respectively on planning and agricultural progress. Industrial progress in the period 1946-1955 is described by Prof. C. N. Vakil and Mr. B. C. Desai with the help of relevant statistics. The authors rightly hold the view that "India's outstanding achievement in the decade following Independence seems to lie in the successful attempt to create the industrial base for a dynamic change of the entire economy." Social services and social progress come in for treatment in the last chapters. Shrimati Hansa Mehta, after giving "an overall picture of the efforts that have been made in the field of education in the last ten years," concludes with the significant remark that "democratic ways are bound to be slow, but the results are assured." And they will be enduring too.

Letters to the Editor

THE STATE BANK OF INDIA

Sir,

In the "Blue Supplement" accompanying your issue of July 26, 1957 and dealing with some problems of Scheduled Banks there are certain statements made about the State Bank of India which appear to be inaccurate. We would therefore like to draw your attention to the following:—

(i) In the article on 'Finance for the Private Sector', you have said: "It is necessary to remember in this context that the private sector's task of finding working capital has become more onerous now in view of the fact that the resources of the State Bank of India will not be available to it in future on the scale on which liberal assistance was usually forthcoming from its predecessor, the Imperial Bank of India. The burden for providing working capital to the private sector, therefore, falls much more heavily on the commercial banks than ever before." Similarly in your article on the 'Role of Banks in the Plan' the following remark appears: "It is important further to remember that with the taking over, by the State, in 1955, of the Imperial Bank of India, the private sector has lost an important financial institution which was playing a substantial and significant part in the financing of trade and industry. The new responsibilities of the State Bank of India are bound to divert part of its resources from the key services which its predecessor was rendering to business." These remarks, in our view, are not justified in the light of the working of the Bank in the last two years nor show awareness of what the Chairman said in his annual speech this year. He said: "It would be relevant to point out in this connection that the sanction of advances to State enterprises has not restricted in range or volume the sanction of advances to enterprises in the private sector. On the contrary, consistently with the rising tempo of economic activity, our advances to the private sector of commerce and industry have increased very substantially—from Rs. 72 crores in December 1955 to approximately Rs. 100 crores in December, 1956."

(ii) Another inaccuracy has crept in the second article under reference. It remarks on page ix: "Thus out of the 400 branches scheduled to be opened by July 1960, the State Bank was able to open only 46 until recently." The progress of the branch expansion programme has been given in some detail in Report of the Central Board of Directors for the year 1956 (pp. 5-6 of the Report). On the specific point of the number of branches already opened we quote from the Report. "Between July 1, 1955 and the end of December 1956, '66' branches were opened, those opened during the year under review being 46."

2. Both the Chairman's speech as well as the Annual Report are published documents. But since it is likely that many of your readers may not have read them, we would be obliged if you publish this letter in your paper at an early date.

Thanking you,

Bombay,
August 14, 1957.

Yours faithfully,
D. S. SAVKAR,
Economic Adviser.

[The error about the number of branches opened is regretted.

As for the assistance available from the State Bank, the two articles in question emphasized the

point that **In Future** the scale of this assistance to commercial banks is likely to decline. A section of the managements of these banks apprehends that as the State Bank fulfils its new obligations of financing other credit requirements, the volume of accommodation to them may not be adequate. If these fears are disproved, it will be a relief to the banking system. The views expressed on this issue will be verified only in course of time.—Ed.]

"COLLECTIVIZED" EDUCATION IN KERALA.

Sir,

In your issue of the July 26, under caption "COLLECTIVIZED EDUCATION IN KERALA," you have stated that "on the credit side, it must be said that the proposed legislation (Kerala Education Bill) makes provision for the security of service and improved employment conditions of teachers. Since even in the case of 'aided' schools, salaries will be paid by the Government directly to the teachers, this will, doubtless, eliminate the notorious malpractices connected with the payment of teachers' salaries."

The above conclusions seem to be the result of incorrect information about the conditions in the Travancore-Cochin State. According to rules now in force, the Education Department has a hand in the appointment of teachers in as much as every appointment in an aided school becomes valid only after it is approved by the Department. The service of a teacher so appointed and approved cannot be dispensed with without the previous Departmental sanction. Thus, the proposed Bill incorporates no new provision to ensure security of service.

Under the "scheme for the improvement of service conditions of Private Secondary School Teachers," the T.C. Government agreed to pay grants to amangements of private schools to cover the whole deficit caused by the salaries of the teachers. During the Adviser's regime the T.C. Government also agreed to pay teachers in the primary section their full salary as grant. Amounts necessary for the payment of salaries are drawn under the joint responsibility of the manager and the departmental officer. The "notorious practices," referred to above, are, therefore, purely imaginary.

So far as Malabar is concerned, some provision is, of course, necessary to ensure security of service. There may also be some irregularity in the case of the payment of the Secondary section in this area. Moreover, the Madras Rules do not ensure security of service. These defects require proper solution.

D. HARI, B.A.,
Editor "The Teacher",

Ernakulam,
August 15, 1957.

(The very fact that Mr. D. Hari admits that "some provision is necessary to ensure security of service" in Malabar as "the Madras Rules do not have adequate provision for that "obviously means that our comments were neither unfounded nor incorrect. Still we thank him for the information he has provided us on the working conditions of the teachers in the various parts of Kerala.—Ed.).

make light work for your workmen

Here is a happy and contented worker.

He works in a factory whose lighting has been planned by Philips, where eye-strain, and the psychological 'dip' which results from inadequate lighting, is banished.

His morale is boosted. He works efficiently, longer, his production is higher. His company makes better profits, gives better bonuses.

UNFAIR AND IRRESPONSIBLE

By
CROESUS

AT a time when almost everyone in this country and abroad has been urging greater consideration to private enterprise, if only because of its record in the first Five-Year Plan and the relatively greater chances of its fulfilling its targets under the second Plan, it is unfortunate that we have some persons in this country who seem to believe that the only way to usher in the millennium is for Government to give up its so-called policy of softness towards the private sector and adopt stronger and stronger methods if a crisis is to be averted. I would have unhesitatingly called such persons "irresponsible," but for the fact that they include even a former Minister who is now holding the responsible position of Vice-Chairman of the State Bank of India—I mean Mr N. V. Gadgil. Although I have great respect for this veteran congressman and his forthright observations, I am bound to say that the latter are invariably exaggerated, even ill-informed at times, and almost always ill-timed. Take for instance, his reference to the strength of the Indian rupee in the course of a recent address to the History and Economics Association of a local college. After saying that the Indian rupee was as respectable as the dollar if not more, in the Middle East, he declared that this prestige must be maintained. This is unexceptionable but he did not stop there; he went on to say: "Therefore, any talk about reducing the proportion of currency cover held in London will be short-sighted and unstatesmanlike." Surely Mr. Gadgil is original. For no one—neither the Union Finance Minister nor the Reserve Bank nor any of our prominent economists has given the need to maintain the prestige of the Indian rupee in the Middle East as an argument against reducing the currency cover held in London. One would have thought that at least as one holding the position of Vice-Chairman of the State Bank of India, Mr Gadgil would have noted the official view on such an important issue—only a few days before the Reserve Bank had released its publication on current trends in banking in which this view is highlighted and refrained from making known his diametrically opposite view, entitled though he certainly is to hold any personal view he may like.

I do not think it would be unfair to Mr. Gadgil if anyone suggests as, indeed, some have done—that his plea to the Government to be tough with the private sector is just as "responsible" a plea as his remarks about the reduction in the backing for our currency as above. But in making this plea, let us see what were his arguments in justification. First, he said that credit freeze and all such monetary weapons had not proved adequate in stabilising the price structure. Then he rushed to the conclusion that "the private

sector, which was responsible for 92 per cent of national production, had not played its part. Perhaps, on second thoughts, he qualified this broad generalisation by adding, "atleast as effectively as it should." So, according to Mr. Gadgil's reasoning, the private sector has to be taken to task even if official measures prove ineffective, and it must of course, be pulled up if it does not play its part as effectively as it should. Now, "as effectively as it should" may mean anything, one might dismiss even the best of performance as saying that it has not come up to expectations. There may also be a valid explanation for the result not being what it should be, such as unforeseen circumstances, and to take anybody to task even in such circumstances for not fulfilling expectations is unrealistic. Mr. Gadgil is only unrealistic thus, but he is even unfair, if I may say so, because, while he is prepared to find extenuating circumstances for the failure of the public sector he is not sporting enough to extend the same benefit to the private sector.

Although Mr Gadgil has pressed into service the price structure and failure to come up to expectations as his apparent arguments for recommending his "be tough with private sector" remedy the real cause of his wrath against the private sector is that "today the free enterprise movement is questioning the major decisions behind the Plan taken long ago." Does this mean that, even if, there is something radically wrong with major decisions, they can not be questioned on the score that the decisions have been taken long ago? The second Five-Year Plan is undoubtedly a major decision. True, it has been drawn up after great deliberation by experienced administrators and experts. It is also a fact that Parliament has approved of it. But, then, even after all our recent experience and the heavy weather we have been encountering, must we keep mum and say nothing about the need to curtail the size of the Plan or to spread it over a longer term? If so, why has Mr Gadgil himself talked of "a revision of the scheme of priorities," although he sought in the same breath to apply unctious to his soul by adding "without seriously changing the timetable or the consequences"?

Mr. Gadgil has advocated wider and rapid industrialisation in the same address but he fails to see that the measures he recommends can only have the effect of retarding industrialisation. If he believes he can honestly help capital formation by still stiffer doses of taxation than wealth tax, expenditure tax and heightened estate duty he is mistaken. Fortunately there is no impartial evidence to support this view.

RESPONSE TO LOANS IN RETROSPECT

By
CROESUS

NOW that details of the subscription to the new loans are available, one may proceed to make certain observations about how they fared. Prima facie, the loans were over subscribed, the total subscriptions aggregating Rs. 105.97 crores—made up of Rs. 56.92

crores against the 3½ per cent National Plan Bonds (Fourth Series) 1967 and Rs. 49.05 crores against the 4 per cent loan 1972. Again, the total subscriptions in cash amounted to Rs. 60.98 crores, the balance of Rs. 44.99 crores being conversions of the 3 per cent

1957 (Rs. 34.74 crores) and the 3 per cent 1958 (Rs. 50.35 crores).

Certain reflections emerge from the foregoing facts. In the first place, why were not the loans kept open till atleast the 10 per cent extra, for which the terms of the floatation and provided was subscribed? Since it is stated in the Reserve Bank's Press Communiqué that every subscriber is to receive full allotment, the Government has even now been able to get nearly Rs. 6 crores more than the loan target of Rs. 100 crores. Would it have mattered very much—even prestige-wise—had the lists been closed at the end of the second, if not the third, day? Secondly, since the total outstandings of the 3 per cent 1957 and the 3 per cent 1958 loans which were permitted to be offered for conversion amounted to Rs. 85.09 crores, why were only Rs. 44.99 crores including those held by the Reserve Bank, offered for conversion? In the absence of any information on or even a clue to the precise holdings of these loans by the Reserve Bank, there is naturally all manner of speculation for which the Reserve Bank has itself to thank. One speculation is that nearly all the conversion represents the holdings of the Reserve Bank. This may or may not be the position, but it is a fact, it gives rise to another query as to why were the existing holders reluctant to convert their holdings into the new loans. One explanation—which seems plausible—that has been offered is that the rates offered by the Government for its loans were not such as to hold out much attraction in the context of the prevailing pattern of interests rates in the money market. If this is accepted, it follows that the loans are undoubtedly a success. Indeed, the main criterion for judging the success of any floatation—the Government or private—is the circumstances prevalent at any given time; if these circumstances are not quite so favourable and the loans are still over subscribed, as at present, the authorities certainly deserve a pat on their back; certainly, if, in spite of favourable circumstances, a particular floatation proves to be a flop, it is but a poor reflection on the floatation itself.

Whenever a government loan is floated, there is interesting speculation as to the degree of support that it will receive from private individuals, institutional investors, and the Reserve Bank. On the eve

of the announcement of the latest loans, one school of opinion had predicted that the Banks would go in for atleast Rs. 25 crores, preferably the medium dated loan (i.e. the 3½ per cent 1967). Even after the figures of subscription to the two loans were made known, because of the relatively larger amount subscribed to the 3½ per cent 1967 loan, some have reiterated this view. As against this, a columnist in a daily contemporary contends that "the response from the banks to the latest issues has not come up to original expectations." Hence, again, it is the relatively poor attraction of the yield, more than even the statutory obligation, that seems to have determined the extent of the banks' response to the loans. In the context of the present call money rates and the usance bill rates, the return of about 3.81 per cent on a medium dated loan and of only 4 per cent on a long-dated loan—these, be it noted, are the yields on the new loans—cannot be described as so excessively attractive as to make banks go ahead and shoulder over one another to subscribe to the new loans. But this is not to argue that the rates should have been higher.

As regards the respective shares of the Life Insurance Corporation, other institutional investors such as trusts, provident funds, etc., and semi-governmental bodies like corporations, one's guess is as good as another's. Including the share of the State Bank of India, one estimate puts this total down as anywhere upto Rs. 40 crores. It is not clear as to how much of this sum represents cash and how much conversion. In any case, if, as against a total offer of Rs. 100 crores, as much as about Rs. 40 crores is taken up by Government or semi-Government bodies alone and the major portion of the announced conversion also is on account of the country's Central Bank, the remaining, which constitutes a negligible fraction must be taken as measure of public response to the loans. This premise itself may be wrong, but if for argument sake it is presumed as correct, it follows that the response of the public, of the individual investor as such, is hardly flattering to anyone—either to the authorities or to the people themselves, may their capacity to save. But is not an explanation for this poor popular response to be found atleast in part in the crushing tax burden on the traditional individual investor.

BUSINESS NOTES

SELECT COMMITTEE ON WEALTH TAX

THE REPORT of the Select Committee of the Lok Sabha on the Wealth Tax Bill which was tendered to the House on August 17 last has had a mixed reception. To those who have allowed their enthusiasm for the socialist objectives of taxation to outrun the objectives of harmonious growth of the economy, the modifications recommended by the Select Committee constitute unwarranted dilution of the Bill. At the opposite point, to those who consider the wealth tax as nothing short of a weapon of expropriation, the report retains the substance of the Bill and merely doles out minor concessions.

Undoubtedly the part of the Bill which has provoked the greatest criticism is the application of the tax to corporate enterprise. Some of the minutes of dissent, of which there are as many as nine, have been emphatic in denouncing the extension of the wealth tax to companies. The Committee has recommended certain changes in regard to company taxation. A tax holiday of five years has been suggested for new enterprises. Similarly, exemption of shipping concerns, charitable institutions and Section 25 companies as well as shares owned by one company in the capital of another has been proposed. In cases where losses are incurred or profits are too inadequate for dividend distribution, it has suggested that the tax should not be levied. In any event, the amount of the tax, it is urged, should not exceed the profit of the year. The gravamen of the charge against the imposition of the wealth tax on companies is that it will tend to destroy capital formation in the corporate sector. By the same logic, the wealth tax on individuals and undivided Hindu families would go to discourage saving and investment. In regard to Hindu undivided families, the limit of exemption has been raised from Rs. 3 lakhs to Rs. 4 lakhs. The criticism regarding the adverse effects on capital formation or saving will need to be watched with close attention. In the light of experience of this tax in operation, revised thoughts may be dictated by considerations of safeguarding the superior objectives of capital formation and investment.

Not all the amendments suggested by the Committee can be referred to here in passing. In respect of non-resident foreigners a rebate of 50 per cent of the tax on the value of investments in India has been recommended. In so far as assets located partly in India and partly abroad are concerned, the Committee has suggested that a proportionate rebate of 50 per cent in respect of assets located abroad should be granted. The exemption of the dwelling house in the case of ex-rulers, although it has been attacked, seems justified on the ground of avoiding sudden and violent upsets in their economic fortunes. The dwelling house of an individual in the rural area is exempted on the reasoning that it has hardly any rental value. A counter question is asked why the same considerate treatment has not been extended to the middle class owner occupying the house himself.

A strong criticism made about the entire scheme of the wealth tax rests on the argument that the present levels of the rates of direct taxes, coupled with the wealth tax, will produce a very injurious effect on potential sources of revenue to the State. It is argued that a maximum limit should have been prescribed for the total quantum of direct taxes to prevent this effect.

CLIMATE FOR PRIVATE INVESTMENT

ONE OF the questions raised constantly in business circles nowadays is whether it is at all possible for the

private sector to achieve the planned target of Rs. 725 crores of outlay allotted to it in the second Five-Year Plan in the face of several and successive blows which it has been receiving at the hands of the Government. A little reflection reveals that this stems out of genuine concern Developments, particularly during last year—the first of the second Five-Year Plan—and the wide fluctuations in share prices bear ample testimony to this. In a country where capital is still very shy and where the capital market as well the money market have not yet developed very well the raising of equity capital is indeed a problem. In fact, with the latest additional onslaughts on the private sector this seems well nigh impossible.

Presiding over the annual general meeting of the Native Share and Stock Brokers Association, last week, Mr. K. R. P. Shroff, President of the Association, very appropriately drew pointed attention to the damaging effects of the official policies on the capital market and the price structure of the shares and securities. He naturally, dwelt, at length on the depression that has been in evidence in all the Stock Exchanges of the country for sometime now. After dealing with the role which the private sector played during the first Five-Year Plan, Mr. Shroff said that, at present, the prospects of new capital being raised in the corporate sector at a rate of Rs 80 crores a year or Rs. 400 crores over the plan period appeared uncertain.

Adverting to the budget proposals of May last, Mr Shroff particularly criticized the wealth tax on companies. He said that whatever be the merits or demerits of the wealth tax on individuals, there could be no manner of doubt that a wealth tax on corporations was wholly "unsound, unscientific and inequitable." To quote Mr. Shroff it is "a predatory tax on capital formation." If it is granted that sustained recovery in the share markets is very vital for the revival of real savings and encouragement to domestic capital formation, it follows that the creation of a climate conducive for investment cannot brook further delay. There is hope that this will be done soon enough, as the importance of savings and investment is being more and more fully recognised by Government of late.

ISSUES BEFORE SHIPPING

MR. C. R. SRINIVASAN'S presidential speech at the last annual general meeting of the Bharat Line was characteristically brief and direct. It placed the issues confronting the Indian shipping industry in a plain but forceful manner. His argument, in short, is that, assuming that funds were made available for investment in the expansion of shipping, Government has to discharge definite obligations to the industry. The enquiry into the revision of freight rates has proved to be vexatiously time-consuming and what is worse the interim relief given by way of ad hoc increases in rates has been nullified by rising wage costs. Congestion at the ports has deteriorated at a rapid rate. Mr. Srinivasan estimated that the total cost on account of detention of ships has jumped from value equivalent to 179 days worth of full-time operation on an 8,000 DWT ship in 1954 to 398 days in 1956. This is surely a staggering measure of the economics of ship detentions at the ports.

The problems connected with procuring finance for the acquisition of tonnage have been discussed in great detail on several occasions. This fact perhaps explains why the Chairman did not deal with them in his speech. He has, however, emphasized that shortages of ships in the coastal trade threaten to reach acute dimensions. It is possible, given energetic

effort by the Government, to procure Liberty ships out of the moth-ball fleet from America. Already, a private Bill recommending release of these Liberty ships to India on terms of loan facilities is pending before Congress. One of the conditions to be attached to the release of the ships is that they should be employed only in the coastal trade. Since the coastal trade will earn rupee revenue for the shipping companies employing them, the issue of servicing the loans will have to be kept actively in mind. But it would be reasonable to assume that in course of time, as the payments become due, the foreign exchange position will improve progressively. The alternative is to allow foreign chartered ships to fill the gap and carry home their earnings in foreign currencies.

TEA INDUSTRY

THE COMMITTEE of the Tea Association of India in its recent memorandum submitted to the Ministry of Commerce and Industry has raised some points on the need for the revision of some of the decisions taken by the Government on the recommendations of the Plantations Inquiry Commission on tea. The memorandum states that the Government's decision to hand over the administration of public warehouses in Calcutta to the Tea Board would introduce the element of monopoly. At a time when the foreign exchange position is almost desperate and when the need for expanding exports is considered imperative, experiments of uncertain value should be avoided in a valuable export industry like tea. The Association also points out that the Government's decision to continue the present slab system of export will have a tendency of rendering our Consumer teas uncompetitive in foreign markets. The Association feels that the competitive character of our common teas in foreign markets could be maintained only by ad valorem duty on teas exported under direct sales and forward contracts and also on those sold for export at Calcutta auctions. The Government on the other hand considers that the abolition of the export quota system for tea would not be conducive to the best interests of the industry or trade.

Regarding the replanting fund, it is difficult to see how, if the fund is set up, it would aggravate the difficulties already experienced by the gardens. Companies' financial resources being slender, the setting up of a tea replanting fund in fact offers the most effective solution to finance the replanting of the tea estates. While it is desirable for tea companies to issue debentures as a source of finance, it is equally important that the subscriptions for debentures issued by tea companies be encouraged by the various financial institutions such as the State Bank of India, the Central and State Financial Corporations and the Life Insurance Corporation of India. The memorandum emphasizes that this could be done by including such debentures in the approved list of securities of these institutions. At the same time, it would be best for the tea companies to strengthen their reserves by greater voluntary restraint on distribution of profits by way of dividend.

ASHOK LEYLAND'S NEW ISSUE

MESSRS. ASHOK LEYLAND Ltd., have offered 9,88,688 equity shares of the nominal value of Rs. 49,43,440 to the public for subscription at par payable in full at the rate of Rs. 5 per share. The shares of the company already issued are dealt in and are officially listed and quoted by Madras Stock Exchange Association Ltd., Madras. An application has been made to the Madras Stock Exchange Association Ltd., Madras, for permission to deal in the shares now being offered and in due course for an official quota-

tion. The Leyland Motors Ltd. of Lancashire, England will subscribe to equity shares worth Rs. 59,21,170 lakhs. The total nominal amount of the present issue is Rs. 1,01,72,610.

The additional capital that would be raised as a result of this issue would be utilized for purposes of completing buildings and equipment enabling the company thereby to complete its programme of 2,500 vehicles a year. So far as meeting the cost of imported plant is concerned there will not be any difficulty in regard to foreign exchange, as the cost of imported capital equipment would be met by the issue of equity shares of the Company to Leyland Motors Ltd., in the U.K. itself. This is significant.

The promising feature of the Company is that except in 1955, it has paid a good dividend annually since its inception. In the year 1956, a dividend of 6 per cent free of tax was paid after making provision for taxation and depreciation and after placing Rs. 15 lakhs to reserve. The bright record of the company and the promising future for India's expanding automobile industry make it certain that the company would continue to grow in strength. These features argue for the attractive offer.

HOUSING PROGRAMME

WHILE NO one would dispute that the housing schemes for low income groups should be pushed through, it is wondered how the 1,000 crores of rupees urban housing programme announced recently by Mr K. C. Reddy, Minister of Works, Housing and Supply would be achieved. The programme is to set up housing corporations in the various States that will provide loan finance, with the Central Government and State Governments giving subsidy. It is intended that these institutions will canalise into housing, funds drawn from the private sector as well as banks, investment companies and financial institutions supplemented by funds from the Life Insurance Corporation, the Employees Provident Fund Account and other sources. The Corporations will give long term loans on reasonable rates of interest. A separate department of housing is also being set up in the Ministry under a Housing Commission to see that the implementation of the housing schemes proceeds expeditiously and in an efficient manner.

The housing programme seems attractive, but it is out of tune with the priorities laid down in the second Five-Year Plan in the context of competing claims on limited resources. First of all there is the problem of adequate funds and, secondly, supply of Steel and Cement raises an element of uncertainty. To these and, similar stark problems, the Housing Scheme of the Government provides no satisfactory answer.

It will be interesting to watch whether the private sector or the financial institutions referred to above would be able to provide nearly Rs. 200 crores annually to execute the whole scheme. None of the financial institutions seems to be in a position to provide long term loans on the scale assumed in this programme. The vulnerable part of the projected programme is the financial resources to implement it. So far as Rs. 10 crores rural programme for housing is concerned, there is, of course, much to be said in its favour. It does not impose heavy demands on the financial resources; it can offer effective scope for mobilising rural savings and creating local employment of which there is great need.

PROSPECTUS

1. A copy of this Prospectus has been filed with the Registrar of Companies, Madras, for registration as required by Section 60 of the Companies Act, 1956.

2. Consent of the Central Government has been obtained to this issue by two Orders No. F. 21 (34) - CCI/55 dated 27-9-1955 and No. F. 21 (67) - CCI/56-286 dated 19-3-1957, of which complete copies are open to public inspection at the Registered Office of the Company at Ennore, Madras. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any Scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

3. The subscription list will open at 10-30 A.M. on Friday, the 23rd day of August, 1957, and will remain open until Friday, the 6th day of September 1957, unless closed earlier at the discretion of the Directors but not before Friday, the 30th day of August, 1957.

ASHOK LEYLAND LIMITED

(Incorporated under the Companies Act, on 7th September, 1948.)

4. AUTHORISED CAPITAL

The Authorised Capital consists of 40,00,000 Equity Shares of Rs. 5/- each	Rs. 2,00,00,000
SUBSCRIBED AND FULLY PAID UP	
19,65,478 Equity Shares of Rs. 5/- each	Rs. 98,27,390
leaving a balance of 20,34,522 Equity Shares of Rs. 5 each available for subscription	Rs. 1,01,72,610

5. Particulars of the issues of Capital, all in Equity Shares of Rs. 5 each, which have been made during the past two years are given in the statement contained in paragraph 19 of this Prospectus.

This statement shows that at the date of this Prospectus Equity Shares of a total nominal value of Rs. 31,29,410 remained unsubscribed from previous issues. Of this amount Rs. 10,82,720 is reserved to be taken up by Leyland Motors Limited of Leyland, Lancashire, and Rs. 20,46,690 is available for issue at the discretion of the Directors.

At a General Meeting held on June 6, 1957, it was resolved to issue a further Rs. 70,43,200 nominal in Equity Shares of Rs. 5 each for payment in full at par and that of these shares Rs. 28,17,280 nominal be offered to Leyland Motors Ltd., and the balance, viz. Rs. 42,25,920 nominal be available for issue at the discretion of the Directors.

Pursuant of these Resolutions, the Directors have offered to Leyland Motors Ltd., who have agreed to take up shares of the nominal value of Rs. 52,29,170. The amounts payable in respect thereof will be subscribed in cash from time to time by Leyland Motors Ltd., normally as and when payments are made to them by the Company in respect of deliveries of Capital equipment. This amount of Rs. 52,29,170 includes Rs. 13,29,170 additional to the amounts mentioned in the preceding paragraphs as reserved for Leyland Motors necessary to bring the eventual total holding of Leyland Motors and other overseas holders in the equity Capital of the Company to 49 per cent in accordance with arrangements recently agreed with Government.

The total nominal amount of the present issue is therefore Rs. 49,43,440, viz. Rs. 1,01,72,610, the total unsubscribed capital, less Rs. 52,29,170 to be subscribed by Leyland Motors Ltd.

9,88,688 Equity Shares of the nominal value of Rs. 49,43,440 are accordingly offered to the Public in terms of this Prospectus for subscription at par Payable in full at the rate of Rs. 5 per share with application.

The shares now offered will rank for dividends and voting rights and for all purposes 'pari passu' with the existing shares except that they will be entitled to

participate in any dividend declared for the year 1957 at the next Annual General Meeting or by way of interim dividend or by way of final dividend so that the total dividend paid for the year 1957 in respect of the new shares shall be in proportion to the length of time, being part of the year 1957 during which the capital thereon is paid up and in proportion to the capital respectively paid up thereon and will thereafter rank 'pari passu' as to dividends and in every respect with the existing shares.

6. The Shares of the Company already issued are dealt in and are officially listed and quoted by the Madras Stock Exchange Association Ltd., Madras. An application has been made to the Madras Stock Exchange Association Ltd., Madras, for permission to deal in the shares now being offered and in due course for an official quotation.

7. Application for shares should be made for a minimum of 100 shares on the Form accompanying this Prospectus and delivered before the close of the subscription list to the Company's Bankers, namely:

- The State Bank of India — at all their branches in the Madras Circles and at their Branches at Bombay, Delhi, Calcutta, Hyderabad, Nagpur, Cuttack, Patna, Lucknow and Bhopal.
- Grindlays Bank Limited at any of their branches,

together with a remittance for the full nominal value at Rs. 5 per share.

8. DIRECTORS

- Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon). Chairman and Director, India Steamship Co. Ltd., Calcutta; Indo Commercial Bank Ltd., Mayuram; T. I. REGISTERED OFFICE

ENNORE — Near Madras

The consent in writing of the above said Auditors,
Bankers, Brokers and Legal Advisers to act in their
respective capacities has been obtained.

OBJECTS OF THE COMPANY

9. The Company was incorporated in 1943 under the
name of Ashok Motors Ltd., which was subsequently
changed to ASHOK LEYLAND LTD., to assemble,
manufacture and trade in motor cars, motor buses and
trucks, diesel engines and all kinds of motor vehicles,
their parts, components and accessories.

The main object of the Company as contained in
the Company's Memorandum of Association is as follows:

To carry on the business of manufacturers, as-
semblers of, dealers in, hirers, repairers, cleaners,
storers, warehousemen, of motor cars, motor cycles,
cycle cars, motors, scooters, motor buses and lorries,
trucks, tractors, cycles, bicycles and carriages,
launches, boats and ships, vans, aeroplanes, hydro-
planes and other vehicles and conveyances of all
description for carrying passengers or their personal
goods, commodities, produce, cargoes and other things
on land or sea or by air (all hereinafter comprised
in the term "motors and other things") whether
propelled or assisted by means of petrol, spirit,
steam, gas, electrical, animal or other powers, and all
engines, chassis, bodies, turbines, tanks, tools, imple-
ments, accessories and other things, materials and
products used for, in or in connection with motors
and other things.

The Company obtained a certificate of commence-
ment on 14-12-1948 and has been carrying on business
since then. Initially, the Company was engaged in
assembling Austin cars and trucks. In 1950, the assem-
bly of Leyland Commercial vehicles was added to its
activities. Steady progress was made in the volume of
production and Ashok Motors Limited became recog-
nised throughout India as one of the pioneers of a new
industry.

When in 1953, the Government of India, on the
advice of the Tariff Commission, selected five firms as
the approved Manufacturers of Automobiles in India,
Ashok Motors Limited, now Ashok Leyland Limited,
was one of the five. At that time, the Company was
assigned 'inter alia' the role of manufacturing heavy duty
commercial vehicles. It was decided in the latter
part of 1952 to discontinue the assembly of Austin
vehicles and to concentrate on the production of Ley-
land Heavy Duty Commercial vehicles for passenger
and for goods transport.

A phased manufacturing programme for the pro-
duction of Leyland "Comet" Chassis was submitted
to the Government of India and approved in March
1954. The Company expressed its intention to extend
manufacture to the complete range of Leyland Com-
mercial vehicles in due course. Leyland vehicles are
world renowned and Leyland Motors Limited of Ley-
land, Lancashire, England, are one of the largest manu-
facturers of heavy duty buses and trucks. Their
range, including vehicles manufactured by subsidiary
Companies in their group, covers buses for every type
of duty including the clutchless high performance
Royal Tiger Worldmaster Chassis with underfloor
engine designed for gross loads up to 15 tons. Ope-
rating as a single deck passenger vehicle and the
"Atlantian" double deck bus which is the most advan-
ced vehicle of the class in the world today, with seating
capacity for 78 passengers. In the goods range, lorries
are available for loads up to 60 tons and includes single
vehicles such as the "Octopus" which without any form
of articulated trailer can accommodate gross loads up
to nearly 25 tons. All these chassis are powered by
the famous Leyland range of direct injection 6-cylinder
engines.

The objects before this Company therefore are,
commencing with the Leyland "Comet" Chassis, de-
signed for gross loads up to 12 tons, to establish the
manufacture of a range of Commercial vehicles com-
parable to the range offered by Leyland Motors Limited
in the United Kingdom and including the manufacture
of the Leyland range of diesel engines. In due course,

it will be the Company's object not only to produce
for the Indian market but also to export to Overseas
markets.

DEVELOPMENT

10. Under the Agreement dated 5-12-1955, planning
of production including manufacture of jigs and fixtures
was to be undertaken by Leyland until competent staff
could be trained in India, the services of Leyland
Technicians were to be available to assist with the
training of staff and the development of efficient mate-
rial control, planning and production control in India,
and facilities were to be provided at Leyland for the
training of Indian personnel.

By the end of 1955, initial planning being complete
and the delivery in India of machine tools, jigs and
other factory equipment having commenced, imple-
mentation of the manufacturing programme was start-
ed. Progress since then has been continuous and at
present after a little over one year from the inaugu-
ration of manufacture, 15.80 per cent of the c.i.f. value
of the Leyland "Comet" is produced in Madras.

FINANCIAL BACKGROUND

11. In the original agreement dated 5-12-1955 con-
cluded between the Company and Leyland Motors
Limited of Leyland, Lancashire, with the approval of
the Government of India, it was provided that the
eventual contribution by Leyland Motors might be
Rs. 80 lakhs, i.e. 40 per cent of the Company's autho-
rised capital of Rs. 2 crores. Pursuant to this arrange-
ment, the capital has been increased from time to time
until the paid up Ordinary Capital amounted to ap-
proximately Rs. 95 lakhs, of which Leyland Motors
held Rs. 38 lakhs. The sanctions granted by the Con-
troller of Capital Issues provide for issue up to 40 per
cent of the capital to non-resident shareholders.

Government have recently agreed that the partici-
pation of Leyland Motors may be increased to 49 per
cent, whereafter the paid up capital was increased to ap-
proximately Rs. 98 lakhs, of which Leyland Motors
held Rs. 41 lakhs. The Company has applied to the
Controller of Capital Issues to increase the percentage
of shares to be issued to non-residents from 40 per cent
to 49 per cent of the capital. The present issue will
bring the total subscribed capital to Rs. 2 crores, of
which Leyland Motors will hold Rs. 98 lakhs. The
purpose of the Issue is to meet Capital and other ex-
penditure as hereinafter mentioned.

OBJECTS OF THE ISSUE

12. The additional capital to be raised as the result
of the present issue is required for the purposes of
completing buildings and equipment necessary to enable
the Company to increase production, in accordance with
the programme of progressive manufacture, up to a
total of 2,500 vehicles per annum.

It is to be noted that the original estimates of the
Capital needed to implement the programme for full
scale manufacture of Leyland "Comet" buses and trucks,
viz. Rs. 2 crores, is likely to prove correct. The sum
of Rs. 1,01,72,610 to be raised by this issue and by the

subscription of shares to be taken up by Leyland Motors
Ltd. will be utilised as follows:

(a) To finance the balance of the building programme and to pur- chase additional factory equip- ment	Rs.	50,00,000
(b) To repay money borrowed for erection of buildings and pur- chase of plant and machinery	Rs.	25,00,000
(c) For addition to working capital	Rs.	23,00,000
(d) For expenses of the Issue	Rs.	2,20,000
(e) Contingencies, being the balance	Rs.	1,52,610
TOTAL	Rs.	1,01,72,610

Automobile manufacture requires substantial work-
ing capital to cover stocks of raw materials, work-in-
progress and finished components awaiting assembly.
In addition to the amount provided for working capital
above the Company will make use of substantial loans
from its Bankers secured on its stocks of raw materials,
work-in-progress etc.

FOREIGN EXCHANGE

13. The Company does not anticipate and problem
in the provision of foreign exchange for meeting the
cost of imported plant, etc. necessary for the expan-
sion programme to be financed from the present issues,
since the cost of imported capital equipment is expect-
ed to be met by the issue of Equity Shares of the Com-
pany to Leyland Motors Ltd., in the U.K., as herein-
before mentioned.

PROSPECTS AND PROFITS

14. Except in respect of the year 1955, the Com-
pany has paid a dividend annually since its inception.
The year 1955 was exceptional in which heavy items
of non-recurring expenditure, such as the payment of
compensation to Managing Agents, writing down the
value of Austin Spares since the assembly of Austin
vehicles has been discontinued, made it inexpedient to
declare a dividend. The working results for 1956 were
good and a dividend of 6 per cent free of tax was paid
after making provision for taxation and depreciation
and after placing Rs. 1.5 lakhs to Reserve.

Sales of "Comet" trucks which amounted to 159
in 1953 have steadily increased and are expected to
reach a total of 1,000 for 1957, which, in the Company's
planning was regarded as a level of production and
sales which would achieve economic results. The ris-
ing demand leads the Company to proceed with its
plans to increase capacity to 2,500 vehicles per
annum, and, given reasonable trading conditions, the
Company expects to be in a position to continue to pay
Dividends on the capital as increased as the result of
this issue.

Leyland vehicles are noted for their long life. The
average life of those now being put on the roads is
estimated at a minimum of 12 years. In many cases
Leyland vehicles remain in service for 20 years or
more. After two or three years service replacement of
worn parts commences during routine overhauls.
There will, therefore, during the coming years, be a
considerable increase in the sale of spare parts which
will have a beneficial effect on the Company's ability to
make reasonable profits.

15. The following is a copy of the report of the
Company's Auditors Messrs. M. S. Krishnaswami and
Jagannathan and Messrs. Suri and Co., Chartered
Accountants.

ASHOK LEYLAND LIMITED

ENNORE, MADRAS

We have examined the accounts of Ashok Leyland
Limited for the five years ending 31st December, 1956,
and in accordance with the provisions of Clause 24 of
Part II of Schedule II of the Companies Act, 1956, we

report as follows. A summary of the Profit and Loss
Accounts for the Company for these years together
with the adjustments to be made is given hereunder:

Year Ended 31st December	1952 Rs.	1953 Rs.	1954 Rs.	1955 Rs.	1956 Rs.
Sales, closing stock and miscellaneous revenue:	2,04,52,081	1,76,98,569	1,50,65,753	2,48,49,459	4,26,58,648
Non-recurring item for which adjustment is necessary:					
Profit on sale of assets:	14,017	42,645	398	8,282	14,909
	2,04,66,098	1,77,41,214	1,50,06,151	2,48,57,741	4,28,93,557
Opening stock, purchases and other expenses including normal depreciation:	1,95,40,043	1,71,79,575	1,45,62,494	2,43,83,298	4,20,24,943
Non-recurring items for which adjustment is necessary:	1,500				
Brokerage on shares	4,42,271	1,17,495	40,246	36,774	
Initial and extra depreciation:	1,100	2,100		3,150	1,000
Donations and Charities:					
Compensation for termination of Managing Agency:				2,50,000	
Payment to former Managing Agents:					11,924
	1,99,84,914	1,72,99,170	1,46,02,740	2,46,78,222	4,20,37,867
Net Profits Subject to Income Tax:	4,81,134	4,42,044	4,03,411	1,79,519	8,55,690
Percentage of					
Dividend 'A' :	5%	5%	5%	Nil	6%
" 'B' :	5%	5%	5%	Nil	6%

We further report that no dividends have been paid in respect of the year ended 31st December, 1955. No accounts of the Company have been made up since 31st December, 1956.

'A' and 'B' Class shares of the Company were converted into equity shares of Rs. 5 each during 1955.

The Assets and Liabilities of the Company as at 31st December, 1956, as disclosed by the Audited Balance Sheet, were as follows:

1. Fixed Assets less Depreciation:					
2. Investments:				Rs. 46,94,617	
3. Current Assets:				500	
Stores:					
Stock-in-trade:		Rs. 1,19,589			
Sundry Debtors:		1,39,87,918			
		25,75,966			
4. Advances, Deposits and Prepaid Expenses:				1,66,83,473	
5. Cash and Bank Balances:				10,75,464	
				4,70,406	
					Rs. 2,29,24,460
Less Liabilities:					
1. Secured Loans:					
2. Current Liabilities and Provisions —					
(Including proposed dividend of Rs. 3,56,580)					
					83,41,653
					53,18,553
					1,36,60,206
					Rs. 92,64,254
Share Capital: 17,13,360 Equity shares of Rs. 5 each fully paid-up:					85,66,800
Reserve and surplus					6,97,454
					Rs. 92,64,254

NOTE:

- The stock-in-trade includes Austin and Proprietary Parts, the original book value of which as on 1-1-1955 was Rs. 26,09,925 (the sales value of which cannot readily be ascertained). After taking into account subsequent purchases and sales and writing down the value by Rs. 3,59,712 out of profits of the year 1955 and Rs. 1,78,418 out of the profits of the year 1956, the value of these parts stood at Rs. 15 lakhs as at 31-12-1956.
- There is a Contingent Liability for Madras Sales Tax amounting to Rs. 4,77,014 not provided for in the accounts, as the matter is under appeal.
- Since the Company's Accounts were made up at the end of 1956, the paid up Capital has been increased to Rs. 98,27,390.

(ii) Suri and Company

Chartered Accountants

Dated, 8-7-1957.

MINIMUM SUBSCRIPTION

16. The minimum subscription upon which the Directors will proceed to allotment is Rs. 49,43,440; subscription of this amount is assured by reason of the underwriting to which reference is made below. This sum together with the amount to be subscribed by Leyland Motors Ltd., in respect of shares reserved for

them, viz. Rs. 52,29,170 will cover the total expenditure of Rs. 1,01,72,610 hereinbefore set out.

VOTING RIGHTS

17. Under Article 92, as modified by Section 87 of the Companies Act, on a show of hands every member present in person shall have one vote and upon a poll, every holder of shares present in person or by proxy

shall have voting rights in proportion to his share of the paid up equity Capital of the Company.

RESTRICTION OF RIGHT TO TRANSFER

18. The Directors may decline to register any transfer of shares upon which the Company has a lien and in the case of shares not fully paid-up, may refuse to register a transfer to a transferee of whom they do not approve.

PAST OFFERS AND ALLOTMENTS OF SHARES

19. The following is the statement required by the Companies Act, 1956, of shares offered, allotted and paid up during the past two years, viz.

(The amounts quoted are nominal values of Equity Shares of Rs. 5 each.)

	Paid-up capital
The total Equity Capital issued and paid-up as on July 31, 1955, was	Rs. 54,56,800
On the following dates shares were offered, allotted and fully paid-up:	
On 1-2-1956	Rs. 10,000
" 2-3-1956	" 4,00,000
" 4-5-1956	" 5,00,000
" 21-6-1956	" 5,00,000
" 20-8-1956	" 5,40,000
" 19-9-1956	" 60,000

" 28-3-1957	" 2,00,000
" 27-6-1957	" 3,00,000
	39,10,000

On 5-12-1956 shares of the value of Rs. 25,17,280 were offered and thereagainst the following amounts were allotted and paid-up:

On 8-2-1957	Rs. 1,60,540
" 22-3-1957	" 3,00,050
	4,60,590
	Rs. 98,27,390

The amount remaining unsubscribed from the offer dated 5-12-1956 was Rs. 20,56,690 to which must be added Rs. 10,72,720 shares unsubscribed from issues prior to 31-7-1955 making the total issued but unsubscribed capital at the date of this Prospectus Rs. 31,29,410.

SHARE CERTIFICATES

20. Every member shall be entitled to one certificate for the shares registered in his name, or if the Directors so approved to several certificates, each for one or more of such shares, in terms of the Articles of Association of the Company.

UNDERWRITING

21. The Industrial Credit and Investment Corporation of India Limited, Fort House, 221, Dadabhoi Naoroji Road, Bombay 1, have agreed to underwrite 9,88,688 Ordinary Shares of the nominal value of Rs. 49,43,440. The Directors are of the opinion that the resources of the Underwriters are sufficient to discharge their underwriting obligation.

UNDERWRITING COMMISSION

22. Underwriting commission at the rate of 2½% of the total nominal value of the shares underwritten, viz. Rs. 49,43,440 is payable to The Industrial Credit and Investment Corporation of India Limited, in accordance with the terms of Agreement contained in letter dated 27th July, 1957, from the Underwriters and the Company's acceptance thereof, dated 29th July, 1957.

BROKERAGE

23. Brokerage will be paid by the Company to recognised Brokers and Banks at the rate of 1 per cent

on the nominal value of shares allotted in respect of applications bearing their stamps.

Brokerage on the same basis will be payable to The Industrial Credit and Investment Corporation of India Limited, in addition to the underwriting commission, on allotments in respect of applications made or procured by them provided that the relative forms of applications bear their stamp.

EXPENSES OF THE ISSUE

24. The expenses of the issue, other than brokerage and underwriting commission, are estimated to amount to Rs. 35,000 and will be payable by the Company.

DIRECTORS AND MANAGEMENT

25. (i) The number of Directors shall be not less than 7 or more than 15.

(ii) The qualifications of a Director shall be the holding in his own right of shares of the nominal value of not less than Rs. 5,000.

(iii) Until otherwise determined by the Company's General Meeting, every Director including the Managing Director shall receive out of the funds of the Company by way of remuneration a sum of Rs. 100 for each meeting attended by him, and all travelling and other expenses properly incurred by them in or with a view to the performance of their duties.

(iv) If any Directors, being willing, shall be called upon to perform extra services or to make any special exertion in going or residing away from his home town for any of the purposes of the Company or giving any special attention to the business of the Company or be appointed to discharge the duties of any office under the Company, then the Company may remunerate the Director so going or so giving special attention or being so appointed either by a fixed sum or by a percentage on profits or otherwise as may be decided by the Directors and such remuneration may be either in addition to or in substitution of his share in the remuneration above provided for the Directors.

MANAGING DIRECTOR

26. Mr. A. E. L. Collins is the Managing Director of the Company. He has been appointed under an agreement dated 25-2-1955 as the Managing Director for a period of 5 years from that date. Sanction of the Central Government to his appointment has been obtained.

Subject to the control of the Board of Directors the business of the Company is carried on by the Managing Director.

The remuneration of the Managing Director is a salary of £3,500 per year and an allowance of £1,000 per year or the Rupee equivalent thereof, both payable in monthly instalments, together with such bonus, if any, as the Board of Directors may decide.

BORROWING POWERS

27. The Directors may from time to time at their absolute discretion raise or borrow any sum or sums of money as they may consider necessary for the purposes of the Company from any person, Company or Bank, so that the amount at any one time owing in respect of moneys so borrowed or raised shall not without the further sanction of the General Meeting exceed Rupees 1 crore.

INTEREST OF DIRECTORS

28. Sir Ramaswami Mudaliar, the Chairman of the Company, is also a shareholder in and the Chairman of The Industrial Credit and Investment Corporation of

India Limited, and as such is interested in the underwriting contract between Ashok Leyland Ltd. and The Industrial Credit and Investment Corporation of India Ltd., to which reference has been made.

Sir Henry Spurrier and Mr. D. G. Stokes, Directors of this Company, are also Directors of and Shareholders in Leyland Motors Ltd., and as such are interested in all transactions with that Company.

Mr. I. G. Macintosh, alternate Director of the Company is the Manager of the Madras Branch of Grindlays Bank Ltd., one of the Company's Bankers.

Mr. A. E. L. Collins is the Managing Director of this Company and as such is interested in the remuneration payable to him.

AGREEMENTS OR CONTRACTS

29. The following Contracts or Agreements have been entered into and are or may be material:

- (a) An agreement called the Financial Agreement dated 5th December, 1955, between the Company and Leyland Motors Ltd., Leyland U.K.
- (b) An Agreement called the Manufacturing Agreement dated 5th December, 1955, between the Company and Leyland Motors Ltd., Leyland, U.K.
- (c) An Agreement dated 25th February, 1955, between the Company and Mr. A. E. L. Collins, appointing Mr. Collins as the Managing Director of the Company.
- (d) Letter dated 27th July, 1957, from The Industrial Credit and Investment Corporation of India Ltd., making an offer to underwrite and the Company's acceptance thereof, dated 29th July, 1957.
- (e) Letter dated 20th June, 1957, from the Government of India agreeing to Leyland Motors Ltd.'s subscription of 49 per cent of the Company's capital.
- (f) Letters dated 20th May, 1957, and 28th June, 1957, from Leyland Motors Ltd., agreeing to subscribe 49 per cent of the Company's capital.

DOCUMENTS

30. The following documents can be inspected at the Registered Office of the Company at any time during business hours of a period of 14 days from the date of publication of this Prospectus or until subscription list closes, whichever is earlier.

1. Copy of the 'Memorandum' and 'Articles of Association of the Company.
2. Copies of the Agreements referred to in paragraph above.
3. Copy of Auditors' Report and copies of Balance Sheet and Profit and Loss Accounts upon which the report is based.
4. Original consent orders from the Controller of Capital Issues.

31. Further copies of the Prospectus and the application forms will be available at the said office of the Bankers, from the Brokers to the issue named above, from the Underwriters and from the Company's Registered and City Offices at Madras. Where no allotment is made the deposit will be returned in full and where a partial allotment is made, the unutilised balance will be returned. The Directors reserve the right to refuse any application wholly or in part without assigning any reason. Failure to pay any amount due on the shares allotted when due will render previous pay-

ments liable to forfeiture. The shares when issued will be subject to the Memorandum and Articles of Association of the Company, a copy of which may be inspected during business hours at the Registered Office of the Company and the City Office at Bank of Mysore Buildings, N. S. C. Bose Road, Madras 1. The Share Certificates will be issued within three months of the date of allotment.

Dated this First day of August, 1957.

Economic Report from the U. S.

ECONOMIC DEVELOPMENT

(By GUY SIMS FITCH)

NEW YORK, August 20.—Among American economists and business men the question is now being raised whether the U.S. is entering perhaps a new phase in its economic development. According to those inclined to this belief, the first post-war phase of rapid growth may be coming to an end and what may lie ahead are a few years in which the remarkable gains of the past decade will be consolidated, to be followed by another upsurge in the 1960's. It should be noted that this view does not reflect in any sense a fear of economic decline. Continued growth is still the byword, though possibly at a slower rate.

Those who hold this view point out that the gross national product of the United States — its total output of goods and services — shot up from \$232,000 million in 1947 to \$415,000 million in 1956. If allowance is made for the change in the value of the dollar, the real expansion was a phenomenal 43 per cent. Instrumental in this growth have been such factors as the expansion in the money supply and huge increases in business and personal assets, to say nothing of the spectacular technological progress, as seen in the rapid growth of such industries as electronics, chemicals and atomic energy. Now there is a feeling that the earlier forces may be spending themselves. Money, for instance, is tighter, and the initial burst of expansion in such new consumer industries as television and pharmaceuticals seems to be settling down to a steadier pace.

Thus, technological progress, while continuing, may not be as dramatic or as stimulating as in the early post-war period. The vast sums business men are putting into research and development will be important sustaining factors in the economy, of course. But their full effect may well be felt later, the day after tomorrow rather than tomorrow — that is, when they begin to "pay off" in the form of greatly improved or wholly new consumer and industrial products. Another factor to be considered is the nation's changing population pattern. The relatively low birth rate of the 1930's could lead to a slower rate of household formation and a less expensive market for houses, furnishings and automobiles during the years immediately ahead. By the mid-1960's, however, the higher birth rates of the 1940's and 1950's would begin to work as new, growth-accelerating factors.

These projections seem to be substantiated in a special opinion survey among U.S. business leaders by the noted American magazine, 'Business Week'. The survey indicates that business men, while they anticipate no slowdown in their spending on new plant and equipment in the next few years, are no longer thinking in terms of a break-neck race to expand production. A greater proportion of outlays may be going into improving the efficiency, as against expanding the capacity, or facilities. None of the executives queried

foresees any reversal of the post-war growth trend. Most expect the gross national product to exceed \$500,000 million — in constant prices — by the early 1960's, and then to jump to nearly \$600,000 million a year by 1965. It is significant that virtually the same projection of future trends — a temporary slowing down of the explosive post-war expansion — were offered in a similar survey of business opinion during the 1955-56 upsurge, when the U.S. economy was advancing at a much faster rate than it is now. This would seem to support the soundness of the present estimates.

Company Meeting

THE BHARAT LINE LIMITED

CHAIRMAN'S SPEECH

Speech delivered by Shri C. R. Srinivasan, Chairman of The Bharat Line Limited, at the Eleventh Ordinary General Meeting of Shareholders held on August 17, 1957.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Eleventh Ordinary General Meeting of the Company. The Directors' Report and the audited Balance Sheet and Profit and Loss Account have been in your hands for some time now, I trust I have your permission to take them as read.

These accounts have been prepared in conformity with the provisions of the new Companies Act and that accounts for the somewhat bulky volume placed in your hands. A number of resolutions have to be passed as Special Resolutions following the directions in the new Act. You might remember that in referring to these provisions last year I said that in parts it imposes a vexatious burden on freedom of enterprise. These seem to have registered in the right quarters and Government have now appointed a Committee to go into the question of revision of the Companies Act suitably. The Committee is now going the round of the country collecting data and it may take some time for final proposals to emerge; but I hope that, as a result of this inquest, reforms wherever needed will be forthcoming in adequate measure.

The second Five-Year Plan to recover and recondition the economy of the country was cast, as you are aware, on a more ambitious scale, with the emphasis shifted to the industrial sector. The first year of the second Five-Year Plan has concluded and there are now definite indications that the size of the Plan may well be beyond the resources at our disposal. Fresh taxation measures on a wide front have been introduced and their disturbing effects both among the investors and the business community are clearly discernible; there are many who have begun to wonder whether the gains are not more than offset by the losses. Students of Public Finance will concede that there is a limit beyond which it would be unwise to push the present generation for the benefit of succeeding generations. It is a moot question whether we have reached that stage in the name of rationalisation of the tax-structure. Apart from this, the need of the moment for servicing the second Five-Year Plan, it is relevant to point out, is not so much internal resources as international resources. We have run almost to the end of our accumulated foreign exchange resources and unless ways and means are found to replenish these resources, I am afraid, need will presently arise to rephase the second Five-Year Plan in respect of priorities and preferences *inter se*. Meanwhile, the Private Sector has been advised to seek extended credit facilities for the import of capital goods and it is becoming increasingly clear that foreign exchange releases will be severely rationed and restricted during the next few years. It is against this background that one has to judge the prospects of industrial expansion of the country in the coming years. Throughout the year under report money continued to be tight and in the closing months of the year credit facilities for established businesses were beginning to be rationed. In the share market there was a psychological malaise which cramped and cabinised normal investments with the result that few new floatations ventured on the market. In my view, the time has arrived when concrete and constructive steps should be taken to restore to confidence of the business community and recharge them with faith and hope.

This applies with equal force to the shipping industry. In an expanding economy transport, it is obvious, will prove the bottleneck and therefore every means of transport, whether it is by road, rail or sea, should be tuned and turned to service the economy. The acquisition of new bottoms for sea transport calls for large investments and if funds are available, unless there is sufficient assurance that its economy will be protected in actual working, there will be little temptation to advance and adventure further. Repeated representations, for example, have been made that the prevalent freight rates were uneconomic, but the tardy relief that was doled out in grudging measure was offset by fresh demands from Labour. Now that there is a separate Minister in charge of Transport and Communications, may we hope that he will be fully seized of the picture and take steps to render prompt relief wherever necessary. In addition to the Eastern Shipping Corporation already operating, a Western Shipping Corporation, similarly state-owned, directed and controlled, has been integrated. In this context, it would be wise clearly to define the bounds of the private and the public sectors in the shipping industry. So far as coastal trade is concerned, if private enterprise is to give of its best, it should be enabled substantially to increase its tonnage. This is possible only if Government come to their help and it can be done if sustained efforts are made by the Government to acquire from the Government of the U.S.A. a few of the Moth-Ball "Liberty" Ships on lend-lease terms. As one who has just returned from America and had opportunities to take soundings in this respect, I believe the prospects are good if a proper approach is made.

It is not my intention this year to review in detail the specific problems pertaining to the shipping industry and catalogue our misery. I will only say that conditions at the ports show no signs of improvement. I pointed out in 1955, that the total detention cost due to port congestion during 1954 equalled in value the full time operation of an 8000 D.W.T. ship for a period of 179 days, or nearly six months, for our Company; the 179 days that I referred to had increased to 299 days in 1955 and 398 days in 1956, I agree that in an expanding economy this is bound to happen with the limited resources at our disposal. I wonder, however, if any efforts have been made to survey and service minor ports on our long coastline which, over a long period of neglect, have fallen into disuse. This is a matter of urgency and importance and will repay attention.

The working of the Company and its financial position have been well brought out by the Directors of the Company in their Report in your hands and I trust you will find them satisfactory.

I shall now conclude expressing my thanks for the uniform co-operation I have received from my colleagues on the Board as well as from the Management and I again bear testimony to the good work of the staff both ashore and afloat. I now formally move that the Directors' Report and the audited Balance Sheet and Profit and Loss Account for the year ended December 31, 1956, already duly sent to the Shareholders, be and are hereby adopted.

COMPANY AFFAIRS

THE TEESTA VALLEY TEA COMPANY, LTD.

The working results of the Company for the year ended December 31, 1956, show that it was a favourable year for the industry. The gross profit was Rs. 3,36,224 against last year's Rs. 1,93,802. The sales of tea improved substantially from Rs. 6,97,482 in 1955 to Rs. 10,68,099 during the year under review. Provision for taxation was made to the extent of Rs. 1,00,284 and that for depreciation, Rs. 45,085. After these adjustments and including the balance brought forward from 1955, a total of Rs. 2,54,831 was available for distribution. An interim dividend of 10 per cent was paid on June 25, 1957, absorbing Rs. 32,000. Final dividend of 15 per cent, making a total of 25 per cent during the year, has been proposed to be distributed absorbing an amount of Rs. 48,000. A sum of Rs. 1,00,000 has been allocated to Renewals and Additions Reserve and Rs. 20,000 to Staff Reserve and an amount of Rs. 54,831 has been proposed to be carried forward to 1957.

The Company has to undertake Renovation of factory building with improvement of withering accommodation, and has to provide for adequate water supply.

THE GIELLA TEA COMPANY LTD.

In spite of the unfavourable circumstances stated below, during the year ended December 31, 1956, the Company converted the net loss of Rs. 62,815 during 1955 into a gross profit of Rs. 70,718 during the year under review. Whether generally was seasonable but pruned areas were severely attacked by red spider early in the year and from the end of August blight was general and as a result a total crop of 2,28,183 lbs of tea was made against an estimate of 2,64,000 lbs. The net average sale price per lb of tea was Rs. 3.01 against Rs. 2.11 during the previous year, therefore the sale proceeds were Rs. 6,30,961 against Rs. 3,64,448 during 1955.

Out of the year's gross profit of Rs. 70,718, Rs. 32,273 have been provided for depreciation and replacement assets. After allowing for the other adjustments there is a net profit of Rs. 20,043 and a final debit balance on this account of Rs. 5,922 is carried forward to 1957.

Having regard to the financial circumstances of the Company the Managing Agents have offered to forgo one half of their agency remuneration, which has been accepted.

THE CHEMBRA PEAK ESTATES LTD.

The year ended March 31, 1957 has turned out to be the most favourable one for the Chembra Peak Estates Ltd. The distinguishing features of its results for the year under review are: a record production of both tea and coffee and a substantial improvement in earnings. The gross profit for the year at Rs. 9.39 lakhs, which constitutes a record in the Company's history, is more than double that earned in the previous year at Rs. 4.35 lakhs. The net profit, after providing for Managing Agents' commission and depreciation and after substantially raising the allocation for taxation from Rs. 1.13 lakhs to Rs. 4 lakhs, also stands appreciably higher at Rs. 4.17 lakhs, as compared with Rs. 1.87 lakhs for the previous year.

In view of the encouraging results, the Directors have raised the dividend to shareholders from 10 per cent to 20 per cent, thereby restoring the cut in dividend made last year. Likewise, the allocation to the general reserve also has been raised to Rs. 2 lakhs from Rs. 1.50 lakhs a year ago, though it still falls short of the provision made from the profit for 1954-55 by Rs. 50,000.

THE FORT WILLIAM JUTE CO. LTD.

The profit and loss account of the company for the year ended March 31, 1957 shows a net profit of Rs. 5,71,100 after providing Rs. 3,98,071 for depreciation. To this has been added an amount of Rs. 1,34,822 brought forward from the previous year. An interim dividend paid on 10,000, 7% Cumulative Preference shares at the rate of Rs. 3.50 per share without any deduction for income tax payable by the company has absorbed Rs. 35,000, leaving a balance of Rs. 6,70,922. A sum of Rs. 1,50,000 has been proposed to be transferred to the General Reserve. The payment of dividend on 2,10,000 Ordinary shares of Rs. 10 each at the rate of Rs. 1.50 per share for the year ended March 31, 1957, without any deduction for income tax payable by the company has absorbed another sum of Rs. 3,15,000. The company has decided to carry forward Rs. 1,70,922 to next year.

In accordance with the main and supplementary Working Time Agreement of the Indian Jute Mills Association, the mills worked 48 hours per week with 5% of the total looms sealed up to July 15, 1956. But in view of the highly unsatisfactory stock position an additional 2½% of the total looms were sealed with effect from July 16, 1956 and a further 5% from September 17, 1956.

INDIAN OXYGEN is playing

a vital role in building a more powerful and self-sufficient India in the Second Five-Year Plan.

From transport to electric power, from the steel works to the oil refinery—every day our technical service is keeping the nation up-to-date with the most modern methods of metal fabrication.

COMMODITY NEWS AND NOTES

PRODUCTION AND EXPORT OF COFFEE

Shri Morarji Desai, Minister for Commerce and Industry, revealed in the Rajya Sabha in a written reply to a question by Shri M. Valiulla that the estimated production of coffee during 1956-57 crop year (from July to June) was 41,565 tons. Out of this, 15,150 tons of coffee had so far been allocated for export. The preliminary estimate for the 1957-58 crop was 35,750 tons. The Deputy Minister for Commerce and Industry, Shri Satish Chandra, replying to another question by the same Member said that out of the 1956-57 crop, 725 tons of coffee had been sold to the Soviet Union through the State Trading Corporation. A sizeable quantity had been earmarked for export to specified countries. Shri Satish Chandra said that there was an unsold stock of coffee in the Coffee Board's accounts at present. Asked whether the cost of production had gone up, he said, the cost was likely to have gone up owing to the recent increase in wages, liability on the industry to contribute to the Employees' Provident Fund and implementation of the provisions of the Plantation Labour Act. The exact quantum of increase was, however, not known.

SECOND ESTIMATE OF POTATOES FOR 1956-57

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of potatoes for 1956-57, plus that year's area and production at 691,000 acres and 1,599,000 tons, as against the corresponding adjusted estimates of 667,000 acres and 1,649,000 tons for 1955-56. This shows an increase of 24,000 acres or 3.6 per cent in area and a decrease of 50,000 tons or 3.0 per cent in production over 1955-56.

The increase in area during the current year has been shared by almost all the major potato growing States, except Uttar Pradesh and Himachal Pradesh. This increase is particularly marked in the case of Bihar and Bombay States and has been attributed to favourable climatic conditions at the time of sowing. Despite increase in acreage, the production during the current year has declined. The decrease in production has been shared mainly by Uttar Pradesh, West Bengal and Assam and has been attributed to unfavourable weather conditions during the growing period. This decrease has, however, been offset to some extent by increases reported mainly by Bihar, Bombay and Punjab States. This estimate gives information up to the end of May 1957. In this estimate, acreage data relates to both winter and summer crops, while production data are given only in respect of winter potato. Production data for summer crops will become available at the final estimate stage only. Past experience has shown that the area at the final estimate stage is slightly higher than those given in the second estimate.

ISI CERTIFICATION MARK FOR CEMENT

The Indian Standards Institution has recently granted a licence for the use of its Certification Mark for portland cement to the India Cements Ltd., Sankarnagar, Talaiyutha, District Tirunelveli. The Certification Mark, consisting of the monogram of the Indian Standards Institution and number designation of Indian standard being inscribed in the top side of the monogram, will be applied to gunny bags in which cement manufactured by the firm is to be packed. The Certification Mark will certify that contents of the bag satisfy all the requirements given in IS: 269-1951 Indian standard specification for ordinary, rapid hardening and low heat portland cement. The use of the Certification Mark for cement is a great step taken by the Institution in making available to the common consumer goods of standard quality. If there is any complaint regarding quality of cement packed

in a bag bearing the ISI Certification Mark, it may be brought to the notice of the licensee as well as the Institution, 19 University Road, Delhi.

IMPORT OF EGYPTIAN COTTON

The Government of India have decided to permit the import, with immediate effect, of a further quantity of 10,000 bales of Egyptian cotton of staple length over 1-3.16" against the special payments procedure. The licensing of this quantity and other procedural details will be the same as for the earlier quantities of Egyptian cotton already permitted for import against the special payments procedure.

COPPER REQUIREMENTS

The total quantity of copper required for the country's use during the Second Five Year Plan was estimated at 1,90,000 tons, said Shri K. D. Malaviya, Union Minister for Mines and Oil, in reply to a question by Shri B. S. Murthy in the Lok Sabha. The total quantity available from indigenous sources during the Second Five Year Plan was estimated at 37,500 tons, added the Minister.

TRENDS IN COFFEE PRODUCTION

The actual receipts of the 1956-57 coffee crop into the pool amounted to 41,200 tons, against the estimated 42,000 tons, according to a Coffee Board release.

The preliminary estimate of the 1957-58 crop still stands at 35,750 tons. A total of 2,149 tons was released in July in the internal market, bringing the total offtake till the end of last month to 14,737 tons against 13,718 tons released during the same period last year.

The price for coffee has been steady for the past three years. The average pool sale price for Plantation A in 1955 was Rs. 217.31, in 1956, Rs. 213.44 for the period January to July this year Rs. 219.15, all per cwt. ex-works and ex-bags.

Prices have, however, shown a tendency to rise since June this year.

COPRA EXPORTS FROM MALAYA

Heavy buying from India was the chief reason for a four-fold increase in Malaya's copra exports in the first six months of this year, compared with the same period last year.

This was the first time in three years that Malaya had experienced a marked increase in its copra exports. Exports in the first half of this year totalled 47,564 tons—of which India bought 44,170 tons. Smaller quantities went to Pakistan, Burma, Thailand, Poland, Japan and other countries.

EXPORT OF NIGERSEED AND KARDISEED OILS

The Government of India announced that, as a measure of export promotion, evidence of valid firm sale contract in any form in common usage in lieu of cable offer and acceptance will be accepted in regard to export of nigerseed oil and kardiseed oil for the period of July-December, 1957.

The Government, on July 5, released quotas of 5,000 tons each of kardiseed oil and nigerseed oil for export. The announcement had said that these quotas would be licensed freely by all shippers on shipping bills, supported by evidence of valid firm sale contract up to the end of December, 1957, or till the ceiling was reached, whichever was earlier.

COAL PRODUCTION

Coal raisings and dispatches from all fields in India recorded a decline during June this year. Production fell to 3,330,400 tons from 3,794,092 tons in May this year. Dispatches declined from 3,187,466 tons to 2,915,343 tons. Stocks of coal at pit-heads were estimated at 3,252,383 tons at the end of June this year.

Rephrasing the Plan

THE Lok Sabha debate on the Finance Ministry's demands for grants marked the climax in this year's protracted series of searching surveys of the working of the various Ministries. It was assumed that the climax would be reached in this debate since no problem had exercised the mind of people in recent months so much as the critical problem of foreign exchange. The climax was noteworthy because it vindicated the capacity of the Government to take a hard decision on a matter on which it had set its heart. In a sober and well reasoned speech in reply to the debate, Mr. Krishnamachari made it clear that the Plan

could not be carried out in its entirety. The resources position in general and the drain on the foreign exchange resources in particular had dictated the necessity for a re-examination of the size and a rephrasing of the programmes in the Plan.

The Finance Minister announced in no equivocal terms that some amount of pruning of the Plan had become imperative. What is important as a re-statement of policy, he informed the House that the Planning Commission was now seized of this matter. That and no other

was the real implication of re-ordering the priorities in the Plan. In cold logic this may appear to be an obvious decision to take. But it had a political content too. For this reason, it cannot be denied that the decision represented an act of robust realism and great courage on the part of the Government. Now that mental reservations regarding the Plan have been removed the Government and the people can proceed with a determination not to spare any labour until at least the core of the Plan and a few top priority projects are pushed through. How much of the Plan outside these categories can be implemented will be clear possibly after a couple of years or so, as the picture of the availability of foreign exchange becomes clear.

The goal in the short run, very likely until the end of the third year of the Plan, is being set. Great caution will naturally be dictated in the allocation of foreign exchange. This over-riding necessity will make it incumbent to confine the allocations to projects of the highest priority. First in the order come the projects which constitute the core of the Plan and without which the base of the Plan cannot be built—steel, minerals, power and transport. Fulfilment of the core of the Plan has become an article of faith with us now—the irreducible minimum. Over and above this minimum, two types of projects can be taken in hand without adding to the severity of the strain on foreign exchange. Programmes which have been carried to an advanced stage of execution and require but a fraction of their total import component to be procured still form the first type, while projects whose import requirements have been covered by accommodation in the nature of deferred payments and which have a potential to earn foreign exchange or to effect economy in it constitute the second type. The whole range of the residual schemes and programmes in the Plan is being scrutinised by the Planning Commission for their order of essentiality and magnitude of import content. This is the real task of rephasing the Plan in which the Planning Commission is engaged for some time past. The preliminary programme of rephasing which it has prepared is in the process of taking final shape.

It was inevitable that the emergence of the foreign exchange crisis should provoke a sharp controversy in the House. The gravity of the situation in this respect cannot be minimised, nor has any attempt ever been made to under-rate it. During the first sixteen months of the second Plan, the net withdrawals from the foreign reserves have worked at a monthly average rate of Rs. 28 crores. It is clear that the Opposition missed the crucial point in the debate on the crisis of the import surplus. The facts marshalled by the Finance Minister demonstrate that his stewardship of the Commerce portfolio was marked by an imaginative and forward-looking policy of developmental imports which have put considerable vigour in the economy. The Opposition was on weak ground when it tried to make out a case that import policy over the years was muddled through. The crisis emerged in the first year of the present Plan and not before—steel and capital goods being obviously at the bottom of it. Nor can one accept the Reserve Bank's theory to explain away the import surplus in the first year in terms of the annual average over the Plan period in the face of the obvious fact that imports in the first year exceeded the planned peak in the third year by not less than Rs. 86 crores. The

error of policy seems to have lain in planning for bold imports without planning concurrently, or more correctly, in advance, to cover the anticipated shortfall in foreign exchange. Mistakes of judgment are bound to occur, but what really matters is a determination to prevent their recurrence. The Finance Minister's concluding assurance in his reply to the effect that Government would act with realism in future commitments on the Plan is heartening indeed.

It must be conceded that at least a part of this heavy deficit was due to factors which could not be anticipated. Price inflation has always proved to be elusive for planners, while some of the provisions of outlay in the Plan turned to be gross underestimates. Freakish monsoons forced diversion of resources for food imports, while an unpredictable source of additional import was expenditure on defence. It is somewhat intriguing to be told, in the face of import control and licensing of expansion or new plants, that private investment exceeded the Plan estimates. Nevertheless, this is expected to yield early fruit and mitigate the pressure on foreign exchange. The lesson of vigilance has now gone home and corrective action has been taken in clamping stringent control on foreign exchange. Imports have been cut drastically—in fact a practical squeeze has been applied during the current quarter. Export promotion which has always been a long-term proposition is being stimulated from time to time. In both the cases home supplies are strained and they go to aggravate the pressure on prices.

A large gap in the foreign exchange resources is implicit in a plan which aims at building basic resources of an import-intensive character. It is implicit in the dimensions of the gap that it should be filled essentially by external sources. The core of the Plan and the fringe covering specific programmes of high priority can hardly be implemented without foreign assistance. Once it is recognized that this is the instrument which we have to employ to fulfil the minimum programme there must be a proper realisation of the implications involved in its procurement. Load assistance at government-to-government level has a restricted scope for operation and our choice is narrowed down by pressures in the balance of payments on most of our friendly countries. It is pertinent to remember that the only country which can offer help in a substantial measure—the United States—will very probably slash its foreign aid programme in the current fiscal year.

Private capital, however, will continue to remain the major potential source of massive contribution. It can be induced only by normal incentives—attractive economic climate, a reasonable rate of return, rational burden of taxation, liberal treatment of private enterprise, and the like. The adequacy of these incentives will, of course, be judged by the foreign investor. Are we providing these incentives in a full measure as several other countries are doing or do our policies fall short of these functions? This is the crucial problem to which the Government ought to address itself. Having addressed itself to this problem, it will need to make up its mind as to the positive directions in which adjustments will be required in our economic policies to stimulate the flow of financial resources from abroad if only to ensure that the minimum programme of development is carried out successfully.

The Problem of Rice Prices

THE Asoka Mehta Committee on Food is just touring the country and taking evidence on a 22-point questionnaire of which as many as 15 questions are concerned directly with prices and marketed surplus of food grains. It is, indeed, an intriguing situation that faces the Committee—a situation (as of 1956-57) in which population has increased by 9 per cent, rice production by 21 per cent, rice supply (production plus import) by 19 per cent, and rice price by 37 per cent over 1949-50. This spectacular rise in the price of rice (which accounts for nearly 60 per cent of the total production of staple food grains, namely, rice, wheat, jowar and bajra) when the rate of population increase has not outstripped the rate of increase in production, needs to be explained. Incidentally, the price of wheat has increased only by 3.5 per cent over 1949-50 while the price of jowar has decreased by 13 per cent since that year. The Committee's probe into this intriguing phenomenon may be watched with interest.

At the moment, however, the behaviour of prices in different States is of more than academic interest. It is found that the average price of rice in the beginning of August 1956 ranged from Rs. 15.5/- per maund in Mysore to Rs. 21.8/- per maund in Assam; at the end of July 1957 it ranged from Rs. 16.3 in Orissa to Rs. 24/- in Punjab. Only in three States has the price slightly declined; in Madras it has come down from Rs. 19.3 to Rs. 18.6, in Orissa from Rs. 17.7 to Rs. 16.3 and in Kerala from Rs. 19.11 to Rs. 18.4/- . In the other States—Andhra, Assam, Bihar, Bombay, Madhya Pradesh, Punjab, Uttar Pradesh, West Bengal and Mysore—the percentage price increases have been 13, 5, 21, 23, 21, 26, 16 and 29 respectively.

As for wheat, its average price ranged from Rs. 14.11 per maund at the beginning of August 1956 in Uttar Pradesh to Rs. 17 per maund in West Bengal; at the end of July 1957 it ranged from Rs. 13.9 in Madhya Pradesh to Rs. 19.5 in Bombay. In at least three States its price has declined during the period; in Madhya Pradesh from Rs. 15.4 to Rs. 13.9, in Punjab from Rs. 15.9 to Rs. 15.2 and in Rajasthan from Rs. 16/- to Rs. 14.10. The percentage price increases in other States—Bombay, Uttar Pradesh, West Bengal and Delhi—have been 26, 7, 4 and 3 respectively.

It may be seen from these figures that the problem of food grain prices is one predominantly of rice prices. The reasonable behaviour of wheat prices in the last one year should have been due to the sale of American wheat received under the P.L. 480 Agreement. If a similar restraint on the upward trend of rice prices has not operated, it should have been due to the fact that only a small quantity of rice (200,000 tons) could be had during the year under the said agreement. As even a second P.L. 480 Agreement which is under negotiation may not provide this country with a quantity of rice sufficiently large to bring down its prices significantly, the question arises as to how they could be brought down without sizable imports from other sources involving current payment (besides the 5 or 6 lakh tons to be got from Burma in the period 1957-60 in return for credit advances made by India) and without procurement and control of prices and distribution. As far as wheat is concerned, this question will

not arise so long as P.L. 480 wheat under the current and the prospective agreement is available to restrain its prices.

It is thus clear that rice supplies in the monetised sector are far more scarce in relation to demand than wheat supplies are. The shortage may only be marginal; a statistical guess (pending estimate by the Asoka Mehta Committee) can be hazarded that it may not be more than two million tons. But its effects in terms of prices are disproportionately unfavourable to the consumer and distinctly more favourable to the rice-producer than the supply-price-demand relationship in the case of wheat is to the wheat producer. Incidentally, if the wheat producer were to demand better money returns for his crop it would not be surprising. If he is not to make any such demand, the Asoka Mehta committee should assemble conclusive statistical evidence to reject the persistent demand in rice-producing areas for an 'economic' price for paddy—a demand calculated to conceal the fact that its price has been much more than economic all these years. Surely, if the present wheat prices are deemed economic for the wheat-producer, the present rice prices must be deemed more than economic for the rice producer for there is no reason to believe that the costs of rice cultivation have increased to a greater extent than those of wheat cultivation.

To revert to the problem of rice shortage. The Asoka Mehta Committee itself anticipates continuing scarcity where it asks the question: "Having regard to the long-term prospect of shortage of rice, would you suggest any steps being taken by way of propaganda or otherwise to promote the larger consumption of wheat in rice consuming areas?" The long-term solution clearly lies in persuading habitual rice-eaters to convert one of their two or three daily meals into a chapati meal which is any day more substantial and nourishing than their usual rice diet. In the same way the long-term (or medium-term) solution lies in bringing about a sizable increase in rice production. But it is with the immediate or short-term problem of unreasonable rice prices that the planners and consumers alike are most concerned for obvious reasons.

The need of the hour is to bring down rice prices to a reasonable level; this can be done only by making more supplies available in the market. The present attempt to bring down the high level of bank advances against food grains may have the effect of releasing some stocks although there can hardly be any doubt that it will curtail the quantum of *bona fide* credit required by a section of agriculturists from whom the traders and millers cannot be separated. A better alternative than this—better also than procurement and rationing—would be to freeze forthwith rice stocks in the hands of big traders, rice-millers and substantial producers, to requisition them at their purchase prices plus transport and/or milling costs, as the case may be, in the case of traders and millers and at the same prices in the case of big producers, with a 5 per cent profit margin in all the three cases, and to regulate their releases to fair price shops, co-operative sales societies and departmental depots catering to postal, railway and other government employees. At what prices these requisitioned supplies are to be sold is also of no mean importance. It is here that the Rs. 25-crore food subsidy fund can be effectively brought into play.

Subversion in Syria

IT is a pity that a minor incident in Oman should have obscured a major development in Syria, threatening as it does to cast its shadow over the entire Middle East. Not only the Commander-in-chief and nine other senior army officers of that country have been dismissed, but it appears that all those suspected of "rightist" tendencies or critical of the pro-Soviet orientation of Syria's policy have been purged. A large number of even junior officers have not been spared—they, too, have been put behind bars. Colonel Abdul Hamid Serraj, Director of the Military Intelligence Bureau and his friends, and not the general staff, now control the Syrian army and the Government. The new Chief of Staff, General Afif El Bizri, while vehemently denying that the Syrian Government is subservient to the country's army, has had no hesitation in formulating and stating government policy. Moreover, it would be wrong to forget what the Syrian Defence Minister, after signing an agreement for further deliveries of Soviet arms, said recently at Moscow. "Our army will be on the side of the Soviet armies", he declared, "whenever the need for the defence of peace and freedom in the world arises". As if to emphasize the anti-Western stance of the regime, the Syrian Government has accused America of trying "to destroy the independence of the Middle East countries and to give them piecemeal to Zionism and imperialism". It has instructed its representative at the United Nations to draw the attention of the Security Council to "the conspiracy plotted by the United States Embassy in Damascus against the present Syrian regime". Washington has, of course, promptly declared the Syrian charge as "obviously frivolous" and Syria's Ambassador to the United States and another official as *personae non gratae*.

It is perhaps necessary to receive Syria's latest version of the United States intrigue with something more than the traditional pinch of salt. It is obviously a smoke-screen behind which the pro-Communist group is trying to build up its power. It is perhaps the consciousness that their complaint is weak and would not stand the scrutiny of the Security Council that Syria has had to content itself by merely drawing the Council's "attention to the matter". Probably the same consideration has led it to make the complaint unilaterally. It has obviously found it inexpedient to consult fellow Arabs. The Arab League has had nothing to do with this queer complaint.

The pattern of what is happening in Syria is an old one. First economic and military aid; then penetration into the country with their agents in key positions; and finally entronement of their "own men". In a decade since World War II, one East European nation after another became mere outposts of the Soviet Empire through this process. Some observers are sceptic of this. According to them Syria's geographic distance from the Russian soil automatically saves it from eventually becoming a Soviet colony. But what these well-meaning sceptics ignore is the fact that in the era of atomic stalemate, the ingenious Russian rulers have forged new weapons for expansion through so-called economic and military aid. They have concentrated for some time past their attention on Syria, occupying as it does a strategic position both geographically and politically, in the Middle East. Its proximity to the Suez Canal and virtual control of the oil pipeline from Iraq that passes through it are vital factors. Moreover, as a cen-

tre of influence in the Middle East and as potential threat, Syria is obviously equivalent to the American Sixth Fleet in the Mediterranean: a base there would permit Moscow to leapfrog the northern tier of Western defences.

Doubtless, the developments in Syria have once again demonstrated that world-wide Communist infiltration is not over and that the much-bruited peaceful co-existence and competition by Moscow is in effect an accessory to it. It cannot, however, be denied that the Syrian coup is another feather in the cap of Russia's Middle East strategists. They have been able to win it because they have skilfully reconciled the pursuit of their own interests in the region with a pose of altruism. Their attitude has so impressed the Syrian leaders, including some of the nationalists, that they have begun to repose blind faith in their *bona fides*. They are apparently oblivious of the fact that the course on which they have embarked contains no safeguards against future Soviet intervention such as the one witnessed by the world in Hungary.

As against these Russian skilful manoeuvres, the free world has failed to evolve a positive common policy. In fact by its shortsighted policies, both political and economic, it has unwittingly strengthened the hands of the leftist elements in Syria. The Anglo-French misadventure and the virtual economic blockade of Syria by the United States have been used by the Syrian leftists and anti-West nationalists as arguments in favour of seeking help from and closer relations with Russia. As against that this month a further instalment of assistance was negotiated at Moscow, amounting to 300 million dollars in goods, services and credits. Similarly, the free world has failed to counter Russia's political moves in the area. Doubtless, under the Eisenhower doctrine, the American President has authority to come to the aid of any State in the Middle East requesting assistance against Communist aggression. But he cannot deal with piecemeal subversion on the present Syrian pattern.

Thus, current developments in Syria have caught the free world and the United States on the horns of a dilemma. They know that Syria is rapidly moving into the Soviet orbit, but they cannot take effective measures to prevent that denouncement. They cannot take any such measure because these might only boomerang on Western interests in the Middle East. The only possible course is to alert the Middle East nations to the grave implications of the Russian success in Syria. This may cause Syria to be ostracised by the other Arab nations. Isolated from them, the Syrian leftists will no doubt try to move closer to Russia. But their open collusion with the athiestic Russian regime may not be tolerated by the deeply religious-minded Arabs. Already anti-Communist Middle Eastern leaders are beginning to close their ranks in opposition to the pro-Soviet moves in Syria. That is why Syria's neighbours, in particular Turkey, Iraq, Jordan, and the Lebanon are consulting on the ways and means of establishing a *cordon sanitaire* around this potential Communist infection. Moreover, the United Nations' debate on the report of its Special Committee on Hungary may serve as a striking reminder of what happens to one in the bear's embrace.

An operator does not toss a coin to decide which vehicle to buy.

He wants his vehicle to be sturdy and economical, with a long, trouble-free life.

So he buys a —

THE WEEK'S NOTES

INDIA AND HUNGARY

THE REPORT of the United Nations Special Committee on Hungary will be placed before the General Assembly on September 10. There is nothing extraordinary about this. It is the normal procedure: a committee appointed by the United Nations should report to it and the United Nations should discuss it. India's attitude to the discussions, judging from newspaper reports, raises some interesting points. According to the reports, it will not be "interested" in a proposition which seeks to condemn Russia and the present Hungarian regime. Such a denunciatory resolution, the India Government feels, will not help improve the situation in Hungary. It will, on the other hand, serve only to maintain the cold war tension, without bringing any relief to the Hungarian people.

This attitude smacks of double standards. India has always been indignant about the Anglo-French aggression in Egypt and the wrongs done by these two "imperialist" nations in their colonies. These wrongs are many and to be condemned. But similar — indeed, much greater in degree — are the wrongs that Russia has committed in Hungary. The Hungarian turmoil in October last was a people's movement against poverty and foreign occupation. The revolution was stifled. Vast areas of Hungary and its beautiful cities were battered, bludgeoned, smashed and bled into submission. Hungry, sleepless, hopeless, the freedom fighters battled with pitifully feeble equipment against the crushing weight of superior Soviet arms; and they fought alone, cut off from the world. Since then, Russia has crushed all rights and all liberties in unhappy Hungary, and has been trying to bury the revolution in rubble and lies. But the troops who have smothered the revolution, and the Government they have installed, are sitting on the verge of a volcano of hatred and resentment — a volcano that is ready to erupt. It is, however, difficult to say how long the present regime, representative of Russian imperialism and powerless to act on its own, will last.

The Russian aggression provoked the indignation of the entire world. In fact, in the history of the world no other nation's fight for freedom excited greater sympathy than that of the Hungarians. It is, therefore, unfortunate that India apparently should indulge in legal and political niceties, oblivious to a nation's agony and grief, rather than come boldly into the open and demand the end of Russian aggression in Hungary. This policy does not seem to be based on the dictates of conscience and common humanity, but on opportunism and partisanship. This time, India cannot have even the excuse of being ignorant of the facts of the case. It has before it now the report of the United Nations' Special Committee on Hungary. If there is any defect in the report, the blame for it lies with Mr. Janos Kadar's Government, which obstructed the Committee from getting at the truth. The attitude of India — as of any other Afro-Asian country — will make known once for all to the free world whether its policy of neutralism does or does not flow from sincere conviction. Let not India lose the opportunity to speak out.

NAGAS' HAND OF FRIENDSHIP

2,000 delegates from the various tribes of the Naga Hills and Tuensang, which recently met at Kohima, offered its hand of friendship to the Government of India. It appealed to the Govern-

ment to constitute a single administrative unit of the present Naga Hills District of Assam and Tuensang Frontier Division of the North Eastern Frontier Agency, under the aegis of the Ministry of External Affairs, for the creation of conditions necessary for a political settlement. The Convention even went so far as to postpone the question of "retransferring of forests immediately" to the proposed administrative unit to "the time of entering into negotiations for a political settlement". To achieve such a settlement, the Convention urged the Government to grant general amnesty to enable its delegates to hold "free, frank and full discussions" with those of their brethren who have taken to violence.

The fact that the delegates did not reiterate the demand for an independent, sovereign State of Nagaland is significant. It is an earnest of their desire to end the deadlock between the followers of Mr. A. Z. Phizo and the not very farseeing bureaucrats of the Government of India. Three reasons make the sincerity of their overture unquestionable: first, they held the Convention despite the threats of the Naga extremists. That the threats were real is obvious from the strong shots fired at the delegates, two of whom were seriously injured. Secondly, they appealed to their "fellow-tribesmen in arms to give up the cult of violence" which had brought them to the "brink of a total disaster". And, thirdly, they have, on their part, pledged to work actively to end "hostilities" and to try by all means in their power "to heal the old wounds" and "work for the good of our land and the free development of our people according to our own traditions".

The failure of the repressive policy of the Government of India has frequently been noticed in these columns. The failure has made this country's north-eastern frontier vulnerable to possible Chinese infiltration and subversion. It has helped to make Chinese Communism appear a real alternative to the Nagas and other tribesmen in the region. The effect of this could be disastrous for the entire country. The anti-Indian feeling that has been unwittingly helped to grow in NEFA will perhaps take a whole generation to be forgotten. The pity is that this feeling is not unfounded. Even the secretary of the reception committee of the Convention, Mr. Jaskie, was constrained to state publicly that "our homes have been disrupted, and some of our children are living as criminals in jungles and the rest are made to live in disgrace. Cultivation has suffered and a large number of people have died of disease". In view of the olive branch offered by a representative gathering of Nagas, and in view of their "long tale of misery, suffering and death", it would be wise on the part of the Government of India to accept its demands unequivocally and forthwith. Dilly-dallying will only precipitate matters and may well lead to permanent estrangement.

EMERGENT MALAYA

BRITAIN'S LAST major dependency in Asia, Malaya, will be independent on August 31. The Malayan Federation will be an independent State within the Commonwealth, but will be neither a Dominion nor a Republic. It will have its own constitutional monarch. Malaya's inclusion will mean that the number of White and non-White members in the Commonwealth will be equal — five each. The new State will comprise the nine princely States of Johore, Kedah, Kelantan, Negri Sembilan, Pahang, Perak, Perlis, Selangor and Treng-

ganu and the two Strait Settlements of Malacca and Penang.

Like all newly liberated countries Malaya will have its teething troubles. The first problem confronting it will be the position of Chinese settlers, who number over 2,216,105 in the new set-up. Recent Far Eastern history teaches that the loyalty of Chinese settlers is not limited to the country of their residence; it is emotional and transcends national boundaries. The Reid Commission did well, therefore, to ensure liberal grant of citizenship and franchise to allay the fears of the settlers, who are prone to look to Communist China for help and inspiration. But the problem of internal subversion has by no means been dealt with. The Communists, mostly Chinese, are already active and on the path of insurrection; the flexible loyalty of these settlers makes the problem more grave. Moreover, like all underdeveloped countries, Malaya, too lacks capital, skilled labour and technical know-how. For foreign co-operation in these essential resources of development, it must adopt appropriate policies.

Malaya's independence is the latest step in the astonishing evolution which is transforming the British colonial empire into a partnership of equal nations. On the other hand, Russia, while vehemently attacking Britain for "colonialism" and "imperialism" has added to and perfected the old colonial ways. The Russian empire is in our time at its zenith. It has not only kept in chains the Asian territories conquered by the Tsars, but has also subjugated East European nations. The irony is that its slogans are able to captivate so many even after repeated exposures of its barbaric exploitation of peoples. In spite of its professions of liberty, equality and fraternity, it has yet to show the world its Nehru, Bandaranaike, Suhrawardy, Nkrumah and Tengku Abdul Rahman.

RAW SILK PRICES AND S.T.C.

AT THE last meeting of the Technical Development Committee of the Central Silk Board held in Srinagar, towards the end of June last, the standing Committee is reported to have accorded its approval to a scheme for the fixation of floor and ceiling prices for indigenous raw silk with a view to stabilising the price trend in the Indian silk market. The June Newsletter of the Central Silk Board (C.S.B.) expatiates at length on the significance of the scheme. The scheme is no doubt important, inasmuch as it seeks to help primary producers of silk, cocoon rearers, silk reelers and silk weavers and promote quality production, but one hopes, in the light of the country's experience with cotton in the light of the country's experience with cotton ceilings and floors, that the ceilings and the floors fixed by the C.S.B. will, in fact, be "effective" ceilings and floors and not tend to become "notional" ceilings and floors as might suit the convenience of the Board.

Hitherto, the efforts of the Board were confined to distribution of imported silk. It has been claimed that, since the C.S.B. took over the distribution of imported raw silk early in 1955, the silkworm rearers and others in the industry have had less cause for worry on the score of supplies. At the same time, it is pointed out, in justifying the introduction of the scheme for ceilings and floors, that, however effective the control over the imported silk may be, "it is obvious that a rise in the price of raw silk (indigenous filature and 'charks') cannot be checked at times of severe short-fall in the supply of imported raw silk". This, naturally, raises the question of the efficiency of the agency entrusted with the import of raw silk into this country. It is common knowledge that this work is now being handled by the State Trading Corporation of India (Private) Ltd. The total quantity of raw silk

actually received by the S.T.C. during the year 1956-57, that is, July 1956 to June, 1957, comprising the two licensing periods July-December, 1956 and January-June, 1957, according to the C.S.B. Newsletter itself, was only 1,39,161 lbs. out of 2,33,067 lbs. contracted for by that body. So, after the S.T.C. took over the responsibility for importing raw silk, the chances of a short-fall in supplies of imported raw silk must have increased materially. If so, the decision to have a scheme of ceilings and floors for raw silk prices gains additional significance. For the Board has to contend with yet another uncertain factor, namely the import performance of the S.T.C.!

HEALTHY TRADE UNIONISM

THE ADVICE given by the Labour Minister in his reply to the debate on his Ministry's demands that trade unions should disassociate themselves from political parties need be increasingly followed by those having interests of labour at heart. There will continue to be distrust of the intention of the party in power and complaints of favouritism towards the I.N.T.U.C. which is gifted with its blessings so long as the above principle is not observed. It is hardly surprising that no less a man than the leader of the Communist group in the Lok Sabha levelled a charge against the Government of discrimination between different trade unions in recognition and representation on committees. Quite naturally the union alleged to be discriminated against is the Communist Party controlled All-India Trade Union Congress, and the one favoured is the Indian National Trade Union Congress. The Labour Minister was able to refute the charge by satisfactory evidence. As pointed out by the Minister the All-India Trade Union Congress had a higher percentage of cases sent up for adjudications during 1954-55 and 1955-56. In the matter of representation in sub-committees of the conference, the Labour Minister reiterated that the official policy as it has emerged is the fruit of the collective effort of all the trade union organisations. He referred to the labour policy of the government as truly national. If at all there is a cause of grievance regarding representation in certain sub-committees, it may be pointed out that the representation at any time might be in proportion to the strength in members of different trade unions. The INTUC has the largest membership of industrial workers. Its membership is three times that of A-ITUC and a little less than double of both Hind Mazdoor Sabha and A-ITUC. It is for the A-ITUC to ponder and convince itself why it could not enlist the support of workers.

The discussion, however, raises a fundamental question of policy in trade union organization; control and direction of trade unions by outside leadership. The dangers attended with such association cannot be overemphasized. In the interest of healthy growth of trade unionism and to avoid rivalries such an alliance should strongly be discouraged. It is only then that trade unions will be able to run on genuine trade union principles. In India, leaders of the trade unions are mostly found from outsiders. They are professionals and party workers. Without underrating their role in the organisation of labour it must be urged that workers themselves should be encouraged to run their own unions. It need not be denied that outside leadership has a definite function to perform in the development of trade unionism in this country in its present stage of growth. This fact is recognised by the statutory provision which allows the specified proportion of outsiders in the executive bodies of trade unions. But there should be a progressive trend towards control and management of trade unions by the workers themselves.

A WIDE RANGE OF EQUIPMENT
FOR
IRON & STEEL WORKS

Blast Furnace Equipment:

Mains and fittings for hot blast stoves, Dry and wet gas cleaning plant, Fittings for gas mains as well as complete Blast Furnace departments.

Steel Works Equipment:

Open hearth furnaces with a capacity from 12 up to 150 tons, Dryers for ladles, Dryers for steel and cast iron foundries. Gas Producers and various other equipments for Martin Bessemer and Electrical Steel Work.

Rolling Mill Equipment:

Rolling stands, Pinion stands, Roller beds as well as complete Rolling Mills of all types, sizes and capacities.

Industrial Furnaces:

Pusher type furnaces, Force furnaces with fixed and bogie hearths, Soaking pits Special furnaces, Heat treatment furnaces with fixed and bogie hearths of various types, Roasting furnaces, Igniting furnaces, Galvanising plant.

Other Machines and Equipment:

Slag and pig-iron ladle cars, ingot cars, casting cars, casting machines, Rolling mill gear units of various power ratings, couplings, shunting and hoistings equipment, Mechanical equipment for thickeners, Mixers, Gantry cranes from 5.5 up to 30 tons lifting capacity, Pouring cranes, Ingot stripping cranes, Magnet cranes Grab cranes, Section handling cranes, workshop cranes, and many other appliances which find application in the metallurgical industry.

One weapon the world can forget

It was hit-or-miss. Usually miss. Thank goodness that in the unending war against insect pests better weapons are now to hand than the unreliable fly-swatter.

To-day, Science has provided for homes, offices, stores—wherever insects are a problem—a new insect-killer of great power which gets insects *everywhere*, whether they fly or whether they crawl.

It is *Shelltox* with *dieldrin*. *Dieldrin* is a wonderful new SHELL insecticide, the strongest and most persistent ever known, which world health experts have proved in their fight against insect-borne disease.

Used as a space spray, *Shelltox* rapidly clears the air of insects. But it does much more. It introduces a new technique into insect-killing—brushing the liquid on to a surface so

that no insect can crawl there. This is because *dieldrin* stays effective longer than any insecticide ever before. You can now secure a room against insects simply by spraying this safe liquid on to the floors, windows, walls, cupboards, etc.

The housewife in her home, the caterer in his restaurant, the motorist in his car, the industrialist in his factory—they all enjoy the fruits of modern oil research through products which Burmah-Shell are distributing day and night in India

BURMAH-SHELL... in India's life and part of it

A Window on the World

ODYSSEUS IN GERMANY

BONN (By Air Mail)

THREE outstanding developments have launched a grand debate in Europe on the future of NATO—the North Atlantic Treaty Organisation, with its fifteen member countries, the USA, the UK, Canada, Iceland, Denmark, West Germany, Belgium, Holland, Luxembourg, France, Italy, Portugal, Greece, and Turkey. These developments are, first, the British White Paper of last April, which said in effect that if the UK was to be a strong and reliable NATO partner, its economy must be prosperous; a military effort which strains the economy is of no value. The UK therefore proposes certain re-apportionments in military expenditure, combined with reduction in numbers of men and reliance on more powerful weapons and a revised strategy. Secondly, the Disarmament Conference in London has raised hopes and fears. Thirdly, the forthcoming German elections have attached something like a question mark to Germany's position in NATO.

These were the problems that I had most in mind in the course of a three weeks tour which has been taking me from NATO headquarters in Paris to Bonn, capital of the West German republic, and to Düsseldorf, Hanover, Berlin, Hamburg, Kiel, Munich, Mittelwald, Frankfurt, and back to Paris.

In the next week or two, I propose to render some account of the conversations that I have been having with government officials, politicians, officers and men in the French, British, American, German, and other armed forces of the NATO countries, journalists, radio commentators, foreign correspondents, university students, professors, policemen, and for good measure, three ambassadors.

In Bonn, I attended a press conference given by Dr. Rust, Secretary of the Ministry of Defence, and General de Maizière, Director of Training to the German army, to a group of correspondents from NATO countries.

The basic point made by these official spokesmen was that the new German army is being re-constituted as a contribution to the common defence of the NATO countries and not primarily as a German weapon for Germany's national defence. The size and structure of the German army were conditioned by NATO's requirements. It was emphasised by these spokesmen, as by many other Germans, that defeat in two world wars had brought home to the German people that they could not defend themselves alone; they could hope to survive only as one of a group of allies. They dismissed self-sufficiency in armaments manufacture as an impossible ideal, placing too heavy a burden on Germany's economy. They were ready to buy in France, Italy, the UK, or wherever might be convenient, those heavy armaments which Germany did not manufacture herself, and they regarded this not merely as a commonsense easing of the burden on Germany but as a contribution to the integration of Europe's economy, a step towards the European common market, in the promotion of which Germany has played a leading part.

15 NATO FACE 240 COMMUNIST DIVISIONS

In conventional weapons and forces the strength of the Soviets, and their satellites, towers over that of the free countries. There are 175 Soviet and 65 satellite

divisions with the colours, compared with less than 15 NATO divisions—a comparison which provides its own comment on Soviet allegations of Western aggression. What redresses the balance and prevents the USSR from exploiting its overwhelming "conventional" superiority is the deterrent of the H bomb. Nevertheless, NATO's military advisers consider that there should be 30 NATO "conventional" divisions available in Europe to guard against the risk of local or regional incursions. Without this NATO shield, the USSR might extend its influence by a series of regional accomplished facts, gambling on the reluctance of the NATO countries to turn a local war into a global war by recourse to the H bomb in the absence of adequate conventional forces.

The German government has agreed, that, providing US, British and other NATO forces are retained in Germany, it will contribute 12 divisions towards the required 30. These promised German divisions cause heart searching among several NATO countries. The French, Belgians, Dutch, Norwegians, and Danes find it hard to forget their sufferings under German domination in World War II, and while they recognise the necessity for a German contribution to NATO, they argue that if it is insisted that Germany should produce 12 divisions, she would have the most powerful land forces in free Europe and be in a correspondingly strong position to dominate Western Europe. If the UK were to remain outside the European common market, Germany's domination would be economically, as well as politically, complete.

The German reply to such fears is to insist, first, that they are not building a self-sufficient national defence but are integrating their armed forces to NATO requirements and relying on the whole of Europe's economy for their armament and maintenance, and secondly, that they would welcome the extension of the European common market to include the UK and as many other countries as wish to join.

This reply is convincing as far as it goes, but the fact remains that the Germans are capable and hard working people who have the most flourishing economy in Europe because they have not handicapped themselves by Socialist, state control, but have given free play to enterprise and initiative and that, barring some unforeseen disaster, Germany cannot fail to play a dominant role in Europe. This is one of the facts of life that the French need to digest. If the French had ratified the plan for western European defence in 1954, Germans would today be forming part of the common European army and there would be no national armies, German or other, at all. But that historic *lus* was well and truly missed once and for all.

'COMPARABLE PROPORTIONATE EFFORTS'

That Germany will, however, raise all of the promised 12 divisions is not beyond doubt because, as General de Maizière told us in Bonn, Germany is ready to make her "fair contribution, proportionate to the comparable efforts of her allies", and the divisions were promised before the British White Paper's proposals for reductions in Britain's contribution were announced. The British viewpoint is that their contribution to the defence of freedom, not only in NATO, but outside in the Commonwealth, has been proportionately greater

than that of any other free country, and that the British balance of payments shows that they cannot keep this pace up and remain of any use to the alliance. Therefore a cut is necessary, but that does not mean that this is a precedent for Germany or any other country which is not yet making its full proportionate effort.

Now, most observers with whom I talked in Germany thought that the forthcoming German elections would show that Adenauer's policy of defending Germany through the NATO alliance commands but a bare majority of the German people. In such a "touch and go" position, the German Government may well wish to seize any excuse to slow down re-armament in order to capture the marginal voters. Many observers believed that the German Government is ready to take advantage of the many practical difficulties that impede the re-constitution of the German army.

When, just over two years ago in May, 1955, Germany entered NATO, she had no armed forces whatsoever. Now, to build up an army, navy, and airforce, from scratch, you need experienced officers and NCO's. At first sight it seems extraordinary that in a nation with Germany's military record, there should be an extreme scarcity of officers. But the war ended 12 years ago, and assuming that an "experienced" officer should have had, say, a minimum of two years with the colours and actual experience of command in battle, that would mean that he would today be at least 32 years old. But Germany is not anxious to recruit a middle aged army.

A second difficulty arises because after the war there was a tendency on the part of the victorious allies to regard all German officers as potential war criminals, a suspicion which the mass of the German people — painfully conscious of their defeats in two successive world wars provoked by "German militarism" — found easy to accept. Consequently German ex-officers have found it difficult to get employment since the war — except as porters, night watchmen, garage hands, and in other similar jobs. From this it follows that, on the one hand, among a substantial section of German public opinion, service in the armed forces, far from carrying any prestige, has some stigma attached to it, while, on the other. It was to be expected that all those German ex-officers who had failed to overcome the difficulties of making good as civilians would jump at the chance of returning to the life of "an officer and a gentleman."

But the German authorities do not want armed forces officered by cast-offs from civilian life — people who might be expected to have a grudge against the new German democracy. So the army accepts only those who have made good — like the captain I met who had risen from garage hand to motor car sales manager. This selective policy explains why all the German officers and NCO's with whom I talked were men of outstanding guts and character, men who had given up a good job in civil life, and were ready to brave social stigma, for the sake of service in the armed forces. But the net result is a serious shortage — particularly of junior officers and of NCO's, the ratio of whom to the troops is far below that in the British and American armies.

The widespread antagonism in Germany to the revival of "Prussianism" in the army adds to training difficulties and slows progress down. Knowing that popular feeling is behind them, the men are sometimes difficult to discipline. It can, for example, happen in any army that three or four young men who are

off duty take a couple of drinks too many and proceed to beat the town up. But the German commanding officer of today hesitates to punish such behaviour in the manner normal to all armies — for fear that the men may write to the newspapers or complain to a member of parliament that they have been victims of old-time Prussian drill-serjeant bullying. Today's commanding officer in Germany has to jolly his men along and feel his way towards raising standards of discipline.

CAT

MOTOR GRADERS

All over India on the big construction projects with municipalities ; state farms ; and with the leading contractors, you can see Caterpillar Motor Graders hard at work.

Building or maintaining existing roads, ditches, shaping banks, there is no tool like the profit making Caterpillar Motor Grader.

All over India, and throughout the world successful contractors and project engineers give Caterpillar their first choice. The main reasons for this preference are the proved low cost, high production and long-lived performance of these famous machines.

Ensure the job gets done to time by using a Caterpillar Motor Grader. There are three models the No. 12, 112 and 212. One of these, or more, is the answer to your problem.

No. 12—115 HP

No. 112—75 HP

No. 212—50 HP

WEST GERMANY'S FOREIGN TRADE CRISIS

(From Our Special West European Correspondent)

PARIS, August 24.

THE crisis in international trade brought on by West Germany's continuing export surpluses remains the main preoccupation of West European finance ministers. Capitals other than Bonn are prodigal with suggestions on what West Germany should do to resolve the crisis, but Bonn is unwilling or unable to do anything, least of all on the eve of the elections in mid-September. In any case, most of the suggestions and counter-proposals put up in this dispute are concerned with quite limited aspects of the case: we have discussed some of them on this page in recent weeks — currency realignments (up-valuation of the mark and/or devaluation of other European currencies), increased foreign investment by West Germany, "good-creditor" policies (freer imports, debt repayment), and so on. All of these are important and no doubt would have a notable influence on the situation — but that influence would certainly be temporary, for there are deeper-lying causes of the present unbalance and these are less susceptible of manipulation.

Plainly, as long as West German consumption levels are markedly lower than the West European average as long as German industry is heavily biased toward exportation, and as long as her neighbours and main competitors are laden with "imperial responsibilities" (i.e. non-commercial and unproductive investments in backward territories, such as colonial wars and the education and uplift of colonies and ex-colonies) — then no amount of fiddling with exchange parities and international credits is going to stabilise the position for very long. The foreign trade policies of all the other leading industrial powers — the USA, Russia, Britain and France — are set in a social and political context: exports are in each case limited by the necessity to sustain investments and consumption at home (this being what the German liberals denounce as socialism and inflation), while exports and foreign credits are directed in accordance with, and on terms suitable to, a politically determined programme (this being what the Germans denounce as imperialism; the satellite system or dollar diplomacy). West German heavy industry alone is free of both these servitudes: it can neglect the home market, decline to make unproductive investments abroad and push the greater part of its output on to foreign markets on straight commercial terms.

The upshot is the accumulation of foreign currencies in West German banks, a total unbalance of international trade and ultimately impoverishment of Germany's customers such as must make impossible the maintenance of German exports. Cut-throat competition eventually cuts the practitioner's own throat. No amount of "good-creditor" practice on West Germany's part can now correct this situation; for example, greater German investments abroad, as long as they were made on strictly business terms, would both increase German exports and contribute to the favourable payments balance, thus worsening the situation at least in the short term.

There are four ways in which the German economic potential could be harnessed to a social and political programme and thereby ease the strain on international trade in an age when all other major economies are

geared to such programmes. The first is more consumption (or if you like, more socialism) at home. But socialist-consumption policies cannot be forced on a people that does not demand them. The distributive economy can work in the USA because Americans are big spenders, and Keynesian policies can work in Britain because half the British population is born little Keynesians; the Germans are neither.

The other three concern international politics; German foreign trade could, in theory, be geared to the international programmes of one Russia, two the USA or three Britain and France. What would be involved in each of these theoretical cases?

The Russian solution, though politically unthinkable, is economically the most natural and the most in line with Germany's traditional economic ties. It would mean the reunification of West Germany with the much less prosperous and more backward East Germany, on terms such that the united country would be integrated into the economic system of East Europe. This would give West German industry the task of incorporating the 18 million East Germans into the present prosperous system, and would re-open to the Germans their traditional markets in Central and East Europe. This would at once correct the unbalance in world trade, for it must not be forgotten that it is the closing off of East Europe and hence the displacement of German exports to the West that is at the root of this unbalance, plus the fact that political division of the country has provided West German industry with an inexhaustible source of labour from a region where it has no social responsibilities. But this "solution" is politically impossible and would create more problems than it settled. Still, the fact stands that the West which is so worried about the German impact on its trading system cannot afford to forget that it is only by working for German reunification and a renewal of free East-West trade in Central Europe that the German economic problem will find an enduring solution, though this must be obtained on acceptable political terms.

The American solution has in fact been partly tried, and has failed, again for political reasons. This would be to get West German industry to shoulder its share (or if possible more than its share) of the anti-Communist rearmament effort. By burdening West German industry with the same sort of disability as has been suffered by Britain and France since 1948 and by replacing Allied military effectiveness beyond the Rhine with German, this would restore some of the balance in the West European economy and positively lighten the unproductive load carried by West Germany's main competitors. But it would also mean restoring German military power in Central Europe, and the French (and the British hardly less) showed that they were no more willing to envisage this than the Russians were; hence the failure of the European Army and the abortion of NATO. So the American solution of getting West Germany essentially to take over American defence responsibilities in Europe has failed.

The third solution would be to harness West German industry to the task of development of backward and colonial territories, a task now left substantially to Britain and France. This would mean not just making

commercial investments in those territories, building steel-mills and motor car factories, but actually accepting the burden of unproductive investments such as education, administration, public health, road and port development, and the like. It is investments of this sort that absorb a notable part of British and even more (in proportion) of French public outlays. In the past, the responsibility for such investments has been part of the cost of direct political hegemony, that is, it was part of imperialism. But today that is no longer wholly or even mainly true: as the old imperialist powers surrender political control they nevertheless retain the burden of social investments in their ex-colonies; witness the French subsidies to independent Morocco and Tunisia and the British contribution to the Colombo Plan, etc. And even in regions where the metropole's power is still intact, such as in French West and Equatorial Africa, immense investments are being made at the same time as progress toward political autonomy continues. So there is no reason why, with suitable but intricate political agreements and adjustments, West Germany should not contribute to this work without incurring the stigma of "imperialism". It is just this that the French had in mind when they insisted on including the overseas territories in the European Common Market, seeking to bind West Germany to an obligation to finance some of the public investment in those areas.

Unfortunately, there was Suez. And there still is the Algerian war. These naturally disincline the Germans (and equally the Swiss) to associate themselves with international programmes that can still be represented as old-fashioned imperialism. In fact, by far the greater part of the international responsibilities now shouldered by Britain and France have nothing to do with imperialism, even supposing (what is not perfectly certain) that Algeria and Suez (and Oman) betray the continuance of outdated attitudes, and nothing more. It is in this direction that there is most hope of progress and the Common Market will have justified itself if it succeeds in attracting West Germany into the field of common effort with Britain and France in the development of backward territories, particularly in Africa.

What is the alternative for West Germany? The course of her trade with the Middle East shows that

at the end of her present path of independent and strictly commercial trading lies self-defeat. In the last six years West Germany has increased her exports to the Near East by 220 per cent, and the only result is that Turkey, Iran and all the Arab countries cannot balance their trade and are driven into the same payments difficulties as Germany's European neighbours in EPU. The Germans have sought to remove these economic obstacles to their own trade by extending lavish credit to an extent that has become dangerous to themselves and their customers (witness the spectacular defaults in Turkey), and has moreover drawn accusations of dumping from competitors. The further Germany goes in this direction, the clearer it becomes that the classic weapons of economic competition are useless in seeking to develop trade with the underdeveloped countries. The only solution to the West German economic problem, which has now become the economic dilemma of all West Europe, is political.

Northern Railway

HOLIDAY CONCESSIONAL RETURN TICKETS

Indian Railways are issuing concessional return tickets on the occasion of Dussehra, Dewali and Christmas holidays at 1-3/4 single journey fares for first, second and third classes to stations situated at a minimum chargeable distance of 150 miles. For shorter distances, return tickets can, however, be issued basing fares for 150 miles, if the two single journey fares are more than the return fare for 150 miles.

The tickets will be available for 15 days, including the date of issue, for completion of the return journey. The return tickets for Dussehra will be issued this year from September 20 to October 3 for Dewali from October 19 to October 24, and for Christmas from December 15 to January 5.

Break of journey on return trip will not be permitted but on the outward trip passengers can enjoy this concession as applicable on ordinary tickets.

Passengers are required to get their return tickets dated, indicating the date of commencement of the return journey, from the Booking Office of the starting station for the return journey failing which they will be treated as travelling without tickets.

For further details contact the nearest Station Master.

CHIEF COMMERCIAL SUPERINTENDENT.

REFINERY-MY NEW HOME

rejoices Adipocere (Pronounced 'adi-po-saire')

I've been buried underground for centuries, and I'm drilled from the earth by oilmen and transported to a "tank farm" in the Refinery. At the Refinery, which is a maze of pipelines and towers, the refiners extract from me more than one thousand separate products of oil, such as the high quality gasoline that powers your car.

From the "tank farm" I am transferred to a furnace where the refiners put the heat on me.

The various processes by which I am converted to different petroleum products are collectively called "refining." I undergo three major changes: Fractional Distillation, Catalytic Cracking and Treating. In other words I am "fractionated," "cracked" and "treated". My new life begins... keep watching these columns for what is to happen to me.

STANVAC—the name that stands for progress

Standard-Vacuum was the first to enter into an agreement with the Government of India in November 1951 for the construction of the First Modern Oil Refinery. Built at a cost of 17½ crores of Rupees, this project was completed in the record time of 18 months.

PS1VOC-46/57

WORLDGRAM

AGRICULTURE

Seed Farms in Second Plan: The second Plan provides for setting up of 4,328 seed farms—485 in 1956-57, 1,416 in 1957-58, 2,363 in 1958-59 and 64 in 1959-60. With an area of 25 acres, each seed farm will have a seed store as well. In this way, it is planned to supply pure seed to a total area of 215 million acres by the end of 1959-60. Nucleus seeds will also be supplied to registered growers for multiplication under the supervision of an agricultural officer in NES Blocks and distribution centres, and seed farms will be located at development blocks throughout the country. This is estimated to result in an increase of 10 to 15 per cent in production of main food and cash crops, such as wheat, gram, paddy, cotton, pulses, jowar and bajra. The Central Government will give a total amount of Rs. 1150.50 lakhs for the scheme—Rs. 553.12 lakhs as loan and Rs. 597.38 lakhs as subsidy in the period 1956-57 to 1959-60.

US Share in World Agricultural Exports: US exports of agricultural commodities rose in 1956 above the level attained in the late 1920's, and reached a new high figure. Of equal significance is the fact that agricultural exports of other producing countries also reached a new peak. These facts are pointed out in a study by the US Department of Agriculture, which is based on quantities of exports (valued in constant prices) of 52 commodities, omitting from the trade of other countries those farm commodities which the United States does not export, such as coffee, tea, and rubber. Agricultural exports of countries other than the United States have increased steadily since 1951, indicating that this export trade, in the aggregate, has not been disrupted by US efforts to increase its exports under various surplus disposal programmes. US exports in 1956 rose to \$4.7 billion—a sharp increase from \$3.1 billion in 1955—and accounted for 22 per cent of world farm exports. Two thirds of the 1956 increase was in cotton, as cotton exports of other countries declined, mainly because of smaller availabilities and not because of the US cotton disposal programme. Exporters in countries outside the United States are expected to have only normal carry-overs at the end of the current marketing season, and world cotton prices have been rising of late in the European market. Smaller exports of wheat from other countries in 1956 were the result of the winter freeze in Europe and a smaller exportable surplus in Argentina. Soybean exports of countries excluding the United States fell in 1956 owing to smaller supplies from China, the only large exporter outside the United States. From 1951 to 1955, total agricultural exports of countries other than the United States made constant gains, whereas US exports lagged and the United States became a residual supplier to the foreign agricultural market. Revisions in US export policies and programmes have, however, restored the competitive position of US farm products during the past two years.

Korean Grain Programme: The Ministry of Agriculture and Forestry of the Republic of Korea has formulated a Five-Year Plan designed to raise grain production from 26 million suk in 1958 to 31 million suk in 1962 (1 suk=317.5 pounds). The 1958 output target would be a figure 10 per cent higher than annual average production in the three preceding years. Under the programme the area planted to grain would be increased from 2.7 million chungbo (1 chungbo=2.45 acres) in 1958 to 2.8 million chungbo in 1962, largely through land reclamation; also, higher yields per acre are expected. For rice, the programme sets a produc-

tion target of 18.8 million suk by 1962, which is about 4.3 million suk more than the yearly average of the past three years.

Milk Boards for Urban Areas: To organise the dairy industry on a sound basis and improve milk production and distribution in the country, the entire work of supplying milk to the urban areas should be entrusted to licensed bodies. The licensing authority will be the 40 statutory milk boards to be set up in 40 cities, having a population of above one lakh, during the second Plan period. This is the main recommendation of the two-day Conference of Dairy and Health Officers which held a session recently. Another recommendation relates to a more efficient enforcement of the provisions of the Prevention of Food Adulteration Act, 1954. It was felt that additional staff and equipment required for this should be provided wherever necessary.

Research on Farming: In a statement placed on the table of the Rajya Sabha today in reply to a question by Shri Nawab Singh Chauhan, the Union Minister for Co-operation, Dr. Panjabrao Deshmukh said that use of radio-active isotopes in agricultural research was at present being made at the Indian Agricultural Research Institute, New Delhi. This work had been started only recently. A fully equipped laboratory to carry out experiments had been established at the Indian Agricultural Research Institute and work was underway on a number of soil-fertiliser problems of immediate practical importance to the country's agricultural development. Lately, at the same Institute, work had also been taken up in radiation genetics for production of better varieties of crops and for protection of crops against diseases and pests. A number of important results had been achieved already through this study.

INDUSTRY

Specification for Multipurpose Grease: The Indian Standards Institution has just published a specification for multipurpose grease, no. 1, 2 and 3 (IS: 1002-1957). This specification prescribes the requirements and the methods of test for multipurpose grease for three grades suitable for automotive as well as industrial use for the lubrication of plain as well as ball and roller bearings. The grades 1 and 2 are principally intended for use where high-pressure greasing equipment is employed.

Cable Factory in Kerala: In a written reply to a question by Shri T. C. N. Menon in the Lok Sabha, Shri Manubhai Shah, Minister for Industry, said, that a Cable Factory was to be started shortly at Tripunithura in Kerala. An application for the grant of a licence under the Industries (Development and Regulation) Act, had been made for the establishment of the factory. Shri Shah said that it was to be a joint Indo-Japanese venture and the authorised capital had been specified in the application as Rs. 50 lakhs. The conditions of foreign collaboration, Shri Shah said, were under examination.

Draft Standard for Bayonet Lampholders: The Indian Standards Institution has circulated, for eliciting comments, a draft Indian standard specification for bayonet lampholders. It covers both metal-cased as well as insulated lampholders and prescribes dimensional requirements and materials considered suitable for their manufacture. It also prescribes tests for determining their quality. This draft standard, when finalized, is expected to meet the long-felt need and

help the industry in producing uniform quality goods. Attention of the industry is particularly drawn to the dimensions of the lampholders included in this draft. The manufacturing practice in this country has been largely following the FPS system so far.

Production of Khadi: Over 3.81 crore sq. yards of khadi was produced during 1956-57 as against 2.52 crore sq. yards in 1955-56 and 1.91 crore sq. yards in 1954-55. This information was given by Shri Morarji Desai, Minister for Commerce and Industry in a written reply to a question by Shri Sugandhi in the Lok Sabha. The Minister said that these figures included the production of khadi by self-spinners

TRADE

Finland's Trade and Payments Arrangements: A protocol has been approved regulating trade relations and the system of payments from April 1 through September 30, 1957 between Finland and 12 Western European countries — Austria, Belgium, Denmark, France, the Federal Republic of Germany, Italy, Luxembourg, the Netherlands, Norway, Sweden, Switzerland, and the United Kingdom. The 12 countries have agreed to grant as liberal treatment as possible to Finnish exports, and Finland will be liberal in the granting of export licenses. The licensing of imports by Finland from the participating countries is governed by three groups of quota lists annexed to the protocol. The first group consists of 64 "global" quotas, amounting to Fmk 29 billion; within each quota, the importer is free to select both the commodity to be imported and the participating country from which it will be obtained. The second group covers 13 quotas, amounting to Fmk 3.5 billion; for this group, the Finnish authorities will determine the importer and the commodity, but the choice of the country of supply is free. The licensing of imports in the third group (Fmk 6 billion) is fully controlled. The system of payments between Finland and the participating countries is based on multilateral principles; thus Finland has the right to transfer foreign exchange earnings from one country to another. The agreement is retroactive to April 1, 1957. Finland's bilateral agreements with the participating countries will be modified to the extent necessary to conform with the new protocol.

FINANCE

Burmah-Shell Refineries Limited, 1956 Accounts: The following items are of interest in connection with the Directors' Report and Annual Accounts for 1956 for Burmah-Shell Refineries Ltd. which cover the first full year's operation of the Company. The various plants, utilities and auxiliaries have been in steady operation during the year apart from the scheduled shutdowns for routine inspection and maintenance. A total of 2.35 million tons of crude oil from the Persian Gulf was processed during 1956, yielding 2.19 million tons of finished products. By processing this crude in India, instead of the equivalent quantities of refined products being imported, Burmah-Shell Refineries saved the Indian economy Rs. 7.51 crores in 1956 in foreign exchange. The Edleanu processing unit for improving the quality of kerosine produced came into operation in June 1956. Construction of the Platforming unit has proceeded according to plan, only minor items being outstanding at the year end. Capital expenditure incurred during the year amounted to Rs. 3.02 crores. In September 1956 the Directors decided, after most careful consideration, that the financial position of the Company arising from operations based on current working conditions and on the Refinery performances to date, was sufficiently encouraging to recommend that the Indian Government be advised with effect from 1st October, 1956 that Burmah-Shell

Refineries Ltd. was willing to forgo the duty protection of 2 annas per Imperial Gallon enjoyed on motor spirit production, for which provision had been made under the Agreement with the Indian Government for the construction and operation of the Refinery. This duty protection was calculated to amount in a full year to approximately two crores of Rupees. The Central Government revenues would therefore benefit to this extent from the offer made by the Company which was accepted by Government.

The net income of the Company for the year ended on 31st December, 1956 after providing for normal depreciation and the estimated liability for taxation amounts to Rs. 632 lakhs. To which is added the balance brought forward from 1955 Rs. 136 ..

Rs. 813 ..

From which an appropriation is proposed representing the difference between depreciation (including development rebate) allowed for taxation purposes to date, and the provision made by the Company for depreciation in its Accounts to date .. Rs. 511 ..

Rs. 307 ..

From which has to be deducted dividends amounting to .. Rs. 302 ..

Leaving an unappropriated balance of .. Rs. 5 ..

which the Board recommends to be carried forward to next year's Account. No specific provision has been made for debenture redemption: the commitment for redemption will fall to be met from reserves and from future earnings. In regard to future prospects, it is to be expected that earnings will show some reduction. Apart from the effect of forgoing protection on motor spirit, experience in oil refineries elsewhere shows that maintenance expenditure on the plant will progressively increase with each year's operation of the units, with consequent adverse effects on profit margins. Further, the recently announced increases in Crude Oil prices in the Persian Gulf will narrow the margin between crude oil and refined product prices with a consequent reduction in the level of refining income. The training of Indian staff continues and the Indianisation programme is being implemented according to schedule, the number of expatriate staff being reduced from 43 to 32 during the year.

GENERAL

More Workers to Get Provident Fund Benefits: About 76,000 more workers are likely to get provident fund benefits from December 1957 when the Employees' Provident Funds Act, 1952, is extended to workers in gold, manganese, iron-ore and lime-stone mines. The Act will apply only to those mines which have 50 or more workers and have completed three years of existence. It is estimated that the monthly contributions of these workers to the fund and the employers' share will amount to Rs. 7.40 lakhs. The Employees' Provident Funds Act, which came into force in November 1952, initially applied to six industries. It has now been extended to 24 industries, five classes of plantations and newspaper establishments. About 4,600 factories, 1,300 plantations and 160 newspaper establishments are covered by the Act. The total number of workers, who will be covered when the provident fund scheme is extended to the mine workers in December, will be about 24 lakhs. The contributions to the fund till May 31, 1957, amounted to Rs. 84.14 crores.

**Euclids move
BIG
loads from the pit**

The role of steel in modern civilisation is immeasurable. Without steel, industry would come to a standstill. The modern comforts we enjoy today would not exist. Without coal there could be no steel. Consequently coal plays an equally important part in world progress.

To cope with the ever-growing necessity for more coal, strip mining has been developed; so truck haulage has now become a major factor in the production and distribution of coal to meet thousands of industrial needs. In this new phase of coal production, Euclids are playing a leading part, moving materials efficiently and economically.

NEWS IN BRIEF

INDIAN

Employment exchanges registered 15,791 scheduled caste applicants and served placements for 2,538 of them during May, 1957. Of these placed, 247 were under Central Government, 844 under State Governments, 177 under quasi-government establishments and local bodies and the remaining 270 with other employers.

A meeting of the Southern and Eastern Regional Committee on animal husbandry is being held at Trivandrum from August 28 to September 3. Another meeting of the Northern and Temperate Region will be held at Nainital from September 23 to 25.

It is reported that about 10,059 villages will be electrified during the second Five-Year Plan.

The demand for steel castings is envisaged to be of the order of 40,000 tons per year by the end of the second plan period.

A sum of Rs. 5.52 lakhs has been allotted during 1957-58 to the Kerala State Government for the welfare of scheduled castes under the centrally sponsored programme.

The Indian Standards Institution has granted a license to Messrs. Geigy Industries Private Ltd. now incorporated in Messrs. Tata Fison Private Ltd., Bombay for the use of the certification mark of the Institution, on DDT dusting powders, and DDT water dispersible powder concentrates.

Shri Morarji Desai, Minister for Commerce and Industry stated in the Rajya Sabha recently that 15,62,553 handlooms had been registered in the country up to June 30, 1957. This includes 2,24,000 handlooms registered in Assam up to May 1, 1957.

The Minister for Commerce and Industry, Shri Morarji Desai stated in the Rajya Sabha recently that a zinc rolling mill had been set up last year at Calcutta for the manufacture of electric cell cans. The total cost was Rs. 28 lakhs approximately.

It is proposed to establish a deep sea fishing unit at Visakhapatnam by using vessels obtained under T.C.M. aid. An Ice and Cold storage plant procured under T.C.M. aid has been allotted to Andhra Pradesh and the State Government in erecting the plant.

To meet emergency demands for improved varieties of wheat seeds in the areas where scarcity conditions occur in the area, five regional wheat seed stores are proposed to be set up soon—one each in the five main wheat-growing areas. Similar stores will also be set up for paddy seeds in the main rice growing areas.

FOREIGN

A bank rate has been announced for the first time by the Bank of Rhodesia and Nyasaland, the central bank of the Federation, which was established in March 1956. The rate announced is 4.5 per cent.

A further relaxation of import controls has been announced in the Union of South Africa. From now on importers full requirements of all motor cars will be covered on a replacement basis; i.e. their relevant import permits will be replaced to the extent that they sell motor cars.

The note issue (currency issue plus sight liabilities) of the Central Bank of Chile on July 13 was \$75 billion, almost exactly the same as at the end of 1956.

Several measures designed to stimulate residential construction in the United States have been adopted by the government housing authorities.

The Government of Afghanistan and the United States have concluded an agreement under which US private investors are assured, under the provision of the Mutual Security Act of 1954, of the free convertibility of currency, protection against expropriation, and protection against loss of their investments owing to military action.

The Indonesian budget for the Calendar year 1957 which was submitted to the Parliament on July 12, estimates revenue of Rp. 19.2 billion and expenditure of Rp. 20.8 billion.

Japan's cotton imports of 2,316,000 bales (500 pounds gross) from August 1956 to April 1957 were 40 per cent higher than imports in the same period a year earlier and the highest reported in 20 years.

The foreign exchange account of the Bank of Taiwan for the first six months of 1957 showed a surplus of US \$19.3 million, compared with a deficit of \$2.1 million for the corresponding period of 1956.

In the year 1956-57 financial year Australia sharply cut her dollar deficit, turned a deficit with the sterling area into a surplus and registered a substantial increase in its surplus with other countries.

Tunisia and Morocco have now both aligned their currencies to the new value of the franc. The Moroccan Government has introduced its own system for the application of the 20 per cent partial devaluation.

The Dutch Bank rate has been increased from 4½ per cent to 5 per cent. It was raised from 3½ per cent to 4½ per cent on July 16.

The Chilean Government has authorised the export of copper wire of up to 6 mm. in diameter to all countries without exception.

Our SALES RESEARCH ORGANISATION with its world wide connections and experience since 1916 will help you to get your requirements of IRON & STEEL—from BASIC PIG-IRON to FINISHED STEEL such as:

PIG IRON: Basic and Foundry grades.

INGOTS & SEMI FINISHED PRODUCTS: Steel Ingots, Alloy Steel Ingots, Billets, Blooms, Slabs, Sheet bars etc.

FINISHED STEEL:

BARS:	Rounds, Squares, Flats.
SHAPES:	Angles, Joists, Channels, "T" & "Z" Bars, Sheet Piling.
RAILS:	Light & Heavy.
PLATES:	Ship building plates, Wagon plates, Boiler plates, Chequered plates, Floor plates, Ordinary M.S. Plates etc.
SHEETS:	Black Sheets (Hot & Cold rolled, Commercial and deep drawing qualities) G.I. Sheets (Plain and Corrugated) Panel Sheets, Art Metal Sheets, Drum Sheets and Sheets for Electrical and Automobile industries.
HOOPS & STRIPS:	For Rolling stock, Machinery, Packing materials, Cables, Pipes and Bicycle rims.
WIRE RODS:	For Building materials, Welding rods, Telegraph Wires, Galvanised Wires, Wire Ropes, Wire Nails and Wire products.
STEEL TUBES & PIPES:	For Gas, Oil, Steam and Water transmission and Tubes for Automobile, Cycle and Electric Transformer industries.
STEEL BALLS & ROLLS:	For Cement Factories and Re-rolling Mills.
CASTING & FORGINGS:	In all shapes and qualities.
HIGH SPEED STEEL:	For all industries.
STAINLESS STEEL:	In all forms.

We also specialise in REFRACTORY BRICKS for IRON & STEEL INDUSTRY.

The Unknown Warrior

His name is unknown. He came from snow-capped mountains, from placid paddy fields, from humble villages, and proud cities. One thought inspired him — the thought of his country. He left behind weeping wives and lamenting mothers. He was lost in a whirlpool of blood, fury and hate. In which unknown soil his dust mingles ... we do not know. He is the unknown warrior.

*In memory of 1857
— a homage from*

TATA STEEL

Namaste, Bhai Sahib !

Can you spare us a minute, please? We would like to talk to you, Bhai Sahib, about an important topic—TEA; especially India's tea and, even more particularly, the tea you and your family drink.

Tea, as you know, is no ordinary harvest. You would have to visit gardens, factories, speak to our tea tasters and call on shops in towns and villages with our salesmen to understand this complex and fascinating business of producing and selling tea.

Yet tea is important to you—because you spend your hard-earned money on a packet of tea and you are entitled to judge whether you get a fair bargain.

Important to India because tea sold abroad provides money—Rs. 143 crores in 1956—to help the Government with its Five Year

Plans and the excise on tea provides still more money—Rs. 3.5 crores—for your welfare and your children's future.

You will see, Bhai Sahib, that we have kept ourselves till the last... Brooke Bond! We have a vital role to play in the tea industry and we believe you will find it interesting to learn all about us, too.

Economic Report from the U. S.

CUSTOMS SIMPLIFICATION ACT

(By GUY SIMS FITCH)

WASHINGTON, Aug. 27.—The way is now clear for putting into effect one of the most significant of all United States trade liberalization moves. The U.S. Treasury Department a few days ago released a list of about 800 imported commodities it proposes to exclude from the provisions of the Customs Simplification Act which became law in August 1956. To understand this seeming paradox—how the publication of a restrictive import list brings closer to operation a liberalization measure approved a year ago—one must examine the Act itself. At its heart is a provision that U.S. "ad valorem" duties—duties assessed against imported goods on the basis of a percentage of their value—will be computed on the single standard of "export value." This value is the price at which goods are sold for export to the United States.

Currently, 'ad valorem' imports, which make up the bulk of all U.S. dutiable imports, have their duties fixed on the basis of either "export value" or "foreign value," whichever is higher. The foreign value is the price at which they are sold for consumption in the exporting country. Since the export value usually is lower, most dutiable goods entering the United States will be assessed under the new law at lower rates. The result will be an automatic reduction of a wide range of U.S. import levies. In addition, the Treasury no longer will have to go through the drawn-out process of determining the value of imported goods by two different methods. This inevitably will mean less uncertainty and a saving of time, as well as money, for both foreign exporters and American importers. Where, then, does the last week's treasury list come into this picture? When the Act was being considered by Congress, the understandable objection was raised that it might prove unduly harmful to some American industries if the final "export valuation" were to be

substantially below prevailing tariff rates. Therefore, Congress stipulated that those goods whose duties would be reduced by 5 per cent or more would be exempted from the act, and would be treated under the old dual formula.

This accounts for the delay in putting the Act into effect. For the past year, the Treasury Department has been making a painstaking study of the Act's probable impact on all goods entering the United States. The result of that study was the list of 800 exempted items. This is expected to have little material effect on the Act's operation. The 800 items which include such products as certain organic chemicals and rubber footwear, make up a small fraction of the many thousands of foreign products sold in the United States. They represent 16.5 per cent of the total value of U.S. dutiable imports and only 2.3 per cent of the total import dollar volume during the year that ended June 30, 1954—the base period for calculating the proposed exemptions. It should be noted, in this connection, that about half of all U.S. imports enter the country free of any duty.

American business men now have 60 days in which to request that other items be added to the proposed "exemption" list. After the Treasury studies those requests, the way will be clear for its promulgation of the final exemption list, which probably will differ little from the present preliminary list. And 30 days after that, the new valuation system will become effective. Now that the first major hurdle has been cleared, Treasury officials are hopeful that the Customs Simplification Act of 1956 will be in operation by the end of 1957 or shortly thereafter. And despite the delays and the exemption, American importers appear quite satisfied with it.

CO-OPERATIVE URBAN BANKS

By
CROESUS

IN a sense, small and medium scale industries are verily coming into their own. These industries are receiving prominent attention not so much because of their contribution to economic production as such as because of their so-called employment-potential, but there is no reason why they should not also prove to be economic units. It is, therefore, gratifying to note that this aspect too has begun to receive steadily increasing attention at the hands of the several agencies which have been entrusted with the responsibility of fostering these industries. By the way, the number of these agencies has grown to such an extent that one may be excused for not knowing all these agencies or at least the particular agency that one may have to approach for securing assistance for one's industry, if it is small or medium sized. Similarly, it is becoming more and more difficult to say whether or no there has already developed a certain degree of overlapping, calling, therefore, for a clearer definition of the respective sphere and scope of each of these agencies. Equally important seems to be the need for a co-ordinated—the term more in vogue these days is “integrated”—approach in the matter of financing these industries. It is a healthy sign that more agencies are coming forward to help small and medium industries with the latter's greatest need—money. Inasmuch as this is both an untried line for these agencies and also a line fraught with considerable risk, it is but natural that the concerned agencies should look to the State to be a sort of underwriter of their risks.

There is also another reason why these agencies deserve encouragement. It is that they serve to minimise the distress of the ‘small man’ in urban areas and thereby strengthen the economic structure of the towns and cities. As Mr. R. C. Saraiya, President of the First Conference of the Bombay Co-operative Urban Banks, held last week, observed, “the effort to revitalise the village economy will not bear fruit within the desired period, if towns are neglected”. It is in this context, I believe, that he complained that no systematic effort had been made to assess the magnitude of urban problems and the voluntary effort made by different agencies, including urban banks, to tackle them. Hence his suggestion to the Reserve Bank to make a survey of the productive elements like small-scale industries in the urban sector on the lines of the Rural Credit Survey. The interest of the urban co-operative banks in such a survey is more clearly brought out in the resolution adopted by the Conference. One of such resolutions read, ‘inter alia’, thus: This Conference recommends “that the Reserve Bank of India should, in collaboration with the State Co-operative Banks' Association, sponsor a survey of the problems confronting urban banks, including their organisation, methods of banking business and their ability to assist the small-scale producers within their fold”.

Unusually for such occasions, Mr. Saraiya did not have a long catalogue of difficulties to list before the Conference, a point which, I see, did not escape the notice of Mr. H. V. R. Iengar, the shrewd Governor of the Reserve Bank of India, who inaugurated the Conference. But Mr. Saraiya did have a couple of complaints which require mention and also comment.

The first of these was about the competition for deposits among banks, commercial and co-operative, but much of the validity of this complaint was lost—so it seemed to me—when he himself stated that some of the urban banks were able to hold their own and even increase their deposits, notwithstanding the fact that they offered a relatively lower rate of interest on deposits than did the commercial banks. If this is the position, it only means—or it could mean—that there was something wanting in the case of those urban banks that could not stand the competition. I am afraid, therefore, that Mr. Saraiya was not able to convince one as to what he precisely meant when he wanted the Central banking authority to co-ordinate the policies of all banking institutions to avoid unhealthy competition.

Secondly, Mr. Saraiya complained about the State Bank of India opening branches in the areas that were already being served by the urban co-operative banks which had been the pioneers in the field and had taken the trouble to explore it successfully. This is not the first nor, by any means, a new complaint, which only goes to prove that, as much as any other commercial bank, the State Bank also is anxious to enter only a prepared field, contrary to what the public has been led to believe all along. But now that the State Bank has also established itself, despite the competition, and even losses perhaps, it has per force to stay on, if only because it cannot afford—or is it “it will not be allowed”—to close down and discharge its employees. It occurs to me, therefore, that, in future at least, the State Bank can very well make use of the agency of the urban co-operative banks to explore fresh areas and, instead of establishing its own branches and slowly uprooting from such areas the urban co-operative banks—not forcibly but by its competition—let the latter banks themselves do its work as its agents. In other words, as Mr. Iengar suggested, by reason of the other and far more important responsibilities it has to shoulder, it seems desirable for the State Bank to remain in the background and guide and assist these small but handy and useful institutions.

While still on the subject of competition, I feel, a reference requires to be made to the question of interest rates. It is true the commercial banks offer and they have to do so—higher rates to attract deposits. It is not urban co-operatives alone that feel the competition thus, but even commercial banks have, in their turn, complained about the Exchange Banks offering higher rates and taking away the funds they would otherwise have got. This state of affairs has arisen because of the newly developing pattern of interest rates, thanks to both internal and external pressures. If the rates have gone up to some extent, as they would have done in the normal course by the higher outlay on the developmental projects under the second Five-Year Plan, they have gone up a little more now because, as Mr. Iengar pointed out, the Exchange Banks, which could not bring funds from their Head Offices owing to the higher money rates obtaining abroad, in particular in the UK, also have been tapping the Indian money market. The Indian Banks' Association has repeatedly drawn pointed attention to this feature and has even

sought some sort of protection against this powerful source of competition but to no effect so far, for, obviously, this is as delicate a problem as it is complicated involving perhaps constitutional issues. Mr. Jengar did not say all these but he must doubtless have had them all at the back of his mind when he said that, as far as he could foresee, there was no likeli-

hood of the interest rates going down. The latest restrictions on bank credit will certainly not help bring down interest rates; one must be thankful if they don't have the effect of further raising the rates by reason of future bank credit being more selective and thus not left to be decided by any normal bargaining between the lender and the borrower.

TRIBUTE TO TISCO

By

CROESUS

NO Indian, whether he attended the annual meeting of the shareholders of the Tata Iron and Steel Co., Ltd., on August 27, 1957, or not, would refrain from paying his own personal tribute to that great man, Jamsetji Tata, who, even two generations ago, had the vision to realise that political freedom, without economic and industrial strength to support and defend it, would be a cruel delusion and straightaway set out to lay the foundations of industrial power by establishing the largest steel-producing unit in the country, which is also the biggest single private enterprise of India today. Looking at the Company now and considering the resources and potentialities of the iron and steel industry in India which have been widely made known, it is difficult to imagine the struggles and hardships that the pioneers like Tata and his sons must have faced and overcome. Several others also have made a notable contribution to the building up of the TISCO, and it is only appropriate that, on the day of commencing the second fifty years of the existence of the Company, Mr. J. R. D. Tata, an illustrious scion of the Tata family and the present Chairman of TISCO, should have paid full some tribute to the memory of all these.

What has the Company achieved in the past fifty years? To quote Mr. Tata, "in the fifty years of our life, we made over 22 million tons of steel, paid Rs. 175 crores in wages and bonuses, about Rs. 45 crores in dividends, well over Rs. 70 crores in taxes and Rs. 40 crores into government price equalisation fund. In the process we saved the country hundreds of crores worth of foreign exchange and are doing so today at the rate of same Rs. 50 crores a year, which will rise to about Rs. 90 crores from next year onwards." With this record of achievement, the Company's Chairman could well claim: "I feel we have amply repaid the country for the protection granted to the steel industry during the difficult years following the first World War."

Mr. Tata did not forget on the occasion to recall the services of many others who made these results possible. Indeed, he was generous enough to admit that, if the Company has been able to overcome, over the past fifty years, all the obstacles and difficulties it met with, "it is partly because, even in the darkest days of our history, we enjoyed the trust and the support of our staff, workers, government and shareholders". The TISCO Chairman particularly expressed his appreciation for those shareholders who have held shares in the Company since its very inception by calling them "that stalwart band of Shareholders".

In all these, and especially in being frank enough to their mistakes whenever they occurred, the TISCO management could well declare "We never forsook the ideal bequeathed to us by the founder or lost sight of our duties and responsibilities to the country." In

having done so, TISCO has undoubtedly provided, as Mr. Tata declared, "a living and dynamic answer to the charge that 'Free Enterprise cannot deliver the goods, is only inspired by selfish motives, and does not serve the needs of the people'". Tatas have, indeed, served the country consistently and well. May they live long, prosper and carry on this great tradition from generation to generation. For, with even one outstanding example like that of the Tatas, Free Enterprise can still hold its head aloft.

more homes every day...

Today India needs more homes—better homes—for her millions, calling for more cement and more steel. For the maintenance and expansion of cement production, components such as lining plates and grate plates are essential. Until recently these tough castings made of manganese steel were imported, but now they are made in India—by Mukand!

We are equipped to manufacture, in increasing quantities, reinforced mild steel bars and rods, too, so vitally needed for the construction of buildings. With our expansion programme taking shape, we at Mukand, will help meet the nation's growing needs in Steel and Steel Castings.

BUSINESS NOTES

TISCO: FIFTY YEARS OF PROUD PROGRESS

MONDAY, AUGUST 26, marks a golden jubilee of the Tata Iron and Steel Company. Looking back over the last fifty years, the company can take legitimate pride in its contribution to the progress of the nation. In a sense, therefore, the jubilee is an event also of national significance. Mr. Jamsetji Tata's pioneering zeal and unflinching faith in the industrial future of this country was the real force behind the birth of this great enterprise. A band of distinguished leaders charged with the onerous task of piloting the destiny of the company over the last fifty years has also contributed greatly to building the enterprise to its present stature.

Mr. J. R. D. Tata's speech on this memorable occasion gives a picture of the shape of things to come in the immediate future. The ambitious programme of expansion aiming at an annual production target of 2 million tons is now within sight of achievement. The programme is proceeding according to schedule, notwithstanding the pressures exerted by a heavy and accelerated schedule. This one instance constitutes eloquent testimony to the capacity of Indian private enterprise to take real risks even in a heavy industry and to deliver goods.

Mr. Tata had a happy news to break to the shareholders and also to the country about the management's success in raising the balance of development finance which was so far left unprovided. The uncovered gap was of the order of \$35 million. The good offices of the World Bank have been of great value in filling it and the country no less than the company will be grateful to it for this assistance. The Bank has agreed that it would give extra credit up to a maximum of \$17.5 million to the company on condition that an equal amount is raised from other sources first. Active efforts are under way and negotiations are proceeding with commercial banks in the United States for raising credits to the tune of \$17.5 million. It can be confidently hoped that these credits will be raised and the entire expansion programmes will be fulfilled in time. In case, however, rising taxation reduces the company's internal savings or the capital costs of the different projects in the expansion programmes go up, the Chairman has disclosed that the company would approach the Government for an increase in the retention prices. The possibility of taxation undercutting the company's internal savings seems to be real. The Chairman has estimated that the additional taxation resulting from the budget proposals and the excise duty on steel used in the expansion programme will be of the order of Rs. 1 crore. This is a measure of the inroad which the new taxation is making into the finances of the private corporate sector of industry.

RAYON YARN PRICES

RECENTLY, A section of art silk manufacturers would appear to have complained to the authorities that the rayon manufacturing industry had raised rayon yarn prices unduly during the third quarter of the current year, thereby implying that the latter was taking undue advantage of the scarcity created by the restricted import policy of the Government of India. As this is a very important question affecting the 'bonafides' of the rayon industry, the Rayon Manufacturers' Association (R.M.A.) has naturally had to come out to place before the authorities concerned all the "salient features and facts" about their industry. This it has done in a detailed memorandum which it has submitted to the Secretary, Ministry of Commerce and Industry, Government of India.

The manufacturers point out that there had been a plethora of yarn far exceeding the poor demand,

thanks to the increases in imports, which totalled 66 million lbs. as against the usual 50 million lbs., during the period April 1956 to March 1957. Owing to this and other factors, the indigenous yarn manufacturers were compelled to lower the prices and fix them as low as Rs. 3-9-0 and 3-14-0, inclusive of the excise duty. This price, according to the rayon manufacturers, has been the lowest and "at no time in their history they were called upon to sell their yarn at such a low price as obtained for the first two quarters".

Continuing, the R.M.A. memorandum maintains that the prices now fixed are comparable not only to the average selling prices since 1952 but they also "compare very favourably with the landed cost of imported yarn. The rate of 150 denier works out lower by about As. 5 per lb. of yarn". On the basis of the latest quotation, received from the importers, for the supply of 120 and 150 denier yarn, according to the memorandum, the price works out to 43d. per lb. of yarn. The landed cost works out to Rs. 3-13-9 for 150 denier. The rates quoted by the two premier rayon manufacturing units—The National Rayon and the Century Rayon—it may be noted, works out to about the same as far as 120 denier yarn is concerned and actually about 5 annas lower than the landed cost as far as 150 denier is concerned. Furthermore, the rates now fixed, the R.M.A. memorandum points out, do not take account of the increased cost of production since. It is recognised on all hands that the cost of production has been mounting. Notwithstanding this, the Rayon Manufacturers have not only excluded the increased cost from the rates now fixed but have even absorbed more than 50 per cent of the excise duty.

In order to substantiate this, the R.M.A. points to the results of working of two producing units, viz. the National Rayons and the Travancore Rayons which have returned a gross profit of 15.3 per cent and 17.3 per cent respectively, before depreciation and taxation on their gross block capital expenditure. When compared to this, some of the weaving industries, according to the Association, have shown a return of anywhere up to 65 per cent, a position which seems to have been assured to them, inasmuch as the artificial silk fabric industry now enjoys protection with a complete ban on imports.

The foregoing analysis clearly shows that the Rayon Manufacturers have not exploited the situation. It is, therefore, unjust to make any such charge against them. This is all the more so when, even the Government, according to the R.M.A., is convinced that whatever increase there has been is appropriate.

INDO-BURMA TRADE

WITH THE Burmese Trade Delegation presently touring the country, the commercial relations between India and Burma are expected to improve in the near future. Although the principal purpose of the delegation is to study the industrial development of the country, it is expected that negotiations may be made for purchasing cotton textiles. The chances of Burma buying cotton textiles from India seem brighter particularly when Japan has very recently not seen its way to agreeing to the request of Burma for a price concession in respect of her textiles. It devolves now on the textile trade interests to impress on the trade delegation the benefits of entering into longer deals with India.

Imports of cotton textiles into Burma from India in the recent years have been falling considerably. As against 38.60 million yards in 1954, imports from India in 1955 stood at 10.90 million yards. Although there was some improvement in the year 1956, this was less

than 50 per cent of Burma's intake of Indian cotton textiles in 1954. It is relevant to mention here that with the abolition of preferential duties on imports and levy of the standard rates for imports from all other countries, Indian textiles lost the price advantage which they enjoyed in relation to Japan whose competitive strength was enhanced. The latest developments show that Japanese cotton textiles are not priced at a level which Burma would desire.

The situation lends weight to the thesis that cotton textile exports will begin to have an increasing share in the Indo-Burma trade. Jute is another commodity in which exists ample scope for export as indigenous production in Burma is not sufficient to meet its entire demand. So far as exports from Burma are concerned, timber and rice will always have a good market in India.

EXPORT PROMOTION COUNCIL FOR LEATHER

EVERY YEAR India exports hides and skins worth nearly Rs. 30 crores, which works out to roughly about 5 per cent of the total foreign exchange earned. If the quality of raw hides and skins, which is reported to be deteriorating gradually is improved and if vigorous efforts are made to increase our exports, we are told, this industry, which has already carved for itself an important enough place in our economy, is bound to play a more important role still. It is, therefore, heartening to note that this aspect has already been receiving due attention at the hands of the Government.

For the purpose of finding out ways and means for the export of finished leather production, the Chief Minister of Madras, Mr. K. Kamaraj inaugurated only last week, the Leather Export Promotion Council—the eighth in the chain of Export Promotion Councils set up by the Government of India. While both he and Mr. A. J. John, Governor of Madras, who presided over the inaugural function, stressed the importance of the leather industry as one of the chief foreign exchange earners, Mr. K. Rangaswami, Chairman of the Leather Export Promotion Council, availed himself of the occasion, appropriately enough, to explain the objectives of the Council. He said that the Council would take all the steps necessary for organising a steady market in the Middle East and Africa, where the demand for finished leather goods was very great. Another task of the Council, according to Mr. Rangaswami, is to achieve diversification of exports and the establishment of more direct relations with the importers and the actual users on the Continent and elsewhere.

OIL PRICES

IN THE recent debate in the Lok Sabha on the demands for grants of the Ministry of Steel, Mines and Fuel, the price of petroleum oil turned out to be a combustible subject. An impassioned plea was made by some members that the price of petroleum oil be considerably reduced. It was pointed out that after the establishment of foreign refineries in India, there was no justification to stick to the old basis.

An analysis of the whole situation would reveal that it is pointless to demand a reduction in the price of the petroleum oil when the Government has already committed itself to price fixing in the agreements with the oil refineries. These agreements ought to be honoured since sanctity of contracts must be upheld. The agreements in the board outline are quite reasonable and positively very beneficial to India. While sentimental reasons might provoke one to seek changes in the agreements, the wider implications of such a course and the probable repercussions of pressure policies cannot be ignored. Hence the import parity basis for the pricing of petroleum product, has to be adhered to. One very vital and basic question to consider is the effect of imposed modifications on the foreign investor's confidence. Will not foreign capital which is already shy tend to be discouraged?

The demand for petrol is increasing year after year and the country has not made much headway in the production of petroleum. No doubt aero-magnetic surveys have been carried out in Jaisalmer and the Gangetic region and exploration has also been done at Naharkatiya, but the fact cannot be ignored that prospecting for oil is not only too expensive but literally a gamble. It is still to be determined in the light of a long-term programme of exploration to what extent India will be self-sufficient in her requirements of mineral oils. The necessity for imports is most certain to continue in varying degrees. At the same time, it should be appreciated that the foreign oil companies are amenable to persuasion. They have agreed to switch over from the Gulf of Mexico price parity to Persian Gulf price parity which means a saving of at least two crores of rupees to us at the present rate of consumption.

RATIONALISING THE SALES TAX

IN A STATEMENT on sales tax, adopted unanimously by the Sales Tax Conference convened by the Federation in Bombay on the 24th and 25th July last, the F.I.C. & I. suggested certain solutions to the "numerous difficulties and vexations caused by the administration of sales tax". The Federation suggested, for example, the centralisation of sales tax and distribution of the proceeds of the tax to the States on an agreed basis. This, in its opinion, would put an end to the various complexities. Among others, it suggested the formulation of a model sales tax Act for the guidance of the States, uniformity of rates, system, method of levy, administration and prescribed forms in all the States and certain modifications in the present Sales Tax Act to ensure that no purchase tax is levied by State Governments. With regard to the effect of sales tax on foreign trade, the Federation made a notable suggestion. In the context of the present acute foreign exchange situation, it said, Government should give encouragement to exports, whereas, actually, under our Sales Tax Act, only the last transaction is exempt, thereby making a large volume of exports bear an element of sales tax. This is clearly detrimental to increase our exports. The Central Sales Tax Act, as the Federation has said, needs modification to "the extent the export transactions should be defined as transactions which involve goods meant for export. Purchases made by an exporter for the purpose of export should not be subjected to sales tax".

Dr. Lokanathan, who is making an official enquiry into the structure and administration of the sales tax, also feels that there is a necessity for simplifying sales tax procedure and administration. While addressing the Madurai-Ramnad Chamber of Commerce, he said that one of his recommendations to the State Government would be that the rates of sales tax should be uniform at least in the neighbouring States. He also indicated that recommendations to make assessments quick and expeditious would be made by him. Presently, he said he was concentrating on how to ensure relief to small dealers whose turnover was less than Rs. 20,000 or Rs. 30,000. All the recommendations of Dr. Lokanathan would be watched with considerable interest, especially by the small traders and business men who strongly complain of several hardship in carrying on their trade these days.

A CORRECTION SAVINGS THROUGH "PEOPLE'S SHARES"

In the Business Note under the above caption on page 168 of our issue dated August 2, 1957, please make the following correction:

In the first line, for "Australia" read "Austria".

The whole scheme of "People's Shares" discussed in the first paragraph of this Note relates to the novel experiment that is being carried out in Austria. The error in printing is regretted.

Company Meeting

THE TATA LOCOMOTIVE & ENGINEERING CO., LTD.

Summary of the speech delivered by the Chairman, Mr. J. R. D. Tata, at the Annual General Meeting of the Shareholders of the Tata Locomotive and Engineering Company, Limited, on Monday,

August 12, 1957.

Addressing the Twelfth Annual General Meeting of Tata Locomotive and Engineering Company, Limited, the Chairman, Mr. J. R. D. Tata observed that the all round progress made and the satisfactory profits earned by the Company during 1956-57 had enabled the Directors to recommend an increase in the dividend to 8%.

The provision of adequate funds to finance the growing operations was today one of their main problems, said Mr. Tata. "By the nature of the industries in which we are engaged," he added, "and the circumstances peculiar to this country in the matter of essential supplies and bought-out items, it is necessary for us to maintain substantial stocks of raw materials and bought-out components. This locks up large funds as can be seen from the considerable amount of borrowings shown in the balance sheet. In addition, we still have a large amount of capital expenditure to incur in the next few years as we proceed with our current manufacturing and expansion programmes. Although, in the long run, the funds provided from year to year out of allocations to depreciation and various reserves will substantially cover the total amount of capital expenditure so incurred, the heavy commitments during this year and the next make it necessary for us to raise additional finance in the very near future. While no decision has as yet been made, the possibility of an additional issue of equity shares, possibly in the form of debentures convertible into ordinary shares cannot be ruled out."

The Company's commitments to deliver locomotives at the rate of 100 complete units per year from the beginning of 1958 would be fulfilled and possibly improved upon. The Chairman added that with the increase in output, further improvement in efficiency and fuller utilisation of available capacity it was expected that the costs would come down to a satisfactory level despite the recent steep increases in the costs of materials and in wages.

Mr. Tata observed that in India as elsewhere a gradual but inevitable movement towards the "dieselisation" of rail transport was taking shape, and said, "As and when oil in adequate quantities is discovered within the country, the process is bound to be accelerated. As mentioned in my speech last year, our works are exceptionally well equipped to undertake the manufacture of diesel locomotives. The Railway Board have recently issued enquiries for a fairly substantial number of such locomotives and we propose to respond to this enquiry in collaboration with our technical associates, Messrs. Krauss-Maffei A. G., and Messrs. Daimler-Benz A. G. We are in this regard fortunate in our association with both these firms, for Krauss-Maffei are leaders in the field of main line diesel hydraulic locomotives, while the Daimler-Benz range of high efficiency diesel engines are ideally

suited to rail traction. If our expectations fructify, we can look forward to a long period of continued collaboration with, and service to, the Indian Railways, even after the cessation of steam locomotive manufacture."

The Automobile Division was nearing the end of the second stage of development strictly according to schedule and despite the many complicated problems affecting supplies and operations the Company was confident that the manufacturing programme would be maintained.

Referring to the popularity and dominant position in the market of the Tata-Mercedes-Benz commercial vehicles the Chairman said that they had no doubt of the ability of these vehicles to withstand any competition they might have to face. Mr. Tata expressed gratitude to Government for their decision to sanction to the Company its reasonable requirements of foreign exchange for plant and equipment to implement its approved manufacturing programme. This would enable the Company to complete its plans by the end of 1959 when the Company was expected to be in a position to produce almost entirely Indian-made diesel truck and bus chassis. With the completion of this programme the foreign exchange saved each year would be larger than the aggregate amount spent for the purchase of plant, machinery and equipment for the Automobile Division.

Mr. Tata welcomed the decision of the Government of India to give the automobile manufacturers in the country a reasonably free hand to fix the prices within the overall limits, with a return of 10% on cost, subject to general supervision and check by the Government as this would go a long way towards providing an effective incentive for the rapid development of the industry.

In conformity with the Tariff Commission's views, the Company had submitted to Government a scheme for doubling once again the capacity of the Automobile Division and bringing it upto 12,000 vehicles per year. Mr. Tata said that the Government of India have informed the Company that the scheme would find acceptance provided suitable credit arrangements could be made to stretch out the foreign exchange expenditure over a period of years.

The Chairman hoped that the Government of India would in due course also enable the Company to diversify the output of its Automobile Division by manufacturing other types of vehicles such as light commercial vehicles, cars and diesel engines for various uses. Such diversification would promote efficiency and reduce costs. "The best warranty that we can offer to Government for the fulfilment of these objectives in due time," said Mr. Tata, "is our actual performance in the fulfilment of the initial programme

of manufacture of trucks and buses on which we are now engaged."

Continuing, Mr. Tata said, "On the recommendation of the Tariff Commission, the Government of India have decided to grant protection to the automobile industry for a period of ten years. Our present manufacturing programme will have been completed long before the end of this period. We hope also, before that time, to be well on the way to completing the expansion plan as well as further plans for other products. In effect, it is our intention to build up in this country, as rapidly as circumstances and the authorities concerned will permit, a self-contained and highly efficient automobile industry."

"We have also taken steps to implement other recommendations of the Tariff Commission, so far as they relate to us, amongst which is the extension of hire-purchase facilities, with the collaboration of our bankers and insurers, to the buyers of Tata-Mercedes-Benz vehicles."

Mr. Tata informed the meeting that the construction of the Steel Foundry—unquestionably the most up-to-date in the country—had been virtually completed. The production of castings in the Alloy Iron Foundry for the Automobile Division was expected to commence according to schedule.

Referring to matters of personnel and labour, Mr. Tata said that it was disappointing to note that in the year under review there had been a tendency on the part of certain sections of workmen to take matters in their own hands. "Our men," observed Mr. Tata, "are amongst the highest paid in the engineering industry. They enjoy excellent conditions of work in a fine integrated factory equipped with the best machinery and equipment to which we are continuously adding." "The capital investment per employee in our Company," added Mr. Tata, "is probably the largest in the industry. Our employees have a fine and safe future before them, but it is time they realised that the Company's continued ability to pay high wages and provide the maximum of amenities and job security depends on high productivity which, in turn, requires that the workers put in a reasonable day's work."

"Although some progress has been made, we are not satisfied with our present standards of productivity which, in the case of the Locomotive Division, have been criticised in the past by the Tariff Commission as comparing unfavourably with those at Chittaranjan. We are pursuing our efforts to achieve a satisfactory labour output but these will be in vain unless our employees and their Union co-operate with us. I am sorry that such co-operation has shown signs of weakening in recent months rather than the opposite, and I particularly regret that, in spite of its responsible and mature leadership, the Union has recently aggravated the lack of discipline by instigating the workers to down tools for a few hours in each shift mainly, it seems, as a protest against their not having been consulted in regard to the quantum of bonus declared this year. This action was, I feel, particularly unfair as the figure of bonus proposed to be declared was in fact disclosed to the Union some time before the publication of the Report and Accounts and the total amount distributed is twice that of last year and proportionately much in excess of the corresponding increase in dividends."

"As our manufacturing programme develops and an increasing proportion of the contents of our products are made in our own Works, our results will depend increasingly on the work and productivity of

our own men. Nothing could bring greater benefit to them as well as to the Company and its shareholders than a sound and cordial relationship between Management and Labour based on mutual understanding, respect of co-operation. I sincerely hope, therefore, that our workers and their Union, with both of whom we are anxious to maintain the most cordial relations, will take a correct and responsible view of the situation and will co-operate with the Management in their own long-range interests as well as those of the nation."

The Chairman referred to the satisfactory progress of the Apprentice Training Scheme and of the arrangements with the Company's technical associates for imparting higher practical training in their factories abroad to the Company's personnel. "We attach the greatest importance," he said, "to the efficient recruitment and training of young engineers which we consider as a vital part of our programme of development. We are trying to make every young man who comes to us feel he is well looked after, his worth recognised and every chance given to him to equip himself, at our expense, for a successful, imaginative and rewarding career."

The Chairman expressed appreciation of the valuable services rendered by Mr. Y. N. Sukthankar and Mr. V. T. Dehejia as Directors of the Company. He also expressed appreciation of the services rendered by Dr. Heinrich Korsch, General Manager of the Company from October 1951 to the end of April 1957 when he retired for reasons of health and of Mr. F. G. S. Martin's ready compliance with the Management's request to take over again temporarily the responsibilities of the post of General Manager. The Chairman then expressed his thanks to his colleagues and to all the members of the staff for the year's excellent work.

"Since this speech was written," said Mr. Tata, "the labour situation at Jamshedpur has, I regret to say, taken a serious turn. On the 5th of August, a minor matter concerning the temporary transfer, many weeks earlier, of three men, without loss of pay from one section of the Auto Division to another in accordance with established practice, was made the excuse for an illegal lightning strike which had obviously been well planned in advance, accompanied by violent behaviour towards German supervisors on the part of the ring leaders."

Mr. Tata said that the instigators had acted without the support or knowledge of the recognised Union. They refused to listen to Union representatives and insisted on being represented by a communist group.

Continuing, Mr. Tata said, "A serious aspect of the situation is that the trouble is clearly not an ordinary trade dispute, which could be settled in the normal way by negotiation with the Union concerned, but a deliberate attempt on the part of Communist leadership to disrupt operations at the Telco Works. There is evidence that this incident is part of a larger plan to disrupt the working of the whole of the industrial complex of Jamshedpur."

Mr. Tata observed that industrial strife formed a part of the traditional pattern of Communist action throughout the world, and that if they had failed up to now to achieve their ends in the Steel Works at Jamshedpur, it was because of the strength and success of the Tata Workers' Union and the good sense of the workers themselves.

A secondary but important issue to which Mr. Tata drew the attention of the shareholders was the

situation in Jamshedpur and elsewhere of foreign technical staff brought to India to assist the country in the establishment and development of new industries. It was impossible, he said, to exaggerate the contribution made by these technicians to the successful establishment of the industry. The German supervisors at Jamshedpur had been greatly upset by the prevailing indiscipline and violence. It was pointed out by Mr. Tata that if discipline was not re-established and maintained, the Company's operations would be paralysed and the completion of the programme of progressive manufacture, essential to the full establishment of the Locomotive and Automobile industries and to the resulting saving of large amounts of foreign exchange, would be seriously delayed. Mr. Tata pointed out that this situation applied not only to Jamshedpur but to other Companies and centres in India where new equipment and processes are being introduced with the assistance of foreign experts.

Mr. Tata expressed the hope that the highest authorities in the Central and State Governments, whose attention had been drawn to this matter, would take a firm stand in Jamshedpur and everywhere in India where the Congress Governments are in power and that they would make clear by word and action their determination to protect the industrial life of the country.

At the conclusion of his speech, Mr. Tata issued a note of warning and said that if this conspiracy to sabotage the country's progress was allowed to succeed at Jamshedpur and elsewhere, not only would the economic crisis looking before the country be aggravated but law and order and the peaceful and democratic development of the country would be imperilled.

(Note: This is not a report of the proceedings at the above Annual Meeting).

COMPANY AFFAIRS

NEW CHUMTA TEA CO., LTD.

The gross profit of the Company for the year ended December 31, 1956, is Rs. 3,02,186, out of which have been provided Rs. 72,523 for Taxation and Rs. 52,504 for depreciation of assets. Allowing for these and other adjustments, there is a net profit of Rs. 1,97,233, which with the balance brought forward from 1955 gives a total of Rs. 2,76,930 available on this account. The directors have paid an interim dividend of 10 per cent on the July 25, 1957, absorbing Rs. 30,900, and have allocated Rs. 1,00,000 to Renewals and Additions Reserve and Rs. 25,000 to Staff Reserve, and there is a balance of Rs. 1,21,930. It is proposed to pay a final dividend of 15 per cent, making a total of 25 per cent for the year, absorbing Rs. 45,000. A sum of Rs. 76,930 has been decided to be carried forward to 1957.

Weather conditions generally were favourable and a crop of 5,64,457 lbs. of tea was made and disposed of on the Calcutta Auctions. Total net average sale price during 1956 was Rs. 1.86 per lb. against Rs. 1.65 during 1955. Working cost per pound of tea produced was Rs. 1.30 and Rs. 1.43 respectively.

In accordance with the voluntary scheme accepted generally by the Tea Industry in North East India, plucking closed on the November 20, and it is estimated that this resulted in a reduction in crop by some 40,000 pounds.

THE CARRON TEA COMPANY, LTD.

The audited Accounts of the Company, for the year ended December 31, 1956, disclosed a profit of Rs. 1,31,886.

After the transfers of Rs. 15,100 from Investment Reserve and Rs. 33,000 from Provision for Taxation being a reserve no longer required, there is a balance at credit of Profit and Loss account amounting to Rs. 1,50,586, of which Rs. 65,000 have been transferred to Revenue Reserve.

The Directors have recommended a dividend of 10 per cent leaving Rs. 25,586 to be carried forward. The average selling price realized was Rs. 2 per lb. as against Rs. 1-13-7 per lb. in the previous year.

POOBONG TEA COMPANY, LTD.

The audited accounts of this Company for the year ended December 31, 1956 also disclosed a loss of Rs. 1,47,845.

This sum when transferred to Profit and Loss Account and after sundry adjustments, including the transfers of Rs. 30,000 from Hail Reserve and Rs. 1,10,000 from Revenue Reserve, shows a balance at credit of the Profit and Loss Account amounting to Rs. 759, which it is proposed to be carried forward. The disappointing result of the year's working is attributed to increased wages, the full impact of which was only felt for half of the preceding year, loss of crop from hail damage and the recalcitrant attitude of the labour on the Pullongdong division, which necessitated the intervention of the armed police, coupled with the poor standard of their work.

A severe hail storm in April did considerable damage to the bushes and set back the crop by an estimated 287 maunds of made tea. The average selling price realized was Rs. 2-5-7 per lb. as against Rs. 2-5-11 per lb. in the previous year.

KUNCHUNPORE TEA COMPANY, LTD.

The audited Accounts of the Company for the year ended December 31, 1956, disclosed a loss of Rs. 5,344. On transfer of this sum to Profit and Loss Account and

after sundry adjustments, there is a balance at credit of that account amounting to Rs. 3,189, which it is proposed to carry forward.

Despite more favourable prices for the Company's produce, the year's working resulted in a small loss. This is due to high labour costs, a reduction in the crop and additional State levies. Severe flooding in June 1956, had its effect on the bushes and inevitably led to a smaller outturn. The average selling price realized was Rs. 2-0-9 per lb. as against Rs. 1-11-6 per lb. in the previous year.

BRIDGE & ROOF CO. (INDIA) LTD.

The audited Accounts of the Company have been prepared for the financial year 1956 in conformity with the provisions of the Companies Act, 1956.

The profit for the year (including items relating to previous years) after providing for Taxation and Depreciation, was Rs. 6,14,612. To this is added refund under Rule 7 of the E.P.T. (Post-war Refund) Rules, 1942 amounting to Rs. 1,536. The balance brought forward from 1955 was Rs. 1,51,297. Out of this total of Rs. 7,67,445 the Directors have set aside Rs. 3,50,000 to General Reserve, leaving a balance of Rs. 4,17,145 available for distribution.

A Dividend of 20 per cent has been proposed to be distributed, which will absorb Rs. 2,40,000. A sum of Rs. 1,77,445 has been decided to be carried forward. The increase in sales during the year from Rs. 134.66 lakhs to Rs. 173.20 lakhs reflects an increased tonnage output from the Works. Production of railway wagons rose from 639 in 1955 to 1,030 in 1956 and fabricated steelwork included blast furnace casings and other special plant for Steelworks extension.

**The South East Asian market
— a problem ?**

Businessmen interested in trade with South East Asia couldn't do better than to consult the Indian Overseas Bank. The bank has extensive experience in trade with South East Asian countries through its chain of branches strategically located all over South East Asia. Before you invest in trade in this area it would be wise to consult the Indian Overseas Bank.

COMMODITY NEWS AND NOTES

INCREASED COAL OUTPUT IN MAY 1957

Coal output in the country increased to 3,794,092 tons in May 1957 from 3,726,290 tons in the previous month, according to information received from the Chief Inspector of Mines in India. Despatches of coal during May were 3,187,466 tons as compared with 3,184,217 tons in April. Coal stocks at pitheads at the end of May were 3,245,646 tons as against 3,091,633 tons at the beginning of the month. During May, 831 collieries were reported to be working with an average daily employment of 347,257 workers. Output per man-shift was estimated at 1.13 tons for miners and loaders, 0.61 ton for all workers underground and in open-working and 0.41 ton for all persons employed including surface workers. The percentage of absenteeism was 13.93. Nine coke plants at collieries and elsewhere produced 372,375 tons of hard, soft and other kinds of coke, and despatched 184,070 tons during the month.

WHEAT PRODUCTION FOR SOUTH

To ensure a sufficient supply of wheat products at reasonable prices in South India, where the milling capacity is limited, the movement of maida, rawa and suji to Andhra, Mysore, Madras and Kerala from any of the northern wheat zones is now permitted without export permits. An order to this effect has been issued by the Department of Food of the Central Ministry of Food and Agriculture. Previous to the order, the movement of wheat products was governed by export permits. In view of the limited demand for wheat products in South India, there is little possibility of large quantities being exported by the flour mills in any of the States from which free export is now allowed. In any case, if exports from any of the States are found to be large enough to affect the price of wheat products in those States, the Government of India will make available to them for distribution suitable quantities of wheat from Central reserves. The new order will obviate the time-lag between the submission of applications by the flour mills and the issue of export permits by the State Governments, besides relieving the latter of work involved in dealing with mills' requests. The scope of the order does not extend to Bombay City, where the mills obtain their supplies of wheat entirely from Government. Movement from Bombay City will continue only on the basis of export permits.

STEEL IN INDIA

Though India is second only to Brazil in the possession of the world's largest reserves of high-grade iron ore, her output constitutes only 2 per cent of the total world production—compared to USA's 43 per cent and USSR's 18 per cent. India's annual output of steel is a little less than 1.5 million tons compared to 17 million tons in the UK and over 100 million tons in the United States. India consumes only 11 lbs. of steel ingots per head in comparison with USA's 1,237 lbs., UK's 628 lbs., Australia's 540 lbs. and Italy's 137 lbs. The first Five-Year Plan accorded high priority to the expansion of the steel industry and laid down a target capacity of 1.65 million tons of steel (as against 1.01 million tons in 1950-51) to be attained by 1957-58. By the end of the first Plan, the Government of India decided to set up three steel plants of 1.0 million ton ingot capacity each in the public sector, located at Rourkela (Orissa), Bhilai (Madhya Pradesh) and Durgapur (West Bengal). The total estimated cost of the three plants exclusive of townships will be Rs. 353 crore. The target of steel production for 1960 is 6 million tons. This includes the output of new works in the public sector as well as production through the expansion of existing works.

PRODUCTION OF COARSE GRAINS

In a written reply to a question in the Rajya Sabha the Union Minister for Food and Agriculture,

Shri Ajit Prasad Jain, said that during 1956-57, the first Year of the second Five-Year Plan, the production of coarse grains was estimated at 20.0 million tons as against 19.0 million tons during 1955-56—an increase of one million tons. Under the second Five-Year Plan, the additional production of coarse grains was fixed at 3.5 million tons over 1955-56, to be achieved by the end of 1960-61. On this basis the additional production in 1956-57 over 1955-56 appeared to be satisfactory.

EXPORTS OF LINSEED OIL

Before World War II India exported linseed in large quantities, but produced little of oil. Now, with the expansion of the oilseeds crushing industry, nine-tenths of the total produce is crushed in the country. India has thus emerged as an exporter of linseed oil, and her share in the international trade in this commodity has risen from a meagre one per cent to nearly 7 per cent. India produced 3.76 lakh tons of linseed and 1½ lakh tons of linseed oil in 1955-56. The exports which went mainly to the United Kingdom, Australia and New Zealand amounted to 81,000 tons of oil and earned Rs. 9½ crores in foreign exchange.

EXPORT OF SALT

In a written reply to a question by Shri Shree Narayan Das in the Lok Sabha, the Deputy Minister for Commerce and Industry, Shri Satish Chandra, said that total quantity of salt exported in the first six months of this year was 3,21,256 tons as against 1,00,400 tons during the corresponding period of 1956. The Deputy Minister said that salt exported to foreign countries had been exempted from the levy of cess. Prospects of exports were brought to the notice of the salt manufacturers associations.

POTATO ACREAGE IN BRITAIN

The area planted with potatoes this year in England and Wales and Scotland is over 72,000 acres less than in 1956, (which was 732,000 acres) the potato Marketing Board has announced. The acreage for earlier only is down by 16,000 and per main crop and second earlies by 56,000. Though the 1957 crop has improved a great deal from the rains in July, the Board says it is fairly clear there will not be anything like the heavy surplus of last year. The acreage figures are returned by 81,000 registered producers—about 90 per cent of all growers.

**Where STEEL is a problem
UNITED STEEL
is the answer**

United Steel produces in its vast Steelmaking Plants, in great quantity and variety, those Steel Products which form the basic requirements of every aspect of India's Industrial Progress.

Company Meeting

THE TATA IRON & STEEL CO., LTD.

The following is the speech of the Chairman, Mr. J. R. D. Tata, delivered at the fiftieth Annual General Meeting of the shareholders of the Tata Iron & Steel Company, Limited, on Tuesday, August 27, 1957.

Ladies and Gentlemen,

We meet this afternoon one day after the fiftieth anniversary of the birth of our Company and of the Indian Steel Industry.

GOLDEN JUBILEE

2. The Company is today so well and successfully established as the biggest single private enterprise in the country and its largest steel producer, that we are inclined to forget the struggles and heartaches of earlier years and the difficulties which had to be overcome before and after it was brought into existence. Considering the resources and potentialities of the iron and steel industry in India as we know them today, it is not easy to realise how little they were appreciated only fifty or sixty years ago and the extent of the doubts and disbelief with which the original proposals were greeted. Had it not been for the name and prestige of Jamsetji Tata and his sons, Dorab and Ratan, backed by their faith and determination, many more years would have passed before the steel industry was established in India. Amongst the patriots and leaders of his generation Jamsetji, more than anyone else, realised that political freedom without economic and industrial strength to support and defend it would be a cruel delusion, and that the foundations of industrial power were made of steel.

3. It is proper, therefore, as we look back today upon a half century of progress, that we should pay tribute to the memory of Jamsetji Tata and also remember the part played by his sons and others who are no more, including R. D. Tata, B. J. Padshah, John Peterson, Nowroji Saklatvala and Ardeshtir Dalal.

4. In the fifty years of our life we made over 22 million tons of steel, paid Rs. 175 crores in wages and bonuses, about Rs. 45 crores in dividends, well over Rs. 70 crores in taxes and Rs. 40 crores into Government's price equalisation fund. In the process we saved the country hundreds of crores' worth of foreign exchange and are doing so today at the rate of some Rs. 50 crores a year, which will rise to about Rs. 90 crores from next year onwards. I feel we have amply repaid the country for the protection granted to the steel industry during the difficult years following the first world war.

5. We have had our ups and downs and have made mistakes, but through good years and bad, we never forsook the ideals bequeathed to us by the Founder or lost sight of our duty and responsibility to the country. Our Company has provided a living and dynamic answer to the charge that free enterprise cannot "deliver the goods", is only inspired by selfish motives and does not serve the needs of the people. In all humility, I think we can justly claim we have served the country consistently and well.

6. If through these many years we have overcome so many obstacles and difficulties, it is partly because even in the darkest days of our history we enjoyed the trust and the support of our staff, workers, consumers, Government and shareholders. For that we are grateful and I am glad of the opportunity to say so today. I should particularly like to express grateful appreciation for their loyalty and support to that stalwart band of shareholders who have held shares in the Company since its very inception.

7. Before I leave the subject of the Golden Jubilee of the Company, may I refer to the view expressed by some shareholders that the occasion should have been celebrated in some suitable form, such as the distribution of an enhanced dividend or bonus shares? The fact is that we are today considering the annual report and accounts for the year 1956-57, while the fiftieth anniversary of the Company's foundation falls in the financial year 1957-58. I cannot say today what the Board may find it possible to do when considering the accounts for the current year. Much will depend on the results achieved and the circumstances in which we shall then find ourselves, but I can give the assurance that the Directors will give the matter their sympathetic consideration.

SECOND FIFTY YEARS

8. Today we begin the second fifty years of our existence with confidence. We are conscious of the heavy additional burden of work and responsibility that faces us and of the many problems and difficulties ahead, but with the combination of an expanded and renovated plant and a strong and mature organisation, we hope to give a good account of ourselves.

TWO MILLION TON PROGRAMME

9. Our first and most important task is to complete the expansion of our plant and reach our two million ton target as quickly as possible. Our schedule of construction was from the start an extremely tight one. Kaiser's still hope to adhere to the original schedule, but it is too early as yet to forecast the exact dates on which each of the new units will come into full production. One unavoidable consequence of having to telescope much of the programme into one year has been a greater degree of interference with existing production than previously anticipated, the effects of which on current production are being seriously felt.

SECOND FIVE-YEAR PLAN

10. The year under review was characterized by a severe reversal in the country's balance of payments position and by the emergence of inflationary pressures which, unless checked in time, may lead to a crisis even more serious than that relating to foreign exchange. Both these developments can be traced to the same source, namely, the mounting national expenditure in

both sectors of the economy under the second Five-Year Plan.

11. The essential questions to be faced are whether the total resources available in India and obtainable abroad are sufficient to meet the rate of expenditure proposed under the Plan, and even if they are, whether the Plan can be implemented without imposing such a strain on the economy that the material benefits would be lost in the resulting inflation. If the answers to either or both of these questions are in the negative, as I believe they are, there will, I hope, be no hesitation on the part of those in charge of our economic destinies either to prune the Plan or to phase it over a longer period, or both.

12. In view of the magnitude and urgency of the country's needs the planners were right in setting their sights high and attacking the problem with boldness. At the same time, the very complexity of the task, the difficulty of estimating precisely the costs of materials, equipment and services over a period of years, and the uncertainties in regard to political and economic trends throughout the world, made it all the more necessary to temper boldness with realism and to provide some margin for under-estimates, increases in costs and other contingencies. Instead, out of the original planned investment of Rs. 4,800 crores, no less than half, or Rs. 2,400 crores, was made dependent on such uncertain factors as foreign assistance, deficit finance and further taxation over the above the additional taxation of Rs. 450 crores already provided for. The estimated expenditure has since risen to Rs. 5,600 crores or more, increasing the gap to an even larger one. Faced with such a situation, I believe the Government of India recognise that substantial adjustments of the planned expenditure are inevitable.

13. The Plan, after all, is only a means to an end, not an end in itself, and the progress we make during the current five years is only one step in a long and steady march towards our ultimate goal. If we keep our eyes on that distant target, the exact measure of the step we take in the second Five-Year period loses some of its apparent importance. By taking a shorter and surer step today we may, in fact, reach our goal sooner and we shall certainly incur less risk on the way.

FOREIGN CAPITAL

14. Everyone, from Government downwards, recognises the crucial importance to India of foreign capital, whether in the form of aid, loans or equity. There is today an unprecedented demand for capital funds in all countries which has resulted, even in an enormously wealthy country like the U.S.A., in an acute tightness of money. It stands to reason that with local demand competing strongly for available funds there is little inducement for foreign capital to flow to India. Our constantly rising burden of taxation and the disincentives contained in various enactments and measures hardly represent the best way to create enthusiasm abroad for investing in, or lending money to, India.

15. Yet there is in the advanced countries of the West realisation of the tremendous long-term possibilities of increased trade with India and of opportunities for investment. If our Government and Parliament realising the full extent of such possibilities were to revise some of their policies so as to generate greater confidence in the investment markets here and abroad, I believe that over the years a substantial flow of foreign capital could be induced to this country and our foreign exchange position thereby greatly eased.

STABILITY OF THE RUPEE

16. The question of foreign exchange is linked, in the Indian context, with the question of foreign balances and the value of the Rupee. In recent years the Indian rupee has shown remarkable strength which has contributed much to the economic stability of the country. The extent to which the maintenance of substantial foreign balances has been responsible for the strength of the rupee in international markets cannot be assessed with certainty, but there is no doubt that it has played a part in the confidence our currency has enjoyed. I therefore view with alarm the suggestion advanced in some quarters that such foreign balances are wholly unnecessary as a backing to our currency and that statutory requirements for the maintenance of foreign balances should be abolished.

17. Confidence in a country's currency is a delicate plant which needs to be carefully nursed and which it is difficult to grow again once it is allowed to die. Both international credit and internal stability depend upon it and there are too many historical examples of the calamitous consequences to a country and its people of a collapse in the value of their currency, to permit of any risk being taken in the matter. I am sure that our Government are fully alive to the need of maintaining public confidence in the rupee both in India and abroad.

FINANCE FOR EXPANSION PROGRAMMES

18. Coming to our own affairs, perhaps the most important matter about which I think you will be interested to hear from me today is the progress we have made in securing the balance of the funds required to finance our current expansion programmes.

19. In paragraph 14 of the Directors' Report, it has been said that the Company had initiated negotiations in the U.S.A. Your Vice-Chairman and I spent a month there in June this year, during which we held discussions with the World Bank and with American commercial banks.

20. As before, we were received with the utmost consideration by the distinguished President of the World Bank and other Executives of that great Institution. They were good enough to agree to increase the amount of the previous loan of \$75 million by an amount equal to that which we were able to raise elsewhere subject to a maximum of \$17½ million, which is half the remaining gap of \$35 million. In order to facilitate our task they went further. They agreed to raise the amount of the present mortgage up to \$110 million, so that other lenders in the States could rank 'pari passu' with the World Bank in the matter of security, and they also agreed to the prior repayment of the loans from such lenders. We are deeply appreciative of the consideration and assistance extended to us by the World Bank, without which the task of raising the necessary funds would have been well-nigh impossible.

21. With these valuable concessions and the powerful assistance of the First Boston Corporation who have been appointed the Steel Company's financial agents for this purpose, and whose outstandingly able Chairman, Mr. George Woods, is one of India's best friends abroad, we approached a group of leading commercial banks in the States with a view of securing medium term credits from them up to a total of \$17½ million. The negotiations are still proceeding between these banks and the First Boston Corporation representing us and I hope they will fructify in the near future.

22. I should like to take this opportunity to thank the Government of India for the assistance they have given us in this matter, both by sponsoring and guaranteeing the additional loan from the World Bank and by helping us in various ways in our negotiations with the commercial banks.

23. Realising the valuable savings in foreign exchange and also in expenditure on steel used under the Plan which our expanded output will generate, the Finance Minister has, from the beginning, taken a great deal of personal interest in our expansion programme and in the means of financing it, and I wish on your behalf to express our grateful thanks to him for his support and sympathetic understanding of our problems.

24. The amount I have mentioned as being required to complete the financing of our programme of expansion is based on the assumption that the rate at which our internal savings accrue and the capital cost of the various projects in hand correspond with the estimates. To the extent that additional taxation reduces our net savings or enhanced customs and excise duties increase the capital cost of our new plant, we shall require additional funds and we are making a representation for an appropriate increase in our retention prices.

TAXATION

25. It is relevant that I should briefly discuss here the implications of the new taxation proposals, as taxation has nowadays a major impact on the operations and finances of industry. It is inevitable that a high rate of national expenditure calls for high levels of taxation, both corporate and individual. During the first Five-Year Plan, central taxation amounted to about Rs. 255 crores. The second Five-Year Plan, as originally conceived, visualized additional taxation of Rs. 450 crores over and above the existing levies, to which must presumably be added a part of the gap of Rs. 400 crores then left uncovered. Since then, however, the Finance Minister has indicated his intention to reduce the quantum of deficit financing from Rs. 1,200 to Rs. 800 crores, while the expenditure on the Plan has increased by a further Rs. 800 crores. The total uncovered gap would thus reach the formidable figure of about Rs. 1,600 crores. If any appreciable part of this gap were sought to be met by a further increase in taxation, it would place an unbearable burden on industry and commerce and deprive them of what little is now left of funds available for investment.

26. Apart from the magnitude of the additional burden of taxation proposed, the Budget for the current year presented to Parliament embodies new and unprecedented features. Of these, the one which has rightly met with almost universal disapproval is the Wealth Tax on companies. It is difficult to understand how such a measure of personal taxation can be applied to the assets of large public companies made up of contributions by thousands of shareholders, rich and poor alike.

27. The Wealth Tax on companies has been sought to be justified on the ground that in the peculiar conditions of India, very few shares in companies are owned by small shareholders. I think the best answer to this view is given in the figures recently quoted by the President of the Bombay Stock Exchange which show that, on the basis of a survey of ownership of shares and securities in Bombay City undertaken by the Reserve Bank of India in 1954, 60 per cent of the shareholders of companies were persons with incomes below Rs. 8,000 a year. In the case of our own Com-

pany, nearly half of our shareholders have holdings of less than Rs. 1,000 each, while the holdings of about 87 per cent amount to less than Rs. 5,000 each. The subjection of companies of Wealth Tax will therefore hit a large section of the middle class, will result in the shareholders being taxed twice on the same assets, and will act as a powerful disincentive to save and invest.

28. Apart from the controversial nature of the Expenditure Tax and the annual Wealth Tax, these taxes together with taxes on income, will result in individual assessee in the higher brackets paying substantially more than 100 per cent of their income. In effect, in addition to the whole of their income being taken away from them, they will now be made to pay something for the right to live and work in their own country. Nowhere else in the world does such an extraordinary situation exist. I can only hope, that even at this stage, Government will revert to a simpler and less drastic scheme of taxation. The only sure method of increasing tax revenues is to provide incentives for investment which, in the train of larger profits thereby generated, will bring in larger revenues to the State.

29. As a result of the Budget proposals, the amount of additional taxation which our Company will have to bear, including excise duty on steel used in our expansion programmes, will be approximately Rs. 1 crore for the current year and corresponding amounts in subsequent years, thereby adding to the financial stringency with which the Company is already faced in implementing the Two Million Ton Programme.

LABOUR

30. Some of you will have read in the papers the remarks I made at the annual general meeting of the Tata Locomotive and Engineering Company earlier this month on the labour situation at Jamshedpur.

31. While the position in the Steel Company was generally satisfactory during the year and the Company's relations with the Tata Workers' Union continued to be maintained on a basis of co-operation and mutual confidence, the general wave of labour unrest in the country, coupled with the recent attempts of the Communist Party to disrupt the working of the industries located at Jamshedpur, has recently affected the situation in our Works.

32. One of the most discouraging features of the labour movement in India up to now has been the relatively slow progress made in building up, as in other countries, strong and stable unions well organised and staffed, endowed with substantial financial resources and enjoying the sustained loyalty and support of the workers.

33. With rare exceptions, the labour movement here has suffered acutely both from the lack of support from within and from being kept in a constant state of uncertainty and agitation by a never-ending struggle for power, often in total disregard of the interests of the workers concerned. Once a union is well-established and recognised, it is made the butt of attacks and intrigues by outsiders bent upon acquiring control or establishing a rival union. If the union has established sound and constructive relations with employers, and even though it may, as in our case, have obtained through negotiations valuable concessions in

the form of increased wages, bonuses, retiring and other benefits, job security, consultative machinery and the like, its leaders are charged with betrayal of the workers' interest and its members instigated to renounce them and to follow others who promise to get them better terms from the employers.

34. The bewildered workers who, because of the lack of education still prevailing in our country, are easily influenced by such promises and exhortations, are kept in perpetual doubt as to where their interests lie and fail to see that they are the main sufferers from their unwillingness or inability to support their proved leaders in their efforts to build up strong and responsible unions.

35. The attempts of the President of the Tata Workers' Union and his colleagues to strengthen their organisation have been obstructed for some years by a continuous and virulent campaign against them by outside parties, with Communists now in the lead. As can be seen from recent events in Telco and the Tinsplate Company, these disruptive elements have succeeded in creating trouble and unrest which, if unchecked, may spread to the Steel Works.

36. All the policies and plans of the Government for developing the country and raising the standards of living of its people are based upon the achievement of a rapid and continuous rise in the output of all kinds of goods and services and particularly in industrial output. The Communists are well aware of this. In their eyes success in achieving prosperity through a mixed economy and by democratic means would be a severe set-back to their plans and must therefore be thwarted at all costs. Progress and happiness must be achieved the Communist way or not at all and they cannot afford to let success in India disprove the necessity of the totalitarian methods used in some countries which they seem to love more than their own.

37. There is evidence that their present activities at Jamshedpur are part of a pre-determined plan. Jamshedpur is one of their obvious and principal targets in the labour field, for control of the growing steel and heavy engineering industries there would provide them with a stranglehold on one of the most vital and sensitive sectors of the economy. Our information, confirmed by the recent developments at Jamshedpur, is that in the first phase which we are witnessing today their plan of action contemplates no frontal attack on the labour movement there but a series of localised incidents in each factory and neighbouring mines directed at destroying morale, fostering indiscipline and, wherever possible, at disrupting production through slow-downs and lightning strikes. Agitation, coercion and intrigue, in the traditional pattern of Communist action, all play their part in this preliminary softening-up process. If it succeeds, the pressure will be increased and extended to other units in the next stage until the present trade union movement and its leadership are destroyed. The last step would be to take over the whole labour movement at Jamshedpur and elsewhere.

38. The main responsibility for maintaining peace and order and for preventing disruption of industrial production at Jamshedpur by subversive elements, lies with the Government of Bihar, who are fully aware of the developments and of the serious implications of any loss of production that might result from continued disruptive activity at Jamshedpur.

INDUSTRIAL HEART OF INDIA

39. Bihar, along with adjacent areas, is rapidly becoming the industrial heart of India. It is essential that its development should follow an orderly pattern based on the maintenance of industrial peace, productivity, sound trade unionism and a high degree of discipline without which efficient production is impossible. It is gratifying that the Government of Bihar, while continuing to protect the legitimate interests of the workers and to promote their welfare, fully appreciate the importance of maintaining production and good industrial relations in their State. I am sure they will find the Managements of the industries established there more than willing to co-operate with them in carrying out these objectives.

40. The Government of India are also deeply concerned in this matter, for the industries of Bihar are national industries serving the whole country, and progress or set-backs in their working will benefit or injure the nation as a whole. The Central Government are themselves building three large steel works and other plants in the area, and a number of important industries, such as the Chittaranjan Locomotive Works and the Sindri Fertiliser Factory, are owned and run by them. What happens in the area is therefore of vital importance to them, and we look to them, in co-operation with the State Governments concerned, to initiate or support measures calculated to maintain peace, discipline, productivity and efficiency in the great industries on which the future prosperity of this country so largely depends.

41. Before closing I should like to say a few words about the death of Mr. Dinsha Daji to which a reference has been made in the Directors' Report. Apart from his outstanding knowledge of Company Law and his long experience of industrial and business affairs from both of which we greatly benefited, Mr. Daji was a great gentleman who lived a simple life dedicated to his work. We shall sadly miss his counsel and support, and I am sure the shareholders will want to join me in paying tribute to his memory and mourning the passing of a wise and learned man who, while he took a broad and human view of things, never compromised on principles.

42. I would also like to refer to the loss which the Company has suffered by the passing of Mr. A. Rajagopalan, who died on April 5, this year. An exceptionally able and industrious officer, Mr. Rajagopalan, rose to the high position of Agent in charge of the Company's office in Calcutta. Over a period of twenty-five years he rendered outstanding services to the Company in various branches of the administration and particularly in the preparation and presentation of the Company's case in successive Tariff Commission enquiries and in important negotiations with Government in regard to a number of intricate matters connected with finance, costs and prices.

43. Finally, I should like as usual to end on a message of thanks and appreciation to the management and all the employees of the Company at Jamshedpur and elsewhere for the hard work they have put in during the year. The tremendous amount of construction work at the Works, forming part of the Two Million Ton Programme, and the resulting complications and difficulties in maintaining normal operations, place them under a severe strain of added work, worry and responsibility. On your behalf, I thank them for their efforts and wish them all success in the completion of their heavy task.

"Note: This is not a report of the proceedings at the above Annual General Meeting."

A Revitalised Congress ?

much noise has accompanied the latest session of the All-India Congress Committee has quietly transacted some very important business. It has voted, without much debate, far-reaching (and far-sighted) changes in Congress constitution with the avowed purpose of revitalising the organisation and bringing it to the people in a more active and massive way. And it has also discussed, behind closed doors, the current state of the second Plan and the problem, and land reform and co-operative issues. There is, it would appear, much more than meets the eye in this unusually busy procedure of a Congress body which has shunned lavish publicity in the past. The speed with which the Congress leaders sponsored amendments to the party consti-

tution is probably explained by their uneasiness on the score of the Communist challenge in and from Kerala to the pre-eminent position of the Congress in the country — an uneasiness that must have been shared by the rank-and-file also. And the secrecy clamped down on the A.I.C.C. members' views on matters of grave economic import is probably explained by their uneasiness on the score of mounting taxes and rising prices — an uneasiness that must have been shared by the leaders also. It would, therefore, appear that the Congress leadership and the rank-and-file have drawn themselves closer to each other and cleared the decks for the battles ahead. And in so doing, they should have been frightfully aware of the spectre hanging over the Congress and the country alike — the spectre of Communism. For,

although the Congress has won many a battle so far, the decisive battles are yet to be fought if it is to win that war — the war against poverty and social disruption (and Communism) in a peaceful, gradual and democratic manner.

This is the background against which the radical changes in the Congress constitution become easily comprehensible. The proposed constitution of mandal committees as the bases of the organisation at the rate of one such committee for an area of 20,000 population may well be a step in the right direction only if the Pradesh Congress Committees do not generally constitute subordinate committees below the mandal committees although they are permitted to do so, if they want, under Article XV of the amended constitution. The permissive provision for possible subordinate committees is not quite justifiable, for one would have thought that total elimination of small but numerous Congress committees at the village level in rural areas and the ward level in towns was called for in view of the proved difficulties of co-ordinating their activities and in view of their inherent incapacity to prevent effectively the infiltration into them of crypto-communists and fellow-travellers.

As a mandal committee is to consist of members (directly elected by persons of the age of 18 and over, subscribing to the object of the Congress and paying an annual subscription of four annas each) at the rate of one for about 2,000 population corresponding to not less than 25 and not more than 75 four-anna members, it should be a good enough democratic base deriving its strength from the general assembly of hundreds of primary (four-anna) members enrolled within the area of a mandal—neither too small nor too unwieldy, at once compact in its composition and capable of planning and pursuing mass-contact activities in a comparatively modest area of from 20 to 30 villages. A multiplicity of committees in that area which is by no means large by the size-standards of State Assembly constituencies would only make for confusion by way of election feuds and unrelated or unco-ordinated activities. A mandal committee, with up to 50 per cent of its total membership consisting of representatives of functional groups — propaganda or service teams, special elements like peasants and labourers, and popular organisations or institutions —, can be expected to operate effectively in all parts of its area without the aid of any subordinate committee. At least the mandal committee should not become an agency for transmitting orders received from above or a body sending down orders to any committee below. There is already far too much of red-tapism, bureaucracy and shirking of responsibility at every tier of the Congress organisation, and so the responsibility for organising mass-contact activities should be squarely placed on the mandal committees.

If the mandal committee, by virtue of its being constituted by direct elections, can thus be a popular body for active work among the people, the district or the pradesh committee, with its members elected by elected members of mandal committees besides having co-opted representatives of functional groups and organisations of its own, can well be an efficient, streamlined agency for co-ordinating, assisting and guiding the activities of the mandal committees. It is only at the mandal level that the Congress can be in direct, living touch with the people and their day-to-day problems and directly reflect their grievances and aspirations. For their part, the

district committees and the pradesh committee, by virtue of their being based on the mandal committees, can also become automatic carriers of representations, on behalf of the people, to the district administration and the State Government concerned.

While thus the limiting of direct elections to mandal committees is calculated to reduce the excessive preoccupation of Congressmen with internal party elections and squabbles arising therefrom to a bare minimum, the manner of constitution of the three-tier committees can, by itself, minimise the chances of Communist infiltration into Congress ranks. It cannot, however, wholly eliminate or block such infiltration because the current radical or socialist professions of Congressmen and Communists are such as to blur the differences between them. Incidentally it may be noted that this process of infiltration with its concomitant in increasing radicalisation of a section of Congressmen has been going on to some extent since the Palghat Congress of the C.P.I. Perhaps the Party's calculations are that the process would get accelerated in the next few years as a sequel to the Communist Government's slogans and doings in Kerala. Which probably explains the expectation of some Communist leaders that their Party would be in a position to form, following the next General Elections, a coalition government at the Centre with a section of Congressmen.

This, however, can be dismissed as a highly exaggerated hope on the part of some Communists. For, infiltration is necessarily a slow and laborious process and the placing of Trojan horses at strategic points in a colossal organisation like the Congress cannot be done all at once, as if by the wave of a magic wand, one fine morning. In any case, what little infiltration takes place can still be neutralised by functional representatives such as known Gandhians working in Bhoodan, Harijan uplift, social reform, cottage industry and other constructive spheres of activity and moderate and independent or pro-Congress leaders of kisan organisations and trade unions. The active association with the Congress committees of large numbers of Gandhian constructive workers who are today keeping themselves at a respectable distance from the Congress bodies out of sheer disgust with their mad scramble for the loaves and fishes of office, would be the most potent way of countering the forces of disruption both inside and outside that Party for Gandhians are essentially firm believers in the golden mean of compromise and moderation, some of their familiar fads notwithstanding.

Perhaps their distinctive contribution to the process of revitalising the Congress organisation could well lie in the land reform sphere where the State Governments are cutting a sorry figure. As the land problem today is, in the last analysis, virtually a Harijan amelioration problem, a vigorous application of the Bhoodan approach (with its pronounced bias in favour of Harijans) not only to rehabilitate as many of them as possible on donated lands but also to get for the rest voluntary concessions from landowners in respect of crop-shares and wages, should be of greater psychological value to the Congress both by way of cordial relations with the far more numerous class of landowning agriculturists and by way of speedy though modest relief to the landless than any body of radical agrarian legislation which would be more honoured in the breach than in the observance.

The Debate on the Finance Bill

THE debate on the Finance Bill in both the Houses only confirms the impression that despite the best of effort on the part of the Finance Minister and the stout defence which he put up for his taxation proposals, Parliament could not be convinced fully of their propriety and advisability in the prevailing situation. It ought to be conceded frankly that in spite of the wearisome process of having to traverse the same ground which he had already covered on several occasions since the budget proposals were announced, Mr. Krishnamachari did not relax in his zeal to expound the rationale of his taxation policy and its urgency at the present time. But the fact that his earnest advocacy could not sufficiently persuade or win the two Houses conveys important implications about the view which Parliament and the people take of the additional tax burdens. Probably the most important outcome of the debate was the definite indication given by Mr. Krishnamachari about the Government's positive approach to foreign capital.

The Finance Minister dealt at length with the role of taxation as an instrument of financing the Plan and propounded a 4-point thesis which was abstract in its essence. The most important part of the objectives of taxation as explained by him relates to its social ends. It should, however, be clear that the income redistributive function of taxation to achieve the objects of an egalitarian and at the same time prosperous society can hardly find place in an underdeveloped economy. It is bound to produce adverse repercussions on economic progress as it would impede the overriding goal of increasing the wealth and levelling up the standards of living first. In its absence redistributive taxation will bring about equality in the downward direction. In vindicating fresh taxation of the magnitude imposed in the current year, the Finance Minister has made out a new case for a greater emphasis on taxation than originally contemplated in the scheme of financial resources for the Plan. He has laid much stress on the diminishing efficacy of public borrowings as a source of finance. The underlying implication of this observation needs to be fully realised. If public borrowings fail to come up to the expectation of the planners, it would undoubtedly indicate that the economic climate is not as conducive to voluntary savings as it ought to be. The reason why it is not so conducive is more important than the assertion of the superiority of taxation over market borrowings as a source of finance.

When the Finance Minister hinted at the possibility of the belief being entertained that too many taxes were being compressed in the budget proposals in a single year, he had in fact gauged the general reaction and spotted one serious flaw in this year's scheme of taxes. His explanation for having imposed a multiplicity of taxes, however, hardly carries conviction. If the country is facing a difficult economic situation particularly because of inflation, taxation is not necessarily the most important answer to it. The second ground furnished for levying so many taxes, however, is noteworthy. The Finance Minister has explained that it is a good policy to give the entrepreneur and the businessman a clear and definite picture of what he should expect by way of taxation during the Plan period so that he may not be assailed by doubts and uncertain-

ties. There is some force in this argument to the extent that he has placed his cards on the table and given an assurance that there would be no further new taxation during the period of the Plan. But it cannot alter the fact that so many taxes imposed simultaneously have brought too great a burden on the people and far from removing the uncertainty about the future, they have created a basic uncertainty about the climate in which they have to function. A heavy tax burden cannot be imposed in an underdeveloped economy without impairing the incentives which are essential for intensive activity at all levels. If anything, heavy taxation resulting from too many new taxes will hamper the very object which is claimed to be its virtue.

One of the objects why the burden of taxes has been raised so steeply, it is claimed, is to hold in check the forces of inflation. It is argued that excise duties on which a great emphasis has been placed in the budget will help in creating a defence against inflation, first, because they will restrain consumption and, secondly, because they will help to mop up a part of excess profits. While these objectives may be realised in some measure, this argument overlooks the fact that excises have a real potential to inflate prices and the Finance Minister himself has straightaway stated that the new excise duties levied this year are admittedly stiff. The burden of new taxation has been falling heavily on the middle class both because the exemption limit of income-tax has been lowered and the excise duties make a direct inroad on its income. This is to inflict hardship on a strategic class of society whose insurance against want is of crucial importance to political and social stability. The concessions given to the wealthier class through reduction in the rates of personal income-tax at the top level have been more than nullified by the imposition of the wealth tax and the expenditure tax. The wealth tax on the corporate sector which is unprecedented in the history of taxation anywhere is bound to create serious problems for companies. By depressing incentives and retarding capital formation the new taxes will add to the difficulties of intensified production.

The Finance Minister's firm and forthright rejection of the Communist suggestion to put a ban on repatriation of foreign profits and foreign capital, although it was obviously expected, serves to reiterate Government's attitude to foreign capital. More important than this reiteration of policy was a significant observation made by the Finance Minister in his reply to the debate in the Lok Sabha. Its significance is enhanced by the fact that it comes as a purposeful statement in a prepared speech on the eve of his visit to the United States. He emphasised that while every developing economy must necessarily depend upon foreign finance for part of its requirements of resources, foreign capital can come only if one "actively seeks" it. His further observation in this very context that our approach to the problems created by the Plan is pragmatic and that we are now engaged in readjusting the size of the Plan should provide an answer to the oft-repeated criticism that it is too ambitious for the available resources. The Finance Minister will no doubt take upon himself the task of actively seeking external finance while he will be abroad in the course of the next few days.

Degrees and Services

THE report of the 10-member Lakshmanaswami Mudaliar Committee, appointed by the Government of India to recommend the basic qualifications for recruitment to and promotion in the public services, has now been made public. Appointed in April, 1955, the Committee submitted its report more than a year ago.

The problem of recruitment to public services is important to every country, more so in India where Government happens to be the principal and the biggest employer. Its proper solution can, therefore, not only provide a firm basis for administrative reform and efficiency, but also initiate change in the bias of the educational system. The very purpose of our educational system has been in practice perverted by Government's pre-condition of a university degree as the minimum qualification for all but the lowest posts and services. The result of this indiscriminate insistence on university degrees, the Committee rightly emphasizes, "has been to create a rush for university education even among people who can neither afford such education economically nor are likely to profit by it intellectually." The Committee has, therefore, recommended that the university degree as a requirement for the public services need not be a necessary qualification for all levels of Government services: clerks, junior officers, and senior officers. A university degree, the Committee suggests, should not be insisted upon for the first category; though it would not "disqualify" graduates from entering the clerical services, yet it would certainly "discourage" them from doing so. To achieve this the age-limit suggested is 17 to 19. For the middle category, the Committee has suggested that the university degree should not be made the minimum qualification but that graduates should be given an opportunity to compete if they so desire. Entry into the Senior Executive and Administrative Services, including the all-India Services, as well as the Central and State Class I Services, should be restricted to graduates. The Committee's recommendations on the question of classification of services are, however, not meant to be applicable to posts of technical and professional nature, such as Engineering, Law, Medicine and Teaching.

In their dissenting note, three members of the Committee, Prof. Humayun Kabir, Mr. N. K. Sidhanta and Dr. Sushila Nayar, have asserted that there was no sufficient justification for insisting on a university degree as a pre-condition for entrance to any "non-technical posts" under the Government. These dissenting members have referred to England and America where such a pre-condition would be considered "not only undesirable but also undemocratic." It would appear that the majority view is sounder than that of the dissenting minority. The latter seems to have omitted to take into account the fact that while in Britain and America, Government jobs go begging so to say, in India as much as a quarter of the present output of the graduates fervently hopes for services under the Centre or States, as there is practically no other opening available.

It is perhaps to meet the view of the dissenting members halfway that the Committee has recommended that the Government should "undertake re-examination of the methods of promotion" so that "as far as possible" promotions are not denied to non-graduates merely be-

cause of the accident of their not possessing a paper degree.

The Committee has also recommended "a system of weeding out (of the candidates) by preliminary examinations" to permit "wastefully large" numbers from appearing in various examinations held by the Public Service Commissions in the country. The final examination held for recruitment should be of a comprehensive nature and should test the mental qualities rather than merely the memory or the fund of information of the candidates. In addition, there should be some test for judging the personality, attitude and aptitude of candidates. The Committee has suggested the evaluation of the candidates' achievements during probation and adding it to the competitive examination marks for determining the final ranking in the services.

The principal advantage of adopting the Committee's recommendations so far as the first and second categories are concerned will be that the pressure on the universities, which have at present to cope with unmanageable number of students, will be relieved to some extent. But this is an advantage but of temporary value. If academic qualifications are divorced from the qualifications for recruitment to services, not only will all the present teaching schools be turned into coaching shops for public service examinations but many more may also spring up. Properly organized schools and colleges even with all their defects are in every way better than purely commercial establishments. Should we then in an attempt to reduce the number of students seeking admission to universities encourage the unhealthy growth of private money-making teaching shops? Surely it will not do at all either to allow every applicant to have a try or to adopt some *a priori* standards to decide which applications are worthy of consideration and which should go into the wastepaper basket. The Committee itself is conscious of such a development. That is probably why it has suggested a process of weeding out through a preliminary examination. If this suggestion is implemented, competitive examinations may well become as much of a problem as matriculation examinations are, wherein tens of thousands of candidates may be forthcoming to compete. Moreover, to do away with such a yardstick as a minimum qualification would be to throw open the doors to all manner of extraneous influences—not all of them healthy. It is true that there are many who cannot be considered truly educated even though they may possess the degree qualification. But the university degree remains the only criterion to decide whether a candidate possesses a passable minimum equipment of education and general information.

Again, there is no reason why the clerical as well as the middle services should not be open to graduates and non-graduates alike. Government service, even at the clerical level, in our increasingly complex society, calls for an amount of competence, judgment and maturity which a lad of 17, fresh from school, could hardly be expected to have. The remedy seems to be in speeding up economic development, and thus ensuring alternative channels of gainful employment. Only then will the stage be deemed to have arrived for reorganization of public services.

THE WEEK'S NOTES

J.P. STOOPS TO CONQUER

MR. JAYAPRAKASH NARAYAN has tendered his resignation from the primary membership of the Praja-Socialist Party. But in his letter to the Chairman of the party, Mr. Narayan has not disclosed any particular reason for his action. He does not even say whether he thinks membership of the Praja-Socialist Party to be inconsistent with the Bhoodan or Sarvodaya movement. Nor does he reveal whether it has interfered with his activities in the new sphere. All he has said is that by freeing himself from party bondage, he will be able to criticise any action of the party openly if he considers it necessary.

The reason advanced by Mr. Narayan for his resignation will probably convince none but the most gullible. It is about a year now since he stopped attending meetings of the National Executive of the Praja-Socialist Party and the party conferences. Whenever he did attend any conference, it was to speak on the Bhoodan movement. Moreover, the freedom he now aspires to enjoy by resigning his party membership he has enjoyed, in effect, ever since he ceased to be a member of the National Executive—which is primarily responsible for formulating the party programme. One is therefore constrained to connect Mr. Narayan's resignation with the failure of his recent efforts to bring about rapprochement between the Praja-Socialist Party and the Socialist Party. That the resignation came about almost simultaneously with the calling off of his talks with Dr. Ram Manohar Lohia reinforces this belief. He had, after all, conducted negotiations with Dr. Lohia against the wishes of the majority of the leaders and rank and file of the Praja-Socialist Party. In addition, he received a rebuff from Dr. Lohia in the form of latter's stubborn and unreasonable attitude and impossible preconditions. Dr. Lohia insisted that the Praja-Socialist Party should accept 'in toto' the constitution, policy and programme of the Socialist Party if a single party were to be evolved of Socialists in the country. In fact, he went to the extent of saying, in his letter of July 31, that all the rules and sub-rules made for the Socialist Party "must also be understood as included in the constitution" of his party and that "if there is any programme which may not be correct, not to speak of policy, that, also, has to be followed". Thus, Dr. Lohia, by his intransigence, frustrated Mr. Narayan's commendable move for a single party of those who believe in Democratic Socialism and probably forced him to leave the Praja-Socialist Party.

In Indian politics personalities are still more important than policies and programmes. Mahatma Gandhi's influence on the Congress, it may be remembered, grew after he ceased to be even a primary member of that organization. It should not, therefore, surprise any one if Mr. Jayaprakash Narayan's formal withdrawal from the Praja-Socialist Party should but increase his influence over the adherents of Democratic Socialism. A 'formal' resignation from the Praja-Socialist Party has given Mr. Narayan more elbow-room to move and manoeuvre than he had when he was in the party. This affords him an opportunity to use his undoubted influence in the political life of the country to greater effect than hitherto—which is all to the good.

NEW COMMUNIST "LINE"?

FROM SINGAPORE to Syria, the Communists are emerging in the open and adopting insurrectionary methods. The Singapore Government recently uncovered a Communist plot to instigate an armed revolt in the island for the purpose of capturing power. The police

arrested and detained 35 Communists in several raids on Left-wing organisations, including the People's Action Party into which the Communists had infiltrated since their own party was outlawed in 1948. Mr. Lim Yew Hock, Chief Minister of the Crown Colony, said that his Government was forced to resort to this extreme step to save those who uncritically and unwarily accepted the easy and deceptive slogans of the Communists, thus helping to create "objective" conditions for them. "No ideal of nationalism or humanitarianism is too sacred", he said, "for their exploitation in the interest of their more rapid progress to the control of absolute power." The Communists, whose tactics after 1948 had been peaceful penetration into trade union and Left-wing organisations, had apparently returned to violent methods.

This change in the policy of the Singapore Communists does not seem to be an isolated phenomenon. In Syria, for instance, the Communists are active and seem to have succeeded in putting their "own men" in key Government positions. Some four months ago, similar Communist efforts in Jordan were defeated by King Hussein's determined and timely action. In Iran, too, a Communist conspiracy was uncovered by the secret police. In Pakistan, the pro-Communist ex-Major General Akbar Khan is trying to rouse mass hysteria over Kashmir, doubtless to steal the thunder from Mr. Suhrawardy and prepare a mass base for the banned Communist Party's reorganisation. In India, the Communists are not encouraging lawlessness in Kerala only; they have come into the open in Kashmir also and have launched a campaign of vilification against the National Conference and Bakshi Ghulam Mohammed's Government. In Burma, the activities of the Communists caused enough anxiety to force U Nu to give up his self-imposed exile from administrative responsibility and take up again the reins of Government. In free Malaya, the Government's first task has been to deal with the continuing guerilla activities of the Communists. In South Vietnam, Communist subversive activity seems to be on the increase; this is evident from the frequency with which arm dumps seem to be discovered and Communist cadres responsible for attempted rioting taken into custody.

It would not be unsafe to infer from all this evidence that international Communism is on the way of renouncing the policy of "peaceful co-existence"—in effect if not in form yet. Are we then on the eve of the repetition of 1948? It would only be proper and opportune for the Government of India to be alert to the activities of the Communist Party of India, its numerous front organisations and its Ministry in Kerala. Democracy in our age is too often made a cover for the enemies of democracy to function.

"NOT BY BREAD ALONE"

THE SOVIET news agency, Tass, circulated a few days ago Mr. Khrushchev's remarks, made partly on May 13 last, at a writers' conference. Mr. Khrushchev's remarks would seem to have been occasioned by a novel, "Not By Bread Alone", written by Vladimir Dudintsev. Final comment on the book will be possible only when it is available. But one may speculate, basing such speculation on the fragments of criticism that make their way out of the Soviet Union. Speculation with the meagre data available is bound to be incomplete and perhaps misleading. But under the circumstances there seems no other way.

Dudintsev's book is about a school teacher and engineer, Lopatkin, who has succeeded in designing a machine for the centrifugal casting of iron pipes that

will save considerable labour and material. But a factory director, Drozdov, obstructs Lopatkin's project for bureaucratic and organizational reasons. The struggle between them is unequal, for Lopatkin is poor, a mere nobody, who lives in a slum. In the end Lopatkin's invention is accepted by authorities higher than Drozdov. The book lays emphasis on idealism, individualism and fearlessness. But it is not quite certain whether it criticizes the "system". After Lopatkin's invention is accepted, a friendly industrial executive says to him: "I say you are a believer. You believe and struggle. You have not become disillusioned I am often scolded as an idealist by those so-called practical people. But only the devil knows what it is all about.... And so I say: 'Here is an idealist, there's an idealist, in a third place you look and there's a so-called idealist One bumps into them at every step. But without bright insignia you will not recognize them, nor they you...'"

To judge from what is available of the proceedings at the plenum of the Union of Soviet Writers held in May, supporters of the Party "line" and some "heretical" younger writers indulged in exchanges which could have much significance. Dudintsev would appear to be not alone in thinking as he does. According to an article in "Literaturnaya Gazeta" of May 22, the silence that greeted the accusers astonished and even alarmed them. L. Sobolev, who wrote that article, warned the un-answering writers that their silence was dangerous. "What does it mean?" he asked. "What does it conceal? A proud disregard of the opinions of others? A contemptuous confidence in your own infallibility?" At a meeting of the Union of Soviet Writers and the Party organizations of the Moscow writers, Kaverin along with Dudintsev, E. Kosakevich, M. Aliger, V. Rudny and V. Tendryakov, "persisting in their errors", as "Literaturnaya Gazeta" of June 6, put it, "dissociated themselves from their comrades of the Party and writers' organizations". This schism, if it is that, may well be the result of the younger writers' disregard for the "wisdom" of the elder writers in laying down the "line". It is not clear whether they object to the laying down at all of an official "line". Dudintsev's "Not by Bread Alone" derives significance from the prevailing political climate. Mr. Khrushchev has said that "so far as Comrade Dudintsev is concerned, I believe that he will be able to steer on to the right track, given our help and his wish, and work together with the whole body of our writers, for the good of the people and for the good of our Socialist homeland". The past tells us that the current Soviet leaders know the "right track" and are always "helpful" towards those who deviate from it.

WHO HOARDS FOOD?

IT IS at once easy and difficult to answer this question. One has necessarily to go by some general impressions. The Mysore Chamber of Commerce, for example, thinks that it is not the trader but the large-scale producer who hoards food grains. How the primary producer is able to hold out for higher prices, it is not difficult to explain. In the opinion of the Chamber, his holding capacity or staying power has been considerably strengthened by increased Governmental assistance by way of credit facilities, manures, fertilisers, etc. (The Union Finance Minister, it may be recalled, also holds the view that the good prices obtainable for his crops has increased the peasant's holding power although he says, at the same time, that there has been some hoarding by trade also). The trader, on the other hand, does not hold up his stocks for a longer time than is absolutely necessary. In Bangalore, for example, only two or three weeks' stocks of rice out of the City's monthly intake of one-and-a-half lakh bags are generally available with the traders. This is probably true

of Bangalore; the accuracy of the Chamber's statement need not, therefore, be questioned as far as that City is concerned.

But the question is whether it would be possible to generalise on that basis and conclude that a similar situation obtains in all the urban markets in the country. (Incidentally the Mysore Chamber makes no such generalisation for its views are confined to its own State). There is no reason to believe either that the traders do not generally hope to profit at a time of rising prices or that there are not small consumer hoards on a wide scale at such a time. Perhaps it would be nearer the truth to say that everyone concerned — the producer, the trader, the miller and the consumer — "hoards" to some extent. Such hoarding is quite natural at a time of rising prices and cannot be easily described as anti social. But many a mickle makes a muckle, and it is therefore necessary to make some more rice supplies available in all the urban markets so as to bring down the prices. How some stocks could be released from the big producer, the big trader and the rice-miller without too drastically pulling down the rice prices, has been dealt with in a leading article in "The Eastern Economist" last week.

THE PLIGHT OF PLANTATIONS IN KERALA

THE PLANTATION industry in the South is in an unenviable State. Every year that passes adds more problems. This year's 'outstanding' is the emergence of Kerala State with a Communist Government. The Chairman of the United Planters' Association of Southern India, Mr. M. M. Varghese, made a pointed reference to this in his address to the annual general meeting of the Association held at Coonoor on August 29. Mr. Varghese referred to the two significant developments that were taking place, affecting the incentive for expansion and development of the industry: One, the fiscal policy adopted against the industry, and, secondly, the growing indiscipline among labour. The Kerala Government, unable to achieve its declared objective of nationalising foreign-owned plantations, has been hard in its exactions on the industry. The levy of agricultural income-tax is heavier in Kerala than either Mysore or Madras. The high rate of super-tax combined with the basic agricultural income tax exceeds the rate of the Centre's Corporation-tax. The disorderly state of affairs due to labour troubles has not improved in spite of the statement of the State's Chief Minister.

It appears that the Kerala Communist Ministry is oblivious to the dangerous consequences of its two-pronged onslaught on the plantation industry. While heavy taxation is likely to lead to fragmentation, thus weakening the competitive position of the industry in the foreign market, its reluctance to check lawlessness will scare away the foreign investors. Moreover, a valuable avenue of co-operation of foreign capital in national endeavour of economic development will be lost. Can it be hoped under the present dispensation that the rot that afflicts plantation industry in Kerala will be stopped, especially when the plantation industry is a vital part of the nation's economy? It is the largest earner of foreign exchange. It provides more employment than any other industry, and holds a pivotal position in the economy of Kerala State.

A CORRECTION

In 'The Week's Notes' in our issue dated August 30, 1957, in the note entitled "Nagas' Hand of Friendship" on page 299, the first line was inadvertently omitted. It reads as follows:

"The Naga People's Convention, attended by nearly" The error is regretted.—Ed.

A TOWER OF STRENGTH

in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

A Window on the World

NON-VIOLENCE AGAINST A DICTATORSHIP

By
ODYSSEUS

THAT BRITAIN should cease nuclear armament and adopt a policy of national defence by passive resistance is the suggestion made by Sir Stephen King-Hall, the well-known publicist and editor of the "King-Hall News Letter" (162 Buckingham Palace Rd., London, S. W. 1) whose views I outlined in the two preceding weeks. Sir Stephen does not claim that his proposals would work but only that if they are to be rejected it should be after searching investigation by a Royal Commission. He emphasises that hitherto all discussion of pacifism has been from the moral viewpoint whereas, he points out, since pacifists constitute an infinitesimal fraction of the population, pacifism has no chance of being adopted as a national policy unless it is found to be workable from non-pacifist motives.

I begin by challenging the universal belief, which Sir Stephen appears to share, that history offers examples of a disarmed population securing their objectives against armed forces solely by non-violent passive resistance.

We saw last week that Sir Stephen cited the success of the German resistance to the French in the Ruhr in 1923, the Sinn Fein terrorist campaign against the British in Ireland, the Israel victory over the British mandatory administration, the Algerian struggle, Eoka, the resistance movements against the Nazis in wartime France, and civil disobedience in India. But all these movements were (or are) supported by violence and/or terrorism.

For example, the German resistance in the Ruhr was accompanied by outrages in which hundreds were killed. "The state of violence was similar to that in Ireland in 1921 when the British Auxiliary Police were engaged in guerilla warfare against the Sinn Fein party.... The whole world watched.... this terrible struggle between armed force and disarmed Germany.... The pressure on the German economic system was devastating. The rate of exchange of the Mark in London crashed from about 100,000 to the £ in the Spring of 1923 to about 15,000,000 in the autumn.... At last.... the German Government surrendered and withdrew its support from the passive resistance movement.... Morally France was well satisfied.... she had proved that Germany was still at her mercy". (Sir Stephen King-Hall may perhaps accept this account of events in the Ruhr because I am quoting from the 'History of Our Own Times' (p. 127. 1940 edition) written by that admirable authority Sir Stephen King-Hall). Moreover, it was during this period that violence became endemic in Germany and political extremists, fanatics, and gangsters of all kinds, seized the opportunity to increase their following and, by sowing disorder, to prepare the way for the Nazi dictatorship.

As for India, we are apt to forget that Gandhiji insisted at first that mass civil disobedience should not be initiated until a "non-violent" atmosphere had been created, that he subsequently yielded to pressure and agreed to give it a trial at Bardoli, that following the violence which attended the arrival of the Prince of Wales, he wavered, and that he called off civil disobedience in February, 1922, after a mob had set fire to the police station at Chauri Chaura, where 21 lives

were lost. While there were heroic moments of non-violent resistance, civil disobedience was punctuated throughout by the violence that Gandhiji condemned. With his characteristic honesty, Gandhiji said in 1942 that he could not guarantee that once a large-scale non-violent movement had been launched there would be no violence. "I do not want rioting as a direct result," he wrote in the 'Harijan' of July 19, 1942, "If, in spite of precautions, rioting does take place, it cannot be helped." In the event, hundreds lost their lives in 1942. Nor did this rebellion justify non-violence, or even violence, by attaining its objective.

The first conclusion that suggests itself is therefore that if despite the revered example of Gandhiji, India, with considerable elements in its population naturally disposed towards the religious pacifist attitude, failed to achieve genuine non-violence, how vastly more difficult would it be for the people of the UK, of whom only a decimal fraction are attuned to pacifism, of whom the majority are ordinary flesh and blood.

THE AFTERMATH OF VIOLENCE

Is, then, the alternative that the British should not attempt non-violent resistance to a foreign foe but should adopt the sort of civil resistance, accompanied by underground acts of violence, practised by the Germans in the Ruhr and Eoka in Cyprus?

I submit that civil resistance with violence must seriously affect the social fabric of the nation adopting it. Organised fighting in armies is disciplined. I do not suggest that this discipline never breaks down, but that the practice of violence in, as it were, an orderly and responsible manner, by bodies of men subject to discipline does not undermine the Rule of Law and social fabric of the nation as partisans practising guerilla warfare do.

Guerilla violence recoils on those who practice it. The violence of the German resistance against the French in 1923 let loose the political extremists and gang warfare that paved the way for Hitler's brutal dictatorship. In France, after World War II, as many as probably 100,000 "traitors" were executed in the name of justice. Most of these cases were in fact private vendettas or acts of irresponsible haste carried out by the rival parties of the French resistance. These tragic memories have added to the divisions and bitter-nesses of the Fourth Republic. The habit of violence: once encouraged among civilians is not easy to shake off.

In short, if the British were to try to defend their way of life by pacifism against Soviet invaders, all history suggests that it would not be possible to keep civil resistance non-violent, and that the longer the struggle the more widespread and irresponsible the violence. Against a determined dictatorship, which does not shrink from purgings and deportations by the hundred thousand, violence might become endemic, and the British would end by destroying the very way of life which they were seeking to preserve.

From the Indian struggle for independence, and from those periodical moments in it when Gandhiji's ideal of non-violence was attained, I suggest that it is difficult to draw conclusions of universal application because of factors which made it a special case. First, the struggle was not between two peoples who hated each other, like the Soviets and the Hungarians in the revolt of 1956, but between two peoples who fundamentally respected and liked each other. While there were doubtless individual exceptions, it was fought with regret by both sides. Again and again the nationalist leaders have in their writings paid tribute to the regret and embarrassment that they so often encountered in those who had to repress them. Again and again was the same sentiment expressed by Britons, not least by Mr. C. N. Broomsfield, the judge who, in sentencing Gandhiji in March, 1922, said:

"Mr. Gandhi, you have made my task easy in one way by plead-guilty to the charge. Nevertheless, what remains, namely, the determination of a just sentence, is perhaps as difficult a proposition as a judge in this country could have to face. The law is no respecter of persons. Nevertheless, it will be impossible to ignore the fact that you are in a different category from any person whom I have ever tried or am likely to have to try. It would be impossible to ignore the fact that, in the eyes of millions of your countrymen, you are a great patriot and a great leader. Even those who differ from you in politics look upon you as a man of high ideals and of noble and even saintly life" — a remarkable relationship between judge and accused. I regret that I have no space for the full text of the judgment which continues on this high level. You will find it in the "Selected Writings of Mahatma Gandhi", edited by R. Duncan (Faber, 1951).

VITAL POWER OF PUBLIC OPINION

Moreover, since a section of British opinion was increasingly critical of imperialism in India and out-

spokenly embraced the Indian cause, and since this section eventually established itself as a majority of the British nation and enacted Indian Independence in 1947, can it be argued that the struggle for independence was wholly between Indians on the one side and the British on the other?

Civil disobedience was conducted in India against a people with a conscience and a public opinion free to express and to organise itself. It was because the British conscience was shocked by such tragic events as Jallianwala Bag in 1919, that that section of British public opinion which sympathised with Indian aspirations was able steadily to increase its influence and the struggle in India was free to wax in intensity.

But supposing that India had had to deal with Soviet imperialism? During and after World War II, the Soviet Government dissolved four Autonomous Republics and expunged four major, and several minor, nationalities from the ethnographic map of the USSR. These people saw their political and cultural institutions destroyed. They were taken from their homes and dispersed over vast areas of the USSR. The liquidation of the Germans of Russia was, for example, one of the outstanding achievements of the Soviet regime. The Germans in Russia had an important civilising influence as long as Russia was in process of being opened up. The pioneer work over, the Russians turned against the German minority. The Czarists hated them. It was left to the Soviets by the decree of August 28, 1941, to expell them from the family of the Soviet peoples and to order the removal of some 200,000 from the Volga to the far off, deserts of Siberia, Omsk, and the Altai region.

Non-violent, or violent, can civil disobedience succeed against such ruthless rulers?

FRANCE AND SPAIN

(From Our Special West European Correspondent)

PARIS, August 31.

WHEN the French deputy foreign minister last weekend paid a brief visit to San Sebastian, the summer capital of the Francoist Government, and was received by the Spanish foreign secretary, this was the first meeting at this level between the neighbouring regimes for more than a quarter of a century. We can expect to see more frequent encounters in the near future, because both Governments are determined to liquidate the cause both disputes and grudges that have accumulated over 25 years. Some of these are of long standing: the frictions of the Civil War years. Spain's alliance with the Axis, France's leadership in the U.N. attempt to wind up the Francoist regime immediately after the war, and Spain's encouragement of anti-French agitation in North Africa. There is still a total contrast between the regimes and even if a reconciliation is achieved in the coming months, France and Spain cannot be comfortable allies as long as Franco is in Madrid. But their need of each other is great; it is to the future rather than to the past that they must look, and in the future closer Hispano-French co-operation will be inevitable.

Most people in France outside the Catholic Right would have preferred to postpone the reconciliation until Franco was gone, or at least had proclaimed a sufficiently notable change in his regime (e.g. by restoring the monarchy) to make it plain that the French were not compromising with "fascism". But events have moved too quickly: European integration and the opening up of the Sahara Desert have made further delay impossible. It was Mendes-France who first sought to resolve the old quarrel and Antoine Pinay followed him in these efforts; the Guy Mollet government had prepared a more ambitious act of settlement, and it is the present coalition of Radicals and Socialists that is seeking to implement this. So the new understanding with Franco is being sought by parties that cannot be suspected of any sympathy with the Madrid regime.

What makes this new understanding possible is that Spain fears the consequences of being left out of an integrated Europe, particularly the Common Market, while France fears that she cannot exploit the Sahara as long as political disputes about its borders have not been settled. On the one side it is clear that the rickety Spanish economy would be dealt a fatal blow if Euro-market were closed to its exports. On the other side, it is clear that the French are already going to have enough trouble in the Sahara with the Moroccans and Tunisians (and possibly the Algerians) without having Spain continue her traditional policy of exploiting French political difficulties in Africa to her own petty advantage. There is the basis here for a deal: the French facilitate Spanish entrance to the OEEC, encourage British plans for a free exchange area surrounding Euromarket so that Spain (like Britain) will be guaranteed against losing her markets in west Europe, and conclude a trade-and-currency agreement that will safeguard the peseta from the shock of the franc devaluation. Against that, the Spanish would agree to desist from all connivance at anti-French activity in the south-west Sahara and conclude an agreement on frontiers that puts a stop to all Moroccan claims to the desert.

Last weekend's meeting in San Sebastian was brief and it is improbable that anything so complete as this programme was discussed. But the Moroccan reaction was instantaneous and sharp. It was sensed in Rabat that a Hispano-French reconciliation could only be at the expense of Morocco, and this would be the end of the profitable Moroccan policy of playing Spain off against France in north-west Africa. The external affairs ministry in Rabat at once accused the French of violating the convention between the two countries that there should be consultation between them on all external matters of mutual interest. While a spokesman was reading this declaration the French ambassador was already giving an account of the San Sebastian meeting to the Moroccan Government. This incident showed the sensitivity of Rabat to any suggestion of co-operation between the two former "protectors" of Morocco. The forms having been respected, the Moroccan Government could not protest, but this has not prevented the Moroccan Press voicing all its suspicions: Madrid and Paris are accused of making a secret pact aimed against Morocco and so on.

What the French really hope to get out of the Spanish as regards Africa can only be appreciated by looking at a map of the Sahara. Oil and other minerals extracted from the northern parts of the desert can be transported through Algeria, provided that country remains under French control. But the very substantial mineral resources of the western regions and Mauritania are separated from the Atlantic seaboard by the long strip of foreign territory formed by Morocco and the Spanish possessions of Ifni and Rio de Oro. It is from these territories that incursions have been made by armed bands that are hindering French development of the western desert; neither the Governments in Rabat or Madrid are necessarily sponsoring these incursions, for these areas are mostly quite lawless, but neither are they doing all they could to stop them. Moreover, since the resources of the western Sahara have been discovered and prospected by the French, the Moroccans have claimed that all the territory down to Senegal is by rights theirs: this involves a claim not only to large parts of the French Sahara but also to the Spanish possessions mentioned. The Moroccan claim is no doubt baseless but the legal definition of frontiers in this part of the world has always been vague. A glance at the map will show that if the Spanish and French firmly settled the borders between Mauritania and Rio de Oro and then extended their respective authorities right up to those borders, Moroccan ambitions to extend their territory southwards would be checkmated.

It was for this reason that Guy Mollet had prepared a frontier convention with the Spanish, and although nothing has been said of it we can assume that this was mentioned again last weekend in San Sebastian. Quite apart from limiting Moroccan ambitions, the map shows that the French can get nothing out of the desert except through the seaboard states, and the more alternative routes they can guarantee, the more strongly they are placed in their negotiations with any one of those states. As long as the war continues in Algeria, that entrance to the desert is dangerous, as the rebels have recalled lately by extending their activities into the far south where the French are already beginning to exploit oil deposits. So the French must depend on

FLY TWA SUPER-G

FIRST CLASS

Ambassador Service

TWA/6189

Morocco and, to a lesser extent, on Tunisia and Libya; a reconciliation with Spain would reduce this dependence, at least in one important part of the continent.

Another reason for Moroccan dismay at the Hispano-French reconciliation is that Rabat has just decided to get tough about Ifni, the tiny Spanish enclave on the southern Atlantic coast of the country, a sort of Spanish Goa. There has been recurrent trouble here over the last few months, and last week Rabat recalled its ambassador in Madrid to give him instructions to open negotiations for the return of this territory to Morocco. The Moroccan claim to this region is very good, the enclave is of no special value to the Spanish and the French have no particular interest to see the Spanish stay there; so the negotiations could have some success. But it is feared in Rabat that co-operation between Franco and the French might reinforce Spanish determination to hold on to Ifni.

Spain's interests in Africa are in fact quite small and there is no doubt that Madrid's main concern in seeking French co-operation would be to facilitate Spain's admission to the European community. To date she has been firmly excluded from this. American support has got her into the various international organisations but French opposition has kept her out of the purely European organisms. True, when the European powers declined to accept Spain in NATO the Americans concluded the Iberian treaty with Spain and Portugal, and since Portugal is in NATO, Spain is in practice a sort of second-class member. But in the face of growing European integration, second-class membership is not enough, particularly in economic matters. Spain has begun a programme of industrialisation, behind a barrier of protection, and thus could not afford to join the Common Market, even supposing she were invited to do so; but she cannot afford to stay out either, for her main exports are still agricultural produce which is sold principally in the Common Market area. She must seek some special form of association with the Common Market that will protect her secondary industries while it guarantees her agricultural exports. And it is only by a renewal of co-operation with France that this will be possible.

Growing illiberalism in France necessitated by the hopeless Algerian war seems to have disposed to French

to co-operation with the "fascists" whom they have been denouncing for 20 years past. Or at least, the French case in Algeria is founded so heavily on "non-intervention in domestic affairs of other nations" that they could scarcely continue to raise questions about the nature of General Franco's regime. Whatever the reason, the fact that France and Spain are back "on terms" will be of importance in Europe and Africa.

Lift Irrigation Schemes: A total number of 1,513 schemes in Punjab, PEPSU and Himachal Pradesh for lift irrigation had been completed and an expenditure of Rs. 22.23 lakhs was incurred on them during the first Plan period, said Shri A. P. Jain, Minister for Food and Agriculture, in a written reply to a question by Shri Hem Raj in the Lok Sabha. Shri Jain also stated that 933 lift irrigation schemes were proposed to be undertaken during the second Plan period in Punjab (including PEPSU) and Himachal Pradesh.

Central Assistance for Minor Irrigation and Fishery Development: In a statement placed on the table of the Rajya Sabha by the Union Minister for Food and Agriculture, Shri Ajit Prasad Jain, stated that a loan of Rs. 4,799.65 lakhs and a subsidy of Rs. 607.60 lakhs for minor irrigation schemes and another loan of Rs. 113.47 lakhs and a subsidy of Rs. 76.07 lakhs for the development of fisheries were sanctioned by the Central Government to the various State Governments during the last five years. The rate of interest charged on the loans varied from 3 per cent to 4½ per cent depending upon the period of repayment.

Supply of Quality Jute Seeds: For multiplication of quality jute seeds, seven farms have been set up — one by the Centre and the remaining six by the States in main jute-growing areas. The Central Nucleus Jute Seed Multiplication Farm, with an area of 212 acres, was established at Panagarh in the Burdwan district, West Bengal, and started work in 1956-57 under the supervision of the Indian Central Jute Committee, Calcutta. The West Bengal Government has established two major farms for which the Central Government sanctioned long-term loans amounting to Rs. 8,11,500. Similar farms have been set up by the U.P. and Assam Governments — one in each State. The Central loan granted to Assam for this purpose amounted to Rs. 1 lakh. In addition, the Bihar Government was sanctioned a loan of Rs. 4,63,144 and the Orissa was sanctioned a loan of Rs. 2,67,192 in 1956-57 for setting up two farms. A further loan of Rs. 86,818 has been sanctioned to the Orissa Government for 1957-58 for extension of the farm in the State.

INDUSTRY

Steel Foundries: In a written reply to a question by Shri M. Valiulla, in the Rajya Sabha, Shri Morarji Desai, Minister for Commerce and Industry, stated that 12 steel foundries were proposed to be set up during the second Plan period. Of these, three would be in the public sector and nine in the private sector. The Minister laid a statement on the table of the House giving details about the location and the estimated cost of each of these steel foundries. According to the statement, one of the units in the public sector will be established at Chittaranjan in West Bengal at an estimated cost of Rs. 3.5 crores and the other in Bangalore in Mysore State at an estimated cost of Rs. 60 lakhs. The location of the third unit has been provisionally fixed near Ranchi in Bihar State, the cost of which has not yet been worked out. Of the nine units to be set up in the private sector, two each will be in Jamshedpur in Bihar and Sukehar in West Bengal and one each in Dalmianagar and Dhansar in Bihar, Triuvettuyur and Peelamedu in Madras and Ulhasnagar in Bombay. The total cost of the nine units is nearly Rs. 4 crores.

Standard for Paper Sizes: The Indian Standards Institution has just published an Indian standard for paper sizes (IS: 1064—1957). This standard prescribes

the requirements of printing, writing, wrapping and casing paper sizes, machine-made and hand-made, normally held in stock by the trade. Foolscap and crown sizes of paper, now prevalent in the country, are not included in the main series recommended to be adopted ultimately. However, their equivalent sizes have been recommended with a view to helping the industry in the intervening period before adopting completely the main series.

Manufacture of Pozzolon: Shri Manubhai Shah, Minister for Industry, stated in the Lok Sabha that a plant had been set up by the Bhakra Nangal Project authorities to manufacture pozzolon. The Minister said that pozzolon had been used in the construction of a portion of the Bhakra Dam. Shri Shah said that the cost of production of pozzolon was stated to be Rs. 65 per ton, while cement for use in the Bhakra Nangal Project was available at about Rs. 93 per ton.

Manufacture of Newsprint from Bagasse: Shri Manubhai Shah, Minister for Industry, said in the Lok Sabha that a German expert firm had recommended the adoption of the A-Z process, patented by it, for the production of 30,000 tons of newsprint per year at Shakarnagar in Andhra Pradesh, utilising the sugarcane bagasse available from the sugar factory there. The Minister said that the implementation of the scheme was dependent upon the negotiations of suitable terms of credit for the procurement of plant and equipment. Shri Shah added that discussions in this regard were in progress. He said that a report had not yet been received from the Italian experts.

Locomotive Parts Factory: It has been decided, stated the Deputy Railway Minister, Shri Shah Nawaz Khan, in a written reply to a question in the Lok Sabha by Sarvashri Bhakt Darshan and Bibhuti Mishra, to establish a locomotive component manufacturing factory at Manduadih, near Banaras and construction work is being taken in hand. Subject to the availability of the necessary foreign exchange it is expected to be completed in about three years time.

TRADE

Import of Skimmed Milk Powder: Two thousand five hundred metric tons of skimmed milk powder are being shipped to Calcutta from the United States of America. This is part of 5,000 metric tons of skimmed milk powder being imported by the State Trading Corporation. Information for the shipment of the remaining quantity will be announced shortly. Price at which the milk powder will be made available in the country, will also be announced by the State Trading Corporation in due course.

Business Transacted by S.T.C.: The Deputy Minister for Commerce and Industry, Shri Satish Chandra, stated in the Rajya Sabha that the State Trading Corporation of India had transacted by the end of June 1957, business amounting to Rs. 27.14 crores for exports of Indian goods. During the same period the business transacted for imports of different commodities totalled Rs. 15.15 crores. He said that during the 12 months July 1956-June 1957, the Corporation purchased indigenous cement worth nearly Rs. 54.55 crores. The Deputy Minister said that the amount of expenditure incurred by the Corporation so far had not yet been finally assessed. The following details were given in a state-

FINANCE

Foreign Exchange Requirements: The total requirements of foreign exchange for the Indian Railways for the second Five-Year Plan have been estimated at Rs. 425 crores. This information was supplied in a written reply by the Deputy Minister for Railways, Shri Shah Nawaz Khan, to a question in the Rajya Sabha by Shri M. Valiulla. The Deputy Minister added that out of this sum, foreign exchange so far secured is as under:

- Aid under the Technical Co-operation Mission amounting to Rs. 24 crores in respect of rolling stock and steel.
- Aid under the Colombo Plan amounting to Rs. 4.5 crores for rolling stock.
- Loan from the International Bank for Reconstruction and Development (World Bank), for which an agreement was recently signed, amounting to Rs. 42.8 crores in respect of rolling stock and steel.

Total = Rs. 71.3 crores.

This does not take into account disbursements made out of the sterling balance resources of the country. The amounts under (a) and (b) have been computed at normal world prices. It is expected that a substantial portion of the balance of the requirements of foreign exchange would be forthcoming by way of loans from abroad. It is not possible to say at this stage, however, as to when and what amount of such further loans would become available.

State Governments Loans: The Governments of Bombay and Mysore have announced the issue of their new loans bearing interest at 4½ per cent for amounts aggregating Rs. 900 lakhs as under:

Government	Amount of Loan	Issue Price
Bombay	Rs. 600 lakhs	Rs. 99.75 per cent
Mysore	Rs. 300 lakhs	Rs. 98.75 per cent

The above loans will be repaid at par on September 16, 1969. The loans will open for subscription on September 16, 1957 and close on September 18, 1957, or earlier without notice as soon as subscriptions approximate to the amount of each issue. The State Governments reserve the right to retain subscriptions up to 10 per cent in addition to the notified amount. The loans will bear interest from September 16, 1957. Interest will be subject to income tax. Subscriptions may be in the form of cash/cheque in respect of both the loans. 3 per cent Mysore Government Loan 1958 will be accepted at Rs. 99.75 per Rs. 100 nominal for conversion into the new loan of that Government.

Deferred Payment: Shri Manubhai Shah, Minister for Industry, said in the Rajya Sabha that 37 cases of deferred payment with regard to imports into India had been approved by Government of India so far in the current financial years. Their total value was Rs. 20.87 crores. The Minister added that six cases of deferred payment of the value of Rs. 3.24 crores had been rejected by the Committee dealing with proposals for deferred payments.

Economic Assistance from Netherlands: Dr. Panjabrao S. Deshmukh, Union Minister for Co-operation, replied in the affirmative to a question whether the Netherlands Minister of Agriculture had offered economic and other assistance from his Government to the Prime Minister of India during the latter's recent visit to that country. Replying to Dr. Ram Subhag Singh in the Lok Sabha, Dr. Deshmukh said that the Netherlands Minister of Agriculture had presented to the Prime Minister two memoranda during the Prime Minister's recent visit to the Hague. The Memoranda contained offer of financial and expert assistance for the establishment of an advanced training centre for work in hides and skins tanning, curing, tanning and the manufacture of shoes at Bakshi-ka-talab near Lucknow, U.P., and financial support for the operation of a pilot scheme for the reclamation of saline soils in the north coastal area of Saurashtra (Bhal area). The Minister further said that the Netherlands Government had earmarked a sum amounting to approximately 650,000 guilders (Rs. 812,500) for the training centre at Bakshi-ka-talab and about 850,000 guilders (Rs. 10 lakhs) for the execution of the project for the Bhal area in Saurashtra.

GENERAL

Employees' Provident Fund Scheme: The Government of India have amended the Employees' Provident Fund Scheme, 1952, with a view to liberalising the rules regarding payment of an employer's contribution to the fund to outgoing members. A subscriber will now receive in full the employer's contribution, with interest thereon, on attaining 15 years' membership. He will receive 85 per cent of the employer's contribution where the period of membership is 10 years or more but less than 15 years; 75 per cent where it is 5 years or more but less than 10 years; 50 per cent where it is 3 years or more but less than 5 years and 25 per cent for less than 3 years' membership. In case of death, permanent disability, superannuation and retrenchment, the full amount including the employer's share will continue to be paid. Hitherto, a worker could get a full refund of the employer's contribution only after 20 years' membership and no part of the employer's share was paid to a worker with less than 5 years' service provided he had not attained the age of superannuation. The employee's own contribution, with interest thereon, however, was payable in all cases.

NEWS IN BRIEF

INDIAN

The Government of India have announced that export of nickel scrap for conversion into rolled nickel plate anodes will be licenced freely, subject to the condition that after refining and reshaping a full 100 per cent, less refining losses of the scrap, is imported back into India.

The Government of India have fixed September 20, as the last date for submission of applications for conversion of import licenses, according to a public notice issued in a 'Gazette of India' extraordinary.

A purchasing mission is to proceed abroad soon for getting suitable equipment needed by Indian ports.

The cashew and pepper Export promotion Council has decided to ascertain the export possibilities of cashew in countries where this commodity is not exported at present.

The production of clocks in India increased substantially in 1956 as against the preceding year.

Production of steel structurals in India increased from 90,000 tons in 1955 to about 102,000 tons in 1956. The output in 1954 was only 28,000 tons.

It is reported that there has been a considerable increase in exports of cotton carpets, rugs and durries during the last two years.

Shri Jaisukhlal Hathi, Deputy Minister of Irrigation and Power told the Lok Sabha recently that an amount of Rs. 12.98 crores had been provided for loan assistance to the Governments of Punjab and Rajasthan for irrigation and power works of the Bhakra Nangal Project.

India has entered into an agreement with Japan to supply 7.2 million tons of iron ore to Japan between April 1957 and March 1962.

It is reported that in July 1956, the Civil Supplies Board of Burma had called for tenders for 14,000 bags of prawns from India to be supplied during August-September 1956. Against that tender, the authorities accepted an offer of 8,000 bags from Indian exporters.

The Indian Standards Institution has just published a standard giving methods for testing the performance of sparking plugs (IS: 1062 — 1957) used in high tension spark ignition system of internal combustion engines, excluding aircraft engines.

In a written reply, Shri Ajit Prasad Jain, Union Minister for Food and Agriculture informed the Lok Sabha recently that the production target for sugar for the second Five-Year Plan was 22.5 lakh tons per annum, out of which 20.2 lakh tons had already been produced during 1956-57 season.

FOREIGN

Ceylon produced 27.9 million lbs. of tea in July, 2.8 million lbs. more than last July. Production in the first seven months this year totalled 257.6 million lbs.

Increased taxation in luxury articles and modifications in the tax structure have been proposed in Burma's budget for 1957-58. In the budget which shows an overall deficit of Rs. 64,15,000, the estimated revenue receipts for the year are Rs. 98,01,33,000 and current expenditure Rs. 94,08,20,000 showing a revenue surplus of Rs. 3,93,13,000 for the year which begins on October 1.

The French Finance Minister, Mr. Gaillard announced recently that the Government had decided to freeze prices from August 28, at the level of August 15, in an effort to halt inflation.

U.S. steel production is rising slightly but a sharp pick-up is not anticipated. Output edged up to 30.6 per cent of capacity during the week ended August 18, from 29.4 per cent in the preceding week.

Rubber consumption in the U.S. in July was 109,331 tons, some 2,000 tons less than in the previous month. But the July figure was still 13,000 tons higher than a year ago.

It is reported a private Japanese trade delegation will leave for Peking around September 10 to negotiate the fourth private trade agreement with Communist China since 1954.

A cold steel rolling mill is to be established in Ashkelon on the Mediterranean coast of Israel, by the French Giro Company.

South Viet Nam re-entered the international rice trade this year, with exports totalling 156,000 tons up to the end of July.

The Iraqi Government has approved a £250,000 subsidy to help barley exporters dispose of the carry-over from last year's crop resulting from the closure of the Suez Canal. This is estimated at more than 260,000 tons.

The Indo-China, State of Cambodia has suspended exports of local products to the France zone until further notice, pending classification of the recent trend in the exchange value of the franc.

It is reported that Poland has asked Jordan to supply her with 100,000 tons of phosphate this year and expressed her willingness to pay in dollars.

German industrial turn-over during the three months period ending June 30, amounted to £4,107 million or 2.2 per cent more than during the first quarter of 1957 and 5.3 per cent over the comparable figure of last year.

CANADA'S LONG-RANGE ECONOMIC OUTLOOK

WHAT will the Canadian economy be like in 1980? To investigate this question, the Canadian Government appointed a Commission in June 1955. It was asked to inquire into the long-term prospects of the Canadian economy. The Commission has recently published its preliminary report which shows that the average Canadian will have, in all probability, two-thirds again as much net income in real terms in 1980 as he had in 1955. This works out to a little less than 3 per cent (simple) per annum in per capita terms.

The analysis of the Canadian Commission rests upon three broad assumptions. In the first place, it assumes that there would be no global war during the next 25 years. Secondly, it assumes that there would be no depression of the type which overtook the world in the thirties. It also assumes that the Canadian Government would not initiate any major changes in its economic policy which would have a strong bearing on the progress of the economy. It does not, however, mean that the Government in the next 25 years would play an inactive role.

The Commission has estimated the population of Canada for every quinquennium-end till 1980. Table I below shows the forecasts of Canada's population from 1955 to 1980.

TABLE I.
Forecast of the Population of Canada
(Assumed net immigration - 75,000 per annum)

Year	Persons
1955	15,575,000
1960	17,505,000
1965	19,515,000
1970	21,640,000
1975	23,990,000
1980	26,650,000

It shows that Canada's population in 1980 is estimated to be around 26.65 million as against 15.58 million in 1955. This estimate is based upon two assumptions. In the first place, it is assumed that net immigration per annum would be around 75,000. Estimates show that the immigration rate might lie anywhere between 50,000 and 100,000 per annum. It is safe to assume the rate at the mid-point. The second assumption is with regard to the Canadian birth rate which is supposed to be slightly lower than that of the last decade. The fertility rates in the coming decades will be governed by the level of economic activity and employment. It is observed that an inverse correlation exists between birth rate, and level of economic activity and employment. With rise in incomes, the size of the family tends to be smaller.

The rate of increase in productivity in different sectors of the economy is the second most important characteristic which will govern the course of the economy. In agriculture, for example, it is predicted that productivity will increase at an average rate of 3 per cent (compound) annually until 1970 and at a low rate of 2.5 per cent (compound) annually for the next 10 years until 1980. For the business sector, recent experience shows that it may lie between 2.5 per cent and 3.25 per cent. The Commission has assumed in average of these two rates.

Estimates in regard to gross national product are set out in Table II below. Here 9 sets of estimates are tabulated. In addition to the rate of net immigration, productivity factor plays a vital role in the generation of G.N.P. The productivity factor may range anywhere between 2½ per cent and 3½ per cent for the business sector. The Commission believes that net immigration rate of 75,000 per annum coupled with the average productivity factor for the business sector gives the best possible estimate of gross national product. On the basis of these assumptions G.N.P. at constant 1955 dollars in 1980 will be \$76.1 billion as against \$26.8 billion in 1955. In other words, the total gross national product of Canada will nearly treble itself during the next 2½ decades.

TABLE II.
Forecasts of the Gross National Product
(Billions of constant 1955 dollars)

		Assumed Net Immigration		
		50,000 per annum	75,000 per annum	100,000 per annum
Productivity factor 2½%(1)				
1965		38.0	38.7	39.5
1970		46.7	48.0	49.3
1975		56.3	58.2	60.2
1980		67.7	70.3	73.0
Productivity factor 3½%(1)				
1965		40.2	41.1	41.8
1970		50.9	52.4	53.9
1975		63.5	65.7	67.9
1980		78.9	82.0	85.2
Average of the above				
1965		39.1	39.9	40.7
1970		48.8	50.2	51.6
1975		59.9	62.0	64.0
1980		73.3	76.1	79.1

(1) Assumed rate of productivity increase per annum for the business sector.

Note: In 1955, the Gross National Product was \$26.8 billion.

A still clearer picture of the course that the economy will take in the future is depicted by Table III on the next page which sets out per capita gross national product both in terms of dollars and index numbers. It shows that per capita gross national product in 1980 will improve by 67 per cent in 25 years. In terms of Canadian dollars, it will be 2,859 dollars—nearly 50 per cent more than the current American level of per capita income.

The graph below shows the probable trend till 1980 of population, labour force and the G.N.P.

A close study of this 186-page Report leaves an impression of confidence and optimism in the long-range economic prospects of Canada. This confidence is born out of the fact that Canada possesses reserves of all those commodities which the growing economy of its next-door giant will need desperately in the coming years. Canada will not suffer from any shortage of working force because of its high rate of population growth. Another additional factor is the congenial climate for attracting foreign funds. Canada offers an alluring climate for investment which does not exist in any other country of the world. The last most important reason is that a large portion of the land mass in the North remains undeveloped and there is ample scope for a "push" to the North.

This long-range study has been made possible by thirty-four separate studies prepared by experts in various aspects of the economy. These studies formed the basis on which the forecasts were erected. When these separate studies are published, they will be of great assistance for long-range forecasting in other countries.

TABLE III

Forecasts of Per Capita Gross National Product

Assumed net immigration — 75,000 per annum Average between the high and low projections

(1955 dollars)

	Per Capita Gross National Product	
	Dollars	Index (1955=100)
1955	1714	100
1965	2044	119
1970	2320	135
1975	2584	151
1980	2859	167

THE OUTLINES OF A FERTILISER POLICY—IV

By

C. R. RANGANATHAN

It is obviously useless to create a demand for balanced fertilisers unless steps are taken to meet it. This raises the entire question of production and distribution. It also raises the question whether the outlets at the consuming points should supply straight fertilisers and leave it to the farmer to mix them or whether the outlets should supply mixed fertilisers, or both.

FERTILISER MIXTURES

The theoretical advantages of balancing fertilisers by using them separately in the straight form are well

known. By adopting this method, the dosage of nutrients can be more precisely related to actual requirements, and the separate fertilisers can be placed in the soil in the appropriate manner and at the appropriate time. There will be a saving in buying the fertilisers separately, but this will probably be offset by the additional cost of labour involved. As against these advantages, the practical convenience of using mixed fertilisers of an appropriate formula is indisputable. This applies with special force to the case of small farmers who do not possess the knowledge or the

facilities for mixing their own fertilisers in the soil. If mixtures are standardised as contemplated in the recently issued Fertiliser (Control) Order and technical advice is rendered to the farmer as to the right kind of mixture for his soil, there is a good deal to be said for mixed fertilisers in the present circumstances. But whether the outlets at the consuming points supply straight fertilisers or mixtures, it is obviously desirable that the farmer should be enabled to get all his requirements at the same outlet.

RAW MATERIAL SUPPLY FOR SUPERPHOSPHATE

The programme of fertiliser production in the second Plan has been referred to in the first article and attention has been drawn to the large gap between the production aimed at and the anticipated consumption. For the immediate future this gap will have to be filled by imports, but serious consideration will have to be given to measures for stepping up indigenous production of fertilisers. The superphosphate industry relies on imports of sulphur and rock phosphate which were of the order of 75,000 tons and 55,000 tons respectively. These imports are expected to rise to 210,000 tons for sulphur and 400,000 tons for rock phosphate at the end of the second Plan. The search for indigenous sources of these minerals, particularly rock phosphate, needs to be intensified. The Geological Survey of India may be informed of the urgency, from the point of view of the fertiliser industry, of finding indigenous sources of rock phosphate.

DISTRIBUTION PROBLEMS

The problem of effective distribution of fertilisers is a large and complicated one and is likely to become even more complicated with the increasing use of fertilisers, unless steps are taken at once to rationalise it. Some idea of the diversity of the methods and agencies adopted and the difficulties experienced at present by mixers, dealers and consumers is given in Mr. Hart Walters' recent report on 'Fertiliser Distribution in India.' No attempt is made to cover this ground in this note. Mention may be made of the recommendation of the last meeting of the Standing Committee on Manures and Fertilisers that a Committee should be set up to go into this question at an early date.

CREDIT PROBLEMS

An equally complex question is that of providing credit facilities to the farmers for the purchase of fertilisers. This again is too large a subject to be dealt

with here. Here too is work awaiting investigation and rationalisation by an expert committee.

NEED FOR SOIL TESTING

Being concentrated sources of plant nutrients, fertilisers have to be used with due regard to the actual requirements of the soil and the crop, if waste is to be avoided and deleterious consequences averted. It is also necessary to keep track of the effects of the fertilisers used on soil acidity and alkalinity, so that timely correctives can be applied. This implies that fertiliser use must be based on soil classification and soil analyses. The status of plant nutrients in the soil changes as a result of cropping and their replenishment should be related to requirements, as assessed objectively by soil tests. Soil surveys and periodic soil testing are thus ancillary to regular use of fertilisers. A network of soil testing laboratories is being set up in India, thanks to the generosity of the Technical Co-operation Mission of the U.S.A. These should be regarded as only a small beginning in a vast country like India. The real difficulty lies not so much in providing soil testing facilities, but in getting the farmer to make use of them. A great deal remains to be learnt about the role of fertilisation in crop production and the soil testing laboratories can play an important part in the research work involved. It is necessary to consider how best these laboratories can be popularised and put to fruitful use in our food production drive.

NEED FOR BREEDING RESEARCH

The present varieties of wheat, paddy and other cereals in India have been developed by selection and breeding to grow under conditions of traditional manuring. Experience has shown that while they will respond to application of fertilisers up to certain limits, they cannot stand very high dosages of fertilisers. Under the Japanese method of cultivation cases of rice lodging under very high levels of fertilisation, such as are used in Japan, have come to notice. This was no doubt due to the local variety of rice being unable to stand very heavy fertilisation. A limit will soon be reached to the quantity of grain that can be grown with our present seed strains even with optimum use of fertilisers. Development beyond that limit will depend on breeding new varieties which can give high yields with high fertilisation. As genetical work of this character takes time to produce results, it would be wise to initiate a programme of research for breeding varieties which can respond to high fertilisation as soon as possible.

BOOK REVIEWS

COMMUNISM AND WRITERS

The March of a Conspiracy (Writers as Accessories):
By Gopal Mittal: Published by National Academy,
9, Ansari Market, Delhi: Price Rs. 2.

Gopal Mittal is not the first poet turned crusader, and like the rest of them he makes a remarkably forceful fighter for the truth he holds. He turns from the subtle nuances of Urdu poetry and handles with ease and telling effect the medium of English prose. Having himself been attracted by the theory of communism, and been a member of the Communist-controlled Progressive Writers' Association, he was thoroughly disillusioned as have been many young enthusiasts before him.

This book is concerned with the appearance of "a cloud on the literary horizon of India" in the shape of

the Progressive Writers' Association. Inaugurated in 1936, it was opposed to the Congress as much as to the hated imperialism of the British. Under the guise of freeing Indian art and literature from the shackles of tradition and orthodoxy the Communist bias began to appear. "Indian literature since the breakdown of classical culture, has had the fatal tendency to escape from the actualities of life", they said, and the accent was on the "people" and on "basic problems of existence today". Needless to say the inspiration came from outside, from the Communists in Britain and in Russia.

In spite of the obvious conviction of the author that communism is a pernicious growth, there is a balance in his writing that adds to the interest of the book. The growth of the censorship in both the USSR and in Communist China is traced with method and logical sequence. The logic is, of course, all on the part of the author. The two Communist governments display the

height of irrationality. "The Thaw and the Freeze" in Russia is the rather desperate story of how the Communist government professed liberalism, and the unfortunates who made the mistake of believing them. It is the same "partyism" in China where Mao Tse Tung invites a hundred flowers to bloom and then prescribes the colours and perfumes.

Gopal Mittal's final chapter has a picture of what he calls "Socialist Realism in East Europe". Czeslow Miloz, a Polish artist who realised that communism and art were contradictions, the Czechoslovakian Hallas who sold his soul for bread, and many others point the same terrible moral. The Hungarians who suffered so tragically have the final word—"the writer must have unlimited freedom to tell the truth, to criticise anyone or anything, to be in love, and to think about death.... to believe in Almighty God and to deny God.... to think in a non-Marxist way...." This would communism deny its artists and literary men, and it is to preserve this freedom against the conspiracy of communism that Gopal Mittal writes and exhorts his fellow writers not to be accessories to the crime.

INDIAN INDUSTRIES

Surveys of Indian Industries: By B. Srinivasa Rao. Vol. I: Published by Oxford University Press. Pp. 358: Price Rs. 15.

With the country set firmly on the road to rapid industrialisation, it is natural that increasingly greater attention should be paid to literature bearing on this subject. The author of this book, who is the Industrial Correspondent of 'The Statesman', has therefore done well in attempting to bring together all the relevant information pertaining to the development of important industries. In this first volume of his project, the author has dealt with the following industries: iron and steel, the non-ferrous metals, automobiles, diesel engines, light mechanical and electrical engineering, coal, electricity, petroleum, chemicals, drugs and pharmaceuticals and fertilisers. In his second volume, he proposes to cover some of the other important industries.

This volume, as the author himself points out in his preface, is the outcome of a series of surveys of Indian industries which have appeared in 'The Statesman' and, by and large, these have been kept intact except to bring the surveys as far up to date as possible. It is obvious that in view of the rapidity of the changes, any book written on industrial development is bound to lag behind and, to that extent, depress the interest of the reader. This volume confirms this amply. For instance, it is rather odd, while reading the section on the Iron and Steel industry, one should be told that "a second State steel plant is under consideration". This basic defect covers the entire volume and the story of the progress of industrial development in many fields stops with 1955 or even earlier. This perhaps may be inevitable, but of this the reader should be warned lest he should feel disappointed. However, as providing a background to the study of industrial development in this country, the book has undoubtedly its value. And to be fair, the author is very modest in his claim. He says: "Together, these surveys constitute an attempt to relate a few facts of first importance as accurately as possible.... That a picture of the past is perhaps the best basis for understanding the future is its only justification". One could naturally have no quarrel with this. The volume is neatly got up though one might wish its cost were less prohibitive.

SUGAR INDUSTRY

The Indian Sugar Industry (1955-56 Annual): Editor M. P. Gandhi: Published by Messrs. M. P. Gandhi and Co., Jan Mansion, Sir Pheroza Shah Mehta Road, Fort, Bombay-1: 344 Pages: Rs. 6.00.

'The Indian Sugar Industry Annual' for 1955-56 maintains its usual quality as a standard reference-book of facts and figures bearing on the industry. The number of statistical tables giving comprehensive information pertaining to the industry in India and abroad has been increased to nearly 150 in this Annual. Although its publication has been unavoidably delayed, the Editor has taken advantage of such delay to bring the figures up-to-date in many respects covering the 1956-57 season. And the promised publication of the 1956-57 Annual by February 1958 may further make up for the present delay. This forthcoming Annual may be awaited with interest by trade and industry for its possible exhaustive treatment of the question of exports now that production of factory sugar in the country has reached an all-time peak of 20.3 lakh tons in 1956-57 and is expected to reach 22.5 lakh tons in 1960-61. As the Government is trying to restrain domestic consumption (although 'per capita' consumption of sugar in India is still deplorably low at not more than 11 lbs. per annum and the domestic market for sugar can easily absorb what is produced) in order to create an export surplus for earning some foreign exchange, this question of exports has acquired great importance at the present time. It is to be hoped that Mr. M. P. Gandhi's 1956-57 Annual will throw light on current achievements and prospects in the matter of sugar exports.

BENGAL CHAMBER OF COMMERCE

Report of the Committee of the Bengal Chamber of Commerce and Industry for the year 1956.

This Report will interest those in business and outside. Besides giving a survey of the Chamber's activities, it is a compendium of important economic events of the year 1956. The report includes important points from Law and Legislation concerning companies, Import, Export and Customs regulations, Taxation, Transport, Industry and labour. Proceedings of the Annual general meeting of the Chamber are also given.

RECORDS & STATISTICS (QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

Plan for Progress

Power and Plenty

Giant walls taming  the rushing waters, irrigation channels bringing new life to barren soil, and heavy cables carrying a mighty surge of power throughout  the country are today laying the  foundations of India's economic self-sufficiency. During the Second Five Year Plan  electrification will be extended  to 10,600 additional towns and villages and irrigation to an extra 21 million acres. Textile Machinery Corporation Limited is proud to play its part in this nation-wide endeavour to bring power to industry,  light to village homes, food  to the hungry and prosperity and happiness to the people. A pioneer in many fields of engineering, it supplies industry, railways and river valley projects with a wide range of equipment.

THE INTRIGUING PROBLEM OF RISING FOOD PRICES

By

CROESUS

WITH the presence here, last week, of the Food Grains Enquiry Committee, otherwise called the Asoka Mehta Committee, the question of food grain prices naturally dominated to such an extent that it is difficult for any columnist to resist making a reference to it. True so much has already been written on the subject, but it is equally true that the picture one gets after reading it all is still distorted and confusing. Several views that have been put forward on the subject may seem closely reasoned, but they do not seem to clinch the issue. To sift all the memoranda presented, besides the mass of evidence already tendered, to the F.E.C. would take several weeks even for a conscientious and indefatigable Chairman like Mr. Asoka Mehta. It is only thereafter that the whole Committee could sit down to record its findings and make recommendations. However, Mr. Mehta has reiterated the commitment he made when he was in the South to submit his report by the end of next month. Even so it means waiting for nearly two months more from now. But, meanwhile, Mr. Mehta has said enough in press statements, and at several press conferences, for any one to guess how his mind, is not that of his whole committee, is working on this question. At any rate, the F.E.C. Chairman has indicated in clear terms the probable nature of the Committee's recommendations. This he did at a press conference he held in Bombay after completing the Committee's sittings here. At this conference he said: "our recommendations should be fair to the producer, fair to the consumer, and also favourable to the economic development of the country."

Frankly, I don't know how the F.E.C. would be able to make recommendations that would at once satisfy all these three tests. For, if any price is to be fair to the consumer and also to the country's economic development, it cannot but be as low as possible. One would desire it to be very low. But no price, however, low, can be below the producer's cost of production plus a reasonable of profit. Here, the difficulty would be not only in ascertaining the exact cost of production of each individual farmer but also in convincing him that is his overall cost and he must be satisfied with, that is his overall cost and he must be satisfied with, assuming that, in the larger interests of the country, he can be prevailed upon to agree to this).

That the problem does not permit of an easy solution even if and when an acceptable formula on these lines is evolved becomes evident from the demand that at least one State Government has made — The Andhra Government — to the effect that the price to the producer must not only be based on his own cost of producing food grains but as much on the prices he has to pay for the goods he, in turn, has to purchase for the requirements of himself and his family, including those of cultivation such as seeds and fertilisers. (It may be recalled that, in pre-Independence India, a Central Minister for Agriculture — I believe it was Sir Azizul Haque — had put forward a similar thesis when he pleaded for a correlation between what he termed the "exchange price" and the "exchangeable price" of the cultivator.) The subsequent report in the daily papers that the Union Finance Minister had told the 'Lok Sabha' that he wanted to widen the scope of the Asoka Mehta Committee's enquiry to include the trends in the prices of other essential commodities also lent support to this command and Mr. Mehta was actually questioned about this at the Bombay Press Conference.

Although Mr. Mehta replied that he did not know about it, he seemed not altogether disinclined to take on this additional responsibility if the Government wanted it; he, however, added that this could form the subject-matter of a second report to be submitted later, only if his Committee agreed to the Government's proposal and could find the time necessary for it. What Mr. T. T. Krishnamachari actually stated in the 'Lok Sabha', when replying to a non-official resolution asking for a setting up of a committee to report on a clear-cut price policy, by the way, was: "The Asoka Mehta Committee will take into account the trends in the prices of essential commodities other than food grains, and the fact remains that, after all, for the bulk of the community food prices are the most important of all prices." Evidently, this does not suggest any widening of the scope of the F.E.C. as such. In fact, this aspect was stressed by Mr. Mehta himself at the Bombay press conference when he referred to the fact that, while it might be necessary to go into the question of prices of other essential commodities, the price of food grains was the most important in the context of the prevailing inflationary conditions, inasmuch as food grains constituted about 31 per cent, of the entire trade of India.

According to another school, it is not enough to have price parity between food grains and other essential goods; there should also be price parity between food crops and commercial crops. This has been urged because, otherwise, it is feared, the cultivator would be tempted to give up food crops and take to commercial crops, as he has already begun to do in some cases, a factor which, according to some, has had the result of reducing the total volume of food grains that might easily have been higher otherwise.

It is noteworthy that most of the State Governments (those whose views have been made known to the Committee so far) would appear to be opposed to compulsory procurement and rationing. But, as Mr. Mehta observed at the same time, few could be found in the year of grace 1957 that would opt for unfettered free trade. Indeed, many of the witnesses examined by the F.E.C. are believed to have been of the view that the best solution to the problem lay somewhere midway between compulsory procurement and rationing, on the one hand, and unfettered free trade, on the other. But this view does not appear to be shared by Mr. Mehta himself personally.

Talking of rationing and distribution of food grains, one's thought inevitably turns to the working of fair price shops, by which the Food Ministry seems to lay great store. But opinion outside of New Delhi, both official and non-official, is not in favour of these fair price shops. Again, on the question of Citizens' Committees to supervise the working of these shops, all the States other than Kerala, where such committees are there already, want them, but it is significant that the opposition parties in Kerala do not seem to favour them, presumably because they have been sedulously kept out. Be that as it may, the Calcutta system of a family ration card has attracted considerable attention, nay even acceptance, and it is not unlikely that the Asoka Mehta Committee will recommend this modified system of rationing.

Of all that Mr. Asoka Mehta has said so far, one remark stands out, and it is his undertaking to include in the Committee's report a complete and thorough assessment of all the available statistical data on food production in the country. There is certainly no dearth

of food statistics, but now far these statistics are reliable is anybody's guess. Even to this day, no one is quite sure as to whether we achieved all the food targets in the first Five-Year Plan, although the overall food production did increase. Similarly, there seems to be some doubt on whether the food position has fully recovered since 1953-54. While one set of figures suggests that the position has been more than fully retrieved, some official spokesmen aver it has not. Thus, according to the Union Finance Minister, the latest food production figures — those for 1956-57 — are better than those for either the preceding year or the year previous to that. He stated in the 'Lok Sabha', the other day, that food grains production in 1954-55 fell below that in 1953-54 by two million tons and that food grain production in 1956-57 fell further by 1.5 million tons as compared to 1954-55, but that the corresponding figure for 1956-57 was higher by 3.7 million tons over the figure for 1955-56. This suggests that the 1956-57 figure is higher than the 1953-54 figure by 0.2 million tons; yet Mr. Krishnamachari is reported to have stated that "this is still slightly below the peak level reached in 1953-54." Factually, however, Mr. Krishnamachari is correct, because, according to another set of official figures, again, the post-war peak in food production of 68.7 million tons was reached in 1953-54, while, in 1956-57, food production was nearly the same at 68.6 million tons. This is mentioned here only to point out the discrepancy even as between two sets of official figures. What is relevant for our purposes, however, is the fact, as declared by Mr. Krishnamachari, that "food grains production has not risen in keeping with the demand".

Why has the demand for food grains risen so much? Is it due to the increase in population outstripping the pace of increase in food grains production? "The Eastern Economist" (vide page 295 of the issue dated August 30, 1957) at any rate holds the view that the rate of population increase has not outstripped the rate of increase in production, especially of rice, the price of which it is that has risen by 37 per cent over 1949-50. Professor

B. R. Shenoy also shares this view. Thus, when he addressed a Forum of Free Enterprise meeting last Friday (August 30, 1957) on "The Food Situation And The Common Man", he stated categorically that the rise in food grain prices was not due to any shortages in supplies but that it was due to the inflationary expansion of money incomes. "It is not that supplies are short," he said, "it is rather that the money demand for food grains is too high." One cannot help agreeing with the Professor's view that "the sharp bulge in food grain prices is principally due to the fact that, in a poor country where consumption of food by vast masses of the people is below nutritional standards, a rise in money incomes is apt to be spent first on food grains". Hence his exhortation to the Government of India not to indulge any more in over-investment and to import food grains to meet the deficit in what he calls "an artificially created market shortage."

How effective is selective credit control in regard to food prices? This question also figured both at Mr. Mehta's press conference and at Professor Shenoy's meeting. From what Mr. Mehta stated at the press conference, it would seem that opinion is sharply divided, depending presumably on where one locates the hoarding to have taken place. Some feel that the hoarding of food grains these days is not so much by the trader as by the large scale producer, while others are equally vehement that it is the latter who has been hoarding and not the former. Although Professor Shenoy does not proceed on this basis — his thesis, on the other hand, is that the reasoning that links up the price rise with hoarding is rather superficial — he is frankly sceptical about the effectiveness of selective credit control.

All in all, thus, the present position in regard to food grains prices is an intriguing phenomenon and, as such, more than ordinary interest is being evinced in what the Asoka Mehta Committee will say on the question.

BUSINESS NOTES

A NEW FORMULA FOR IMPORTS!

WHILE EVERYONE accepts the imperative need for curtailing imports all round and as far as possible, one is unable to justify the woefully small allocation of the foreign exchange believed to have been made by the Government of India for the licensing of replacement of textile machinery, for more than one reason. In the first place, this industry contributes in quite a handsome way to the country's foreign exchange earnings; in 1955-56, it earned for the country as much as Rs. 86.3 crores, while, in the following year, it was only slightly lower at Rs. 80.2 crores. It is, therefore, of the utmost importance to ensure that this export-earning potential of the industry is not adversely affected by any short-sighted action by our own Government. Secondly, the industry supplies an important item of consumer goods that enters into the family budget, of almost every Indian, so that we cannot afford to stall the continuous working of the industry by failing to provide it with the machines it needs, as this would only lead further to intensify the tempo of inflation. And, thirdly, the textile industry's needs of capital goods for replacement are about the utmost minimum that any organised Indian industry requires, thanks to the rise and growth of a well-equipped indigenous textile machinery-making industry which is able to manufacture most of the spinning, weaving and bleaching machines. In other words, the likely drain of foreign exchange that would be occasioned by this industry, even if it is allowed to import all its requirements, is so small that it seems hardly worthwhile to prune it down further.

But saying all these is not to approve of a reported suggestion by the concerned importing interests that, inasmuch as the Indian textile industry accounts for earning a substantial amount of foreign exchange, it must be allowed, say, at least 25 per cent of such earnings on imports of textile machinery and parts, if only for the essential purpose of replacement of old, worn-out and obsolete machines and machines required for balancing existing equipment, as the Government seems to have committed itself to allow. For, apart from being wrong in principle, this would give rise to all manner of fantastic demands by other industries and State Governments. Already, the suggestion of Dr. John Mathai, a former Finance Minister of the Government of India, that, since Kerala's exports account for a large amount of foreign exchange, Kerala can very well ask for a higher allocation for the State's economic development than has been allowed to it is believed to have prompted the wise men of other States also to restudy their respective strong points and to press such of them as are plausibly strong for claiming a higher subvention from the Union Government. This would, of course, be over and above what these States must have already claimed when presenting their respective cases to the Finance Commission.

But another suggestion credited to the same source — the importing interests — seems feasible and is, therefore, worth consideration. This is an offer by the concerned interests to an agreed phased programme of deferred payments to be staggered between one and five years from the date of shipment of the machinery, and also varying with the value of the machinery. This correlating of the value of the machinery with the term of deferred credit is as interesting as it is novel, and seems, in fact, to permit of application on a wider front. The forthcoming meeting of the Import Advisory Council would do well, therefore, to give this suggestion earnest and sympathetic consideration.

TAX ON RAILWAY TRAVEL

THE FINANCE MINISTER had a sound case in arguing the propriety of taxing railway travel when it is recalled that railway fares have not been put up since World War II in anything like the same proportion as the rise in the cost of living. But he was treading on unsure ground when he tried to justify the purpose for which the proceeds of the tax were intended to be used.

It was a foregone conclusion that the Railway Passenger Fares Bill would meet with stiff opposition in the Lok Sabha. This was what actually happened as was obvious from the points of order raised against the motion for consideration of the Bill and the strong disapproval of the tax shown by speakers from all the parties including particularly the party in power. This is, however, not the same thing as to say that the passage of the Bill was in doubt. Two more important concessions have been made. Like the travel by season tickets, travel up to the first fifteen miles has been exempted from the tax. In the next place, apprehensions about the steep incidence of the tax on travel in hill areas have been removed by either total abolition of inflated rates of fares in these areas or their reduction up to 25 per cent.

Easily, the most valid and convincing argument in support of this levy is that the tax is required because the exchequer requires increased revenue to meet expenditure on development. But the real snag is that the tax is being imposed to meet the requirements of the State Governments. They are its direct beneficiaries. The Finance Minister demonstrated that a federal tax is levied on railway travel in the United States and Germany. But he did not demonstrate that it is levied in these countries for the benefit of the federal units. It is true that the Central exchequer in India owes an obligation to find tax revenue to finance the requirements of the State Governments. But in this case there was a failure to determine whether priority in the claims over this fresh revenue should have been assigned to the needs of the railways or to the needs of State Governments. The Railways in India have been hard put to it in finding adequate resources to meet their own share of the outlay in the second Plan. Besides, the original outlay has been raised by Rs. 200 crores and only last week the capacity target was also raised. It would have been more appropriate to make an outright increase in railway passenger fares in the Railway Budget to meet part of the railways' own share of the total development expenditure than to levy the tax under a separate Bill, transfer its proceeds to the State exchequers and provide aid from the Central funds to the railways on the plea that they are unable to fulfil the target of self-financing fixed for them in the Plan. There is an irony in this entire circuitous procedure.

L.I.C. INVESTMENTS

FEARS WERE expressed at the time of its set up that the Life Insurance Corporation may not be able to invest in the private sector the same percentage of investment in equities, preference shares and debentures of joint stock companies as before nationalisation of life insurance. In this context, it may be recalled that an assurance was given on the floor of the House by the then Finance Minister, Mr. C. D. Deshmukh, that the proportion of investment in the private sector would not be allowed to fall below the pre-nationalisation level. On the whole it can be said, that the assurance has been kept up and implemented by the Corporation. On August 31, the total value of all investments amounted to Rs. 341.40 crores of which investments in debentures, preference shares and ordinary shares of companies amounted to Rs. 57.09 crores, or 16.8 per

cent of the total value of all investments. On June 30 1957, the total book value of all investments of the Corporation stood at Rs. 361.03 crores, out of which Rs. 65.71 crores were invested in debentures, preference shares and ordinary shares of companies accounting for 18.1 per cent of the total investments of the Corporation. The Corporation even ventured upon the writing of new issues. A total of over Rs. 75 lakhs was invested in new issues of which Rs. 18 lakhs was in debentures, Rs. 5.8 lakhs in preference shares and Rs. 2.5 lakhs in ordinary shares. The Corporation no doubt imparted strength to the capital market and helped sustain the confidence of investors but that was only during a short period. The room for grievance still remains that it has not accorded the same accommodation to the private sector in regard to funds and resources as private insurers did before nationalisation.

While the investment policy may be considered in this manner without decrying the corporation's management, the business record in life insurance has been poor. In order that the Corporation may be able to devote greater attention to its primary task of acquiring new business, a Bill has been introduced in Parliament which seeks to entrust the work of investment of the funds of Life Insurance Corporation to an Investment Board. The investment Board of which the Governor of the Reserve Bank will be the Chairman, will consist of Chairman of the Central Board of the State Bank and the Life Insurance Corporation. The Bill also provides for the formation of advisory Committees in Bombay, Calcutta and Madras to advise the Board on investment problems. Separation of the functions of investment and acquiring new business would give a greater opportunity to the corporation to concentrate on the latter on which great effort is absolutely necessary not only to recover the ground that was lost after nationalisation but to assist the supreme task of encouraging savings. But the separation of functions is an indirect reflection on the capacity of the corporation to manage what is managed every where else and also in this country before nationalisation by the same authority. The claim of higher efficiency under integrated management which is held up as a virtue of nationalisation is not strengthened by this bifurcation.

CO-OPERATIVE MOVEMENT IN INDIA

THE IMPRESSION that one gets, regarding the trend and progress of the Co-operative Movement in India, during the year 1955-56, after a perusal of the "Statistical Statements relating to the Co-operative Movement in India for the year 1955-56"—the latest Publication of the Agricultural Credit Department of the Reserve Bank of India—is not altogether unmixed. Though all types of societies in general and the primary agricultural credit societies in particular increased numerically and there was also "a general improvement in the profits of all societies", it is somewhat disquieting to note that increase in the owned funds and deposits of all types of co-operative institutions has not been commensurate with the increase in their borrowings, other than deposits. Two other equally disconcerting features may be observed. First in the case of all primary societies, there is an increase in overdues at the end of the year; the amount overdue at the end of 1955-56 was Rs. 22.63 crores, as compared with Rs. 16.38 crores, Rs. 16.26 crores, and Rs. 21.82 crores, respectively, during the preceding three years. The second feature relates to the capital structure of the central banks, which, according to the Publication itself, is "still weak in a large number of States". On this point the Report points out that, except in the case of Madras, Andhra, Bombay, Mysore, and Madhya Pradesh, the average share capital per central bank for all the remaining States was less than Rs. 2 lakhs as on June 30, 1956.

To turn now to certain general aspects of the Co-operative Movement during the year 1955-56. The number of co-operative societies of all types rose from 2,19,288 in the preceding year to 2,40,395 in 1955-56, recording an increase of 9.6 per cent. So also, the membership of primary societies and the working capital of all types of societies recorded increases, the former from 16.02 million to 17.62 million, or by nearly 10 per cent, and the latter from Rs. 390.52 crores to Rs. 468.82 crores, while the loans advanced by primary societies increased from Rs. 111.15 crores to Rs. 140.78 crores, profit earned by all types of societies stood only at Rs. 6.26 crores, which means only a slight improvement over the profit figure for the previous year, the relevant figure for that year being Rs. 2.71 crores.

The following table shows a few of the other important features of the Co-operative Movement in India during 1955-56, at a glance:

Type of the institution	Number	Member-ship	(Rupees in thousands)	
			Loans advanced	Working capital
			Rs.	Rs.
State co-op. banks	24	36,394	67,86,38	63,33,93
Central banks and banking unions	478	2,99,555	79,83,43	92,66,65
Primary agricultural credit societies	1,59,939	77,90,850	49,61,72	79,10,18
Primary non-agricultural credit societies	10,003	30,72,600	72,06,22	85,73,67
Grain banks	8,169	7,30,428	56,42	2,42,11
State non-credit societies	82	22,894	..	9,20,41
Central non-credit societies	2,764	19,14,715	..	19,93,87
Primary agricultural non-credit societies	30,268	23,91,826	..	28,40,89

Central land mortgage banks	9	90,786	2,83,04	18,52,63
Primary land mortgage banks	302	3,13,827	1,73,64	11,34,85

THE MYSORE PAPER MILLS

IN SPITE of the difficulty in getting adequate supplies of imported pulp, the Mysore Paper Mills made a significant progress both in reducing the production cost and improving the financial condition of the Company during 1956. This was possible due to greater output and utilisation of larger quantities of indigenous pulp. The production of the Mysore Paper Mills reached 7,500 tons, which shows a good performance in the situation as it obtained.

The Company faces two problems; inadequacy of wood pulp and marketing of increasing output. In both these directions the Company is well set to meet any difficulty. The policy of the company to reduce the use of imported wood pulp and to depend increasingly on indigenous bamboo pulp is being pursued steadily. Thus whereas in the year 1948-49 wood pulp constituted 50 per cent of the raw material requirements of the unit, it comprises less than 7 per cent today. Regarding the problem of marketing Mr. T. Shamanna, Chairman of the Company, pointed out at the twenty-second ordinary general meeting that the response from dealers and distributors to co-operate in this respect was quite encouraging. The Company has drawn up a sales programme in collaboration with dealers and distributors, and it hopes to tide over the difficulty of slack demand and accumulation of stocks.

4 $\frac{1}{4}$ %

BOMBAY

STATE DEVELOPMENT LOAN, 1969

ISSUE PRICE Rs. 99.75 PER CENT

Open on the 16th September 1957

The loan will be closed as soon as a total of approximately Rs. 6,000 lakhs has been subscribed, and in any case not later than the close of business on the 18th September, 1957.

The applications for the loan will be received at —

- The offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi.
- The branches of the State Bank of India within the State of Bombay except at places mentioned in (c) below.
- The branches and treasury pay offices of the State Bank of Hyderabad within the State of Bombay.
- The Government treasuries and sub-treasuries in the State of Bombay at places where there is no branch or treasury pay office of the aforesaid banks.
- Applications will also be collected by the State Bank of Saurashtra at Bhavnagar and its Branches within the Saurashtra area of Bombay State and forward to the nearest receiving office.

Economic Report from the U.S.

MUTUAL SECURITY PROGRAMME

(By GUY SIMS FITCH)

WASHINGTON, Sept. 3.—From some of the anguished cries that have greeted the final congressional action on the Mutual Security Appropriation for the current fiscal year that began on July 1, one might think that this vital programme had been all but wiped out. Yet the fact remains that Congress appropriated more than \$3,400 million to carry it on. Now \$3,400 million is a lot of money even for the United States, and while it is not as much as many experts in this field would have liked, it obviously will enable the United States to continue a substantial programme of economic and military aid to other countries.

The congressional economy knife cut deeply, of course, the \$3,400 million appropriated is about \$1,600 million less than President Eisenhower had asked for originally, and about \$570 million below the amount appropriated last year. At the same time, more than a few observers are pleased that the cut was not even deeper, in view of the hue and cry raised throughout the country about the need for governmental economy. As it stands, it is about in line with past congressional reductions in Presidential "foreign — \$" requests.

It should be noted, moreover, that about half of this year's cut came in so-called military "hardware" — that is, direct military aid to friendly countries. And it is this part of the programme that has the biggest backlog of previous voted but still unspent funds. There were only small reductions in some other phases of the programme. These include both defence support — economic aid to help allies maintain their military forces at necessary strength and special assistance — a catch-all category designed largely to provide emergency assistance that cannot now be foreseen. Funds for technical co-operation with other countries also were cut moderately. This essential part of the Mutual Security Programme is likely to proceed at about last year's level. That leaves the element of outright economic aid for less-developed land in all parts of the world. And it is in this part of the programme that economists generally express the greatest disappointment — not so much in the actual amounts appropriated perhaps, as in the rejection of important new approaches outlined by the President.

JARDINE HENDERSON, LIMITED

NOTICE is hereby given that an Interim Dividend at the rate of 2½%, less Indian Income-tax thereon, will be paid to the Registered holders as on the 21st October, 1957, of the 50,000 Cumulative Preference Shares of Rs. 100 each in the Company in respect of the year ending 31st March, 1958.

The Share Transfer Books of the Preference Shares will be closed from the 14th to the 21st October, 1957, both days inclusive.

By Order of the Board,
D. SMALLEY,
Actg. Secretary.

The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label...but your customers don't know the 'behind the scenes' story that ensures the complete reliability of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for you!

Look for

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

ASP/IT 9

BAGALKOT CEMENT COMPANY, LTD.

Despite certain adverse factors such as short supplies of coal, transshipment bottleneck (at Hoigi station) and restrictions on wagon movements from time to time, which affected production as well as despatch of cement, the Bagalkot Cement Company, Ltd., was able to show a profit of — Rs. 6,77,649 (as compared to Rs. 12,16,666 for the previous accounting period, which, however, was only two months) after meeting all expenses of operation and management and after providing Rs. 8,01,602 for depreciation and Rs. 55,000 for payment of bonus to employees. To this must be added Rs. 14,622 being amount set apart for rehabilitation expenses at the instance of the Government of India, which the Government subsequently asked the Company not to maintain. Out of the net profits, the Directors have provided for income-tax (paid in respect of previous years) Rs. 1,01,023 and have recommended a dividend of 6 per cent on the capital paid up on the old shares (without deduction of income-tax), while also providing for part repayment of Guaranteed Dividend Account to the Government of Bombay of Rs. 1,43,168.

When the State Trading Corporation of India took over the sale of all cement manufactured in the country, the Bagalkot Cement Co., Ltd., was also affected, but it was appointed as one of the Selling Agents of the Corporation in respect of its production. At this time, the price payable to the Company was fixed at Rs. 54.8-0 ex-works, exclusive of packing charges and excise duty. The cost of production of cement has since gone up considerably and the Government of India has asked the Tariff Commission to go into the cost structure of the cement industry and to fix up a fair price to be paid to the producers. The Directors, as a result, expect that the price payable to the Bagalkot Cement Co., Ltd., will be raised.

The Directors report that production during the year roughly corresponds to the rated capacity of the Plant. Incidentally, it is proposed further to expand the productive capacity of the Plant by 200,000 tons of cement in two stages of 100,000 tons each. Negotiations are in progress in this connection. In order to meet the cost of the new expansion, the Company issued Rs. 25 lakhs worth of new shares. But of the new issue, there are still 1,35,222 shares (worth about Rs. 13½ lakhs) to be subscribed.

AMAR DYE-CHEM LTD.

The Third Annual Report of Amar Dye-Chem, Ltd., showed a small profit of Rs. 2,839 during the short period of production (the whole factory was commissioned into production only on October 14, 1956), which began only during the year of report. This too was possible, because the Managing Agents agreed to forgo their commission for the year 1956. For obvious reasons, no depreciation could be provided for, nor any provision made for taxation.

It is noteworthy that the installation of all the three plants of the Company, namely, Amarthol Plant, Fast Base Plant and BON Acid Plant, were completed in less than two years. At the inaugural function last October were present Mr. James Hill (Jr.), Chairman of the Board of Directors of Messrs. Sterling Drug, Inc., U.S.A., Messrs. Nelson S. Knaggs and John L. Prichett, representatives of the Company's Technical Participants, Messrs. Hilton-Davis Chemical Co. The Directors report that items of expenditure on construction and installation which amounted to Rs. 1,32,742 were allocated and capitalised.

THE MYSORE SPINNING AND MANUFACTURING CO., LTD.

The results of working of the Mysore Spinning and Manufacturing Co., Ltd., for the year ended February

28 1957, showed a gross profit of Rs. 8,99,282. After providing for depreciation on Buildings and Machinery, amounting to Rs. 3,87,386, the net profit for the year stood at Rs. 5,11,896, as compared to Rs. 4,94,379 for the previous year. The Directors have proposed a final dividend of Rs. 3 and also a bonus of Rs. 3 per share. Together with the interim dividend of Rs. 3 per share, the total distribution for the year thus amounts to Rs. 9 per ordinary share, or 18 per cent per annum. The total distribution, however, is the same as in the previous year.

Although the depreciation for the year under review amounted to Rs. 3,87,386 as stated above, the total depreciation that had to be provided for by the Company was higher by Rs. 2,15,000, this amount having been provided out of the General Reserve. The necessity for this arose, it is stated, as the Income-tax authorities accepted this liability only during the year under review, when the payment also was actually made. It is noteworthy that, as a result of the allowable losses and depreciation allowances of the year under review and the year preceding it, no provision has been found necessary for tax for the year. In view of this, it follows, no tax will be deducted on the dividend payable on the preference shares.

The Directors also observe in their Report that the demand for cloth slackened and the position became worse when from September 1 1956, there was a further steep and sudden increase in the excise duty, over and above the increase in excise duty on cloth that had already been imposed on March 1, 1956. As the Mills had to bear half the increase in duty against pending contracts, it is stated, the Company's realisations were naturally affected adversely. According to the Report, the position has worsened since; "conditions since then have deteriorated to such an extent that profit margins have been practically wiped off and sales of cloth even at prices below cost have become very difficult."

COMMODITY NEWS AND NOTES

IRON ORE PRODUCTION IN JUNE

Output of iron ore in India during June 1957 was estimated at 366,471 tons. Production in the previous month was 417,662 tons. Returns received by the Chief Inspector of Mines in India from 128 mines during June showed that 272,380 tons were despatched to iron and steel plants and 77,381 tons to the export market. Iron ore stocks at the end of June were estimated at 1,525,610 tons.

OUTPUT OF OILSEEDS

The output of major oilseeds, namely, groundnut, mustard, sesamum, castor and linseed in 1956-57 was estimated at 60.3 lakh tons. Two factories had been set up in the first Plan period to refine castor and other oils. Six factories, had been licensed so far in the second Plan period. Bombay led the other States with the production of 12.86 lakh tons. Andhra produced 12.22 lakh tons, Uttar Pradesh 9.31 lakh tons, Madras 9.06 lakh tons, Mysore 5.9 lakh tons and Madhya Pradesh 4.1 lakh tons. Rajasthan and Punjab produced 2.77 lakh tons and 1.59 lakh tons respectively while the other States produced in all 2.51 lakh tons.

COTTON SEED OIL EXEMPTED FROM EXCISE DUTY

Cotton seed oil is at present subject to excise duty at the rate of Rs. 56 per ton. With a view to encouraging the crushing of the seed for oil and in the hope that this would enable some ground-nut oil to be released for export, the Government have decided to exempt, with effect from August 28, cotton seed oil from the whole of the excise duty leviable thereon.

EXPORT OF GREEN TEA

The Minister for Commerce, Shri Nityanand Kanungo, said in the Lok Sabha that green tea had been included in the list of items to be exported in an increasing measure from India to Afghanistan under the Indo-Afghan Trade Agreement concluded recently. He added that it was also proposed to send a Tea Delegation from India to Afghanistan for making personal contacts. Shri Kanungo was replying to a question by Shri Hem Raj and another Member. The Minister said that a decrease in exports to Afghanistan which was India's principal market for green tea, was responsible for the accumulation of stocks of green tea with the growers. Shri Kanungo said that the quantity of green tea produced in the Kangra district was about 21.46 lakh pounds in 1956 as compared with 16.54 lakh pounds in 1955. In Himachal Pradesh the production was 2.36 lakh pounds in 1956 as compared with 2.91 lakh pounds in 1955.

FORECAST OF BAISAKHI AND JETHWI LAC CROP

According to the final estimates of the Baisakhi lac crop for 1957, issued by the Indian Lac Cess Committee, the total crop is estimated at 6,50,000 maunds, as compared to the revised estimate of 5,93,000 maunds of last year. The final report of the crop indicates an increase of 57,000 maunds over the revised estimates, mainly because arrivals of sticklac at Gondia and other centres in Madhya Pradesh have been higher than expected. Hence, estimates for Madhya Pradesh and Bombay have increased. In addition to the Baisakhi crop, about 20,000 maunds of Jethwi (Kusumi) have also arrived in the markets.

EXPORT OF IRON ORE

Shri Nityanand Kanungo, Minister for Commerce, stated in the Rajya Sabha that the State Trading Corporation to which the export of iron ore had been entrusted, hoped to exceed in 1957-58 the target fixed in the second

Plan. He added that the total exports over the second Plan period might well exceed 11 million tons. The Minister said that the second Plan provided for the export of iron ore to reach a level of about two million tons by the last year of the Plan.

The Minister also laid a statement on the table of the House showing the quantity of iron ore exported during the last two decades. According to the statement, the export of iron ore in 1956-57 was 17.93 lakh tons as compared with 14.97 lakh tons in 1955-56 and 10.10 lakh tons in 1954-55.

IMPORT OF SUGAR

The total quantity of white sugar imported on Government account and of raw sugar imported by sugar factories for refining during the last four years beginning from 1953 was 13.27 lakh tons and 0.76 lakh tons respectively at a total cost of Rs. 68.73 crores and Rs. 3.38 crores respectively. The entire quantity of white sugar imported on Government account had been sold. The total amount realised as sale price was about Rs. 107 crores. All the sugar produced by the refining of raw sugar had also been disposed of by the factories concerned. The profit made by Government on white sugar totalled about Rs. 5.84 crores after the payment of Customs Duty of Rs. 28.33 crores and meeting incidental charges.

Company Meeting

THE MYSORE PAPER MILLS, LIMITED

Speech delivered by Sri T. Shamanna, M.A., I.A.S., Chairman and Managing Director, The Mysore Paper Mills Ltd., at the Twenty-second Ordinary General Meeting of the Company held at Bangalore on Friday the 30th August 1957.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Twenty-Second Ordinary General Meeting of the Shareholders of the Company and to place before you the report of the Directors and the Audited Balance Sheet for the year ended 31st March, 1957. These have been circulated already and with your permission, I shall take them as read as usual, and proceed to briefly review the main features of the year's operations.

In exercise of the right to appoint a Director on the Board of Directors of the Company as provided for in the Deed of Mortgage, dated 31st March, 1953, the Industrial Finance Corporation of India have appointed Sri T. Bhaskara Rao, I.C.S. (Retd.) M.P. as a Director on the Board, in the place of Sri K. Narayanaswamy, Director of Industries and Commerce, who resigned his seat on our Board. Your Directors have placed on record the valuable services rendered by Sri K. Narayanaswamy as Director. I welcome Sri T. Bhaskara Rao, and I am sure his wide knowledge and administrative experience will be of great advantage to the Board.

It had been reported to you that owing to the shortage of pulp, we could not reach the target production of 8,000 tons, that action had been taken to increase the production of bamboo pulp and to instal certain equipment to secure economies in the operations. I am glad to inform you that we have been able to produce 7,500 tons of paper and production costs have also been brought down. This is reflected in our accounts to which I shall refer later.

The policy initiated in 1948-49 to reduce the use of wood pulp and to increase the use of indigenous bamboo pulp has been pursued steadily with the result that while we were using 1,800 tons of wood pulp in 1948-49—nearly 50 per cent of our requirements—today we are using only about 500 tons of wood pulp which works out to less than 7 per cent of our requirements to feed the two Paper Machines.

Our paper making capacity still exceeds our pulp making capacity. Limited quantity of waste paper pulp has to be used as the market demands high quality papers and imported wood pulp cannot be used as its price is high and hence uneconomical. To surmount this difficulty, action has been taken to further step up bamboo pulp production from 6,000 to 7,000 tons. Alongside the expansion of the Pulp Plant, action has also been taken to recondition the First Paper Machine which has worked continuously for over 18 years and requires urgent attention. Licences to import the necessary equipment have been obtained from the Government of India.

I am extremely happy to report that the record turnover this year has exceeded a crore of rupees.

Although the market conditions were generally favourable, the demand was slack during the early part of the year. There was therefore accumulation of stocks which led to locking up of funds. This caused a little strain on our financial resources in common with Concerns which finance their Expansion Scheme from current resources. The situation has improved and our ways and means position is now satisfactory.

With a view to studying the needs of the market and to adjust the manufacturing programme to the demands of the market and also determine any new lines of manufacture that the Company could undertake with advantage and to avoid occasional set-backs in trade, I convened a Conference of the Distributors and Dealers of our products. I am happy to say that the response was very good and our Distributors and Dealers from Bombay, Poona, Madras, Salem, Coimbatore, Trivandrum, Pudukottai and almost all parts of our State attended the Conference. These deliberations proved fruitful and we hope to draw up our manufacturing and sales programmes which would ensure to a great degree steady and regular supplies to Distributors and Dealers and through them to Customers at reasonable prices.

It was also encouraging to note that our Distributors and Dealers expressed the view that they would all help in marketing the products of our Concern if and when we increase our present output.

I have stated earlier that the increased production and reduced costs of production are reflected in the accounts. The financial results of the operation of the Company during the year under review are quite satisfactory. The results achieved are directly attributable to greater output and utilisation of larger quantities of indigenous pulp. The results would have been much more appreciable but for the increase in the cost of Chemicals, Coal and other essential raw materials. We have provided for depreciation on Fixed Assets a sum of Rs. 10,50,086, calculated on the basis of rates allowed for normal depreciation and extra shift allowance as per Income Tax Act and have paid interest amounting to Rs. 2,75,212-7-0 on borrowings. A provision of Rs. 2,00,000 has been made to meet the liability towards payment of Retirement Gratuity and this, together with Rs. 50,000 provided last year, will cover in full the Company's liability for payment of Gratuity for employees who have completed 15 years' service as on 31-3-1957 in terms of the Industrial Award, 1955. Further, a sum of Rs. 2,50,000 towards cost of repairs and replacements and Rs. 25,000 towards Wealth Tax have been provided and after making all these provisions, the net profit for the year stands at Rs. 5,00,531-7-3 as against Rs. 4,61,729-9-8 in the previous year.

A sum of Rs. 2,00,000 towards the third instalment of the loan to the Industrial Finance Corpora-

tion of India, which was due on 1-7-1957 has been paid in May 1957 alone to save interest charges. In addition, the fourth instalment of Rs. 2,50,000 due on 1-7-1958 has been paid in August 1957 with the same object. On account of advance payment of instalments the loan account of the Industrial Finance Corporation of India now stands at Rs. 42 lakhs. We have been able to do all this while maintaining the Cash Credit Account with a credit balance.

I have no doubt that you will agree that the financial results have been quite satisfactory.

Out of the surplus of Rs. 5,47,697-10-7 inclusive of carry over, your Directors have decided to set apart a sum of Rs. 2,50,000 towards the Industrial Finance Corporation of India Loan Redemption Fund and to recommend declaration of 10 per cent dividend absorbing Rs. 2,50,000, the balance being carried forward.

It has been reported to you before that the Government of India have accorded sanction to the construction of 300 tenements in our Labour Colony under the Labour Housing Scheme. The work of construction is progressing rapidly and with the completion of the construction of these houses, most of the labour force would have been provided with quarters.

A bonus equivalent to 3 months' basic pay or wages has been sanctioned to staff and labour. The wages and rates of Dearness Allowance obtaining in the Mills are those laid down in the Consent Award passed in 1955 which is current till the end of October 1957. Government have recently revised the rates of Dearness Allowance and in accordance with previous practice, we have also revised these rates entailing an extra expenditure of Rs. 42,000 per annum. The Labour Association has been making representations for further amenities and I take this opportunity to assure them that the Management will consider sympathetically the reasonable demands of labour as in the past.

I had reported to you at the last meeting that we should consider increasing the production capacity from 8,000 to 16,000 tons. I have since gone into this matter in some detail and I am advised that the production capacity of an economic unit should not be less than 16,000 tons, with a like capacity of pulp plant which alone justifies the installation of a Modern Soda Recovery Plant to secure maximum economies in heat conservation and chemical recoveries. While I feel it is necessary to undertake such an expansion programme, I have not been able to formulate specific proposals in this behalf having regard to certain recent developments relating to tightness of the money market, scarcity of foreign exchange, etc.

In regard to raw materials, a new factor has to be taken into consideration. At present, we are using mainly bamboo for purposes of pulp. All over the State, new Sugar Mills are coming up and a Mill has been installed very near Bhadravati. It has been established that paper could be manufactured out of bagasse which is the agricultural residue. The points for consideration are how to replace bagasse which is used as fuel by coal and the economies involved in the process. It would be economical for us if the Sugar Companies have disposable bagasse. However, this is a matter which requires detailed investigation and in any future development of our Mill, this factor has to be seriously considered.

Further, in view of the scarcity of foreign exchange and the long delivery periods quoted for supply of machinery from abroad, it would be also a matter for consideration if we should not make use of old machinery available in the country if it suits our purpose and proves efficient and economical.

All these matters have been receiving our earnest attention and a comprehensive project with alternative approaches will be prepared. Implementation of any such project will involve huge outlay and you will agree that such heavy amount could be met partly by

raising the capital but mainly by borrowing. In view of the satisfactory performance of the Mills in repaying the current loan, I hope that the necessary funds could be found and when the project report is drawn, I shall place the proposals before you for consideration.

The Government of India have appointed a Committee to review the working of the 1956 Companies Act and when that report is ready, and consequential legislative enactments are completed, I shall request you to meet in an Extraordinary General Meeting to effect the necessary amendments to our Articles of Association.

I take this opportunity to express on behalf of the Management our gratitude to the Government of India, the Government of Mysore, and the Industrial Finance Corporation of India, for their continued interest and sympathy in the progress and prosperity of the Mill.

Your Directors and I highly appreciate the untiring and enthusiastic co-operation extended by all classes of the Company's employees, and I trust that their continued co-operation will be extended to us in our efforts to achieve further progress of the Mills.

I also wish to express my grateful thanks to my colleagues on the Board for the uniform courtesy and co-operation that they have extended to me and their valuable advice.

Gentlemen,

With these observations, I beg to move that "The Directors' Report, the Audited Balance Sheet and Profit and Loss Account for the year ended 31st March, 1957 be Approved and Adopted."

NOTE: This is not a report of the proceedings at the above Annual Meeting, of which proceedings a separate report will be circularized.

The State of the Nation

NE sign that the country is not in the best of health is the frequency with which the state the nation is being discussed both in public and in private. Today the Planning Minister, G. L. Nanda, made an elaborate assessment of the Lok Sabha obviously to meet much unpublished criticism of the likely failure of the second Plan. The Prime Minister himself also spoke today at the Delhi University in a speech which can be read as more defensive than almost any other in recent months. Indeed, it is obvious that whatever brave face is placed on planning difficulties, these difficulties are not merely severe in themselves, but have produced grave doubts both within and outside the country on the capacity to finance and to implement even the 'hard core' of the Plan within the period specified. It is not defeatism to face the facts, and it is wholly wrong for any person, inexperienced in the problems of industrial organisation and the need for facing hard facts in the process of overcoming them, to deprecate this assessment of the facts as being defeatism, and, therefore, evil.

There is no defeatism in facts. The defeatism is in a matter of unwise opinion, not an assessment of things as they are. Much of the unwisdom is in fact on the Government side.

One should recognise that things as they are justify a considerable amount of criticism of both the planning authorities and the Government of India. In the first place, as Mr. Nanda observed, the Plan was based on two assumptions which were as rigid in their fulfilment as the success of the Plan itself. The first of these was that the current rate of saving should rise from 7 to 11 per cent, a condition which, as was pointed out when the Plan frame first appeared, assumed a marginal rate of saving of 30 per cent. A substantial reason for the inflation which has occurred is that this assumption was wide of the mark, and, in any case, could not be effective unless substantial increases of real income had occurred. This attracts the second assumption on which the Plan was based, namely, that real income would be rising at an average rate of about 4 to 5 per

cent per year. From where else could increments of saving come? And, if real income did not rise, could the Plan proceed just the same? It is the Government which has ignored the absurdity of fulfilling a Plan irrespective of the fulfilment of its assumptions. It is time they understood the error, which Mr. Nanda showed no inclination to accept.

While neither of these basic assumptions has been fulfilled, the Government of India has proceeded almost blindly to implement the Plan as framed as though vast new savings could be extracted from a country when no new real income per capita was being produced. There is no evidence that, after providing for the increase in population, per capita income in the last two years is significantly above what it was in 1954-55. Yet investment has been forced to double with results which are all too obvious in the price level and in the crisis which has been produced. The fact that much of this investment has been obtained by taxation is secondary. It is the combined effect of inflation and taxation which must be reckoned. That they have been excessive the discussions in Parliament over the last two months have made abundantly clear.

To argue, as Mr. Nanda argued yesterday, that the basis of the Plan was that some substantial impression had to be made on living standards and employment and that, therefore, the Plan was from the point of view of needs the minimum that could be envisaged, does not answer the point that we have outrun our resources in the short period. It is wholly right to argue that a permanently cut Plan is no solution to the Indian problem, which is the maintenance of a rate of development of at least 4 to 5 per cent per year overall. But, surely, one cannot assume that because this must be our average rate of progress, we can at all times proceed at this rate. Fluctuations are written into economic growth as they are written into political life. One wonders why politicians who are so ready to recognise their own changing fortunes are so unmindful of the point that they share with their electors—the changing fortunes of the economic game, like their own, a game of chance no less than of skill.

If Indian agriculture had performed well in 1955-56 and 1956-57, there would be everything for proceeding headlong with the measures which the Government of India has initiated on taxation, direct and indirect, as well as on most other things. But two major handicaps, one on rupee resources and the other on foreign exchange, have raced far ahead of schedule. It is blindness to assume that our difficulties can be overcome merely by persuading ourselves how eminently reasonable in terms of the challenge that we face are the targets that were initially made. These targets are not absolute; they depend on resources. Since the Indian people will not accept inflation, this means necessarily a drastic revision of the Plan. It is hoped this revision will be temporary, but unless we can break bottlenecks, instead of merely describing them, they may well be permanent and crippling.

Equally one might argue with Mr. Nanda, that while it is reasonable for us to expect foreign assistance at the level contemplated in the Plan on the basis of our needs and of the existence of the world's surplus capital, it was wholly erroneous that the paltry efforts we have made to sell ourselves to the world should be deemed adequate to

attract the vast sums we need. What is reasonable as an expectation must be judged also by what is reasonable in terms of efficiency in implementation and the power to persuade and attract a scarce commodity. No effort has been made properly to understand the demand for the world's surplus capital and the terrific pressures to which it is at present subjected. If a detailed study had been made, even in the last six months, it would have been appreciated that an explanation of the Plan such as is now being painfully undertaken by the Indian Industrial Delegation abroad, and is likely to be undertaken by the Finance Minister in the next 30 days, should have been begun much earlier and in a much more ambitious and flexible manner. The recklessness with which one assumes that foreign capital whether by aid, loan or equities is independent of the structure of foreign and domestic policies is something which must be seen to be believed. Thus on the day following a request for a 500 million dollar loan both the Prime Minister and the Defence Minister thought that this request was entirely irrelevant to a pointed, and not extremely well-informed assessment of the trouble in the Middle-East attributed to Western policies. Whether or not one accepts the view presented by the Prime Minister or the Defence Minister in this case, it will be read abroad certainly and in some sections at home as a direct disincentive to foreign lending by the United States to this country. It cannot be that the Prime Minister and the Defence Minister are wholly unaware of the structure of that portion of opinion in the United States which settles major issues of this kind. To argue, therefore, as Mr. Nanda does, that because we have a reasonable expectation we are not to blame if the reasonable expectation does not mature, is to indicate a childlike simplicity which is wholly inconsistent with the kind of practical determination which alone can accomplish great tasks of this kind. It is quite a serious situation which has been created by just this kind of unawareness of the problems of the real world. If domestic and foreign policies are continuously being oriented in terms which have no chance of filling foreign exchange gap or obtaining our domestic resources, it surely cannot be claimed by the wildest stretch of imagination that the Government of India is not responsible for the crisis that has occurred.

It is time that the country which has as large, and indeed a greater, stake in the success of the Plan than have its authors, set out the conditions under which Ministers of the Central Government can frame policy in depreciation of the targets of the Plan and its practical implementation. There will be all over the country an anxiety to share in the sacrifices of a Plan, which will be successful in fact as well as in talk. But there is all over the country at this time serious doubt as to whether the men who demand these sacrifices—and these include the Finance Minister and the Defence Minister—have the competence and the power of persuasion to draw either at home or abroad the resources without which the task cannot be accomplished. The practical men may all be right in the very long period. But who will claim that their theories already bear the stamp of proved wisdom which they choose cheerfully to arrogate to themselves? Surely the course of wisdom is to be critical of all things. Whether the politicians like this or not, this country will test all things and hold fast to those which are good. Therein lies their hope—and their peril. Today their peril is far greater than their hope.

Extended Austerity

MR. MORARJI DESAI'S speech at the Import Advisory Council's meeting on Monday this week presented a faithful picture of the reality of the situation. If it was somewhat austere in its tone, it was because, consistently with his reputation for clarity and objectivity in outlook, he could give no quarter to misplaced expectations. His description of the prospect for import as rather grim is strictly confined to the immediate future. This is an interlude which throws up a challenge to us to demonstrate our capacity for austerity for sometime more. The outlook beyond the proximate future, however, promises a heartening change as preliminary indications tend to disclose. But until distinct evidence of the coming change is available, austerity in imports must be given an extended lease. This was what the Minister for Commerce and Industry categorically emphasised and the Council too concurred in his view.

Those who had cherished hopes of relaxation in import austerity after the end of the current quarter — July to September — were certainly wrong in doing so. The quarterly period was selected not as a period of critical transition but to facilitate a change-over to six-monthly import licensing periods to be adjusted with the financial year in place of the former calendar year base. Licensing policy for this quarter had imposed a virtual ban on consumer goods and it also saw the abolition of the O.G.L. except for the border trade between India and Pakistan. It also stopped the issue of fresh licences to established importers. How far this policy was effective in easing the strain on the foreign exchange resources can be determined only when relevant data become available after some time. One welcome development which has emerged is the prompt response given by the trade and industry in making a success of the scheme of conversion of licences into those for essential goods. This gesture has been amply appreciated.

The stringency which has been clamped on imports does not necessarily imply an abrupt decline in the flow of imports of essential equipment and materials. It has certainly not resulted in a dislocation of industrial production. There are positive assurances that the flow of essentials will be sustained to maintain the tempo of industrial production at the present level, if not at a higher level, and certainly there is no ground for apprehending that production will decline. What has been a target of much criticism in the recent past is now providing relief to keep the wheels of productive activity moving. Accumulated licences out of past issues have involved definite commitments with suppliers abroad and it is in pursuance of these orders that imports are pouring in to satisfy priority requirements of industry in an adequate degree. There has been undoubtedly much greater investment in the public as well as the private sectors in the initial months than envisaged in the Plan. Its magnitude will have to be reckoned as a factor in pruning the original programmes of development. Nevertheless, this investment has prevented a sudden slowing down of the tempo of production in industry.

The state of our present reserves of foreign currency does not admit of anything but a very

cautious rate of withdrawals. During the ten weeks preceding the end of August this year, the foreign exchange reserves declined by Rs. 89 crores to Rs. 380 crores. It is common knowledge that the Reserve Bank has been granted permission to allow withdrawals below the normal statutory limit of Rs. 400 crores as a matter of urgency. This is a signal for extra restraint in expenditure from the reserve. Nevertheless, current earnings of foreign exchange, even if they are admittedly lower than the expenditure of foreign exchange, constitute an important source to keep up the level of imports. During the second half of 1956 exports increased by Rs. 15 crores to Rs. 315 crores above the previous half year and the trend during January-May this year shows a further marginal increase in export earnings. This trend, however, has been more than off-set by the increasing volume of imports and the trade gap is likely to widen by about Rs. 70 crores in the first half of 1957, above the previous half. Restricted imports which are made possible with the help of these two resources are expected to meet at least the minimum demands of industry in respect of essential raw materials, capital goods, components and spare parts.

In the meantime, until the picture of foreign exchange resources improves and takes a clear shape, Government has hardly any course left open but to extend the policy of austere imports. What is happening in India now is a repetition of the situations which arose in the post-war period in different countries demanding a tightening of the belt in the matter of imports of consumer goods and non-essential materials. Only some marginal changes are likely to ensue when the licensing policy for the next half-yearly period commencing in October will be announced. It is, however, obvious that wherever imports can be obtained on terms of deferred payments, they will be permitted as a part of the declared policy of the Government. Negotiations for imports on the basis of deferred payments have now been made expressly subject to prior letters of authority from the Import Trade Control Authority to ensure that they qualify for accommodation in terms of the official policy.

The emergency in imports has brought a keener appreciation than before of the necessity of foreign assistance to finance the foreign exchange component of investment in the second Plan. As it now transpires, the Planning Commission's original estimate of the requirements of foreign assistance was conservative, although it is true that the size of our requirements has been inflated partly by rising prices. Mr. Morarji Desai made a significant reference to this type of assistance materialising in the near future. Certain reassuring developments, too, have followed to lend added strength to his optimism. The Prime Minister has indicated the magnitude of assistance from the United States which would go to help solve the import problem in the second Plan and has placed it between \$500 and \$600 million. Almost simultaneously Mr. Dulles gave an indication of the American Government's attitude of sympathy and helpfulness to India's needs in this behalf. Necessarily, some time will have to elapse before these hopeful developments take concrete shape and the period of import austerity is ended.

Ballistic Blessing ?

MR. ZORIN, leader of the Russian delegation to the Disarmament Sub-Committee of the United Nations, recently announced in London that the Soviet scientists had produced a missile capable of reaching "any part of the world." The claim was later reiterated by a Tass message that a "super long-distance, inter-continental, multi-stage ballistic rocket" was launched and that it flew at "unprecedented altitude" and "landed in a target area." The announcements do not, however, give details of the rocket. Nor do they say whether Russia could manufacture them in sufficiently large numbers for operational use.

The announcement by Russia has been received with cautious alarm and deep scepticism in the free world. "We do not take the Russian claim as a gospel," said Sir Dermont Boyle, Chief of Command of the Royal Air Force. Others have even said that the Russians were bluffing. But in its own interest, the West would be well advised to concede the Russian claim. Moreover, past experience has shown that even when they made propagandistic claims of this nature they found the means and talents to make it good. That has been the story ever since 1949 when they exploded their first atom bomb. In 1951, the Russians claimed that they had an hydrogen bomb and proved some time later that theirs was not, at least then, an empty boast. It will be, therefore, wrong to dismiss the present Russian claim as entirely unrelated to facts. The Inter-Continental Ballistic Missile may not be the "ultimate weapon," which the Russians claim it to be, but this should be sufficient to make the West sit up and dig for its own resources and plans to meet the challenge that it poses. There is, of course, nothing "ultimate" in the field of human inventiveness and the I.C.B.M. is a weapon only in so far as it can carry conventional or nuclear warheads, and it will be some time before it can attain reckonable precision. The difficulties include the need for accuracy in directing a ballistic missile to its target, the provision of a warhead which can stand the strain of re-entering the earth's atmosphere, and the designing of a mechanism which will detonate at the right moment. Whether the Russians have succeeded in finding ways to prevent such missile mishaps is still in doubt. Both Mr Dulles and the British Defence Minister, Mr Duncan Sandys, have referred to this uncertain aspect of missile strategy. Moreover, experimental success is one thing, mass production of I.C.B.M. is another. But in a few years' time a position will have been reached where both the free world and the Russian empire could launch rocket-borne hydrogen warheads at selected targets in the heart of each other's territory through a push button operation. Thus neither the free world nor the Communists can build its strategy around a technical lead of a few critical years. It would be also wrong to draw the conclusion— as has generally been done in India by the Press and the general public—that with the I.C.B.M. in Soviet hands the free world has lost the superiority it has enjoyed in the nuclear field since the armaments race began. It is also immaterial whether it is the free world or the Russian empire that possesses more and deadlier atomic weapons. Numerical superiority has little relevance in the nuclear age. America has enough bases, number- ing 135 according to a Russian estimate, in different parts of the world to strike directly at the

Russian empire. It can still hit Russia harder and quicker than it can be hit in return. But need mankind go on thinking only in terms of attrition and annihilation?

Paradoxical as it may appear, the invention of the I.C.B.M. has made war an absurdity as an instrument of policy. The new weapons have made it absolutely essential for international society to outlaw test explosions and ban war with deadly weapons of mass destruction. If that is done, and a war is unleashed, humanity will be faced with perils it has never faced before. After all, the days are gone when Man was afraid of the forces of Nature and worshipped them. The position appears to have been reversed now. The forces of Nature seem to disintegrate before the ingenuity of Man.

The new discovery will make nonsense of the military plans which find strength in large armies and numerous foreign bases. The international ballistic missiles have also rendered Mr. Dulles's plan of zonal inspection obsolete because ballistic missiles require neither elaborate bases nor strategic air forces for launching attacks and delivering warheads on targets. Again, considerations which are impeding the reunification of Germany, Indo-China, and Korea and have precipitated a highly explosive situation in the Middle East have today lost their significance and relevance. Now that both sides have deterrents, there might really be no war. The Russian possession of "the ultimate weapon," thus, has strengthened the nuclear stalemate which has so far been the best guarantee for peace. Whether the Russians with their new-found self-confidence can be induced to take a more conciliatory attitude towards the West is however problematical, but it justifies probing at all levels and from every angle.

This possibility raises certain other and perhaps more important political and diplomatic questions. The problem that faces the free world is to devise a new policy in regard to the uncommitted nations, now that the Communists will try to realize their dream of "world revolution" by internal subversion through economic aid and the threat of their new weapons, being more confident of their striking power than ever before. What is needed now is a new diplomacy for the nuclear age and a new political philosophy more in conformity with the new situation. The free world can only check the Communist subversion by proving that its way of life is superior to that of the Communists' and that it means to practise its principles of liberty, fraternity and equality among nations, big and small.

The main advantage of the Russians so far has been their propensity and ability to exploit situations which are themselves explosive. If their moves in the Middle East or the Far East have demonstrably succeeded, they have had local situation to profit by. The Arab and the Israeli and the Chinese and the Korean have been, in a sense, inviting preys to them. The weapons and wars that they have utilized have merely been accessories to their plans of overall world domination. It is from these that the free world can draw instructive lessons. What is necessary is political astuteness and a sense of timing.

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

"...and the trains I'll ride will be of aluminium"

Light, fast aluminium trains are no longer things of the future. The Indian Railways are using increasing quantities of aluminium in coaches, wagons and locomotive cabs and tenders.

Indian Aluminium Company, with the assistance of Canadian capital and technical resources, is playing a vital part in this development. The Company is now installing a new 10,000-ton smelter at Hirakud in Orissa, which will make more aluminium available for our railways and for numerous other applications of this versatile metal.

THE WEEK'S NOTES

DISTINCTION WITHOUT A DIFFERENCE

A SIGNED editorial note entitled "Congress Socialism and Communism" is published in the A-I.C.C. 'Economic Review' of September 1, 1957. In this note Mr Shriman Narayan bitterly criticises a leading article under the title "Distinction without a Difference?" in 'The Eastern Economist' issue of August 16 last. As a reply, the Congress General Secretary's criticism is extremely weak for it does not even attempt to meet any of 'The Eastern Economist's' arguments squarely. And it is misleading, too, for it does not even refer to this journal's main arguments. Instead, the two concluding sentences alone of the article in question are quoted—not as conclusions but as unsubstantiated (?) observations—to drive home the point that 'The Eastern Economist' has confused the Congress policy with the Communist or totalitarian policy.

To black out, as Mr Narayan's note has done, the arguments in a 144-line article and to allege that "it appears the writer has not even read the full article of the Congress President carefully" are positively unfair to 'The Eastern Economist' Mr Shriman Narayan may well note that it has always been the practice of this journal to base its criticisms on original documents as far as possible and not on their summarised versions in the daily papers. In the present case particular care was taken to secure in advance copies of the 'Youth Congress' issues (of July 1, July 15 and August 1, 1957) in which Mr Dhebar's article entitled "Post-Election Heart-Searching and Revitalisation of the Congress" has been serialised.

Any objective and fair-minded reader of 'The Eastern Economist' article would readily know that Mr Dhebar's article was not only read but read with extra care. To say that the writer has not even read Mr Dhebar's article and then to quote the Congress President, as Mr Narayan does in his note, in connection with the well-meaning distinction he has sought to draw between Congress Socialism and Communism, are calculated to ignore the fact that in the second para of 'The Eastern Economist' article the theoretical distinction drawn by Mr Dhebar between the two approaches is clearly and succinctly given. The purpose of this journal's article is to show that the laudable theoretical distinction cannot be sustained in practice if the policy for nationalisation of industries as advocated by the Congress President comes, by any chance, to be implemented. The third para of 'The Eastern Economist' article has listed Mr Dhebar's criteria for nationalisation which are mostly novel and certainly run counter to the policy of the Congress-run Government of India. And the fifth para of the article brings before the reader "the picture of Indian economy that the Congress has in mind" and which is delineated by Mr Dhebar.

The arguments of 'The Eastern Economist' are solidly based on the most relevant passages in Mr. Dhebar's article. The long and short of this journal's thesis is that the Congress brand of Socialism may well, in the conditions of nationalisation visualised by Mr Dhebar, slide into the Communist brand and that if more and ever more nationalisation is conceded as essential for Socialism, "the very bureaucratisation and State Capitalism that Mr Dhebar does not quite relish will become inevitable." It needs only to be added that the logic of this conclusion must have been so compelling that Mr Narayan, refusing to be convinced, has resorted to something bordering on abuse even as some persons resort to baculine argumentation when vocal argument fails.

RESERVE BANK'S FRANK APPRAISAL

THE RESERVE BANK'S recently published report for the year ended June 1957 makes refreshing reading by virtue of the striking fact that it contains a frank analysis of the state of the country's economy and recommends forthright remedies as essential correctives. The analysis which it makes may look as still another corroboration of the appraisals made at different levels in the recent past. Its merit, however, lies in the fact that the Central Board of Directors, as custodians of the country's Central Bank, feel impelled to speak out boldly and frankly that the time has now arrived when action cannot be delayed to relieve the heavy strains on the economy which have manifested themselves since the very start of the second Five-Year Plan. These strains have taken concrete shape in the form of upsets that have been caused in the general price level and in the balance of payments position. The Central Board of Directors of the Bank have categorically stated that, although expansion of money supply and bank credit is implicit in developmental programmes of investment, it ought to be recognised that the growing payments deficit has prevented the expansion of money supply at a faster rate.

This is to underline the important fact that foreign currency reserves have been drawn upon heavily to provide resources for investment inside the country. The normal minimum limit of Rs. 400 crores as a currency reserve was not lowered at the end of the year under survey. But since then special permission has been granted to the Reserve Bank to draw upon the reserves below this limit, but not below Rs. 300 crores as provided by the statute. It is not clear at this stage what would be the size of foreign capital that will be available to us. But in the meanwhile it has become clear that the original assessment of our requirements of foreign exchange by way of assistance in various forms from abroad was an under-estimate. The gap in foreign exchange is most likely to prove larger than what foreign help and secondarily export promotion at some cost of consumption at home can be reasonably expected to fill. The only moral of this stark prospect is that investment programmes as envisaged in the Plan must be pruned. Once this is done and a reasonable relation is established between investment targets and available resources, internal as well as external, it will be for the Reserve Bank to continue unrelaxed its vigilance on the vital front of bank credit and money supply. The report devotes an important part to the elucidation of the Bank's policy of controlled expansion with special reference to selective credit control. Care will need to be taken to ensure that real requirements of funds will not be neglected. The demarcation line between speculative demand and genuine demand for credit is not always clear. Furthermore, the Bank's claim to the effect that it has tightened the screw only against speculative demand in the pursuit of its policy of selective control is debatable.

BACKWARD CLASSES AND SCHEDULED TRIBES

DESPITE THE usual yearly improvement claimed by Mr. B. N. Datar, Minister in the Ministry of Home Affairs, in the expenditure and welfare of backward classes and scheduled tribes, dissatisfaction with what has been done so far was expressed in the Rajya Sabha. Those who spoke on the occasion were practically unanimous on the slow and uninspiring progress, and complained against "improper" use of money granted for the relief and welfare of these benighted people during the last seven years. They also asserted that

there had been hardly any improvement even in the machinery for collecting adequate information about them. They quoted from some of the reports of the Commissioner for Scheduled Castes and Tribes in which it is repeatedly said that there were delays in sanctioning money for the desired welfare schemes by the Centre because of the failure of many of the State Governments to comply with requisite formalities. In this connection it may be remembered that even the Planning Commission has had to admit that during the first Five-Year Plan period it experienced considerable difficulty in assessing the progress of various programmes for the development and welfare of these people, because of the paucity of information. In his reply to the debate the Minister concerned was constrained to admit indirectly that what had been done till now fell far short of expectations.

Most of the members, especially those belonging to the backward classes and tribes, therefore, pleaded for the extension of the special privileges granted to these backward sections under the Constitution for a further period of twenty years. Their main, and almost unassailable, argument in support of this plea, was that practically nothing had been done so far to improve their conditions and bring them within the orbit of modern civilization. It would be difficult to deny the wisdom of this argument. It is, indeed, the duty of the Government of India to help these people, who have suffered unspeakable indignities for centuries, to catch up with their more fortunate countrymen as early as possible. Without the extension of the present privileges, these unfortunate people will not be able to compete with the more advanced section of the Indian people; they will be condemned to live for ever in the prevailing shocking conditions. This would be not only unfair, but immoral in a democratic country. Democracy, is, after all, based on the concept that every one of its citizens should have equal opportunities. Dr H. N. Kunzru was unmistakably right when he observed: "We must either grapple with this question as quickly as possible or create a force that will be hostile to democracy." Backward people are generally more amenable to the suggestions and machinations of anti-social elements, whether they are socially conservative or politically "progressive."

It would be fruitful to probe into the utilization of the Rs 130 crores allotted for the various welfare schemes under the first and second Five-Year Plans. This is called for not only because grave charges have been levelled at the authorities about the use of the allotted funds, but also because the schemes have not in implementation been given the priority which they had been given in the national plans.

CHINA'S DREAM OF AN EMPIRE

MR. CHOU EN-LAI has accused the United States of "pouring" weapons and military personnel into the Republic of Viet-Nam and trying to "link" it with South-East Asia Treaty Organization. He has also accused the Republic of obstructing "free general elections." "Supported and connived at by the United States of America," the New China News Agency reports him as saying, "the South Viet-Nam authorities again and again rejected the reasonable proposals (put forward by the North Viet-Nam authorities for free general elections)." Mr Ho Chi-Minh dutifully echoed him in Hanoi. He is quoted as having said in course of a speech, "While the North of our country is becoming stronger and stronger, in the South, American imperialists are increasing their intervention."

It may be remembered that, along with Britain, France and Russia, China voted for partitioning the country and for an armistice control commission to be present for supervising and observing whether the stipulations of the Geneva Agreement were carried out. Among other things, it was laid down that the current

armed strength of each party was not to be increased. If Mr Chou En-lai now accuses the United States of "pouring" arms and military personnel into the Republic of Viet-Nam, he indirectly accuses the Armistice Control Commission of either being lax or dishonest. We shall not go into the accusation; the members of the Commission will doubtless themselves answer the charge and clarify to the public on its truth or untruth. But we would certainly like to know how Mr Chou En-lai has convinced himself of the propriety of advising or upbraiding the Commission. The reason for his "concern" for the Vietnamese is not obscure: it may well be that Mr Chou and the regime he speaks for are carried away by ambitious dreams of reviving a "glorious" past. China extended its tyranny over rich and fertile Viet-Nam for about a thousand years: today it is entrenched in its northern part. This is obvious from, among other things, the ruthlessness with which protest against Chinese paternalism is curbed. Revolts in the northern part are known to have occurred among intellectuals as well as peasants. Mr Chou's visit to Hanoi on November 18, 1956—soon after the peasant uprising at Quynh Luu, Quynh Nam and other places—cannot have been forgotten. There was on that occasion not enough time for the Hanoi authorities to construct even the usual triumphal arches. Many observers, among them the "Economist" of London, saw in that visit a purpose similar to Mr Krushchev's when, as suddenly, he visited Warsaw. This would connect Mr Chou's journey with the discontent and revolts in north Viet-Nam. In this atmosphere, the Communist leaders of China and north Viet-Nam demand free elections. It may be remembered, in this connection, that the representative of the National Government of Viet-Nam, after proposing a cease-fire without partition, suggested the holding of free elections under United Nations' supervision. But the Viet-Minh representative, under the undoubted influence of the Chinese, rejected the proposal. This could indicate that the Chinese dream of reviving a "glorious" empire in Viet-Nam was mature at the time of the Geneva conference in 1954. The Communists' prowess in connection with the holding of "free" elections is known and if elections do take place under the Communists, the southern part of the Viet-Nam will be added to the north, and the entire country will pass under the "protective wing" of the Chinese. For Mr Chou and his Comrades, what better prospect is there than this?

THE WILL TO POWER

SIR STEPHEN KING-HALL'S suggestion that the UK should disarm and rely for defence in civil resistance has attracted public discussion. In preceeding weeks I outlined his arguments and I suggested that the sort of civil resistance that was practised in India was only possible against a state susceptible to appeals to conscience and in which public opinion was free to express and to organise itself. But against a ruthless dictatorship, such as that of the USSR, which has dissolved four Autonomous (sic) Republics and expunged four major, and several minor, nationalities from the ethnographic map of the USSR, taking whole families forcibly from their homes and dispersing them in distant provinces, civil resistance has no meaning.

Moreover, the relevance of the other instances cited of successful resistance, such as that of the French during the German occupation in World War II is open to debate.

Resistance movements flourish as long as there seems a chance of ultimate victory. A resistance believed to be hopeless fades away. The French resistance was actively aided with weapons and equipment by the British regular armed forces and fought on in hopes of the Allied landing which eventually took place on D-day in 1944. If the Allies had lost the war, the French resistance would have evaporated if the Germans had been prepared to purge, shoot, kill and deport wholesale. You can only argue with an armed man if he will let you. If not, not. I submit therefore that whether British civilians could put up any prolonged resistance against regular Soviet forces would depend on how they estimated their chances. If they faced the Soviets alone, without aid from the USA and the Commonwealth, the chances would be nil. But here another of the questions put forward for investigation by Sir Stephen King-Hall becomes relevant: "Could a national resistance policy be carried out irrespective of the views of Britain's allies and the Commonwealth?" The answer is: No. What is more, a serious proposal that the UK should adopt a pacifist defence policy would so undermine US confidence in Britain that one could expect an agonising, probably isolationist, re-appraisal of Soviet-American relations at the expense of all that Britain held dear. The point of departure of US and Commonwealth thinking would be that while they were ready to spring to the aid of a Britain that was making its contribution to the common defence, they would see no reason to pay any attention to the interests of a Britain that was content to let others shoulder the expense in peace and shed the blood in war.

Liberal ideals were undoubtedly among the several reasons which led the British to leave India, but included among these reasons must also be listed a decreased will-to-power and the loss of that supreme self-confidence in their destiny which characterised the British in the nineteenth century. Whatever the reasons for this—among them the material losses and psychological sufferings in two World Wars suggest themselves—the fact remains that a people whose self-confidence and will-to-power have been undermined must gradually yield ground in the type of struggle conducted by the Congress Party and Mahatma Gandhi.

But this is an all-important qualification which does not apply to the Soviet rulers who, on the contrary, are in the first, power-drunk phase of a nation which has found its youth, is full of the lust of life, and looks forward to ever greater economic and imperial expansion. The Soviet ruling class has (rightly or wrongly) the intoxicating sensation that the future belongs to them. With a nation of 214,000,000 occupying two-fifths of the land surface of Europe and Asia, at their backs, the will-to-power of the Soviet rulers is broadly based and their freedom from (a) the inhibitions of conscience in affairs of state and (b) a public opinion free to express and to organise itself endows their dictatorship with a ruthless determination. There is no record of any constituent people of the former Czarist Russia surviving as a cultural, or other un-Russianised, separate entity under the Soviets.

The civil resistance and partisan movements cited as apparently successful in Algeria, Cyprus, Ireland, and elsewhere, are all examples of resistance against democracies with (a) public consciences, (b) public opinions, and above all, (c) uncertain wills-to-power and dimmed self-confidence. Their examples are therefore, irrelevant in a discussion of the feasibility of civil resistance by a disarmed and semi-pacifist Britain against Soviet invaders impelled by a lusty will to power, uninhibited by conscience or public opinion. That there is no parallel between these two cases is one of the basic points of my argument.

The fundamental point against the view that passive civil resistance is feasible as a weapon of diplomacy, foreign policy, and national defence, is that self-assertion and aggressiveness are part of the innate, psychological make-up of all human beings. A degree of aggressiveness is biologically necessary for the survival of an individual, a race, nation, culture, or a way of life. I fear that I shall attract the wrath of the many million followers of the Hindu ascetic leaders, of Christ, and of the Buddha, when I assert that the nation which consistently practised all the virtues of selflessness, meekness, love for its enemies, and the turning of the other cheek (or should we say the opening of the other frontier?) in response to foreign aggression would in due course vanish from the face of the earth, leaving it to be shared out between the enemies that it had loved as well.

Among the 14 questions that Sir Stephen suggested that a Royal Commission should investigate (see this column for August 23), were "if it were decided to adopt a new policy, how long would it take to implement it?" and "What training must the population be given in schools and elsewhere for its role in a war of non-violent resistance?" When one reflects that Buddhism and the Hindu ascetics have been preaching against the instincts of self-assertion and aggression, and upholding the virtues of peace-making, patience, humility, and respect for life, for 2,500 years over the greater part of Asia, and Christianity doing likewise for 1,900 years throughout Europe and vast areas of the rest of the world, the prospects of transforming lip service into

action—say, within a generation or two, to say nothing of a decade—are discouraging.

SHOULD INDIA ECONOMISE RS. 253 CRORES?

When one reflects further that, having a considerable section of its population naturally disposed towards pacifist ideals, and virtually the whole contemporary population having for some 30 years lived under the inspiration and the teachings of Mahatma Gandhi—one of the great religious leaders of all time and the incarnation of non-violence—India, now that it is free to make its own policies, has not chosen disarmament and non-violent resistance as the main sanction behind her national defence but that, on the contrary, the Lok Sabha recently passed by unanimous vote, the largest sum ever voted (Rs. 253 crores) for her three armed services, and that this represents no less than 40 per cent of the budget, one wonders what hopes there are of converting to non-violence the British who have never attained any conspicuous success in the practice of meekness, mildness, and the turning of the other cheek? Any British politician who stood for a pacifist defence policy would forfeit his deposit and would lead any party so suicidally minded as to adopt it into the limbo of lost political causes.

Sir Stephen King-Hall listed among the possible reasons why the Communists wished to destroy the democracies the fear that the long-term objective of the West is to overthrow the USSR Government by force.

I agree that the West should aim to allay this fear. This is largely a problem of establishing a two-way flow of personal contacts between leaders and peoples on both sides of the Iron Curtain and requires time and patience. But the danger of unilateral disarmament is that it would simultaneously allay fears and create an invitation to the Soviets to give uninhibited vent to their natural human instincts of aggression, which are at present kept in check by a healthy fear of the NATO alliance, backed up by the might of the USA. In the circumstances imagined, there would be no need for this aggression to take the form of war. The USSR would simply send missions to re-organise the UK economy as best suited the USSR. They would transform it into a "colonial" economy geared to Soviet interests, as was India's to Britain in the nineteenth century.

Tibet is the only nation which has tried out non-violence as a national policy. China had no reason to fear that Tibet's long-term objective was to overthrow the Peking regime by force. Tibet was the supreme example of an unarmed people, anxious only to live, the world forgetting, by the world forgot, careful to threaten no one by raising armed forces, careful to avoid getting mixed up with power blocs by seeking the protection of powerful allies.

That is why Tibet was "liberated". That is why there is no longer a Tibetan way of life.

ALGERIA BEFORE THE U.N. DEBATE

(From Our Special West European Correspondent)

PARIS, September 7.

THE Algerian situation, which is to come before the United Nations this month, has considerably worsened since the last U.N. session, at which France was given a reprieve on the understanding that she would try more liberal courses in the near future. It has worsened because in the interval the ultras have come to power in both camps: the rebel leadership has hardened and is now less under the influence of the Algerian intellectuals who preach its cause in foreign capitals; while in the French Government Algerian affairs are in the hands of the most conservative politicians that could be found within the present Radical-Socialist coalition. The Bourges-Maunoury Cabinet is now committed to total military repression. The "framework-law" that it is preparing for Algeria does not seem likely to impress the rebels as a liberal measure is in any case intended rather as a showpiece to display at the United Nations.

French methods have certainly improved in recent months as a result of the vigorous campaign in France itself against brutality and atrocities. Civil liberties are better safeguarded, legal treatment of suspects is more nearly the rule, public enquiry into irregularity is more prompt and there is evidently less recourse to "special methods" for extracting information. But this only means that the Army is being used for military rather than Gestapo purposes—and it is now being used to fight the rebels with more vigour than ever. In this it has achieved what appear to be successes: more rebels have been killed and captured and the flow of arms into the country from across the borders has slowed down. It is quite another question whether these military successes bring the French any nearer controlling the situation politically. Perhaps not. But the present Government is determined to continue this policy until it unambiguously fails or succeeds. In other words, no change of heart can be expected from the French side as long as this Cabinet remains in office—and as long as its military policy holds out hope of success, no Parliament will overthrow it.

How far the Bourges-Maunoury Government is prepared to go in this direction has just been demonstrated. The French have built a fantastic fence over 200 miles long running the length of the Tunisian-Algerian border, in an effort to block off the supply of arms from the east. This barrage consists of several rows of barbed wire, electrified hedges, minefields, and radar equipment; it required 20,000 tons of material and was built by 12 battalions of engineers and 7,000 local workmen. It follows the north-south railway line from Bone down beyond Tebessa. It is impossible to continue the passage of the barrage, between the railway line and the actual Tunisian border, a considerable no-man's-land has been emptied of population, dotted with desert forts and is constantly patrolled by aviation. Behind the barrage is another empty no-man's-land and behind that again a region where all movement is strictly controlled. Once this fence was near completion, the French Government served notice on the Tunisians that if any rebels made an incursion into Algeria from their side of the border, they would be pursued back into Tunisia by French troops. Within a few days, this new policy

was applied and there was a bloody skirmish on Tunisian soil. Obviously, the Government in Paris is willing to ruin its relations with Bourguiba (although Bourguiba is the one man who could help find a genuine political settlement) in an effort to seal the borders of Algeria.

Whether or not this desperate military programme can succeed remains to be seen. But it is clear that a Government that ventures on it is giving no thought to seeking a political settlement. So the "framework-law" must be taken, not as an attempt to meet Algerian aspirations, but as a device to gain a further reprieve from the United Nations, to give time for the military programme to prove itself. The Americans have already told Paris that at this U.N. session they will abstain from voting, rather than round up support for the French, unless some definite step has been taken toward liberalising the Algerian regime. Since France would certainly be heavily outvoted if the Americans declined to use their influence to get a favourable vote, the "framework-law" is being hurriedly concocted to give Washington an excuse to preach patience.

The "framework-law" is in fact the merest gesture. It offers nothing beyond a measure of decentralisation and would not bring Algeria to anything like the stage reached by India in 1935 after the Government of India Act. It has not yet been approved by all the parties that Bourges-Maunoury needs to get a favourable vote in the French Assembly, but its present terms are these: it divides Algeria into five or six regions in each of which there would be a "territorial assembly" elected by direct universal suffrage. Over these territorial assemblies, there would sit in the city of Algiers a "co-ordinating assembly" which would attend to questions of common interest but would not have legislative powers and would not be elected by universal suffrage. Real power would remain with the third part of the regime, and executive or administration sitting in Algiers and presided over by a minister nominated from Paris. Even supposing, what is quite likely, that the rebels would be content with something less than the absolute independence they are claiming, nevertheless the dispensation envisaged in the "framework law" would be quite inadequate to secure their support. But then, I repeat, it is scarcely meant to attract their support.

Since the French have apparently abandoned all effort at negotiation such as was going on constantly and secretly under the Guy Mollet Government and have set themselves on a total military victory, what chance do they have of achieving it? In theory, if the borders of Algeria with Tunisia and Morocco were completely sealed, the rebellion in Algeria could be exhausted within several months. The rebels receive all their arms and ammunition from across these borders; they retreat across them when pursued by the French; they have rest camps and training centres in Tunisia; they get supplies from the Tunisian administration and are allowed to use official services and transport for their purposes; Tunisians officials along the border (who in this no doubt go beyond the orders or even the connivance of the Government in Tunis) actively co-operate with them. In all these respects the newly independent Government of Tunisia is clearly violating its international obligations. The administration

and army that it allows to assist the Algerian rebels is subsidised and maintained by the French; in fact Tunisia is simply passing on to the rebels a share of the money and arms it receives from Paris. Similar observations would apply to Morocco, though Moroccan complicity in the rebellion is considerably less.

If this outside support could be stopped, the French Army argues, the armed rebellion would collapse. But it would be immensely difficult to seal borders that run across the desert, even by such grotesquely expensive means as the French have used in building the Bone-Tebessa fence. And even without outside help, the rebel movement would no doubt be able to continue terrorism on a politically significant scale for many months, perhaps in some regions for years. But what the French are banking on as much as an outright victory in the field, is the discouraging effect of continuous military successes on the rebel leadership. This leadership is already acutely split. Ever since Colonel Nasser founded the FLN in Cairo, by splitting off pro-Egyptian elements from the older MNA revolutionary movement, the Algerian cause has been deeply divided, and these two groups spend as much time terrorising each other as they spend fighting the French. Their rivalry has increased in recent months, and now there

is growing division within the FLN itself. The chiefs who conduct the rebel bands in the field are out of sympathy with the intellectual leadership whom they variously accuse of being pro-French, pro-Communist or pro-Egyptian. It is this division of the rebel movement that enables the French to say they cannot negotiate because there is no one party to negotiate with—and this is true, even if it is not the only reason the French are disinclined to negotiate. Above all, this division encourages the French to persist in their military programme in the hope that the rebellion, if sufficiently hard pressed, will collapse under its own internal contradictions.

An idea of how much support the Bourges-Maunoury programme enjoys among the French electorate was provided this week by a Gallup poll taken by the Institute of Public Opinion. It showed that 36 per cent of the metropolitan French favour maintaining Algeria's present status as a juridical part of France, 34 per cent favour greater local autonomy while retaining Algeria within the Republic, only 18 per cent favour outright independence, and 12 per cent had no opinion. So less than one-fifth of the French people are yet willing to envisage the solution recommended this month by Mr. Nehru.

VIA JAMSHEDPUR

Four hundred young engineers who will man the three new State steel plants will spend six weeks at Jamshedpur before they go abroad for training.

Here at the steel city, an orientation course will acquaint them with the first essentials of steelmaking in India. And they will undoubtedly get a friendly tip or two from Tata Steel veterans.

Jamshedpur is proud to welcome these steelmakers of tomorrow.

TATA STEEL

TN 1416

THE TATA IRON AND STEEL COMPANY LIMITED

"I AM FRACTIONATED"

stammers Adipocere
(Pronounced 'adi-po-saire')

After drilling me out of the earth, they take me to the Refinery. Here I am passed through a continuous process in which I am heated in pipes running through a furnace.

By now I am a mixture of hot vapours and liquid discharged into a fractionating or "bubble" tower, and I pass through vents in a series of trays. As my fractions are separated at different boiling points the residue is drawn off at the bottom, the lubricating oils at the middle of the column, motor gasoline and kerosene fractions still higher up.

Distillation is but one step in a series of complex refining processes which make possible a wide variety of petroleum products.

And after all this, there is yet another process to which I am subjected—that of Catalytic cracking.

Keep watching these columns for what is to happen to me.

STANVAC — the name that stands for progress

Regarded as one of the world's most modern refineries, the Stanvac Bombay Refinery combines several petroleum refining processes in the Model Four Combination Unit—the latest in oil refining.

STANVAC-49/57

WORLDGRAM

AGRICULTURE

Nitrogenous Fertilizers: The requirements of nitrogenous fertilizers in the country during the calendar year 1956 were 6,55,500 long tons, revealed Shri Ajit Prasad Jain, Union Minister for Food and Agriculture, in the Rajya Sabha. Out of this, 3,88,990 long tons had been produced locally. The country's requirements in terms of sulphate of ammonia, Urea and ammonium sulphate nitrate last year were 6,13,000 long tons, 24,600 long tons and 17,900 long tons respectively.

Delhi Milk Supply Scheme: Shri M. V. Krishnappa, Deputy Minister for Agriculture, informed the Rajya Sabha in a statement placed on the table of the Sabha that the New Zealand Government had agreed to make a grant-in-aid of £800,000 to the Delhi Milk Scheme under the Colombo Plan. The amount would be utilised for meeting the cost of imported milk-processing equipment required for the Central Dairy and its ancillary rural milk collection and chilling centres. The cost of equipment was estimated at Rs. 153 lakhs. No plant was to be received from New Zealand. The statement further said that the Central Dairy, which would house the main plant, would be located in Delhi near the West Patel Nagar Railway Station. The milk animals, removed from Delhi, would be housed at a cattle colony near Badli. About 350 maunds of milk would be secured from the cattle colony and 6,650 maunds of milk from the other rural areas. It was difficult, at this stage, to work out the quantities. Only whole milk would be sold in the beginning, but toned milk would be prepared, if there was a demand for it.

Uttar Pradesh Irrigation Projects in Second Plan: Ten irrigation and multi-purpose schemes, which will benefit an area of 15.59 lakh acres in Uttar Pradesh, have been included in the second Five-Year Plan. The total cost of the schemes, three of which will be carried over to the third Five-Year Plan, is estimated at about Rs. 38.37 crores. Of this amount, Rs. 22.90 crores are likely to be spent during the second Plan period. Nearly 15.59 lakh acres will receive irrigation benefits during the period. A sum of Rs. 50 lakhs has been earmarked for investigations during this Plan period. One of the major schemes is the Rs. 15.99-crore Ramganga river project. This is expected to irrigate 7.01 lakh acres in various districts of the State. Rs. 4.50 crores are to be spent on the project during the second Plan period.

Bhoodan Land in Bihar: A pilot scheme has been formulated to resettle landless agriculturists on the Bhoodan land in Bihar on a co-operative basis. Resettlements will be made on suitable blocks of 75 to 100 acres, and it is proposed to settle 25 families on each of 10 such blocks. In this way, 250 families will be settled on Bhoodan land, having an area of about 750 to 1,000 acres. The Government of India has sanctioned a sum of Rs. 2½ lakhs for resettlement of these families.

INDUSTRY

Target for Industrial Alcohol: The Committee of experts on alcohol industry appointed by the Government of India has recommended that the target of production of industrial alcohol should be raised from 30 million gallons per year to 46.8 million gallons per year by 1960-61. The Committee had recommended that in order to achieve this rate of production the

target capacity should be raised from 36 million gallons per year to 52 million gallons per year. The Committee had made certain other recommendations for the development of the industry and for the utilisation of the increased production during the second Plan. The Report of the Committee was at present being considered by the Government.

Manufacture of Machine Tools and Hand Tools: By a notification published in a Gazette of India, the Government of India have exempted from the operation of the registration and licensing provisions of the Industries (Development and Regulation) Act, 1951, all industrial undertakings engaged in the manufacture or production of machine tools, hand tools and small tools for their own consumption. Any undertaking which manufactures these tools need not, therefore, apply for registration or licence unless its manufacturing capacity is such as would enable it to effect sale of the tools to the public, in addition to meeting its own requirements.

Production of Rayon Yarn: The Minister for Commerce and Industry, Shri Morarji Desai, stated in the Rajya Sabha that licences under the Industries (Development and Regulation) Act had been issued to seven firms for the manufacture of rayon yarn with a total capacity of 80 million lbs. The present production of rayon yarn, Shri Desai said, was only 20 million lbs.

TRADE

Indo-Austrian Trade Agreement Extended: Letters have been exchanged at Vienna between the representatives of India and the Austrian Federal Republic extending the validity of the Indo-Austrian Trade Agreement up to June 1958. The Trade Agreement, which was signed on December 9, 1952, was initially valid for two years ending June 1954 and was extended from time to time. It was last extended in September 1956 and was valid up to June 1957. In terms of the latest exchange of letters, the Austrian Federal Government have agreed to license freely for importation into Austria from India of walnuts, kapok, raw wool, pig bristles, cotton seed oil for industrial purposes, crushed bones for use as fertilizers and bladders and guts. Other commodities that are permitted to be imported freely into Austria from India are castor oil, coir, coir yarns, fibre for brushes and brooms, handicraft manufactures of ivory, brass, horn and brocade, iron ore, manganese ore, mica, shellac, linseed oil, myrobolans, spices, cashewnuts, tanned leather, tea, carpets, sports goods, hydrogenated oil for industrial purposes and raw cotton.

Indo-Japan Trade Treaty: The Minister for Commerce, Shri Nityanand Kanungo, said in the Lok Sabha that the possibility of concluding a trade agreement with Japan before the end of this month was under active discussion with the Japanese Government. Shri Kanungo was replying to a question by Shrimati Tarkeshwari Sinha and another Member whether there was any proposal to extend the provisions of Article 2 of the Indo-Japan Peace Treaty of 1952 beyond September 30, 1957. The Minister added that the question of extending the provisions of the Article for a further period did not arise at this stage.

Export of Iron Ore to Japan: The Minister for Commerce, Shri Nityanand Kanungo, said in the Lok Sabha that the State Trading Corporation was confident of delivering the contracted quantities of 1.3 million

tons of iron ore to Japan during the period July 1957 to June 1958 for the supply of which it had entered into an agreement. A total quantity of nearly 1,20,600 tons had been shipped up to August 25, 1957. Considering seasonal difficulties, the deliveries so far had not been unsatisfactory. Shri Kanungo added that the S.T.C. was receiving necessary assistance from the Ministries of Railways and Transport.

FINANCE

Financial Aid for Warehousing and Co-operative Societies in States: For development of warehousing schemes in the country, loans amounting to Rs. 7.5 lakhs—Rs. 2.5 lakhs to Orissa and Rs. 5 lakhs to Madras Governments—have been sanctioned by the National Co-operative Department and Warehousing Board for setting up of State Warehousing Corporations in the two States. The loans to the Orissa and Madras Governments are a contribution to share capitals of the State Warehousing Corporations, and represent 25 per cent of the total paid up value of the shares. The Board has also sanctioned about Rs. 30 lakhs as subsidies and loans for development of large-sized and small-sized co-operative societies in Bombay, West Bengal, Uttar Pradesh, Delhi and Himachal Pradesh for 1957-58.

Low-Income Group Housing Scheme: Shri Anil K. Chanda, Deputy Minister of Works, Housing and Supply, in reply to a question by Shri Maheswar Naik in the Rajya Sabha laid the following statement on the table of the House giving the names of the State Governments which had availed up to August 31, 1957, of the facility of the grant of loans by the Government of India for the acquisition and development of sites for sale to persons in the Low-Income group on a no-profit-no-loss basis: Andhra Pradesh—Rs. 5.55 lakhs; Bihar—Rs. 16.00 lakhs; Bombay—Rs. 22.65 lakhs; Jammu and Kashmir—Rs. 5.00 lakhs; Madhya Pradesh—Rs. 23.25 lakhs; Madras—Rs. 4.24 lakhs; Punjab—Rs. 5.00 lakhs; Rajasthan—Rs. 8.50 lakhs; Uttar Pradesh—Rs. 47.00 lakhs and Delhi—Rs. 25.00 lakhs.

Foreign Exchange for Business Travels: Foreign exchange expenditure on business travels in 1956, according to information available from the statistics maintained by the Reserve Bank, was Rs. 39.5 lakhs against the total foreign exchange expenditure (both visible and invisible) of Rs. 1,089.3 crores. During January-April this year, out of a total foreign exchange expenditure of Rs. 427.7 crores, the amount spent on business travels was Rs. 28 lakhs.

Decimal Coinage: The total value of all denominations of decimal coins put into circulation during the period April to July 1957 was about Rs. 1.6 crores, said the Finance Minister, Shri T. T. Krishnamachari, in a written reply to a question by Shri Manabendra Shah, in the Lok Sabha.

GENERAL

Employment Situation in June 1957: In spite of a fall in registrations, vacancies notified and in the number of employers utilising the services of Employment Exchanges, there was an increase in the number of persons placed in employment in June 1957. During the month, 91,533 applicants were submitted to employers for selection as against 1,04,870 in May. The number of placements in June was 17,369 as compared with 17,271 in the previous month. The increase in placements was appreciable in Uttar Pradesh and

Madras, while there was a decrease in Delhi, Madhya Pradesh and Kerala. Of the total number of placements, 5,605 were under the Central Government, 7,661 under the State Governments, 1,352 under quasi-Government establishments and local bodies and the remaining 2,251 under other employers. At the end of June, 7,79,478 applicants were on the live Register of Employment Exchanges. This was 3,455 less than the figure at the close of the previous month.

Specifications for Dairy Products: The Indian Standards Institution has issued four draft Indian standard specifications for dairy products for eliciting comments. These drafts, prepared by the Dairy Industry Sectional Committee of the Institution, cover milk powder (whole and skimmed), condensed milk, casein (acid), edible and industrial, and lactose. In the draft specification for milk powder (whole and skimmed), requirements for moisture, total milk solids, solubility index, ash, fat, acidity and bacterial count have been prescribed. In the draft specification for condensed milk, the four types of condensed milk, full cream sweetened, and unsweetened and skimmed sweetened and unsweetened have been covered. The draft Indian standard specification for casein (acid), edible and industrial, prescribes the requirements in respect of moisture, total ash, acid insoluble ash, fat, nitrogen, etc. in respect of two grades of the material, namely edible and industrial. The fourth draft standard series deals with lactose. In view of the fact that lactose is used both for commercial and for pharmaceutical purposes, the Sectional Committee decided that requirements for the material used for these two purposes should be specified separately.

State Electricity Boards: State Electricity Boards have been set up in West Bengal, Madhya Pradesh, Bombay, Kerala, Madras, Rajasthan and the Union territory of Delhi, said Shri Jaisukhlal Hathi, Deputy Minister of Irrigation and Power, in a written reply to a question by Shri Nawab Singh Chauhan in the Rajya Sabha. Shri Hathi added that all the remaining States had agreed to constitute the boards shortly and were engaged in finalising the preliminaries. The boards could not be established in these States earlier on account of certain administrative and technical difficulties.

Indian Students and Trainees in Germany: During the State visit of the Prime Minister, Shri Jawahar Lal Nehru, to West Germany a number of scholarships were offered by the Government of the Federal Republic of Germany to India. A number of other scholarships were also offered by the West Germany, 600 from the Government of the Land North Rhine Westphalia, for students and trainees, 100 from the Hamburg Chamber of Commerce, 10 from the Senate of the Free city of Hamburg for post graduate study and research work at Hamburg University and two scholarships were offered by the Student Body given through the Student Council of the Hamburg University.

Expansion of Matchwood Plantations under Second Five-Year Plan: During the second Five-Year Plan, it is proposed to bring in an additional area of about 50,000 acres under matchwoods. The scheme is being undertaken in suitable forest localities by the States of Bombay, Madras, Orissa, Bihar, West Bengal, Assam, U.P., Punjab, Mysore, Andhra Pradesh, Kerala, Manipur and Andamans. The total provision for the scheme for the Plan period is Rs. 1,01,78,000.

NEWS IN BRIEF

INDIAN

With a view to promoting Consumption of pure coffee within the country, the Coffee Board has recommended that import of chicory should be banned.

The National Industrial Development Corporation is conducting negotiations with a few foreign firms for obtaining technical and financial collaboration in this project for the manufacture of intermediates for dye-stuffs and drugs.

The Indian Standards Institution has just published a code of practice for use of structural timber in building (material, grading and design).

It is reported that the Steel Purchasing Mission of the Railway Board have placed orders for most of the steel requirements of the railways. Orders have been placed for 5.22 lakh tons of iron and steel valued approximately 36 crores of rupees.

A more comprehensive range of life insurance policies, lower premium rates, omission of extras for war risks and insurance of women on a liberal basis are some among the several measures taken by the L.I.C. to afford better insurance facilities to the people.

To promote the small savings movement in the Community Development and National Extension Service Areas, the Ministry of Community Development have suggested to State Governments to establish two to four pilot projects in each State, depending upon its size, for an intensive drive.

Salem magnesite is proposed to be exploited through the formation of a Corporation in which the Government of India, the Madras Government and a private firm—Burn and Company—will participate.

The Government of India are understood to have agreed to licence the setting up of a 12,000 spindle co-operative textile mill in the Ramnad district in Madras. The mill is being set up as a co-operative venture of handloom weavers and cotton producers.

It is reported mill molasses of Bombay origin will be licensed freely for export to all permissible destinations.

Copper base alloys conforming to the standard specifications such as B.S.S., A.S.T.M., I.S.I. will be licensed freely for export to all permissible destinations.

Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel stated in the Lok Sabha recently that in 1956-57 the Punjab was allotted 57,196 tons of steel. The State's total allotment for the first two quarters of 1957-58 was 22,186 tons.

FOREIGN

The Federation of Malaya had a favourable trade balance of \$M23.8 million in July, according to preliminary figures issued in Kuala Lumpur. Exports in July were \$M174.1 million and imports \$M150.3 million.

Pakistan had received \$124.6 million of aid up to June 30 this year for various development projects.

Yugoslav shipyards at Rigeika, Pula and Split have concluded contracts with British and other foreign shipowners to build 36 Ocean vessels worth about £50 million by the end of 1962.

The Ceylon Government has reduced the export duty on all rubber, except scrap crepe, by four cents per pound.

Rubber consumption in the US in July was 109,331 tons, some 2,000 tons less than in the previous month. But the July figure was still 13,000 tons higher than a year ago.

It is reported plans for a Portuguese steel industry would shortly be finalised. Its target is the production of 300,000 tons of iron and steel annually. Siderurgia Nacional, the company which will own and operate the new industry, estimates that by 1960 it will be able to produce 20,000 annually.

A Bill to extend the US National Wool Act for another four years to March 31, 1963 was introduced in the Senate recently.

South Africa's total gold and foreign assets in the week ended August 23 totalled £112,936,000 compared with £112,821,000 a week earlier. The last total comprised £80,198,000 in gold coin and bullion, £21,595,500 in foreign bills, £7,103,000 in foreign securities and £4,040,000 in other foreign assets.

Dutch foreign trade in July showed a decided improvement. Imports totalled Fls. 1,375 million against Fls. 1,299 million in June and Fls. 1,277 million in July 1956.

It is reported Saudi Arabia has become a member of the International Monetary Fund and World Bank.

British and Anglo-Dutch oil companies produced 125.2 million tons of the 868.9 million tons record world oil output for 1956. The British-Dutch share represented an increase of about 7 million tons on 1955, this new peak being achieved despite the effects of the Suez crisis on Middle East output in the last two months of the year.

A tender from the Czechoslovakian Techno-Export Corporation to build a sugar factory in Ceylon has been accepted by the Ministry of Industries.

German plastics production has now reached an annual value of £42 million—a 54 per cent increase over 1954. In the same period, the plastics processing industry's output increased by 64 per cent to £98 million.

A motor oil so good
it cuts petrol consumption

up to **15%**

CALTEX

RPM

**20-40 SPECIAL
WORKS FOR
YOU LIKE THIS**

when you start your car

you need the performance of a 20 oil

Every time you start, your engine needs a light, quick-lubricating 20 oil. Bearings are then instantly protected, petrol is not wasted overcoming friction caused by a heavier oil, excess power is not drained from the battery.

ten minutes later

you need the performance of a 30 oil

As your engine warms up it needs a SAE 30 oil—an oil with more "body" to resist the increase in engine temperature. At this stage, a lighter 20 oil would not give complete protection or maximum performance, a SAE 40 oil would be too heavy.

twenty minutes later

you need the performance of a 40 oil

Out on the open road your engine will operate more efficiently with the full-bodied protection of a SAE 40 oil.

RPM 20-40 SPECIAL meets engine requirements during all stages, gives extra protection at full throttle and ensures cooler, smoother running all the time.

RPM 20-40 SPECIAL gives you these important benefits:

1. Up to 15% increased mileage per gallon
2. Up to 33% less consumption of oil
3. Quicker, smoother engine response during warm-up
4. Less drain on battery
5. Minimises wear
6. Meets passenger car and truck manufacturers specifications
7. Can be used in all weathers, all seasons, all driving conditions

STATE DEFICITS: THE WAY OUT

THE State Budgets for 1957-58, taken together, reveal a considerable deficit for the third year in succession. The aggregate revenue deficit this year is Rs. 77 crores (after taking into account the estimated yield of additional taxation of just under Rs. 10 crores in all in the States of Bihar, Uttar Pradesh, Punjab, Rajasthan, Orissa, Madras and Kerala) as against the same figure in 1956-57 (Budget) and Rs. 66 crores in 1955-56 (Revised). As for overall deficit, it is of the order of Rs. 111 crores this year, and this is to be partly met by reduction of cash balances and by sale of Rs. 25.5 crores' worth of securities in investment accounts. Still the closing balance will be a negative item of Rs. 59 crores. This state of affairs for which the revenue deficit is largely responsible is, perhaps, not as disquieting as it looks, for this may well be considerably reduced if the final recommendations of the second Finance Commission regarding the Central grants-in-aid to States and the distribution of the divisible Central taxes turn out to be generous according to general expectation.

Incidentally, the trend in regard to shared taxes is that the States' share has increased from Rs. 53 crores in 1951-52 to Rs. 98 crores in 1957-58 (Budget). This increase of Rs. 45 crores is by no means phenomenal in the context of an increase of about Rs. 300 crores in the entire tax revenue of the Centre since 1951-52. On the other hand, Central grants to States have increased to a greater extent from Rs. 34 crores in 1951-52 to Rs. 122 crores in 1957-58 (Budget). As the present Finance Commission is rightly expected, in the context of State Governments' inability to levy any substantial additional taxation after the huge tax effort of the Centre this year, to recommend a pattern of tax-sharing and grants-in-aid which would be more favourable to States, the States may get an additional revenue of not less than Rs. 50 crores in the budget year (1957-58) under 'shared taxes' and 'grants' together. Even after the possible transfer of about Rs. 50 crores to the State Governments this year, there will be a gap of Rs. 27 crores which, according to present indications, are likely to be covered later in the year by additional taxation. If there is to be no negative closing balance, additional taxation may have to be at least Rs. 36 crores in all.

With the expected increase in resources made available by the Centre, such resources 'plus' loans might come to Rs. 527 crores accounting for 48 per cent of the States' aggregate expenditure of Rs. 1,106 crores on revenue and capital accounts together in 1957-58. In other words, roughly half of all expenditures of the State Governments could be incurred only with the aid of resources made available by the Centre. How centrally-regulated planning has brought about an increase in the financial dependence of States on the Union Centre can be seen from the first table in the next column.

If State autonomy which is, to some extent or other, already circumscribed in practice by this financial dependence is not to be curtailed further, the State Governments may have to cease asking for more and more from the Centre and either to curtail their plan budgets suitably or to get some more revenue by additional taxation. As continuing overdrafts and sale of securities to the Reserve Bank (as distinguished from short-term ways and means advances by the Centre and the Reserve Bank) largely constitute deficit-financing, the State Governments may have to

raise additional resources by taxes in order to reduce the need for such deficit-financing to some extent.

(In Rs. Crores)

Year	Resources from the Centre by way of shared taxes, grants & loans	Expenditure of States on Revenue & Capital Accounts together	(2) as a percentage of (3)
(1)	(2)	(3)	(4)
1951-52	160.1	544.0	29.4
1952-53	221.6	572.5	38.7
1953-54	272.8	625.0	43.6
1954-55	343.7	701.5	49.0
1955-56 (R.E.)	433.0	947.4	45.7
1956-57 (B.E.)	479.6	1040.7	46.1
1957-58 (B.E.)	476.8	1105.7	43.2

Here one is led to examine the scope for additional taxation in the States. As things stand at present, the scope for raising more revenue from such tax-heads as 'Stamps and Registration,' 'General Sales Tax,' 'Sales Tax on Motor Spirit,' 'Entertainment Tax,' 'Electricity Duties' and 'Motor Vehicles Taxes,' seems to be very limited for these reasons: Stamp duties, registration fees and motor vehicles taxes are already known to be very high in this country; any further increase in the rates of sales tax in general and on motor spirit would respectively add to the present heavy burden of indirect taxes on the consumer and increase the cost of road transport at a time when it has to relieve the pressure on railways; any increase in electricity duties would add further to industrial costs at a time when they are going up on account of other well-nigh uncontrollable factors; and any increase in the rates of entertainment tax would be stoutly opposed by the cinema industry which caters to the masses. The only tax-heads which provide scope for additional revenue are 'Land Revenue,' 'Agricultural Income-Tax' and 'State Excise.'

TAX REVENUE OF STATES

Tax-Head	(In Rs. Crores)	
	1951-52 (Accounts)	1957-58 (Budget)
Share of Income-tax	52.65	61.78
Estate Duty	—	2.44
Union Excise	0.70	19.21
State Excise	49.41	41.78
Land Revenue	47.99	92.54
Agricultural Income-tax	4.33	6.34
Stamps and Registration	25.56	29.12
General Sales-tax	54.40	88.57
Sales-tax on Motor spirit	4.53	9.08
Entertainment-tax	6.39	6.91
Electricity duties	3.39	5.99
Motor Vehicles taxes	10.09	17.37
Urban Immovable property tax	1.85	2.03
Profession tax	0.07	0.29
Other taxes and duties	19.69	17.97
Total	281.05	401.42

But unfortunately any proposal to increase substantially the revenue from these sources would involve political and non-economic or non-fiscal considerations. These considerations are not so compelling as the Congress-run State Governments take them to be. For example, in the case of land revenue it is thought that any steep increase in the rates of assess-

ment would make the Congress unpopular with the enormous body of landowners and probably lead to its defeat at the polls. This is an unwarranted fear because the comparatively greater prosperity of the landowning classes as a result of the higher prices they have been receiving for their surpluses since de-control and on account of the larger aids they are being given through community projects and otherwise, provides good enough justification for stepping up the rate of land revenue assessment to an extent that might be agreeable to them in the context of their increased well-being.

It may be retorted in this connection that land revenue has increased from about Rs. 48 crores in 1951-52 to nearly Rs. 93 crores in 1957-58 (Budget). Such a reply ignores the fact that the increase in land revenue is mostly a sequel to the abolition of Zamindari and jagirdari tenures which were yielding far less revenue to the State Governments than would have been the case if ryotwari tenure had prevailed in their place. In other words, the land revenue yield would have been not less than Rs. 80 crores even in 1951-52 if ryotwari tenure is supposed to have prevailed all along throughout the country. As ryotwari rates of

assessment have practically remained at a more or less constant level in the last 20 years or so in spite of the increase in agricultural prices since war-time, it is admitted that, on an average, the acre-assessment represents only from 5 per cent to 6-14 per cent of the current net income from an acre of land. There is, therefore, a case for revising the ryotwari rates upwards in resettlements so as to increase revenue. Of course, it would not be possible to raise the rates to the full half-net level of ryotwari assessment in view of the increased cost of living of the landowning classes. Even if the rates cannot be generally doubled so as to make them correspond to from 10 per cent to 12-12 per cent of the current net income from land, they can at least be generally raised by half which would mean an additional revenue of up-to Rs. 50 crores a year. If, at the same time, the exemption-limit for agricultural income-tax other than on plantations is maintained uniformly at the same exemption level as under the Central Income-tax in all the States (other than Punjab and Bombay where it is not now levied) and if extension of Prohibition is postponed indefinitely, a way-out of the budgetary difficulties will have been found for the State Governments.

1957-58 BUDGETS OF STATES

(Figures in Rs. Crores)

State	Revenue Budget				Capital Budget			
	Revenue		Expenditure		Receipts		Disbursements	
	Tax	Non-tax	Develop-ment	Non-Deve-lopment			Develop-ment Out-lay	Non-Deve-lopment Outlay

PLANTATION EXPORTS

THE CASE HISTORY OF TEA EXPORTS

(CONTRIBUTED)

EXACTLY a hundred years ago, Britain's consumption of tea was 69 million lbs., of which India supplied two million lbs. This year's import of tea by Britain would be over 520 million lbs., of which no less than 300 million lbs. would have been supplied by India. Of the world's total output of tea, excluding China's, over 1,000 million lbs. are exported to consuming countries. More than half of that export goes to the United Kingdom. In 1857, only 3 per cent of the 69 million lbs. received by Britain came from British possessions and 97 per cent came from China. Last year, tea import by the U.K. was nearly 513 million lbs., of which only 2.1 million lbs. came from China. Part of this transformation was due to the systematic promotion of tea drinking carried on for over a century by the British tea trade.

Tea takes the pride of place as the first commodity in which co-operative publicity was attempted by the producers. In 1887, Ceylon started a publicity campaign for the Island's tea and this was followed a year later by India. In 1902, the producers in India submitted a memorial to the Governor-General for the introduction of a Bill which would force all producers to bear the burden in proportion to their share of the export market under statute. The first Bill of its kind, the Tea Cess Bill of 1903 was enacted and a committee to administer the cess fund was constituted under the Act. This Act is to be remembered for three features which have a bearing on any consideration of export promotion to day. The first was that the cess was a specific levy on an industry and it was for a specific purpose. The second was that the cess was levied on export,

because the money was primarily required to promote the export market. The third was the nature of the committee. It was composed entirely of producers, from whose produce the cess was being collected, and it was for the purpose of promoting the sale of their produce with which they were the party most concerned.

It was in 1933, after the great depression and when India agreed to participate in international regulation of planting and export, that a change occurred both in the constitution of the Cess Committee and in the statutes affecting tea directly. The Cess Committee became the Indian Tea Market Expansion Board and was a new body, the Indian Tea Licensing Committee, was found under the Indian Tea Control Act to implement the Tea Agreement in India. The setting up of the Board marked the beginning of a new phase in tea promotion. The Indian Board was a parallel body to the International Tea Market Expansion Board set up in 1935 in London and was based on the idea that India provided an unlimited market for the Indian tea industry at its doorstep and it should be developed for the future stability of the industry. The Board showed up two new features. One was that its funds still came from a charge on the foreign consumers of India's tea and the other was the emergence of a specially qualified technical staff for the conduct of propaganda. It retained two old features. The producers still continued to be in a majority on the Board and the cess collected was wholly devoted to tea promotion, whether it went into export promotion, propaganda in India, or to the Board's reserves.

The threatening cloud of official interference in matters which were the concern of the Tea Board came in 1952. In September, the Government suddenly, and without warning its partners on the International Tea Market Expansion Board, withdrew from it. This action was taken without the knowledge or consent of the Tea Board, which was supposed to be an autonomous body charged by statute with the conduct of tea propaganda. One of the sections of the Tea Board Act provided for the Tea Board being consulted on matters affecting its responsibility. That section was, of course, ignored. To this day the country—not to speak of the industry—has not been vouchsafed an explanation why India withdrew from the I.T.M.E.B. without the advice of the Tea Board, without any stated reason, without intimation or consultation with Ceylon, Indonesia or Pakistan and thereby losing the assets of the Board built up over 17 years, the services of some of the best propagandists and the disorganisation of a promotional machinery spread over 12 countries.

Within four months followed the introduction of a Bill in Parliament totally and in almost every important detail altering the constitution and composition of the Tea Board. The long-established planters' organisations were no longer free to nominate their own representatives on the Board. The chairman of the Board was to be an imprest holder and appointee of the Government. The Board's income from cess was to be found through the Consolidated Fund of India and there lay no automatic right with the Board to the proceeds of the cess. In effect, the specific cess became an item of revenue and payments to the Board became appropriations and grants. Board budgets and appointment of officials became matters for direct Government decision. All the procedural rules of the Government became applicable to the body which was composed of members who are there by Government nomination. The producer members the affairs of whose industry were to be discussed and decided by the Board were in a minority. Interests, in some cases opposed to the producers, have been placed on the

Board, with the result that Board discussions stray far from business discussions and get involved in political and philosophical alleys and by-ways. Not rarely the debate ends in such a way that an objective discussion is impossible and decisions of the Government however wrong cannot be corrected.

The consequential change affected by the new Plantation Act is the reduction of the most vital interest in the Board and whose livelihood and interests would be directly affected by any decision of the Board, to an emasculated minority. With a rise in Government interference with the functioning of the Board can be traced two new developments affecting promotional efforts: one is the dissociation of the representatives of the industry from the responsibility of shaping, fashioning or controlling propaganda work; the other is the increasing weight of procedural rules which take the life out of any concept of imaginative promotion.

The export Promotion Councils, which have come into being during the last four years, had their origin in a flash of idea which has not been tested and which has only a remote resemblance to the Joint Promotional Councils which existed in the United States under the International Tea Market Expansion Board. The Tea Council, brought into being by the Tea Bureau in New York, was a joint promotion Council, the contributors to its fund being the Tea Bureau of New York which was controlled by the I.T.M.E.B. in London, which, in turn, was controlled by the producing countries and the tea trade of the United States. On this Council, the Bureau had sufficient weight, apart from the fact that its entire executive was composed of Bureau appointees and the Council consisted of men drawn from the top of the tea trade in America. In bringing together promotional Councils in India with members who have never in their lives done any publicity on their own and with scarcely any idea of organisation, there exists no parallel on which to build such joint Councils. Another serious defect is the excessive faith put in part-time work as Chairman by officials who are already saddled with their department. It is part of the promotional Councils' constitution that the Chairmen of such Councils should be the Import and Export Controller of the Commerce and Industry Ministry. The association of such an official with a body of this kind can be considered quite helpful, but placing them as the 'ex-officio' chairman in each case has not done anything to add to the efficiency of these councils. The funds for the councils are to be raised in a manner which will find most of these councils functioning with scarcely any resource capable of creating an impact by their work. The Government will contribute to the fund a sum equal to the total voluntary contribution made by the industry. When an industry is not organised, the raising of such a fund is extremely difficult, as has been proved in the case of councils like the Cashew and Pepper Export Promotion Council and many others. The anxiety to make these councils departmental has induced in their staff some of the attributes of Government officials and a reverence for procedural correctness which render the Councils totally unfit to fulfil the functions for which they were created. A proper appraisal of the worth of these councils and of the propaganda organisation of the statutory Boards should be undertaken by a body familiar with publicity methods on behalf of commodities and by persons who are capable of making an objective and impartial study. Otherwise, the Government would merely perpetuate organisations which are never likely to produce any worthwhile result and yet have invested with a trust to accomplish the desired objectives. It is in the interests of both the industries concerned and the Government to make such an appraisal as early as possible.

BOOK REVIEWS

SECRETARIAL PRACTICE

Secretarial Practice in India: By Bahl and Acharya: Publishers Messrs. N. M. Tripathi (Private) Ltd., Bombay 2: Pp. 619: Price Rs. 8.75.

With the enormous expansion of joint stock enterprises in the country, Secretarial Practice has assumed tremendous importance. The passing of the 'Indian Companies' Act 1956—perhaps the most complicated legislation passed so far by the Indian Parliament—has increased the responsibility of Secretaries by leaps and bounds. It is no wonder, therefore, that both the subjects of Secretarial Practice and Business Management are receiving steadily increasing attention in our universities. Provision of a given course of study or creation of a new faculty is only the least important of our academical problems these days. The really knotty problem, a problem that does not appear to have been effectively tackled yet—if it has at all received attention—is that of suitable text books for these new courses and faculties of studies. There is no gain-saying the fact that, even today, there is a paucity of good and suitable books, particularly text books on these new subjects. The book under review, written by two eminent professors—Prof. J. C. Bahl and Prof. B. K. Acharya—of the Siddharth College of Commerce and Economics, Bombay, should meet the requirement at least in respect of one important new subject.

As the authors have written this book, keeping, in main, the syllabuses in Secretarial Practice of the various Indian universities in view, it follows that the publication does not say much by way of criticism of either the existing Secretarial practice or Company Law as such. We feel they might have included an Appendix dealing with this at least to help serious students of company management. This apart, the publication should be useful both for students and for business men wishing to know what precisely is the correct secretarial procedure, inasmuch as it explains, in very simple and clear language, all the cumbersome procedure after collecting and collating the material from

several sources. A particularly useful feature of the publication is that every aspect of secretarial procedure explained has been substantiated, wherever possible, by illustrations, specimen forms, letters and other documents which are actually taken out from the files of some of the leading Indian joint stock companies. The two chapters on "Management of Companies" and "Winding Up" have been revised in the present edition (fourth edition) in accordance with the provision of the new Companies' Act. In short, the publication bids fair to be a valuable guide to students of commerce and business management, as also to others desiring to specialise in secretarial practice.

STATISTICS

Fundamentals of Statistics: By D. N. Elhance: Published by Kitabmahal, 56A Zero Road, Allahabad: Price Rs. 15.

The literature on statistics has grown enormously during the last decade. But there do not seem to be very many good books dealing with the elements of statistics written primarily for the Indian student. This comprehensive volume of more than a thousand pages meets the long-felt need for a lucidly written book on the subject. Mr. Elhance has tried to limit mathematical treatment to the minimum in order not to confuse the students of Commerce. The book will be found specially useful for those appearing in the Indian Administrative Service and the Provincial Civil Service examinations.

Beginning with the definition of statistics the book covers measures of central tendency, measures of dispersion, index numbers, time series, correlation, theory of attributes, sampling, analysis of variance, interpolation and business statistics. The last chapter on the growth of statistics in India is a special feature of this volume. The usefulness of this book to students is greatly enhanced by the abundance of examples worked out and the test questions provided at the end of each chapter.

The Business World

THE FUTURE OF PLANTATION INDUSTRY IN KERALA

By
CROESUS

MANY must have awaited with bated breath the proceedings of this year's annual meeting of the United Planter's Association of South India (U.P.A.S.I.) and its several committees, because this happens to be the first occasion for the plantation interests in South India to make known to the public of the country, at first hand, the peculiar problems of their industry under the new State Government of Kerala. What the proceedings have disclosed cannot have surprised many; these have only served to confirm the worst apprehension they must have had about what private enterprise could expect under any Communist regime, despite all assurances to the contrary by the leading spokesmen of the Communist party of India and the present Kerala Government. I do not think the shrewd spokesmen of private enterprise at any rate had expected it to be otherwise; if there were any, they must have since become as completely disillusioned as the few innocent independents in China who had the temerity to air their individual views, following that seemingly reassuring, but most carefully calculated, statement of Mao Tse-tung: "let a hundred flowers bloom."

It is nothing short of a tragedy that, along with the reorganisations of the States, Kerala, the largest plantation State in India, should have come under a Government with its known bias against private enterprise. It has not taken long for the plantation interests of the State to discover that the days of any growth or development of their industry in the corporate sector in Kerala are well-nigh over. In fact, their confidence was shaken immediately on the present Government's assumption of power in Kerala. For the first thing that the new Government did was to declare with much fanfare its objective of nationalising foreign-owned plantations. The Kerala Government would probably also have implemented this but for the firm stand taken by the Government of India, in particular, by the Union Minister of Commerce and Industry, Mr. Morarji Desai. Mr. Desai was quick enough to perceive the dangerous repercussions of any such move, and that in respect of a century-old industry which has been making a very handsome contribution to the nation's economy and revenues. Had the insidious move succeeded, it would not only have driven away entrepreneurial experience, enthusiasm and capital from this country, but led to the establishment of a rival industry by these very interests in countries where they are verily wooed and welcomed today. It is India's good fortune that it did not. All the same, it has shaken confidence, and it will be difficult to restore the confidence thus lost. Confidence is not a quality which is built so easily as it can be shattered.

Hardly had enough time elapsed for this initial shock to be forgotten came the Kerala Government with its new budget proposals. It is true Kerala's is not the only State Government to impose fresh burdens on the plantation industry, but it has left the Madras and the Mysore Governments so far behind that these two Governments can now claim to be relatively moderate in their exactions on the plantation industry.

It is not this fiscal burden alone that the industry has to bear in Kerala; it has also to put up with an unprecedented degree of labour indiscipline. The Kerala Chief Minister has no doubt made an important statement on labour policy, but the result has been a total disregard for even the minimum discipline required for maintaining successful production. The

statement has served rather to increase than to mitigate lawlessness, especially in the ranks of plantation labour. In the name of labour dispute, the police is studiously kept out. Mr. E. M. S. Namboodiripad did not mince words when he said that the police were not there to protect the interests of landlords and capitalists, but to maintain law and order; only he did not qualify "law and order" by saying "elsewhere than on plantations". I wonder whether, under our Constitution, it is open to any State Government thus to deny the fundamental right of protection of law and order to a particular section of the community.

Many may not be able to realise the important place that the plantation industry occupies in our economy in the absence of this industry's sizable contribution to our national output and to the nation's exchequer. In 1956, for example, the plantation industry produced a record coffee crop of 42,000 tons, out of which more than 15,000 tons have already been allotted for export and some more are expected to be similarly allotted. In spite of large areas of old and worn out rubber trees having been cut down for purposes of replanting, the rubber industry accounted for an all-time high production of about 24,000 tons. And the tea industry (south India) gave a total outturn of 127 million pounds, of which exports amounted to 80 million pounds. It may be mentioned here, in passing, that, barely 20 years ago, the total value of all the plantation crops produced in India did not fetch in export anything more than Rs. 40 crores, as against which, these very crops earn for the country today over rupees one hundred and seventy four crores! This is not to suggest that only foreign consumers of our plantation products have been benefitted. Internal consumption of all the three crops also has risen appreciably. The estimated consumption of tea today is 220 million pounds (as against 110 million pounds before the war), of coffee 24,000 tons (as against 7,500 tons before the war) and of rubber 30,000 tons (as against 6,000 tons in the late thirties).

One would have expected any Government not only to maintain and foster such an industry but encourage it to develop to its maximum potentiality, but the Kerala Government has unfortunately chosen, doubtless for political considerations, to penalise this industry, especially the bigger units there of. Even the first budget proposals of the Communist Government in Kerala are so discriminately against the plantation industry that the basical agricultural income-tax in the State, coupled with the high rate of super tax, exceeds even the Centre's Corporation Tax. The Kerala Government seems to have forgotten that the plantation companies in the State are large corporate bodies consisting of innumerable middle class shareholders, who it is that are hit ultimately, by its tax imposts. But then the Communists apparently do not care as much for the middle class as for the working classes. For is it not the latter that can give them more votes and is it also not through them that they can manage effectively to paralyse the country's economy? I am suggesting that the interests of labour are to be relegated to the background. At least in the case of the plantation industry, it cannot be seriously contended by any one that the workers have not had a fair deal.

Some of the larger plantation companies have, in fact, conformed to the highest standard of labour wel-

fare and have provided all manner of amenities to their workers. But sympathy for workers cannot be the sole force guiding or governing Government's policies to the exclusion of all regard to the normal economic facts of the industry. If the Kerala Government feels convinced that enough is still not being done to labour by plantation employers, let it convince the public about it. As the spokesmen of the industry have themselves asked, let there be a factual study of the industry, its wage structure, costs and the contribution it makes to the State's economy had to the nations exchequer by way of the large foreign exchange it earns for the country, as also the large employment it provides for the people of the State (Kerala's un-

THE PRESSING PROBLEM OF THE WOOLLEN INDUSTRY

Bv

CROESUS

THE more one goes into question of import restrictions, the more one realises how complex, if not complicated, the whole question is. For each industry has its own peculiar import problems and not unless the import licensing authority is fully seized of all these can it do adequate justice to the import requirements of every industry. It behoves them to do adequate justice to the needs of every industry, even if the industry be in the private sector, because the resulting benefit is by no means confined to those in immediate charge of a given industry but to a very much larger section of the population, nay to the country's economy as a whole. Take, for instance, the Indian Woollen industry. The number of units in this industry is, and, between them, these units provide employment to 11,625 persons. Whatever some may say, woollen textiles are not a luxury, at any rate to people in some parts of our country, and so these must either be imported from abroad or produced indigenously. By reason of our foreign exchange shortage, there is undoubtedly a case for banning imports of woollen goods, which the Government has done. In doing so, obviously, the Government has been influenced by the fact that the country has an indigenous woollen industry which can supply the requisite quantity of quality woollen textiles. But, after completely banning imports of woollen goods into the country, as was done in June, 1957, it becomes the responsibility of the authorities not only to keep the indigenous industry going but also to ensure that there is no idle capacity in the industry. If there is any idle capacity, not only would the country's national output be adversely affected, but the industry's ability to meet the requirements of woollen goods to sections of the population that must needs have them would also be reduced. As a matter of fact, such a situation would appear to be already developing, as stocks of imported raw wool with the Indian woollen industry are believed to be getting fast exhausted and it is anybody's guess as to when fresh supplies would become available.

The ensuring of adequate wool and wool tops supplies presents a problem even normally and it is all the more so now, what with import control, port congestion, transport bottleneck, etc. For foreign wool and wool tops required by the Indian woollen industry are not in regular supply throughout the year. These must be got at the time of auctions by the leading wool-producing countries, such as Australia, Canada, New Zealand, South Africa and the UK, and the auctions are confined to a part of the year only—generally to the period between August and November. It is only at the time of these auctions that the requisite types and the required quantities could be got on the most favourable terms. It is thus seen that the Indian industry has necessarily to adjust its buying

employment problem would undoubtedly have been magnified a thousand times without its plantation industry) and then formulate its industrial policy. No statement of industrial policy, however impressively worded, will inspire confidence among industrialists, as witness the Kerala Government industrial policy statement itself. What will inspire them is the measure of incentive for expansion and development that the Government policy affords. If the leaders of the plantation industry are to be believed, the present Kerala Government has been at special pains to remove practically every incentive. No wonder then that they regard the days of any growth or development of their industry in the State as finished.

programme to the exigencies of the international market and the latter cannot be expected to adapt or adjust itself to the special requirements of our import control, whatever may be our peculiar problems or needs.

Now the last import licensing period was July-September, and, in the ordinary course, the fresh import licences would be available only after the policy for the next licensing period is announced and that may be sometime in October. And, by the time the import licence is actually obtained and orders are placed, some more time would elapse, which means that the Indian woollen industry would almost have missed the bus, that is the auction season. Surely it cannot be that the importing authorities do not appreciate this, although it is difficult to understand why, if they are able to do so, they have not been prompt enough in moving in the matter. If what the spokesmen of the Federation of Woollen Manufacturers in India say is to be believed, unless "immediate and necessary" measures are taken to ensure adequate supplies of wool and wool tops for the industry, very soon, one woollen mill after another would be compelled to close down.

If the plight of the Indian woollen industry is thus unenviable, it seems to me that the demands of the industry are unexceptionably legitimate and reasonable. All that they want is that they should be allowed either to import their raw material requirements under the O.G.L. or to get all their twelve-month requirements based on any formula naturally acceptable to them and to the Government. While this would enable them to cover their entire requirements on the most favourable terms, there can be no fear of their over-importing or creating a sudden demand for all the foreign exchange to cover the total cost of imports of wool and wool tops by the industry. This is so because imported wool and wool tops are used only by the few woollen mills in the country and, further, there is no open market for them in which the importing mill can sell the raw material and make a profit. In consequence, the mills would take care to cover just their requirements and no more, especially today in view of the tight money conditions. Secondly, although the mills may cover their year's requirements, the orders would be spread over the whole year, if only to take the maximum benefit of forward deliveries, so that the demand for foreign exchange also is spread practically over the entire twelve-month period.

I have reasons to believe that the foregoing analysis of the problem is objective and dispassionate and, if so, the conclusions cannot be questioned. In that event, it is hardly necessary to add, the plea of the Indian woollen industry for "immediate and necessary" action deserves the promptest attention possible at the hands of the authorities.

WANTED: A REVISED CLOTH POLICY

By
CROESUS

THE Cotton Textile industry has made a twofold plea—one, for a production target to the mills commensurate with the growing cloth requirements of the country and, two, for permission to modernise their plant and machinery so that they might be able to offer quality goods at economic prices in the domestic as well as in the foreign markets. There is ample justification for this, and for those who care to be convinced, the Millowners' Association, Bombay, has got up a neat and attractive brochure. This brochure is appropriately titled "The Indian Cotton Mill Industry: Its Importance to the Nation".

After tracing briefly the history of this premier industry of India, the brochure deals with the present problem of the industry under the caption—"Textiles in the Plan". While the planners envisage a cloth offtake in the country at 18.5 yards per head by 1960-61, when the population according to them, is expected to increase to nearly 400 million, the millowners hold or rather reiterate their view that the rate of cloth consumption would assuredly be more than this, their own estimate being about 22 yards 'per capita'. Without saying in as many words that the Government has failed to appreciate this; the Millowners say, the Government has been "over-generous in assigning the production targets to non-mill sectors". However, when the defects or inadequacies of this textile policy became obvious in the latter half of 1956, largely due to the rising demand for cloth, the Government took several remedial measures. Paradoxically enough, those who had been arguing for a rising standard of living, felt called upon now, by force of circumstances, if not by reason of their short-sighted policy, to adopt measures to check consumption. The most painful of these has been the substantial increase in the excise duty on mill cloth. It is much better that one reads in the original itself this sad tale of the excise duty on mill cloth, which has increased from 12.33 crores in 1949-50 to 72.00 crores (estimate) in 1957-58! 'Inter alia' the brochure observes thus:

1957-58! 'Inter alia', the brochure observes thus. 'It is difficult to find justification for such a sharp increase in the excise, especially when the rise in cloth prices was by no means substantial. In fact, we have the testimony of the White Paper on the Budget for 1957-58 that the index for cotton

CO-OPERATIVE URBAN BANKS—A POST-SCRIPT

By
CROESUS

IN my piece on the above subject ('vide' issue of 'The Eastern Economist' dated August 30, 1957) I had said: "I am afraid Mr. Saraiya was not able to convince me as to what he precisely meant when he wanted the Central Banking Authority to co-ordinate the policies of all banking institutions to avoid unhealthy competition", especially after reading his earlier statement that "some of the urban banks were able to hold their own and even increase their deposits, notwithstanding the fact that they offered a relatively lower rate of interest". I am thankful to Mr. Saraiya for clarifying the position to me when I met him recently and we talked about this. It is Mr. Saraiya's contention (a contention with which, let me say, I agree) that, while there is a general increase in the deposits of scheduled banks, the increase in the deposits of the urban banks is not of the same order. In other words, the tempo of increase in deposits is more in the former case than in the latter. Mr. Saraiya is not only naturally concerned about this, but his greater concern would appear to arise from the feeling that the urban banks would have lost much more of their

manufactures in 1956 increased by 4.3 per cent only. This small rise in prices cannot justify an increase in excise by an average of 11.2 per cent over August, 1956 and 14.8 per cent over December, 1955. Today, excise calculated on the mill prices of a variety of representative qualities of cloth varies according to classification from 11.5 per cent to 31.9 per cent and averages 24.8 per cent—an average increase of 11.2 per cent over August, 1956. In fact, on certain categories of superfine cloth, it is as high as 38/39 per cent”.

The result of all these ill-conceived measures was a perceptible decline in the volume of cloth offtake in the country, as neither the dealer nor the consumer was in a position, let alone be prepared, to bear the incidence of this abnormal levy. Obviously the industry, which was also forced to countenance "the intractable problem of cost inflation" could not bear this heavy additional burden and the stocks of cloth began to accumulate, exceeding even the 500,000-bales mark!

The foregoing narrative clearly shows, "that the most effective safeguard against a recurrence of cloth crisis and disorganisation of trade is", as the brochure itself points out, "to allow the mills to instal additional productive equipment on a scale commensurate with the growing cloth requirements of the people". The Association rightly maintains that, apart from the rising standard of living, the fact that the increase in population is creating a market for about 4.5 million new customers every year must be taken into consideration. To maintain stability in prices, on which depends the success of the Plan, it is imperative to ensure higher production, in particular, of consumer goods, such as food grains and cloth.

The need for modernising plant and machinery has also been emphasised in the brochure. It is very necessary in order that the cotton textile industry might be in a position to offer its production at economic prices in both national and international markets. It is to be hoped that the Government would bear in mind the background furnished in the comprehensive brochure under review, so as to be able to consider the twin pleas of the industry referred to above in a dispassionate way.

deposits, had it not been for the co-operative loyalty of the members and the services which the urban banks have been rendering to their members. He further apprehends, and not without reason, that the urban banks cannot go on attracting deposits even to the extent they have been managing to do so far, if commercial banks should offer considerably higher rates of interests. There is, after all, a limit even to co-operative loyalty, especially when there is a glaring disparity in interest rates. Mr. Saraiya is opposed to this unhealthy race for raising interest rates to attract deposits and asks: "Is it in the interest of the banking system to go on offering higher and higher rates of interest on deposits and raising the rates against all borrowers, including the greatest borrower, the Government of India?"

After this clarification, I am bound to say I fully endorse the suggestion of Mr. Saraiya that there should be some kind of co-ordination of the policies of all banking institutions and that this should presumably be brought about by the good offices of the Reserve Bank of India.

BUSINESS NOTES

THE UNUSUAL FALL

THIS MONTH'S fall in the gold and dollar reserves of the sterling area has caused much concern. The pressure on reserves is exceptionally severe; much more than what can be expected due to seasonal factors. The deterioration in the reserves position by \$225 million during August is the biggest since the Suez month, when reserves dropped by \$279 million. At \$2,142 million the reserves are barely \$142 million above the minimum which cannot be pushed further consistently with considerations of safety. If the deficit of £63½ million with the E.P.U. that belongs properly to this month is also counted the fall in reserves approximates \$320 million. But this settlement is due only in the month of September.

Financial circles blame speculation in favour of D. Mark very largely for this big fall in the reserves. But there are certain other factors also responsible for this. For sometime exchange systems in Europe have been in a bad state. The de facto devaluation of the French franc only underlined the necessity of reconsideration of the existing exchange parities. The powerful impulse comes from the emergence of Germany as a potent competitor in industrial production and from the mounting export surplus which she is recording in the E.P.U. trade. As against it other European countries including UK suffer from inflationary conditions. There has been regular influx of gold into Germany. This has led many due to her successful export drive. This has led to anticipations of an upward revaluation of the D. Mark; one result of which is that the private balances usually kept in London are now kept in Germany. This transfer of funds is undoubtedly due to speculative anticipations regarding the upward revaluations of the D. Mark. The British Treasury does not take an alarmist view of the whole situation. It is rightly affirmed that the economy is in sound health because the U.K.'s payments position outside E.P.U. is strong. The growing strain calls for a cautious approach. It needs to be mentioned here that the reserve figure of \$2,142 million does not include the I.M.F. standby credit of \$738 million and the line of credit of \$500 million from the Export-Import Bank in the United States. In this connection the cost structures of the UK and also of the sterling area's manufactures need to be reviewed to impart them competitive strength. After all the strength of sterling is determined by the competitive strength of the sterling area's exports.

On a wider plane the recent pressure on sterling area's reserves and the special position of D. Mark forebode difficulties for the prospective European Common Market. Owing to the persistent drain represented by the German export surplus, some of the participating countries may be forced to take defensive measures. And that will create difficult circumstances for the development of the organisation. In this context the repeated and emphatic disclaimer of any intentions by the German Government to change the parities of the D. Mark has long-term implications. A right solution to this question will have to be found sooner rather than later.

AVERTING SUGAR IMPORTS

NOT VERY long ago, it may be recalled, we had to import into this country, even with about 175 sugar mills (excluding gur refineries) working, over Rs. 42 crores worth of foreign sugar. Fortuitously—also fortunately—for India these years did not happen to be years when large imports of food grains also had to be got. Otherwise, it is not difficult to imagine how much more of a drain there would have been on India's fast-depleting and none-too-comfortable foreign exchange reserves. But could not even these Rs. 42

crores expended on sugar imports in 1954-55 and 1955-56 have been saved? The argument of those who say so is that, if what the sugar industry has achieved in the past two years had been done a little earlier which was not impossible, in all conscience the country would not have been obliged to expend Rs. 42 crores on imports of sugar.

It is this interesting point that Mr. M. P. Gandhi has appropriately highlighted in his "The Indian Sugar Industry—1955-56 Annual" (reviewed last week in this Journal vide p. 359). According to him, "how exactly it has been possible for the industry to report a consistent performance in the past three years and be confident of being able to maintain production at high levels is not quite clear. The answer is probably to be found", he proceeds to say, "in the fixation of minimum prices for sugarcane which are relatively more remunerative for the cultivators". But, he rightly hastens to add, "the pursuance of a policy which assures the availability of a satisfactory return on the production of sugar for over a period is even more important". This is an aspect which those in authority are liable to forget these days.

Mr. Gandhi is evidently satisfied with what is being done by the Government to maintain, nay increase, sugar production, although he would like, it seems, the target of 25 lakh tons by 1960-61, now fixed by the Planning Commission, to be somewhat higher still, not only because of the definitely rising trend in the 'per capita' sugar consumption but of the prospects—more than the prospects, the need—for larger exports. At least in regard to the sugar industry, the bogey of unequal competition as between the mill sector and the cottage industry sector—gur and khandasari—is not being raised to the same extent as in regard to the cotton mill industry. Happily for the sugar industry, the 'gur' industry also is not feeling the competition, as it seems to be having its market largely intact. If both the mill sector and the 'gur' industry are to keep going, they must be assured of an adequate supply of sugarcane, and the sugarcane crop must be much higher—say, 850 lakh tons—than the current figure of 546 lakh tons and the present target of 770 lakh tons. Mr. Gandhi feels—and we agree with him—there is no reason why this should not be, as there is still a very long leeway between our present average per-acre yield of 13 tons and 30-40 tons actually raised on some of the well-managed farms of private companies. Evidently, here, as in Indian agriculture generally, there is the urgent need to carry to the fields the benefit of research work that is being successfully undertaken in the various model farms, to which the Governor of Mysore referred in Coimbatore recently.

COTTON TEXTILE EXPORTS

INSPITE OF the fact that India has established herself as a major producer and exporter of cloth, she has not been able to strengthen her position on the export of cotton textiles. There has been a considerable decline in exports of cloth since the peak was achieved in 1950. While in 1950 India exported 1,133 million yards of cloth in 1956 exports amounted to only 721 million yards. This comparison is, of course, subject to the important qualification that exports in 1950 were pushed so high without due regard to the home demand. Japan a rival of India in the world export market on the other hand has made a considerable headway. Her exports in 1956 amounted to 1,262 million yards.

In the second Five-Year Plan, the production target for cloth has been fixed at 8,400 million yards assuming that the per capita consumption would be 18.5 yards by 1961. The estimate is erroneous if the increase in

per capita income and in population are taken into consideration properly. The rising population along with rising incomes is bound to add to the pressure of demand on cloth supplies, which means that the rate of cloth consumption per head would be around 22 yards as estimated by the industry objectively. The question arises how is this increasing demand to be met. Will the handloom sector be able to meet the desired needs? The past performance of the handloom sector shows that in spite of active assistance from the Government it will not be able to fulfil its second Plan target. The Government has adopted a policy of putting restraint on rapid expansion of the mill industry with the object of encouraging the handloom sector to expand at an ambitious rate. Although the mill sector has been allowed to install 18,000 automatic looms, the concession is severely qualified by the reservation that output resulting from auto looms will be exported and in case it is sold at home a penal excise duty will be levied.

The Government, of course, is anxious to export more cloth to earn some valuable foreign exchange. Recently it introduced a Bill in Parliament which levies an additional duty ranging from six naye paise to 12 naye paise per square yard on export quota diverted to the internal market. The Bill has been passed by the Lok Sabha but it is to be doubted whether the measure would be able to achieve the desired objective as exports would depend on the competitive strength of the Indian cloth in the world market. On the other hand it is feared that the excise levy on the mill made cloth would hit the domestic consumer or create difficulties in the disposal of stocks.

The main factor in the textile problem is that cloth should be produced at reduced cost and this can only be possible by modernising and rationalising the industry and the textile machinery. The drive for more exports can only be secured when there is more cloth for export on competitive and attractive terms. That is possible when there is installation of more productive equipment. Why Japan has been able to capture more markets, because she has the textile industry equipped with the latest machinery. In the interests of the industry both at home and abroad, it is essential that an adequate foreign allocation be made for the import of machinery and spare parts. It is, however, to be recognised that rationalisation ought not to be forced at a pace which will cause a serious disturbance in employment.

NO EXPORT OF GROUNDNUT OIL

MR. MORARJI DESAI'S flat refusal to accede to any request for lifting the ban on export of groundnut oil, the other day at Madras, may seem surprising to many, especially to those engaged in the groundnut oil business. 'Prima facie', when no stone is being left unturned to augment our earnings of foreign exchange as much as possible to meet the requirements of the Plan, the Union Commerce Minister's refusal to allow exports of this product, which is known to earn every year considerable amount of foreign exchange, may even appear to be a wrong policy. But Mr. Desai had his reasons for the refusal, reasons which cannot be easily challenged. Thus, he said that, for crores of people in India, particularly for the poor, groundnut oil was the only source of fat. He even went to the extent of saying that, when the Southern India Hides and Skins Merchants' Association (which felt that, if the export of groundnut was allowed, the acreage under that crop would increase and the country also would get a lot of foreign exchange) referred to it, they "did not think in terms of India", but only "in terms of the good of Madras State". In other words, he mildly scolded them as being parochial. They would certainly be parochial if they were thinking in terms of exporting groundnut from only the South. There is,

however, no evidence that this was what the Association was aiming at.

STALEMATE OVER AUTO LOOMS

THERE ARE nine textile mills in India which have completely taken to automatic looms. The number of textile mills having both automatic and ordinary looms is 53 while the number of mills using only ordinary looms is 231. Many of the mills which were permitted to instal the automatic looms are stated to have made no progress at all. The reason for not installing the automatic looms are varied and manifold. In the first instance, the representative of the mills point out that there should be no obligation that the mills must instal 24 automatic looms produced in India as the efficiency of the indigenous products is not equal to that of the foreign made looms. It may be recalled last year the Government had announced that the industry be permitted to instal 18,000 automatic looms to produce an extra quantity of 350 million yards of cloth for export. But not much progress seems to have been made in this direction. The industry also does not appear to be very enthusiastic over immediate installation of auto looms, because it is not certain if all the cloth produced would be exported particularly when competition is increasing and because of its having to bear the penal levy of additional excise if stocks are sold in the home market. The penal levy is of 2 annas per yard. Added to it is the steep rise in the excise duty which have adversely affected the profits of the industry.

Government seems inclined to take the view that licences already issued should be cancelled if concrete steps are not taken to utilise them and to go ahead with the programme of installing auto looms as already fixed. This would be a drastic course to take before the entire problem of the virtual stalemate in the programme is fully and sympathetically examined. Further it would hardly lead the industry nearer to the target. It is advisable that different aspects of this question should be reconsidered in order to evolve a via media to see how the mill industry will be partially rationalised if only to strengthen its competitive position in the export market. This is precisely what the industry and Government desire. The question bristles with difficulties and does not admit of short cuts or simple solutions.

Taxila

What looks like an oil pipeline is, in fact, part of a 9" earthenware pipe laid in Taxila sometime in the 2nd century B.C. It was originally encased in stone and appears to have been used for sewage disposal. The work of the unknown tubemakers of Taxila has withstood the ravages of time for over twenty centuries.

Economic Report from the U. S.

ECONOMIC TRENDS

(By GUY SIMS FITCH)

WASHINGTON, Sept. 11.—This is the time of year when the experts take another look at United States' economic trends, for just about now, the fall upswing should be getting underway, replacing the summer lull. The consensus of those willing to draw conclusions during this still somewhat mixed and uncertain period is that the economy will follow its normal course this year. They expect a moderate advance during the last quarter, and would be distinctly surprised by either a downturn or a spectacular rise.

In making this assessment, economists are taking account of several major factors. One is the impact of tight money. There is evidence that the scarcity of funds in relation to the demand, reinforced by the government's generally restrictive monetary policies, may finally be having its traditionally restraining effect on business activity. There is reason to believe, moreover, that the government's money managers will soon over, that the government's money managers will soon be easing their stand to any significant degree. They still hold that the economy has enough bounce to resume an inflationary upsurge if the reins are relaxed too much too soon.

There is some evidence that tight money is affecting business spending on new plant and equipment, as companies find it somewhat more difficult to borrow all the funds they want for expansion and modernization. There are also signs of over-capacity in some industries. This points to a possible slowdown in the current record rate of plant and equipment expenditure in the months to come. But if it actually materializes, any such slowdown will not be on the sensational side. Industry will continue expanding and modernizing on a vast scale, in the knowledge that new and improved facilities will be needed over the years to meet the requirements of a growing economy. Then there is the impact of reduced US government spending. The Administration's request for new funds for the 1958 fiscal year ending next June 30, have been cut sharply by Congress. The net effect on actual spending will not be nearly as large, but the budget cuts will be a restraining influence, nevertheless. To this must be added the Administration's own plans to cut expenditures. For instance, while an increase in defence expenditures is entirely possible next year, an attempt is being made to hold down these outlays this year. An official force, however, are state and local government outlays. These will continue to rise as the need for schools, hospitals, highways and other public facilities continues to grow. In total, governmental spending at all levels will be somewhat higher this year than last.

The largest element in the economy remains, of course, consumer spending for goods and services. The consensus is that consumer expenditures, even if a little less buoyant than last year, will hold at record rates, supported by continued high levels of income and employment. As of now, therefore, the economy presents a rather placid picture, it appears headed for its usual seasonal rise, with—at worst—only a few minor adjustments in the offing. And if this adds up to a "breathing spell" for the next few months, there are many economists in and out of government who

would welcome it as a timely development, to take the edge off inflationary pressures and maintain a balance between economic growth and stability.

BOMBAY

STATE DEVELOPMENT LOAN, 1969

ISSUE PRICE Rs. 99.75 PER CENT

Open on the 16th September 1957

The loan will be closed as soon as a total of approximately Rs. 600 lakhs has been subscribed, and in any case not later than the close of business on the 18th September, 1957.

The applications for the loan will be received at —

- The offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi.
- The branches of the State Bank of India within the State of Bombay except at places mentioned in (c) below.
- The branches and treasury pay offices of the State Bank of Hyderabad within the State of Bombay.
- The Government treasuries and sub-treasuries in the State of Bombay at places where there is no branch or treasury pay office of the aforesaid banks.
- Applications will also be collected by the State Bank of Saurashtra at Bhavnagar and its Branches within the Saurashtra area of Bombay State and forward to the nearest receiving office.

Full particulars can be obtained at any of the offices of the Reserve Bank of India, Branches of the State Bank of India, branches of the State Bank of Hyderabad within the State of Bombay, branches of the State of Saurashtra within the Saurashtra area of the Bombay State and the Treasuries and sub-treasuries in the State of Bombay.

COMPANY AFFAIRS

HINDUSTAN MACHINE TOOLS (PRIVATE) LTD.

The Fourth Annual Report on the business and operations of the Company and the Financial Accounts for the year ended March 31, 1957 can be read with special interest because the year witnessed the production and sale of the first series of H-22 high speed precision Lathes. The original production programme of the Company drawn up in consultation with Messrs. Oerlikons in 1955 and early in 1956, was to reach a production of 400 machines per annum by 1960-61. A number of steps since undertaken during the latter part of 1956, such as the introduction of multiple shifts, emergency recruitment of additional personnel and the provision of increased training facilities, emergency provisioning of stores and raw material to the extent required, and increased supervision and efficiency, have resulted in the production of 135 machines against the original target of 57 Lathes for 1956-57, showing an increase to 237 per cent of the target.

The profit of the Company for the year, after providing interest of Rs. 4,02,282 (including Rs. 3,91,746 for 4½ per cent interest on advances from Government of India), amounted to Rs. 17,02,464. From this amount Rs. 13,02,770 were separated for the provision for depreciation. From the balance Rs. 3,38,237 have been recommended to be utilised to write down the development and commissioning expenditure and the balance of Rs. 61,457 have to be carried forward.

During the year, expenditure on training of workmen and supervisory staff for the initial manning of the factory, amounting to Rs. 17,33,190 has been charged to Development and Commissioning expenditure. Including the amount of Rs. 57,05,047 brought forward from the previous year, the total Development and Commissioning expenditure stands at Rs. 74,38,237 as on March 31, 1957.

During the year the Company has received from the Government of India Rs. 125 lakhs as advance, and including Rs. 50 lakhs drawn during 1955-56, the total amount received as advance from Government is Rs. 175 lakhs as on March 31, 1957. Provision has been made in accounts for the year for a sum of Rs. 3,91,746 towards interest at the rate of 4½ per cent on this advance. The government has been requested, to treat this advance as interest-free or alternatively as addition to share capital and the decision of the Government in the matter is awaited.

THE RUNGLEE RUNGLIOT TEA CO., LTD.

The audited Accounts of the Company for the year ended December 31, 1956, disclose a profit of Rs. 1,00,045. On transfer of this sum to Profit and Loss Account and after sundry adjustments, including a transfer of Rs. 10,500 from Provision for Taxation, being a reserve no longer required, there is a balance at credit of the Profit and Loss Account amounting to Rs. 1,04,355, of which we have transferred Rs. 15,000 to Hail Reserve, and Rs. 20,000 to Revenue Reserve. The Directors have recommended that dividend of 35 per cent be declared leaving Rs. 20,355 to be carried forward.

The average selling price of tea realized was Rs. 3-1 per lb. as against Rs. 2-9-4 per lb. in the previous year.

KILLCOTT TEA CO., LTD.

The audited Accounts of the Company for the year ended December 31, 1956, disclose a profit of Rs. 6,12,052. On transfer of this sum to Profit and Loss Account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 4,46,058 of

which Rs. 1,50,000 have been transferred to Revenue Reserve and Rs. 50,000 to Buildings and Machinery Reserve.

The Directors have recommended a dividend of 20 per cent to be declared at the Annual General Meeting, leaving Rs. 66,058 to be carried forward. The average selling price of tea realized was Rs. 2-2 per lb. as against Rs. 1-14-10 per lb. in the previous year.

OKAYTI TEA CO., LTD.

The Audited Accounts of the Company for the year ended December 31, 1956, disclose trading profit of Rs. 1,269 which will be absorbed in meeting labourers' bonus and hence this sum has been provided for and the profit is thereby reduced to nil. On transfer of the sum of Rs. 8,000 to Profit and Loss Account, representing a part of the reserve for taxation no longer required, and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 13,844.

The Directors have recommended that a dividend of 7 per cent on the Preference Shares for season 1955 be declared at the Annual General Meeting, leaving Rs. 10,344 to be carried forward.

The average selling price of tea was Rs. 3-1 per lb. as against Rs. 2-6-4 per lb. in the previous year.

LLOYDS BANK LIMITED INCORPORATED IN ENGLAND

4¹/₄ per cent State Government Loans

- (1) Government of Bombay Rs. 600 lakhs Issue price Rs. 99.75 per cent.
(2) Government of Mysore Rs. 300 lakhs Issue price Rs. 98.75 per cent.

Both the State Governments reserve the right to retain subscriptions up to ten per cent in excess of the notified amount.

The above loans will be repaid at par on 16th September, 1969.

THE LOANS WILL OPEN FOR SUBSCRIPTION ON 16TH SEPTEMBER, 1957 AND CLOSE ON 18TH SEPTEMBER, 1957 OR EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

The loans will bear interest from 16th September, 1957.

Subscriptions may be in the form of cash/cheque in respect of both the loans.

3% MYSORE GOVERNMENT LOAN 1958 will be accepted at Rs. 99.75 per Rs. 100 nominal for conversion into the new loan of that Government; interest on the securities of the loan tendered for conversion will be paid up to and including 15th September, 1957.

APPLICATIONS FOR BOTH THE LOANS WILL BE RECEIVED AT THE OFFICES OF THE RESERVE BANK OF INDIA AT BANGALORE, BOMBAY, CALCUTTA, MADRAS AND NEW DELHI.

APPLICATIONS will also be received at PLACES WITHIN THE RESPECTIVE STATES as follows:

(i) At the office of the Reserve Bank of India at Nagpur, branches of the State Bank of India, branches and Treasury Pay Offices of the State Bank of Hyderabad and the Government treasuries and sub-treasuries in the case of Bombay loan.

(ii) At the branches of the Bank of Mysore Ltd., State Bank of India, State Bank of Hyderabad and at Government Taluk treasuries in the case of Mysore Loan.

Copies of Notifications and Application Forms may be obtained at any receiving Office.

COMMODITY NEWS AND NOTES

INCREASE IN SUGARCANE AREA

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of sugarcane, 1957-58, puts the current year's area at 5,022,000 acres as against the corresponding adjusted estimate of 4,723,000 acres for 1956-57. This shows an increase of 299,000 acres or 6.3 per cent in area during the current year, as compared to last year. The increase in acreage during the current year has been reported by almost all the sugarcane-growing States. The increase has been marked in the case of U.P. and has been attributed partly to high prices of 'gur' at the time of sowing and partly to better irrigational facilities and seasonal conditions during the current year, as compared to last year. However, some decrease in area has occurred in Andhra Pradesh and West Bengal States. This estimate generally covers the period up to the middle of June 1957. Till then, the condition of the crop was reported to be generally satisfactory.

This estimate does not cover the entire area sown to sugarcane crop during 1957-58. Past experience has shown that the area at the first estimate stage forms roughly 94 per cent of the area of the crop finally reported.

INCREASED PRODUCTION OF COPPER ORE IN INDIA

The production of copper ore in India increased to 99,066 tons during the quarter ending June, 1957, according to the Indian Bureau of Mines. The output represented an increase of 4,064 tons compared to that of the corresponding quarter of 1956. The entire output of copper ore is from the Singhbhum district of Bihar State. The production of fire refined copper from the ores was higher at 2,080 tons in the quarter ending June 1957 as compared with 1,781 tons in the preceding quarter.

NO CHANGE IN EXPORT DUTY ON TEA

The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty at Rs. 2.74 per pound as against Rs. 2.55 per pound in force from August 1, 1957. There is no change in the existing rate of duty of 38 Naye Paise per pound.

PRODUCTION OF INDIGENOUS SUGAR

The production of indigenous sugar amounted to 20.20 lakh tons up to August 15, 1957, in the current season as against 18.54 lakh tons in the corresponding period last year. The total off-take including quantities despatched for exports was 16.86 lakh tons. The stocks with factories on August 15, 1957, stood at 8.64 lakh tons.

SUPPLY OF PIG-IRON TO MADRAS

There was no discrimination against Madras in the allocation of pig-iron, said Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, in reply to a joint question by Sarvashri Subbiah Ambalam and Thanu Pillai in the Lok Sabha. The Minister further stated that the entire demand could not be met owing to the general shortage of pig-iron in the country. The allotment in 1956-57 represented about 59 per cent of the demand as against 42 per cent of the demand in 1955-56.

IMPORT OF STEEL IN 1958-59

Two bulk contracts placed in 1955 and 1956 included 80,000 tons of steel from a firm in West Germany and 15,525 tons from a firm in the UK for delivery in 1958, said Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, in Reply to a question by Shri M. Valiulla in the Rajya Sabha.

SULPHUR DEPOSITS IN NORTH GARHWAL

The Geological Survey of India was investigating the information given by a Lucknow University teacher

about the discovery of a promising deposit of sulphur in the North Garhwal of U.P., revealed Shri K. D. Malaviya, Union Minister for Mines and Oil, in the Lok Sabha. The Minister added that no sulphur deposits of economic value had been discovered in that area. It was understood that Shri B. S. Tiwari of the Lucknow University claimed to have discovered a promising deposit of sulphur from Piti Udiar in the valley of Rup-ganga in the neighbourhood of Bhanela Forest plantation about 30 miles east of Nandprayag.

Challenge and Response

EVENTS this week have underlined the challenge which India's Plan and, through it, the people of India have now to face. It is obvious that we have reached one of those critical challenges which will determine, for many years to come, the path of this nation. It may be in the spacious Toynbeeian metaphor, one of those critical challenges of Indian civilisation. Again, in the Toynbeeian sense, this challenge must call for its appropriate response if the civilisation which it challenges is to survive. There may be there almost certainly is — a continuing character in the present crisis. If it is developed over the next ten years as a perpetual limitation on Indian economic development, it may decide the next decade the future course of Indian political life. It is right that one should recognise this, both for India and for the Free World, there tremendous stakes involved in this challenge and its coming response. If the response is feeble and inadequate to the great challenge which has been thrown before us, the democratic way of life in India may well suffer a permanent eclipse.

Because of the great stakes which are involved, it is necessary that we should bear ourselves as much with knowledge as with dignity which, in times of stress, marks out strong nations from the weak. There should be no attempt to hide the realities of the situation from the Indian people or from our friends or enemies

abroad. We have, indeed, nothing to hide. We have made serious mistakes in the estimate of the original foreign exchange resources required for the Plan, and an almost equally great mistake in the expenditure of something like Rs. 200 crores of foreign exchange in the first eighteen months which could conceivably have been deferred. To admit this error is not to correct it, and nothing could be so foolish as to spend much time in re-primination instead of considering how best our current difficulties can be remedied. In a sense the urgency with which the Finance Minister has recently spoken and the resilience which the Central Government seems to have shown in the brief which has been given to him in order that he should adequately recognise the need for some accommodation in our policies, seem to augur well for the future. The past is dead; let the dead bury the dead. The present is critical; let us be flexible to its demands. The future is ours to make or to mar.

Stripped of all its complications, the problem stated by the Finance Minister on the eve of his departure is simple enough. It is to obtain Rs. 700 crores in foreign exchange to finance the Plan over the next three and a half years. Events this week have again underlined the point that much the greater part of this amount must come from the United States. The rise of the British Bank Rate to 7 per cent — an all-time peak —

indicates the tremendous pressure to which sterling is now subject. It is almost certain that any accommodation which might conceivably have been given by the U.K. Treasury or by the City of London will, at any rate for the short period, be completely shut off. Again, it is obvious that the extent to which we can draw on our sterling balances is limited by the condition that while the sterling crisis persists our expenditure outside the sterling area will be restricted because of the burden it might impose on gold and dollar reserves which are nearing their lower critical limit. It is not believed that this crisis will last for very long, but since devaluation of the pound is not a means out of this dilemma and the strengthening of the gold and dollar reserves will take a considerable time, we may well be on short commons for a period which may extend to twelve months. There is thus added to our own need for foreign exchange a new factor the dimensions of which are uncertain, but the existence of which aggravates our burdens, whether in the price of deferred payments, or in the volume of foreign exchange which can be currently spent.

Equally, though this is not yet recognised in India, undue optimism should not be displayed in regard to West Germany which the Finance Minister is likely to visit on his return from the United States. Although West Germany is in a position, because of its vast foreign currency reserves, to assist in foreign investment, this investment is not written into current thinking at Bonn or at the great centres of German private financial investment, Düsseldorf and Frankfurt. A great deal of explanation has to be undertaken in West Germany before foreign capital which undoubtedly exists in that country is channelled in a reasonable flow to this country. There is no likelihood of any substantial loan of the order of between Rs. 50 and 100 crores from West Germany within the next twelve months.

Even if we assume — and this is by no means likely — that India could obtain over the next three years foreign credits from European countries including the USSR, of Rs. 200 crores additional, there would be left another Rs. 500 crores which will need to be covered by the United States. Here it must be remembered that a new PL 480 loan can make little contribution, as it contains no free foreign exchange. Again, new foreign private investment outside the Plan is a meagre remedy. Since most of the foreign exchange which it invests will be required for new projects, it may assist internal employment, but is not a means of finance of the hard core within the public sector. By the same token, private foreign investment which sets out new projects outside the Plan will be an additional burden on the supply of some scarce factors, particularly steel and transport, and thus may, in the short period, even imply a new domestic pressure on the Plan. It is quite obvious, therefore, that to look on private foreign investment — however welcome it is for other reasons — as a solution of the problem of finding finance for the hard core of the Plan is an error. It is obvious that foreign aid, and foreign aid only, can surmount our basic difficulties here.

This is by no means to underestimate the need for creative, by wise modification of existing rules on deposits of companies and excessive taxation of foreign companies — a more suitable climate for foreign

capital as a major instrument in the general problem of economic development in India. The agreement that has been signed this week guaranteeing remittances of capital read with the guarantees given by the United States to foreign private investors is all good so far as it goes. Nothing that has been said about limitations on private foreign investment as an instrument in the financing of the hard core detracts from the welcome recognition that private foreign investment must be encouraged by every means possible.

In the last analysis, it should be clear that, since aid must come from the Congress of the United States, there needs to be recognition in India that a request for the loan which the Finance Minister is currently making in Washington must be read against the minds of those leaders of Congress who determine the attitude to foreign lending. It would be difficult to be too sanguine about the result, and all that can be said here is that what is being tested is their imagination and our flexibility in determining whether, for the purpose of financing the Plan we will accept some limitations on the recklessness of our utterances on many matters, which may have quick financial implications.

There is no doubt that there are specific implications in respect of foreign policy statements. It may have been unwise for the Finance Minister to have given a suggestion, in an interview to the *New York Times* last week, that our defence policy is even distantly related to the possibility of an attack by the Soviet Union or the People's Republic of China on the democratic principles of the Indian people. But while the Finance Minister may have exceeded his immediate brief in this utterance, it is none the less true that the background of India's current challenge is against the struggle between the democratic and totalitarian ways of life. It may not be that the Union of the Soviet Socialist Republics or the People's Republic of China desire a Communist Government in India, though it would be plainly logical for them to applaud one, if and when, one, by great misfortune, should arrive in this country. The Finance Minister is right to insist that this country should be prepared for all contingencies. It is also likely that our heavy defence expenditure will be more rapidly appreciated in terms of our long-period responsibilities than in respect of our immediate needs of security as a result of arms aid to Pakistan. Whether he has erred or not, the Finance Minister should receive in the United States, where he is fighting a lone fight to save the Plan, the full support of the Central Government and the Indian people. This involves no decline of our independence or of dynamic neutrality.

The challenge today is thus to all of us. We must suspend our criticism of the Finance Minister for the duration. He is today the emissary of India in a foreign land. He must receive the warm support of the Indian nation, that is, the support of all shades of political or economic belief. For it is the future of the whole country that is at stake, and India's needs rank high above our personal needs and prejudices, or above political and party passions. As the plenipotentiary of India, we must ensure that he speaks with the voice of a united nation. He carries the nation's confidence; he cannot carry more. From our hearts we must wish his mission well; and with our minds we must support him without reserve.

The Verdict in Germany

DR. Konrad Adenauer's victory in the general elections held last Sunday has been sweeping. His party, the Christian Democratic Union, has been reconfirmed in power for the third time by an absolute majority of 43 in the Bundestag (Lower House) compared with a slender one of 13 in the last House. The present victory is, indeed, even greater than these figures would indicate. Without the German Party, Dr. Adenauer's coalition partner in the outgoing House, his party's majority consisted of but one vote.

The elections have been yet another landmark on Germany's road back to independence and power. The Federal Republic is eight years old; it began life as a makeshift arrangement, the West's answer to the breakdown of the Potsdam agreement in the wake of the Berlin blockade; the first Bundestag sat in the shadow of occupying Powers. The Bundestag will now be meeting as an assembly of an unfettered sovereign State. Although Dr. Adenauer's victory was never in doubt, his party's increased majority has unquestionably been a matter of surprise to friends and foes alike.

Nevertheless, it will be wrong to overstate the achievement and claims of the Christian Democrats. The main source of the accession of strength to them has been the near-elimination of minor groups, whose only difference from them in either economic or political theory for the most part lay in the accentuated inclination to the Right. Moreover, the Social Democrats too have more than held their own; indeed, they seem to have gained almost exactly what the German Party, a coalition partner of the Christian Democrats in the old House, lost — 16 seats. Superficially, this would seem to indicate in Germany a move towards a two-party system as known and practised in the firmer parliamentary democracies of the West. In the first post-war elections in 1949, there were as many as 58 parties in the field. As an indication of stability this would be welcome to all who are keen to see the heart of Europe regain firmness and vigour. The subversion of Weimar Constitution was made possible by the multiplicity of political parties then in existence. Dr. Adenauer is by no means a person inclined to or capable of becoming a dictator. Moreover, the Social Democrats are so placed as to block any constitutional amendment of a far-reaching character. None the less this seeming stabilization of position in Germany may well be the harbinger of one-party rule. The German by temperament likes order usually associated with a strong rule under one power-constellation. And therein lies the danger to parliamentary democracy as we know it.

The results of the elections signify that the West German people are satisfied with the present Government's home and foreign policies. For the average German voter, it is Dr. Adenauer and his Christian Democrats who have ushered in an era of unprecedented prosperity, regained sovereignty and forged an alliance with the Western Powers which ensures national security at the minimum cost. Under his administration the Mark, in contrast to the Franc — and even the Pound — has been exceptionally strong. Unemployment has

been reduced to a bare 2 per cent of the population. Moreover, under the much-maligned system of free enterprise half a million houses have been built every year since 1949 and Britain has been ousted as the world's third largest producer of steel. German capital has once again begun to flow abroad and replenish investments lost through post-war confiscations. In spite of the expanding economy, prices have been held remarkably steady, with indices moving up incomparably more slowly than in all other European countries. Against such incontrovertible and delectable facts of an era of economic prosperity unparalleled in Germany since 1914, it was natural that the German people should have been in no mood to experiment with political elements. Further, Dr. Adenauer's Government had announced that it hoped to reduce taxation after the elections, while it has produced a whole string of tax, bounty and pension concessions — biggest in Europe. These have been surely more effective as vote catchers than the promises of the Social Democrats of "fair shares" and better things to come.

The real reason for the failure of the Social Democrats was, however, their inability to formulate an adequate alternative programme. Failing to find a rallying point in the present situation, they spoke to the voter, who could see prosperity all around him, of possible unemployment in the future. They could not use nationalization of heavy industries as a useful plank, for private enterprise has manifestly been so successful a participant in the nation's rapid recovery. On foreign policy, too, the Social Democrats failed to make much impression. Just as they were not willing to meddle with the existing economic system, they kept the issue of German forces in the background. Their slogan of a "neutral unified Germany" ceased to have much value, once the Russians made it plain that they were not disposed to give up their position in East Germany on honourable terms. The room for manoeuvring thus restricted, even the idea of detaching West Germany from the North Atlantic Treaty Organization and moving it into an ill-defined state of neutrality lost its attraction. The continuous stream of refugees from East Germany and other satellites, the Soviet aggression in Hungary, the failure of the disarmament talks and Mr. Khrushchev's recent diatribe against West Germany in traditional Stalinist fashion appeared to confirm that Social Democrats were dupes of wishful thinking. In politics it is not enough merely to have good motives.

While Dr. Adenauer's victory will surely be gratifying to the free world, Russia too need not feel wholly disappointed. The Russian rulers may even be glad to have now an extended slogan as an answer to the question of re-unification of Germany: they may, while concealing their real motives, find it plausible to say that there was not much use in discussing the problem with a confirmed NATO partner. They can now also plead the alleged German rearmament as their reason for unwillingness to let Germany reunite. Adenauer's success may, therefore, be, in equally good for Russians so long as they hold on to their empire in Eastern Europe.

A Floating Pound?

THE weakness of sterling over the past months is part of the general uncertainty of the pattern of exchange rates of European currencies. A great deal of speculation has been going around about the possible, or rather inevitable, realignment of exchange rates. The approaching meeting of the I.M.F. has accentuated this speculation. New par values, of course, will not be discussed at the Fund's meeting starting on Monday next week. Nevertheless, informal discussions will undoubtedly be held and they are expected to promote better appreciation of the overall problem and an understanding approach to its solution. However pressing might be this problem in the immediate context of E.P.U. settlements, it cannot be ignored, as will be shown presently, that the disease is rooted in the world's recurring dollar shortage on normal trade and capital account. An attack on this disease will clear the climate for healthy exchange transactions. But this is a long-range problem and a long-range operation. In the meantime there can be no escape from the immediate issue. The feasibility of flexible rates needs to be considered as the possible solution. Prof. Robins' dictum that "when the general financial position is strong, free rates are usually unnecessary and when it is weak they are apt to be a source of appalling danger" undoubtedly stands as sound policy. But when a weak financial position assumes dimensions which press for an immediate solution that may possibly be sought in free rates, the danger in respect of which he utters a warning ought to be jealously guarded against.

Actually for some time past the D-Mark is selling at higher forward premiums than the U.S. dollar. This appreciation is to be interpreted in the immediate context of the devaluation of the French franc which has set in motion a fresh bout of speculative activity in anticipation of a readjustment of exchange values. This expectation has dominated the exchange market for several months now and is the outcome of the continuous payments surplus Germany has built up with the rest of the E.P.U. community. The surplus largely flows from Germany's remarkable achievement in recovery and development of her industry. The gains so acquired are being consolidated. Meanwhile, the drain which the chronic surplus inflicts on the gold reserves of the other members of the community has accentuated the demand for revaluation of the D-Mark. At the same time there is recognition on their part of the necessity of an interim realignment of their own currencies. While Germany is prepared to concede the fact of undervaluation of the D-Mark in relation to the European currencies, her plain contention regarding irrelevance of this appreciation in the context of the U.S. dollar is hard to refute. This weighty factor has influenced her decision not to take premature action in upvaluing the mark.

The way out of this impasse apparently lies in relaxation of the rigid official margin of one per cent from the par values of currencies in exchange transactions. Realignment of rates based on wider margins would undoubtedly ease the severity of the strain on the reserves of the member countries of E.P.U. Margins extending to ten per cent are freely advocated as an immediate remedy. Currencies permitted to float between the margins would tend to find their relative

rational levels which would minimise the area of speculation. This contingency, however, depends absolutely on the ability of the countries to adopt firm policies in dealing with inflationary forces in their internal economies. Failure in this respect would invite strong pressures for further enlargement of the margins and in effect floating currencies would be on the road to gradual devaluation. Once this risk is clearly recognized and fully safeguarded against co-operative action has reasonable potentiality of making a success of the transitional arrangement until the participants are able to rehabilitate their payments position. Dr Adenauer's return to power with greatly added strength reinforces the hope for giving shape to this proposal to which his government was not totally averse before the general elections.

A floating pound moving down to a margin of \$2.70 would be much less vulnerable to speculative onslaughts than it is at the present time. It is true that Britain has accepted by choice onerous obligations of a welfare state and made commitments of heavy investment programmes when industrial reserves are slender and industrial capacity is not fully adequate. But these are difficulties which beset the long-term perspective and will need to be tackled by independent instruments of policy. The short-term problem of rectifying the persisting disequilibrium and injecting strength in the sterling, however, cannot be put off. Britain's position on current account is by no means weak. Her latest drastic action in raising her Bank Rate steeply by 2 per cent to 7 per cent signifies her determination to defend the sterling by a frontal attack on inflation. Germany's reduction in the Bank Rate by 1 per cent, too, should further assist the process of discouraging speculative pressures on the sterling.

In the long-term global context the heart of the problem of exchange disequilibria is to be located in the recurring emergence of the world's dollar gap. Such recovery as was staged in recent years has proved to be short-lived and the world is now up against a dollar gap. American export surplus is the major disturbing factor. During 1956 the effect of the increase of \$1.8 billion over the previous year in American Government expenditure abroad and net outflow of private capital was wiped out by an equivalent increase in the trade surplus. The dollar deficit of the rest of the world recurred in the last quarter of 1956 with a gap of \$39 million and shot up to \$450 million in the first quarter of 1957. The correction of this baffling trend alone would pave the way for a stable structure of exchange rates. This is a long-term function. The remedies suggested are a restraint on dollar imports and reducing world's dependence on the dollar as a medium of international payment. An alternative arrangement for this second corrective is still to be found.

Floating currencies based on wide margins can operate successfully only by action in concert. The alternative to concerted action is continuance of morbid conditions in foreign exchange markets until they become no longer tolerable or improvement is brought about in external payments. On the whole, however, it is good to remember a currency can remain overvalued for surprisingly long periods, particularly with payments assistance from the I.M.F. It would be wrong to assume that the devaluation of the pound is near.

A matter of confidence

'CONFIDENCE' is essential in all human affairs. An advanced economy depends on confidence because of the interdependence of its members.

Confidence is the real backing for all forms of currency and credit, and for the reputation of business houses. For instance, people talk of having confidence in Binny's because they know from the experience of three generations that Binny's fabrics are dependable for their good quality.

Plan for Progress

Transport and Travel

A network of steel rails  girdling the country, ribbons of tarmac stretching over the land, and invisible paths traced across the skies are today breaking  the barriers of vast distances in India to meet the needs of her developing economy.  Thousands of millions of passengers  and millions of tons of freight are carried every year by rail, road and air. During  the Second Five Year Plan will be built 18,000 miles of surfaced roads and eight aerodromes and gliderdromes, and 2,258 locomotives and 1,18,611 coaches  and wagons will be put into commission. Textile Machinery Corporation Limited is proud to play its part in this mighty effort to strengthen the economic life lines of the nation. A pioneer in many fields of engineering, it supplies industry, railways and river valley projects with a wide range of equipment.

geared to our better tomorrows

THE WEEK'S NOTES

FALSE FOREBODINGS

INDIAN OPINION is easily exercised by the very mention of Goa. Of late it has been considerably inflamed by reports that a move was afoot for converting Goa into a base for North Atlantic Treaty Organisation. Even Mr. Nehru, in the course of his review of the international situation in the Rajya Sabha last week, while referring to these reports, emphatically declared that any such move would be treated by India as an "hostile" act. In a subsequent clarification Mr. Nehru, however, observed that the Government did not have any definite information that Goa had been converted into a NATO base. There was no definite information about any proposal on this score either. The only possible source on which the Prime Minister presumably relied upon was a news item published in the Russian Press, and broadcast by Moscow Radio, which was picked up by 'Reuter' and circulated in India. A similar news item was circulated about two years ago. It too had its origin in Moscow. On investigation it was, however, found incorrect. India had on that occasion approached the countries concerned for clarification, and the replies received were, as Mr. Nehru put it, "more or less satisfactory." The replies were to the effect that Portuguese colonies did not come directly within the scope of North Atlantic Treaty Organisation, though under the Treaty the subject could be discussed.

Accustomed to seeing in every Western move an effort to maintain, perpetuate, or expand imperialism most Indians are, therefore, suspicious of the possibility of "the subject being discussed". The assumption is that the Western Powers are probably not worried about the loss of India's friendship and goodwill; acquisition of a base in Goa would more than counter-balance the loss. Superficially, this is a plausible assumption. But there are factors, both military and political, often overlooked out of anti-Western bias, which make the assumption untenable. Every NATO Power, especially the United States, knows too well that any such move will be tantamount to writing off India completely from the non-Communist world. Strategically, too, Goa is of little value to the free world. Being surrounded by Indian territory and cut off from the main NATO lifelines by thousands of miles, Goa is not ideally situated for any military build-up. Moreover, Pakistan, already a member of the Baghdad Pact and South-East Asia Treaty Organisation, provides a much better base.

The timing as well as the origin of the report is, however, significant. The news emanated from Russia and was circulated on the eve of the United Nations General Assembly's discussion on the Special Committee's Report on Hungary.

EXPERIMENTAL CO-OPERATIVE FARMING

THE STANDING Committee of the National Development Council has recommended that just 3,000 experimental co-operative farming societies be organised throughout the country in the last three years of the second Plan. What is gratifying in this decision is that the proposed number is far less than the 10,000 'demonstration co-operatives' recommended for the remaining part of the Plan period by the Patil Delegation to China on co-operative farming. What is still more gratifying is that the launching of even the proposed 3,000 experiments would be subject to further consultation with States. As some of the bigger States like Uttar Pradesh and Madhya Pradesh have no pronounced enthusiasm for co-operative farming, it is just likely that not more than 1,500 experiments will have been launched in the next three years. Even this

trivial number of societies will be organised on a purely voluntary basis and keeping intact the right of a member to opt out.

This decision of the Standing Committee is as wise as it is cautious for obvious reasons. Even Mr. Nehru, with his theoretical attachment to co-operative farming, has conceded in a way the force of arguments against the pooling of lands in joint farms. This welcome, though slight change in the attitude of the Prime Minister should be widely appreciated — especially by the Indian Press which made possible a well-informed country-wise debate on co-operative farming in the last ten months or so. One has only to recall the following words of the Prime Minister uttered in November last year to know how he has quietly climbed down from his previous dogmatic heights: "I have heard it said that co-operatives do not suit the temperament of the Indian farmer. Probably it does not suit the temperament of the person who puts forward this agreement." Perhaps Mr. Nehru has now realised that it is just not sufficient if co-operative farming suits his temperament alone. As the demonstration value of the couple of thousands of experimental societies is not likely to be great in view of the inherent difficulty of keeping their members together in the absence of coercion and compulsion of some kind or other, one can reasonably look forward to the end of the second Plan when co-operative farming may cease to be a hobby-horse or a bogey.

ON THE HORNS OF A DILEMMA

MR FRANK ANTHONY recently said Hindi was increasingly becoming a "symbol of disunity." He referred in this connection to the trouble in the Punjab. He argued for the retention of English, on the grounds that besides being the mother-tongue of a recognized and sizable community, it was the "last remaining bond of emotional integrity." He also contended that the regional languages like Bengali and Tamil would tend to fall into disuse if the study of Hindi was made compulsory. While the last assertion may seem somewhat remote, it cannot be denied that the value of English as an "emotionally" integrating factor is very real. Hindi has, of course, gone some way towards integrating the greater part of North India. But it is mainly those parts where some dialectal variations of the language was already spoken, such as Madhya Pradesh, Rajasthan, Uttar Pradesh and Bihar. Mr Anthony's words are significant when read in conjunction with the happenings in the Punjab. In that State Hindi enthusiasts have been involved in a regrettable exhibition of fanaticism. The fact that some Hindi writers have pleaded for tolerance and urged that those interested in the cause of Hindi should not create any dispute does not absolve the "Save Hindi" agitators.

Apart from these considerations, it would be folly to discard English, because, as Mr Anthony put it, it has immense value in the field of education. India is one of the very few countries in the world where people doubt their ability to learn more than one language thoroughly. Given the proper training, there seems no reason why school children cannot be made proficient in Hindi, English and a regional language. It is admittedly a difficult task in a country with few teachers and schools. But with patience and tolerance much can be accomplished. Tolerance, because Hindi enthusiasts must realize that others value their language as much; very often, as in the case of Bengali, Tamil, etc., the language is older and richer than Hindi, with a considerably wider literature. And patience is necessary, because time is needed by the vast majority to absorb Hindi. It would be wiser perhaps to implement

the "Three-Language Formula" evolved at the last meeting of the State education Ministers. If this not done, Indians will seek unity and prosperity in vain, like the builders of the Tower of Babel.

GOVERNOR FAUBUS'S INTRANSIGENCE

A RATHER distasteful situation, which is likely to have international repercussions, has developed in the United States due to the "apartheid" policy of the Governor of Arkansas, Mr. Ovral E. Faubus. In defiance of the decision of the Federal District Court for de-segregation in respect of educational institutions, he has decided not to allow Negro children to enroll themselves in White schools. To achieve his object, he recently called out the National Guard (State militia) to prevent them forcibly from joining the Little Rock Central High School. The armed soldiers had, of course, little difficulty in turning back the nine Negro children who had come to seek admission. Not quite satisfied, the Governor carried his intransigence further. He revealed at a press conference that he had informed President Eisenhower that he would continue to defy both the Federal Government and the Supreme Court. Numerous dynamite explosions in the Southern State followed on the heels of his statement. Windscreens of several cars carrying Negroes past schools were smashed, and a Negro clergyman, the Rev. F. L. Schuttlerworth, and his 12-year old daughter were manhandled.

There will therefore be widespread relief at President Eisenhower's prompt action. He has bluntly informed Governor Faubus that "the Federal Constitution will be upheld by me by every legal means at my command", and asked him not to thwart the law. The President has, at the same time, instructed the United States Attorney-General to file a petition with the Federal District Court at Little Rock, Arkansas, for an injunction restraining the State Governor for using the National Guard to prevent eligible Negro students from entering White schools. Washington, it appears, is taking recourse to a court of law in the belief that if the Governor continues his defiant attitude, the Federal Government would move to get him cited for contempt of court and mobilize public opinion against him for gross violation of the rule of law. How this lengthy process is going to help the Negro children immediately is open to question. A more decisive action was needed to save the basic issue of racial inequality from being sidetracked into a court case or into a contest between Federal Rights and State Rights. For instance, President Eisenhower could have assumed command of the National Guard and ordered its withdrawal. This was all the more necessary because it would be no exaggeration to say that the entire course of de-segregation in public schools in the Southern States hangs on the outcome of the present crisis. At present, out of the 9,000-school districts in all the 17 Southern States, only a third are bi-racial; the rest are either all-White or all-Negro. The four States of the deep South — Alabama, Mississippi, South Carolina and Georgia — have declared that they do not intend to de-segregate the schools.

Racial discrimination has become an international problem; no nation can wriggle out of its embarrassment by dubbing questions raised in respect of it as "interference in internal affairs", as South Africa has been doing. Moreover, its practice by a section of the people of the leading democracy provides a God-sent opportunity to the Communists to win the favour of the peoples of newly-liberated countries, colonies and backward regions. It is necessary for American statesmen and intelligentsia to see that racial segregation is given a decent and early burial.

VAGRANTS IN RUSSIA

THE RUSSIAN FEDERATION, the biggest constituent unit of the Soviet Union, has drafted a Bill providing

banishment or compulsory labour for able-bodied people leading "anti-social and parasitic life". The Bill will be placed before the Supreme Soviet during the next session. In the Preamble of the Bill, it is stated that in spite of the fact that in Soviet society exploitation of man by man has been abolished and the "social reasons" for the parasitic existence eliminated, some people prefer to engage in vagrancy and begging and often commit crimes or live on unearned incomes.

The Bill is revealing. It accepts for the first time, though this has been widely known in the non-Communist world, that in spite of the claim of the Russian Communists and their Comrades abroad, equality has not been achieved in the Soviet Union. Instead, the two classes of the bourgeoisie and the proletariat have been supplanted by the two classes of the commissars and the workers, with the meanest content in the term. Like all "class-ridden" societies, society in Communist Russia too has its beggars, vagrants and parasites. It is interesting to remember that Karl Marx described these categories of people "as the outer expression of the inner rottenness of society divided into irreconcilable classes". It was the condition of existence, he observed in his characteristic self-righteous way, that determined one's being. He would turn in his grave if he knew all that is perpetrated in his name in the Communist world. The Soviets have admitted that some people live on unearned incomes. This implies that there are differences of income between the different classes of Russian people and that the Russian boast that Communism has been achieved in the country is hollow—which is, of course, true to Soviet tradition.

Incidentally, the proposed Soviet legislation unwittingly brings to mind the vigorous administration of the Poor Laws in eighteenth century England. During that period the good intentions of these laws gave way to the desire to revive villeinage. Vagrants, beggars and touting scholars, who were in the Tudor period regarded as an unbearable burden by the parishes and were meted out barbaric treatment, now became assets. The reason for this change was not that the British had had a change of heart, but that the rise in the price of corn had made it profitable for landlords to plough more land. These former "parasites" proved handy. Perhaps Mr. Khrushchev, in order to realize his dream of beating the United States in the production of milk and butter, has decided to "discipline" the vagrants, parasites and those who enjoy unearned income for "socially useful work." The virgin land of Siberia is there to provide them with work.

A Window on the World

THE ANTAGONISM OF EAST AND WEST

By
ODYSSEUS

THE ANTAGONISMS between East and West are formidable, and, unless ways can be found to diminish them, the outlook for the individual is dim throughout the East and West and the prospect for bureaucratic despotism is bright.

If we go back far enough in History, we find no East-West antagonism. Contacts between East and West began around 1,000 to 500 B.C. when civilization (as opposed to local cultures) of a persistent and recognizable kind were spreading in China, India, Mesopotamia, and Egypt, and began to reach out towards each other and towards the peoples of the Mediterranean.

In the course of time the communications between the Mediterranean peoples and the East were broken by the nomads from the Steppes and by the Mongol invasions. Later, the Arabs completed the barrier between East and West by land, and when, at the end of the fifteenth century, the Portuguese opened the sea route round the Cape to the Far East, Europeans and Asians had forgotten each other's existence. In the meantime forces had been at work in both that were ultimately to erect barriers of the mind almost as impenetrable as the physical barriers enforced by the intervening Mongol-Arab strip.

In a remarkable little book of 82 pages, entitled "The Interplay of East and West" (just published by Allen and Unwin at 10 sh. 6d.), which I exhort you to add to your list of permanent acquisitions, Miss Barbara Ward argues that we can unravel today's East-West relations by comparing the kind of contact that occurred before this long gap between the last of the East-West land caravan-traders around the seventh century A.D. and the first of the East-West sea-traders 700 years later. During those centuries the Asian civilizations—despite the rise and fall of dynasties—remained unchanged in their basic social and economic institutions. Before the gap, broadly, like contacted like in East and West. But after the fifteenth century, changes were occurring in Europe which made the two continents steadily more dissimilar in institutions and outlook.

After 500 B.C., in the thousand years before contacts between East and West were broken, the civilization of both had reached a similar stage. In place of many gods, the idea of a single source of being or moral order had been attained. The idea of rituals and propitiation was giving way in the minds of original thinkers to the idea of a religion of the spirit. In place of a blind acceptance of a mysterious universe, there began to emerge the idea of man rising above material things to share in the Divine Being. With varying emphasis, Miss Ward says, these three concepts were the basis of the spiritual revolution wrought by the Vedas, Buddha and Confucius in Asia, and by the Greek philosophers and Jewish prophets in the West, so that it is hard to say whether the Indian thinkers influenced the Greeks more or the Greeks the Indians, because (and this seems to me the significant point) the contact was between people with a similar approach or a similar quest.

BOUND TO THE WHEEL

Yet even then the embryos of subsequent differences were discernible. "In spite of the spiritual revolution in Hindu, Buddhist and Confucian thought, one archaic concept retained its influence—the idea of a material reality bound to a recurring wheel of change. For Indian thought, this reality was illusion and one escaped from it into the limitless ocean of Being. In China, the material order was the real substance of man's life and could be restored to harmony by obedience to the moral law. It would then revolve in orderly fashion, unchanged in the perfect pattern established millennia before by the Yellow Emperor. Both attitudes limited the range of man's thinking about material reality—the Hindus by rejecting its importance, the Chinese by innate conservatism."

But, in the West, the Jews did not regard the pageant of material things as largely meaningless or as already fixed by a standard of perfection achieved in the past. They believed in the progressive revelation of God's purpose over the centuries and that they had a role in that purpose. Here are the seeds that developed into personal freedom, belief in progress, and concern with the material things of this world—all of which, Miss Ward points out, are dominant ideas in the development of Western civilization. The contribution of the Greeks was their insatiable curiosity about all things human, and their belief that man could find in Nature things of intrinsic interest and at the same time evidence of a Divine order. Reason was the Greek tool.

In government, East and West started from the same point of departure. During the principal period of contact between the West, India, and China, neither Alexander the Great, nor the Roman nor Byzantine emperors differed from Eastern rulers. The empires of East and West were run by bureaucrats drawing their authority from the divine or semi-divine personality of the emperor, whether Roman in the West or Mauryan or Han in the East.

The point, as I see it, is not that there were no conflicts between East and West, not that Alexander did not invade India, nor Xerxes employ Indian troops in his attack on Greece, but that these struggles did not present themselves as conflicts between East and West, between civilizations of fundamentally opposed aims. Those were the days of wars between dynasties. They might spread misery and destruction but there was no persisting rancour or bitterness—the creation of the post-fifteenth century nationalism which sprang up in Europe and then, from the nineteenth century on, spread to Asia.

The Renaissance in Europe is the watershed between East and West. Before it, the world was a more or less homogenous whole. After it, a transformed West, shot explosively ahead, while in the East, religious, political, and economic development ambled along.

Christianity developed Europe away from the once universal belief that this world is an illusion, or bound

to an unbreakable wheel of destiny. Christians saw the world as a testing ground, a creative area. From the Jews came the idea of the progressive revelation of God's purpose. Time was not therefore an illusion. It was important. From the Jews also came the un-Asian concept of Progress. The Greek idea of a citizen with rights mingled with the Jewish idea of the sinner with personal responsibility: hence the embryo of individual freedom and of equality (for women as well as men). And in the sphere of politics, these embryos led to the idea of constitutional government—in which all are equal under the law.

Miss Ward, in some acutely reasoned passages, concludes that these concepts gave support to the up-thrusting groups of merchants and entrepreneurs who did not find themselves, as in a static and closed hierarchic society, working against every preconceived idea held by their fellow-citizens.

PURITANS, PALACES, AND ZENANAS

The enterprising middle classes were also aided by the unique Western development of separate religious and secular powers. They avoided the political form, prevalent until the last few decades in the East, of a single religiously dominated social order. Society was loosened up, the individual set free to seek outlets for his intellectual curiosity, his sense of adventure, all his creative energies. The Puritan tradition combined the idea of religious vocation with hard work which allowed men to see virtue in accumulating vast fortunes and then not spending them on worldly temptations. In Asia, capital has traditionally been for enjoyment in palaces and zenanas. In Europe, it set in motion the cycle of saving and development.

Individual freedom, constitutional government, the spirit of free enquiry and of humanist idealism, the application of science to raw materials in industry, and the possibility of freeing the masses from the wheel of poverty, these are the credit entries in the Western balance sheet.

In the forefront of the debits, Miss Ward sets nationalism. In mediaeval Europe, as in Asia until the nineteenth century, peasants and artisans had no part in government and little in fighting. Wars and dynasties came and went. The peasant and townsmen carried on, minding their own affairs. Nationalism could not emerge in such conditions.

In the West, nationalism developed as the effort was made to associate more and more strata of the population with civic responsibilities and government. At best, this effort generates creative patriotism; at worst, the aggressive and narrow nationalism which started two world wars. Another Western weakness arises because while scientific enquiry has swept away much paralysing superstition, it has also undermined spiritual values. "It has," says Miss Ward in a striking phrase, "left either an unthinking materialism or a vacuum of faith which, more recently, has been invaded by an organized and philosophic materialism, in the shape of Communism coming in to fill the void."

Under pressure of the same ideas, the West has produced two opposed versions of industrial society. The sovereignty of the people—responsible participation by citizens, and government in their interests—is the aim of Western constitutional government. But Marxism has twisted the sovereignty of the people to mean the divine right of the majority—the working masses—to establish a dictatorship and give all power to the Party which is held to represent the will of the people. Marxism has revived the forms of ancient despotism—the concentration of power, the imposition of a single philosophy of life, the subordination of the individual.

Next week, we will consider the impact on the East of these mighty forces generated in the West in the last 500 years, note the antagonisms created, and search for means of East-West co-operation in hopes of preserving for the individual the best that each world has to offer.

ITALY IN THE MIDDLE EAST

(From Our Special West European Correspondent)

PARIS, September 14.

THIS week, while the President of Italy, Signor Gronchi, was in Iran as the guest of the Shah, the Government in Rome received for important discussions the King of Arabia, the Industry Minister of Egypt and the Economic Minister of Iraq. The coincidence highlighted Italy's present activity throughout the Middle East and in fact touched off a political storm in Rome, where the liberal (pro-American) politicians are accusing Signor Gronchi of again exceeding his presidential powers and of seeking to lead Italy into the dangerous adventure of sabotaging Western policies in the Middle East. We might be excused for wondering whether there exists any coherent "Western policy" in the Middle East for Italy to undermine, and even if there were whether what Italy is doing is really so dangerous to the interests of the Atlantic alliance. But there can be no doubt that what she is doing is exceedingly dangerous for the Western oil companies, and it is for this reason that Rome has been under considerable American pressure in recent months.

The state visit to Iran has been the centre of the controversy. At the level of protocol this is just a return visit for the Shah's various sojourns in Italy, where he took refuge when in exile. But President Gronchi rarely restricts himself to mere protocol; he is accused in Italy of attempting to play a directly political role, especially in international affairs, and there has already been a keen controversy earlier this year when President Gronchi replied to a diplomatic note from President Eisenhower without taking the permission of his government. Signor Gronchi indeed would probably like to transform the Italian President's symbolic office into something nearer the active role of the American President, and he has his own very definite ideas on what part Italy should play in world politics, especially in the Middle East.

So his visit to Iran would have aroused suspicion among a section of Italian opinion in any case. But Signor Gronchi is reported to have the intention of making a similar visit later in the year to Syria, and it is plain that the Americans would regard this project with an even more jaundiced eye than the Iranian, tour. Signor Gronchi made clear that he does not see these exchanges with the Islamic countries as mere courtesy calls by saying a few days ago: "We Italians must free ourselves from certain complexes which have restrained us hitherto, and in the first place from the anxiety not to offend anybody. We cannot stand by as idle spectators of the events that are occurring today." And in his speeches at receptions in Teheran this week he has gone well beyond presidential banalities and held up Italy's relations with the Middle East countries as a model for the rest of the Western world. Encouraged by his frankness, the Shah spoke out too and said it was incredible that Italy's efforts to put Arab-European relations on a new and non-imperialist footing should have made Rome the subject of intolerable pressures from some of her allies.

But if Signor Gronchi is in himself a controversial figure, the real cause of the furore is that he did not go to Teheran alone. He took with him the Italian Foreign Minister, Signor Pella, but that was presumably

just to keep himself covered from allegations of pursuing a foreign policy independent of his ministry's. He also took with him Signor Enrico Mattei—and wherever Signor Mattei goes, there is bound to be trouble. Signor Mattei is the most brilliant and dynamic figure post-war Italy has produced. He is the head of the E.N.I. (Ente Nazionale dei Idrocarburi), the State corporation that has a monopoly of all Italian oil interests, and is known as the "petrol dictator." He is the target of constant criticism at home and abroad, but does not seem to care; for the Americans he is the best-hated Italian of the present regime. Assured of the support of President Gronchi, surrounded by the leaders of the anti-fascist resistance in which he played a major role himself, controlling personally a section of the Italian Press, Signor Mattei follows his own audacious policies without regard for Cabinet Ministers or foreign governments.

It was Signor Mattei who concluded the pact with Colonel Nasser, long kept secret, that guaranteed his State oil monopoly the right to prospect for oil in the Sinai peninsula, and it was this agreement that determined Italy's frigid reaction to the Anglo-French Suez war, to the chagrin of London and Paris. He has just returned from Morocco where he has signed a prospecting agreement with the King of Morocco, which the French fear might compromise their claim to parts of the Sahara. But above all it is Signor Mattei who has carried through the agreement with the Iranian Government for Italian exploitation of Persian oil on a basis that leaves Iran 75 per cent of net profits. This agreement, signed this week in Teheran under the patronage of the Shah and President Gronchi, has aroused the furious hostility of the seven giants of the world oil cartel because it threatens the 50-50 pacts they now have with governments and principalities throughout the world. It took years of struggle for the oil-producing countries to get the 50-50 deal with the oil companies, but once that stage was reached the oil firms felt that there would be no further demands. After all, 50-50 has a fair and equitable ring, and it would take a lot of impertinence to ask for more. Signor Mattei has undone all that, and the oil companies fear that he has started something that could spread like a chain reaction throughout the Middle East.

It is this brazen Italian irruption into the close preserve of the Middle East oil empires that has brought Rome under pressure from abroad, and especially from Washington. The 'New York Times' in a vigorous article wrote lately that the State Department "is following the activities of the E.N.I. in Iran with great care," and Italian papers claim that this great care takes the form of diplomatic pressure on the Roman Government to put a stop to the "dangerous ambitions" of Signor Mattei.

How can Signor Mattei afford to do what the oil companies cannot? Very easily. His organization is a State monopoly and he feels that if it makes any sort of profit after providing for re-investment and expansion, then it has done well enough. His main aim to ensure Italy a sure supply of oil payable in Italian currency. It is the foreign exchange that must be paid for oil that concerns the national economy, not the profits of the oil monopoly. The present agreement with Iran

promises to provide Italy with independence in oil supplies, whether or not she builds her own pipeline. (This pipeline project could have something to do with Signor Gronchi's reported intention to visit Syria).

Petrol is not the only Italian interest in Iran. The Italians have built near the Caspian Sea two textile factories that have cost 11 million dollars and will be the biggest and most modern in the Middle East. They will increase Iranian textile supplies by 20 per cent. During the talks in Teheran this week more extensive forms of economic co-operation between the two countries have been projected. Similar investments and technical aid schemes were discussed with the Egyptian and Iraqi ministers who visited Rome this week, and Italy has close connections with both Morocco and Tunisia which she hopes will lead soon to firm agreements on economic co-operation. Worse, Italy has been taking too independent an interest in Algeria, and Signor Folchi, Under-Secretary of State for Foreign Affairs who passes for one of Signor Gronchi's mouthpieces, has just criticized "excessive French nationalism" in Algeria and declared that present French policies are contrary to the spirit of the European treaties.

These various activities in the Islamic world irritate Italy's Atlantic allies, especially when Signor Gronchi presents them, as he did this week in Teheran, as a model to be followed by the misguided imperialists who are seeking to perpetuate outdated forms of con-

nection with Arab nationalism. They cause anxiety in Italy itself where it is felt that the President is taking too much into his own hands and that his disregard for Italy's allies' sensibilities will damage the Atlantic alliance which necessarily must remain the basis of the country's foreign policy. It can be no comfort to the President that the most enthusiastic support for his policy comes from the Communists and other Italian Leftist parties, whose hostility to the Atlantic alliance is greater than their love of Arab nationalism. The Right-wing political leaders have called for a full discussion of Italy's foreign policy as soon as Signor Pella returns from Iran, and the line they will take was indicated by one of them this week when he said that the Middle East was too dangerous a region for Italy to go pursuing a lone wolf foreign policy and added: "Italy's loyalty to the Western cause must remain clear and without reserve."

Signor Gronchi and his supporters reply to this that Italy is not seeking to set up a "third force" between the great power blocs in the Middle East and she is not hoping to exploit to her own advantage the discomfiture of the former dominant powers in this region. They claim that, on the contrary, the sort of peaceful co-operation Italy is establishing with the Arab world must benefit the Western cause in general. It must be admitted that, once one is free of the anxiety not to do anything that might cause offence in Washington, Paris or London, the Italians have a good case.

Electricity is one of the modern marvels we have come to take much for granted. Electric **power** lights our streets, brightens our homes, provides us with transport, and enables us to read, write and work with less strain.

The tiny radio, the swirling fan, **and** giant factories as well—all derive their motivating power from electricity. Power from Hydel and Thermal stations turn the wheels of industry faster and faster, producing more goods and creating more employment.

Life Insurance savings of millions of people are being channelized towards industries vital to the development of the country. The growth of these industries will in turn create a better life not only for the policy-holder but for the country at large. This is the chain reaction of progress; a chain in which the Life Insurance Corporation is proving an important link.

Life Insurance Corporation of India

WORLDGRAM

AGRICULTURE

Cotton Institute opened in Holland: On September 6, the Netherlands Cotton Institute was opened in the city of Arnhem by Mr. A. J. Blydenstein, well-known cotton industrialist. This new institute, established by a group of the cotton industry in Holland and with the assistance of the Cotton Council International in Paris (France) endeavours to stimulate the use of cotton by giving all sorts of information to consumers and to the cotton industry. The first activity of the Cotton Institute is an educative exposition, which will be circulating through a large number of schools in the Netherlands.

Research on Weed Control: In a written reply to a question in the Rajya Sabha, the Union Minister for Food and Agriculture, Shri Ajit Prasad Jain, stated that a co-ordinated weed control scheme was in progress in Andhra, Assam, Bombay, Madhya Pradesh, Punjab and West Bengal. A centre had also been sanctioned recently in Rajasthan. The scheme, financed by the Government of India since 1952, is likely to continue during the second Plan period.

Milk Products Factories Under Second Five-Year Plan: Seven milk products factories, two each in the Punjab, U.P. and Andhra and one in Bihar, would be established under the second Five-Year Plan in "milk pockets" capable of supplying a minimum of 500 maunds of milk per day. Each factory was estimated to cost Rs. 20 lakhs, he added. These factories would manufacture butter, ghee, casein and milk powder, each one manufacturing about 470 tons of ghee or 500 tons of butter and 600 tons of skimmed milk powder, annually.

Soil Conservation in Saurashtra: The Government of India has approved a scheme for demonstration of soil conservation methods in the Saurashtra region of Bombay in 1957-58. The demonstration will include contour-bunding after systematic surveys on an area of 1,800 acres. The Central assistance to the Bombay Government for this scheme amounts to Rs. 44,778 — Rs. 22,158 as subsidy and Rs. 22,620 as loan — in 1957-58.

INDUSTRY

Industrial Production in Japan: The Ministry of International Trade and Industry has reported that industrial output in Japan during the first half of 1957 was about 23 per cent more than in the same period of 1956. However, the rate of growth slowed down in June 1957 as a result of the tight money policy adopted in early May. The production of machinery in the first half of 1957 was 58 per cent higher than a year earlier and that of ships, 51 per cent; other sharp production gains were in railway rolling stock (37 per cent), petroleum products (29 per cent), iron and steel products (22 per cent) and textiles (21 per cent). According to the Ministry, this rapid growth of production affected the domestic price situation and the balance of payments position. Wholesale prices, which had risen during 1956, remained steady at a high level in the first half of 1957; the index for June was 4.2 per cent higher than a year earlier. Imports of industrial raw materials increased, and larger quantities of manufactured goods were purchased abroad in order to lower domestic prices. As a result, total imports in the first half of 1957 were 56 per cent more than in the first half of 1956. Despite the high level of exports, the foreign payments position deteriorated markedly.

Licences for Roller Flour Mills: Owners or persons in charge of roller flour mills used in the manufacture

of wheat products such as maida, atta, suji, rawa, resultant atta and bran will have to obtain licences in future according to an Order published in the Gazette of India Extraordinary on September 9. Entitled the Wheat Roller Flour Mills (Licensing Control) Order 1957, and issued in exercise of Government's powers under the Essential Commodities Act, it extends to the whole of India, except the State of Jammu and Kashmir.

Draft Standard for Reagent Bottles: The Indian Standards Institution has issued a draft Indian standard specification for reagent bottles for eliciting comments. This draft standard prescribes the requirements and methods of test for reagent bottles used for storing and stocking of pure chemicals. The draft standard deals with two types of reagent bottles, narrow-mouthed and wide-mouthed with any of the stoppers of the three types, namely, flat, dustproof and upright grip. It also lays down requirements in respect of capacity, material, pattern, dimensions, workmanship, finish, etc.

Development of Coir Industry: A proposal from the Coir Board for the establishment of licensed warehouses to handle coir yarn is being examined by the Government of India. A scheme submitted by the Kerala Government for the development of the coir industry in the Neyyattinkara Pilot Intensive Development Project area was under examination. The State had requested for financial assistance for implementing the scheme. The Coir Board is examining a proposal to conduct a market survey for coir goods in Central and East Africa. Details of areas to be covered and the cost of survey and similar matters have not yet been worked out. Reports about fall in the prices of coir yarn have been received. The Kerala Government has taken steps to purchase and stock coir yarn up to Rs. 10 lakhs for disposal when the markets are favourable. The Coir Board is examining the question of production cost of an improved model of coir spinning machine and the possibility of improving the mechanism and efficiency of the machine.

TRADE

Trade Arrangements With Democratic People's Republic of Korea: The Minister for Commerce, Shri Nityanand Kanungo, stated in the Rajya Sabha recently that letters had been exchanged between the leader of the Trade Delegation from the Democratic People's Republic of Korea and the Managing Director of the State Trading Corporation of India outlining the arrangements for trade between India and the Democratic People's Republic of Korea. The list of goods to be exported from India to the Democratic People's Republic of Korea include jute goods, tea, shellac, coffee, ores, vegetable oils, cotton and woollen textiles, coir and coir manufactures, soaps, machine tools, sewing machines and linoleum. The list of goods to be exported from the Democratic People's Republic of Korea to India include cement, glass sheets and plates, electrolytic zinc, steels, caustic soda and other chemicals.

Textile Export to Jordan: There is little scope for marketing Indian coarse in Jordan and other neighbouring countries, according to a report received from the Indian Trade Representative in Baghdad. Syria, which has a number of well-organized industries, will cater to the needs of the Jordan market for cotton textiles, hosiery goods, silk and vegetable ghee. Syria is at present manufacturing grey long cloth, bleached long cloth, drills and tobranco. India is, therefore, likely to have a limited market for the varieties of cotton textiles manufactured by that country. Further, the Indian textile trade is at present facing competition

from East European countries such as Czechoslovakia, Hungary, Yugoslavia and Bulgaria. These countries have offered grey sheeting at a price most competitive to Indian textiles and large imports have taken place. Some of the textile importers in Jordan previously used to import from India, have now diverted their purchases to these countries. Meanwhile exports of cotton piece-goods from Bombay port during July, 1957, improved slightly to 54.77 million yards from 50.54 million yards in the preceding month, according to figures released by the Textile Commissioner. While exports of grey cottons last month improved to 30.76 million yards from 23.13 million yards in June those of white cotton piece-goods rose to 13.39 million yards from 9.5 million yards. In the case of coloured piecegoods, however, exports declined to 10.62 million yards during the month under review from 11.91 million yards in June. Export earnings of mill-made cotton piecegoods also rose fractionally to Rs. 3.87 crores last month from Rs. 3.53 crores in the previous year. The value of apparel and other textiles exported last month also increased to Rs. 85 lakhs from Rs. 60 lakhs in June.

Yugoslavia's Foreign Trade: Following a considerable increase during the first quarter of 1957, Yugoslavia's exports decreased slightly in each month of the second quarter. At 8.67 billion dinars in June, they were 7 per cent higher than in June 1956 (1956 monthly average: 8.04 billion). Imports continued to rise, reaching 19.76 billion dinars in June, an increase of 16 per cent over June 1956 (1956 average: 11.8 billion). The trade deficit increased from 9.8 billion dinars in May to 11.1 billion dinars in June (1956 average: 3.8 billion). During the first half of 1957, exports amounted to 52.0 billion dinars, an increase of 8.5 billion dinars over the comparable period in 1956. Since exports during the second half of the year are usually higher than during the first half, the planned export value of 100 billion dinars may be surpassed. In the first half of 1957, imports were 100.4 billion dinars, compared with 73.4 billion during the first half of 1956. The trade deficit thus increased from about 30 billion dinars to about 48 billion.

U.K. Trade: The value of U.K. exports f.o.b. in July was £281.4 million, £5.5 million more than in June, and equal to the monthly average in the first six months; imports c.i.f. amounted to £359.6 million, £36 million more than the low June figure and 3 per cent more than the monthly average in the first half year; and re-exports f.o.b. were £9.4 million, 19 per cent less than the half-year monthly average. Thus, the excess of imports over total exports in July was £68.8 million, £31 million more than in June and £12 million more than the monthly average in the first half of the year. Most of the increase in exports was due to increased shipments to North America. Exports to the United States were 7½ per cent, and exports to Canada 13 per cent more than in the first half year.

FINANCE

Customs and Excise Revenue Collected in Indian Union for June 1957: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during the month of June 1957, amounted to Rs. 14.14 lakhs as compared with Rs. 12.95 lakhs in the corresponding month of the previous year. The comparison in the subsequent paras should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 12.49 lakhs as against Rs. 10.91 lakhs, export duties for Rs. 132 lakhs as against Rs. 177 lakhs and land customs and miscellaneous for Rs. 33 lakhs as against Rs. 27 lakhs. The total gross collection

of Union excise duties amounted to Rs. 19.96 lakhs as compared with Rs. 15.27 lakhs. During the three months, April to June, 1957 the grand total of gross customs and Union excise revenue realised was Rs. 104.63 lakhs as compared with Rs. 80.83 lakhs during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 40.54 lakhs as against Rs. 32.85 lakhs, export duties for Rs. 395 lakhs as against Rs. 559 lakhs, land customs and miscellaneous for Rs. 101 lakhs as against Rs. 70 lakhs and Union Excise duties for Rs. 59.13 lakhs as against Rs. 41.69 lakhs.

Sudan Joins Fund and Bank: The Sudan became a member of the International Monetary Fund and the International Bank for Reconstruction and Development when the Article of Agreement of these institutions were signed in Washington on behalf of the Government of the Sudan by His Excellency Dr. Ibrahim Anis, Ambassador for the Sudan in Washington. The quota of the Sudan in the International Monetary Fund is \$10 million and its subscription to the capital stock of the Bank is 100 shares with a total par value of \$10 million. Sixty-three nations are now members of the Fund and Bank. Admission of the Sudan brought the total of members' quotas in the Fund to \$8,991,000,000. The total subscribed capital of the Bank is now \$9,318,400,000.

GENERAL

Mechanisation of Country Boats: A provision of Rs. 40 lakhs has been included in the second Five-Year Plan for the mechanisation of about two hundred sailing vessels. No detailed scheme for the grant of financial assistance to the owners of sailing vessels who were desirous of mechanising their vessels had, however, been drawn up yet, pending the enactment of legislation for giving necessary powers to Government to control the sailing vessels industry. It was proposed, to incorporate suitable provisions to cover the sailing vessels industry in the consolidated Indian Merchant Shipping (Amendment) Bill, which was expected to be ready shortly for introduction in Parliament.

Increase in Number of Foreign Tourists: India drew twice the number of foreign tourists in 1956 than in the previous year, according to statistics compiled by the Tourist Division, Government of India. The number of foreign tourists, other than Pakistanis, who visited India during 1956, was 68,880 as against 33,269 in 1955. Country-wise, the largest number of these came from the United States (15,111), followed by the United Kingdom with 13,411. The corresponding figures for 1955 are USA, 11,028 and the U.K. 8,681. Other countries from where larger numbers of tourists came during 1956 are: Ceylon 12,179; Burma, 5,060; Germany, 2,171; France, 1,716; Afghanistan, 1,549; China, 1,528; Japan, 1,426; Canada, 1,158; and Russia, 1,047. During the last four years, two Government of India Tourist Offices have been opened in the United States of America — New York and San Francisco — and one each in the United Kingdom, France, Germany, Ceylon and Australia.

Supply of Metallurgical Coal: About 1.99 million tons of metallurgical coal were supplied to Railways during the period January to April, 1957 said Sardar Swaran Singh, Union Minister of Steel, Mines and Fuel, in the Lok Sabha. The Minister, who was replying to Shri Vittal Rao, further stated that the second Five-Year Plan provided for the progressive replacement of coking coals by non-coking coals for use in locomotives. Production of non-coking coal of higher grades was being increased suitably. A systematic replacement was expected to commence from the middle of 1958.

NEWS IN BRIEF

INDIAN

The Government of India have set up a 7-Member Committee, with the Textile Commissioner, Shri V. Nanjappa, as Chairman to inquire into the quality, production and delivery of indigenous automatic looms.

A total area of 3,000 acres in the catchment region of the Ganga and Jamuna rivers in Meerut and Bulandshahr districts of Uttar Pradesh will be treated for soil conservation work in 1957-58.

Adequate stocks of National Plan Savings Certificates have now been printed and supplied to post offices authorised for Savings Bank work. Intending investors who had been issued preliminary receipts in lieu of certificates can now have these exchanged for the certificates themselves.

The Steel Purchasing Mission of the Indian Railways, which went abroad recently for the purchase of steel and pig iron, has placed orders for 5.22 lakh tons of track steel and pig iron.

In furtherance of the Family Planning Programme, grants amounting to Rs. 1,70,104 were sanctioned by the Ministry of Health during the period ending August 21, 1957.

There are now more than 1,100 information and community centres functioning at the headquarters of the Community Development and National Extension Service Blocks.

A lump sum allocation of Rs. 5 crores has been made in the second Five-Year Plan for special schemes for the educated unemployed.

It is reported a sum of Rs. 3,20,000 as loan had been sanctioned during 1956-57 to Rajasthan, Bhopal, Himachal Pradesh and Pondichery in order to enable these States to grant loans to agriculturists for the purchase of agricultural implements.

It is proposed to send a technical mission abroad for making purchases of cranes, cargo-handling and other mechanical equipment for the major ports.

Four hundred and thirty three students were studying or undergoing training in West Germany and 168 in Canada on 1-1-56.

The Government of India have further amended the Mineral Concession Rules for providing quicker disposal of applications for prospecting licenses and mining leases.

Under the craftsmen training scheme, 11,091 persons were undergoing training in technical and vocational trades in various training institutes and centres in the country at the end of June, 1957.

FOREIGN

The U.S. International Co-operation Administration announces that it has agreed to lend Indonesia \$2 million (£700,000) to buy a 2,200 ton cargo and passenger vessel from Finland.

Coal available in the European Coal and Steel pool area during the fourth quarter this year will be nearly 750,000 tons more than in the third quarter.

Following the directive from the Central Bank on Conserving foreign exchange, the Ceylon Commercial banks have increased interest rates on money lent for the import of luxury or non-essential goods, increased the margin for opening letters of credit for importing these goods and reduced the limits of accommodation in regard to some items of goods very drastically.

Egypt and East Germany signed a trade pact recently providing for an annual exchange of goods worth £E9 million each way.

Pakistan signed recently a trade agreement with Japan for one year after two months of hard bargaining. Under the agreement Pakistan will sell Japan cotton, jute, salt, chrome ore, cotton linters, hides and skins and a number of other raw materials.

Degussa, of Frankfurt, will soon set up Germany's first Uranium production plant in Hesse. The Uranium will be produced by vacuum melting.

The release of foreign exchange for investment in shares of Ceylon sterling companies registered in the U.K. is suspended for one year under new Government regulations to conserve foreign assets.

First official estimate of the area sown for wheat for harvesting in November-December next is 5.3 hectares. This is 11 per cent lower than last years area and one of the lowest recorded figures in recent years.

South Africa's gold and foreign assets in the week ended August 30, totalled £112 million as compared with £112,936,000 a week earlier.

A British cotton-exporting concern has sold £1 million worth of Uganda cotton to China. The deal, negotiated in Hong Kong, involved 17,600 bales of long staple Uganda cotton, which would be shipped to Shanghai soon.

Higher sales and net income are reported by the Royal Dutch-Shell Group for the second quarter of this year. Sale proceeds and other become totalled £66.3 million against £559.7 million for the corresponding three months of 1956, making £1,307.4 million for the half year, an increase of £212.2 million.

Wherever there is heavy duty work to be done

use LEYLAND Comets for SPEED and ECONOMY

A Leyland Comet can carry in two trips what others do in three or more

EVERY project in the private sector or the public must be completed in record time to get maximum value out of investment. The Leyland Comet with its large body space and 7½ ton payload capacity, helps you transport more goods more frequently with maximum efficiency. The fast, powerful, Leyland Comet trucks, tippers and tractors, have proved their reliability and exceptional fuel economy in well over 50 countries.

The Comet has behind it the design features developed from extensive testing over all sections of the Motor Industry Research Association's proving ground in Britain. The Comet stood these tests over thousands of miles on a track scientifically designed to produce the most damaging effects of the worst types of road surfaces.

Leyland COMET

The only 7½ ton payload chassis made in India

Special Articles

QUERY OF FOOD STATISTICS: 1956-57

THE figures of food production in 1956-57 released by the Ministry of Food and Agriculture show that there has been a rise of 3.7 million tons or roughly 5.6 per cent over the previous year. In percentage terms, the food output of 1956-57 stands about 27 per cent above 1949-50 — the base year for the targets set in the first Five-Year Plan. These figures of production are, no doubt, heartening but they have created some unbelief because instead of depressing prices, the increased output has been accompanied by rising prices. Table I below shows the magnitude of rise in wholesale prices in respect of cereals, pulses and food articles during the last two years. The over-all index for food articles shows a rise of more than 10 per cent in June 1957 as compared with June 1956. During the last three months also, the index has shown an upward trend.

1955-56, in absolute terms, the increase in output of food grains has been to the tune of 20 per cent, whereas the index shows an improvement of only 11.5 per cent. Happily, this index takes into account the non-reporting areas in the later years and, since it is based on chain-base method, it tends to make figures comparable. This index, however, does not correct the error introduced by the new technique of crop cutting surveys.

TABLE II

PRODUCTION OF FOOD GRAINS IN THE INDIAN UNION

			(Base: Crop year ending June 1950 = 100)	
			(Million tons)	
TABLE I				
WHOLESALE PRICES				
(Base: 1952-53 = 100)				
	June 1955	June 1956	June 1957	
(1) Cereals	69	95	104	1949-50 54.0 100.0
(2) Pulses	50	75	86	1950-51 50.0 90.5
(3) Food Articles	83.7	99.0	109.3	1951-52 51.2 91.1
				1952-53 58.3 101.1
				1953-54 68.7 119.1
				1954-55 66.6 114.4 (a)
				1955-56 64.9 111.5 (a)
				1956-57 68.6 115.7 (a)

(a) Provisional

The paradoxical situation created by rising production and rising prices cries out a critical examination of the figures of output of food grains. The increase of nearly 14 million tons of food grains between 1949-50 and 1956-57, if it were real, should have resisted the inflationary spell through which the Indian economy has been passing during the last twenty months, especially because the tempo of imports has also been accelerated during the last year. There is 'prima facie' evidence that the figures of output released by the Ministry of Food and Agriculture for the eight years are not strictly comparable. The error arises from two sources. In the first place, there are certain areas in the country which were non-reporting areas before 1949-50. Every year more and more of such areas have contributed their share of output to the figures of India's total production of food. In the second place, the new technique of crop cutting surveys has tended to impart an upward bias in the estimates of crops. It seems that both these causes are at the root of the inflated figures.

An additional proof of the fact that the figures in the latter years have been inflated by the inclusion of non-reporting areas is offered by Table III on the next page which compares the rates of rise in the output of various crops in two groups of States. The group 'A' consists of all those States which before November 1, 1956, were known as Part 'A' States. The group 'B' on the other hand, consists of all the States which formed Part 'B' and 'C' States before reorganisation. It is clear that the faster rate of growth shown by group 'B' States is mainly due to the inclusion of non-reporting areas.

The thesis that the absolute figures of food grains production during the last eight years are not comparable is supported by the official index of agricultural production computed by the Ministry of Food and Agriculture. In Table II alongside the index of total food grains output and the figures of absolute output are set side by side. It will be seen that the index numbers do not show the same rise as shown by the figures of absolute production. Between 1949-50 and

If corrections are made for both these factors, it will be found that the domestic availability of food grains in per capita terms has not increased substantially during the last eight years during which period the population of the country has also increased by nearly 10 per cent. This conclusion suggests that the internal price line, in regard to food grains prices especially, can be held only by more imports of food grains. Since foreign exchange is not available, this implies greater utilisation of PL 480 loans from the United States.

TABLE III
FOOD GRAINS PRODUCTION

Commodity:	1950-51		1955-56*		(In '000 tons)	
	Group A	Group B	Group A	Group B	Percentage Change	
					Group A	Group B
Rice	18,577	1,674	22,762	2,712		
Jowar	3,817	1,591	4,433	2,507	+22.5	+ 62.0
Bajra	1,866	688	2,119	1,281	+ 16.1	+ 57.6
Maize	1,300	402	1,548	971	+13.6	+ 86.2
Ragi	971	436	1,168	736	+19.1	+141.5
Small Millets	1,442	280	1,716	387	+14.1	+ 68.8
Wheat	4,961	1,399	5,812	2,536	+19.0	+ 38.2
Barley	1,953	387	1,904	817	+17.2	+ 81.3
					- 2.5	+111.1
Total Cereals	34,387	6,857	41,402	11,947	+18.7	+ 74.2
Tur	1,509	183	1,601	213		
Gram	2,638	955	3,349	1,516	+ 6.1	+ 16.4
Other Pulses	2,358	635	2,701	807	+27.0	+ 58.7
					+14.5	+ 27.1
Total Pulses	6,505	1,773	7,651	2,536	+17.6	+ 43.0
Total Food Grains	41,392	8,630	49,053	14,483	+18.5	+ 67.8
States in Group "A": Audhra, Assam, Bihar, Bombay, Madhya Pradesh, Madras, Orissa, Punjab, Uttar Pradesh and West Bengal.						
States in Group "B": Hyderabad, Jammu and Kashmir, Madhya Bharat, Mysore, PEPSU, Rajasthan, Saurashtra, Travancore-Cochin etc. etc.						

* Final Estimates and not partially revised ones.

A SALES-TAX AMBIGUITY

By
C. V. NARAHARI RAO

A FIRM of cotton dealers has, to cite an actual example, different offices within the same State and also in several other places in other States. A branch office of this firm in Coimbatore, say, makes a contract for the sale of cotton, which is "declared goods," to a mill in Coimbatore. The cotton is to be transported by rail or lorry from a place X in another State, say Andhra. The selling firm hands over a delivery note and a debit note to the purchasing mill for the value after the goods are received at the mill's premises. Or it may be that the railway receipt is handed over and payment demanded in cash instead of the value being drawn through a bank by "a transfer of documents of title to the goods." Is the sale in question an intra-State sale or an inter-State sale? If it is the latter, which is the "appropriate State," which is entitled to collect the inter-State sales-tax and also demand the "Declaration Forms," if such forms are to be filed with the Return to the assessing authority, in relation to the seller?

Now according to Section 3 of the Central Sales-Tax Act, 1956, "a sale or purchase of goods shall be deemed to take place in the course of inter-State trade or commerce if the sale or purchase

- occasions the movement of goods from one State to another; or
- is effected by a transfer of documents of title to the goods during their movement from one State to another."

Clearly this sale has occasioned movement of the goods from the place X which is in another State to Coimbatore (place C, let us call it) and therefore the

sale should come under sub-clause (a) above. By virtue of Explanation (i) to Section 2(a) of the Central Act, the "place of business" in the case of goods in the course of inter-State trade or commerce falling within clause (a) of Section 3 is "the place from which the goods have been moved by reason of such sale." X must therefore be deemed to be the place of business for this dealer for this transaction. And Section 2 (a) (ii) states that "appropriate State" means in relation to a dealer who has one or more places of business situate in different States, every such State with respect to the place or places of business situate within its territory. As X is to be regarded as the "place of business," the "appropriate States" in this case is Andhra wherein X is situated and not Madras State wherein place C is situated. In that case the rate of tax that will be leviable on this inter-State sale of "declared goods" to a manufacturer and not to another dealer for re-sale will be according to the sales-tax law of this "appropriate State," namely Andhra and not Madras State, and not necessarily the one per cent Central Sales-tax. If (for example and argument's sake) the appropriate State's sales-tax law prescribes a two per cent tax for this class of goods, then this higher rate will govern this transaction. Anyway, the appropriate State being Andhra, the place of business being taken to be there, the Central sales-tax will have to be paid to that State.

Now, on the facts stated, the transaction seems to fall also under clause (b) of Section 3, stated above, because the sale is effected by a transfer of documents of title to the goods during their movement from one

State to another. Arguing on the same lines as in the first instance, we find that according to Explanation (ii) to Section 2(a) in the case of a sale falling within this clause, "the place of sale is the place where the sale is effected." C in Madras State must therefore be deemed to be the "place of business" for this dealer for this transaction. Section 2 (a) (i) states in this connection that "appropriate State" means, in relation to a dealer who has one or more places of business situate in the same State, that State. Therefore, Madras is the appropriate State. If so, since Section 8(1) states that "Every dealer who, in the course of inter-State trade or commerce sells to a registered dealer goods of the description referred to in sub-section (3) shall be liable to pay tax under this Act, which shall be one per cent of his turnover," the seller has to pay one per cent tax for this sale of cotton to the Madras State. If the sales-tax for cotton is less than one-per cent (supposing) the seller need pay only that tax and if it is 2 per cent as for declared goods he should pay only that rate.

Anyway, if Madras State is regarded as the appropriate State a curious feature results thereby. Let us look at sub-section (4) of Section 8 now. It states that "the provisions of sub-section (1) shall not apply to any sale in the course of inter-State trade or commerce unless the dealer selling the goods furnishes to the prescribed authority in the prescribed manner a declaration duly filled and signed by the registered dealer to whom the goods are sold, containing the prescribed particulars on a prescribed form obtained from the prescribed authority." Here, therefore, we have a curious spectacle of one registered dealer, who is in the same State as the registered seller-dealer, having to furnish the Declaration Forms to be submitted by the seller, of course, to the self-same authority which issued those Forms to the buyer. This is unlike the first example explained above, where, the Andhra State being the appropriate State, that State was entitled to receive the Declaration Forms from the Madras dealer (seller) who was having his "place of business" in Andhra, though the forms have to be furnished by the Coimbatore mill.

Or again, let us suppose that the dealer in question, instead of sending the documents of title through a

bank delivered the cotton himself to the mill in Coimbatore by arranging lorry transport from X to C and obtained cash payment from the mill. Here, if the transaction is regarded as one involving movement of goods from one State to another the inter-State sale will come under clause (a) of Section 3 of the Act, but will not satisfy clause (b) because there is no transfer of documents. However, Explanation I which follows this clause (b) states, "where goods are delivered to a carrier or other bailee for transmission, the movement of the goods shall, for the purposes of clause (b), be deemed to commence at the time of such delivery and terminate at the time when delivery is taken from such carrier or bailee." Here the 'time' of commencement of movement is defined but not the 'place' of commencement of movement, which might perhaps be regarded as obvious. It cannot at any rate be so obvious as in the present instance where both the seller and the purchaser are in the same State and delivery actually takes place in the same State where both are and the buyer has had no responsibility for the movement or for its duration until the goods were delivered at C. Compare for instance what Explanation II to Section 3 says. The gist of it is that where the movement commences in a State and terminates in the same State, then there will be no inter-State sale although the goods in transit might have actually passed through an intermediate State. But this need not be taken as an absolute comparison.

This sale seems, therefore, to have all the elements of an inter-State trade, except that the seller being in the same State nevertheless arranged to get the goods from another branch office or elsewhere but actually delivered the goods to a purchaser in his own State. Section 4 (2) (b) of the Central Sales-Tax Act may also be usefully looked into in this connection. It states, "A sale or purchase of goods shall be deemed to take place inside a State if the goods are within the State, in the case of unascertained or future goods, at the time of their appropriation to the contract of sale by the seller or the buyer, whether assent of the other party is prior or subsequent to such appropriation." It may well be argued in this instance that the appropriation to the contract was made by the buyer when the goods were brought by the seller to the mill's premises in the Madras State.

METAL NEEDS PROTECTION

Whatever the nature of the metal surface, it can be protected indefinitely against corrosion by the use of a specific **Shalimar Paint Product**.

... That's because only **Shalimar Paint Products** are backed by over 55 years of manufacturing experience in India. The extensive paint research, constant progress, and development carried out is a guarantee that **Shalimar Paint Products** will stand up to the difficult and extreme climatic conditions in India.

Whatever the need, specify the purpose when you order

LAND REFORM

The Land Problem of Reorganised Bombay State: By G. D. Patel: Publishers Messrs. N. M. Tripathi (Private) Ltd., Bombay 2: Pp. 466: Price Rs. 12.50.

Perhaps at no other comparable period of time were so many measures of land reform undertaken in such quick succession as during the last decade. In almost all the States, there has been, in fact, a plethora of these land reform measures with the twin objectives, no doubt, of establishing an egalitarian society and increasing agricultural production. Though the first objective of our neo-socialists may seem to be materialising as a result of these measures, serious doubts exist as to the achievements of the second objective—the stepping up of agricultural production, directly stemming from these reforms. The author of the publication under review, Mr. G. D. Patel, though very competent to deal with the “rationale” of these reforms, has not done it in the way he might have done to be of use to critical students of agricultural policy. On the other hand, he seems to have contented himself with indicating just what the Government's approach is. Perhaps this inhibition is what all Government officials suffer from.

Mr. Patel begins by saying that “the economic policy and institutional changes have to be planned in accordance with these democratic and egalitarian ideals” (page 40). This is all right for a responsible Government official to say, although it may not impress everybody. But, as he himself admits in the Preface, “in evaluating this book, the fact that the writer is a Government official having limitations under the service rules should not be forgotten”. Nevertheless after stating the approach to the problem thus, he has discussed, in a detailed and lucid style, the entire labyrinth of land legislation and reforms of the State of Bombay, which is, as Mr. Chavan says in his foreword to the publication, “leading other States in several respects”.

With the formation of the bilingual State of Bombay, the land problem, complicated even as it was before, has become doubly so. For, there is a lot of diversity in the respective land problems of the constituent units. Mr. Patel's attempt to present a more or less complete picture of “the land system, survey and settlement, the land revenue legislation, the systems of revenue accounts, the land tenure reforms, the tenancy reforms, the ‘Bhoodan’ and its role, the prevention of fragmentation, the consolidation of holdings, co-operative farming and co-operative management, land census, land reforms and rural credit, etc.” of all these units of the bigger bilingual Bombay State in a single publication, with appropriate statistics and documentation, besides being commendable, should be very useful to all those interested in land problems in general and those appearing for the Revenue Qualifying and the Revenue Lower and Higher Standard Examinations of the State Government in particular.

MARXIST MISSILE ON “MUTINY”

Rebellion — 1857 — A Symposium: People's Publishing House Private Ltd., New Delhi: Price; Library Edition Rs. 12, Popular Edition Rs. 8.

Indian Marxists try hard these days to dig roots into our country's resistant soil. All the more reason, therefore, that the centenary of 1857 uprising should be seized upon by them with avidity. For here they find blood and thunder, the comprehensible atrocities of popular rage or cool hate, “the people” in arms. This, surely, could be proclaimed as India's tradition as much as revulsion at Kalinga.

The editor of the symposium under review Mr. P. C. Joshi, a former general secretary of the Communist Party of India, has fully taken advantage of this situation. With a mass of quotations (mainly from secondary sources) he has built up a formidable case, as much against as Dr. S. N. Sen's sedate study as against the “Firanghi's Raj”, though the shower of invectives and the passion of the style does come a little too close to self-flagellation. Among the other contributors, Talmiz Khaldun makes an original contribution when he describes the political organization of the rebels. He is to be commended for having delved into original Persian and Urdu manuscripts, simultaneously with other better known books. But he hesitates to call the 1857 uprising a war of independence, is rather severe on the “feudal” leadership, and asserts that it was a “peasant war” as much against indigenous landlordism as foreign imperialism. However, not enough is done to back this up with factual data. Incidentally, it is interesting to find Mr. Joshi rapping Mr. Khaldun's knuckles for “leftism” — a battle of the Marxist flowers?

These are the two main contributions to the symposium and with all their weaknesses they make the volume a powerful challenge to traditional analysts. Dr. Sen and Dr. R. C. Majumdar are cardboard defences against the ballistic missile of this partisan scholarship. Dr. K. M. Ashraf on the Wahabi's and Mr. Benoy Ghosh's apologetics — more Manheimian than Marxian — for the standoffishness of the Bengali intelligentsia are not rich fare. There is a literary section which is remarkable in conception but rather dismal in the actual execution — from Mr. Gopal Halder's mere cataloguing of the names of Bengali writers and literatures to Mr. Ehtesham Hussain's feeble survey of Urdu. Mr. Joshi's paper on folk songs is, however, excellent.

The final section of the symposium comprises contemporary reactions to 1857 in Britain, France, China, Italy and Russia. Outstanding here — indeed, by any standards — is James Bryne on British reactions. The other papers in this section are a shade too contrived. However, ‘Rebellion, 1857’, is to be welcomed, if only as a change from “objectivity”.

USSR STATISTICS

National Economy of the USSR (Statistical Returns): Issued by the Central Statistical Board of the USSR Council of Ministers: Published by the Foreign Languages Publishing House, Moscow.

The statistical information in regard to the USSR has not been made available to the free world for a long time. With the publication of this volume of nearly 230 pages, packed with statistics, the curtain on the secrecy of USSR production data is now lifted. The book brings home the great strides that the USSR economy has taken during the last four decades. It shows how the pattern of industrialisation has taken a wide swing in favour of producer goods. As against the share of producer goods at one-third of the total industrial output in 1913, the production of producer goods was as high as 70.6 per cent in 1955. There is no doubt that this amounts to an extraordinary reversal in the pattern of industrial growth.

The book deals not only with the growth in population and national income of the USSR, but it also traces, in statistical terms, the progress in industry, agriculture, capital construction, transport and communication, employment, culture and public health. Students of the socialist systems, will find a fund of useful information for study and analysis.

The cane mutiny

‘RISE and fall, rise and fall. I'm getting the bends,’ muttered the sugar-cane furiously. ‘Here I am, destined for the choicest confitures in Sydney — and how do they treat me? Battered down in this hot hold, jounced and bounced around for weeks on this endless ocean. And they expect me to stay sweet. I won't stand it, I won't, I won't, I won't!’ And it dissolved into a sticky pool of self-pitying tears.

Don't let your shipments turn sour on you. Send your silks and spice and other things nice by AIR-INDIA INTERNATIONAL. It's swift, safe and economical. A.I.I. flies every Monday to Sydney via Singapore and Darwin and offers easy connections to Indonesia and New Zealand.

DESIGN BEHIND TELCO DEBATE

By
CROESUS

IT is a great pity that, even in the avowedly most well-informed quarters, there should be so little appreciation of the machinations of our Communist friends. To start mischief and say "Mischief thou art afoot. Take what course thou wilt" is a game at which the Communists are admittedly adept. For all that they want is to create confusion, so that they may fish in troubled waters. And, I must say, they have eminently succeeded in this special game of theirs in respect of the 'Telco' episode enacted in the Lok Sabha recently. Failing to take note of the unseen hand of the Communists in this affair, some unthinking allegations have been made by responsible persons against disgruntled high officials, rival industrialists, and protagonists of the public sector. But those who have made these allegations may be excused for their innocence and inability to discern the deep game of the Communists. I feel convinced, however, that, whatever may be the truth or otherwise about the hand of others in this so-called premeditated and motivated attack against the Tatas, it is the Communists who successfully engineered the enactment of this episode in the Lok Sabha. My reasons for this conclusion are as follows:

First the Communists wanted to hit back at the Tatas for the public condemnation of the growing Communist menace in Jamshedpur by Mr. J. R. D. Tata at the last annual meeting of the Telco (Tata Locomotive and Engineering Co., Ltd.) held on August 12, 1957. It will be remembered that Mr. Tata stated, as a post-script to his Chairman's address on that occasion: "Since this speech was written, the labour situation at Jamshedpur has, I regret to say, taken a serious turn. On the 5th of August, a minor matter concerning the temporary transfer, many weeks earlier, of three men, without loss of pay from one section of the Auto Division to another in accordance with established practice, was made the excuse for an illegal lightning strike which had obviously been well planned in advance, accompanied by violent behaviour towards German supervisors on the part of the ring leaders." Continuing, Mr. Tata said, "A serious aspect of the situation is that the trouble is clearly not an ordinary trade dispute, which could be settled in the normal way by negotiation with the Union concerned, but a deliberate attempt on the part of Communist leadership to disrupt operations at the Telco Works. There is evidence that this incident is part of a larger plan to disrupt the working of the whole of the industrial complex of Jamshedpur." This was apparently too much for the Communists to swallow.

Secondly, the Communists wanted to create a further split between not only the Government and the private sector but as between different groups in the private sector itself. They seem to have almost succeeded in this.

Thirdly, on the eve of the Union Finance Minister's visit to the U.S.A. to explore the prospects of foreign aid on a fairly large scale, nothing could be more effective than repeated cries of nationalization of this industry and that to scare away the American investors. This explains why it was not only the nationalization of Telco that was demanded but the nationalization of the sugar industry and of the banks as well. Thanks to the considered replies of Mr. Jagjivan Ram the Communists probably thought Mr. Jagjivan Ram would

readily consent to nationalizing Telco as he has been responsible for nationalizing the railways, not reckoning, however, that Mr. Jagjivan Ram has probably been having second thoughts on the wisdom of that hasty move of his) and Mr. A. P. Jain, the game of the Communists was foiled. However, the Lok Sabha discussions on 'Telco' have not failed in their purpose of producing a sort of a chain reaction in the minds of foreign investors. But the Communists knew that any talk of nationalization would do great harm—and they were doubtless intent on seeing this happen—to the country's economy at the present juncture. What pains one is that, as if this damage is not sufficient, we should also be having at the present juncture well-meaning elders counselling against foreign loans albeit for good reasons, and impetuous adults comparing any aid that may be extended to India now to the U.S. aid given to the Chiang Kai-shek regime in China.

That some Congressmen also should so unsuspectingly allow themselves to be fed by the Communist hand and appear in the role of misguided champions of the poor tax payer passes one's understanding. I am not out here to hold the brief for Telco, but being a scrupulous respecter of our laws and conventions, I feel strongly for the way in which the Tariff Commission, a statutory body comprising persons of high calibre and integrity, has been made to appear as being rather partial. If the 'bona fides' of even such persons serving on statutory bodies are suspected, I am afraid, no honourable person worth his salt would be forthcoming to serve on these bodies in future.

Now, much was made in the Lok Sabha of the clause on which, according to the terms of reference, the Tariff Commission was required to base its award. A large part of what was said in this connection was quite wide of the mark. It seemed that no one cared to take note of the existence of a written agreement between the Government and the Telco. Surely it cannot be suggested that the Tariff Commission should have disregarded this agreement, even assuming that the agreement was unfortunate in some details. No responsible independent body would, even in such circumstances, suggest an abrogation of the agreement. For if agreements entered into between a Government and any industrial venture are abrogated, even when they are found to be inconvenient to conform to, as would appear to have been the case in this instance, that would result in undermining the confidence of investors to such an extent that a feeling of insecurity would develop both within the country and outside.

It seems to be a part of the agreement between the Government and the Telco — as it is a feature of all agreements — that there should be arbitration in the event of a dispute between the parties to the agreement. Let us assume, for argument's sake, that the dispute in question had been referred to an arbitrator. In that event, the arbitrator's award would have been final, without any appeal thereon. But, in the case in question, despite the existence of such a provision, it was decided to refer the dispute (regarding prices payable for Locomotives and Boilers delivered at different periods as stipulated) to the Tariff Commission, of course after Telco consented to it. This meant that the Telco people actually conceded a point in favour of the

Government, inasmuch as the Tariff Commission's findings were not final, as would an arbitrator's award have been, but subject to the Government approving of them. There was thus an opportunity for the Government, even after reference of the dispute to the Tariff Commission, to disapprove of the findings of the Tariff Commission, and if the Government thought it fit and right not to do so, but to accept the recommendations of the Tariff Commission, the presumption is that it must have fully convinced itself about the correctness and the objectivity of that body's findings.

Nor could it be otherwise. For the Tariff Commission not only heard the two parties directly involved, namely the Railway Board and the Telco management, but also had the benefit of the expert opinions of a tried Cost Accountant and a well-known Technical Adviser — Mr. D. W. Hadfield — who is regarded as a world authority on locomotive manufacture. It is only in the fitness of things that the Tariff Commission have acknowledged the great help to it of Mr. Hadfield's wide knowledge of the problems of the locomotive industry in carrying out its investigations. This is what the Commission says of Mr. Hadfield: "He has subjected every single problem referred to him to a searching inquiry and has given us an illuminating report. We have drawn upon his analysis in the preparation of the technical sections of our report."

It could not be that a Tariff Commission, consisting of an I.C.S. officer and three distinguished members of the Commission, two of whom are regarded as eminent economists, and having the assistance of two experts, one of whom is known to be an outstanding authority in the locomotive industry, would have missed any of the points raised in the Lok Sabha debate. And, yet, if it has come to the conclusions it has arrived at, the least decency that one would expect is that the 'bona fides' of such a body are not questioned.

A reference was made in the Lok Sabha to the question of depreciation. As far as one can make out, I don't think the Tariff Commission has displayed any mental reservations on this subject. Its report clearly states that, under the agreement, any special or additional depreciation or other allowances or rebate allowed at any time during the pendency of the agreement for tax purposes should be treated as part of the cost of production of boilers and locomotives and so, irrespective of the rightness or otherwise of such a stipulation — for which the persons who drafted the agreement are alone to blame — the Tariff Commission had to accept the Telco's demand and rule out the Railway Board's contention.

Then, as regards the allegation that Telco was paid more than it asked for, it seems clear that the blame or responsibility cannot be laid at the doors of either the Tariff Commission or the Telco people. For the Commission's report ('vide' para 15.2) says that it was at the instance of the Railway Board that depreciation at income-tax rates was charged as and when it fell due, instead of being spread over the remaining period of the agreement. Indeed, the latter course was actually suggested by Telco, it would seem, and the Tariff Commission also has mentioned in its report ('vide' p. 46) that the prices payable to Telco would have been lower than those recommended by it (Tariff Commission), had the Railway Board accepted the principle of evenly spreading out depreciation, as suggested by Telco. Not only has the Tariff Commission pointed out what would have been beneficial to the Railway Board thus, but it has, whilst scrutinising the costs in detail, negatived quite a few of Telco demands. Apropos the principle of depreciation allowance adopted, it may not be out of place at this point to mention that the prices paid so far to Telco are only due to the loading of certain

elements in the earlier years and that what would be payable in future, when there would be no occasion for such loading, would be progressively lower.

There seems to be an impression — or shall I say "lurking suspicion"? — that the loco division of Telco is being loaded with the overheads of the whole Telco show — that is both the locomotive and the automobile divisions. Enquiries reveal that, apart from there being no such loading of overheads at the expense of the loco division so far, the prospects are that, in future, the auto division itself would absorb a sizeable portion of the overheads of the loco division.

Finally, a word about the demand for nationalization. I repeat that this demand could never have been instigated by rivals in the field, although that might occur to one readily and even seem plausible. Such a charge, in my opinion, amounts to underrating the capacity for proper understanding of the implications of nationalizing Telco. It should be noted here that, if at all the Government is driven to adopt such a course by political pressure, it can only be the locomotive division of Telco and not the whole of Telco. Should this eventuate, the auto division of Telco would be not less able but more able, as it could then concentrate on one thing only, to compete with its rivals in the automobile manufacturing field. Surely the rivals of Telco in the auto field are not so short-sighted as to precipitate this day. Even otherwise, the demand for nationalization of Telco (or, for that matter, any other industrial unit in the private sector today) is without any substance. By developing the manufacture of diesel trucks, this Company has contributed greatly to the mitigating of the problem of inadequate road transport in India and, if this is conceded, it follows that Telco has served to meet the road transport needs of the second Five-Year Plan. The Government's help to Telco—even if it may appear excessive to some—has but strengthened the heavy engineering industry of our country. We have the disinterested assurance of the Tariff Commission that capital has only been ploughed back and there has been no dissipation of resources.

BUSINESS NOTES

SUGAR NATIONALISATION

THE RESOLUTION for the nationalisation of the sugar industry, sponsored by the Praja Socialist Party, was rightly rejected by the Lok Sabha by a substantial majority. It is curious that, while so much hard and realistic rethinking is taking place in Britain on nationalisation as an essential instrument for the achievement of socialism and economic equality and preponderating opinion is veering away from it, socialists in India should still persist in thinking in the old rut. The case for the nationalisation of the sugar industry is not tenable on any reasonable ground. This is one of the industries which have made rapid strides in recent years and promise even a better performance. The cane grower has been assured fair prices and the worker has received a square deal. The State is vested with powers of regulation which provide a safeguard that the grower and the worker can always rest assured of equitable treatment and that mismanagement can be effectively dealt with. One major reason advanced for nationalisation is that the industry's profits can be put to the use of the public sector. To describe these profits as "colossal" and to argue that they can provide a fruitful source for investment in the Plan is to betray lack of knowledge of the real situation. Moreover, far from assisting the resources position of the Plan, nationalisation will drain away scarce resources to the extent of Rs. 150 crores by way of compensation. Who with any sense of responsibility can be a party to this uncalled for drain?

Mr. A. P. Jain vigorously expressed Government's opposition to the resolution on its merits as also on the score of Government's Industrial Policy Statement. This Statement reserves future expansion of the sugar industry in the private sector. Nothing has happened since then to justify deviation from this policy. But Mr. Jain's assertion that future expansion of the industry should be directed on the lines of co-operative organisation cannot be sustained. It is true that 38 out of 55 sanctions for new units in the sugar industry have been awarded to co-operative enterprises. Nevertheless, it is also true that co-operative units are leaning heavily through government mediation on the Industrial Finance Corporation of India. The Corporation has undertaken to advance loans to them on an unusual scale. During the accounting year ended June 1956, more than one-third of the Corporation's loans were granted to sugar co-operatives. A noteworthy feature of these loans was that they were granted solely on the guarantee of the Central and State Governments on a basis of fifty-fifty. The consequences of this liability undertaken by these governments will have to be watched with attention. More important than this, the working of sugar co-operatives will need to be followed with care to assess their efficiency in operational and financial management. The experience of co-operatives — and of industrial co-operatives which is scanty — does not speak for their reputation on this count. Mr. Jain's bias and enthusiasm for co-operatives notwithstanding, Government must keep an open mind on the question of the future pattern of the expansion of the sugar industry — whether expansion should be entrusted to co-operative enterprise or to private enterprise — and come to a policy decision on the evidence of proved capacity.

REPORT ON MYSORE LAND REFORMS

THE MYSORE Tenancy and Agricultural Land Laws Committee, in its report submitted to the Government of Mysore last week, has suggested "the elimination of the landlord-tenant relationship and redistribution of land to satisfy the aspiration of the landless." A ten-

member Committee, under the Chairmanship of Mr. B. D. Jatti, a former member of the Bombay Ministry, this Committee has, by reason of its monumental work, paved the way for a comprehensive land legislation in the enlarged State of Mysore. After an analysis of the range of size of holdings and the percentage of land leased out in each group of holdings, it is noteworthy, the Committee has come to the conclusion that the agricultural economy of the State "largely approaches the ideal of peasant-proprietorship." It further adds that only 28 per cent of the people working on the land are landless and 'owner-cultivators are more 13 times than the rentier class' (emphasis ours). The total number comprising the rentier class and persons with large holdings is only 3.4 per cent of the population and the tenant class number 9.3 per cent of the total population. According to the Committee, nearly a quarter of the land is under tenancy. Another important point which the Committee has drawn attention to is that as much as 99.44 per cent of the holdings comprising 89.80 per cent of the area do not exceed 100 acres. The Mysore Government should bear this broad picture of the agricultural economy of the State in view before embarking upon any drastic land legislations; ill-conceived and hasty measures, however potentially vote-catching they may be, may do more harm than good to the State's economy.

Among the major suggestions of the Committee, mention may be made of its suggestion for the constitution of what it calls a "Land Commission" to act as the agency to implement the tenancy law proposed by it. With regard to the quantum of rent, the Committee considers that the limits laid down in the first Five-Year Plan were fair and suggests its adoption. The Jatti Committee recommends that the maximum rent might be a fourth of the produce in the case of land having assured irrigation facilities and a fifth of the produce in other cases. As regards ceilings, it recommends that those on existing holdings under personal cultivation may be 4½ family holdings (Rs. 5,400 in terms of agricultural income), as against three family holdings for future acquisition. The ceiling is, however, double this where the family consists of more than five members. Finally, the Committee recommends payment of compensation for the surplus over the ceiling to vest with the Government at 15 times the average net annual income derived by the owner from the land. It recommends that the Land Tribunal is to allot surplus land on a system of priorities.

It is interesting to note here that the existing coffee estates as on January 1, 1957 and also tea estates as on the same date are exempted from the operation of the ceiling. As regards sugar cane farms, while co-operative sugar factories which take land from members on lease are exempted, no single sugar factory is allowed to own more than a sixth of the area required to feed it, by the Committee. One would like to know the basis on which the Committee has arrived at this figure and one would also like to know if this rule is to apply even to sugar factories in which the State is the major shareholder. In any case, before hastening with any such rule-of-the-thumb principle, the Government should see that the growth of the sugar industry in the State is not adversely affected. The problem today is not reforms and legislation but more production and that economically.

THE COST OF STEEL

SIR BIREN MUKERJEE has done well to draw pointed attention to the economics of the three Government steel plants at the annual general meeting of the shareholders of IISCO. He pointed out that it has been conceded even by Government spokesmen that after the two-

Appearances...and a pair of pears

PEARS, like appearances, are deceptive. You can't tell their quality by gazing at them. Moral: If you're buying pears, taste them first.

But testing by tasting gets you nowhere if, for instance, you are buying soap. For that (and most packaged goods, too), sensible shoppers have a surer guide to quality: they go by a name they can trust, a brand they have used and found reliable.

For nearly 70 years, people have trusted Hindustan Lever products because their high quality has been unvarying. And they trust because we test.

At Hindustan Lever, we examine *all* our products at *every* stage of manufacture. We make sure that they stand up to storage: we 'create climate' in a laboratory to observe them under all weather conditions. We check their performance by using them as you do in the home.

All this means 1,200 tests a week on products like Lifebuoy Soap, Dalda Vanaspati and Gibbs SR Toothpaste — familiar products because they are so widely trusted, and trusted because they are tested.

Hindustan Lever serves the home

H.L.L. 5-X52

major plants in the private sector reach their planned extension of output and the three Government plants start working at their rated capacity there will be some exportable surplus. It is here that Sir Biren casts serious doubt: Would it be possible for the Government to export steel at C.I.F. price which is acceptable in the world market?

The available estimates of the production cost with the Government have now become out of date. The prices of all the raw materials, labour and ancillary services have since increased. The erection of Government plants will make a competing demand upon the already scarce supplies of electric power, coking coal, lime stone, etc. pushing their prices still further. Besides the availability of adequate transport facilities trained manpower will be another factor. As against this the entire steel industry, particularly in Europe, including the Soviet Bloc is fast expanding. And they may be competing in the export market after meeting their domestic requirements. Unlike India, the iron and steel industry in Europe has not to spend large sums in importing plant. Possibilities of exports of Indian steel to South-East Asian countries are also very bleak. In the first place they will like to purchase goods at competitive costs. And, secondly they may not afford to import iron and steel unless they are able to pay the price by the export of their own products. In the circumstances it is doubtful that the Government will be able to earn this foreign exchange.

DEBATE ON TEA

IN A recent debate in the Rajya Sabha on the recommendations of the Plantation Enquiry Commission on Tea, it was urged that the Government should reconsider its decisions already announced and accept the recommendations of the Commission regarding the replanting fund, ware-housing and conducting of tea auctions in Calcutta and Cochin. In this context, it needs to be pointed out that while it was essential to have a replanting fund, it did not necessarily mean that the problem of keeping the tea plantations in good condition would be solved. No rigid limit of average life of plants can be assumed as life varies by wide margins from 25 years to 80 years. There was, therefore, no point in laying down that the Government must insist on replanting after 50 years. The main factor is that the plantations be kept in good health. Mr. Nityanand Kanungo has explained that while the Government is not inclined to accept the Commission's recommendations in this issue straightaway, it is considering how a suitable formula can be evolved to ensure funds for replanting.

As regards the sales of tea at Cochin and Calcutta, the fear that the Government control may lead to monopoly is not baseless. The main criticism during the debate was that the tea industry was still largely controlled by British interests. While it is true that the production, distribution and auctions are in the hands of British managements which have made investments and taken risks in this industry over several decades, the fact cannot be ignored that during the last ten years Indian interests were getting more and more control over the tea plantations and distribution of tea. The tea industry was pioneered and owned by British enterprise.

The urgent problem was that the tea industry be nursed in such a manner that not only its competitive position regarding quality and price be maintained in the international market but also other markets found to expand its exports as Indonesia is coming back on the scene rapidly. So far as the high cost of tea was concerned, it was pointed out by the Minister for Commerce, Mr. Nityanand Kanungo that the Government was considering the question of setting up a directorate of production to collect data regarding production costs of tea and production practices in tea plantations.

SILK STRIVES FOR BETTER QUALITY

THE VERY existence of any industry, let alone its continued prosperity, depends, to a very large extent, in these days, "when intelligence and technique have a priority over numbers and strength," upon the maintenance of quality. This is particularly so in the case of our exports. In the export markets, where competition is very keen, only those products, which are up-to-date in design, are of good quality and are economic in prices, attract customers. Now, the maintenance of high quality calls for the translating of the results of scientific research into practice. This is the gist of what Mr. D. N. Shroff, President of the Silk and Art Silk Mills' Research Association said, at the seventh annual general meeting of that body held recently in Bombay.

Turning to the activities of the Association, Mr. Shroff said, that in collaboration with the Indian Standards Institution, the Association has been engaged actively in setting up standards for various kinds of rayon fabrics, such as Taffeta or Shioze, plain sari cloth, rayon half-crepe, rayon crepe, Ninons and Chiffons and linen, Jacquards and Sharkskins, etc. Mr. Shroff also revealed that the modern testing laboratory which is a part of their research organization has already planned to undertake testing of raw materials as well as finished products. This has come none too soon, as consumers have become quality-conscious, if not quality-critical. Gone are the days when they were content to judge the quality of the products in a rather empirical way, by using their senses of sight, smell or touch. It is gratifying to note in this connection that the Association is planning to publish, apart from providing full-time day courses for young men who want to specialize in its industry and evening courses for the existing technical personnel, already employed in the industry, a technical Journal devoted to silk and man-made textiles with special reference to the Indian Silk and Rayon Industry.

THE ESSENTIAL COMMODITIES ACT

THE AMENDMENT of the Essential Commodities Act recently passed by the Lok Sabha is to be welcomed, as it would remove all doubts being agitated in Courts of law regarding Government's power to requisition stocks of food and other essential commodities. It makes it clear that the Government's power under the Essential Commodities Act to compel stockists of essential commodities to sell their stock to "such person or class of persons" specified in the order, covers sale to the Government itself or one of its officers or agents. The object of the Essential Commodities Act is primarily to empower the Government to deal with the situation arising from an acute shortage of essential commodities. The Act when applied recently in the case of seizure of stocks of rice in West Bengal had indicated certain loopholes. The Calcutta High Court had upheld the objection that the Government's action in requisitioning of stocks of rice and paddy was not in accordance with the law. To remove the doubts and to plug the loopholes, it was essential that an amendment be brought forward and the whole position clarified beyond doubt. Certainly, hardships cannot be allowed to be imposed on people in the matter of essential necessities while nice issues of interpretation are being discussed in time consuming litigation.

In no way does the amendment to the Essentials Commodities Act seek to bypass the authority of the Court of Law if the spirit and intention behind it are properly appreciated. As stated by Mr. Asoke K. Sen, the Law Minister, the amendment only seeks to make the provisions of the Act clear beyond doubt. In times of crisis when there is shortage of production of essential commodities like food, it is absolutely necessary that Government be vested with the power to distribute stocks of essential commodities.

Put **SPEED** in your accounting!

INCREASING business volume and growing competition call for rapid methods of accounting. Today's transactions can't wait till tomorrow to be recorded. Put *speed* in your accounting! Put **COMPTOMETER** on the job. This super-fast machine that adds, subtracts, multiplies and divides is designed for accurate, easy, efficient operation.

GREATER SPEED:

Light weight, yet durable metals used in its construction give the lightest, floating touch for super-fast calculation. There are no keys to set, no cranks to turn, no handles to pull and no carriage to shift. Press the keys—and the answer is there!

100% ACCURACY:

To err is human, but the Comptometer is infallible! The Comptometer has a control key which locks the key-board at the point of error... a perfect safeguard for cent percent accuracy!

EASY OPERATION:

Anyone who can count from one to nine and press a key can operate the Comptometer! Giant-size clear numerals, scientifically designed slope and light cushioned key stroke, make for easier operation, larger turnover.

COMPLETE COMPTOMETER SERVICE

P. N. Ganesan & Sons are equipped to offer you quick, efficient repair and maintenance service. You'll get a spare machine when yours is taken for repairs. They'll train your staff free of charge to become skilled Comptometer operators. Every Comptometer you buy carries with it a guarantee, against any manufacturing defect, for one year.

Write today to any of our following offices:

MADRAS:	No. 12/13 Angappa Naick St., P. O. Box No. 1257

Sole Concessionaires in India for world famous Comptometer, Comptograph, Walther Calculator and Comptometer Dictation Machines hitherto marketed in India by Fek & Tarrant (India) Company

This may shrink

This will not shrink

That's why people look for 'Sanforized' on the label!

The Trade Mark 'Sanforized' inspires such confidence that people all over the world pick fabrics trade marked 'Sanforized'—knowing they bear this assurance: *This garment will not shrink out of fit—even after many, many washings!*

It adds value and prestige to your own label—enables you to sell with confidence—and assures the public that you take trouble to give them value.

People rely on you to serve them well—so serve them cloth labelled 'Sanforized'.

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements

ACP. 4362 (Rev.)

Economic Report from the U.S.

IMPORT TRADE

(By GUY SIMS FITCH)

WASHINGTON, Sept. 17.—Two little-noted reports testify to the sustained vigour of United States import trade. Last week, the U.S. Department of Commerce estimated July imports at an unprecedented \$1,137 million. Since this is only a preliminary figure, the Department is not yet heralding it as a new monthly record. But if it holds up in the final tabulation, it will exceed the previous monthly high of \$1,131 million achieved this last March.

Assuming no significant change in the preliminary July figure, U.S. imports for the first seven months of 1957 come to the remarkable total of about \$7,650 million. This exceeds the total for the corresponding period of 1956, the present record import year, by some 3.5 per cent. Thus, the import gain so far is even a little larger than was generally expected earlier this year, when most experts were forecasting that U.S. purchases of goods from other countries would exceed the 1956 high by about 3 per cent. This trend seems to be corroborated by the second of the two reports. In it, the U.S. Treasury Department noted briefly that customs receipts for dutiable goods entering the United States during August totalled nearly \$66.9 million. This was about 2.7 per cent above receipts in July, and about 4 per cent above receipts in August, 1956. Customs receipts are, not necessarily precise indicators of import totals, of course. There are bound to be some month-to-month differences in the kinds and quantities, and hence in the duty assessments, of goods entering the country. Also, normally about half of all goods entering the United States are subject to duty at all.

Nevertheless, customs receipts have proved to be fairly reliable barometers of import trends. On this basis, it is fair to assume that imports in August were noticeably higher than the \$1,055 million of August 1956. Whether they equalled or exceeded the July 1956 total remains to be seen. In any case, it is virtually certain that U.S. imports for 1957 as a whole will be exceeding those of 1956. It would take a highly unlikely setback of some magnitude to change that picture now. This is not to say that some leveling-off is not possible. But on the basis of figures now available, most of the experts—even those given to conservative estimates—foresee U.S. import total in the neighbourhood of \$13,000 million this year, compared with last year's \$12,600 million.

The Commerce Department is not citing any such exact figures as yet. But it does offer the prediction that U.S. foreign trade, both exports and imports, will continue at a "high rate" during the latter part of the year. Just this week, the Department came up with an analysis of trade trends for 1957, based on results during the first five months. It indicates that imports are flourishing in a broad scale, with a great variety of

goods — from raw materials to finished products — entering the United States from all parts of the world. Showing significant gains, for instance, are imports from Latin America and Western Europe. Trade with Africa and Australia also is on the rise, while purchases from the Far East are maintaining their 1956 pace. Only in the case of the Near Eastern area has there been a decline in U.S. imports, and even there, such lands as Iran, Kuwait, and Saudi Arabia are enjoying high levels of trade with the United States, and appear headed for record foreign-exchange earnings.

COMPANY AFFAIRS

JOST'S ENGINEERING COMPANY, LTD.

The results of working of Jost's Engineering Company, Ltd. for the year ended March 31, 1957, which, incidentally, marks the completion of fifty years by the Company, make satisfactory reading. There was, during the year, an increase in turnover, the Company having had record sales and orders for electrical instruments. For the current year also, the Company has on hand substantial orders for electrical equipment, especially from colleges and technical institutions, but the directors state: "owing to the foreign exchange position and the curtailment of import licences, a considerable number of orders have had to be cancelled". And this, they add, "cannot but have an adverse effect on the trading position for next year" (1957-58). Even during the year under report, it is stated, the profits were not considered quite adequate to pay to the General Manager of the Company the full amount due to him under the terms of his agreement with the Company. Nevertheless, the Directors have not denied the shareholders the benefit of the year's good results, such as these have been. Thus, the dividend proposed has been raised from 8 per cent for the previous year to 10 per cent. Incidentally, since 1908, Jost's Engineering Co. has not passed even one year without paying a dividend, although the rate of dividend has varied from a low of 5 per cent (in 1935 and 1948) to as high as 60 per cent (in 1921 and 1922). This is, indeed, a unique record. During this 50-year period the Company's issued and paid-up capital has increased three-fold, that is from Rs. 2 lakhs to Rs. 6 lakhs.

NEW CENTRAL JUTE MILLS CO., LTD.

Notwithstanding difficult trading conditions in Jute Industry, the Company achieved satisfactory results. The audited accounts for the year ended December 31, 1956 show a surplus of Rs. 43,31,103 after crediting Rs. 3,11,553 to Capital Reserve on realisation of investments. Depreciation on fixed capital expenditure has been provided to the extent of Rs. 10,25,112 and provision for taxation, Rs. 325,000. The sale proceeds from gunny were to the extent of Rs. 7.21 crores against Rs. 4.54 crores during the previous year.

The Directors have recommended a dividend (without deduction of income-tax) on 33,000 7 per cent cumulative preference shares of Rs. 100 each at the rate of Rs. 7 per share, which absorbs Rs. 2,31,000. Final dividend has been recommended to be on 8,55,000 ordinary shares of Rs. 10 each at the rate of 75 nP per share (making a total of Rs. 1.50 nP per share i.e. 15 per cent for the year) absorbing Rs. 6,41,250. A balance of Rs. 3,36,601 has been decided to be carried forward to the next year.

The Company has received wide loom plant machineries which are in the course of commission. About half of the plant is now in operation. The Indian Jute Mills Association has now agreed to exclude production of carpet backing cloth that would be manufactured on these looms from the operation of Working Time Agreement with effect from July 29, 1957. Production of this plant would, therefore, now be additional to the normal output of your Company's jute mills.

The Company is establishing a new industrial undertaking under the style of 'Sahu Chemicals' near Varanasi (U.P.) for manufacture of 40,000 tons each of Soda Ash and Ammonium Chloride per annum. A long term loan of Rs. 1.45 crores has been received by the Company from the Government of U.P. to finance this project. The total capital cost is estimated to be of the order of Rs. 3.5 crores. Shipments of machineries have already started and installation of the plant is expected to be completed by the end of 1958. Import licence for a portion of the machineries, particularly

boilers for power plant is yet awaited from the Government of India.

THE HOOGHLY DOCKING AND ENGINEERING CO. LTD.

The audited accounts for the year ended December 31, 1956, show that the value of work billed during the year amounted to Rs. 1,24,94,195 against Rs. 68,57,049 in the previous year, an increase of about Rs. 56.3 lakhs. The increase was mostly due to the completion during the year of the construction of three new river tugs. The gross profits for the year, after taking credit for sale of scrap, amounted to Rs. 11,16,507 representing 8.9 per cent of the total sales, compared to 7 per cent for the previous year in which the gross profit earned was Rs. 4,83,373. The net profit for the year was Rs. 2,68,176 against Rs. 1,12,120 for the previous year.

After charging all expenses including depreciation and writing off Rs. 33,230 as bad debts the profit for the year amounted to Rs. 4,98,176. To this has been added the balanced of Rs. 2,037 brought forward from the previous year. Out of this a sum of Rs. 2,30,000 has been provided for taxation, leaving a balance of Rs. 2,70,213 available for distribution of Dividends.

The Directors recommended the payment of a dividend of 12½ per cent free of tax absorbing Rs. 1,56,250. A sum of Rs. 1,00,000 has been transferred to Development Reserve and Rs. 13,963 have been carried forward to next year.

INDIAN OXYGEN is playing

a vital role in building a more powerful and self-sufficient India in the Second Five-Year Plan.

From transport to electric power, from the steel works to the oil refinery—every day our technical service is keeping the nation up-to-date with the most modern methods of metal fabrication.

THE INDIAN OXYGEN & ACETYLENE CO.
 PRIVATE LTD.

COMMODITY NEWS AND NOTES

INCREASING PRODUCTION OF NATURAL RUBBER

The implementation of the ten-year Rubber Re-planting Scheme for increasing the production of natural rubber in India has begun. Against the target of 7,000 acres to be replanted in 1957, the Rubber Board, under the Ministry of Commerce and Industry, has already sanctioned subsidy for 6,185 acres. Under the Scheme, expected to cost about Rs. 2 crores, 70,000 acres of worn-out rubber lands are to be replanted with high yielding strains over a period of 10 years. Subsidy ranging from Rs. 250 to Rs. 400 per acre is being paid to the growers to encourage replanting. The higher rate of subsidy is for the small growers. The production of rubber in India in 1956 was about 23,450 tons while the production has been steadily increasing,—from about 17,150 tons in 1951 to 23,450 tons in 1956—consumption has also been rising. In 1956 over 6,500 tons of rubber had to be imported to meet the internal demand. The Replanting Scheme is expected to meet the rising demand in the coming years to a considerable extent. Applications for the grant of subsidy for 1958 and 1959 have also been invited by the Rubber Board so that subsidy could be granted well ahead of the period of replanting. Of 359 applications received for 1958, subsidy permits have been issued to 29 small growers and three large growers. Against 90 applications for 1959, subsidy permits have already been issued in a few cases.

PRODUCTION OF WHITE SUGAR

A target of 22.5 lakh tons has been fixed for the annual production of white sugar during the second Five-Year Plan period, stated Shri Ajit Prasad Jain, Union Minister for Food and Agriculture, in a written reply to a question in the Rajya Sabha. This target is expected to be achieved in the 1958-59 season. Production during the 1956-57 season was 20.4 lakh tons.

COFFEE GROWING IN ANDAMAN ISLANDS

The Andaman and Nicobar Islands have been found suitable for coffee cultivation by a Team of Experts of the Coffee Board which has recently completed a survey of the Islands. According to the report of the Team, humidity, temperature soil and other conditions on the Islands are not unfavourable for the cultivation of coffee. Blossom sowers, necessary for growing coffee are practically assured by the rains which occur in April and thereafter showers are regular. The Team has estimated that an area of 15,000 acres on the Islands is suitable for coffee growing; about two-thirds of this will be suitable for cultivation of robusta and the rest for the arabica variety of coffee. The Team has recommended that before launching on large-scale planting, exploratory trials with selected varieties of arabica and robusta should be conducted. It has also recommended six representative centres on the Islands where the different varieties can be grown on an experimental basis. The six centres selected represent the six zones with rainfall varying from 80 to 120 inches and different soil conditions. It is estimated that for a period of 5 years, the expenditure on this trial cultivation would be about Rs. 2.3 lakhs. Large-scale planting may be taken up after watching the results of these trials which would also help in drawing up a calendar of operations suited for the Islands.

COAL DEPOSITS IN GARO HILLS

Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, recently detailed the steps taken by the Government of India to exploit the coal deposits of Garo Hills in Assam.

The Minister said that drilling operations had been started by the Geological Survey of India to find out the potentialities of those coal deposits. The manner

and method of exploitation would be determined by the drilling data, which would be compiled and analysed as soon as drilling operations were completed.

MICA EXPORTS IMPROVE

Mica exports during the first half of 1957 rose to 281,900 cwt from 224,650 cwt in the corresponding period of last year. Export earnings from this mineral during the period under review at Rs. 4.87 crores showed only a nominal increase of Rs. 57 lakhs, because the bulk of the increase took place in exports of scrap mica, which fetches a low price in the world market. Exports of scrap mica, which totalled 127,337 cwt in the first half of 1956 rose sharply to 180,197 cwt during the period under review. Shipments of splittings also rose by 7,002 cwt to 79,735 cwt, but those of block mica, which commands a higher price in the world market, declined from 21,074 cwt to 19,808 cwt. Mica of mixed descriptions also showed a fall in exports from 3,506 cwt in the half year ended June, 1956, to 2,250 cwt in the first half of the current year.

The U.S.A. maintained its position of leading buyer of Indian mica, with an offtake of 86,879 cwt valued at Rs. 1.82 crores. The U.K. was the second largest customer, importing 90,639 cwt of mica worth Rs. 85.5 lakhs. Germany and Japan, the two other important buyers, lifted mica worth Rs. 54 lakhs and Rs. 62 lakhs respectively.

RISE IN IRON ORE EXPORTS

Exports of iron ore in the first half of the current year were higher at 589,805 tons, compared with 483,820 tons in the corresponding period of 1956, according to trade sources.

Export earnings from iron ore during the period under review were placed at Rs. 3.16 crores. Japan maintained the position of the leading buyer; and lifted 273,884 tons of iron ore valued at Rs. 1.45 crores. Poland occupied the second place with an offtake of 97,738 tons worth Rs. 51 lakhs. Exports to Germany, which were placed at 63,567 tons, were worth Rs. 33 lakhs and those to Italy at 55,006 tons worth Rs. 33 lakhs. Czechoslovakia took 51,091 tons of iron ore valued at Rs. 27 lakhs during the period under review. France, Holland, Yugoslavia, Norway and Hong Kong were other important buyers of Indian ores. Further improvement in iron ore exports is foreseen because Japan the main buyer, has contracted to import from India 1.45 million tons in 1957-58, compared with 1.2 million tons taken by her in the previous year.

RUBBER OUTPUT IN JULY

Production of indigenous rubber in India which fell to 750 tons in June last from 1,645 tons in May, has again gained ground in July by yielding 1,499 tons, according to the monthly issued by the Rubber Board. It was further disclosed that 2,820 tons of rubber were consumed by manufacturers during last month. Stocks of raw rubber with estates and dealers and with manufacturers as on July 31, 1957, together amounted to 5,315 tons, besides 1,090 tons of synthetic rubber. There were no exports of rubber, but 1,068 tons of rubber of all grades were imported during the month.

PRODUCTION OF INDIGENOUS SUGAR

The production of indigenous sugar amounted to 20.21 lakh tons up to August 31, 1957, in the current season, as against 18.56 lakh tons in the corresponding period of the last year. The total off-take including quantities despatched for exports, was 18.00 lakh tons. The stocks with the factories on August 31, 1957, stood at 7.54 lakh tons.

That is What?

HAVE not come here" said Mr. Peter Thorneycroft, Britain's Chancellor of the Exchequer, to the Governors of the International Monetary Fund on September 24, "even to discuss the change rate parity of the pound. It stays at 80; nor shall we allow the margins to widen. I stated this before I left London. I repeat it now. The German Government has been equally emphatic that the existing exchange rate of the mark will be held where it now is. Thus the policy on the exchange rate of Germany and the U.K. is definitely determined and that is that." These decisive and, apparently final, words of certainty on the exchange rates of the pound and mark would appear to have been dispelled. It is, indeed, no small gain to be recorded; for the devaluation of the pound, which was greatly feared, would have raised serious problems for us, in particular increasing the burden of our foreign payments, and further depleting the volume of our purchases outside the sterling area. Apart from that it would have thrown a rather sinister shadow over our works, necessitating re-estimation of cost elements in hundreds of projects included in the Plan. In this sense, therefore, the British decision to stay put and even to stand firm is of substantial benefit to this country though it does not, except in marginal

cases, change the basic structure of India's economic problems.

It would be a mistake, however, to see in Mr. Peter Thorneycroft's determination a final answer to the problem of the weakness of sterling in recent years. Part, but only a very small part, of the trouble is in the United Kingdom itself. It is wrong—because it is erroneous in fact—to claim, as many Indian observers have recently done, that the weakness of sterling is the result of a perennial deficit of payments in the U.K.'s domestic account. These critics have ignored the point that Britain has recently balanced her payments and, indeed, except for the Suez period, her own individual account has shown a strong and even a bullish character. While, undoubtedly, the British Welfare State and the absence of wage restraint in that country put pressure upon the pound, that pressure has not in recent years been the main reason for the continuing weakness of sterling. It is undoubtedly because the rest of the sterling area, at one time the builder of balances, has now turned spender; it would be unfair to assume that heavy drawing by India has not played a substantial part in the weakness of sterling against the dollar and the mark.

Blind Justice?

This is not to argue that these drawings are in any way unjustified in principle, as distinguished from incorrect phasing of withdrawals. The economic development of India—as, indeed, of other under-developed countries—cannot be postponed. It is no argument to present to under-developed countries to assert that, because they are part of a currency area, they must necessarily exercise perpetual restraint. There are serious political consequences, as Mr. Krishnamachari has pointed out this week in Washington, of the failure to develop at all. Advanced Western countries which do not face the political perils of violent instability can afford to build balances by curtailment of imports. This is not substantially the case with India, Pakistan and Ceylon at the present time. While, therefore, it is true that these countries are all instruments in the weakening of sterling, their predominant political problems make it inevitable that they should act, more or less, as they have done in the last two years. It is this factor and not the absence of restraint in Britain which reduces the degree of finality which Mr. Thorneycroft has sought to present in Washington. The character of both political and economic pressures in the under-developed countries (inside and outside the sterling area) implies that these countries are likely to run adverse balances of trade for many years to come. If these adverse balances of trade are not made good by grants or payments from other sources, including private foreign investment, there will have necessarily to be a withdrawal of capital balances wherever they exist. So far as India and Pakistan are concerned, it seems extremely likely that within the next five years they will run their sterling balances down substantially. This is not a matter of choice if the foreign lending of the world does not permit of current imports being paid for outside our sterling account.

How far will the pattern of exchange rates at the present time withstand this weakening of sterling which it seems must continue over the next few years? Thus Mr. Thorneycroft's assurance is surrounded by a substantial margin of speculation. The fact that sterling has stood withdrawals so well in the last eighteen months is not conclusive. During the last eighteen months, India's heavy drawings were, in substantial part, compensated by Australia's accumulation. It does not appear as though, in the very short period, Australia's performance in the current year will permit of an equally substantial offset of India's and Pakistan's withdrawals. Unless, arranged are substantial credits which Britain has additional strain placed upon the sterling area, the maintenance of the \$2.80 parity for the pound may prove more difficult than in 1956-57 even in the absence of speculative moves which, presumably, will exert less pressure now that the pound-parity has been settled and the bank rate is to stay at seven per cent in Britain "for the duration." The question of the future behaviour of sterling is a problem compounded of the Commonwealth's total dollar-mark deficit and the capacity of Britain to keep hot money in London for a substantial period. All that can now be said is that the first round has been won. The second and the third rounds may well prove arduous.

What is also to be said about the rupee as distinct from sterling? The Finance Minister in Washington has been wise to reiterate that no devaluation of the rupee is under consideration.

Serious strain on the rupee is not likely to be felt until the sterling balances are substantially below the £200 million mark, when it is conceivable that bearish movements against the rupee and in favour of the pound might lead to a substantial discount of the pound-rupee rate in free markets. It is not, however, the free market which is of consequence provided India can meet all her commitments. In order, however, to complete the Plan, a further foreign exchange adverse balance of trade of Rs. 700 crores will have to be incurred by 1961. It is clear that without substantial foreign lending we cannot continue to maintain payments when orders exceed the volume of our balances. This underlines the point that the future strength of the rupee is as much in the hands of the United States and Germany who seem to be in the strongest position to lend as it is in our own. The Minister for Finance has stated India's case admirably; it is only necessary to underline the implications of a refusal of the United States and Germany to recognise the international imbalance to which their prosperity has contributed. Germany has shown in recent months the capacity to under-stand her international obligations, both by an advance payment of £75 million to Britain in respect of war reparations and a loan from Germany's Central Bank to the World Bank of another £75 million. There is no reason why this latter loan should not be channelled in part to the under-developed countries to whom the World Bank owes a special responsibility. Again, to the extent that the sterling area by German reparations payments can permit of heavier overseas investment, surely the under-developed countries have the first claim to use these resources. Surely we can argue that our investment plans—the minimum required for the maintenance of stability—should be allowed to proceed without undue checks by the rich on the desperately poor.

In the last analysis, while it is obvious that investment in the world as a whole has proceeded ahead of what might be called a "normal" payments position and investment in some countries will need to be cut back, the answer is not to cut back investment in all countries proportionately. This would merely widen the gap between developed and under-developed countries, and in the end produce the dangerous political instability which economic development has been designed to restrain. While accepting the general proposition that investment is proceeding too fast in the world, we should maintain that the answer must be found in regulating investment so that we do not widen the gap between the developed and the under-developed countries. This can only mean that the rate of investment in the under-developed countries in terms of national income generated must be considerably faster than the rates in developed countries. Since the developed countries have the capital while the under-developed have none, it follows as a logical principle in the regulation of investment that the developed countries will need to cut back their investment substantially more than the inflationary potential which excessive investment has created; this is in order to export more capital to the under-developed countries whose economic progress cannot, otherwise, be adequate to sustain a firm political base on which the world's true prosperity can be built. This is asking for imagination as well as unselfishness on a big scale. Perhaps the real trouble with the world is that it is sadly deficient in both.

WHILE inaugurating the first conference of the State Law Ministers recently in New Delhi, Mr. Nehru criticised both India's judicial system and its judiciary. Had such scathing criticism come from any other leader, it would undoubtedly have shocked enlightened public opinion which, trained in British ways of justice, correctly regards an independent judiciary as the best protector of individual liberty. He characterized the country's judicial system as "belonging to a more leisurely, bygone age"; its real "purpose", he said, was not merely individual justice but keeping "pace with social and economic structure of the society and of the nation". He even went a step further, and condemned unequivocally the judges for "living in an ivory tower, unconnected with social developments and getting isolated from the facts of life". He accused them of "casual" and "perfectly scandalous" behaviour. These remarks were not only uncalled for, but also unfounded.

Encouraged by Mr. Nehru's unkind remarks, the conference decided that a high-power committee should be appointed in each State and at the Centre to review pending cases and all writ applications, and decide whether their perusal by the High Courts was at all necessary. Such a step, it was hoped, would reduce arrears in courts. Whether the proposed procedure was within the purview of the Constitution, no one seems to have given thought to—either because of unnecessary haste or over-enthusiasm.

The anxiety of the Prime Minister, and the Conference, to eliminate the law's delays and to reduce the volume of litigation in the country is, to be sure, understandable. The fact that there should be at present no less than 164,000 cases pending in the various High Courts is regrettable. But Mr. Nehru's attributing the accumulation of this staggering number of cases to "a large number of people, who by some processes in the law courts hold up the working of our laws," is a classic example of over-simplification.

The total impression of Mr. Nehru's speech is, however, rather unhappy. Both the assumptions on which he proceeded to criticise the judiciary are unrelated to facts. The judiciary in India is undoubtedly slow-moving. But speed is not a particular ingredient of justice. Moreover, the large number of writ petitions is surely caused by the large flow of legislation from Parliament and the State legislatures, and the detailed and elaborate nature of the Indian Constitution. In the past one year Parliament alone has passed no fewer than 105 Bills. Legislation at such a pace has necessarily to be hurried, leaving many loopholes for the lawyer. Conflicts between individuals and the State are also bound to arise in these conditions. If the Prime Minister had cared to analyse the pending cases, he would have found that a large number of them originated in either inadequately considered executive decisions or hasty legislation. In such disputes neither the Government policy nor its objectives as they are sanctioned by the legislature are in question. What are in question are the laws, and these are for the judiciary to interpret, not the executive. It is a matter of satisfaction that our judiciary has consistently interpreted the law and the Constitution, and not trespassed into the

ground of policy-making. Mr. Nehru's exhortation to the judiciary to have "a more flexible approach to the laws enacted by Parliament" could easily be construed as a plea to the judiciary to accept *prima facie* the case of the Attorney-General and the Public Prosecutor.

To hold up in this connection the example of the American Supreme Court was also unwarranted. The two Supreme Courts, American and Indian, have had historically to face very different situations and perform different tasks, in practice. The Founding Fathers of America gave a written but very sketchy Constitution. For the Supreme Court this meant, in later years, not merely interpreting Federal and State laws in accordance with the Constitution, but also filling the lacunae in its various Articles. The Supreme Court's "liberalism" was thus, in a way, forced upon it by its historic role, since otherwise the Constitution might have proved exceedingly difficult to work. By contrast, the framers of the Constitution in India have made it extraordinarily detailed. Moreover, while elaborating on Fundamental Rights, they made Constitutional change comparatively easy. Within seven years the Indian Constitution has been amended seven times, some of the amendments drastically curtailing the Fundamental Rights. In these circumstances, it is natural that there should be a spate of writ petitions and that the judges should scrupulously interpret these laws in accordance with the provisions of the Constitution.

Mr. Nehru's recipe for the malady is the creation of administrative tribunals for settling industrial disputes which demand an early settlement to avoid adverse effects on the country's economy. He insinuated that such consideration seldom weighed with "the high judicial authority which sits with dignity, regardless of the crisis in the social fabric". But to seek to constitute such tribunals, outside the jurisdiction of the Supreme Court would be dangerous for the nascent Indian democracy. This bias for administrative tribunals might very well lead in the long run to the supremacy of the bureaucracy and the executive over the rule of law. Moreover, as Professor Sylvester Petro points out in a recent study about their working in America: "Administrative tribunals have only added substantially to the law's delays and instead of liberal expertise they have given us a wooden, pettifogging kind of mechanical jurisprudence." The Franks Committee, in Britain, too was "convinced that an intimate control in matters of law should be exercised by the traditional courts." Adherence to this principle is more, not less, necessary in this country where authoritarian rule and popular dependence on authority are a tradition.

Inexpensive and speedy justice is of course desirable. But the alternative suggested, it seems, would merely undermine individual freedom. Justice should not only be done; it is socially advisable that justice should also appear to have been done. The changes contemplated in the judiciary do not seem to do either. The establishment of administrative tribunals and high-power committees may well lead to cockeyed justice, development ominous and dangerous to democracy.

The Nationalisation of Text Books

ONE of the items on the agenda at the conference held in Delhi this week of State Education Ministers related to the nationalisation of text books. It is difficult to determine from the character of the discussion what action will follow. But it is opportune nevertheless to draw attention to the extraordinary inopportune-ness of the discussion of an item like this at a time when the country is facing a many-sided crisis, of which at least one thing is certain that the country has no resources either in money or in organisation to waste on untried things. The fact that an issue like the further nationalisation of text books could be raised at a time like this for reasons quite unconvincing suggests that the whole environment in which discussion of economic affairs is proceeding is violently ideological, unrelated not merely to the particular problem of education in the country with which this meeting was concerned, but also to the hard economic facts in which education must live and move and have its being.

The argument against nationalisation at the present time of every line of economic activity applies in particular to text books. It is that, when resources are scarce and they already exist in the private sector, it is sheer cussedness to duplicate them in the public sector, creating an additional pressure on resources for the Plan and additional unemployment, the removal of which should be the prime purpose of public policy. Every single case of nationalisation advocated should be judged by the test that it should not create any further difficulty for the Plan and any additional unemployment in the country as a whole. It will be impossible to contend in the particular case of nationalisation of text books that this is the case. Quite apart from these major considerations, there is the issue of the capacity of the public sector to deal in a line of business which is highly specialised, and in which its record at the present time has been dismal and disappointing. Not, indeed, that the whole of the private sector in this respect is good. There are deplorably bad private publishers as well as deplorable public ones. But on the whole, the number of good publishers in the private sector is large enough to encourage the belief that with some imaginative assistance and a little additional finance, they could meet the country's needs over the next five years, at least with relative satisfaction to the country and the education authorities in particular.

Many publishers are also booksellers so that the only way of tackling the problem would be to regard publishing as an instrument in establishing a sound book trade. Comparison with the highly organised book trades abroad shows that where the Indian book trade is lacking is in organisational and financial resources. The immediate need is to help in reorganisation of the existing book trade in India, a process which would involve the Government in little more than bringing the leading publishers together, giving them close contact with and advice of the educational needs of the country, pointing out to them, and helping them to overcome, difficulties in distribution and, finally, in rigidly suppressing the insidious growth of factors such as corruption and nepotism which, much to the distaste of the best in publishing, are being allowed, over

and over again, to put bad publishers in business instead of driving them ruthlessly out. Gresham's law certainly applies in the book trade; bad publishers are tending now to drive out good. Corruption is often the instrument of this evil deed.

The cry everywhere is for cheaper and cheaper text books while costs are rising. Costs are aggravated by Government action such as increases in excise duties on paper in successive years, the highest bookpost rate in the world, and steep railway freight charges. The acute shortage of production of paper in this country is the result of severe restriction and excessive taxation on imported paper. A publisher is unable to obtain newsprint for cheap publications which is so badly needed; only newspapers can get it. The import duty brings up the price of both imported and Indian produced paper to a level higher by about 20 per cent than in Britain and America. The State Governments still want to charge sales tax on all books including some States' text books.

Thus, while the cry for ever cheaper text books exists, everything is being done to make them more expensive. Unless more can be spent on production, they cannot possibly be better and the result of the money squeeze is to produce a drab uniformity at a low, and falling, level. In most countries abroad, a wide range of choice is given to the teacher so that he may choose the best money's worth as well as the best educational value for his students. Teachers of slow pupils can choose a book with a different approach from more difficult books intended for brighter pupils. In India he is pinned down to a choice made by a committee which frequently selects and prescribes books irrespective of their real merit.

The only way to bring the Indian book trade to a state of reasonable good health will be to do away with the present system of complete and crippling monopolies, and introduce instead a system reasonably competitive. Instead of prescribing one book for one State in one class, any reasonable number of books, provided they come up to the standards required, should be approved. Where large projects involve investment of sums of money beyond the resources of any one private publisher, the Government should provide a sympathetic and helpful response.

The right kind of conference, so much needed at present, is one of publishers and booksellers either individually or through their associations, with supporting delegations from Central and State Education Departments. A start has been made in South India with the formation of the Southern Languages Book Trust. It is to be hoped that the National Book Trust will follow the Southern example, but if the National Book Trust is to be the nucleus of a State publishing organisation on totalitarian lines, the country should be made aware at once of the danger of cruel regimentation that is sought to be imposed on the nation's youth. The problem of State monopoly obviously goes far outside the text book trade. State monopoly of text books is a bar to freedom of thought and, therefore, of a fundamental liberty of the Indian people. It is necessary that we should be on our guard; eternal vigilance is the price of liberty.

The Story of Oil--1

As old as time

As industries go, the world's petroleum industry is quite new. Yet even the youngest deposits of crude oil originate from long before the dawn of Man. Scientists say our oldest reserves are more than 50,000,000 years old.

In prehistoric times much of what we now know as dry land was covered by warm seas. Giant trees and jungle plants and countless millions of tiny marine creatures flourished on the edges of the swampy, shallow waters. Their remains, when they died, fell to the bottom of the sea and were buried in layers of sediment.

As age upon age went by the original sea floors were folded or broken by tremendous movements of the earth's crust. Mountain ranges were pushed up. Parts of the earth cracked and slipped down

to become valleys and basins. Tidal waves invaded the land to form new seas. Old seabeds emerged as new continents.

These conditions—massive sedimentary deposits, decaying organic matter and gigantic earth movements—produced the crude oil we know today. The locations of the old seabeds are now fairly well known. They occur in almost every region of the world.

Parts of the continent of India have these marine sedimentary rocks beneath them. The waves [of ancient seas once rolled over Assam, and here, close to the growing Himalayan and Naga ranges, the oil-pools of Digboi and Nahorkatiya began forming many millions of years ago.

Assam Oil

A full-scale petroleum industry

This is one of a series of informative advertisements about the petroleum industry.

Plan for Progress

People's Prosperity

Fields swaying  with golden corn, tall chimneys

spouting smoke, flowing waters generating power, and a network of

roads, railways and airways linking  remote distances are

today creating new opportunities for a richer and fuller life for the

Indian people. By the end of the Second Five Year Plan 

the total national income will have risen by 25% and the per

capita income, by 18%  Textile Machinery Corporation

Limited is proud to play its part in this mighty adventure of

bringing plenty, prosperity and happiness  to the people.

A pioneer in many fields of engineering, it supplies industry,

railways and river valley projects with a wide range of equipment.

geared to our better tomorrow

TXC-14

THE WEEK'S NOTES

THE CALCUTTA BANK STRIKE

AN ANOMALOUS situation has arisen owing to the action of the Calcutta bank employees in going on strike from September 18. This situation has now taken a critical turn because of legal technicalities. In view of the great hardship which the strike is imposing on the community in that city it is expedient that all efforts must be made to restore normal working of banks.

The Bengal Provincial Bank Employees Association has made a demand that in view of the large increase in the prices of food grains and other essential commodities in Calcutta city an ad hoc increase of 25 per cent in pay should be made by way of allowance. Bank employees maintain that the additional allowance is in the nature of a compensatory allowance. The present position about the increase or decrease in the allowance payable to bank employees is governed by the Gajendragadkar Award. This Award provides that in case the All-India average consumer price index for the working class for the half-yearly period ending on June 30 or December 31 rose by 10 per cent above 144 (base 1944=100) the allowance should be raised in the prescribed ratios in the subsequent half year. The same rate of reduction in the allowance would be applicable in case of a decrease in the consumer price index on the same basis. To make the position sure, the Government of India referred for opinion to Mr. Salim M. Merchant, a member of the Labour Appellate Tribunal, the question whether compensatory allowance is covered by the Gajendragadkar Award. If it is covered, the Bank employees have no case for an increase because the consumer price index for the relevant period has not increased by 10 per cent. If the interpretation is that compensatory allowance is not covered by this Award, then it is open to bank employees to agitate the point. It then becomes a point of dispute and in the ordinary course the first step to be taken should be reference of the dispute for adjudication.

The Indian Banks Association, Calcutta, and the Calcutta Exchange Banks Association approached the Regional Labour Commissioner, after their attempts for settlement failed, with a request to refer the matter to a labour tribunal or court of enquiry. What is embarrassing, however, is that the Regional Labour Commissioner declined to grant the request on the ground that a reference was pending before Mr. Merchant for his opinion. On a technical objection raised on behalf of the employees, the reference before Mr. Merchant has been postponed until October 16. The reasons why it is postponed until this date are not clear, but surely it is an inordinately long postponement considering the urgency of immediate restoration of normal working of banks. Technically, Mr Merchant's pronouncement will not amount to a decision of the Appellate Tribunal. Whichever party is aggrieved by his expression of opinion will be competent to take up the dispute in the proper forum. In these circumstances it was really anomalous that the request of the two Banks' Associations should have been turned down. Feverish efforts at the ministerial level are being made to bring about a settlement. It is to be trusted that they will bear fruit, failing which reference of the dispute for enquiry will be the only course left open and that will put an end to the stoppage of work. As we go to Press the Government has referred the dispute for adjudication which makes the strike illegal.

THE ECONOMY DRIVE

THE GOVERNMENT of India has become or is stated to have become "economy-conscious" of late. This, to some, may seem too good to be believed. It is true

an 'Efficiency Committee' has been functioning for some time to examine the quantum of work with different government officials, and an 'economy drive' has been initiated recently to effect all possible savings in expenditure on administration. The results to date do not, however, appear to be heartening. According to the latest statement of the Prime Minister in the Lok Sabha, the measures taken by the Central Government are likely to result in a saving of Rs 21 crores only during the current financial year. The measures include postponement or abandonment of certain projects, the abolition or keeping in abeyance of certain posts and curtailment of other expenditure.

A break-down of this saving shows that as much as Rs. 8.7 crores is accounted for by the postponement of orders for electric coaches for the Calcutta suburban sections while the saving resulting from the postponement of construction of office buildings for different railways and of the oil drilling programme for 1957-58 is Rs 2.2 crores. It is not known how much can be saved by abolishing some posts and by not creating some others. Any tangible economy in this direction would be very difficult to achieve in the face of the administrative bureaucracy's innate propensity to expand and of its proved disinclination to contract. The scope for economy in civil services may be theoretically enormous and the Prime Minister's remark that 50 per cent of the junior staff could be retrenched without impairing efficiency need not, therefore, be disputed.
