OTTO T. MALLERY

1881-1956

Otto Tod Mallery, oldest in point of service of the members of the Board of Directors of the Academy, was killed by an automobile as he was walking in front of his home, on December 16, 1956.

Mr. Mallery was born in upstate New York in 1881, and was educated at Princeton and Columbia Universities and the University of Pennsylvania. Throughout his long and active life he was associated with more than a score of governmental, civic, and industrial agencies. At the time of his death he was President of the world-wide Interdependence Council and Chairman of the Board of the National Recreation Association. In previous years he had been President of the Philadelphia Public Education Association and had served on the Philadelphia Charter Commission. He had served as consultant to the President's Conference on Unemployment, the National Resources Planning Board, and the International Labor Office. Also, he had been a staff member of the National Youth Administration, the War Department, and the Department of Commerce.

These and many other associations, and his wide-ranging writing in the fields of industry and finance, illustrate the scope of his interests and his versatility. The Academy had been the beneficiary, since 1918, of his informed counsel and his restless energy.

FOREWORD

During the past decade we have seemed to be "more afraid of what man will do with nature than of what nature will do with man," and this changed emphasis has helped obscure the fact that during the last decade as many major natural disasters have occurred in this country as in the preceding four decades. Nevertheless, in recent years the human and economic consequences of major disasters and of the several hundred lesser disasters that occur here annually have increasingly come to be recognized as a matter of vital national concern. The possible impact of natural disasters on readiness for war has influenced thinking, as has the hope that measures of prevention, preparedness, prediction, and relief incident to natural disaster might be organized and co-ordinated in a way that would contribute significantly to an essential preparedness for enemy attack.

The intent of this volume of *THE ANNALS* on natural disasters and disaster relief is to increase understanding and sharpen thinking by bringing together for the first time a broad review of the physical characteristics and the human and physical consequences of natural disaster; the nature and scope of the truly far-reaching, complex, but well-co-ordinated efforts of government in preparation and avoidance, recovery and restoration; and the widespread but specific and detailed voluntary preparedness, relief, and rehabilitation measures; together with one or two examples out of recent experience in applying the plans and measures to acute major disaster situations.

Although many of the articles were written by those directly involved in administrative or other professional capacities, it is certain that if any objectivity was sacrificed it has been more than compensated for by the intimate knowledge and concern of those contributing. Each author is of course entirely responsible for his general treatment of the subject and for the facts and points of view presented.

Some common threads appear repeatedly throughout the studies and analyses: What basic principles can be identified, delineated, and observed? How does the actual disaster hazard as revealed through experience over the years compare with the existing theoretical potentiality? What are the strengths and weaknesses of the current practice of equating natural disasters with situations created by enemy attack, and what are the specific similarities and differences? Recognizing how far-reaching, carefully co-ordinated, and meticulously detailed present planning is, what are the principal aspects that require further and continuing realistic study and practical action?

To me the most impressive single fact about this volume is that it shows the extent to which thought and action are being directed at many levels, by many agencies and persons, and in a wide variety of ways to minimizing the human suffering and material loss that are the inescapable aftermath of natural disaster.

DEWITT SMITH

Physical Characteristics of Disasters: Historical and Statistical Review

By HOYT LEMONS

Abstract: The article presents data on nature, incidence, causes, and consequences of peacetime disasters. Disasters tend to become more and more deleterious as population increases and occupies the wide expanse of the country. A map indicates that coastal areas and the "midlands" are most exposed. Detailed analysis is made of fires, floods, hurricanes, tornadoes, tropical storms, earthquakes, hailstorms, thunderstorms, and winter storms. Analysis of American Red Cross records, 1925-55, is made, showing disaster effects by month, type of disaster, and state. Statistics are offered on the number of dead and injured, homes wrecked, and number of families involved.—Ed.

EACH day's news tells of explosions, wrecks, storms, and a variety of other "accidents" in which there are injuries, fatalities, and property damage. The sum total of loss from these occurrences in a year's time reaches staggering proportions. Obviously, not all such occurrences are of serious enough import to be classed as disasters. In 1955 there were 25,000 fatalities due to highway and domestic carrier accidents, yet accidents with four or fewer deaths each accounted for 23,500 of the total.¹ In a given year there are two million separate fires, causing a total loss of one billion dollars, yet in 1955 there were only 325 fires involving losses of \$250,000 or more each. When natural or man-made forces concentrate destructive forces in limited and inhabited areas, killer disasters are apt to occur. It is the intent of this article to present background material on the nature, incidence, causes, and consequences of the nation's disaster-type phenomena. Where data per-

mit, disasters, as such, are treated. In this discussion, the emphasis is naturally oriented toward deleterious happenings. The reader is reminded, therefore, that the weather is not always bad and that disasters are abnormal, not normal, occurrences.

Peacetime disasters considered according to their origins are of two main types, naturally occurring and man-made. A variety of both types occurs in this country and their deleterious effects—economic, political, and social—are increasing. This trend continues in spite of our best efforts to date with preventive and precautionary measures such as flood and hurricane forecasts, industrial safety measures, and public educational safety campaigns.

DEFINITION AND TYPES

The concept of disaster varies with the kind and degree of "ego involvement" of the person or groups concerned. "Disaster" signifies one thing to the family or community involved, another to the disaster research scientist, and yet another to the government-

Hoyt Lemons, Ph.D., is Assistant for Research, Health Emergency Planning, Office of the Surgeon General, United States Public Health Service, Washington, D. C., and Lecturer in Geography, University of Maryland. He was formerly Research Co-ordinator, Federal Civil Defense Administration.

tal agency or voluntary relief organization which is charged with relief and rehabilitation measures. Webster says: "Disaster implies an unforeseen mischance bringing with it destruction of life or property . . . ; sudden and extraordinary misfortune; a calamity." Berkner has a sophisticated definition—"a disruption in the normal flow of energy that is uncontrolled."² In reference to communities, Powell states:

Disaster means the impinging upon a structured community of an external force capable of destroying human life or its resources for survival, on a scale wide enough to excite public alarm, to disrupt normal patterns of behavior, and to impair or overload any of the central services necessary to the conduct of normal affairs or to the prevention or alleviation of suffering and loss. Usually, the term disaster refers to an episode with tragic consequences to a substantial portion of the population.³

The American National Red Cross holds as follows:

Disaster means a great national catastrophe such as a flood, tornado, or hurricane, and also a sudden extraordinary catastrophe such as fire, explosion, transportation wreck, or similar public calamity in which numbers of persons are plunged into helplessness and suffering.

It would appear, then, that disasters, regardless of how or by whom they are defined, have certain common attributes. They include injury, suffering, and death for several people and damage or destruction to possessions and property. They may be man-made or naturally caused. Emergency situations

² L. V. Berkner, "The Common Aspects of Disasters," an unpublished address given at the American Association for the Advancement of Science Symposium on Disaster Recovery, St. Louis, December 27, 1952.

³ John Walker Powell, "An Introduction to the Natural History of Disaster," unpublished report of the Psychiatric Institute, University of Maryland, 1954.

involving fewer than five families are not recorded as disasters by the Red Cross. Resources within the community, if properly co-ordinated and utilized, are usually adequate for meeting the relief needs of fewer than five families. When the Red Cross does extend relief in such situations the activity is recorded as "emergencies involving fewer than five families."

There is no commonly accepted categorization of disasters, although they are ordinarily typed by the primary cause, whether natural or man-made. For operational purposes the Red Cross recognizes the following types: hurricanes; tornadoes; other windstorms; floods; flash floods; all other storms (for example, snowstorms, hailstorms, "cold weather," dust storms, electrical storms); explosions; fires, wrecks (for example, train, ship, airplane, bus); and other disasters (for example, earthquakes, landslides, drought, structural collapse, epidemics).

Some concept of the fatalities caused by disasters of different types may be gained from material prepared by the Metropolitan Life Insurance Company.⁴ Exclusive of military aviation, in the period 1937-46 there were 919 "catastrophic accidents" or disasters, involving 12,987 lives; three fourths of the deaths were attributable to man-made disasters and one fourth to natural ones (see Table 1). About half of the disasters and a third of the deaths were due to transportation, with about 30 per cent of the disasters and of deaths due to fires and explosions. In 1955

such catastrophes were responsible for about 1,500 deaths, some 300 more than in 1954.

CAUSAL FACTORS IN DISASTERS

There are two main elements involved in the ever increasing disaster hazard in the United States. First is the geographic position of the country, which makes it subject to a variety of causes of natural disaster. Second is the nature and trend of human occupation. The growth of population and the more widespread use of land make man, his works, and his society more vulnerable to natural disasters by increasing the number and size of targets for disaster forces. At the same time, these factors generate more opportunities for man-

made disasters. Generally stated, causes for the nation's disasters, both natural and man-made, stem from its physical geography and human occupation.

Physical geographic factors

The more important physical geographic factors of the country which give rise to natural disaster-producing phenomena include large size (3,020,387 square miles); large range of latitude (25° to 49° N. lat. approximately), allowing influences from both tropical and Arctic areas; weather and climate, including location in the westerly wind belt with its cyclonic storms; proximity to tropical hurricanes; extensive areas of forests and wild lands; lengthy rivers and coastlines with vast areas of flood

plain, delta, and coastal plain lands; the predominant low relief of the interior; and presence of earthquake-producing "faults" in certain places. Of all these, climate and weather are most significant.

Although popularly termed "temperate," the climate is, in actual fact, "intemperate," being predominantly continental and characterized by hot summers and cold winters and various deleterious phenomena in the different seasons. Low relief in the interior makes for ease of invasion by cold dry polar air masses from the north and warm moist tropical air masses from the south. Interactions of these masses in the form of cyclonic storms or of "lows" and "highs" and their attendant "fronts" are the prime causes of thunderstorms, hailstorms, and tornadoes in late winter, spring, and early summer. The Great Plains and adjacent areas, being of low and variable precipitation, are subject to disastrous droughts in summer. Late winter, spring, and early summer are the periods of precipitation for most of the country (fall and winter on the West Coast). During these periods, particularly with a coincidence in snow melt, runoff frequently overburdens streams and produces floods. The Southeast is in low latitude and in close proximity to a major source of tropical storms, several of which impinge on the coastal areas of the Gulf and Atlantic Coast states each year.

It may be concluded, therefore, that physical geographic factors give rise to a variety of natural disaster producers in the different regions of the country, particularly the "midlands" area, and in the different seasons of the year, especially from spring to fall.

Human occupancy factors

Man, directly and indirectly, plays a vital role in causing disasters. As his

numbers increase,⁵ as further encroachment is made on flood plains and coastal plains, as urban centers expand, and in general as industrial society increases in complexity, disasters and disaster effects increase. "Targets" become larger, more numerous, and more susceptible to tornadoes, hurricanes, floods, and other natural forces. Further, an increasingly complex society itself produces more explosions, fires, smog, traffic accidents, and other catastrophic incidents. Fatalities and property damage resulting from traffic accidents illustrate this. For the eleven-year period 1945-55, more than 216,000 passengers died as a result of accidents in automobiles and taxis, buses, domestic air carriers, and railways.⁶ Fatalities approximating 13,000 in 1945 reached 25,000 in 1955, almost a 100 per cent increase. In 1955 there were 8,716 train accidents, resulting in only 259 fatalities and 1,183 injured (passengers plus workers), but a total property damage of \$48,143,403.

It is apparent, then, that a large and increasing population, farmlands, industry, urban areas, and transportation and communications networks provide excellent "targets," in most parts of the country, which are susceptible to "attack" by the forces of nature. In addition, human occupancy and activity produce a variety of their own, or man-made, disasters.

AREAL AND TEMPORAL DISTRIBUTION OF DISASTERS

Figure 1 indicates the principal disaster areas of the nation. Of particular note are the following: the area com-

⁵ Current population is estimated by the Bureau of the Census to be 168,000,000 (estimated at 168,361,000, August 1, 1956), and is increasing at a rate of 2.5 to 2.8 millions per year. It is estimated that it will be well over 200,000,000 by 1975.

⁶ For sources see note 1 *supra*.

FIG. 1. INCIDENCE OF DISASTERS IN THE UNITED STATES

prising the Midwest, the Great Plains, the South, and the Southeast is subject to a variety of natural disasters at all seasons, but especially in spring and summer, and to man-made disasters the year round; Gulf and Atlantic coastal areas are subject to natural disasters particularly in spring, summer, and fall and to man-made ones in all seasons; the Northeast is subject to both natural and man-made disasters in all seasons; and the West Coast also is subject to both natural and man-made disasters in all seasons.

MAJOR TYPES OF DISASTERS

Increasingly disastrous fires in the United States in the last hundred years have caused losses of life and property exceeding those for any similar period for any country in world history. Further, the problem grows in magnitude; for example, in 1930 losses from all fires approximated 500 million dollars and

6,000 lives; in 1955, 1 billion dollars and 12,000 lives.⁷ While most individual fires do not result in disasters, fire is one of our foremost disaster producers. During 1955 some 325 fires produced losses of \$250,000 or more each.

It is estimated that there are 2,000,000 individual fires of all kinds in a year, causing total loss of 1 billion dollars; only 40 per cent of all fires occur in buildings, yet they produce some 85 per cent of all losses⁸ (see Table 2). Most of these fires originate in homes, the principal causes being smoking and matches, electrical wiring and appliances, and heating and cooking equipment. The remaining 15 per cent

⁷ "Fire Protection Developments in 1955," *Quarterly of the National Fire Protection Association*, Vol. 49, No. 3 (January 1956), p. 201.

⁸ "Fires and Fire Losses Classified, 1954," *Quarterly of the National Fire Protection Association*, Vol. 49, No. 2 (October 1955), p. 186.

(approximate) of fire losses are of non-building-type origin, for example, aircraft, motor vehicles, forests, and rubbish. More building-type fires occur in winter than in summer, owing to winter heating of homes and other buildings. The predominance of forest and wild-land fires in the warm season is due to the dryness of the areas and the presence of tourists and hunters, and also to other causes. Some examples of "peak fire seasons" in forests and wild lands for selected states are: Idaho, June 1 to September 30; Colorado, July 1 to September 15; northern California, June 10 to October 10; New England states, April 20 to June 30 and October 1 to November 30; North Carolina, February 20 to May 20, and October 10 to December 10.⁹

For the five-year period 1951-55, there was an average annual occurrence of 165.8 thousand forest and wild-land fires, burning 10,334,000 acres and caus-

⁹ Source: A. A. Brown, Division of Forest Fire Research, U. S. Forest Service.

ing damage of 90.4 million dollars. States of the south, southeast, and central areas together with California ranked highest in acreages burned and damages sustained.¹⁰ During an eighteen-day period in late August and early September of 1955, forest and watershed lands of California were subjected to unprecedented losses by wild fires. Preceding months had had below normal precipitation and vast areas were dangerously dry far earlier than usual. A total of 436 fires resulted; 377 were man-made and 59 naturally occurring.

Floods

Floods are a major source of disasters in this country. A normal, not an abnormal, part of the laws of nature, they occur throughout the country and follow the seasons with regularity. They are not increasing in magnitude or frequency, yet damage

from them is increasing to such an extent (estimated 40 per cent increase since the first of the century)¹¹ that they may be termed a menace to our national welfare, because man's utilization of flood-susceptible areas—rivers, flood plains, delta lands and coastal lands—is outstripping preventive measures. The destructiveness of floods results from the mechanical force of the water and of the debris which it carries, from the dirtiness of floodwaters as well as their wetness, and from the strong winds and ice jams which sometimes accompany them.

Floods are frequent in winter and early spring on the Pacific Coast, and in southwestern and southeastern states because of the heavy precipitation that results from the cooling of warm, moist, tropical air masses. Spring rains, plus the melting of snow in the mountains of the West and in northern states and occasional ice jams in streams, bring high flood incidence to the rivers which have headwaters in those areas, for example, the Columbia, the Colorado, the Missouri, the Mississippi, the Ohio, and the Susquehanna. Throughout the summer, sporadic and localized floods due to heat and orographic thunderstorms may be expected in most parts of the country, except the West Coast. The Gulf and Atlantic Coasts are subject in late summer and fall to floods due to hurricanes and other tropical storms. The record of flood losses indicates clearly that the major stream and hurricane floods account for the bulk of flood damage.

Land subjected to flooding in the United States has been estimated at fifty million acres—2.5 per cent of the nation's land area; some ten million people, 6.5 per cent of the population, occupy these lands and hence are subject to flooding. This population den-

sity on flood plains is judged to be more than twice the national average.¹²

Flood losses are of two sorts: direct losses in which property or human life is wholly or partially destroyed and indirect losses in which community or other services are impaired and there is social dislocation and distress, and psychological and traumatic effects to individuals, families, and groups. Indirect damage may be categorized as follows: urban (damage to industrial plants, stores, residences, and so forth); highway and railway (damage to bridges, roadbeds, goods in transit, and so forth); public and semipublic (damage to schools, churches, theaters, and so forth); utilities; and agricultural (damage to farmland, buildings, equipment, crops, and so forth).¹³

Weather Bureau records indicate 95 disastrous floods from 1902 through 1955, at least one occurring in almost each year of the period. There were five in both 1955 and 1954. Average annual property loss due to floods in recent years approximates 500 million dollars.¹⁴ Weather Bureau records indicate total property loss for the thirty-two-year period 1924-55 as almost 5.5 billion dollars, and average annual loss as 170 million dollars. During the last five years, however, the average annual loss has been close to 500 million dollars. Monthly rankings and total losses (1924-55) are as follows: July, \$1,127,021,461; April, \$887,145,258; June, \$678,455,791; May, \$555,483,887; January, \$492,205,581; and March, \$327,182,878. In 1955, August had a total damage of \$686,516,000 and December, \$103,744,000. There were

¹² *Ibid.*, pp. 12-13.

¹³ *Ibid.*, p. 78.

¹¹ William G. Hoyt and Walter B. Langbein, *Floods* (Princeton, N. J.: Princeton University Press, 1955), p. 88.

2,743 lives lost through flood action (1924-55), with an annual average loss of 86. In 1927 there were 423 fatalities. In recent years loss of life from floods has been relatively low except for 1955, when it totaled 296.

Property damage, considered for the country as a whole, is about equally divided between farm and nonfarm categories, aside from miscellaneous and unclassified types:¹⁵

AREAS OF DAMAGE	PER CENT
Rural.....	32
Urban.....	18.5
Transportation and public utility.....	12.5
Miscellaneous and unclassified.....	37
Total.....	100

However, the situation varies in the different regions of the country. In the Great Lakes and St. Lawrence regions, losses to urban property are foremost, whereas in the North Atlantic and New England areas, losses to railways, highways, and public utilities are somewhat higher than urban losses, as is the case also in the Ohio Basin and on the West Coast. Elsewhere, losses on farms account for more than half of total flood damage.

The East sustains the greater proportion of the nation's flood damage, some 40 per cent of the total occurring in the Ohio Basin and in the Northeast.¹⁶ The Ohio Basin has more damage than any other single river basin in the country. The Missouri Basin and the drainage basins of the West Coast are the principal areas of flood damage west of the Mississippi River.

Hurricanes and tropical storms

The term "tropical storm" refers to a tropical cyclone. If accompanied by winds exceeding seventy-five miles per hour such a storm is generally termed

¹⁵ Hoyt and Langbein, *op. cit.* (note 11 *supra*), p. 82.

¹⁶ *Ibid.*, pp. 82-83.

"hurricane." In this hemisphere, "West Indian" hurricanes and other tropical storms frequently produce extensive damage to property and injury or death to people, as a result of the high winds, heavy seas, and rain and floods which they bring. Gulf and Atlantic Coast states form the hurricane and tropical storm regions of the country (Fig. 1). Since the first of the century, coastal areas of these states as far north as Massachusetts have sustained major destruction from tropical storms ten to fifteen times, and southern Alabama and Florida and the coastal areas of North Carolina, fifteen to twenty times.¹⁷ Inland areas of these states are also affected but to a lesser extent.

Weather Bureau records indicate recent increases in numbers of tropical storms and hurricanes affecting this country.¹⁸ For the past sixty-nine years (1887-1955) there has been an average of four a year; for the past thirty years, five a year; and for the past ten years, seven a year. The greatest number in any one year was eleven in 1950. The period of August through October constitutes the principal season for hurricanes and other tropical storms in this country. The average life of a hurricane is about nine days; those of August average twelve days; and those of July and November, about eight days.

For the forty-one-year period 1915-55, a total of 142 tropical storms (including 78 hurricanes) produced in this country approximately 3 billion dollars of damage and 4,863 deaths, or a yearly average of about 71 million dollars and 119 deaths. In the past twelve years, yearly damage, averaging about 186

¹⁷ *Federal Disaster Insurance* (cited note 14 *supra*), p. 128.

¹⁸ U. S. Weather Bureau, *Notes on Hurricane Habits and Habitats*, L. S. 5504, Revised June 1, 1956 (Washington, D. C.) and *Summary of Tropical Storm and Hurricane Occurrences, 1915-1955*, L. S. 5604, Revised May 1, 1956 (Washington, D. C.).

million dollars, has more than doubled, probably because of the increased value of property subject to tropical storms, while deaths, averaging 47 per year, have dropped as a result of better warnings.

In years past, the death toll from hurricanes has at times reached catastrophic numbers; for example, in 1900, 6,000; in 1915, 550; in 1928, 1,836; in 1935, 414; and in 1938, 600.

Tornadoes

Although small in size compared with hurricanes, tornadoes are highly destructive of life and property and occur in greater numbers in this country than anywhere in the world. They have been reported in all states, although they are of serious occurrence only east of the Rockies, specifically in the central and southern Great Plains and portions of the Midwest and South (Fig. 1). An occasional one brings disaster to the East and Northeast when it strikes a large city, for example, the Worcester, Massachusetts, tornado disaster of June 9, 1953.

Tornadoes occur in all months but are most frequent in spring.¹⁹ Monthly distribution is as follows: 68 per cent, March through June; 21 per cent, July through October; and 11 per cent, November through February. In those states where they are most frequent they occur at all hours of the day and night; however, 50 per cent of them occur in the afternoon from 2:00 to 7:00 P.M.²⁰ In the South the most destructive ones have occurred between midnight and nine o'clock in the morning.

Early in the year tornado activity begins near the Gulf of Mexico and advances northward as the season progresses. In March maximum activity is

in northern Mississippi and adjacent areas; in April, in western Missouri, northern Texas, Oklahoma, and Kansas; in May and June, at the peak of activity, a zone of activity extends up the Great Plains and Midwest from northern Oklahoma to southern Minnesota, where it remains, diminishing in intensity through the summer and receding southward in the fall. During the hurricane season there is an increase in tornado frequency along the east coast.

Some 8,000 tornadoes occurred in the period 1916-55, an average of 200 per year.²¹ Kansas, Texas, Oklahoma, and Iowa had the most, with average annual frequencies respectively of 26, 21, 18, and 14. During the period 1951-55 there were 2,567 tornadoes, a yearly average of some 513. This apparent recent increase in annual incidence is explained by more comprehensive reporting by the Weather Bureau.

Total property loss for the period 1916-55 was \$824,438,100, or an average yearly loss of \$20,610,952.²² Damage was greatest in 1953 (\$224,345,900). States sustaining greatest loss were Texas, Georgia, Oklahoma, Illinois, Missouri, and Ohio. Over the period, 137 tornadoes caused damages of one million dollars or more each or an average of 3.5 such tornadoes per year, while 931 tornadoes produced damage of \$100,000 or more each, or an average of 24 such tornadoes per year.

There were 8,899 deaths due to tornadoes from 1916 through 1955, giving an annual average of 222.²³ Such fatalities are most frequent in south central United States between western Oklahoma and the Appalachians of Kentucky and Tennessee and between east central Texas and coastal South

²¹ *Federal Disaster Insurance* (cited note 14 *supra*), p. 132.

²² *Loc. cit.*

²³ *Loc. cit.*

²⁰ *Ibid.* p. 54.

Carolina and Georgia. Arkansas, Illinois, Mississippi, Texas, Alabama, and Oklahoma have average annual fatality rates ranging between 25 and 17.

In a study of tornado deaths in the United States for the years 1916 through 1953, Linehan found that four fifths of such deaths occur in the period March through June.²⁴ Further, three fourths of all tornado deaths occur between 1:30 and 9:30 P.M. He concludes that there is a long-term downward trend in such fatalities due primarily to improved Weather Bureau forecasting and warning services.

Earthquakes

Compared with other types of disasters such as those resulting from floods, fires, and hurricanes, earthquake disasters in this country are considered of relatively minor significance. While activity in recent years has centered near the Pacific Coast, the strongest United States quake occurred in New Madrid, Missouri, in 1811 and was felt throughout two thirds of the country.

Major United States earthquake belts exist along the San Andreas Fault in California, the St. Lawrence River valley, and the confluence of the Mississippi and Missouri Rivers.²⁵ Other areas of the country have had earthquakes which caused minor and moderate disasters and nearly all regions receive tremors each year. Earthquakes occur at any time of the year, and pinpoint prediction as to time and place of occurrence is not presently practical. Some areas are obviously susceptible, such as the San Andreas Fault area of California. Figure 1 shows the dis-

²⁴ Urban J. Linehan, "Tornado Deaths in the U. S.," Ph.D. dissertation (unpublished), Clark University, 1953; the U. S. Weather Bureau is preparing a technical bulletin for publication from this manuscript.

²⁵ *Federal Disaster Insurance* (cited note 14 *supra*), p. 140.

tribution of past earthquake disasters and classes them as major, moderate, and minor. A dozen or so major earthquake disasters have occurred in the United States and Canada within the past three hundred years.²⁶ These are as follows:

Great Quebec Earthquake	1663
Great Boston Earthquake	1755
Great New Madrid (Mo.) Earthquake ..	1811
Great San Francisco Earthquake	1865
Great San Francisco Earthquake	1868
Great Owens Valley (Calif.) Earthquake	1872
Charleston (S. C.) Earthquake	1886
Great San Francisco Earthquake	1906
Calexico-Mexicali (Calif.) Earthquake ..	1915
Great Santa Barbara (Calif.) Earthquake	1925
Calexico-Mexicali (Calif.) Earthquake ..	1927
Bakersfield (Calif.) Earthquake	1952

According to estimates of the United States Coast and Geodetic Survey, earthquakes have caused the deaths of some 1,300 people in this country from 1811 to the present, 700 of these occurring in the San Francisco earthquake alone. Moderate to major earthquakes have produced approximately \$300,000,000 in property damage from 1865 to the present. This estimate of damage includes \$90,000,000 of loss in the San Francisco earthquake of 1906 and \$60,000,000 of loss in the Bakersfield earthquake of 1952. The estimate does not include 1.5 billion dollars of loss (in terms of 1950 dollars) as a result of fire damage during the San Francisco disaster.

It has been suggested that California should expect a severe earthquake causing damage once in twenty-five years and New England, a disastrous one in each hundred years.²⁷

Hailstorms

Hailstorms in this country, while not a menace to life, are of serious import

²⁶ John Ripley Freeman, *Earthquake Damage and Earthquake Insurance* (New York: McGraw-Hill Book Company, 1932), p. 98.

²⁷ *Ibid.*, p. 99.

to agriculture. While most states receive visitations of these storms, those of the Great Plains and Central Lowland are most seriously afflicted. The field crop and other property damage which these areas sustain results from the following factors: these areas have the highest incidence of hail (some ten to fifty damaging hailstorms per state annually); they contain the most extensive croplands of the country and the crops are types which are highly susceptible to damage by hail; and the majority of the crops are in the field during the period of high frequency of hailstorms, that is, spring and summer.²⁸

Some 90 per cent of the mean annual loss from hailstorms occurs during the six months of the warm season, April 1 to September 30, June having the greatest damage. Some fifty million dollars or more are lost through crop damage each year. Originating in the Gulf Coast area in early spring, hailstorms develop progressively northward, accompanying the northward unfolding of the growing season. It is not infrequent for a given hailstorm to cause damage of a million dollars or more. In one year Kansas had six different storms each of which caused a million dollars' worth of damage.

Thunderstorms

The common thunderstorm frequently produces damage to local property, because of its high winds and heavy precipitation. It contributes to flash floods and other types of floods, and, by lightning, to forest and wild-land fires. Thunderstorms cause sizable losses each year to electric utilities and communication networks. Many thunderstorms also contain hail.

Thunderstorms are warm-season phe-

²⁸ Hoyt Lemons, "Hail in American Agriculture," *Economic Geography*, Vol. 18, No. 4 (October 1942), p. 364.

nomena. United States Weather Bureau records for the period 1904 through 1943 indicate average annual number of days with thunderstorms as follows: South and Southeast, 60 to 90; East and Northeast, 20 to 40; Midwest and Great Plains, 20 to 60; and the Rocky Mountains and intermontane basins, 10 to 50.²⁹ Few thunderstorms occur on the West Coast.

Winter storms

Tropical storms, tornadoes, and hail and thunderstorms are predominately occurrences of the warm season. In the winter the country is subject to blizzards, glaze storms, and snowstorms. Winter storm disasters occur primarily in the northern and central Midwest and Great Plains areas and in the Northeast, with the northern tier of states most affected³⁰ (Fig. 1). The South occasionally has widespread damage, of disaster proportions, to crops and orchards through invasion in winter of cold air with subfreezing temperatures.

DISASTERS AS REFLECTED IN RED CROSS OPERATIONS³¹

Relief operations of the American National Red Cross reveal significant aspects of disasters—their incidence by months and by states and their effects on people and property. Through the courtesy of the Red Cross, its records were analyzed for the thirty-one-year

²⁹ *Federal Disaster Insurance* (cited note 14 *supra*), p. 137.

³⁰ *Ibid.*, pp. 134-35.

³¹ For the data used in this section, and much of its preparation, the author is indebted to the American National Red Cross, and particularly to its staff members and offices as follows: Chester Whelden, Jr., Burton L. Quigley, and Hilda M. Seal, all of the Office of Research Information; the Office of Machine Records.

TABLE 3—EFFECTS OF DISASTERS^a BY MONTHS: RED CROSS EXPERIENCE, 1925–1955

MONTH	NUMBER OF FATALITIES	NUMBER OF INJURED	NUMBER OF FAMILIES SUFFERING LOSS ^b
January.....	1,483	7,184	133,121
February.....	1,298	5,819	205,661
March.....	3,667	20,915	301,124
April.....	3,156	14,981	217,007

December.....	1,269	7,691	73,236
Total.....	23,244	134,222	2,177,548

^a Includes disasters of ten types: hurricanes; tornadoes; other windstorms; floods; flash floods; all other storms (e.g., snowstorms, hailstorms, "cold weather," dust storms, electrical storms); explosions; fires; wrecks (e.g., train, ship, airplane, bus); other disasters (e.g., earthquakes, landslides, drought, structural collapse, epidemics).

^b Includes all families suffering loss in "Red Cross disaster areas" regardless of whether they received Red Cross assistance.

period 1925 to 1955, and the findings form the basis for the discussion which follows. These records include only those disasters in which the Red Cross has participated in relief operations. The Red Cross groups disasters into ten types, including both natural and man-made ones.³²

Disaster effects by months

Table 3 indicates that for the period 1925–55, a total of 2,177,548 families suffered loss³³ and 23,244 people were killed and 134,222 injured in the various disasters in which the Red Cross

³² Hurricanes; tornadoes; other windstorms; floods; flash floods; all other storms (e.g., snowstorms, hailstorms, "cold weather," dust storms, electrical storms); explosions; fires; wrecks (e.g., train, ship, airplane, bus); other disasters (e.g., earthquakes, landslides, drought, structural collapse, epidemics).

³³ It is known that because of variations in reporting requirements and practice the figures for families suffering loss in the first ten or twelve years of this period are incomplete by a considerable margin.

was active. These disaster effects were well distributed in all twelve months, although effects were greater in the months March through May, and August through October. August was first and March second in total numbers of families suffering loss. September was first and March second in both number of persons killed and number injured.

For the period 1925–55, high lights of disaster effects by months are as follows: September had the highest total of dead (3,375) and injured (12,535) from hurricanes, but August the highest for families suffering loss (230,533). March was highest in fatalities (2,025) and injuries (12,920) resulting from tornadoes, with April the highest in numbers of families suffering loss (39,991). November was first with fatalities (66), injuries (509), and families suffering loss (50,109) from "other windstorms." March was first in total fatalities (484) and number of families suffering loss (224,585) from floods, with December first in total number injured (4,410).

August was first in fatalities (228), injuries (8,597), and families suffering loss (47,226) from flash floods. With "other storms," February was first in total fatalities (50), and January first in number injured (907) and families suffering loss (34,749). March and April were about the same in total fatalities resulting from explosion (approximately 730), with April first in total injuries and May first in total numbers of families suffering loss in such disasters. April was first in fatalities resulting from fire (709), although November approached it with 604 fatalities. September was highest in injuries from fire (4,509) and December in number of families suffering loss from fire (6,041), although all months were high in this respect, with the months from September through March approaching this figure. Fatalities from wrecks were highest in November (455), as were families suffering loss (3,407), although injuries were highest in February (1,338). Fatalities from "other disasters" were highest in March (97), and total injured highest in September (5,035), with

March also approaching that level (4,967), while January was first in number of families suffering loss (5,432).

Disaster effects by types of disaster

Table 4 summarizes effects from ten types of disaster from 1925 through 1955. Floods ranked first and hurricanes second as causes of families suffering loss, the former affecting more than a million families and the latter more than one-half million. For number of people killed, tornadoes with 6,117 fatalities ranked first, explosions with 4,288 fatalities second, hurricanes with 3,644 fatalities third, and fires with 3,289 fatalities fourth. For injuries, tornadoes (46,681) ranked first, fires (16,433) second, floods (16,098) third, and hurricanes (15,516) fourth.

Table 4 also indicates rankings of disaster types as to property damage and destruction. For the thirty-one-year period, the disasters of all types brought destruction to 97,763 homes and damage to an additional 1,111,523 ones. Further, they resulted in destruction to 221,883 and damage to 629,317 build-

TABLE 4—DISASTER EFFECTS BY TYPES OF DISASTER: RED CROSS EXPERIENCE, 1925–1955

TYPE OF DISASTER	NUMBER OF FATALITIES	NUMBER OF INJURED	HOMES		OTHER BUILDINGS ^a		FAMILIES SUFFERING LOSS
			Destroyed	Damaged	Destroyed	Damaged	
Hurricanes.....	3,644	15,516	23,200	324,259	44,979	161,946	552,111

^c Earthquake, landslide, drought, structural collapse, epidemic, etc.

ings other than homes.³⁴ Tornadoes were first in homes destroyed (31,094), floods second (29,608), and hurricanes third (23,200). Floods were first in homes damaged (492,823), while hurricanes were second (324,259) and tornadoes third (93,510). With destruction of buildings other than homes, floods were first (90,022), tornadoes second (70,557), and hurricanes third (44,979). With damage to buildings other than homes, floods were also first (316,664), hurricanes second (161,946), and tornadoes third (80,047).

Disaster effects by states

States ranking highest in effects sustained from the various types of disasters for the period 1925-55 are as follows: Hurricanes—Florida with 2,800 fatalities, 9,419 persons injured, and 136,503 families suffering loss; tornadoes—Illinois with 756 fatalities and

³⁴ Includes barns, apartment houses, business structures, public buildings, etc.

Texas with 5,019 injured and 21,426 families suffering loss; "other windstorms"—New Jersey with 30 fatalities and 350 injured and Texas with 16,710 families suffering loss; floods—California with 417 fatalities and 5,629 injured and Kansas with 105,492 families suffering loss; flash floods—Pennsylvania with 96 fatalities and Connecticut with 5,136 injured and 19,665 families suffering loss; "other storms"—Utah with 40 fatalities, Nebraska with 408 injured, and Texas with 36,923 families suffering loss; explosions—Texas with 827 fatalities and 2,054 injured and Nevada with 4,679 families suffering loss; fires—Massachusetts with 600 fatalities, California with 6,388 injured, and Illinois with 6,891 families suffering loss; wrecks—New Jersey with 368 fatalities, Ohio with 763 injured, and New York with 3,261 families suffering loss; "all others"—California with 144 fatalities and 5,268 injured and Wyoming with 4,000 families suffering loss.

Floods

By SAMUEL DAVIS STURGIS, JR.

Abstract: Floods can occur in almost any river valley at almost any time. They are unpredictable. Flash floods and the sudden failure of dams and other structures offer the greatest threat to life; major sustained floods are most threatening to health. The average annual potential damage to property is estimated at nearly a billion dollars. Even though floods are no worse or more frequent than formerly, they are more costly as the flood plains increase in population and economic development. The flood-control measures of the federal government are described; those completed or authorized will prevent about three fourths of the potential damage under present conditions of flood-plains use. The program is, however, still incomplete.—Ed.

RIVERS are the natural drainage channels which carry away part of the precipitation that falls on the earth's surface. The sizes and shapes of the river channels are constantly changing and adjusting to the variable demands of the precipitation and runoff. The type and amount of adjustment depends on the degree of variation of precipitation and the physical characteristics of the terrain. Most rivers have developed a main channel which is adequate to contain the amount of flow that occurs practically every year. Adjoining the main channel there is usually a rather well defined flood plain which is inundated to a greater or lesser extent at irregular intervals depending on the variable amounts and rates of precipitation that occur. These periodic inundations are natural, not man-made, phenomena that were occurring long before men began to alter the environment; they have left their record through the ages, both on the land itself and in the history of man's use of the land.

There are many variations in the

causes, types, incidence, and consequences of floods. Many of the variations can give rise to disaster conditions. For example, a small flash flood might do more harm than a greater but more gradual flood because of the absence of opportunity to move people and property out of the path of the flood. Moderate floods during the growing season can destroy a crop, whereas a larger flood before planting might have caused little agricultural damage and could even have beneficial effects.

CAUSES

Steady rain for long periods, high concentrations of rain over small areas, the torrential rains during hurricanes, and other combinations of meteorologic conditions may cause floods of sufficient magnitude to have disastrous effects. From studies of the most adverse meteorologic conditions theoretically possible it is known that the potentiality exists for much greater rates, amounts, and concentrations of rainfall than have yet been recorded.

Lieutenant General Samuel D. Sturgis, Jr., Washington, D. C., has been Chief of Engineers, United States Army, since 1952, having previously been Commanding General, Sixth Armored Division and Fort Leonard Wood, Missouri, and Commanding General of the Communications Zone supporting the United States Army in Europe.

In northern latitudes, snow may be a principal or a contributing factor to floods. The snow cover may accumulate high moisture content when the insulating effect of the snow during the winter keeps the ground frozen and reduces infiltration. When the snow melts the runoff will concentrate into stream channels more completely and more quickly if the ground is still frozen. The snow may melt more quickly during abnormally warm spells or during prolonged rains. Ice jams may complicate the situation. A combination of these influences can result in disastrous floods. The worst possible combination of such factors would in most cases cause much greater floods than have yet been experienced.

The condition of the ground on which the precipitation falls and runs off into stream channels may somewhat affect the timing, peak, volume, and duration of floods. Ground conditions are important, particularly when they lead to such adverse effects as loss of top soil, scouring, gullying, and deposition of sand and silt. Nevertheless, variations in these conditions are seldom if ever a major factor in the cause of extreme floods.

Man-made obstructions or encroachments in river channels or on flood plains often aggravate flood conditions and may be the cause of considerable local damage where, under natural conditions, the flood peaks might have been innocuous. Extreme examples of this aggravation are failure of inadequately designed and poorly built dikes or dams and high backwaters resulting from unreasonable encroachment by bridges or fills in channels.

TYPES

In the headwaters of rivers, particularly in rugged terrain and on small streams where the time of concentration of runoff into stream channels is short,

floods may develop in a matter of minutes. When floods are caused by unexpected precipitation such as a cloudburst, rather than from more or less predictable rains, the lack of warning may be disastrous. This type of flood may cause damage from the sheer destructive force of a wave or wall of water moving with great speed. Accumulations of debris and boulders in the fast-moving water add to the destructive possibilities.

As the size of the river and its contributing drainage area increase, the susceptibility to sudden floods decreases and there is more chance of predicting the nature and extent of flooding and of benefiting from warnings.

Several days may be required for a flood peak to arrive at the downstream reaches of a large river. Here the flood waters rise slowly and the stage they will reach can often be predicted within approximate limits several days in advance and with fair accuracy several hours in advance. In these situations maximum use can be made of predictions and warnings to minimize the possible adverse effects of the flood. Nevertheless, such floods can be serious from the standpoint of disaster relief, primarily because of the large areas affected and the long duration of flooding. Disruption of normal activities and damage from sustained inundation are often of major proportions.

WHERE AND WHEN FLOODS OCCUR

There are possibilities of a flood of some kind in practically all parts of the nation. Even in the arid and semiarid sections there is the threat of cloudbursts that may cause sudden floods, with attendant serious hazard to life and property. In fact, it is in these areas, where stream flow is intermittent and channels poorly defined, that there are likely to be domestic, agricultural, or industrial developments in flood

plains or on debris cones that are particularly susceptible to damage.

In the northeastern United States, the spring floods resulting from snow melt, or from a combination of snow melt and rain, often reach major proportions. However, this region is also subject to floods at all other times of the year, notably during the hurricane season when some of the region's most disastrous floods have occurred.

In the southeastern section flood-producing rains are most apt to accompany hurricanes in the fall or occur during the rainy winter season.

In the Great Plains and central United States floods from sustained rainfall usually occur in the spring, but cloudbursts are also an important factor in the flood situation, particularly in the South.

In the West the seasonal characteristics are most pronounced on streams having their origins in the mountains where melting snows account for many major floods. Floods may also result in this area from heavy rains during the winter rainy season and at any time of year from sudden storms.

Generally, therefore, floods can occur in almost any river valley at almost any time. Because they are unpredictable on either a short-range or a long-range basis, they must be regarded as a constant hazard.

MAGNITUDE AND FREQUENCY

The length and accuracy of the records of floods on America's rivers vary greatly. For most major rivers there exist at least fragmentary records of the approximate stages dating back to the original settlement of the areas. For many streams, however, complete and reliable records reach back only a few decades; in some cases, particularly for the upper reaches of tributaries and small streams, there are no records at all.

From the available data, computa-

tions can be made of the theoretical frequency of occurrence of floods of various magnitudes. For example, a flood of a given magnitude is referred to as having a recurrence interval of once in fifty years or as having a chance of occurrence of 2 per cent. These expressions of probability are useful in the study of floods and solution of flood problems but they do not afford a reliable means of determining how large a flood to expect or when to expect it. Extreme conditions, approaching the theoretically worst possible conditions, could occur at any time and could recur within a much shorter period of time than indicated by their theoretical recurrence intervals.

CONSEQUENCES

In an area left in a completely natural state, the effect of recurrent floods would usually be the formation of a channel of the proper size to carry flows about equal to or slightly greater than the smallest of the annual maximum flows, and the formation of a flood plain by deposition of sediment at intervals when the normal channel was overflowed. On a portion of this flood plain, the frequency and duration of inundation might be sufficient to preclude plant growth and use by animals. On some of the remainder, the plant growth would be periodically damaged or destroyed and animals might be harmed directly or indirectly through loss of food or shelter. The higher portions of the flood plain would be inundated so infrequently that there would be little or no effect on vegetation and use of the land by animals.

The adverse effects of floods in valleys occupied by man increase directly with the extent and value of use. Some man-made developments in rivers and their flood plains are clearly necessary or economically desirable despite the flood hazard. Many are made in igno-

rance of the hazard involved and, once established, are difficult to change.

It is easy to visualize how advantageous, how necessary even, was the use of river valleys during the early development of this country. Rivers were often an essential source of water supply. For many years, travel was impracticable except by water or on trails, roads, and railroads adjacent to the rivers, which provided natural passes and routes. Sites for homes, farms, and commercial establishments became established on and near the natural communication routes. Other advantages to river valley sites were the availability of water for power or industrial processes and the fertility of valley land for agriculture. Even today, aside from the great difficulties involved in changing established patterns of development, many compelling reasons remain for continuing use of valleys and flood-plain lands, despite the increasing cost of repairing or preventing the damage from floods.

Life and health

The hazard to life is greatest from flash floods and from sudden failure of dams, dikes, or other structures that may be damaged during floods. During the unprecedented and fast-rising floods in the northeastern United States in August 1955 there were 179 deaths, mostly by drowning when the victims were caught without warning by a sudden and complete engulfment of cars or dwellings. In contrast, during the slower-rising Kansas floods in the summer of 1951, when property damages were comparable to those suffered in the northeast in 1955 (870 million as compared with 750 million dollars), there were only twenty-eight deaths attributed to the flood despite the fact that some 87,000 persons were forced to leave their homes.

The hazard to health and the danger

of epidemics are greater during sustained major floods than from floods of short duration. Even though the latter may damage water and sewage services and disrupt normal activities, repairs can usually be undertaken immediately, whereas in an area subject to prolonged inundation, the disruption of normal services may continue for some time. These differences may be important in determining the type of relief and preventive measures needed.

Economic consequences, immediate and secondary

The nature and extent of damage to property vary with the type of flooding. Fast-moving water has erosive effects and destructive force, particularly when carrying boulders or debris. Although the cost of repairing damage caused by slowly rising flood waters may sometimes be moderate with respect to the value of the property, cleanup costs are often large. In addition, the disruption of normal activities has an impact on the welfare and economy of regions even far beyond the flooded area.

Appraisal of the economic consequences of a flood requires consideration of both the physical destruction and the consequent economic disruption. Many estimates, such as those of the United States Weather Bureau, deal more adequately with physical than with induced effects, some of which cannot be immediately ascertained even by those directly affected by the flood. The Corps of Engineers of the United States Army assembles as comprehensive data as possible on all damage and loss directly attributable to floods. These data are used to compile estimates of potential future flood damage, which may be tabulated as annual averages over whatever period may be taken as the expected useful life of proposed flood-control works—currently, fifty years or less. These estimates in

turn help provide an indication of the amounts that may feasibly be spent to prevent flood damage in any given area. In making such use of the data, however, the record of past losses must be converted to reflect current price levels and changes in the extent of economic development in the area affected.

Potential flood damage

The latest (1954) Corps of Engineers estimate of the average annual damage potential of floods in the United States is 911 million dollars. This figure represents the amount of damage that would occur on sections of rivers downstream from sites where major flood-control structures could be located, if no preventive measures were taken. (It does not include potential damage in headwater areas nor damage from erosion caused by water before it reaches established stream channels, both covered in the programs of the United States Department of Agriculture.) Slightly more than half the potential damage is or will be prevented by major flood-control works now completed or in partial operation, and an additional one fourth would be prevented by measures now in the planning phase.

Increasing damage, not increasing floods

A question is often raised as to whether floods in the United States are getting worse. As far as the stage, duration, extent, and frequency of floods are concerned, the answer is no. On some rivers, however, the greatest flood of record has been a recent one; for example, in Kansas it was in 1951, and on some New England streams, in 1955. In many river valleys, on the other hand, there is some evidence that the largest floods occurred many years ago, though accurate records are not available.

It is clear, however, that the damage caused by floods is increasing as a result

of increased development in the flood plains and the increased value of previous developments. A flood of given size today may cause several times the damage that the same flood would have caused fifty years ago. For example, William Glenn Hoyt and Walter Basil Langbein¹ have estimated that if flood-plain development paralleled general development the Ohio River floods which caused damage of \$100,000,000 in 1913 would cause damage of \$550,000,000 today.

EFFORTS TO AMELIORATE FLOOD LOSSES

Typical of the earliest measures to reduce the damage involved in using the flood plains of the rivers of the United States were the levees built by individual landowners and communities along the lower Mississippi. In most cases, these efforts were unco-ordinated and inadequate, and in response to a growing realization of the need for assistance to the states and local groups, Congress enacted the "Swamp Acts" in 1849 and 1850, under which all unsold swamp and overflowed lands were granted to the states to be sold by them, the proceeds to be used for levees and drainage works to protect and reclaim the lands. However, the acts failed in their purpose as flood-control and reclamation measures, principally because of the lack of co-ordination of the efforts of the individual organizations and states.

The first direct participation by the federal government in flood control, which occurred in connection with its responsibility for navigation, was the formation in 1879 of the Mississippi River Commission to operate under the Chief of Engineers, United States Army, and assignment to it of a program of improvements in the alluvial valley of

¹ *Floods* (Princeton, N. J.: Princeton University Press, 1955), p. 86.

the Mississippi for navigation and flood-control purposes.

In 1893 the California Debris Commission was formed to plan, under the Chief of Engineers, the control of mining debris and to protect the navigability of the Sacramento and San Joaquin Rivers. The first work in this area was authorized by the River and Harbor Act of March 1, 1917. In the same year an appropriation of \$45,000,000 was made for carrying out plans of the Mississippi River Commission for flood control.

In the 1917 act Congress also recognized a growing national concern with flood control and the close relationship between flood control and navigation and other water-resource development. The 1917 act specified that examinations and surveys for flood control should be comprehensive and include consideration of the development of water power and such other functions as might be properly related to or coordinated with any project. This act was the forerunner of federal planning and participation in flood control on a nationwide basis, and placed the federal interest in flood control under the jurisdiction of the Corps of Engineers. It was followed by authorization for surveys on many streams in 1924 and by the initiation in 1927, by House Document No. 308, of surveys of all navigable streams of the nation for the purpose of "navigation, the development of water power, the control of floods, and the needs of irrigation." These "308" surveys gave the Army Engineers a framework from which it was possible a decade later to move quickly into a program of construction of key projects needed to prevent disaster-type floods.

Jadwin Plan for Mississippi River

The comprehensive "Jadwin Plan" for the lower Mississippi River (named for

Major General Edgar Jadwin, then the Chief of Engineers) was adopted by the Act of May 15, 1928. Under this basic plan and subsequent modifications and extensions, approximately \$900,000,000 have been expended to construct levees, channel improvements, floodways, emergency spillways, and reservoirs for the protection of more than two million people living in a hundred urban areas or on 200,000 farm units involving nearly twenty million acres. This great project is technically about two-thirds complete, but it has been advanced to the point where it affords substantial protection to this tremendously valuable alluvial valley. It is estimated that these works have prevented over five billion dollars in damage since 1928 on the basis of the state of development and price levels prevailing at the time the potentially damaging floods occurred. This is a significant accomplishment in an area which only thirty years ago suffered a disastrous flood costing 313 lives and affecting 18,000,000 acres of land with 300 million dollars in damage. Larger flows have since been experienced without significant damage.

Flood Control Act, 1936

By the Flood Control Act of June 22, 1936, Congress declared that "flood control on navigable waters or their tributaries is a proper activity of the Federal Government in cooperation with States, their political subdivisions, and localities thereof"; and that "the Federal Government should improve or participate in the improvement of navigable waters or their tributaries, including watersheds thereof, for flood-control purposes if the benefits to whomsoever they may accrue are in excess of the estimated costs, and if the lives and social security of people are otherwise adversely affected." This was the first general federal flood-control legislation.

Current program

Pursuant to this policy, a general flood-control program of over a thousand projects with an estimated eventual cost of 11 billion dollars has been authorized for construction by the Corps of Engineers. Work is complete or underway on some four hundred of these projects with an estimated cost of 6 billion dollars. About three hundred projects with an estimated cost of 3 billion dollars are classified as active and ready for construction as funds become available. The remaining three hundred projects with a cost of 2 billion dollars are currently classified as inactive or subject to re-examination to determine whether they are still suitable to the intended purposes. These figures include some costs for purposes other than flood control, because on some

multiple-purpose projects the costs have not yet been allocated among the purposes.

The effect of the federal flood-control program (including the Mississippi River project) is summarized in the accompanying table.

The total cost of completing all flood-control projects now authorized for construction by the Corps of Engineers and presently considered as active projects is estimated at 5,865 million dollars. As of June 30, 1955, appropriations for such work totaled 2,300 million dollars. Thus 3,565 million dollars' worth of work remains to be performed to complete the present program. These figures do not include the costs of about 600 million dollars allocable to flood control in authorized multiple-purpose developments.

construction, this program might be finished within twenty-five to thirty years. It will be noted that even after completion of this program a substantial portion of the estimated annual damage potential, amounting to about 200 million dollars a year, will remain unprevented. Meanwhile, however, the economic growth of the nation will undoubtedly have caused further commercial, industrial, and other development of flood-plain lands, requiring still further construction for protection. At the same time, it has become increasingly apparent that flood-control measures must be integrated with plans for other aspects of water-resource development, such as inland waterway navigation, municipal and industrial water supply, and pollution abatement. Hence the end of the task of protecting American river valleys from floods is not yet in sight.

SOME HEADWAY EVIDENT

In reviewing the nature, evolution, and present status of the flood problem, and the outlook for the future, especially from the standpoint of the problem of disaster and disaster relief, the following observations are pertinent:

1. The meteorologic, hydrologic, and other natural physical factors that cause major floods have not changed significantly.

2. Future floods can be expected to be as large as, and on some rivers, larger than, those of the past.

3. The disaster potential of floods depends on the type and extent of use or encroachment on flood plains.

4. Over the years the increased use of flood plains, whether justifiable or unjustifiable, has reached the point where economic losses from floods run into

many millions of dollars annually. Such use will undoubtedly continue to increase, thus constantly augmenting the need for protective measures.

5. In some flood-plain areas, particularly those which have not yet been intensively developed, zoning may be a possible solution. Where effective flood-control measures are not economically justified flood-plain zoning may be the only other possibility for reducing flood losses.

6. Efforts to control or restrain floods in order to reduce losses involved in occupying flood plains were ineffective until federal participation was instituted on a large scale.

7. Major flood-control measures completed or authorized will prevent about three fourths of the potential damage under present conditions of flood-plain use, but the program is incomplete and the need is increasing.

In the light of these considerations, it would appear that some headway is being made in reducing the possibility of disasters from floods. The trend in lessening the loss of life through improvement of warnings and protection is already evident. The substantial reduction in the average annual economic loss from floods should become more apparent as the beneficial effects of completed and planned works come into play.

THE JOB REMAINING

The job remaining to be done includes completion of major control and protective works wherever justifiable in order to preserve valuable investments already made; further improvement of warning services; and perfection of disaster plans for areas that will continue to be threatened after all preventive measures have been taken.

Hurricanes, Tornadoes, and Other Storms

By F. W. REICHELDERFER

Abstract: Loss of lives and property through abnormal weather occurrences has become a national concern. It is difficult to conclude that these phenomena have become more frequent in late years, but they certainly strike at more people owing to the increase and distribution of our population. The different types of weather disasters are discussed in considerable detail, especially hurricanes and tornadoes. Information is given on various features of the "warning services" set up to permit the taking of precautionary measures in threatened areas and on research projects now under way designed to improve forecasting and warning services.—Ed.

IN recent years the huge loss in life and property from hurricanes, tornadoes, and other storms (Table 1) has become a matter of great national concern.

Hurricanes Carol, Edna, and Hazel, which in 1954 struck Middle and North Atlantic states, cost about two hundred lives and property damage amounting to about a billion dollars. A year later this record loss was exceeded when Hurricanes Connie, Diane, and Ione brought more high winds and floodwaters to most of the same states.

Of the 532 tornadoes that occurred in 1953, three cost the lives of more than three hundred persons in three widely separated communities: Waco, Texas; Flint, Michigan; and Worcester, Massachusetts. The disastrous Worcester tornado also caused within a few minutes property damage of more than fifty million dollars. Of the 870 tornadoes reported in 1955 one hit Blackwell, Oklahoma, and another, Udall, Kansas, on the same night, bringing death to more than a hundred persons.

Great as the combined losses from hurricanes and tornadoes are, still larger losses normally are recorded annually in

the United States from the sum total of flood-producing rains, thunderstorms, lightning, violent wind squalls, blizzards, cold waves, hailstorms, droughts, freezing rain, sleet storms, and other abnormal weather occurrences.

The secondary human and economic consequences of these annual weather disasters, while not easily measured, are serious and widespread. Public fear and apprehension of similar disasters in the future may have significant effects on property values and development, on the location and expansion of business concerns, and on the personal planning of millions of people.

Although hurricanes, tornadoes, and other storms are all disturbances in the general flow of the atmosphere around the globe and have certain fundamental similarities, they are so different in their major characteristics and their usual locations that they are best discussed separately. For example, a hurricane may cover an area of thousands of square miles at one instant and may travel for days over the ocean with a forward motion of only ten miles an hour. A tornado, on the other hand, may cause damage along a narrow path

Francis Wilton Reichelderfer, D.Sc. (Hon.), is Chief of the United States Weather Bureau, Washington, D. C., and a member of the National Academy of Sciences. He was president of the World Meteorological Organization, 1951-55.

only fifty yards wide and may last only a few minutes as it sweeps across the prairie at forty miles an hour. Other storms also have important differences.

HURRICANES

Hurricanes,¹ the most widely destructive of all storms, are great vortices of

¹For reference material see I. R. Tannehill, *Hurricanes*, 8th rev. ed. (Princeton, N. J.: Princeton University Press, 1952) and *Hurricane Hunters* (New York: Dodd, Mead & Co., 1955); Malcolm Righy (Ed.), *Meteorological Abstracts and Bibliography* (Boston, Mass.: American Meteorological Society); re-

ports, technical papers, and other informational material issued by the U. S. Weather Bureau, Washington, D. C.

air swirling in a counterclockwise direction around a nearly calm center. (In the Southern Hemisphere, tropical cyclones, the general type comprising hurricanes, rotate in a clockwise direction.) Those tropical revolving storms that affect the United States usually form in the southern portion of the North Atlantic Ocean, the Caribbean Sea, or the Gulf of Mexico. Similar tropical storms in the western Pacific Ocean are called

ports, technical papers, and other informational material issued by the U. S. Weather Bureau, Washington, D. C.

typhoons. Both hurricanes and typhoons are accompanied by violent destructive winds, heavy rains, and mountainous seas.

Tropical revolving storms when first formed are usually embedded in the trade winds that blow from an easterly direction, between ten and twenty degrees north of the Equator. They therefore move generally toward the west. After gradually increasing in size and intensity, these storms usually curve toward the north and then northeast. They may either strike the eastern coast of the United States or travel out over the North Atlantic Ocean with the prevailing westerlies found in these more northern latitudes. In other cases the storms may continue their westward movement across the Caribbean Sea or the Gulf of Mexico to reach the coasts of Central America, Mexico, or the Gulf states.

The fastest and therefore the most destructive winds of a hurricane blow counterclockwise in a band twenty to fifty or more miles wide around the storm's center, the "eye," where the winds are light or even calm for a brief time. In this band or ring of violent winds, velocities at the surface of the earth may reach 150 miles an hour, even in brief gusts up to 200 miles an hour. Beyond the zone of highest wind speeds, the winds decrease gradually as the distance from the hurricane's center increases. Frequently there are large differences in wind speed in the four quarters of a hurricane, with the strongest winds in the right forward quadrant of the advancing storm.

The central eye of the storm, usually from five to twenty-five miles in diameter and frequently cloudless, is surrounded by a wall of clouds thousands of feet high, which since it is within the circle of strong winds appears as a cloud mass whirling around the center. Inasmuch as hurricanes reach their

maximum development over the sea, the best observations of their interior structure have come from ships or reconnaissance aircraft. Shipboard observers have reported with amazement the sudden calm air as the ship enters the center of the storm, and the partly cloudy or even clear skies replacing the dark clouds and driving rain. But the ship continues to toss violently on confused and mountainous seas, and the respite from wind and rain is brief, usually only a few minutes before she as suddenly re-enters the circle of hurricane winds and driving rain on the opposite side of the "eye."

Hurricane movements and areas

As a hurricane moves northward out of tropical waters, the forward speed of the entire storm usually increases, occasionally to a marked degree. For example, the famous 1938 New England hurricane and the equally famous Hurricane Carol of 1954 rapidly increased their forward speeds after passing Cape Hatteras, North Carolina, until they were moving northward at more than fifty miles an hour when they hit the New England coast. With some hurricanes, on the other hand, there is for a time practically no forward movement of the storm's center, so that the hurricane winds blow steadily over the same place for hours or even for a day or two. In unusual cases the hurricane center may go through one or more loops or hairpin curves or move from north to south or double back to strike the same land area twice.

The width of destruction caused by the winds of a hurricane as it moves over or near land varies considerably. In a small hurricane the region of major destruction may be less than twenty-five miles wide, but in great hurricanes it may be two hundred miles wide and up to a thousand miles long.

The destructive waters

High water brought on shore by a hurricane has caused great loss of life. A century of records shows that more than three fourths of all deaths in hurricanes can be attributed to drowning in coastal high waters brought in as storm surges. Water eight to sixteen feet above normal tides has been recorded during some of the larger hurricanes along the Gulf and Atlantic Coasts; wave action and pounding seas on top of these high water levels may bring frightful destruction to exposed coastal and bay communities. These wind-driven storm surges can also cause sudden rises in water levels outside the storm's center, usually to the right of the path of the hurricane as it approaches the coast. Local topography, as well as the path, speed, and intensity of the storm, can increase or decrease the effects of storm surges and account for wide variations in water damage over short coastal stretches. Such pre-storm and poststorm changes in water level may produce strong currents and bring unexpected danger locally, especially in bays and other confined water areas.

Hurricane rains are responsible for many of the major inland floods that have occurred in the Gulf and Atlantic Coast states. The most intense twenty-four-hour rainfall from a hurricane on record in the United States occurred in September 1921, when 23.11 inches fell in one day on Taylor, Texas. Up to

twenty inches of rain fell on parts of Connecticut and Massachusetts during the final phases of Hurricane Diane in August 1955; these hurricane rains in New England were the cause of the record floods there.

Hurricane duration

The average life span of a hurricane is about nine days. August hurricanes have the longest average life span, twelve days, and July and November hurricanes normally last only about eight days from origin to disappearance.

Frequencies

Principal hurricane months are August, September, and October (see Table 2).

In recent years the widespread hurricane reporting system has probably observed all well-developed tropical storms, and before the reporting network was so well organized, a few tropical storms may have escaped observations; therefore statistics comparing hurricane frequency in recent decades with earlier periods may be misleading. They indicate long-term irregularities in frequency, with the decade 1946-55 showing a return to greater frequency (see Table 3 and chart). The increase is less impressive, however, when the figures for 1887-95 are converted to comparable basis (1887-95 averages 8.7 per year; 1946-55, 9.5 per year) and it cannot be proven that this small difference is not entirely the result of inadequate reporting during the 1880's and

TABLE 2—TROPICAL STORM AND HURRICANE FREQUENCIES BY MONTHS, 1887-1955

TYPE OF STORM	JANU- ARY*	MAY	JUNE	JULY	AUGUST	SEP- TEMBER	OCTO- BER	NOVEM- BER	DECEM- BER	TOTAL

* No tropical storms have been observed during the months of February, March, and April.

TABLE 3—TROPICAL STORM AND HURRICANE FREQUENCIES BY DECADES, 1887-1955

TYPE OF STORM	1887-95*	1896-1905	1906-15	1916-25	1926-35	1936-45	1946-55	TOTAL
Tropical storms	78	63	55	53	83	91	95	518
Tropical storms reaching hurricane intensity	45	32	24	29	44	38	65	277

* Nine-year period only.

1890's. For the past sixty-nine years the greatest number of tropical storms to attain hurricane intensity in any one year was eleven (1950). In 1893 and again in 1950, four hurricanes were in progress at the same time, including occurrences in the Gulf of Mexico, the Caribbean, and the western Atlantic. The annual average for the entire sixty-nine-year period is four.

HURRICANE WARNING SERVICE

The Weather Bureau is responsible for issuing warnings of hurricanes which approach United States territory and contiguous waters. During the summer and fall, when most hurricanes occur, forecast offices at San Juan, Miami, New Orleans, Washington, and Boston have special communications facilities and maintain an alert day-and-night watch for developing tropical storms and hurricanes.

When there are definite indications that a hurricane is forming, even though it is a thousand miles or more from the mainland, the broadcasting of "advisories" is begun. These are issued every six hours day and night to tell where the storm is, how intense it is, and its speed and direction of movement. Advisory messages are also radioed to ships at sea so that they can steer clear of the storm, and to small isolated islands in the storm's path so that they too can take precautionary action. If the hurricane moves toward the mainland, "bulletins" for press, radio, and television are issued at frequent intervals to keep the public in-

formed of the progress of the storm. Small craft are warned to stay in port or in inland waters.

When a hurricane threatens any portion of the United States coast, extra emergency warning centers are set up at Weather Bureau offices in the threatened area. Representatives of newspapers, radio and television stations, civil defense, Red Cross, city governments, public utilities, and other agencies come to the center to obtain first-hand information on the storm. Special telephone and radio lines are used so that this vital information may be quickly disseminated to everyone concerned.

While a hurricane is forming, special

weather observations are taken at frequent intervals. Upper-air soundings, normally made every twelve hours, are made at shorter intervals to measure meteorological conditions at all levels up to 60,000 feet or more above the earth; reports from ships at sea are requested every three hours or even hourly. Another important source of data is the reports from the specially equipped Air Force and Navy hurricane reconnaissance airplanes. These courageous fliers patrol areas hundreds of miles from land, often penetrating to the center of the storm to obtain direct information on its location, intensity, and movement. During the last few years storm detection radar equipment installed at coastal points has been used to track hurricanes as they approach land. Storms as far as 250 miles from the radar can be located and their courses continuously tracked day and night.

Hurricane watch

Should the hurricane continue to approach the coast so as to constitute considerable threat to coastal areas, a "hurricane watch" is announced for the vulnerable areas. The hurricane watch does not constitute a warning that hurricane conditions are imminent; rather, it provides advance information that the hurricane is close enough so that everyone within the area of the hurricane watch should listen for further advisories and be ready to take precautionary action in case hurricane warnings are issued later.

Hurricane warning

As soon as the forecaster determines that a particular section of the coast will feel the strong effects of a hurricane, he issues a "hurricane warning" specifying the coastal areas where winds of seventy-five miles per hour or higher are expected to occur. When a *warning* is issued, all precautions should be taken

immediately against the full force of the storm, for hurricane warnings are seldom issued more than twenty-four hours in advance and sometimes, in case of unusual or erratic hurricane movement, they may even be issued only a few hours in advance of the onset of hurricane conditions. Issuance of hurricane warnings, however, does not always mean that the center of the hurricane is expected to pass inland over the area warned. It does mean that winds of hurricane force or dangerous high tides or very rough seas are expected within the area of hurricane warning. In some cases the center may pass outside the coastline and still bring hurricane winds to coastal communities.

Usually winds increase gradually as the center of the storm approaches the coast and reach hurricane force six hours or more before the center actually crosses it. Since dangerous winds may extend outward considerable distances from the center of the storm, the area of danger is usually several times greater than that covered by the center itself.

Storm warning

"Storm warnings" as distinguished from "hurricane warnings" are issued to coastal areas when winds of more than thirty-two miles per hour but less than hurricane force are expected to occur not only as a result of tropical cyclones but also for other types of coastal storms. In connection with hurricanes, storm warnings may be issued if a hurricane approaches close enough to cause strong winds but not close enough to cause hurricane conditions. If the hurricane continues to move toward the coast, the storm warnings may become hurricane warnings, and storm warnings may then be issued for other areas on either side of the expected hurricane wind zones, close enough to get gale winds but not close enough to expect winds of hurricane force.

NATIONAL HURRICANE RESEARCH PROJECT

The public interest in further improvement and expansion of severe storm warning services, following the hurricane catastrophes of 1954, resulted in appropriations that enabled the Weather Bureau to enlarge its storm warning operations and to expand its storm research program.

As part of this expanded research program the Weather Bureau has sponsored a National Hurricane Research Project, which includes the consultation, co-operation, or active participation of outstanding authorities on tropical meteorology from universities, scientific institutions, the Air Force and the Navy, and other governmental agencies. Some of the work was begun in the fall of 1955 and the intensive data-collection program in the summer of 1956. Studies under way are designed to advance present understanding of the inception, movement, and development of tropical storms. The program is expected to continue for at least five years.

The research has been paralleled by improvements in service operations and facilities that will result in a considerably improved hurricane warning service. For example, three high-powered hurricane-tracking radar stations, with ranges of 250 miles, are now in operation at Hatteras, North Carolina; Nantucket, Massachusetts; and San Juan, Puerto Rico. Other high-powered sets will be installed early in 1958, at selected points along the Gulf and Atlantic Coasts. In addition to these three long-range radar units, there now are radar installations with a more limited range of 125 miles in operation at several key sites along the coast.

Other recent improvements in hurricane service operations include many new surface and upper-air observing stations in the West Indies and Carib-

bean Sea area; additional ships that report weather conditions while at sea; development of a new storm-surge (floodwaters) forecast program and the assignment of storm-surge specialists to nine major coastal stations; establishment of new river-stage and flood-forecast centers at Windsor Locks, Connecticut (for the New England states), and at Augusta, Georgia (for the South Atlantic states); additional teletype-writer and facsimile chart installations at coastal stations; installation of new radio communication camera and radiophoto equipment at the radar outposts at Hatteras, North Carolina, Nantucket, Massachusetts, and Burrwood, Louisiana, for transmitting radarscope photos of hurricanes to the nearest forecast center at Washington, Boston, and New Orleans, respectively; more hurricane reconnaissance flights by the Air Force and the Navy; and development of a co-operative information program to advance public understanding of the available warning services and the nature of tropical storms.

TORNADOES

Tornadoes² are rotary storms of small diameter and extreme intensity—the most violent of all windstorms, though hurricanes are "most destructive" in their total single-storm destructiveness. The winds of a tornado vortex whirl counterclockwise inward and upward at tremendous speeds which, combined with the partial vacuum at the center, produce explosive effects on surface structures hit by the vortex. None but indirect measurements of such great

² For reference material see S. D. Flora, *Tornadoes of the United States*, 2nd ed. (Norman: University of Oklahoma Press, 1954); Malcolm Rigby (Ed.), *Meteorological Abstracts and Bibliography* (Boston, Mass.: American Meteorological Society); reports, technical papers, and other informational material issued by the U. S. Weather Bureau, Washington, D. C.

speeds have been possible, but reliable estimates suggest that these rotary winds in some instances exceed four hundred miles per hour.

The most characteristic visual indication of a tornado is the dark funnel-shaped cloud which seems to be hanging from the clouds above as it moves across the countryside, often with the lower end of the ropelike or cone-shaped funnel not quite reaching the ground. At night identification is more difficult, since the funnel is seen only during brief flashes of lightning.

Also characteristic of tornadoes is a roaring sound, sometimes audible several miles away, which has been likened to the sound of hundreds of airplanes flying overhead, the rumble of trains crossing trestles, the buzzing of millions of bees, and the whining of strong winds in cables or rigging.

Size, speed, and direction

The diameter of a tornado is usually measured in feet or yards rather than miles. The average width of the destructive path along the ground is about four hundred yards, although some paths have been no more than ten feet wide, and a few have had evident damage tracks over a mile wide. An amazing feature of tornado paths is that the areas of total destruction are often separated by only a few feet from areas that have not been even slightly disturbed.

The lengths of tornado paths have varied from a few yards to perhaps a few hundred miles, with the average about sixteen miles. At least seven tornadoes have been reported with paths more than two hundred miles long. The average duration is less than an hour. However, on May 26, 1917, a tornado traveling across Illinois and Indiana lasted seven hours and twenty minutes and had a record path of 293 miles.

The forward speed of this tornado was forty miles an hour, which is slightly above average. Forward speeds have been known to range from almost zero to as much as sixty-eight miles an hour.

Nearly two thirds of all tornadoes move from the southwest towards the northeast, the direction of prevailing surface winds in the areas where tornadoes develop. If tornadoes that move from the northwest or west are added to those from the southwest, they include altogether seven eighths of all tornadoes. But tornadoes have been known to come from all directions, and some have completely stopped movement, some have sharply changed direction, and a few have made looping paths. It frequently happens that several tornadoes occur on the same day in the same general area and move in nearly parallel lines.

Destructive power

The destructive power of the tornado is terrifying. Strong buildings are torn apart and scattered about like kindling wood, the pieces sailing through the air in a dangerous barrage; walls collapse or topple outward; large trees are twisted or uprooted and the bark is often stripped off; people and farm animals are whirled through the air and then dashed to earth; bridges are wrenched from their foundations and left in twisted masses of metal; heavy machinery is lifted and deposited miles away. The awesome force of the whirling winds within the storm is demonstrated by the shearing off of large tree limbs; by straws and slivers of wood driven deep into boards and posts; and by the penetration of large pieces of wood, javelinlike, deep into the earth or entirely through tree trunks.

Tornadoes in the United States cause on the average more than two hundred deaths and thousands of injuries each

year. The average annual property damage in the United States is more than twenty million dollars.

Formation

Tornadoes usually occur in connection with thunderstorms, and especially with those accompanied by hailstones. They start to form several thousand feet above the earth's surface; some never reach the ground and others barely touch it and immediately rise again.

For tornadoes to form requires the presence of layers of air of contrasting temperature, moisture, density, and windflow. When cool, dry air from the west or northwest moves over warm, moist surface air from the Gulf of Mexico and is accompanied by a narrow band of strong winds at intermediate levels, the kinetic and potential forces sometimes combine to produce a vortex or whirl. The origin and development of the tornado are not fully understood.

Where and when

Tornadoes occur in many parts of the world and have been reported in all of our states, but no place is more favorable for their formation than the central part of the United States (see map, Tornado Distribution in the United States). They normally start to increase in number during February, most frequently in the Gulf states, and the frequency reaches a peak there in March. The seasonal increase shifts northwestward to reach a maximum in Kansas during May and June. In the summer they develop farther north. From July until January there is a rapid decline in the number in the United States.

Tornadoes can occur at any hour of the day or night, but they appear to form most readily in the hours closely

following the warmest parts of the day. About 82 per cent occur between noon and midnight and about 43 per cent between 3:00 P.M. and 7:00 P.M.

Annual frequency

Tables of annual frequency of tornadoes observed in the United States might at first glance be taken to mean that these storms have increased greatly in recent years, for two to five times as many have been reported in the years 1952 to 1956 as in the years a decade or more ago. In earlier years, however, only the more spectacular tornadoes got into the annual records, whereas in recent years the reporting system has been greatly amplified in many ways; for example, reports are now received from aircraft pilots, who see funnel-shaped clouds that would have escaped detection in earlier years. The reported recent increase in the number of tornadoes probably thus signifies not so much an actual increase in annual frequency as (1) greater density of population (to report tornadoes in areas which formerly were relatively unpopulated); (2) greater public awareness and observation of tornadoes through tornado forecasts disseminated over radio and television stations; (3) improved storm-reporting networks and techniques; (4) more trained co-operative observers; and (5) the establishment of community warning networks.

Somewhat similar reservations are necessary in comparing recent annual property losses with losses in earlier years, bearing in mind changing dollar values and the greater number and size of towns in tornado areas.

TORNADO FORECASTS AND WARNINGS

It may never be possible to predict much in advance the exact spot where a tornado will occur, just as it is un-

likely that man can ever determine just where a bolt of lightning will strike. However, recent advances in tornado forecasting techniques now permit predictions up to six or more hours in advance for defined areas (approximately 20,000 square miles in size) where there is a reasonable possibility that one or more tornadoes will occur. The detection and tracking of rain squalls by modern radar equipment have been particularly helpful in the issuance of life-saving tornado forecasts and warnings.

Tornado forecasts for all parts of the United States are now prepared at the Weather Bureau's Severe Local Storm Forecasting Center (SELS Center) in Kansas City. Tornado specialists there analyze and interpret a large number of meteorological charts, diagrams, and reports in their day and night watch of all conditions that may lead to tornadoes. Forecasts are promptly distributed to the public by local Weather Bureau

offices, which make use of radio and television stations in and near threatened areas. The civil defense organizations, the Red Cross, state and local police, sheriffs, school officials, and many others co-operate in relaying tornado forecasts to people throughout threatened areas.

These "tornado forecasts" are issued by the Weather Bureau to alert volunteer storm reporters, police, and the public to watch for tornadoes if the sky becomes threatening. People are advised to take necessary preliminary action so that a place of safety can be reached quickly if a "tornado warning" is later issued.

Tornado warnings are announcements that a tornado has been sighted. These warnings are made possible through the co-operation of many public-spirited people who promptly notify the nearest Weather Bureau office when they see a tornado. Tornado warnings are then

issued announcing the storm's location and direction of movement; this information can be used by those in the expected path of the advancing tornado to find places of safety or to speed away from the path of the storm.

ing their own areas of community responsibility.

WEATHER BUREAU TORNADO RESEARCH PROGRAM

The severe local storm warning network program

The Weather Bureau has responsibility for warning the public of all forms of severe weather developments that offer a significant threat to life or property. Tornadoes are of a much smaller scale, however, than the usual storms for which the regular network of weather-observing stations is designed; hence, tornadoes may pass between established Weather Bureau reporting stations completely undetected and may strike large communities without advance notice.

To meet this limitation, the Bureau has developed in most states a system of severe local storm warning networks. Under this plan, co-operative storm observers are selected at many points surrounding population centers and in rural areas. These observers are trained to recognize tornadoes, and their co-operation is enlisted in telephoning reports to a central point responsible for distributing warnings to others. In many areas, the central point for receipt of reports and origination of warnings is the local Weather Bureau office. To meet the problem in thousands of communities in the United States without a Weather Bureau office, public-spirited local groups have been encouraged to set up their own severe local storm warning networks and to furnish reports to the nearest Weather Bureau office for use in warning other communities.

More than one hundred and fifty Weather Bureau offices east of the Rockies have established local storm warning networks, most of them cover-

In the past few years there has been a great increase in research studies dealing with tornadoes and severe local storms. Efforts are now directed primarily to three distinct phases of the main problem of forecasting the time, location, movement, and intensity of severe local storms: (1) the nature of the storm setting, that is, the environmental atmospheric conditions favorable for a tornado outbreak; (2) the cause of the storm trigger or mechanism that concentrates the energy of the storm into the destructive tornado vortex; and (3) the characteristics of the storm itself.

In December 1955 a Severe Local Storm Research Conference was held to discuss how federal funds could best be used in a detailed study of tornadoes which would lead to improved forecasts and warnings. Participating in meetings held over a three-day period were 117 specialists from forty organizations representing the civilian and military branches of the government, universities, airlines, instrument companies, and other research agencies. They gave much attention to the need for special observing networks and special instrumentation to secure data at a greater frequency and on a smaller space scale than are customary for general meteorological services. Examples include frequent aircraft and instrumented probes of upper-level tornado conditions, cloud photography, denser networks of surface and upper-air observation stations, and a more intense radar photography program.

The current research in tornado forecast problems—with the help of modern telecommunication and observation

networks, special instruments, and aircraft probing—carries promise of new knowledge about tornadoes and severe storms and further effectiveness of the storm warning services.

OTHER STORMS

Hurricanes, the greatest of storms, and tornadoes, the most violent of storms, together cause appalling losses in lives and property each year in the United States, yet greatly in excess of these losses is the total damage wrought by other abnormalities of weather—heavy flood-producing rains, thunderstorms, lightning, windstorms, blizzards, hailstorms, heavy snows, squalls, ice storms, cold waves, hot spells, drought, dust storms, and sleet storms. Almost every day in the year one or another of these weather extremes occurs somewhere in the United States and not infrequently one or another is visiting half of our forty-eight states simultaneously.

For example, the annual loss from floods on the main rivers of the United States averaged more than 300 million dollars a year over the past ten-year period. The annual loss from flash floods on the upper tributaries of rivers has been estimated to be equally large. In an average year several hundred persons are killed and still more hundreds injured by lightning, and an even larger number are killed and thousands injured in the extremely high winds that accompany many thunderstorms. Lightning each year causes damage to innumerable buildings, sets off hundreds of forest and other fires, and causes widespread damage to power lines and other equipment of public utilities. Windstorm losses occur in an endless variety of ways, occasions, and places—from swamped canoes to beached freighters, from torn roofs to collapsed warehouses, from a single upturned tree on a sub-

urban lawn to flattened crops and orchards, and from residential television antennas to thousand-foot radio towers.

When windstorms blow trees over power lines, communities are often blacked out. Transportation can be interrupted for days by blizzards, heavy snows, and ice or sleet storms. Extended cold waves, hot spells, hailstorms, droughts, or prolonged rainy periods can cause crop losses measured in hundreds of millions of dollars and forcing bankruptcy on thousands of farmers and business concerns.

The total losses due to all types of storms and extremes of weather conditions can never, perhaps, be measured or counted in precise figures, nor can all the losses be prevented. They can, however, be further reduced through better understanding of the complex meteorological variables that determine weather and through better public utilization of the warnings, forecasts, reports, and other weather information now available. Much of our new research effort and new operations are designed with this paramount objective in mind.

THIS PUBLIC SERVICE

In any service to the general public like that provided by a national meteorological bureau effectiveness depends greatly on an understanding of the purposes and limitations of the service. Weather services are based on the initiative and intelligent co-operation of many organizations and many individuals. For the original observations on which weather maps and forecasts are based, the Weather Bureau must depend not only on the reports from its own hundreds of stations but also on those from stations of the United States Coast Guard and its lighthouse service and from the other military services, from foreign meteorological services,

and from many unpaid co-operative observers. Collection and analysis of these reports is only the first part of the work. To be useful to the public the data must next be put into readily understandable terms. Many channels of communication must then be used to disseminate weather forecasts, warnings, and other vital meteorological information to cities, towns, and rural areas. Most of this distribution is done without cost to the government by radio, television, and the daily press as part of their general public service.

But in times of destructive storms,

full dissemination of information is not the final step in an effective service. Frequently there must be further action by advisory and rescuing agencies like the Coast Guard, the Air Force, the Army and Navy, the Red Cross, civil defense, state and local public safety organizations, many community interest groups, and countless public-spirited individuals. The prompt and expert service of Red Cross workers, for example, has often been a bright light in the somber picture of widespread destruction from nature's violence.

Earthquakes

By L. DON LEET

Abstract: The effects of earthquakes are well known. Less known are their causes, hidden in the shifting pressures of the substrata of the earth. Their annual number has been estimated at from 50,000 to 1,000,000; accurate instrumental locations date from about 1918. At present, seismographic stations register 600 to 700 a year, over a hundred of which are of major intensity. They cluster in two zones, one bordering on the Pacific Ocean and representing 80 per cent of the total energy released, the other running from Burma through the Himalayas westward through Europe's Alps. However, earthquakes may occur anywhere. They seem to run in cycles, but accurate prediction is impossible. Planning can do much to reduce damage, but their relative rarity and unpredictability make planning difficult; it encounters barriers in inertia, self-interest, and long-term costs.—Ed.

SAN Francisco, on Tuesday, April 17, 1906, was a sprawling example of one of the big cities of its time. Spread among the hills of its bay it had spawned humble dwellings, Nob Hill mansions, and a sprinkling of the "skyscrapers" of that day. Life was filled with the bustle of commerce and living of a growing, prosperous community.

Without warning, at 5:12 A.M. the next day, catastrophe struck and all this was changed. The sharp tremor of an earthquake was followed by a jerky roll. The roar and crash of man-made structures mingled with a dull booming from the earth itself. Then, within about a minute, the shaking tapered off and the disturbance ceased.

A number of buildings were shaken into various stages of collapse. The new seven-million-dollar City Hall was one of these. Many frame buildings were wrenched and distorted, some by the slumping of loose soil under their foundations, but the damage to well-

designed and solidly built structures was less than generally realized. The fourteen-year-old, eleven-story Crocker Building, the steel-framed James Flood Building, the Mint, the new Post Office Building, the partially completed Hotel St. Francis, and scores of others escaped lightly. Authoritative estimates charge the earthquake's shaking with responsibility for less than 5 per cent of the total damage to property on that day. This was what is known as the San Francisco earthquake, one of history's most important.

Before people had gained the open air and begun to take stock of what had happened, puffs of smoke were mingling with the great cloud of dust that rose from the city. Realization of the full sweep of disaster was slow to come. The day wore on, and people discussed their experiences. Some mourned their dead. All paused in momentary panic as repeated aftershocks swept under the city and on to the eastern horizon, but

none of these matched the first great temblor, and gradually the tenseness of the populace eased. Then the significance of a growing pall of smoke down Market Street and over a widening area began to appear. There was insufficient pressure in the city water mains, which had been broken in many places. Ordinary means of combating conflagration failed. The fire was beyond control. Residents of the threatened districts began a trek to open spaces in outlying sections. Three days passed. By the dynamiting of structures in their path, flames were robbed of fuel. Finally, rain fell. Meanwhile crowds of refugees, huddled together without elementary sanitary precautions, were attacked by epidemics of filth-borne disease to cap a week's nightmare. This was the San Francisco fire, which occasioned property losses estimated at \$400,000,000.

Nature produces over a hundred earthquakes every year capable of causing these effects on a modern city. Only the luck of location has spared all but a few in modern history.

Two that were not spared were Tokyo and Yokohama, in 1923. There, again, fire following the earthquake accounted for the loss of 100,000 lives and uncounted values in property. There were 242 fires started simultaneously in different places in Tokyo within minutes after the quake struck. Yokohama was burned 100 per cent and Tokyo 65 per cent. It was noted at the time that modern steel and concrete structures resisted the shaking quite well. Had it not been for the fire, they would have been little damaged.

WHAT CAUSES EARTHQUAKES?

Many of the effects of earthquakes are widely known, but less is understood about what causes them. And to have a proper respect and understanding, yet remove some of the aura of

superstition and fear, a brief look at the causes might be in order.¹

As you look about you on the surface of the earth you see many different materials: soil, pebbles, rocks. Had it ever occurred to you to wonder which, if any, of these constitute the main body of the earth?

Geologists have learned in recent years that the main portion consists of rock 1,800 miles thick wrapped around a liquid core. But if we could see some of this rock at a depth somewhere between a few miles and several hundred it would look and behave quite differently from the types we know on the surface. For one thing, it is under great pressure and in continuous slow motion as the earth shrinks and wrinkles. These pressures are uneven, and in places where they are greatest earthquakes are more common. Every time a block of rock is distorted beyond endurance by these forces, it breaks. The vibration set up by the break is what we call the earthquake.

There are large earthquakes that can be felt for a thousand miles, and small ones that can be felt for only a few miles, and then still others that are never felt at all.

INSTRUMENTAL RECORDS

The compilation of precise statistics concerning earthquakes is in its infancy. Only since 1918 has there been concerted international co-operation in exchange of information leading to the determination of locations of the largest ones from instrumental records. In that short time, the numbers of readings

¹ For reference material on earthquakes see L. Don Leet, *Causes of Catastrophe* (New York: McGraw-Hill Book Company, 1948); John R. Freeman, *Earthquake Damage and Earthquake Insurance* (New York: McGraw-Hill Book Company, 1932); L. Don Leet and Sheldon Judson, *Physical Geology* (New York: Prentice-Hall, 1954).

L. Don Leet, Ph.D., D.Sc. (Hon.), is Professor of Geology, Harvard University, Cambridge, Massachusetts, and seismologist in charge, Harvard Seismograph Station. He has served as consultant to government agencies and private corporations and is author of *Practical Seismology and Seismic Prospecting and many other technical works.*

available for this purpose have tripled by reason of increase in number and improvement in quality of seismographic stations. As a partial result, the number of earthquakes located instrumentally each year has nearly doubled, though it is certain that the actual number of earthquakes has not done so.

Historical records show that a given region may undergo a spasm of activity followed by a lull of one or two centuries, yet our modern instrumental records cover only half a century. Inevitably, therefore, many seismic sections of the globe are not represented in current statistics, an assumption confirmed by the fact that consistently about half of each year's locations are in places from which there was no previous instrumental record. Indeed there are probably not many, if any, square miles of the earth's surface which have not experienced and will not at some future date again experience earthquake vibrations strong enough to be felt or even do damage.

HOW MANY A YEAR?

At the present time, instrumental records are being used to locate an average of from six to seven hundred earthquakes a year. Of these, over a hundred are literally world-shakers capable of causing catastrophe in a large center of population near at hand. In such matters, as illustrated at San Francisco, at Tokyo, and throughout history, man is his own worst enemy in that it is his own devices that trap him, not the absolute fury of nature as in some other forms of catastrophe. If we stretch the thing to some kind of limit by including everything down to the smallest trucklike tremors unrecorded in remote spots, it is likely that a figure of 50,000 earthquakes a year (more than 130 a day) is far short of the true num-

ber. One seismologist's estimate reached 1,000,000 per year.

EARTHQUAKE ZONES

Of these, the majority in our current records tend to cluster in two zones. One of these borders the Pacific Ocean, where 80 per cent of the energy represented by earthquakes is now being released. Of the total energy released by all earthquakes 15 per cent is in a zone that extends from Burma through the Himalayas, into Baluchistan, across Iran, and westerly through the Alps of Mediterranean Europe. On the other hand, major quakes occur outside these zones, and statistics should be viewed with caution when one exception can be a catastrophe. The most violent earthquake in the United States in historic times centered at New Madrid, Missouri, within damage range of Memphis and St. Louis, in 1811; another major shock was at Charleston, South Carolina, in 1886 and another near Boston, Massachusetts, in 1755. All these places are outside the so-called earthquake zones outlined by statistics.

SOME PREDICTIONS

These details throw some light on the value of the predictions of perennial prophets who discover in themselves an ability to foretell earthquakes. In 1935, a resident of New York City achieved some publicity along those lines. Using a system involving planetary conjunctions, first tried unsuccessfully by Konrad von Megenberg in 1359, he named a certain week within which there was to be "an earthquake in islands northeast of Australia." The approximate magnitude was not stated, but to make this any kind of an argument at all, we have to assume that a large one was meant; in the hundreds of thousands of

square miles of active seismic region thus loosely designated, it is unlikely that a week has passed since the dawn of the present geological epoch without the occurrence of several hundreds of small ones. In spite of the latitude (and longitude) which the man allowed himself, he had the amazing misfortune to select one of a dozen or so weeks of the year when not even a moderately large shock was reported from his region. It did happen that the volcano Krakatoa belched during the week, a thousand miles in the wrong direction, and through some species of journalistic legerdemain and geographic confusion, this was published as a fulfillment of the prophecy. Thereupon, dusty professors in highly endowed universities were called upon to blush that an amateur with globe and compass had penetrated the mysteries of earthquakes where their vaunted science and shiny (?) laboratories had failed for generations. Within a month, the prophet had slept undisturbed through the vibrations of a major, but unpredicted, shock in Canada which was felt as far south as Washington, D. C. He promptly did a private act of planetary conjunction popularly known as going into an eclipse.

IRREGULAR CYCLES

Earthquakes, like so many things in nature, occur in cycles, but they are not regular enough to permit even a rough guess as to when another one is due. Our records in California, for example, go back about a century and a half. Concentrating our attention only on the most severe, we find there were major ones in 1812, 1857, 1865, 1868, and 1906.

Northeastern America, though not in the principal zones of present activity, has a history of earthquakes of which records have been kept for the past three hundred years; they include a

major quake at Boston in 1755. Water-supply investigators have found evidence of a progressive tilting of the ground resulting in subsidence of the land relative to sea level at the rate of one foot per century at Boston and about two-thirds that amount at New York. Geologically recent sea beaches are found 700 feet above present sea level near Montreal. The restlessness of the crust necessary for the production of earthquakes appears to be present.

A sweep of nine centuries is covered by records from Lisbon, Portugal, starting in 1009, continuing in one of the world's greatest known earthquakes on November 1, 1755, and carrying through to today. The intensity of the earliest shocks is in doubt, but a major one in 1344 was followed by a principal shock in 1531, followed, in turn, by the shock of 1755. Since the middle of the nineteenth century, the region has been quiescent. Thus Lisbon and Boston, which had their most recent great earthquakes in the same month nearly two centuries ago, are two good candidates for a return to the active class within this century.

WHAT OF THE CITIES?

Without particular regard to the intensity of the shocks, the presence of earthquakes of any kind near spectacularly large cities like New York, Chicago, and Boston is intriguing. All these cities have had them, Chicago as recently as Saturday, February 12, 1938, and New York several times within a little over a year in 1937-38. On Sunday, July 18, 1937, a quake originated on Long Island within fifteen miles of Times Square and shook 1,500 square miles of adjacent land perceptibly. There were several subsequent slight shocks in the vicinity.

Minor activity of this type distributed throughout the northeastern part of the

continent has led to the suggestion that the area may be entering an epoch of increasing numbers of earthquakes which probably has not yet passed a climax. There is absolutely no way of knowing that there will be so much as a single quake more in the next century, but experience in New England and other parts of the world indicates the strong probability that there will be more, some strong and some in the central and southern parts of the district.

PLANNING WOULD HELP

Nothing that has been said should be interpreted to mean that residents of large cities in northeastern America, any more than in California or any earthquake country, should simply resign themselves to the inevitable, in the death-and-taxes tradition. We are not the helpless creatures of fate in connection with earthquakes that statistics make us appear. Precautions can be taken to reduce greatly many of the worst hazards to life and property.

Plans can be made that include a careful analysis of the pattern of water distribution, so that individual sections of a city could be isolated where damage was greatest and pressures maintained in the others for fighting fire. Such planning, as a matter of fact, would meet some of the hazards of fires from other causes. The fact that past earthquakes near large eastern cities have not been of major proportions should not blind us to the risk, for even a minor quake can start devastating fires which get out of control, especially in wintertime New England.

So far as sheer violence of shaking is concerned, many types of first-class modern construction are almost automatically earthquake proof. This is particularly true of the large buildings in a city like New York. If the public could be educated to that fact, fewer

would run wildly into the streets to be hit by falling debris from the outside of buildings otherwise intact.

The effects of an earthquake well short of major intensity were demonstrated in Long Beach, California, and the vicinity on Friday, March 10, 1933. Most striking was the vulnerability of certain types of school-building design and construction. With demand, owing to their special uses, for many window openings and large floor spans, when these were constructed of brick and wood without bracing against horizontal forces, they failed spectacularly by the collapse of walls and fall of floors. The earthquake occurred just before 6:00 P.M. If it had come during school hours, the death toll would have been appalling. The hour of occurrence further reduced loss of life in downtown sections, where streets were nearly deserted when parapet walls, cornices, and various ornamental units crashed into them.

Public interest in earthquake-proof design and construction, earthquake insurance, and public planning for emergency spurts to a high level near such areas after an earthquake. Then certain members of the community discover that proper precautions would involve condemnation of structural types in which they have an interest, others discover that an increased tax rate would result from bond issues for correcting school or public building conditions, and finally the tapering off of aftershocks and the subsequent period of ground quiet remove the prod of immediate fear. Lessons are soon forgotten, while other communities (which really should be the most concerned) look with pity on the stricken district as experiencing things remote from their own sphere, things that "can't happen here."

Seismologists are striving, and probably will have to strive for generations,

to get large cities to prepare in advance rather than after the fact. Perhaps their greatest handicap is factual honesty, which forces them to admit the inadequacy of their own warnings. The average responsible property owner, however, thinks nothing of insuring against fire when the statistical risk in some cities may be less than that from earthquake-caused fire (not generally covered by ordinary policies). We keep hoping for a miracle, for a day when a Boston or a Memphis will develop a community conscience in connection with earthquakes and earthquake fires before its number comes up; and ultimately when every large city will have

building codes which require horizontal bracing in school buildings, removal of loosely hung gingerbread and precariously perched water towers, and similar obvious steps toward what, after all, is nothing but structural sanity anyway.

Since the very nature of an earthquake creates mass panic more quickly and uncontrollably than most types of natural disaster, special planning is needed to cope with this difficulty. Present consideration by the Red Cross, civilian defense, and others of preparation for emergencies of the type to be expected in the event of enemy attack actually outlines many important features needed in a plan for earthquake emergencies.

The Human Being in Disasters: A Research Perspective

By CHARLES E. FRITZ and HARRY B. WILLIAMS

Abstract: Many groups and agencies have a vital need of accurate information on how people behave during disasters. This article presents information which seems to have particular pertinence for disaster preparedness, control, and amelioration. Among the subjects discussed are the problem of how to make disaster warnings effective, behavior during disasters and in the subsequent emergency period, the problem of people's flocking into the area, the need and difficulties of co-ordination and control of rescue and relief activities, the traumatic effects of disaster on its victims, and the sources of possible conflicts between rescue and relief agencies and their clients.—Ed.

SUDDEN disaster strikes a community. How do human beings act in such a situation? According to a pervasive popular conception, they panic, trampling each other and losing all sense of concern for their fellow human beings. After panic has subsided—so the image indicates—they turn to looting and exploitation, while the community is rent with conflict. Large numbers of people are left permanently deranged mentally. This grim picture, with its many thematic variations, is continually reinforced by novels, movies, radio and television programs, and journalistic accounts of disaster.(22)¹

Those experienced in actual disasters are able to reject this picture as a product of ignorance, inaccurate observation, and fertile imagination. In more subtle form, however, stereotypes of this kind influence the thinking of disaster officials and experts and affect their plans and operations. This imagery, therefore, affects both the general public and persons who are responsible for protecting and helping the public in case of disaster.

¹ Numbers in parentheses refer to items in the list of references at the end of the article.

In 1950, a concerted effort to study human behavior in disasters in a systematic manner began. Since that time, there have been numerous opportunities to test the adequacy of these popular conceptions, as well as the more scientific hypotheses relevant to behavior under conditions of stress and crisis. As a result of nearly forty studies of both domestic and foreign peacetime disasters, there is now emerging a clearer, more fundamental understanding of both the typical human responses to disaster and the recurrent human problems of disaster planning and management.(5)(24)

This article will report and analyze some of the more salient general findings of these peacetime disaster studies. In making a selection from the total range of findings contained in the many research studies currently available, we have been guided by a twofold emphasis: First, since much of the current thinking about disaster behavior is based upon observations of the unusual, the dramatic, and the abnormal, we hope to supply a corrective by emphasizing the more general, typical, and recurrent forms of behavior found in disasters. Second, since there are many

groups and agencies which have a current vital need for accurate information on human actions in disaster, we have selected those findings which seem to have particular pertinence for disaster preparedness, control, and amelioration.

DISASTER WARNINGS

The possibility of warning is conditioned by the extent to which the different types of disaster can be predicted reliably. Even with reliable knowledge about a probable danger, however, it is difficult effectively to warn a large population which cannot directly perceive the danger of a disaster. First, there is the question of whether the warning should be issued or not; next, if the answer is affirmative, of how it should be given. (2) The official who makes these decisions worries about what people will do if he has warned them and the disaster does not occur; conversely, he worries about what will happen if he does not warn them and the disaster does occur. In addition, warnings are sometimes withheld because officials fear that people will "panic" if warned, but the relatively extensive evidence now available from studies of warning situations gives no support to this last fear.(1)(7)(13)(21)

An effective warning message must be clear and specific. If it is vague or ambiguous, if it leaves the individual with as many choices of action as he had before, it will almost certainly be ineffective.(14) Warning messages must be transmitted accurately through channels which will reach the entire public. Care also must be taken to ensure that the population to be warned does not receive additional information which contradicts or distorts the intended warning message.

People are reluctant to accept and act upon warnings of those dangers which they do not directly perceive as immediate and personal. Marysville and Yuba

City, California, were flooded during December 1955:

In spite of intensive mass media coverage, Weather Bureau forecasts of flood danger were either ignored or actually not received by substantial portions of those interviewed in the disaster areas. Furthermore, thirty-nine percent of those who remembered receiving such reports indicated that they did not fully believe them.(1)

The investigators found the following reasons, also supported by other studies, for disbelief and reluctance to act upon flood warnings:

Lack of past experience with disasters, the delusion of personal invulnerability [the feeling that "it won't get me"], the inability to adopt a new frame of reference so as to expect unusual events, dependency upon protecting authorities, and the willingness to seize upon reassuring communications or to deny or disregard communications predicting disaster. . . .(1)

Reluctance to abandon property and personal possessions is also a common factor weighing against evacuation of threatened areas.

This brief rehearsal of the difficulties of warning is not intended to mean that effective warning is impossible. Effective warning of an impending tornado, for example, is credited with saving the lives of many school children in San Angelo, Texas.(16) The difficulties are real and well documented, however, and we stress them in order to call attention to the need for further research and to emphasize the importance of human factors in planning warning systems.

SURVIVAL BEHAVIOR

When people have no prior warning, the recognition of danger is frequently delayed. One reason is the commonly noted tendency of persons to associate disaster signs with familiar or normal events. In tornadoes, for example, the roar produced by the high winds of the

Charles E. Fritz is Research Associate and Harry B. Williams, Ph.D., is Technical Director of the Committee on Disaster Studies of the National Academy of Sciences—National Research Council, Washington, D. C.

vortex is often interpreted as the sound of a train passing nearby. In events involving carbon monoxide or other toxic agents, people often attribute their physical symptoms to chronic ailments or predisaster experiences which might account for their disturbances. Particularly in cases where people are unfamiliar with the disaster agent or cannot directly perceive it, this tendency may continue until it is too late to take adequate protective action.(11)(15)

When danger is recognized as imminent and personal, people seek safety by flight, by taking shelter, or by combating the disaster agent. When a tornado funnel is sighted or the house begins to shake or water comes over the dikes, the behavior of people is generally adaptive; they usually take action aimed to protect themselves and others, rather than "freezing up" or engaging in irrational acts which increase the danger. These actions, of course, are not always effective in protecting them against danger. In the first place, the situation usually permits only a limited choice of actions; in the second place, many people, having had no disaster training or previous experience, do not know which of the available courses of action would be most effective.(13)(15)

One method of survival is flight. "Flight" does not necessarily mean "panic," or uncontrolled flight. It is more often orderly and controlled, with people continuing to think of others and continuing to use critical judgment. Often it is the only rational choice individuals or groups can make if they wish to live.² The period of threat,

² The cultural stereotype which equates flight with cowardice and absence of flight with bravery tends to obscure the fact that flight can be a rational, adaptive form of behavior. The thought is well expressed in the old Chinese saying: "Of the thirty-six ways to escape danger, running away is best." Cf. Carlton Culmsee, "Tight Little Island off China," *New York Times Magazine*, August 19, 1956, p. 66.

however, is the time when there is the greatest likelihood of panic.(11) Panic is most likely to occur when (a) people perceive an immediate, severe danger, (b) they believe there is only one or at best a limited number of escape routes from the danger, (c) they believe those escape routes are closing (not closed) so that escape must be made quickly, and (d) there is a lack of communication to keep them informed of the situation.(6)(17)(18)

During the actual impact of the disaster agent, people try to stay alive and protect their immediate associates. Even during hectic, violent impacts many people continue to act, when they can, with reference to other people in the immediate environment, particularly loved ones. Mothers try to protect their children; fathers their wives and children. The extreme importance of the family group in disaster is revealed in the periods of threat and impact, and it continues throughout the disaster.

Actual behavior during impact is largely determined by the nature of the situation as the individual assesses it. Thus during a brief, violent impact one holds on to things and people, seeks cover from flying objects or collapsing walls, tries to shield children, and so forth. People isolated by floodwaters, after reaching a place out of the water's reach, must await rescue (or in some cases devise further means of escape, such as rafts). If isolation continues long enough, they must combat as best they can the rigors of exposure, hunger, and other deprivations. The chief survival problem in an epidemic or toxicological episode is to keep oneself and one's loved ones as much as possible from contact with the dangerous element.(8)

BEHAVIOR IN THE POST-IMPACT EMERGENCY

Although most persons may be temporarily stunned, confused, and some-

what disoriented after impact, they usually regain sufficient self-control within a brief time to extricate themselves, if they are physically able, and assist family members, kin, neighbors, and friends.(10)(15)

People in the impact zone cannot be expected to act as efficiently and discerningly as they normally do, but if they are isolated for periods of an hour or more, they will accomplish many of the immediate and pressing rescue and relief tasks before the arrival of outside aid. In a study of the White County, Arkansas, tornado, for example, the National Opinion Research Center found that during the first half hour after impact, 32 per cent of all persons in the impact area engaged in search for the missing, 11 per cent took an active role in the rescue activity, and 35 per cent performed emergency relief functions. During the following six hours, 28 per cent engaged in search for the missing, 22 per cent in rescue work, and 46 per cent in emergency relief.(15)

These and similar findings refute the notion that psychological disturbances render the population of the stricken area completely dependent and helpless. It should not be inferred, however, that the victim population can handle all the essential rescue, relief, and control tasks by itself or that it can handle them as efficiently as an organized outside force. Much of the relief activity by the victim population, as well as the informal aid from peripheral areas, is sporadic, unsystematic, and inefficient. It tends to be "grooved" along the channels of intimacy and friendship, so that many of the more general community needs are neglected or overlooked.

Where the stricken area is not isolated by physical circumstances or lack of communication, the victim population is soon joined by volunteer helpers from neighboring areas. It has been estimated that in the Flint-Beecher tornado disaster of June 1953 the victim

population and volunteer helpers evacuated two thirds to three fourths of the casualties to hospitals within two hours following the disaster.(20) One participant later stated:

In spite of all that can be said, pro and con by outsiders, they must realize that the first one and one-half hours of this disaster was practically in the hands of the immediate neighbors . . . the problem of moving bodies and saving lives was in their hands. (20)

To an outside observer the initial behavior of persons in a disaster-struck area is likely to appear completely irrational, chaotic, and confused. In the physical devastation surrounding him, the observer sees what appears to be aimless, random, uncontrolled, or conflicting activity on the part of the survivors. People are running or driving vehicles in opposite directions, oftentimes passing each other without acknowledgment or seeming awareness. Some persons are moving out of the impact area, many others are moving into it. Others are "standing around," apparently just looking or talking with each other. Here and there small groups of people are digging in debris, comforting the injured, or attempting to retrieve their scattered belongings. Behavior is so heterogeneous that it defies description in terms of a few simple categories.

It is this lack of uniformity in action that often leads the outside observer to the erroneous conclusion that the population has "panicked." What the outside observer is witnessing is not panic, but social disorganization—uncoordinated activity on a general, community level. It is important to recognize that this social disorganization does not necessarily indicate individual irrationality or personal disorganization. Many individuals and small groups are working within the disaster area with purpose and some degree of organization. How-

ever, they are likely to be focused on discrete, limited tasks and to appear oblivious to the more general needs for assistance. The central problem of disaster management is to broaden the focus of attention and re-establish general, co-ordinated action for this mass of individual and small group actions. (15)

CONVERGENCE BEHAVIOR

One of the central problems of disaster co-ordination and control derives not from the victim population itself, but from the informal, spontaneous, "convergence action" of persons residing outside the disaster area. (12) Contrary to the popular image of behavior in disasters, movement *toward* the disaster area usually is both quantitatively and qualitatively more significant than flight or evacuation from the scene of destruction. Within minutes following most domestic disasters, thousands of persons begin to converge on the disaster area and on first aid stations, hospitals, relief, and communications centers in the disaster environs. Simultaneous with this physical movement of persons, incoming messages of anxious inquiry and offers of help from all parts of the nation and foreign countries begin to overload existing telephone, telegraph, and other communications and information facilities and centers. Shortly following, tons of unsolicited equipment and supplies of clothing, food, bedding, and other material begin arriving in the disaster area or in nearby relief centers. Although the initial convergence derives from areas contiguous or proximate to the disaster site, the process continues for days and weeks following the disaster as wave upon wave of persons from successively distant points send messages and supplies or personally travel to the disaster area.

In virtually every disaster studied, the informal convergence on the dis-

aster area and the mass assault (20) on the problems posed by the disaster have seriously hampered the administration of organized rescue, medical, emergency relief, and rehabilitation programs. The movement of emergency vehicles is often blocked by severe traffic congestion; essential outgoing messages are frequently delayed as a result of the heavy volume of incoming inquiries and messages; and the tons of unsolicited goods, in large proportion comprised of unneeded and unusable materials, greatly contribute to traffic congestion and require personnel and facilities in handling and storage which could be used for more essential tasks and functions.

The misconception that a disaster-struck population automatically panics and flees wildly from the disaster area has tended to center attention on the victim population as the source of control problems. In reality, however, the victim population is much more cooperative and subject to control than persons who converge from the outside. The population affected by a disaster is not confined to the immediate geographical area of destruction, death, and injury but includes all persons who are related to or identified with persons and organizations in the stricken community. Even in isolated, single-community disasters, the converging people, messages, and supplies originate in many parts of the nation and in a number of foreign countries. (12) The effective unit of disaster management is usually national in scope and, therefore, requires national planning and control measures.

Effective control of the convergence process requires not only broadening the unit of disaster management but also recognition of the different motives of the convergers. The problem of convergence is often too narrowly conceived as a problem of blocking or restraining "sightseers," "looters," and other "un-

authorized personnel." This type of thinking often derives from the erroneous notion that most people who converge on a disaster area from outside have exploitative motivations. The actual incidence of looting and other forms of exploitation found in peacetime disasters, however, is relatively insignificant when compared with actions motivated by anxiety over missing loved ones, sympathy for and desire to assist the stricken population, and the need to perceive and comprehend an unusual or unfamiliar event. (12) (15) Satisfaction of these needs depends upon adequate information, positive direction, and guidance rather than indiscriminate restraint.

CO-ORDINATION AND CONTROL

In the light of what has been reported above, it is evident why control and co-ordination of the rescue and relief effort are difficult to achieve. The amount of confusion in disasters is often overemphasized; nevertheless, it does exist. It has its roots in a number of factors: (a) the physical disorganization of the disaster-stricken area; (b) darkness, if the rescue and relief effort is conducted at night; (c) the effects of convergence behavior; (d) a great sense of urgency to act, to get something done to help the victims, which makes taking the time to communicate and co-ordinate decisions seem a luxury; (e) the fact that under stress it is difficult to exercise the more complex intellectual processes, such as looking ahead and thinking about the indirect consequences of a decision—except for the highly trained and experienced and those few individuals who become unusually efficient in crisis; (f) lack of workable, pre-existing plans on a community-wide basis; (g) inadequate

* Arrangements between pairs or groups of collateral agencies are frequent, and community-wide disaster plans sometimes exist on

communication, partly because of the destruction of communication facilities, but more generally because of inadequate and improper use of these facilities; (h) ambiguity concerning what official or agency has the authority for certain decisions; (i) the absence of an agreed-upon, understood division of labor among different groups and agencies; (j) the occurrence sometimes (though not as frequently as rumors would often suggest) of disputes concerning authority, responsibilities, and jurisdictions; (k) the lack of systematic reconnaissance and other procedures for maintaining a central strategic overview of the problem; and (l) the lack of essential central co-ordinating mechanisms, such as means of co-ordinating requests for supplies. (9) (12) (16) (19) (20)

The brief discussion above must, of course, oversimplify a complex situation. The statement that lack of division of labor is a factor impeding co-ordination and control, for example, is not intended to imply that different groups and agencies cannot work efficiently and usefully on the same kinds of task. Nor do we intend to imply that the existence of disputes invariably disrupts the community or affects the services rendered to the victims. Nevertheless, the factors recited above often impede and sometimes confound disaster management; they are problems which must be taken into account if it is to be improved.

EMOTIONAL AND PSYCHOSOMATIC AFTEREFFECT

Most persons who directly experience a disaster or who are closely identified with the victim population suffer some form of emotional or psychosomatic

paper or in an embryonic stage of organization; but if plans are to be effective they must be understood and accepted by all those who have a part in them, including the general public, and they must be practiced.

aftereffect in the early postdisaster period.(11)(15)(23) Despite the universality of such disturbances, however, they usually do not eventuate in heavy drains on psychiatric and medical facilities. Since so many symptoms arise out of such situational factors as fear for the safety of self and intimates, separation of family members, disruption of normal routines, and anxieties concerning the future, an effective "treatment" lies in the alleviation of the situations which produced them. The minimization of exposure to secondary traumatic stimuli, the rapid reuniting of families, the restoration of familial and occupational routines, rapid and efficient efforts at reconstruction and rehabilitation, and measures designed to protect the populace from future danger are positive measures that can be taken to prevent and ameliorate negative emotional and psychosomatic aftereffects.(15)(19) In a small proportion of cases, persons may need individual psychological or psychiatric help.⁴

SOCIAL SOLIDARITY

The net result of most disasters is a dramatic increase in social solidarity among the affected populace during the emergency and immediate postemergency periods. The sharing of a common threat to survival and the common suffering produced by the disaster tend to produce a breakdown of pre-existing social distinctions and a great outpouring of love, generosity, and altruism. During the first few days or weeks following a major community-wide disaster, persons tend to act toward one another spontaneously, sympathetically, and sentimentally, on the basis of com-

⁴ For a further discussion of psychological effects, see the article in this issue of *THE ANNALS* by Calvin S. Drayer, "Psychological Factors and Problems, Emergency and Long-Term."

mon human needs rather than in terms of predisaster differences in social and economic status. This solidarity is of major significance in facilitating both personal and social recuperation. It helps persons to overcome the shock of severe personal injuries, losses, and deprivations and motivates volunteer participation in the numerous rescue, relief, and restoration tasks.

This local solidarity, however, also poses operational problems for outside relief and control agencies. If the informal mass assault has fulfilled a large share of the immediate emergency needs, as it usually does in domestic peacetime disasters, a strong in-group feeling of euphoria and pride of accomplishment tends to develop. If the actions of the outsiders do not coincide with the new sentiments and emergency norms that have arisen among the affected populace, the outsiders tend to be criticized and resented. Outside persons or agencies which adjust to the local sentiments of solidarity and enable the local populace to pursue their self-determined course of action, on the other hand, usually are accepted and accorded high praise.(9)(12)(15)(16)

If there is no recurrent or persistent threat to community survival after the various emergency tasks have been completed and restoration gets under way, the newly engendered social solidarity gradually disintegrates. As larger and larger numbers of people re-establish themselves and return to normal pursuits, the process of social differentiation returns and the standards of reference change from values of survival to values associated with continuity and stability. People begin thinking of the consequences of the disaster not in terms of the immediate present, as they have done during the emergency period, but in terms of the longer-range future; in terms of the effect on them-

selves and their intimates rather than on the community as a whole. Property values and concern with material symbols of status reassert themselves. This return to the normal conditions of existence is likely to be uneven, varying in accordance with the extent of personal loss and property destruction. It is during this period, when persons begin comparing their losses and deprivations in terms of predisaster standards of value, that normal social conflicts and resentments may reappear. In some cases, though certainly not inevitably, pre-existing conflicts may be intensified by the disaster experience.(13)

The rapid shift in values from normal to emergency, from social differentiation to social homogeneity, and the uneven, selective return to normal standards often create difficulties for organizations which have standardized policies and procedures for administering disaster relief and rehabilitation aid. Many of the problems of disaster management result from the temporary lack of "fit" between the conceptions of need of the victim population and of the organizations attempting to administer to this population. As a consequence of these different conceptions, the activities of the organization and the needs of the clients get out of phase; incompatibility and even conflict may result. From an organizational viewpoint, solutions to this problem lie primarily in developing greater sensitivity to the prevailing climate of opinion among the victim population and greater capacity to make rapid adjustments to local situations.

HOSTILITY AND BLAME

Although it is true that conflicts often develop between different agencies and groups and old controversies within the community are sometimes reawakened

in disaster, it is also true that other schisms are healed and new forms of co-operation arise. The commonly held stereotype that in the wake of disasters people inevitably and universally become hostile and irritable, engage in irrational aggressive acts against authorities, or heap blame for the disaster on innocent victims finds little support in systematic research findings.(3)(12)(15)

People, of course, do attempt to assess the causative factors in disaster, the remedial action needed to prevent recurrence, and the groups or agencies responsible for this remedial action. The outcome of this assessment process, however, is not necessarily the focalization of blame, resentment, or hostility on fortuitous or irrational targets. In one city where three airplane crashes occurred within a period of two months, it was found that many persons were attempting to determine responsibility for the crashes, but only a minority of them resented those whom they held responsible.(3)(15) The process of blame assessment is essentially a future-oriented response to disaster; agents who are blamed are not blamed for the disaster just past but for the disaster that may occur in the future. If the responsible authorities are sensitive to the public fear of recurrent danger and deprivation and communicate to the populace that they are genuinely concerned with the problem and are doing everything in their power to take effective measures to provide future protection, the problem of blame assessment can be minimized. In disasters which are defined as purely accidental and nonrecurrent or those in which there is clearly nothing that responsible individuals or agencies can do to remedy the situation, blame assessment is not likely to occur.(3)(15)

An erroneous impression of widespread faultfinding and search for a

scapegoat is often fostered by a few vociferous persons in the community who try to use the disaster to secure power, status, prestige, or other rewards for themselves or for special interest groups. These "issue makers" oftentimes utilize newspaper editorials, feature articles, letters to the editor, and other media of mass communication to express themselves, thereby creating a misleading picture of the generality and representativeness of their viewpoints. In many cases, hostile outbursts by local public officials and representatives of local professional and voluntary associations are inspired by what they interpret as unwarranted outside encroachments of authority, attempts to usurp power and dictate policy, or an attempt to claim credit for success of the relief work.(20) Although they usually do not have widespread public support for their viewpoints, they create issues on which the public is expected to take a stand.(15) They therefore pose the possibility of engendering disruptive conflicts which may hinder the effective administration of relief and rehabilitation programs. Outside agencies, in particular, must be sensitive to this problem and anticipate it in their disaster plans.

CONCLUSION

The possibility of maladaptive, disruptive, or antisocial behavior should not be overlooked in planning for disaster management. Disaster agencies are likely to fall into error, however, if they focus primary attention upon the popular stereotypes of disaster behavior and overlook the more common and recurrent forms of behavior reported in this article. Most of the human problems of disaster originate in the lack of co-ordination among the great mass of people, small groups, and official disaster agencies, each of which is viewing and attempting to meet the needs of the disaster in terms of its own perspective and capabilities. When communities or groups have no practiced plans of action which fit into an organized, overall disaster plan, behavior tends to be too segmental, too limited in scope, and too much dominated by the immediate present to provide efficiently for the more general, continuing human needs posed by a disaster. The challenge for future planning lies in the development of realistic plans for organizing, training, integrating, and co-ordinating the actions of both the general populace and the formal disaster agencies.

Co-ordinating and Extending Federal Assistance

By VAL PETERSON

Abstract: As a result of the Federal Disaster Act of 1950, the national government can now provide disaster aid to states in the most effective way, co-ordinating, through the Federal Civil Defense Administration, the activities of all pertinent federal authorities. The prerequisites and the procedure which set this machinery into operation are described, and a graphic example of how the system works is given in a story of the floods of August 1955, which caused the governors of several northeastern states to call for federal assistance and brought forth the combined efforts of six federal departments and four other federal agencies.—Ed.

ALL assistance by federal agencies in major peacetime disasters is now a co-ordinated operation under Public Law 875 of the Eighty-first Congress, which is the Federal Disaster Act of 1950.

So far as it can be defined in this case, co-ordination means inducing independent agencies to work together for a common purpose. In the Disaster Act of 1950, Section 5(a) declares:

In the interest of providing maximum mobilization of Federal assistance under this Act, the President is authorized to co-ordinate in such manner as he may determine the activities of Federal agencies in providing disaster assistance.

In 1953 the President delegated to the Federal Civil Defense Administrator the carrying out of the Disaster Act, which concerns peacetime assistance to state and local governments.

The opening section of the Disaster Act reflects the uncertain history which brought it about. It reads:

It is the intent of Congress to provide an orderly and continuing means of assistance by the Federal Government to States and

local governments in carrying out their responsibilities (1) to alleviate suffering and damage resulting from major disasters, (2) to repair essential public facilities in major disasters, and (3) to foster the development of such State organizations and plans to cope with major disasters as may be necessary.

Early federal assistance was neither continuing nor orderly. It was voted by Congress to fit each disaster, usually in the form of a money grant some time afterwards. When physical assistance was attempted, it was usually belated and confused. Whether in money or in kind, assistance in general was determined by the outcry.

The first continuing nationwide plan of private assistance to disaster victims was launched by the Red Cross in 1881, by extending its original purpose of relieving suffering on the battlefield to include relieving suffering caused by floods, earthquakes, tornadoes, fires, and other misfortunes. Disaster relief by Red Cross volunteers developed so effectively that Congress in 1900 chartered the American National Red Cross as a quasi-governmental organization, to provide disaster victims with food, cloth-

ing, medical care, shelter, and eventually rehabilitation.

For decades, the humanitarian assistance provided by the Red Cross and by the local organizations that rallied to a disaster continued to be hampered and sometimes frustrated by the interruption of public facilities. In an emergency there were not enough trained fire fighters, rescue crews, and equipment crews to clear away debris, open roads, repair bridges, and expedite transportation for the injured and for food, clothing, and medical and other relief supplies.

The first enactment of a general federal policy of disaster assistance was the Surplus Property Disaster Act of 1947. Whenever the President determined it to be necessary, he was authorized by this act to direct the Federal Works Agency (or its successors under various reorganizations) to draw surplus property from the War Assets Administration and donate, lend, or sell it to states and local governments in a disaster area. Under this authority, the Federal Works Agency could utilize any other federal agency and could legally expend any funds in hand with assurance that reimbursement would be appropriated.

Some time after the Surplus Property Disaster Act of 1947 became ineffective owing to the exhaustion of wartime supplies, which had ranged from bulldozers to household furnishings, Congress enacted the present Disaster Act of 1950.

Meanwhile a division of functions had developed between the Red Cross and federal agencies that had been given special responsibilities in disaster. In substance, the Red Cross was to relieve human suffering; the federal agencies were to repair the special government facilities that protect life and property—such as flood works, highways, public health services. This understanding on the division of functions was written into the Disaster Act of 1950.

The American National Red Cross was confirmed explicitly in its humanitarian responsibilities in Section 4 of the act, which reads:

Nothing contained in this Act shall be construed to limit or in any way affect the responsibilities of the American National Red Cross under the Act approved January 5, 1905, as amended.

Similarly the agencies already assigned disaster responsibilities, such as the Corps of Engineers, the Bureau of Public Roads, the Public Health Service, are protected in their established positions in Section 3(d), which reads:

The authority conferred by this Act, and any funds provided hereunder shall be supplementary to, and not in substitution for, nor in limitation of any other authority conferred or funds provided under any other law.

AUTHORITY TO FILL GAPS

The co-ordinating authority of the act is applicable where needed to keep all federal agencies from neglecting any task. The co-ordinator may not limit, duplicate, or make substitutions for the statutory authority of any federal agency, but he has authority to add tasks to any agency, and the President has a Federal Disaster Fund to pay for such tasks at his discretion. The effect is to stop any gaps in the pattern of federal assistance.

The needed assistance which may be provided under the Disaster Act, as amended, is stated in Section 3, as follows:

In any major disaster, Federal agencies are hereby authorized when directed by the President (or his delegate) to provide assistance:

- (a) by utilizing or lending, with or without compensation therefor, to States and local governments, their equipment, supplies, facilities, personnel and other resources, other than the extension of credit under the Authority of any Act;

Val Peterson, Washington, D. C., has been Administrator of the Federal Civil Defense Administration since 1953. Previously he was Governor of Nebraska during three terms, 1946-52, and for a time Administrative Assistant to President Eisenhower.

- (b) by distributing, through the American National Red Cross, or otherwise, medicine, food and other consumable supplies;
- (c) by donating or lending equipment and supplies determined under existing law to be surplus to the needs and responsibilities of the Federal government, to States for use or distribution by them for the purposes of the Act, including the restoration of public facilities damaged or destroyed in such major disaster and essential rehabilitation of individuals in need as the result of such major disaster; and
- (d) by performing on public or private lands protective and other work essential for the preservation of life and property, clearing debris and wreckage, making emergency repairs to and temporary replacements of public facilities of local governments damaged or destroyed in such major disaster, providing temporary housing or other emergency shelter for families who, as a result of such major disaster, require temporary housing or other emergency shelter; and making contributions to State and local governments for the purposes stated in subsection (d).

This authority to fill gaps in the historic pattern of federal assistance comes into action when the governor of a stricken state applies directly to the President and certifies that the damage outruns the resources of his state. The President may, or may not, declare it a "major disaster" meriting federal assistance. His declaration is guided by the information which he requests from his delegate administering agency.

Usually, assistance takes the form of federal payments for emergency replacement of bridges, roads, culverts, drainage ditches, water works, sewer systems, schools, hospitals, penal and welfare institutions, public buildings, such as courthouses and police stations, and other facilities which have been pro-

vided by local governments for public use and which are essential.

The Congress which passed the Federal Disaster Act of 1950 also passed the Civil Defense Act of 1950 with the understanding that civil defense would later take responsibility for natural disasters. Meanwhile the responsibility for natural disasters was lodged with the Housing and Home Finance Agency. When the President transferred the function to the Federal Civil Defense Administration in January 1953, the key operating personnel of the disaster organization which the Housing and Home Finance Agency had set up were transferred also to the Federal Civil Defense Administration.

ENLARGED AUTHORITY

In transferring the responsibility for maximum mobilization of peacetime disaster assistance to the Federal Civil Defense Administration, Executive Order 10427 enlarged the field of co-ordination.

The President ordered federal agencies to "make suitable plans and preparations in anticipation of their responsibilities in the event of a major disaster" and he added that "the Federal Civil Defense Administrator shall co-ordinate on behalf of the President such plans and preparations." The executive order also recognized explicitly that independent federal agencies with statutory disaster responsibilities can go into operation without waiting for the President to declare it a "major disaster," but it added that "such action shall be subject to coordination by the Federal Civil Defense Administrator, acting on behalf of the President." This statement made the Federal Civil Defense Administrator the federal co-ordinator before, during, and after any disaster and also put a Presidential emphasis on the co-ordination.

In accordance with Executive Order

10427, the Federal Civil Defense Administration negotiated formal memorandums of understanding with certain federal agencies that have independent responsibilities in disaster and also further capabilities on which the Federal Civil Defense Administration might call in an emergency.

The following points were mutually understood in various terms:

1. Co-ordination by the Federal Civil Defense Administration will consist of evaluation of disaster requests and of the total assistance needed and the facilitation of agreement among the various federal agencies to meet the problems involved.
2. The Federal Civil Defense Administration will not directly supervise the operations of the federal agencies but will evaluate the result.
3. The public is to be fully and correctly informed of the assistance provided by each agency.

In the civil defense memorandums of agreement with the various independent agencies, the Federal Civil Defense Administration nominated its Regional Administrators as field authorities to deal with the corresponding field representatives of the other agencies. The field representatives of other federal agencies were to inform the regional civil defense administrators about that agency's functional and geographic responsibility; were to maintain current inventories of their manpower, materials, and equipment usable for disaster in each region; were to instruct the regional civil defense administrators about the operating procedures of the independent agency; and were to exchange between agencies a directory of key personnel and telephone numbers.

The memorandum of understanding with the American National Red Cross recognized that the Red Cross would have full control over its own traditional operations of mass care and rehabilitation. Co-ordination was to con-

sist, in substance, of the exchange of disaster information and of mutual assistance.

Within a year after the transfer of federal responsibility for peacetime disaster assistance in 1953, the legislatures of forty-one states followed federal suggestion and gave responsibility for peacetime disasters to the civil defense director of the state. The remaining states have such legislation pending.

THE COURSE OF DISASTER

Emergency action in disaster now follows a regular course from the locality to Washington and back again. It is important to know what happens as the disaster alarm spreads through state and federal channels.

Locality

At the point of disaster, recovery begins with self-help. It calls out the regular fire and police departments, the transportation and communication services, engineers, bulldozers, rescue trucks, health and sanitation teams.

The load immediately exceeds the regular day-to-day capacity of these services. That is what makes it a disaster. In such a situation, local manpower, equipment, and ready cash are not enough. The locality needs more teams of men who are already equipped and trained and who know how to work together to get the injured out of the wreckage, to give them first aid, to take quick engineering measures which will keep the disaster from involving more people or more property in fire, flood, or collapse.

The source of on-the-spot expansion of the local governmental services in such an emergency is the local civil defense force. Auxiliary civil defense firemen, rescue men, and policemen who are ready to deal with the effects of an atomic blast can deal likewise with the effects of a tornado. The auxiliaries

are welcomed by the regular public services because the regular services have trained them. The officers of the regular services are usually officers of the auxiliaries. They know what the auxiliaries can do. In localities where there is a civil defense force in readiness, emergency operations expand when needed without the handicap of willing but untrained volunteers who often endanger the people they try to rescue and who spread confusion instead of relieving it.

As debris is cleared and fire fighters, rescue crews, medical assistance, and police begin to move into the scene for the restoration of local governmental services, they are welcomed by the Red Cross. In humanitarian assistance the Red Cross has established a position of organized leadership among local and private organizations. In each of the 3,049 counties of the United States there is a Red Cross chapter which is required under its national rules to organize a workable plan for disaster relief and to keep it in readiness. That is the Red Cross position, which is protected explicitly by the Federal Disaster Act.

By agreement, Red Cross volunteers and civil defense volunteers work together. For instance, the Red Cross does not undertake to put out a fire but it does set up canteens to feed the firemen and it undertakes the care of the rescued population—often with the assistance of civil defense volunteers whom the Red Cross has previously trained in first aid and mass care. In peacetime disasters, some civil defense volunteers become, in effect, Red Cross workers. In wartime, the roles would be reversed.

In general, disaster is a local problem at the outset. The mayor of a stricken city or his representative picks up the reins of co-ordination and commands and mobilizes all the community resources. The local action becomes a

holding action while reinforcements are brought up.

State

The call for outside assistance goes from the mayor of a stricken city to the governor of his state. Heretofore the governor's resources were limited to the National Guard, the state militia, the state police, and small detachments of the regular governmental services of the state. Now his capacity to render disaster assistance is multiplied many times by the civil defense organizations of all the political subdivisions of the state.

If the governor finds he cannot mobilize sufficient forces within his own state, he calls on the regional office of the Federal Civil Defense Administration to spread the call for assistance to neighboring states and the federal government.

Regional

The forty-eight states are divided by the Federal Civil Defense Administration among seven regional offices. Each regional office has operating responsibility for interstate and federal assistance to its group of states, in natural and enemy-caused disasters. The regional office co-ordinates the interstate movement of local civil defense forces, and it controls the application of federal resources other than military.

Each regional office is required by the central office of FCDA to establish a register of federal, state, and other agencies operating within the region which have disaster functions or resources, together with the policies which govern their actions and the methods of reaching their key personnel at any hour. This preparation enables the regional office to produce relief forces immediately and to steer them effectively into action.

The regional office co-ordinates the interim actions of any federal agency

which has a standing authorization to intervene in natural disasters without waiting for the Presidential declaration that it is a "major disaster." It also keeps headquarters of FCDA informed of the immediate magnitude of the disaster or its progressive development toward a "major disaster."

National

The Federal Disaster Act comes into effect only after the governor of a stricken state has applied directly to the President, certifying that the damage outruns the resources of his state, and after the President has thereupon determined that it is a "major disaster."

The President is guided in his determination by a formal recommendation which he requests from the Federal Civil Defense Administrator. In turn the FCDA is guided by information from its regional office as to the kind of relief and outlay of disaster funds to be recommended. The federal purpose is to supplement, not to supplant, the state and local efforts.

There is no precise test for a "major disaster." In general, disaster to a limited area or a single establishment, such as the destruction of a school or power-house, is not rated a "major disaster." There are four to five hundred ordinary disasters in the United States in a year. The disasters declared "major" in a year have ranged from ten to twenty-five.

Declaration by the President that a "major disaster" is in progress opens up the resources of all federal agencies in addition to those which may already be acting on their own statutory authority—fighting a flood or a forest fire, restoring flood control works, highways, bridges, transportation, communications, power. The resources of the various federal agencies that may now be called upon by the Federal Civil Defense Ad-

ministration to furnish disaster assistance include professional and skilled personnel able to advise or supervise such operations as debris clearance, emergency evacuation, temporary shelter, the feeding of animals, clothing, water supply, sanitation, sewage, the free distribution of supplies, emergency credit.

The Disaster Act limits assistance by the federal government to the protection of life and property by removal of health and safety hazards and to the emergency repair and temporary replacement of essential public facilities. These operations are intended merely to permit the stricken area to pick itself up and begin to take the real measure of the upset. Permanent restoration is the responsibility of the local body after the disaster is brought under emergency control.

The process of bringing a disaster under emergency control now takes hours where it formerly took days—and days where it used to take weeks. The Federal Disaster Act has contributed several elements which were conspicuously missing when natural disasters struck this nation in the past. We now have organized preparedness, rapid information as to the extent of the disaster, authority to act, and channels of immediate action.

Disasters which are large enough to call for federal and interstate assistance are large enough to cause slow assembly and confused operation of a large relief force, if there is no central direction. Decisions involving the emergency use of governmental equipment or personnel or money, at federal, state, and local levels, used to wait for the answer to the necessary governmental question: "What is the authority for all this?" Now FCDA comes into a disaster situation with clear authorization to expand resources and unroll red tape. It knows where to turn, whom to call, and what to expect.

It should be noted that in all major disasters, in so far as the federal government is concerned, there are two broad phases. In the first, while life and property are in jeopardy the federal government, like any good neighbor, rolls up its sleeves and plunges in to be of assistance without regard to cost accounting. In the second, the cleanup and rehabilitation phase, the federal government lends assistance only upon request from the governor of the state, and accounts are carefully kept. Although figures are not available, the federal government's contribution in the first phase of many disasters is substantial.

IN OPERATION

For about two years and a half, in one disaster after another, the independent federal agencies exercised their statutory authority in their specialized fields according to their established practice and also carried out additional tasks assigned to them by the Federal Civil Defense Administration in accordance with predisaster plans. Then came the first great test of the "maximum mobilization of Federal assistance" referred to in the Federal Disaster Act of 1950, the "suitable plans and preparations" called for in Executive Order 10427, and the co-ordinating responsibility of the Federal Civil Defense Administrator, "acting on behalf of the President." The course of events seems therefore worth recording here in some detail.

NORTHEASTERN STATES FLOODS, AUGUST 1955

On August 18 and 19, 1955, Hurricane Diane reached the northeastern section of the United States and dumped a record rainfall which filled the river basins from Pennsylvania to Massachu-

setts. The Federal Civil Defense Administration had been following its development and had alerted the regions and agencies. Disaster specialists were at the scene in advance. On August 19, when the Governors of Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania, one after the other, asked the President to declare the floods a "major disaster," it was possible for the Federal Civil Defense Administration to concur immediately. The President declared the floods in these states a major disaster on August 20.

The toll of Diane was 180 dead and 7,200 injured or ill. More than 6,000 homes were destroyed and 35,000 families suffered losses. The damage to all types of property was half a billion dollars. The floods wiped out homes, farms, industries, utilities, roads. Lieutenant General Samuel D. Sturgis, Jr., Chief of Engineers of the Army, inspected the area and pronounced it "one of the biggest, toughest rehabilitation jobs since Noah."

When the magnitude of the disaster became apparent, President Eisenhower interrupted his vacation at Denver on August 22 to fly to the scene, as he said, "to make sure everything possible is being done." The President met at Hartford for a conference with the governors of the six disaster states and with the heads of the principal federal agencies having disaster responsibilities.

By nightfall, orders were issued assigning functional responsibilities to the Secretaries of Defense, of Commerce, of Agriculture, and of Health, Education, and Welfare, and to the Administrators of the General Services Administration and the Housing and Home Finance Agency. These and all other agencies having potential assistance capabilities were directed to send daily reports of their activities in the disaster areas directly to the national office of the Fed-

eral Civil Defense Administration, to be consolidated into a single daily progress report for the President.

Section 5 of Executive Order 10427 gives the Federal Civil Defense Administrator authority to redelegate any of his functions to any other federal agency. The agencies having primary responsibility in the measures assigned were directed to co-ordinate their own activities directly with other agencies having similar or related assignments.

The President flew from Hartford to Washington to make sure the necessary disaster funds could be made available. He further directed every federal agency to canvass what it could do in the flooded areas and to report to the Administrator of Federal Civil Defense. The President made it clear that he wanted disaster assistance to come first and that he wanted red tape cut.

Following the Hartford meeting, I returned to the White House to conduct a conference of key officials of the principal federal agencies which were to bring the disaster assistance to a maximum. The representation included the Departments of Defense, Commerce, Agriculture, Health, Education, and Welfare, Treasury, and Labor; also the Housing and Home Finance Agency and the Bureau of the Budget.

The disaster assistance thus mobilized set a new mark in speed and scope. To list all the actions taken by every federal agency would fill volumes and would not now—a year later—be complete, because some of the work still goes on. Here, however, are the high lights:

Department of Agriculture

The Agricultural Marketing Service, in co-operation with the American Red Cross, furnished food (butter, cheese, cottonseed oil, shortening, dry milk, rice, and beans) for more than 33,500 persons in mass feeding programs, and

for more than 16,000 persons as individual recipients. The Farmers Home Administration processed more than a hundred disaster loans. From the President's Emergency Fund, \$500,000 was used to supplement the Department's regular agricultural conservation programs.

Department of Commerce

The Bureau of Public Roads assigned teams of engineers to work with FCDA in evaluating road damage and recommending emergency repair. The disasters caused damage of more than \$30,000,000 to federal-aid road systems, and the Bureau processed requests from states for road-repair funds, anticipating that requests by states for federal matching funds would exceed \$16,000,000. The Maritime Administration shipped 35,000 blankets, sheets, and pillowcases into New Jersey, New York, Massachusetts, Rhode Island, Connecticut, and Pennsylvania.

Department of Defense

Local military commanders responded promptly to emergency requests for assistance from city and state officials and the Red Cross, prior to official declarations of emergency, rescuing trapped persons by boat and helicopter, clearing debris, providing emergency communication facilities, and assisting in emergency sanitation and health measures. More than a hundred diesel-electric locomotives were released from Army War Reserve stocks to help offset the disaster effects on rail transportation systems. The Army Corps of Engineers, with a long record of disaster relief, directed the emergency rehabilitation work of the military. At the request of the Federal Civil Defense Administrator, under authority of Public Law 875, recovery work was performed directly by the Corps and its contractors in nearly four hundred lo-

calities. The work included restoring some 100 water and sewer systems, channel work at more than 235 locations, emergency repairs to 35 dams, and extensive temporary bridge work and highway repairs. At the peak of operations, the Corps had 608 officers and civilians, 3,365 contractors' employees, and 1,423 pieces of heavy equipment engaged in recovery work. The Corps obligated more than \$30,000,000 in its disaster-relief operation.¹

Department of Health, Education, and Welfare

The Public Health Service sent fifty-five sanitary engineers, sanitarians, medical officers, bacteriologists, and health educators into disaster areas to work with local and state health authorities, FCDA, and the Red Cross in epidemic control, sanitation measures, the disposal of contaminated food, and insect and rodent control.² More than sixty food and drug inspectors and other professional personnel of the Food and Drug Administration assisted in surveying more than 5,600 establishments in some forty primary disaster areas. Food, drugs, cosmetics, and similar products valued at more than 35 million dollars were ordered destroyed because of the potential health hazards involved in their use.

Housing and Home Finance Agency

Vacant units among 2,500 units of public housing in disaster areas were opened for emergency housing by order of the Public Housing Administration. At the suggestion of that agency, the Federal Civil Defense Administration

¹ The relief and rehabilitation operations of the Defense Department are recounted more fully in the article in this issue of *THE ANNALS* by Carter L. Burgess, "The Armed Forces in Disaster Relief."—Ed.

² See also *infra*, L. E. Burney, "Public Health Problems in Major Disasters."—Ed.

ordered 141 surplus family trailers moved from Portsmouth, Ohio, to seven cities in Connecticut and Massachusetts. In Connecticut, PHA also turned over 300 units of temporary defense housing to state officials for disaster emergency housing. The Federal Housing Administration provided for the temporary suspension of payments on FHA-insured mortgage and repair loans in the disaster areas, and sent teams of specialists into disaster areas to advise local builders, lenders, and public officials on how to use FHA-insured financing for new construction or repairs. The Federal National Mortgage Association set aside \$10,000,000 to make advance commitments to purchase disaster-relief mortgages where private mortgage markets were not available.

Department of Labor

Some 130,000 workers in six states were unemployed because of the disaster. In the first week after the August floods, state employment security agencies processed more than 43,000 initial claims for unemployment insurance benefits from persons unemployed because of the disasters. Special provisions were made for quick processing of the claims. Local offices of state employment security agencies became focal points for reconstruction activity, and they established streamlined procedures for recruiting workers for reconstruction operations.

Small Business Administration

Small Business Administration established twenty-four temporary offices in disaster areas for processing disaster loans, and sent loan application forms to 1,500 banks in the areas. It worked closely with local bankers and attorneys in making disaster loans. To speed the loans, the temporary offices were authorized to make loans up to \$20,000 without additional referral (double the

authority given in any previous disaster). Regional offices were authorized to make loans up to \$50,000. A simplified, short-loan application form for disaster home loans up to \$2,000 was devised and rushed to field offices. These procedures meant that only a relatively few large loan applications had to be submitted to the Washington office of SBA. By late November 1955, SBA had approved 1,730 disaster loans totaling \$25,036,152.

Department of the Treasury

The Department's Coast Guard personnel saved more than 300 lives and moved nearly 1,000 other persons to places of greater safety. The Coast Guard also transported more than 1,000 trained disaster personnel by helicopters, amphibious aircraft and trucks, and surf boats, provided communication trucks and personnel with portable radio equipment, and helped secure yachts and fishing boats in areas of high waters. Under the Defense Production Act of 1950, the Treasury Department approved disaster loans to private industry of more than \$14,000,000. The Commissioner of Internal Revenue instructed regional commissioners serving disaster areas to take the disasters into consideration in deferring income tax payments and to speed tax refunds to residents of afflicted areas.

Office of Defense Mobilization

The Office of Defense Mobilization, acting to maintain the mobilization readiness of the United States, directed the Department of Defense, the Atomic Energy Commission, and the Maritime Administration to channel procurement contracts to disaster areas whenever possible. It also ordered government procurement agencies to extend dates of delivery by contractors in disaster areas, and in some cases progress payments were advanced to provide damaged con-

tractors with additional working capital. The agency granted accelerated tax amortization for the rehabilitation of facilities damaged by the floods, making it possible for many firms to write off their reconstruction expenses in five years instead of the longer period normally permitted by the Internal Revenue Code. Under ODM direction, idle government-owned machine tools and production equipment were leased in considerable number to damaged defense plants by the Departments of Commerce and Defense. ODM deferred delivery to the government of some 26,000 tons of copper, making it available for the relief of disaster areas, and authorized the sale of copper already in government inventory.³

General Services Administration

Under an FCDA directive, General Services Administration initiated a program whereby surplus federal property and equipment were made available to small business concerns in disaster areas at about 10 per cent of the procurement costs. Federal surplus property valued at about \$11,000,000 was made available to states for disaster rehabilitation. Under ODM direction, GSA sold more than 12,500,000 pounds of copper from government stockpiles for use in disaster areas.

INTERAGENCY CENTERS IN LATER FLOODS

The lessons learned in the northeastern states during the floods of August 1955 have been carried further by experience. No two disasters—no two floods, even—are alike.

In the Christmas floods in California and Nevada in 1955, the Federal Civil

³ For a more detailed description of ODM's role in the August 1955 floods see the article in this issue of *THE ANNALS* by Arthur S. Flemming, "The Impact of Disasters on Readiness for War."—Ed.

Defense Administration introduced Interagency Centers at strategic points in the disaster areas. At each center, representatives were maintained by the federal agencies operating in the surrounding area, whether under statutory authority in their own specialized fields or under additional disaster assignments from the Federal Civil Defense Administration. A representative of the Federal Civil Defense Administration was designated as co-ordinating head of each Interagency Center.

The arrangement found immediate acceptance. Twenty-three independent agencies were represented at the first Interagency Centers, together with the Red Cross.

PROBLEMS

The broad powers of the Disaster Act give rise to certain problems.

The most recurrent problem arises when localities seeking repair or replacement of their public facilities attempt to disregard the modifying words of Section 3(d) of the Disaster Act, which says that such work shall be "emergency" and "temporary." The words are not defined in the act, but the Federal Civil Defense Administration has given them administrative definition by saying public facilities will be put back into such condition that they can be operated while the locality arranges to restore them to their original condition at its own cost. The disaster localities generally want new, not repaired, facilities. In this case, financial aid equivalent to a temporary repair can be given.

Another problem that permits of no forthright solution is the application of the wording of the Disaster Act which says that the declaration of a "major disaster" by the President shall depend on a governor's "giving assurance of the expenditure of a reasonable amount of

the funds of the government of such State, local governments therein or other agencies, for the same or similar purposes with respect to such catastrophe."

There is no prescribed or agreed test of what is a "reasonable amount." In practice, the Federal Civil Defense Administration takes the governor's word that the state is unable to cope with the situation without federal assistance.

TRENDS

As states and localities become aware that systematic federal disaster assistance is available, they want more of it.

The Federal Disaster Act defines a "major disaster" only by listing a few types. It says: "Major disaster means any flood, drought, fire, hurricane, earthquake, storm or other catastrophe in any part of the United States which, in the determination of the President, is or threatens to be of sufficient severity and magnitude to warrant disaster assistance by the Federal Government."

Another trend is the use of the mechanism for the declaration of a "major disaster" to trigger other relief statutes, particularly in agriculture. Under Public Law 115 of the Eighty-third Congress, the Department of Agriculture has an appropriation to use for emergency loans to farmers, feed for livestock, and seed for planting, if the governor of a state applies to the President for such relief and if investigation by the Secretary of Agriculture seems to justify it. A certificate of need must go from the Secretary of Agriculture to the Administrator of Federal Civil Defense, who sends it to the President with a recommendation. If the President declares a major disaster in the specified agricultural areas, the Secretary of Agriculture can proceed to administer the agricultural relief of Public Law 115 in accordance with his own rules.

OUTLOOK

The most constructive outlook for the Administrator of federal disaster assistance is to contemplate the measures being taken to prevent disasters or reduce their impact.

Flood-control works and flood insurance

Floods cause about two thirds of the damage among our recurrent disasters. General Sturgis, Chief of Engineers of the Army, testifying before the Senate Banking and Currency Committee in November 1955, said the flood-control works built by the Army Engineers during the last quarter century have cut flood damage in half and that the present rate of congressional appropriation would bring the flood-control program to completion in another quarter century.⁴

President Eisenhower strongly recommended and supported an experimental insurance program for the immediate relief of victims of flood damage, and Public Law 1016, the Federal Flood Insurance Act of 1956, was enacted by the Eighty-fourth Congress. It sets up an experimental federal system of indemnification of flood losses, within certain limits, together with guaranteed loans where necessary to complete reconstruction.

In signing the act into law on August 8, 1956, President Eisenhower recalled the flood scenes he had visited, and he added:

The average annual flood damage that the Nation suffers runs into hundreds of millions of dollars, and in years of major disaster, such as 1951 and 1955, is in excess of a billion dollars. Private insurance companies have found no way within the limits of their own resources to venture

into this field of risk without danger of being wiped out before adequate reserves can be established.

This new program is a venture into an untested field of risk protection, and it is admittedly experimental. It does not propose putting the Federal Government permanently into the flood insurance business. On the contrary, it provides for the government to lead the way on a basis that will enable this field of responsibility to be absorbed into our private system in the shortest possible time.

As I see it, it is a proper function of the Federal Government to pioneer the establishment of a system of insured protection against the crippling losses of flood and tidal disaster.

The administration of the new federal flood insurance and loan system has been lodged in the Housing and Home Finance Agency, which has the responsibility of applying the complex provisions of the act. It is authorized to provide up to 3 billion dollars of outstanding flood insurance (or 5 billions if the President approves). In its annual report to the President to be submitted to the Congress in 1961, the administering agency is required to analyze the intervening five years experience and to recommend what should be done about flood insurance thereafter.⁵

Improved precautions against other disasters

Hurricanes and tornadoes are being studied to develop better predictions and precautions. Hurricane studies by the United States Weather Bureau, Navy, and Air Force include methods of determining how much rain a tropical hurricane will dump on the United States. A state-wide radar tornado

⁵ The terms of the Federal Flood Insurance Act are discussed further in a later article in this issue, "The Flood Peril and the Federal Flood Insurance Act of 1956," by Edwin S. Overman.—Ed.

⁴ For further details on flood-control work see the article in this issue of THE ANNALS by S. D. Sturgis, Jr., on "Floods."—Ed.

warning system has been installed in Texas, using Air Force radar apparatus obsolete for military purposes but capable of being adapted to tornado warning. Throughout the tornado regions of the nation, the Ground Observer Corps, recruited by civil defense and used by the Air Force to spot low-flying enemy planes, is now being used also to spot tornadoes.⁶

In drought areas and dust bowls, a measure of long-range relief may be expected from improved agricultural conservation practices.

⁶ Projects in hurricane and tornado forecasting and warning are outlined also in F. W. Reichelderfer, "Hurricanes, Tornadoes, and Other Storms" in this issue of THE ANNALS.—Ed.

In the earthquake regions, shock-resistant structures are being more generally built in cities, and mutual aid plans for earthquakes are developing along civil defense lines.⁷

Skirmish with reality

The nation is further ahead in its readiness to deal with peacetime disasters than with enemy attacks. For civil defense, each peacetime disaster is a mere skirmish with reality, compared to the possible onslaught of a nuclear bomb. It is through such skirmishes, however, that the nation moves toward a civil defense which could be a deterrent of war—the greatest of all disasters.

The Impact of Disasters on Readiness for War

By ARTHUR S. FLEMMING

Abstract: The Office of Defense Mobilization is essentially a planning and coordinating agency in the Executive Office of the President. Its chief purpose is to organize and focus governmental activity at all levels to the end that production in an area struck by disaster—natural or man-made—can be quickly restored. This requires techniques for assessing damage and facilities for promoting a rapid resumption of production. The 1955 floods in the northeastern states and California provided a test of the effectiveness of civil defense preparations and caused them to work out new procedures. The author discusses the specific actions taken at that time, the Disaster Readiness Plan since prepared, and the relation of that plan to planning against the disaster of thermonuclear attack.—Ed.

NATURAL disasters bear a close affinity, in what they do to us and what we do about them, to the unnatural disasters caused by man in modern warfare. It is this affinity which justifies my writing an article for this issue of THE ANNALS.

I should note at the outset that the historical trend is in the direction of reducing that affinity. Over the centuries, and particularly in recent decades, man has learned to conquer the plagues and pestilences which once decimated whole cities and peoples. He has built levees and dams, and constructed his cities to be ever more resistant to fire and earthquake. And he has improved the administrative mechanisms by which he fights back against the ravages of disaster. Unfortunately, however, as natural disasters have lessened, man-made disasters have increased tremendously. Modern technology has given man the ability to snuff out lives by the millions in a few hours and to create catastrophes of a magnitude so great as to be almost unimaginable. It is against such catastrophes that this nation now must plan.

A natural disaster may have both a negative and a positive impact on our mobilization readiness. The impact is negative in the extent to which parts of our mobilization base are destroyed. The impact may be positive to the extent that the experience of fighting the disaster helps us to create the organizations and learn the techniques needed to fight the much greater disaster of war.

Many man-made disasters in the past have resulted in actions to contribute to the safety of the rest of us. The sinking of the *Titanic* in mid-Atlantic resulted in an iceberg patrol and stricter lifeboat requirements; the Cocoanut Grove inferno aroused civic authorities throughout the nation to renewed vigilance over fire safety regulations; and the wave of train wrecks in 1943 emphasized the railroads' need for more widespread use of two-way radio communication. In like manner, the floods last year in the Northeast and California provided a test of the effectiveness of civil defense preparations at the state and local levels and caused the Office of Defense Mobilization to work

Arthur S. Flemming, LL.B., LL.D., Washington, D. C., is Director of the Office of Defense Mobilization and President of Ohio Wesleyan University (on leave). He has served on numerous federal commissions.

out new procedures for assessing damage to the mobilization base and for promoting a rapid resumption of production.

In the following pages I shall discuss the specific actions taken by ODM during these floods to minimize their negative impact—actions to maintain, protect, and reconstruct the mobilization base. In a broad sense, the mobilization base is that combination of people, materials, facilities, and equipment that would be available to deal with an emergency situation. Then I shall comment on the way in which our thinking has developed as to the best means of dealing with disaster—small or catastrophic.

THE ROLES OF ODM AND FCDA

The Office of Defense Mobilization and the Federal Civil Defense Administration have closely related and somewhat complementary roles to play.

The Federal Civil Defense Administration is responsible for the development, co-ordination, guidance, and leadership of a national program of civil defense designed to protect life and property from attack. It is also, under Executive Order 10427 of January 16, 1953, the central point of responsibility in the federal government for directing and co-ordinating the assistance of all federal agencies to disaster areas.¹ This responsibility includes the co-ordination of military activities to alleviate the disaster and the co-ordination of ODM's efforts to maintain the mobilization base.

The present Office of Defense Mobilization was established by Reorganization Plan 3 of 1953 to enable one

¹ The role of FCDA in "major disasters" and its functioning in the August 1955 floods are described in more detail in the article in this issue of THE ANNALS by Val Peterson, "Co-ordinating and Extending Federal Assistance."—Ed.

agency in the Executive Office of the President to exercise strong leadership in our national mobilization effort, including both current defense activities and readiness for any future national emergency. It is essentially a policy-planning and co-ordinating, rather than an operating, agency. In addition to co-ordinating actions to develop and maintain the mobilization base, ODM also directs and co-ordinates the overall mobilization readiness planning of the federal government, including the determination of the wartime functions of the various agencies.

ODM IN THE AUGUST 1955 FLOODS

When Hurricane Diane struck the Middle Atlantic and New England states on August 1955, ODM, in concert with the other federal agencies, moved quickly to lend aid and assistance. ODM's role was limited to actions within its legal powers, designed to maintain, protect, or reconstruct the mobilization base and to maintain the mobilization readiness of the United States. The methods employed included procurement assistance, fast tax write-offs, loans and loan guarantees, production equipment leases, priority assistance, and the supply of government-owned materials. These methods were mostly carried out by our delegate agencies, as I shall describe.

Procurement assistance

On August 24, 1955, ODM directed² the Department of Defense, the Atomic Energy Commission, and the Maritime Administration to do what they could to channel procurement contracts to disaster areas. The order stated that preference in awarding contracts to disaster

² Office of Defense Mobilization, Defense Mobilization Order VII-7, Supplement 1, *Emergency Action for Maintenance of the Mobilization Base under Disaster Conditions*, August 25, 1955.

areas was to be considered in the public interest and the interest of national defense.

Through April 15, 1956, when application of this order was discontinued, the military departments had awarded 6,285 contracts of \$10,000 or more in disaster areas, valued at \$2,052,283,716. Of this total, 313 contracts, valued at \$33,236,927, were awarded as a result of preference given these firms by the ODM order. Purchases or contracts of the Atomic Energy Commission in these areas totaled \$21,380,334, and Maritime Administration purchases \$264,341.

All of the procurement agencies also made necessary adjustments in existing contracts to meet disaster conditions, chiefly extensions of delivery dates because of damage to facilities of the contractors or their subcontractors. In some instances, the agencies advanced progress payments to provide additional working capital to damaged contractors.

Fast tax write-offs

We also announced³ on August 24 that we would grant accelerated tax amortization for the reconstruction, rehabilitation, and replacement of facilities destroyed or damaged by the floods. This order applied to all facilities used for the production of materials or services covered by any of the 225 expansion goals issued since Korea, although most of these expansions had been completed and the goals were closed. Through June 15, 1956, ODM allowed ten firms to write off reconstruction costs of \$13,803,660. The largest applicants for this assistance were railroads.

³ Office of Defense Mobilization Regulation 1, Amendment 1, *Granting Accelerated Tax Amortization for the Reconstruction, Rehabilitation and Replacement of Emergency Facilities Destroyed or Damaged by Major Disaster*, August 25, 1956.

Loans and loan guarantees

The President on August 25, 1955, issued Executive Order 10634, which provided that whenever financial assistance was not otherwise available on reasonable terms, loans or loan guarantees could be made under the Defense Production Act to aid in carrying out the reconstruction, rehabilitation, or replacement of facilities covered by open or closed expansion goals.

Following the flood disasters, ODM certified eleven DPA loans, of which the Treasury Department approved seven, amounting to \$19,871,000. The largest of these was a deferred participation of 90 per cent in a loan of \$16,000,000 made to the New York, New Haven and Hartford Railroad Company by twelve New York banks.

Production equipment leases

ODM also helped some defense plants to get back into production quickly by authorizing the lease of idle government-owned machine tools and production equipment to them.⁴ Leases at the rate of 1 per cent of cost per month were made for the period of time necessary for the lessee to obtain delivery on replacement equipment. In September, ODM directed that the monthly rental charge should not begin until ninety days after the arrival of the equipment at the lessee's plant, so that distressed firms would not have to pay rental charges long before they could get back into production.

No over-all statistics are available on the leasing program; however, a considerable number of tools were made available in this way by both the Commerce and the Defense Department. A

⁴ Office of Defense Mobilization, Defense Mobilization Order VII-4, Supplement 1, August 25, 1955 (and Amendment 1 thereto, September 21, 1955), *ODM Policy Guidance on Government-owned Production Equipment*.

considerable amount of Army railroad equipment was also leased to damaged railways in the disaster areas.

Priority assistance

Another means of speeding the resumption of production was by the use of priorities and allocation authority under the Defense Production Act to provide materials for the restoration of productive capacity.⁵ This also applied to all productive capacity covered by open or closed expansion goals.

The Commerce Department sent a number of staff officers into the field to handle this and the other programs of assistance. When applicants were not eligible for formal assistance, the Commerce Department's Industry Divisions, through their close working relations with industries and individual companies, endeavored to get suppliers to provide the materials or products needed.

Supply of government-owned materials

On August 25, 1955, ODM authorized the deferment until June 30, 1956, of some 26,000 tons of copper scheduled for delivery to the government to fulfill existing contracts. On September 14, additional deliveries of 11,000 tons of copper were deferred. This copper was made available by the producers for the relief of flood-damaged areas in New England.

On August 27, ODM authorized the sale of copper already in the Defense Production Act inventory for rehabilitation in the New England disaster areas. The copper was sold by the General Services Administration to fabricators at the market price plus transportation and handling charges, for use in reconstructing power, communica-

⁵ Office of Defense Mobilization, DMO VII-3, Supplement 1, August 27, 1955, *Policy on the Control of Materials and Facilities by the Use of Priorities and Allocation Authority under Disaster Conditions*.

tions, and other facilities and for defense orders. By the end of the year 4,925 tons of copper had been released for New England flood disaster relief and another 955 tons for urgent defense needs.

On January 13, 1956, ODM authorized the sale from DPA inventories of up to 2,100 tons of copper to meet needs arising from the December floods in the Pacific Coast area. By the end of February, 1,923 tons had been released for flood relief and 150 tons for urgent defense needs.

DISASTER READINESS

The orders and actions which I have described constitute a new approach to federal assistance to disaster areas. Precious time was lost while we determined the actions to take and then developed the necessary orders to carry them out. To save that time in the future, we have developed a Disaster Readiness Plan. This plan constitutes a part of the over-all federal plans for disaster assistance which are co-ordinated by the Federal Civil Defense Administration. Its purpose is to provide a list of actions which can serve as standing operating procedure in any future major natural disaster. Most of the orders and directives are "self-triggering," that is, they are drafted so that they go into effect automatically whenever the President declares a major disaster pursuant to the Federal Disaster Act of 1950 (64 Stat. 1109).

In addition to the orders discussed above, two other standby orders have been issued as a part of the Disaster Readiness Plan.

One order provides that in the event of major disaster, all agencies having defense mobilization assignments shall promptly advise ODM of the quantities and qualities of materials needed for specific defense projects.⁶ If other meas-

⁶ Office of Defense Mobilization, DMO V-6, November 15, 1955, *Provision of Materials*

ures are not adequate to supply the needed materials. ODM will again arrange for diversions of material under contract to the government or for release of materials from the Defense Production Act inventory or the Commodity Credit Corporation inventories. A companion order provides that when a disaster has either reduced the supplies of materials needed for defense purposes or has increased defense requirements, all agencies having defense mobilization assignments shall promptly recommend appropriate programs to the ODM for expansion of supply under authority of the Defense Production Act.⁷

Damage-assessment procedures

We have also explored the possibility of adapting for natural disaster purposes the damage-assessment procedures which we are developing for use in the event of attack. In essence, this is a system for rapidly computing assumed bomb damage effects on the basis of information as to the size of bomb, the height of burst, and the location of various mobilization resources. The resources information is recorded on magnetic tapes so that the computations can be made quickly through the use of an electronic calculator. So far, with the co-operation of a number of agencies, particularly the Census Bureau, we have recorded on tapes precise information regarding the location, shipments, and number of employees of approximately 20,000 manufacturing plants in potential target areas; the 400 largest

stations generating electric power; producers of the most important military end items and their principal components and subassemblies; and other key resources data.

This damage-assessment technique has been developed to provide rapid though rough assessments after a major attack when many other channels of information and communication might have broken down. In the case of the more limited natural disasters, ordinary news-gathering media plus judicious use of the telephone would probably provide full information more quickly than this special procedure. Accordingly, adaptation of this technique to disaster reporting is mainly of value as a means of testing the technique and training personnel in its use.

Under arrangements currently being worked out, FCDA would be responsible for reporting on the area of disaster damage, in terms of map co-ordinates. These co-ordinates would then be run through the electronic calculator, which would report on the important facilities damaged. Census enumerators would then visit these facilities to obtain detailed information on damage by means of a previously prepared questionnaire. This technique was tried out experimentally during the recent floods in California. It is still in the planning stage, however, pending the availability of funds for the Bureau of the Census which would permit it to train enumerators and stockpile questionnaires.

MOBILIZATION READINESS

As I have indicated above, the experience of fighting disasters teaches us a good deal about the problems of dealing with the much greater disaster of thermonuclear attack. Another way in which we gain this experience in advance is through the creation of simulated disasters for training purposes, such as Operation Alert 1956. Our ex-

under Government Control As Needed to Supplement Supplies Commercially Available in the Event of a Major Disaster (As Defined and Determined Under 64 Stat. 1109) for Use in Reconstruction or to Meet Defense Orders.

⁷ Office of Defense Mobilization, DMO V-5, November 15, 1955, *Programs for Expansion of Supplies of Materials Needed for Defense Purposes in the Event of a Major Disaster (As Defined and Determined Under 64 Stat. 1109)*.

perience in both real and simulated disasters has affected considerably our thinking and our plans for dealing with massive attack. We recognize the need for continual readiness to act instantly when such a disaster strikes. Accordingly, we have developed the concept of "self-triggering" orders such as those in the Disaster Readiness Plan. Corollary to this is the need for administrative mechanisms at regional and local levels which can move quickly to take the necessary actions without constant referral back to Washington. One response to this need has been the development this year of Regional Mobilization Co-ordinators of the Office of Defense Mobilization, backed up by interagency Regional Mobilization Committees.

Within the past year FCDA's post-attack role has been broadened in an allocation of post-attack responsibilities which I approved with the concurrence of the Administrator of the FCDA, the Secretary of Defense, and the Joint Chiefs of Staff. Under this allocation of responsibilities, the Federal Civil Defense Administrator would be responsible for taking the lead in all civil defense, relief, and rehabilitation matters. The Administrator would direct all efforts in providing and distributing emergency food, clothing, shelter, medical care, and cash allowances; in maintaining order, sanitary safeguards, fire protection, and countermeasures against the hazards of special weapons or unconventional warfare; in essential clearance of debris and restoration of public facilities and utilities basic to the resumption of commerce and industry; and in the establishment of programs that would result in the distribution of goods required to meet consumer requirements.

Under this same allocation of post-attack responsibilities, the Secretary of Defense would determine the necessary personnel, material, and facilities within

the Department of Defense required to carry out the Department's primary responsibility for the defense of the United States and the conduct of military operations incident thereto. All other personnel, material, and facilities under his command would be used to render all possible support and assistance to the Federal Civil Defense Administration in emergency relief and rehabilitation. The Office of Defense Mobilization would be responsible for mobilizing resources, directing production, and allocating resources to the Department of Defense and the FCDA.

Thus it can be seen that our concept of civil defense has changed radically in the few years since World War II, when civil defense meant fire fighters and wardens in tin hats. And the role of the Federal Civil Defense Administration has also evolved substantially since passage of the Federal Civil Defense Act of 1950. Although FCDA was originally designed to meet the requirements of the atomic age, the planners and legislators at that time could not fully anticipate the quantum jump in thermonuclear technology which has since taken place. FCDA is now coming to be the primary federal agency for dealing with broad programs of human assistance under conditions both of attack and of disaster. Concurrently, ODM is developing government-wide mechanisms to assure quick and effective responses to disaster situations at all levels of government.

The experience of dealing with natural disasters and with simulated attack disasters is increasing our competence and capacity to handle the problems of a surprise attack upon us. And by the same token, our ability to handle the problems of an attack will stand us in good stead in responding quickly and effectively to the lesser problems of any future natural disasters with which we might be afflicted.

The Armed Forces in Disaster Relief

By CARTER L. BURGESS

Abstract: Although the basic responsibility for disaster relief lies with civil agencies, national, state, local, and private, the Armed Forces, because of their mobility and organization, are frequently utilized to lend urgently needed aid in emergency situations. National disaster relief, including military, is authorized by the Federal Disaster Act of 1950 and co-ordinated by the Federal Civil Defense Administration when the President declares a "major disaster." However, compelling humanitarian requirements inevitably put the military relief machinery in action the moment disaster strikes. The magnitude of several recent disasters has widened the scope of Department of Defense relief. Beyond the prompt emergency aid rendered, under the authority of the 1950 Disaster Act the Department has helped in postdisaster rehabilitation of public works and basic production facilities in disaster areas.—Ed.

THE American people can take comfort in the knowledge that when disaster strikes, the Armed Forces traditionally move with speed and efficiency to give relief and assistance to stricken areas. Even before the forces which generated the disaster have settled, our servicemen frequently are clearing debris, providing emergency communications, building bridges, reinforcing levees, and bringing in food, medical supplies, and equipment to save lives and ease the suffering of the victims.

The responsibility for alleviating disaster conditions rests primarily with individuals, private industry, local and state governments, the American National Red Cross, various federal agencies having special statutory responsibilities, and other federal agencies having resources that can be utilized. The Armed Forces, however, because of their organization, the widespread location of their posts, camps, and stations, and their resources in manpower and equipment, frequently are called upon in the earliest stages of a disaster to provide

the humanitarian relief which could not otherwise be given in such timely fashion.

During the San Francisco earthquake and fire in 1906, immediate assistance by Army troops helped reduce the suffering brought on by the initial impact of the disaster. Military control of the area was necessary for ten months, until civil officials were ready to reassume their responsibilities.¹

The extent and diversity of military assistance is demonstrated in the Texas City disaster of 1947, which resulted when a ship exploded while loading chemicals: relief supplies included field ranges, fire helmets, asbestos suits, immersion heaters, oxygen cylinders, tents, water cans, lister bags, lanterns, lime shovels, chlorine tablets, flashlights, soap, mess kits, blankets, cots, embalming fluid, formaldehyde, gas masks, penicillin, ether, and bathrobes and pajamas. In the spring of 1955 the Army

¹ Capt. Freda M. Boyle, "The Army in Disaster Relief," *Army Information Digest*, No. 4 (April 1954).

Carter L. Burgess, Washington, D. C., is Assistant Secretary of Defense (Manpower, Personnel and Reserve), Department of Defense. He is a member of the Commission on Government Security.

was called on to use smoke generators to save a million-dollar peach crop in Utah; and in January 1949 the Air Force, in Operation Haylift, dropped bales of hay and feed from planes to snow-stranded cattle and sheep in five western states.

Military assistance in flood relief goes back a long way—to Johnstown, Pennsylvania, in 1889; along the Mississippi River in 1912; at Galveston, Texas, in 1915, and in Vermont in 1927. In recent years military assistance was provided the victims of the 1938 New England hurricane and the victims of Hurricanes Carol, Edna, and Hazel along the east coast in 1954. In 1955 floods on the Pacific Coast and in the north-eastern states created the need for more military assistance. In commenting in a report on the 1955 eastern states floods, the American National Red Cross had this to say:

Heroism became routine as people awoke and warned each other to flee threatened areas, guided each other to safe high ground, rescued the marooned. Among these heroes were firemen, policemen, civil defense workers, national guardsmen, soldiers, sailors, airmen, marines, first aid squads, Red Cross chapter workers, and hundreds of others. All in those frightening early hours were simply people working together in selfless concern for one another. This spirit of working together was to mark the entire month-long job of helping the region back to its feet.²

Such is the spirit in which the Armed Forces come to the relief of communities when disaster strikes.

DEPARTMENT OF DEFENSE POLICY

Under Department of Defense policy,³ disaster relief by the Armed Forces is

² American National Red Cross, *1955 Eastern States Floods*, ARC 1576, January 1956.

³ Department of Defense Directive No. 3025.1, "Responsibilities for Civil Defense and Other Domestic Emergencies," dated July 14, 1956.

provided only in accordance with the authority delegated by the Congress under the Federal Disaster Act of 1950⁴ or by the direction of the President, except when (1) the overruling demands of humanity compel immediate action to prevent starvation, extreme suffering, and property loss or (2) local resources available to state and municipal authorities are clearly inadequate to cope with the situation. Disaster relief by the Armed Forces generally is limited to the emergency period.

Public Law 875 in no way precludes action by the Armed Forces where required in emergencies, pending determination by the President that a disaster is a "major disaster" under the terms of the law. Military assistance before the declaration of a major disaster may be provided under the control and authority of the local military commander.

Typical is the action of the Commander, Hamilton Air Force Base, in the case of the Yuba City-Marysville, California, area disaster in December 1955. He reported his action as follows:

At 1230 hours, 22 December 1955, Beale Air Force Base declared an emergency in the Yuba City-Marysville area. All personnel at Beale Air Force Base are participating in this emergency. Assistance includes patrolling, reinforcing levees, evacuating civilians from Yuba City and Marysville to Beale Air Force Base, and the furnishing of housing, food, bedding and medical service to approximately 8,000 evacuees.

On the following day, the disaster was declared a major disaster.

Armed Forces action subsequent to such a finding, however, is under the co-ordination and direction of the Federal Civil Defense Administration. The extent, manner, and duration of Armed Forces participation is as directed by

⁴ Public Law 875, 81st Congress.

the Federal Civil Defense Administrator, to whom the President has delegated the responsibility for carrying out the authorizations and functions of the act.⁵

ORGANIZATION

The Secretary of Defense has designated the Assistant Secretary of Defense (Manpower, Personnel and Reserve) to co-ordinate disaster relief activities within the Department of Defense and to maintain direct liaison with the Federal Civil Defense Administration, the Office of Defense Mobilization, and the American Red Cross on military assistance in these activities.

Within the Department of Defense, the Department of the Army has been delegated the primary responsibility for providing disaster relief assistance in the continental United States and for co-ordination and control of participation by the Navy and the Air Force.⁶ Field responsibility for military participation in disaster relief has been delegated to the Commanding General of the Continental Army Command and the six Zone of Interior Army Commanders. They have full authority to act on requests for aid from civil authorities within the policies established by the Department of the Army.

The Departments of the Navy and the Air Force have issued instructions to their field commands to authorize unilateral action in disaster relief operations under Army co-ordination.

An appeal for aid by state or local authorities to the commanding general of the Army area involved or to the commanding officer of the nearest military establishment will result in mili-

⁵ Executive Order No. 10427, dated January 16, 1953.

⁶ Army responsibility and policy in disaster relief operations are prescribed in Army Regulation AR 500-60, "Emergency Employment of Army Resources, Disaster Relief," dated October 1, 1952, as changed.

tary assistance in cases where life and property may be in jeopardy. In this event, the commanding officer receiving the appeal will take immediate action to save life, to prevent human suffering, and to prevent or lessen destruction or damage to United States property. Except in such critical situations, local and state authorities normally should request the state governor to obtain military assistance or aid authorized under the Federal Disaster Act of 1950.

After a major disaster declaration by the President, all requests for military assistance from state and local authorities are channeled through the Federal Civil Defense Administration Regional Administrator to the corresponding Army commander. The commander attempts to meet requests for military assistance with resources within his area, including those of the Navy and the Air Force (see Fig. 1). If the resources are not available in his area, he calls for assistance from the Continental Army Commander, who in turn may call upon any of the geographical Army commanders or the other services to fulfill the request.

ROLE OF THE RED CROSS

Under its charter, the American National Red Cross is responsible for continuing a system of national and international relief in mitigation of suffering caused by pestilence, famine, fire, flood, and other great national calamities.

The Red Cross always arrives rapidly at the scene of disaster. Military commanders take advantage of every opportunity to use the experience, organization, and facilities of the Red Cross for providing disaster relief. Because of its nationwide organization, the Red Cross is able to provide advice and recommend action to be taken by military commanders confronted with disaster conditions.

FIG. 1. STEPS TAKEN TO REQUEST MILITARY ASSISTANCE IN A DECLARED MAJOR DISASTER

Military equipment, supplies, and services furnished to any organization in compliance with direct requests or recommendations made by the Red Cross are receipted for by accredited representatives of the Red Cross. Such receipts are accepted as evidence that the equipment, supplies, or services are needed by the Red Cross, or by the agency that requested them, for relief purposes and that every reasonable care will be exercised to restrict their use to relief purposes only; the Red Cross also accepts thereby responsibility for the return of nonexpendable equipment and supplies to the issuing office as soon as the emergency need has ended. In disasters not designated by the President as major disasters, the Red Cross reimburses the Army for the assistance furnished. If in major disasters the Army furnishes assistance directly to the Red Cross at its request, the Red

Cross similarly assumes responsibility for reimbursement.

In addition to the disaster relief supplies and services furnished by the Armed Forces, the Red Cross may desire to buy from the Army, for reasons of economy and efficiency, certain other supplies and services, such as food, medicines, lumber, gas, oil, and transportation. If the desired supplies and services are available, the Secretary of the Army may authorize such sales.

Where the relief of disaster conditions does not come under the scope of Red Cross activities, representatives of that organization may provide military authorities with information concerning the destruction and the needs in the affected areas and make recommendations for emergency assistance by the military. In such cases, the Red Cross is not held financially responsible for such materials. Cognizant military com-

manders are required to maintain property accountability and ensure the return of items furnished local authorities under these circumstances.

ARMY ENGINEERS IN FLOOD CONTROL AND RELIEF

The prevention and control of floods is, by law, the responsibility of the United States Army Corps of Engineers. The special continuing statutory authority for the Corps of Engineers is contained in the Flood Control Acts of 1941, as amended in the Flood Control Acts of 1946 and 1948, and Section 210 of the Flood Control Act of 1950,⁷ as amended by Public Law 99. Eighty-fourth Congress. Operations under these laws are limited to flood fighting, rescue operations, and emergency work on flood-control projects, such as dams or levees threatened, damaged, or destroyed by flood. Public Law 99 authorized an emergency fund in the amount of \$15,000,000 for operations and provided for the annual replenishment of the fund by congressional appropriation. Emergency rescue and flood-fighting operations under this law are designed to supplement the rescue and flood-fighting work of other agencies.

Only when the normally responsible local authorities are unable to cope with a flood emergency and make specific request for such action may a Division or District Engineer of the Corps of Engineers assume full responsibility for direction of flood-fighting operations. When a flood of dangerous proportions threatens, the District Engineer notifies the Department of the Army, the Commanding General of the Continental Army Command, and the appropriate Zone of Interior Army Commander of developments (including the Corps of Engineers flood-fighting activities). There is the closest co-operation between these military authorities and the

Regional Administrators of the Federal Civil Defense Administration, the Red Cross, and other relief agencies to mitigate the results of disastrous floods.

Military assistance in relief of human suffering under the terms of the Federal Disaster Act of 1950, as distinguished from the flood control and relief functions of the Corps of Engineers, is furnished through the Army area commander. In a major disaster under the provisions of the act, however, the Corps of Engineers may be called upon by the Federal Civil Defense Administrator to participate in flood-disaster assistance. When the assistance to state and local agencies thus requested is beyond the statutory authority of the Corps of Engineers the Division or District Engineer informs the Army commander concerned and requests concurrence before such assistance is furnished. At the same time he requests an allotment of funds for such assistance. If available from military appropriations, the Army commander provides the funds. If the military funds are not available, the Federal Civil Defense Administrator certifies that necessary funds are available under the provisions of Public Law 875 and that the Corps of Engineers may provide the assistance from any available civil funds, pending reimbursement.

DEPARTMENT OF DEFENSE IN INDUSTRY REHABILITATION

Disaster relief by the Armed Forces generally is limited to emergency relief. In order to conserve military manpower, equipment, and supplies their use is authorized only during the actual emergency. Normally all troops and equipment are withdrawn and the issue of military supplies terminated at the earliest practicable moment.

However, the magnitude of the disaster occurring in 1955 in the flood-stricken northeastern United States, fol-

⁷ Public Law 516, 81st Congress.

lowed later by the Pacific Coast floods, created a special disaster relief problem for the federal government. The Department of Defense became involved first in the emergency disaster relief operations and secondly in the rehabilitation of disaster-stricken industries in these areas.

Northeastern states floods, August 1955

The most extensive military participation in disaster relief occurred as a result of the August 1955 hurricane floods in New York, New Jersey, Pennsylvania, Massachusetts, Connecticut, and Rhode Island.

The military services acted promptly to assist city, state, and Red Cross officials even before the President had declared the floods a major disaster—rescuing trapped persons by boats and helicopters, replacing bridges, providing emergency communications, transporting emergency medical and other supplies to affected areas, and providing emergency water and sanitation facilities.

The affected areas were declared “major disaster areas” by the President on August 20, 1955. The Federal Civil Defense Administrator assumed responsibility for direction of federal assistance in the disaster area as soon as the President had issued his declaration.

Under a delegation from the Federal Civil Defense Administrator, the Army Corps of Engineers rendered rehabilita-

tion assistance in the six affected states. This widespread disaster relief operation became known as “Operation Noah.” It included work essential for the preservation of life and property, debris and wreckage clearance, and emergency repair and temporary replacement of public facilities. The Corps, in addition, gave guidance and reimbursement to local agencies for work in these categories that were performed by them, when certified by the Federal Civil Defense Administrator as being eligible for reimbursement.

The total estimated cost of Operation Noah was \$35,180,000. A total of \$31,600,000, including the sum of \$12,000,000 which represented reimbursement to local agencies, was allotted directly to the Corps, leaving \$3,580,000 to be reimbursed by the Federal Civil Defense Administration (see Fig. 2). A breakdown of the estimated total cost shows \$1,118,800 for protective work, \$15,625,500 for debris and wreckage clearances, and \$18,435,700 for repairs and replacement of public facilities.

The scale of the operation is further indicated by the fact that about 675 localities were affected by flooding. In addition to debris and wreckage clearance, the recovery work performed directly by the Corps and its contractors in 400 localities included restoration to operation of about 100 water and sewer systems, channel work at over 200 locations, emergency repair to 35 dams, and extensive temporary bridge work and highway repairs. At its peak, Operation Noah employed 608 officers and civilians of the Corps of Engineers and 3,365 contractors’ employees, and used 1,423 pieces of heavy equipment.

Western states floods, 1955–56

No less severe was the flood disaster which occurred in the western states in the floods of December 1955 and Janu-

FIG. 2. OPERATION NOAH—FEDERAL COST

ary 1956. Armed Forces emergency military assistance in the affected areas included military manpower, care of evacuees, and the loan of thousands of blankets, cots, and sleeping bags. The Corps of Engineers, under its flood-control authority (Public Law 99, 84th Congress), in California alone awarded 183 contracts for a value of over ten million dollars, and 77 contracts for debris and other clearance operations of over one million dollars value.

Industry rehabilitation

The disaster conditions in the northeastern United States impelled the Department of Defense into a new role in disaster relief when it undertook to aid in the rehabilitation of industries in the flooded areas. In order to provide immediate relief to the eastern states hit by floods, the Director of the Office of Defense Mobilization, in Defense Mobilization Order VII-4, Supplement 1, authorized the loan of government-owned war reserve production equipment upon request by producing establishments crippled by the floods.⁸ The authority for the immediate release of such equipment to enable damaged establishments to resume normal operations was limited to the disaster areas and to the duration of the flood emergency as established by the President.

This release of war reserve equipment resulted in many types of equipment being put into service in numerous damaged industrial establishments during August and October 1955. The list included machine tools, metal work-

ing equipment, generators, motors, and transformers, as well as testing and measuring equipment. Illustrative of the type of assistance furnished is a statement in a Defense Department Disaster Bulletin of September 1, 1955:

The Department of the Army authorized the Chief of Transportation to loan to the railroads affected by the flood disaster in the Northeastern States locomotives from reserve stocks as follows: Erie, 6; New York Central, 20; and Pennsylvania, 43. These locomotives are in addition to 20 loaned to the New York, New Haven and Hartford Railroad and 25 to the Delaware, Lackawanna and Western Railroad on 25 August. Railroads in all cases will pay costs involved.

Leases of equipment under this order were only for such periods of time as were necessary for the lessee to obtain delivery of equipment to replace that which was damaged or destroyed. In no case were leases entered into for more than one-year terms.

In order to maintain the mobilization base, the Director of Defense Mobilization issued Defense Mobilization Order VII-7, Supplement 1, which states that it is essential to the national defense that productive facilities in major disaster areas be used to the maximum practical extent.⁹

The provisions of Defense Mobilization Orders VII-4 and VII-7 were made applicable to the areas of the West Coast affected by the December floods on December 29, 1955.

To accomplish this objective, Department of Defense procurement agencies used their best efforts to award procurement orders to contractors located in disaster areas and to encourage prime contractors to award subcontracts to

⁸ Office of Defense Mobilization, Defense Mobilization Order No. VII-4, Supplement No. 1, Subject: “ODM Policy Guidance on Government-owned Production Equipment,” dated August 25, 1955, and Amendment thereto dated September 21, 1955. (On the role of ODM during the August 1955 floods see also the article in this issue of THE ANNALS by Arthur S. Flemming, “The Impact of Disasters on Readiness for War.”—Ed.)

firms in those areas. A total of 6,282 contracts with a value of 2.05 billion dollars were awarded under this authority. The authority in the order was terminated April 15, 1956. Table 1 shows the distribution of these contracts by states.

Military departments were authorized to pay price differentials to make awards to other than the lowest bidders—a treatment similar to that authorized by Armed Services Procurement Regulations for bidders in labor surplus areas. New procurement actions awarded as a result of preference authorized in Defense Mobilization Order VII-4 and Defense Mobilization Order VII-7, totaled 320 such contracts for a value of 41.7 million dollars. The application of these orders was terminated April 15, 1956. Table 2 shows a breakdown of such actions by states.

Other actions taken by the military to assist suppliers included speeding up of payments to contractors, suspension of automatic termination of contracts in

damaged facilities, extension of delivery dates, guarantee of loans, and the establishment of industrial clinics to advise potential contractors in those areas of the benefits that could be obtained.

THE RESERVE FORCES IN DISASTERS

Stronger and more effective Reserve Forces are being developed under programs authorized by the Reserve Forces Act of 1955.¹⁰ When objectives of the Reserve program are achieved, there will be organized and trained units in or available to potential disaster areas throughout the United States. This will provide on-the-spot leadership and stability in organizing emergency measures at the scene of a disaster.

The National Guard has traditionally performed such a role. It has a long and outstanding record of professional military support and response to the control of disaster situations. Reserve units under appropriate circumstances could be similarly employed.

The training of Reserve Forces units

lends itself to employment in mass feeding, medical support, field engineering, first aid, and sanitation, all of which are urgently needed when disaster strikes. Their work in disaster relief furnishes firsthand the best practical training for meeting the demands that may be thrust upon them in the event of an enemy attack on the United States. In addition, these Reserve units can provide military experience for pre-disaster emergency planning by local civilian disaster units.

The Reserve Forces are only one component of the military potential that is available to come to the assistance of the nation whenever and wherever disaster strikes. In their entirety the Armed Forces are as vital to the nation in combating natural disaster as they are in defending against enemy attack. The Armed Forces are proud of the help they have given in the past and, as always, stand ready to respond if needed in the future.

SALIENT POINTS IN REVIEW

In summary, these salient points should be noted:

1. The Armed Forces, which are organized, trained, and equipped to defend the national way of life against aggression, are ready to provide military assistance to civil authority when the

overruling demands of humanity compel immediate action.

2. Upon the declaration of a major disaster by the President the Armed Forces furnish assistance under the direction of the Federal Civil Defense Administrator, through the FCDA Regional Administrator. Normally, this assistance is already being furnished well ahead of the time a major disaster is declared.

3. The Red Cross and the Armed Forces co-operate closely in disaster relief. Assistance furnished by the military to the Red Cross upon request of that organization is reimbursed by the Red Cross. Under certain circumstances the Red Cross may purchase military equipment and supplies.

4. The Corps of Engineers has a statutory responsibility in flood control. During a major disaster this requirement is extended to furnishing additional and reimbursable assistance under the direction of the Federal Civil Defense Administrator.

5. The improved Reserve program will increase the ability of the Armed Forces to furnish assistance in disaster relief throughout the nation, on a state by state and county by county basis.

6. The Armed Forces are as vital to the nation in combating natural disasters as they are in defending against enemy attack.

Public Health Problems in Major Disasters

By L. E. BURNEY

Abstract: It is impossible to predetermine rigidly the public health problems in major disasters or the official relief actions to be taken; each disaster presents its own characteristics. Good public health organization must, in such circumstances, be able to co-operate quickly with other relief agencies, identify and evaluate actual and potential public health hazards, mobilize existing health resources, take emergency measures to control or eliminate hazards and restore public health facilities. The co-operative functioning of local, state, and federal health agencies is described by the author, and especially the organization and work of the federal Public Health Service in disaster operations. The author illustrates the functioning of the Service in connection with the outbreak in 1952 of mosquito-borne encephalitis in the Central Valley of California and the 1955 hurricane and floods in the northeastern states.—Ed.

IT is no easy task to separate from the multiple problems of a major disaster those hazards to the affected populations that can be defined exclusively as public health problems. The safety of water and food supplies and the control of communicable diseases, it is true, are readily identified as public health problems of extreme urgency in certain types of disaster. However, the emphasis that has been given to these aspects of public health in the development of national, state, and local disaster relief programs in the United States may reflect rather a tendency to perceive the health problems of human beings under catastrophic conditions in terms of the traditional role of public health agencies than a thorough evaluation of the potential hazards to public health of all types of disaster, and of the substantial federal, state, and local public health resources available at the present time to cope with such hazards.

WHAT EMERGENCY PROBLEMS?

One can visualize, for example, some disasters in which water and food sani-

tation and communicable disease control would be of minor concern, if emergency problems at all. The major public health problem might be deadly air pollution. If one casts a very long look back to A.D. 79, one may observe that in the famous eruption of Vesuvius the major loss of life was due to poisonous fumes, of which the elder Pliny died with his fleet at Stabiae some distance from the volcano. In the continental United States in recent times there have been comparable episodes, smaller but nonetheless disastrous. In 1929, the combustion of X-ray films in the Crile Clinic at Cleveland took 125 lives as a result of poisonous fumes. In 1948, smog conditions at Donora, Pennsylvania, took twenty lives and caused several thousand disabling illnesses. An accident in some types of industrial installations today, or in a nuclear reactor in the future, might pose a similar public health problem on the scale of a major disaster. Such an occurrence might require the full complement of organized disaster relief—rescue, evacuation, emergency housing and

feeding, emergency medical service, protection of essential facilities and services, and so on. But the major public health problem would not be sanitation and communicable disease control. It would be prompt identification and control of atmospheric pollution, emergency diagnosis and treatment of severely affected persons, and protection of affected populations from further exposure.

It appears, then, that public health problems in major disasters can no more be rigidly predetermined than can the immediate, specific actions of responsible officials on the scene of a disaster. The characteristics of the disaster itself determine the problems and the actions. It is essential, therefore, that public health organization for disaster relief be geared to accomplish the following general purposes: (1) automatic liaison with all other components of organized disaster relief; (2) immediate identification and evaluation of the present and potential public health hazards; (3) automatic mobilization of all the public health resources that will be needed, as determined by the evaluation; (4) emergency action to control or eliminate the public health hazards and to protect affected populations from exposure; (5) emergency restoration or substitution of basic public health facilities and services in affected communities; (6) evaluation of damage to structures and property in terms of effects on public health; (7) restoration of public health facilities and services in disrupted and damaged areas; (8) identification of actions needed to avert the recurrence of similar disasters; (9) evaluation and reporting of disaster relief activities, in terms of effectiveness in protection of public health.

Whether a disaster is natural or man-made, whether it is national, regional, or local, whether the costs of relief are to be deferred by official, quasi-official,

voluntary, or private funds, there should be a public health organization capable of fulfilling such purposes. The United States is fortunate that its federal, state, and local public health agencies have been developed to the point that such an organization for public health disaster relief is in being today. Especially during the past twenty years, our state and local health departments have been greatly strengthened and their responsibilities expanded. In many instances, the state health authority is responsible for all emergency public health and medical services in the governor's civil defense and disaster relief organization, and the health officers of many municipalities hold the same position in local civil defense and disaster relief organizations.

HISTORICAL DEVELOPMENT

Thirty years ago, state and local health organizations in most parts of the country were not strong enough to assume their full responsibilities for protecting the public's health even in disasters of state or local scope. Very often little could be done, or was done, until the disaster had wreaked its utmost damage and passed on, leaving the organization of relief and public health controls to outside agencies. Today, every state and territory has a well-organized central public health department operating on the one hand in close co-operation with the United States Public Health Service and on the other with local health organizations or local governments if no local health department is in existence. The capacities of the Public Health Service to assist state health departments, both in the normal operation of their programs and in public health emergencies, also have been strengthened and expanded. In addition, research activities in the Service have been enormously augmented within the past decade, thus implement-

Leroy E. Burney, M.D., Washington, D. C., is Surgeon General, United States Public Health Service, Department of Health, Education, and Welfare. From 1945 to 1954 he was Commissioner of Health, State of Indiana, and Associate Professor of Public Health, School of Medicine, Indiana University.

ing a growing, intensive search for better methods of coping with old problems and for effective means of dealing with new or potential hazards in disasters occurring in our very much altered mid-twentieth century environment.

A certain type of natural disaster—severe and rapidly spreading epidemics—was responsible for the establishment of most of our state and local health departments and for the emergence of the Public Health Service in the second half of the nineteenth century as the federal partner of the states in combating disease, providing a safe and healthful environment, and promoting the health of the people. In fact, one might say that the Service and many of our state health departments “cut their eye teeth” on epidemic control and that their joint activities in this field constituted the first organized “disaster relief” work in the United States.

A century ago, however, state health organization was embryonic—in some instances, established to function solely in emergencies—and the Public Health Service was the only agency capable of putting into the field enough trained personnel to deal with rapidly spreading epidemics. Today, our state and local health departments bring most communicable disease outbreaks swiftly under control and contain them within their own borders without any assistance from the Public Health Service. If assistance is needed, it may take the form of expert consultation or of assignment of specially trained personnel to the state health department, with a loan of equipment and supplies. Personnel so assigned are under the direction of the state health officer, and their disposition and use in the epidemic are at his discretion.

Public Health Service co-operation with the states in epidemic control has been established in law since 1893. The

concurrent growth in scientific knowledge of communicable disease control and in permanent public health organizations has minimized the threat of epidemics as natural disasters; but the increased mobility of the United States population and the lack of effective control measures for some diseases, especially those due to viral infections, require continued vigilance, readiness, and teamwork on the part of our federal, state, and local public health organization.

Mutual experience and a simple administrative mechanism have made it possible for the Public Health Service and the state health departments, co-operating with local health agencies, to establish a national network of public health teams ready to go into action for the protection of public health in any type of disaster. The same public health organization is at the disposal of national and state disaster relief agencies through whatever channels may be available in a given situation.

PUBLIC HEALTH RESOURCES FOR DISASTER RELIEF

The federal law which makes it possible for the Public Health Service and the states to maintain this national organization for public health disaster relief is the Public Health Service Act of 1944.¹ Among many other provisions affecting the nation's health, the following three authorizations in this act are applicable:

First, the Service is authorized to maintain a Commissioned Reserve; that is to say, to commission individuals skilled in the several specialties of public health work who shall be subject to call to active duty for training or service.

Second, the Service is authorized to provide direct assistance to the states in any type of emergency affecting health

¹ Public Law 410, 78th Congress.

and sanitation beyond the resources of the states.

Third, the Service is directed to promulgate and enforce foreign and interstate quarantine regulations as a means of preventing or controlling the spread of communicable diseases from state to state or from foreign countries into the United States.

The Commissioned Reserve

The Commissioned Reserve offers many advantages in the development of disaster relief activities. Through this simple mechanism, the Public Health Service can promptly supplement its Regular Commissioned Corps and other technical staff by calling to active duty in a disaster area Reserve Officers who are resident in the area or nearby and assigning them to the state health department concerned. The same mechanism makes it possible to bring together groups of personnel, both those employed by the Service and those in outside agencies, for training in the newest public health techniques that may be applicable in all types of disaster.

During the past three years, the Commissioned Reserve of the Public Health Service has been expanded to a present strength of 2,436 as of July 1, 1956. Many of these Reserve Officers are staff members of state and local public health departments who have long held reserve commissions in the Service. In recent years, however, the major effort has been to recruit physicians, engineers, sanitarians, and other personnel from industrial establishments, universities, and private practice. Special training courses in basic procedures for epidemic and disaster relief, as well as advanced training in public health civil defense problems, have been organized and more than 3,000 public health workers, including 720 Commissioned Reserve Officers, have received at least

a minimum of training in these procedures.

Regular PHS personnel and emergency action

The permanent staff of the Public Health Service, of course, is immediately available in the event of a serious outbreak of disease or other type of disaster. At headquarters in Washington, a Health Emergency Planning Office in the Office of the Surgeon General serves as the focal point for all emergency activities. This office maintains continuous contact with the Bureau of State Services and its Division of Sanitary Engineering Services, Robert A. Taft Sanitary Engineering Center at Cincinnati, and Communicable Disease Center with headquarters at Atlanta, and with the nine Regional Medical Directors who are in charge of all field personnel of the PHS in their respective regions, covering the continental United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. In the event of disaster, the Regional Medical Director or his designated representative becomes the immediately responsible official for Public Health Service activities.

The Public Health Service has available for emergency assignment to affected areas the following categories of personnel: (1) medical and nursing personnel to assist in emergency medical care and control of communicable diseases; (2) engineers, entomologists, sanitarians, laboratory technicians, and related personnel to assist in maintaining adequate and safe supplies of water and food, safe disposal of wastes resulting from the disaster, as well as normal refuse disposal, and control of insects and rodents; (3) epidemiologists, bacteriologists, chemists, and other laboratory specialists to investigate outbreaks of communicable diseases and other widespread illnesses, to determine effective procedures for controlling the

disease or cause of illness, and, if necessary, to carry out such procedures; (4) public health veterinarians to investigate and determine the means necessary to curtail diseases of animals affecting the health of people.

PHS hospitals and clinics

In addition, the Public Health Service maintains a system of hospitals and out-patient clinics located in strategic coastal and interior cities throughout the country. These facilities may be made available when local medical services and hospitals are overtaxed. Research staffs of the Service, located at the National Institutes of Health, Bethesda, Maryland, and in several field stations also may be assigned to specific activities in severe epidemics or disasters.

Emergency equipment

The major centers of the Public Health Service for epidemic and disaster relief, however, are the Communicable Disease Center and the Sanitary Engineering Center. Through these organizations, the Service maintains in constant readiness emergency equipment and materials to supplement the resources of state and local health departments and other federal agencies.

For emergency water treatment, the Service can put into the field truck-mounted filtration and sterilization units, collapsible storage tanks, trailer-mounted heavy-duty chlorinators, pumps, hypochlorinators, truck-mounted electric generators, and motor-drying equipment. The necessary supplies of chemicals are also available.

The control of disease-carrying insects and rodents requires power equipment for spraying. The Service has such equipment mounted on trucks and aircraft, as well as hand sprayers and dusters. Supplies of insecticides and rodenticides which are difficult to ob-

tain commercially on short notice are also stocked routinely for use in emergencies.

Mobile laboratories for the detection of water pollution and for the diagnosis of infectious diseases also are valuable facilities in emergencies. The Public Health Service maintains seven mobile laboratories for detection of water contaminants and one for detection of disease organisms.

All types of emergency equipment, including various types of field vehicles adapted for use on or off highways, are based at strategic points. Currently, the base areas are located in certain southeast, southwest, and mountain states where distances are long and the resources of large metropolitan areas are not available.

FEDERAL-STATE PUBLIC HEALTH TEAM

It should be understood that the total Public Health Service resources in personnel, facilities, equipment, and supplies merely supplement those of the states and local communities which, in sum, constitute the major national resources for public health disaster relief. How does this federal-state team for epidemic and public health disaster relief perform in action? Several recent episodes come to mind as illustrations.

Encephalitis epidemic in California

In 1952, there occurred a severe outbreak of mosquito-borne encephalitis in the Central Valley of California. No one ever thought of it as a disaster, but in terms of deaths and illnesses and of the area affected, the effect of the encephalitis epidemic exceeded that of many recognized disasters.

Western equine encephalitis is a virus disease of man and horses and is transmitted by a specific mosquito, *Culex tarsalis*. Before the outbreak was curbed, 49 persons had died of the disease and 747 additional cases had been reported.

California's excellent state health department was alert to the threat of an outbreak, since its entomologists had predicted an unusual prevalence of the mosquito because of the unusually long rainy season in the affected areas.

Doctor Wilton L. Halverson, then State Health Officer, acted promptly and decisively. He first obtained from Governor Warren an emergency fund of \$250,000 to step up mosquito control work in the affected area. And on the same day, in his own words:

I called by long distance telephone the Surgeon General of the Public Health Service, informed him of the situation and requested aid in epidemiological studies in order to devise better ways to control this disease which strikes at random over various parts of the country. Within half hour of this call, I received word from the Communicable Disease Center . . . that the request was fully granted; and by the following Tuesday, twenty-two physicians, veterinarians, engineers, and entomologists had actually reported for duty and were assigned to assist local physicians and hospitals in studying and controlling this disease.

The area of action of these federal-state-local teams was a 465-mile stretch, comprising twenty counties. The work was carefully co-ordinated and conducted by local mosquito-abatement districts and health departments, or, where none existed, directly by the state health department. Approximately five hundred individuals worked intensively for two months—not only to bring this "natural disaster" to an end but to avert its recurrence.

The technique devised for this particular situation may be applicable in similar outbreaks involving mosquito-borne diseases for which no effective immunization is available. A "barrier band," one-quarter mile wide, was thrown around more than three hundred towns and cities and these "bands" were

heavily treated with residual insecticides. This was to prevent the movement of mosquitoes from rural areas into towns. Aerosol sprays were applied periodically on a routine plan over the cities and towns. Breeding places of *Culex tarsalis* were inspected and eliminated or treated. Six field zones were established for intensive mosquito abatement in areas surrounding the towns. In addition, four teams consisting of medical and veterinary personnel were stationed at field locations. Their main responsibility was to learn as much as possible about the disease in man and animals, but they also assisted in the diagnosis of cases.

A remarkably comprehensive and sound approach to this "natural disaster" was formulated quickly and as quickly followed up. It was designed to curb the outbreak and to learn more about the disease itself. The intricate and baffling epidemiology of infectious encephalitis, as well as its impact on a community, makes it comparable with certain other virus diseases such as poliomyelitis. To quote Doctor Halverson again: "Federal, state, and local health workers teamed up and did the job which needed to be done in a manner which I believe did credit to public service."

I have given special attention to this episode because it so clearly illustrates the need for continuous, permanent, well-trained, and well-organized staffs—not only for the normal protection of public health, but also for emergency action in peacetime or in war. It also illustrates the value of a simple administrative mechanism for bringing the right kind of expert help to the affected area at the right time.

Epidemic Intelligence Service

The PHS operating unit for epidemic assistance is the Epidemic Intelligence Service of the Communicable Disease

Center. Organized in 1951, this branch provides epidemiologists and related specialists on request to assist the states in combating epidemics, including those that may occur in the course of major disasters. Of equal importance is the accumulation in the PHS of information on outbreaks of unusual diseases, often difficult to identify, as well as on unusual outbreaks of more common diseases. In connection with this intelligence service, laboratory diagnostic tests may be performed by the Communicable Disease Center or by collaborating laboratories equipped to perform such tests. Services of this type were intensified in 1955, and a special unit was set up to provide in co-operation with the states complete epidemiologic information on poliomyelitis in relation to use of the Salk vaccine. The significance of such teamwork between the Public Health Service and the states is enhanced when one considers the possible necessity for very rapid identification and control of artificially stimulated epidemics in connection with biological warfare.

Northeastern states floods, August 1955

In the types of natural disaster most familiar to the American public, such as floods, hurricanes, and tornadoes, it has become increasingly evident that emergency public health services must be brought into action with the onset of danger and continued until all such services have been restored to normal. In addition, many special hazards to health must be recognized promptly and dealt with. The hurricane and floods in the northeastern states in August 1955 present a useful lesson in how these emergency health needs may be met.

The violence and destructiveness in lives and property of the 1955 hurricane and floods have been widely reported. There were radio and tele-

graphic warnings on the morning of August 19, but it would appear that little or no preventive action was taken. When the disaster actually struck, communications failed and an accurate evaluation of the situation was not made until after the damage was done. Rescue and evacuation, the first and most essential components of disaster relief, had to be improvised by local communities with such on-the-spot help as they could obtain from state and national personnel in the area.

Disaster relief, in terms of action on the part of federal agencies and the national headquarters of the American National Red Cross, was essentially postdisaster operations. By August 21, however, state, regional, and national contingents were in action. In Pennsylvania, for example, the state health department had 55 sanitarians, drawn from other sections, in the flooded areas of that state.

Between August 20 and August 26, the PHS dispatched forty-five officers to the affected areas, the majority of whom were assigned to state health departments. Several of these officers served as liaison on behalf of the health department with the Federal Civil Defense Administration and the Army Corps of Engineers. Others were assigned to the FCDA to appraise the damage to community health facilities and determine priority needs in cleanup operations; still others were assigned to the American National Red Cross to appraise the damage to residential structures as a basis for determination by the Red Cross of cash allowances for the rehabilitation of private homes.

Most of the PHS personnel on disaster relief duty, however, worked directly in the field as members of state health department staffs. Their activities illustrate the wide range of sanitation problems that such a disaster commonly presents. Water, milk, and

food supplies in a large area had to be checked for safety. Safe water supplies had to be made available through emergency chlorination or filtration, or by the importation of drinking water in tanks. "Boil water" notices had to be posted. Raw milk supplies had to be diverted from damaged pasteurization plants to undamaged plants. Large quantities of contaminated foods had to be disposed of. The removal of debris and the maintenance of satisfactory sewage and refuse disposal constituted the chief problems confronting health officials in the wake of the floods. The control of flies and rodents in flooded areas after the water receded, as well as at dump areas where debris was being taken, also required such sanitation methods as spraying, burning, and landfill operations.

LIAISON ACTIVITIES IN NATIONAL AGENCIES

The co-ordination of national agencies and the administration of federal financial assistance to communities affected by severe disasters are provided in the Federal Disaster Act of 1950 (Public Law 875). This law may not be invoked, however, until the President has declared that a major disaster exists. Under these conditions, the Federal Civil Defense Administration is responsible for co-ordinating the activities of all federal agencies in the disaster area, for reimbursement of certain expenditures of federal agencies, and for the certification of federal financial assistance to affected communities.

Various federal agencies and the American National Red Cross have made formal agreements as to their disaster relief responsibilities and, in many instances, permanent liaison is maintained. The Public Health Service, for example, maintains liaison with all branches of the armed services so that

arrangements can be made promptly for the transportation of equipment and supplies into disaster areas. Through these arrangements emergency equipment or critical supplies can be allocated either from the Public Health Service or the nearest military installation.

For many years, the Public Health Service and the American National Red Cross maintained close working relationships during disaster relief operations. In 1953, a formal understanding was developed and subscribed to by both agencies for continuous planning and co-operation in the event of natural disasters.

The President has directed federal agencies to make suitable plans and preparations for carrying out their responsibilities in anticipation of a major disaster. The Department of Health, Education, and Welfare and the Federal Civil Defense Administration have developed such plans and procedures, in which the Public Health Service plays a major role on behalf of the Department. These procedures provide for (1) interchange of information and continuing liaison between DHEW and FCDA, both at national headquarters and in the field; (2) accurate and prompt information to the public on DHEW activities relative to the disaster; (3) co-ordination of DHEW disaster activities with state and local efforts and those of other national agencies; (4) delegation of authority by FCDA to DHEW to undertake specified disaster operations and reimbursement by FCDA for services and facilities provided by DHEW under such delegations.

Additional plans and procedures have been developed within the Department of Health, Education, and Welfare to assure prompt activation of its many regional and field organizations for disaster relief. The regional offices of the Department, located in nine strategic

cities of the United States, are responsible for the direction and co-ordination of all disaster assistance provided by the Department to the states. Hence, the Regional Medical Director of the Public Health Service becomes the commanding officer for the Service's disaster relief activities in any given region. All assignments of personnel and allocation of equipment and supplies are made with his approval. He may draw on any part of the Public Health Service for assistance to disaster areas.

Regional offices of the Department of Health, Education, and Welfare have developed plans and procedures which provide for (1) interchange of information with the appropriate FCDA regional office regarding existing or threatened disasters, including requests for assistance from the states; (2) preparation of inventories of manpower, equipment, and supplies available for use in disasters, which are supplied in summary form to the FCDA regional office; (3) exchange of directories of key regional and field personnel of DHEW and FCDA; (4) definition of geographical areas covered by DHEW regional offices and of their operating responsibilities; (5) operating procedures having sufficient flexibility to cover all types of disaster.

In some parts of the country, state and local governments have adopted plans for mutual aid in the event of disaster. In such instances, the state and local health departments will be involved in rescue, emergency medical and hospital care, housing, and mass feeding, as well as in the sanitation and preventive health operations. As state and

local disaster relief programs and staffs gain more experience in planning and action, there is no doubt that additional mutual aid plans will come into being. Reports by Public Health Service personnel assigned to disaster duty frequently document the greater efficiency of relief activities in those areas where advance planning, systems of mutual aid, and full-time local health departments have been in existence.

We have not yet arrived at the stage when the preventive philosophy of public health can be applied to all types of disasters. Prevention, however, should be the aim of disaster relief activities. At present, disasters caused by tornadoes, fires, earthquakes, and explosions seem to strike without warning, so that there is little or no opportunity for protective action. In most instances, however, warning of approaching danger from hurricanes and floods can be given. Every threat of danger and every disaster—whether local, regional, or national in scope—should be used as a training exercise in the efficacy of our national, state, and local planning for disaster relief. Reports by the responsible officials at each level of government should be co-ordinated into one report of the specific disaster, and this report should be studied critically by the same officials with the serious intention of determining those components of disaster relief that need improvement, as well as those that operate satisfactorily. Only by such critical evaluation of existing plans and operations can we build a nationwide network of teams capable of meeting the modern threats of natural and man-made disasters.

How a State Prepares for Disaster

By WILLIAM L. MCGILL

Abstract: The State of Texas leads the other states of the nation in the number of major disasters: it is first in tornadoes and devastating floods and second in hurricanes. This article describes how Texas, under its Civil Protection Act of 1951, without setting up an independent state agency, has gone about mobilizing and utilizing the resources of the state in time of major disaster. The "Texas Plan" is discussed in detail and attention paid in particular to its cost and financing, the planning of disaster relief, preparedness, and training.—Ed.

THE Texas Civil Protection Act of 1951 grants necessary powers to state and local governments to cope with emergencies threatening life and property within the state, and charges the Governor with the duty of providing for "the organization and co-ordination of a program of civil defense and disaster relief adequate to protect life and property in this State in case of natural disaster, enemy action, or the threat thereof."¹

In practice, the act is taken as authority for state and local governments to conduct training in disaster preparedness and the techniques of survival and to co-ordinate action of government and private agencies and individuals in time of disaster caused by explosion, widespread fire, falling aircraft, wrecks, tornado, hurricane, flood, and enemy action. These are considered situations requiring joint action of several agencies and groups and do not include such "emergencies" as highway accidents, public health needs, and similar matters which are the responsibility of individual departments and agencies of government.

This act formalized a long-existent

practice of providing through the regular staff of the Office of the Governor the action required to mobilize and utilize state resources in time of major disaster. In such situations as that caused by the Texas City explosion, a representative of the Governor maintained close liaison with the several departments of state government more largely concerned and with the Red Cross, and served as the co-ordinating agent for these operations.

In the past ten years, 215 natural disasters have occurred in Texas in which 979 people were killed, 5,345 were injured,² and a property loss of \$265,820,100 was sustained.³ The insured loss from fire in Texas in 1955 was \$32,472,785 dollars, representing an economic loss of over one hundred million dollars. Five hundred Texans are killed by fire each year—80 per cent of them women and children.⁴ These sta-

tistics illuminate the questionable honor Texas holds as first in the nation in the number of all major disasters, first in tornadoes, second in hurricanes, and first in devastating floods.⁵

The size of the state—an area of 271,401 square miles—and its great diversity of natural conditions make inevitable a wide variety of hazards and disaster potentialities. Its significance to the military and economic might of the nation also makes the state an area of particular interest to the country's enemies in the divided world of today.

THE TEXAS PLAN

Civil defense and disaster relief activity in Texas on the state level is handled through the Division of Defense and Disaster Relief, created under the authority of the Texas Civil Protection Act of 1951,⁶ notable as one of the few pieces of major legislation ever adopted by a unanimous vote in both houses of the legislature. Though the Division of Defense and Disaster Relief has round-the-clock availability, it does not operate as an independent state agency but functions by combining the facilities and activities of all agencies of state government able to contribute to the joint effort. It is an integral part of the Governor's Office,

⁵ William L. McGill, "Federal-State-Local Government Relationship in Disaster Relief," Speech April 16, 1954, to the Annual Convention of the Southwestern Social Science Association, Dallas, Texas, April 16, 1954.

⁶ House Bill 784, passed by the 52nd Legislature, Regular Session, and signed into law by the Governor on June 1, 1951. On May 27, 1953, the act was amended by Senate Bill 352, which further defined the authority of the state to accept gifts, grants, or loans for purposes of civil defense and disaster relief, and to use, allocate, and distribute such items directly or to political subdivisions of the state. This amendment was a result of the emergency created by the Waco and San Angelo tornadoes of that month.

and the Governor—acting through his appointed State Co-ordinator of Defense and Disaster Relief—is the directing head of the civil defense activity.

The basic concept of this type of plan—a government operation by co-operation—is to bring together all the resources of the state government in a unified, integrated organizational pattern rather than to establish an entirely new department of government. Such a plan is not only more economical but more effective and functional than the creation of a new state agency, which involves competition for the state tax dollar, training of new personnel, and danger of duplication in governmental functions. If the full possibilities of the plan are realized in Texas, the services of all 32,000 state employees can be utilized in case of necessity for civil defense and disaster relief duty.

OPERATIONAL STRUCTURE

Operationally, the state departments directly concerned with the protection of the public safety form the State Civil Defense Council, although state law authorizes the participation of all state agencies in this combined operation if the need arises. The State Civil Defense Council includes the State Co-ordinator of Defense and Disaster Relief as the Governor's representative, and the heads of the Departments of Public Safety, Public Welfare, Civil Aviation, Health, Fire, Highways, the Railroad Commission (Transportation), the Employment Service (Manpower); the Adjutant General; state consultants on engineering and education; and a liaison officer of the American National Red Cross, together with a representative of the Attorney General of Texas, who serves as legal adviser.

The State of Texas is divided into sixteen disaster districts, which parallel

the Highway Patrol Districts as created by the Department of Public Safety. The Highway Patrol Captain in each district serves as the liaison officer between the district and the Division of Defense and Disaster Relief. Counterparts of all other state departments are also found in each of these district organizations.

Under the county judge for the county and the mayor for the city, defense and disaster relief organizations are established in the political subdivisions of the state. Usually, there is a County Defense Council, consisting of the county judge and the mayors of incorporated cities in the county, which has a defense director as its administrative officer. In some cities, there is a separate co-ordinator for the city. In all, there are 159 counties and 300 cities of the state with appointed civil defense directors. The other counties and cities make this a responsibility of some other local official such as the county judge, the mayor, or the city manager.

In the event of disaster, word is received by the Division of Defense and Disaster Relief through the Public Safety liaison, and if the emergency is of major proportions, the State Control Center in the State Department of Public Safety Building at the capital in Austin is activated. Here in the Center all communications are received, via the Public Safety state-wide radio network, and representatives of all agencies making up the State Civil Defense Council are present. District control centers have been established in all Highway Patrol headquarters, and alternate control centers have been designated for use if needed.

Since it is a basic tenet of our system of government that all people should help themselves to the fullest possible extent, a community suffering from a disaster will try to solve its problem with the resources and personnel at its

immediate disposal. If these are inadequate, the resources of the State Disaster District in which the community is located are immediately offered. In the event of a major catastrophe, resources of surrounding districts and of the state are furnished, with federal assistance being requested when the resources of the state are exhausted. These requests for assistance are made through the Highway Patrol Captain of the district and are co-ordinated by the representatives at the State Control Center, who are constantly in touch with the situation.

As a matter of course, arrangements have been made for the district control centers to co-ordinate mutual aid and mobile support and to maintain district-wide inventories of emergency resources of shelter, clothing, food, and medical supplies, and engineering data on all communities, together with information on all vital industries and facilities.

FINANCING DISASTER ACTIVITIES

To carry out its task of co-ordinating this activity, the operating budget for the Division of Defense and Disaster Relief for the biennium beginning September 1, 1955, was \$205,526.⁷ Other state agencies participating in the effort finance the activity from their regular budgets. Under state law, "in the event of war declared by the Congress of the United States and in order to permit the diversion of sufficient monies . . . for meeting the emergency needs for citizens of the State resulting from such war,"⁸ the Governor has the authority to transfer to civil defense the unexpended balances in appropriations for capital expenses for all agencies of state gov-

⁷ "General Appropriations by the 54th Legislature, Regular Session," House Bill 140, p. 88.

⁸ "General Appropriations by the 54th Legislature, Regular Session," House Bill 140, p. 209.

ernment. The amounts of any such transfers, the agency from which the transfers were made, and the purposes and objects for which transferred amounts were used in the civil defense and disaster program must be detailed in the Governor's message to the next session of the Legislature.⁹ The amount in the state's budget available for this purpose, as of September 1, 1955, was \$6,496,758.¹⁰

PLANNING AND PREPAREDNESS

The Division of Defense and Disaster Relief, as its prime function, must make advance plans for coping with disasters and, when the emergency is at hand, must direct disaster relief activity. From the beginning, the state plan has contemplated the handling by one organization of disaster situations resulting from all causes. Therefore, civil defense and natural disaster relief activities are directed under the same program.

Warning network

One of the most important sources of disaster preparedness developed in Texas in the last few years is the radar storm-warning system, which the United States Weather Bureau has characterized as one of the finest of its kind in the world. Surplus radar sets of the United States Air Force were converted by the Research Foundation of the Agricultural and Mechanical College of Texas into storm-warning apparatus, and installed in sixteen Weather Bureau stations throughout the state. The cost of conversion and installation of each set, which varied from approximately \$10,000 to \$12,000 as a result of differences in locality and installation prob-

⁹ *Ibid.*, p. 210.

¹⁰ From statistics furnished by the Legislative Budget Board, June 12, 1956.

lems, was met by the city or county government, in several instances with the assistance of private industry and foundations.¹¹ Each set is currently valued at \$100,000. Bulletins of severe weather conditions—tornadoes, hurricanes, floods, thunderstorms—are transmitted by the Weather Bureau to all stations of the network, and to the district Highway Patrol headquarters for transmittal to the state office, and advance warnings are issued to all affected communities.

Also part of the state warning network is a state-wide emergency communications system, including tie-ins with sheriff's and police departments and state and private agencies.

Within the past year, the Ground Observer Corps has been established in Texas, the Air Defense Command of the United States Air Force furnishing a liaison officer who remains on duty in state headquarters and, together with the State Co-ordinator of Defense and Disaster Relief, directs and maintains organization of the Corps, including 1,397 observations posts, 7 filter centers, and 39,000 volunteer observers.¹² The Ground Observer Corps now cooperates with the severe-weather warning system and, in turn, members of the Texas Highway Patrol assist in plane observation.

The air raid warning system of the state has 5 key-point warning centers, 16 disaster control centers, and 285 local centers.

Inventories

A civil defense organization is only as strong as its ability to provide rapidly

¹¹ *Texas Defense Digest*, Vol. 2, No. 9 (August 1953), p. 1.

¹² Personal interview with Lt. Col. Winton F. Matthews, State Liaison Officer, Ground Observer Corps, 33rd Air Defense Command, U. S. Air Force, on June 15, 1956.

and easily needed emergency supplies to stricken communities. The prime prerequisite to this ability is knowledge of where important resources are located—their kind and number—and accordingly inventories have been made by the state of all important resources and supplies as follows: (1) An inventory of all fire-fighting resources, including personnel, equipment, and matériel, has been made and plans for a state-wide system of mutual aid and mobile support have been completed. (2) Inventories of all hospital resources and facilities, together with all police personnel, equipment, and facilities, have been completed, as well as inventories of all transportation equipment of every agency of state government and listings of their trained personnel. (3) Under the sponsorship of the state Aviation Advisory Council, inventories have been compiled on all civil aviation equipment, facilities, landing fields, and personnel, and information gathered as to how aviation personnel can be contacted day or night.

Many private organizations of business, industry, and labor, and professional and technical associations have agreed to make available their equipment and facilities and the personal services of their staffs when required for emergency use.¹³

TRAINING

The state realizes that in great catastrophes the forces of the regular governmental services would not conceivably be adequate to handle the situation alone. The need of auxiliary aid therefore arises—of citizens who will volunteer for service as auxiliary firemen and policemen, nurses' aides, litter bearers, and in many other capacities. These auxiliaries will, of course, serve under

the training and direction of the regular agencies of government. To augment these citizen volunteers, furthermore, every responsible citizen is urged to prepare for self-reliance in the face of crisis and grave danger.

This philosophy entails the undertaking of a mammoth training program, not only of auxiliaries but likewise of the whole citizen body. Endeavoring to make a reality of its belief that civil defense is everybody's business, the Division of Defense and Disaster Relief has had a major interest in the development of these training programs.

It is felt that at least one person in every family should take the standard first aid course; that one woman in every family should be trained in the standard course in home care of the sick; that every member of the family should learn the simple but essential lessons found in such civil defense publications as "Emergency Action to Save Lives," "Survival Under Atomic Attack," and "Fire Fighting for the Householder"; that following the organization plans of the local defense organization, every area of approximately five hundred people should have a block organization consisting of a block warden, a co-warden, an evacuation warden, a fire warden, a first aid warden, an information officer, a rescue warden, and a communications warden; and that this neighborhood organization should be kept in constant repair, available for every neighborhood need and ready to work in close association with similar groups throughout the community.

Courses have been established by the state for the training of auxiliary police, and institutes have been held for instruction of the state's police personnel, such as the Police Mobilization Conferences now being conducted on the district level. In these conferences, all local police, constable's, and sheriff's personnel come together to form and

¹³ *A Report to the Honorable Allan Shivers, Governor of Texas*, Defense and Disaster Relief publication, July 1952.

train, under state sponsorship, a joint organization for handling the various phases of the police function for the entire district.

Training schools for fire-fighting forces of the state, conducted by the Fireman's Training School of Texas A. and M. College, are continually in progress. During the last ten years, 7,181 students have graduated from these courses, together with 167 students from the Texas Rescue Training School course given at the same institution since February 1955. The Rescue Training School is sponsored by the Federal Civil Defense Administration, the state Defense and Disaster Relief organization, and the A. and M. College.¹⁴

Local government agencies in many areas of the state are also sponsoring training courses in auxiliary fire fighting and policing.

Special institutes were held in training state welfare workers in first aid and in disaster relief and, as part of their regular instruction, first aid training is given all state Public Safety personnel and the staff of the Texas Highway Department.

The state Health Department has held courses in radiology and in emergency medical and sanitation services, with instructors now trained and available in each target area. Radiological monitoring courses have been held by various civil defense organizations on the local level. Biological and chemical warfare defense training, under the supervision of the state Health Department, is in progress in each of the nineteen district laboratories serving Texas. Additionally, a state-wide organization has been formed to cope with the threat of biological warfare, and arrangements have been made for a state-wide report-

ing system on communicable animal diseases.

Besides training courses on the local and state levels, trainees have also been sent to the Federal Civil Defense Administration Staff College at Battle Creek, Michigan, and Olney, Maryland, and to the Federal Civil Defense Administration General Instructor's Course offered at Oklahoma Agricultural and Mechanical College at Stillwater, Oklahoma.

One of the most important means of training volunteers and the local citizenry has been the first aid courses given by the American National Red Cross. During 1955, for example, a total of 31,476 certificates were issued for completion of this standard first aid course, as well as 8,896 in the home nursing course and 54,568 in water safety training.¹⁵

PUBLIC INFORMATION PROGRAM

An endeavor in which the Division of Defense and Disaster Relief has been particularly interested is the development of its public information program. Civil defense material has been distributed regularly to newspapers and radio and TV stations in Texas, as well as to local organizations. The monthly information bulletin published by the state office, *The Texas Defense Digest*, was begun for general distribution throughout the state. Local trade and civic organizations have reproduced and distributed public information material released by the state and the Federal Civil Defense Administration. State and local trade magazines have offered their services and resources, and many carry regular articles on various aspects of the civil defense program. Advisory bulletins and executive orders on all perti-

¹⁵ From monthly statistical reports furnished the Division of Defense and Disaster Relief by Ralph Husted, State Liaison Officer, American National Red Cross.

nent phases of the defense program are distributed regularly to local defense directors.

Manuals and pamphlets covering particular fields of civil defense have been issued by the Division of Defense and Disaster Relief: a welfare service manual containing directives governing identification of casualties; an important pamphlet on "Women's Role in Civil Defense and Disaster Relief," distributed to local women's organizations (co-ordinated by the State Co-ordinator of Women's Defense Activities), with a total membership of approximately two million; a manual governing the role of youth in civil defense and disaster preparedness; a state "Plan for Health and Emergency Medical Services," prepared in harmony with the national pattern; and publications concerning various professional groups such as nurses, dentists, and the clergy. In all, some 711,000 copies of civil defense publications were distributed by the Division in 1955.

Civil defense films, made available by the state office free of charge to local groups and organizations through the services of the Audio-Visual Library of the Texas Education Agency, in 1955, were witnessed by over 230,500 people.

FEDERAL AID IN MAJOR DISASTERS

As indicated throughout this article, state and local defense organizations in Texas serve as co-ordinating agencies not only in the event of enemy attack but also in case of natural disaster. When the emergency markedly exceeds the maximum resources of state and local governments, and the President on appeal from the Governor has declared it to be a "major disaster," federal agencies and funds give assistance under the co-ordinating direction of the Federal Civil Defense Administrator.¹⁶ In the

¹⁶ For procedure under the Federal Disaster Act of 1950 (Public Law 875, 81st Congress) and Executive Order 10427, dated January 16,

past four years, Texas has received \$982,405.24 of federal funds to disburse to affected communities for combating the results of various natural disasters, of which \$211,623 went for the Waco tornado of May 1953, \$12,791.25 for the San Angelo tornado of the same date, \$40,000 for the Orange-Newton flood of June 1953, and \$717,990.99 for the Upper Rio Grande Valley flood of June-July 1954.

In declared major disasters, as specifically provided in the Federal Disaster Act of 1950, the accepted responsibilities of the American National Red Cross continue—organizing and operating emergency welfare services; providing food, clothing, shelter, and emergency medical and nursing aid; and conducting and financing rehabilitation programs for families and individuals on the basis of need, including the repairing or rebuilding of homes and the providing of household furnishings and occupational supplies and equipment.

DROUGHT AND EMERGENCY AID TO FARMERS

The Division of Defense and Disaster Relief is concerned not only with sudden natural disasters, the main subject matter of this issue of *THE ANNALS*, but also with economic or so-called "creeping" disaster. The economic disaster has now assumed such proportions, in respect to loss sustained by the people and the economy of the state, as to make it an even greater disaster than many earlier natural disasters of the sudden-emergency type.

On June 23, 1953, Governor Allan Shivers requested President Eisenhower to invoke Public Law 875 for the western half of Texas, an area then in its fourth year of drought. In some areas, the drought had cut farm income as

1953, see *supra*, Val Peterson, "Co-ordinating and Extending Federal Assistance."—Ed.

much as 65 per cent and lowered real estate and land values 10 to 15 per cent. The cotton crops of 1952 and 1953 ranged from three fourths to one half of normal. The wheat crop in 1953 was one third of normal.¹⁷

To help alleviate the suffering of farmers and ranchers, the federal government instituted in 1953 the drought emergency feed program, which in Texas was supervised by the Division of Defense and Disaster Relief with the aid and co-operation of various state agencies. The United States Department of Agriculture announced a program of buying two million pounds of meat, and to make money more readily available to farmers and ranchers, the Farmers Home Administration made available under Public Law 875 over seventeen thousand two-year loans, totaling \$48,591,177 for the period July 1, 1953, to April 16, 1954.¹⁸

Along with the drought emergency feed program, the federal government also instituted the emergency hay program. The concept of the hay program was to permit livestockmen and farmers in designated drought counties to purchase hay at prices comparable to cost in non-drought counties, funds for the program being provided by both the federal and the state government. During the 1953 and 1954 programs a total of \$1,334,206.55 was expended.¹⁹

An allocation of \$2,322,000 was granted to Texas in 1954 for the development of the emergency wind erosion control program in the state.

On the state level, the Governor requested numerous state agencies to co-operate in the drought relief program.

¹⁷From statistics compiled by the Texas Department of Agriculture.

¹⁸From statistics furnished by the Farmers Home Administration, Regional Office, Dallas, Texas.

¹⁹From statistics compiled by the Texas Department of Agriculture.

He recognized three aspects of the drought problem—the necessity of undergirding the economy of the farming and ranching industries to enable them to withstand the crisis; the need for long-range plans for water and soil conservation; and the necessity for alleviating human suffering as a result of the drought conditions.

The drought disaster problem has been given attention in conferences of various kinds, including the meeting of the Governors of Arizona, Arkansas, Colorado, Kansas, New Mexico, Oklahoma, and Texas with President Eisenhower in Amarillo, Texas, on July 10, 1953, and the conference for the entire Great Plains area held in Denver, Colorado, in June 1955 on call of Secretary of Agriculture Ezra Taft Benson, attended by heads of various agriculture departments and agencies of the states in that area.

In June 1956, the United States Department of Agriculture instituted a new drought emergency feed grain program, again administered by the Division of Defense and Disaster Relief; the possibility of long-term, low-interest loans to farmers and ranchers in the drought areas is being worked out with the Farmers Home Administration.

PROBLEMS AND SUMMARY

Many problems remain to be solved. One of these problems which is the common experience of everyone concerned is that civil defense (taken to mean steps necessitated by enemy action or the threat thereof) is a new concept to this country and one we are reluctant to accept. If we do recognize the danger, we are apt to think of it as so great that no amount of preparation would enable us to prevail against it. These public reactions have come to be spoken of erroneously as apathy. The problem is to convince the people not only that there

is a danger but that to some extent at least something can be done about it. Then by combining civil defense training with preparation for inevitable disaster from natural forces and accidents, we give them greater interest and training in the techniques of survival and in other phases of the task at hand.

In sum, the co-operative plan of governmental operation in civil defense and disaster relief; the contribution in public spirit and service which is being made by private citizens as they volunteer for work as auxiliaries to govern-

ment agencies; revival of the pioneer spirit, and with it renewed self-sufficiency, self-reliance, self-help; and a finer concept of neighborliness and obligation to the common good—all of these things may, we can hope, make the effort in which we are jointly engaged of importance for present needs and of significance in strengthening the tradition that our system of government is indeed an organization of the people, conducted by the people, and designed to function, in all effectiveness, for the people.

The Flood Peril and the Federal Flood Insurance Act of 1956

By EDWIN S. OVERMAN

Abstract: Floods are the most destructive of natural disasters; the 1951 floods in the Southwest caused property damage estimated at two and a half billion dollars. By comparison, all property and casualty insurance companies pay annually for losses totaling about one billion dollars, or about twice the average annual cost of floods. Private insurance companies do not regard flood peril, therefore, as an insurable risk. The Federal Flood Insurance Act of 1956 is designed to fill this gap. It provides for the establishment of a program of insurance, reinsurance, and loans to assist persons to recover from loss due to destruction by floods. The author analyzes the act in some detail.—Ed.

THE increasing frequency and severity of flood destruction during recent years have exerted strong pressure on the government to provide protection against the financial losses from this catastrophe. The manifestation of this public demand for flood coverage is the Federal Flood Insurance Act, which was approved August 7, 1956.

Floods rank first among the causes of natural disasters in the United States if measured by the amount of human suffering and the expenditures for relief and rehabilitation for individuals and families. Moreover, if measured by the damage and destruction to the properties, facilities, and installations of industrial and commercial organizations, to say nothing of federal, state, and local governments and agriculture, flood peril would exceed all other natural causes of disaster.

The extent of the losses resulting from the flood peril may be highlighted by two recent examples. The Southwest floods of 1951 in Kansas, Missouri, and Oklahoma caused property losses esti-

mated at 2.5 billion dollars.¹ Estimates of the total physical property loss suffered by the northeastern states in 1955 during the floods following Hurricanes Connie and Diane have ranged between 1 and 2 billion dollars.²

The significance of these figures is revealed when they are compared with the total losses paid by property insurance companies for *all lines* of insurance in an entire year in the United States. The total loss of the Southwest flood in 1951 is estimated at 2.5 billion dollars. This loss would be two and one-half times the total property losses of approximately 1 billion dollars paid by property and casualty companies each year. On the other hand, per-

¹ This estimate was presented in the House Appropriations Subcommittee proceedings as reported in the October 13, 1951, issue of the *Insurance Advocate*.

² From a flood damage summary appearing in the September 8, 1955, issue, of the *National Underwriter*. The report also indicated that approximately 50,000 families suffered some property damage with 1,300 homes destroyed, 4,800 seriously damaged, and 14,000 substantially affected.

Edwin S. Overman, Ph.D., Philadelphia, Pennsylvania, is Assistant Dean of the American Institute for Property and Liability Underwriters, Inc., the national examining body for the C.P.C.U. (Chartered Property Casualty Underwriter) professional designation in the field of insurance.

haps the average annual flood loss would be a more logical figure to compare with insured property losses. If the average annual flood loss in this country—estimated at 500 million dollars—is used in the comparison, annual flood losses would be equal to one half of the total of all losses for all lines of insured property each year in the United States.

Besides the two floods discussed above, serious flood conditions have occurred in other areas throughout the United States in recent years. Noteworthy were the losses suffered in the Sacramento Valley of California in 1955 and 1956. Disastrous floods have also occurred in the Mississippi and Missouri river valleys during the past few years; indeed, most of the major river valleys have experienced flood losses. One might conclude, therefore, that there is a real need for some form of protection against the financial losses caused by this peril.

PRIVATE INSURANCE UNAVAILABLE

"The traditional position of insurance company underwriters is that specific flood insurance covering fixed location properties in areas subject to recurrent floods cannot feasibly be written."³ The flood peril does not meet the major requisites of an insurable risk.

In the first place, everyone is not exposed to this peril in exactly the same way. Floods cause damage primarily to property located in lowlands—valleys of rivers and streams. Insuring this peril would result in a problem of "adverse selection," because the protection would be disproportionately attractive to those in the more hazardous and exposed areas.

Another important requirement for an insurable risk is that the premium

³ American Insurance Association, *Studies of Floods and Flood Damage 1952-1955*, p. 3.

charge must be adequate to pay all expected losses. At the same time, rates charged for the coverage must be sufficiently moderate for the majority of persons exposed to the risk to be able to afford the insurance. Because of the tendency to select against the insurance company noted above, the premium necessary to insure the peril of flood would in all probability be prohibitive.

A third important requisite of an insurable risk which the flood peril fails to satisfy, according to insurance underwriters, is that the potential loss must not be catastrophic.⁴ If loss expectations from a particular peril are so large that they exceed the amount of funds which could be collected in the form of premiums, then insurance is not feasible.

SUBSIDY, NOT INSURANCE

The conclusion reached by most insurance company representatives is that the flood peril does not measure up to the fundamental principles upon which insurance is based. The attitude of the insurance industry with respect to the government's new flood plan is aptly expressed as follows:

The industry hopes that the word "insurance" will not be used in the indemnification of flood losses under the Federal Flood Insurance Act of 1956. The industry does not believe that the writing of specific flood insurance covering fixed-location properties in areas subject to recurring floods is a feasible undertaking for either private industry or for the government and any plan which the government develops and puts into effect is a subsidy and is not insurance.⁵

⁴ The 2.5 billion dollar flood loss in the Southwest in 1951 is equal to the total value of the free assets of the property-writing stock insurance companies, according to statements reported in a House Appropriations Committee report investigating the flood problem.

⁵ American Insurance Association, "News Release," May 11, 1956.

A spokesman for the insurance industry summarized the argument against federal flood insurance when he stated: "It will be a damage-reimbursement program that will hit the treasury whenever you have a serious disaster."⁶

In spite of the admonition by private insurance spokesmen to use the proper terminology in describing the nature of the benefits of the new government flood plan, the act uses freely such terms as "insurance," "reinsurance," "Disaster Insurance Fund," and "insurance premium." Perhaps the justification for use of such terminology by the government is contained in the safeguards or policy limitations described later in this paper. These restrictions were incorporated in the provisions of the act in an attempt to establish the program on a sound actuarial basis in the future. Only time will tell whether or not the new plan can accomplish this objective.

SELECTION OF THE ADMINISTERING AGENCY

In determining the proper government group to carry out the provisions of the Federal Flood Insurance Act, several federal agencies were considered. The Federal Civil Defense Administration was first discussed, in view of its role in the co-ordination of disaster relief, as provided under Public Law 875; it was rejected primarily because it lacked the insurance experience necessary to administer the new program properly.

The Small Business Administration was considered because of its experience in making disaster loans at the time of the 1955 floods in the Northeast. Although the granting of disaster loans is an important provision of the new flood act, it was felt that the insurance and

reinsurance portions of the act were even more significant and that administration therefore required an agency with this background.

With the idea of combining this new program with already existing disaster insurance programs such as federal crop insurance, the development of an entirely new federal agency was discussed. The conclusion was, however, that something like crop insurance should not be divorced from the Department of Agriculture, which is engaged in co-ordinating many different programs relating to farming.

Finally, the Housing and Home Finance Agency was accepted as the logical choice, primarily because of the agency's extensive insurance experience and because housing is one of the chief types of property which will be covered under the provisions of the new flood act.

MAJOR FEATURES OF THE ACT

There are three important types or elements of coverage provided under the Federal Flood Insurance Act of 1956. The act is designed to provide a combination of (1) insurance, (2) reinsurance, and (3) loans, "in order to provide the greatest variety and amount of protection against loss to the greatest number of affected parties in accordance with individual needs."⁷

The act establishes insurance and reinsurance against loss resulting from damage to or destruction of real or personal property (including property owned by any state or local government) due to flood occurring within the United States.⁸

⁷ Public Law 1016, 84th Congress (Federal Flood Insurance Act of 1956), Sec. 6, p. 3.

⁸ "United States," when used in a geographic sense, means the several states, the District of Columbia, the territories, the possessions, and the Commonwealth of Puerto Rico.

The word "flood" as used in this act includes:

any flood, tidal wave, wave wash, or other abnormally high tidal water, deluge, or the water component of any hurricane or other severe storm, surface landslide due to excess moisture, and shall have such other meaning as may be prescribed by regulation of the Administrator.⁹

The reinsurance provision is designed to provide an opportunity for private insurance companies to enter the field of flood insurance on fixed property and yet to protect themselves from excessive losses by means of "reinsuring" substantial portions of their exposed properties with this government agency. One of the real sources of reluctance on the part of private carriers to insure the flood peril would, it is hoped, be removed by the opportunity to shift the burden of catastrophic losses to the government insurance fund through this reinsurance provision.

The provision for disaster loans is designed to take care of any subsequent loss resulting from damage to or destruction of real and personal property which may not have been covered by insurance or loss which exceeds the face value of the insurance carried. The terms of these loans were designed to encourage persons who suffer flood losses to make use of this provision. By providing disaster loans on very liberal terms, this provision will tend to help persons help themselves recover from flood destruction instead of turning to direct assistance or other forms of charity. To make the interest rate attractive, the act provides that it "shall not exceed 4 per centum per annum on the unpaid principal balance."¹⁰ The duration of the loans is also designed to encourage persons to utilize this fea-

⁹ Public Law 1016 (cited note 7 *supra*), Sec. 22, p. 9.

¹⁰ *Ibid.*, Sec. 5 (b), p. 2.

ture of the act. Loans "shall be on a long-term basis to the maximum extent practicable."¹¹

ELEMENTS OF "SUBSIDY"

The major criticism raised by spokesmen from the insurance business is that the new program is a subsidy rather than insurance. The basis for this charge is found in Section 7 (a), entitled "Estimated Rates and Fees."

A schedule of estimated insurance rates is to be established from time to time and must be adequate, in the administrator's judgment, "to produce sufficient proceeds to pay all claims for probable losses over a reasonable period of years." These estimated rates, however, are to be used only "as a basis for determining the actual fees to be paid by the persons insured." Herein lies an element of subsidy in the new program. Premiums actually charged recipients for coverage under the act must equal 60 per cent, *as a minimum*, of the particular estimated rate for that coverage. Or, as stated in the act, "no insurance policy shall be issued for a fee less than 60 per centum of such 'estimated rate.'" It would appear, therefore, that actual rates charged may vary all the way from 60 per cent to 100 per cent of each estimated rate and that the extent of the subsidy in each case depends upon how far the actual rate charged varies from the estimated rate.

A second element of subsidy may be noted elsewhere in Section 7 (a), concerning the matter of the *expenses* that are necessary to provide coverage established by the act. Each estimated rate must be based on consideration of the risks involved but "shall not include any loading for administrative expenses of the Federal Government under this

¹¹ *Ibid.*, Sec. 5 (c), p. 3.

Act." Therefore, the actual premium rate which a private insurer would have to charge for a given coverage would necessarily be higher than the government's, because of the item of administrative expense known in insurance circles as "loading."

Another indication of subsidy is found in the reinsurance portion of the program. The administrator is directed to negotiate with insurance companies seeking reinsurance for properties they cover against the peril of flood. In establishing fees for reinsurance, rates must be adequate to produce sufficient proceeds to pay all claims for losses but "... shall not include any loading for administrative expenses of the Federal Government under this Act."¹²

STATE AND FEDERAL PARTICIPATION

July 1, 1959, has been established as the date for states to begin their participation in the federal flood program. Prior to that time, the administrator shall pay federal funds into a newly created Disaster Insurance Fund in an amount equal to the difference between the fees charged for insurance policies issued and the amount which would have been charged if the estimated rates had been applied. After the 1959 date, however, each state shall pay from time to time into the Disaster Insurance Fund an amount equal to one half the difference between the estimated rates established and the actual rates charged for insurance policies issued on property in the state. The federal government will then pay the other half of this difference, so that in effect a grant-in-aid program will be established, beginning July 1, 1959.

The wording in the act implies that no coverage will be provided to a person whose property is located in a state which does not make its contributions

¹² *Ibid.*, p. 4.

as outlined in the preceding paragraph. Section 4 states that insurance and reinsurance against flood may be established, "Provided, that insurance policies issued under this Act after June 30, 1959, shall be issued only with respect to property in those States which participate as provided in section 7(a) of this Act."¹³ It will be interesting to see what reaction the various states will have to this provision and whether or not all of them will comply with it.

FEATURES DESIGNED TO MEET CRITICISM

The plan to write flood insurance by the federal government has been opposed by the vast majority of individuals and groups representing the insurance industry. The principal reasons for their objection to this program are (1) flood insurance on fixed-location property cannot be based upon sound insurance principles, (2) the government plan is another encroachment into the private domain, and (3) the flood peril could be handled better by improved flood protection and prevention and through private charity.

Toward sound insurance principles

The argument that flood insurance cannot embody the sound insurance principles of other forms of coverage has already been discussed. The essence of this argument is simply that heavy losses from floods will exceed the amount which could be collected in the form of premiums.

In an effort to overcome this objection, the act provides a number of safeguards or policy limitations seemingly designed to assure that the funds collected in the form of premiums will be adequate to pay losses. These policy limitations are similar to those em-

¹³ Section 7 (a) provides for contributions by state governments into the Disaster Insurance Fund as described in this paper.

bodied by private carriers to guarantee adequacy of their insurance premiums to meet expected losses. For example, the use of deductibles is provided in the act:

Each insurance policy issued by the Administrator shall contain a loss-deductible clause relieving him from any liability for paying the first \$100 of a proved and approved claim for loss, plus 5 per centum of the remainder.¹⁴

A deductible feature is also included in the loan program under the act. Loans may be made only for amounts exceeding the first \$500 of the amount of the loss.

In addition to deductibles, maximum limits have been placed on policies and on the insurance program as a whole. The face amount on any policy of insurance shall not exceed \$250,000 per person. Moreover, the maximum face amount for any dwelling unit including any structures and personal property connected with it shall not exceed \$10,000. As far as the program as a whole is concerned, the total face amount of insurance policies and reinsurance agreements outstanding at any one time under the act is not to exceed \$3,000,000,000¹⁵ minus the aggregate amount of claims under insurance policies and reinsurance agreements but plus fees collected under the act. The face amount of all loan contracts outstanding at any one time shall not exceed \$2,000,000,000.¹⁶

¹⁴ The amount or percentage of this deductible may be larger if the administrator deems it necessary in various classes of risk.

¹⁵ Section 10 (d) states that this limit may be increased with the approval of the President by further amounts not to exceed \$2,000,000,000 in the aggregate if such increase is deemed advisable to effectuate the purposes of the act.

¹⁶ This limit also may be increased on approval of the President, by not more than \$500,000,000 in any one fiscal year.

As a further attempt to preserve the solvency of the insurance fund under the act, provision is made for the administrator to engage in risk selection. He may "issue appropriate regulations regarding the classification, limitation, and rejection of risks assumed by him under authority of this Act."¹⁷ He is authorized, for example, to restrict insurance on property which was constructed in violation of state or local flood-zoning laws. No doubt other specific restrictions on certain classes of property will develop, since the administrator has discretionary powers to issue any appropriate regulations concerning the selection of risks to be covered by the act.

The government and private companies

The second major argument advanced by insurance company spokesmen against the government flood program is somewhat paradoxical. They are in general agreement that private carriers cannot provide insurance against the peril of flood on fixed property. At the same time they object to the government's entry into the field. Their objection is based not only on the fact that the flood peril is such that it cannot be insured properly by any institution. They contend also that the government's entry into the field marks a step in the movement toward greater government activity in what has been recognized in the past as the private sector of the economy.

Several features of the new act seem designed to dispel any thought that the government desires to enter this field or wishes to remain in it permanently. One indication of the government's desire to turn over this program eventually to private carriers is contained in Section 11 (d):

¹⁷ Public Law 1016 (cited note 7 *supra*), Sec. 9, p. 4.

Wherever practicable, the Administrator may encourage, by offering suitable reinsurance . . . , the issuance by private insurance companies of policies insuring against loss resulting from damage to or destruction of real or personal property due to flood.¹⁸

Another significant indication of the government's attempt to draw private companies into the program relates to the matter of the face value limits explained earlier in this paper. "The Administrator shall use his best efforts to encourage private insurance companies to undertake the issuance of insurance policies covering that portion of the loss in excess of the limits"¹⁹ of \$250,000 per person and \$10,000 per dwelling unit mentioned earlier. The act suggests that the administrator may seek to achieve this end through a program of appropriate reinsurance of these excess amounts. Thus private companies are encouraged to carry this *excess* insurance on persons and dwellings and then obtain protection against serious losses through government reinsurance.

Under the loan provisions of the act, the loans must be negotiated through either a public or *private* financing institution, and the administrator is directed to guarantee against loss of principal and interest any loan which may be made by these institutions to persons suffering a flood loss. Direct loans by the government may only be made when funds are unavailable on reasonable terms from private or public lending institutions. This is an indication of the government's attempt to bring existing institutions into the program without creating a government lending institution whose funds would compete with private funds.

The act is clear on the matter of the government's entering an area of insur-

ance in which private carriers are already offering protection:

No insurance or reinsurance, or loan contract, shall be issued under the provisions of this Act covering risks against which insurance is available on reasonable terms from other public or private sources.²⁰

Another indication of the government's desire to co-operate with and encourage private carriers is contained in the provision which states:

The Administrator shall use to the maximum practicable extent the facilities and services of private organizations and persons authorized to engage in the insurance business under the laws of any State including insurance companies, agents, brokers, and adjustment organizations.²¹

Finally, provision is made for the administrator to undertake a continuing study of greater participation by private companies in the programs authorized by the act;²² the intent is to encourage private insurance companies to write as much of the protection authorized by the act as is practicable. The clearest indication of the government's desire to relinquish the entire program, however, is contained in the following provision:

The Administrator shall undertake a continuing study of the feasibility of having private insurance companies take over, with or without some form of Federal financial support, the insurance programs authorized by this Act.²³

Encouragement of preventive measures

The third important argument against government flood insurance propounded by insurance company spokesmen concerns the matter of improved preventive and protective measures to reduce losses

²⁰ *Ibid.*, Sec. 12 (a).

²¹ *Ibid.*, Sec. 13 (a).

²² *Ibid.*, Sec. 17 (b), p. 8.

²³ *Ibid.*, Sec. 17 (c).

caused by flood. They contend that if these means are employed, the balance of the losses will be such that they can be handled adequately by private charity.

The government's position in this controversy is stated in the "Declaration of Purpose" of the act:

Since preventive and protective means and structures against the effects of these disasters can never wholly anticipate the geographic incidence and infinite variety of the destructive aspects of these forces, the Congress finds that the safeguards of insurance are a necessary adjunct of preventive and protective means and structures.²⁴

Nevertheless, certain provisions of the act are directed toward furtherance of these preventive measures. Mention was made earlier of the provision which directs the administrator to restrict insurance on property constructed in violation of state or local flood-zoning laws. Another provision is designed to create zoning laws wherever they may be needed and are not in operation:

After June 30, 1958, no insurance or reinsurance shall be issued under the provisions of this Act in any geographical location unless an appropriate public body shall have adopted . . . such flood zoning restrictions, if any, as may be deemed necessary by the Administrator to reduce, within practicable limits, damages from flood in such location.²⁵

From the standpoint of flood control, perhaps the most significant provision of the act is the requirement that the contributions of each state to the disaster funds be based upon the difference between the estimated rates and the actual fees charged. If a state is successful in reducing the cause of floods, the estimated rates would tend to fall and thus to approach the actual fees

²⁴ *Ibid.*, Sec. 2 (a), p. 1.

²⁵ *Ibid.*, Sec. 12 (c), p. 5.

charged for coverage under the act. This tendency for the estimated rates to equal the actual rates charged would cause the state's contribution to decrease or disappear, since contributions are based on the disparity between these two rates.

Many different means are available to the states for reducing flood losses, and as the Federal Flood Insurance Act of 1956 becomes effective greater attention is likely to be given to this problem of flood control. Moreover, the federal government also will probably intensify its efforts in this direction.

Lightening the burden of charity

The argument that charity can be used to provide for many losses from floods is perhaps answered by the loan provisions of the act. If funds are available for extra-long periods at very moderate interest rates, many persons may be encouraged to help themselves instead of turning to various charitable organizations for assistance. This provision would seem to be a most important one in the light of increasing pressures on private charity in recent years as a result of numerous floods and other catastrophes.

SUMMARY

Because of recent flood disasters, public pressure has resulted in the passage of the Federal Flood Insurance Act of 1956. The flood peril on fixed property is considered by most insurance specialists to be outside the realm of "insurance" in the true sense of the word. This peril does not meet the principal requisites for an insurable risk, and coverage through private insurance is therefore unavailable.

In the absence of private insurance protecting against flood losses, the new act provides for the establishment of a

¹⁸ *Ibid.*, Sec. 11 (d), p. 5.

¹⁹ *Ibid.*, Sec. 11 (c).

program of (1) insurance, (2) reinsurance, and (3) loans to assist persons in their recovery from loss and destruction by flood. The Housing and Home Finance Agency will administer the provisions of the new act because of its extensive insurance experience.

In order to assure the solvency of the insurance funds in the new program, provision is made for the states and the federal government to make contributions in the form of a grant-in-aid. Total contributions from states and the federal government will equal the difference between the insurance rates promulgated and the rates actually charged individuals for coverage. This is an element of subsidy embodied in

the new program for the purpose of guaranteeing that persons who desire insurance will be able to afford coverage.

Many safeguards have been placed in the new act to protect private insurance interests against competition by the government. If existing insurance is available, for example, no insurance, reinsurance, or loans may be issued under the provisions of this act. Moreover, a continuing study must be made to consider means of encouraging private insurance companies to enter the field, and in fact to take over the entire program from the government, with or without federal financial support, as soon as practicable.

The Voluntary Effort in Disaster Relief

By ELLSWORTH BUNKER

Abstract: The disaster relief service of the American National Red Cross is seventy-five years old. During this period it has engaged in over 6,700 disaster relief operations, all financed by voluntary contributions. The principles governing the work of the Red Cross in these operations are explained, and a description is given of the national, regional, and local structure and functions of the organization, which has about 3,700 local chapters; these have first responsibility for emergency action but can count on the help and guidance of professionally trained personnel from the national organization.—Ed.

DISASTER is older than the recorded history of mankind. Most of us have been brought up on the story of the great flood in the Book of Genesis. It is probably the earliest account of a disaster relief operation on record.¹ A question may well arise whether Noah's efforts can properly be described as entirely voluntary; an authoritarian aspect is certainly there. Nevertheless, Noah's effort in dealing with a great flood is a model of careful planning, organization, and effective disaster relief in its successive stages: advance warning to the populace, the building of the Ark (probably the first mass shelter in recorded history), evacuation of people by family units to a place of safety, and finally reconstruction and restoration.

TRADITION OF NEIGHBORLY HELPFULNESS

The early history of our nation records the occurrence of great disasters. A century ago Clara Barton (founder

¹ Variations of the story of the great flood appear in the history of several ancient peoples.

and first president of the American Red Cross) wrote:

... our southern coasts are periodically visited by the scourge of yellow fever; the valleys of the Mississippi are subject to destructive inundations; the plains of the West are devastated by insects and drought, and our cities and country are swept by consuming fires.²

We have no account like the chronicle of Noah, but can there be any doubt of the mutual helpfulness of the pioneers who settled this country? In the aggregate, voluntary help in emergencies must be tremendous, the help of one neighbor to another; neighboring communities, each helping the others; groups sharing a common faith and interest helping members of the group. Such help is not measurable, and no record of its extent or nature exists. Nonetheless, voluntary effort for the alleviation of human suffering is a recognizable fact. The impulse to help others is basic to both our religious and pioneering traditions. It has motivated disas-

² Foster Rhea Dulles, *The American Red Cross: A History* (New York: Harper & Brothers, 1950), p. 14.

His Excellency Ellsworth Bunker, Ambassador of the United States to India, was President of the American National Red Cross from 1954 through 1956. He was Ambassador of the United States to Argentina in 1951 and to Italy in 1952-53 and was previously chairman of the Board of Directors of the National Sugar Refining Company.

ter relief in the past as it still does in the present.

In the United States, an organized program of disaster relief had its beginnings, strangely enough, in the movement to enlist adherence to the Geneva Convention, providing for the neutralization of aid to the wounded in time of war. The convention was ratified by the major European countries in 1864. Although the United States was represented unofficially during preliminary conferences, the principle of no entangling alliances was cited by the then Secretary of State, William H. Seward, as a reason for withholding co-operation. While the United States was prepared "to forward all humanitarian action," he stated, its well defined policy was one of "holding itself aloof from all European congresses, or compacts of a political nature."³

It was not until 1882 that the Geneva Convention was signed by President Arthur on March 1 and approved unanimously by the United States Senate fifteen days later. The strongest and perhaps the most persuasive argument favoring the convention was the proposed peacetime role for the Red Cross in disaster. Clara Barton urged:

Although we in the United States may fondly hope to be seldom visited by the calamities of war. . . . In all such cases [disaster], to gather and dispense the profuse liberality of our people, without waste of time or material, requires the wisdom that comes of experience and permanent organization.⁴

Thus disaster relief became the oldest of the Red Cross services, antedating by two decades the duty imposed by federal statute in 1900. During the seventy-five years of its history, the Red Cross has served in more than 6,700 disaster relief operations; all its expenditures

were derived from voluntary contributions.

THE LEGAL BASE: QUASI-GOVERNMENTAL STATUS

Historically, the American National Red Cross was created, so-named, and incorporated by special act of the Congress approved by President McKinley on June 6, 1900,⁵ to implement the Geneva Convention of 1864. The text defining the principal purposes and duties of the corporation has survived in subsequent acts revising the original charter. The following relevant excerpt quoted from a study made by Dean Sturges of the Yale Law School is a carryover from the original text; the only change to date is the duty for prevention added by the 1905 Act of Reincorporation⁶ appearing at the end of the final sentence:

With respect to peace-time disaster relief services the corporation is declared duty-bound to "continue and carry on a system of national and international relief in time of peace and apply the same in mitigating the sufferings caused by pestilence, famine, fire, floods, and other great national calamities, and to devise and carry on measures for preventing the same."⁷

The nation's voluntary agency in disaster relief

All voluntary organizations operate within the framework of government; it could not be otherwise. Several national organizations other than the Red Cross have federal charters. The unique role of the American National Red Cross derives from the specific charge imposed by federal statute to furnish volunteer aid in "great national calamities." Gov-

⁵ Prior to that enactment, "the American National Association of the Red Cross" had been incorporated in 1881 under the corporation laws of the District of Columbia.

⁶ P.L. 4, 33 Stat. 599.

⁷ Wesley Alba Sturges, "The Legal Status of the Red Cross"; forthcoming article.

ernmental supervision in the fulfillment of that duty is implicit in the requirement that the President of the United States appoint eight members of the Board of Governors, including the principal officer of the Corporation, and in the provision for an annual audit of its expenditures, and an annual report to the Congress of its operations and finances.

Thus, the authority for Red Cross activities is federal, deriving from the Congress, and is national in scope. "It is at once closely associated with government in the promotion of these objectives and independent in organization, wholly supported by private contributions. It has no counterpart in other humanitarian or charitable organizations in this country."⁸

The official status of the Red Cross was again recognized by a joint resolution of the Eighty-fourth Congress on June 7, 1956:

Whereas more than fifty years ago the Congress determined that the work of the American National Red Cross was of such importance to the Government and people of the United States and to the preservation of the dignity of all human beings that provision should be made for its operation under such grant of authority and such Government supervision as would impart official status and thus invite the confidence and support of all the people, but that, to preserve and safeguard its impartial, non-political character, it should carry out its duties solely by means of the voluntary contributions of funds and services by the people. . . .⁹

The concluding paragraph reads:

Resolved by the House of Representatives (the Senate concurring), That the Congress extend its greetings and felicitations to all the members of the American National Red Cross on the occasion of its seventy-fifth

⁸ Dulles, *op. cit.* (note 2 *supra*), p. 1.

⁹ House Concurrent Resolution 232, 84th Congress (70 Stat. B32).

anniversary, express to them its appreciation for their services to humanity, and urge the continued voluntary participation by the American people in the work entrusted to the organization by the Congress and the Government.¹⁰

Service to people in time of emergency is a shared responsibility. The achievements of the Red Cross in the field of disaster relief are built on the voluntary contributions of many individuals, groups, and agencies, too numerous to mention, working together in a common purpose to be helpful. In keeping with its mandate, the Red Cross will continue to co-operate with all volunteers and voluntary groups as their central rallying point for united and effective performance.

EVOLUTION OF THE PROGRAM OF DISASTER SERVICES

The program of the American Red Cross in disaster is the product of experience and adaptations to circumstances rather than of any preconceived doctrine. As with any institution, the program has been influenced by personalities, but more importantly by changing public policy growing out of the changing expectations of the population and the changing role of government in relation to individual need.

Many elements have contributed to its present strength. Of first importance is the spontaneous response of the American people, motivated by their basic impulse to help their neighbors, however remotely distant. Next is the co-operative, co-ordinated approach under national leadership vested by the Congress in the American National Red Cross. Third is its highly decentralized operation carried out in the main by volunteers in every community throughout the length and breadth of the land. No other voluntary effort in our nation

¹⁰ *Ibid.*

³ *Ibid.*, p. 14.

⁴ Dulles, *op. cit.* (note 2 *supra*), p. 1.

has been so well supported and equipped to deal flexibly and effectively with the complex human problems created by disaster.

Effects of disaster

Social disorganization and total community involvement are the common elements in disaster. It is this aspect of disaster that differentiates it from conditions dealt with by other social welfare activities. In disaster, suddenly the customary machinery of community living breaks up. Indispensable means of communication are crippled or annihilated; food sources are cut off; lighting and water systems break down; stores, banks, and industries are closed. Government and other community agencies to which people normally turn for protection and safety are disorganized, or, because equipped to meet only normal needs, are inadequate to the extraordinary demands of a disaster situation.

At the same time, people are dislocated from their familiar landmarks: homes, jobs, churches, schools, social relations. The shock and excitement of the disaster, compounded by personal loss of loved ones and destruction of homes and property, create uncertainty, crippling anxiety, loss of self-confidence, discouragement, dependence. In short, at the very time when the needs for social helpfulness are greatest and most acute, the normal protective and helping processes are inoperative or disrupted.

Social disorganization is directly related to the population density of the disaster-struck community. In sparsely populated communities, the effects of disasters are dispersed and consequently not so marked. Personal tragedy for those affected is just as great although general confusion and disruption may be less apparent.

Economic and social background, 1881-1904

In 1881, when the Red Cross program of disaster relief was in its beginnings, the family was the basic economic, as well as the social, unit of the community. The family farm provided both a source of livelihood and security against the hazards of unemployment, old age, and disaster. In a very realistic sense, the family unit was economically self-sufficient. Opportunity was limited only by individual capacity and effort. The prevailing culture attached high value to self-reliance and social stigma to dependence on outside aid.

For persons unable to work or otherwise in need, the concept of relief was simple and direct. Problems of human need there have always been, and charity comes naturally in our Western culture. Broadly speaking, American communities provided ways and means for meeting relief needs beyond the point where temporary neighborly help sufficed. The concept of local responsibility for relief has endured in the America of today.

When in 1881, therefore, Clara Barton undertook practical demonstration of the concept of peacetime service in disaster that would reach beyond the community, there was no blueprint or precedent to guide her efforts. No single organization or governmental unit was concerned with the problems created by disaster.

In the main, the program followed was the collection of relief money and supplies, delivered by Miss Barton to temporary local committees of inexperienced persons for actual distribution, with adjustments made as Miss Barton recognized changing needs.

To sum up, in Clara Barton's day the American National Red Cross was little more than a small volunteer committee,

active in disaster with the distribution of relief in kind.

Effect of the changing environment

Within the past seventy-five years the population of the United States has more than trebled. Perhaps even more significant than population figures is the fact that we have changed from a decentralized agrarian society of small communities to an industrial urban nation.¹¹ "Industrialization has made city dwellers or suburbanites out of most Americans. . . . Today, the farm population is less than a sixth of the total, and 2 people out of 3 live in urban areas."¹²

The changing environment, from agrarian to industrial and urban, has effected marked changes in outlook for many people. Reliance on the family farm and individual effort is no longer adequate. Problems of human need created by factors beyond the control of the individual and the separate community and involved with economic issues of money, wages, and employment have become increasingly complex. Solution could no longer be found in the unaided efforts of the individual and his local community. Intensified industrialization and mobility of people have affected public policy, particularly the role of the federal government in relation to individual need. "Many individuals who once looked no further than their city hall or State capitol now turn toward Washington when problems arise. We are doing today as a Nation

¹¹ In 1880: total population, 50,155,783; urban, 14,129,735; rural, 36,026,048. In 1950: total population, 150,697,361; urban, 96,467,686; rural, 54,229,675. In 1956: total population, 168,091,000; urban and rural not shown.—U. S. Census.

many things that we once did as individuals, as local communities, or as States."¹³

Red Cross responsibility in disaster

Our federal system of divided responsibility in relief matters, with primary responsibility vested in local government, precludes complete reliance on government for the necessary flexibility and freedom of action called for in disaster. Disasters are no respecters of legal jurisdiction, and human suffering cannot wait for the relaxation of statutory limitations and untangling of conflicting or overlapping authorities. While it is recognized that government has a basic responsibility, the traditional response to emergency in our American society has always been, and continues to be, self-help supplemented by neighborly aid.

The Congress by federal statute, and Presidents by proclamation, have therefore repeatedly distinguished between activities operated with public funds in disaster and services performed by the Red Cross with voluntary contributions. In accordance with both the statutes and the proclamations, the Red Cross has interpreted its responsibility to be that of providing assistance to individuals and families, rather than that of restoring utilities or other facilities or services maintained under supervision of public authorities.

Evolution of disaster services

It has been said that each generation creates its own institutions. The Red Cross program of disaster relief—as it operates today—was created by a generation deeply concerned with economic and social reforms. Significant changes in human relations throughout the country were evolving in the beginning years of this century. Responsibility for relief was changing from an individual

¹³ *Ibid.*, p. 1.

18 Dr. Edward T. Devine, general secretary of the Charity Organization Society of New York, and Mr. Ernest P. Bicknell, General Superintendent, United Charities of Chicago, were en route to assist on a voluntary basis. They arrived in San Francisco together.

sponsible government officials, served by Presidential appointment; a Board of Incorporators of sixty-five eminent citizens representing the country at large; and the requirement of an annual audit by the War Department and an annual report to the Congress. By contrast, Red Cross organization consisted of a few state branches, almost completely inactive, not one "competent to carry on the practical relief work."¹⁹ The national organization had about \$10,000 in money, no experienced staff, no established headquarters. But the precedent was established of defining the role of the Red Cross to be that of providing assistance to persons and families with funds contributed by the nation.

Organizational structure for disaster services

The period beginning with World War I, and with the impetus of United States entry, were the years of growth, development, and buildup of the machinery of organization for effective service in disaster.

State societies were prescribed in the original charter, but the organizational structure that ultimately evolved was national (with headquarters located from the beginning in Washington, D. C.), regional, and local community (chapter). This form has endured and has demonstrated in practice the flexibility needed to administer disaster relief effectively.

Over the years the geographical subdivisions of the national organization (areas) within the continental United States have varied from thirteen to three and are now established at four: the eastern and northeastern states with headquarters in Alexandria, Virginia; the southeastern states with headquar-

ters in Atlanta, Georgia; the midwestern states with headquarters in St. Louis, Missouri; and the Pacific Coast states and Alaska with headquarters in San Francisco, California. Chapters in territory of the United States outside of the continental limits and Alaska maintain direct contact with national headquarters in Washington.

Every community in the continental United States and Alaska, and in the other territory of the United States, is covered by a Red Cross chapter. These now number approximately 3,700. Each chapter covers a compact, geographically defined territory, county-wide for the most part, but otherwise where desirable in conformity with local conditions. The chapters create subdivisions (branches) as may be necessary to extend the work effectively over their jurisdictions; these branches now approximate 3,400 in number. The chapters are unincorporated branches of the corporation and, within the continental United States and Alaska, report through the respective area offices as indicated.

All chapters are expected to have a plan for instant action when disaster strikes. The chapter studies community hazards, arranges for buildings that would be available as shelters, first aid stations, and canteens. It should know where to locate quickly supplies of food, clothing, and medicines. Volunteers are trained in first aid, mass feeding, communication and transportation activities, and the handling of welfare inquiries. Professional nurses in the community are enrolled for voluntary disaster service.

But the chapter plan takes into account more than the immediate resources of the Red Cross. The chapter works with all community groups in the planning and sharing of responsibility—with veterans' organizations, labor groups, churches, the local civil defense organization, and the local government, especially the mayor. Above

all, the head of local government has an interest to see that this plan is kept current by frequent review and disseminated as the official disaster plan of the community.

Personal contact with chapters is maintained regularly by a professional field staff assigned from the Red Cross area offices to assist and support chapter workers according to their respective requirements.

Administration of disaster services

Administration of disaster services is highly decentralized; Red Cross organization has been described as "a working partnership between the 3,700 chapters and the national organization."²⁰ Two aspects of administration are involved in the partnership: local and national.

Of necessity, disaster relief begins with the chapter in whose jurisdiction the disaster occurs. Every Red Cross chapter has first responsibility for action in the emergency, in conjunction with local government and other organized groups closest to the scene. Red Cross responsibility is to provide temporary shelter, food, clothing, and emergency medical and nursing care for the injured. On request of governmental authorities, the chapter may assist with warning, rescue, and evacuation of people.

The national organization is the reserve for all chapters, providing assistance and support, guidance, and co-ordination of outside aid with local effort. The Red Cross follows the principle of leaving to its local chapter, and the community of which it is a part, as much responsibility as they can handle in meeting the emergency needs of disaster sufferers. Experience has shown that helpful elements are always present in every disaster situation and that there is never a dearth of willing volun-

teers. Frequently, experienced guidance is all it takes to unite the voluntary effort already there and to get them together under co-ordinated direction. But there is no equality in the effects of disaster and community resources to deal with them.

In major disasters, such as the great eastern states floods of August 1955, the resources of the affected community are inadequate to cope with the magnitude of the damage inflicted. In such situations the national organization takes over the administration of the relief operation, drawing on trained disaster workers from all over the country.

In essence, the national organization provides organizational continuity and co-ordination to the entire program, thereby assuring adherence to basic policy and standards of service while providing flexible adaptation to community patterns. The national organization functions as the accumulation point of operating knowledge, for the receipt and exchange of information, and its evaluation and practical application.

Financing disaster relief

All activities of the American Red Cross, including those related to disaster, are financed entirely from voluntary contributions. The Red Cross has never received—and does not now receive—appropriations by government from public funds.

Several factors peculiar to the disaster situation complicate the financing of disaster relief. In addition, like everything else these days, disaster relief costs more.

Since disaster relief needs fluctuate widely from year to year, the Red Cross follows the practice of seeking annually, during its general appeal to the public, funds for disaster services in an amount sufficient to cover what experience over a long period of years has shown to be the average needed. As with any aver-

¹⁹ Mabel T. Boardman, Secretary, American National Red Cross. See also her *Under the Red Cross Flag at Home and Abroad*, Philadelphia: J. B. Lippincott Co., 1915.

²⁰ E. Roland Harriman, Chairman, American National Red Cross.

age, actual spending never actually coincides in any one year. A disaster revolving fund is maintained to stabilize financing. Overexpenditures in any one year are met from the revolving fund, which is replenished by unexpended balances in other years. Experience indicates that under present conditions a fund of between ten and fifteen million dollars provides a reasonable safety factor for this purpose.

The entire plan is predicated on the fact that exceptionally large demands in the major disasters occurring with relative infrequency will require nationwide appeals following proclamation by the President. Even in smaller disasters many persons desire to make special contributions when disaster occurs; hence limited campaigns for funds are made, on a local or regional basis, as the particular circumstances warrant.

Summary

At the turn of the century, "The American National Red Cross" was in spite of its name anything but a national organization. "The struggling little society had no financial reserves whatsoever and no trained staff ready to swing into action at a moment's notice. . . . It had no nation-wide system of cooperating chapters."²¹

From very modest beginnings, the Red Cross has built up a truly national organization of more than 3,700 chapters that can go into action immediately whenever disaster strikes. The national organization maintains, among other things, as a reserve to support and assist its chapters:

1. A mobile staff of experienced professional personnel to assist chapters with training activities for volunteers the year round, and when disaster occurs with relief and rehabilitation services. Essential skills such as community organization, social work, nursing,

building and repair, accounting, and public information are included.

2. A roster of graduate professional nurses enrolled and trained for emergency medical and nursing aid in disaster.

3. A revolving reserve fund to meet without delay the emergency needs of disaster sufferers pending receipt of other voluntary contributions.

4. A network of about fifty Red Cross regional blood centers, with several hundred co-operating units, prepared to provide life-saving blood and blood derivatives for immediate use of hospitals and doctors in saving lives.

5. An independent telecommunications system linking the national headquarters, the area offices, and chapters in every section of the country into a single network for effective communication, so vital in emergency.

INTEGRATION OF VOLUNTARY AND GOVERNMENTAL EFFORT

The special value of looking at the past, it is said, is to help face the future more wisely. This brief look at the past voluntary effort in disaster, expressed through the social institution known as the American Red Cross,²²

²² In addition to publications cited earlier in the article, the following contain useful reference material: Commission on Intergovernmental Relations, Subcommittee on Natural Disaster Relief, *A Subcommittee Report on Natural Disaster Relief*, submitted to the Commission June 1955 (Washington, D. C.: Government Printing Office); *Disaster Manual for Chapters*, ARC 209, revised January 1955 (Washington, D. C.: American National Red Cross, 1955); Clyde E. Buckingham, *Red Cross Disaster Relief: Its Origin and Development* (Washington, D. C.: American National Red Cross); [American National Red Cross, War Council],

²¹ Dulles, *op. cit.* (note 2 *supra*), pp. 39, 41.

points up the great and growing importance of close integration of voluntary and governmental effort.

The Red Cross program in disaster developed in response to a need, recognized almost spontaneously when Clara Barton first made her public appeals, for a responsible medium through which the sympathy of the nation could be expressed in practical form to the victims of disaster. The Red Cross pioneered in finding better and more lasting ways of social helpfulness than the early distribution of donated goods. A program was evolved and established that looks beyond the immediate emergency needs of people to restoration of their human dignity and normal independence. Viewed from the perspective of its seventy-five years' experience, this voluntary effort in disaster relief has grown steadily in effectiveness and in popular support, both with personal participation and funds.

Disaster has a disruptive impact in many areas of life: homes, jobs, schools, churches, business—and politics too. Governmental machinery is necessarily involved, and the federal government has been active in disaster relief since the early days of our national history. Co-operative effort by the Red Cross with official agencies is obviously essential; it is nothing new in Red Cross history.

The development of new federal programs has not lessened Red Cross responsibility, either for emergency relief measures or for careful planning with

families for their recovery. It has necessitated, rather, successive readjustments to each new development and increased effort toward integration with governmental agencies.

This mid-decade of the twentieth century has brought new problems of adjustment in disaster as elsewhere. Granted the importance of large-scale planning, the impact of disaster with all its attendant dislocations and human suffering is still the lot of the local community and must be dealt with, in the last analysis, within the disaster-struck community. Many interests converge on the stricken community, each with its own special concern, adding to the inherent confusion at the scene of disaster. The Red Cross contribution to community recovery is to meet the needs of the basic unit of our society, family by family. This naturally places the Red Cross in a centralizing position. In integrating its organized voluntary efforts with those of government, together they can achieve greater co-ordination than if each worked separately.

A realistic program for disaster relief requires therefore decentralized planning and operation broadly based in local communities. But it requires also the establishment and co-ordination of policy by the national organization, and in the case of a major disaster, administration by that organization as well. Thus all the great resources of the Red Cross can be mobilized on a national scale to render prompt and effective assistance.

Finally, the need is for more, and strengthened, voluntary effort—not less—for the indispensable task of promoting the readiness and ability of each local community to assume its share in preparedness and relief. The American Red Cross offers its full support to all who work to safeguard our communities and to safeguard that greater community that is the United States of America.

Emergency Mass Care

By DEWITT SMITH

Abstract: Disaster, by common usage a term now applied to natural rather than war catastrophe, has brought about the development of emergency mass care—a means of meeting the urgent and temporary physical needs of populations suddenly made homeless. In the years 1950–55 almost a million persons have received such care from the American National Red Cross, the organization which has over the years built up an elaborate and well-functioning system for meeting the emergency needs of disaster victims. Nevertheless there is need for continued study and research in order to arrive at even more effective plans and action designed to minimize the effects of disasters.—Ed.

DISASTERS are generally defined by types or causes, as floods, hurricanes, or tornadoes, but they have been defined also in many other terms, depending on the approach and purpose. For purposes of emergency mass care, perhaps any situation may become a disaster when "man becomes the victim of forces . . . he normally controls."¹ However, this article is concerned not with the total physical and social disorganization that is large-scale disaster, nor even with all the destruction or damage to the installations and facilities of government and of industrial, commercial, and agricultural organization, but rather with the extent and nature of human suffering and need resulting from natural disaster.

NATURAL AND WAR-CAUSED DISASTERS

Increasingly, and for understandable reasons, the tendency in recent years is to equate natural disasters with situations that could be created by enemy attack. This tendency contrasts with the

philosophy and practice of the federal government during World War II, when the use of "disaster" to describe situations created by enemy attack was avoided, and assistance to civilians thus affected was designated "civilian war aid." In addition to the natural reluctance to describe any situation imposed by an enemy during war as a disaster, it was agreed:

Through long usage the word "Disaster" has come to have special significance as referring to natural and accident caused situations. . . . [Therefore] Civilian War Aid will be used to describe the relief aspects of situations created by enemy action.²

Now that "disaster" is generally used for both natural and enemy-caused situations, it is important from the standpoint of human need that differences as well as similarities in the two cases be recognized. Otherwise, the les-

² "Agreement Between the Office of Defense Health and Welfare Services and the American Red Cross," in Thomas H. Reynolds, "American Red Cross Disaster Services 1930–1947" (Historical Monographs, American National Red Cross, Washington, D. C., Vol. 20 C), p. 206; unpublished.

sons learned from experience with natural disasters cannot be brought fully to bear in the larger war-caused situation; nor, conversely, can the organization and other resources developed in anticipation of possible war-caused need be utilized effectively in time of natural disaster.

While steps toward preparedness, avoidance, and control have tended over the years to lessen some of the consequences of natural disasters, the destructiveness of weapons of war has increased so fantastically that the differences in degree between the consequences of war-caused and natural disasters may be expected further to increase rather than to diminish.

In addition, it is important that some of the problems peculiar to each should not be permitted to constitute a handicap in dealing with the other.

Despite great progress in recent years, many problems admittedly remain to be solved in the further development and permanent maintenance of an adequate civil defense organization throughout the country. "One of these problems which is the common experience of everyone concerned is that civil defense (taken to mean steps necessitated by enemy action or the threat thereof) is a new concept to this country and one which we are reluctant to accept. If we do recognize the danger, we are apt to think of it as so great that no amount of preparation would enable us to prevail against it."³

Another present consideration is that, while many of the human needs growing out of natural disasters are the same in principle as those that must be met following large-scale enemy attack, there is such a difference in degree that from the standpoint of natural disaster relief alone it becomes difficult to convince communities or regions of the necessity

³ William L. McGill, "How a State Prepares for Disaster," in this issue of *THE ANNALS*.

to develop and maintain continuously in being for natural disaster purposes an organization of such magnitude and elaborateness as would be required to deal effectively with the aftermath of enemy attack.

PERSPECTIVE ON THE NATURAL DISASTER HAZARD

It is true that present scientific knowledge supports the assumption that, in the most adverse combination of conditions theoretically possible, there exists the potentiality for even more destructive natural disasters than any thus far experienced.⁴ Moreover, the increased density of population and more intensive industrial, agricultural, and other development could conceivably create greater destruction and need from disasters no more severe theoretically than those previously encountered.

The record over a seventy-five year period shows it to be equally true that natural disasters in the United States are as certain as anything in human experience. Nevertheless, the precise time and place that disaster will strike remain unpredictable. In terms of the larger disasters an experience of several decades is necessary to provide a reasonable pattern and to develop guides for dealing with the infinite variety of needs that arise at such uncertainly spaced intervals. Disasters are highly variable not only in spacing but also in locale, circumstances, duration, and effect. Some, as in explosions and fires, happen quickly within a limited area. Some, as tornadoes, happen in a short time but may occur simultaneously over scattered areas. Others, like hurricanes, develop progressively over a period of time and considerable territory. Still others, like some floods, also develop progressively, spread over states and re-

⁴ See articles in this issue of *THE ANNALS* dealing with the physical characteristics of disasters.

gions, and in addition are more lasting in duration and effect.

Notwithstanding these many uncertainties, there is an actual seventy-five year record of disasters in the United States measured in terms of the persons or families given emergency relief and rehabilitation assistance. This is the record of the disaster relief operations conducted by the American Red Cross. They probably reflect the longest experience of any single organization in dealing with the effects of disaster.

Records and statistics

Disasters are defined by the Red Cross for its own operational purposes to include: natural catastrophes such as floods, hurricanes, and tornadoes; sudden catastrophes such as fires, explosions, and wrecks; and similar public calamities in which numbers of persons are plunged into helplessness and suffering.⁵

The Red Cross for statistical purposes records as a disaster only those situations of distress involving five or more families. Actually, much emergency assistance is given by Red Cross chapters when lesser numbers of families are affected. Observing the five-family definition, the Red Cross has conducted 6,755 disaster relief operations within the continental United States during the period from its inception in 1881 through the calendar year 1955.

<i>Period</i>	<i>Number of operations</i>
1881-1916 (36 years).....	60
1917-24 (8 years).....	430
1925-49 (25 years).....	4,248
1950-55 (6 years).....	2,017
Total.....	6,755

For many reasons this is not an accurate historical count of all disasters that occurred during the seventy-five-

⁵ *Disaster Manual for Chapters* (ARC 209, January 1955), p. 3.

year period, nor yet an accurate record showing trends in the incidence of disasters. It was not until the period of World War I (1916-1919) that the American Red Cross developed a constantly ready, truly nationwide organization reaching into every community and extending overseas as required.⁶ While this expansion resulted from the impetus of war, it provided for the first time the basic national, regional, and local organization necessary for effective disaster relief. It provided also strong financial support, together with volunteers by the millions and full-time professional workers by the thousands. Of equal or even greater importance, it brought the first vigorous interpretation of the authority under which the Red Cross serves persons suffering from disaster⁷ as "not only a grant of power but an imposition of duties."⁸ Moreover, it was not until several years later that the full potential of the Red Cross in disaster relief began to be realized, and more complete reporting became possible.

It is significant that more than two

⁶ *The Work of the American Red Cross During the War, . . . July 1, 1917 to February 28, 1919*, Washington, D. C.: American Red Cross, 1919.

⁷ Public Law 4, 58th Congress, 3rd Session, January 5, 1905 (33 Stat. 599); "... to continue and carry on a system of national and international relief . . . and apply the same in mitigating the sufferings caused by pestilence, famine, fire, floods, and other great national calamities, and to devise and carry on measures for preventing the same."

⁸ John W. Davis, then Solicitor General of the United States and Counsellor of the Red Cross, to Henry P. Davison, the Red Cross War Council Chairman, August 15, 1918: "When any question arises as to the scope and activities of the American Red Cross, it must always be remembered that its charter is not only a grant of power but an imposition of duties. The American Red Cross is a quasi-governmental organization. . . . It owes, therefore, to the government which it serves the distinct duty of discharging all those functions for which it was created."

thousand disaster operations are shown during the most recent six-year period (1950-55). These figures point up the continuing importance and need for emergency relief and rehabilitation assistance following not only major disasters but also the three hundred or more other disasters that occur annually throughout the country, many relatively small but some rather large.

DISASTERS OF GREAT MAGNITUDE

Of greater significance in terms of emergency mass care (and likewise re-

habilitation assistance) is an examination of relief operations of the American Red Cross in principal disasters⁹ during the half century 1906-55 (see Table 1).

Of these thirty principal disasters, which aroused nationwide interest, half occurred during the last nine years and

⁹ Within the Red Cross these are generally referred to as "major disasters" but they are here designated "principal disasters" to avoid confusion with disasters declared "major" by the President of the United States under the terms of Public Law 875, 81st Congress (the Federal Disaster Act of 1950).

the other half during the preceding forty-one years. The greatest number in any one year (1947) was five. The longest interval between them was eight years (1928 to 1936). Strangely, there was an almost total absence of such principal disasters during both world wars. In one disaster, assistance was given to more than a million persons (the 1937 Ohio—Mississippi Valley flood); in one other, more than 600,000 persons were assisted (the 1927 Mississippi Valley flood). Of the thirty disasters, twelve resulted from floods (plus

two others where floods followed a hurricane), seven from tornadoes, seven from hurricanes, two from forest fires, one from an earthquake and fire, and one from an explosion and fire. The greatest number of counties affected in any single disaster was 318 in twelve states (the 1937 Ohio—Mississippi Valley flood). Four of the disasters were so concentrated geographically that each affected but a single city or metropolitan area.

To relate this experience more directly to the subject of emergency mass

care,¹⁰ these disasters in which such care was given by the Red Cross to more than 25,000 persons are listed by order of number of persons (Table 2). There were sixteen such disasters during the half century. Of these, nine were floods, five hurricanes, one an earthquake and fire, and one a forest fire. Five separate disasters involved emergency mass care for more than a quarter of a million persons.

Comparisons on the basis merely of number of persons given emergency mass care must be made with caution. Space limitations do not permit the detailed analysis necessary to take into account length of time under mass care and other factors. In some large-scale flood situations extending geographically over several states and in time over several months, mass care was required for long periods of time but with considerable turnover among persons affected.

LESSER DISASTERS

In addition to these selected disasters of a principal nature, a far greater number of lesser disasters occurred, usually not involving physical and social disorganization on a scale representing total community or area involvement. However, many of these lesser disasters occurring in smaller or less well-organized communities do represent a proportionately difficult measure of physical and social disorganization.

The total number of disaster relief operations recorded by the American Red Cross during the six calendar years from 1950 through 1955 shows in the aggregate just under one million persons given emergency mass care; the maximum number in any one year was 330,000 and the minimum 88,000 persons. The maximum number during

¹⁰ The combination of relief methods employed in the immediate emergency temporarily to provide basic physical necessities to large groups of persons in need.

TABLE 2—DISASTER RELIEF OPERATIONS OF THE AMERICAN RED CROSS INVOLVING EMERGENCY MASS CARE TO MORE THAN 25,000 PERSONS, 1906-1955

Arranged in order of decreasing number of persons

Date and designation of disaster	Persons given emergency mass care
1937, Ohio—Miss. Valley flood.....	1,062,000
1927, Miss. Valley flood.....	637,500
1936, Spring floods (eastern and southeastern states).....	400,000
1913, Ohio—Miss. River flood.....	323,000
1906, San Francisco earthquake and fire.....	300,000
1955, Eastern states floods.....	144,000
1955, Western states floods.....	86,500
1947, Ala.—La.—Miss. hurricane.....	80,500
1947, Florida hurricane.....	76,000
1952, Missouri Valley floods.....	52,000
1948, Oregon—Washington flood.....	45,600
1951, Kan.—Mo.—Okla.—Ill. floods.....	45,000
1954, New England hurricane.....	42,300
1947, New England forest fires.....	41,200
1926, Florida hurricane.....	35,000
1928, Florida hurricane.....	30,300

the total period resulting from any one type of disaster (floods) was 584,000 persons; the next highest number was 175,000 persons, in hurricanes (see Tables 3 and 4).

HUMAN CONSEQUENCES OF DISASTERS

No two disasters are alike but, whatever their nature, among the grim facts are sudden disruption of the daily patterns of work and other aspects of normal living; the dislocation of families and their members; personal injury, even death; and the destruction, loss, or unavailability of real and personal property. Many of the resources and ways of dealing with human needs and problems are suddenly not available or are inadequate.

The modern community depends on a highly organized and closely integrated network of public and private facilities that provides the necessities and niceties of our way of life. Any significant breakdown in these facilities,

supplies, and services, added to the human suffering of persons directly affected by the disaster, creates stress, disorganization, and confusion. For obvious reasons, this confusion and disorganization are greatest immediately following the onset of disaster.

The victims of disasters are seldom any special group. They include those found in every community: the aged, in increasing number with the lengthening life span; the employed, who may lose their jobs or become injured or even permanently disabled; men and women beyond their most productive years, who have built up small businesses and would find it hard to start all over again; the widowed; the orphaned; and persons

otherwise handicapped. Most of these people have resources—some more than others—in personal ability, material goods, and relatives who can help. Some are more thrifty than others; some have never managed well but have lost what little they had. All are equal in their lack of responsibility for the misfortune that has suddenly befallen them, and equal in their appeal for sympathy and social helpfulness.

EMERGENCY MASS CARE

These chaotic conditions created by disaster call for measures of relief designed to deal with large numbers of bewildered and sometimes helpless persons. The emergency mass care serv-

ices are organized and operate in this setting of great confusion and personal tragedy; they should be recognized as unavoidable measures of expediency for meeting quickly, on a temporary basis, the immediate physical needs that people have in common, without regard for differences in their normal social or economic status. A pioneer in disaster relief thus described the method:

... This is not a time for hesitation over small questions but it requires judgment and firmness and allows little opportunity for discussion or the nice weighing of alternatives. . . .

The period of emergency relief is comparatively short and may roughly be said to end when the victims of the calamity have received or are receiving proper medical care, food, clothing and shelter, when families have been united, the dead buried, and the panic among the people quieted. . . .

During the emergency stage of relief the people are dealt with in large groups with little attention to the special needs of individuals. The chief object is food for all, clothing and shelter for all.¹¹

This concept of mass care was restated a decade later:

Obviously the exigencies of disaster often necessitate at the outset treating people in the mass. . . . It is the province of emergency relief to provide for immediate, common needs. The promptness and completeness with which they are met are the sole tests of efficiency.¹²

Mass care in this sense should not be confused with group or congregational care, as in the care of the aged and dependent children, or group care provided in hospitals or other specialized institu-

tions. As soon as possible, however, disaster victims falling within such categories of need should be suitably placed for proper care.

From the beginning emergency mass care has been concerned primarily with meeting the urgent and temporary physical needs of large numbers of persons suddenly made homeless: temporary shelter, food, clothing, and medical, nursing, and hospital care. With repeated experience, the methods most commonly used and the services provided in meeting these basic emergency needs have become established, and the term mass care is now generally applied to refugee shelters, feeding stations, clothing depots, and emergency medical facilities. In the course of time, both resources and methods developed to meet emergency needs have come to be signified by the term mass care, and the term has been extended in its application to war-caused and other emergency situations involving large numbers of persons when the customary resources are inadequate to the needs.

Shelter, food, clothing

Temporary shelter is usually provided in public buildings such as schools, churches, or assembly halls; in private buildings such as unoccupied dwellings or tourist camps; in tents, especially in rural territory, set up on home sites, or in groups on public or private property; and at times in erected temporary barracks or in trailers provided from public or private sources. Food is provided in a variety of ways, depending on the facilities remaining available: in shelters with cooking equipment; from mobile or fixed feeding stations; and through the distribution of cooked or packaged foods to families living in tents on home sites or in the habitable parts of damaged homes. Clothing, especially outer garments, is provided, particularly when the families are forced out of their

¹² J. Byron Deacon, *Disasters and the American Red Cross in Disaster Relief* (New York: Russell Sage Foundation, 1918), p. 168.

homes without opportunity to take essential items with them.

Medical care

Medical, surgical, dental, hospital, and nursing care is provided by the responsible professional groups at or near the scene of the disaster, at first aid stations, in hospitals, and in the offices of physicians. The Red Cross emergency mass care medical and nursing program is co-ordinated with the local public health officials, physicians and related professional groups, and hospitals. The primary functions for which the Red Cross may assume responsibility are: providing medical and nursing care in Red Cross shelters; establishing and staffing first aid stations and temporary infirmaries; providing nursing personnel when needed to ensure adequate care of patients; and providing whole blood and blood derivatives. Local community planning to meet mass needs in both natural and war-caused disasters, with full recognition of the roles of both the Red Cross and government, is particularly effective in the medical and nursing field.

Warning, rescue, and evacuation

Warning, rescue, and evacuation are primarily governmental responsibilities.¹³ In extreme situations, however, and on request of constituted authorities, Red Cross volunteers assist with and support these activities. Substantial progress in forecasting has been made in recent years by many governmental agencies; but all recognize that warnings of impending disaster, unless accompanied by precautionary measures and arrangements for the protection and care of people, may do actual harm. This again is an area of social helpfulness where the co-operative effort of govern-

¹³ See articles in this volume dealing with the government in preparation and avoidance, recovery and restoration.

mental and organized voluntary services pays dividends in saving lives, lessening human suffering, and reducing destruction of property.

Over the years, too, experience has shown that paralleling the physical needs of the emergency period are many less tangible but frequently no less important spiritual and psychological needs and those related directly to them. Prompt and effective material relief, quickly and kindly administered, has important therapeutic values. It is a truism, but nonetheless important, that "man does not live by bread alone." Especially in such situations as prolonged floods and tornadoes with extensive destruction of homes, along with physical needs of the emergency period are such needs as communication with loved ones, religious solace, recreation, and participation in group activities. Many effective plans and methods, including those for handling emergency welfare inquiries, for providing facilities to meet essential recreational problems, for providing opportunities to attend church services and schools and to participate in community events, and for dealing with morale and adjustment problems, are now integral parts of most disaster relief operations.

Red Cross manuals

Nowhere perhaps are the methods and techniques applicable to the aspects of these activities related to the alleviation of human suffering and need set forth in more detail than in the manuals of the American Red Cross.¹⁴ These have gone through revision after revision as a result of many decades of trial and error. Although experience in nearly

¹⁴ *Disaster Relief Handbook: A Manual for National Personnel* (ARC 234, August 1950); *Disaster Manual for Chapters* (ARC 209, January 1955); *Mass Care in Disaster* (ARC 1540, June 1951); and many manuals dealing with specific phases of emergency relief, subsidiary to the foregoing basic manuals.

seven thousand actual disaster relief operations, extending now over seventy-five years, has not required fundamental change, many adjustments to changing circumstances have resulted.

REHABILITATION ASSISTANCE

Disaster relief consists of much more than the distribution of food and clothing and the providing of temporary shelter and emergency medical and nursing aid. Just as those forms of relief must be preceded by the essential services of warning and rescue, and sometimes evacuation, so they must be followed by the necessary rehabilitation phases. Mass care is an important and essential emergency relief measure but it is by no means an end in itself. Seen in proper perspective, mass care is also the beginning step in restoring victims to their predisaster status. No responsible organization could properly undertake a program of emergency mass care without some plan for its early termination by substituting for it the more basic measures to meet continuing needs and to bring about a restoration to normal independence of the victims of disaster.

This is no mere theory; it has been demonstrated time after time over more than half a century and following several thousand disasters, large and small. The same pioneers who first defined emergency mass care simultaneously described rehabilitation with equal vision and in terms that have endured:

The second stage is that of re-establishing the normal regime within the shattered community. . . . the people must be carefully transferred from relief support to dependence upon their own earnings. . . . One by one the broken threads of familiar every-day life, the life of custom and habit, must be reunited.¹⁵

The province of rehabilitation is to help each family meet the needs peculiar to it

and return to its normal manner of life. Its efficiency is tested by the degree to which it succeeds in accomplishing these results. Emergency relief plans and acts to meet present needs, rehabilitation plans and acts for ultimate welfare. All disaster relief should be a process of evolving from dealings with its victims en masse to treatment of them as individual families. The wisdom of using every means of hastening the progress from mass to individual treatment is amply attested by the experience in all successful disaster relief work.¹⁶

The problems of people in disaster are of themselves no different from those encountered in the day-to-day experience of many social welfare agencies. They differ, however, in number and magnitude; the situations do not develop one at a time but occur simultaneously, frequently in exaggerated or distorted form and in unusual combinations. Furthermore, the people involved are normally self-reliant. It is important therefore to apply the customary casework methods as soon as conditions permit. People recover most quickly with individualized assistance; mass care is not a departure from this principle of effective helpfulness but only a temporary modification to alleviate physical suffering of many persons in an emergency situation. During the initial chaos of disaster, families should be kept together; young children especially should not be separated from their mothers except for the most compelling reasons. So far as possible, displaced families should be assisted in their normal groupings for mutual help and support; similarly, mass care should be provided in familiar surroundings. Public information on which people can depend should be released quickly from reliable sources to relieve anxiety, dispel false rumors and uncertainties, and to facilitate family planning.

¹⁶ Deacon, *op. cit.* (note 12 *supra*), pp. 168-69.

¹⁵ Bicknell, *op. cit.* (note 11 *supra*), pp. 6-7.

FOUR PHASES OF DISASTER RELIEF

Today, the original and now time-proven concept of two phases of disaster relief should, perhaps, be expanded and thought of in four stages:

1. The period before disaster threatens or occurs, when hazards are being identified and plans made for warning and rescue, emergency mass care, and rehabilitation; when organization is perfected; and when volunteer and other personnel are recruited, trained, and assigned.

2. The phase of imminent threat or impact, when all combined effort, official, quasi-official, and voluntary, is directed toward saving lives and property.

3. The post-impact phase of emergency relief, which includes not only emergency mass care but also the clearance of debris; the making of temporary repairs; other arrangements for the restoration of public, corporate, and private facilities and services; and the general restoration of order.

4. The phase of permanent rehabilitation and restoration, not only of families but also of the public, corporate, and private installations, facilities, and services.

DISASTER PLANNING AND PREPAREDNESS

If we accept this fourfold concept, it will be found that never before in our history has such far-reaching, co-ordinated, and precisely detailed planning been done in stage one, the result in no small measure of our having accepted the necessity of being adequately prepared for the consequences of both natural disasters and enemy attack.

In this setting the Red Cross has been able to strengthen and intensify its long established preparedness measures in organization, in financing, in staffing and training, in the further development of steps for individual self-help, and in

many other ways that cannot be elaborated. During the World War II period the Red Cross issued certificates evidencing completed training in first aid, home care of the sick and injured, and related subjects to more than fourteen million persons;¹⁷ during the fiscal year ended June 30, 1956, comparable certificates were issued to nearly two and one-half million persons.¹⁸ As an outgrowth of its having provided to the Armed Forces during the World War II period more than thirteen million pints of voluntarily contributed blood, the Red Cross now operates a network of regional and subsidiary blood centers extending across the country, which provide a broad base for expansion to meet the greater needs of either war-caused or natural disaster and which currently supply some 40 per cent of the peacetime civilian blood needs of the entire country. In the national interest, the Red Cross, as an organized and trained community force, has pledged its support and assistance, in all those fields where it has special competence, to civil defense.

Civil defense

Actual experience in the United States with enemy-caused disasters is fortunately quite limited. During World War I supervision over civilian protection was exercised by the Secretary of War. During World War II "many state and local defense councils were revived"; a federal Office of Civil Defense was established in 1941 and "abolished" by Presidential directive on June 30, 1945.¹⁹

The current program of civil defense

¹⁷ *Red Cross Service Record: Accomplishments of Seven Years, 1939-1946* (ARC 541, November 1946).

¹⁸ *American Red Cross Annual Report, Fiscal Year 1955-56* (ARC 501).

¹⁹ Commission on Intergovernmental Relations, *A Report to the President for Transmittal to the Congress*, June 1955, p. 176.

was established to deal with enemy-caused disasters, and the Federal Civil Defense Administration was created to carry out its purposes.²⁰

The federal government and the Red Cross in disasters

The Congress acted also

... to provide an orderly and continuing means of assistance by the Federal Government to states and local governments in carrying out their responsibilities to alleviate suffering and damage resulting from major disasters, to repair essential public facilities in major disasters, and to foster the development of such state and local organizations and plans to cope with major disasters as may be necessary.²¹

Co-ordination having previously been handled through other offices, the President in 1953 delegated to the Federal Civil Defense Administration certain peacetime responsibilities related to natural disasters under these provisions of the act. They include predisaster planning, co-ordinating the activities of federal agencies, and administering federal grants to states and local governments.²²

In the Disaster Act of 1950, the Congress was careful to preclude any interpretation of it as a limitation or redistribution of the authority and responsibility of the Red Cross to continue its traditional disaster relief work, by providing that "nothing contained in this Act shall be construed to limit or in any way affect the responsibilities of the American National Red Cross under the

²⁰ Public Law 920, 81st Congress (Federal Civil Defense Act of 1950), approved January 12, 1951.

²¹ Public Law 875, 81st Congress (Federal Disaster Act of 1950), as amended, approved September 30, 1950.

²² Executive Order 10427, dated January 16, 1953; see also article in this volume by Val Peterson, "Co-ordinating and Extending Federal Assistance."

Act approved January 5, 1905 (33 Stat. 599), as amended."

To prevent possible confusion or overlapping of effort, the Federal Civil Defense Administration and the Red Cross have worked out general and specific mutual understandings that recognize this unchanged role of the Red Cross in carrying out its traditional services to people under its own administrative and financial control.²³

Figure 1 indicates the respective responsibilities of the agencies of government and of the Red Cross in natural disasters at the local community level. In the emergency period following disaster, co-operative effort is directed toward effecting rescue and evacuation, providing shelter, food, and clothing, and extending emergency medical and nursing aid to all in need. As quickly as possible after the emergency the government assists in restoring public works and buildings; providing sanitation and otherwise maintaining public health; rebuilding roads and bridges; and restoring or maintaining other essential public services. In contrast, the Red Cross serves people—individuals and families, and the proprietors of small businesses—who need emergency relief and help in returning to a self-sustaining basis.

CONCLUSION

In essence, the emergency mass care and other disaster needs of the country will be served most effectively if a number of basic considerations are recognized and observed.

The natural disaster hazard should be understood in terms of theoretical potentiality and actual experience over the years: what kinds of disasters are likely

²³ Statement of Understanding Between the Federal Civil Defense Administration and the American National Red Cross, February 6, 1953, and Supplement 1 (April 1953), Supplement 2 (April 1953), Supplement 3 (August 1953), and Supplement 4 (November 1953).

FIG. 1. RESPONSIBILITIES IN NATURAL DISASTERS

to occur, when and where will they strike, and what will be their human and material costs? In relating natural disasters to war-caused situations the differences as well as the similarities should be understood.

There is imperative necessity for advance planning and preparedness measures nationally, by regions or states, and locally, directly attuned to the hazards disclosed. Plans and organization must be constantly reviewed and modified as changing circumstances dictate. The public should be reasonably aware of the purposes, extent, and details of the co-ordinated plans of government, the Red Cross, and other organizations and groups. Although the authority and responsibility of government at all levels and of the Red Cross are clear and their prompt action in time of disaster is universally expected, it must be remembered that, however effectively their functions are co-ordinated, they need and welcome the co-operation of other agencies and indeed of the general public in carrying out their responsibilities. Great values as well as some problems

are implicit in the desires of all to help following dramatic disasters.

The news of major disasters evokes spontaneous public sympathy, generous giving, and widespread voluntary support. Moreover, in the aggregate, great needs result from a multiplicity of small disasters that do not get the headlines; these do not require large-scale governmental effort, but none the less bring acute needs to those directly affected. Consequently, plans, organization, personnel, and financing are required to meet the needs of minor as well as major disasters.

The limitations as well as the purposes of emergency mass care must be understood; the method should not be used at all if it can be avoided; when used, plans should contemplate its earliest termination.

There is vital need for continuing study and research, the results of which can be translated into more effective plans and action directed toward preventing or minimizing disasters or ameliorating their conditions when they cannot be avoided.

Relief and Rehabilitation of Families and Individuals

By ROBERT E. BONDY

Abstract: Using the casework principle, the American Red Cross has developed an effective system of disaster rehabilitation. Relief available to families is, principally, food, clothing, housing and repair, furniture, medical aid, and occupational equipment and supplies. Aid is rendered on a need basis and is limited to disaster areas and those immediately affected, supplementing local community efforts. Through sound personnel policies and modern techniques, the Red Cross has steadily improved its capacity to bring aid rapidly to stricken areas and to evolve long-range rehabilitation programs. Through its disaster relief, the Red Cross has also contributed to the social sciences by means of its community and casework studies and has brought about important improvements in national welfare.—Ed.

THE story of the relief and rehabilitation of families and individuals affected by natural disaster is largely the story written by the American National Red Cross. This is so because the Red Cross position for decades as America's voluntary disaster relief agency has made it responsible for both emergency care and rehabilitation of people in time of disaster; particularly in rehabilitation of families and individuals, the Red Cross has been the only agency over the years conducting a service to help the individual family restore its capacity to reach and maintain its predisaster standard of living.

The Red Cross defines rehabilitation as the process of assisting families and individuals in meeting disaster needs beyond their own resources so that they may become self-sustaining members of their community once again. Such an objective comes as close to facing and meeting a social problem as may be found in the field of social welfare.

The problem facing families and individuals affected by flood, tornado, hurricane, fire, or explosion is often one

of widespread chaos and devastation, with family members killed or injured, with home and household goods damaged or destroyed, often with livelihood threatened. The savings of a lifetime as represented in home and possessions may be gone. Health or other problems present in the family at the time of the disaster may make recovery a doubly difficult undertaking. Credit may be scanty or nonexistent. How can the family or individual confronted without warning by these problems return to a self-sufficient existence? To meet such problems the relief and rehabilitation service of the American Red Cross is provided.

REHABILITATION AN EXTENSIVE SERVICE

For each family assisted to become self-sustaining, rehabilitation service is of high significance and the total of such service to all families affected by disaster in any one year is an extensive contribution to America's well-being.

The number of disaster operations calling for Red Cross rehabilitation

service has increased year by year through various climatic, topographical, and other factors. For example, during the six calendar years from 1930 through 1935 the Red Cross gave service in 560 disaster operations compared with 2,017 during the six calendar years from 1950 through 1955. In the 1937 Ohio-Mississippi Valley flood 236,147 families were given rehabilitation assistance.

PHILOSOPHY AND GOVERNING PRINCIPLES

The basic philosophy is that people everywhere will do all that they can to help themselves in recovering from the effects of disaster. To the extent that the family or individual cannot make recovery, rehabilitation assistance is provided. Some of the underlying principles developed through the years should be stated at the outset.

1. Assistance is restricted to those families or individuals affected by the disaster. A disaster relief operation by restricting itself to disaster-affected families and individuals supports rather than duplicates the regular and continuing social welfare services of the community. Furthermore, donors to a disaster relief fund give because they desire to help people affected by the disaster.

2. The total resources and needs of each family should be considered as a unit. This means that the Red Cross functions as a family casework agency and uses the casework method.

3. Assistance is given on the basis of need. The rehabilitation process is primarily concerned with the adequacy or inadequacy of a family's resources to meet basic living needs following a disaster.

4. Assistance is given without political, religious, or racial discrimination when it has been established that the

family's resources are inadequate to meet basic living needs. Deviations from accepted standards, such as delinquency, immorality, and the like, are not regarded as sufficient grounds for withholding assistance when all other prerequisites exist. Neither United States citizenship nor legal settlement is considered in determining eligibility.

5. Loans are not made to disaster sufferers; relief given imposes no obligation of replacement; and there is no charge for any service.

6. Individual awards and case records are kept confidential in order to safeguard the applicant from inappropriate use of information. This casework principle does not prevent discriminate use of carefully selected case information for the benefit of the applicant and the program, as required in presentation of case material to the local advisory committee, in contacts with persons having specialized knowledge about the case, and in joint planning with another social welfare agency.

7. Public benefits available through tax resources such as old-age and survivors insurance benefits, public assistance, unemployment compensation, and veterans' benefits are considered as family resources. Assistance received from any organization prior to the disaster is expected to continue, as disaster rehabilitation is intended to meet disaster-caused needs. Rehabilitation assistance is not given to educational, charitable, or religious organizations or to government bodies. However, individuals connected with such agencies are entitled to the same consideration as others.

8. Rehabilitation includes aid to small businesses owned and operated by families who are dependent upon the restoration of income from such businesses for family living.

9. Consideration may be given to meeting predisaster problems including

Robert E. Bondy, New York City, is Director of the National Social Welfare Assembly. He was Director of Public Welfare, District of Columbia (1939-41) and national Red Cross director of disaster relief and administrator of services to the Armed Forces in World War II.

predisaster debts when the situation in the family resulting from the disaster would be best helped in that way.

10. An underlying consideration in all rehabilitation is that each family and individual is different and that assistance must be based upon facts carefully collected and evaluated in each situation.

RESPONSIBILITIES FOR DISASTER RELIEF

First responsibility for meeting the rehabilitation needs of families and individuals affected by disaster rests upon the families and individuals themselves. Each family is expected to draw upon its own resources for its own rehabilitation, utilizing those resources to the extent that is compatible with the continuing interests of the family. In the best tradition of American social welfare, the affected community takes its full measure of responsibility for the needs that the family cannot meet. The traditional expression of this responsibility of the community, whether it be the town or city or the nation, is through the American Red Cross disaster rehabilitation program. The Red Cross assists the family in the full utilization of its own resources and by advice and material assistance beyond that provided by the family when such assistance is indicated.

This system of rehabilitation of families and individuals in time of disaster has evolved over the seventy-five years of American Red Cross service, and in its present form more particularly over the past thirty-five years. However, some of the basic principles and assumptions in rehabilitation have their roots in the practices developed by Miss Clara Barton in rehabilitation assistance in the eighties and nineties of the last century.

In the Johnstown, Pennsylvania, flood, in Ohio Valley floods, and in the Sea Island, Georgia, hurricane disaster, the basic concepts of community assistance,

of responsibility of the family for its own recovery, were recognized.

DEVELOPMENT OF METHODS

In the San Francisco earthquake and fire in 1906 the practice of making loans to disaster sufferers rather than outright grants was found to be unworkable. Some beginnings were made there in co-ordination of rehabilitation under a common community plan. During the Cherry, Illinois, mine disaster Ernest P. Bicknell applied a plan of "pensions" for the survivors to assure a minimum maintenance over a period of years. While this plan recognized the differences in family needs based on the number of dependents, it was more automatic in the entitlement of families to it than are the individualized rehabilitation awards of today. But even so, this recognition that families required aid beyond the brief emergency care given and that the resources of the community should be drawn upon to assist in re-establishing at least some measure of the way of life existing before the disaster was indeed a milestone. There has been but little wavering from this concept of rehabilitation as well as of emergency care since those days almost fifty years ago.

In the early decades the rehabilitation processes that form the basis for today's program brought the more formalized and sharper policies of the family as the unit for relief, of need rather than loss as the basis for rehabilitation, of grants as opposed to loans as the method of assistance, of trained staff to get the facts and assist the family in the plans, of a strong local citizens' advisory committee, and of a centralizing of rehabilitation under the Red Cross.¹ Fortunately even these

¹ Clyde E. Buckingham, *Red Cross Disaster Relief: Its Origin and Development* (Washington, D. C.: Public Affairs Press, 1956), p. 31.

basic policies and procedures in rehabilitation have been kept flexible enough to adjust to the changing social and economic state of the country and to the expectations of the people.

ADAPTATION TO CHANGING CONDITIONS

A service as dynamic as disaster rehabilitation and as conditioned by the changing economy and expectation of the nation inevitably has flexibility as its conditioning feature. The social, economic, and political setting for disaster rehabilitation today is significantly changed from fifty years ago or even twenty-five years ago.

Today government's solicitude for the well-being of its people is expressed in the social security program and in health and other public welfare services. It is inherent in the times that people expect more than they used to from employers, and from government and voluntary organizations, in protection against the hazards of a dynamic and expanding economy. Voluntary hospitalization plans, industrial pension provisions, slum clearance and low-cost housing programs, huge federal expenditures for highways, millions of dollars in research to protect the health of the people, soil banks and crop insurance are public devices to ensure the general welfare of the people.

This dynamic, expanding situation has inevitably changed welfare agency concepts and policies, including American Red Cross disaster relief and rehabilitation. Community leaders and people generally have new and greater expectations. They expect flexibility; and particularly they expect responsiveness to the trends of the times and to the expectations of the people and particularly of the contributors.

All of this suggests that a flexible application of the basically sound need policy in rehabilitation would take into account such variable factors as the

economic and social setting of the day, the expectations of the community and the contributors, the standard of living of the community and the people affected by disaster, and the available funds. Administration of a flexible need policy calls not only for a lucid statement of the policy in instruction material, but also for a sensitive, informed, and adaptable staff leadership under which each disaster is viewed as a case in itself, with the level of assistance determined for it in the light of the factors given above.

Rehabilitation cannot be played by ear, done in a haphazard style according to mood and temperament. The only guide as yet found is need. But the definition of need is not the same everywhere, all the time. Need is a variable, imperatively demanding a flexible approach.

INDIGENOUS NATURE OF DISASTER RELIEF

The strength of the Red Cross disaster rehabilitation service lies in its indigenous nature. It is of and by the people and the communities in which they live. Its strength lies in making its national as well as its chapter service indigenous to the communities.² Part of the job of being indigenous is that of integration into the community. Strength comes through a philosophy and way of work in which people are generally aware that the rehabilitation program seeks to play its important part as part of the community effort.

Simplicity and warm humanity in administering relief brings hearty response and support from the community and the affected families in the future as in the past. Rehabilitation is an extremely

² For the organizational structure of the American National Red Cross see *supra*, Ellsworth Bunker, "The Voluntary Effort in Disaster Relief," under the subhead "Building an Organizational Structure."—Ed.

personal affair, and the manner of accomplishing it is vitally important, because any rehabilitation program must deal with people off normal balance and bruised. The sympathy need is sometimes greater than the money need.

These are some of the considerations that harmonize disaster relief rehabilitation with the demands of the times and with the expectations of the people. Basic policies and procedures are given flexible interpretation, though those policies and procedures may not be changed in their fundamentals.

CATEGORIES OF RELIEF

One basic element in rehabilitation is the categories of relief or assistance available to families. There are five principal categories: food, clothing, and other maintenance; building and repair; household furnishings; medical and nursing care; and occupational supplies and equipment and small business rehabilitation.

In contrast to immediate assistance with food, shelter, and clothing given during the emergency period on the stated need of the family, a rehabilitation maintenance award is planned according to the total budgetary needs of the family. The purpose of the award is to provide a livelihood for the family until other resources become available, such as earned income, benefits from social security, insurance vocational training, or transfer to another agency. The anticipated family income, either from earnings or from another source, should be kept in mind.

A rehabilitation program undertakes to assist homeowners with the basic needs in the building and repair of their homes and other essential structures after the maximum resources available to the family have been utilized to meet the need. A basic need in this category includes consideration of the mini-

mum cost of placing essential buildings in a safe and usable condition.

Assistance is given to families with the purchase of basic furnishings essential to family living. Furniture of adequate quality may be purchased. Such assistance is given when a study of the family situation shows that essential items have been lost and that the family does not have the resources to obtain them.

Prompt and adequate medical and nursing care to those individuals and families in need of such services is another category of relief. Assistance under this classification is intended for those who are ill or injured because of the disaster or whose condition is aggravated by the disaster, and who otherwise would be unable to obtain medical, dental, and nursing care.

The occupational supplies and equipment category is for the purpose of helping operators of small farms, owners of small businesses, and those who own their own occupational equipment with a view to re-establishing the family income, though not necessarily on the same scale as before the disaster. Also included under this category is vocational rehabilitation for wage earners or potential wage earners when such rehabilitation is necessitated by the disaster.

The relative amount needed in these different categories in any given disaster will vary according to the type of disaster. For example, a tornado or a hurricane may cause more deaths and injuries proportionately than a flood and therefore call for more medical and nursing care. The high velocity of water in a New England flood may result in more total damage to homes than in a slow-moving Mississippi River flood. Whatever the difference in type of disaster and in the relative amounts needed in categories of relief, the rehabilitation plan for each individual and family is based on a careful study of the needs

and resources of the individual or family.

APPLICATION OF CASEWORK TO DISASTER

The casework method may be regarded as the most fundamental of the procedural assumptions in disaster relief rehabilitation. Disaster rehabilitation is a social welfare program using the casework method in helping the individual family restore its capacity to reach and maintain its predisaster standard of living. The program is sufficiently broad to provide financial assistance adequate to meet any disaster-caused needs existing after the family has applied its resources. The disaster caseworker counsels with each applicant in studying the disaster losses, in order to determine the extent of his total needs and his ability to meet these needs, and to establish the amount of assistance needed. The caseworker must deal with individual problems, complex and varied, created by the disaster.

Rehabilitation in disaster follows the broad outlines of family casework in the use of such techniques as consultation with families, verification of pertinent information, consultation with outside sources, and the development of plans to meet the needs of each family situation on an individual basis. Family participation in planning is an integral part of this process, since each family is expected to effect as much of its own recovery as possible.

Special characteristics of disaster casework

Disaster creates special situations that must be handled by the caseworker:

1. The emotional shock, anxiety, and tension among families affected by a disaster situation are intensified among persons who suffer personal tragedy or loss, serious injury of loved ones, and loss of real and personal property.

2. The number of family problems that may need to be considered is larger than in most family casework situations; their scope is often greater.

3. The cost of rehabilitation usually far exceeds the cost of relief extended by casework agencies during a comparable period of time.

4. Disaster rehabilitation is primarily concerned with the adequacy or inadequacy of the family's resources to meet the problems caused by disaster.

5. A short-contact type of relationship is indicated, since the cause of the family's need is clearly established and rehabilitation policies are designed to deal directly and positively with material needs, illness, and injury. The specialized function of disaster casework precludes a long-range type of social treatment.

6. Disaster casework concerns itself only with problems caused by disaster.

7. Rehabilitation relief is given on a need basis only.

8. Speed in making plans with families whose whole way of life is disrupted and whose suffering will be increased by delay is of the essence.

Chronological procedure

The processes that often occur chronologically in dealing with a family's needs include the following: Following the occurrence of the disaster, the family receives emergency care largely on the basis of the stated need of the individual. Application is made by the family for rehabilitation consideration, the applicant filling out an application form giving the facts of loss and of resources. The family caseworker counsels with the family in the disaster office and in the family's home for the making of a plan of rehabilitation. The agreed plan is then presented by the caseworker to the local advisory committee for concurrence. Upon action of the committee, an award is then estab-

lished and the family notified. Opportunity is then given the family to do its own shopping for articles needed or to make its own contracting arrangements for building and repair or otherwise to proceed with the carrying out of its own plan. Payment is then made by the Red Cross.

Types of assistance

Rehabilitation assistance may be given in kind, through purchase orders, or in cash. Often donated supplies of clothing, household goods, or building materials are received and may become part of the assistance given under the rehabilitation award. Generally assistance is in the form of a purchase order made out to the vendor of the family's own choosing. With this purchase order in hand the family is then able to make its own decisions as to the items to be obtained or the building repair work to be done—all within the general spirit of the rehabilitation award and within the dollar amount approved.

Cash grants as a method of relief may be given when the facts show that cash assistance is the best way to meet a family's need. This procedure often expedites the rehabilitation of the family and enables it to proceed in the manner to which it is accustomed.

From emergency care to rehabilitation

Much of the effectiveness of the rehabilitation process is dependent upon the proper blending of the emergency care into the rehabilitation services. The disaster-affected family usually has its first contact with the relief organization during the period of emergency care. It learns then of the emergency and rehabilitation policies and procedures and the purposes and circumstances under which rehabilitation assistance is given. The application for rehabilitation service is usually made during the emergency care period; and the smooth-

ness of rehabilitation often is dependent on the rapport established between the disaster worker and the family, and the clarity with which policies are explained and the application process inaugurated during the emergency care period. The two periods of emergency and rehabilitation care are therefore two parts of but one period of recovery from disaster.

REHABILITATION AN EVOLVING PROCESS

Disaster rehabilitation has improved and evolved over the years because the Red Cross has kept its methods open to review constantly and has been responsive to changing times. For example, the high tempo of life today has seemed to have its counterpart in the expectation that disaster relief operations, including the rehabilitation process, be speeded up and up. Disaster relief operations that a decade or two ago consumed four to six months from the occurrence of a disaster until the completion of the last award may often be carried out today in two to three months. This has seemed to have justification in possible saving of funds and prompt provision of relief. In this process of expediting rehabilitation the Red Cross has established certain safeguards. The best interests of the families affected have been kept in mind as well as the protection of the disaster rehabilitation workers, both the paid staff and the citizen volunteers.

As rehabilitation is the very core of disaster relief, the Red Cross has given close attention to strengthening the organization and administration of the entire disaster relief operation. Sound administrative practices have been studied and applied to disaster relief operations where pertinent. The partnership of the professional worker and the volunteer worker has had attention. As the volunteer plays an important role in most disaster operations, a special ef-

fort is made to dignify the place of the volunteer, particularly at the point of contact with applicants.

The role of the professional or staff worker is that of a person trained and experienced in rehabilitation processes, including casework methods, ability to act with flexibility in a highly dynamic situation, strength and stamina for the grueling duties and long hours and the usual qualities of devotion to service and dependability. While the American Red Cross has a large body of experienced professional workers available for assignment in disaster, the larger disaster relief operations require additional people from public and voluntary organizations. Working understandings have been developed between these organizations and the Red Cross on staff availability and conditions under which staff will be loaned. As far as possible, continuing attention is given to the maintenance of sound personnel practices.

CITIZEN PARTICIPATION

Service on the local advisory committee is one of the most significant contributions of the citizen volunteer in a disaster relief operation. Particular care must be taken to select for advisory committee service men and women of strong, representative qualities who will work in harmony with the basic policies and procedures in rehabilitation and willingly assume responsibility for decisions. Each advisory committee must be carefully oriented in its authority and responsibilities.

The role of the local advisory committee is to share with the staff administratively responsible for the disaster relief operation the decisions on awards to individuals and families made in the rehabilitation process. This means that the committee is not merely advisory and is certainly not a rubber stamp; rather, financial authority for decision on awards is clearly accorded

the members of the committee. Such financial authority would rest in majority decision of the committee, and in extent would be equal to that vested in the staff administratively responsible for the operation. It should be understood that such financial authority may be exercised only in cases adhering to basic disaster rehabilitation policies.

Through such a partnership of local community leadership with the staff assigned to the relief operation, rehabilitation becomes responsive to the wishes of the community and also is based upon the best experience of the past.

As disaster relief rehabilitation calls for the use of the resources of the individual and the community, it is clear that the Red Cross as the responsible rehabilitation agency has taken an appropriate position in seeking co-operative relationships with other organizations, both governmental and voluntary. For example, the formal working agreement between the American Red Cross and the American Federation of Labor-Congress of Industrial Organizations well illustrates the scope and possibilities of such co-operative understandings. Provision is made for recognition of the role of the American Red Cross, and for training and participation of members of the labor organization in a disaster relief operation as well as for assistance in raising funds for the central Red Cross relief fund. The Salvation Army, the American Legion, fraternal organizations, and many local social welfare agencies have made significant disaster relief contributions of service over the years. Some of this relates to the rehabilitation period but more of it to the mass care period.

ROLE OF GOVERNMENT

Historically, government—federal, state, and local—has made its resources available in time of disaster. Some of the traditional roles of local and state

government are especially significant in time of disaster, such as maintaining law and order, protecting the public health, providing communication facilities. Federal and state government services have been and are called upon when local resources are inadequate. During the decades of this century significant disaster service has been given by the National Guard and state militia, Corps of Engineers of the United States Army and the Army itself, United States Coast Guard, Extension Service of the Department of Agriculture, United States Weather Bureau, the Disaster Loan Corporation, and during the 1930's the Reconstruction Finance Corporation.

In 1947, an act to make surplus property available for the alleviation of damage caused by flood or other catastrophe formalized a federal policy of disaster assistance. The Federal Disaster Act of 1950 not only called for special federal aid in declared "major disasters" (Executive Order 10427 of 1953 assigning to the Federal Civil Defense Administration the co-ordination of government services and facilities) but also confirmed the American National Red Cross in its humanitarian responsibilities.³ Many agencies of local, state, and federal government now make their services and facilities available in time of disaster.

The most recent expression of federal government activity in disaster relief came with the passage of the Federal Flood Insurance Act of 1956 by the Eighty-fourth Congress. The act provides a system of federal subsidy for insurance against floods and authorizes study of the feasibility of extending insurance coverage to certain other types of natural disasters.⁴

³ See also *supra*, Val Peterson, "Co-ordinating and Extending Federal Assistance."—Ed.

⁴ See also *supra*, Edwin S. Overman, "The Flood Peril and the Federal Flood Insurance Act of 1956."—Ed.

Close working arrangements between the Red Cross and agencies of government are particularly important. Many people are the beneficiaries or recipients of government assistance and services, such as public assistance, old-age and survivors insurance benefits, and unemployment compensation. The responsibility of the Federal Civil Defense Administration for co-ordinating the resources of government in time of disaster, particularly for restoration of public property and governmental services, emphasizes the value of the close co-operation between the Red Cross and the Federal Civil Defense Administration that characterizes disaster relief operations.

PUBLIC RELATIONS

The best public relations are made possible by a highly effective rehabilitation service. Yet much must be done to acquaint the public with the services of rehabilitation and the accomplishments. This statement relates to good understanding on the part of the people of the country and also to effective interpretation of rehabilitation policies and procedures to the disaster sufferers themselves and the community immediately affected. The second is at times the more difficult of the two jobs. Public relations in the disaster area are a continuous process throughout the rehabilitation period, participated in not only by staff people on the disaster operation but by advisory committee and other local people. Broad policies should be stated but human interest and illustrative case material should also be employed. The channels of information most commonly known to the affected families should be utilized.

SIGNIFICANT BY-PRODUCTS OF DISASTER RELIEF

As a final word it may not be claiming too much to say that disaster reha-

bilitation as carried out over the years by the American Red Cross has had very significant by-products. Unfortunately the scope of this paper does not permit a complete listing. However, many thousands of individuals and families have been helped back to a way of independent living. Communities have been restored more rapidly as a result of rehabilitation and of the flow of business and cash that the rehabilitation process brings to the affected community.

Relocation of homes out of disaster hazard areas into new areas of safety has been planned in some disaster relief operations and carried out. The natural human tendency to want to remain in the same location calls at times for careful planning, but when that is possible a real by-product of high value results.

The rehabilitation and casework methods used in disaster relief have brought important technical and professional contributions to the field of social welfare and of casework. The short-time casework called for in disaster has been suggestive to organizations requiring that kind of service in their day-by-day activities. Staff loaned to a disaster operation have benefited from experience in dealing with community-wide forces and have had higher vision because of the adequacy of rehabilitation and the

measurability of restoring a family to its predisaster status. It may well be that some of the early Red Cross practice of giving long-time maintenance to orphans and widows and the basically sound policies inherent in the rehabilitation process have had much to do with forming the foundation for such public provisions as Workmen's Compensation and other governmental maintenance provisions.

The Red Cross has introduced new gardening and food habits to whole sections of the country to combat illness due to dietary deficiency found among families affected by disaster. The Red Cross was the first organization to provide for widespread use of yeast as a preventive of pellagra. It introduced screening and other measures for malaria control in areas where such measures were previously unknown. Organization of local Red Cross chapter committees on preparedness for disaster has resulted in measures being taken that in many instances have reduced loss of life and property damage.

Clearly, it may be said that for sheer social achievement the specific aids to restoration of families and individuals affected by disaster and the by-product values label American Red Cross rehabilitation services as one of the most significant contributions to human well-being.

Emergency Medical, Hospital, and Nursing Care

By HAROLD C. LUETH

Abstract: Carefully planned emergency medical service is essential if disaster casualties are to receive full benefit of modern facilities and techniques. Detailed but flexible plans are required, since nonprofessional assistance cannot otherwise be utilized to full advantage, a fact abundantly clear in recent disasters. Any plan should center on co-ordination with other community services. Basic elements of a plan should stress reception of casualties; sorting and initial diagnosis; emergency medical care; and evacuation of casualties. It is incumbent on the medical profession to initiate the training and guidance of emergency medical cadres to make any emergency plans effective.—Ed.

EMERGENCY medical service is a type of medical practice that is receiving increased attention from doctors. In the past, the average practitioner has not given it much consideration, and he has rationalized his neglect by assuming that if the problem should arise, he would simply go to work and do his best. But natural and man-made disasters are, unfortunately, ineradicable parts of modern living, and if they are to be met efficiently and effectively plans must be made in advance.

Plans must be made for proper reception and registration of casualties, for skillful and rapid diagnosis of injuries, for the utilization of recognized procedures, and for the formation of teams of skilled auxiliary workers. To be assured of having an opportunity to render good medical service during a disaster and its aftermath, physicians must take the lead in making certain that similar careful planning has been done in the related fields of rescue, communication, transportation, and fire and police work. Thus, two distinct obligations face the physicians: acquisition of

recognized techniques for the handling of medical emergencies, and stimulation and training of auxiliary workers. Men and women in related health fields are eager for the leadership which only the medical profession can give.

Daily papers and news broadcasts report disasters that give us pause. All of us feel regret and unhappiness after receiving these reports, but too frequently we reassure ourselves with the thought that nothing of the sort could happen to our locality. On the contrary, disasters are unpredictable and can happen anywhere. Tornadoes, floods, and severe fires can come suddenly or with little warning. Streamlined trains and airplanes have multiplied the possibilities of accidents and serious injuries; jet planes, with still greater power and speed, add to the potential destructiveness of such accidents; they are more and more likely to injure not only the fliers but people on the ground as well. The wide variety of chemical agents being used in commerce, many of them explosive, present new hazards. Technology, with the greater use of powered machinery, has added to the list of po-

tentially destructive agents, in spite of the advances that have been made in safety programs.

Physicians are being called upon to treat emergencies more frequently than in the past, but in too many instances emergency medical care has been the concern only of a small group of doctors—the industrial surgeons and the military surgeons. Increased possibilities of need for emergency medical service, including the possibility of thermonuclear warfare, make it essential that all physicians take an active interest in it.

All of us recognize disaster or emergency care as a professional obligation, one wholly unpredictable as to time, place, and extent. Many indications point to the likelihood that disaster in one form or another will always be with us. What has not been so generally recognized and accepted is the necessity of incorporating into everyday activities and planning some thought and practice for the proper handling of the varied medical repercussions of a disaster. Perhaps a broad review of the probable types of activities necessary for sound emergency medical care after disaster would serve to clarify the problems in professional practice confronting professional groups and help them find solutions to the complex and intricate problem of realistic, sound medical care in emergencies.

DISASTER PLANNING

It is imperative to plan for disaster well in advance of the event. Plans should be broad enough to cover a wide variety of conditions: tornadoes, fires, floods, earthquakes, explosions, and enemy attack. In planning, consideration should be given to building upon existing resources of the community, with medical services enlarged by the augmentation of personnel, supplies, and equipment. Disaster plans must indi-

cate the evolution from normal practice in civilian life to the maximum expansion of the medical facilities of the community. The advice of General Sir Frederick Morgan to the planning staff of the Normandy coast invasion, "Think big—plan carefully, soundly, and in realistic terms," applies aptly to plans for medical care in disaster. All possible eventualities should be weighed with a disciplined imagination.

Various types of disasters will produce casualties of different types and in different numbers. The heart of the problem to professional people is not the physical damage or the enemy action, but rather how the best care for the largest number of casualties can be given. All plans should be directed toward the proper professional care of sick and injured people, using the total resources of medical skills and within the supporting framework of the other technical services, as engineering for power, utilities, heat, and road maintenance; sanitation; communication; police; fire; rescue and warden work.

Too frequently, professional people are concerned with the provision of transportation, communication, engineering, and other services and have not realistically envisioned a plan of action for the *proper medical care of casualties*. Once a series of sound medical plans has been developed, it will be easier to co-ordinate these plans with supporting services and thus to assure a complete plan of action for the community as a whole. Many technical services (such as fire, police, rescue, and engineering) have adopted plans considerably in advance of those of the health fields, and are training for their execution.

A sound, realistic plan for emergency medical care, broad enough to cover a variety of circumstances and elastic enough to permit local changes and minor modifications, will most effectively cope with the multitude of prob-

Harold C. Lueth, M.D., Evanston, Illinois, is Clinical Professor of Medicine, College of Medicine, University of Illinois, chairman of the Committee on Civil Defense, Council on National Defense, American Medical Association, and chairman of the Civil Defense Committee, American Hospital Association.

lems arising from any disaster. To prepare a specific, detailed plan to cover every possible disaster would be difficult, if not impossible. The unpredictable course of events in natural or enemy-caused disaster combines with many other things to make a rigid plan of action difficult to execute.

Expect the unexpected, and make minor changes in plans and operations promptly. The basic plan is merely a directional guide. Improvisations will be necessary. Plan for, and train personnel to meet, new situations. But the more resourceful the advance planning, the more comprehensive the professional training, the more closely knit the group or health team, the less will be the reliance that will have to be placed on improvisations. Adequately trained key personnel, acting within their own resources and guided by sound plans, under competent leadership will meet any or all types of disaster with skill, confidence, and efficiency.

PERSONNEL

Personnel trained as professional people are a very special and small segment of the general population. In civilian life under ordinary circumstances all phases of the health services are available to the general population. Nearly all types of civilian medical, dental, and nursing service are predicated on a small, orderly flow of patients seeking these services. Disaster carries the possibility of a large number of people requiring health services at the same time or within a short period of time, which will require major modification of the generally accepted modes of practice.

In ordinary circumstances, with the regular and slow flow of patients to the health services, professional people are able to give freely of their time and effort to each patient. The physician, dentist, nurse, and other personnel do all they can for that particular patient.

This basic principle underlies professional teaching and practice. In a disaster, there must be acceptance of a new principle—that of doing the greatest good for the largest number. Health services must be extended to cover the widest possible application to the largest number of people. The matter requires serious thought, after a critical scrutiny of current technical procedures from which there might evolve a series of new techniques for emergency medical care. Professional people have become so accustomed to various daily procedures considered basic and essential that it would not be easy to change them. In disaster, however, they might have to be radically changed in order to meet the requirements of emergency medical care and yet remain within good medical practice.

Personnel should be assigned to positions commensurate with their potentials for giving the best care to the largest numbers. Professional people will have to become accustomed to playing new parts, for certainly disaster can hardly be called "business as usual." They will have to learn new skills, teach different methods of handling patients, and accustom themselves to new positions. Drastic changes of this type require patience, tact, and gentle persuasion for their ultimate accomplishment.

A related and equally difficult problem is the development of the team spirit among professional people. Traditionally, physicians and nurses have worked together as a group. In a disaster, there must be the harmonious working of all members of the health services in a team. Physicians and dentists, and to a lesser extent nurses, have been accustomed to individual practice, which permits a wide latitude of individual action, but in a disaster, much of the individual action must be coordinated and harmonized with the actions of others. Through conferences,

planning sessions, and simulated operation tests, it will be possible to move toward these objectives. Adjustments and occasional deviations from original plans may have to be made under certain circumstances. It is desirable to retain as much individual action and operation as is consistent with the efficiency and harmonious working of the group.

Uncertainties as to the ready availability of all personnel make it desirable to assign key personnel in depth. It would be wise to have one or several assistants or alternates for each key position. A staffing pattern of this type would also permit the operation of the health team for a prolonged period of time and under conditions of severe stress. Nearly all professionally trained personnel should have assignments to at least one duty and preferably to several. Uncertainties as to the types and number of casualties combine to make this a prudent personnel policy. It should be anticipated, too, that some personnel will be away from home, sick, or otherwise unable to respond for immediate duty after a disaster. Assignment of personnel in depth and multiple-duty assignments are helpful in overcoming these problems.

FLEXIBLE PLANS NEEDED

For convenience, the complex problems of emergency medical service can be arbitrarily divided into (1) reception of casualties, (2) sorting and arriving at initial working diagnoses, (3) initiation of emergency medical care, and (4) evacuation.

When there have been few casualties, the usual methods of management suffice, but when large numbers of casualties have occurred simultaneously, there is a necessity for team effort, and team effort presupposes preplanning.

The medical aspects of emergency medical care start with speedy recep-

tion. Advance plans should include means of permitting large numbers of casualties to be received at the hospital with a minimum of confusion. Often hospitals and medical staffs have inadequate or unelastic disaster plans. Realistic, sound disaster planning takes time, thoughtful appraisal of small details, and careful co-ordination of all sections of the medical staff and of the elements of the hospital. Wasteful and unco-ordinated action by the staff can easily prevent the rendering of speedy and effective medical treatment to patients when large numbers of them have been brought in at the same time or in rapid succession.

Experience at Texas City, Flint, Worcester, and other disaster sites has shown the need for advance planning. Disorganization and resultant confusion in each instance prevented utilization of the full professional capabilities of the city. The major problem is not what the doctor will do after he and the patient have been brought together. It is the recruiting, training, and organizing of laymen and a relatively small number of professional people whose work will enable the doctor to reach the patients in the order that the nature of their injuries demands and to treat them adequately.

Disasters vary in type and in extent. It is desirable for each community or group of communities to make flexible plans for full and complete utilization of its medical resources. The worst must be planned for. Once the complete plan for full-scale disaster relief has been drawn, modifications to cover less extensive emergencies can be formulated rather easily. Plans should be flexible enough to cover all types of natural and artificial calamities. A serious train wreck near a small community would severely tax the entire medical resources of that town and of the surrounding ones as well. Each

community, large or small, should plan on the same basis. It matters little whether the casualties follow a tornado or a nuclear attack, for the medical problems are essentially those of number and types of injuries. Communities may be faced with the task of treating large numbers of severely burned patients after an explosion of some highly volatile chemical. Their injuries would not be very dissimilar to the burn cases produced by an A- or H-bomb burst. Alternate plans for using a part of the hospital's resources and personnel should be made for disasters of lesser magnitude.

Flexibility can be accomplished through planning, as far as possible, for each of the hospitals in the vicinity to prepare to handle no more than one or two types of casualties—shock, fractures, chest injuries, burns, and so forth. The number of casualties is merely expression of the extent of the disaster. Even in a minor catastrophe, there is strong likelihood of there being various types of injuries.

Plans should be simple and easily understandable. It is desirable that they be written, so that they can be studied by all hospital personnel. Printed operational plans will permit study by new staff members and new hospital employees. And if printed copies of the plans are available at the time a disaster occurs, they can advantageously be distributed to volunteer workers.

Experience indicates that in nearly all disasters the procurement of volunteers is no problem. They arrive on the scene in large numbers. The difficulty is that in many instances their help is utilized poorly, if at all. During a flood in a midwestern city, for example, a group of nurses offered their services, but no one about the hospital was able to suggest an assignment for them. When they had looked around them, they discovered that large numbers of evacuees,

many of whom had been injured, were crowded about the admission office. After making a few inquiries, the nurses began a registration service that permitted an orderly admission of patients to the hospital. These women rendered real assistance, but with advance planning, clerical personnel could have been secured to do the registering, and the nurses could have been utilized to greater advantage in caring for patients. Utilization of volunteers involves some real problems, best met by means of plans agreed upon in advance and written, printed, and publicized.

RECEPTION OF CASUALTIES

Reception and registration of patients is an important phase of combating any disaster. A hospital administrator, working with clerical personnel in his community, can devise methods of expanding these vital services rapidly. An information bureau should be established as early as possible. Inquiries concerning relatives and friends will be made in large volume, soon after the disaster. These personal inquiries, telephone calls, and telegrams must be answered promptly if the public is to be satisfied and if the chances of panic are to be reduced. The volume of messages is often staggering, and a fairly large staff must be recruited to handle them. There is no doubt that some of them scarcely deserve answering. An analysis of inquiries following disasters has shown that calls, wires, and letters come not only from close relatives, neighbors, and intimate friends of the people involved, but also from distant relatives and casual acquaintances. It is one of the vagaries of human nature that a person may become quite genuinely concerned about a distant relative or a one-time acquaintance on hearing of a disaster in which he may possibly have been killed or injured. Inquiries sometimes are made concerning people who

had moved from the region years before the disaster. Priorities, nevertheless, cannot easily be set up; it takes time to process all of the inquiries; and they must be answered if anxiety is not to be built up in the minds of the interrogators.

Traffic management is another problem that must be anticipated. Those who live relatively near to the disaster area drive over to see "how things look," and crowd the already heavily taxed highways. Physicians and auxiliary personnel must be provided with a means of passing through police lines if they are to get to the hospital to care for the injured. And congestion must be avoided on the streets and roads between hospitals.

Some people may wonder why these matters not directly related to medical practice are being permitted a place in this discussion. The answer is that unless adequate attention is given to the registration of casualties, to the establishment and operation of an information bureau, and to traffic control, physicians will be interrupted in their professional work or will be prevented from doing it at all. Physicians have a vital interest in seeing to it that lay men and women are ready to attend to these important details.

SORTING PATIENTS AND MAKING WORKING DIAGNOSES

As each patient is admitted to the hospital, a physician should examine him promptly and carefully, so as to arrive at a working diagnosis of his injuries and decide how promptly they need to be treated. The doctor will note the presence or absence of shock. He will refer the slightly wounded to the proper agency for further treatment. Injuries requiring specialized care will be referred for treatment on the spot, or will be transported to the hospital which, according to the plan, is special-

izing in the patient's type of difficulty. It is the sorting physician who makes that decision. He occupies a position that requires quick but sound judgment amid very trying conditions. It goes without saying, then, that he must be a well-experienced and mature doctor of medicine, for through sound judgment and proper classification he will probably save as many lives as anyone in the hospital.

INITIATION OF EMERGENCY MEDICAL CARE

Physicians too frequently assume that the group of nurses and hospital attendants with whom they are accustomed to work will always be available to them. But after a disaster, many if not all of the physicians in an area go to the hospital to give emergency medical care. The operating-room staff and the ward staffs that have previously worked with the private practitioners more or less in rotation cannot work with all of them at the same time. Disaster planning must therefore include provision for the augmentation of operating-room and ward staffs.

Administratively, the provision of auxiliary personnel of this sort poses an especially difficult problem. The teaching of untrained or partially trained people is time consuming and can be looked upon as a nuisance, for it upsets the well-ordered routines of a smoothly working operating-room staff. But if disaster is not to bring confusion, it must be done. Physicians and nurses should find places for teaching sessions and for trial runs of emergency disaster teams and, in addition, they should give the recruits some routine hospital training and experience. Following a disaster, the abilities of the professionals will be sufficiently taxed without their having the added responsibility of training their assistants "from the ground up." Sundays, holidays, and the least busy

weekday hours can be advantageously used as training periods.

Care should be taken so that casualties on medical and health-service teams will not seriously cripple their effectiveness. Having one or possibly two alternates for each position, selected and trained in advance to fill vacancies that may occur, is desirable, but if such detailed preparations for trouble are too much to ask, the establishment of a key group or cadre of staff members is a scheme which has proved effective in some places. As far as possible, they can prepare to coach the green or partially trained personnel who may be added to the hospital staff in a time of stress.

To a large extent, the effectiveness of surgical care in an emergency will depend as much upon the functioning of operating-room and ward staffs as upon the competence of the surgeon. After the Flint tornado, one middle-aged hospital attendant went to the hospital to work. She was a diet maid, and there seemed to be no opportunity for her to perform her accustomed duties. No one was able to suggest anything else for her to do, but she found an essential task for herself. After hearing nurses complain that soiled operating-room linen was accumulating, she summoned several of her friends and neighbors to come to the hospital to help her wash it. Thus she enabled the operating-room service to continue functioning.

The medical profession must take the initiative and exercise leadership in recruiting, selecting, training, and guiding professional cadres for emergency medical service.

EVACUATION

Evacuation plans must be made in advance of a disaster. It is natural for all sick and injured to be brought to a hospital for care, regardless of the magnitude of their ailments. Unless

some evacuation plan has been agreed upon in advance, hospitals soon become overcrowded. All hospitals in a locality and in surrounding communities must share in a master plan for coping with disaster. The evacuation aspect of that joint program especially demands careful planning, tact, and wise judgment. At Worcester, Flint, and Jackson, several hospitals were filled to overflowing when other hospitals only a few miles away were still waiting for patients. Careful planning could have prevented that difficulty, for transportation crews could have been instructed which type of patients to bring to each of the co-operating institutions.

Evacuation is dependent upon transportation facilities and adequate communication. Arrangements should be made in advance for individually powered radio nets between hospitals and between the hospitals and the transportation facilities. The disruption of electric power and telephone lines at Worcester completely isolated the various hospitals.

TRAINING

Training should be direct and specific. Each key person should review his position or positions and make a careful, complete job analysis. The essential elements of the job should be itemized and, if needful, taught to alternates. Job analysis is a time-consuming task, but it will repay the time and effort expended by giving a clearer understanding of the duties of each key person. Positions will be clarified, specific functions will be delineated, attention will be directed to the fields of mutual operation, and there will emerge a better understanding of who does what—when, where, and why.

There is an abundance of good teaching material and training aids for the instruction of civilian practice. Elements of emergency medical care or dis-

aster medicine are much more difficult to find, and the same thing is true of nursing. Many teaching aids must be developed. This circumstance is not unfortunate, for the development of new teaching media will give, inevitably, a greater understanding of the problem. Splendid lectures and graphic demonstrations of the proper handling of war wounds by members of the faculty of the Walter Reed Institute of Research and the Army Medical Service School are some of the newer helps in the field of emergency medical service. A small group in this field is doing pioneer work. Proper management of trauma and soft tissue wounds has wider application to peacetime practice than might at first be suspected. The Committee on Trauma of the American College of Surgeons is also making an important contribution. For the ultimate fulfillment of the task before it, each community must enlist the aid of all local professional groups to review and teach the lessons of emergency medical care, using the materials from the Army, the American College of Surgeons, the American Medical Association, the American Dental Association, the American Nurses' Association, the American Veterinary Medical Association, the American Pharmaceutical Association, and other professional groups. A local civil defense health council, using all of these resources together with the local personnel, can furnish the solution to the complex and intricate problem of emergency medical service.

Training, to be effective, must be progressive and continuous. Progress is constantly being made in professional fields, and the newer findings from the clinic, the laboratory, and research groups must be translated into current practice. A progressive system of training must be envisioned. For example, members of local professional associa-

tions should make arrangements to attend courses in emergency surgery given to the medical profession by surgeons. After some training, there should be opportunities for nurses, dentists, and others to assist surgeons in the handling of accident cases in the civilian hospitals, over the week end, on holidays, or at some other period. In time, there will emerge from among the nurses those who will be able to give emergency training to other nurses. Much the same sequence of events should take place in respect to dentists and veterinarians.

Training programs will vary with each community, and each should properly make its own arrangements. Experimentation with techniques for better adaptation to the hurried conditions under which emergency medical care is given is at this point of great importance. The outgrowth from such experimentation may well be a handy manual of standardized techniques (as in first aid) tested under normal conditions for the guidance of all physicians.

All professional people must be trained in the elements of emergency medical care. There are three phases to be considered: (1) pre-attack; (2) attack and immediate post-attack; (3) later post-attack. Pre-attack is from the present until the time of disaster. During this time planning, recruitment, training, and operational exercises should take place. In the attack, medical and health personnel must go to their posts and provide medical care. This period of emergency medical service may last from several hours to several weeks. The post-attack period will see a gradual shift from emergency medical service to normal civilian activities, a gradual resumption of the pattern of normal living.

Training must take place in several fields, for in disaster assignments are likely to include several duties. There

tion may limit in different degrees an individual's capacity to respond. Physical barriers (as in fires or floods) may modify considerably the avenues for appropriate action. Yet within these externally imposed bounds, a human being will be controlled chiefly by the overall meaning of the experience to him. As one writer put it very succinctly not so long ago, ". . . people are extraordinarily different in what bothers them."¹

It is true, of course, that all individuals are so constructed that certain disturbances in their internal equilibrium can be expected almost universally in any stressful situations. Quickening of the pulse, some tautening of the skeletal musculature, blanching or flushing of the face, and odd sensations in the throat, chest, or abdomen are examples of what all of us have noticed in ourselves at some time. For a number of years Selye has been emphasizing the nonspecificity of manifestations such as these and various associated changes in bodily chemistry which he includes under the term, "general adaptation syndrome." Extensive research has been initiated, and roughly five thousand articles are appearing annually which deal more or less directly with these nonspecific stress phenomena. Yet serious gaps remain in our knowledge. In the most recent Annual Report on Stress,² Selye himself states that we

¹ D. D. Bond, "The common psychological defenses to stressful situations and the patterns of breakdown when they fail," in *Symposium on Stress*, Army Medical Service Graduate School, March 16-18, 1953, Washington, D. C. Much useful information to which the author has not made specific reference in this article can be found in the *Symposium on Stress* of which Doctor Bond's article forms a part. An excellent review of much of the literature on civilian reactions to the disaster of bombing is available in I. L. Janis, *Air War and Emotional Stress: Psychological Studies of Bombing and Civilian Defense*, New York, 1951.

² H. Selye and G. Heuser, *Fifth Annual Report on Stress, 1955-56*, New York, 1956.

know "virtually nothing" about the link between the "stressors" and the adaptive processes he and many other workers have studied so exhaustively. In this shadowy area between stimulus and response, it has long been recognized, lie the greatest mysteries of human behavior. Many somewhat overlapping terms such as "the mind," "the self," "the psyche," "the ego," and "the soul" have been proposed in various frames of reference in an effort to bridge intellectually this baffling hiatus. The intangibility of all these concepts remains frustrating to most thinking men, and the hope continues that some day the physiologist and biochemist or their successors will effect a "breakthrough" into this hazy realm. Awesome (and monotonous) as the prospect may be of an enlightened age in which all reactions of all individuals to all stimuli can be predicted (or controlled) with absolute certainty, there seems to be little basis for hoping (or fearing) that the dawn of this age is imminent.

TREATMENT AND THERAPY

On all sides we see a striving for "push-button" solutions to problems. "Automation," electronic "brains," and other technical triumphs are hailed as the heralds of a new day. Even in the author's own field of psychiatry, such advances as electro-convulsive treatments, psycho-surgery, and, more recently, the "tranquilizing" drugs have been regarded, and used by some, as sufficient means for dealing with the almost infinite complexities of psychological conflict. All these forms of treatment have real values in their proper place. They are *not* the panaceas some wish they were, and one may well agree with the amusing slip of the tongue by one of the author's patients who referred to the new tranquilizing drugs as "tantalizing" drugs!

Selye quotes an interesting case re-

port which illustrates the disturbing intricacies of the problem. A certain lady was given one of the adaptive substances to alter an unfavorable balance which was thought to have developed in her adaptive system. This lady had been a mediocre pianist. An unexpected side effect of the medication seems to have been a phenomenal improvement in her ability to play the piano. She began to master sonatas with almost the skill of a concert artist. Unfortunately she was concurrently becoming somewhat psychotic. To offset this regrettable development, the medication was gradually reduced. For every ten units the dosage was lowered, she lost a sonata!

In brief, we can tamper more potently with the human mechanism than ever before. The multiple results of such tampering cannot always be predicted in their entirety nor with certainty.

In dealing with psychological problems, therefore, it is still important to recall a distinction between treatment and therapy based on the etymological derivation of these terms. "Treatment" comes from the Latin verb meaning "to handle." "Therapy" comes from the Greek verb meaning "to serve" in the sense of "attending" or "going along with." We are yet unable completely to "handle" people psychologically by what we do *to* them. We have developed certain skills whereby we can help people by means of what we do *with* them in seeking resolutions for their individual conflicts.

PSYCHOLOGICAL PREPARATION FOR DISASTER

We may now consider the relevance of these considerations to the problems of psychological reactions to disasters.

On the one hand, we have no methods available whereby a given individual, to say nothing of whole populations, can be thoroughly "immunized"

against all unfavorable or inappropriate reactions to catastrophes. Some five years or more ago a somewhat unreliable Air Force officer claimed to the author that he had developed a chemical technique which rendered plane crews "panic proof." Unless his method has become one of the most "top secret" items in the Defense Department, there is no evidence that his claim has been substantiated.

On the other hand, procedures are available which do reduce inappropriate reactions below the disabling level in most disaster victims. These methods are far from new or revolutionary. Their essentials must have been recognized by the elder Pliny or he could not have behaved in so exemplary a fashion (as described by his nephew, the younger Pliny) before his death during the famous eruption of Vesuvius in A.D. 79. How to be brave in the face of mortal danger is an old and honored art. Yet even today the ways of developing this valuable skill seem strangely unfamiliar to many. Consequently, a somewhat elementary review of the subject appears to be fully justified.

The keynote to reliable bravery is *preparation*. Sporadic instances are found in most major disasters of individuals who, without obvious specific preparation, have met the challenge with almost unbelievable heroism. Some of these gallant people (like the elder Pliny) have actually been prepared in a general sense by having developed a remarkably flexible and adaptable personal philosophy. Others—and this is no reflection on the great value of their services—have been "brave" only because the shock of the catastrophe has, in a sense, numbed them to fear. Such "grass-roots" leaders are impressive, but it is patent folly to leave their appearance in time of trouble entirely to chance. Hence the principles of psy-

chological preparations for disaster are vastly important.

Ideally such preparation should provide the potential victims and their potential rescuers with reasonably definite answers to the following questions about potential disasters: (1) What may be the disasters? (2) What will be their characteristics? (3) When can the disasters be expected? (4) What courses of action will be useful?

The recurrent disaster

In practice, it is often most difficult to answer all or even some of these questions as fully as one might desire. A Kansas farmer belongs to a local culture which has a familiarity with tornadoes; he knows the time of year they are most common, and he knows that a cyclone cellar is the best solution if he and his family can manage to reach one in time. When the freak tornado hit Worcester, Massachusetts, however, there was no such specific cultural preparation, and great confusion resulted, especially in the rescue activity. Recurrent natural disasters lend themselves well to adequate psychological preparation of the population, particularly if the disasters have a tendency toward seasonal periodicity with enough frequency to give each succeeding generation some degree of personal experience with them.

The Far West has its earthquakes, the Midwest has its tornadoes, and recently the East has been having its hurricanes. Most sections of our country are occasionally subjected to disastrous floods. In all these situations a certain amount of knowledge about the various "natural" destructive agents accumulates in the regions most subject to them. Even though some (such as earthquakes or tornadoes) give little or no warning each time they occur, this lack of a definite answer to question 3 above seems to be counterbalanced by

a community awareness that recovery from the possible damage is probable. When much of San Francisco burned after the earthquake of 1906, a stabilizing factor in the population is said to have been the recollection that the symbol of the city was the phoenix. There had been five disastrous fires in the previous century; each time San Francisco had risen from the flames, been rebuilt, and continued to grow.

It is also interesting that recurring natural disasters seldom depopulate an area subject to them, unless the effects are prolonged, as from sustained drought (for example, the cliff dwellers of Mesa Verde and the "Okies" from the Dust Bowl). In other words, intolerable anxiety does not seem to develop often in a population during the interim between recurrent but episodic and rather cataclysmic catastrophes. Return to a familiar land from which they know they can wrest a decent living appears to outweigh any fear they may have of the next disaster, which can reasonably be expected to occur some time. Italians will climb back up the slopes of Vesuvius after each eruption and plant again the vineyards from which the wine called Lachryma Christi will be produced. The farmers on the lowlands of the Missouri, Mississippi, and Ohio Rivers will repeatedly return to the rich farms from which they have been flooded out many times, even though there may be no real prospect of adequate flood control in the section where they have their homes and raise their families.

Acts of God

It may also be suspected that people get somewhat less disturbed about "natural" disasters in which they feel little reason to blame any other human being for their misfortune—the so-called "acts of God" of which the insurance companies tend to wash their hands.

Earthquakes and volcanoes have a very impersonal quality that encourages attention to the needs of the immediate situation and discourages making a scapegoat of "the government" or some other human authority which might conceivably have lessened the danger. Hence, the victims' efforts are more inclined to be directed toward salvage or escape than is the case when they are filled with anger against some official or human agency which they feel has been negligent in regard to their safety.

Information about relief

While cultural experience with given disasters, willingness to take calculated risks in living in areas subject to recurrent disasters in order to gain certain ends, and a widespread tendency toward rather phlegmatic acceptance of "acts of God" can all be given considerable credit for the general lack of serious psychological disturbances in most natural disasters, this does not mean that better preparation for these disasters would not be well worth while psychologically. For example, the knowledge that organized relief will be on the way as quickly as possible contributes greatly to a sense of security among all disaster victims. Yet if they could know more in advance about the nature of relief efforts by having some elementary training themselves in relief work, they would be less upset by the unavoidable limitations of the relief when it arrives and be more responsive to the workers who are trying to help them.

The wrong questions

If we now turn to the peacetime disasters not usually regarded as acts of God (such as great fires, large explosions, and train wrecks), we see more clearly the need for answers to the questions listed previously. These are events

which can happen in many communities where prior experience and expectancy of disaster are lacking or negligible. Furthermore, the suspicion of some human responsibility for such disasters can easily lead to rumors from which several sorts of disruptive social behavior can arise. "Who set the fire?" "Who allowed explosive material to be stored here?" "Who derailed the train?" Important as these questions may be for the courts to decide after the damage is controlled and the injured are rescued, they are psychological dynamite immediately after the disaster has occurred. In communities where hated minorities live, even riots may develop, to the obvious detriment of effective relief work.

UNIVERSAL DISASTER TRAINING

Whatever the setting, it is evident that the more general the knowledge of what to do in the presence of human injury the less occasion there is to displace feeling into panic, scapegoating, and rumormongering. For many years the Red Cross and such other groups as the Boy Scouts and Girl Scouts have offered training in the essentials of first aid. More recently the Federal Civil Defense Administration has endeavored to arouse nationwide interest in relief organization for all citizens, to improve the handling of peacetime disasters as well as to prepare against the devastation of enemy attack. Commendable as these considerable efforts have been, it is the author's strong conviction that they fall tragically short of their basic goals by having to depend entirely on volunteer trainees who are under no obligation to keep their knowledge alive and useful once it has been gained. Personal involvement in gruesome disaster is *not* a fundamentally pleasing prospect to anyone who is not seriously ill mentally. It is hardly surprising that

large blocks of our population fail to find the strong, public-spirited interest within themselves which would offset their natural and deep-seated aversion to any training which implies they might some day have to care for mutilated fellow beings. Until we can devise some way in our democratic system to require universal disaster training with continuing rotation of assigned availability, our society will remain vulnerable to undue psychological disorganization from any really major disaster—whether that disaster be a freak “act of God,” the result of human carelessness, or the ultimate horror of enemy attack with nuclear, chemical, and bacteriological weapons. Perhaps the political scientists who read *THE ANNALS* can conceive an answer to this dilemma!

In all candor, one must admit that continuation of the present very spotty training of Americans in even elementary relief procedures will probably not be a primary cause of our national downfall—*unless* we are ravaged badly by sudden enemy attack. We are told in no uncertain terms that whatever its probability, the possibility of such attack is painfully real, and the potential devastation is painted as virtually unprecedented in the history of man. How the present feeble efforts to train our civilian population in ways of taking care of themselves can do more than make the slightest dent on the danger of utter chaos, both psychological and physical, in the event of a major enemy offensive is completely beyond the author's comprehension. Yet the federal government, in its presumed wisdom, seems dedicated for an indefinite period to relying chiefly on military defense with relatively little attention to the concurrent development of an equally strong standing civil defense force. The author can only hope his gloomy forebodings about the results of this policy are largely unfounded.

COMMON PSYCHOLOGICAL DISTURBANCES IN DISASTER

Whether Pax Americana persists or not, disaster more within the bounds of past experience than truly total war will obviously continue to plague us from time to time. Earthquakes will rumble, tornadoes and hurricanes will lash our homes and persons, rivers will flood, trains will collide, and planes will crash. Unaffected segments of our population will shudder at the reports, and if close enough, many will clog the roads to the stricken site out of morbid curiosity rather than out of any awareness that they might personally be of some help. Yet the over-all tenor of national life will probably go on as smoothly as it has in the past after even rather outrageous “acts of God” that are only regional or sectional in their damage.

Those directly involved in the various inevitable disasters as victims or relief personnel will obviously be more affected than the rest of the nation. The degree (quantity) of psychological disturbances will vary considerably with the magnitude and circumstances of each disaster. The types (quality) of psychological disturbances are fairly predictable. For convenience, these common disturbances will be reviewed in relation to the three major time phases of any disaster: pre-impact phase, impact phase, and post-impact phase.

Pre-impact phase

The pre-impact phase varies most according to the nature of the disaster. With earthquakes, explosions, collisions, and flash floods it can scarcely be said to exist. With temperamental tornadoes and rapidly spreading fires it can be very short. With predicted hurricanes and floods it can extend over hours or days.

If the danger is accurately perceived

and appropriate courses of action are easily discernible, a fair number of people respond reasonably well during a short pre-impact phase, especially if they have had at least a slight amount of previous training and if the circumstances are not too different from what they have been led to expect. Students will often file out of a burning school building, in orderly fashion, if they are familiar with fire drills and the teachers do not lose their heads. Passengers on a sinking ship will assemble tensely but quietly at their proper boat stations if time permits and they have confidence in a disciplined crew. The greater the number of unexpected factors, however, the more likely it seems that at least a portion of the potential victims will dissociate themselves somewhat from what they suddenly conclude is an overwhelmingly threatening situation. As they narrow the view of a terrifying prospect, they necessarily restrict their awareness of suitable behavior. There may be a mad rush for already choked exits; useless quarrels may break out; and some threatened people will sink into hopeless apathy. Such dissociation from too threatening reality accounts in part for odd incidents such as the famous one in which a naked girl came walking down the stairs of a slowly burning building with nothing in her hand but a bird cage.

Longer pre-impact phases present their own problems. Morale is often reasonably well maintained as long as tasks are available, the doing of which will clearly reduce somewhat the damage which can be expected from the approaching peril. Boarding up windows before a hurricane; piling up sandbags along a rising river; laying in provisions before a severe blizzard—these are all examples of how many threatened people can maintain their psychological perspective and sense of personal value in the face of anticipated danger. Once

all possible precautions have been taken, however, the situation gradually changes. The longer the subsequent period of waiting before the danger materializes, the more tension mounts. Again some will become unduly irritable. More appear inclined to retreat into a rather hostile apathy. Nothing is so difficult to do as nothing—especially when danger looms ahead. This was expressed poignantly in a letter found by the author among the rubbish left by the Germans in a hospital in Rome that we occupied in 1944. The letter was dated March 15, 1944 (nearly three months before the invasion of Normandy) and had been written to a German soldier by a civilian friend in Berlin. After the writer had commented on the fact that the section in which he lived had not been too badly damaged by the air raids, he went on to say: “One is now wondering constantly what the next military developments in the West will be. On their outcome hang many, if not all my plans. Grant that we may not be kept waiting too long.”

Impact phase

By this term we mean direct and actual involvement with the destructive agent. The arrival of a hurricane and the final plunge of a sinking ship are examples. In almost all disasters this phase is relatively short—a matter of minutes. In spite of its brevity, it is in many ways the most critical. Here a peak effort for maximum efficiency is often urgently needed—sometimes even to survive. Under such stimulus a number who have sunk into depressed apathy during the pre-impact phase will be galvanized into some useful action. The irritable characters may also organize themselves better when action is clearly required. Unfortunately, others of the apathetic may simply become more remote and glassy eyed, presenting a distressing problem to those of

their companions who are in better contact with actuality. A few individuals may explode into pointless rushing about in a manner which can be well compared to the actions of a chicken with its head off. Such behavior obviously may add greatly to the peril already threatening the individual and his better oriented companions.

It should be pointed out, of course, that leaving the scene of disaster quickly can often be an act of wisdom and not of panic. No moral or social gain can be claimed for adding one's own death to that of a person who could not possibly have been saved. True heroes are those who realistically see at least a remote chance of saving a victim and consciously risk their own lives to do so. The heroism of a person who goes down with a drowning companion he has no conceivable chance of saving is more questionable.

Post-impact phase

Here a wide spectrum of human reactions may sometimes be seen. The survivor who had reacted with apathy before and during the disaster may gradually shake off his lethargy and join in the simple forms of salvage operations if these are being undertaken by others. The more aggressive victim, who has done rather well up to this point, may suddenly feel he has had a very close call and withdraw into himself, particularly if he has seen someone dear to him lost or badly injured in the disaster (the "near-miss reaction"). Others may cry uncontrollably, and many will feel the urge to talk excessively.

Most disaster victims seem to recover fairly well from their harrowing experience without much in the way of specific help, and long-term, severe psychological disturbances after the usual peacetime disasters are apparently not frequent. Severe personal loss of family

or possessions may so dislocate a person that continuing problems after the disaster will tend to overwhelm him. A sense of failure during a crisis may haunt some individuals, especially if they suspect others died or suffered unduly because of their own inadequacies. Thyroid disease is occasionally precipitated by the stress of disaster. Rates of actual insanity are not increased by even prolonged disasters such as the bombings of World War II.

Aids to recovery

In spite of the remarkable ability we find in the majority of human beings to recover psychologically from the commoner disasters, it is obviously advantageous to accelerate this recovery whenever possible. Restoration of contact with the immediate situation and its possibilities is the crux of psychological first aid. This can best be done by initial sincere acceptance of the normality of the victim's feelings which have led him to withdraw into apathy or become overly excited. Once he is helped to see that his feelings, as such, are natural and human, he can then begin to mobilize his resources to control them and return to some degree of normal function in the post-impact, salvage phase of a disaster. These principles are more fully described in the pamphlets on psychological first aid³ and disaster fatigue⁴ published by the author's *ad hoc* Committee on Civil Defense of the American Psychiatric Association at the request of the Federal Civil Defense Administration.

No specific mention has yet been made of the bodily disturbances which may bedevil disaster victims as a re-

³ C. S. Drayer, et al., *Psychological First Aid in Community Disasters*, Washington, D. C.: American Psychiatric Association, 1954.

⁴ C. S. Drayer, et al., *Disaster Fatigue*, Washington, D. C.: American Psychiatric Association, 1956.

sult of the psychological tension to which they have been subjected. Tremors, excessive sweating, rapid pulse, vomiting, diarrhea, and splitting headaches are among the symptoms of Selye's "general adaptation syndrome" that may add to the misery created by the disaster. In war these symptoms are so frequent in battle that they are called "normal combat reaction." In peacetime disasters, they may afflict both the victims and their rescuers in varying degree during any of the disaster phases reviewed. They all tend to diminish with continued effort to function in spite of them, and the chief danger lies in the tendency of those suffering from them to suspect they indicate serious damage from concussion, radiation, or some other factor relevant to the particular disaster in question.

THESE GHOSTS . . .

In conclusion, the earlier statement about the fundamental importance of the *meaning* of a disaster to the casualties deserves more comment. By vir-

tue of our human abilities to recall and anticipate, and by virtue of our complicated communications with each other, no experience is a simple thing for any of us. What we have heard, as well as what we have been through personally in the past, colors deeply our interpretation of the present and the future. After the atomic bomb burst over Nagasaki, a little boy found himself pinned down by a spike just over his chest. He immediately thought he was being punished for having pinned butterflies to a board!⁵ Guilt, fear, anxiety—all sorts of unconscious feelings can be brought sharply to the fore by the pressures and horrors of serious disaster. The only known "magic" for laying these ghosts reasonably well is training which enables the person to deal with the crisis for what it is in fact and not in terms of what it may symbolize to him in relation to the individualized conflicts present in all of us.

How a Community Met a Disaster: Yuba City Flood, December 1955

By WILLIAM W. STILES

Abstract: The Yuba City flood of December 1955 was the worst disaster to strike California since the San Francisco earthquake. Initial attempts to bolster the levees, with the assistance of the military from nearby Beale Air Force Base, were unsuccessful; but as the waters swept over the countryside, well-organized evacuation took place. Beale provided emergency technical rescue and relief service. The Red Cross established numerous shelters and several giant kitchens and mobile canteens. As the waters subsided, the local health department undertook the massive task of arresting contamination and pollution, and the town contracted for the removal of the thousands of tons of debris. Flood post mortem suggests that long postponed control measures, including dam construction, might have staved off the disaster.—Ed.

NORTHERN California had seen plenty of rain before, so a little more did not seem unusual. But then it started in force on December 18 and, accompanied by violent gusts of wind, continued as an unremitting downpour for nine days, drenching a land area of about 100,000 square miles. Precipitation of 20 inches or more was recorded by numerous valley and coastal gauges, while several in the Sierra exceeded 30 inches, establishing a 78-year record. The runoff transformed obscure rivulets into angry streams which soon roared out of their usual channels. The resulting floods washed away railroads and highways, destroyed farmlands and orchards, engulfed towns, drowned animals, and inundated homes by the thousands. As a nightmarish Christmas week turned into a dismal New Year, the water gradually subsided; the stricken counted their losses: 80 persons dead, 335 hospitalized, 4,338 injured, 50,000 forced from their homes, 1,277 homes destroyed, 2,725 homes wrecked, 225 million dollars property damage, and

inestimable loss of fertile topsoil. Thus, California suffered one of its worst floods in history—in many respects its worst disaster of any kind since the San Francisco earthquake and fire in 1906; from the standpoint of relief expenditures, the nation suffered its sixth worst disaster since the founding of the American Red Cross in 1881.

One center of tragedy was Yuba City, the seat of Sutter County, situated on the west bank of the Feather River about 120 miles northeast of San Francisco. On the opposite bank is the twin city of Marysville, the seat of Yuba County. Both are fast-growing communities of about 10,000 population. Both are centers of prosperous fruit and dairy farms. Both are at an elevation of only 45 to 55 feet above sea level, while the height of the nearby levees is 82.5 feet. Soon after the original villages were laid out in 1849, hydraulic mining in the area began burying farms under debris and choking river bottoms with silt. But conditions were improved after 1875 when great earthen dikes

were constructed along both sides of the Feather. Thirty miles to the north, this river issues out of the foothills above the city of Oroville, while less than ten miles to the east the Yuba River enters the valley country to join the Feather just below Marysville. Each of these rivers carries the combined flow of a number of forks rising high in the Sierra. Precipitation over this mountainous area was extremely heavy during the six peak days of the storm. As the rivers rose to their brims the twin cities were threatened with floodwaters, but the danger was considered much greater in Marysville. This city, which lies in a bowl-shaped area completely surrounded by a separate levee 18 feet high and 7 miles in circumference, seemed to be doomed by the waters already lapping at the top of the levee. On the other side, Yuba City appeared to be safe, even though it had no secondary protective levee, simply because of the broad expanse of lowlands extending miles to the south and west.

MOBILIZING PROTECTIVE MEASURES

As the threat of flooding increased, personnel of the state Division of Water Resources and the various levee commissions and others began a watchful patrol of more than 200 miles of levees. Hydrologic data and information throughout northern and central California were collected by means of a radio stream gauge network, and constant telephone contacts were maintained with various agencies and personnel in the field. Incidentally, the levee systems in California are the primary responsibility of local levee districts, comparable to water or fire districts; each has its board of directors, its engineer, its levee patrol, and other employees. Of the 120 such quasi-independent bodies in the state, nine are in the Yuba City area. During the morning of December 22, the Marys-

ville Levee Commission requested one hundred men from Beale Air Force Base. From then on, as the danger increased, calls on Beale's reservoir of organized manpower continued. Within twenty-four hours about 2,000 troops and an equal number of civilians were thrown into the levee battle. Heavy equipment and supplies were mobilized from every conceivable source. A tremendous number of sandbags were used to bolster the weakening levees—the exact total will never be known. A large number of bags intended for packing the local rice crop were put into service, as well as gunny sacks from Beale and elsewhere. The Sixth Army furnished 60,000 sandbags from Martinez and another 50,000 from Brentwood. A fleet of trucks started hauling fill material from diggings at the old Chiem airport in Marysville, a luckily convenient deposit. In some spots the crown of the levees was supplemented with layer after layer of improvised construction. Where water ate into the walls, sandbags were rolled over the side by the scores or hundreds to pile up and protect the weakened spot.

EVACUATION

At about 3:00 A.M. on December 23, local officials ordered evacuation of the low-lying areas south of Marysville (Linda and Olivehurst districts). About 9,000 persons left these semirural areas by means of some 2,000 autos interspersed with trucks and buses, establishing a record of the largest and speediest escape from disaster ever staged in the West. Most of these persons took refuge at Beale Air Force Base seven miles to the east, where complete accommodations were provided for several days. Military police directed the new arrivals to parking places where they were given further instructions over loud-speakers. Five enormous mess halls were made ready and everyone finished

William W. Stiles, M.D., M.P.H., Associate Professor, School of Public Health, University of California at Berkeley; formerly Medical Director of Region 7 (the eight western states) of the Federal Civil Defense Administration.

his breakfast of hot cakes, fruit juice, and coffee by 9:45 A.M. Registration was attempted but proved cumbersome and incomplete because of the constant movement of evacuees. Assignments were made to sleeping locations, and persons who had not brought bedding with them were assigned military supplies. Tobacco, candy, and minor items were made available at the exchange; 10,000 cans of baby food and 2,000 pounds of old sheets for diapers were provided; and medical and nursing care were given the sick. Beale eventually served more than 100,000 emergency meals and either used or sent to relief agencies outside the base some 2,000 mattresses, 2,500 blankets, 1,200 comforters, 2,800 sleeping bags, 431 sheets, and 268 cots.

Members of the Marysville City Council met again at 5:00 A.M. on December 23, having adjourned the previous midnight. Later in the morning, on advice of the Levee Commission, they issued a warning of the impending dangers. The city's two hospitals (Rideout Memorial and Yuba County) were emptied of their patients. Improvised facilities were established in multistoried buildings for those who had not recovered sufficiently to be cared for in their homes. At 11:40 A.M. the first tragic event occurred eighteen miles downstream when a newly constructed section of the levee on the east side of the Feather gave way. As the water broke through, it spread over about 24,000 acres—mostly agricultural and dairy lands but also including the hamlets of Nicolaus and Verona. Here no human lives were lost, but hundreds of farm animals were drowned. Following this break, the decision was made to evacuate Marysville. Approximately 1,500 persons had already left the city and about the same number remained to work on the levee; most of the remaining 6,000 took off in their cars west-

bound across the bridge. Possibly 1,500 stopped with friends in Yuba City, while the majority continued on twenty-six miles to Colusa, and a few journeyed as far as Chico or Sacramento (about fifty miles).

Meanwhile, tension was mounting on the opposite side of the Feather, for waterspouts or "boils" were observed along the base of the levee which persisted in breaking through in spite of attempts to seal them off with hundreds of sandbags. As the situation worsened, Yuba City officials ordered evacuation of the lower portion of the city; and the Sutter County sheriff and his eight men took the initiative of evacuating residents of the outlying areas in jeopardy. Almost at the stroke of midnight, shortly before the crest of the river was expected, a second and more tragic event took place. The levee gave way at a point about a mile below Yuba City, opposite a landmark known as "Gum Tree" and just above the so-called "Shanghai Bend." A tremendous surge of water enlarged the original break to an estimated 4,500 feet. Two of the sheriff's deputies and three other persons riding in cars nearby were drowned by the deluge and buried in the silt. While a torrent poured into the Gilsizer Slough, a natural drainage channel to the south and west, a wall of water swept northward towards Yuba City. Houses in its path were torn from their foundations and some reduced to kindling. But as the water reached the fringe of the city it tended to flatten out, so that its entry into the city streets, while rapid, was not as violent as its action in the outskirts.

COMMUNICATIONS AND WARNINGS

Although telephones throughout most of the city had been silenced since mid-afternoon, when both the cables across the Fifth Street bridge and the structure itself were washed away, a dozen

walkie-talkies and the two-way radios in police cars were still operating. The alarm was spread by means of a loud-speaker mounted on one of the police cars and by sounding the city's fire horn. Announcements over the radio told of the levee break, but listeners were left with the impression that the flood danger was limited to the southern outskirts of the city. Meanwhile, another radio station confused the issue by relating a circumstantial account of the Marysville evacuation, frequent reassurances being given that these activities did not apply to Yuba City. An hour passed before many started to leave town. Even those who acted most promptly were in water hub deep before they escaped. It was estimated that 23,000 of the 30,000 residents of Sutter County were finally driven from their homes, and that the water rose to the contour line of 50 feet, inundating about 90 per cent of the city and 100,000 acres of land, including much of the famous "Peach Bowl."

RESCUE

About 3,000 persons in the Yuba City area were marooned by the floodwaters and had to be rescued by boats and amphibious vehicles. Over a three-day period, more than 400 of these were rescued by helicopters supplied by the Armed Forces. Meanwhile, 37 persons were drowned, and 8 others died of causes associated with the flood. In addition, 2,884 were injured or became ill, and of these, 124 were hospitalized. Most of the sick suffered respiratory infections, while the injuries included fractures, contusions, strains, circulatory disturbances, hernias, puncture wounds, abrasions, and lacerations. At the same time, ten babies were born. Rideout Memorial Hospital was used as a screening center for victims of the flood, while nineteen other hospitals, including one as far away as San Francisco, became

havens for the Yuba City area sick and injured. Behind these words there is a story of horror and terror, of heroic rescues and unbelievable self-sacrifice which will never be known to the rest of the world.

During the early morning hours of December 24, cars and truckloads of refugees began pouring into the nearby towns. Before the day ended, the Red Cross had established thirty-eight shelters in thirteen towns located in five different counties, caring for a total of 9,260 persons. About the same number were cared for on Christmas Day, but thereafter the number diminished so that there were 565 on New Year's Day, and less than 100 after January 6. When a partial evacuation of Yuba City was ordered again on January 15, the number increased to 1,007 but fell again after a few days. Some were still in shelters in mid-February. At the outset, the Red Cross was serving about 30,000 meals daily in these shelters, about half this number at the turn of the year, and several hundred daily for a month thereafter. Food, clothing, cots, bedding, and medical care were provided to meet the physical needs of these homeless persons, while registration, entertainment, and recreation were undertaken to relieve their anxieties. Thousands of telegrams and calls were made in an attempt to find missing persons and to reunite families. Both disaster and relief agencies relied heavily upon amateur radio operators, for often the efforts of these seemingly tireless "hams" provided the only means of communication of the stricken areas with the outside world. Those equipped with emergency power generators were especially valuable after power lines in certain areas were swept away. Commercial radio and television stations still on the air co-operated fully in broadcasting news of general interest and concern and provided entertainment for

many during their long wait. Newspapers and other publications likewise disseminated information and pictures to keep the people aware of the situation and to aid them in restoring their possessions. In the midst of all these activities, Christmas festivities could not be neglected.

MOVEMENT BACK TO FLOOD AREAS

Back in Marysville, the levee surrounding the city remained intact and the flood threat lessened, so on Christmas Eve the city officials announced that residents might return to their homes. Churches in the city carried on their humanitarian work in spite of tremendous odds, converting their facilities into relief centers. Two clergymen conducted services on Christmas Day for twenty-three and twenty-four persons, respectively, while in the midst of day and night work. Over in Yuba City, however, only those persons necessary for emergency operations were permitted to remain in the area. To assist the local police and civil defense deputies, some three hundred National Guardsmen were ordered in to prevent looting, to keep out the throng of sightseers, and to assist in other operations. The city council established its headquarters in the office of a concrete pipe plant on higher ground outside the town, and the city clerk acted as director until the city administrator returned from a trip to the East. The following day, the water had receded enough to permit access to the city hall. A control center was established there and chiefs of the various emergency services were appointed and each assigned to a desk. At first there was uncertainty and confusion in their operations, but these soon fell into an orderly pattern. After a few days, residents were permitted to return to their homes between 7:00 A.M. and 5:00 P.M. daily

to salvage what they could. This curfew was lifted on January 2.

Mass feeding in Yuba City proper was handled by the Red Cross in two major operations. One started as a canteen at their headquarters on December 28, and from the next day on was augmented by a cafeteria at the facilities of the California Packing Company. Operations went on around the clock, with nearly 2,000 meals being served daily until January 18. Two cooks and two cook helpers were hired for this task, assisted by some fifteen to thirty volunteers, including five school-lunch program supervisors. The second major feeding operation was that of mobile canteens. As many as sixteen motor vehicles were used for this task. For a few days, beginning December 28, they dispensed an average of 8,500 meals daily, but by January 4 the number had dropped to 4,000 and by January 11 to 1,500. When another emergency developed along the river, the mobile canteen routes were changed to include the levee workers and patrols. Two soldiers were sent from Beale to operate field ranges throughout the operation, while five to fifteen volunteers handled all the driving and serving. The Sacramento chapter of the Red Cross may be credited with the major support of this activity, which continued until mid-February.

PUBLIC HEALTH SERVICES

Health services in the wake of the disaster were of paramount concern. Seven of the nine wells scattered throughout Yuba City, which provided the community's water supply, were inundated by the flood. Thus, warnings to boil all drinking water were immediately issued by the Sutter-Yuba Health Department. As soon as the floodwaters receded from the entire area supplied by a given well, it was heavily chlorinated and the sup-

ply lines were flushed out. This flushing-out process had to be applied to individual faucets in each home as well as to the main lines, for all contaminated water had to be voided from the lines before the water was safe to use. Bit by bit, the chlorine content was reduced until it was restored to normal. At one time there were as many as nine portable hypochlorinators in use, which had been supplied by the state Office of Civil Defense. A mobile water-testing laboratory from the state Health Department was sent to the fringe area to aid in the restoration of water services from private wells. Meanwhile, since the community's sewage system was rendered useless by the flooding of its two booster pumps, a hundred outdoor chemical toilets were moved in and strategically placed throughout the town as substitutes for the water-flushed toilets. Restoration of the sewage service was delayed a week because the motors of these two pumps were of a special type which could not be easily replaced but had to be dried out and completely rebuilt. Fear of typhoid fever, traditionally linked with polluted waters, led to a popular demand for mass inoculations; consequently, more than 6,000 were given "shots."

Inspectors from the Sutter-Yuba Health Department, in addition to personnel from other local, state, and federal health agencies, made the rounds of all food establishments and drug stores. They condemned most of the foods, drugs, and beverages that had been in contact with the floodwaters. Foods in sealed tins and frozen meats, as long as they remained frozen, were not discarded because they could be made safe by superficial cleansing and cooking. But meats and other frozen articles that had thawed out were condemned regardless of whether or not they had been contaminated by the water. Glass-packed goods, perishable

foods such as breads, and other edibles suspected of being contaminated were also condemned and then hauled off to the dump. Meanwhile the sanitarians inspected the emergency cafeteria and mobile canteens, but recorded no outbreaks of food poisonings or food-borne infections. Though all had been put out of business temporarily, the town's food stores, drugstores, and restaurants were back in operation within five to fourteen days after the flood.

Filth and debris strewn about the city presented a monstrous problem of hauling and disposal. Early cleanup operations were handled by military units, but after the emergency phase local construction companies were contracted by the city, removing fifty to sixty truckloads of material each day. Dead animals created a major problem, especially in the rural areas. Here at least 6,000 cows and many thousands of chickens and other animals were drowned—sheep, goats, dogs, and cats—even two deer and a bear. Floating carcasses were towed by boats; those left in mire were dragged by half-tracks, and some were handled by military weasels. Rendering plants utilized many of the carcasses, but after a few days the remaining animals had decayed so much that they had to be buried in great pits bulldozed out for the purpose. Proliferation of rodents, flies, and other vermin might have become a serious menace had these and other control measures been neglected.

RENEWED THREAT

After the breaks, there began the gigantic task of rebuilding the levees—a struggle against oozing mud and flowing water. The State Reclamation Board gave this project top priority. Four thousand men labored in considerable physical danger through new rains and in alternating daylight and darkness until the gaps were sealed.

Repairs were half accomplished by December 30 and nearing completion on January 17. Then followed the "desperate hours" with the river rising within 12 inches of the top of the 69-foot emergency levee. One-third of Yuba City and the surrounding countryside was again evacuated as a precaution. The saturated levee at "Gum Tree" was then described as a bowl of jelly; how it held together no one knows, but it did. Perhaps it was because an ingenious expedient was tried. Countless tarpaulins, hauled from as far away as Stockton, were stretched out to form a canvass skirt 30 feet wide and 5,800 feet long and pegged to the dirt slopes as a waterproof facing to save the soft earth underneath. Next it was decided to put a permanent riprapping of stone over the earth fill. From a nearby quarry came 160 trucks operating around the clock and moving through Yuba City by a special, patrolled route. Meanwhile a heartbreak was felt at Nicolaus. All but 300 feet of the break had been filled in by dredging operations when the rampaging river washed away all evidence of three weeks of backbreaking work. Water spilled out again into the countryside, filling the Nicolaus area to the brim. The million dollar patches at Nicolaus and "Gum Tree" were finally completed about February 25.

LOSSES OF PUBLIC AND PERSONAL PROPERTY

Meanwhile, the state Division of Highways estimated that damage to the roads in the area (District III), would approximate another 1 million dollars, but would take much longer to repair. Destruction of streets and other public property in Yuba City itself was estimated at more than 2 million dollars. There \$60,000 worth of gravel was dumped as an emergency measure to make the streets passable and appro-

priate signs such as "Street Closed" or "Residents Only" were posted to keep out sightseers; however, these did little to ease the burden. Damages to Pacific Gas and Electric Company's property in the area were estimated to be \$540,000. Nevertheless, gas and electric utility service continued and street lights still burned even after residents were driven from their homes. When repairs of individual customers' facilities were needed, services were restored almost as soon as the owners were ready. Damages to the facilities of the Pacific Telephone and Telegraph Company made it necessary to send nearly a hundred pieces of mobile equipment and repair crews into the area, while 25,000 telephone sets had to be flown from the East to replace damaged instruments. Damages to railroad property in the area approximated \$200,000.

Damages to homes and personal possessions in the Yuba City area were estimated to be in excess of 13 million dollars. An analysis of these losses is shown in Table 1. The assessed valuation of the private property in Yuba City before the flood was 17.25 million dollars. Because two-thirds of the dwellings were affected by the flood in some way, the valuation dropped to an estimated 11 million dollars. Virtually none of this property in the Yuba City area was covered by flood insurance. Although little physical evidence of the devastation remained after four months, it was thought that at least two years would be required to rehabilitate the community completely.

GOVERNMENTAL AID

Early in the emergency, both Governor Knight and President Eisenhower declared most of Northern California "major disaster areas," clearing the way for more extensive use of state and federal resources for relief. Help came from numerous state agencies, including

TABLE 1—DAMAGE TO HOMES AND PERSONAL POSSESSIONS IN YUBA CITY FLOOD OF DECEMBER 1955

LOCATION	NO. DESTROYED (\$6,500)	MAJOR DAMAGE (\$1,500)	MINOR DAMAGE (\$600)	TOTAL NO. BUILDINGS	TOTAL COST

the National Guard, Office of Civil Defense, Department of Agriculture, Health Department, and Department of Veterans Affairs (CALVETS). The University of California converted its facilities at Davis into an almost ideal shelter for refugees, and its Agricultural Extension Service produced and distributed thousands of a series of eighteen leaflets containing recommendations, policy statements from official agencies, and other current information of help in dealing directly with flood problems and aiding people in personal or financial distress. During the long period of rehabilitation, farm and home advisers and officials of the Farm Bureau Federation assisted families to find suitable replacement livestock, hay, and feed supplies; to lay out plans for farm buildings, corrals, and orchards; and to find means for reconstruction, bracing, silt removal, and termite control. Federal agencies also played an important role in almost every phase of these disaster operations, co-operation between military and civilian authorities being noteworthy. The Weather Bureau, Corps of Engineers, Army, Navy, Air Force, and Coast Guard deserve special commendation.

On Christmas Day, a field office of federal agencies was established in the Chamber of Commerce building in Yuba City, an official of the Federal Civil

Defense Administration serving as coordinator. Representatives of the United States Public Health Service, Food and Drug Administration, and Internal Revenue Bureau were active in dealing with problems of sanitation and narcotics control. The Housing and Home Finance Agency gave the community two hundred family trailers to be used as emergency housing, made interest-free loans to assist in planning construction and reconstruction of streets, storm sewers, and water facilities, and provided technical assistance for urban renewal projects. Under the latter program 1.8 million dollars of local funds would be increased to 5.4 million dollars by federal monies. In addition, it offered families with damaged or destroyed homes special financial assistance. The Small Business Administration estimated that its loans might total 10 million dollars in the West. The Veterans Administration granted a thirty-day grace period for veterans in the stricken areas who were unable to pay their government insurance premiums on time, and the Bureau of Internal Revenue granted appropriate delays in filing income taxes. Under Public Law 875, 1.61 million dollars was provided through the Federal Civil Defense Administration for rehabilitation of public property in the area; 9.5 million dollars throughout the state.

FAMILY REHABILITATION

During the period of rehabilitation, people came into the Red Cross headquarters by the hundreds requesting buckets, brooms, rubber boots, mops, and all sorts of cleaning equipment. In addition, disaster victims who were being cared for in the homes of friends were given purchase orders for food, clothing, cots, and bedding. Families and owners of small businesses suffering losses were advised to make application for rehabilitation of their property. An experienced caseworker was then assigned to help the individual owner evaluate his needs relative to food, clothing, and maintenance, building and repairs, household furnishings, medical and nursing services, occupational supplies and equipment. The granting of assistance was based on need instead of loss, families being expected to do as much as they could to help themselves. Awards for restoring families to their predisaster status were then reviewed by a local committee of citizens representing the various segments of the community. Purchase or disbursing orders were used, so that an accurate accounting was possible for all monies spent. The number of applications received by the Red Cross and the appropriated funds, which were free gifts of the American people, are shown in Table 2.

In addition to Red Cross awards, lesser gifts of money, goods, and serv-

ices came from the Salvation Army, relief societies, and religious, veteran, fraternal, labor, and youth groups. A few of these organizations found difficulty in administering their own programs equitably and turned to the Red Cross for assistance. Some 160 Red Cross staff members were assembled from various chapters and offices, many coming from distant states. Thousands of volunteers served under their leadership with such dedication and compassion as to warrant comparison with the highest traditions of that agency. The flood victims celebrated in many ways during their mucking-out process and their long road to recovery. One was a "Christmas in February," which first started out as a toy drive. Unfortunately, this celebration was almost washed out by the return of heavy rains and high winds.

IN RETROSPECT

Who was to blame? In the wake of this disaster, as in every other, human nature became manifested in fault finding. Everyone admitted that nothing could have been done to stop the rains, but there was general agreement that the runoff could have been handled better and that the disaster operations could have been more effective. Criticism seemed to center on the failure to build the long-authorized 400-million-dollar dam across the main Feather River above the town of Oroville, pro-

posed eight years ago and delayed by government and private agencies while alternate sites were considered. As it was, about one-third of the runoff was captured behind more than half-a-hundred existing dams, which helped save Oroville and Marysville and prevented greater destruction in Yuba City. Additional criticism was leveled at the original construction of the levees along the Feather River, particularly in the region of "Gum Tree," where the foundation was on loose sand and the angle of the curve was too sharp for rapid flow. Maintenance of the levee was decried, as was the failure to provide proper diversionary water escape routes. Some levees originally provided had been obliterated, notably the one eliminated ten years ago at Hazelbusch some twenty miles above Yuba City. A safety levee known as the "Bow" that protected Yuba City was removed only two years ago, allegedly because of selfish interests. Questions were asked why the waterspouts or "boils" that developed along the levees during the height of the storm were given so little consideration, and when the levee did break why the situation was not immediately recognized as serious. The Sutter County grand jury issued a blistering fifty-two page criticism of the state and local agencies, mentioning the state Division of Water Resources, the State Reclamation Board, the County Board of Supervisors, the directors of Levee District No. 1, the city-county civil defense organization, as well as an appalling lack of leadership and the eventual collapse of city government. In the state legislature there was a prompt proposal to create a central water-control agency. There were even attacks

on President Eisenhower's Annual Message because he barely mentioned the flood disasters. Litigation arose from the Yuba City incident which will undoubtedly continue for years, for even after months of argument it has not been fully decided who owns the houses that were washed from one lot onto another. To all of this was added the criticism of outsiders who contended that the whole community suffered from a strange forgetfulness of the dangers that existed in living behind the earthen banks of a potentially rampaging and murderous river.

LESSONS FOR THE FUTURE

Out of the adversity of the Yuba City disaster, many lessons were learned that are the hope for a better future. Perhaps the word should be "relearned," for the lessons were essentially the same ones already taught by hundreds of other disasters. Foremost among these was the fact that "it can happen here." This was especially true along the Feather, where serious floods have occurred over the years—even as recently as 1937, 1940, 1942, 1944, 1948, and 1950. The well-known aphorism that hindsight is better than foresight was hardly excuse under these circumstances. There was certainly a need to overcome the misconception that a disaster always happens to some other community, just as most persons have erred in thinking that an accident always happens to someone else. It was learned that there is no substitute for a carefully conceived disaster plan, for thorough training in emergency skills and techniques, for periodic trials of disaster operations, and for critical evaluation of the entire program.

SOCIOLOGY AND ANTHROPOLOGY

PITIRIM A. SOROKIN. *Fads and Foibles in Modern Sociology and Related Sciences*. Pp. viii, 357. Chicago, Ill.: Henry Regnery Company, 1956. \$10.00.

Works devoted to the methodology of the social sciences fall mainly into three groups. There are, firstly, treatises written *de haut en bas* by logicians or philosophers who themselves have had no experience of sociological research or contributed to social theory. There are, next, contributions by working social scientists who, however, have had no special training in logic or epistemology. These generally take the form of first or last chapters in textbooks or treatises, and more often than not the methodology throws no light on the material actually handled and does not arise out of it. There are, thirdly, discussions far more uncommon by those who are equipped both on the scientific and philosophical side. To this last group Professor Sorokin clearly belongs. There can be few sociologists who have his encyclopaedic command over the history of thought or who have contributed so much to the various branches of sociological investigation. What he has to say on methodology has therefore to be taken very seriously by all students of the social sciences.

In this work Professor Sorokin subjects "modern" social science, that is the social science of the last twenty-five years or so, to a ruthless examination. The main burden of his argument is that which is new in these studies is not good and what is good is not new. The root of the trouble, in his view, is to be found in the slavish

imitation by social scientists of the methods—generally ill-digested and misunderstood—of the natural sciences. Hence their "quanto-phrenia" or the reckless application of quantitative methods to problems to which they are not adapted, their predilection for a heavy terminology which serves to hide emptiness of content, their illusory search for an "objectivism" which leads them away from the really important subjects of investigation into a "blind alley of subjective and evanescent hear-say trivia." These charges are backed by a careful and detailed analysis of the use made in recent sociological investigations of intelligence and other mental tests, of mathematical models, scalograms, and the like. Sorokin shows that in these studies the underlying assumptions are not disentangled, so that methods which in their proper fields may be unexceptionable, are applied to data to which they are not suited. An examination of the results supposed to have been attained by these methods shows their sterility: they have led to nothing but "painfully elaborated platitudes and poorly reiterated generalizations discovered long ago and defined more accurately by preceding social thinkers." Should present trends continue, the social sciences are in danger of losing all vitality and failing completely to serve any interests, theoretical or practical.

To ward off this danger it is necessary, Sorokin thinks, to adopt what he calls an "integralist" conception of knowledge. This implies a combination of three modes of cognition, the empirical, the logico-mathematical, and the intuitional. These matters have, of course, been discussed by Sorokin in his other works. In the book before us

the relation between the three kinds of knowledge is dealt with only in outline. Sorokin recognizes that each is liable to error and that they therefore need to be mutually corrected. Is this process of mutual correction the work of the logico-mathematical method? Or has intuition the last word? Until these questions are answered we can hardly form any definite conception of the type of propositions which would go to the making of an "integralist" sociology.

JAMES H. S. BOSSARD and ELEANOR STOKER BOLL. *The Large Family System: An Original Study in the Sociology of Family Behavior*. Pp. 325. Philadelphia, Pa.: University of Pennsylvania Press, 1956. \$6.00.

The Large Family System is of a type which may come to be known popularly as the book reviewer's nightmare. It defies all standard approaches. Unqualified praise is no more appropriate in the case of this book than is summary dismissal. The damning-by-faint-praise gambit, while perhaps tempting here, would also be grossly out of place. The difficulty stems essentially from two sources. First, one must conclude that the net addition to our fund of knowledge concerning the American large family system contributed by this book is extremely slight. If this were the only consideration, then one might easily follow the more standard procedures of criticism. But there is another factor involved, namely that our fund of knowledge in this area is so pitifully meager that virtually any contribution to it must be deemed important.

The work describes certain characteristics of 100 large families, defined to be those in which the parents bore a minimum of six children, as seen through the eyes of one of the offspring. In only seven-teen cases was corroboration of these views sought by means of interviewing at least one other family member. The areas of interest were broad and undeniably of fundamental concern to sociologists. Attitudes

of the members toward the family, disciplinary practices, interactions among siblings, and socioeconomic factors were analyzed in detail together with several other important variables in order to determine whether there is "... a pattern of family living which is peculiar to the large, as compared with the small, family" (p. 16). And herein lies the rub, for what is true of the authors' 100 large families clearly need not be true for large families generally. These cases constitute the population of large families containing at least one member who both heard about the Bossard-Boll study and volunteered to participate in it. As such it cannot be said to constitute a random sample of any other population. Moreover, what is true of these 100 large families may or may not differ from what is true of small families, but we have no way of knowing because the authors make no attempt at systematic comparison.

The authors may have recognized these facts for they state at the outset that, "this book is not a statistical study. . . . To assume differently is to miss the purpose of the entire project" (p. 22). Then follow no less than fifty-eight statistical tables. And the bulk of the text, although generously larded with case excerpts, is given over to interpretation of these tables. Whether or not the purpose be missed, it must be reported that this is in fact a statistical study and that it is one which is far from being a model of rigorous procedure. Despite these shortcomings, the book does make a contribution which, in an area almost destitute of knowledge, looms large indeed.

ROBERT MCGINNIS

University of Wisconsin

WILLIAM J. GOODE. *After Divorce*. Pp. xv, 381. Glencoe, Ill.: Free Press, 1956. \$6.00.

Professor Goode has written a meaty volume on a subject which hitherto has yielded too many slivers and bones. As such, *After Divorce* will probably take its place among the top books in the family field. There are flaws in the research design—some perhaps major—but this is true of practically all of our large-scale family

studies, and in view of the pioneering nature of the task, Goode's venture has proved most rewarding.

Based on a random sample of 425 divorced mothers (Detroit, 1948) the author utilized the personal interview method to explore such areas as stated causes of the marital conflict, attitude toward ex-spouse, steps involved in the decision to divorce, social pressures experienced, property settlements, effect of divorce on children, as well as a variety of background characteristics of the divorcees; indeed, the flow of research findings is so vast that certain sections must be read and reread if one is to "stay with it."

Although the data were collected through personal interviews, no case histories are reported. (*Vive!*) The findings are almost entirely statistical. The tabular and correlational analyses are clearly superior, and—quite importantly—all the hypotheses and findings are framed in such a manner as to lend themselves to future empirical testing.

In terms of study design, whether Goode should have restricted his sample to divorced *mothers* can be debated. Most divorcees do not have children. Readers will probably wonder, also, to what extent the *husbands'* responses would have affected the over-all project results. These question marks are fully recognized by the author. The latter does not, however, explain why first marriages and remarriages are not given separate statistical treatment. In view of the basic variables in any divorce study—race, nativity, marital status—as well as such factors as age, socio-economic status, religion, duration of marriage, and children, the present reviewer would opine that Goode had too small a sample for the items which might have been held constant. (We can almost hear Goode replying, "Do you know how much an interview project that size would cost?")

After Divorce is more than a collection of findings. The author has deftly woven his findings into a fabric of theory. Tabulations and correlations lead to hypotheses, and hypotheses lead to further statistical explorations—and the end result is a series of major theoretical considerations, solidly rooted, capable of being pruned and shaped

by any one with enough gumption and ability to effect a replication study. Goode's theories as they relate to divorce trauma, concomitants of redating, the institutionalization of postdivorce adjustment, the potentially beneficial effects of divorce on children, and so forth—are the culmination of sharp data handling and originality of thought.

This is a substantial book. It is to be hoped that After Goode other family researchers may be inspired to similar efforts.

WILLIAM KEPHART

University of Pennsylvania

HORACE BELSHAW. *Population Growth and Levels of Consumption: With Special Reference to Countries in Asia*. Pp. xxix, 223. New York: Institute of Pacific Relations, 1956. \$4.50.

This book's "central theme is the relationship between population growth and levels of consumption." The core of the book (Part II) is concerned with the economic and social changes which determine the rate of increase in production in underdeveloped countries. After a statement of the population situation in different parts of the world the author concludes that the hardships of various kinds, which, during most of man's history, have kept population growth down, are still operative to a greater or lesser degree in most underdeveloped countries. However, modern health knowledge and its application are leading to the reduction of death rates in many of these countries and the consequent growth of population, since the birth rates are little changed. This raises serious problems because it cannot be assumed that the increase of population is automatically accompanied by a like increase in production, to say nothing of a proportionally greater increase. Without a greater production increase the level of living will remain stationary or may even decline.

Part II, *Some Fundamental Relations*, treats chiefly of the conditions, both economic and social, which will determine whether or not production will increase faster than population in the underdeveloped areas, and hence whether levels of consumption will rise. It will only be

possible here to mention the chief topics treated. Under "A 'Development' Equation" almost the last statement is: "The discussion so far leads to the conclusion that a rise in levels of consumption in a growing population would require one or more of the following conditions:

(1) A rate of increase in capital stock (i.e., rate of investment) exceeding both the rate of increase in population and that in national income.

(2) Economies of a scale large enough to offset such diminishing factor returns as might occur if the rate of growth of population exceeded that of capital stock.

(3) An improvement in the ratio of labor to population.

(4) Improvements in the efficiency of labor and/or capital."

The author then proceeds to discuss some of the problems involved in attaining the changes implicit in the above conclusions: "Economies of Scale" (Chap. V); "Investment" (Chap. VI); "Savings" (Chap. VII); "Population and Effective Supply of Labor" (Chap. VIII); and "Innovation" (Chaps. IX and X). The reviewer was especially glad to see even the very brief discussion of the "Social Costs and Obstacles" to innovation (Chap. IX).

Mr. Belshaw's conclusions regarding what is needed to secure improvements in levels of consumption in underdeveloped areas may be summed up in what he calls the "approaches" to this problem:

"(a) An increase in the rate of capital formation.

(b) The most effective use possible of available capital in terms of its ability to generate income.

(c) An improvement in the utilization of the potential labor force.

(d) The promotion of innovations.

(e) A deceleration of the rate of population growth."

The readers of this little book will hope that the promise of a more complete treatment of the problems of increasing the per capita consumption of the peoples in underdeveloped areas will not be too long delayed.

WARREN S. THOMPSON

Oxford, Ohio

BENJAMIN MALZBERG and EVERETT S. LEE. *Migration and Mental Disease: A Study of First Admissions to Hospitals for Mental Disease, New York 1939 to 1941*. Pp. x, 142. New York: Social Science Research Council, 1956. \$1.50.

This monograph is an important contribution to the literature on migration differentials.

As pointed out by the authors, interest in the relation between migration and mental disease is of long standing, both among scholars and the general public. With some exceptions, such as in the work of Ødegård, and of Malzberg and associates, most of the earlier studies have suffered from the lack of standardization of data for sex, age, and race so that their generalization about the relationship between mental disease and migration have been open to serious question. In this work great pains have been taken to hold constant the sex, age, and race variables.

To correct the defects of earlier studies, the authors have calculated age and sex specific rates for first admission to all mental hospitals in New York State for the years 1939 to 1941. Rates have been calculated separately for the foreign born and native New York born, for those born outside New York State and for those migrating to New York from other states. Rates have also been computed separately for recent migrants (those moving into New York within the last five years). Commitment rates for whites and nonwhites, and for each sex, have also been computed separately.

The major results point to higher commitment rates for migrants than for non-migrants when age, sex, and color are held constant. The foreign born do not differ significantly from the native born, the greatest differential appearing between females of the two groups. Rates for migrants from other states are substantially higher than for the New York born, with intermediate rates for the foreign born. Rates for recent white male migrants are approximately twice as high as those for the white New York born, and three times as high for the nonwhite. Recent migrants also show much higher rates than

earlier migrants. The notion that dementia praecox shows striking differentials holds only between immigrants and the native born and not between native born and migrants from other states nor between recent and early migrants.

The greater incidence of mental disorder among migrants may be due to selection at the point of origin, to the greater strain of social adjustment to which migrants are subjected or to differences in the incidence of various psychoses in different states. The latter interpretation is rejected by the authors, leaving the observed differences to be explained as the result of a combination of the first two factors. That some selection at the point of origin may be of importance is shown by the large number of persons who are admitted to hospitals soon after their arrival in the State.

The authors are careful to qualify their generalizations by pointing out that their results might have been affected by differences in admission policies in different states, by the heavy emigration from the State, which may also have been selective, and by the possibility that the same factors which impel migration may also result in mental disorder. It also occurs to the reviewer that the native-born and earlier migrants may have been exposed to the risk of admission for a longer period of time than have recent migrants, and this represents a more highly selected population than the latter.

The investigation is a milestone in method for studies of this kind. As the authors point out, New York, with its heterogeneous population and heavy urban concentration, is an atypical state. Definitive conclusions about the problem await a similar analysis with the same methods and the same painstaking procedures in other states.

University of Missouri

JERZY ZUBRZYCKI. *Polish Immigrants in Britain: A Study of Adjustment*. (Studies in Social Life, III.) Pp. xix, 219. The Hague: Martinus Nijhoff, 1956. Guilders 11.65.

When one thinks of "Anglo-Polonica," which is the category in which this sociological study belongs, the late Wacław

Borowy comes at once to mind for his contributions in English as well as in Polish to our knowledge of Poles in England and, of course, of Englishmen in Poland. And so one misses his name in the long list of authorities cited, the more so since considerable space is given to the pre-1939 Polish migration to Britain, from Reformation times on; Jasnowski is cited (*England and Poland in the 16th and 17th Centuries*), though Borowy was the one who over a period of years performed the real and extensive research in this field.

The present work is, nevertheless, an important and needed study, not the least of its virtues being its fine perspective. Thus we see that World War II produced a Polish community in Britain, which is the main focus of the study, in relation to all Polish communities abroad, and not as an isolated phenomenon. This is to be expected in a work which had its prime spur and inspiration in the classic study of the Polish community in the United States by Thomas and Znaniecki. Professor Znaniecki, we may note, supplies one of the Prefaces to the present work.

Zubrzycki's study comes at the exact moment when the validity of the policy which has kept the community described intact, and which has informed it spiritually through and through ever since the earliest World War II arrivals, is being put to its first great test. Because of homesickness and the lure of Communist bait, outstanding leaders of the community, including some of the most vocal, one may even say the most Catonic, makers of the policy itself are returning to Poland, though they know there is no hope of realizing the community's great objective: the restoration of Poland to independence and a place of honor in the family of nations. The emigration is a political emigration, the Polish community in Britain a political community, Zubrzycki asserts, again and again, and as such it is conscious of an obligation to keep itself intact for the great end. Naturalization is frowned upon, assimilation not encouraged. A certain accommodation to British ways is conceded as inevitable, but in the hostels and industrial colonies of Polish composition, even this is often found unnecessary. Now, as

we know from the daily papers, this community is slowly beginning to disintegrate. A second Zubrzycki study is undoubtedly already in progress to chart its course.

One conclusion arrived at by Zubrzycki is striking: while for the population of the given country as a whole, in this case England, it may or may not be desirable for a community to come into being intact and apart from the general community, for the individual Pole in Britain, the existence of this Poland-outside-Poland has meant life itself. Adjustment to so differently traditioned, and so xenophobic, a society as the British would have been out of the question for vast numbers of the Polish immigrants had the Polish community not existed.

Zubrzycki's study is fully documented, and his conclusions are arrived at by use of primary materials, such as case histories, records of the many Polish associations in Britain, and newspaper reports. He supports his conclusions with lavish use of tables; and his study, though sometimes verbose, is to be recommended.

MARION MOORE COLEMAN

Alliance College

S. N. EISENSTADT. *From Generation to Generation: Age Groups and Social Structure*. Pp. 357. Glencoe, Ill.: Free Press, 1956.

My review falls into three folds: prospects and promise, technical problems of editing, and theoretical difficulties.

This volume is written by an able man who admires Max Weber and intends to carry on the massive comparative approach which Weber brought to bear with such provocative results. Professor Eisenstadt attempts some theoretical propositions based as firmly as the sources permit on empirical materials from a large number of different and apparently diverse societies. Though properly bold and daring, he is well aware of the difficulties posed by the state of his data. He is determined to do his best with the material at hand. He fears banality more than error.

Like Weber, Professor Eisenstadt starts his comparative analysis with an explicit problem. He has a major hypothesis about the structure and function of age groups in

different sorts of societies. Less general matters are related to his hypothesis as subsidiary forms of it. More general matters appear properly as assumptions.

Finally, his major hypothesis is relevant to many other theoretical problems, appears manageable in at least its present elementary form, and in my opinion is of considerable intrinsic interest. In a somewhat oversimplified form this hypothesis maintains: "Specifically organized age groups are necessary for the continued maintenance of any society in which the categorization of adults on a very wide variety of scores proceeds on the basis of what they can do as opposed to who they are or who they were before being classified as adults. This specifically organized age group must cover at least a portion of the development of the individual just prior to his being classified as an adult and frequently covers a period in which other members of the society are ambivalent about the classification of the individuals concerned as fully responsible adults." There is not space here to examine whither this leads.

This is without doubt the most poorly edited professional publication that I have ever tried to read. I am on the whole neither sensitive to nor picayune about the niceties of editing. I would probably not have noticed the deficiencies if they did not completely pie the main line of argument from time to time. The problem begins early: see the basic hypothesis of the volume in its initial statement (page 9, item VII); at the top of page 51 an extra negative makes the passage state the opposite of what is intended; the statements at the bottoms of pages 120 and 183 contradict one another (also the latter, if left standing, would contradict the entire main contention of the volume).

I believe that at least one approach from the purist point of view should be made to any volume with such prospects and promise. From that point of view, the work shows too little concern for the rigor necessary for its goal. For example, Professor Eisenstadt follows Talcott Parsons in use of the "patterned variables" set up on the basis of two mutually exclusive categories. When used in construction of a

model, this eliminates the need for the arduous consideration of differing combinations of any pair of patterned variables. It may be possible to do this and obtain fruitful results, but one cannot simultaneously claim the privilege of side remarks to the effect that phenomena classified as "universalistic," for example, really contain "particularistic" elements as well. If the distinction inheres in different degrees and kinds of "particularism" or "universalism" (that is, in whether something is "predominantly universalistic" or not with a given setting) the statement of the main argument in binary terms with side remarks in contradiction is little more than a subtly self-deceptive way of begging the question. That question hangs on what degrees and kinds of combinations of the variables concerned are relevant to the points that necessitated analysis in terms of these concepts in the first place. To be blunt, but plain, most current work in terms of the "patterned variables" seems to me to fall under what might be called the "fallacy of misplaced dichotomy" or the "error of untenable dichotomies" or some combination of the two. On pages 117, 118, 160, and elsewhere such difficulties arise. In general the theoretical difficulties are of this sort rather than ones which arise from the lack of a fertile and stimulating imagination.

Princeton University

ELIHU KATZ and PAUL F. LAZARSFELD. *Personal Influence: The Part Played by People in the Flow of Mass Communications*. Pp. xx, 400. Glencoe, Ill.: Free Press, 1955. \$6.00.

A judicious combination of foresight and hindsight makes this book a major contribution to our understanding of the communication process and of the channels of influence which affect marketing choices, fashion changes, movie selections, and opinions about public affairs. The study which prompted the volume was conducted in 1945 in Decatur, Illinois. For ten years it was under analysis, years during which the authors and several colleagues at Columbia's Bureau of Applied

Social Research probed for motivations to explain the behavior of their data.

Results of the unusually successful analysis are presented in two parts. Part I summarizes recent investigations of opinion leadership, of decision making, of the role of reference groups in influencing response to communications, and of the patterns of communication within the group, as well as a large number of earlier studies by social psychologists. This excellent analysis of research relevant to the study of communication process and effects is lucid and readable. Special attention is paid to the role of the group, and of interpersonal relations, in modifying communication effects. But those brought up on the symbolic interactionism of George Herbert Mead, and familiar with previously published studies by Lazarsfeld, Merton, Berelson, the Rileys, and others, may consider the authors' pleasure in the "rediscovery of the primary group" as a variable in the communication process somewhat anti-climactic.

Part II constitutes an exhaustive examination of the Decatur study. The scope of this study was necessarily more restricted than the theoretical discussion which precedes it. Relying largely on self-designated opinion leaders—partially validated by follow-up interviews—the report includes the following among its major findings: influence, except in the realm of public affairs, tends to flow horizontally rather than to cut across class strata; opinion leadership is related to an individual's gregariousness, to his position in the "life-cycle," and—in the case of public affairs—to his social status; messages seem to flow from the media to opinion leaders, and from them to the less active section of the population; and personal influence is generally the most effective medium of communication.

The authors are refreshingly candid about the shortcomings of their study and the tentative nature of some of their hypotheses. The procedures used in the identification of opinion leaders seem inadequate in the light of more recent studies, and "life-cycle" as a factor in opinion leadership may merely reflect differences in interest and opportunity. But these are minor faults in a book which will prove

invaluable to both students and practitioners of mass communication.

KENNETH P. ADLER

University of Chicago

FRANKLIN D. SCOTT. *The American Experience of Swedish Students: Retrospect and Aftermath*. Pp. xiii, 129. Minneapolis: University of Minnesota Press, 1956. \$3.00.

The benefits and glory of overseas travel and experience are well appreciated by Americans. But, with all the grants to individuals from foundations and governments, hardly any efforts have been made to see if travel creates better international understanding and good will.

Professor Scott, as one of several persons at work on studies of foreign students, has attempted to analyze what effects American travel has had upon a small sample of fifty Swedish students, professors, businessmen, government officials, and others. These persons were interviewed concerning their original opinions of the United States and what these later became. They were also asked whether or not travel in the States influenced their careers and to what use it had been put. Many other questions are conveniently summarized in a set of tables.

The results are hardly surprising in view of the characteristics of the sample taken. These persons sought opportunities for travel in the United States and arrived here with value judgments about certain aspects of American society and about the advantages of study here. Swedes generally found the United States a better place than they expected and, contrary to their preconceptions, somewhat less materialistic. They classed their experience as determinative for their careers. They continued to respond to American influences and found little difficulty in adjustment to either the American environment or to Swedish ways upon their return. Swedes, in other words, liked the United States and found their travel most beneficial.

Professor Scott indicates his own hesitation about conclusions for either Swedish visitors or other foreign students. The United States could neither be as unblemished nor the Swedes as nonperceptive as

this study makes both appear. The sample is too small and its selectivity too lopsided. No check seems to have been used against a natural "halo effect" nor upon an inclination to remember the best impression and to cancel out the worst. The size of the sample, the attitudes of individuals, the academic nature of the Swedish background, and the eager receptivity to the American milieu nullify most conclusions applicable to a general situation.

It is always pleasant to be flattered. Dr. Scott's study by its revelation of favorable predisposition and its absence of "built-in" controls is saccharine flattery of the worst sort. But it does point out the need for investigation of the values in spending funds on foreign travel and exchanges. Other studies are forthcoming which will give more substantial conclusions for judgment of these programs.

RAYMOND E. LINDGREN

Occidental College

ROBERT J. HAVIGHURST, and others. *Potentialities of Women in the Middle Years*. Pp. xiv, 198. East Lansing: Michigan State University Press, 1956. \$3.00.

This is the report of a symposium on the situation, problems, roles, and potentials of middle-aged women in the second half of the twentieth century. The symposium was an observance of The Centennial Year at Michigan State University. Since there are some 20 million women between 40 and 65 years of age and because each contributor presented a serious and thoughtful paper, *Potentialities of Women in the Middle Years* must be regarded as a very significant document.

The central theme is that the position of women has changed from that of preindustrial homemaker and chorewoman to a confusion of roles as our country has shifted from an agrarian-craft society to a mechanized, urban economy. This socioeconomic revolution has changed the lives of all women, but particularly those in middle age who are freed from household responsibilities in the traditional kinship household at the same time the length of their lives is being extended.

Maintenance of health is discussed ex-

pertly in terms of physiological changes, nutrition, and psycho-physical problems. Dr. Pearl Swanson says that middle-aged women have much to learn about healthful eating. Dr. Harry August destroys the myth that psychological depression is a natural consequence of the menopause. Dr. Catherine Macfarlane urges that women make certain their physicians are correctly informed regarding the properties of the age-retarding therapies. Professor R. J. Havighurst and Dr. Lawrence Frank address themselves to the changing family responsibilities and social position of women at middle life and to their search for new and useful roles. Havighurst contrasts the subordinated nineteenth century women with twentieth century women who, he says, are becoming equal partners with men. Their great problem, he adds, is for women to develop new and expanding interests that will replace those of the parental period.

In tackling the same problem, Frank points out that women are not entirely able to make free choices. Some remain involved with children, some have responsibility for aged parents, and many have husbands with exacting needs. Frank suggests, too, that women must find new, absorbing activities if they are to be real persons throughout the second half of their lives. Some are meeting the challenge, he says, but many are regressing into unhappy, listless boredom.

Mrs. Agnes Meyer follows with a provocative essay on ways in which women with leisure can bestir themselves and find usefulness and satisfaction. Society and the community have responsibility too, say all three of these contributors, to help create favorable attitudes and conditions.

The conclusion must be that the middle-aged woman at mid-century is a pioneer in search of new sources of life fulfillment in a changing society which thus far offers little guidance. The book reports a number of researches that may help point the way to new outlets for the potentials of women in modern society.

CLARK TIBBITTS

U. S. Department of Health, Education,
and Welfare

ELI GINZBERG and others. *The Negro Potential*. Pp. xvi, 144. New York: Columbia University Press, 1956. \$3.00.

The Negro Potential has unusual interest from at least two standpoints. First, it represents one of the few current incursions of research economists into the area of demographic analysis and minority group problems; and secondly, since much of the materials appear to be drawn from work done on separate projects by the Director of the Conservation Project, one is apt to be pleasantly surprised at the continuity of treatment which is afforded by the theme of the conservation of human resources.

The wide range of materials covered by the authors warrants a review of each of the six chapters. In the opening chapter, called "The Challenge of Negro Potential," the authors detail both their point of view and a summary of their findings.

The economic progress of the Negro in the past fifteen years and the probable economic future of Negroes in the urban and rural South and in cities outside of the South are treated in the chapter on "Expanding Economic Opportunities." The economic progress and problems of Negroes in each of these demographic areas are carefully documented with emphasis on the problems of Negroes in obtaining jobs as production workers in the South and at supervisory and management levels outside of the South, and the difficulty of Negro women in the North as well as in the South in finding employment beyond the narrow confines of service work.

The chapter on "The Educational Preparation of the Negro" describes the serious deficiencies in the quantity and quality of the education of Negroes as compared to the education of the white population, not only in the South but in all parts of the country. The authors call attention to the poor quality of schools attended almost solely by Negroes in the North because of residential segregation, an oft-neglected item in discussions and measurements of the educational differentials between whites and Negroes.

The spectacular changes which have taken place in the armed forces are discussed in a chapter on "The Negro Sol-

dier." An insightful account is given as to how segregation affected the performance of Negro troops and how, with determined leadership, significant changes in behavior can be made in a relatively short time.

"Better Preparation for Work" stresses the importance of making Negro youth aware of the new opportunities in order to prepare themselves to take advantage of them; that preparation for work is a cumulative process that begins in earliest childhood and involves the total life of the individual, not only his formal education and training; and finally, that much of the responsibility for improving the Negro's preparation for work falls on the Negro community itself. Here the authors stress the importance of breaking down racial residential segregation in the North as well as in the South.

The final chapter deals with "Lessons for Manpower Policy." One finds here, perhaps, an unresolved dilemma in the authors' analysis. They declare on the one hand that "the first and perhaps most significant finding emerging from this study is that improvements in the position of the Negro occurred primarily as the direct outgrowth and consequences of forces unleashed in the market place. They were not primarily a result of alterations in our social and political thinking and behavior." On the other hand, they state, "the outcome of the struggle between the free world and Soviet Russia for the minds and hearts of millions of men who are not yet committed will depend on actions, not speeches. . . . For hundreds of years the private conscience and public morality of America have been weakened by the guilt we have carried over our treatment of the Negro. . . . The greater challenge that now faces us as leader of the free world has at last forced us to recall and to act upon Lincoln's warning: 'Those who deny freedom to others deserve it not for themselves, and, under a just God, cannot long retain it.'" In other words, is it not possible that the social and political "alterations" whose influence the authors tend to minimize were in large measure responsible for the unleashing of the "forces" of the

market place to which they attribute such great significance?

Dr. Ginzberg and his associates have given us a highly significant book, distinguished by balance and objectivity as well as by wisdom and clarity. It deserves careful attention and wide reading.

PRESTON VALIEN

Fisk University

GEORGE S. STEVENSON. *Mental Health Planning for Social Action*. Pp. x, 358. New York: McGraw-Hill Book Company, 1956. \$6.50.

Social movements generally are begun by persons acting with aggressive political motives, the spirit of religious revivalism or fanatic devotion to a cause. But if the movement survives and matures, it generally develops a new leadership, willing to build with patience and planning to develop a stable organization with a well-formulated program. The stability is usually purchased at the price of limiting itself to action on programs supported by sufficient social consensus about what is right and wrong. This allows technicians to apply what they know to a progressive diminution of a gap between conditions which exist and those we would like to see develop.

Mental Health Planning for Social Action is a textbook written by a distinguished physician who has led the mental health movement in America into its present stage of organizational "maturity." It avoids highly technical issues and is therefore all the more useful to persons interested in what is being done in the mental health field by community organizers, social planners, and educator-social actionists. The book is divided into two major parts. The first deals with activities to help people with *problems*—the mentally disordered, veterans, legal offenders, and others who are unable to cope with life in terms of standards regarded as *mentally healthy*. Other chapters deal with *preventive* mental health services through the family, church, school, the military, industry, and other institutions of society.

Students and public-spirited citizens interested in the mental health movement

will find this book a good guide to the topics that are regarded as relevant to it. Without ever saying so, Dr. Stevenson makes it quite clear that mental health encompasses every facet of social life. It is a movement not content with ameliorating conditions in mental hospitals, prisons, institutions for social outcasts like alcoholics and defectives; it has branched out to include the planning of programs for family life education, for social security, and for good international relations.

The book makes no pretense of being a thorough summary of what mental health specialists may know. It is primarily descriptive and illustrative. Professionals in the field of mental health will find little in it that is new to them, but may find it useful as a well-organized and easily readable summary of much of what they must know and use in the everyday pursuit of their work. Health educators will also welcome the appendix on visual aids. It is organized to run concurrently with each chapter of the book, greatly facilitating its use as a text for mental health study groups.

NORMAN Q. BRILL and GILBERT W. BEEBE.
A Follow-Up Study of War Neuroses
(VA Medical Monograph). Pp. xviii,
393. Washington, D. C.: Veterans Ad-
ministration. No date. No price.

The problem of manpower shortage in the Armed Services prompted this investigation, as it did, three years ago, the work by Eli Ginzberg and his group (see my review of Eli Ginzberg *et al.* on *Psychiatry and Military Manpower Policy*, THE ANNALS, Vol. 292, March 1954, pp. 183 ff.).

Ginzberg's group sent out questionnaires to psychiatrists in order to pool their experiences. Brill and Beebe asked psychiatrists to examine veterans; they gathered 1,475 carefully devised questionnaires from 200 co-operating psychiatrists. Brill and Beebe's statistical methods will not be dealt with in my review because this reviewer's impression is still that of a task which an engineer would describe as submitting an unknown material, which should serve an unknown purpose, to little known

tests. The basic fact is that the Armed Services constitute to more than 75 per cent a logistic apparatus, so that only one at the most of four inductees ever sees combat action. What are the requirements for which the three others are inducted? This is one of the unknowns. Furthermore, according to the urgency of the momentary needs, the viewpoints in selection, with a given manpower pool, kept changing. The experience of one author, who is quoted, that 79 per cent of those rejected by psychiatrists for disorders not on the level of psychosis, were able to function in some capacity while wearing the uniform, is borne out by some of the case histories. These form a particularly valuable part of the book. As in the older study by Ginzberg, here again the need for experienced psychiatrists is made clear. Unfortunately, only 9 of the 393 pages of the book are devoted to case histories.

While all this is not said to detract from the value of this painstaking effort, it must be stated that objective psychiatric methods as such are not yet available to answer the question: will this man with this prehistory and these emotional and neurotic disorders be able to function in the Armed Services? A similar question has vexed us regarding the traumatic neuroses in civilian life. The experience of the individual psychiatrist is still the most important factor. However, as was said in the review of the previous publication, a better feedback of experiences to the individual examiners is still on the wanted list.

W. G. ELIASBERG

New York, N. Y.

PAUL RADIN. *The Trickster: A Study in American Indian Mythology*. With commentaries by C. G. Jung and Karl Kerényi. Pp. xi, 211. New York: Philosophical Library, 1956. \$6.00.

The Trickster myth is told, in one form or another, in almost all human societies, and, because of its wide distribution and known antiquity in the Mediterranean civilizations, is believed to be an extremely ancient story form. The Trickster, in the shape of a man, a god, or an animal (such as raven or coyote), is a picaresque hero: a being with voracious appetites, particu-

larly for food and sex, who in the course of trying to satisfy his hungers plays tricks with social and natural law, sometimes to his own discomfiture, and sometimes (to the delight of his audience) with success. Paul Radin in this volume presents one version of this widespread tale: the Winnebago trickster cycle, translated from a written text obtained by him in Nebraska from a Winnebago informant in 1912. The episodes are Rabelaisian and pan-humanly biological enough to amuse (or shock) most non-Winnebago readers.

Similar narratives are to be found in many ethnographic and historical sources. What give this publication a special significance to the general reader in the social sciences are the explanations of the psychological meaning of the Trickster cycle by Radin and by Jung. These explanations are certainly speculative, and they fall into the general class of theories of myth: an overpopulated domain within the region of comparative religious research. More narrowly, they belong to the psychoanalytically inspired tradition. Nevertheless, the subject is an important one and these theories are suggestive. Radin interprets the essential Trickster myth (that is, the *Ur-myth* divested of various theological arguments added to it in many versions) as a symbolic expression of the psycho-social development through which every human being must go. The Trickster is represented, at the start of the story, as an infantile creature without ego-boundaries, with uncontrollable appetites, ignorant of the workings of the world; he grows gradually, in the school of hard knocks, to accept (albeit somewhat regretfully) the inhibitions required by life in the real social and natural world. Jung, somewhat more metaphysically, sees the image of the primordial Trickster as representing the survival in modern man of an extremely ancient, almost precultural, stage of human psychic evolution, which we, in order to control (and also to enjoy vicariously), must maintain in consciousness by such devices as telling Trickster tales. By Jungian metaphysics aside, the argument is a plausible one. The ancient paradox of mythology—why do more or less civilized men invent and tell these grotesque tales?

—has been answered in many ways. The supposition that their telling is an ego-integrating process deserves consideration.

ANTHONY F. C. WALLACE

University of Pennsylvania

PETER VIERECK. *The Unadjusted Man: A New Hero for Americans, Reflections on the Distinction Between Conforming and Conserving*. Boston, Mass.: Beacon Press, 1956. \$5.00.

Professor Viereck's title is interesting; but the numerous short essays of which this volume is composed do no more than skim the surface of the problem of adjustment and individuality in modern life. One's impression of haste and confusion, on reading these pages, is heightened by Mr. Viereck's almost frenzied style, adorned with paradox and pun, which afflicts *The Unadjusted Man* as it afflicted Mr. Viereck's earlier books—despite the claim of his publishers that "there never has been such a Viereck before." Professor Viereck himself apologizes for his disorderliness by maintaining that he deliberately reflects, in his books, the confusion of the modern world. But the world always is confused, and the mission of the serious writer is to extract order from confusion.

Despite here and there a lively insight (insights, however, which Mr. Viereck already has labored in his earlier books), *The Unadjusted Man* is not very interesting. Professor Viereck does not really concern himself with his announced subject, but collects here his occasional reflections on political controversies and party struggles of recent years. He does not write for posterity. Already the portions concerned with the vices of Joseph McCarthy and the virtues of Adlai Stevenson—amounting to nearly two-fifths of this collection—are out of date, and five years from now the book will be bewildering to anyone who takes it from the library shelf. Mr. Denis H. Wrong, writing in last April's *Commentary*, shrewdly observed that "too many intellectuals nowadays have won a reputation for originality and profundity simply by negating yesterday's clichés, or by 'splitting the difference' between rival ideologies and presenting the synthetic re-

sult as a bold new philosophy for the times. Peter Viereck, an energetic publicist hailed as a challenging new thinker by people who ought to know better, carries this approach to extremes of absurdity. . . . It is hard to see how, at least at Viereck's level, such jousting with what is taken to be the public mood of the moment can ever transcend the kind of sloganized thought it aims to correct."

Regrettably—for Professor Viereck at times has shown courage and imagination—this new volume will confirm Mr. Wrong's judgment. Although inveighing against ideology, sometimes Professor Viereck seems himself to be erecting his "new conservatism" into a complex ideology, to which all conservatively minded persons are supposed to subscribe on pain of ostracism; and of that ideology, as Comte was the high priest of positivism, so shall Professor Viereck be king and judge. A new conservative must adore Mr. Stevenson, for instance, and abjure all the works of "cash-nexus Republicans." The trouble with President Eisenhower is that he is so unlike Governor Harriman. What we need is "mad squires." But of the particular political and economic institutions which produce squires, mad or sane, Mr. Viereck has almost nothing to say. To ape Professor Viereck's own rhetorical trick of allusion and inversion, "Tis pity he's a bore."

RUSSELL KIRK

Mecosta, Mich.

J. S. SLOTKIN. *The Peyote Religion: A Study in Indian-White Relations*. Pp. vii, 195. Glencoe, Ill.: Free Press, 1956. \$4.00.

This account of the North American Indian Peyote cult is noteworthy in two respects: it is written by a professional anthropologist who joined the cult, was "elected one of the Menomini delegates to the intertribal conference of the Native American Church of North America [an incorporated Peyote group], and at that conference . . . [was] elected an official of the Church"; it is the most comprehensive account of the Peyote cult, an objective account, largely historical, and a

revealing narrative of what the cult means to participants.

The nonlegal means employed, especially by the Bureau of Indian Affairs and certain missionaries, to suppress it, and outlaw it, are given in some detail. The author finds no warrant for the allegation frequently made that Peyote is a narcotic or a stimulant; it has less of these qualities, he alleges, than has coffee, tea, and tobacco. Many phases of Christian belief and practice have been incorporated into the cult; it is an amalgam of Christianity and native concepts and practices; "an Indian defense against consequences of white domination. . . . Peyotism socially is an example of accommodation rather than militancy; culturally, . . . it is a case of Pan-Indian nativism" (p. 7).

There is extensive annotation and a lengthy bibliography.

WILSON D. WALLIS

South Woodstock, Conn.

G. MURRAY MCKINLEY. *Evolution: The Ages and Tomorrow*. Pp. ix, 275. New York: Ronald Press Company, 1956. \$4.00.

The central topic of this interesting book is the present situation of man, his place and his prospects in the universe. An accomplished zoologist and teacher, Professor McKinley clearly sees and demonstrates that true knowledge of the nature of man can come neither from intuition nor from revelation, but only from painstaking study of the phenomenal world and of its long history. In five preliminary chapters current ideas on the origin of the earth and of life, on the mechanism of evolution, and on its course are reviewed very briefly—perhaps all too briefly for readers mainly interested in evolution, as such, or with no previous knowledge of those topics.

Then starts the main business of the book: discussion of man as the natural outcome of an inherently self-guiding process and, up to now, its highest product. The evolution of societies in animals and on to societies and civilizations in man is reviewed. Psychological evolution in its many aspects is followed for several chapters and the point is made that here, too,

the unique qualities of man are the inevitable outcome of natural processes and trends. Turning to the future, the author sees our principal dangers in overpopulation and in decreasing average intelligence. He endorses the search for rational, naturalistic ethics and expresses confidence that human capacities guided by such ethics can evade the dangers and ensure a long, worthy future for our species.

The treatment is reasonable, nonargumentative, and, as far as space permits, adequately supported by fact and authority. The central thesis must convince anyone who can approach it without prejudice or dogma. The author is under no delusions about the near universality of precisely such prejudice and dogma, but his book is a welcome contribution to the necessary struggle against them.

A reviewer who approves the aims of the book and who agrees with most of its conclusions would be happy to stop writing at that point. Yet, the ethics shared by author and reviewer demand addition of some less favorable remarks. There is some awkwardness of organization: a chapter on "The Trends of Evolution" quickly loses the thread and becomes a discussion of Korzybski's semantics. There are countless small infelicities. Some are mere slips of syntax or vocabulary: "Under the control of the American Army another 6,000,000 were added" to the population of Japan; "Man, a bipedal-bifocal ape." Some are flat statements on debatable points: "Geneticists know the ways by which the average capacities of the brain . . . could be raised." Others are unnecessarily incomplete simplifications: "The size of a population is controlled solely by the number of births and deaths." A few are definite errors: "Dry sperm (pollen)."

More important is a recurrent philosophical and semantic ambiguity. While insistent on a monistic view of the universe and a wholly naturalistic interpretation of evolution and of man, the author is no less insistent on the concepts of purpose in the universe and of a goal in evolution. This can become tautological or trivial: for "purpose" read "causation," for "goal," "result." If taken more literally, the wording indicates a personification, al-

most a deification, of nature that is inconsistent with the author's data and probably wide of his intentions.

GEORGE GAYLORD SIMPSON

American Museum of Natural History

MARVIN HARRIS. *Town and Country in Brazil*. Pp. x, 302. New York: Columbia University Press, 1956. \$4.50.

A community study engaging in theoretical argumentation as well as the usual description is still refreshing fare, despite a generally increasing but still restricted tendency for ethnological work to concern itself with more than tidy and isolated little universes. But Mr. Harris has not been content with only this distinction. He has the temerity to suggest that the town of Minas Velhas, whose 1,500 citizens languish in lonely past glory and contemporary neglect in northeastern Brazil, is strongly imbued with an urban ethos, despite the lack even of electricity, let alone belching blast furnaces. Small size, high degree of isolation, and low level of technology do not automatically spell ruralism, says Harris on his first page, and proceeds to spend the rest of his space in demonstration.

Understanding the nature of the present growth of industrial urbanism in Latin America depends in great measure on an appreciation of the style of the pre-existing service and governmental cities. Of no less importance is the strong tendency toward town living, even on the part of agricultural workers. A lack of self-awareness has often led American social scientists to equate the small with the agricultural (and incidentally with the "good") to the detriment of noticing how poignant may be the aspirations for full urban culture and how sharp the rejection of the stultifying forms of agricultural work in almost all of non-Indian Latin America. *Town and Country in Brazil* seems to have chosen its example with care and to have presented its case with a praiseworthy "feel," both for Minas Velhas and for the national scene which is the object of the townsmen's gnawing yearning.

So far as can be told without knowing Minas Velhas itself, the book appears highly accurate. Certainly no one who has

ever spent time outside of Latin America's capital cities will fail to smile in recognition of many facets of country-town life recalling similarities in, say, Mexico, Guatemala, or Chile. Through the standard coverage (economics, a notable chapter in class and race, the family and the individual, government, religion, and folk belief) always weaves the thread of urban-national identification and of rural-isolationist rejection. The sad counterpoint of limited ability, poor resources, whining personalism, and the real gulf which does separate them from Brazil's metropolises prepares the reader for the unwholesome desire for a Messiah characterizing this town. And in truth, they will probably get one, should the astounding rhythm of national Brazil continue.

This reviewer is left with a desire for more information, such as on the administration of justice or attitudes toward crime, for example. But despite some gaps, this is indeed a very good book, flavorsome, cleanly written, well considered.

K. H. SILVERT

Tulane University

HISTORY

GEOFFREY BARRACLOUGH. *History in a Changing World*. Pp. viii, 246. Norman: University of Oklahoma Press, no date. \$4.00.

In the opinion of the reviewer, Professor Barraclough's volume is the most stimulating collection of historical essays to be published in the United States since the appearance of James Harvey Robinson's *The New History* in 1911. Like the brilliant Robinson book, it is mainly a collection of essays, lectures, and articles but has a unifying orientation and frame of reference.

The book, as a whole, is devoted mainly to three chief themes: the nature and purposes of history, an illuminating interpretation of the more critical periods in the historic past, and the nature and significance of the unique problems and perspectives created by the events of the last forty years.

The author believes that we are now in a great critical era or "climacteric," roughly comparable to the downfall of classical civilization, the trends in the eleventh and twelfth centuries, the Reformation, and the French Revolution. Specifically, our age most closely resembles the end of the Roman Republic and the trend toward Empire. But the extent of the disintegration, readjustments, and possible hope for the future in our era is unique and defies close comparison with any earlier crisis in human experience.

A notable phase of the current situation is that our era marks "the end of European history," in the sense of regarding the European continent as the center of institutional development and political power. This has now passed to the United States and Soviet Russia. The influence of Europe in the future will rest on tradition and culture, if anything. Ultimately, the main concatenation of power and control may pass to Asia and Africa.

Professor Barraclough gives much attention to the theory of progress. He contends that, for mankind as a whole, there is no doubt of the reality of progress, but the dogma does not hold for specific civilizations. For the most part, they have risen, prospered, and fallen apart. Much of the pessimism of writers, including historians, today is due to myopia and provincialism—the assumption that because the older European civilization is now disintegrating as the main custodian of political and military power, human civilization as a whole is in jeopardy or doomed. Every civilization in the past has had a similarly grim view in its declining epoch, but mankind has gone ahead, nonetheless. If we can control and inhibit the new technological implements of mass-murder in warfare, there is every reason to believe that better periods than the past has ever known may lie ahead.

In the reviewer's opinion, the only possible serious flaw in Professor Barraclough's argument lies in his failure to reckon with the Orwellian trends in our day, which can mean that the formula of cold and phony war—"perpetual war for perpetual peace"—may freeze our culture in a sterile pattern for an indefinite period.

In his selection of the critical and influential periods in the experience of Western society since Rome, most alert historians would criticize his rather old-fashioned emphasis on political and religious history; for example, placing the Investiture struggle, the Reformation, and the French Revolution ahead of the scientific and technological advances in the Middle Ages, the expansion of Europe after 1500, and the Industrial Revolution as dynamic impulses to a new era.

HARRY ELMER BARNES

Malibu, California

EDMUND S. MORGAN. *The Birth of the Republic, 1763-89*. Pp. ix, 177. Chicago, Ill.: University of Chicago Press, 1956. \$3.00.

This is a well-organized and beautifully written little book, whose great merit is that it combines much of the latest scholarship on the Revolutionary era with a coherent interpretative narrative of the principal events involved.

Professor Morgan's interpretation has a distinctively "Whiggish" flavor, and indeed it comes near to exemplifying the old saw: "scratch a historian and you find a patriot." Thus he emphasizes the novel and even revolutionary character of the new imperial tax program, and he dwells with evident sympathy upon the colonial argument that "taxation without representation is tyranny," while he condemns the British parliamentary argument for virtual representation as "specious nonsense." He draws heavily upon O. M. Dickerson's *The Navigation Acts and the American Revolution* (1951), to illustrate the essentially capricious and even rapacious character of the British customs service under the Townshend Acts. He rejects by implication the work of the historical school which finds class and sectional conflicts in the Colonial social order at the root of much of the disturbances incident to the Revolutionary crisis. Instead, he emphasizes repeatedly the great degree of unity which existed among the colonists of all classes in their growing quarrel with the mother country, and he caps the argument with the assertion that the appeal to arms was

successful in part because "it was a people's war." And finally, he finds the greatest significance of the Revolution to lie in Jefferson's dictum in the Declaration of Independence "that all men are created equal." The Revolution, in other words, was a vital step forward in the evolution of American democracy.

Thus we have an essentially conservative interpretation which Andrew McLaughlin would have heartily endorsed two generations ago. The same somewhat conservative view appears in the latter portion of the book, in which the author rejects firmly the thesis advanced by Jensen and other scholars that the Confederation government constituted a successful experiment in agrarian democracy. He concedes that the economic achievements of "the critical period" were "creditable," but emphasizes nonetheless the "impotence" of the government in finance, the decline of Congress, the growing irresponsibility of the states and the swelling hysterical talk of "dictatorship." And he concludes with a critical rejection of Beard's *Economic Interpretation of the Constitution*, evidently based in considerable part on Robert Brown's recent slashing attack in *Beard and the Constitution* (1956). In short, Professor Morgan has managed very nicely to work recent scholarship into an adequate and highly convincing defense of a rather conservative and traditional historical treatment of the Revolutionary era.

ALFRED H. KELLY

Wayne State University

WESLEY FRANK CRAVEN. *The Legend of the Founding Fathers*. Pp. 191. New York: New York University Press, 1956. \$4.50.

The study of American mythology has received far too little attention. While the traditional political historians have been counting the ballots of old elections—and have often seemed content with that—important influences helping to determine the results of those elections continue to be ignored. *The Legend of the Founding Fathers* is, happily, a case to the contrary. It describes, with unusual insight, the way the image of America was conceived, pur-

posefully altered, and thoroughly popularized.

Professor Craven has taken a long look at how we reshaped our early history to make it conform with our preconceptions. The reshaping was done at the popular level through uncounted numbers of 4th of July orations, political speeches, lectures, newspaper items, and certainly (one should add) through the give and take of a multitude of conversations which were never recorded but whose general content can be deduced. The reshaping at higher levels was done chiefly through the histories published in the first half of the nineteenth century. Both the histories of given states, Virginia and Massachusetts, for example, and the histories of the entire nation were characterized by an exaltation of this country which was as enthusiastic as it was naive. The enthusiasm focused on individuals, especially the founding fathers and George Washington. We built our pantheon and set their statues in it.

That is what Professor Craven is implying. But he states it with a moderation so great as to be inordinate. "There may even be some advantage," he says in a low voice, "in considering the whole effort as an attempt by a new nation to find for itself a suitable group of national heroes."

Though the individual played more of a part in the legend than did the mass, Professor Craven also explains the methods several prominent groups took in order to establish a tradition which would aggrandize them. We all know about the Virginians who have taught us to forget that they are descended from anything except ringleted Cavaliers. But the author shows us that the Scotch-Irish also, now perhaps the most respected of national groups in the pages of American history, were characterized by one clergyman in the late eighteenth century as "the worst vermin on earth." Such language, Professor Craven adds, was extreme; but it was probably far from unique. It was only as the succeeding decades moved along that the Scotch-Irish were able to win widespread approbation. The Catholic Irish too made efforts to hallow their patriotic role which

were all the more strenuous because the mass of Irish immigrants came in later than the Scotch-Irish. Other national groups as well yielded to the desire to affirm their high origins and great service to the United States.

Not the least value of this stimulating book is its unspoken reminder that attempts to manipulate history to suit the legend have by no means stopped. Various so-called patriotic organizations would still have us teach a brand of history in which America is always right and one American can still beat ten of any other breed.

The political effect of the legend, past and present, is not negligible even though its extent can never be precisely defined. In the Midwest today, to cite a case in point, the shade of Washington is frequently invoked by the isolationists. And other effects of the legend on our culture must be manifold. The way we think of ourselves as Americans and as inheritors of the American tradition may determine at times what books we choose to read, what church we join, what societies we belong to, and what entertainment we enjoy.

CARL BODE

University of Maryland

JOSEPH B. JAMES. *The Framing of the Fourteenth Amendment*. Pp. ix, 220. Urbana: University of Illinois Press. 1956. \$4.00 cloth; \$3.00 paper.

This small book is volume 37 in the Illinois Studies in the Social Sciences. The purpose of the author is to put the reader in the environment in which the Amendment was written. Use has been made of the "tremendous amount" of available correspondence and other manuscript material which has survived from the period. Some notice has been taken of the political and social movements prior to December 1865, which directly influenced Congress in framing the Amendment.

The reading of this book leaves one with the feeling that he really was present at one of the exciting and important periods of our history. This review is being written just after an election campaign and an international crisis. One feels that he can

learn almost as much about the characters and events of the ninety-year-old period covered by this book as he can remember about the more recent events.

The preoccupation of those who were active in framing the Amendment with the question of the right of Negroes to vote suggests some afterthoughts, after the lapse of ninety years. Their presentiment that Negroes would not in reality get their other civil rights if they were not secured in their right to vote was well founded, as history has shown. But it was politically impossible at the time to obtain a general guaranty of the right of Negroes to vote because many northern states denied them this right, as well as many other rights. So the best that could be done was the provision in section 2 of the Amendment for the reduction of representation in the House of Representatives of the states which denied the right to vote to any of their adult male inhabitants. The section was never enforced, and in spite of the seeming importance of the question at the time, it turned out to be quite futile. The book does not, of course, cover the subject of the Fifteenth Amendment, what was hoped for from it, and what was realized. Section 3 of the Amendment, disqualifying participants in the rebellion for public office, and section 4, repudiating the Confederate debts and guaranteeing the validity of the Union debt, were regarded as of great importance at the time; but they were, in the long run, of little importance.

Section 1 relating to the privileges and immunities of citizens and due process and equal protection of law was not the subject of much controversy. It was probably regarded as a formulation of pious and obvious abstractions, not comparable in importance to the problem of voting rights for Negroes or the "de-Nazification" of rebels. But its eloquently stated declaration has, of course, turned out to be one of the most important foundation stones of our liberties. It has been put to some surprising uses. The author in several places comments on the lack of evidence that it was intended to protect corporations. But the morality which the section legislates has grown and is still growing in vitality. Its undoubted purpose to protect

a minority and relatively helpless part of the population is better realized today than ever before. One must never underestimate the power of an idea, especially if it is expressed in clean and eloquent prose.

This book greatly illuminates one of the decisive events of our history.

J. WARREN MADDEN

The United States Court of Claims
Washington, D. C.

JOHN HOPE FRANKLIN. *The Militant South, 1800-1861*. Pp. xi, 317. Cambridge, Mass.: Belknap Press, Harvard University Press, 1956. \$5.00.

Without a doubt a martial air in ante bellum times and even down to the present was more evident in the South than in other parts of the country. With this thought in mind, the author sets out to sift the records and accumulate the evidence which would substantiate this fact and to explain here and there why it was so. His labors have taken him far and wide and left little untouched.

There were wars and rumors of war which kept Southerners on the alert. Even before the Revolution there were brushes with the enemies of Mother England, and then the Revolution swept the land. The South had a heavy hand in bringing on the War of 1812, took a principal part in the Mexican War, and in the meantime fought in a couple of Seminole wars in Florida. Where there was no open war, Southerners were quick to engage in the well-known filibustering schemes, first in the Mexican province of Texas, then in Cuba with Lopez, and later with the remarkable William Walker in his conquest of Nicaragua.

Switching from the purely martial atmosphere into personal broils and violence, the author goes into an account of the quick temper of Southerners to resist a fancied insult by fighting duels or merely wielding knives, pistols, and fists in rough-and-tumble fights. Preston Brooks beating Charles Sumner comes in under this category.

All these factors and others were evidence of the militant South; but how did the South get that way? Basically, the author thinks the reason was the fact that the

South was frontier in its conditions and ways of thinking and never in ante bellum times got away from it. Since the South was sparsely settled with big plantations adding to that sparseness, the individual was left largely to his own prowess for protection. The institution of slavery, both in its control internally and in its defense from outside Yankee interference, was a breeding ground for Southern self-assertiveness. Schools, what few there were, and even the churches encouraged the spirit of militancy in the individual as well as in society as a whole. A rash of military schools in the later ante bellum period was an expression of this spirit, nourished as it had been for a long time by the militia musters and volunteer military companies.

Sectional resistance to Northern aggression with the consequent solidification of the South played a fundamental part in Southern combativeness, and during the last decade before the Civil War, the author thinks the South was feverishly getting ready for that conflict. Industrialism, the lack of which had worried some Southerners for a long time, was now on the road—largely, in the author's opinion, for the purpose of providing sinews for the oncoming war. Briefly, this is an indication of what is in this book.

The reader is left somewhat puzzled as to whether it was the intention of the author to write a book on the martial South or on the violent South. It has certainly resulted in a rather illogical mixture of both—and that may account for the title. Militant may mean something less than martial and something more than violent, and therefore straddling both. By lumping together personal violence, pugnacity, militant braggadocio, and the martial spirit; by setting up George Fitzhugh, William L. Yancey, and such extremists as the legitimate spokesmen of the South; and furthermore by uncritically accepting as typical every facet of information in support of this point of view, the author has been enabled to portray a very unattractive picture of the South. From his first sentence to his last, it is evident that he disapproves of the ante bellum South for being so mean and uncivilized, and that he is equally dis-

pleased with the present South for not having thrown off this evil heritage.

E. MERTON COULTER

University of Georgia

W. C. NUNN. *Escape From Reconstruction*. Pp. xv, 140. Fort Worth: Texas Christian University, 1956. \$2.50.

While several articles on the Confederate exiles who fled from their homes after the collapse of the Confederacy have appeared, there is still room for a full study of the Confederate migration to Mexico. It is fortunate, in the judgment of the reviewer, that this study was cast in the form of a book—even though a slender one—instead of being buried in the volumes of some historical periodical.

In this story we find drama, romance, and high adventure based on careful research in American and Mexican sources, couched in an interesting style. The average reader, even one devoted to history, may not know the story of several thousand unreconciled Confederates—exact numbers cannot be cited—who shook off the dust of the United States from their feet to find a refuge and carve out a fortune in a foreign land. The author is able to convey much of the atmosphere of a tropical land and something of the insecurity in the last months of the colonization effort.

It was a short-lived movement for even before the withdrawal of the French sent by Napoleon III to Mexico to sustain Emperor Maximilian, the Confederates, discouraged by civil warfare, illness and fevers, unlicensed banditry, and unrewarding toil on a crop unfamiliar to them, like coffee, were slipping away from Mexico; many leaving unpaid debts. Instead of unbounded freedom, they had found all sorts of restrictions. After the French withdrew to the coast, a stampede on the part of the ex-Confederates followed to Vera Cruz and then a voyage on any bark afloat back to the once-despised homeland.

There are many prominent Confederate names running through the pages of this volume: Generals Kirby-Smith, Sterling Price, J. B. Magruder, and T. C. Hindman; Governor Henry Allen, who edited the *Mexican Times* in English for the exiles; Governors T. O. Moore of Louisi-

ana, T. C. Reynolds of Missouri, and the renowned Matthew Maury, to name but a few of the more famous of the group.

The volume contains a number of interesting illustrations: of Emperor Maximilian and his wife, in whose honor the most important colony, Carlota, was named; of Matthew Maury, who was named Commissioner of Colonization by Maximilian; and a group of five of noted Confederate generals in Mexico; of the French Marshal Bazaine and his wife. Not the least interesting is the picture of the bamboo huts of the Carlota colony.

ELLA LONN

Goucher College

BERNARD SCHWARTZ (Ed.). *The Code Napoleon and the Common-Law World*. Pp. x, 438. New York: New York University Press, 1956. \$12.25.

On March 21, 1954, the French Civil Code was 150 years old. Energized by Napoleon, its draftsmen attempted to codify the law so that it would be readily accessible to all. The extent of their success is eloquently evidenced by the widespread adoption throughout the world of analogous codifications. Perhaps Napoleon was right when he wrote, while a prisoner at Saint Helena, that "... what will live eternally, is my Civil Code."

The Code's sesquicentennial was heralded by appropriate celebrations throughout the legal world.

The Code Napoleon and the Common-Law World papers delivered during that commemoration contains eighteen essays, all but one of which were delivered at New York University. The exception is "Codification and National Unity" by René Cassin, which replaced an unfinished paper by Dean Boris Mirkine-Guetzévitch, whose death prevented its completion. However, Dean Mirkine participated at the opening session of the celebration and, from my own experience, as one of his listeners from time to time, I can only envy those who were, unfortunately, his last audience.

The title, *The Code Napoleon and the Common-Law World*, is a misnomer. Most of the papers do not deal with the Anglo-American legal system, but rather with the French Civil Code in particular or codifi-

cation in general. Claude Léwy, for example, discusses property concepts under the Civil Code and Professor von Mehren its contract provisions. Dean Jean Limpens considers its territorial expansion and Professor Nikola Stjepanovic its application in postwar Yugoslavia. All in all, the papers are excellent even though they fail to justify the title that purports to unify them.

Perhaps the most interesting essay for common-law lawyers is Professor Angelo Sereni's "The Code and Case Law." It is Professor Sereni's hypothesis that, despite the basic differences between common-law and civil-law systems, the latter is seeking a uniform line of decisions which implement and are consistent with the broad provisions of the Code. This so-called *jurisprudence constante*, once established, becomes the rule of decision until overruled by a higher court. On the other hand, Professor Sereni sees common-law countries, particularly the United States, tending to subordinate the importance of precedents to the broad legal principles and issues involved in each individual case. This rapprochement between the two systems can only serve to make each more flexible in an age when flexibility is a cardinal virtue.

Professor Bernard Schwartz, the energetic director of the Institute of Comparative Law, is to be congratulated both on the calibre of his participants and on the good sense to make their papers available in book form. Students of comparative law will find it a valuable addition to their reading lists, and it is only to be regretted that its circulation will be somewhat restricted by its \$12.25 price.

WILLIAM M. KUNSTLER

Kunstler & Kunstler
New York, N. Y.

AARON NOLAND. *The Founding of the French Socialist Party (1893-1905)*. Pp. viii, 233. Cambridge, Mass.: Harvard University Press, 1956. \$4.50.

Professor Noland has put a large amount of work into this study of the development of political socialism in France during the twelve years between the substantial electoral successes of 1893 and the foundation

of the Unified Socialist Party (S.F.I.O.) in 1905, with Jean Jaurès as its leader. He has made full use of the available Congress reports of the rival Socialist factions and has read widely in the parochial writing of the period. In addition he had access to the Guesde Archives, now in the International Institute of Social History at Amsterdam—a fact which leads to a more intimate treatment of the Guesdist Parti Ouvrier than of either the Allemanists and Broussists (Possibilists) or the Blanquists. He does, however, deal very fully with the Independent Socialists, including Millerand as well as Jaurès, and with the joint parliamentary group of the 1890's—the Union Socialists. Sticking closely to his immediate subject, the factors leading towards the unification of 1905, he almost wholly ignores the strong antipolitical, or rather anti-parliamentary forces at work in the French working-class movement during these years. Neither Pelloutier nor Griffeuilles, nor even Sorel, appears at all in his index; and Lagardelle is barely mentioned. The Anarchists too are almost ignored, though Maitron's book on them appears in the bibliography. A great deal of attention is rightly given both to the Dreyfus and to the affaire Millerand—the combined effect of which was first to split the French Socialists into two sharply opposed blocs and then to impose unity upon them at the strong insistence of the Second International. Professor Noland rightly stresses the extent to which, up to these disturbing events, the theoretically revolutionary Guesdist and Blanquist parties had been modifying their practical policies and accepting reformist parliamentary methods. He also brings out clearly the underlying contrast that remained between Jaurès's devotion to the tradition of *la République* and Guesde's refusal to regard the defense of the Republic or its good name as a matter in which any responsibility could fall on Socialists hostile to the bourgeois régime.

Professor Noland's narrative, within its self-imposed limits, is competent and thorough; but these limits reduce it to much less than a history of French socialism during the period it deals with. It is in fact what it declares itself to be—a monograph;

and the lack of any attempt to relate it clearly to the wider background of Socialist and of social development inevitably renders it rather dull. It is in effect a praiseworthy and useful study based on an intensive study of a large mass of ephemeral material; but even within its limited field it is inadequate in its handling of the Possibilist and Allemanist tendencies, and also pays too little attention to the share of Benoît Malon in the development of his conception of *Le Socialisme Intégral* and in his influence on the shaping of the Independent Socialists. Only one of Malon's works appears in the substantial bibliography, which is in other respects also rather curiously selective.

G. D. H. COLE

All Souls College
Oxford

G. D. H. COLE. *A History of Socialist Thought: The Second International, 1889–1914*. Pp. xvii, viii, 1,043. New York: St. Martin's Press, 1956. \$16.00 (2 vols.).

The Second International (in two volumes) is the third instalment of Professor Cole's monumental history of socialist thought. In his Introduction the author expresses the hope that, if he will live to write it, volume IV will bring the record up to 1939. This hope will be shared by all students of modern political thought, since there is no one writing in any language to-day who is as qualified to write a history of socialist thought as is Professor Cole. In the present scope, the work is not only the best on the subject, but virtually the only one that can claim the scholarship and style so happily combined in Cole's writings. The author is one of the most prolific writers in the field of social thought (not to speak of his many detective novels, which he must have written just to do something in his spare time); yet it is safe to assume that of all his works his *History of Socialist Thought* will endure as his *magnum opus* and as the crowning achievement of his life. Moreover, he writes from intimate experience and participation in the socialist and labor movements over a period of over forty years, particularly in Great Britain, supplemented by documen-

tary research on socialist movements in many other lands, European and extra-European.

In *The Second International*, Professor Cole covers the period of 1889, its start, to 1914, its demise. In many respects, those twenty-five years are the most interesting in the history of world socialism; socialist movements were not marred as yet by the failures and frustrations of governmental responsibility, and socialist ideas and ideals still commanded an increasingly growing appeal to men of goodwill and humanitarian leanings. Moreover, communism—except in Russia as a minor fraction under Lenin's leadership—had not arisen as yet as a world-wide movement bent on competing with socialism, and on ultimately destroying it. Volume I of *The Second International* concentrates on the major European socialist movements in Great Britain, Germany, France, and Russia. When he writes about British socialism, Professor Cole, one feels, is really at home, and his two chapters on British Labour are the best in the entire work. His study brings out clearly why British socialism ultimately emerged as the most successful democratic labor movement in the twentieth century. In the first place, British socialists operated within a democratic and liberal environment and could thus concentrate on social reform, whereas Continental socialists had to fight for political democracy and social reform at the same time. This two-front war was too much for most of them, as can be clearly seen from the present-day plight of the French socialists: by looking upon the defense of republican and democratic institutions as their first priority of policy, they have deliberately weakened themselves in the struggle for working-class social and economic achievements. The second advantage of British socialism during the period of the Second International lay in the fact that Marxism was never able to dominate the thinking of British socialist or labor leaders. On the Continent, most socialist movements suffered from intellectual paralysis and sterility, because by accepting Marx (verbally, at least) little seemed to be left that could still be said in the field of socialist theory. By contrast, British social-

ism continually drew upon new and diverse sources of intellectual inspiration, generally incompatible with Marx: the esthetic and artistic protest against capitalism of Ruskin and Morris; the idealism of Christian socialism as applied "practical Christianity"; the philosophical radicalism of Bentham and John Stuart Mill, the latter ending up, in his own words, as a "qualified socialist"; and finally, the empirical tradition of British thought and life, as reflected in the Fabians. As so often, Britain was out of step with the Continent, but this very fact may have saved British socialism from the fate of Continental socialism in many countries.

Volume II of *The Second International* deals with the lesser European countries and the extra-European movements in the United States, Canada, Mexico, Latin America, New Zealand, Australia, South Africa, China, and Japan. Limitations of space frequently result in very sketchy accounts, as it is virtually impossible to give an adequate picture of Chinese socialism in fifteen pages or of South African socialism in six pages. Where the author allowed himself more space, as in the case of Austria, Belgium, or Scandinavia, the results are much more satisfactory. Despite the necessary brevity in several instances, the world-wide review of socialist thought adds a dimension of breadth and universality, indicating that socialist influence was not confined to a few advanced, major nations in the West.

All in all, *The Second International* is a worthy successor to the earlier instalments in Cole's *History of Socialist Thought*, and it is to be hoped that the author will be able to bring the story, not only up to 1939, but completely up to date.

WILLIAM EBENSTEIN

Princeton University

FRANK E. MANUEL. *The New World of Henri Saint-Simon*. Pp. xi, 433. Cambridge, Mass.: Harvard University Press, 1956. \$7.50.

With the Count de Saint-Simon so well established a figure in the history of ideas, it is quite surprising that only now, 130 years after his death, a full-fledged appraisal of the man and his work has be-

come available in the English language. Professor Manuel, the distinguished historian at Brandeis University, has written a book that all students of social and economic thought will peruse with profit and pleasure, and that undoubtedly will be the standard work on the subject for many years to come.

Drawing invariably on the original sources and frequently on material available in the French archives, Professor Manuel generally allows his hero and his contemporaries to speak for themselves, and he wisely abstains from burdening the discussion with arguments concerning the priority of some of the key ideas in nineteenth-century social thought with which the names of Saint-Simon and of other writers are linked. By the same token, Professor Manuel's principal concern is with Saint-Simon himself rather than with the impact of his work on others and the echo of this impact in the more recent literature, such as, for example, in the writings of Dean Mason and Professor Hayek.

The outstanding features of Professor Manuel's work are the biographical detail, which has been assembled with great care and ingenuity, and the synopses of Saint-Simon's writings, culled from the 47-volume edition of the works of Saint-Simon and *Enfantin*, and from many other sources—newspapers, pamphlets, advertisements, circular letters, and other depositories for the products of the Count's untiring pen. In the early chapters of the book we learn about young Saint-Simon's adventures in America, where he fought at Yorktown and eventually was elected to become a member of the Society of the Cincinnati. Saint-Simon's stay in America, limited, as it was, to a period of two months, was one of the turning points of his life; so at least it seems in the light of the evidence of his later writings. After his return from America Saint-Simon set out on his exciting career in politics and business, a career characterized by such episodes as the manufacture of republican playing cards (no Kings, Queens, and so forth) and the sale of the leaden roof of Notre Dame de Paris. Having become wealthy for the time being, Saint-Simon then kept open house for the Paris scientists, who, however, "ate much

and talked little," thus frustrating his desire for a scientific education.

Saint-Simon's literary career, which is the principal topic of Professor Manuel's work, had to wait until Saint-Simon was in his forties. In spite of many fiascos and harassments, which brought with them temporary insanity and attempted suicide, this career, during the last twenty-five years of his life, led him to a position of influence attained only by a handful of nineteenth-century thinkers. In the words of Professor Manuel: "Saint-Simon's 'industrial doctrine' ended in a vision of the good society, a social order administered by working industrialists, scientists, artists, and engineers, all in the service, not of the state, but of 'the most numerous and the poorest classes.' Because he grasped the essence of the new industrialized society before it became bewildering in its complexity, Saint-Simon's work is a revelation of western social ideals in modern times."

HENRY W. SPIEGEL

Catholic University of America

WILLIAM NISBET CHAMBERS. *Old Bullion Benton, Senator From the New West: Thomas Hart Benton, 1782-1858*. Pp. xv, 517. Boston, Toronto: Little, Brown and Company, 1956. \$6.00.

Thomas Hart Benton's contemporaries saw him as the equal, even the superior, of his great senatorial adversaries: Clay, Calhoun, and Webster. As lawyer, soldier, editor, political leader, and publicist, for three decades Benton played a major role in issues of the day. Jackson found him a tower of strength in battling the "monster" Bank of the United States in the 1830's, and Benton fought equally hard to prevent slavery from disrupting the Union in the 1840's and 1850's. He worked for liberal land laws, for westward expansion, and for modification of the electoral college in the interest of democracy. His achievements entitled him to rank among America's great statesmen.

The loss of many of Benton's private papers in a fire shortly before his death made it difficult for later historians to present an adequate picture of his career. Theodore Roosevelt and William M. Meigs published biographies of him at the turn

of the twentieth century, but neither did the necessary work of searching for the scattered pieces of evidence essential to constructing a full-bodied picture of the man. As a consequence, Chambers gives us the first satisfactory biography of Benton almost a hundred years after his death. It constitutes a fascinating story.

Chambers presents Benton against the background of his times. In so doing, he takes the reader through the tortuous maze of politics in the Middle Period but with such facility of style and clarity of presentation that he makes the venture interesting throughout. As a good biographer should, Chambers probes the mainsprings of Benton's personality. Driven out of the University of North Carolina on the charge of petty thievery, Benton seems to have developed an enormous urge to prove himself and an extremely touchy sense of personal honor. He engaged in a dangerous brawl with Andrew Jackson as a youth in Tennessee and later killed young Charles Lucas in a vicious duel on "Bloody Island" near St. Louis, Missouri. Benton's egotism and domineering ways plagued him throughout his lifetime, but friend and foe alike had to recognize his courage, industry, and devotion to the right as he saw it. Within his own family circle he cast aside his imperious ways and became the devoted husband and doting father. Family sorrows cut him deeply but in public he never asked for quarter, even when a greater measure of compromise might have foiled his political enemies in the twilight of his political career. Even cancer could not conquer him until he had completed the last task which he had set for himself. Chambers brings Benton to life as a great statesman, a great personality, and a great American.

INTERNATIONAL AFFAIRS

GEORGE F. KENNAN. *Russia Leaves the War: Soviet-American Relations, 1917-1920*. Pp. xiii, 544. Princeton, N. J.: Princeton University Press, 1956. \$7.50.

This is the first of several volumes in which George F. Kennan will tell the story of American-Russian relations during the first stages of the Soviet era. Volume I deals with the crucial first four months, from the Soviet upheaval in November 1917 to the Brest Litovsk Treaty and Russia's quitting of the war.

Mr. Kennan, who has had twenty-five years' service with the State Department, is an outstanding expert on the Soviet Union. He headed the Policy Planning staff for a time and later served as United States Ambassador to Moscow. Since 1953, when he left the government service, he has devoted himself to the writing of history. With this book he proves that he possesses all the qualities requisite for an historian: ability to find and to analyze original material, familiarity with the sources, contacts with surviving actors of the drama, and an exquisite literary style. His book is one of the finest works on American policy of the period and the initial Soviet steps in the field of international relations.

The American official family in Petrograd (the capital was not moved to Moscow until March 1918, near the end of the period covered by this volume) were not unanimous in their evaluations of the meaning of the Soviet upheaval, and the divergency of views as to the present and future of Bolshevism, while not too sharp, was nevertheless important. Some Americans were more sympathetic to Lenin's government than others; some wanted to believe in a "democratic" essence of the new regime, while others could not be reconciled to such a belief. To some extent, the attitudes which prevail in this country today can be traced to the disputes of those first weeks of the Soviet regime.

Hoping against hope, the Americans in Russia at that time tried to influence Lenin's government against concluding a separate peace with Germany; exaggerating the impression made by Wilson's Fourteen Points on the Soviet leadership, they expected that, with American backing, Russia would stay in the war. One American, William B. Thompson, who had donated a million dollars to the Socialist revolutionaries when Kerensky was in power, now

described the Bolsheviks as "kindly, earnest men, heartily desiring to live at peace with their fellow men and being absolutely unwilling to fight each other or to enter into any form of civil war."

The exciting and, in a way, tragic Diamandi incident is recounted in interesting detail by the author. When a conflict broke out between the Russian troops operating in Rumania and the Rumanian government and measures were taken by the Rumanians to expel the Russians, Lenin, still in his infancy as a chief of state, responded by simply ordering the arrest of the Rumanian minister, Constantine Diamandi. In a body, the entire diplomatic corps called on Lenin and protested his action. Lenin had obviously not foreseen such a reaction. Diamandi was set free after a few days and ordered to leave Russia. He was accompanied by a commissar Svetlitsky to Finland, where both fell into "the hands of the White Finnish authorities." According to one (though not entirely reliable) report the "White Finns" proceeded to search them, and "were astounded to find on Svetlitsky an order, signed by Trotsky and addressed to the local Red Commissar of Torneo, calling upon him to 'do away with' Diamandi at the border. With relish, the Finnish Whites executed Svetlitsky instead."

Although Allied intervention did not begin until later, its first steps are traceable to diplomatic exchanges between the United States, Britain, France, and Japan in these winter months of 1917-18. London and Paris were favorable to a Japanese intervention in Siberia, whereas the United States sternly rejected such an action; the Japanese themselves were divided on this issue, being apprehensive that the Americans would have too much leeway in the Pacific if Japan should get bogged down in the vast spaces of Siberia.

In Mr. Kennan's forthcoming volumes we may expect to read the details of the absorbing drama of the Allied expeditions into Siberia.

DAVID J. DALLIN

New York, N. Y.

HENRY L. ROBERTS. *Russia and America: Dangers and Prospects*. Pp. xxxiv, 251.

New York: Harper and Brothers for the Council on Foreign Relations, 1956. \$3.50.

In the spring of 1953, the Council on Foreign Relations in New York organized a study group of distinguished Americans drawn from the worlds of business, law, and higher education to consider the problems of Soviet-American relations. In this group were individuals who had served in the government at home and abroad, scientists conversant with nuclear warfare, and experts in the field of Soviet studies. The chairman of the group was John J. McCloy, and author of the final report was Dr. Henry L. Roberts, director of the Russian Institute at Columbia University.

Mr. McCloy has contributed a long foreword to this study, in which he lays down broad perspectives of American foreign policy; he writes, "The struggle with Soviet Russia now extends beyond the military to the political, economic and social areas." While military aspects of Russian threat are not discounted by Mr. McCloy, he believes that we should concentrate more than we have in the past on these other areas of conflict. Mr. McCloy, however, very rightly does not consider that all of America's problems vis à vis the world are due to "Soviet devilry and cunning."

Dr. Roberts' report is divided into three parts: first, a statement of the atomic problem; next, the requirements of American policy; and finally, the areas of conflict between Russia and America. In the first part much valuable discussion is given on the implications of atomic and thermonuclear developments in regard to Russian-American rivalry and the nature of Communist totalitarianism. Dr. Roberts points out how difficult it is for us to grasp the nature of totalitarianism. He continues to assess the strength and vulnerabilities of the Russian-American problem by outlining three forms of antagonism: physical power—a full thermonuclear war, a limited war to attain specific gains, and a political war "to threaten, to bluff, to disarm, to discourage."

The second part of Dr. Roberts' report deals with what he calls "American Policy Requirements." He believes that a general

thermonuclear war or the world-wide establishment of Communism would be a "terrible disaster," but that the avoidance of both war and Communist domination is not an absolute policy requirement. He believes that if put in these terms the United States has to stop the world-wide establishment of Communism at the expense of a general war.

American policy requirements in this regard involve the following corollaries as he puts them: the maintenance of American strength, the coupling of American strength with that of our allies, and the stopping of further absorption of territory into the Soviet bloc. Dr. Roberts then discusses the implications of these minimum requirements through defense policy, keeping allies and winning neutrals, economic assistance, and social reform.

The final part of Dr. Roberts' formulation of the Committee study covers the areas of Russian-American conflict: Germany, the eastern European satellites, and Communist China and the question of Asian security. All of these questions are discussed in a very lucid analytical manner. Dr. Roberts believes that no final solutions are in sight, but his trenchant pen reflecting a very deep analytical ability to delineate these problems has contributed much to our further understanding of them.

WILLIAM B. BALLIS

University of Washington

MAO TSE-TUNG. *Selected Works*, Vol. IV: 1941-1945. Pp. 348. New York: International Publishers, 1956. \$3.00.

The present volume corresponds to the third volume in the original Chinese edition of Mao's selected works (*Mao Tse-tung hsüan-chi*, Peking, 1951-53). Its scope encompasses the last four years of the ill-starred Kuomintang-Communist "united front"—actually, the period in which the breach took on its definitive form. These were also the four years of American participation in the Pacific war after Pearl Harbor. We have been learning that we cannot understand our postwar world without knowledge of what happened during World War II. Here we have a most important basis for understanding the difficulties that would beset Chiang Kai-shek after

V-J Day, for appreciating the inherent difficulties of the Marshall Mission, and for grasping the characteristic underpinnings upon which the present superstructure of Chinese Communism rests.

Mao Tse-tung is shown here as a many-faceted leader with an extraordinary gift for self-expression. In lucidity, he far surpasses Stalin. In contrast to Stalin's obvious contrivances, Mao's strong sense of humor seems to grow from the essence of China; even in sarcasm, Mao's lightness and deftness ("The Hurley-Chiang Duet is a Washout," pp. 324-27) stand in sharp contrast to Stalin's hard breathing and heavy-handedness. Mao is capable of drawing upon classical Chinese allusions, even to the point of referring favorably to Confucius, when his purpose is to lampoon his comrades' tendencies to clothe Marxism-Leninism in antiquated or formalistic terms ("Oppose the Party 'Eight-Legged Essay,'" pp. 46-62). The works of such personalities as Stalin and Mao Tse-tung are seldom evaluated as literature, because we are preoccupied with the political implications of what they have to say. But the present volume demonstrates Mao's appeal to the Chinese *literati* in form and style, and the intellectual acuity that underlies his leadership of the Chinese Communist party.

The thirty-two selections in the present volume include: major political documents, such as Mao's "report" to the Seventh Party Congress in 1945 ("On Coalition Government," pp. 245-315); directives for the "ideological reform" (Cheng Feng) movement of 1942-43, which gave Chinese Communism a distinctive character ("Rectify the Party's Style in Work," pp. 28-45); "Maoist" interpretations of the party's history ("Resolution on Some Questions in the History of Our Party," pp. 171-218); an analysis of party policy with respect to art and literature, which has remained almost constant since 1942 ("Talks at the Yen'an Forum," pp. 63-93); and a wide variety of statements on strategic, tactical, political, economic, and organizational questions of the time. From one point of view, these materials offer an explanation of recent history; from another, they offer insights into contemporary policies unobtainable in other ways. Whoever wants to

understand how Chinese agriculture was substantially collectivized (or "cooperativized") during 1956 might well begin by reading "Let Us Get Organized" (pp. 148-56)—Mao's address of November 29, 1943!

H. ARTHUR STEINER

University of California
Los Angeles

NICHOLAS P. VAKAR. *Belorussia, the Making of a Nation: A Case Study*. Pp. xii, 297. Cambridge, Mass.: Harvard University Press, 1956. \$6.50.

———. *A Bibliographical Guide to Belorussia*. Pp. xii, 63. Cambridge, Mass.: Harvard University Press, 1956. \$2.00.

These two volumes represent close to a decade of very diligent research on the part of the author and are made all the more important by the previous absence of a suitable introduction to Belorussia in the English language.

The introductory volume commences with a brief excursion into the ethnography, demography, origins, and popular traditions of Belorussia. Only six chapters—totaling some ninety pages—are historical in the sense that they deal with the pre-World War I period. The bulk of the volume is devoted to the beginnings of the national movement in the late nineteenth and early twentieth centuries under Russian rule, the conditions prevailing during the partition of the country by the Soviet Union and Poland during the inter-war period, the reunion of the country in the autumn of 1939 as a result of the Soviet attack upon Poland, the German occupation in World War II and postwar developments both in the Belorussian SSR and amongst the émigrés in the West.

Professor Vakar teaches Russian literature at Wheaton College and is a veteran associate of the Harvard Russian Research Center. He writes with detachment and caution explaining the Belorussian point of view with fairness. He has utilized the data obtainable from the Belorussian émigrés and their publications but has not accepted their views.

While this is a sound introduction to a people little known in the West, it is not an entirely complete analysis or synthesis. A social scientist might have written a

somewhat different volume. Be that as it may, this is a volume of substance with which the critic cannot easily quarrel, although it is not pleasant reading for many Poles because of the sordid record of Belorussian-Polish relations during the interwar period. One objection which can be made is that the evidence presented is often of a contradictory nature and the contradictions are not always resolved; in fairness to the author it should be stated that, given the nature of the subject matter, a certain degree of irresolution is inevitable. In general, Professor Vakar paints a dark future for Belorussian nationalism and even writes of it as moving "toward complete dissolution in the Soviet sea" (p. 225), but at the same time he refers to factors which might serve to qualify this conclusion.

The *Bibliographical Guide* contains more than two thousand entries and is an outgrowth of the principal volume under review. No scholar can readily use the introductory volume without employing the *Guide* since all sources referred to in the former are given in terms of the authors and the numbers which correspond to their listings in the *Guide*.

JOHN S. RESHETAR, JR.

University of Pennsylvania

ANATOLE G. MAZOUR. *Finland Between East and West*. Pp. xiv, 298. New York: D. Van Nostrand Company, 1956. \$6.50.

The fascinating history of Finland falls naturally into three unequal periods: over six centuries of union with Sweden during which the Finns were politically "native Swedes" in the full sense of the term; the precarious union from 1809 to 1917, as an autonomous state, within the Russian Empire, culminating in an independent Republic in 1917-19; and the story of nearly forty years under the Republic.

Professor Mazour has not made use of this pattern. Instead he has employed the concept that Finland has been and is a border area between East and West in which coexistence is no recent experience, but an old and unchanging condition of life. The use of this concept represents a simplification that cannot but be misleading in many ways. For instance, it ob-

scures the all-important fact that the Finns' political experience in general and their democratic institutions in particular, to say nothing of culture patterns in the large, are Western and in no way a hybrid product of existence "between East and West." Despite the limitations imposed by the author's formula, however, he has produced a lively narrative. The main accent is on the period since 1917, and half of the book is devoted to the years 1939-56. Twelve appendices covering roughly one-third of the volume contain documents illustrative of Finnish-Russian relations from 1920 to 1948.

The Russo-Finnish two-phase war in 1939-44 was an exceptionally interesting and dramatic one of World War II. The nature of Soviet aggression in 1939 and 1941 has been pretty well described by now, but the whys and wherefores of Finnish policy and the nation's resolve and capacity to resist will no doubt be debated for many a year. The author enters the debate with gusto. He combines enthusiastic admiration for the Finns with cautious weighing of pertinent fact and circumstance. He appears to conclude that a Finnish policy of "less daring and more statesmanship" would have produced better results than fighting (the book contains quite a bit of laborious argument in support of this notion), but fails to suggest how the Finns could have avoided subjugation by the USSR without resisting invasion. The author's verdict in the matter is curiously vacillating, probably because he has been unable to make use of pertinent Finnish materials and studies.

A final caveat is in order. The blurb on the jacket claims that Professor Mazour's book is more candid than Finnish accounts, and that Finnish scholars have never dared to be as frank as the author in describing Finland's post-1939 diplomatic and military relations and problems. The claim is extravagant. The fact is that Finland's development and history since 1939 have been described in a considerable number of Finnish studies of high calibre. Not one of those that have come to the reviewer's attention could be said to lack—whatever their other shortcomings may have been—the kind of daring claimed for

Professor Mazour's tome. This applies with special emphasis to the excellent study by Max Jakobson (its title in translation is *The Winter War of the Diplomats*), whom Professor Mazour identified in his Preface as one of many people to whom he is indebted for advice and "constructive criticism."

JOHN H. WUORINEN

Columbia University

ABRAHAM YESELSON. *United States-Persian Diplomatic Relations, 1883-1921*. Pp. ix, 252. New Brunswick, N. J.: Rutgers University Press, 1956. \$5.00.

Although excellent general texts dealing with American diplomatic history are abundant, rarely do they contain discussion of American foreign relations with the Middle East. "This area of the United States foreign policy," the author complains, "has been neglected"; and the purpose of his book is to "fill one of the gaps in the studies of American diplomatic history." Since the United States has found itself inevitably involved after World War II with Persian external and internal problems, an examination of the traditional American policy toward Persia since the establishment of a legation in the Persian capital in 1883 is deemed necessary by the author which may throw light on the understanding of present-day events and policies. In the formative period, American policy has stressed nonentanglement and nonintervention in Persian affairs in spite of the repeated requests of the Persian Government to invite American diplomatic support in its struggle against Anglo-Russian intervention. When finally an American financial adviser, Mr. Shuster, was appointed in 1911 to help reorganize the financial chaos, Russian and American pressure on the Persian Government led to his dismissal without even a formal protest made by the American Government. This policy has finally been greatly adopted under the changed circumstances of the post-war world in which American leadership in the Middle East as in other parts of the world is bound to assert itself.

The author presents a straightforward account of American diplomatic relations with Persia during the formative period.

He made extensive use of archives material, now accessible in the National Archives, and of all important published studies in Western languages; but he made no attempt to use native source material unless it is found in Western languages. However, his treatment of the subject is dispassionate, and the book is well-organized and lucid. The author is to be congratulated for a thorough and scholarly study.

MAJIID KHADDURI

School of Advanced International Studies
of Johns Hopkins University

V. P. MENON. *The Story of the Integration of the Indian States*. Pp. 511. New York: The Macmillan Company, 1956. \$7.00.

Here are indeed stirring annals of achievements in political and social science accomplished in the vast laboratory of "princely" India by an indefatigable administrator of unusual competence and vision. Within five years, Mr. Menon and his associates in the States Ministry of the newly independent government of India brought to pass what many experts in Indian affairs had prophesied to be impossible without violent revolution—namely, the integration of nearly all the former princely States with the new Union of India. His book is a tribute to his chief, Sardar Vallabhbhai Patel; it is no less a tribute to the co-operation between the leaders of the new India and the members of the former civil and military services. Mr. Menon had spent his life in the Indian Civil Service and was about to retire as constitutional adviser to the Governor-General when the challenge of this extraordinarily complex, formidable, and exhausting task confronted him.

Mr. Menon confines himself to a straightforward account of this great drama as he personally saw it. When he ceased to be connected with events, as in Kashmir after referral of the case to the United Nations, he does not pursue the subject further. His account provides an excellent demonstration of what he calls the "compulsion of events," especially in Junagadh, Hyderabad, and Kashmir. He is most convincing in showing that in many states,

situations developed which were not foreseen in advance, and that many a crucial decision seemed the only one possible in the stress of the moment. He disposes quite effectively of the notion that the States Ministry, like the spider in the fable, enticed the princely flies into its parlor with the bait of "accession" to India in respect to "defence, foreign affairs, and communications only," and then swallowed them whole. Indeed neither princes nor ministers understood in 1947 that full integration would have to come so quickly. No one realized that a new constitutional structure could be so speedily built. What is more, no one, especially on the princes' side, realized that the traditional authoritarian government, especially in the smaller states, would have to be superseded by "responsible" government in some form if administrative chaos and communal strife within the princely states were to be avoided. Mr. Menon is quite right to point out that there could after August 15, 1947 be no such thing as the old "paramountcy" exercised by Indian government officials over Indians. Nevertheless, he seems strangely oblivious to the fact that his chief and he often coerced princes to an extent undreamed of by British officials. Janjira is a case in point: "We now informed the ruler that he must sign the merger agreement and that the Government of Bombay would take over the entire administration of his state. The Nawab consented" (p. 204).

In his narrative, Mr. Menon is eminently fair to the princes. The eccentricities and extravagances of the few disreputable rulers are referred to only in so far as they explain what took place. Mr. Menon is most anxious to leave his readers in no doubt that the immense advantages gained by the integration of the princely states with the new Republic of India far exceed the obligations incurred by the guarantees of "privy purses," titles, and dignities to the princes. At the end, one detects in the author a certain anxiety lest the further changes in the map of India now taking place may unsettle his work. Nevertheless, it remains an achievement in which he may well take great pride. Designedly written for those well informed on Indian

affairs, this book will not be easy reading for the uninitiated. It is to be hoped that a popular condensed version may be prepared and made available in Indian languages as well as in English for a few rupees a copy.

University of Pennsylvania

A. B. LAL (Ed.). *The Indian Parliament*. Pp. xxiv, 296. Allahabad: Chaitanya Publishing House, 1956. \$4.00.

This collection of fifteen essays examines significant aspects of the organization and work of the Indian Parliament, reviews the growth of parliamentary institutions, and assesses the current condition of parliamentary democracy in India. The symposium will no doubt be of greatest value to the layman who wishes to obtain a view of the "hub and pivot of the political system" in India, but who does not have readily available Indian constitutional documents. However, the work is not only descriptive; several critical essays introduce the reader to an inside view of the stresses within Indian democratic forms and processes.

The office of the President of India has often been referred to as little more than that of honorary head of State. Several authors in the book under review, however, call attention to the potential latent in the constitutional provisions regarding the office. Mohan Lal (of Allahabad University), in his chapter on "The President and Parliament," discusses the channels through which an unscrupulous President might be able to subvert the democratic principles upon which the Republic is founded. He concludes that the "real test" of the relations between the President and Parliament may not come until "either the extremist parties acquire a majority in Parliament or when the President and the Prime Minister belong to two different parties." India's first President, Dr. Rajendra Prasad, has refrained from testing the extent of the powers of the office and, therefore, as Mohan Lal points out, the President and Parliament have "not yet found their level." Much will, indeed, depend upon the kind of party system which evolves, an observation in effect supported

by the chapter on "The Opposition" contributed by the Communist leader in Parliament, A. K. Gopalan.

Mr. Gopalan insists that the "real opposition" in India is that led by the Communists, but he makes no secret of the fate awaiting an opposition should Communists come to power. The opposition role, he states baldly, is "decided by the attitude taken by the ruling party towards the aspirations of the people. When there is no conflict between the two there is no room for another party" (p. 82).

Perhaps the liveliest chapter is that by Dr. Lanka Sundaram on "The Role of an Independent Member." He makes an excellent case for the contribution which can be made by the true Independent and illustrates from his own experience the frustrations but occasional triumphs possible for an Independent Member of Parliament.

A word of caution with regard to the short chapter on "The First General Elections" by Asoka Mehta: the statistical analysis is apparently a fragment culled from the author's 1952 booklet, *The Political Mind of India*, and has not incorporated later figures made available by the Election Commission Reports. It was a disappointment to this reader that Asoka Mehta had not contributed a chapter based upon his more recent experience in Parliament.

In the concluding chapter M. G. Gupta (of Allahabad University) reviews the problems which face parliamentary democracy in India and the achievements with which it may justly be credited.

Professor Lal has written a useful Introduction which reviews salient features of Indian government and raises some significant questions.

JOAN V. BONDURANT

University of California
Berkeley

PHILIP W. THAYER (Ed.) with the assistance of WILLIAM T. PHILLIPS. *Nationalism and Progress in Free Asia*. Pp. xvi, 394. Baltimore, Md.: Johns Hopkins Press, 1956. \$5.75.

For some years the School of Advanced International Studies of Johns Hopkins University has been performing a notable

service by bringing together each summer a group of scholars and government officials to discuss contemporary issues in some major world area or region. From these conferences have come a distinguished series of volumes of which the one under review is the latest. This conference is distinguished from its predecessors in that a counterpart conference on the same theme was held abroad at the University of Rangoon where the School has co-operated in the establishment of a study center.

The contributions to this volume consist of papers delivered at these two conferences, together with a commentary on each paper. The thirty-seven contributors and commentators include such distinguished names, chosen at random, as Walter S. Robertson, Assistant Secretary of State for Far Eastern Affairs; D. G. E. Hall, Professor of History from the University of London's School of Oriental and African Studies; Professor Rupert Emerson of Harvard University; G. L. Mehta, Ambassador from India; Victor Purcell of Cambridge University; Brian Harrison of Hong Kong University; Soedjatmoko, Secretary, Indonesian Council of World Affairs; U Ba Nyunt, University of Rangoon. Topics covered include reciprocal views of each other by the United States and South and Southeast Asia: an analysis of the European impact on the area, progress of nationalism, political and economic development, demographic and racial problems, international relations, and foreign questions.

It is unavoidable that a symposium of this type should contain dull as well as bright spots, areas of duplication and gaps of omission. Southeast Asia receives a good deal more attention than South Asia, although Richard L. Park of the University of California contributes a paper on political development which underlines India's experience. Avoiding, in his own phrase, "resounding clichés and overstuffed generalizations," Park, while cautiously optimistic, calls attention to some of the difficult problems new parliamentary governments face, such as making a change "from a civil service of imperial control to a public service in the building of welfare

states," in which the claims of administrative competence may appear to clash with those of democratic control.

J. S. Furnivall, advisor to the Government of Burma, comments memorably on the paper on "Aftermaths of Colonialism" by Walter H. Mallory, Council on Foreign Relations. Furnivall sharply asserts that the impact of the West on "oriental economy" was not attributable to "colonialism," by which he refers to settlement by European colonizers, nor even to the introduction of European capital, but rather to the intrusion of "capitalism as a social system," a system which, Mr. Furnivall says, caused "the transformation of the social order into a business concern."

For the economist, Abdul Aziz of the University of Malaya provides a vigorous attack on some widely accepted notions about the "lazy native's" preference for leisure to income, his unwillingness to increase work output in response to wage increases. Papers and comments by Harold H. Fisher of Stanford University, Lucian W. Pye of Princeton, now at M.I.T., and Roger Swearingen of Southern California shed light on the motivations which lead diverse groups of Asians to accept or reject Communism. An index provides an essential key to the volume as a whole, making it possible to browse here and there to satisfy one's own curiosity, perhaps a better way to approach this book than by an attempt to read it straight through.

FRED W. RIGGS

Indiana University

KENNETH INGHAM. *Reformers in India, 1793-1933*. Pp. xi, 150. New York: Cambridge University Press, 1956. \$3.50.

This valuable book is, according to the subtitle, an account of the work of Christian missionaries on behalf of social reforms. Its author is a man of experience and competence within the range of the social work depicted and evaluated on the part of his chosen characters. Although he dwells upon their social work, he reflects the true spirit and just accomplishments of Christian teaching in the mission field.

India profoundly furnishes the setting,

and Ingham's book brings into due perspective activities and accomplishments—and sometimes failures—between the years 1793 and 1833. It is, therefore, history with appraisal of forty years thereof, dependent largely upon the writings of active missionaries of the period—including official correspondence and personal letters. For its small compass as a book it is exhaustive, a prodigious survey brought into attractive form reflective of individuals and societies of Great Britain.

The duly educated reader will meet a host of familiar names, but may likewise meet a great array of the unfamiliar. He will have his grasp of the situation greatly broadened and strengthened. Nearly two hundred fifty Protestant Christian missionaries at work in India are specifically and appropriately referred to in well-integrated passages. This is indeed a valuable volume not only for the casual reader, but also for the student who is bent upon perspective and accomplishment in a momentous era of modern Christianity. No sincere reader will find its multiplicity tedious. In reading, however, one must give thought to its contents.

There is Indian atmosphere and detail in the volume, reflections of festivals, the lot of women, the scope of education, languages and literature, medicine and agriculture. Here is a worthy summary of forty years of Christian expansion. The reader who is so concerned will find the sources of the book's contents duly listed and may augment, if he will, what he immediately reads, although it must be conceded he may not find the sources always readily handy. In any case, the book will serve an excellent purpose in any earnest reader's stock. It is in itself a unique venture highly to be commended.

JOHN CLARK ARCHER

Yale University

JOHN R. WILLIAMS. *The Conservative Party in Canada: 1920-1949*. Pp. x, 242. Durham, N. C.: Duke University Press, 1956. \$6.00.

This is a chronicle of decline. From the high water mark of its popularity and power, under Sir John A. Macdonald in 1884, to its present position of being "prac-

tically a one Province party," the deterioration of Canadian Conservatism is traced in a series of well-documented chapters, each of which is a separate study in itself. Among the causes of decline the party leaders, "well intentioned men lacking in ability," are assigned a chief place. They were unable to cope with the strong tides of religious and racial prejudices which divided the country before and after World War I. Because of their conscription policy it might be truly said that the Conservatives "won the war but lost the party." Under the "cold, reserved, and dogmatic" Arthur Meighen in the 1920's the party became "a one man affair," lacking warmth and popular appeal. But it was the coincidence of the depression and the "bullying tactics" of R. B. Bennett in the thirties that produced the final debacle. Bennett's belated "New Deal" split the party beyond repair. Conservative seats in the House of Commons were reduced from 137 in 1930 to 39 in 1935. (The present representation is 51.) Among the expedients tried to rejuvenate the party were the introduction of a National Convention similar to the American system, and an attempt to build up a national organization. The author devotes considerable space to these experiments because of his own personal acquaintance with them during the election campaigns of 1948-49. American readers will be interested in the contrasts he points out between the Canadian political system and their own. The Convention, especially, appears to be an American importation only partially adaptable to the Canadian system. The result is that it has "created and spread disunity" and may be considered as one of the causes of decline. The National Organization of the Conservative party is also inadequate and exists mainly as "window dressing." The failure of the party to find a vital role for women and for youth, their inability to solve the problem of Anglo and French Canadians, and the general suspicion that, despite pronouncements, the Conservatives were unsympathetic with labor, complete the impression that any significant revival of the party is very doubtful.

The latter part of the book is devoted to rather detailed studies of Canadian elec-

tion returns and of the performance of the Conservative party in Parliament. These are supported by excellent statistical tables and charts. One becomes increasingly aware that the Conservative party has ceased to be a national party in any true sense of the word, and that for the most part its platforms are identical with those of its traditional rivals, the Liberals. The fact that the party has changed its name five times in twenty years, and now bears the incongruous epithet "Progressive Conservative," is an indication of the internal tensions. The author feels that there was great value and stability in a two-party system where the only difference was that one party was *in* office and the other party *out*, and, like a true Conservative himself, shrinks from the changes that might develop in Canada if the socialists became the alternative to the Liberals. However, he recognizes clearly that the Conservative party in Canada is "in a precarious position."

Since the author has approached his subject topically, leadership, conventions, organization, and so forth, there is considerable repetition. However, the book is very readable and thought-provoking and is certainly a welcome addition to the growing literature on Canadian history and politics. The footnotes are ample and are packed with interesting quotations culled from private interviews or from the study of unpublished papers. If there is any criticism of the present book it would be that it stops at the election of 1949 rather than that of 1953, and that it does not attempt to analyze the cause of Conservative decline beyond the federal level. The eclipse of Conservatism in the provinces, especially in the west, and the emergence of very strong farmer or Social Credit governments and political machines would seem to indicate that at the "grass-root" level a new political philosophy has already replaced "Progressive Conservatism" in Canada.

MAURICE W. ARMSTRONG

Ursinus College

ARTHUR P. WHITAKER. *Argentine Upheaval: Perón's Fall and the New Regime*. Pp. x, 179. New York: Praeger, 1956. \$3.50.

This is not a great book. It is not intended to be. It is merely a running account, with intelligent interpretation, of the events that led to the overthrow of Argentina's Perón and the establishment of a provisional government in place of the "Justicialist" dictatorship. Yet within the modest framework designed by the author, the book undoubtedly serves a most useful purpose. It brings together within a single volume a substantial number of facts, and provides just enough background to make a well-rounded story.

This story begins on June 16, 1955, the day of the abortive revolt against Perón, and ends on December 1 of the same year, the day that the book went to press. Therefore it manages to include such significant events as the transfer of power from Lonardi to Aramburu. On the other hand, it necessarily omits all reference to dozens of subsequent happenings of major importance, such as the bloody uprising against the Aramburu regime in June 1956. One could wish that Professor Whitaker had waited a little longer before finishing his account, in order to tell a little more; but one must also admit that no matter how long he had waited, the story would still be unfinished. The trouble with history is that it never stands still.

Professor Whitaker is, of course, well qualified for the task that he has set himself in this book. He has visited Argentina many times, and has taught at a number of Latin American universities. His recent work, *The United States and Argentina*, is generally recognized as a model of scholarship. To some extent *Argentine Upheaval* may be considered a brief sequel to the earlier work, though of course it deals with much more than Argentine-United States relations, which are given special treatment in one of the final chapters. It is at this point that Professor Whitaker makes a rather curious suggestion—namely, that we might strengthen the present Argentine regime by engaging it in a sharp diplomatic controversy, and then offering financial aid as the price of peace. "This would cost no more than we were, by hypothesis, already prepared to pay and the 'defeat,' which would do no harm to so strong a nation as the United

States, would make possible the realization of the assumed objective of its policy." Perhaps such a diplomatic defeat would not hurt the United States, but it would almost certainly hurt the political party responsible for the incident.

AUSTIN F. MACDONALD

University of California

LOUISE W. HOLBORN. *The International Refugee Organization: A Specialized Agency of the United Nations, Its History and Work, 1946-1952*. Pp. xiv, 805. London, New York, Toronto: Geoffrey Cumberlege, Oxford University Press. Issued under the Auspices of the Liquidation Board of the International Refugee Organization, 1956. \$7.20.

This volume is the official record of the International Refugee Organization, the first international agency created by the United Nations and the most successful example of large-scale international co-operation for humanitarian purposes. It is happily concerned not merely with structural and administrative matters, but with the operations and achievements of this great service organization in meeting a vast and urgent human problem.

The IRO was established to deal with the residue of the problem of refugees and displaced persons at the end of the war, to do what the Allied military authorities, the United Nations Relief and Rehabilitation Administration, and the Intergovernmental Committee for Refugees had been unable to accomplish. During the four and a half years of its operation it dealt with more than one and one-half million people dislocated by war or persecution, in search of asylum and livelihood. The great majority of these unfortunates were assembled in camps, which in many instances took on community aspects, located chiefly in Germany, Austria, and Italy but also in Western Europe, the Middle East, and elsewhere. The IRO provided care and maintenance, rehabilitation, legal and political protection, counseling, vocational training, employment, and other services. It undertook to trace missing persons and reunite families, to repatriate those who so desired, and to re-establish the rest in coun-

tries of first refuge or resettle them overseas. These activities were carried on despite many material difficulties and at a time when the doors of most nations were closed to immigrants. The IRO also had to face the opposition of the USSR and its satellites which never officially recognized it and consistently voted against it in the UN. Although only eighteen governments out of the fifty-four of the UN participated in establishing and financing the IRO, they contributed over \$400 million and demonstrated what a limited number of governments can accomplish through joint effort.

Repatriation to their countries of origin or previous permanent residence was at first considered the primary means of reducing the refugee problem. Actually, due to fear of persecution, it concerned only a small part—some 72,000. More important among the permanent solutions were local settlement or integration in countries of first refuge, involving over 100,000; and resettlement overseas, which provided for more than 1,000,000. Resettlement was effected in forty-eight countries ranging from the United States which accepted 328,851 to Panama which accepted 63.

Dr. Louise W. Holborn, professor of political science at Connecticut College, has shown great skill in organization and exposition of a great mass of detail. Not only is this a valuable reference work; it also provides a readable and authoritative account of interest to the student of immigration, political administration, and international relations.

MAURICE R. DAVIE

Yale University

ANDREW W. LIND. *Hawaii's People*. Pp. xii, 116. Honolulu: University of Hawaii Press, 1955. \$2.75.

Hawaii has a distinguished reputation for successful race relations in a world that very much needs such examples. Professor Lind of the University of Hawaii, in this short, well-organized, and very readable book, surveys the facts of Hawaii's racial mixture, shows where in Hawaii the different races have lived and live, how they have earned and now earn their liv-

ing, and the trend of marriage and amalgamation. Five main groups live in Hawaii. In 1950, by the partly arbitrary census classifications, there were in the half million total population 37 per cent Japanese, 23 per cent Caucasian, 17 per cent Hawaiian, 12 per cent Filipino, 6 per cent Chinese and 4 per cent "other races."

What are the evidences of good adjustment over a century ago of one language (English); the rapid rise since 1890 in the per cent of the population of all races who are literate, and of young people of all races who have been attending school; the rising proportion of all races who are citizens and the rising numbers of voters of all races; and the similar income levels of all races (1949 data: lowest median income of males, Filipinos at \$1,995; and highest, Chinese at \$2,964). The pattern of early marriage and large families accepted in most of the peasant societies from which come Hawaii's immigrant and indigenous peoples has been generally giving way to postponed marriage and restricted family size. Sharply falling infant death rates indicate similar sanitation and medical practices. Inter-racial marriages have been rapidly growing among most races in the last forty years. There has been a steady decline (data of 1931 to 1950) in the proportion of children whose ancestry is exclusively of one race.

In brief, Hawaiians have been becoming more similar in many ways and they have been losing any sense of significant differences.

Why have Hawaii's race relations been so good? Lind feels the following factors help to explain it: the explorers and traders who visited Hawaii in the first fifty years were not interested in conquest of those small and isolated islands, but mainly in supplies of food and water. "Moral and racial tolerance was . . . a by-product of the market place." The missionaries, in from New England, were strong supporters of the pattern of racial equality set by the traders. The plantation system threatened for a time to impose a racial hierarchy, but that influence has been weakened and overbalanced by the effect of competition from the commercial centers for labor and by

compulsory education and other causes of social mobility. Since annexation to the United States in 1898 our constitutional guarantees of equality before the law have applied equally to all races. Tourists come to Hawaii in increasing numbers year by year and often with the racial prejudices of their home communities. But in search of adventure they may discard their stereotypes "with surprising ease."

I would myself add two further aids to racial harmony. Hawaii has been blessed with an expanding economy until today it has one of the highest income levels of the United States. Prosperity favors tolerance. Is it fanciful to feel that a remarkably fine climate and beautiful scenery dispose toward less personal tension and so also toward more tolerance?

THEODORE MORGAN

University of Wisconsin

KENNETH B. CUMBERLAND. *Southwest Pacific*. Pp. xviii, 365. New York: McGraw-Hill Book Company; New Zealand: Whitcombe and Tombs, 1956. \$6.50.

The highly versatile author, professor of geography, Auckland University College, offers all the physical and human geography of Australia, New Zealand, and their Pacific Islands neighbors: New Guinea, New Hebrides, Solomons, Loyalty Islands, New Caledonia, Fiji, Samoa, Tonga Islands, and so forth. The book deals with the historical background of the various peoples and their economics, as well as with their future prospects and manifold problems.

The population of Australia, the most sparsely peopled continent, is about 9 millions, one-third of one per cent of the world's population—almost as many people live in New York or London. Australia and New Zealand's importance, however, in the world is greater than their numbers would suggest. "Their high levels of education and technology have enabled them to take maximum advantage of the resources at their disposal, given a high level of per capita productivity and of world trade and enabled their two countries to take a relatively prominent part in world affairs—economic, political, social

and military." The 125 million sheep of Australia produce one-quarter of the world's wool, the sale of which brings about half of what the continent gets from the sale of all its exports.

It is almost surprising the large number of facts that the author is able to demonstrate. The many statistical tables, the interesting ninety-nine photographs and ninety-two maps help us to understand the subject matter. There is no doubt that the author will attain his purpose "to make available to the people of Australia and New Zealand especially, and to the younger generation of future politicians, administrators and businessmen in particular, an objective geographic account of the territories of the Southwest Pacific." But this valuable work is not only designed for schools; because there does not exist any other study covering the same subject, general readers all over the world will need it.

The only data I miss has to do with my visit to Australasia in 1909 and covered in my book, namely, the highly developed social legislation, especially the old-age pensions in which Australia has been leading the world since 1898.

ALFRED MANES

St. Petersburg, Fla.

LUIGI VILLARI. *Italian Foreign Policy Under Mussolini*. New York: Devin-Adair Company, 1956. \$6.00.

Dr. Luigi Villari has chosen to study and defend Italian foreign policy under Mussolini. His book covers over the two decades in which Italy, from the state of a war-weary and exhausted nation (1918-25), reached a relative state of well-being (1925-33), and then gradually drifted towards the tragedy of World War II and its dire consequences.

Dr. Villari attributes the failure of Mussolini's foreign policies to such Italian political expatriates as Count Carlo Sforza and Gaetano Salvemini, to communistic propaganda, and to the blindness of the political leaders of England, France, and the United States.

The work is well-documented and most of the events here presented are historically

accurate. The reader must, however, conclude that the thesis espoused by Dr. Villari can only ask its validity from the heart-breaking truth that nations are motivated in their foreign policies by egotism, lack of sincerity, and opportunism. By the strength of this argument, Dr. Villari cannot absolve Mussolini of his political and moral responsibilities. Even if one admits that undoubtedly Mussolini was trying to better the conditions of his country and give to it a greater international prestige, one cannot conclude that he was possessed of a truly new outlook in international life nor of new principles and methods. He followed the same road that nations have followed since time immemorial: strife, violence, and war.

In attributing to England the failure of Mussolini's policies in Ethiopia, Dr. Villari most assuredly knows that, here again, this claim does not relieve Mussolini of his moral responsibilities in the Ethiopian War. Mussolini was very rash, took steps that were condemned by the conscience of thinking men and women who were not represented in the Council of the League of Nations, and failed miserably in Ethiopia, destroying all the work and achievements that Italy had laboriously accomplished there in almost a century.

Dr. Villari's book appears at a moment that seems propitious to the author, in that European and Middle-East nations are following policies not different from those followed by Mussolini. Only a cynical philosophy of history could lead one to conclude that, because of this, Mussolini was justified in attacking Ethiopia, in joining Hitler and Japan in an avowed attempt to conquer the world, and in attacking France and England. In spite of the utilitarianism and a morality of political conduct, one has to conclude that, in looking at the screen of human history, the residuum of historical actions has positive connotations. No one will ever question the nobility of the aims and accomplishment of Lincoln in our own Civil War, nor that of Italy during the Risorgimento period. A dignified treatment of an historical period must conform to this positive connotation of history and of historical figures, if it wants to claim significance.

It seems to this reviewer that the weakness of the present book lies in the author's attempt to justify Mussolini in all that he attempted in the international sphere, on the ground that, in his foreign policies, he was not different from those who between the two wars held in their hands the destinies of the world.

DOMENICO VITTORINI

University of Pennsylvania

UNITED STATES GOVERNMENT

EDWARD S. CORWIN and LOUIS W. KOENIG.
The Presidency Today. Pp. ix, 138.
New York: New York University Press,
1956. \$3.00.

The Presidency Today has a triple guarantee of excellence. It was produced by the collaboration of the writer of the most significant book on the Presidency and a younger man who has been making a name for himself in this field. Distilling the leading points as it does from Professor Corwin's book and other sources, it makes its own contribution by giving us a beverage which is 98 per cent proof. Drawing as it does upon many recent developments, it justifies the use of the word "today" in its title without sacrificing that historical perspective so characteristic of its senior author. It is, in short, one of those rare books which both the general reader and the serious student of government will find worthy of perusal.

The proposal is advanced once more that Congress and the President make a compact by which he would bring legislative leaders into his cabinet and consult this body before announcing important decisions, and Congress would consider his legislative recommendations regardless of whether they had the approval of the new cabinet. The reviewer can only hope that this suggestion will fall on deaf ears in the future as it has in the past. The secret of popular government lies in a wholesome interplay of leadership and responsibility, of tutorship and public response; and of these two elements the President "represents" the one and Congress the other. To

obscure the distinction would be to dilute leadership and compromise responsibility.

Nor can the reviewer accept as satisfactory the treatment of the steel seizure case. Though the application of so general a principle as the separation of powers to many situations is in the nature of things doubtful, the situation before the Court in that case came so near the bull's-eye of the principle that it could be said to be beyond its circumference only by reducing the principle itself to a very tiny circle indeed. This is the logical justification of the decision from which escape is not to be had by talking of many things, including, quite irrelevantly, Washington's neutrality proclamation.

Whether in these two respects Homer is caught nodding is a question which is well raised if it sends anybody to this fine book.

JAMES HART

University of Virginia

V. O. KEY, JR. *American State Politics: An Introduction.* Pp. xviii, 289, ix. New York: Alfred A. Knopf, 1956. \$4.50.

This book is a brilliant study of important aspects of the two-party system in states outside the South by means of a statistical analysis of state primary and general elections. The title, however, is somewhat misleading since the book is not a comprehensive survey of the field of state politics after the plan of Key's *Southern Politics*. The author examines the relationship in selected states between presidential and gubernatorial voting, the interrelation of cycles of national and state politics, the relationship between gubernatorial and legislative voting with special reference to the gerrymander, the relationship of popular voting in primaries to party competition, the growth and stability in split-ticket voting, and the residue of traditional voting. The author inclines to the view that the long ballot, the separation of powers, the rigid framework of local government, the unfair apportionment of state legislative districts in favor of the rural areas, and the direct primary have tended to prevent the development of a healthy two-party system in the states. He finds the states are incapacitated for effective

political action and there is a trend toward federal centralization. In some states he holds it almost impossible to displace the strangle hold that one party had on the legislature and upon local positions. While the author shows great ingenuity in working out tables and charts to support his thesis, he admits the limitations of his data. He has raised some challenging questions regarding the effects of the direct primary upon the organization and leadership of state parties. The book is basic for students of state political institutions, primary laws, and state politics.

Political scientists have not agreed upon how important the constitutional system and the election laws are in determining the character and strength of the party system. Key has presented a strong case for the thesis that over a period of a half century the direct primary has had a deteriorating effect upon state party organization and leadership. This book is limited in scope. Key would be the first to admit that many other influences shape the character of our state parties. Let us all hope that he will continue his studies in this field and throw light upon some of these other influences among which might be mentioned the changing social and economic characteristics of the electorate, the increasing complexities of modern living, the development of techniques of mass communication, and the development of national party leadership.

HAROLD F. GOSNELL

American University

ARTHUR T. VANDERBILT. *Judges and Jurors: Their Functions, Qualifications and Selection.* Pp. 76. Boston, Mass.: Boston University Press, 1956. \$3.00.

Again the indefatigable Chief Justice of New Jersey has given us a careful and succinct statement of present professional thinking and aspiration in important aspects of the administration of justice. Here, with a wealth of technical and historical citation, he sets forth what is generally regarded by modern bar leaders as the most desirable qualities for those two great partners in law administration: judges and jurors. This little volume is quite invaluable as a student handbook.

The chapters consist of three lectures originally given at Boston University. The first discusses the historic roles of judges and jurors, stressing the traditionally commanding position of the judge and the unfortunate attempts in America to limit it to that of umpire and referee. The second, after defining the attributes of a good judge, considers the various methods of judicial selection, including appointment, election, and the present American Bar Association supported "Missouri Plan" of executive selection restricted to nominees chosen by a commission, with the judge running for re-election only against his own record, not opposing candidates. The last describes the selection and qualification of jurors historically and in modern practice, concluding with a brief note on criticisms of the jury and its substantial decline in England.

The author's commanding position as lawyer, law school dean, Bar Association president, and now Chief Justice of a model court structure gives him wide experience and also predisposes him to support the professionally sponsored movements for law reform. It is no criticism to point out that even this, useful as it is, may not be enough for final disposition of all difficult problems. Professional interest in selection of judges, though disinterested and high principled, naturally tends to stress technical ability; and the "Missouri Plan" does guard against the selection of incompetent judges. Yet historic contests between the courts and vigorous presidents from Thomas Jefferson to the second Roosevelt have shown that the able judge thus legally trained may not have the broad vision to serve well a developing era of governmental expansion. Thus these vigorously supported plans, though often affording welcome escape from politically motivated judges, may receive only lukewarm assistance from organized labor, for example. Again the pressure of litigation, notably of automobile accident cases, raises anew the question whether the jury is not too cumbersome and dilatory an instrumentality to cope with the problems of congested court calendars in metropolitan areas. On the other hand, its value as a political symbol is such that even scien-

tific study of it has been made criminal by recent legislation—a striking commentary on the difficulty of making any improvement in our governmental institutions once they become hallowed. The scope of this book did not call for consideration of these perhaps insoluble social problems. But this is only to say that professional thinking even on a high level does not exhaust the challenging possibilities of the field.

CHARLES E. CLARK

United States Court of Appeals

The States and the Metropolitan Problem: A Report to the Governors Conference. Pp. x, 153. Chicago, Ill.: Council of State Governments, 1956. \$3.00 cloth, \$2.50 paper.

The political scientist and the urban dweller have long been aware that we are faced in this country with a serious governmental problem in our metropolitan regions. The former is offended by the crazy-quilt pattern of units of government existing in these areas—governmental units often without adequate financial resources and lacking legal powers necessary to deal with the myriad of problems facing them. The latter is often bewildered by the complexities of metropolitan governments, and he can testify that he is not receiving the governmental services and protection which he wishes and requires.

This study deals then with one of the most important governmental problems facing us. It is a problem which demands our attention not only because of its grave proportions, but also because it will continue to grow increasingly critical as more of the people of this country become urban dwellers. This is a scholarly, although somewhat uninspired, treatment of the question. The rise of metropolitan areas is discussed and the problem is diagnosed as in fact a series of problems arising from such factors as an inadequate governmental structure, deficiencies in services and in regulatory activities, financial resources which are often inadequate and vary widely among units of local government, and ineffective citizen control of metropolitan areas.

Part II is given over to a consideration

of our efforts to solve the problem. Such traditional devices as annexation, city-county consolidation, city-county separation, federation, functional transfers and joint efforts, and metropolitan special districts are analyzed with reference to the history of their utilization. Since no one of these approaches to the problem has apparently proved a satisfactory general solution, this study suggests, as a possible approach, that the states establish metropolitan units with adequate powers and financial resources and that these units be so constructed that they will be directly responsible to and controlled by the people served. These units may be of three types—multipurpose metropolitan district, federation, and urban county. As is pointed out, all three types have their appropriate uses and all present their peculiar difficulties. Two possible approaches to improving metropolitan government which are advanced as of secondary importance are large-scale annexation and city-county consolidation.

Finally, it is recommended that each state appraise its units of local government with reference to size, financial ability, administrative organization and methods, and authority enjoyed. To do this, the state should create a new agency or adapt an existing one.

Students of local government will not find much new data in this study nor any startling proposals for reorganization. It is, however, a competent summary of the problem, succinctly stated. Its emphasis on the responsibility of the states to engage in a continuing appraisal of the effectiveness of their units of local government and its recommendation that some state agency should have responsibility for this program are ideas which state legislatures should seriously consider. The challenge of an effective metropolitan government is as serious as any now facing us and if local democracy is to flourish, municipal government must be reorganized to take cognizance of the fact that we are not only an urban people, but also a metropolitan civilization.

ECONOMICS AND LABOR

FRANK H. KNIGHT. *On the History and Method of Economics: Selected Essays.* Pp. vii, 309. Chicago, Ill.: University of Chicago Press, 1956. \$6.00.

It has become quite fashionable to publish the learned articles of eminent scholars between hardback covers. The appearance of *On the History and Method of Economics* marks the third time Professor Frank H. Knight has been so honored. Drawn from his prewar writings, which failed to appear in *The Ethics of Competition* (1935) or in *Freedom and Reform* (1947), and from his recent writings, the present selections focus on problems in the history and method of economics.

The task confronting the reviewer of such a book is extremely difficult. On the one hand, lack of space precludes comments on each article, while, on the other, notwithstanding the unifying rubric chosen by the editors—Professor Knight did not edit the volume—the articles are sufficiently disparate to defy terse characterization and comment. One thing should be made clear to the unwary reader, however: this is not the kind of book with which one curls up in front of the fireplace. Discussions of method are tedious; Professor Knight on method is in addition difficult to follow. In short, few people, other than specialists in methodology or in the peculiarly Knightian world of ethics and economics, will want to read the articles in the book consecutively.

As for the articles selected, this reviewer has little objection, particularly since the best of Professor Knight had already been pre-empted by the earlier volumes (unaccountably, one article, "Statics and Dynamics: Some Queries Regarding the Mechanical Analogy in Economics," also appeared in *The Ethics of Competition*). On examining them once again, however, one becomes conscious of the negative, and often querulous, quality of his criticism. Whether he is evaluating Ricardian economics from the "correct" viewpoint of neo-classical economics, or castigating sociologists for failure to appreciate the virtues of the free market, or chiding John

Maynard Keynes "who for a decade succeeded in carrying economic thinking back to the dark age" (p. 252), Professor Knight is never quite satisfied. But this is precisely why he occupies such a high rank among American scholars. He is never complacent, even about the market mechanism, and he will not allow us to become complacent. A true iconoclast, he had made it his special mission to destroy academic icons wherever they appear. A perusal of this latest anthology of his articles makes this abundantly clear. It will not be widely read, but for those who take the trouble it can be very rewarding. Professor Knight's criticisms are always incisive, particularly when they incise our own prejudices.

KARL DE SCHWEINITZ, JR.

Northwestern University

LEO ROGIN. *The Meaning and Validity of Economic Theory.* Pp. xvii, 697. New York: Harper & Brothers, 1956. \$6.50.

This volume was unfinished when Dr. Rogin had to lay it aside in 1947. His widow and former associates completed it. Only the last chapter, on Keynes, was half-written, while marginal notes indicated proposed changes in some of the others. In all, however, it is Dr. Rogin's work.

The book bears a subtitle, *A Historical Approach*, but it is not an historical approach in the accepted meaning. He regards economics as a science of fact and then tests its validity by checking theory with real events. The critical historical issues that developed over the years are used to help explain the quality of the political economy that was developed. Dr. Rogin shows that the objective meaning of economic theories is found in the uses to which they are put, and that new systems of economic thought emerged as either pro or con arguments in social reform movements. Hence the study is concerned "primarily with the approach of different systems of theory at the time of their original projection" (p. 13) (*Italics original*).

Historical research provides a fruitful method of approach rather than a "series of definitive interpretations" (p. 13). The chapters on Ricardo and Malthus, which are excellent, illustrate the manner in which

the new theories are oriented to specific issues of policy. Ricardo dealt with problems of "long-run equilibrium" whereas Malthus was annoyed by intermittent disturbances. Keynes later showed the problem was created by the failure of effective demand. The economic facts were not clear to the disputants so they argued over matters of "gluts."

After an explanation of his approach to the study of "systems of economic theory" in Chapter I, there follows a chapter on the Physiocrats and thirteen chapters dealing with the best-known European economists presented in strict chronological order. They treat Smith, Ricardo, Malthus, Mill, Marx, Walras, Jevons, Menger, Böhm-Bawerk, Marshall, and Keynes. Each chapter is an essay in itself. In the reviewer's opinion the chapter on Marx is the best; Dr. Rogin's summary and critical evaluation of Marx's economics is as good as can be found. The Menger chapter lacks the excellence of the one on Böhm-Bawerk which is most incisive and reveals the famous Austrian as a prolix pedant. The reader will find Marshall in the setting of Victorian England as an eclectic thinker who never strays far from orthodox economics. It is unfortunate that some American economists are missing. The work is of high quality and a very worthwhile contribution to economic thought.

J. F. BELL

University of Illinois

HAROLD K. CHARLESWORTH. *The Economics of Repressed Inflation*. Pp. 126. New York: The Macmillan Company, 1956. \$2.50.

This is a closely reasoned study of a "Disequilibrium System": the postwar United Kingdom's, 1945 to 1950. With effective demand far in excess of the supply of factors and consumer goods, the government had to assume rationing responsibilities that the price system could not be allowed to assume for fear of at least labor, and at most social, disorder. In wartime the assumption of that responsibility is relatively easy, but in peacetime "the powerful emotional factor of patriotism" is not present "and the pub-

lic, with its vast hoard of liquid savings, acquired because of repression during the war years, will increase sharply its consumption expenditures in the goods market" (p. 95).

The dictates of limited space do not permit doing justice here to this important study. The model used to explain the theory is the case which is illustrated by the United Kingdom: "... a partially controlled economy exists where there are two markets—one controlled and one uncontrolled." We had this in the United States when we had partial, but direct controls. Three other "degrees or cases of repressed inflation" are distinguished as theoretical possibilities ranging from "permanent, universal and continued repressed inflation" to the much milder case of the United Kingdom. The more important bases of comparison among the four cases are the behavior of factor supply and the consumer reaction. Out of the compact analyses of these come successive chapters on factor allocation, repressed inflation from the single industry standpoint, and "the black market pressure against controls." Fiscal policy is the subject of the presummary chapter and there is a Postscript on the handling of inflationary pressures (U. K., 1950-54) when emphasis passes to indirect controls again. There is an Appendix.

This is a peacetime study. So it differs from Professor Galbraith's famous study of the United States during World War II (1947).

The losses of repressed inflation (one cannot say disadvantages, as there may be no practical alternative to governmental intervention) are productivity losses flowing out of increasing inelasticity of labor supply, declining productivity of substitute factors, bottlenecks because of capital shortages and labor-hoarding, irresponsibilities of management as a result of easy profits, the "umbrella" protecting the submarginal producer and the soporific effect of high and steeply progressive rates of income taxation (p. 98). The gains are social: fair shares and full employment.

The author uses systems of individual indifference curves to bring out the points that he wishes to make in connection with

his analysis of the "four degrees or cases of repressed inflation," as far as concerns the discounting by the factor supplier of the income received above the sum necessary to purchase the rationed goods. Demand and supply curves are used in the study of the effects of repressed inflation upon an industry. There are trade-and-payments-balances tables relevant to the Postscript study of the United Kingdom experience after the virtual ending of rationing in 1950.

ROBERT ROCKAFELLOW

University of Rhode Island

MAURICE DOBB. *Economic Theory and Socialism*. Pp. viii, 293. New York: International Publishers, 1955. \$4.00.

Here is a volume of some of Mr. Dobb's shorter writings collected from widely scattered and inaccessible sources, many appearing for the first time in this country. Seventeen essays are included, from an early lecture on "The Entrepreneurial Myth" to writings on capital investment in underdeveloped countries and on current problems of socialist planning.

These essays are a curious mixture composed at different dates, in different contexts, and for different audiences. Part I consists chiefly of articles written for academic journals and for specialist readers; Part II contains lectures or essays intended for a wider and less specialized public; Part III is a grab bag of shorter notes and reviews.

As a benighted "bourgeois" economist, I find Mr. Dobb's Marxist theorizing repetitious and boring. It is musty wine in old bottles. But Dobb is more than a Marxist theorist; he is, in many respects, an apologist—perhaps a sophisticated one—for the economic policies of the Soviet Union. As such, he succeeds in blinding himself to all we have learned about the Russian system—especially since World War II.

Some examples will illustrate my point. In his essay on class conflict, Mr. Dobb makes the traditional Marxist assertion that, under capitalism, labor is exploited by capital: "Even if it were true that a gain to labour and a gain to capital were generally associated, it might still be the case that the gain to labour is made

smaller, and any increase of income retarded, by the institution of private ownership of capital" (p. 99). Consider the foregoing in the light of this statement by the All Union Central Council of the Soviet Trade Unions for 1953: "The most important task of the trade union organizations in concluding collective agreements is the mobilization of all workers, engineers, technicians and employees for the unconditional fulfillment of the tasks set by the 19th Congress of the Communist Party of the Soviet Union. . . . Socialist competition must be more widely developed for the fulfillment and overfulfillment of the state plan by each enterprise, shop and section; for further raising the quality of production and lowering the cost of production; for the careful utilization of raw materials, fuel and electric energy and the consistent application of a system of economy." Not a word about improving the workers' conditions or their standard of living in this classless workers' paradise!

Another example of Mr. Dobb's exaggerations is his discussion of Soviet economic development, where he claims that "the U.S.A. 1948-outputs would be comfortably surpassed in everything but oil by 1960" (p. 129). That this projection is palpably preposterous has been pointed out by the British economist Nove. "American electric generation," says Mr. Nove, "increased in the five years 1950-55 by more than the entire Soviet production of 1955. Soviet output of cement has roughly quadrupled since 1937, but the physical rate of increase in that period has been greater in the United States by a wide margin. Even in steel, in 1950-55 the United States has very nearly kept her lead in terms of tons. Of course, on a *per capita* basis, the gap is greater still." Russia certainly has a long way to go to catch the United States and, as Hodgman wisely remarks, she "may find the gap between Soviet and American industrial performance increasingly difficult to close the narrower it becomes."

Obviously the Soviet Union has made great strides in industrialization since the days of the Revolution. It would be foolish to ignore her economic challenge to the

West through an exaggerated concern with military problems or through obstinate complacency. On the other hand, it would be naive to accept Soviet propaganda claims about the superiority of "socialist" economizing in the economic war for competitive co-existence.

WALTER ADAMS

Michigan State University

SIDNEY FINE. *Laissez Faire and the General-Welfare State: A Study of Conflict in American Thought, 1865-1901*. Pp. x, 468. Ann Arbor: University of Michigan Press, 1956. \$7.50.

In the late nineteen-forties and early fifties the Committee on Research in Economic History sponsored a series of volumes on state economic policies before the Civil War. These studies of Georgia, Massachusetts, Missouri, and Pennsylvania together with Joseph Dorfman's *The Economic Mind in American Civilization*, Volume II, provide guides to ideas and policies regarding laissez-faire and state action before 1860. Mr. Fine has continued both types of study up to 1901 with emphasis on the entire national scene and a brief summary of legislation in the states. Unlike the committee volumes on the earlier period, the focus of Mr. Fine's book is on thought rather than action. Except for such laws as the Sherman Anti-Trust act, state and federal legislation is merely noted. The content and effect of laws tending to create the welfare state are not analyzed. In view of the length of the present study and the importance of the discussion, the slighting of action can scarcely be criticized, but it leaves to subsequent writers the task of a more detailed analysis of the patterns of regulatory legislation particularly in the states.

Mr. Fine's major contribution is in his critical and wide ranging discussion of opinions bearing on the concept of laissez-faire between 1865 and 1901. Politicians, academic scholars, businessmen, clergymen, journalists, and social reformers are all included. The gospel of wealth, for example, is placed in its relations to laissez-faire or state action, as are businessmen's ideas regarding labor unions or William Graham Sumner's views of Herbert Spencer. The

range of Mr. Fine's reading is impressive and his distinctions are clear and to the point. The footnotes serve as a valuable guide to the literature of the period.

A final chapter summarizes the defeat of laissez-faire and the general acceptance of the welfare state between 1901 and 1950. The Employment Act of 1946 which created the President's Council of Economic Advisors is selected as symbolizing the final victory of the welfare concept. In its support President Truman asserted: "Our economy within reasonable limits will be what we make it and intelligent human action will shape our future." President Eisenhower has continued to make use of the Council.

THOMAS C. COCHRAN

University of Pennsylvania

CORWIN D. EDWARDS. *Big Business and the Policy of Competition*. Pp. x, 180. Cleveland, Ohio: Western Reserve University, 1956. \$3.50.

This compact volume is based on four lectures delivered in April 1955, under the joint sponsorship of Western Reserve University and Case Institute of Technology and under a grant from the Merrill Foundation for the Advancement of Financial Knowledge. It includes a supporting appendix of thirty-six pages, cataloguing the antitrust record of the fifty corporations listed as the largest by A. D. H. Kaplan in 1948. This lists 102 cases which have gone against the companies (including *nolo contendere* pleas and consent decrees) plus twelve cases pending. The list goes back to the Standard Oil and Tobacco cases of 1911; but the bulk of the cases, as is natural, were decided in the last fifteen years.

Corwin Edwards is here epitomizing his views on the relation of bigness to the task of maintaining a healthy competitive system, drawing on his ample knowledge of the facts and avoiding doctrinaire theorizings. His diagnosis recognizes that size carries positive services as well as dangers, but leans toward emphasizing the latter. His policy judgments look toward a better informed vigilance and discriminatingly selective treatment, on a case-by-case basis.

His concept of competition avoids the

models of abstract theory and centers in free access to trades, absence of undue inequality of size and power, and the number and variety of independent alternatives offered to buyers as a result. Later, his discussion of oligopoly adds a conception of "fully competitive" behavior, as "resembling in kind and intensity that which economists attribute to an industry composed of small producers." This is his nearest approach to "pure competition." It appears that a few oligopolies meet this test, and "there is no reason to condemn" such (pp. 37-38). This standard falls short of definiteness—as is perhaps inevitable. As for the implication that there is reason to condemn most oligopolies, Edwards would apparently be satisfied to look for actions identifiable as violations of law and stand ready to use divestiture as one remedy, among others, to be used if appropriate.

The second chapter, on the dangers of size, is a brilliant piece of condensed exposition of a theme congenial to the author. Distinctions are recognized between "sheer size," fewness, and inequality between competitors; also between relations with customers and suppliers; but brevity prevents doing these distinctions full justice. The theme of the third chapter, "The Case for Bigness," seems less congenial. While the final judgment is balanced, much of the preceding argument is occupied with deflating "the case," using arguments not all of which appear co-ordinated. For example, the argument that great size does not always mean superior efficiency suggests that competition between firms of unequal size deserves more weight and fuller treatment than is given it (cf. pp. 91, 76-77).

However, Edwards has safeguarded most of the critical points that might occur to a captious reviewer, and the book as a whole is a distinguished performance.

J. M. CLARK

Columbia University

EDWARD C. BURSK (Ed.). *Human Relations for Management: The Newer Perspective*. Pp. ix, 372. New York: Harper & Brothers, 1956. \$5.00.

The objective of this book is, as the publisher states, to bring together the best of current thinking on the conduct of human relations in business. This takes the form of seventeen articles which have appeared in the *Harvard Business Review* of which Mr. Bursk is editor. These have been grouped under five headings: General, Communication, Administration, Supervision, and Personnel Relations. The authors range from General Robert Wood Johnson, chairman of the board of Johnson and Johnson, and Abram T. Collier, vice president, John Hancock Mutual Life Insurance Company, through a number of consultants in personnel work, researchers, and members of the faculties of Harvard and other universities to Solomon Barkin, director of research, Textile Workers Union of America, CIO. As might be expected, a considerable diversity of points of view results.

If the seventeen articles can be said to have a common theme, it is the importance of the *individual worker*, his problems and his social interrelations as they are encountered in industry. Almost without exception, they emphasize the need for industry to give the same consideration to human values as it customarily gives to technologies. General Johnson's article reviews the problem and needs in broad perspective. The articles which follow deal in a large measure with the implementation of these principles, for example, "Making Human Relations Work" by Elizabeth and Francis Jennings, "Communication in the Work Group" by Harriett Rinkin Lynton, and "Observing People" by the Rev. Theodore V. Purcell, to mention only a few. Several, particularly "Leadership Pattern in the Plant" by Chris Argyris, also raise some very searching and challenging questions concerning the *kind* of leadership employees need and want in terms of the realities of large-scale industrial operations. James R. Surface likewise raises some interesting questions concerning the actual effect of much industrial training in his article, "Resistance to Training."

As is inevitable in a symposium of this character, there is some unevenness in calibre of the pieces selected for inclusion.

The weakest appear to be those which deal with ethical and spiritual values as they apply to management-employee relations and the broader field of human goals and aspirations. The sentiments which are expressed certainly represent goals toward which men *should* strive; the question is: will they? In short, how tough-minded and realistic are the authors' recommendations in these areas?

Taken as a whole, the book is extremely provocative and stimulating. The articles which analyze specific problem situations and suggest methods for dealing with them are especially valuable to the working personnel man. However, the book has its greatest worth to members of top management. This is because it will give them a perspective on the role of the worker in industry today and an insight into a number of his more subtle but nevertheless urgent problems and their effects on his adaptation to "big industry" today. In this sense, it is must reading for every major executive.

ROBERT N. McMURRY

McMurry, Hamstra & Company
Chicago, Ill.

F. EMERSON ANDREWS. *Philanthropic Foundations*. Pp. 459. New York: Russell Sage Foundation, 1956. \$5.00.

The sevenfold increase in the number of foundations within the past ten or twelve years and the more than 50 per cent growth of their assets within the current year, due in the main to the fact that 22 per cent of the stock holdings of the Ford Foundation acquired a market value, have caused this chiefly American phenomenon to become a matter of considerable interest not only to our society but to nations throughout the world. Indicative of this fact is the increasing interest of late, both on the part of foundation trustees and officers and leaders of nonprofit organizations seeking foundation support, in information as to how foundations are set up and how they function. Russell Sage Foundation's recognition of the need for a publication emphasizing the organization and administration of foundations has therefore been applauded.

This latest book of Emerson Andrews' yields a vivid current picture of how foundation trustees and officers function, covering such matters as the handling of foundation funds, the use of professional staff, the selection of grantees and their follow-up, the choice of fields of activity and accounting to the public. Moreover, throughout the volume, the author raises questions regarding current practice and out of his wealth of experience points in many instances to the road which will lead foundations in the direction of the greatest contribution to our society.

The author secured his facts through interviews with foundation executives, analysis of foundation reports and publications, testimony of foundation officers and trustees at Congressional hearings, and documents filed by foundations with Congressional committees. He approaches the subject from the angle of the broad aspects of the foundation movement and gives, where comparable material was available, the comparative development of foundations in several areas. The final chapter deals with trends and prospects. The Appendix, including a bibliography and selections from the Internal Revenue Code, adds to the book's value.

The chapter dealing with scientific research expenditures of the larger foundations is based upon research undertaken by Russell Sage Foundation for the National Science Foundation and was part of that government agency's project to estimate total research expenditures in the United States. Figures obtained were for the year 1953 with comparative data, where possible, for 1946 and 1939. For the base year it was found that 15 per cent of the expenditures of the 77 larger private foundations were devoted to the support of research in the life, physical, and social sciences. Of special note to readers of this periodical is the chart indicating fluctuations in foundation support of research in the social sciences between 1939 and 1953. In the last named year the amount involved was slightly in excess of 10 million dollars.

WILMER SHIELDS RICH

American Foundations Information
Service of Raymond Rich Associates

MARGUERITE GREEN. *The National Civic Federation and the American Labor Movement, 1900-1925*. Pp. xii, 537. Washington, D. C.: Catholic University of America Press, 1956. \$5.50.

This solid book was written as a dissertation in order to "throw light on the relations between the NCF and the American labor movement." Pointing out that the available materials for a study of the relations between the two groups "are of a very high quality," Dr. Green has labored mightily to create a new body of factual knowledge. In this she has succeeded.

Ralph Easley, founder and chief organizer of the National Civic Federation, carried on a prolific correspondence and saved everything. The "mountain of papers" is now, happily, in the New York Public Library. The NCF was a coalition of serious-minded men, both industrialists and labor leaders, "interested in progressive reform," according to the author, although its conservatism was staunch in later years and its "great work . . . was accomplished . . . before 1916." A national forum for national questions, it enlisted the enthusiastic efforts of Mark Hanna, Samuel Gompers, Matthew Woll, and other persons well known to readers of the historical literature of twentieth century labor and business.

Although not always easy to read, particularly at first, this pioneering book about the NCF is destined to be pored over by scholars for many years. Its 1,202 footnotes refer overwhelmingly to private correspondence.

Many sidelights appear. Mark Hanna often said that he would rather give up his Senate seat than his position (1901-04) with the NCF. Hanna, we are told, "won the complete confidence of the national leaders of labor." Eight of the nine member Commission on Industrial Relations in 1914-15 were NCF members. Easley corresponded with Presidents and cabinet members, men of wealth, and labor leaders, arranging conferences and pulling strings. Like Woll, he was a fighter against Communism in years when such activity brought only ridicule. Eleanor Roosevelt wrote him June 15, 1927 that Woll only

criticized Communism to gain sympathy for the labor cause. She was unhappy over "fool organizations which are constantly sending out propaganda and letters and warning as to the Bolsheviks who is to be found around every corner and under every bed." The future First Lady of New York State and the United States wrote that the real danger to the country in 1927 could be found in the hysteria and fear complex of the patriotic organizations.

The validity of Dr. Green's historical periodization of NCF activities into initial accomplishments in industrial mediation, years of work on legislative changes, and final struggle against change and radicalism, seems reasonable. Yet the enormity of the subject and its attractiveness will soon bring other writers and other emphases. There may not be ultimate agreement with many of the author's interpretations. In any event, we are grateful for this view, *from the inside*, of an organization for many years important in American industrial life.

VAUGHN DAVIS BORNET

Menlo Park, Calif.

WALTER W. WILCOX. *Social Responsibility in Farm Leadership: An Analysis of Farm Problems and Farm Leadership in Action*. Pp. xi, 194. New York: Harper & Brothers, 1956. \$3.00.

This book is seventh in a Series on Ethics and Economic Life prepared under the direction of a study committee of the National Council of Churches. In *Social Responsibility in Farm Leadership*, the author discusses the relation of ethics to economic philosophy and legislation on the assumption that equity—defined as "fairness" or "evenhanded impartiality"—is a basic ethical goal in our society, largely shaping the legislation and other rules governing economic life. He points out that farmers, like other economic groups, organize to reach goals that they cannot attain by individual action, and that these goals often conflict with the interests of certain other individuals and groups, or with more general interests shared by many or all groups. The quality of farm leaders is demonstrated in and measured by their contribution to equitable solutions

of farm problems. Thus their best contribution is expressed in their endeavor to keep farm groups aware of the relation of their problems, policies, and goals to the interest of society as a whole. He cautions in this connection that "a democratic society will not long respect the claims of a merely self-seeking group."

In the light of this general frame of reference, the author discusses such matters as differentials in income between farm and nonfarm people; the concepts of parity price and parity ratio and the general usefulness of the parity formula; and such price stabilization measures as price supports and marketing agreements. Additional subjects considered are the ethical justification as to whether we should continue to produce surpluses and give them away abroad, what can we do about the low-income farm families, are hired farm workers to be considered a disadvantaged group, the special problem of migratory farm workers, achieving land tenure and credit improvements, soil conservation problems, and farm leadership in government. The entire second part of the book deals with farm leadership in action as expressed largely in a description and analysis of farmers' organizations as they function on local, state, national, and even international levels. An Appendix consists of a very interesting discussion of "Farmer Cooperatives" by Charles H. Seaver.

The author is eminently correct when he says that "effective farm leadership in government as in the farm organizations is based on both a sense of social responsibility and a mastery of the results of scientific analysis of farm problems." This book should be widely read by farm leaders everywhere, all of whom need, in varying degree, the sort of perspective it provides.

WILSON GEE

University of Virginia

- A. ZALEZNIK. *Worker Satisfaction and Development: A Case Study of Work and Behavior in a Factory Group*. Pp. xiii, 140. Boston: Harvard University. Graduate School of Business Administration, Division of Research, 1956. \$2.00.

This is a study of the informal groupings and relationships identified by the author in his observations of the work habits of fourteen men in a machine shop, a single department in a small but growing manufacturing company. Distinct differences in social and ethnic backgrounds, in education, age, skills, jobs, and rates of pay might indicate a disintegrated, individualized work group. However, work habits and recreational activities observed indicate that a well established informal social structure existed, in addition to the fact that the men met the minimum work assignments of management.

In addition to being a case study of the social structure of this machine shop, the work group furnishes the author with an assumed typical work situation about which he can make a series of generalized observations, chiefly on the inevitability of the development of informal organizations in work groups and the challenge of this to the administrator. The author also relates the findings of several other human relations in industry research projects to his findings and observations in this situation.

This reader feels that the evidences of a social structure—patterns of tool borrowing and of seeking and securing advice and help on work problems, the card-playing group, and the conversational group—are perhaps too thin to stand up by themselves as the stuff of a true social structure. Four chapters of case study data do not serve to prepare the reader for the identification of Ron as the "informal leader" of the group in Chapter V, since the only evidence presented on him previously was as a tool lender and advice giver and as a nonparticipant in either of the two leisure-time activities of his fellow workers.

Although the author is enabled to range widely and challengingly in his observations as to the significance of group usages from the patterns of activity of these fourteen workers, he is notably unwilling to comment on the fact of the absence or the presence of a union in this workshop, or to speculate on the cause of its absence, assuming that there was none. Ron's role as informal leader is described as precarious; in a unionized situation, it would seem natural that he would be performing the

functions of the informal leader of the group, and as such would not be in a precarious position.

With such a large percentage of manufacturing industry now unionized, it would seem that the value of this type of study would be greatly enhanced for administrators by focussing research attention on shops which are unionized and by examining the role of the union in the formal and informal structure of the shop and its role in the leadership relations of the group, rather than being in a position of having to speculate on the possible development of informal work group activities along lines which are in "conflict with management purposes" (p. 103). Something new has been added to the work group in the shop since the pioneering case studies were made at the Hawthorne plant; the time has come to recognize this in such studies.

FOREWORD

The remarkable growth of American interest in international affairs has encompassed the labor field. Government agencies concerned with labor problems, academic institutions, trade unions, and business firms are devoting an increasing share of their resources to the study of international and foreign labor movements and of comparative labor relations. The present volume of THE ANNALS represents an effort to indicate some of the most significant recent developments in international labor policies, activities, and research in the economically developed and underdeveloped countries of the free world.

The articles in the first section are concerned with truly international organizations and their activities. This is a period when the International Confederation of Free Trade Unions faces the World Federation of Trade Unions in labor's counterpart of the cold war, complete with technical and financial assistance programs, phony peace movements, boycotts, exchanges of delegations, wooing of the so-called neutralists, active use of labor intelligence services, and so forth. The structure of the organizations involved, their relationship to one another, their accomplishments and regional alliances, as well as the really difficult problems daily to be faced, are well worth recording at a time when in crucial areas of the world the industrial worker and his union have become focal points of attraction for democratic and Communist forces seeking to maintain or fortify hard-won positions. While the first three articles deal with international labor movements as essentially private and voluntary associations (making due allowance for the dubious voluntary character of Communist labor movements), the fourth considers some of the challenging questions presently faced by the International Labor Organization which is, of course, an intergovernmental agency operating within the framework of the United Nations.

The postwar emergence of new problems in labor relations abroad, as indicated in the second section of this volume, was followed by a search for new approaches and new solutions. The nationalization of substantial portions of industry in Britain and France, plus major changes in political configurations, led to reappraisals of established patterns of labor-management relations. The results were perhaps not as dramatic as had been either dreaded or hoped for. The German experiment in codetermination, which incidentally is by no means the only major development in the German postwar labor relations scene, has now reached the stage for preliminary evaluation. Here, too, the outcome seems to have been far from revolutionary, despite some earlier forecasts to the contrary. The postwar trade union movement in Italy has not yet become reconciled to Italy's own form of "underdevelopedness." Its structural problems reflect sincere efforts to establish viable plant-centered unions in the face of severe handicaps.

The achievement and maintenance of full employment in most industrialized countries of Western Europe (Italy being the outstanding unfortunate exception) and in other parts of the world have raised important questions of economic and social policy. Does the maintenance of full employment require the development of a national wage policy? To what degree do governments feel compelled to intervene in wage bargaining, and what is the character of their intervention? What changes in the wage structure—occupationally, industrially, geographically—have

occurred, if any? And in what measure has the power structure of the trade union movement itself been compelled to adjust to centralized forms of wage determination? Four articles in the third section analyze the experience of countries that have had to deal with these and related questions.

The final section contains five studies of labor problems in economically underdeveloped countries that have either achieved national independence in the immediate postwar period or are still striving to obtain it. India and Israel have gone the full distance; Ghana, which will still be known for some time as the Gold Coast, was on the threshold of self-government as this volume was being prepared; federation is in sight for the British West Indies; while Malaya's target date is August 1957. In all these countries the trade union movements are deeply imbued with nationalist feelings and must grapple with problems arising from, or connected to, the fight for political independence in addition to those which stem from the drive toward industrialization. However, they have not permanently submerged their traditional protective functions nor—and incomparably worse—have they become transformed into agencies of state control. Quite the contrary, whether in Kuala Lumpur, Accra, Kingston, Bombay, or Haifa, they do undertake organizing drives, do struggle to win recognition from employers, and do seek to incorporate their tangible gains into the form and substance of collective bargaining agreements. While they are thus approaching more and more the West's conception of the role of labor organizations, we may also confidently expect that for many years to come they will search for new forms of trade unionism appropriate to the particular conditions of their own environments.

It has of course been quite impossible to explore or even to span within the confines of this volume the full range of issues in international labor relations. Rather, the choice of articles represents an effort to highlight some of the crucial problems of policy which have arisen and some of the major developments which have taken place in the past ten years within individual countries and on the international scene. If some of the articles do not appear to take into account the very latest happenings as of March 1957, it should be noted that most contributions were completed by November 1956.

JOHN P. WINDMULLER

John P. Windmuller, Ph.D., Ithaca, New York, is Associate Professor in the New York State School of Industrial and Labor Relations and Co-ordinator of the Institute of International Industrial and Labor Relations at Cornell University. He has studied labor relations in several European countries and has contributed articles on international and foreign labor problems to professional journals. He is the author of American Labor and the International Labor Movement: 1940 to 1953 (1955).

The Structure of International Labor Activities

By LEWIS L. LORWIN

Abstract: The international labor movement, over a hundred years old, is embodied in the associations of trade unions and other labor organizations in different countries that are formed for mutual aid and joint action in matters of common interest. The history of the movement is sketched by the author. The International Confederation of Free Trade Unions, the International Federation of Christian Trade Unions, and the World Federation of Trade Unions are the three general organizations which are now active in the field, together with a number of International Trade Secretariats and regional organizations. The programs of work, organization, and financing of these various agencies are described.—Ed.

A SIGNIFICANT feature of international life today are the associations of trade unions and other labor organizations of different countries formed for the purpose of mutual aid and common action in economic, political, and social matters. These associations are the carriers of what is generally described as the international labor movement, whose aim it is to represent the interests of the labor group in world affairs.

ORIGINS AND PRE-1914 BACKGROUNDS

For historical, ideological, and organizational reasons, the structure of present-day international labor activities is complex. Historically, the international efforts of organized labor can be traced back for more than a hundred years to the international leagues formed by small groups of workers of a few West European countries between 1830 and 1848, to the International Working Men's Association (known as the First International), which achieved a considerable following in Western Europe and in the United States between 1864 and 1872, and to the Socialist, or Sec-

ond, International, which attained importance between 1889 and 1914. All these organizations were animated primarily by the Socialist idea of the "final emancipation" of the workers from "capitalism," but they were also instrumental in stimulating the formation of distinctly trade union internationals, and they developed some of the ideas—international aid to strikers, international control of migration, international regulation of labor standards, international labor co-operation for the prevention of war—which have since become an essential part of international labor programs.

In the course of these historical developments, the international labor movement evolved an ideological pattern whose outlines have not changed essentially since. By 1914, three main tendencies had asserted themselves, reflecting the diversity of outlook in the several national labor movements. The trade unions of Great Britain and the United States were pragmatic in their international programs, being concerned with measures for dealing with migration, mutual aid in strikes, and similar

Lewis L. Lorwin, Ph.D., New York City, Research Consultant, New School for Social Research, has been professor, journalist, and economic adviser in international and United States government employ. He is author of The International Labor Movement (1953).

practical issues. At the other extreme were the labor unions of France and radical Socialist labor groups in other countries, which advocated methods of "class struggle" for "the abolition of capitalism" by means of a "social revolution" in the not distant future. In between were the social-reformist trade unions and labor parties of Germany, Austria, Belgium, Holland, Switzerland, and the Scandinavian countries, which professed faith in socialism as a goal to be achieved gradually and peacefully, but which were mainly concerned with immediate improvements in labor and social conditions. The international labor organizations managed to maintain a relative degree of unity between these three groups by means of *ad hoc* compromises.

By 1914, the international labor movement had also given form to its organizational structure. Three types of organization came into being, which have formed the framework of the movement since. One type was represented by international associations of trade unions in a given industry in different countries, for example, international associations of miners, transport workers, printers, textile workers. These associations, concerned with specific industrial and labor problems, became known as International Trade Secretariats. A second type was the association of various national labor federations (or national trade union centers) like the American Federation of Labor, the General Federation of German Trade Unions, and the British Trades Union Congress, which had as its aim the advancement of general economic and social programs. In 1914, there were two international labor organizations of this type, the International Federation of Trade Unions and the International Secretariat of Christian Trade Unions. The third type—that of international associations of political labor parties and groups—

was exemplified by the Socialist, or Second, International.

INTERWAR YEARS (1919–39)

The relative unity of international labor was shattered by World War I, but particularly by the Bolshevik Revolution of November 1917. After establishing themselves as a ruling dictatorship, the Russian Bolsheviks formed under their own auspices first (in 1919) an international political organization—the Communist, or Third, International (known also as the Comintern, or Moscow International)—and then (in 1923) a trade union International—the Red International of Labor Unions (or Profintern)—and unloosed a vigorous and violent campaign in all countries to "capture" existing trade unions and political labor and Socialist parties. On the other hand, the social-reformist labor unions of Western Europe in 1919 re-established and enlarged the pre-1914 International Federation of Trade Unions (which became known as the Amsterdam International) and the International Trade Secretariats. Between 1924 and 1928, several attempts were instigated by the British labor unions to bring about the unification of the Amsterdam and Moscow Internationals, but without success. The disruptive tactics of the Russian Bolsheviks, their dictatorial theories and methods, their violation of political freedom and individual liberty, their subjection of the trade unions to the control of the state, and their attempts to stir up revolutions in other countries aroused deep resentment among the moderate and social-reformist labor groups of Western Europe. The latter were determined to protect the political independence and the peaceful and democratic character of their international organizations.

The international labor movement thus split into opposing camps: the Comintern and Profintern made headway in

some countries of Europe, in the Far East, and in Latin America; the Amsterdam International and the International Trade Secretariats had the support of most West European labor movements. American labor, represented by the American Federation of Labor, kept aloof from Europe after 1920 and founded the Pan-American Federation of Labor to rally under its banner the labor organizations of Latin America.

Between 1933 and 1939, all international labor organizations lost ground as a result of economic depression, political tensions, and the onslaught of nazism, fascism, Spanish falangism, and Latin-American dictatorships. With the outbreak of World War II they practically ceased to function.

DEVELOPMENTS SINCE 1939

The feeling that internal labor divisions had been a factor in bringing on World War II, and the hopes aroused by the war of a great social and international renovation, revived the desire for unity among organized labor groups in many countries. In 1945, at congresses held in London and Paris, the British Trades Union Congress, the French Confederation of Labor, the Soviet trade unions, and the Congress of Industrial Organizations of the United States (CIO) combined to form a new organization—the World Federation of Trade Unions—on a large program of postwar reconstruction, social reform, and political independence and economic development for underdeveloped countries. During the first two years of its existence, the World Federation of Trade Unions made rapid progress and began to exercise influence in the reconstruction of Western Europe, in the trade union movements of Asia and Latin America, and in the United Nations.

By 1948, however, the Federation was in deep internal crisis as a result

of three specific developments, which reflected the old divisive forces in new form. In the first place, the International Trade Secretariats, which re-established themselves after 1946 and whose continued concern was the concrete improvement of working and living conditions, were convinced that the Soviet Communists and their allies had no real interest in trade unionism and were manipulating the World Federation of Trade Unions in the political interests of Soviet Russia; the Secretariats, therefore, refused to co-operate with the Federation. Secondly, the opposition of the Soviet government to the Marshall Plan in 1947 shocked the labor leaders of Western Europe and of the United States, and when the pro-Soviet elements in the World Federation of Trade Unions tried to align the organization on the side of Russia these leaders rose in revolt. A third factor, by no means the least important, was the active campaign of the American Federation of Labor against any co-operation with the Soviet trade unions or with their allies in other countries.

After two more years of futile attempts at compromise, the British Trades Union Congress, the central labor organizations of several other West European countries, and the CIO finally broke with the World Federation of Trade Unions. They joined with the American Federation of Labor in December 1949 to form a new organization under the name of International Confederation of Free Trade Unions. The World Federation of Trade Unions continued, however, under pro-Communist leadership. After 1949 the struggle between the two organizations was sharpened by the cold war and the general East-West conflict.

CURRENT ORGANIZATIONAL SETUP

The developments sketched above have shaped the present structure and scope

of international labor activities. Today, these activities are carried on by three general organizations—the International Confederation of Free Trade Unions (ICFTU), the International Federation of Christian Trade Unions (IFCTU), and the World Federation of Trade Unions (WFTU)—and by a number of International Trade Secretariats affiliated with one or another of the general organizations. In addition, there are regional labor organizations in Western Europe, Asia, and Latin America that exercise a certain degree of local autonomy although they are subdivisions of the general organizations.

THE ICFTU

The most important labor International today is the International Confederation of Free Trade Unions. Its affiliated members include the British Trades Union Congress (TUC); the strongest national trade union centers of Belgium, the Netherlands, the Scandinavian countries, the German Federal Republic, and Austria; minority labor federations in France and Italy; the AFL-CIO and the United Mine Workers in the United States; the recently united trade union federation of Canada; central labor organizations in Mexico, Cuba, and several other Latin American countries; trade union federations in Tunisia, Algeria, and Morocco, the leading trade union federations of India and Pakistan; a trade union federation and a number of important independent unions in Japan; the national trade union centers of Australia and New Zealand; and smaller independent unions in Asia and West and East Africa. In July 1956, the ICFTU reported that at the end of 1955 it had had 114 affiliated organizations in 81 countries, with a membership of over 53 million, and that in July 1956 it had 117 organizations in 83 countries.

Philosophy and program

The emphasis of the ICFTU, both in its structure and in its philosophy and program, is on freedom and democracy. It includes only "free" trade unions, that is, such as are voluntary in character, democratic in management, and not sponsored or dominated by governments or political parties; it refuses to admit Communist-controlled or Fascist or other government-sponsored labor organizations. Its general aims are to strengthen the process of collective bargaining as a method of improving working and living conditions, and to help build gradually and by legal methods a peaceful world based on political freedom, economic democracy, social justice, and co-operation between free and self-determining nations. These aims are summed up tersely in the phrase "a free society based on free labor" and in the slogan "Bread, Peace, and Freedom."

As the ICFTU sees it, social progress and world peace today are threatened by totalitarian trends, violent nationalist movements, undemocratic industrial relations, and extreme poverty in the underdeveloped countries. In view of this situation, the ICFTU considers it necessary to concentrate on five specific tasks: (1) to combat Communist and Fascist ideas and to defend the rights of free trade unions to organize and to bargain collectively; (2) to support the labor movements of the advanced industrial countries in their efforts not only to raise labor standards but to achieve greater participation in the management of industry (what the German unions describe as "codetermination"); (3) to help the workers in the underdeveloped countries to organize, to improve their working and living conditions, and to achieve political freedom and self-government; (4) to help strengthen the United Nations as the

chief instrument of collective security and world peace; and (5) to obtain adequate representation for organized labor in the United Nations and the specialized agencies, and in all other official international bodies, so that the workers may have an active part in shaping world policy.

In pursuance of the above tasks, the ICFTU carries on a wide range of activities. To combat communism it publishes special bulletins which present material highly critical of political and economic conditions in the USSR and in the "People's Democracies" and gives financial and organizing aid to its affiliated unions threatened by Communist tactics (in France, Italy, and elsewhere). In defense of trade union rights it tries to bring pressure on governments violating such rights by appeals to local and world public opinion. It maintains an International Solidarity Fund which extends financial and moral support to victimized trade union organizers. (The Fund voted £2,000 to the strikers in Poznań, Poland.) Owing largely to ICFTU demands, the International Labor Organization (ILO) established in 1950 a Fact-Finding and Conciliation Commission on Freedom of Association and in 1951 a special committee of its Governing Body to make a preliminary examination of complaints addressed to ILO alleging infringement of trade union rights, with a view to their submission to that Commission. Allegations of this nature received by the UN Economic and Social Council when they concern states that are members of ILO are now referred to the Governing Body of that organization without being brought to the attention of the Council.

Relations with UN and other agencies

The ICFTU promotes its general economic and social program through regional conferences, special missions to

various countries, and particularly through participation in the work of the Economic and Social Council of the UN and of the specialized agencies, in which it has "consultative status." Representatives of the ICFTU attend regularly the sessions of the Economic and Social Council and try to influence its deliberations and decisions by submitting reports, by addressing the plenary sessions, by maintaining personal contacts with members of friendly delegations, and by lobbying generally. The main effort of the ICFTU is to stimulate the Council to bolder action and to more effective measures for implementing decisions with regard to forced labor, full employment, higher labor standards, larger financial contributions for technical assistance, international financing of economic development, and the inclusion of trade union advisers in teams of experts sent by the United Nations to underdeveloped countries. While the ICFTU has no "consultative status" in the General Assembly of the UN, it tries to influence the Assembly's position not only on economic and social questions but also on political issues such as self-government in dependent areas, French policy in North Africa, the admission of Spain to UN agencies, racial segregation in South Africa, and the international control of atomic energy, by addressing letters and documents to all members of the Assembly and especially by obtaining the support of trade union members of the delegations. Among the specialized agencies, the ILO offers the ICFTU opportunities for bringing its point of view to bear upon such problems as the forty-hour week, higher productivity and wages, migration and aid to refugees, labor-management relations, and vocational training in underdeveloped countries, while UNESCO helps the ICFTU in programs of general and workers' education.

Besides United Nations agencies, the ICFTU is also either represented on, or maintains regular relations with, such official regional bodies as the Organization for European Economic Co-operation (OEEC), the headquarters of NATO (North Atlantic Treaty Organization), the Council of Europe, and particularly the European Coal and Steel Community. Of the seventeen workers on the consultative committee of the Community, twelve are leading members of trade unions affiliated with the ICFTU, and one of the nine members of the High Authority of the Community is the former president of the ICFTU.

Workers' education

A large part of the resources and energy of the ICFTU is devoted to specific programs of workers' education and training in trade union methods, especially in underdeveloped countries. Besides arranging international summer schools, particularly in Western Europe, the ICFTU maintains a resident Trade Union College in Calcutta, India, and regular trade union training courses in Africa and Latin America. Workers from Europe, Asia, Africa, and Latin America are accorded scholarships by the ICFTU to attend these colleges and courses, which last from several weeks to a year and which serve to train organizers and administrators for free trade unions.

Organization

The activities of the ICFTU are directed by a general secretary (J. H. Oldenbroek), an assistant general secretary, and a director of organization, subject to the directives of and review by an Executive Board of some thirty members. The Board is elected on the basis of proportional representation from

all parts of the world and is headed by a president and seven vice-presidents. (George Meany and Walter Reuther are the two chief members of the Board from the United States.) The central headquarters are in Brussels, Belgium, with a staff of seventy or more persons. Branch offices are maintained in Paris, Geneva (for relations with ILO), New York (for relations with the United Nations), Singapore, Tokyo, Accra (in Ghana), Nairobi (in Kenya), Rio de Janeiro (Brazil), and other areas.

In response to the needs and demands of its varied membership, the ICFTU has also set up three regional organizations—the European Regional Organization (ERO) with headquarters in Brussels, the Asian Regional Organization (ARO) with headquarters in New Delhi, and the Inter-American Regional Organization—*Organización Regional Interamericana de Trabajadores* (ORIT)—with headquarters in Mexico City. These regional organizations combine the national trade unions of their respective regions affiliated with the ICFTU, have their own general secretaries and staffs, hold annual or biennial conferences, and carry on within their respective areas the programs approved by the ICFTU. While exercising considerable autonomy in local matters, they are subject to supervision and control by the ICFTU central secretariat in Brussels.

Finances

The ICFTU is financed by annual fees of its affiliated unions. Up to five million members, the rate amounts to \$10.50 per thousand. For members in excess of five million, the affiliation fee decreases to \$7.00 per thousand. As lower rates have been granted to less affluent organizations, the regular budget of the ICFTU in recent years has been about \$400,000 a year. In addition, it has collected considerable contributions

from its affiliates for a voluntary Regional Activities Fund. As the ICFTU attaches great importance to its work in underdeveloped countries, a decision was approved in 1955 to replace the voluntary fund with a regular assessment on all affiliated organizations of one U. S. cent per member per year. Up to the end of March 1956, some \$182,000 had been received from this assessment. The total income anticipated from this levy is about \$335,000 a year. Even then, the budget of the ICFTU will be less than \$1,000,000 a year, which is a modest sum for an organization with world-wide aims and interests and with a widely dispersed staff and activities involving extensive travel and numerous conferences and meetings.

Proposals for strengthening

Partly for financial reasons and partly for reasons of internal structure and leadership, the ICFTU has not fulfilled entirely the expectations of many of its affiliated members. American trade unions in particular have felt that the ICFTU is not vigorous enough in its campaign against communism, in organizing workers in the underdeveloped countries, and even in bringing to public attention the successful work it has done. Proposals for strengthening the ICFTU in Asia, Africa, and Latin America and in general for making it a more vital factor in international affairs will be a main topic of discussion at the Fifth World Congress of the ICFTU to be held in Tunis in July 1957.

INTERNATIONAL TRADE SECRETARIATS

The activities of the ICFTU are reinforced in scope and depth through interlocking relationships with the International Trade Secretariats (ITS). The latter, as already indicated, are organi-

zations of unions in specific trades and industries concerned primarily with industrial conditions (such as methods of wage payment, hours of work, paid holidays, industrial safety and hygiene, social security, and so on), whose unequal effects on the competitive position of workers of different countries in world markets may be mitigated by international agreements on labor standards and policies. The ICFTU recognizes the right of the Trade Secretariats to maintain independent organizations, to have full jurisdiction in trade and industrial matters, and to exercise autonomy in their internal affairs. The Secretariats, in turn, recognize the ICFTU as the representative international organization of labor which formulates and executes general policies. The relationships are cemented by a system of mutual representation, which allows delegates from the Trade Secretariats to attend meetings of the Executive Board and the biennial congresses of the ICFTU and which provides for closer contacts through a Consultative Council composed of officials of the Secretariats and the ICFTU.

There are nineteen International Trade Secretariats recognized by the ICFTU; in April 1955 they reported over thirty million members in sixty-seven countries. The three largest are the International Metalworkers' Federation with over 7,000,000 members, the International Transport Workers' Federation with over 4,600,000 members, and the Miners' International Federation with over 2,500,000 members. Seven other organizations with more than a million members each are the International Federation of Building and Woodworkers, the International Federation of Unions of Employees in Public and Civil Services, the International Federation of Commercial, Clerical and Technical Employees, the International Federation of Textile Workers' Associations, the In-

ternational Landworkers' Federation, the International Federation of Industrial Organizations and General Workers' Unions, and the Postal, Telegraph and Telephone International. Six Secretariats with a membership of less than a million but more than 100,000 are the International Garment Workers' Federation, the International Graphical Federation, the International Union of Food and Drink Workers' Associations, the International Shoe and Leather Workers' Federation, the International Union of Hotel, Restaurant and Bar Workers, and the International Federation of Petroleum Workers. The three smallest Secretariats are the International Federation of Free Teachers' Unions with some 80,000 members, the International Federation of Tobacco Workers with 70,000 members, and the Universal Alliance of Diamond Workers with 12,500 members in seven countries. Most of the Secretariats are still essentially European organizations, though a few have become world-wide in scope. American trade unions of miners, textile workers, steelworkers, auto-workers, garmentworkers, and so forth, are affiliated with seventeen of the nineteen Secretariats.

The main activities of the Trade Secretariats are to keep the unions of different countries informed on each other's problems and developments, to help in organizing, particularly in underdeveloped countries, to extend financial aid in strikes, to promote international labor legislation by participating in the work of the ILO, and to support the general aims of the ICFTU. As an example of financial aid, one may cite the case of the striking miners in Rhodesia in 1955, to whom the Miners' International sent £6,000 and who received further aid from the miners' union of Japan and from the steelworkers' union of the United States. The Trade Secretariats

have also made large contributions to the Regional Fund of the ICFTU for organizing in Asia and Africa; as an example of such activities one may cite the joint campaign of the Landworkers' International and of the ICFTU to organize the sugar and other plantation workers of Asia and Latin America. For promoting international labor standards, the Trade Secretariats are particularly active in the so-called industrial committees of the ILO, which are composed of representatives of governments, employers, and workers and which meet periodically to consider questions of productivity, costs and wages, hours of work, and labor-management co-operation for the expansion of output and of world demand in their respective industries. The Trade Secretariats have proved themselves staunch supporters of democratic principles and have played an important part in the struggle against Communist infiltration.

The main problems with which the Trade Secretariats are concerned today are to extend their membership and influence, to develop more effective methods of co-operation with the ICFTU, and to enlarge their representation in the ILO and in other official international organizations.

CHRISTIAN LABOR INTERNATIONAL

The free unions affiliated with the ICFTU and its Trade Secretariats aim to include all workers without regard to race, color, or creed. But from the earliest days of trade unionism, there have existed in some countries labor unions organized on a denominational Christian basis. These unions justify their separate existence not on economic but on moral grounds, namely, that it is necessary to cultivate in the workers religious and ethical ideas and to combat not only communism but also social-

ism and other doctrines which they regard as inimical to religion and to the Church. The Christian trade unions first formed an international organization in 1908. It was reorganized in 1919 and then again in 1946, and functions today under the name of the International Federation of Christian Trade Unions (IFCTU).

The Christian labor international today is a relatively small organization, with affiliated trade unions in sixteen countries and a total membership of some two million. Its strongest affiliates are the Catholic unions of France, Belgium, the Netherlands and Canada, the rest of its membership being in Germany, Austria, Luxembourg, Switzerland, Ecuador, Chile, Brazil, other Latin American countries, and several North and West African countries. The organization is directed by a general secretary (A. Vanistendael) with headquarters in Brussels, Belgium, under the guidance of a General Council and an Executive Committee. The IFCTU also has a number of affiliated trade secretariats of miners, metal, textile, and agricultural workers, public service employees, and workers in several other trades. The budget, financed by dues from affiliated unions, is small.

In its general philosophy, the IFCTU is guided by the ideas of social justice and labor welfare expressed in papal encyclicals and in other approved Catholic pronouncements. One of the leading ideas of the Christian unions is that of "industrial democracy," in accordance with which they advocate a larger share for workers in the management of industrial plants and the formation of national industrial councils in which employers and workers may co-operate for the consideration of problems of the national economy. Such councils are advocated as a means of combating both communism and "liberal capital-

ism" and of giving concrete expression to Christian ideals.

On issues of international policy, the IFCTU generally takes a position similar to that of the ICFTU, supporting the work of the United Nations and of the specialized agencies. Like the ICFTU, the IFCTU has consultative status in the Economic and Social Council of the UN and in the ILO, and is represented on the advisory committees of the European Coal and Steel Community and other official international agencies. Its role in these agencies, however, is modest.

On several occasions, suggestions have been made for closer organizational ties between the ICFTU and the IFCTU. A workable arrangement has, however, proved impossible, since the ICFTU sees no valid reason for the existence of separate Christian trade unions. The relations between the two organizations thus vacillate between ideological friction and practical co-operation on specific issues. In general, the activities of the IFCTU in the United Nations, in ILO, and in other governmental bodies tend to reinforce the demands and influence of the ICFTU.

WFTU

The ICFTU, the Trade Secretariats, and the Christian labor international (IFCTU) are faced in their activities with the challenge of the World Federation of Trade Unions (WFTU), which, having been expelled from Paris (in 1951) and requested to leave Vienna (in 1955), now has its headquarters in Prague.

Since the split in 1949, the WFTU has undergone a change in composition, structure, and character. About 90 per cent of the eighty million members which it now claims are in the state-controlled trade unions of the USSR

and the "People's Democracies" of Eastern and Central Europe, China, and North Korea. Its other affiliates, such as the larger national labor federations of France and Italy, central labor federations in India, Indonesia, Ceylon, and the Philippines, trade unions in French Africa, and the Confederation of Workers of Latin America, are under Communist or pro-Communist leadership. In structure, the WFTU has been tightened by the setting up of twelve Trade Departments of metalworkers, miners, transport workers, and so forth, under the control of the central Secretariat (Louis Saillant, Secretary-General). In character, as evidenced by its activities, by its publications and official statements, and by its close co-operation with known Communist-inspired organizations, it has played the role of a front organization for the Communists and Soviet Russia. Its financial resources, which are not made public but which are said to be large, are derived in the main from contributions by the trade unions of Soviet Russia and the "People's Democracies" of Eastern and Central Europe.

Claiming to be a nonpartisan trade union organization, the WFTU, through its publications in many languages, public meetings, and conferences and in other ways, carries on continuous campaigns for such labor demands as higher wages, the forty-hour week, larger social security benefits, full employment, and so on. The general strategy of the WFTU is to outbid the ICFTU and its affiliated unions in formulating and urging extreme demands and to attack the ICFTU for making more realistic demands and for its advocacy of labor-management co-operation. At the same time, the WFTU continues to appeal for "unity" among all workers. As a means of promoting its propaganda, the WFTU and especially its Trade De-

partments have been organizing visits of trade union delegations from non-Communist countries to the Soviet Union and the "People's Democracies."

The WFTU is particularly active in the underdeveloped countries of Asia, Africa, and Latin America. With the aid of Communist groups, it utilizes the nationalist movements of these countries to gain ascendancy in the newly developing trade union organizations. Conversely it uses its influence in the trade unions to promote extreme nationalist movements and Communist-inspired causes. It also uses the opportunities offered by the UN Economic and Social Council and its commissions and by ILO, in which it also has consultative status, to support the demands and policies of the Soviet and other Communist delegations, in opposition to the delegations of Western Europe and the United States, and to the ICFTU and the Trade Secretariats.

Despite recent setbacks, the WFTU remains a force in many countries. To the extent to which it is effective, it is a disruptive factor in the effort to build a system of free and democratic international labor relations and activities.

OUTLOOK AND MEANING

As long as general international conditions remain unchanged, the several international labor organizations are likely to continue in their present course. This means, in particular, that the International Confederation of Free Trade Unions and its affiliated Trade Secretariats will try to expand their present activities and especially to build up solid free trade unions in Asia, Africa, and Latin America and to cement their ties with the free unions of Western Europe and the United States. How successful such efforts of the ICFTU and the ITS may be will depend on

many conflicting factors of national and international life.¹

During its earlier stages, the leaders of the international labor movement believed that it would become the main directive force in international affairs. In the light of the experience of the past hundred years, it is clear that inter-

¹ For an analysis of these factors, see Lewis L. Lorwin, *The International Labor Movement* (New York: Harper & Brothers, 1953), pp. 332-44.

national labor organizations can be no more than a subsidiary factor in international life. What is important, however, is that, as their activities show, the ICFTU and the ITS can play the role of a constructive opposition within the official and semiofficial international system. In the context of present-day international developments, such a role is a historic factor in the struggle for world-wide social progress and for the building of a free international society.

Regional Organizations of International Labor

By ARNOLD L. STEINBACH *

Abstract: Since World War II, the focus of power in the international labor movement is no longer in Europe. Events, in which American labor has played a significant role, have favored a definite trend toward decentralization and the strengthening of regional organization. This has been secured in part by the establishment of regional (Asian, European, Latin American) offices by international federations of unions in specific trades or industries, and in part by the creation of regional organizations in Europe, the Americas, and Asia by the International Confederation of Free Trade Unions. The author discusses some of the problems involved in these trends, the specific difficulties which face the extension of the movement to Africa, and the rivalry between the leading world confederations of labor, the ICFTU and the Communist World Federation of Trade Unions.—Ed.

BEFORE World War II, international labor organizations, whether political or economic, were by and large of European vintage with some sprinkling of out-of-Europe membership. World War I brought about the beginnings of a shift of economic power from Europe to the New World and to parts of the European colonial possessions. World War I also represented a step in the process of freeing the political and economic life of the world from centuries of European domination. World War II accelerated by leaps and bounds a normal evolutionary process. The political and economic upheavals stemming from this acceleration affected the organizational forms of international labor. In the field of ideological organizations the Socialist International was the first victim. International solidarity of labor ended at the borders of Europe. Asian socialism declared its

independence, and the Socialist International today is more than ever a European organization with a sprinkling of outsiders.

Among economic labor organizations, the trend towards regional organizations of international trade union federations is a typical post-World War II phenomenon, a recognition of the shift of organized labor's power center from Europe to other continents. Some regional organizations of trade unions already existed before World War II. However, they were formed as independent area organizations by interested unions in the area concerned, not by international trade union federations in the process of decentralizing their functions. It is interesting to note that these earlier ventures occurred in the Western Hemisphere. The first tendencies toward an independent regionalism were evident in the formation by United States labor of the Pan American Federation of Labor in 1918. In 1938, a second and successful attempt was made, but without the co-operation of

the United States labor movement, when the Confederación de Trabajadores de America Latina (CTAL) was formed, under the leadership of Lombardo Toldano of the Confederación de Trabajadores de Mexico (CTM), as an independent Latin American regional federation of trade unions. In 1945, the CTAL became the regional organization (liaison bureau) of the World Federation of Trade Unions in Latin America, Communist-dominated and still in existence, though weak and with few adherents.

NEW CONCEPTS IN ICFTU

The International Confederation of Free Trade Unions was the first international labor federation which accepted, by statute, the end of European labor as the sole carrier of the gospel of trade unionism. The ICFTU's regional setup, with its consequent decentralization of power, came about mainly as a result of the influence of the United States unions, which had the foresight to recognize that the future and strength of international trade unionism lie in the areas which are still struggling to overcome backwardness. But full implementation of this principle for various reasons has not yet been realized. Some of the reasons will be set forth in this article.

Until the formation of the ICFTU, international labor federations of the past had been organized in a highly centralized way, with the center of gravity at the seat of the headquarters and with the main power in the hands of a secretary-general. The United States unions introduced two new establishments of regional organizations. Through the enhanced role of the new regional organizations, the central headquarters has become very sensitive to the needs, grievances, and major problems of its affiliated organizations. Beyond that, the previous pattern of domi-

nation of international organizations by their European affiliates was much weakened. The way was thus opened to a de facto shift of power away from Europe once the regions had developed sufficient knowledge, experience, and resources.

WORLD FEDERATION OF TRADE UNIONS

The World Federation of Trade Unions (WFTU) inherited a regional setup made to order, when the Latin American CTAL joined the WFTU at its founding convention in 1945. Most of the WFTU activities in Latin America have since been either initiated by CTAL headquarters in Mexico or are being carried out from there. No information is available as to the extent to which plans for regional activities are being made at the WFTU headquarters or in Mexico. The financial dependence of the CTAL headquarters on the WFTU makes it difficult for the CTAL to develop an independent policy in Latin America. CTAL's rights within the WFTU may be limited to making recommendations or to the distribution of allocated money, particularly for the purpose of sending delegates to WFTU meetings and visitors to Soviet bloc countries. While CTAL has lost strength and influence in recent years, it is still a potential power in the area. Its very existence strengthens the WFTU, which otherwise would not have any "watch-dog" in its relations with its Latin American affiliates. Overt CTAL activities consist mostly of infrequent conventions and of the encouragement of fellow-traveling conferences, some of which cater to unions in certain key industries.

Reacting to the formation of the ICFTU, the WFTU decided in 1949 to strengthen its position in Asia against an anticipated ICFTU challenge by establishing in December 1949 an Asian Liaison Bureau. This bureau was no regional organization of affiliated unions

*The views expressed in this article are those of the author and do not necessarily reflect those of the Office of International Labor Affairs, Department of Labor.

Arnold L. Steinbach, Dr. Jur. (Vienna), Washington, D. C., is Specialist on International Trade Union Organizations, Office of International Labor Affairs, United States Department of Labor.

with specified rights and privileges but rather a transmission belt between headquarters and the area. Established Communist concepts of organizational centralization plus a possible fear of the increasing power of Communist China appears to have led the WFTU to the decision to establish a bureau rather than a regional organization in Asia. Nevertheless, the Liaison Bureau has come more and more under Communist Chinese supervision, which has sought to use the bureau for purposes not always identical with WFTU, that is Soviet Russian, objectives. European and WFTU influences were further reduced by the removal of the bureau's first secretary, the Australian Communist Ed Thornton.

The bureau has had an important role in Communist efforts to foment uprisings in certain non-Communist Asian countries. Subsequently, when this undertaking did not fully succeed, it planned and directed the efforts to torpedo the ICFTU regional organization in Asia through the attempted formation of a neutral Asian federation open to Asian Communist and non-Communist labor federations in line with the well-propagandized Communist unity drive. If successful, this Asia federation, though formally independent, would unquestionably come under the control of Communist China and would maintain only loose relations with the WFTU.

INTERNATIONAL TRADE SECRETARIATS

The only International Trade Secretariat (ITS) which has for years conducted extensive organization work beyond the borders of Europe is the International Transport Workers' Federation (ITF). Its activities outside of Europe were dictated by the need for protecting the world-wide interests of its members. Thus, the ITF had established offices in Asia and Latin Amer-

ica well before the ICFTU created its own regional organizations. The Mexican ITF office, established in 1954, was on the way to becoming a model regional agency when the death of Trifon Gomez, its able local secretary, halted the full execution of plans to develop a net of branch offices around the Mexican office. It is interesting to note that the experience and the pioneering activities of the ITF in the international field outside of Europe have been recognized by the ICFTU by electing J. H. Oldenbroek, the former Secretary-General of the ITF, as its own Secretary-General, and some years later by making the present Secretary-General of the ITF, Omer Becu, its President. The two top positions of the ICFTU are thus held by a former and a present ITF Secretary-General.

Besides the ITF, the International Metalworkers' Federation has begun to make plans for the establishment of a regional office in Asia, but for the time being it is satisfied with using the Tokyo office of the ITF. The Postal, Telegraph and Telephone International has established a regional office in Latin America after an intensive membership drive which netted twenty-four new affiliates; it also intends to call an Asian conference. The International Union of Food and Drink Workers' Associations, which through the work of its United States representative, Ernest Schwarz, has been able to gain considerable membership in Latin America, has recently called a conference of its Latin American affiliates. It now maintains an office in Mexico. The International Federation of Textile Workers' Associations has also shown interest in activity in Latin America. As a beginning, a bulletin in Spanish is regularly issued for use in Latin America. The Miners' International Federation plans to call a conference of Latin American miners' unions early in 1957.

Influence of U. S. unions

The regional activities of most of the other International Trade Secretariats are still rather embryonic. Except for a few ITS's which have foreseen the slow but steady transfer of the center of gravity of the world labor movement from Europe to other parts of the world, in particular to Asia and the Western Hemisphere, most Secretariats have only an incidental membership outside Europe. Where "outside" membership has reached a substantial proportion, it consists mainly of United States unions. The latter have been instrumental in developing membership drives in other areas and have encouraged regional activities. Many United States unions have joined the Trade Secretariats not to obtain direct economic advantages, but rather to show their solidarity with the international labor movement. It is only quite recently that American unions have discovered that intensive international activities are necessary to safeguard their own standard of living by raising low labor standards in underdeveloped countries and have recognized that the security of the United States itself might be endangered by the infiltration of Communist ideologies in world labor. The participation of United States unions in the International Trade Secretariats acquires added importance because they have the hard currency without which effective work in underdeveloped areas cannot be conducted.

In the past few years, a number of International Trade Secretariats have sent missions to various parts of the world, to Asia, the Western Hemisphere, and Africa. Latin America has become the main focus of ITS drives to gain members and to begin regional activities. Partly responsible is the increased interest of United States unions in ITS activities and in the development of a strong and free trade union movement

in Latin America which will be able to resist Communist and other totalitarian efforts to control Latin American labor.

THE ICFTU

Some of the early proponents of regional organizations in the ICFTU considered decentralization as a panacea which, once regional activities were established, would automatically result in organization of the unorganized, strengthening of the free trade unions, enhanced resistance to Communist infiltration, attainment of sizable economic gains, and so forth. It soon developed, however, that a regional organization is only as good as the composition of its membership. Material and financial help from the outside can accelerate progress but it cannot replace such vital factors as native leadership. The ICFTU regional organizations have thus developed quite unevenly.

The ICFTU has until now established three regional organizations which, in their aggregate membership, comprise 53.7 million out of the 55 million total ICFTU members. The organizations for Europe and the Western Hemisphere are about equal in membership strength, with 24 million each. The Asian organization represents almost 5.7 million.

European Regional Organization

The European Regional Organization (ERO), established in 1950, was the first ICFTU regional body. In a sense, the formation of ERO represented merely a continuation of close relationship between unions which for many years formed the nucleus of the international labor movement. Its member unions come from every European country where trade unions may organize freely. Excluded, therefore, are the Soviet bloc countries, Yugoslavia, Spain, and Portugal. About 70 per cent of ERO membership is derived from the affiliation of the British Trades Union Congress and

the German Federation of Trade Unions (DGB, Deutscher Gewerkschaftsbund). With few exceptions, ERO component organizations are financially strong; have a tradition of able leadership risen from the rank and file, with much experience in organizing and collective bargaining; are skilled in handling administrative problems; and conduct extensive workers' education programs. Aside from France and Italy, where Communist trade union federations still play a powerful role, ERO member countries have not depended on ERO for assistance in their national activities; they have therefore been able to use the regional organization for joint and "supranational" undertakings. The European regional organization has few organizational problems. Most of its interest is in problems such as full employment, automation, economic and social integration of Europe, manpower and migration, and productivity.

Some have questioned whether it was necessary to form a special regional organization to attend to these important problems which go far beyond the interests of one specific region and which are clearly in the jurisdiction of the Economic and Social Department of the ICFTU. Whenever in the past serious problems have arisen in the European area, they have been handled, significantly enough, by the Executive Board rather than by ERO—to wit, the creation of the Berlin Committee to help the victims of the uprisings in East Germany; the actions in connection with the Poznań riots; the formation of the International Solidarity Fund; the assistance to the French and Italian free trade unions; the Saar problem. Moreover, some of the affiliates have organized intraregional groupings, such as Benelux and the Scandinavian countries, without the benefit of ERO leadership; these hold regular meetings and discussions of common problems. The

relations to the European Coal and Steel Community are being handled by a special committee on which the ICFTU and ITS are prominently represented. Although money and highly qualified personnel could be saved for other more essential ICFTU work by making the ERO an integral part of the Brussels ICFTU headquarters, the ERO will probably continue as a kind of successor of the prewar International Federation of Trade Unions.

Inter-American Regional Organization

The Inter-American Regional Organization (ORIT) was established in January 1951. In a sense, it took the place of the Confederación Interamericana de Trabajadores (CIT) which had been formed by the AFL and Latin American trade unions in 1948 as a counterforce to the Communist-dominated CTAL. In the transformation from CIT to ORIT, the major newcomers from North America were the CIO and the Canadian Congress of Labour. The first two years of ORIT's existence were marred by the absence of the Confederation of Mexican Workers (CTM), which had walked out of the founding congress of ORIT because of dissatisfaction with arrangements involving the location of headquarters and the general secretaryship. Reaffiliation of the CTM bolstered ORIT's prestige, and the decisions of the 1953 Congress to move the headquarters from Cuba to Mexico City and to install the able Costa Rican, Luis Alberto Monge, as Regional Secretary, laid the ground for continued growth in membership and influence.

ORIT now has members in thirty-three of the thirty-four countries and areas within the Western Hemisphere with ICFTU membership. Its United States and Canadian affiliates comprise nearly three fourths of total membership, with Latin America accounting for

almost one fourth, and the Caribbean area something over 1 per cent. Brazil, Cuba, and Mexico are the strongest Latin American affiliates.

A Caribbean Area Division has been created with headquarters in Bridgetown, Barbados. This division co-ordinates the special interests of the Caribbean area trade unions and in the formation of Caribbean federations of individual industrial union groups. ORIT offices are also maintained, jointly with the ICFTU secretariat, in Chile and Brazil.

Within the six years of its existence, ORIT has become an organization recognized and respected by friends as well as by enemies. In the trade union field, it has at present no serious competition in the Western Hemisphere. The number of countries in which the free trade union movement is restricted is now limited to two, Venezuela and the Dominican Republic. The strongest trade union centers are well represented among ORIT affiliates. Bolivian labor may sooner or later make the decision to join ORIT, and only the labor movement of Ecuador is still under the control of a WFTU affiliate.

Problems of ORIT

The growth of strength is likely to accentuate past and present weaknesses. The addition of new affiliates has increased expenditures, without corresponding increases in affiliation fees. Most of the new affiliates need appreciable assistance. Without the substantial financial help from North America and Cuba, ORIT would have to restrict its services or go bankrupt. Large contributions by Cuban labor, both financially and by making organizers available, are not, however, easing the existing jealousies between the various major Latin American countries for leadership in the trade union field.

The contribution by the United States

unions, though highly welcome and vital for the development of effective programs, may be resented by those who have found it simple and popular to lay all the blame for economic ills and maladministration on the doorsteps of mystic Yankeeism. The anti-Yankee complex has already once come into the open—at the 1953 convention in Rio de Janeiro. It may again cause serious frictions and controversies in the light of basic differences which exist about the concept and objectives of trade unionism between the "free enterprise" United States trade unions and most of the Latin American unions, in particular those in South America. Rooted partly in anarchosindicalism and partly in old-fashioned Marxian socialism, unadjusted to the lessons of the last two decades, many Latin American unions still dream of the overthrow of the prevailing economic systems as the ultimate solution to social and economic injustices. Nationalization has become the favorite recipe in the action program of some unions, as a simple means of curing poverty and raising the standard of living. Recently, it has been propagated as a means of keeping foreign investors from exploiting basic resources. ORIT will have to take a stand on these issues. But it will take skillful leadership to find a common denominator on which to base actions and write resolutions on this and similar issues.

In addition, the dependence of most of the Latin American and Caribbean ORIT affiliates on their governments (these often of an uncertain fate related to the outcome of the frequent revolutions, with or without an accompanying total or partial dictatorship) has made ORIT policies and planning very sensitive to political developments. It took time and patience for the United States trade union movement to adjust itself to these weaknesses. Serafino

Romualdi, American labor's representative, has done pioneering work to build a bridge between the methods, objectives, and needs of labor north and south of the Rio Grande, but he has not been able to change the habits and traditions of the area. Some years ago, these differences threatened to split ORIT into a North American and a Latin American region of the ICFTU.

One of the many unknowns which may still change the course of ORIT is the entrance of the Argentine labor movement in force into ORIT. Since this movement will bring into ORIT not only membership, but also leadership and finances, it will certainly want to influence ORIT policies in a direction which nobody can yet foresee. Any increase in Argentine activity may also encourage a greater participation of the Brazilian labor movement, which up to the present has been in the main a passive partner. If Bolivia should finally join, there will be four countries within ORIT with a more or less vital interest in nationalization—Bolivia and Mexico with practical experience; Brazil and Argentina with a strong clamor for nationalization, at least in the oil industry.

Asian Regional Organization

The situation in Asia was not as favorable to the establishment of an effective regional organization as it was in Europe and in the Western Hemisphere. There were no strong and effective ICFTU affiliates in existence, nor did the affiliates have the financial strength to provide the means necessary to maintain a regional organization. In addition, there was no tradition of free trade unionism. Most of the countries had been under the rule of colonial powers for a long time and had only recently gained their freedom. The rank and file was often illiterate and had no

experience in trade unionism. The leadership was in the hands of intellectuals who were linked to political parties representing various ideologies. Friction existed between the newly freed countries, and many of them aspired to leadership or at least to a prominent place in Asian politics. These frictions and aspirations engulfed also the unions. For example any decision on the seat of the regional headquarters was bound to reflect upon the status of the country within the area. The wide range of languages and dialects spoken throughout the area did not facilitate the search for compromises. Under these circumstances, it was surprising and encouraging that the Asian Regional Organization (ARO) was able to hold its founding convention as early as April 1951.

Since then, the work of the Asian Regional Organization has been frequently and strongly criticized. It is claimed, in particular, that ARO has not made much progress in developing free trade unions in the underdeveloped Asian countries, and that communism has remained a strong factor in Asian labor. All this in spite of the fact that ARO has been heavily subsidized to carry out its organizational and educational program.

It was chiefly with an eye to Asia that the 1955 Vienna Congress of the ICFTU created the new post of Director of Organization. It was felt that more intensive efforts must be made to improve the trade union situation in underdeveloped countries and that a special office should be charged with the development of the necessary plans and action. How successful the ICFTU will be with this new venture remains to be seen. Its concern is understandable. Asia has become one of the most important parts of the world. The largest number of inhabitants of the world are crowded into the Asian coun-

tries. Most of the countries were long held back in their economic development. World War II destroyed the myth of the supremacy of the white man. Great numbers of underprivileged Asians have become aware of their potential strength and are demanding recognition as equals, politically and economically. This is the environment in which the Asian Regional Organization was formed and was expected to work miracles. Speaking in absolute terms, the accomplishments of the Asian Regional Organization are rather small; speaking in relative terms, they are significant and creditable. The very fact of continued existence in spite of internal frictions is already a major accomplishment. The strong emphasis upon trade union education was a wise decision. "Knowledge is power" was the motto of European labor. Creating the Asian Trade Union College in Calcutta was a good though modest start.

Singapore Office

The establishment of the Singapore Office by the ICFTU, in co-operation with interested International Trade Secretariats, for the purpose of organizing plantation workers was probably the most significant accomplishment in the Asian region. This step helped the Malayan plantation workers to consolidate and protect their organizations against Communist infiltration. Assistance given by the Asian Regional Organization may also have been a factor in the development of a strong free trade union movement in the Philippines.

WFTU in Asia

One of the major questions at this time is whether the WFTU will succeed in forming an Asian or Afro-Asian federation dominated by Communist trade unions. Alone, the ICFTU Asian Regional Organization may not be able

to prevent such a development. Until now, the existence of an Asian Socialist Federation with influence in countries where ARO has not been able to gain a foothold has been an important factor in halting Communist progress; it may also prove to be a serious handicap to the future aspirations of the WFTU in Asia.

Japan

A decentralization of some of the ARO activities is a must, considering the polyglot composition of the affiliates. At present, the Far East is neglected in the distribution of leadership of the ARO. Japanese labor and Japanese pride will never be satisfied with an organization centering its activities in far away India. Japan has a highly developed industry, a highly skilled labor force, and it has again a powerful trade union movement. This situation is being recognized internationally. It is notable that the ITF with its long tradition in Asia has found it necessary to move its Asian headquarters to Tokyo, thus acknowledging the revival of trade union power in the Far East. Up to now, Japan's participation in the ARO has been very small. The new ICFTU Director of Organization in studying the Asian situation will probably pay the necessary attention to the needs of the Far East area, particularly with respect to its sensitiveness to overtures from Red China.

Africa

The splurge in African activities has been to a great extent forced upon the ICFTU by the surge of anticolonialism which is engulfing ever greater parts of Africa. Economically, the basis for a mature free trade union movement prevails in only a few parts of Africa. Existing labor organizations are used by nationalists as a springboard for political objectives. The few able trade un-

ion leaders find themselves automatically lured into political activities. Of the underdeveloped countries of Central Africa, only Northern Rhodesia and the Gold Coast have been able to form a solid trade union movement which promises to withstand all the day-to-day tensions caused by a membership which has not learned as yet the art of restraint. The attempted formation of a regional organization may or may not succeed. As a first step an African Congress was held in Accra in January 1957.

All the odds are against the success of an African regional venture. A compromise may have to be found in making the existing strong points of the ICFTU in Tunis, Kenya, and the Gold Coast the seats of subregional activities without changing the basic character of the present organization. Such a subregional establishment may be success-

fully used to siphon off money from the new Director of Organization. This hope may, however, be shattered if the reports are true that the new Director of Organization is earnestly considering replacing some of the present grants by a system of repayable interest-free loans from a revolving fund. Apparently this plan would be designed to reward those affiliates willing to mobilize their own forces and make the necessary sacrifices for strengthening the labor movement.

A North African subregion may have the best chances of survival if it is centered around the powerful and highly developed Tunisian trade union movement. Its very existence and demands will, however, increase the differences within the Brussels headquarters, which must effect a compromise between the views and interests of some of its European affiliates and those of the affiliates in dependent territories.

Economic and Social Aspects of International Trade Union Work

By ALFRED BRAUNTHAL

Abstract: Social and economic activities are the primary concern of trade unions, but these can flourish only under political freedom; the fight against dictatorship and the support of democratic movements must be waged by unions. International trade union work knows no geographical boundaries, but its character is influenced by the stage of economic and social development of a region. In industrially advanced countries it encourages and strives to maintain policies of full employment and full share by labor in resulting benefits of a stable economy, for instance. In underdeveloped countries, where trade union movement has just begun, it seeks to help in economic and social development geared to needs. The community of interests of workers in these two types of economies is stressed.—Ed.

THE political, social, and economic interdependence of all countries, of the largest no less than the smallest ones, has become so intense in the free sector of the world that no individual trade unions in any of these countries can remain aloof from involvement in international affairs. But while many national trade union centers from time to time express their views on international problems, international trade union work is for obvious reasons concentrated in the international trade union organizations. Aside from the Christian trade unions—whose international organization by and large has a regional character—nearly all genuine trade unions, that is, trade unions organized independently both of governments and of employers, have affiliated themselves vertically, through their national centers, with the International Confederation of Free Trade Unions, and many of them also horizontally, as industrial organizations, with the International Trade Secretariats. As, however, these hori-

zontally organized international trade union organizations, although strictly autonomous, are closely co-operating with the ICFTU and consider themselves associated with this organization, there is no need to dwell upon the division of international work between the ICFTU and the International Trade Secretariats. A survey of the economic and social aspects of the work of the ICFTU will suffice in the framework of this article.

RELATIONSHIP OF SOCIAL AND ECONOMIC WITH POLITICAL ACTIVITIES

Since workers organize themselves in trade unions in order to better their conditions, social and economic activities must be considered the primary concern of trade unions. This applies to unions on all levels, on international no less than on local and national ones; but in actual practice trade unions will seldom be able to confine their activities to social and economic problems. First of all, in order to achieve social

Alfred Braunthal, Ph.D. (Vienna), is Head of the Economic and Social Department of the International Confederation of Free Trade Unions, Brussels. He was formerly research director of the United Hatters, Cap and Millinery Workers International Union (AFL-CIO).

and economic goals, trade unions, like any other organizations representing social and economic interests, will often have to resort to political activities, be it directly or in co-operation with political organizations with which they have ties.

Moreover, since trade unions cannot truly represent the workers' interests unless they are really free, that is, independent of both governments and employers, they can act genuinely only under conditions of political freedom, and such conditions can be established only where democracy rules and people can determine their destinies for themselves. The establishment of democracy and self-determination where they do not exist, and their restoration where they have been destroyed, must be a major concern of the free trade union movement as a whole, and especially of the international trade union organizations. In order to ensure the rise and preservation of genuine trade unions in the whole world, the international free trade union movement must fight dictatorship, whether of the Communist or of the Fascist brand, everywhere in the world. It must for the same reasons help as much as possible to bring about a rapid development towards self-government and self-determination of peoples under foreign rule.

This political fight is necessarily intertwined with the social and economic activities of the international free trade union organizations; but since an account of these political activities would exceed the scope of this article, this brief reference to the relationship between political and social-economic activities will have to suffice.

Trade union freedom

In one field of trade union activities, however, a distinction between political and social-economic action of free trade unions cannot be drawn at all: in their

fight for trade union freedom itself. There is hardly any trade union organization, even in countries with well-established democratic systems, where at one time or another trade unions have not had to battle for establishing or preserving full trade union rights. The trade union legislation which was adopted in Great Britain after the general strike in 1926, the Taft-Hartley Act in the United States, and the right-to-work laws in some states of the United States, are well-known examples of measures which the trade unions have regarded as encroachments on their rights and against which they have taken up a determined fight. The same holds true for legal impediments to strikes of civil servants and restrictions in their bargaining rights, which can be frequently found in democratic countries.

In self-governing democratic countries trade unions will as a rule be able to achieve and preserve full trade union rights through their own means. For other countries the international free trade union movement will frequently have to act. The ICFTU plays indeed the role of a watchdog for the whole world. Wherever it finds that fundamental rights, and trade union rights especially, have been infringed, it will intervene, be it by a direct appeal to the government concerned, be it by appeals to the United Nations or the International Labor Organization. The complaint procedure which—largely as a response to pressure on the part of the trade unions and their representatives within the ILO—has been established by that organization has proved to be an effective instrument of world public opinion and has been frequently used by the ICFTU to submit complaints against governments which have disregarded trade union rights. For obvious reasons such complaints have been mainly directed against dictatorship governments and against metropolitan gov-

ernments which have curbed trade union freedom in dependent countries, as well as against such countries as South Africa which practice social discrimination. While international bodies like the United Nations and the ILO have no remedial powers in such cases, their moral authority, which has time and again been invoked against the violation of trade union rights, has doubtless increased the respect for labor rights and freedom.

DIFFERENT SOCIAL AND ECONOMIC PROBLEMS

In examining the international aspects of social and economic trade union activities, one is at first glance inclined to think of interests which are common to all workers in all countries. Very broadly speaking, there are a great number of such interests. All workers in all countries are interested in decent working conditions; in wages which secure to them adequate living standards; in the abolition of discrimination; in a continuous rise in real wages; in creating favorable conditions for wage increases, such as a steady rise in productivity; in a sound limitation of the hours of work; in corresponding limits of the working year (vacations with pay, public holidays with pay); in satisfactory industrial relations, including appropriate machinery for having the workers' voice heard and respected by management; in social security; in decent housing facilities; in the establishment or maintenance of economic conditions ensuring full employment; in economic stability as one of these conditions; in a continuously expanding economy as a condition of full employment of a growing population and as a condition of rising living standards. This catalogue can of course be enlarged ad libitum, by including among conditions for full employment, for a stable and expanding economy, and for

rising living standards, for example, appropriate fiscal, credit, public investment, foreign trade, and agricultural policies.

International trade union work might consist in establishing general principles for all these sectors of social and economic activities; in working out concrete programs on the basis of these principles; in agreeing upon joint or co-ordinated action on the part of all national trade unions; and in deciding upon a strategy aiming at achieving the maximum objectives which can be realized at any given moment.

Were the international trade union movement confined to countries in more or less equal or similar stages of economic and social development, such a policy would be perfectly adequate. There was indeed a stage in the development of trade unionism for which this policy proved to be so. That was the period in which trade unionism was more or less confined to the economically advanced countries of Europe, North America, and Oceania. The leading international trade union organization of that period, the International Federation of Trade Unions, was indeed able to conduct such a policy. And to the extent to which even at present certain problems affect this group of countries, this policy is still being pursued by the ICFTU or its European section, the European Regional Organization.

But while it is true that workers of all countries are interested in, and in the final analysis strive for, the goals enumerated above, the stages of social and economic development of the countries in which they live show such huge differences that the establishment of identical objectives for all of them would have hardly any practical meaning. The objective of adequate living standards, for instance, must necessarily mean something utterly different in the

United States where *hourly* wages of three dollars may appear adequate for large groups of workers, and for India or the Philippines or a great number of other countries where a *daily* wage of three dollars for any group of workers would appear utopian.

That the ICFTU a few years ago propounded the objective of the *full employment economy* for the industrially advanced countries, worked out a concrete program to this end, and coordinated the actions of the national trade unions in this field was of great importance for organized labor in this group of countries and proved to be a highly successful trade union action, since conditions were ripe for this achievement. However, to pursue the same policy in those economically underdeveloped countries in which the economic resources are far too sparse to absorb the huge masses of the underemployed would be meaningless. The arduous process of economic development must obviously precede the proclamation of such a goal.

It follows from these considerations that in a period in which the international trade union movement envelops countries in very different stages of economic and social development, its social and economic activities must differ for each of the major groups of countries. And that is the case in contemporary trade unionism. For reasons which to explain would far exceed the scope of this article, free trade unions have developed or are rapidly developing not only in countries in various stages of the process of industrialization, but even in countries in which there are hardly any manufacturing or mining industries, as is the case in most African territories. In such countries workers are organizing in plantations and in transportation and public services. The ICFTU comprises more and more of these young trade union movements; it

has become truly world-wide, with the exception of course of the Communist and other dictatorial countries.

Fundamental community of interest

Yet the necessity to differentiate in its social and economic work according to the stages of development of those countries in which free trade unions operate does not imply any clash of interests between the various groups of countries. On the contrary, never before has international solidarity of workers had such a profound meaning and such a world-wide scope as it has acquired with the expansion of free trade unionism and its international organizations over the whole free world. It is readily understandable that in a world-wide organization such as the ICFTU, composed of trade unions of such different traditions, working in countries with so widely differing interests, there will occur from time to time differences of opinion, difficulties in reaching agreement on certain matters, and tensions arising from these difficulties. Yet there has never been any major difficulty or tension within the ICFTU in the social and economic fields. There has never been any grave problem in working out social and economic policies for the various groups of countries and in the practical co-operation in these fields between the trade unions of the various groups of countries.

Such a harmonious collaboration cannot be coincidental. It must result from a fundamental solidarity of interests between the workers in the principal groups of countries, that is, in the industrially advanced and in the economically underdeveloped or developing countries. A brief survey of the chief social and economic problems with which trade unions in these two groups of countries have to cope may contribute to explaining this solidarity of interests.

PROBLEMS IN INDUSTRIALLY ADVANCED COUNTRIES

The main social and economic problems which trade unions in economically advanced countries have to face revolve around the need for combining economic stability and economic expansion. This combination, the establishment and preservation of a stable and at the same time expanding economy, is indispensable to ensure to the workers both full employment and rising living standards. Once this problem has been solved, trade unions in industrially advanced countries, given political freedom and true democracy, can be assumed to dispose of sufficient power and determination to ensure for the workers the maximum of social and economic protection, security, and progress which corresponds to the given economic situation.

The international tasks which derive from these problems can be grouped under two headings: functions connected with establishing general trade union policies to this end and functions directed towards the equalization of social conditions within the industrially advanced countries.

First of all, international co-operation and co-ordination are needed in developing and carrying out policies aiming at the establishment and preservation of a stable and expanding economy of full employment and of workers' full participation in the benefits arising from the achievement of these goals. This has been, as mentioned above, one of the main concerns of the ICFTU in tackling the social and economic problems of the industrially advanced countries.

In this connection, the relationship between wage policies, employment policies, and productivity problems must be continuously examined, especially with a view to fostering productivity,

but ensuring at the same time the prevention of technological unemployment and the full participation of the workers in the benefits arising from increased productivity.

Equalization of social conditions

Parallel with this function of the international trade union movement goes that of aiding in the equalization of the pace of social progress. Although the equalization of social conditions between the group of industrially advanced countries and that of the economically underdeveloped or developing areas is necessarily a long-range task, the equalization within the former group is an immediate trade union function, not unlike that of equalizing wages and working conditions within a particular country.

The interest which the American trade unions have in lowering and eventually abolishing the wage differentials between the South and the rest of the country is obvious. Their efforts towards organizing the South, although resulting from general considerations and ideals, are also connected with this objective. French trade unions, to mention one more example, are combating the regional differentials in the official minimum wages. In many European countries national union agreements, with uniform wage rates and working conditions, are prevailing. Under this aspect international efforts of the same kind are but logical.

A glance at international wage statistics will show that there is a wide gap between wages in North America and Oceania on the one hand and Europe on the other, and that, moreover, within Europe there is a wage ladder with several steps. To narrow the gap between North America and Europe, the international trade union movement, especially in its European sec-

tion, has concentrated its efforts on two objectives: the acceleration of the pace of technological progress in Europe—with proper safeguards, of course, for the workers' interests within this process—and the social and economic integration of Europe. Both objectives are to a large extent interdependent. Progress in the productivity of labor is obviously hampered by the narrowness of European markets. If the market for industrial products within which no custom or other trade barriers exist is confined to areas comprising from four to fifty million persons, the advantages of large-scale production cannot be exploited to the same extent as in industrial markets comprising 170 million persons.

Toward European integration

It is for reasons of this kind that the ICFTU and its European Regional Organization have been conducting a systematic campaign for the social and economic integration of Europe and for the introduction on the largest possible scale of a "common market." The close collaboration of the ICFTU in the launching of the Schuman Plan and its continuous co-operation in the work of the European Coal and Steel Community is no less traceable to the interest of the free trade unions in European integration, as are its co-operation with the Organization for European Economic Co-operation and its intense propaganda for fostering the plans for a common market within the countries of the European Coal and Steel Community and for Euratom.

European integration has clearly the double objective of narrowing the gaps in economic progress and in social standards which exist between Europe as a whole and North America and of reducing the inequality in social and economic conditions between the various European countries themselves. In

other words, any step towards economic integration of Europe is a step towards social and economic equalization within the particular European countries. This does not mean, however, that the ICFTU and its European Regional Organization are holding back in carrying out their equalizing functions until Europe has been integrated. Much can already be done and is being done by the free trade unions to bring about a greater equality in working conditions, social legislation, and social security systems within Europe than exists at present. Such a process will in turn facilitate the economic integration process.

PROBLEMS OF UNDERDEVELOPED AREAS

As has been emphasized above, the social and economic problems of the economically underdeveloped or developing countries which the trade unions have to face are of an entirely different nature from those of the industrially advanced countries. That does not mean that each and every one of these problems is so fundamentally different that nothing could be learned from the experiences of the other group. Indeed, much can be learned in many respects. For example: India plans to introduce some kind of workers' participation in the management of industries. In order to choose as intelligently as possible among various already existing systems of workers' participation, the Indian government has established a tripartite study group consisting of government, employers, and trade union representatives and has sent it on a study tour through Europe. It was but logical that this group first visited ICFTU headquarters and discussed there the various problems and alternatives and that the ICFTU in turn was in contact with the trade unions of those countries which were to be visited by the study group.

The fundamental problem of the economically underdeveloped countries, a problem entirely peculiar to them, is that of social and economic development not within but towards an industrial society. Not that it would necessarily be rational for all the countries of this group to industrialize. There is no valid economic reason for imitating the policy of industrialization at any price—in practice, at the price of terrific sacrifices of human well-being—which has been consistently pursued by the Communist countries. The free trade unions have kept clear of the erroneous belief that industrialization is the only rational way of economic and social development. They realize that for many countries the development of a rational agricultural structure is no less important than speedy industrialization, and may in fact be more so. Rationalization of agriculture requires in many of the countries of this type a thorough agrarian reform, aside from, or as condition for, technological progress in the countryside by modern cultivation methods, adequate irrigation systems, and so forth. Surely, even in countries of this type much could and should be done as quickly as possible to develop or expand certain manufacturing industries. But this would not imply a radical change in the ratio between industrial and agricultural production.

Yet whatever type of economic development an underdeveloped country may choose, the fundamental problem remains that of organizing this process and of finding ways and means to finance it adequately and to create all political, administrative, and technical conditions necessary for carrying it through. Aware of the paramount importance of economic development for the underdeveloped countries, the ICFTU has been giving all its attention to the problems involved and has been making every ef-

fort to do its share in aiding the development process.

Outside financial aid

From the international point of view the outstanding problem with which the free trade unions have to deal in this connection is that of outside financial assistance. They have never approached this problem with an attitude of *either . . . or*. They have never ignored or neglected the important part which such undertakings as the Point Four program, the Colombo Plan, and the financing activities of metropolitan countries in their dependencies have been playing in furthering the economic and social development of underdeveloped countries. They have had to convince themselves, however, that this approach cannot suffice, but that for general development projects which do not qualify for loans from the International Bank for Reconstruction and Development and for which financial aid from other sources cannot be expected or asked for but which are nevertheless of great importance for particular countries of this group, assistance from a general international development fund would be indispensable.

It is on these grounds that the plan to establish a Special United Nations Fund for Economic Development (SUNFED) was launched and enthusiastically welcomed both by all economically underdeveloped nations and by the ICFTU. The free trade unions have never been inclined to exaggerate the importance of SUNFED or, for that matter, of any outside financial assistance. They have always been aware of the parallel need of creating within the underdeveloped countries conditions favorable for development and of the countries' themselves straining all their forces. But the unions are in serious disagreement with the position taken by the governments of the financially strong countries

that means for the establishment of SUNFED cannot be found until the need for high rearmament expenditures disappears. The ICFTU holds that if the readiness exists to make certain sacrifices, means and ways can always be found within wide limits for diverting economic resources from use at home to assisting foreign countries. The free trade unions are, moreover, convinced that financial assistance for the economic development of underdeveloped countries, far from competing with rearmament expenditures, should be considered to be a part of them, since it strengthens the resistance of this group of countries to Communist penetration. Needless to state that under this aspect the initial fund planned for the establishment of SUNFED can be considered only as the first step in a vast development effort.

This position has been repeatedly defended by the ICFTU before the competent international bodies. The ICFTU considers its insistence upon the creation of SUNFED and, generally speaking, upon the organization on the largest scale of international financial assistance to economically underdeveloped countries as one of its essential functions in the social and economic fields.

SOLIDARITY OF WORKERS' INTERESTS

It might appear at first glance probable that the interests of workers in economically advanced and in underdeveloped countries would clash. Workers in the former group of countries might consider the industrialization of economically underdeveloped countries as a threat to their own industries. Moreover, they might resist large-scale financial aid to these countries since it involves sacrifices on their own part. It cannot be denied that in certain instances workers in economically advanced countries feel that their living

standards or their employment opportunities are threatened by competition from low-wage countries and that they ask for protection against such competition. But by and large within the whole of the group of economically advanced countries these instances are rare and can be dealt with without shaking international workers' solidarity. In any event the solidarity of workers' interests between the two groups of countries prevails.

Competition from underdeveloped countries

This strong prevalence of international workers' solidarity in the social and economic fields rests on two considerations. First of all, the workers of the economically advanced countries have come to realize that the best guaranty for preventing competition from countries with extremely low living standards is social progress in these areas. However idealistic their motives may be in fostering social progress in that group of countries, by helping in the development of trade unions and in many other ways, it cannot be denied that their own well-understood material interests point in the same direction. From this position follows logically the awareness that economic development is a prerequisite for social progress in underdeveloped countries and that therefore sacrifices made by the workers of industrially advanced countries for financial aid to underdeveloped countries are justified for the same reason.

Economic interdependence

The second consideration which makes for international solidarity of workers' interests in the social and economic fields is the awareness of the economic interdependence between the two groups

of countries. For the underdeveloped countries their dependence on the industrially advanced countries is obvious. They cannot expect to receive from them a steady expanding flow of capital funds for their development unless economic stability and progress are ensured in the advanced countries themselves. In this respect the interests of the workers of the advanced and the underdeveloped sectors of the world economy are quite obviously identical.

In addition, the underdeveloped countries are depending on the advanced countries as the chief markets for the raw materials and foodstuffs which they produce. Whenever the stability of the economies of a large part of the advanced countries is disturbed, the international markets of raw materials and foodstuffs are immediately gravely affected. Whenever an economic depression occurs in the advanced countries, the markets of primary commodities collapse, with disastrous effects on employment, living standards, and development plans in the underdeveloped sector. This sensitivity of the international commodity markets towards disturbances in the economic stability of the advanced countries is another factor which contributes to the international solidarity of the workers.

Reliance on the general stability of the economies of advanced countries is, however, not a sufficient guaranty for the stability of the markets of each and every primary commodity. Even in a very stable world economy prices of particular commodities may fluctuate considerably unless institutions ensuring their stability to a certain degree are created. The ICFTU has therefore given its special attention to the problem of the stabilization of prices and production of primary commodities, has shown great interest in the conclusion of international commodity agreements, both for foodstuffs and for raw

materials, and has pressed for the continuation and improvement of existing agreements.

It is less obvious, but no less true, that the workers in the industrially advanced countries are also dependent on social and economic development in the underdeveloped areas. Their political interest in such a development is self-evident. The free trade unions consider the social and economic development of these areas, with the aid of the democratic countries and the United Nations agencies, as an essential condition for the preservation of the democratic world. But apart from these political considerations, economic stability and rapid economic progress in the underdeveloped sector of the world economy aid also in maintaining economic stability in its advanced sector. Even if for the advanced countries the ratio of trade with underdeveloped countries to their entire foreign trade is generally small, instability and lagging behind the general expanding trend in even a marginal portion of their foreign trade constitutes an unstabilizing element.

It is for all these reasons that the free trade unions of all countries have come to realize not only that their philosophy and their political views require international solidarity and co-operation but also that their immediate social and economic interests are best served by such policies. This holds true not only within the economically advanced countries, which prior to the foundation of the ICFTU formed the only international trade union group, but also for the relations between them and the economically underdeveloped countries, in which for the first time in history trade unions on a large scale have been emerging. The social and economic functions of the contemporary international free trade union movement concern to a very large extent these relations.

WITHIN THIS FRAMEWORK

In this bird's-eye view of the social and economic aspects of international trade union work only the framework within which numerous concrete problems are constantly tackled could be outlined. It would have been impossible to discuss these concrete problems themselves, important as they may be for the day-to-day work of the trade unions. One example, however, may be mentioned, the recent and still continuing campaign of the ICFTU and the International Trade Secretariats for a reduction of the hours of work in economically advanced countries to forty hours. This action can in effect be un-

derstood as part of the trade-union-fostered process of adjustment of working conditions in Europe, where the forty-hour week does not yet exist, to those in North America and Oceania, where it does exist.

As this example shows, the whole network of particular social and economic activities of the ICFTU can in its essence be understood only if placed in the framework of the great social and economic tasks which the international free trade union movement has been undertaking and is consistently carrying out, as an essential element in the fight of the democratic forces for political freedom and continuous social and economic progress in the world.

The International Labor Organization in a Changing World

By DAVID A. MORSE

Abstract: The changing conditions of the world have changed also the program of the International Labor Organization. Organized in 1919 by the industrialized nations, much of its early attention was given to setting up labor standards to avoid "unfair" competition from countries with cheap labor standards. Today the main emphasis of the ILO is on improving working and living conditions by helping the less advanced countries to develop their economic potential and raise their productivity and by helping the more advanced countries to lay the social basis for greater economic co-operation. The machinery and the techniques developed to achieve these aims are described in some detail.—Ed.

TODAY, social conditions and the movements which they generate are the very stuff of world politics. Never before has consciousness of political goals touched so many people in so many parts of the world. Never before has the social objective of these goals been so explicit.

The past decades have seen the awakening and the dramatic, sometimes chaotic, progress of new mass movements. These movements, of different pedigrees and adopting different methods, have at least one common characteristic: the pledge to improve the welfare of the people. In Asia, Africa, Latin America, and the Middle East, the promise of social progress to overcome the poverty of ages is itself a strong force in political and economic life. It has become a living idea to many millions of people who have not previously been drawn into the mainstream of national and international development. It is at the root of the large-scale development programs which most industrially less advanced countries have launched during the past ten years.

INDEPENDENCE AND ECONOMIC DEVELOPMENT

National independence is a cherished goal in these parts of the world. There are many reasons for this. Highly important among them is the fact that independence is viewed as a requisite for more rapid social progress. It is sought to end "exploitation" so as to be able to concentrate national energies and resources on economic and social development; to end "colonialism" by narrowing the gap in productive capacity, health, education, and welfare between the industrial countries and the areas of former colonization; to end poverty. But independence alone cannot close the gap. It cannot overcome poverty. Economic development is a slow process. Promises of improved social well-being are hard to fulfill and impossible to fulfill from one day to the next. Difficulties are inevitable. Social strain, deriving both from the changes which are taking place and from the fact that the pace of change is not fast enough, is very great.

David A. Morse, Litt.B., LL.B., is Director-General of the International Labor Office, Geneva, Switzerland. Previously, he was general counsel of the National Labor Relations Board and Acting Secretary of Labor, Washington, D. C.

CHANGES IN INDUSTRIALIZED AREAS

In the more industrialized areas of the world, the past decades have also been characterized by great changes in technology, industrial organization, and social concepts. The last world war marked the end of one era and the beginning of another. The distinguishing characteristic of the era which began was, as in the awakening countries of Asia, the Middle East, Africa, and Latin America, the primacy accorded to the social objective and the consequent emphasis on social well-being. To be sure, many of the good intentions of the immediate postwar period have dissolved in the political conflicts and economic difficulties of these last ten years. Entrenched systems of national protection have been on the defensive, in Europe and elsewhere. Many of these traditional systems have made it difficult to develop the greater international co-operation needed for economic growth. True, limited efforts have been made to widen areas of co-operation. In Western Europe, for example, persistent attempts towards greater regional co-operation have made some progress in the last few years, particularly in limited practical fields. These efforts have been directed primarily towards improving the competitive position of the countries in this area of the world, but it is perhaps significant that the co-ordination of social policy has been—inevitably—a significant preoccupation.

SOCIAL POLICY AND POLITICAL PROBLEMS

The universal search for social progress has built up new rivalries in the world. The great powers are competing with each other in efforts to provide financial and technical assistance to countries in process of development. In some technical and specialized fields,

these efforts do not interfere to any great extent with traditional concepts and ways of life. In many fields, however, there is frequently a clash of outlook and methods, which comes primarily from differences of social systems.

Our work in the International Labor Office is necessarily part and parcel of this world picture. The recent history of the International Labor Organization has shown how close social policy lies to the heart of a complex of domestic and international political problems in the world today and how, at the same time, the political situation influences and conditions the achievement of the social objectives to which the peoples are committed.

THE WRENCH AND RISK OF TRANSITION

We are, I think, living through a social transition of tremendous importance to the future of mankind. It is a transition towards industrialization and interdependence in an increasingly interdependent world community. The problems of freedom, material welfare, and security are intertwined. Industrialization at any cost endangers many other values most people hold dear. The risk of social instability is very great. We have only to look around the world today to see how complicated the pattern, how great the risk. Our essential problem is, I believe, to learn how to combine economic progress with social progress, to combine the search for improved social well-being with the search for greater human freedom. The heart of this problem lies in the field of social organization and social relationships. The ILO, which deals with labor and social policy in a wide sense, should accordingly be able to make a unique contribution to peace and orderly change throughout the world.

The ILO was set up in 1919—thirty-

eight years ago—in a very different world from that in which we live today. It has worked steadily and usefully ever since then. In recent years, the Organization, like the rest of the world, has been going through a period of adjustment. It has been seeking to adapt its policies and machinery to the changes which have taken place since the last war and to discover how, in present circumstances and with limited resources, it can make the best contribution to the achievement of its unchanging goal—the improvement of the working and living conditions of people everywhere.

ILO MEMBERSHIP

Many will recall that the initial impulse for the establishment of the ILO came mainly from the highly industrialized countries of Western Europe and, though its membership from the earliest days included states from the Americas, Australasia, and Asia, it was essentially a European organization, shaped and tempered to the needs and problems of European countries. Since the last war, however, the situation has been radically changed, very largely as the result of the great increase in the Organization's membership. In December 1939 there were fifty-seven members; today there are seventy-seven. Most of these new members are non-European countries from Asia and the Middle East, countries which have newly become independent and are taking their place on the international scene for the first time.

CHANGING EMPHASES

The preoccupations of the Organization have also changed. Today, the Organization deals not only with problems of concern to the advanced countries but also with problems of particular interest to the less developed areas of the world—problems of underemployment, problems of plantation workers,

problems of agricultural workers, who still form the bulk of the working population in so many of our member countries, problems of handicraft development, and so forth.

Fair labor standards

In the past, a very large part of the ILO's work was aimed at setting "fair" labor standards, on the theory that such standards, accepted by all competing countries, were needed to avoid "unfair" competition in international trade. Indeed, to put it bluntly, an implicit purpose of the early ILO was to prevent any country, and particularly the less industrialized countries, from entering into international trade competition on the basis of cheap labor standards. Hence the concentration on the adoption of conventions and recommendations aimed, directly or indirectly, at formulating a body of uniform labor standards which would, it was thought, take human labor out of the world market place and help to equalize labor costs from one country to another.

Development of economic potential

Now, by contrast, a very great part of our effort is directed towards enabling countries to develop their industries and particularly towards promoting economic expansion and social growth in the less developed countries. Nowadays we know that the importance of differences in labor costs as factors affecting international competition has been greatly exaggerated, that by and large the high labor cost countries have not encountered any special difficulties in selling their goods abroad. Take the United States example. This country pays the highest wages in the world and its workers work about the shortest hours. But it can sell its products on the world's market to great advantage and in fact has shown a persistent tendency to export more than it imports.

The answer is to be found in the fact that the United States and other high-wage countries have a number of compensating advantages—rich natural resources, relatively abundant capital equipment, and relatively skilled entrepreneurs, management, and workers. And it is precisely these advantages that have enabled them to become high-wage countries. Wages, hours, and other conditions of work are only some of the factors entering into labor costs, and unit labor costs are only one factor in the over-all production costs entering into the trade complex. As the United States Commission on Foreign Economic Policy put it a few years ago:

Neither low wages nor low unit labor costs, in and of themselves, constitute unfair competition. But [it added] it is to the advantage of the United States that labor standards throughout the world be raised. . . . The Commission recommends that the United States attempt to raise labor standards through consultative procedures and co-operation in international conferences such as those sponsored by the I.L.O.¹

Today, therefore, we look at the ILO standards from a positive angle—as a means to promote the realization of the practical social aims of the different countries which now make up our membership. Our standards of labor and social policy are a clear expression of growing social demands in the different countries and often translate these demands into specific measures of policy. And, in consequence, our main emphasis today is on improving working and living conditions by helping the less advanced countries to develop their economic potential and to raise their productivity and by helping the more advanced countries to lay the social basis for greater economic co-operation.

This shift of emphasis does not in-

¹ Commission on Foreign Economic Policy, *Report to the President and the Congress*, January 1954, p. 62.

volve abandonment of the important role of the ILO as a standard-setting agency. I believe that it may be regarded as an advance, as rounding out our previous approach with the additional approaches found necessary to service the increasingly diverse needs of an industrializing world society.

NOT BY LEGISLATION ALONE

Labor and social legislation is, after all, only one aspect of social policy. Legislation relies on administration, and good administration is not easy to come by. Moreover, legislation touches only a fringe of the area of industrial and labor concerns. Employers and workers hold the primary responsibility for pursuing sound and progressive social policies in many parts of the central area. We have known instances in which overemphasis on the legislative side has discouraged employers and workers from positive action in their own areas of responsibility and has led to an unhealthy reliance on the state to solve problems which are the proper function of industry itself. It has been increasingly recognized throughout the world that management and labor have a significant and important role to play in making the social changes which are continuously necessary in order to adapt to the dynamics of modern industry.

POSTWAR ACTIVITIES

Since the war, I should say, the ILO has been reshaping its machinery and activities in response to several central needs of our times.

Wider contacts

First, I would emphasize the need to have direct contact with a wider range of people who deal with labor problems in the different countries, so that the Organization may have a fuller appreciation of the problems to be met in a

changing world. The holding of regional conferences reflects one aspect of our response to this need. Since the war, we have held four American Conferences, three Asian Conferences, a preliminary Middle Eastern Conference, and, in 1955, a first European Conference. The setting up of Industrial Committees to discuss the problems of the world's major industries is a further step to meet this need for wider contacts. Since the war such committees have been established in eight industries (coal mining, iron and steel, metal trades, chemicals, building and civil engineering, inland transport, textiles, and petroleum), and somewhat similar committees deal with the problems of salaried employees and of plantation workers. The maritime industry has special machinery dating back to the early days of the Organization. There is also a network of committees or conferences on particular subjects, say women's work, safety, labor statistics, or the employment of children and young persons. The contacts made possible in these ways keep the Organization alive to the practical problems of the industrial world, and the discussions which take place often help to suggest lines of solution.

Technical assistance

Secondly, there is the need to give practical assistance to governments in overcoming the obstacles to broader and more efficient labor policy. The basic response to this need is our developing technical assistance work, which has grown to sizeable proportions over the last five years or so. In 1955, the ILO sent 241 experts to 41 countries and territories and offered 602 fellowships and study grants to enable officials of 47 different nationalities to study abroad. Our technical assistance work corresponds to our emphasis on improving social conditions by improving the in-

fra-structure required for lasting social growth: higher productivity, higher human skill, better safety, healthier conditions of employment. Two thirds of our technical assistance effort goes into projects directed to these ends.

Aid to governments in negotiating international agreements

Thirdly, we have felt the need to increase the flexibility of our services as an international organization so as to encompass the practical problems of particular governments faced with particular international situations. In Europe, for example, the efforts towards greater economic and social co-operation have brought new problems into being and given us new opportunities for service. I would mention only two examples of our work in this area: the Rhine Boatmen Conventions, whereby the governments concerned negotiated under ILO auspices to reach agreement on several aspects of social security and conditions of work for the 45,000 workers on boats plying the River Rhine; and the European Inland Transport Social Security Agreement which gives a minimum of social security protection to the workers moving from one country to another in the course of their work. In both cases, the ILO has provided the necessary agency for bringing together the parties concerned so that they could negotiate and reach agreement on specific technical and human problems.

Labor-management co-operation

Fourthly, we have been drawn into the area of labor-management relations more deeply in order to see what types of relations are needed in the modern world to cope with industrial problems effectively. In this area of policy we are now seeking to expand our work so as to provide services which management and labor need today in order to

come to grips in their own way with their own problems. Some of these services are informational and others are advisory. A meeting of experts on industrial and human relations, held in Geneva in July 1956, suggested a program of research and technical assistance which has provided useful guidance in the work ahead.

Technological change

Finally, I would emphasize the need underlying all these others, that is, the need to study and give what guidance we can in dealing with the social problems consequent on economic and technological change, both in the rapid industrialization of the less developed areas and in the introduction of automation and analogous technological processes in the more developed countries. The spread of technology in the world today is a primary force changing industrial organization and work relationships inside countries and changing the relations between countries and the peoples which make them up. In the ILO, one of our principal concerns is to anticipate these changes and to draw on our membership to provide the guidance needed to move from one stage to another with as little friction and human suffering as possible. In June 1957, the Conference is to discuss the labor and social implications of recent technological developments, with particular reference to automation and atomic energy, and on the basis of the guidance so provided the ILO will expand its work in this field as may be necessary.

Determined by economic and social pressures

These needs which I have summarized in so general a fashion are not new. They have been recognized since the ILO was first set up. Each need is filled in terms of the times. What

seems new today simply derives from the evolution of industry and labor throughout the world and reflects the current position. Our contacts are wider, our practical assistance to governments and other bodies has increased, our services have become more flexible, our opportunities for assisting labor and management to cope with their problems have increased, our fact-finding and research field has widened. The expansion has been necessary because of the steady, inexorable growth of industry and labor over the last thirty-eight years; because of the equally steady and inexorable pressure of social demand everywhere and the impetus given to it by the social movements which have taken shape, particularly since the last world war; and because people are not willing to be pushed around by these forces—they want to know what is going on, today more than ever before.

THE NEED FOR EDUCATION

If I were to single out the element in our activities which seems to me to contribute most to growth, I would say it is the educational factor, education and training in the broadest sense—training of labor inspectors to translate laws into social practice; education and training of young people for the economies of tomorrow; management education and development to cope with the changing problems of these economies; workers' education so that the workers may play their full part in national development; education and training of administrators, technicians, statisticians in all fields of concern to us; and education through international contacts, however brief, however limited in scope. The need for education, in its wide sense, has been increasing with the spread of industrialization and urbanization and the many problems of social

adjustment arising with new ways of work and life.

POLITICAL CONTROVERSY

Despite the very broad measure of support which has been given to the types of ILO activity I have just mentioned, recent years have also seen political controversy in the Organization. This in itself can hardly be surprising in view of the close relationships between politics, ideologies, and social questions which affect national and international policies. The ILO has always been confronted with political issues of one kind or another and many of them have related to the representation of employers and workers within the Organization. But these so-called "political" issues have come particularly to the fore since the re-entry into the Organization of the USSR in 1954.

Current problems center around the representation of employers' and workers' delegates from Communist countries and the seating of these representatives at the Conference and on the committees and other bodies where the work of the Organization is done. Employers' representatives from other countries have challenged the credentials of employers' representatives from the USSR and other Communist countries on the ground that they were not, properly speaking, representatives of free employers but were really government representatives. A number of the workers' representatives tended to take the same view about the workers' delegates from these countries.

The problem was discussed by the Governing Body, which decided to set up a special independent committee to examine the extent to which employers' and workers' organizations were independent of government control in all the various states that are members of the ILO. This committee, chaired by Lord McNair (a former President of the In-

ternational Court of Justice at The Hague), submitted a report early in 1956. The ILO Governing Body, before considering this report, asked for the views of the annual ILO Conference, in order to obtain an expression of opinion on the question, particularly from countries not directly represented on the Governing Body at the present time. The Conference in June 1956 held an exchange of views on the general issues and the matter went before the Governing Body once again in November 1956. After debating the complex issues involved and hearing the divergent views expressed by government, employer, and worker members from different countries and backgrounds, the Governing Body finally decided to ask me to make proposals to it as to the desirability and practicability of setting up continuing machinery which would establish the facts regarding freedom of association in the ILO's member countries and report its findings to the Governing Body and the Conference. The Governing Body also asked, in this connection, for a report from me on improvement of the practical methods of working of the Conference. These proposals are now being prepared.

Healthy discussion and reappraisal

It would not be proper for me to comment upon the various points of view expressed on this issue. There are, however, two observations I might make. In the first place, despite the highly controversial nature of the issues, all parties have respected the law and procedures of the Organization. This both strengthens the processes of international co-operation and gives an example of how the most serious issues can be dealt with through free discussion and constitutionally reached decisions. In the second place, the result of this debate, which involved considerations of the structure and purposes

of the ILO, will, I believe, prove healthy for the Organization. The problem is one that must be resolved gradually, and I am sure that the representative organs of the ILO, with the wisdom they have consistently shown in dealing with the major issues in the life of the Organization, will prove able to deal constructively with those I have just referred to.

FUTURE NEEDS

Events of recent months have cast a graver mood upon international rela-

tions. It cannot be said as I write these lines exactly what new responsibilities may fall upon the international organizations, and in particular upon the ILO. It is clear to me, however, that these organizations (and the ILO not least among them) will need at this time and in the period ahead to call to the fullest upon their inner strength and resiliency and upon the support of nations devoted to international co-operation, so as to serve the world in troubled times as they were intended to do.

Nationalization in Britain: A Sobering Decade

By GEORGE B. BALDWIN

"In spite of the gains made by work-people in their conditions of employment and the increase in the power and influence of the unions, there does not seem to have been a commensurate improvement in the climate of industrial relations. There is in every nationalized industry a feeling among rank and file workers that no fundamental change has occurred. The behaviour pattern of the unions does not appear to be significantly different from what it was under private enterprise, and many observers are disappointed at what seems to them to be the failure of the unions to grasp their opportunity to contribute towards making nationalization a success."—B. C. Roberts, "Trade Unions and Nationalization," *Progress*, Winter, 1954-55.

A REVIEW of labor developments in Britain's nationalized industries makes sense only on the assumption that there ought to be something special to say arising out of the fact of nationalization. There would otherwise be no excuse for lumping together post-war developments in the coal mining, electricity, transport (railway and long-distance trucking), and iron and steel industries—let alone the Bank of England. For these are, in order, the industries touched by the wand of nationalization between 1945 when the Labour party came in and 1951 when it went out. Its exit was promptly followed of course by the denationalization of trucking and iron and steel, so that a record of experience really exists for only four industries.¹

¹ I am not insensitive to the importance of the struggle for life at the Bank of England; but in any properly weighted equation the class struggle in that venerable institution can probably be ignored. Omitted also will be any discussion of the other "minor nationalizations"—civil aviation and the overseas telegraph monopoly (Cable and Wireless, Ltd.). All of these "industries" were nationalized in a sense more technical than real. None has labor problems of general interest.

NATIONALIZATION AND LABOR RELATIONS: HOPES AND ACTUALITIES

In 1945 there were two reasons for thinking that there might be an important relationship between nationalization and labor relations. First, there were good grounds for believing that in some industries labor problems were so important to the efficient working of the industry, and were in such a sorry condition, that nationalization was necessary to put things right. Through nationalization the workers were to gain justice, the nation a more efficient industry. This argument was conspicuously true of coal mining and only slightly less so of the railways. The second hope was that even in those industries which were to be nationalized primarily for reasons having nothing to do with poor labor relations, nationalization might nevertheless bring important benefits to the employees in the course of fulfilling its larger economic purposes. This hope was applicable, for example, to the production and distribution of electricity and gas (nationalized mainly to secure co-ordinated de-

George B. Baldwin, Ph.D., is Visiting Associate Professor of Economics and Assistant Director of the Graduate Program in Economic Development, Vanderbilt University, Nashville, Tennessee, and author of Beyond Nationalization: The Labor Problems of British Coal (1955).

TABLE 1—EMPLOYMENT^a IN GREAT BRITAIN IN THE FOUR MAJOR NATIONALIZED INDUSTRIES, AND OTHERS, AT THE END OF MAY 1955
(In thousands)

INDUSTRIES	WORKERS		
	Male	Female	Total ^b
<i>Four major nationalized industries:</i>			
Coal mining.....	771	16	787
Railways (excluding shops & ancillary trades for which British Transport Commission is responsible).....	464	37	501
Electricity generating & distributing.....	177	24	200
Gas manufacturing & distributing.....	130	14	144
Total.....	1,542	91	1,632
<i>Other nationalized industries and government services:</i>			
Air transportation.....	23	7	30

Local government service.....	544	186	730
Total.....	1,172	459	1,633
<i>Industries nationalized by Labour, denationalized by Tories:</i>			
Trucking.....	163	14	177
Iron & steel.....	408	49	457
Total.....	571	63	634

^a Total employment in Great Britain as of the end of May 1955 was 21,460,000.

^b In a few cases the figures for male and female workers do not add up to the horizontal totals exactly because of rounding.

^c Excludes armed services and employees of departmental industrial establishments (e.g., ordnance factories).

Source: *Ministry of Labour Gazette*, February 1956. The above figures differ from those representing the number of employees in the service of each "nationalized industry" as reported in their annual reports. The most significant adjustment would be an inflation of the "railways" figure by about 20 per cent to include shopmen and others classified differently by the Ministry of Labour. Nationalization of trucking and iron and steel did not touch more than about half the total employees in those categories because of the exemption of certain large classes of firms left in private hands.

velopment, along with coal, of the nation's fuel and power industries) and to iron and steel. In iron and steel and in gas, labor relations were among the best in British industry; when iron and steel was denationalized, there was no protest from the leading unions in the industry.

The nub of nationalization is coal mining and the railways, two declining industries whose efficiency depends on the "human factor" to a degree not true

of gas or electricity. As Table 1 shows, these two giant industries employ 1.3 million people, or about one out of every fifteen in the British labor force. The coal mines and the railways have also been the principal storm centers of labor relations among the state industries, so that if nationalization has any special relationship to labor relations we ought to be able to find it in these two industries. I shall pay much more attention to these two giants than to

electricity and gas, industries in which the "labor problem" plays a *relatively* minor role.²

There is one overwhelming conclusion to be drawn from the first decade of nationalization that should be stated at the beginning. It is this: so far as labor relations are concerned, nationalization is essentially irrelevant. This is much too strong a statement to make, but it is worth making none the less. It is only another way of saying what it has become almost fashionable to say, that labor relations in a nationalized industry are no different from labor relations in any other industry. Generally speaking, this is a correct judgment on the past decade. But there are so many qualifications to enter against "general statements" that the matter cannot really be left there. As we shall see, nationalization has indeed affected labor relations at a great many points; but it has done little to affect them at precisely those points where everyone's hopes were highest. It does not help much that many of those hopes were foolish.

To say that nationalization has not been a huge success is not to say that it has been a failure. This would be true only if one's judgment were based wholly on the exaggerated hopes with which Socialist ideology had surrounded nationalization. If we put aside the ideological disappointment, we will find that nationalization has indeed meant progress in many areas involving the "human factor" in industry. But it has also meant some loss of the "personal touch" and an increase in the time it

² I shall say nothing more about iron and steel, since it was nationalized for such a brief period (about four years) and since labor relations in it have traditionally been excellent and were a negligible influence in the decision to nationalize. Had this industry remained in public ownership, the main interest would have been to see whether or not its good relationships deteriorated.

takes to make decisions because of the advent of centralized and sometimes remote control.

In Socialist circles it is fashionable to say that nationalization will justify itself if only it is followed by "socialization"—that is, by a progressive extension of industrial democracy. But "industrial democracy" can mean anything from more union representatives on the national Boards to smoother joint consultation or better supervision or employee voting over the price of tea in railway canteens. "Industrial democracy" really means the same thing as "good labor relations," and if we can spell out the one in specific, practical terms, we will already have hold of the other.

QUESTIONS FOR RE-EXAMINATION

If the ideological failure of nationalization has done nothing else, it is forcing a basic re-examination of two vital questions: (1) What can reasonably be expected of nationalization? and (2) What changes in the structure, attitudes, and policies of British unions and managements may be necessary to realize the objectives which many had vaguely assumed nationalization would satisfy automatically? And today many of the disappointments of nationalization are being put down not to bureaucracy and overcentralization, nor to the harsh facts of Britain's economic situation, but to the lack of adaptability of British unions, to the narrow conception of collective bargaining given by British tradition, and to an outmoded conception of industrial management. Added to these lessons concerning industrial relations is the growing realization that many traditional Socialist objectives long sought in part through nationalization (for example, full employment, greater equality, and increased security) are in fact achieved much more satisfactorily through a new

conception of fiscal policy and the welfare state. These are the reasons why the first decade of postwar nationalization has been a sobering one and why responsible leaders of both the Labour party and the trade unions are approaching the subject of further nationalization with more caution and less confidence than they approached it during the heady days following Labour's victory in the 1945 election.³

So much for some general preliminaries. I want now to turn to a summary review of some more specific developments that seem to be characteristic of all four of the nationalized industries under review. Later, I shall discuss a few of these points more fully.

MAIN DEVELOPMENTS SINCE 1945

Collective bargaining in the nationalized industries has certainly had to be conducted within the framework of pressures imposed by Britain's postwar economic situation—persistent inflation, a continuing balance of payments crisis, the ever-present fear of hurting Britain's ability to compete in world export markets, and the huge need for capital modernization and expansion in nearly all industries, not just the nationalized ones. There has been an almost continuous shortage of labor for more than fifteen years. Finally, Britain's future position in world export markets has depended on a structural reorganization of her economy represented by the need to expand new export lines (for example, engineering goods, aircraft, elec-

³ The more cautious trade union approach is evident in the Trades Union Congress pamphlet, *Public Ownership: An Interim Report*, which was approved at the TUC's 1953 Conference. For a first-rate discussion by a political leader, see Fabian Tract 300, *Socialism and Nationalisation*, by Hugh Gaitskell, M.P., Mr. Attlee's successor as head of the Labour party. The party, though far from unanimous, is today more interested in extending nationalization than are the trade unions.

tronic and electrical products, and chemicals) to compensate for the decline in old export staples such as coal, textiles, and the "invisibles" lost during World War II.

Against this economic background, I have selected thirteen points that I think illuminate specific relationships between nationalization and industrial relations.

Bargaining atmosphere

Nationalization has not provided workers with a horn of plenty into which they could dip their hands whenever they felt pressed by the struggle for life. Collective bargaining has been remarkably like what it is in any large centralized industry in the United States.⁴ Management has not been "soft" and the government has not intervened in wage negotiations any more than has the American government over the same period. Generally speaking, wages in nationalized industries have not risen faster than the general level of British wages since 1945. In coal, average wages have improved more than the national average (but the more important *entry* wage has barely kept pace); railwaymen's wages have lagged distinctly behind the general level; in electricity and gas wage increases have just about matched the national average. Many observers believe that the net effect of nationalization has been to

⁴ However, both the Labour and Tory governments have gone to unusual lengths to create a moral and political environment that would encourage people to act responsibly—that is, with restraint or resignation—in the use of their economic freedom. It is not surprising that the dynamics of union politics and union rivalries have made for certain difficulties. There have also been other difficulties that have had no relation to irresponsible pressures welling up from inside the unions. Prominent among these has been the difficulty of using wage increases to redistribute the labor force at a time when any wage increase has been officially frowned on.

keep wage levels from rising as rapidly as they otherwise would have. In 1956, after a decade of close co-operation with both Labour and Tory governments to restrain wage increases, the Trades Union Congress broke with this policy and accused the Eden government of using the nationalized industries as a "drag anchor" to keep down the British wage level.

Dominant wage pressures

Nationalization has greatly diminished competitive forces in wage determination. In effect, the nationalized industries still have to compete with other industries for labor, but competition for labor by individual operating units has gone in favor of uniform national or district rates. True, industry-wide bargaining has produced a nominal uniformity in many private British industries; but these rates are minimums, and individual employers have been free to pay higher rates if they needed to bid for labor. Thus the nationalized industries have wage levels that respond more exclusively to administrative decisions (centralized bargains) than most other industries. If competitive influences have been reduced by nationalization, there has been no reduction in the attention which both management and labor have had to give to problems of wage *structure*. With respect to both internal and external considerations, the intended or unintended shifting of the relative wage position of specific groups has produced constant problems. The attempts to rationalize the wage structures in both coal and railways have stumbled over this political and psychological problem, involving as it does personal and institutional rivalries and sensitive questions of status.

Rise in attention to welfare measures

Nationalization has meant a substantial increase in attention given to safety

and welfare, even though capital expenditures have been necessitated at a time when government has been forced to choose carefully among investment expenditures. Coal has benefited most, the railways least, in relation to need.

Spread of interunion rivalries

Ironically, nationalization introduced a period of insecurity for many unions. There has been an unforeseen intensification and extension of interunion rivalries and tension. These have expressed themselves in disputes over jurisdictions, employer recognition, and compulsory union membership. But these were temporary problems associated with getting nationalization started; now that the situation in each industry has been restructured, considerable stability has been achieved.

Absence of syndicalism

Experience so far has not resulted in any responsible sentiment for a radical extension of "workers' control" in the old syndicalist sense. There are exceptions among some unions, like the National Union of Railwaymen which has long wanted more direct union representation in the councils of management. But while this has led to some grumbling among railwaymen, the NUR has not tried to force its views on the industry through industrial action. Syndicalist sentiments can still be found in many local and national unions as a minority commotion "in the wings." But the British labor movement was far more militant a generation ago than it has been since 1945. This is hardly surprising in view of the responsibility which the unions have brought on themselves by virtue of their historical rise to power.

Industrial relationships

The approach to more democratic industrial relationships has been pri-

marily through a vast extension of joint consultation, or advisory labor-management committees. This machinery has been kept separate from the negotiating machinery in coal and electricity and at some levels in gas; but in the railways the same machinery has tried to serve both ends. Everywhere the trade unions have been sensitive to the threat which independent consultative bodies represented to their own authority, and they have pressed for and secured substantial control over the membership on such committees.

The system of consultation—essentially a vast experiment in union-management co-operation—has required a great effort but has so far yielded only small results. There is as yet no movement to abandon this new institution (which is also widely used in private industry). Many advocates put their hope in the passage of time to make the system work better; a few are asking if this is the most hopeful way of securing the kind of workers' control over labor matters that Socialists have always wanted. They wonder if the area of collective bargaining might be widened as to topics covered, and deepened by encouraging more local bargaining, than has been customary in Britain. This would help remove some continuing confusion between matters appropriate for consultation and collective bargaining.

Union structures and officers' workloads

Nationalization has greatly increased the workload on trade union officials, and doubtless on most management officials as well. Unions have been very slow to adapt their structures and organization to help them perform better the many new tasks which nationalization requires of them. At a time when the amount of responsibility exercised by the unions has greatly increased, they

have not shown any disposition to increase their staffs, their meager research efforts, or their educational work. This unimaginative conservatism is frequently cited to help explain the widespread apathy about union affairs among large sections of the labor movement.

Changed position of union officials

Trade unions have had to assume considerable moral and political responsibility for the performance of the nationalized industries, mainly by trying to resist the pressures to pursue policies that officials know would not be best for the industry. This fact has altered the way union officials have had to think about their jobs, their attitudes toward management, and their political position vis-à-vis their own memberships. They have necessarily developed more understanding of management problems, more sympathy for managers, and they have had to put away their traditional, instinctive response: "Our members' interests, right or wrong." With the continuing low salaries paid British union officials, nationalization has probably decreased the attractiveness of union careers, except as a bridge to jobs in management. These jobs, heavily concentrated in the labor and welfare fields, have opened an important new set of career opportunities for union officials.

Efficient use of labor

With some exceptions, nationalization has not made it easier for management to undertake reorganization schemes that involve changes in long-standing labor practices. Such "rationalization" involves the closing of uneconomic canals and branch lines on the railroads and of uneconomic coal mines, the modification of some featherbedding practices on the railroads (such as the abolition of "knockers-up"—a group of about six hundred who used to wake up train

crews before the invention of the alarm clock), and the elimination of redundant labor where jobs are found to be overmanned. The Herbert Committee, for example, criticized the Central Electricity Authority for its "passive attitude" towards redundancy for fear that it would be too difficult to handle:

[This attitude] has caused management at all levels to be disinclined to seek out redundancy because it is known that it will be difficult to deal with that redundancy when ascertained. In consequence we find that work-study, operational research and investigations into restrictive practices are undertaken without enthusiasm, if they are pursued at all. The effect on management itself is therefore bad because the most effective deployment of manpower is never possible. The effect of hidden under-employment upon the workpeople themselves is equally bad and is likely to undermine . . . morale. . . .⁵

This is an area where some unions have given contractual pledges of co-operation with management in "efficiency" measures, but where practical results have been few because the unions have understandably shrunk from the practical implications of their pledges.

Modernizing personnel practices

Nationalization has unquestionably been a powerful instrument for "modernizing" labor relations in the affected industries. The amount of attention now being paid to the training of new recruits, to providing opportunities for higher education, to systematic promotion policies, to job evaluation and work study, to the improvement of methods of wage payment, to personnel records and to personnel research—the attention that management is giving to these subjects is immeasurably greater than

⁵ *Report of the Committee of Inquiry into the Electricity Supply Industry* (Sir Edward Herbert, LL.B., Chairman), p. 73.

it was before nationalization. True, personnel management has not been carried as far in Britain as in the United States. But the nationalized industries, which once included some of the most backward on this score, must now be counted as among the most advanced. Where labor relations only recently exercised a residual claim on management's attention and energies (chiefly at the periodic crises produced by negotiations), today it constitutes an "overhead" claim that is constant, specialized, and formalized. The rapid improvement in personnel policies and their administration is helping to increase vertical mobility in British society.

Spread of voluntary arbitration

Nationalization has greatly extended the use of arbitration. In coal, for example, there is a voluntary agreement between the NUM and the Coal Board to submit *all* unresolved disputes to arbitration, including disputes over new contract terms. This does not mean that unions have given up the right to strike under nationalization (the basic arbitration agreement could be scrapped if the union got sufficiently fed up with arbitrators' awards); it simply reflects their feeling that they can now secure satisfactory settlements by less primitive means. The only union-approved strike in any nationalized industry has been the nineteen-day strike of locomotive personnel called in June 1955 by the Associated Society of Locomotive Engineers and Firemen. Although this stopped 80 per cent of Britain's rail traffic for nearly three weeks, there was no serious government proposal to introduce any special measures for controlling strikes in "essential industries." The strike did lead the Trades Union Congress to one minor reform: it authorized its General Council to inter-

vene at an early date, and member unions.

Persistence of unofficial strikes

Despite the spread of arbitration, the improvement of management personnel effort, and the responsible attitude of union leaders in most situations, unofficial strikes have presented major difficulties in every nationalized industry. Management and union officials have been firm in refusing to negotiate while such strikes were in progress. These unofficial strikes seem to have been similar in cause and in frequency to unofficial strikes in pre-nationalization days: they do not seem to represent a substitution of unofficial for official direct action. Since nationalization, union officials have been much more co-operative with management in trying to head off and end such strikes.

The two "sides" of industry

There has been an unmistakable improvement in working relations—in understanding and respect—between union leaders and management in all the nationalized industries, save possibly on the railways. This new top-level relationship is not duplicated at the employee level—there has not been any marked reduction in the "we-they" psychology that has traditionally separated employees and management. The real question is how strongly this traditional sentiment persists; this is a matter of opinion very hard to test (statistical measures of absenteeism, turnover, unofficial strikes, and so forth are not very helpful). My own judgment is that there has been some improvement in morale in coal and electricity, but some deterioration on the railways. Labor relations in the gas industry have traditionally been good; nationalization does not seem to have changed the situation significantly.

UNION SECURITY

One of the ways in which nationalization has changed labor relations most unexpectedly was the unsettling effect it has had during the early years on the security enjoyed by particular unions. These problems were partly transferred from the old order of industry—they have not sunk entirely out of view. A discussion of these problems can illuminate some of the more pedestrian but still very important aspects of industrial relations in nationalized industries.

A union's security depends upon many factors—the sincerity and degree of acceptance of its presence by employers; the acceptance of its jurisdictional claims by other unions; the satisfaction of various groups with the service and status given them within the union; and the extent of nonunionism within the union's jurisdiction. The handling of these questions differs greatly in Britain and the United States.

In America there is a long tradition within the union movement of granting exclusive jurisdiction to individual unions; this principle is not recognized in Britain. British unions do indeed have "demarcation" disputes, but they are softened by the absence of the American principle of "exclusive jurisdiction" and by a tradition of interunion negotiations. These factors structure jurisdictional battles so that British unions "pull their punches."

Recognition has depended on the employers' will, sometimes forced by pressure from the union but never by any government authority (there is nothing comparable to the National Labor Relations Board in Britain). Unions recognized by employers do not enjoy exclusive bargaining rights for everyone in a well-defined bargaining unit; sometimes one finds two unions signatory to a joint agreement with an employer

covering their respective members in a common bargaining unit.

Finally, British unions have rarely sought any kind of "union security" clauses from employers, mainly because they did not regard employers as bent on destroying them at the first opportunity and because the British respect for voluntarism, even among working-class leaders, is so strong that most of them shrink from compelling nonunionists to join or stay in. However, there is a universal contempt for nonunionists, and union membership is normally very high.

These questions of union jurisdictions, union recognition, and compulsory membership were rarely if ever discussed in terms of nationalization. No one seems to have anticipated that nationalization would greatly disturb these rather routine areas of union life. In practice, however, nationalization produced an atmosphere within the affected industries not unlike that produced in the United States by the passage of the Wagner Act in 1935. For nationalization offered British unions prizes something like those offered American homesteaders when the federal government threw open new territories for "staking" a century ago. It was hardly surprising, therefore, that there ensued a very early scramble to stake out new claims, that there was much jockeying and postling among the contenders, and that the unions' behavior was affected by the ground rules governing the way the game was to be played.

Determination of bargaining rights

The most important fact about these "ground rules" is that nationalization formalized them. Each nationalization act, for example, carries a clause similar to this one from the Coal Act of 1946:

It shall be the duty of the Board to enter into consultation with organisations appear-

ing to them to represent substantial proportions of the persons in the employment of the Board, or of any class of such persons, as to the Board's concluding with those organisations (collective bargaining) agreements. . . .

The effect of this clause was to make the National Coal Board its own "National Labor Relations Board" for determining representation questions. In private industry, which unions were to represent which employees was traditionally left up to the unions alone. Furthermore, the Board was under a legal compulsion to recognize unions that raised their heads for any class of employees (including clerical, technical, professional, and managerial employees), provided only that the union represented a "substantial proportion" of those employees. Without intending anything so subtle, the unions had transferred the right to determine bargaining rights from an internal concern of the union movement into an exclusive right of the employer. The heart of the matter was how the new giant employers would choose to exercise their new authority.

One can imagine the scramble for bargaining rights that developed when one realizes that by 1951 there were more than fifty unions active in five of the nationalized industries.⁶ In coal mining and on the railways, two huge industrial unions—unions which had played leading roles in the historic drives for nationalizing their industries—asserted jurisdictional claims over all

⁶ Coal had 9, electricity supply 10, gas 14, the railways 12, London transport (part of the British Transport Commission) 20, and civil air transport 16. For a useful list of which unions were active in which industries, see the table on pages 30-31 of the Acton Society Trust's first-rate study, *The Future of the Unions*, No. 8 in a twelve-part series of studies of nationalized industry published in 1950-51. This slender pamphlet is one of the best studies of how nationalization has affected union-management relations.

employees in their industries. These claims embraced not only clerical workers but any others who might show any interest in becoming union members. These moves naturally threatened other unions which had long been active among particular classes of employees, as well as outside unions which moved in to seek a place in the nationalized industries.

The reaction of the new employers was to reject these claims and to avoid any direct exercise of their legal power by throwing recognition questions back into the unions' own laps. That is, both the Coal Board and the Railway Executive, in certain important recognition disputes, said that they would recognize whatever unions the Trades Union Congress suggested they recognize. Several potentially explosive rivalries in coal yielded to this treatment, but on the railways the TUC's inability to persuade rival unions to adjust their disputes left the Transport Commission with no alternative but to make its own choice. When it chose to recognize only unions which had been active in trucking before nationalization, a union which had moved in rapidly only after nationalization withdrew from the field. There was no serious strike threat by the militant NUR to try to coerce the Commission into granting its claim to represent everyone in railroading.

Organization of nonmanual employees

So far it is clear that we have been talking only of horizontal rivalries. One important product of nationalization has been the rapid extension of organization among grades of employees not formerly organized, or only slightly so—clerks, technicians, and both lower and higher managerial grades. For these employees, nationalization meant that their employer had become the only employer in their industry, that it had become a somewhat more im-

personal employer, that the terms and conditions of employment became more standardized and less personal, and that decisions affecting these matters were now made at a greater distance and with longer delays. The result was to introduce a new feeling of uncertainty and loss of control over one's situation among these clerical, professional, and managerial employees. These grades accepted organization fairly rapidly, if often somewhat apologetically. But one thing became clear very quickly: these special groups wanted to be represented by their "own" unions and resisted the embrace offered by some of the manual workers' organizations. The general rule in all four industries was to grant white-collar and other nonmanual employees representation by unions limited to their own kind. But a great deal of energy and maneuvering went into decisions concerning which unions many borderline classifications ought to belong to.

Break-away movements

A somewhat similar representation problem has involved "break-away" movements—usually dissident craft groups which were represented by a larger union at the time of nationalization and which hoped to look out for their own interests by securing independent recognition under the nationalization acts. The most important of these break-away movements has involved the attempt of the colliery winding enginemen, a key craft group, to get out of the National Union of Mineworkers and bargain independently. In this bitter dispute between the winders and the NUM, the Coal Board has been caught in a hopeless middle: the winders have repeatedly engaged in strikes to force recognition by the Board; but the Board could not recognize the winders without facing a counterstrike by the NUM to prevent such recognition.

The NUM has supplied "scabs" to keep the pits running when the regular winders struck. In civil aviation, the Amalgamated Engineering Union has similarly prevented the British Overseas Airways Corporation and British European Airways from recognizing the Aeronautical Engineers' Association. On the railways, the National Union of Railwaymen has held a similar club over the Union of Railway Servants, a craft union of signalmen that has grown since nationalization but which did not feel it could use the advent of nationalization to win a recognition long denied it under private ownership.

Membership

In this scramble for position in nationalized industry, compulsory union membership might have taken on a new appeal for two reasons. First, union shop agreements would have been one method by which one union could have prevented any others from securing a foothold in a particular bargaining unit. The NUM did in fact submit a closed shop demand to the Coal Board during the first round of bargaining, but the Board rejected the demand "on principle," though it granted a dues check-off. Second, it might have been thought that the unions would have used the occasion of nationalization to achieve 100 per cent membership by widespread resort to union shop agreements. But nothing like this occurred; there was only a rather timid flurry of interest in such clauses. The British tradition of voluntarism led the employer to reject such demands and led the unions to accept his decision without a fight.

In sum

To sum up: nationalization had the effect of greatly stimulating interest in union membership among many groups that had traditionally remained outside trade unions, of stimulating many old

unions and several new ones to stake out claims in the new industries, of bringing many unions into conflict with each other both horizontally and vertically, of raising delicate and knotty questions of allocating union representation on joint negotiating and consultative boards, and—as a result of all these developments—of putting to a severe test the ability of rival unions to co-operate with each other by settling their rivalries through compromise rather than by force. Despite a few major eruptions, these rivalries were settled with remarkable success. Another effect of some importance was the ending of all employer resistance to recognition of unions representing groups close to higher management, for example, clerical employees on the railways or technical and managerial employees in all four industries. Historically, these were areas where British employers had not recognized unions without resistance—and in which organization was therefore weak and spotty.

The resultant pattern of union-management relations in the nationalized industries is complex and untidy, and the amount of energy expended on these mundane matters by trade union and management representatives has been huge. Although these problems were not foreseen, it is difficult to see how they could have been avoided.

UNION APPRAISALS OF NATIONALIZATION

It is easy to let the ideological disappointment with nationalization tempt people into calling it a failure. But this would be a shallow and superficial conclusion: if all union members over thirty-five years of age were given an opportunity to vote on whether or not, on balance, they preferred life under nationalization to their previous lot, I am reasonably sure that the coal miners would give nationalization a strong

endorsement,⁷ electricity and gas employees a rather weak and neutral endorsement, and only the railwaymen would probably feel sufficiently disappointed by nationalization to want to return to a private existence. The vote "for" nationalization would run more favorable among union officials than among their membership.

SOCIALIST IDEOLOGY AND ECONOMIC REALITY

Even though nationalization cannot be called a failure, it should have produced a bigger improvement in labor relations than it has. The most important explanation of this gap between hopes and performance is the unreality of the expectations which socialism had historically generated for nationalization. Socialists had long claimed that they could make a unique contribution to the labor problems of modern industry; a decade's experience has shown this claim to be much less valid than many once believed. The main reason for this disappointment is that the ideological symbols of socialism's political struggle are not closely related to the economic and social motivations that determine morale in the workshop. The body of insights and principles developed over the past twenty years in the fields of industrial relations and personnel administration are more important to industrial morale than whether or not an industry is nationalized. This statement might not be true if conditions deteriorated badly in the product market: a nationalized monopoly industry would

⁷ The best evidence is the fact that despite an abundance of other job opportunities nationalization has succeeded in re-establishing a respectable rate of juvenile recruitment to the pits, something absolutely necessary to prevent a disastrous fall in manpower over the next twenty years and something that could not have happened if mining parents had not fundamentally revised their feelings about the industry.

probably be able to shelter its employees from such pressures better than private profit-minded employers struggling for existence under competition. But the greater ability of nationalized industries to dampen down shocks in the product market might be at some expense to the structural flexibility of the economy. The past decade has not given us any test of nationalization's behavior under deflationary conditions.

NOT ENOUGH HELP FROM BRITISH UNIONS

There is a second explanation, an ironical one. It is that the organization, attitudes, and policies of the British trade union movement present as many difficulties to "making nationalization work" as does the bureaucratic organization of the huge new state employers. This is not a truth widely acknowledged within the British labor movement. But there are enough respected students of the British scene who have come to this conclusion to put it beyond doubt. Here is how one of the most perceptive of these, Professor John Mack of Glasgow, puts the matter:

Broadly speaking, the formal relationship between trade unions and the wider society in Britain is much the same as it was in 1913. . . . The only new factor in the situation is that the balance of industrial power has swung decisively in favour of the unions. They have increased in weight and influence, but they have retained their former attitudes. They are unwilling to exercise the responsibilities which . . . are a condition of the proper exercise of their growing power.⁸

He goes on to say that while many leaders wish to exercise the new responsibilities they feel, they are frustrated by a reluctant rank and file. The fundamental shift in the role which nationali-

⁸ John A. Mack, "Trade Union Leadership," *Political Quarterly*, January-March 1956 (Special Number on Trade Union Problems), p. 73.

zation requires of a trade union is that it stop pursuing purely sectional interests and invariably protecting the interests of its members whenever the latter feel injured, rightly or wrongly. No longer can unions afford the luxury of simply standing in protest against society and against employers; under nationalization and the welfare state unions must take some responsibility for seeing that what has to be done is not made impossible. This is an extremely difficult and delicate adjustment to carry through within a framework of freedom, especially for an institution with the deep and democratic traditions of the British unions. For individual British unions are not disciplined by anything like the degree of structural centralization that characterizes the Swedish or German unions, to take two examples from Continental countries whose national economic problems are not unlike Britain's. Without such centralization, it is much easier for irresponsible leadership to throw its weight around at the expense of the general interest. The only restraint on such conduct becomes self-restraint induced by an understanding of the problems of the country and of particular industries. The extent of self-restraint and understanding has not been negligible among union leaders in postwar Britain; but it has served negative rather than positive ends: the unions have seen to it that nationalization did not fail but they have not done much to help it succeed. To do the latter may require far-reaching changes within British unions and in some attitudes toward industrial relations traditional in Britain on both sides of the bargaining table.

NEEDED REFORMS

Some progress might be made if British unions were willing to spend more time and money on education and re-

search, of which there is now very little. There are some structural reforms that seem overdue: the addition of specialized staff to deal with the affairs of the nationalized industries, a rethinking of the kind of workshop organization the unions ought to have (it is now weak in many industries, though not in mining); more attractive terms of employment for union officials. But perhaps the most hopeful source of progress lies in a re-evaluation by labor and management alike of the kind of collective bargaining that would best suit their objectives. For example, by encouraging more local bargaining on local topics it should be possible to eliminate some of the confusion surrounding the proper role of joint consultation—by defining as negotiable many issues now haggled over on a consultative basis and in so doing to set up a clearer grievance procedure wholly separate from consultative meetings.⁹ Again, a more widespread use of "horse trading" in bargaining, instead of the characteristic approach of trying to negotiate separate agreements for each subject "on its merits," would contribute to an easier position for union officials when it comes to accepting measures which they know

⁹ Professor Cole has written that workers need to be given much more control over questions at workshop level than consultation has so far yielded them. How does he see this being realized? ". . . By building on joint consultation an extended kind of collective bargaining, under which, in each establishment, the rules and regulations governing workshop practice will be embodied in negotiated agreements, accepted as binding upon both parties and backed by the Trade Unions as an integral part of the structure of collective bargaining." This is nothing but "workers' control" as it exists in the United States. The British difficulty today stems from national bargaining without any provision for supplementary local bargaining. It is the latter that needs building up, not the former that needs to be broken down. (See G. D. H. Cole, *What Is Wrong with the Trade Unions?*, p. 20.)

the industry needs but their members will not like. Management can then be made the chief lightning rod for absorbing the emotional aggression generated by rationalization moves. This is, I realize, a characteristically American reading of some of the difficulties in which the British unions find themselves (and not only in nationalized industries—the difficulties only stand out more sharply there). But some British observers, such as B. C. Roberts, are urging this point upon their countrymen.

NATIONALIZATION NO CURE-ALL

We are brought, then, to a very pedestrian conclusion, one that should perhaps have been obvious in advance before history drove it home. It is that the most significant and most interesting aspects of labor relations in Britain's nationalized industries have comparatively little to do with the fact of nationalization. They have to do either with attitudes and practices that

are characteristically *British*, or with the history, technology, and environmental characteristics of a particular *industry*. The form of ownership of an industry is less significant than either of these other two major influences on what labor relations are like within Britain's nationalized industries. This is not to say—as I did say in an unguarded moment at the start of this essay—that nationalization is irrelevant. But its primary relevance is that it provides a more auspiciously structured environment within which the specific labor problems of these industries are being tackled and a more professional and systematic approach to these problems.

If nationalization was to have proved the decisive, almost surgical, solution for an industry's labor problems that many thought it would be, the reality of social relationships would have to be much simpler and human nature much less perverse than history shows them to be.

SELECTED BIBLIOGRAPHY

A major difficulty in studying the labor problems of nationalized industries is the paucity of published research on this subject. As the editors of the *Political Quarterly* observed in 1955, labor relations is that aspect of nationalization "on which least light has been thrown in any of the nationalized industries." The available literature is heavily weighted toward rather general analyses of nationalization's successes and failures with relatively little empirical material based on detailed study of particular industries. As of November 1956 there were no major published studies of labor problems in the railroad, electricity, or gas industries. In the absence of a few scattered articles on the labor problems of those industries in specialized British journals not easily found in the United States, the best source of specific information for a particular industry is the annual reports issued by each of the industries. These can be read intelligently

only if one has first developed some familiarity with the British trade union movement. Except for coal mining, the following list will help primarily those whose interests are general and not focused on the particular problems of specific industries.

Books

- Baldwin, G. B. *Beyond Nationalization: The Labor Problems of British Coal*. Cambridge, Mass.: Harvard University Press, 1955. 324 pp. A detailed study of how nationalization has affected labor relations, and vice versa.
- Clegg, H. A., and T. E. Chester. *The Future of Nationalization*. Oxford: Basil Blackwell, 1953. 211 p. See especially Chap. III, sec. 5, on "Industrial Relations," pp. 153–58. A brief but excellent review of the purposes, performance, and unsolved problems of nationalization.

Clegg, Hugh. *Industrial Democracy and Nationalization*. Oxford: Basil Blackwell, 1951. 147 pp. A good discussion of the "classical" problems by an author with wide knowledge of practical labor problems.

———. *Labour Relations in London Transport*. Oxford: Basil Blackwell, 1950. One of the few industry studies.

Crosland, C. A. R. *The Future of Socialism*. London: Jonathan Cape, 1956. 540 pp. A widely hailed major contribution, by an economist.

Flanders, Allan, and Hugh Clegg (Eds.). *The System of Industrial Relations in Great Britain*. Oxford: Basil Blackwell, 1954. 380 pp. Has quickly become a standard introduction to the subject of its title.

Haynes, W. W. *Nationalization in Practice: The British Coal Industry*. Cambridge, Mass.: Harvard University, Graduate School of Business Administration, 1953. 413 pp. An excellent appraisal, but with only a secondary interest in labor problems.

Lewis, Ben W. *British Planning and Nationalization*. New York: Twentieth Century Fund, 1952. 313 pp. Relates two fundamental aspects of socialism and includes chapters on each of the major nationalized industries.

Longhurst, John. *Nationalisation in Practice: The Civil Aviation Experiment*. London: Temple Press, 1950. 227 pp.

Roberts, B. C. *Trade Union Government and Administration in Great Britain*. Cambridge, Mass.: Harvard University Press, 1956. 570 pp. A major contribution based on study of sixteen unions.

Robson, W. A. (Ed.). *Problems of Nationalized Industry*. London: George Allen & Unwin, 1952. 390 pp. A collection of essays that has very little to say about industrial relations.

Spero, Sterling D. *Labor Relations in British Nationalized Industry*. New York: New York University Press, 1955. 83 pp. Highly compressed, but has some useful insights.

Wigham, Eric L. *Trade Unions*. Home University Library. London: Oxford

University Press, 1956. 277 pp. Mainly important because its judgments are those of the labor correspondent of *The Times*.

Pamphlets, articles, and documents

Acton Society Trust. *Studies in Nationalized Industry* (a series of twelve Research Papers dealing with aspects of the nationalized industries). Claygate, Surrey, 1950–51. See especially No. 8, *The Future of the Unions*. 31 pp.

Baldwin, G. B. "The Effect of Nationalization on Britain's National Union of Mineworkers," *Proceedings of the Fifth Annual Meeting*, Industrial Relations Research Association, 1952. Concerned only with how nationalization affected the union's side of the industry.

Clegg, Hugh. *Labour in Nationalized Industry* (Interim Report of a Fabian Research Group). Fabian Research Series 141, July 1950. 40 pp. Particularly valuable for its references to arrangements in specific industries.

Cole, G. D. H. *What Is Wrong with the Trade Unions?* Fabian Tract 301, September 1956. 28 pp. Clear and provocative diagnosis by the foremost student of British labor history.

Crossman, R. H. S. *Socialism and the New Despotism*. Fabian Tract 298, February 1956. 24 pp. Somewhat popular critique of the new state industries.

Labor Relations in Postwar Germany

By WILLIAM H. MCPHERSON *

Abstract: After the last war, the reconstruction of German labor organization faced great difficulties but proceeded rapidly and along partly new lines, compared with earlier decades. Once the Republic was established in 1949, the German Federation of Trade Unions (DGB) was created, uniting sixteen industrial or multi-industrial unions including 87 per cent of seven million organized workers and pledged to a nonpartisan political policy. So far attempts to split the DGB have failed, but the effort to inject a political program, in particular by the Social Democratic party, may yet succeed. The author discusses these and other problems, such as collective bargaining, work councils and other forms of employee representation and participation, and the settlement of labor disputes.—Ed.

WHEN the Nazi government finally capitulated in 1945, Germany lay in ruins. Not only had its industrial equipment and its housing been extensively demolished, but its political structure was annihilated, its social institutions had crumbled, and the psychology of its citizenry was shattered. For the moment, the people were living in almost an economic and social vacuum.

What needed to be done on the economic front was relatively clear. The mines, the factories, and the transportation system had to be reconstructed and rehabilitated. The task was enormous, but both the path and the goal were fairly plain. For a time there was uncertainty as to whether industrial reconstruction would take place along capitalistic or quasi-socialistic lines, but it gradually became evident that there would be no socialization. Factories soon began to rise from the rubble as executive and supervisory employees toiled side by side with laborers and office workers to rebuild a work place for themselves.

* Mr. Herbert Oestreich assisted in studying recent German periodicals.

The road to political and social reconstruction was less clear. Revulsion from the Nazi philosophy and methods was widespread, so that there was broad acceptance of Allied insistence on the removal of all formal vestiges of totalitarian rule. But the constructive problem of shaping new democratic institutions to take their place was formidable. Dire need brought quick action on the economic front, but on the social front disillusionment and apathy were widespread.

UNION STRUCTURE

The Nazi's German Labor Front was immediately disbanded. Its basic function of employee regimentation rather than employee representation had become discredited. Labor naturally looked back to the pre-Nazi period for a pattern of union structure and operation, but sought to avoid the weaknesses of the earlier system.

The occupation authorities insisted that the new union structure be built from the ground up. Organization began at the plant level, extended rapidly to a community basis and gradually to

William H. McPherson, Ph.D., Urbana, Illinois, is Professor of Economics in the Institute of Labor and Industrial Relations of the University of Illinois. In 1952–53 he lectured at German labor academies under a grant from the Department of State.

a regional basis. After the French, British, and American zones were merged to create the Federal Republic, the German Federation of Trade Unions (DGB, Deutscher Gewerkschaftsbund) was established, in October 1949.

A major early issue regarding the structure of the new labor movement was whether the national industrial unions should be relatively autonomous organizations or mere departments of one big union. Labor leaders in various parts of Germany were sharply divided on this issue,¹ so that strong advice from the occupation authorities in favor of relative autonomy was perhaps a determining factor in the final outcome.

The new union structure differs from the old one in two major respects. In the first place, the pre-Nazi General Federation of German Trade Unions included some craft and mixed groups, whereas the DGB unites sixteen industrial and multi-industry unions encompassing workers from all branches of the German economy. In the second place, while the old labor movement had been divided along political and religious lines into competing Socialist, Christian, and Liberal federations, the DGB comprises about 87 per cent of the seven million organized workers² and is pledged to a nonpartisan policy.

In retrospect, it seems probable that Allied insistence on organization from the ground up may have been a factor in determining the industrial and nonpartisan characteristics of the new German unions. When organization takes place widely and suddenly at the plant level in a highly industrialized nation,

craft and political cleavages are unlikely to develop. On the other hand, it appears equally unlikely that the old labor leaders who were most active in union reconstruction would have emphasized such distinctions even if they had been able to rebuild the unions from the top down, since they had had such a sad lesson on the importance of labor unity at the end of the Weimar period.

THREATS TO UNION UNITY

It is still uncertain whether unity can be long maintained. Constant attacks on it have come from certain circles among the employers, the churches, and the political parties. Some industrialists have assumed that a divided labor movement would be a weaker one, but they have not taken effective open steps to promote division.

Some Catholic churchmen, on the other hand, have not hesitated to make pronouncements in favor of separate Christian unions, and the International Federation of Christian Trade Unions has worked vigorously to re-establish a German affiliate. To the time of this writing, these efforts have borne meager fruit. A new German Federation of Christian Trade Unions was founded in October 1955 with strong financial backing which came in part from assessments on members of some Christian unions outside Germany; but it attracted only insignificant defections from the DGB. At the time of its first convention in June 1956, its undisclosed membership was estimated by outsiders at less than 20,000,³ and it appeared that its only prospect of gaining any significance lay in merger with the Christian unions of the Saar.

Party pressures have also threatened union unity. The first serious blow from this source came with the establishment of the initial West German

³ "Fiasko der Spalter," *Die Quelle*, Vol. 7, No. 7 (July 1956), p. 294.

government. If Adenauer and his Christian Democratic Union (CDU) had formed a coalition with the Social Democratic party (SPD) on their left instead of with the parties on their right, the political division within the DGB would have been much less significant and the possibility of dissension resulting from political activity would have been sharply reduced.

SPD leaders have longed for the more practical aid they could receive from the unions if the policy of political neutrality could be broken. They have felt that the party would gain from having a major union federation to serve as its industrial arm—as during the Weimar period—even if such an alliance should lead to the withdrawal of 10 or 20 per cent of the DGB membership. Many Socialist union leaders have wondered whether political neutrality was not too big a price to pay for union unity.

It has recently appeared possible that political activity within the DGB in sympathy with the SPD may bring about the defection of union members who belong to the CDU. Among the Christian elements in the DGB there has long been dissatisfaction with what they consider to be their inadequate influence in policy formation and inadequate share of official union positions, and occasional complaint that the DGB has given political aid to the SPD. It seems probable, however, that Christian influence has been more than proportionate to its numbers. In 1931 the Socialist unions were nearly eight times larger than their Christian counterparts, and the division of allegiance within the DGB membership today is probably not significantly different. With such a preponderance of membership it is indeed difficult for the DGB Socialists to exercise enough political restraint to accommodate their CDU brothers.

The nonpartisan policy was subjected

to serious strain in the closing sessions of the DGB convention in October 1956 when resolutions were adopted in favor of such political issues as the priority of German reunification, condemnation of atomic tests, and opposition by all legal means to rearmament and the draft. While these actions did not disrupt the DGB, they serve to underscore the possibility that the most serious threat to union unity may come from SPD sources rather than from the churches and the Christian unions in other countries. The strains may mount until the national elections in the fall of 1957.

COLLECTIVE BARGAINING

Contract negotiations are normally conducted on a multi-employer basis, except when they concern government employees. They result, therefore, in industry-wide agreements—usually regional in scope, but sometimes national and occasionally local. The unions bargain with employers' associations organized on an industrial basis. The agreements governing wage rates are typically separate from those dealing with the other terms of employment. If they cover more than a single community, they often classify the areas covered into several wage groups, instead of providing a single set of rates. As in many other European countries, the collective agreements initially govern only employers belonging to the contracting association, but may be extended by government action to apply to all employers and employees in the industry.

These master agreements—unlike labor agreements in the United States—do not set the actual terms of employment, but only the minimum terms. Employers may deviate from their provisions, provided the deviation is to the advantage of the employee. Such deviation in wage rates is now a normal practice, and the spread is often sub-

stantial. Thus industry-wide bargaining, as conducted in Germany, comes far from resulting in wage uniformity.

In addition to the master agreements negotiated by the unions and the employers' associations, there are two types of agreements that are frequently negotiated with a single company or plant management. These are (1) the shop regulations, which deal with certain details of wages and other terms of employment for the purpose of implementing the master agreement and adapting it to special local conditions and (2) the shop agreement, which deals with various details that are not covered at all by the master agreement (for example, timing of shifts and assignment of vacations).

A striking feature of employee representation in Germany is that these supplementary shop agreements are not negotiated by the unions, for there are no local unions in Germany. The employee belongs directly to the national industrial union. Its local office in his community is not the counterpart of a local union in the United States, but resembles more the district office of an American union. When a local membership meeting is held, it is not limited to the employees of a single company. The local union official seldom deals with an individual company, and the worker seldom has any personal contact with his union.

Only recently have the unions become generally aware that this lack of contact is a source of weakness. The use of shop stewards, which has long existed in some unions, has increased rapidly in recent years. In some unions the stewards are appointed, while in others they are elected by the union members in the individual plant. The function of the shop steward is to recruit new members and collect dues. He seldom deals with a grievance, except in some of the largest plants. He

is often useful as a line of communication between the members and the local officers of the union.

WORKS COUNCILS

It is the works council that performs the employee representation function at the plant level. These councils, whose members are elected by all the employees of the plant, were first established at the end of World War I. During the following decade, when the employees of many organized plants were divided between unions affiliated with the three major federations, the works councils performed a useful function of co-ordinating the approach of the three unions in the conduct of labor relations at the plant level. In the absence of the American concept of exclusive bargaining rights for one union in a bargaining unit, some method of co-ordination was essential. In negotiating with the employers' associations the unions used joint negotiating committees, while the works councils served a similar purpose in the negotiation of the supplemental shop agreements. Under present conditions of union unity the co-ordinating function of the works council has become unnecessary.

It was unfortunate for the unions that the early labor organization in the separate plants at the end of World War II took the traditional form of the works council rather than developing into local unions, as they might have done if the occupation authorities had exerted a real influence in that direction. By now there is no possibility of the repeal of the legislation on which these councils are based, for the employer prefers to deal with his own employees and the worker identifies himself much more closely with his fellow employees on the council than with his union officials. The unions make the best of this situation by maintaining close relations with the works coun-

cils. They hold conferences and provide training for the great majority of the councilors who are union members.

The law that now governs the structure and functions of the works councils is the Works Constitution Act of October 1952.⁴ It provides that all plants with over twenty employees shall have a works council with from three to thirty-five members, depending on the size of the work force. A multiplant company has an additional united works council.

The works council negotiates the plant regulations and agreements that supplement the master agreement negotiated by the union and the employers' association. It also handles grievances. It is to be consulted prior to a dismissal, and new hires must be cleared with it. It may protest a hire on the grounds that the prospective employee has been selected because of his personal connections and is unqualified; that his selection constitutes discrimination against other applicants on the basis of race, sex, religion, nationality, union activity, or political views; or that there is reason to anticipate illegal or antisocial conduct.

Certain items regarding terms of employment are to be settled only on agreement of the council. These include the setting of shift hours, establishment of incentive rates, assignment of vacations, administration of employee welfare institutions, and rules of employee conduct. If agreement cannot be reached on such items, the parties are obliged to set up an *ad hoc* arbitration board to decide the issue.

The council has a lesser influence on

⁴ International Labor Office, *Legislative Series*, 1952, Ger. F.R. 6. For summary of this and other current German labor laws see H. C. Nipperdey, "Development of Labor Law in the Federal Republic of Germany since 1945," *International Labour Review*, Vol. 70, Nos. 1-2 (July-August 1954), pp. 26-43, 148-67.

economic questions that seriously affect the employees, such as the sharp curtailment or shutdown of operations, movement of production to another site, merger, or basic change in the type of activity. In the event of disagreement on such matters, the parties shall establish a mediation board, which may make a nonbinding recommendation for settlement.

Under the terms of this law the works councilors are not the sole representatives of the workers at the company level. The employees also elect one third of the members of the supervisory board, which is roughly similar to our board of directors. At least two of those chosen must be employees of the company. This representation is not a complete innovation. It is similar to a provision of the Works Councils Act of 1920,⁵ except that the earlier legislation permitted only two employee representatives on the board and called for their election by the works council.

No significant field study has yet been made of the actual operation of the 1952 law, but on the basis of experience during the Weimar period and what is known regarding the recent operation of similar provisions introduced in some German industries prior to 1952, it seems reasonable to surmise (1) that new hires are rarely challenged, (2) that recourse is seldom had to the *ad hoc* boards, and (3) that the influence of the employee representatives on the supervisory boards is largely psychological, their presence making the other members more conscious of employee interest in board decisions.

CODETERMINATION

A much stronger form of employee representation, known as "codetermina-

⁵ International Labor Office, *Legislative Series*, 1920, Ger. 1-2. For the more detailed provisions of a subsequent law see *ibid.*, 1922, Ger. 1.

tion," or joint management, was introduced in the steel industry at the time of decartelization in 1947. The Codetermination Law of April 1951⁶ gave it a statutory base in this industry and extended its scope to the mining industry. Under the terms of this act the functions of the works council are roughly the same as in other industries, but labor consultation is reinforced by labor participation in top management. Labor has not one third representation on the supervisory boards but representation equal to that of ownership. If the board has eleven members, five are selected by the stockholders, two by the works council, three by the national industrial union and the DGB, and the odd man is selected by the first ten. It will be noted that the labor representatives are chosen by the works council and the unions, whereas in other industries they are elected directly by the employees.

Top management in the steel and mining firms takes the form of a managerial board, consisting normally of a production manager, a business manager, and a labor manager. The latter is in a sense a labor representative, since his appointment or dismissal requires a majority vote of not only the supervisory board but also the labor representatives on that board. All major managerial decisions are made jointly by the members of the managerial board, but primary responsibility for routine administrative action is divided among them.

From the studies⁷ of the operation

⁶ *Ibid.*, 1951, Ger. F.R. 2.

⁷ W. M. Blumenthal, *Codetermination in the German Steel Industry* (Princeton, N. J.: Princeton University, 1956); Herbert Spiro, "Codetermination in Germany," *American Political Science Review*, Vol. 48, No. 4 (December 1954), pp. 1114-27; W. H. McPherson, "Codetermination in Practice," *Industrial and Labor Relations Review*, Vol. 8, No. 4 (July 1955), pp. 499-519; W. H. McPherson and

of this unique form of corporate control, it is clear that this innovation has worked less well in the mining industry than in the steel industry, where it was introduced four years earlier, at a time when management was in desperate need of the full co-operation of the work force. It also appears that within each industry codetermination has worked to the satisfaction of all concerned to a greater extent in some companies than in others. In general, the results have been much less striking than was widely anticipated. While they are pleasing to labor and displeasing to stockholders, neither the high optimism of the one group nor the extreme fear of many in the latter group has proven justified.

The actual day-to-day operation of codetermination has been much smoother than was expected. Sharp division in voting has generally been avoided in both the supervisory and managerial boards. Decisions are reached typically by consensus rather than by nose counting. When strong differences of judgment are encountered, it is usual to defer action until a compromise solution can be worked out. In some companies the odd member of the supervisory board has never cast a deciding vote. In general, the labor members play a major role in decisions regarding personnel and social questions, and the action on strictly financial and technical questions is left largely to the ownership members.

The extent of influence of the labor manager within the managerial board varies with the capability of the person appointed. It is difficult to find men who combine a strong labor background and managerial experience, but the position has not proved to be quite as incongruous as many anticipated. While

others, "German Experience with Codetermination," *Proceedings of Eighth Annual Meeting*, Industrial Relations Research Association (1955), pp. 118-49.

it is the responsibility of the labor manager to present the labor viewpoint, most union officials—if not always the workers—have come to recognize that he must have a major interest in the success of the enterprise and must be management-minded, as distinguished from ownership-minded.

SIGNIFICANCE OF CODETERMINATION

The ultimate effect of codetermination on collective bargaining cannot yet be clearly determined. It would appear that labor, while occupying all the chairs on one side of the bargaining table, has also some seats on the other side. Such a picture may be misleading. In negotiations at the industry level, the union deals with the employers' association. That association in the mining industry limits its membership to the production and business managers, so that the labor managers have no influence on its policies. The association in the steel industry admits labor managers, but the actual negotiations are conducted by staff members. The labor managers, moreover, tend to take a management point of view, although they are in close touch with the union leaders.

The labor influence on the other side of the bargaining table is probably greater at the company level than at the industry level. But here again it must be recognized that the labor manager, while generally sympathetic with the labor point of view, is essentially management-minded. His attitude may be much like that of a union official who has been appointed as personnel director in an American corporation. He can be expected to have a full appreciation of the labor point of view, but he is no longer a labor representative.

In collective bargaining under codetermination, it may reasonably be expected that management will better understand employee interests and be less

likely to take an unreasonable position and that union officials will have a better picture of the problems of the industry. In the long run the result should be fewer strikes. Already the events seem to support this expectation, though it is too soon to make any final appraisals.

To what extent labor has benefited from codetermination is difficult to determine. There is some indication that increases in plant wage rates above master agreement rates have been larger in the steel industry than in metal fabricating, where the same union operates without codetermination. There is also evidence that, during minor recessions, steel companies have made more of an effort to avoid or defer layoff than would have been expected in the absence of codetermination. In addition, employee welfare programs have probably been expanded to a greater extent in steel than in most other industries, and codetermination tends to reduce their paternalistic aspects. Yet, to many workers, the chief gains have been psychological. They report a new sense of participation and responsibility and an improved status in their relations with supervisors.

Managers in some plants have reported that the company has gained by a reduction in problems of supervision and discipline resulting from the improved sense of responsibility on the part of workers.

CODETERMINATION IN HOLDING COMPANIES

After the occupation, the Allied program of decartelization was reversed. Coal and steel companies have been regrouped under new parent corporations to which the Codetermination Act was held to be inapplicable. The control of the parent corporations over the individual steel and coal companies threatened to undermine the significance of

codetermination. A number of the parent companies agreed to introduce codetermination without legal compulsion, but some later modified this willingness. For three years there was sharp debate on this issue both in the industry and in Parliament. Finally in June 1956 a law⁸ was passed applying a modified form of codetermination to the parent corporations in the coal-steel industries. The principal modifications are that (1) the labor manager is chosen in the same way as the other members of the managerial board, without any special voice for labor, and (2) a majority of the labor members of the supervisory board are elected by the employees from among their own number, with only a minority selected by the unions.

UNION POLICY

Codetermination has been the major legislative goal of the German unions largely because of union unity. Here was an issue on which Socialists and Catholics could agree. The former thought that they saw in it a step toward socialism, though it now seems more probable that, as many industrialists have hoped, it will reduce worker interest in socialization.

The unions have tried without much success to extend the application of codetermination. In 1952, as we have seen, it was applied to other industries only to the extent of providing a one-third representation of labor on the supervisory boards. Finally, it was extended in still more limited form to government employees by the Personnel Representation Law of August 1955.⁹ Here the role of the union is sharply reduced. Personnel councils at each administrative level may confer with ad-

⁸ *Bundesgesetzblatt*, Teil I, 1956, No. 38 (August 8), pp. 707-11.

⁹ *Ibid.*, 1955, No. 25 (August 6), pp. 477-89.

ministrators on a variety of employment details. Disagreements may be appealed to higher levels and, on certain issues, to a mediation board. The results of the legislative battles on the laws of 1952 and 1955 can scarcely be regarded as union victories. In any case they indicate an increasing legislative strength of union opponents.

Similar indications were seen in the drafting of the Labor Court Act of September 1953¹⁰ and its revision of December 1955,¹¹ where certain past prerogatives of the unions have been extended to religious employee associations.

As a result of their legislative defeats, the unions have recently modified their traditional policy of seeking their major goals by statutory means and are making more vigorous efforts through collective bargaining. Until recently the postwar unions have followed a moderate wage policy. After experience with severe inflation in the 1920's and the early postwar years, they have been extremely fearful of contributing to a new spiral. The reluctance to strike has also been due in part to a hostile public opinion, the lack of employee financial resources after wartime devastation, and the inadequacy of union funds to finance strike benefits during an industry-wide stoppage.¹² DGB leadership provided little or no support to its member unions in case of strife. Probably as a result of this situation, there have been but modest gains during recent years in union membership, which has failed to keep pace with the growth of the labor force.

Finally, there was a revolt of the delegates to the DGB convention of 1954, evidenced in criticism of DGB

¹⁰ *Ibid.*, 1953, pp. 1267 ff.

¹¹ *Ibid.*, 1955, pp. 743-44.

¹² Union funds have, however, grown fairly rapidly from dues that are scaled to approximate one hour's earnings per week.

officials and demands for an action program.¹³ Since then the unions have been pressing wage and hour demands with new vigor and with considerable success. The average annual percentage increase in real earnings in manufacturing was 5.7 in 1955 as compared with 2.5 in 1954.¹⁴

A major plank in the unions' new action program is the forty-hour week, to be achieved by degrees through collective bargaining. Heretofore a forty-eight-hour week has been the norm in Western Europe. The workday of underground miners has been reduced from eight to seven and a half hours; and by agreement of June 1956 the metal union has won a forty-five-hour week with an 8 per cent wage increase to more than offset the reduction in hours. The winter of 1956-57 has witnessed a vigorous and largely successful strike for vacation and sick-leave gains in the metal-fabricating industry of Schleswig-Holstein. This struggle appears to be regarded by the unions as a pilot or pattern-setting action, and may well indicate a new interest in "business unionism."

SETTLEMENT OF LABOR DISPUTES

Grievances not settled by the works council and the employer can be taken by the employee—with legal assistance from his union, if he is a member—to a local labor court composed of an employer, an employee, and a neutral chairman.¹⁵ Under certain conditions an appeal can be carried to an appellate court and to the Federal Labor Court. These courts deal with violations of labor agreements and labor

laws. They provide a prompt hearing at slight cost before persons having a background in labor relations.

In disputes regarding the terms of a new labor agreement the parties may call upon a state conciliator, but there is no federal mediation service. Most unions and employers' associations have established their own mediation machinery by agreement. In September 1954 the DGB and the Federation of German Employers' Associations agreed on a model draft of a conciliation agreement, which they recommended for adoption by their members. It called for bipartite mediation commissions with rotating chairmanship and a time limit for acceptance or rejection of the mediation proposal before a stoppage is permissible.¹⁶ The machinery established in the various industries deviates considerably from this model and lacks uniformity. For example, the mediation agreement of June 1955 for the steel and metal fabricating industries provides for mediation only at the request of either party, so that a stoppage without prior mediation is possible.¹⁷

CONCLUSIONS

The phenomenal postwar recovery of German industry has been accompanied by a substantial reconstruction of its labor relations. A strong union structure has been built. A relatively high proportion of the employees are union members, and substantial union financial reserves have been accumulated. A strong and extensive system of workers' education has been developed. After following a policy of moderation in

¹⁶ "Bewährungsprobe der tariflichen Schlichtung," *Die Quelle*, Vol. 5, No. 10 (October 1954), pp. 441-42. The addition of an impartial chairman was mentioned as a possible alternative.

bargaining demands, the unions have recently adopted an "action program" that has resulted in significant wage increases and a widespread reduction of the previous forty-eight-hour work week.

There is evidence that a novel wave of negotiations for improvements in fringe benefits is in the making. We may be witnessing in 1957 a fundamental shift of union interest from the legislative chamber to the bargaining table—a shift that may drastically alter the character of German unionism. The German labor movement has heretofore been characterized by a considerable preoccupation with broad socialistic reform. In the future it may be much more concerned with the "business unionism" that has typified its American counterpart.

The chief union weakness lies in the fact that the labor relations activities that are most meaningful to the employee—those at the plant level—are in the hands of the works councils rather than the unions. There seems to be no present possibility of replacing the councils by local unions. On the contrary, labor legislation has in recent years consistently placed additional limitations on union activity and reduced the union's role as labor representative by expanding the significance of the works councils and of religious employee associations. Most of these changes, however, have been minor and have affected union prestige more than union power.

Since 1951 legislation on employee representation appears to have been based increasingly on the concept that the labor-management relationship at the industrial level takes the form of conflict, but that at the plant level it should take the form of collaboration; and that the unions should be confined to the industrial and interindustrial levels, with the works councils holding a monopoly on labor representation at the plant level.

Such a concept might be dangerous not only for the unions but also for industry. If the unions are excluded from activities that emphasize the partial commonality of interests among labor, management, and ownership and are confined to areas where they face constant opposition, may they not be expected to become increasingly hostile? Furthermore, a weakening of the relationship between the unions and the works councils means an illogical dissociation of the agents negotiating labor agreements from those who will implement and administer them. It is to the interest of everyone concerned that the negotiating unions have a full understanding of plant problems, an understanding possible only as long as the unions retain a close relationship with the works councils.

Another danger in augmenting the autonomy of the works councils is their susceptibility to Communist control. German unions have been largely freed of Communist influence, but in works councils Communists have occasionally won influential positions.

As of now there is still a fairly good working relationship between the unions and the councils, but a number of apparently minor provisions in recent labor laws give evidence of strong forces at work to weaken this relationship.

The drive for codetermination has made no substantial progress since it gained extension of this system from steel to the mining industry in 1951. Certain industrialists became more outspoken in their opposition after the steel and coal industries were returned by the occupation authorities to private ownership, and by the rebuilding of giant industrial combines they succeeded for a time in largely negating the intent of the new corporate structure. Only after a surprisingly lengthy parliamentary struggle did the unions finally win legislation which applies the principle

of joint management to the new parent corporations. Even here the structure was modified to the disadvantage of the unions, but it is unlikely that the changes will significantly alter the operation of the system.

Codetermination has been the most novel aspect of German postwar labor relations. It has been beneficial in some respects to the employees, though not to the extent that many had anticipated. These gains have not greatly aided the unions, for most employees probably credit their benefits more to

the works councils than to their labor organizations.

While many industrialists bitterly resent codetermination, others—more in steel than in mining—consider it workable and in some ways beneficial. Industrialists were probably correct in their expectation that codetermination would weaken the drive for socialization. The amazing recovery of German industry and the rapid expansion of its exports demonstrate that its competitive strength and earning power have not been undermined by this experiment.

Collective Bargaining in Postwar France

By VAL R. LORWIN *

Abstract: The labor movement in France since 1944 has had a hectic history. The unions, especially those united in the General Confederation of Labor (CGT), played a strong role in the resistance movement and gained great political influence. By 1946, labor had won a place on the boards of directors of all the nationalized services and industries and had gained influence in other industries. After 1946, Communist politics split the CGT and in the process a considerable number of workers simply left organized labor. The author discusses the resultant disorganization and strife, the attempts of the state to regulate collective bargaining, the introduction of a new collective bargaining law in 1950, the initiative of some managements, public and private, in introducing plant bargaining rather than industry-wide or area-wide bargaining, and the forces making for change in industrial relations and those holding back change.—Ed.

COLLECTIVE bargaining in France is more interesting than happy. Among the factors that make it interesting are these:

1. The contrast between the advanced social aspirations and social legislation of France and the underdeveloped state of its industrial relations.
2. The weakness, in collective bargaining and in action at the plant level, of the union movement, divided along political and religious lines, with its major segment dominated by the Communist party.
3. The strength of employers' associations.
4. The extensive role of the government in determining not only conditions of employment and the structure of wages but also the very conditions of union functioning in the plant.
5. The contrast between centralization of general wage movements (through

state action and through employers' association bargaining) and the anarchy of actual wage-rate determination in the plant.

6. The failure, thus far, of nationalization of a number of basic industries to change the climate of industrial relations.

Since 1950 France has been engaged in its third attempt to generalize collective bargaining. The first was an attempt to meet worker unrest at the end of World War I; it foundered almost immediately on the rocks of political schism in the unions. The second, much broader, attempt came with the Popular Front in 1936. Again, political strife in the unions and employer opposition limited the possibilities of free bargaining, and the state stepped in with compulsory arbitration of all labor disputes. The war halted the all too brief experiment, and from 1939 to 1950 the government itself set wages.

UNIONS AT THE LIBERATION

To understand the state of collective bargaining today, we must go back to

the hectic several years following the liberation of Paris in 1944 and the war's end in 1945.

The liberation was the high point of all time in the prestige of labor and the political left in France. The unions revived rapidly, both those of the General Confederation of Labor (CGT, *Confédération Générale du Travail*), the oldest and most important wing of French labor, and those of the French Confederation of Catholic Workers (CFTC, *Confédération Française des Travailleurs Chrétiens*). The Communists soon took control of the CGT's leading industrial unions and the confederation's central apparatus. Politically, the Communist party emerged from the underground period with the strongest party organization France had ever seen, a scarcely challenged predominance in working-class support, and about five million votes (one fourth of all those cast) in every national election since liberation.

The CFTC, long restricted chiefly to white-collar employment and textiles in a few regions, for the first time became a significant minority in a number of basic industries. For the first time too, thanks to the role of many Catholic unionists in the resistance, its *bona fides* was not seriously challenged by the dominant CGT.

A new confederation appeared, the General Confederation of Supervisory Employees (CGC, *Confédération Générale des Cadres*). It became the leading union of foremen, salesmen, and supervisory staff.

POST-LIBERATION REFORMS

Employers and the political parties of the right were discredited at the liberation. They were publicly held responsible for the nation's lack of political, material, and military preparedness against the Nazis, for the tawdry Vichy regime, and for the nation's old social

injustices. Thus they were unable to offer any real resistance to the measures of social and economic reform which the nation, led by the basically conservative General Charles de Gaulle, then enacted.

These measures set the stage for later union-management relations. To handle worker grievances, shop stewards are elected in all establishments with ten or more workers. To give workers greater industrial democracy and greater interest in production, plant committees are elected in establishments with over fifty employees; they operate employer-financed social welfare programs and advise on production problems and on mass dismissals. Both stewards and plant committee delegates are elected by all workers, whether union members or not, from among competing union slates.

Social security, especially health insurance and family allowances, was greatly enlarged in coverage and in benefits, and the law gave the unions places on the elected boards of administration. The nation took over the coal mines, gas and electric power, the biggest banks and insurance companies, air transport, and Renault, France's largest automobile company. The unions were given representation on the boards of directors of all these public enterprises and of the previously nationalized railways.

DECLINE OF THE UNIONS

All this was done by 1946; then social reform halted. In 1947 began the great decline of the unions. The Communists, after three years of co-operating in the national reconstruction, followed the Soviet lead into the cold war—at the expense of the CGT. They launched a general strike, ostensibly for overdue wage increases, but actually against the Marshall Plan and French economic recovery. The anti-

* I wish to thank the Inter-University Study of Labor Problems in Economic Development for the support which made possible research in France on which my discussion of the most recent developments is based.

Val R. Lorwin, Ph.D., Chicago, Illinois, is Assistant Professor of the Social Sciences at the University of Chicago. He is the author of *The French Labor Movement* (1954).

Communist minority (Socialists and nonpolitical trade unionists) helped defeat the strike, then withdrew from the "old house" of labor to form the new Workers' Force Confederation (FO, Force Ouvrière). For the third time in a single generation the CGT was split—again, as in 1921 and 1939, by Soviet and Communist international politics.

The CGT has lost over two thirds of the six million members it claimed at its 1946 peak, by the 1947 split and later hemorrhages of membership following other politically inspired strikes. But it remains the strongest organization among manual workers in practically every major industry. Most of the disaffected instead of joining the CFTC or FO have dropped into what the French call the "largest organization of all, the unorganized." FO and the CFTC have their chief strength among white-collar employees, FO especially among government clerks.

The unions are disunited not only in every branch of private and public employment, but in almost every shop of any size. They suffer from the old weaknesses of French union structure, dues, and discipline.

Membership is such a loose concept that no membership figures are meaningful. People may be considered—and consider themselves—members even if they pay only a few months' dues each year. The local, base of the union movement, still has no clear functions of contract administration or grievance handling and thus lacks effective arguments for eliciting union membership. There are no closed or union shops or union hiring halls to enforce union membership.¹

To gauge the relative influence of the

¹ The CGT printers' union has had a closed shop in some newspaper printing plants. A 1956 law declared the closed shop illegal, but it remains to be seen whether the law will be effective.

three workers' confederations, in the absence of membership figures, we can best look to the elections of the workers' representatives on the boards of directors of the semiautonomous social security system. All workers may vote, choosing from among the rival union and other (minor) slates. In the 1955 elections, out of 6.7 million votes, the CGT received 2.9 million, or 43 per cent of the total vote; the CFTC, 1.4 million, or 21 per cent; FO, 1.1 million, or 16 per cent.²

EMPLOYER ORGANIZATION

The employers too regrouped after the war. Industry and area associations linked up in the astutely managed new French National Employers Council (CNPF, Conseil National du Patronat Français), successor to the prewar General Confederation of French Employers. The industry and area groups developed a membership coverage and a cohesion they had never had before the war. Employers recovered public standing and the power so shattered at the liberation. With the political swing to the right, they regained political influence and access to government.

BURDENS OF RECONSTRUCTION

The economy had come out of the war and occupation depleted and devastated by bombings, German takings, and resistance sabotage. By 1948 industrial production had recovered to the immediate prewar level of 1938. (But 1938 had been a mediocre year, 25 per cent below the best prewar year, 1929.) For all the postliberation social reforms, workers and pensioners were

² Another 1.3 million votes (20 per cent of the total) went to minor unions, mutual aid societies, and "family associations." These results do not include the special social security systems of the mines and the railroads, where the CGT shows even greater strength.

bearing most of the burdens of reconstruction and inflation. Income per capita was only about one third of that in the United States, and its distribution was glaringly unequal. Real wage-earner income from all sources was still below prewar, on the average.

Averages were more than ordinarily misleading, because of the upheavals in the structure of wages. Skill differentials and differentials between women's and men's rates had been narrowed; so had those between the provinces and the Paris region. Most important, the expansion of health insurance and family allowances had been achieved, it appeared, only at the expense of direct wage rates. It had shifted income from the healthy to the sick, and from single workers to heads of families with two or more children. Thus real hourly wage rates by 1950 were still only 63 per cent of prewar.

This was the situation when collective bargaining finally resumed, after ten years of government fixing—not just control—of wages. With price and rationing controls finally lifted, Parliament in 1950 voted a law³ setting the framework for what was hopefully announced as a new era of labor-management negotiations.

BARGAINING PATTERNS

Bargaining occurs, typically, between a well-organized district, regional, or national employers' association, or a public corporation, and two, three, or more unions. Union pluralism is inevitable; the religious and political cast of the unions does not permit majority rule and an exclusive bargaining agency. The rival unions most often do not concert their demands and tactics. On the union side, therefore, bargaining is competitive, uneasy, and often irrespon-

³ Law No. 50-205 of February 11, 1950, *Journal officiel*, February 12, 1950, with rectifications February 22 and March 14, 1950.

sible. It is distorted by the political gymnastics of the CGT, which alternately is pushed by the Communist party into political agitation and then veers back toward economic action. The unions have hardly any research staffs to back up their negotiators. The disparity of power, information, self-assurance, and cohesion between the bargaining parties is evident.

The content of agreements is often skimpy. The law spells out in detail what it terms a full-fledged "collective agreement," in contrast with a mere "wage settlement." But it does not oblige either party to bargain in good faith. Employers have often negotiated wage settlements with a few skeletal clauses or with the slightly embroidered repetitions of legal obligations. Area-wide or national industry agreements sometimes specify wage rates, sometimes not. Where they do, they provide only for minimum rates. These are usually set low enough to meet the requirements, real or fancied, of the least efficient members of the employers' association. Effective rates, including a maze of bonuses and incentive pay rates, are then set by each plant, sometimes by agreement with the unions or the plant committees, often by unilateral management decision.

Agreements may provide improvements over the fringe and social security benefits required by law or over the rather low overtime penalty rates that the law imposes. Seniority provisions are rare, nor are they generally asked for by the unions. Contracts seldom spell out grievance procedures beyond what the shop steward legislation requires. Only a few contracts provide binding arbitration either of unresolved grievances or disputes over contract interpretation.

Workers and unions, and fair employers, may get a further advantage from a full-fledged "collective agree-

ment." Such an agreement the government may "extend," that is, decree its application to the employees of all firms in the area and industry concerned, regardless of whether they were represented by the contract's signatories. This makes the private agreement a part of public regulation, subject to labor ministry inspection and enforcement like other public law.

ROLE OF THE STATE

Modern democratic governments all intervene in labor relations, but the French more than most. It is a weak government, but ubiquitous in economic life. It is almost torn apart by the pressure groups, including unions and employers, which are in principle all contemptuous of government intervention and are in practice all busy seeking it from Parliament, cabinet, and civil service.

The state employs—in the administration and in nationalized enterprises—more than one fourth of France's civilian nonagricultural wage earners. Its action as an employer often sets off wage movements throughout private industry. So do its determinations of the national minimum wage, for, in the nation's low wage economy, changes in the minimum immediately stir ripples of adjustment upward through the occupational wage hierarchy. The government's determination of family allowance and social insurance levels and fringe benefits removes perhaps a third of workers' remuneration from the realm of private bargaining.

By shop steward and plant committee laws, the state sets the basic conditions of worker representation in the shop. (Collective bargaining may improve on them.) By deciding what unions are "representative," it determines what unions may offer candidates in shop elections and what unions shall be convoked for government-sponsored

collective bargaining. (The bargaining sessions need not be convoked by government officials, but they often are.) So far the government has considered the CGT, CFTC, and FO all nationally "representative" for all categories of workers, and the CGC "representative" for supervisory employees.

THE RIGHT TO STRIKE

Strikes still have more the air of episodes of class conflict than of tests of economic strength between bargaining partners. Oddly for a government which regulates so much, the Fourth Republic has enacted almost no regulation of the right to strike, even in government administration or public-service type industries. The nationalized coal mines and railroads, in fact, have felt the worst strikes since the war; the CGT has made them a chief target, hitting at the government and at the vitals of the economy.

In some public utility strikes the government has stretched its powers under the 1938 National Service Act to "requisition" workers, that is, order them to stay on their regular jobs as civilian workers. But this weapon, intended originally only for wartime and national emergencies, does not command enough public support to be decisive. In fact, the government has not dared expose its own weakness by using it in the severest of the postwar strikes.

The government tried, in its draft of the 1950 collective bargaining law, to restore the prewar compulsory arbitration of labor disputes. In the face of both employer and union opposition, it had to give way. The law merely provides for what is erroneously called "compulsory" conciliation, by joint union-management panels under government chairmen. The panels have had little success in averting strikes, and a modest amount of success in helping settle them once they broke out. An

alternative and more flexible procedure was made available by a 1955 decree. In wage disputes in private industry, the government may appoint a single mediator, with powers of fact finding and recommendation. In a year's experience (1955–56), such mediators had already proved their usefulness. Perhaps most important are the old practices of *ad hoc* mediation and pressure by government officials at every level: Ministry of Labor officials,⁴ mayors, subprefects and prefects,⁵ cabinet officials, and occasionally prime ministers.

NEW DEVELOPMENTS

Not all is frustration and refusal of responsibility. Not all unions are looking to present government or future political upheaval for the solution of their problem; not all employers are authoritarian or shortsighted. Some new methods are being tried, some signs of a new spirit are in the air.

One innovation came from the hardest hit of all French industries. In 1953 the national employers' association of the textile industry negotiated an agreement of general principle with the non-Communist unions to make a joint effort for greater productivity while easing the impact of layoffs and dismissals on workers. The association's earnestness has been attested to, and sweetened, by a series of wage raises and supplementary pensions.⁶

In the summer of 1955, strikes and lockouts and angry blasts of old class hatreds shook the ports of St. Nazaire

and Nantes. Suddenly caving in, and making up for over-long lags behind Paris wages, St. Nazaire shipbuilders yielded a tremendous wage increase. This gave the signal for widespread strikes in many areas, even in industries which had recently negotiated contracts. Then, before the strikes hit Paris, Renault signed a contract which marks a milestone.

RENAULT AGREEMENT

The Renault contract incorporated many tangible improvements over the fringe and welfare benefits required by law: paid vacations for three weeks (instead of two weeks) after a year's service, supplementary pay to hourly-rated personnel for days lost by sickness or work accidents, more generous maternity leaves, added death benefits, and supplementary pensions to long-service personnel. It reaffirmed a 1950 guarantee of cost-of-living adjustments in wages. It added an "improvement factor" increase: an assured wage raise of at least 4 per cent each year for the contract's two years. A clause requiring consultation before any strike or lockout sought to protect management from the "quickly" strikes, so common a weapon of the weak French unions.⁷

At first only FO, the CGC, and an independent workers' union signed the agreement. The CFTC hesitated, then added its signature.⁸ The CGT, strongest union by far among Renault production workers, raged at its rivals' "sellout"—and then, in one of the greatest humiliations of its Communist leadership, heeded rank-and-file opinion and offered to sign—but with a qualification

⁴ There is no specialized body of government mediators, although many Ministry of Labor officials have experience in mediation.

⁵ The prefects are the powerful nationally appointed officials who administer the ninety departments into which Metropolitan France is divided.

⁶ Despite unemployment and short time, the textile industry increased wage rates between 1946 and 1954 more (percentagewise) than any other industry.

⁷ For the text of the agreement, see *Année politique, 1955* (Paris, 1956), pp. 621–25. Some of the contract's advantages had already been in effect, by management decision; these now became contractual.

⁸ An agreement remains open (by law) to later signature by organizations which did not sign when it was negotiated.

"reserving all its rights." Renault insisted on an unqualified signature or none at all, and there the matter remained.

The wave of strikes broke at the gates of the nation's capital and subsided, in large part as a result of the spectacular Renault agreement, which had been gained without a strike and on the company's initiative. In a few months a number of large private employers and several public enterprises negotiated "Renault-type" contracts. The hot arguments in union circles over two of the typical clauses throw a lurid light on the labor relations scene. One was the so-called no-strike clause. It was denounced by the CGT, which claims the right to strike at any time and for any purpose, without warning. Even many free trade unionists wondered whether they were sacrificing the basic "right to strike" in giving up the tactical weapon of surprise strikes.

Similar debate took place over the "productivity clause." This was a simple declaration recognizing, in the words of the Peugeot automobile agreement, "the solidarity which exists between the possibilities of prosperity of the firm and those of its personnel." This platonic affirmation, which would be banal in most other industrial countries, worried some of the free unionists, and naturally agitated the CGT leadership most. For the CGT argues that productivity increases in a capitalist society can come only out of the worker's hide.

INNOVATION BY BARGAINING

The "Renault-type" contracts were important not so much for their specific clauses on wages or fringe benefits, or even for their no-strike clauses and declarations of joint interest in productivity, as for the fact that, for the first time in France, innovation had been

made by collective bargaining, rather than by the government's imposing reforms on unwilling but temporarily powerless employers.⁹

These agreements showed the possibilities of shifting the locus of bargaining from the employers' association to the individual employer. The unions might now try to take their standards from the successful firm, not the marginal enterprise. The pressures of higher wages might help force greater efficiency—or shutdowns—on some of the inefficient firms which have so often set the pace, from the rear, for the economic and social procession. Contracts at the plant level could reinforce the unions, and especially the democratic unions, at the point where their structure is weakest, the shop. Such bargaining and its corollary of real contract administration might help workers and unions look at management and society more realistically. They might begin to shake themselves free of the oversimplified fixed imagery of a class warfare which, whatever its rationale in the nineteenth century, does not correspond to the complex realities of the mid-twentieth century.

Contracts like that at Renault place the CGT in the dilemma of any organization of revolutionary aims operating in the trade union world. The CGT claims that the capitalist system cannot give improvements to its workers, but must constantly pauperize them more and more. On the other hand it claims that gains such as those of the Renault contract were won by the workers' "unity of action"; but that other unions, which sign when the CGT does not sign, have sold out the workers and "played the game of the reactionary employers and the government."

⁹ In 1956, however, a law generalized one of the Renault advantages. It made the three weeks' paid vacation the legal requirement in all employment.

SOURCES OF CHANGE

In the present inequality of power between unions and employers, the greater responsibility for social progress remains with the employers. Some new influences are at work among them. Several *avant-garde* employer organizations have helped bring together the managerial elite from both private and public enterprise, to overcome old suspicions and spread new ideas. The first steps in a practical sort of management training are being taken here and there. The renewal of Catholic zeal and social doctrine since the war has caused many employers to question the old ways of doing things, which some now hold largely responsible for the alienation of the working class and France's teetering on the edge of a social and political abyss.

Greater contact with the outside world has been a factor of change; new horizons have been opened by exchange visits with other free European nations and the United States. The liberalization of imports (from other countries of the European Coal and Steel Community and the Organization for European Economic Co-operation), hesitant and limited as it has been, has let in a few wholesome breezes of competition and fresh ideas. The accelerated tempo of technological change and economic growth in the last few years is itself generating more rapid change and making people more receptive to change. By mid-1956 industrial output reached levels 90 per cent above 1938 (and about 50 per cent above the prewar peak of 1929), and real wage rates averaged almost 40 per cent above 1938. Workers were tasting some of the benefits of an expanding economy, and envisioning more,¹⁰ after three years of

¹⁰ Characteristically, however, most workers seemed genuinely unaware of how much their real wages had gone up. In a 1955 survey,

the greatest increase in productivity and in production, with stable prices, in French history.

It is too soon to let oneself go in the sort of cheery predictions which French history has often blown into dust. Collective bargaining determines wages and working conditions less than do government action and management fiat. Employers' associations oppose individual firm bargaining and wage leads by progressive firms. Employer resistance to any sharing of authority in the plant is great, and Communist unionism seems to give it a species of moral justification. Many managements value "business secrets" more than employee confidence. Paternalism mars many efforts at improving workers' conditions.

A number of the small and medium-sized firms so important in France do not live up to the modest contractual or even legal minimum wages. Union activists still get inadequate protection against discriminatory dismissals.

Workers have continued to support the CGT and the Communist party, with their votes if not their membership, by reason of a lack of vigor in the non-Communist alternatives and out of fear of clericalism in the CFTC. A few good contracts cannot overnight dispel deep-seated class hostilities and sentimental allegiances.¹¹ The CGT may be shut out of important contract negotiations, but it is unsatisfactory to have to shut out the representatives of unions for which a majority of the

75 out of 100 unskilled laborers (a group whose purchasing power had gone up on the average at least 35 per cent in the period) said that they had experienced no improvement in the past five years.

¹¹ Despite the success of the Renault contract, the elections of plant committee members at Renault a few months later found the CGT still pulling 17,212 votes among production and office employees, as against only 5,844 for a coalition of the CFTC, FO, and the independent union.

workers in shop elections regularly vote.

Old ideas weigh down the free unions, and old quarrels separate them from each other, while internally each tries to reconcile discordant factions. The unorganized majority of workers have turned from hopes in collective action to a "privatization" of their lives. If this denies the Communists solid control of labor, it also denies the hopes of the free unions.

The economy, even in recent good years, has navigated between the rocks of inflation and the shoals of stagnation. Workers and unions are fearful of innovations which might cause layoffs and dismissals, and tend to accept lower wages for fear of shutdowns and unemployment. Although unemployment has been slight (except in textiles and leather goods) since the war, there is no unemployment compensation, only a scant unemployment assistance. An acute housing shortage further discourages movement. The economy and the polity are vulnerable to possible international conflict and to the immediate consequences of continued warfare in Algeria. Too many demands converge all at once on a people lacerated by two great wars on their own soil in a single generation.

If the changes we see cannot be taken as the sure dawn of a new day, however, it would be equally wrong not to see that change is at work. Of that

change, collective bargaining is one sign and one method. It may yet help to bring mutual tolerance and fair play into labor relations, to add a spur to economic growth, and to win back the working class for democratic social politics.¹²

¹² For a more detailed study of collective bargaining, as well as of union history, structure, functioning, and political ties, see Val R. Lorwin, *The French Labor Movement* (Cambridge, Mass., 1954). For the prewar period, see David J. Saposs, *The Labor Movement in Post-War France* (New York, 1931); Joel Colton, *Compulsory Arbitration of Labor Disputes in France, 1936-1939* (New York, 1951); and Henry W. Ehrmann, *French Labor: from Popular Front to Liberation* (New York, 1947). On wages, see Lloyd G. Reynolds and Cynthia Taft, *The Evolution of Wage Structures* (New Haven, Conn., 1956), Chap. VIII; John T. Dunlop and Melvin Rothbaum, "International Comparisons of Wage Structures," *International Labour Review*, Vol. 71, No. 4 (April 1955); and Adolf Sturmthal, "Collective Bargaining in France," in Adolf Sturmthal (Ed.), *Contemporary Collective Bargaining in Seven Countries* (Ithaca, N. Y., 1957). On employers' associations, see *Organized Business in France*, by Henry W. Ehrmann (forthcoming), and on the role of government, a forthcoming book by Warren C. Baum. To these should be added the third volume, dealing with union-management relations, of Paul Durand (in collaboration with André Vitu), *Traité du Droit du Travail* (Paris, 1956).

The Italian Labor Movement in 1956: The Structure of Crisis

By MAURICE F. NEUFELD

Abstract: The development of a democratic, anti-Communist, and effective labor movement in Italy is rendered difficult by several things: the lack of political unity and a single economic ideology of the large national federations, the top-heavy administrative structure, and the well-rooted system of highly centralized control. Industry-wide bargaining has proved ineffective in getting the greatest benefits to labor in various sections of the country. Factory unions are being looked upon now as the answer; they have begun to be established but have not yet become effective instruments. What is needed is a new type of leadership which can build the labor movement from the bottom up rather than from the top down. Young labor leaders are now being trained, and in their hands lies the key to the future of the Italian labor movement.—Ed.

THE Italian labor movement has always lived from hand to mouth and from crisis to crisis. In today's crisis, as in the past, labor unions are still divided by political rancor into separate and competing confederations (see below, Outline of the Three Main Italian Confederations of Labor and the Principal Independent Unions, 1956). Most employers, like their predecessors, have remained recalcitrant in their attitude toward developments in industrial relations which are generally accepted in other advanced Western societies. Union members, dissatisfied with the meager gains collective bargaining has brought to them, have become discouraged and indifferent; union membership has declined; and large segments of workers are either unorganized or grouped into independent unions (see Outline). As a consequence, CGIL (Confederazione Generale Italiana del Lavoro), CISL (Confederazione Italiana Sindacati Lavoratori), and UIL

(Unione Italiana del Lavoro), the three principal confederations of labor, are experiencing grave financial difficulties.¹ To give the crisis further edge, the Italian economy is still stalked, despite remarkable improvements, by unemployment ranging from 1,500,000 to 2,000,000 human beings. Underemployment is estimated to harass a like number.

¹ Three sensational articles on the membership and financial crisis in the Italian labor movement, written by Giancarlo Galli, appeared in the Milan newspaper, *Il Giorno*, on July 17, 18, and 20, 1956. Galli estimated that the present membership of all unions was 6,000,000, as compared with a total of 9,000,000 in 1948. These figures were repeated without comment or objection in an article in *L'Unità* on October 4, 1956, written by Luca Pavolini. In discussing the financial emergency, Galli estimated that the three main confederations of labor had been able to collect only between 30 per cent and 40 per cent of the dues owed to them in 1956. Galli's estimates should be considered with caution as wide-ranging, rather than narrowly pointing, indicators.

Maurice F. Neufeld, Ph.D., Ithaca, New York, is Professor of Industrial and Labor Relations at Cornell University. During World War II he served in the regional headquarters of Allied Military Government in Sicily, Naples, Rome, and Milan. He is author of *Labor Unions and National Politics in Italian Industrial Plants* (1954).

OUTLINE OF THE THREE MAIN ITALIAN CONFEDERATIONS OF LABOR AND THE
PRINCIPAL INDEPENDENT UNIONS, 1956

CGIL

CGIL (Confederazione Generale Italiana del Lavoro) is the largest union confederation in Italy. Membership estimates run from the 4,040,000 claimed by CGIL itself and accepted by *L'Unità*, the official newspaper of the Italian Communist party, to as low as 2,800,000.

In order to support its claim of being the most representative organization as well, it recognizes at least eight political currents within its ranks:

1. Communists, the largest single political group and the controlling one.
2. Nenni Socialists, the second largest group.
3. Social Democrats, a small group, since the largest number of Social Democrats are in UIL and CISL.
4. Unitary Christians, who are alleged to be members of the Christian Association of Italian Workers (ACLI) as well. Most Catholic workers, however, are affiliated with CISL.
5. Anarchists who have joined in order to defend labor unions.
6. Independents and some Liberal party and Radical party members.
7. Popular Unity, adherents of the tiny party of Ferruccio Parri, leader of the resistance and former Premier of Italy.
8. Republicans, especially those who remain faithful to the "true" principles of Mazzini (who fought both Marx and Bakunin). Most Republican party workers are in UIL and CISL.

For further details, see Lietta Tornabuoni, "Le Correnti," *Lavoro*, March 18, 1956, pp. 7-9.

CISL

CISL (Confederazione Italiana Sindacati Lavoratori) took its present name in 1950. In October 1948 the Christian Democratic labor leaders in CGIL withdrew and formed the Free Italian General Confederation of Workers (LCGIL). In the summer of 1949, labor leaders of the right-wing Socialist and of the Republican party persuasions left CGIL to form the Italian

Labor Federation (FIL). In April 1950, under the amicable pressure from anti-Communist labor leaders in the United States, the leaders of FIL were convinced that they should join with LCGIL. The name of the united organization was then changed to CISL. Membership estimates run from 1,100,000 to 2,140,000.

UIL

UIL (Unione Italiana del Lavoro) was constituted in 1950. To form UIL, labor leaders faithful to the third Socialist party in existence at that moment, the Unitary Socialist party, who had left CGIL in 1949, joined forces with Republican party labor leaders and right-wing Socialists who could not find it possible to enter what they considered the Catholic-dominated CISL. Membership estimates, for the most part, run from 125,000 to 730,000.

PRINCIPAL INDEPENDENT UNIONS

1. Italian Confederation of National Workers Unions (Confederazione Italiana dei Sindacati Nazionali dei Lavoratori—CISNAL) is generally thought to be under the influence of the neo-Fascist Italian Social Movement (MIS) and of corporative ideology.
2. Italian Confederation of Company Executives (Confederazione Italiana Dirigenti di Azienda—CIDA) is made up of five union federations which cover establishments in industry, commerce, credit and finance, insurance, and agriculture.
3. General Confederation of Executives in Public Employment (Confederazione Dirigenti Statali—DIRSTAT), which joins together four federations with jurisdiction over national administrative offices, the state-owned railroads, communal and provincial secretaries, and heads of state institutions.
4. The National Federation of Autonomous Unions (Unione Nazionale Sindacati Autonomi—UNSA) of which the National Autonomous Union of Elementary School Teachers, listed below, forms the principal part.
5. The Community Movement is limited

to certain plants in Piedmont and Lombardy. It was recently organized and is directed by the highly esteemed, imaginative, socialistic, and somewhat erratic head of the efficient, prosperous, and humane Olivetti enterprises.

6. Of the large number of independent railway workers unions, the following four are the most important:

- a) Union of Locomotive Engineers, Assistant Engineers, and Heads of Repair Depots (Sindacato Macchinisti, Aiuto-Macchinisti, e Capideposito—SMAC).
- b) Union of Administrative and Technical Employees of the State Railways (Sindacato Funzionari Amministrativi e Tecnici delle FF.SS., Gruppo B—SIFAT).
- c) National Union of Railroad Workers, Group C (Sindacato Nazionale Ferrovieri, Gruppo C—SNFGC).
- d) Union of State Railway Technician Heads and Workers (Sindacato Capi Tecnici, Operai delle Ferrovie dello Stato—SCOFS).

7. Of the large group of independent school and university teachers unions, the following five are considered most important:

- a) National Union of High School Teachers (Sindacato Nazionale Scuola Media—SNSM).

These features of crisis have culminated in the contemporary inability of the labor confederations to satisfy the modest demands of their members through the centralized, industry-wide bargaining process prevalent in Italy. But out of this defeat has come an entirely new element which offers a faint possibility of long-needed beneficent reform. In February 1953, CISL began to question the wisdom of industry-wide collective bargaining as the sole approach to wage formulation. It recognized the fact that industry-wide contracts, far from ensuring adequate

- b) National Autonomous Union of High School Teachers (Sindacato Autonomo Scuola Media Italiana—SASMI), a group which broke away from SNSM.
- c) National Autonomous Union of Elementary School Teachers (Sindacato Nazionale Autonomo Scuola Elementare—SNASE).
- d) National Union of Art Teachers (Sindacato Nazionale Istruzione Artistica—SNIA).
- e) Union of Tenure Professors and Department Heads (Sindacato Presidi e Professori di Ruolo—SPPR).

8. A multitude of unions in the banking and insurance field.

9. The National Confederation of Independent Farmers (Confederazione Nazionale Coltivatori Diretti), while confining most of its activities to the organization of working farmers who own their own land, has also taken into its fold a substantial number of sharecroppers, thus arousing the ire of the sharecroppers unions of the three labor confederations, CGIL, CISL, and UIL.

For further details concerning some of the independent organizations listed, as well as others, see "La Indipendenza delle organizzazioni sindacali," *Rassegna del Lavoro*, November 1955, pp. 1633-66. The standard directory for the names and addresses of organizations of all kinds, including labor unions and management associations, is *Guida Monici*.

wages, hours, and working conditions, served merely to set basic standard rates which met the needs of the less efficient and marginal firms, ensuring, at the same time, high profits for well-organized and technically progressive companies. CISL drew from this realistic appraisal the fundamental doctrine of its new wage policy. It would no longer accept the interpretation of the employers that the contracts established maximum rates and conditions. Instead, CISL insisted that they merely established minimum rates and conditions. Therefore improvements would

be sought not at the national level of bargaining, where failure had occurred, but at the plant level.²

But plant bargaining required a union organization at the factory level. Unfortunately, none existed. To remedy this lack, CISL began a campaign within its own organization to create factory unions. It elicited the immediate opposition of the Communist-led CGIL, which continued its counterpropaganda for three years. In early 1956, however, CGIL reversed itself, so preoccupied by the stresses within that confederation become. Factory unions were approved and the constitution of CGIL was amended to confer official status upon them.³

²For a description of the industry-wide collective bargaining process, see Luisa Riva Sanseverino, "Collective Bargaining in Italy," in Adolf Sturmthal (Ed.), *Contemporary Collective Bargaining*, Ithaca, New York, 1957. For an analysis of the consequences of industry-wide bargaining and the possibilities of plant bargaining, see Gino Giugni, "Esperienze corporative e post-corporative nei rapporti collettivi di lavoro in Italia," *Il Mulino*, Nos. 51-52 (January-February 1956), pp. 3-17; "Contrattazione aziendale e democrazia industriale," *Il Mulino*, No. 54 (April 1956), pp. 195-206; "The Structure of Collective Bargaining in Italy," *Industrial and Labor Relations Review*, Vol. 10 (April 1957). For discussions by CISL of its new wage policy, see "Il Sindacato e l'organizzazione di fabbrica," *Quaderni di studi e documentazione*, No. 1, 1955, and "La Politica salariale della CISL," *Bolletino di Studi e Statistiche*, No. 11 (November), 1955, pp. 1-22 (405-426).

³The crisis within CGIL is composed of many factors. Since 1953, its majority within the various internal commissions (similar to American grievance committees) has suffered an over-all percentage loss of 14.1. In the important plants of the Fiat complex its adherents on the internal commissions were reduced to minority status. See Maurice F. Neufeld, "Appunti sul funzionamento delle commissioni interne," *Il Diritto del Lavoro*, No. 6 (November-December), 1956. The revelations which followed in the wake of the desanctification of Stalin created serious discontent and disaffection in the ranks of the Italian Communist party which spread to the

The concept of factory unions seems like an ingenious one, for it appears to combine practical needs with the ideals of local democracy, initiative, and responsibility. But the actual creation of these basic units has proved difficult and time consuming, notwithstanding CISL's enthusiasm and good will and CGIL's superior resources. The reason for this very limited success lies at the heart of an essential weakness of the Italian labor movement: its top-heavy administrative structure.

ORGANIZATIONAL PATTERN

A step-by-step analysis of the structure of Italian unionism brings to the surface this central defect of a labor movement destined throughout its his-

rank and file of CGIL. The crisis took material shape in the membership losses and financial difficulties described in detail in the articles in *Il Giorno* mentioned in footnote 1. CGIL's crisis was further deepened during the summer, fall, and winter of 1956 by the attempts at unification of the Social Democratic party (PSDI) and the Socialist party of Pietro Nenni (PSI). A successful agreement between the two Socialist parties could have profound effects upon the Italian labor movement and especially upon CGIL. These effects might be of various kinds, but true eventual unification would undoubtedly isolate the Communists in their own labor confederation, since the Nenni Socialists would be forced to withdraw upon the creation of a strong Socialist confederation of labor. Such an eventuality would leave CISL, in all probability, as the organization primarily of Catholic workers. To the threat of possible isolation, CGIL responded by making concessions to the Nenni Socialists within its ranks, by redoubling its propaganda campaign for unity of labor action (CGIL, CISL, and UIL) at all levels of activity, and by proclaiming its purely labor union character. In Italy, especially at the local levels, the unity-of-action doctrine might have wide appeal. CGIL, in desperation, is hoping that a successful unity-of-action campaign might lead to ultimate unity of organization. In the midst of this campaign, in October and November 1956, the revolutionary events in Poland and Hungary burst upon the consciousness of Italian workers and intensified still more the stresses within CGIL.

tory to be organized from the top downward under horizontal rather than vertical leadership.⁴ For all territorial and category units within a confederation, a common pattern of institutions (congresses, councils, committees, and secretariats) exists. The composition, number, elective powers, duties, and responsibilities of these institutions, in all units from the top confederation down to the factory union, are detailed in a large synoptic chart, especially prepared for this article and available for the first time in either Italian or English. However, limitations of space have prevented its publication here.⁵ The nature and functions of these institutions will first be described and then the various units in the confederal hierarchies will be defined and their effectiveness appraised.

The following institutions compose the common pattern:

⁴"Horizontal" organizations are defined as the top national confederations, the provincial chambers of labor, and the communal chambers of labor. "Vertical" organizations are defined as the industrial, trade, white-collar, and agricultural unions known as *sindacati di categoria* and therefore referred to in this essay as "category unions."

⁵The synoptic chart of "The Administrative Structure of the Principal Italian Confederations of Labor in 1956" and one of the "System of Dues Payments and Methods of Collection in the Principal Italian Confederations of Labor" are available to interested readers on request to Distribution Center, New York State School of Industrial and Labor Relations, Cornell University, Ithaca, New York.

The constitutions (*statuti*) of the three confederations and of the national category unions do not furnish specific enough details concerning their actual modes of operation. Constitutional provisions were therefore supplemented by observations in the field and by frequent interviews with officials in the three confederations. Warm thanks must be given to Dott. Bruno Trentin and Dott. Alieto Cortesi of CGIL, to Dott. Giuseppe Jelmini of CISL, and to Dott. Vincenzo Berteletti of UIL for information imparted with great patience.

1. The assembly, congress, or convention legislates policy, approves estimated and final budgets, and elects members of specified committees and councils.

2. The general council is the chief deliberative body. It is composed of the directive committee (described below) and a wide representation of pertinent territorial and category organizations.

3. The directive committee interprets the policy decisions and directives of the assembly or congress and has the ultimate responsibility of seeing that they are carried out.

4. The executive committee aids the secretariat (described below) in carrying out the decisions of the directive committee and the congress.

5. The secretariat, which forms part of the body from which it has been elected, is headed by a secretary-general, responsible secretary, or secretary. It carries out, from day to day, the policies set by the congress and the decisions taken by the directive committee.

The secretary-general is aided in his co-ordinating task by a varying number of secretaries and vice-secretaries. This is true for the larger territorial and category bodies. These secretaries are made responsible for specific activities. The full range of these activities, present only at the confederal level, three or four national category union headquarters, and the larger provincial chambers of labor, is as follows: organizing activities; union controversies and technical aspects of collective bargaining; research; education; social insurance and assistance; press and propaganda; youth programs; special services for women workers; and internal administration—purchase, supply, and financial control.

6. The college of honest men (*probi-viri*) settles controversies between indi-

vidual union members and between constituent organizations. It also acts in cases of a disciplinary nature. The college of auditors is responsible for ensuring financial regularity and efficiency. The quasi-independent institutes of social welfare and insurance help union members to process claims for various types of social insurance and assistance. These institutes are financially supported by government subvention based upon the number of cases handled. The quasi-independent institutes of vocational training are also subsidized through government funds which are granted in proportion to the number of union workers trained in the classes organized by the institutes.

All of the institutions described have regularly established times of meetings, as well as special meetings which may be called under constitutionally provided circumstances and methods. These institutions are present in the different organizational units in varying measures of completion, becoming fuller as the level of the units advances from that of the factory unions to that of the national confederation.

PROSPECTS FOR FACTORY UNIONS

With time, patience, skill, money, and more good fortune than is now foreseeable, the basic element in Italian unionism may become the factory union in which CISL has placed so much present hope for plant bargaining.⁶ At the present time, however, the prospects of success are less than fair since two conditions must be fulfilled: the factory unions must be organized and kept alive; in addition, they must function effectively. During field interviews, local officials of the confederal offices and of the category unions have admitted

⁶ Factory unions are called *sezioni sindacali di fabbrica* in CGIL, *sezioni aziendali sindacali* in CISL, and when they exist at all in UIL *nuclei di fabbrica*.

that most of the factory unions claimed by CGIL and CISL (CGIL, 6,525; CISL, 1,500; UIL, virtually none) are little more than paper organizations, still in an embryonic stage of development.

But presupposing that they were actually functioning, under what circumstances could they be effective? Given the chief premise of CISL's new wage policy, successful bargaining at the plant level can take place only in those companies where the profit margin is large enough to warrant concessions above the rates established in the national contract. In Italy, this limits considerably the number of factories where CISL may pursue its policy. Of even more importance is the fact that in most plants CISL cannot hope to press its case alone. Its factory unions would need the aid of CGIL's factory unions. Yet such co-operation would assure success to CGIL's propagandistic efforts for unity of action among all workers and would prove very embarrassing indeed to the top leadership of CISL. Therefore, in all likelihood, CISL is presently limited to the achievement of favorable plant contracts in those firms where the employers are sufficiently anti-Communist and sufficiently friendly to CISL to be willing to present the prestige of a contractual victory to a minority union group in their plants.⁷

⁷ On May 22, 1956, the management of the huge Fiat complex at Turin signed a history-making local agreement reducing the hours of work for its employees, without loss of pay, to the lowest level in Italian factories. Ironically enough, Fiat's management concluded this pioneering agreement not with CISL's and UIL's factory unions, which do not exist in the Fiat plants, nor, in the absence of factory unions, with CISL's and UIL's provincial category unions, but with the representatives of CISL and UIL on the internal commissions, where these confederations control a majority of the seats, thus isolating CGIL. The internal commissions, which resemble

COMMUNAL CATEGORY UNIONS

At this point it should be recalled that union officials do not even pretend that factory unions exist in most plants. Since they must still be formed, the question naturally arises, Where may factory workers look for guidance in the creation and sustaining of factory unions? The answer might seem to lie in the direction of the communal category unions or the communal chambers of labor. There are 7,906 communes in Italy. In each commune, whenever a sufficient number of workers in the same industry or trade has been organized, a communal category union is formed.⁸ CGIL claims 16,006 communal category unions; CISL, 15,000; and UIL, an estimated 15,000. Direct observation has shown that communal category unions are either pitifully weak, manned by a lone volunteer after working hours, or nonexistent. Even in the industrial north, they are effective only in large

American grievance committees, are elected in each plant by all workers, whether union or nonunion. Although there is some question whether, under the terms of the accord on internal commissions signed by the three labor confederations and Confindustria, they have the right to negotiate contracts in contrast to the clear right to supervise the administration of contracts, the Fiat contract on reduction of hours was hailed by both CISL and UIL as a landmark victory for the democratic unions. There is no doubt that the victory was a resounding one, but not for the concept of factory unions and local agreements signed by them.

⁸ These communal category organizations are known as unions or leagues. The latter term is usually applied to communal groups of agricultural and building trades workers. At times, when not enough members of the same category exist in one commune, a district or zonal category union (*sindacato mandamentale o zonale di categoria*) is set up. Conversely, in a few very large cities, when workers are too numerous in certain categories to make communal category meetings manageable, ward category unions (*sindacati rionali di categoria*) have been created.

cities like Milan, Turin, and Genoa. Clearly, help and guidance for the factory unions cannot be expected from communal category unions which need help and guidance themselves.

COMMUNAL CHAMBERS OF LABOR

Nor is the prospect of aid from the communal chambers of labor much brighter.⁹ In theory, they encourage, aid, and co-ordinate the local labor movement, since they unite all members of all category unions in the commune. Again, except in the larger cities, they exist mostly on paper, despite CGIL's claims of 2,210 communal chambers of labor, CISL's 6,973 communal and 744 district chambers of labor, and UIL's estimated 3,000 communal and 600 district chambers of labor. Again, the affairs of the local chamber, miserably housed, are handled by a volunteer who appears in the late afternoon, having already put in a full day's work at the plant or shop. These chambers are so poverty-ridden, starved for personnel, and isolated that they are largely ineffective. Factory unions must look elsewhere for help and comfort.

PROVINCIAL CATEGORY UNIONS

The communes of Italy are grouped into ninety-two provinces. The provincial category union has been designed to co-ordinate and direct the activities of all local unions of a given industry, trade, or profession within the province. These union groups might certainly seem like the logical organizers and advisers of the factory unions. The claimed number of provincial category unions (CGIL, 2,867; CISL, 3,892; and UIL, an estimated 3,000), like the claimed number of communal category unions and communal chambers of labor, should

⁹ Communal chambers of labor are called *camere del lavoro comunali* in CGIL, *uffici comunali* in CISL, and *camere sindacali comunali* in UIL.

not arouse hope. Even the best of the national category unions—the metalworkers, the chemical workers, and the textile workers—are able to maintain but few provincial category unions of their own. Usually, they assign one or two full-time officials to the provincial chambers of labor in the larger cities. All too often, the salaries of even these officials must be supplemented by grants from the provincial chambers and the parent confederations. Since this arrangement holds true for some of the larger national category unions, the state of the provincial unions of the other categories can easily be imagined. If it were not for the monthly subsidies of the parent confederations, both to the weaker national categories and to their provincial units, they would be reduced to virtual ineffectiveness.

PROVINCIAL CHAMBERS OF LABOR

The provincial chambers of labor are the traditional centers of the Italian labor movement away from Rome.¹⁰ They have always occupied a unique position in the affections and needs of Italian workers. Before fascism, they had served as employment centers and co-ordinators of the movements of unskilled and semiskilled workers who, through necessity, had to shift from one kind of plant to another and, hence, from one category union to another—services which the category unions were never well enough organized to perform. Moreover, as collective bargaining and strikes spread beyond the limits of the single large city or community, the chambers took a major part in the formulation of contract demands and the direction of strike activities. They had also assumed the initiative in starting various kinds of workers' insurance and

¹⁰ Provincial chambers of labor are called *camere del lavoro provinciali* in CGIL, *unioni provinciali* in CISL, and *camere sindacali provinciali* in UIL.

self-help projects, more economically and efficiently performed on the larger territorial basis of the province rather than in the commune. Of great importance, too, in establishing the hegemony of the provincial chambers was the predominance of organized agricultural workers, even in North Italy, whose numbers established the center of gravity of the labor movement, at its beginnings at least. Wherever agricultural labor predominated, a provincial chamber, as a co-ordinating and directing body, was the only logical and effective method of organizing and communicating with widely scattered workers. Finally, the Italian labor movement, from its very inception, had been steeped in politics; this fact alone would have moved the organization of labor away from its communal base toward the important provincial level, even if the other factors described had not evolved.

Today, the chambers group all provincial category unions and all communal chambers of labor in the province within their co-ordinating and directive orbits. Because of the weakness or absence of the units already described, the chambers of labor must assume the duties and responsibilities better undertaken by communal and provincial category unions were they organized and equipped to do so. Officials in the average provincial chamber of labor—overworked, underpaid, perpetually short of payroll and office expense funds, beset by transportation difficulties and torn between the demands of the national headquarters in Rome and local exigencies—must organize and direct strikes, keep in touch with workers throughout the province, and supply technical knowledge to scores of groups ranging from those in agriculture, food processing, and the underemployed building trades to those in small metal-fabricating shops, textiles, banks, commercial establishments, and public em-

ployment. It is small wonder that one provincial chamber officer, when asked what was done to bring unorganized workers into the unions, replied: "Well, you know, within the larger plants there already is a natural spirit of unionism and the workers there tend to organize themselves. We just do not get at the smaller plants."

These limitations are further illustrated by the fact that of the full range of services listed in the description of the secretariat, only the offices of organizing activities, union controversies and collective bargaining, and social insurance and assistance function in the average provincial chamber of labor in CGIL. Only one third of the chambers are claimed to provide the full range of services with the exception of research.¹¹ Since CGIL is still the strongest of the confederations, both numerically and financially, the proportion of fully serviced provincial chambers in CISL would be somewhat less, and would dip considerably lower for UIL. Withal, these chambers are the only possible sources of encouragement and aid to the factory unions, so essential to the democratic progress of Italian unionism, now or in the near future.

NATIONAL CATEGORY UNIONS

The national category unions group all members of a given trade, industry,

¹¹ CGIL's estimate that about one third of its provincial chambers of labor provided the full range of secretariat services, except research, should be considered in the light of statistics cited in the articles of Galli referred to in note 1. According to Galli, the Milan Chamber of Labor, CGIL's most powerful, closed its books in 1955 with a deficit of almost \$15,000 (L. 9,285,596), a large amount for Italy. This figure did not include the deficits of the various provincial category unions. The Turin provincial Chamber of Labor, CGIL's second largest, closed its books in 1955 with rental debts of \$11,200 (L. 7,000,000) and unpaid social insurance contributions for its employees amounting to \$12,800 (L. 8,000,000).

or profession into a country-wide organization. There are 52 national category unions in CGIL, 33 in CISL, and 55 in UIL. Logically, they should be the dynamic centers of a labor movement. But in Italy, as a result of national and labor history, the greatest number of them are weak and dependent upon the parent confederations for their very existence. In CGIL, only five national category unions are sufficiently well organized to afford the full complement of secretariat services: the metalworkers, textile workers, chemical workers, agricultural day laborers, and sharecroppers. In CISL, this situation would hold true for only the first three categories mentioned, while in UIL perhaps only the chemical workers can maintain such full services.

Toward Rome, then, lead all union roads as well.

CONFEDERATION NATIONAL HEADQUARTERS

The national headquarters of the three confederations exercise centralized control over most union activities which, in the United States, would be assumed by the national and international unions and their subordinate bodies. Whenever confederal control is weak, the cause may be sought less in the absence of will than in the lack of funds and personnel. Instead of rehearsing in detail the activities of each of the confederal offices in Rome, a simple listing of the accomplishments during a single month of one of the offices will suffice to illustrate the degree of centralization which exists.

Office of organizing activities

The office of organizing activities reported to its particular secretariat that it had organized congresses of agricultural workers in one of the important regions of the country; provided confederal speakers for more than three

score May Day meetings; acted as peacemaker between provincial chambers and category unions concerning the division of confederal dues and monthly category dues; aided in the formation of a new national category union; called meetings of provincial groups of activists to encourage the creation of factory unions; continued its special programs for women workers; arranged meetings and prepared printed materials as part of the plan for unionizing agricultural workers; and, as part of a vast program for extending the influence of the confederation in central and southern Italy, called conferences to identify the specific problems of particular provinces, arranged for courses adapted to the needs of the provinces, provided for visits of personnel from confederation headquarters to local groups, and taken action with public officials in behalf of the building trades unions to have contractors working on the reform projects fostered by the Fund for the South constrained to pay a union scale of wages. To ensure the efficacy of the special program for central and southern Italy, the office of organizing activities assigned personnel, specially trained and paid directly by confederal headquarters, to key provincial chambers of labor in order that new zonal offices might be adequately supervised.

Dues collection procedure

The daily tasks assumed by the confederal office of organizing activities are undoubtedly an impressive demonstration of centralized control. However, for its most dramatic symbol, analysis must turn to an appraisal of the kind of dues used by the Italian labor movement and the involved and almost incomprehensible arrangements made for their collection by the confederations. A synoptic table has been prepared as a guide through this tortuous procedure, since it has never been fully described

even in Italian studies. Unfortunately, limitations of space have prevented its publication.¹² A careful exploration of the dues collection procedure demonstrates that confederal headquarters and the provincial chambers of labor completely dominate the entire transaction.

The income of the confederations in Rome depends wholly upon the sale of confederal dues cards (*tessere*) in CISL and UIL, for while CISL headquarters is theoretically entitled to a share of national category union dues, it actually receives none; UIL headquarters make no attempt to share in the dues of the national category unions. On the other hand, CGIL attempts to collect 6 per cent of the national category dues. However, it must be remembered that in a large majority of instances, CGIL headquarters must subsidize the category unions. Thus, income from the confederal dues cards is vital to the existence of the central confederations. These cards are printed in Rome and then distributed to the various provincial chambers of labor. In CGIL and CISL, this distribution is effected by means of the central headquarters and provincial branches of the Banca Nazionale del Lavoro, a private institution which has no official connection with the Italian labor movement. In UIL, the distribution is made directly by the confederal offices in Rome to the provincial chambers. Consequently, each member of a given confederation, regardless of the category union to which he belongs, receives his dues book from the confederation, by way of the provincial chamber, and not from his category union. Since these dues cards do not indicate the category to which a worker belongs, emblems for each category must be printed, distributed to the provinces, and pasted on the dues cards when they are sold to individual mem-

¹² For the address from which this synoptic table may be secured see note 5 *supra*.

bers. In CGIL and CISL, the emblems are printed by the national category unions and then sent out to the provinces. In UIL, they are all printed centrally in Rome and distributed to the national category unions, which, in turn, make them available to the provincial chambers. Below the national confederal level, the constituent organizations must live on the proceeds from their share of the confederal dues (*tessere*) and from their share of the monthly category dues (*contributi*). The monthly category dues are collected through the sale of stamps (*bolli*). These stamps, in various colors and denominations, are printed by CGIL and CISL headquarters in Rome and then distributed to the appropriate organizations. Only UIL allows the provincial chambers to print the monthly category dues stamps, thus losing one means of ensuring uniformity and control.

The confederations themselves are fully aware that this centralized system of confederally printed and distributed dues books and monthly dues stamps is cumbersome, complicated, time consuming, and deficient in securing adequate collection. But they cannot devise methods of simplification in which they might place confidence. The national category unions and even the provincial chambers, poverty-stricken as they are, cannot be relied upon to do the job of dues collection efficiently and to remit to the confederations their proper share of the proceeds. Consequently, the confederations cannot allow themselves to become dependent upon their dependent subsidiary adherents. Thus, weakness and poverty spin the plot. The only solution which might ensure decentralization involves adequate resources and strong category unions. Both of these presuppositions are impossibilities now and for the immediate future.

CENTRALIZED, BUREAUCRATIC CONTROL

The hegemony of the national confederations in the Italian labor hierarchy may well be an inescapable manifestation, for it derives its strength from a persistent combination of certain national characteristics and the tragedies of history. No one familiar with the Italian scene can fail to observe a native tendency toward centralized, bureaucratic control, even if inefficient; the elaboration of plans inflated beyond any normal hope of realization; and the preference for impressive organizational façade at the expense of sound structure.

But a more significant key to understanding is the heritage of history. Weakness, poverty, and politics forced confederal dominance upon the pre-Fascist labor movement. Fascism substituted for the free unions even more centrally controlled labor organizations. With the fall of Mussolini, the surviving non-Fascist labor leaders had to proceed in urgent haste, from headquarters in Rome, upon their mission of creating an entirely new labor movement, not from the ground up, which was impossible, but from the top down. After 1948, when the non-Communist labor leaders and their followers broke away from CGIL, this process of creation from above had to be repeated. At that time, the emergency was so compelling that the democratic labor leaders could not await a slow evolution of anti-Communist labor unions at the local level, for the fight against communism at the polls had to be reinforced at once by the national voice of free labor. Today, while CGIL's sponsorship of factory unions and talk of 'democracy at the base may be looked upon with justified skepticism, there can be little doubt that CISL's leadership is sincere in its campaign for the creation of factory unions as a concomitant of a demo-

cratic and efficient labor movement. But neither wishing nor unlimited funds, even were they available, could accomplish these ends.

TRAINING PROGRAMS A HOPE FOR THE FUTURE

A democratic and efficient labor movement must be founded upon collective bargaining, mutually beneficial to both labor and management and conducted in good faith by both sides of the table. Otherwise, Italian workers will continue to turn, in desperation, toward Parliament for succor, thus ensuring the paramountcy of politics in union affairs. Management, on the other hand, to protect itself against politically inspired demands, will reinforce its policy of rendering unions weak and ineffective, especially at the plant and local levels from which a sound labor movement must draw its strength. Under such circumstances, the pattern of nationally bargained contracts will remain unaltered and uninspired by the realities of local demands. The substantive defects of these contracts and their difficulties of enforcement will continue to plague the relationship between unions and management in Italy.

To avoid this kind of future development, which would be catastrophic to the democratic life of the nation, a vast training program must be initiated by both management and labor. Competent personnel directors and industrial relations experts, not to mention qualified industrial engineers and technicians, are almost totally absent from the factory scene. No Italian university of stature is willing to support instruction in industrial relations or busi-

ness administration, since such vital knowledge is deemed beneath the humanistic dignity of an institution of truly higher learning. As a consequence, the Institute for Industrial Reconstruction (IRI), the governmental agency which resembles the American Reconstruction Finance Corporation and which controls large segments of Italian industry through its stock holdings, has been forced to embark upon a program of training personnel directors and industrial relations experts in classes of its own. This pioneering program is based upon IRI's newly formulated concept that competent industrial leadership is essential if true collective bargaining is ever to start upon a constructive course in Italy.

The free trade unions, like CISL, also realize that young labor leaders, filled with the spirit of democratic unionism, must first be trained, for fascism wiped out an entire generation of democratically motivated union officials and staff members. In addition, the new leaders of the future, at all levels of the labor movement, must receive technical instruction as well, else workers at provincial, communal, and factory pivotal points cannot hope for proper guidance toward the eventual goal of constructive contract making and contract administration. This evolutionary process has indeed begun, directed with great patience and wisdom by CISL's leaders. At Florence, on the Via della Piazzuola of the famous villas, stands the Study Center of CISL. It is the only assurance in a world of chance that democratic decentralization may some day become the way of life for the Italian labor movement.

Wage Movements and Wage Policy in Postwar Britain

By ALLAN FLANDERS

Abstract: Since 1945 there has been a constant upward movement of the indices of wage rates in Britain, average weekly earnings (only slightly affected by shifts in the employment distribution of wage earners), and retail prices. The margin between rates and earnings has progressively widened, to a considerable degree owing to overtime pay. Wage rates and retail prices have shown parallel rises on the whole. The various factors involved in these movements are analyzed, including the policies of the Labour and the Conservative governments.—Ed.

TWO indices are available for measuring the general movement of wages in Great Britain, one for rates and another for earnings. The rates index records changes in a representative selection of time rates (and some standard piece rates) settled nationally by collective agreement or statutory order.¹ As agreements and orders usually fix minimum rather than standard rates of pay, and payment above the minimum has become common practice, this index does not adequately reflect changes in the actual rates paid by individual firms to their workmen. The index for average weekly earnings, while taking into account payments above the national rates, also includes changes in take-home pay due to the working of overtime or short time and variations in systems of payment by results. Moreover, unlike the rates index, which is based on a constant pattern of employment, it is affected by shifts in the employment distribution of wage earners, according to age, sex, occupation, or industry.²

¹Wages Councils and Wages Boards have been set up to regulate wages by statutory orders in those industries where voluntary arrangements are inadequate.

²In another respect the two indices are not strictly comparable. While the rates index is

The postwar movement of these two wage indices together with the index of retail prices (designed to measure changes in the wage earners' cost of living) is shown in the accompanying diagram. For the sake of comparison the war years are included as well. It will be seen that since 1945 there has been (1) a constant upward movement of all three indices; (2) little divergence in the movement of rates and prices; and (3) a more rapid rise in earnings than in rates.

What the diagram further serves to illustrate is the difference in the movement of the rates index, and in the relative movement of all three indices, during four postwar periods: 1945-48, 1948-50, 1950-52, and 1952-55. The

designed to be representative of all wage earners, the earnings index relates only to certain industries employing some ten million, or 60 per cent of all wage earners. Among the excluded industries are agriculture, coal mining, shipping, docks, distribution, and catering. A comparison of the increase in the national wage bill with that of average weekly earnings from 1948 to 1955 shows only a slight divergence between them. Allowing for the increase in the total number of wage earners employed, the movement of earnings in the industries not covered by the index was roughly the same as that in the industries on which it is based.

Allan Flanders, M.A., is Senior Lecturer in Industrial Relations at Oxford University. He is author of Trade Unions (1952) and part author and coeditor of The System of Industrial Relations in Great Britain (1954).

DIAGRAM SHOWING PERCENTAGE INCREASE ON 1938 OF WAGE RATES, WEEKLY EARNINGS, AND RETAIL PRICES, 1940-1955

contrasts are brought out more sharply in Table 1. This particular division of the postwar years has a political significance, for the second and fourth periods correspond with attempts under Labour and Conservative governments to curb the upward movement of wage rates.

During the first period, 1945-48, negotiations between trade unions and employers were centered on immediate postwar readjustments. Towards the end of the war, for obvious reasons, earnings had stopped rising. In seeking compensation wage earners managed to

secure a greater increase in weekly rates in 1946 than in any of the war years. The increase in hourly rates was even greater: over a substantial part of industry the normal working week was reduced from 47-48 to 44-45 hours, without loss of pay, during 1946 and 1947.³ A sharp rise in retail prices between mid-1947 and mid-1948 provoked

³ During the war the Trades Union Congress started a campaign for the introduction of a forty-hour week as a part of its postwar reconstruction program. Eventually it was decided that this could best be brought about in two stages. The reductions secured in 1946-47 were intended to be the first stage.

fresh wage demands, especially as a new price index was introduced at this time which gave a truer reflection of the wage earners' cost of living. Thus over the whole period there was a slightly greater average annual increase in all three indices than during the war years.

The second period, 1948-50, was the time when the policy known as "wage restraint" met with some success. The movement of the indices for rates and prices was slowed down to about one half of their annual average increase over the three previous years. Earnings were less affected, and the gap between rates and earnings widened appreciably. As the story of the Labour government's experiment in wage policy has already been told several times⁴ it will suffice to state some of its more salient features.

LABOUR'S EXPERIMENT IN RESTRAINT

Contrary to established practice, the *Statement on Personal Incomes, Costs and Prices*, which in February 1948 initiated the policy of restraint, was issued without prior consultation with the trade unions and the employers, probably in the knowledge that their agreement would not have been obtained for its recommendations. Apart from emphasizing that there was "no justification for any general increase of individual money incomes" it said little more than that "each claim for an increase in wages or salaries must be considered on its national merits." This might have been the preliminary to a national wage policy if "national merits" had in some way been defined, but only one example was given—"the national

interest to man up a particular undermanned industry."

Faced with the publication of the White Paper as an accomplished fact the General Council of the Trades Union Congress felt that it could hardly condemn the action of a Labour Chancellor of the Exchequer and gave it their reluctant support on certain conditions. The first was that dividends should be limited. The second, that the government should pursue a policy not only to stabilize but to reduce prices and profits. The third amounted to substantial modifications in the policy proposed by the White Paper: the General Council listed five reasons which in their view would justify wage increases, broad enough to provide support for any claim. Having left the door wide open in theory, they then proceeded to try and close it in practice by urging their affiliated unions to exercise restraint.⁵

⁵ Restraint was applied not only by the unions. The analysis made by A. T. Peacock and W. J. L. Ryan ("Wage Claims and the Pace of Inflation," *Economic Journal*, June 1953) of a sample of 430 wage claims from 1948 to 1951 suggests that an increasing time lag and a decreasing proportion of the settle-

All the same, devaluation could not be avoided. When this step was taken in September 1949 Sir Stafford Cripps as Chancellor used the shock it administered to try and secure a more stringent restraint. After prolonged negotiations he managed to get the support of the TUC General Council for a formula which, if it had been successfully applied, would have meant a temporary wage freeze. It was undoubtedly the boldest, if not the wisest, decision the General Council has taken since the war. But it ran into various difficulties. For some unions the formula meant their giving up the automatic wage increases to which they were entitled under cost-of-living sliding scale agreements, and this most of those concerned refused to do. When recommended to a special conference of trade union executives it was accepted by so small a majority that there was little hope of making it effective.

The existing policy of voluntary restraint was already leading to growing tensions within and among the unions. It had been imposed from above and met with relatively little understanding, beyond a vague feeling of loyalty to the Labour government, among the active rank and file. A number of union executives found their decision to support the new wage-freeze policy changed by ballot or reversed by delegates at annual conference. There were, too, growing complaints against the inequity of restraint among trade unions, not only because some were exercising more restraint than others, but also because

ment to the claim helped to slow down wage increases. In round figures their average results for all claims were:

TIME LAG (months)	AMOUNT OF SETTLEMENT (per cent of claim)
1948..... 4	50
1949..... 4½	40
1950 (first half) . . . 4	{ 70
1950 (second half) 3	
1951 (9 months) . . . 3	70

union members who were paid standard time rates had not the opportunity of increasing their earnings open to others on payment by results.

1950 Trades Union Congress

In view of this situation, further aggravated by a more rapid rise in the price index, the TUC General Council thought it expedient to issue a statement prior to their Congress in September 1950. They admitted "that there must be greater flexibility of wage movements in future," adding that they were "firmly convinced that there is no formula which can be devised as to how this flexibility can operate."⁶ Even this did not save them from defeat at Congress, although there was doubt in the minds of some delegates whether they were voting against all restraint or against the more recent proposal for a wage freeze, which had in fact been dropped. The 1950 Congress was the effective end of the experiment in voluntary restraint. There were signs that the Labour government had not abandoned hope of trying to revive it,⁷ but the mood of the General Council could now be summed up as "once bitten, twice shy."

Rising prices, 1950-52

Many factors, not least a growing confusion as to what it implied, contributed to the breakdown of the policy of restraint. Whatever significance may be attributed to each of them, we can now see in retrospect that it could hardly have survived the sharp rise in prices which took place during the pe-

⁶ Trades Union Congress, *82nd Annual Report*, 1950, p. 269.

riod 1950-52. Devaluation had caused the sterling prices of imports to rise, but this was strongly reinforced by the increase in world market prices for raw materials brought about by the Korean War; Britain's import prices rose by 40 per cent between 1949 and 1952.⁸ Although there was a slight recession in production in 1952, the index for wages and salaries per unit of industrial output rose from 98 in 1950 to 118 in 1952 (1948 = 100).⁹

CONSERVATIVES TRY BUT FAIL

The Conservative government came into office in October 1951. It was not long before it had taken up the problem of wage policy. In May 1952 the Chancellor of the Exchequer, Mr. R. A. Butler, presented a statement to a specially convened meeting of the National Joint Advisory Council.¹⁰ After emphasizing, as previous Chancellors had done, that "it would be foreign to our ideas and practice to curb wages and salaries by central direction and administrative fiat" he asked both sides of industry "to establish conditions under which the national wage bill will advance in step with national production, but not outstrip it, without destroying the flexibility of relative wages which is needed in a progressive economy." The Council, he suggested, should appoint a committee to examine "the possibility of devising methods of relating wages more closely to productivity and of modifying the existing wage struc-

ture of many of our industries with this end in view." The proposal was accepted by the British Employers' Confederation and the representatives of the nationalized industries, but rejected by the TUC.

Prior to the meeting and following upon Mr. Butler's first budget, the TUC General Council had already told the government what kind of measures they expected it to adopt to diminish inflationary pressure:

... food subsidies should be moderately increased, income tax and surtax should be increased on the larger incomes, particularly unearned incomes, profits tax should be increased on both distributed and undistributed profits; a capital gains tax should be introduced; and dividends should be limited by statute.¹¹

A tall order of redistributive measures, which a Conservative government had no intention of fulfilling.

Back-door approaches

Having failed in a frontal attack on the problem, the government appears to have thought that it might be approached through the back door. At least there followed a series of events which suggest this conclusion. The first was the action of the Minister of Labour in July 1952, when he referred back for reconsideration in the light of the Chancellor's statement the proposals for wage increases by a dozen Wages Councils. A strong protest was made by the TUC and by Labour members in the House of Commons. All the Councils resubmitted their proposals unamended and by September the Minister had issued Orders to give effect to them. This did not save him from further trade union complaints about delay, and in 1954 he was having to reassure the TUC General Council that

^a Of about 17 million wage earners, roughly 13 million are employed under collective agreements (with 2 million covered by sliding-scale agreements) and another 4 million under statutory regulations.

^b Particulars relating to employees in government establishments and to shop assistants were first introduced in 1948, so that 1945 to 1947 are not strictly comparable with subsequent years.

Source: *Ministry of Labour Gazette*, January issues, various years.

since the beginning of that year on an average only 8.3 days elapsed between the Wages Council's making proposals and the issuing of statutory orders.¹²

Next it was noticeable that towards the end of 1952 a number of important wage claims were rejected by arbitration tribunals. This coincided with a stiffening of the employers' resistance in negotiations, so that more claims were being referred to arbitration. During 1953 the awards of the Industrial Disputes Tribunal on wage claims were so similar in character and so small in amount (running at about four shillings a week) that trade unionists accused it of following a wage policy. The large Confederation of Shipbuilding and Engineering Unions failed altogether to secure a wage increase; the settlement of its claim was, in fact, delayed until April 1954. The effect of the new re-

¹² *Trades Union Congress Report 1954*, p. 192. Under the Wages Councils Act, 1945, the Minister is required to make an Order to give effect to proposals submitted by a Wages Council, but he is empowered to refer back their proposals for reconsideration.

straint exercised by employers and arbitration tribunals can be seen in Table 2 both in the relatively small amount of wage increases in 1953 and, still more, in the unprecedented low proportion resulting from voluntary negotiation.

Influence of railway unions

The attitude of the railway unions played a decisive part in breaking down the use of arbitration to check wage increases. The engineering unions, it is true, refused to submit their claim to arbitration and called a one-day strike in December 1953, the first official national strike in a major industry for twenty years, but this yielded no immediate results. The National Union of Railwaymen went further and, after having rejected a four-shillings award by the railway arbitration tribunal, threatened a Christmas strike. After government intervention the strike was averted by the British Transport Commission's conceding increases ranging upwards from seven shillings a week, which immediately became the pattern

for the settlement of claims in other industries. A year later the NUR again threatened to use strike action in support of a demand for higher wages, although this time there was the complication of its rivalry with another railway union, the Associated Society of Locomotive Engineers and Firemen. The stoppage was again averted by government intervention, which helped, however, to precipitate an actual strike by ASLEF a few months later. In January 1956 the Transport Commission thought it expedient to give an increase of 7 per cent for all railwaymen without putting up any struggle at all.

The financial position of the railways goes a long way to explain why they should have become the scene of the most active resistance to wage restraint imposed by arbitration. The inability of the Transport Commission (or earlier the Railway Executive) to secure a revenue adequate to cover its expenditure placed the railway unions at a disadvantage in obtaining wage increases for their members. Moreover, railwaymen have few opportunities, apart from working overtime, of increasing their earnings above their rates. The other consequence of the railways' deficit was to subject them to a greater degree of informal government control than any of the other nationalized industries. The Commission could hardly enlarge its deficit by wage concessions without government approval.

Courts of Inquiry proposal

Two other developments in 1954 have to be mentioned to round off the picture of the Conservative government's efforts to do something about wages. In February of that year the Courts of Inquiry set up to deal with wage disputes in the engineering and shipbuilding industries declared their concern about the "wider problems affecting the national economy" raised by the dis-

putes, and proposed that an "authoritative and impartial body" should be appointed to consider these problems and "give advice and guidance as to broad policy and possible action."¹³ No one knew quite what the Courts of Inquiry had in mind, but the government took up the proposal with the National Joint Advisory Council, only to find the TUC adamant in its opposition.

The General Council were unanimously of the opinion [they stated in their annual report] that whatever needed to be said to the Trade Union Movement on the present economic situation could most appropriately be said by themselves . . . the suggestion of the Courts of Inquiry should not be agreed to in any form.¹⁴

Ince Plan

The "Ince Plan" met with the same fate. Early in the year Sir Godfrey Ince, Permanent Secretary of the Ministry of Labour, had suggested in a public address that all industries should make provision for the use of arbitration in their collective bargaining procedure as the final step in the settlement of disputes.¹⁵ In view of the unions' recent experience with arbitration this suggestion could hardly have come

¹³ Cmd. 9084. The significance of wage settlements in the engineering and allied industries (including shipbuilding) can be gauged from the fact that some 3.75 million workers are likely to be affected. In the period 1949-55 these industries accounted for 21 per cent of the total increase in weekly rates of wages recorded by the Ministry of Labour.

¹⁴ *Trades Union Congress Report 1954*, p. 290.

¹⁵ According to a statement made at the time by the Minister of Labour to the TUC, of 152 industries (excluding those with statutory wage-fixing machinery and those where the central government is the employer), 75 included provisions for arbitration. In 51 of these the parties had agreed in advance that unresolved disputes shall be referred to arbitration, while in 24 the agreements provided that disputes might be referred. See *Trades Union Congress Report 1954*, p. 239.

at a less appropriate time. The TUC General Council rejected the government's subsequent proposal that the Minister of Labour should write to the trade unions and employers in those industries without binding commitments to resort to arbitration urging them to adopt this course. The British Employers' Confederation took a similar view.

Rise in real wage rates, 1952-55

None of these indirect attempts to curb the upward movement of wages having come to anything, rates forged ahead of prices during the fourth period, 1952-55. The movement of wages seemed to have acquired a momentum of its own which was not appreciably diminished by the fact that prices no longer continued to rise as rapidly as in 1950-52. If in the previous period wages had been chasing prices, prices were now chasing wages. For the first time since 1946 there was an annual rise in real wage rates. As the margin between rates and earnings was also increasing between 1952 and 1955, the increase in real weekly earnings was even greater and amounted in all to over 15 per cent. Another feature of wage movements in the period, not revealed by the general indices, was an increasing preference for percentage over flat-rate increases. This checking of the previously well-established trend towards a narrowing of the relative skill differential appears to be related to the reassertion of the use of the strike in collective bargaining. The evidence lies in a series of disputes and stoppages over wage differentials.

British Employers' Confederation

In dealing with the action taken by Labour and Conservative governments to influence the movement of wages, the reactions of the trade union movement have been described. Little has been said, however, about the attitude

of employers' organizations. During the period of wage restraint their role, when compared with that of the trade unions, was largely a passive one. They used the arguments of the White Paper in opposing wage claims, but the British Employers' Confederation, their central body for labor questions, did not try to influence the conduct of its affiliated organizations or make any public pronouncements. Under the Conservative government the BEC has not only had more to say in private circulars to its members: in September 1955 it also published a statement of its views on "the existing inflationary situation" with the title *Britain's Industrial Future*. The main reference to wage policy was contained in the following passage:

In conditions of shortage of particular classes of labour, individual employers may seek to attract essential workers by offering superior wages and working conditions. It is natural that individual workers should take advantage of this situation. Where such employers and workers are members of employers' organisations and trade unions which have negotiated collective agreements on their behalf they are, however, under a moral obligation not to subvert those agreements by extravagant bidding up in this way. Incentive schemes, moreover, must be devised so as to provide real incentives to effort; otherwise they may be merely a disguised method in present conditions of attracting labour from one employer to another. On a larger scale, employers' organisations and trade unions must themselves avoid engaging in a competitive race between industries which would frustrate any attempt to halt inflation.

One is tempted to draw a parallel. Just as the TUC had earlier sought to use its moral influence to persuade trade unions to moderate their wage claims in support of a Labour government, so the BEC was now asking employers not to bid up wages beyond the agreed rates when a Conservative gov-

ernment was pursuing financial and economic policies of which it approved. The common denominator in the attitude of employers' associations and trade unions throughout the postwar years has been the maintenance of their traditional opposition to any form of government interference in wage determination. The principle of "industrial autonomy" has been firmly upheld on both sides of industry, and no government has dared openly to challenge it.

FULL EMPLOYMENT AND WAGE STRUCTURE

The postwar interest of British governments in wage policy has been aroused by the wage-price spiral, and especially its adverse effects on the country's balance of payments. But, if that has been one of the consequences of continued full employment, there has been another consequence which has claimed less attention and aroused less concern—its impact on wage structure. The term "wage structure" is sometimes used to describe any relationship which may be found to exist among comparative rates and earnings. In this sense there are as many structures as the observer cares to discover, since they depend only on the classifications which he employs to summarize his data.¹⁶ To the subjective notion of wage structure can be opposed a more limited and an objective one, namely, that of an *organized* relationship among wages, a relationship which is the outcome of their deliberate regulation replacing the interplay of the market. Wage structure thus defined is one of the achievements of collective bargain-

¹⁶ See Lloyd G. Reynolds and Cynthia H. Taft, *The Evolution of Wage Structure* (New Haven, Conn., 1956), p. 9. "One is forced by the sheer mass of the material to summarize. It is this process of summarizing which gives rise, in a sense artificially, to the 'wage structures' and 'wage differentials' which are analyzed by statisticians and economists."

ing, although legislation and custom are, of course, alternative instruments of regulation to the collective agreement.

What, then, has been the impact of full employment on wage structure in its objective sense? The answer lies in the widening of the gap between rates and earnings. We can separate the quantitative effect of some of the factors, other than changes in national rates, which have influenced the movement of average weekly earnings. Allowances can be made for the effect of (1) changes in the employment distribution of wage earners according to sex, age, and industry and (2) overtime and short-time working. This leaves an "unexplained residue" made up of upgrading within industry, changes in shift working, extension or improvement of income yields from systems of payment by results, and, finally, payments above the national rates. Table 3 gives the results of such calculations. It permits the following broad conclusions:

1. The effect on average earnings of shifts in the employment distribution of wage earners has been slight since 1948.
2. A very substantial part of the increase in the margin between rates and earnings after 1948 can be attributed to overtime.
3. The main increase in the "unexplained residue" occurred between 1948 and 1950, although there has also been a further increase since 1952.

It is known that the increase in the "unexplained residue" during the period of wage restraint coincided with an extension of payment by results and with local increases above national rates in many industries. We can therefore assert with some confidence that from about 1948 onwards the growing divergence between rates and earnings has been due largely to three factors, all of which imply some weakening in the collective regulation of wages. This

is obvious enough in the case of payments above the rate. What of overtime and payment by results?

Overtime

The point about overtime is its systematic character; it has become in fact an accepted method of increasing the weekly pay packet of adult male workers. The average number of hours worked by men has risen fairly steadily from 46.3 in April 1947 to 48.8 in October 1955; the figure for October 1938 is 47.7.¹⁷ Thus, although the agreed working week is generally some three hours shorter than before the war, the actual working week is an hour longer. Not all overtime is systematic, but in some industries the figures are too high and too consistent to suggest anything else. About 30 per cent of the operatives in manufacturing industries covered by the Ministry of Labour's returns were working an average of eight hours overtime in one week during November 1955.¹⁸ Jobs have frequently been advertised with the inducement

¹⁷ Ministry of Labour Gazette, March 1956.

¹⁸ Ministry of Labour Gazette, January 1956.

"plenty of overtime." One of the troubles about systematic overtime, as the *Times* Labour Correspondent has remarked, is that it is "self-perpetuating."

Once it is accepted, employers can too easily fall into the rut of aiming at higher production by increasing hours rather than increasing productivity, while workers may insist that it shall be maintained so as to keep up their earnings, or even make sure that work is not completed during normal working hours.¹⁹

The clauses in collective agreements settling the length of the normal working week and stipulating higher rates of pay for extra hours were originally intended to keep this from happening. Their regulative purpose has been seriously undermined by the postwar practice of British industry.

Payment by results

Payment by results is a more complicated issue. Its extension as an alleged method of raising productivity has been strongly advocated on all sides since the war. The main increase in the proportion of workers covered by systems of

¹⁹ "The Canker of Overtime," *Times* (London), October 26, 1954.

payment by results took place between 1947 and 1951 (see Table 4), and may have been due in part to a belief shared by employers and trade unions that they were making a contribution to the productivity drive. The government told them so and, on occasions, used its influence to get them to comply.²⁰ But one of the attractions of payment by results schemes to employers and to workers has been the opportunity they provide of increasing wages above the national rates. The extent of this practice is tacitly recognized by the British Employers' Confederation in the passage already quoted from *Britain's Industrial Future*. Payment by results can never be as effectively regulated by collective agreement as payment by time. Its extension in postwar Britain has certainly been responsible for a further weakening in collective wage regulation.

Wage competition from below

Payments above the rate, systematic overtime, and payment by results have all been used by employers to attract labor by offering more money in the pay packet. Under the pressures of this wage competition from below, many of the existing wage structures have been distorted and weakened. Naturally in industries, like engineering, where a wage structure can hardly be said to exist, the pressures, unrestrained by administrative control, have had full play and wage relationships have become more and more chaotic.²¹ The ensuing

²⁰ When the wartime Essential Work Order, enforcing a system of payment by results in the building industry, was abolished in 1947, the government took the initiative in inducing both sides to agree to the reintroduction of a new scheme for incentive payments.

inequities and anomalies help to build up the demand for further increases in national rates to compensate those workers who have been least fortunate in the lottery for extra earnings.²²

Nationalized coal mining—the exception

Nationalized coal mining is the one outstanding postwar example of an industry which has tried to bring more order into its wage relationships. The National Coal Board inherited an extremely complicated wage system which had been built up locally at each colliery, with many adjustments superimposed at district and national level. In 1955, with the co-operation of the Na-

taken from their scatter diagram on page 120, shows that in one firm the average earnings of timeworking laborers as a percentage of the earnings of timeworking fitters was more than 140 per cent, while in another firm within the same region it was less than 60 per cent in May 1952.

²² This theme is developed at length by H. A. Turner in "Wages, Industry Rates, Workplace Rates and the Wage-Drift," *The Manchester School*, May 1956. "Workplace margins rise," he writes, "and workers who do not benefit demand 'industry' increases in compensation. But parallel advances in 'industry' rates are demanded and conceded to the recipients of 'workplace margins' who regard the latter as established minimal additions to the former."

tional Union of Mineworkers, it succeeded in introducing a national wage structure for about 400,000 day wage men. At the start there seemed to be about 6,500 different jobs in the industry, but many of them were local variations in names for describing the same work. By eliminating duplicates and grouping similar jobs they reduced the number to about 400 "real" jobs and classified these in thirteen grades of "equal work value." They found "a substantial overlapping of rates from the lowest to the highest grades and the variations in wage rates for a given job far exceeded the differences between average rates for jobs of different kinds."²³ The final agreement provided that no man should have his wage rate reduced and about 95 per cent should have their rates increased from one shilling to six shillings a shift. As a result 70 per cent of the day wage men are now being paid national standard rates and about 30 per cent are on personal rates (that is, above standard rate); these they retain only as long as they remain in their present jobs. There remain the 300,000

²³ National Coal Board, *Report and Accounts for 1955*, Vol. I, p. 39.

pieceworkers and taskworkers. They have been graded, but the grading applies only to a fall-back wage. The standardization of piecework prices is, of course, a much more complicated reform and is still the subject of negotiations.

SPIRALS WITHIN SPIRALS

It would be foolish to hang any weighty conclusions on so summary an account of wage movements and wage policy in postwar Britain, but one final observation may be worth making. The familiar problem of the wage-price spiral under full employment is rather like a set of Chinese boxes. It contains within it the problem of the wage-wage spiral, which in turn contains the problem of the rates-earnings spiral. Any attempt to solve one of these problems while ignoring the others is not likely to succeed. Granted that wages cannot be stabilized unless prices are stabilized, can wage rates be stabilized while unions are competing with each other for successes, the wage-wage spiral? Or while employers are competing for labor by bidding up earnings above agreed rates, the rates-earnings spiral?

Swedish Wages and Wage Policies

By GÖSTA REHN

Abstract: A review of 1939-56 wage developments and policies shows the willingness of trade unions to exercise self-restraint. Inflationary pressures, however, caused an uncontrollable and distorting "wage drift." Wage-price explosions resulted: repeatedly it appeared necessary to reshape the wage structure on the basis of rank-and-file psychology and market developments as well as long-term principles ("solidaristic wage policy"). At times centralized master agreements were used. All this is the background of a recurrent discussion as to how to solve the dilemma of wage policy in full employment without destroying the self-determination of the organizations. The institutional background is shown by implication.—Ed.

THE movement of hourly earnings from 1940 to 1956 for male workers in manufacturing is shown in Table 1. In addition to the basic series, namely, hourly earnings (money and real) and the cost of living, Table 1 also shows the yearly percentage increases in wages resulting from the central agreements between the Swedish Trade Union Federation (LO) and the Swedish Employers' Confederation (SAF), other collective agreements between national unions and employers, and the remainder, or "wage drift," that is, those increases in earnings not accounted for by wage increases negotiated in collective bargaining.

Comparative figures for some of the important groups of wage and salary earners are presented in Table 2. This table demonstrates some of the reductions in income differentials which occurred during World War II and, to a lesser extent, after the war. This trend concerned all types of differences—skill, sex, cost-of-living zone, and branch of industry. Among the various branches of manufacturing, the range order was radically changed. In particular, workers in the sheltered "home-market"

branches such as food and printing (where trade unions had been strong at an early stage) lost their once favorable relative position to those in heavier industries. Consequently, in recent years the former revised their previously negative attitudes toward incentive wage systems. (In 1939, 50 per cent of all hours worked in manufacturing industries generally were compensated through some incentive wage system—usually on a simple piece-rate basis, individual or group. By 1955, the corresponding figure had risen to 61 per cent.)

To a considerable extent, the narrowing of differentials may be viewed as a result of the greatly strengthened bargaining position of agriculture during the periods of war and full employment. In 1947 the Swedish Parliament declared that the rural population gradually should be given an economic status comparable to that of the rest of the population. This decision was made feasible in an economic sense by migration from rural areas to urban centers induced by full employment. Another force behind the leveling development has been the trade union movement's "solidaristic" wage policy, proclaimed

Gösta Rehn, M.A., Stockholm, is economic adviser to the Swedish Trade Union Federation (LO); he is presently on leave for research work in the Ministry of Finance.

TABLE 1—INCREASES OF HOURLY EARNINGS OVER 1939, AND THEIR COMPONENTS, FOR MALE WORKERS IN SWEDISH MANUFACTURING INDUSTRIES, 1940-1956

INDEXES AND PERCENTAGE INCREASES	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949	1950	1951	1952	1953	1954	1955	1956
<i>Index series (1939 = 100):</i>

Sources: Official wage statistics from the Social Welfare Board (Socialstyrelsen). Noncomparable and noncontinuous wage data for salaried employees up to 1946 and beyond have been put together with the assistance of the statistics of the organizations for 1946-47.¹ A fuller picture of wages in Sweden (1939-52) is given in Lloyd G. Reynolds and Cynthia E. Taft, *The Evolution of Wage Structure* (New Haven, Conn.: Yale University Press, 1956), Chap. IX.

in the late thirties after long discussions at several LO conventions and aimed at eliminating wage inequities through traditional union methods and with the help of government economic policy.

The leveling of the wage structure came to a standstill at the end of the 1940's, at least with regard to manual workers. In some of the later years, there has actually been some regression involving an increase in certain differentials. This has been the result, in part, of an economic setback in low-wage industries, but in certain cases of skill differentials it has been the result of conscious union and employer policy.

THE WAGE DRIFT

The desire to pursue a balanced and noninflationary wage policy, which is basically common to the organizations of employers and workers and the Swed-

ish Labor government,¹ has been repeatedly frustrated by the uncontrollable development of earnings called "the wage drift."² This wage drift has been a very important feature in wage movements, especially with regard to manual workers in most of the manufacturing industries (see Table 1). It is being regarded more and more as a crucial problem in a full-employment economy. Depending on one's ideas about its character and causes, one can draw the most disparate conclusions

¹ The Labor party (Social Democrats) has been in government virtually since 1932, either alone or as the most important partner in coalitions, mostly with the Agrarian party. The trade unions of manual workers are strongly Social Democratic. Most other unions are neutral.

² We use this translation for the Swedish word "löneglidning" because the expressions "wage slide" and "wage gliding" have provoked misunderstandings.

concerning "the proper wage demands" of various groups of wage and salary earners after a period when the wage drift has altered ("distorted" or "corrected") the previous wage structure. Is the wage drift a just and equitable result of an ever increasing intensity of work among wage earners on incentive rates or—and just the opposite—is it an inflationary occurrence benefiting groups with a flexible wage system?

It is quite evident that the wage drift is largely a result of the shortage of labor prevailing in most industries and trades since the war.³ But this does not exclude the possibility that a voluntary speed-up—and not merely and simply loose piece rates and individual additions to wages and salaries—is precisely one of the results of this shortage of labor, giving the worker improved security against being deprived of the fruits of his efforts through piece-rate reductions and thus eliminating the former restraints on the production pace of piecework. Furthermore it is evident that differences in the "propensity to drift" inherent in the various wage systems partially explain the annoying differences in the rate of the drift for different groups of wage and salary earners. Deplorably, however, we cannot make the quantitative statements on these questions which the wage policy makers ask for.

³ Excluding seasonal unemployment in the building industries, the unemployment funds of the trade unions since 1945 have shown only 2 to 3 per cent unemployed (annual averages). The connection between the rate of wage drift and excess demand for labor has been established by detailed correlation studies. See B. Hansen and G. Rehn, "On Wage Drift," in *Twenty-five Economic Essays in Honor of Eric Lindahl*, Stockholm, 1956. The statements in this paragraph are also based on inquiries among some hundreds of employers and local union leaders and statistical studies of wage dispersion among piece-rate workers, partly conducted by a joint group of LO and SAF research workers.

CHRONOLOGY OF POSTWAR WAGE POLICIES

The development of attitudes and institutional customs can best be depicted by a year-by-year description of postwar developments in wage policy.⁴

The voluntary wartime wage freeze gradually thawed out, as did the wage restraints based on frustrated hopes for postwar price reductions. The disappointing results of a five months' strike⁵ in the engineering industry in 1945 did not appreciably hamper wage develop-

⁴ Organizations referred to in this paper are the following:

SAF (Svenska Arbetsgivareföreningen), the Swedish Employers' Confederation. SAF has 43 affiliated associations with 15,000 members and 700,000 workers in manufacturing and construction industries. Several other organizations, covering the remaining industries, cooperate with the SAF. An affiliated association cannot sign an agreement without SAF confirmation.

LO (Landsorganisationen), the Swedish Trade Union Federation. LO has 44 affiliated national unions, mostly industrial in structure, with 1,400,000 members, that is, nearly all manual workers and some groups of white-collar workers. Collective agreements are generally made industry by industry on a nationwide basis, in the first months of each calendar year. Any contemplated strike of any importance has to be submitted for approval to the LO Secretariat; LO then pays a certain part of the strike benefits which are regularly paid out by the unions. But the final decision in questions regarding wage disputes and agreements lies with the governing bodies of the national unions; LO directives as well as member ballots are only advisory.

TCO (Tjänstemännens Centralorganisation), the Central Organization of White-Collar Workers. TCO has 42 affiliated unions with 350,000 members. TCO is less centralized than LO, with which it maintains friendly relations. Besides TCO, there are a few other organizations, some of which compete with TCO among high-salaried employees.

⁵ This strike was conditioned by the temporary rise of Communist influence in the years at the end of the war. The Communists never seized the majority in any important union. Now they have lost the majority even in their local strongholds, with rare exceptions.

ments in the postwar boom. Substantial money wage increases were a part of the inflationary wave of 1946-47. In its customary wage policy resolution in the fall of 1947, the Representative Body of LO, after discussions with the Minister of Finance Wigforss, recommended "strong wage restraints" for 1948. This appeal, however, failed, and the government was forced to introduce excise taxes so as to curb excessive consumer demand. From this, the trade unions drew two conclusions: a wage rise nullified by tax and price increases was not much to strive for; and a wage freeze had to be total and complete in order to be possible at all.⁶

LO, therefore, asked all its affiliated unions to extend for another year their collective agreements expiring in the next twelve months. A few unions, requesting minor exceptions, were persuaded to withdraw their requests by the argument that any exception would defeat the entire anti-inflationary action. TCO followed LO's lead in the wage freeze.

For many union members the wage freeze meant a not inconsiderable wage drift, plus a government guarantee of stable prices together with some measures against excess profits. It was, therefore, not too difficult for the new Minister of Finance, Sköld, to persuade the unions of the need for another extension of collective agreements for 1950. The anticipated effects on the cost of living of the 30 per cent devaluation of the Swedish currency in September 1949 were to be counteracted by subsidies during the first year in order to make the wage freeze feasible. In this way, cost and price levels

⁶ As will be seen below, these conclusions were revised in later policy discussions. A wage increase, "nullified" by an anti-inflationary tax, brings about a change in the wage-profit division of income to the benefit of wages.

were to be kept low in order to improve Sweden's competitive position in world markets.

Large wage and price increases in 1951

During the two-year wage freeze such great discrepancies developed in the wage structure as a result of the wage drift that a "wage explosion" became inevitable, even though its noise was drowned out by the thunder of the Korean War and the resulting price hysteria in world markets. The government now decided that a one-time inflation, estimated at 10 or 12 per cent, would be better than going against the world current. Consequently, the "free" wage round of 1951 provided for rather substantial increases. Some groups whose wages had lagged particularly far behind subsequently benefited, relatively, from the fact that the actual price increases were much higher than originally expected. These groups brought up the rear in the chronology of collective contract negotiations, timed in line with SAF policy of avoiding, if possible, high settlements at the start of the bargaining period. The result, of course, led to uneasiness among the groups which had already signed.

Master agreement for wage increases in 1952

On an average, wages in 1951 rose only about as much as prices in spite of a substantial rise in the real national income. Labor felt itself a loser, something that strongly conditioned union behavior in the next wage round. Therefore, in the fall of 1951, LO asked SAF that a reopener (index) clause be included in all the forthcoming 1952 agreements. It explained that otherwise the wage claims of the various unions would again be very high. The SAF replied that it could only disregard its principle of barring index escalators in peacetime on condition that all agree-

ments under SAF-LO jurisdiction be centralized into one general negotiation, thus keeping wage-rate increases within reasonable limits. LO then countered that such a high degree of centralization was precisely what it could not persuade its affiliates to accept. The government issued a recommendation that the increase in money earnings, including the wage drift, should be kept below 5 per cent, since this appeared to be the margin available for a general increase in incomes. In Parliament, the president of LO, Axel Strand, replied that this would be quite impossible since the proposed wage policy agreed neither with the economic nor the psychological situation in the labor market.

Eventually, LO and SAF concluded a central agreement providing for a general wage increase of 8 per cent for men and 10 per cent for women (or 25 öre per hour if that was more, so as to pacify unions representing workers in industries with low wages). Groups with less than a 20 per cent rise in earnings during the preceding year were to be entitled to additional increases to compensate for the lag. In some cases, even older types of lags or inequities were to be accepted as good cause for additional increases. The estimated rise in the price level resulting from the wage increase itself was placed at 3 per cent. If prices rose a minimum of 3 per cent above this anticipated level, unions would be entitled, under a reopening clause, to bargain for full wage compensation for the excess price rise. (Actually, the reopening clause was of only theoretical importance.)

Permissible wage increases beyond the general 8 and 10 per cent were subject to bargaining between the various LO and SAF affiliates. This enabled the parties to show a certain amount of tacit understanding for each other's problems. Nevertheless, in some cases the negotiating committees washed their

hands of the central agreement, thus compelling the executive committee of their union to sign an agreement against its will and against a probable or manifest (by ballot) majority of union members. The greatest difficulty was experienced in the Paper Workers Union, since profits in this export industry were extraordinarily high. In this instance, LO had to use its strongest statutory weapons, threatening to withhold all moral and financial support in case of strike.⁷

Economic policy and world economic developments in 1952 created a sizable reduction in employment in some industries. Severe unemployment was avoided (and held to an increase of less than one per cent among LO members) owing to a rapid movement of workers to other industries and government contracts for the most heavily affected industry, textiles.

Restrictive wage policy for 1953-54

The wage policy recommendation issued by the Representative Body of LO in September 1952 stated that the prevailing situation did not permit any major wage increase for 1953. Instead of demanding general increases, unions were advised to concentrate on improvements limited to special cases and groups, as for example women workers, night-shift workers, and so on. A restrictive wage policy, the statement continued, would strengthen hopes for price reductions. It was also felt that foreign trade should not be impeded through increases in labor costs.

The general LO recommendation this time was in accordance with the pre-

⁷ The normal weekly LO contribution to a striking union—now 18 kronor—amounted in 1952-56 to 12 kronor per member involved, or about one fourth of the usual strike benefits paid out, these in turn running around one fourth of the ordinary 48-hour earnings (220 kronor in 1956) of a male worker in manufacturing industry.

vailing situation in the labor market and was thus generally followed by member unions. Only in the food-processing industries, where relative wages had decreased very rapidly, was there a one-month strike, supported by LO in spite of its general recommendation, and as a result 25,000 workers received a 3 per cent increase.

Wage restraints were continued in 1954 on recommendation of LO, although less sharply than in 1953. In the course of the year, inflationary pressures intensified, while at the same time wage disparities, which had had two years to grow, made themselves noticeable. These factors created a situation ripe for another "wage explosion." The government, therefore, expressly recommended to the unions that wage increases be kept within the narrow limits provided by the economic forecast and budgetary estimates for the ensuing year, and "threatened" to recoup excessive wage increases in one way or another. Just as in 1952, LO explained in Parliament through its president that it was psychologically impossible to follow the government's recommendation; the unions had been held back for two years and now had to have a round of "freer" bargaining.

Wage settlements in 1955: uneven high increases

The SAF sought to use the government's recommendation as a bargaining weapon to bolster its "line of defense" for the year: no wage increase in excess of 3 per cent. Some unions, for example the Metalworkers with their rapid wage drift, accepted new agreements on this basis. But the Paper Workers Union, with lagging wages, huge profits, and unpleasant memories of 1952, threatened to strike for much higher wages. The SAF countered with a warning of a lockout to affect practically all manufacturing industries, including those in

which new contracts had already been signed. Its strategy was apparently based on the hope that these other unions would put pressure on the Paper Workers to bring about a settlement.⁸ After the government convened a special conciliation commission, the facilities of the normal conciliation machinery of course having already been exhausted, the parties accepted an extension of the legal one-week cooling-off period. Subsequently, a new agreement providing for a 7 per cent increase was signed. Meanwhile, the 3 per cent defense line had been breached in several other cases. It is possible, as some observers have held, that the risk of a major shutdown of Swedish industry in the final analysis put more pressure on employers than on the workers.

In most industries, wages of white-collar workers are usually set in negotiations on a firm-by-firm basis, with representatives of the national employer and TCO organizations participating. Ordinarily, these negotiations, steered in some cases by a centrally negotiated recommendation, have been secondary in importance to the patterns set by the unions affiliated with LO. In 1955, TCO unions, however, obtained a general wage increase of at least 7 per cent in several leading firms and thereby set the floor or minimum pattern for white-collar workers in all industry.

Maintaining that the wage increase had been "too high," the Minister of Finance prepared legislation for forced savings to reduce consumer demand by 2 per cent. LO supported the legislative proposal, although the LO Secretariat expressed the view that a purchase tax would have been a wiser measure. But because strong political opposition developed, with even the Labor party's coalition partner in the gov-

⁸ Swedish law permits sympathy strikes and lockouts, although other work stoppages are forbidden while a valid agreement is in force.

ernment, the Agrarian party, dissenting, the government decided instead to raise the tax on business profits, intensify credit restrictions, and increase the interest rate.

Master agreement for 1956

These measures, however, could not check the boom rapidly enough. The shortage of labor and the wage drift continued undiminished. It was feared, therefore, especially in view of the unevenness of the 1955 wage settlements, including the relatively high wage increase for white-collar workers, that a general wage race between all groups would develop in 1956. To avoid such a race, the LO, TCO, and SAF together negotiated virtually one collective agreement for the entire economy, providing an increase of 3.7 per cent (or 16 öre per hour, whichever was higher) for all groups of manual workers. This increase was calculated to average out at 4 per cent—a figure which was applied to the TCO unions since they do not adhere to the "solidaristic" wage policy.

The parties did not provide for adjustments in the interindustry wage structure; only internal adjustments within the groups and industries covered by the various ordinary collective agreements were permitted. Interindustry distortions were thus left to grow.

THE DISCUSSION OVER WAGE POLICY

The dilemma of wage policy under full employment conditions, illustrated in this survey of postwar trends in Sweden, was clearly stated in a report to the 1951 Convention of LO.⁹ If we abolish the inflationary level of effec-

⁹ Swedish Trade Union Federation, *Trade Unions and Full Employment* (English edition 1953). This report was prepared by a committee appointed by the Secretariat of LO (following demands expressed at the LO Convention in 1946) in co-operation with the LO Research Department.

tive demand, private enterprise will not automatically create full employment everywhere. Islands of unemployment will tend to appear. If, however, the inflationary pressure is not reduced, then all sorts of distortions will appear in the economy (because of the uneven possibilities of control), and wages will be forced upwards despite trade union wage restraint and responsibility. The wage drift in some sectors, together with high entrepreneurial profits, will soon provoke a wage race which, in turn, will develop into a destructive race between wages and prices.

The report indicated a solution of the dilemma. Excessive demand must be substantially reduced by general monetary and preferably fiscal means. The tendencies toward unemployment, which are to be expected in a balanced economy, should be combated not by restoring the general level of demand but instead by strictly local measures. First and foremost, these should stimulate a voluntary reallocation of labor, entrepreneurship, and production in a way that would eliminate the islands of unemployment very rapidly—preferably before they appear as real deviations from full employment.

In this more deflationary type of full employment, the report continued, trade unions would not be forced into an inflationary wage policy; this is, however, no guarantee that trade unions will refrain from exerting an inflationary influence. The unions have their own responsibility, as well. On the basis of the principle of solidarity, wage differentials should reflect as much as possible the differences in the content of the job, not the differences in business conditions between various industries. An equitable wage structure is just as necessary a precondition to noninflationary wage movements as a reasonable, nonprovocative division of the national income between wages and profits. (The

report realized that the ultimate proof of the equitableness of a wage structure is the possibility of obtaining workers willing to fill the available jobs—provided that there is free entry into all trades and that effective measures are taken to facilitate labor mobility.)

To promote these aims, according to the report, a greater degree of co-ordination in wage policy is needed. In Sweden, such co-ordination should be based essentially on LO's moral authority and guidance and on the allocation of LO's economic resources so as to benefit the groups most in need of support. The report recommended the establishment of a central Wage Policy Council responsible for annually investigating wage problems and advising the LO Secretariat. The Secretariat supported this recommendation and the 1951 LO Convention decided accordingly.

Recent attitudes of the labor market organizations

However, the LO Secretariat and its Wage Policy Council, composed of a few leaders of affiliated unions and high LO officials, have proceeded very cautiously. Far-reaching measures like the Dutch general system of job evaluation were already rejected in the original report in 1951. The terms of master wage agreements have been kept rather simple. On the other hand, LO representatives participating in the various negotiations of affiliated unions have continued to exert an important influence which is not always apparent on the surface. Compromises between prevailing market forces (economic and psychological) and the "solidaristic" wage ideals have been preferred to detailed applications of rigid principles.

The experience with the very crude type of co-ordinated wage policy used in 1956 has caused top union leaders, including Arne Geijer, newly elected

LO president, to stress that co-ordination of wage policy, though necessary, should also be more differentiated. This position was endorsed by the 1956 LO Convention.¹⁰

In TCO circles the opinion has grown that white-collar workers have been falling behind because of their acceptance of a policy of wage restraints, since such a policy is in most instances more effectively implemented for them than for manual workers. Currently (October 1956), TCO has gone on record against any wage co-ordination for the following year. Leaders of TCO have frequently stressed the need for a more restrictive economic policy as a condition for wage stability.

Leaders of the employers' associations often speak out against what they re-

¹⁰ In November 1956, the Representative Body of LO recommended to the unions that they concentrate their efforts on low-wage and lagging groups (women in particular were mentioned) because the margin for an increase of real wages in 1957 would be very limited. It was indicated that LO Secretariat should influence the initial wage demands of the unions, so as to prevent competitive bargaining, which could nullify the recommendation, as happened in 1948. In a meeting with the presidents of the affiliated unions, the LO president advised them, therefore, that wage proposals for 1957 should not exceed, on the average, 5 per cent or 25 öre (which in effect would mean 7 per cent for women). Except in a few special cases the unions have shown a high degree of compliance with this advice. One big exception, supported by LO, is the case of state employees, where wage drift is negligible. Because of their lagging wage level they negotiated an agreement with the government (in December) giving them adjustments amounting to an average of 7 per cent plus a promise that they would be granted an additional increase similar to the wage increases forthcoming in the present wage round of private industry. Here the outcome is as yet unknown. After a long initial deadlock some sort of new centralization of negotiations seems inevitable. Whether this will result in a settlement of a rigid or flexible, a simple or differentiated, type cannot be foreseen as this article goes to press (end of January 1957).

gard as a too simplified application of the unions' "solidaristic" demands for wage leveling. They are apt to stress either the need for more attention to prevailing business conditions from case to case or else the need for a greater and more systematic differentiation of wages. Full employment seems to have stimulated interest in more refined methods of wage payments (motion-time measurement and job evaluation), thus promoting the aim of differentiation and at the same time creating greater stability and resistance against the wage drift.

Preventing inflation under full employment: whose responsibility?

During the entire period here surveyed there has been a running discussion between union economists and the successive Ministers of Finance in the government, with union leaders often occupying an intermediary position, over the allocation and division of responsibility in accomplishing the difficult task of preventing inflation under full employment. Already in the 1940's, the LO Research Department warned against wage-price explosions to be expected if too heavy reliance were placed on wage restraints and wage freezing. The government gradually but explicitly has been changing its policy in the direction of the anti-inflationary measures recommended in the 1951 LO Report. In recent debates the idea has been advanced that workers would accept the reinvestment of a greater part of the revenues of production (in place of

higher cash wages) if unions were to receive some form of "codetermination" over this capital. However, this proposal does not contribute very much to a solution of the stability problem, since it really deals more with the question—important as it is—of capital accumulation and expansion. Current preparations for an improvement of the old-age security system (implying anti-inflationary savings in the form of huge insurance funds in the hands of the government, the employers, or the labor market organizations), investigations into methods for operating a possible sales tax, and numerous proposals with regard to forced saving or stimulation of voluntary saving suggest alternative lines for attaining both economic stability and more room for capital investments.

All parties involved in wage policy share one common view: wage policy should remain a matter for the organizations concerned, to be settled in a not-too-centralized fashion. The state should confine itself to advising the top organizations of employers and labor and to creating the best possible economic environment for a noninflationary wage policy. Since dissenting groups are placed in a very difficult bargaining position, the central employer and labor bodies will probably be at least as capable in the future as they have been in the past of exerting a strong influence on the policies of their affiliated organizations to attain the not easily defined objectives of a rational wage structure and rational wage development.

Postwar Wage Determination in the Netherlands

By JOHN P. WINDMULLER *

Abstract: Out of the confusion of the occupation period, a bipartite body, the Foundation of Labor, was constituted with representatives of top employers' associations and trade union federations. Wage questions are dealt with by a board, created by a government decree of 1945; the Foundation acts in an advisory capacity and has great influence on policy. The author discusses the organization and powers of these agencies, their relation to the government, the objectives of trade union policy, and wage factors and wage movements. The stability of the wage structure in the Netherlands is credited in large measure to the great restraint and sense of responsibility shown by the unions.—Ed.

THE liberation of the Netherlands in May 1945 from five years of Draconian German rule and occupation marked the end of one of the most destructive periods in the modern history of the Dutch nation. Railroads, canals, dikes, roads, factories, mines, and other necessities of a twentieth-century economy were left in a state which in most cases required complete rebuilding. The shortage of capital and skilled labor, the disruption of the means of transportation and communications, the plunder of capital and of consumer goods, the scarcity of the most essential foodstuffs, the large national debt, and the inflated currency required the establishment of tight economic controls over prices, wages, rents, and the labor market.¹

* I am grateful to Professor M. G. Levenbach of the University of Amsterdam and to my colleague, Professor Robert Raimon, for reading the manuscript and for a number of important suggestions.

¹ For a summary of economic and social conditions in the Netherlands during and immediately after the German occupation see N. W. Posthumus (Ed.), *The Netherlands During German Occupation*, THE ANNALS, Vol. 245 (May 1946).

THE FOUNDATION OF LABOR

In full awareness of the chaotic situation that would exist after liberation, the Netherlands government in exile in London and the underground employer and trade union groups had set to work long before the German capitulation to draft the measures that were to govern the process of social and economic reconstruction. Employers' associations and trade unions had been dissolved one after another in the course of the German occupation, but consultations between them proceeded clandestinely in an atmosphere more cordial and harmonious than had prevailed in the years of freedom before the war. In part, this new relationship of trust and good will, which later also characterized much of the postwar period, developed out of common privation and hardship. In part, also, it was the direct outcome of the refusal by the employers' associations to deal with the "Labor Front" established by the occupation authorities to replace the dissolved bona fide labor organizations. Because of their stand, the employers' associations were also declared illegal,

John P. Windmuller, Ph.D., Ithaca, New York, is Associate Professor and Co-ordinator of the Institute of International Industrial and Labor Relations at Cornell University.

and gained great respect in the eyes of underground union leaders.²

The secret labor-management discussions resulted in a decision to establish as soon as the invader had departed a bipartite body, the Foundation of Labor, in which the country's major employer and labor groups were to be represented. The principal purposes of the Foundation, as then envisaged, consisted of (a) improving labor-management relations through organized co-operation between employers and workers, (b) representing industry's viewpoint in governmental bodies and before the public, (c) promoting the development of collective bargaining, and (d) furthering the adoption of standard economic and working conditions in industry. The Foundation began its work in May 1945, having been constituted at that time by the top employer associations in industry, commerce, and agriculture, and by the three bona fide trade union federations. Its activities, especially in the field of wage policy, will be reviewed below.³

THE TRADE UNION STRUCTURE

The traditional division of all facets of Dutch society along ideological and denominational lines was only slightly affected by the upheaval of the war. There are three major trade union federations (or four, if one includes, the Communist Eenheidsvakcentrale which is recognized neither by government, nor the employer associations, nor the other labor federations): the nondenominational Netherlands Federation of Trade Unions (NVV, Nederlands Ver-

bond van Vakverenigingen), the Catholic Workers Movement (KAB, Nederlandse Katholieke Arbeidersbeweging), and the Protestant Labor Federation (CNV, Christelijk Nationaal Vakverbond).

In the early years of the rise of the trade union movement, anarchists, syndicalists, and various Socialist groups fought for control of the nondenominational unions. Out of these internal struggles that wing of socialism emerged victorious which talked the language of radicalism but in reality supported reform measures through parliamentary political action. As a Socialist-dominated and anticlerical organization, the NVV, created in 1906, could gain acceptance neither from the Roman Catholic Church, centered mainly in the South of the Netherlands, nor from the Calvinist Protestants of the North. *Rerum Novarum* (1891), the encyclical of Leo XIII on labor questions, provided the initial impetus, first for the Catholics and then for the Protestants, to establish denominational trade unions which over the years grew into viable, firmly established federations. The NVV, however, consistently remained the largest federation. In 1956, its membership approached 500,000 with the KAB counting about 350,000, and the CNV some 200,000.⁴

In the 1930's, the NVV and the Social Democratic Labor party (later simply Labor party) began to shed their official Marxist tenets in the hope of broadening the base of the party. This undertaking continued into the war and early postwar years with the objective of making the Labor party (and the NVV) acceptable to individual Catholics and Protestants. A real effort to merge the trade union federations, similar to that which developed in Italy,

⁴ Data on membership are from the Centraal Bureau voor de Statistiek, *Omvang der Vakbeweging in Nederland*, various dates.

Austria, and Germany after the war, was not seriously attempted. A Pastoral Letter promulgated by the Netherlands Catholic bishops in 1946 prohibited Catholic workers from joining the NVV on the ground that, despite programmatic changes, the NVV and its affiliated unions still remained Socialist and materialistic organizations. This edict was reaffirmed in 1954, and the Protestant trade union federation recorded its agreement with the stand of the Catholic Church. Consequently, interunion harmony was somewhat impaired after 1954, yet the co-operation between the three federations on economic issues continued substantially unchanged. It may seem paradoxical that the effort to break through religious lines turned out to be somewhat more successful on the political than on the trade union side. A number of Catholics are now occupying positions of responsibility in the Labor party, including some seats in Parliament, while membership in the NVV, which unquestionably maintains close ties with the Labor party, may be assumed only at the risk of refusal of the Holy Sacraments.

EMPLOYERS' ASSOCIATIONS

Confronting the three trade union federations are three employer associations, also organized along ideological and sectarian lines. In contrast, however, to the trade union side, where the combined membership of the two denominational federations exceeds that of the NVV—a matter occasionally of no slight importance—the two denominational employer associations are actually quite small. The Protestant association especially has a very small membership, probably under 5 per cent of all employers, but it serves a purpose beyond representing Protestant patronal interests: it preserves the symmetry of

triangular employer representation vis-à-vis the three trade union groups. There is some duplication of membership, but most employers, about 80 per cent, belong to the liberal nondenominational association (CSWV, Centraal Sociaal Werkgevers-Verbond), which consequently can speak for Dutch employers more authoritatively than the NVV can speak for the trade union movement.

LAW AND ADMINISTRATION OF WAGE CONTROLS

The basic law which has furnished the legal foundation for the controlled wage policy of the postwar period is the Extraordinary Decree on Labor Relations (BBA, Buitengewoon Besluit Arbeidsverhoudingen) of October 1945.⁵ This law, passed as an emergency measure ostensibly for a limited time, is still in effect at this time (November 1956).⁶ Its provisions restored the prewar standard work week of forty-eight hours for most industry, and required government approval of worker dismissals and voluntary quits.

Board of Government Conciliators

Most importantly, the law framed a scheme for wage controls and established a Board of Government Conciliators (which should more properly be called a Wage Stabilization Board)⁷

⁵ The 1945 law superseded a 1944 decree promulgated for the southern part of the country, which was liberated several months before the northern part.

⁶ An English translation of this document is contained in International Labor Office, Legislative Series 1945, Netherlands 1, *Decree to Issue the Extraordinary Employment Relations Decree, 1945*, Geneva, October–December 1946.

⁷ The Labor Relations Law of 1923 first established the office of "Rijksbemiddelaar" (government conciliator), a part-time office for the purpose of mediating industrial disputes. Under the German occupation, the function of administering strict wage and

³ For a description of the activities of the Foundation see C. Westrate, "Industrial Peace in the Netherlands," *Industrial and Labor Relations Review*, Vol. 6, No. 1 (October 1952), pp. 88–93.

with power to (1) establish principles and rules of wage determination, (2) set specific wage rates, (3) approve, disapprove, or modify the terms of collective agreements, which are not valid without the Board's approval, (4) extend the provisions of collective agreements to parties "outside the bargaining unit," (5) grant exceptions to established wage rates, and (6) obtain compliance with its regulations through court action.

Limitations of the Board's powers

The powers of the Board, while comprehensive, are limited in two important respects. In the first place, it operates within the framework of basic policy decisions taken by the Minister of Social Affairs. This limitation has meant much more than a desire for administrative tidiness. As a member of the cabinet, the Minister is responsible to Parliament for matters within his jurisdiction, so that democratic checks exist at least potentially on arbitrary and capricious administration of wage controls. In actual practice, the origination of policy decisions has depended on the importance of the question. Various levels of government—the cabinet as a whole, the Minister of Social Affairs by himself, a sub-cabinet group (the Interdepartmental Committee on Wage and Price

price controls was initially given to the government conciliators (as a board), partly because of a lack of other qualified individuals and partly because of fear that the alternative would be a German-controlled agency. Subsequently, the Germans set up their own scheme anyway. After liberation, the Board of Government Conciliators again became the administrative body supervising the system of wage controls. See M. G. Levenbach, "Collective Bargaining and Government Wage Regulation in the Netherlands," *Modern Law Review*, October 1953, pp. 453–55; R. J. Erdbrink, "30 Jaren Rijksbemiddelaars," *Economisch-Statistische Berichten*, No. 1936 (July 14, 1954).

Policy), and the Board of Government Conciliators—participate at various times in the process of policy making. Administration of policy has been entrusted entirely to the Board, so that in matters of implementation and interpretation the Board has frequently served as a buffer for the government, as Professor Levenbach, a member of the Board, has pointed out.⁸

The Board's discretion is limited in the second place by the statutory requirement that it must obtain the advice and opinion of the Foundation of Labor "concerning matters of more general importance." Conceivably this provision could have been handled as a mere formality, but in fact it has been taken so seriously that the Foundation has become "the heart of the system."⁹ In its own environment, the system of unilateral government authority, tempered by the advisory power of a top labor-management group, has proven a highly effective alternative to the tripartite situation developed in the United States during World War II and the Korean conflict. Among its features is the establishment of a series of buffers, or lines of defense, against inevitable and predictable attempts by industry and labor to push through established wage ceilings in a tight labor market. Under the customary procedure, for example, requests by the management and labor representatives of an enterprise for an exception from a prescribed wage rate or for greater flexibility are first scrutinized by representatives of labor and employers in the industry concerned. In the same or perhaps in already whittled-down form, the request is then brought before the Wage Committee of the Foundation of Labor,

⁸ Levenbach, *op. cit.* (note 7 *supra*), p. 457.

⁹ Bert Zoetewij, "National Wage Policy: the Experience of the Netherlands," *International Labour Review*, Vol. 71, No. 2 (February 1955), p. 152.

where representatives of the top employer and trade union groups consider it, conciliate existing differences, if any, and pass it on to the Board with a recommendation based on the national interest as a whole. While the Board and the Foundation have tended to apply similar standards and criteria, the Board has been further removed from the direct pressures of industry and labor than the Foundation.

Balance of power

In case of serious conflict over important questions between Board and Foundation, the Foundation can, if need be, bypass the Board and attempt to deal directly with the top levels of government. Moreover, the Foundation consists of the most powerful economic blocs in the country, and each of its constituent groups maintains close relations with one or another of the major political parties.¹⁰

¹⁰ The direct influence of the Foundation as an advisory body to government was somewhat reduced by the creation of the Netherlands Social-Economic Council under the Industrial Organization Act of 1950. The Council is a tripartite body with fifteen representatives each from industry and labor plus fifteen independent experts, appointed by the Crown. It differs from the Foundation not only in its tripartite character but also in being a public, not a private, body, created by law for the express purpose of advising the government on broad and long-term questions of social and economic policy. Its establishment caused certain "jurisdictional" problems, notably between the Council and the Foundation of Labor. For a time, in fact, the continued existence of the Foundation was in question, but it now appears that the essentially private nature of the Foundation, its usefulness as a meeting ground for management and labor, and the desire of the parties to retain it, all point toward a continuing, though perhaps somewhat diminished, role. Concerning the future administration of wage policy, a recent official recommendation by the Social-Economic Council favored the disestablishment of the Board of Government Conciliators and the creation, in its place, of a Tripartite Wage Board (*Loonraad*) which would function as

But this does not mean that the Board has ever been a figurehead. Quite the contrary; the personal prestige of the individual Board members is very high, Board membership is carefully allocated to ensure representation from the major political and religious groups, and the Board itself maintains close relations with the cabinet, especially with the Minister of Social Affairs. Aside from a few crises, as in 1953, such an admirable balance of power between the key groups has been achieved that nobody would willingly assume the responsibility of upsetting the system by seriously threatening to withhold co-operation. If basic changes come about, they are likely to be the result of general agreement, not of economic force and coercion.

OBJECTIVES OF UNION WAGE POLICY

Among the three trade union federations there has been general agreement on the major objectives of postwar wage policy: full employment, price stability, uninterrupted production, and a rational wage structure. Certain differences over the most efficacious methods to reach the objectives have from time to time arisen, but they have been of a minor character, at least until recently. These key objectives, of course, have been shared by government and employers, although not without occasional divergencies in view over ways and priorities.

Full employment

Trade unions have seen their foremost objective as the attainment and maintenance of a full-employment economy.

a standing committee of the Council. A substantial minority of the Council, however, took exception to this recommendation, and the disposition of the issue is still uncertain. See Sociaal-Economische Raad, *Advies inzake het vraagstuk van de toekomstige loonpolitiek*, Publikaties van der SER, No. 4 (1955), especially pp. 17–34.

To achieve it, they have been willing to accept stringent controls over wage bargaining and the wage structure—controls in whose establishment and administration they have been accorded an important role. Part of the reason for the unions' single-minded concern with full employment must be sought in the experience of the prewar period. For example, by 1936 physical production in the Netherlands had decreased by 72 per cent from 1929, while unemployment had risen by 411 per cent. In 1936, also, fully one third of the membership of the Netherlands Federation of Trade Unions was totally unemployed, while a substantial percentage was only partially employed.¹¹ An aggressive wage policy in the postwar period, the unions feared, might contribute to a repetition of the economic situation of the 1930's. In any case, the unions have had no desire to assume responsibility for raising the price level beyond the point which enables Dutch industry to compete successfully in international markets, especially in hard-currency countries, with consequent adverse effects on employment.

Furthermore, because of a rapidly increasing population, Dutch trade unions have been forced to contend with a steadily rising labor force for which jobs must be found. This ever more serious problem of overpopulation is a result of possibly the highest birth rate in Western Europe (22.4 per 1,000) and of perhaps the world's lowest death rate (under 8 per 1,000). Planned programs of increased industrialization, vast land reclamation projects, and government sponsored emigration have been organized to cope with overpopulation, but there is no question that wage policy has also been enlisted in the struggle.

Under all these circumstances, the

¹¹ Nederlands Verbond van Vakverenigingen, *Information Bulletin*, No. 19 (October 1952), p. 11.

striving for full employment has been decidedly successful. Despite a rapid increase in the number of people gainfully employed, unemployment since 1948 has exceeded 3 per cent in only one year, 1952, and has remained below 2 per cent since 1954.¹² This is one of the best records in Western Europe.

Low price level

To achieve and maintain full employment in an economy which depends as heavily on international trade as the Netherlands, the preservation of a low price level has been deemed imperative. Dutch unions, more than their counterparts in most other countries, have been forced to recognize the relevance of the balance of payments to wage settlements, and they have generally refrained from making demands which according to their economic advisers and those of the government would lead to price increases and consequent decreases in exports. A stable price level has also eased the burden on trade union leaders to keep in check rank-and-file pressure for higher wages based on cost-of-living arguments. On balance, Dutch unions have seen no net advantage in opposing or even retarding measures to increase productivity, provided that the government possessed, and if necessary would exercise, powers to remedy any unemployment effects of higher productivity, and provided also that increased per capita output would be reflected in a rising standard of living.

The objective of low price levels has had to be balanced against the goal of economic co-operation and eventual economic union with the other two partners in Benelux whose price and wage levels

¹² *International Labour Review*, Vol. 74, No. 3 (September 1956), Statistical Supplement, p. 83.

in the postwar period have exceeded those of the Netherlands quite consistently. In this connection it is significant that Belgian demands for higher Dutch price and wage levels have been received far more sympathetically by the employers than by the trade unions. Employers have seen in the pressures from across the southern border a welcome opportunity for loosening the restrictive ties of economic controls, especially on prices. The unions, on the other hand, especially the NVV, have been less willing to trade the system of centralized wage controls for selective wage increases in favorably situated industries.¹³

Freedom from strikes

Among the factors which at the end of the war led to the establishment of the Foundation of Labor was the belief, shared by employers and trade unions, that economic recovery could proceed only under conditions of industrial peace and stability. A centralized wage policy, capable of assuring a social minimum wage and of removing wage inequities, was therefore considered by the trade unions a sine qua non of a strike-free labor-management relationship.

¹³ Commenting on the slowly decreasing wage differentials within Benelux, Michael Hoffman wrote in the *New York Times* on June 17, 1956: "The last major obstacle to full economic union among Belgium, Luxembourg and the Netherlands has been overcome. This is, or was, the difference in wages, which are high in Belgium and low in the Netherlands. . . . As recently as 1952, Dutch wages in industry were little more than half those in Belgium, when converted at the current rate of exchange. Now they are somewhere between two-thirds and three-quarters, depending on how the calculation is made. . . . Somewhere between the relative levels of 1952 and 1956, an invisible and incalculable line was crossed and wage disparities ceased to be a cause of disequilibrium between the two economies."

The achievements have been impressive. Although the Netherlands was not a strike-prone country before the war, the postwar record is possibly unique. With the exception of 1946, which was in many respects anything but normal, not a single postwar year has witnessed more than 300,000 man-days of work lost because of labor disputes. In 1951, according to estimates of the Central Bureau of Statistics, man-days lost because of strikes, as a percentage of man-days worked, amounted to 0.01. In 1952, this percentage was cut in half, 0.005, an amazingly low figure for a democratic country which, despite severe economic problems, has taken pride in maintaining the right to strike.¹⁴

While a substantial share of the credit for this accomplishment must go to the system of institutionalized labor-management consultation and co-operation within the Foundation of Labor and to the introduction of a centralized wage policy, it should be recalled that about half of the organized workers in the Netherlands belong to Catholic and Protestant trade unions which have historically followed a policy of striking only in extreme circumstances. Moreover, it is reasonable to assume that, on the nondenominational side of the trade union movement, the increasing tendency toward centralization in decision

¹⁴ Data from Centraal Bureau voor de Statistiek, *Statistiek der Werkstakingen en Uitsluitingen*, 1952. Up-to-date comparable figures for other countries in Western Europe were not available. See, however, Arthur M. Ross and Donald Irwin, "Strike Experience in Five Countries, 1927-1957: An Interpretation," *Industrial and Labor Relations Review*, Vol. 4, No. 3 (April 1951), especially Table V. If the data are comparable, which is doubtful, United States figures are much higher. For 1950 and 1951, U. S. percentages were 0.44 and 0.23, respectively, that is, about forty times as high.—U. S. Bureau of Labor Statistics, *Monthly Labor Review*, Vol. 79, No. 6 (June 1956), p. 761.

making and authority at the federation level has also contributed to the low strike frequency.

Rational wage structure

Finally, trade union wage policy has striven for the attainment of a rational wage structure based, at the bottom, on a social minimum wage and supporting differentials principally by reference to differences in skills, living costs, and individual output. The meaning of these factors is discussed below. Here it should be pointed out that the really striking aspect of the content of union wage policy lies in those factors which are either omitted or considered secondary to the wage structure, to wit, profits and ability to pay of the industry (or firm), historical differentials (industry, area, or occupational), productivity of the industry (or firm), and changes in the demand for and supply of labor to the industry (or firm). This does not mean that these elements have been considered entirely irrelevant by the Foundation of Labor and the Board of Government Conciliators. It would be impossible completely to ignore them in determining the national wage structure. But they have certainly not been of primary importance—a fact attributable partly to union efforts to eliminate the irrationalities of the prewar period, partly to centralized collective bargaining, and partly to equalitarian tendencies.

WAGE FACTORS AND MOVEMENTS

In September 1945, the Central Bureau of Statistics calculated a minimum weekly budget sufficient to enable an unskilled worker to support a family of four in a large city. It included the cost of food (not difficult to compute since practically all basic food items were rationed), rent, taxes, and other essential components. This very modest budget of f 34.52, raised to f 35.00

so as to provide a margin of safety, became the basic weekly wage of unskilled workers in large cities.¹⁵ In the standard forty-eight-hour week, its hourly equivalent was 73 Dutch cents.¹⁶ This concept of the social minimum wage was held to be a living concept and as such had to be capable of reflecting changes in living costs and national output.

Space permits only a brief review of major wage movements in the postwar period, but it is clear that changes in consumer prices have been the principal cause of national wage changes. National wage increases occurred in November 1947, December 1949, and September 1950, each time as a result of price increases. The price rise preceding the wage increase of September 1950 followed on the heels of the outbreak of the Korean War. Continuing pressures on the Dutch economy in the winter of 1950–51 led to the "consumption cut" of March 1951, when workers accepted a 5 per cent wage increase in full knowledge that the government would be forced to let prices rise by 10 per cent. This proposed cut in real wages presented the trade unions with an especially difficult problem, for they felt that they could not officially sanction a predetermined decrease of an already low standard of living. They extricated themselves by verbally protesting the government's proposal at the discussion stage, after which they proceeded to persuade their members to make the

¹⁵ P. S. Pels, *De Ontwikkeling van de Loonvorming*, 2d ed. (Alpen a. d. Rijn: Samson, 1952), pp. 21 ff.

¹⁶ In 1945 the Dutch guilder (f) corresponded to about 37½ American cents. Allowance should be made for differences in purchasing power and living standards, but a simple arithmetical conversion of the social minimum wage results in approximately \$13.00 per week. Following the currency devaluation of 1949, the guilder reached its present level of about 26¼ cents.

sacrifice. Subsequently, the unions succeeded in obtaining a small one-time payment because the real wage cut had turned out to be slightly higher than 5 per cent (November 1951). Restoration of the former wage-price ratio had to wait until January 1954, all in all a remarkable demonstration of the Dutch worker's willingness to lower his standard of living and even his share in the national income for almost three years.

Generally favorable economic progress has led the unions in the past few years to shift the emphasis in the argumentation for wage increases from cost of living to rising productivity and to the steady increase in the national income. In September 1954, they succeeded in obtaining a 6 per cent wage increase based principally on the "rising prosperity" argument. In the fall of 1955 an increase of 3 per cent of the wage bill was permitted for the purpose of providing more fringe benefits, particularly more paid holidays. Subsequently, in March 1956, a 3 per cent retroactive payment on 1955 wages was allowed, plus an additional increase of up to 6 per cent, depending on an industry's ability to absorb higher wages within the confines of a maximum 3 per cent price increase. This latest wage round also marked a departure from past wage movements by permitting differential increases between industries. It was the outcome of a partially successful offensive by the denominational trade unions, together with the employers' associations, for greater flexibility of wages between various industries—a trend which the NVV was unable to halt.

Wage zones

Wage determination in the Netherlands has taken cognizance not only of changes in living costs over time but also of differences in living costs from place to place. Before the war, sub-

stantial wage differences existed from community to community. During the war, the German-supervised system of wage controls lessened and rationalized these differentials according to size of the community and corresponding variations in consumer prices. On the assumption that variations in consumer prices continued to exist in the postwar period, chiefly in the rent component, postwar wage determination adapted the wartime scheme in somewhat simplified and modified form. Five classes of communities, or wage zones, were established, ranging from the largest industrial and commercial metropolitan areas, like Amsterdam and Rotterdam (Wage Zone I), to the rural towns in the predominantly agricultural provinces (Wage Zone V). On an hourly basis, differences from zone to zone have generally ranged from 2 to 3 cents, so that the maximum difference in standard rates between the highest and the lowest wage zone has generally not exceeded 12 cents per hour. In recent years, efforts have mounted to abandon the geographical differentials in the face of growing equalization in the cost of housing, which used to be chiefly responsible for cost-of-living differences. It is likely that these pressures will eventually result in the abandonment of the five-zone system.

Skill differentials

A further modification of the equalitarian wage system has consisted of skill differentials. Prewar differentials between skilled and unskilled workers averaged, roughly, 25 per cent. In the immediate postwar period, agreement was reached in the Foundation of Labor to reduce the differential to 20 per cent as an "acceptable and reasonable" figure, with half, or 10 per cent, for semiskilled workers.¹⁷ Fear that wages

¹⁷ P. S. Pels, *op. cit.* (note 15 *supra*), p. 22.

in export industries would otherwise rise too high, and ethical and social considerations, specifically the equalitarian objectives of the trade union federations, seem to have weighed most heavily in the decision to narrow the differential.

By 1946 it had become clear that wage controls could not be operated effectively with the relatively crude system of categories of skills. Under the auspices of the Foundation, and with the strong support of the Board of Government Conciliators, a national survey of job classification and job evaluation was undertaken, which subsequently resulted in the introduction of a standardized method of job evaluation.¹⁸ Whatever initial hesitation and opposition to the scheme existed within the ranks of the trade union movement—and unquestionably there was some—was overcome by the central trade union federations, which realized the potential importance of universal job evaluation in removing interindustry and intra-industry inequities, facilitating the adoption of wage incentive systems, potentially increasing the wages of certain highly skilled workers beyond the 20 per cent limit, and, last but by no means least, furnishing the Foundation of Labor and the Board of Government Conciliators with an improved yardstick for administering a national wage policy. It is likely that more than 75 per cent of all industrial

¹⁸ For a description of the system see Hoofddirectie voor de Normalisatie in Nederland, *Standardized Method of Job Evaluation*, Vols. 3,000 and 3,001 (The Hague, 1953). See also Adriaan Vermeulen, *Job Evaluation in the Netherlands*, European Productivity Agency, Union Study No. 5. The concluding chapter of Lloyd G. Reynolds' book on *The Structure of Labor Markets* (New York, 1951) contains a strong recommendation for the "extension of job evaluation techniques across industry lines to provide a comprehensive ranking of jobs throughout the economy" (pp. 261 ff.).

jobs are now included in the standardized method of job evaluation.¹⁹

Equal pay for equal work

While job evaluation has had the objective of promoting equal wage rates for comparable jobs, regardless of the industry, firm, area, or other possible modifying factors, it has not yet gone so far as to eliminate differentials based on sex. A discussion in the Social-Economic Council, the Netherlands top advisory group on major social and economic problems, over the advisability of ratifying the International Labor Organization's Equal Pay for Equal Work Convention brought out that "the NVV representatives . . . and the other members of the Social-Economic Council unanimously agreed that the principle of equal pay for equal work should be applied gradually and after international consultation, in order to prevent disequilibrium in international competition."²⁰ However, the views of the denominational trade unions on the importance of home and family and on the role of woman as wife and mother make it unlikely that the concept of equal pay for equal work will be extended in the foreseeable future to include the elimination of sex differentials.

Incentive schemes

Almost concurrently with the introduction of job evaluation, incentive pay schemes came to the fore in the early postwar years. While job evaluation sought to rationalize and equalize the wage structure, incentive systems had the objective of stimulating production by rewarding special effort with differential earnings. Because of a history

¹⁹ In connection with this point and with the general subject of Netherlands wage policy, see Bert Zoetewij, *op. cit.* (note 9 *supra*).

²⁰ Nederlands Verbond van Vakverenigingen, *Information Bulletin*, No. 32 (May 1955), pp. 2-3.

of abuse in the prewar period, the introduction of incentives was surrounded by various safeguards, including a ceiling on extra earnings. Trade union participation in rate setting has aided in removing most workers' suspicion of incentive schemes, while the opportunity for income beyond standard wage rates and the development of skill in rate setting have led to the removal of the ceiling and to increasing use of various group and individual incentive programs.

SOME MAJOR RESULTS

The Netherlands wage structure has been one of the most stable in the world since the end of World War II. This stability of wage relationships, predetermined at the conference table, has prevailed in respect to various types of differentials. For example, the ratio of skilled to unskilled standard (that is, prescribed or government-ordered) hourly wage rates in November 1945 was fixed at 120, meaning that hourly wage rates of skilled workers were to exceed those of unskilled workers by 20 percentage points. Nine years later, in October 1954, this ratio, then at 122, was still practically the same.²¹ There was no significant difference in the ratios as between the five wage zones. Moreover, the most recent available figures on average hourly *earnings* showed that the skilled-unskilled ratio for the country as a whole stood at 119, thus showing practically no difference from standard hourly rates.²² Or, taking still

²¹ For detailed data on standard hourly rates see P. S. Pels, *op. cit.* (note 15 *supra*), p. 31, and the more recent figures in Dr. Pels's essay, "The Development of Collective Employment Agreements in the Netherlands," in Adolf Sturmthal (Ed.), *Contemporary Collective Bargaining in Seven Countries*, Ithaca, N. Y., 1957.

²² Earnings data collected by the Central Bureau of Statistics appeared in Centraal Sociaal Werkgevers-Verbond, *De Onderneming*, Vol. 6, No. 19 (September 15, 1956), pp. 730-31.

another measure, standard hourly wage rates of skilled workers in large cities (Wage Zone I) rose by 69.8 per cent (from f 0.88 to f 1.26) from November 1945 to October 1954, while standard hourly wage rates of unskilled workers in the same zone rose by 70.9 per cent (from f 0.73 to f 1.03) over the same period—a difference of less than two percentage points.²³ As the *Economic Survey of Europe in 1955* summarized the Dutch experience:

The purely historical differences between high- and low-wage sectors have been largely eliminated; differentials have generally narrowed and, at the same time, a more subtly differentiated structure based on the principle of "equal pay for equal work" has been introduced within [and between] each industry.²⁴

Toward greater flexibility

What some call the virtue of stability, others would term the evil of rigidity. While centralized wage determination was accepted by all parties concerned in the early postwar years as a precondition to economic recovery—and viewed by some of the parties as a desirable system in itself—the return of more ordered economic circumstances has since about 1953 fostered demands for progressive "decontrols." What employers' associations and denominational trade unions have demanded above all is the introduction of more wage flexibility between industries. Their combined pressure to include differences between industries as to profits, ability to pay, and productivity

²³ The possible objection that these figures are national averages, concealing larger differences within the various industries, cannot be rejected out of hand, but scattered data on this point do not support the objection. See Economic Commission for Europe (UN), *Economic Survey of Europe in 1955* (Geneva), pp. 154-55.

²⁴ *Ibid.*, p. 156.

in the roster of wage criteria has been gaining ground, as the most recent round of wage increases demonstrated. It would be erroneous to conclude, however, that the objective of these groups is the return of free collective bargaining and the removal of government from the sphere of wage determination. This may be true of some employers, but most proponents of greater flexibility concede the need for continued government supervision of the wage structure and wage trends. Their objective is the limited one of greater autonomy for the different industries, and one of their main arguments cites the need for bringing about a closer relationship than exists at present between output and earnings. Their position rests on the two concepts of equity and incentive—"equity" in the sense that workers are entitled to share more directly in higher productivity on an industry-by-industry basis, and "incentive" in terms of their belief that a closer relationship between output, profits, and wages will, in turn, stimulate still higher productivity. The non-denominational NVV has thus far remained unconvinced. It maintains that the concept of "equal pay for equal work" is a socially more desirable objective and in addition that, given the economic circumstances of the Netherlands, the government cannot be expected to maintain full employment without the instruments of centralized wage control. Until the outbreak of the Suez crisis, the trend was in the direction of more flexibility, favored by conditions of very full employment and a rising national income.

Centralization

A further result of the postwar system of wage determination has been the high degree of centralization of decision making in the central trade union fed-

erations and, to a somewhat lesser degree perhaps, in the central employer associations. This development is a direct result of a system which has accorded the labor federations a key role in a key institution, the Foundation of Labor. The Foundation has been the scene of centralized wage bargaining, with results subject of course to government sanction. At the same time it has had a powerful advisory role in the adjudication of the wage claims of the various industries over requests for wage rates below or above the national pattern, fringe benefits, incentive systems and rates, and so forth. It would lead too far afield here to appraise the effects of centralization on relations between the federations and the national unions and between the national unions and the individual worker, but the following speculative observations may be offered.²⁵ (1) Skillful distribution of seats on the governing bodies of the federations has mitigated internal tensions, although on the whole, as one would expect, the strong unions in profitable industries have been more inclined toward greater industrial autonomy than the weak unions in less profitable industries. (2) National unions have had fewer opportunities than in the prewar period to demonstrate to their members the ability and power to obtain wage increases and other economic benefits through collective bargaining because major wage settlements are made centrally and are nationwide in application. Moreover, the prewar trade union benefit programs have been largely incorporated into the postwar social insurance system. Unions have therefore been forced to expand their noneconomic programs, especially if we

²⁵ Local unions in the Netherlands, like local unions in most Western European countries, are structurally and functionally different from and less important than local unions in the United States.

include in this the limited form of codetermination gradually being introduced. (3) While it is true that total membership has steadily increased, it is believed that the total figures hide a substantial turnover. This inflow-outflow movement appears to have affected the NVV more than the denominational unions. It is, however, hardly surprising that such problems have arisen under centralized wage controls. What is more important, and from the American point of view more interesting, is the willingness of trade unions to support a centrally directed wage policy.

Union restraint and responsibility

Unquestionably, the Dutch unions have demonstrated a degree of restraint and responsibility in the postwar period for which there is no parallel in their previous history. In this, they have not stood alone, for the union movements of other Western European countries, always excluding of course the Communist-dominated federations in France and Italy, have generally shown an equal or almost equal sense of wage restraint.²⁶ Some of the underlying factors have already been reviewed. The labor-management rapprochement during the occupation, the abandonment of the "class struggle," the exigencies of economic recovery, and the institutional forum for the discussion of controversial questions provided by the Foundation of Labor have been of cardinal importance.

Furthermore, the political parties which have in coalition governed the Netherlands since 1945 have all maintained more or less close ties with the

trade union movement. This has been true not only of the Labor party, which finds much of its political support in the NVV, but also of the denominational political parties whose "left" wings have been composed of adherents or supporters of the denominational trade union federations. The trade unions have thus acquired a stake in government transcending anything in the prewar period. To preserve the stability of "their" government, they have been willing to enter into unwritten understandings that they will conduct a reasonable wage policy in return for effective government control over consumer prices, rents, and profits. There is a pervasive trade union confidence in the willingness of government to support a fair tax structure, to provide honest price and wage statistics, and to include the trade unions in consultations on every major and most minor economic problems.

Participation in economic planning has had the further effect of making trade unions more conscious than ever before of wage-price relationships. It is something of a paradox that on occasion the trade unions have been far more concerned than the employers over the effect of a wage increase on the general price level, and that the trade unions, far more than the employers, have been the defenders of a centralized system of wage controls. But their attitude becomes understandable in the light of the overriding concern with full employment—at the expense, if necessary, of wage maximization.

Even then, of course, trade unions have not had an easy existence. A tremendous and largely successful educational effort has had to be made to persuade workers of the need for wage restraints, higher productivity, incentive wages, job evaluation, and decreased differentials. Full employment and a

²⁶ For a discussion of factors underlying general wage restraint in Western Europe since 1945 see Leonora L. Stettner, "Wage Pressures and Inflation Controls in Western Europe," *Monthly Labor Review*, Vol. 79, No. 6 (June 1956), pp. 664-70.

gradually rising real wage have been the pillars of national wage controls. Without them—aside from temporary setbacks like the consumption cut of 1951—it is doubtful that Dutch workers would have accepted continuing controls over such an extended period. Yet it now seems as though full employment and a rising living standard are themselves generating pressures that promise to lead to a decrease in central wage guidance and a corresponding increase

in industrial self-regulation. Conceivably, after twelve years of controls which have also been twelve years of economic progress, the sense of national emergency is beginning to fade. If so, only a major turn of events, such as the threat of rapid inflation or sudden severe unemployment or a prolongation of the adverse economic effects of the unsettled situation in the Middle East, would be capable of reversing the present trend toward decentralization.

Economic Growth and Government Wage Regulation: The Australian Problem

By MARK PERLMAN

Abstract: Australian industrial relations present peculiar features, owing to the fact that the Constitution of the country permits extensive federal intervention in this field. The result has been the creation of a system of governmental agencies and regulations which have had a checkered career and undergone many changes in the last fifty years. The latest reorganization occurred in 1956, when a statute was passed dividing responsibility and functions among three agencies, a Commonwealth Conciliation and Arbitration Commission, a Court of Conciliation and Arbitration, and an Industrial Court. The major problems facing these bodies are discussed.—Ed.

THERE are several features of the long Australian experience with governmental regulation of industrial conditions which interest foreign observers. Principally they include (1) how the system tries to prevent strikes and lockouts; (2) how the system erects a wage structure for Australian industry and trade; and (3) whether the system can successfully countervail inflationary changes in prices.

This paper refers briefly to these usual queries, but on the whole is concerned with post-World War II developments. In it we trace the recent evolution of the arbitration law and summarize the reasons for its changes. We also refer to the overwhelming post-World War II problem of inflation, which even more than industrial warfare¹ has plagued Australia. We con-

clude by putting both the problems of industrial dispute regulation and inflation in the context of what we regard as the major current issue, namely, the economic development and growth of Australia.

DEVELOPMENT OF FEDERAL REGULATION

Originally the major purpose of federal intervention in the industrial relations field was to prevent or settle strikes and lockouts. This goal was to be accomplished by expert determination of "fair and equitable" standards of wages and working conditions.

To understand the course of the Australian experience, however, it is necessary to consider four separate factors: (1) the basic enabling clause of the Australian Constitution which permits

¹ For analyses of strikes and strike statistics see James W. Kuhn, "Grievance Machinery and Strikes in Australia," *Industrial and Labor Relations Review*, Vol. 8 (January 1955), pp. 169-76; Mark Perlman, "An Industrial Problem: Australia's Longshoremen," *Labor Law Journal*, Vol. 4 (July 1953), pp. 462-73, and *Judges in Industry: A Study of Labour Arbitration in Australia* (Melbourne: Mel-

bourne University Press, 1954); Arthur M. Ross and Donald M. Irwin, "Strike Experience in Five Countries, 1927-1947: An Interpretation," *Industrial and Labor Relations Review*, Vol. 4 (April 1951), pp. 323-42, Vol. 6 (April 1953), pp. 395-98. For reasons of brevity we must omit discussion of this interesting and important feature of postwar events.

Mark Perlman, Ph.D., Baltimore, Maryland, is a member of the faculty of the Department of Political Economy of The Johns Hopkins University. He is author of *Judges in Industry: A Study of Labour Arbitration in Australia* (1954).

federal intervention in the industrial relations field, (2) the nature and the scope of the program undertaken by the arbitration authorities, (3) the reaction of the Australian High Court toward the constitutionality of the program of the arbitration authorities, and (4) what the litigants themselves seemed to want, and how they attempted to give the arbitration authorities "guidance."

Australian experience with direct governmental regulation of wages and working conditions actually antedates Federation (1901). Arbitration was discussed at the two Constitutional Conventions (1891 and 1897-98), where it was decided that it would be wiser to put the governmental power not in the hands of a politics-minded Parliament but in the hands of an expert commission which presumably would be free of political party pressure. Thus Section 51 (XXXV) of the Constitution authorizes Parliament to legislate for interstate trade in the industrial relations field only to the extent of creating a tribunal to conciliate and arbitrate labor disputes. Unlike the American Congress, the Australian Parliament, itself, may not pass laws dealing directly with wages, hours, or working conditions. In 1904 the Commonwealth Court of Conciliation and Arbitration came into existence, for the purpose of preventing and settling industrial disputes. To facilitate its mission it encouraged the formation of unions and employers' associations, with whose cooperation it tried to function.

Henry Bournes Higgins and the Arbitration System

The architect of the Arbitration System was Henry Bournes Higgins. He drew up the original constitutional clause, framed the original Arbitration Act (1904), and was from 1906 until shortly after World War I President of

the Arbitration Court. His views about industrial arbitration are beautifully expressed in a series of court decisions, in a series of articles published under the title, *A New Province for Law and Order*,² and finally in a little pamphlet privately printed after he had left the Arbitration Court.³

Justice Higgins sought to regulate all aspects of industrial relations by promulgating expertly determined *Common Rules*. These *Common Rules* set forth the minimum standards for wages and working conditions for each interstate industry, and would inevitably tend to serve as guides for the state arbitration authorities in their determination of relevant state policies. Thus Higgins tried to establish a rational approach to industrial relations; it is from his early decisions that the present system developed.

The Basic Wage

He set a minimum wage in 1907 which he believed sufficient to cover the bare necessities for a married man with family. Called the Basic Wage, the amount was to be the minimum paid to any workman regardless of his skill or productivity. Added to this Basic Wage were differentials (called "margins") for skill and other reasons, including productivity. Thus, in practice, the wage rate for a particular occupation was determined by adding an appropriate "margin" to the Basic Wage. The size of the margin depended upon the ability of the industry to pay, as well as whatever other factors the Court thought relevant.

The Basic Wage and the margins together constituted the actual wage

² Sydney: Workers' Education Association, 1922.

³ *The [Australian] Commonwealth Court of Conciliation and Arbitration*. London: Privately printed, 1925.

structure for all crafts and skills, because there was a historical tendency for employers to pay no more than the legally prescribed minima.

After 1913 the Basic Wage was varied (first yearly, then quarterly by geographic area) to adjust for changes in retail prices (cost of living). And from time to time the Basic Wage, itself, was recomputed to compensate for generally increased (and during the Depression generally decreased) living standards. The "margins" were not adjusted automatically and consequently tended to be dwarfed when the Basic Wage rose.⁴

Besides developing a rational wage structure, Higgins sought to incorporate into the national system all the details of maximum hours provisions, provisions for amenities, occupational classifications, and the like. He saw his role as that of an *administrator* of industrial relations, with the primary duty of defining standards. While, of course, he listened to the demands of the litigants and to their proposals, he did not feel bound by their views. His was the ultimate responsibility and he promulgated what he thought wise. In my study, *Judges in Industry*,⁵ I call his approach the "administrative" one; it represents one philosophy of arbitration. It was particularly liked by those employers who feared "destructive" competition from others in the industry and found in his awards uniform standards ap-

plying to everyone. It was also liked by weak unions who saw him as a protector.

High Court decisions

The High Court did not permit Higgins to develop this program effectively. The High Court held, for instance, that the *Common Rule* principle could not be used and that only the actual parties to a dispute could be bound by the award, which, incidentally, had to fall within the boundaries set by the litigants. Moreover the High Court in a series of decisions held that the arbitration authority as originally constituted was not, in spite of its courtlike title and appearance, a court in the legal meaning of the word. Hence the Arbitration Court could not, without amendment to the Arbitration Act, interpret the meaning of its awards or enforce them nor could it punish people for contempt. In one decision after another the High Court clipped the wings of Higgins' Arbitration System and forced it to go to Parliament for aid. Thus Parliament was given repeated opportunities to influence Arbitration Court policy, because each time that the Court had to seek enlargement of its powers, it had to listen to the desires and advice of the Members of Parliament. A description of the critical High Court decisions and the resulting amendments to the original Arbitration Act can be found in Orwell de R. Foenander's works.⁶

Autonomous approach to arbitration

Higgins' administrative approach to arbitration was, as noted above, well liked by poorly organized employers or weak unions. As time was to demonstrate, however, strong employers' federations and strong unions definitely did not like having the Court "meddle in their affairs." While they accepted the principle of governmental intervention, they wanted that intervention to be strictly limited in scope to the questions they themselves raised. This second approach to arbitration stressed a restricted role for the Arbitration System, which I term the "autonomous" approach. Its evolution is discussed in detail in my *Judges in Industry*⁷ and in Walker's more recent study.⁸

By World War II the Court, although oriented to the practice of administrative arbitration, was beginning to utilize the autonomous approach in some industries. During World War II Australia underwent a dramatic change. Her geographic isolation brought her to the brink of defeat, and the eclipse of British naval power with the consequent disruption of commerce made her realize how important development of local industry was. To defend herself and later to aid in an Allied victory, her manufacturing industries were greatly expanded. Significantly, it was these industries, where the employers did not fear competition and where the unions were strong, which expanded; consequently the demand for the autonomous approach to arbitration increased. In addition the war brought full employment to Australia, and there was general pressure on the Court by both employers and unions to raise wages more and more.

⁷ Cited note 1 *supra*.

⁸ Kenneth F. Walker, *Industrial Relations in Australia*, Cambridge, Mass.: Harvard University Press, 1956.

General dissatisfaction

There also developed a general sense of dissatisfaction with a court of law form in the handling of labor relations. A belief developed that the elimination of lawyers as well as more direct dealings between the litigants would expedite settlement. And when in 1946-47 the *Forty Hours Case*, involving the shortening of the standard work week from forty-four hours, took over a year to hear, it became evident that the judges could not possibly handle the postwar load if the Court were to function as before. In addition, many Australians were of the opinion that too great reliance was being placed on arbitration and not enough on conciliation.

REVISIONS OF THE ARBITRATION SYSTEM IN 1947

Thus in 1947 Parliament, led by a Labor government, reorganized the whole system. It split the functions between a judge-manned Arbitration Court and a layman-manned Conciliation Commissioner service. The Court was principally to perform the following functions: (1) determine the Basic Wage, (2) determine the length of the general work week, (3) determine the length of long-service vacations with pay, and (4) determine the "Basic Wage" for females (the Basic Wage applies only to men). Each of the Conciliation Commissioners, on the other hand, was to be in charge of an industry or group of industries. They were to prevent strikes, if possible, and were to use their good offices to conciliate differences. Failing success through persuasion, they were empowered to issue arbitral, binding awards on such issues as "margins," piece rates, annual vacations, and working conditions. Consequently, the adjective "Conciliation" notwithstanding, the

Commissioners were in practice arbitrators.

However, if any question arose regarding the meaning of a Commissioner's award, he was not, under basic Australian constitutional law, empowered to clarify the meaning of his words. That duty was reserved for the Arbitration Court. Thus the closest the judges came to fashioning awards for particular industries (except the coal and stevedoring industries, which were handled otherwise) was through interposition via interpretation.

In effect the 1947 revision made each of the Conciliation Commissioners a final "tribunal" for one or more specified industries. As might have been foreseen (but evidently was not), great disparity between the terms of individual awards developed; some Commissioners being "softer," others "harder." The Commissioners were for the most part not legally trained; indeed several of them came out of "career positions" in the trade union movement. The heterogeneity of their personal backgrounds plus the many guises in which the same or similar issues came to them, individually, resulted in a proliferation of dissimilar awards. To complicate matters further, some of the Commissioners were adamant in refusing to incorporate into their awards any recognition of the policies being worked out by fellow Commissioners. In some industries the awards provided for greater benefits; in others for less. Thus distortions in wage relationships between industries appeared.

The Arbitration Court, itself, did not confine its operation to the four enumerated questions, although most of its time was occupied with repeated hearings on the adequacy of the Basic Wage, which it raised by 20 shillings in 1950, and in 1954 it eliminated the quarterly cost-of-living adjustment. What the Court began to consider with increasing

frequency was a series of politically inspired strikes, the worst of which occurred in the coal industry in 1949. This concern led the Court to pay increasing attention to the internal administration of left-wing unions. On several occasions the Court intervened and set aside election results when fraud was alleged to have occurred. In addition, the Court became increasingly bold in ordering compliance with its orders reinforcing the Commissioners' awards, on pain of contempt citation and conviction. Parliament agreed with the wisdom of the Court's new policies and passed enabling legislation. Some of this legislation was temporary and was repealed or expired when the immediate crisis passed; other legislation was incorporated into more or less permanent practice. At one time the Arbitration Court even had eight leaders of the stevedoring, miners', and ironworkers' unions in jail on contempt citations.

1952 amendment

In 1952 Parliament amended the 1947 act to allow permissive review of a Commissioner's award if it appeared to the Court or to the Commissioner to be in conflict with some other Commissioner's award or awards. This amendment seemed to have met at least one of the major objections to the lack of control resulting from the 1947 legislation. Nevertheless there was general disappointment with the 1947 system and particular dissatisfaction with the Commissioners. In more and more instances parties tended to stay away from the system, and to "settle" their own differences as best they could on a catch-as-catch-can basis. It was a relatively prosperous period, and employers were generally willing to pay more than the award rates. No one was satisfied, but few were actively rebellious against the system. (Exceptions were the stevedoring and mining unions—both of which

had remained under the influence of pro-Communist, if not actively Communist, leadership. The ironworkers' union had been "purged" of its "red" leadership as a result of Court supervision of union elections.)

THE BOILERMAKERS' CASE

Finally, in May 1955, the uneasy institutional situation came to a head when the Arbitration Court ordered the Boilermakers' Union to comply with the terms of an award. The union persisted in its willful disregard of the Court's order, whereupon it was indicted, convicted, and fined A£500 (\$1,125). The union then appealed to the High Court of Australia for relief, submitting that the Arbitration Court was, in effect, trying to perform both legislative (award-making) and judicial (award-enforcing) functions and that according to Australian constitutional theory both functions could not be vested in one agency. In effect, the Boilermakers' Union, which had the support of the Australian Council of Trade Unions, asked that the Arbitration Court be enjoined from employing the prerogatives of a court—particularly those permitting it to fine and punish parties in contempt.

The High Court delayed delivery of its judgment until Parliament was again sitting; on March 2, 1956, by a vote of 4 to 3, the High Court held the Arbitration Act of 1904-52 to be *ultra vires* (unconstitutional), saying in effect that Parliament cannot locate at one and the same time and in one and the same agency both legislative and judicial powers, except that a court is empowered to make procedural rules pertaining strictly to its judicial functioning.

Whether the High Court's decision was wise or not remains a moot question (one dissenter, Mr. Justice Williams, wrote a vigorous and particularly clear rejection of the majority's view).

The decision has now been appealed to the Judicial Committee of the Privy Council in London, where it will probably be adjudicated in 1957.

RECASTING OF ARBITRATION PROCESS IN 1956 ACT

In the meantime Parliament recast the whole federal arbitration process with the intent of (1) overcoming the specific objections stipulated in the *Boilermakers' Case 1955-56*, (2) providing for continued state intervention in union affairs, (3) providing for continued administrative arbitration where applicable, (4) providing for further development of autonomous arbitration and its concomitant, bipartite collective bargaining, and (5) providing for effective enforcement of awards.

The 1956 act provides that there shall be three bodies entrusted with different parts of the general program of federal intervention in industrial relations. To replace the amorphous corps of Conciliation Commissioners, there will be a Commonwealth Conciliation and Arbitration Commission consisting of at least three legally trained and qualified judges (the President and two Deputy-Presidents), one Senior Commissioner, and at least five Commissioners. The Commissioners, as before, need not have legal training and do not enjoy the lifetime career advantages of the "presidential" members. But the Commissioners, unlike those in the 1947 system, are to have their work co-ordinated both by the Senior Commissioner and by the President of the Commission. The former is to handle personnel assignments within the Commission; the latter is to arrange for co-ordination of policy. Each Commissioner is, as before, to try to prevent or, if necessary, to settle most types of industrial disputes in a particular industry or group of industries. If he cannot get agreement, he *may with the permission of the Presi-*

dent of the Commission issue an order. That order is of a compulsive character and may incorporate penalties for non-compliance. Appeal against it does exist, in most instances through a special session of the "full Commission" (meaning three members, at least two of which are presidential members, that is, judges).

Only a "full Commission," where two of the three members are presidential members, can issue awards that (1) alter the standard hours of work in an industry, (2) alter the Basic Wage, (3) make provision for long-service vacations with pay, or (4) determine or alter the "Basic Wage for adult females." Thus the legislative duties of the 1947 Arbitration Court, although still kept in the hands of judges, are now technically part not of a court's powers but of a legislative commission's duties.

Commonwealth Court of Conciliation and Arbitration

The old Commonwealth Court of Conciliation and Arbitration is retained, primarily in order to make the appeal to the Privy Council legally possible, but it has been given a very limited set of purely judicial functions. Of these, interpreting the meaning of a Commission award is the most important. No appeal on substantive grounds is allowed from this Court's interpretations.

Commonwealth Industrial Court

A new Commonwealth Industrial Court now exists. It consists of not less than two nor more than three legally trained and qualified judges. This Industrial Court, presided over by a single judge, will handle all anti-union member discrimination cases (which carry, incidentally, penalties), interpret its own awards, and perform some procedural functions like granting the right to appeal against union certification orders.

The full court, consisting of at least two judges, can (1) order compliance with any award, particularly those made under the powers of the Industrial Commission after it finds that the award has been disregarded, (2) enjoin and punish for contempt any party who threatens to or has willfully contravened this act or an award made under it, and (3) perform all the functions permitted a single judge as noted above.

An experiment to be watched

These are the main provisions. Brevity requires the omission of many details. Whether the new act will succeed where the others failed is in our opinion quite doubtful, unless the technical ability of the newly appointed personnel is vastly greater than has been characteristic of many previous appointments. Nevertheless this new experiment should be watched closely; it is a new chapter in the division of the responsibility of state intervention in industrial relations.

PRICE INFLATION

One of the greatest problems facing Australia since 1947 has been retail price inflation. The following index indicates its magnitude:

INDEX OF RETAIL PRICES, 1945-1955 (1939 = 100)

1945 = 122.4	1951 = 204.7
1946 = 124.5	1952 = 238.9
1947 = 129.2	1953 = 250.3
1948 = 140.8	1954 = 252.9
1949 = 153.9	1955 = 258.6
1950 = 164.7	

Source: Based on the "C Series," Commonwealth Bureau of Census and Statistics.

While there are obviously many causes for this price inflation, we are concerned primarily with the question of how extensive a role the Arbitration System has played in it.

In the first place we must realize that

virtually the entire period 1945-56 has been one of full employment and often of "over-full employment" in Australia. Thus actual Arbitration System policy has been influenced by the knowledge that in many instances both management and workers have negotiated private, over-award, rates. Consequently there have been effective limits on the system's actual ability to come to grips with the problem, particularly in the areas where the autonomous approach existed.

In 1946-47 the Court held hearings resulting in a 10 per cent reduction of the standard work week without any change in weekly wage rates. This 40 *Hours Case* had originally been postponed during the war, and although the judges procrastinated, when they had to make an award the least that they "could" give was to increase minimum pay for the usual forty-four hour week by 15 per cent (including overtime). If the decision had not been forthcoming, there would have been continual work stoppages, which would possibly have been even more inflationary. In

any event the effect of the award was inflationary.

In 1949-50 the Court held hearings on the Basic Wage. In December 1950 through a "fluke" award, the Basic Wage was increased by one Australian pound.⁹ This again was probably inflationary in consequence, although in many instances employers were already paying over-award rates and the new order may have merely absorbed part of that difference.

Some of the Conciliation Commissioners, notably J. M. Galvin in the metal trades, tried to hold the line after 1950. In 1952 he refused an increase in engineers' (machinists') margins, arguing that such a pay increase would be inflationary. Regardless of any merit in his opinion, most employers effectively met the union demand and paid more. It is not clear whether Galvin's award was noninflationary. In so far as it was not observed, it cannot be held responsible for any subsequent inflationary effects. In the long run, however, a relatively great increase in the margins of the most highly skilled and those holding the most responsible jobs might have been deflationary. Of this we shall say more in the next section.

In 1952-53 the Arbitration Court again held hearings on the Basic Wage. In the end, they decided neither to raise nor to lower the going Basic Wage and ordered suspension of quarterly cost-of-living adjustments to it. Thus in effect they froze the Basic Wage. As such the decision was a deflationary effort.

To what extent has the wage-earning population suffered as a result of the inflation—in other words, have real wages fallen? The *Commonwealth Statistician* publishes a nominal (money) wage index which can be compared with

⁹ O. de R. Foenander, *Studies in Australian Labour Law and Relations* (Melbourne: Melbourne University Press, 1952); Mark Perlman, *op. cit.* (note 4 *supra*).

the "C Series" retail price index to which we have already referred. Both series, it must be noted, may not adequately reflect changes. There is difficulty in getting satisfactory figures for wages paid, and for part of the time, at least, the price index reflected official, not black market, prices. Since goods were for the most part not easily procurable through legitimate channels, the index was at least a little distorted.

On the whole real wages have increased, it would appear, 20 per cent since 1939 and about 17 per cent since the end of World War II. Recently the increase amounts to 1 per cent per year. All things considered, that is not a staggeringly great amount!

A major part of the explanation for the small change rests upon the marked efforts Australia has made since 1940 to divert resources from immediate consumer goods into producer goods channels. The next section deals in part with one aspect of this investment program—that is, investment in "human resources," through immigration and an expanded educational program. Here it suffices to note that prices have more than doubled since 1939—and real wages have risen only slightly.

TODAY'S MAJOR PROBLEM

The specific problem of inflation and the general question of controlling industrial relations should be seen in the light of Australia's need to increase its rate of economic growth. Of course, there are many factors influencing national economic growth, but of these, three stand out as being connected in an important sense with industrial relations.

First, Australia needs a larger reservoir of human skills. These are obtainable by increasing the population and by giving better training to those in the labor force. Government policy since 1946 has been to encourage large-

scale immigration from Britain and from Europe. Intensive efforts have been made to acculturate the newcomers—to provide homes, the "necessities" of a high living standard, general education, and job skills. It is noted, incidentally, that an inevitable side effect of the immigration during this period has been to increase the inflationary pressures. In this respect, as in the expected flow of future goods, this immigration represents investment.

Second, Australia needs vast amounts of capital investment in both the governmental and the private sector of the economy. One way to encourage this development is by maintenance of industrial peace and efficient adjudication of labor disputes. Here the Arbitration System can make a positive contribution.

Increased productivity

Third, Australia very much needs increased industrial productivity, from both labor and management. Like the maintenance of industrial peace, increased productivity will also encourage capital investment.

As we see the Australian record, we are overwhelmed by the acceptance in all quarters of a belief that high wage rates must mean increased labor costs. Quite the contrary: labor paid at high rates may be most economical if it is not used wastefully or allowed to dissipate its working time on tasks requiring only a small fraction of its skill.

Traditionally, economic egalitarianism has been an unwritten Australian policy. We hold that the new Industrial Commission should abandon it if Australian economic growth is to be accelerated.

Increased labor productivity essentially means more economic use of the resources within the labor force. It generally requires higher levels of job skills and increased willingness to un-

dertake greater job responsibilities. By enlarging margins for skill and the acceptance of job responsibility the arbitration authorities can play an important role in providing motivation for ambitious workers to train for and hold more important positions. In earlier decades the system considered this point, but it was politically unpopular.

Increased labor productivity is also directly affected by the level of managerial efficiency. And managerial efficiency is a topic which the Arbitration System would do well to consider at all times. By and large there is a crying need for increased use of industrial engineering techniques in all sectors of the Australian economy. It is not always new equipment that is needed; often simple work rationalization and improvements in work flow patterns will suffice. The Arbitration System can encourage developments in this direction by basing its awards on the ability to pay of fairly progressive firms rather than on the ability of those which are not competitive with overseas suppliers and which have hidden behind tariff barriers. A transitional period would be required—when firms would have to rethink their production decisions. Making management really manage would result in putting pressures on unions to co-operate by eliminating economically undesirable practices.

Besides stressing recent scientific contributions to production, the system should seek to encourage Australian management to rely more heavily on

well-trained first-line supervisors. Raising weekly rates for supervisors might cause employers to pay more attention to selecting those who are ready and able to increase production following rational least-cost economic principles. As yet this is a generally unexplored avenue.

CHALLENGE TO THE ARBITRATION SYSTEM

In sum, the challenges offered the Arbitration authorities, if limited, are also important. The system cannot single-handedly really check the present inflation; that is a task for those handling fiscal, monetary, and import controls. But it can do much more than it has done to accelerate and shape the development of Australian industry. So long as it has some measure of control over wage rates, it must do whatever it can to encourage increases in the reservoir of human skills and in the long run to augment production. At the turn of the century Justice Higgins had faith in the performance of disinterested experts at least somewhat removed from political life. The authorities, we feel, must now become economically more sophisticated. If they do, it is possible that non-Australians in the future will add a fourth question to the three posed at the outset of this article: How has the system, organized originally to prevent industrial strife, been able to adjust its role so that it has stimulated the rate of Australian economic growth?

This is the challenge.

Labor Relations in Ghana

By R. B. DAVISON

Abstract: Labor relations in the Gold Coast (Ghana), or aspects thereof, such as collective bargaining, free trade unions, and arbitration, cannot be discussed as though a free market economy existed there or on the assumption that it will develop as in Europe and in America. The state is the dominant employer of labor and the principal source of capital; without its initiative the economy would not have developed. So long as this persists an effective free trade union movement will be difficult to secure, and it is as yet too early to attempt to predict how the trade union movement will develop. To a considerable degree the direction of African thought may depend on the understanding shown by the West of the magnitude and complexity of the economic and political problems facing the new statesmen in Ghana.—Ed.

ON March 6, 1957, a new sovereign state—Ghana—will emerge upon the world stage. For the past eighty years Ghana (previously known as the Gold Coast) has been a British colonial territory, one of the four British West African tropical dependencies, and its emergence into complete independence marks an important landmark in the onward march of the awakening continent of Africa. For some time the Gold Coast has had an all-African government with an African Prime Minister (Dr. Kwame Nkrumah) and complete autonomy in its internal affairs. After March 6, 1957, this government, which was re-elected last year by a substantial majority in an election conducted on the basis of universal adult suffrage, will assume responsibility for the country's defense and external relations. Ghana's relationship with Britain will be analogous to that of India, which is also a sovereign state within the British Commonwealth.

ECONOMIC DEVELOPMENT OF GHANA

The development of Ghana will be watched with considerable interest in

all parts of the world. The country has chosen to remain a member of the British Commonwealth, and indications are that it will also, at least for the time being, remain in the sterling area. The Gold Coast, incidentally, has been one of the few countries in the sterling area which regularly earn a comfortable surplus on their dollar accounts. Already, it is an outstanding example of economic development in tropical Africa. A recent United Nations study¹ reported that in tropical Africa south of the Sahara 40 per cent of the adult male population in 1950 were engaged in "commercialized production" (that is, the production of goods for sale rather than for domestic consumption); the remaining 60 per cent were engaged in subsistence agriculture. In the Gold Coast, by way of contrast, 79 per cent of the adult males were engaged in "commercialized production," by far the highest proportion recorded. Next was the Belgian Congo, with 59 per cent of adult males producing for

R. B. Davison, B.Sc. (Econ.), Ph.D., is a staff tutor in the Department of Extra Mural Studies, University of London. He was a member of the Faculty of Economics, University College of the Gold Coast, 1951-55, and is author of *Migrant Labour in the Gold Coast* (1955).

the market. At the other end of the scale, French West Africa, geographically contiguous to the Gold Coast, recorded 23 per cent so engaged.

Not only is Ghana politically and economically well in the lead of tropical Africa; there are great opportunities for future expansion. For many years there has been under consideration a proposal to dam the river Volta to generate electric power, to be employed primarily in the manufacture of aluminum, using the bauxite deposits which are fairly plentiful in the interior. The surplus electricity would be available for industrial development. The Volta River project has been the subject of an exhaustive inquiry by a commission, which has estimated the capital cost as between £230 and £300 million at current prices. Originally the scheme, which is of vast proportions for a country the size of Ghana, was to have been financed through a tripartite arrangement involving the Ghana government, the United Kingdom government, and a consortium of private aluminum companies associated with the Aluminum Company of America. It cannot be said that there is agreement on this issue now, and it is perhaps significant that the Volta River project has been referred for consideration to the International Bank for Reconstruction and Development.

Whatever may happen to the Volta River project, the fact remains that Ghana is at a significant stage of economic as well as political development. Her progress—or lack of it—will be noted by many eyes, not only in the rest of Africa but throughout the underdeveloped regions of the world. The issues involved are fundamental and important. The politically uncommitted nations are going to judge the present battle of ideologies between East and West not in terms of slogans or propaganda, but in the light of economic

growth. In Russia and China, the problem of underdevelopment is being attacked by political methods which not only repudiate the sovereignty of the market in economic affairs but also regard individual liberty as a secondary consideration. If, however, they can demonstrate with each passing decade substantial improvements in their rate of economic growth, no amount of persuasion or military action by the West, unless accompanied by clear demonstration of the superiority of its economic systems, will prevent countries like Ghana and others in Africa at present in the Western sphere from turning to political systems that in American and British eyes are repugnant. This is the issue and the challenge, and it is against this wider background that the question of labor relations in Ghana must be viewed.

PROJECTION OF WESTERN IDEOLOGIES

As R. H. Tawney has pointed out,² "The most significant differences distinguishing different societies from each other are not different forms of constitution and government but different types of economic and social structure." It is important to keep this proposition in mind in any analysis of the contemporary development of Africa. There is an understandable tendency on the part of American and British observers commenting on the economic and social problems of a country like Ghana to start with the assumption that the issues they are considering are fundamentally similar to the ones they are used to dealing with "back home." When faced with particular problems, such as the regulation of labor relations, Europeans and Americans are initially inclined to think in terms of "free" trade unions, collective bargaining, arbitration procedures.

² R. H. Tawney, *Equality* (4th edition; London: Allen and Unwin, 1952), p. 94.

wage incentive schemes, and the like. This is the way progress has been made in the capitalistic economies of America and Western Europe, and at first sight it seems reasonable to assume that these institutions should work equally well in Africa. This assumption has underlain British colonial policy in the labor field from the beginning and motivates the International Confederation of Free Trade Unions, with its strong American component, today. In particular, from the inception of the Gold Coast Labor Department in 1938, under some pressure from the Labour party in Britain, it has been tacitly assumed that projection into the African context of British trade unionism with its superstructure of collective bargaining is the obvious and right way to bring about an improvement in labor relations. There is, however, no a priori justification for assuming that what is right in one country at a given stage of its development is necessarily right, with or without modification, in another, or that what has worked well "back home" must (unless the local people are incorrigibly stupid) necessarily work well "out here." Colonial administrators tend to try to create, if not people, then societies in their own image.

One of the greatest dangers facing the student of labor relations in an underdeveloped area is that of allowing himself to be blinded by a political ideology to such an extent that he loses sight of economic reality. He may be so intent on upholding principles he regards as fundamental in his own society that he projects them without close scrutiny into a situation where they cannot possibly apply. At the same time, the practical administrator, preoccupied with day-to-day problems of government, sets about creating and trying to stimulate institutions which, in their familiar form, are not at all suitable as instruments for coping with

the actual situation. Has this happened in the Gold Coast of today? What lessons have yet to be learned in the Ghana of tomorrow?

HAS GHANA A FREE MARKET ECONOMY?

Let us begin by declaring explicitly that, given a free market economy, even if it shows marked tendencies towards oligopoly, the machinery of collective bargaining with its concomitant apparatus of governmental conciliation and arbitration, resting on the firm base of a free trade union movement, has demonstrated its value beyond question in those countries where, by devoted efforts and sacrifices, the machinery has been created. But what happens if there is no free market economy? When we have to deal with a situation in which, by virtue of historical rather than ideological necessity, there is immense concentration of economic power in the hands of the state or of private (expatriate) firms, how are labor relations to be regulated? This is the dilemma which has yet to be satisfactorily resolved in the underdeveloped territories, and it is instructive to look at the economy of Ghana to see to what extent, if at all, we find conditions which may fairly be described as "free market" conditions.

Agriculture

We should logically begin with agriculture, inasmuch as Ghana is, and is likely to remain, predominantly an agricultural country. For present purposes we can ignore the sector of the economy which is concerned with purely subsistence agriculture. There are no problems of "labor relations" here, because production is largely carried on within the family group. We must concentrate on the export and local-market crops, for it is the sale of the crop that brings in the cash with which any

hired labor is paid. Only one export crop matters—cocoa—since this crop accounts for about 70 per cent of the value of agricultural exports. Is there a “free market” in the Gold Coast in cocoa? Emphatically not. Since the war a body known as the Cocoa Marketing Board, originally conceived as a producers’ organization, has been turned into a monopolistic state purchasing agency which, by manipulating the internal cocoa price, has accumulated a large reserve of over 100 million pounds. Furthermore, by the operation of a loans section of a subsidiary company, a start has been made on what amounts to a collectivization of agriculture by the pawning or pledging of farms to the state-created organization. The process has not gone far, and the word “collectivization” would be indignantly repudiated by the local politicians, but there is no point in ignoring the fact that the more farms become pledged to the state, or its agency, the greater becomes the likelihood that individual farmers, as independent entrepreneurs, will disappear and become, in effect, hired labor of the state. Because of the state’s complete control over the marketing of the major crop and because of the chronic indebtedness of most of the small farmers, the absorption of small farms into larger units (and consequently, the creation of a rural proletariat in place of small independent farmers) is likely to proceed apace after the achievement of political independence. The British colonial administration never dared to attempt such a program of “collectivization” (call it by another name if this one is objectionable), but local political leaders, once firmly in power, will not for long fail to see its potentialities.

Let there be no indignation about this. It is as essential a development, if the economy is to avoid stagnation, as was the Enclosure Movement in Britain in the eighteenth century, and pow-

erful arguments may be advanced in support of the view that a reorganization of agricultural holdings, with its inevitable modification of the system of land tenure, is unavoidable if agricultural productivity is to rise. If the next Ghana government shrinks from the task (which will be politically difficult, but need not necessarily be inhumane), not improbably a new government will arise which may well tackle the problem in the same way that Mao Tse-tung is dealing with his agrarian problem in China. The creation of a problem of labor relations in the agricultural sector is the inevitable consequence of agricultural reorganization. Furthermore, there is little evidence in the history of the past thirty years that small, scattered farms can hope to result in any material improvement in the level of productivity per acre or per man.

Mining

Agriculture is dominant, but mining is also an important industry in Ghana. Does a “free market” exist here? Gold, diamonds, and manganese are the important products, and most mining operations are carried on by large firms, usually British expatriate companies. In the diamond industry there has recently grown up an African alluvial diamond digging sector, but although there are hundreds of independent diggers working under license from the government, all diamonds must be sold either through a single bank or through licensed government purchasers. There is, therefore, nothing approaching a “free market” even with alluvial diamonds. In the other sectors of the mining industry, from the point of view of the African miner, there are no competing firms. Many are interlocked in London, and all are associated with the local Chamber of Mines, which lays down wage rates for all the mines, with or without

prior consultation with the Mines Employees Union. This union, which has not yet succeeded in securing the right of collective bargaining, as all decisions have to be referred to London for ratification, has just emerged severely shaken from a seven-weeks’ strike. The strike resulted not in any classical adjustment of wages to supply and demand but in an alteration in government policy on taxation and subsidies for the mines. What happened, in effect, was that a strike in a private industry was solved by political action. It would take the ingenuity of a mediaeval sophist to explain these events within the framework of any economic theory postulated on a “free market economy.”

Government the dominant employer and principal source of capital

Outside the mining districts there are urban areas, some of which are developing rapidly both in quantity and diversity of paid employment. There is, however, one striking fact which cannot be avoided: the government is the largest single employer of labor, both clerical and artisan. The railways, the roads (but not the trucks running on them), electricity, broadcasting, harbors, and other public utilities are owned by the government and are subject to Treasury control in the payment of wages. In the building industry the government dominates the scene. A new state agency, a Housing Corporation, has now entered the field to expand the work already done in the provision of houses by the Housing Department. Schools, hospitals, public buildings, roads, bridges, and new harbors are all controlled by the government, which therefore directly and through its contractors (whose power to determine wage rates is severely demarcated by contract) is the dominating factor in this important sector of a rapidly developing economy. Broadly

speaking, outside the agricultural and mining industries, over half the employed persons are directly employed by the government, with wages and conditions ultimately determined by the Legislative Assembly. A large proportion of the remainder are employed by firms which are executing government contracts and are bound by the terms of the contract to pay neither more nor less than the prevailing government rate for any particular grade of employee.

This sketchy analysis, which cannot avoid being somewhat sweeping because of its enforced brevity, is an attempt to illustrate—though it does not claim to have proved—the proposition that we deceive ourselves if we try to discuss labor relations in Ghana today (and probably in the rest of tropical Africa also) on the unspoken assumption that the “free market” and “competition” is the normal state of affairs. We cannot assume that the prevalent power groupings are temporary and regrettable deviations from free market conditions. Nor can we assume that Africa will necessarily need to adopt a form of economic structure based upon Western capitalism if she is to accelerate her rate of economic growth. The state is the dominant employer of labor as well as the principal source of capital. It must be emphasized that this situation has come about not on account of any predisposition towards “socialism” by colonial administrators (who are rarely radical in their views!) but because they were faced with the fact that if the state did not take the initiative the economy would probably not have developed at all. The fundamental economic question facing Ghana on the threshold of independence is whether to decentralize economic power and rely upon private initiative to sponsor further development or to continue to rely primarily on state enterprise. This issue

cannot be further discussed here; for immediate purposes it is significant in its impact on the future of labor relations. So long as the state retains its predominant position in the economic life of the country it is difficult to see how any system of collective bargaining in any way analogous to that in Western countries can be created. Apart from the mining companies, who are powerful enough to pursue to some extent an independent line, all urban employers of labor closely follow the government lead in wages and working conditions. Within the government service, the decisions in this field are ultimately made as an integral part of over-all economic policy. Collective bargaining can therefore concern itself only with minutiae and it has little direct effect on government policy. A strike in government service, if at all widespread, would be regarded as an attempt to "coerce the government" and would be declared illegal. There is no arbitration machinery in the Civil Service, and it is difficult to see on what basis such machinery could operate, as it has no independent labor market to which it could refer.

THE UNIONS AND POLITICS

As the ultimate decisions are political ones, it is hardly a matter of surprise that the trade unions have, from the beginning, tended to concentrate on political activity to an extent which, to many Western observers, is undesirable. To the political activities of the trade union movement we must therefore pay some attention. With the end of the war there came an upsurge of African nationalism in the Gold Coast which had as its primary objective the attainment of independence and the removal of British political authority. At first, discontent tended to center in the veterans' organization. These men, many of whom had served in Southeast Asia,

were grossly dissatisfied with their prospects upon demobilization. Many had been trained in the services as artisans and were understandably reluctant to return to civilian life as unskilled urban laborers or farm workers. The discontent flamed into violence in 1948, when a few demonstrators were killed as police opened fire on a procession converging on the Governor's residence in defiance of the regulations. The agitation was taken up by the newly formed Convention People's Party (CPP), led by Kwame Nkrumah, who had recently returned from the United States and Britain declaring "self-government now" as his aim. He caught the popular imagination, and soon a fairly elaborate political party was organized.

Meanwhile prices were rising, wage rates, as always, were sluggish, and there was a growing discontent among the workers, who were in many cases former servicemen in civilian clothes. The discontent found expression in the trade union movement, which had been actively encouraged and assisted by the government Labor Department since the early 1940's. Early in 1950 the railways were the spearhead of a strike of a few days' duration; though the miners stood aloof, it was widespread. The trade unions were largely shattered by this impact with the state; the shaky Trades Union Congress (TUC) disappeared temporarily, and Nkrumah and some of his followers went to prison.

In 1951 a general election was held under a new constitution, as a result of which Nkrumah underwent the most dramatic metamorphosis that a politician can experience. He was brought from his prison cell and installed as the Leader of Government Business in the new Legislative Assembly in which his CPP was overwhelmingly dominant. The adherents of the CPP began deliberately to infiltrate the trade union movement. They were resisted at first

by the established union leaders, who, trained by British labor officers and academics in the doctrine of "free" trade unionism, wanted to steer clear of any political affiliations. A fierce struggle took place within the Gold Coast TUC which ended in a victory for the CPP element. Up to this point the CPP spokesmen had been vituperative in their abuse of the TUC for linking up with the ICFTU, which was opening an office in Accra about this time. Within a few weeks of obtaining power within the trade union movement, the CPP showed a complete reversal of policy: the ICFTU ceased to be vilified in the party press as the "yellow imperialist international" and the TUC under its new leadership renewed its ICFTU affiliation. Since 1952 the Gold Coast TUC has witnessed a series of splits, secessions, schisms, and explosions, but by the end of 1956 even the unions whose leaders first opposed the CPP so strongly had decided to co-operate with what appeared to be inevitable.

By January 1957 the wheel had turned the full circle. In that month the ICFTU convened its first all-African trade union conference with the full approval of the Gold Coast government, in Accra, and the assembled delegates were addressed by Dr. Nkrumah. He expressed the view that

... it would be a mistake if trade unionists were to consider that their duties in regard to Africa consisted merely in helping to establish trade unions. It is essential that trade union movements throughout the world understand and take into account the political and economic developments which are taking place in Africa. ... The trade union movement has a great part to play and a far wider task to perform than merely the safeguarding of the conditions and wages of its members. ...

He called upon trade unions to play an "active part" in the struggle against co-

lonialism, thus working for the ultimate political freedom and emancipation of their territories. Unfortunately Dr. Nkrumah did not make clear what role trade unions are expected to play after independence has been obtained. Apparently many of the delegates present agreed with him, for they adopted a manifesto which, *inter alia*, declared that "African labor movements must unite and form the spearhead of the struggle for emancipation of the African peoples from colonialism and dictatorship."

This, in broad outline, appears to be the position on the labor front as Ghana enters the world stage as an independent power. Nkrumah with his CPP controls the government and is thus in control of the largest employing agency, which in turn dominates the labor situation in the country generally. At the same time, his followers control the TUC, though by no means all of its constituent unions. To Western eyes this may not appear to be a particularly healthy situation. It could easily lead to a form of totalitarianism, and it may yet do so. Indeed, among the Gold Coast Africans there is a powerful opposition to Nkrumah and the CPP, centered around the traditional chief of the Ashanti, which openly accuses Nkrumah of dictatorial tendencies and corruption, alleging that he is unwilling to tolerate any genuine opposition. The Ashanti are pressing for a federal form of government, and they resent Nkrumah's control over the cocoa funds, half of which are derived from Ashanti farms. The trade union movement has now again split upon this issue.

CURRENT UNCERTAINTIES

It is clearly too soon to attempt a prediction as to how the trade union movement in Ghana will develop. Apart from the fundamental issues in eco-

conomic and political affairs, to which reference has already been made, the trade unions have many problems to overcome in the internal organization of the movement. Many of them are fragmented, internally split, and often inefficiently administered. The railway union appears to be disintegrating into segments based upon the various grades of the railway service—traffic, locomotive, and clerical. The mineworkers' union (numerically by far the most important) has been thoroughly shaken by its recent clash with the mining companies, but appears to have retained its organization intact, though much weakened. On the other hand new unions, particularly among government servants such as teachers, local government employees, and hospital workers, are showing signs of rising activity.

SOME STATISTICS

Official statistics are always tardy in making their appearance in Africa, and are not always readily accessible. However, to round off the present sketchy review, some information collected by the writer relating to the position of the trade unions in 1953 might be of interest.³ By the end of 1952, 97 trade unions had been registered by the official registrar of trade unions. Of these, 8 had amalgamated with others, in 9 cases the registration had been canceled, and 21 were defunct, inactive, or in process of splitting up. Of the remaining 59, 18 were described as "active" or "fairly active" by the government Labor Department in its annual report, and no comment was passed on the remainder. Three of the "unions" were not organizations consisting solely, or even mainly, of employed persons. Two

³ For more detailed information on Gold Coast trade union development see also an article by the present writer which appeared in the *Industrial and Labor Relations Review*, Vol. 7, No. 4 (July 1954), pp. 593-604.

were gold- and silversmiths' associations (defunct by 1952), and the third was the Gold Coast Motor Union, which was, and still is, a transport association of trucking-company owners and self-employed owner/drivers, as well as employed persons.

Excluding the unions which have amalgamated with others, become defunct, or had their certificates canceled but including those described as "inactive," the trade unions in the Gold Coast are classified by size in the accompanying table.

GOLD COAST UNIONS IN 1953

MEMBERSHIP	NUMBER OF UNIONS
Under 50.....	9
50-249.....	30
250-999.....	12
1,000-4,999.....	7
Over 5,000.....	1
Total.....	59

The total paid-up membership of these unions in March 1953 was reported to be 34,960. Of this number, approximately 40 per cent were enrolled in the single Mines Employees Union.

The degree of trade union organization varies from industry to industry. The writer has unofficially estimated that in 1953 the average degree of organization in urban employment (that is, excluding agriculture) was about 15 per cent. The highest strength of trade union organization was apparent in the mines, where 34 per cent of the labor force appears to be organized. Transport comes next, with 18 per cent in the trade unions. Organization is weakest in the construction and building industry (where migrant labor is widely employed) with probably less than 5 per cent organized. These estimates are, it must be stressed, very rough and ready; without careful scrutiny, too much reliance cannot be placed on them.

AFRICA AND THE WEST

Ghana may, or may not, be typical of other "underdeveloped" areas. Indeed, perhaps the use of such phrases as "underdeveloped," "backward," and "politically uncommitted" in relation to the new nations of Africa and Asia is a source of confusion. Be that as it may, this paper has attempted to argue that it is a cardinal error to discuss labor relations in general, or particular aspects of them such as collective bargaining, free trade unions, and arbitration, as if we were talking about a political and economic situation which will inevitably follow Europe and America

in developing the market as its dominant economic instrument on the one hand and liberalism as its political creed on the other. Nor must we assume that Marxism will necessarily provide the answer. In Ghana, from now on, the Africans will make the decisions and take the responsibility. Western institutions will be subjected to searching and critical scrutiny. It may well be, however, that a material factor in the development of African thought will be the understanding shown by the West of the magnitude and complexity of the economic and political problems facing the new statesmen in countries like Ghana.

Trade Unions in Malaya

By J. NORMAN PARMER

Abstract: The young trade union movement in Malaya has been subjected to many stresses that have limited its effectiveness either as a political force or as a means of achieving the goals of labor. Communist-dominated up to the time of Communist party armed rebellion against the British colonial and protectorate governments, since 1948 the movement has under British influence been developing slowly along liberal lines. A plural society, a lopsided representation in existing unions, and poor organization and financing have continued to attenuate the movement, while the growth of a new militant left wing has split it at a time, shortly before Malayan independence, when it needs all the strength it can muster.—Ed.

WESTERN trade unionists visiting the British Crown Colony of Singapore and the British-protected Federation of Malaya have remarked that the Malayan trade union movement is one of the strongest and most democratic in Asia. If the appraisal is correct, the achievement is made more impressive when one realizes that the present trade union movement has emerged only since 1948. Malaya's first trade union movement appeared at the end of World War II but collapsed with the outbreak of the Communist rebellion, styled "the Emergency," in June 1948.

Trade union movements in Malaya are postwar phenomena but prewar roots are traceable. Chinese journeymen's organizations date from the 1920's.¹ Unions of unskilled Chinese rubber-plantation, tin-mine, and factory workers and of seamen appeared in the early 1930's. Another prewar root was associations of government employees. The British co-

¹ Journeymen's organizations and syndicates of skilled workers were preceded by Chinese guilds, some of which were founded in Malaya in the nineteenth century.

lonial and protectorate governments gave unenthusiastic recognition to the organizations of journeymen and public employees but suppressed the unions of unskilled workers on the ground that they were Communist dominated. Strikes in 1937 in support of wage demands involving thousands of unskilled workers caused the government and forward-looking European employers to try to place labor relations on a more satisfactory footing. Basic trade union and industrial relations legislation was enacted in 1940, and the appointment of an officer to advise and to instruct trade unions was discussed. The new legislation was not implemented before the Japanese invasion in December 1941.

For five decades before World War II, Malaya's labor force was composed mostly of immigrant South Indian and Chinese laborers.² The indigenous Ma-

² For a history of labor in pre-World War II Malaya, see the author's "Colonial Labor Policy and Administration: A History of Labor in the Plantation Rubber Industry in Malaya, 1910-1941," unpublished Ph.D. dissertation, Cornell University, Ithaca, New York, 1957.

lay people, many of whom were actually immigrants from nearby Indonesia, were farmers and fishermen and were not attracted to wage employment. Migrations to Malaya of several hundred thousands of persons from China and India occurred annually. The colonial and protectorate administrations regarded the immigrant laborers as sojourners and made no attempt to assimilate them. But these immigrant laborers or their children are now permanently domiciled in Malaya, although culturally unassimilated and perhaps unassimilable. The Federation of Malaya has a total population of about 6,300,000—consisting of approximately 3,000,000 Malays, 2,400,000 Chinese, and 750,000 Indians. The Colony of Singapore has a population of 1,200,000, of which more than 80 per cent are Chinese. A plural society thus exists, enormously complicating attempts to resolve the country's social, economic, and political problems.

POSTWAR COMMUNISM

The trade union movement of 1945-48 was largely under Communist control. The Malayan Communist party, whose members are mostly Chinese, used the Japanese occupation years to train cadres for intensive postwar organization in all sectors of society. The fall of 1945 and the early months of 1946 witnessed the rapid formation of trade unions. The party's efforts were assisted by widespread economic distress and the psychological impact that the war and the occupation had had on the people. An ill-defined expectancy of political and social change pervaded most people's thinking, and organizations of all kinds were formed to serve as vehicles of expression. After unsuccessful attempts at political general strikes early in 1946, the unions eschewed overt political activity and resorted to economic action. Hundreds of costly

but often successful strikes for higher wages occurred in 1946 and 1947. Trade union policy of the returning British authorities was a resumption of the prewar policy of legislative control and official guidance. The policy was not, however, suited to the circumstances, because a large and vigorous trade union movement was now in being.

The Malayan Communist party's decision to undertake armed rebellion against the British colonial and protectorate governments in June 1948 resulted in the disappearance of many key union officers with union funds into the Malayan jungle and caused the collapse of most trade unions. Only then was the government able to implement its policy of regulating and guiding the trade union movement. With the help of a British trade union adviser, the present movement has gradually been established since 1948. The Communist rebellion is still in progress; it has failed to obtain widespread popular support and cannot be regarded as a nationalist revolt against an imperialist power. Present Communist policy is to de-emphasize rebellion and concentrate on subversion through a "united front" policy.³

ORGANIZATION AND MEMBERSHIP

The trade union movement today has a total membership of perhaps 250,000.⁴ Approximately 170,000 members in 240 unions are in the Federation of Malaya, where the largest union is the National Union of Plantation Workers with a total reported membership of 110,000. Other strong unions in the Federation are those of railway workers and civilian employees of the armed services and

³ See *New York Times*, January 6, 1956, p. 4, for a report on the Malayan Communist party's policy.

⁴ As compared with approximately 290,000 members in 425 unions in 1945-48.

J. Norman Parmer, Ph.D., College Park, Maryland, is an Instructor in the Department of History, University of Maryland. He spent 1952 to 1955 in Malaya and Southeast Asia.

certain unions of government employees. Workers in the construction, factory, mining, and transport industries have had little or poor organization, although since mid-1955 some important gains in membership have been claimed by the National Union of Factory and General Workers, the National Union of Transport Workers, and the Malayan Mining Employees' Union. In Singapore, the strongest of some 140 unions are those of the civilian workers of the armed services, which have a total membership of about 25,000. Approximately 18 per cent of Singapore's gainfully employed are organized.⁵

The characteristic form of organization is the local union organized according to the district, occupation, educational level, or ethnic community of its members. Thus at one time more than two dozen unions of schoolteachers functioned in the Federation and some fifteen unions of harbor workers existed in Singapore. The Trade Union Adviser has urged the merging of local and regional unions into national unions. Amalgamation has been hindered by the ethnic divisions in the labor force, a parochial outlook, and the reluctance of local officers to sacrifice their personal interests.

The membership of Malayan trade unions is ethnically lopsided. Of the three communities in the Federation, the Chinese predominate in the labor force. Yet 65 or 70 per cent of trade union members are Indians. The Malays, who are numerically insignificant among wage earners, are approximately equal to the Chinese in union membership. The absence of the Chinese in the present trade union movement is disturbing, since they took the lead in the 1945-48 movement. Chinese reluctance

⁵ Approximately 500,000 persons are gainfully employed in the Colony of Singapore. Comparable figures are not available for the Federation of Malaya.

to join the unions is usually ascribed to apathy, fear of Communist retaliation, and disillusionment with trade unionism. We may add that the Chinese laborer is inclined to regard the present movement as government controlled and Indian dominated. Chinese now in the unions are mostly English-educated and from white-collar occupations.

Union leadership has in a few instances been outstanding. But as might be expected in a trade union movement encouraged by a colonial government, some trade unionists are more dependent on official backing than on members' support for their positions. Moreover, opportunists have used the unions as a means to government favor. The most serious problem of leadership is that most union officers are English-educated salaried or professional people who lack intimate contacts among the non-English-speaking, often illiterate, wage workers.

The financial resources of most unions are meager. One union, the Penang Municipal Services Union, has the check-off and is comparatively wealthy. Other unions have sought the checkoff without success. Some unions have been aided by British and American trade unions, and the International Confederation of Free Trade Unions has recently helped the plantation workers' unions to obtain financial assistance. Improvidence on the part of union officers is disappearing.

National and international groupings

National trade union centers exist in the Malayan Trade Union Council in the Federation and the Singapore Trade Union Congress. The MTUC and the STUC lack strong powers in respect to member unions, and their chief function is to represent labor on issues of general public interest. They have been handicapped by financial stringency and lack of support by the unions, not all

of which have affiliated. Since mid-1955, a new organization, the Trade Union Working Committee, has appeared in Singapore to challenge the STUC as Singapore's trade union center. The TUWC is a militant left group supported by the Singapore Factory and Shop Workers' Union and the Singapore Bus Workers' Union. Its leaders include persons prominent in the 1945-48 movement.⁶

Both the MTUC and the STUC are affiliated with the International Confederation of Free Trade Unions. Relations with the ICFTU have been poor because of the latter's preoccupation in Asia with cold war politics and also because of the paternal and gratuitous advice given by some ICFTU representatives. In 1956, MTUC officers voted in favor of withdrawal from the ICFTU. At the same time, an invitation was received from Sohyo, the General Council of Trade Unions of Japan, to participate in the formation of an Asian international trade union organization.⁷ No public action has been taken. If the Malayan unions do leave the ICFTU, the step will probably not be taken before national independence is obtained. The Singapore Trade Union Working Committee has no known international ties but is uncompromisingly critical of the ICFTU and has recently exchanged fraternal greetings with trade unions in the People's Republic of China.

Employers' associations

Employers' associations, particularly those of European employers, are better financed than the unions. Aside from the government, which is a major employer, the most important employers'

organization is the Malayan Planting Industries Employers' Association, followed closely by the Malayan Mining Employers' Association. These associations maintain close liaison with one another and with United Kingdom employers' organizations.

INDUSTRIAL RELATIONS

The formation of trade unions is regulated by law, and all unions are required to register and to provide information as to their membership and financial resources. The government may refuse to register a union, and an unregistered union is an unlawful association. The registered union obtains rights and immunities, for example, freedom from charges of conspiracy in restraint of trade.⁸ Strikes and "peaceful" picketing are legal. The law also provides for the settlement of disputes through a government-appointed industrial court, courts of inquiry, or arbitration. Arbitration requires the consent of both parties. In industries where union representation is absent or inadequate, the government may appoint wages councils. The government is ordinarily reluctant to intervene in disputes, and the policy has been to encourage independent negotiation between employers and workers' representatives. Employers and unions have been urged to establish permanent consultative or negotiating bodies, and the government has set the example by establishing such councils with its own employees.⁹ A Labour Department has functioned since 1911 and the conciliation of industrial disputes has been one of its principal responsibilities.

⁸ For a comparison of Malayan trade union and industrial relations legislation with that of Great Britain, see Charles Gamba, *Labour Law in Malaya*, Singapore, 1955.

⁹ Modified Whitley Council machinery has been established in both the Federation and Singapore.

⁶ Most of these persons were imprisoned without trial in 1948 or afterwards under the government's Emergency Regulations. In recent years, they have been gradually set free.

⁷ A similar invitation was received from trade unions in Burma in 1955.

The largest plantations, mines, and factories are European owned and managed. European employers have usually recognized, though somewhat reluctantly, unions among their workers. The largest local employers, who are mostly Chinese and Indian, have treated the unions similarly. But small and medium-sized local employers vigorously oppose recognition of unions and often equate unionism with communism. They have fought the unions with every weapon available, including Chinese secret society thugs. Because of this opposition unions are more often found in European than in Malayan places of work. Union leaders have occasionally urged that employers be compelled by law to recognize and negotiate with unions. The government has refused to legislate on this subject, although government officers have sometimes strongly advised employers to recognize unions.

Collective bargaining

Collective bargaining is now fairly well established between the unions and European employers, and Malaya today may have proportionately more workers under collective agreement than any other Southeast Asian country. The days when union officers began wage negotiations with a lightning strike or a press release attacking the employer have to a large extent passed. Nevertheless, difficult problems remain. Cultural differences between employers and union representatives, a paternalistic tradition, and the association of the employer with the colonial power in the minds of union officers and members have made bargaining difficult. Bargaining is usually done on a regional or national level, in spite of the multiplicity of local unions in the same industry. Local grievances are resolved locally although a national union officer often assists in the settlement. Wage demands have been the chief subject for

negotiation. The right to bargain exclusively has not been a vigorously sought object of the unions. But in April 1956, the National Union of Railwaymen demanded and obtained exclusive bargaining rights for cargo handlers at Port Swettenham, the chief Federation port.

The rubber plantations

Industrial relations in the rubber plantation industry deserve special comment because of the overwhelming importance of the industry in the Malayan economy and because the majority of organized workers in the Federation are in the plantation workers' unions. Numerous wage disputes have occurred and arbitration has been frequent. The unions have seen difficult times. A low point was reached at the end of 1954, when the unions proved incapable of halting a decline in wages, which by agreement are scaled to rubber prices. Since 1954 the unions have shown a remarkable recovery, as a result of improved rubber prices, able leadership, the formation of the National Union of Plantation Workers, and financial and organizational help from abroad. Industry-wide economic action in support of demands was not attempted until May 1956, when the NUPW called upon all plantation workers to go slow in their work. The action was effective in winning wage increases and vacation and overtime benefits. A consultative council has been established, and union leaders have promised co-operation with the employers in the industry's struggle to compete with American-made synthetic rubber. Relations in the industry may now be called good.

Strikes

Constitutional reforms introducing a substantial measure of self-rule in both the Colony and the Federation in 1955 have been accompanied by numerous

strikes. In part the strikes have been due to the workers' demand for a higher real income. Some strikes have been a by-product of the relaxation of colonial rule. In Singapore, however, strikes have been undertaken for specific political purposes.

TRADE UNIONS AND POLITICS¹⁰

Sympathetic Malayan observers have hoped that the trade union movement might serve several political ends: to help resolve the plural-society problem by dividing the population on class rather than ethnic lines; to exert a liberal influence in a society top-heavy with conservative elements; and to serve as a training ground for political democracy. The unions have had little success in reshaping society on class lines. Class consciousness exists among Indian and Chinese workers but communal consciousness is stronger. Communal barriers between unions have disappeared only at the top level of leadership and even there somewhat uncertainly. Representatives of the unions have often voiced a liberal viewpoint but have lacked the popular support to command respect. Only as an exercise in parliamentary practice have the unions fully realized a political role.

Trade unionists have had little doubt that labor should participate in politics. But they have differed rather sharply on *when* the unions should attempt to play a political role. One view has been that even under the best-intentioned colonial government—which some union leaders do not believe they now have—unions are limited in the economic action they can take. Political action is therefore necessary to achieve economic

objectives. This view is buttressed in the minds of some unionists by the belief that economic action alone, particularly in respect to the local employer, will not ameliorate oppressive conditions quickly enough. The other view has been that, before engaging in politics, better trade union organization is necessary in order to provide a firmer foundation for political action. To enter politics prematurely might result in divisive influences, exploitation by political adventurers, and ultimately the ruin of the unions.

The labor parties

While debate continues, many trade unionists as individuals have engaged in politics. The present popularly elected coalition government of Singapore is led by the Labour Front party and the Chief Minister of Singapore, Mr. Lim Yew Hock, is a former officer of the Singapore Trade Union Congress. The Labour Front is led and supported by professional persons and trade unionists. The People's Action party, among the opposition parties in Singapore, is similarly supported. In the Federation, the Labour party of Malaya, led mainly by trade unionists, has had some successes in local elections, but it failed to win any seat in the important Federal elections held for the first time in July 1955. Labor political parties have been handicapped by lack of funds and factionalism. Neither in Singapore nor in the Federation do formal ties exist between the unions and the labor political parties. Partly because of legal restraints and partly out of choice, the trade unions have not supported the labor political parties. Pressure on the unions to take part in politics is increasing as independence approaches.

The labor political parties, preoccupied with obtaining national independence, have seldom detailed their social and economic programs. Broadly,

¹⁰ For the background to recent political developments in Malaya, see various articles by F. G. Carnell in *Pacific Affairs*, 1953 to date, and the author's "Trade Unions and Politics in Malaya," *Far Eastern Survey*, Vol. 24, No. 3 (March 1955), pp. 33-39.

their leaders profess democratic socialism and want higher living standards with adequate housing, medical care, and education for all. With qualifications, they favor public ownership of important industries. The Labour party in the Federation and the Labour Front in Singapore have been advocates of moderate socialization and a comparatively gradual approach to resolving social and economic problems. The People's Action party on the other hand has championed a more vigorous approach and has adopted aggressive tactics. The PAP, being an opposition party, has been able to play on popular feelings without having to bear the responsibility of satisfying popular demands.

Unions, students, and PAP in Singapore

An exception to the absence of trade union support for labor political parties is found in Singapore. The Trade Union Working Committee together with the Factory and Shop Workers' Union and the Singapore Bus Workers' Union has received aid and encouragement from the People's Action party, for which it has become a kind of labor wing. These unions have called strikes for the purpose of embarrassing the Labour Front government. Their officers have looked upon themselves as the successors to the trade union movement of 1945-48 and even of the suppressed prewar unions of unskilled workers.

Intimately associated with the PAP and with the unions are the youths in Singapore's Chinese schools. Traditionally these schools have served as centers for political indoctrination and currently they serve as covers for Communist activity. The students possess a tremendous pride in being Chinese and have a strong admiration for the People's Republic of China. They have supported the PAP and striking workers, and in turn have been defended by

the PAP. Undoubtedly PAP leaders have accepted, if not actually sought, Communist support for the purpose of building an organization with as wide a popular base as possible.

In mid-1956, the Labour Front government began a campaign to suppress Communist or near-Communist elements in Singapore. In October, matters reached a crisis. While the PAP called for the resignation of the Labour Front and new elections, clashes occurred between students and workers on the one hand and police supported by troops on the other. Several hundred arrests were made, including most of the officers of the Factory and Shop Workers' Union and the Singapore Bus Workers' Union. One of the PAP's elected representatives in the Singapore Legislative Assembly, who is also an officer of the FSWU, was among those arrested. Under Singapore's public security legislation, these persons may be detained without trial.

On the British model

By way of conclusion we may observe that the object of British trade union policy in Malaya has been to encourage the development of a trade union movement based upon Western, and particularly British, experience in the belief that such a movement would contribute to social and economic stability and be a bulwark against communism. The policy has had to overcome many difficulties in implementation, not least of which has been the need to yield occasionally to contradictory policies with a higher priority. Moreover, the British authorities have been in the dilemma of trying to encourage democratic trade unionism while at the same time having to guard against political subversion and to suppress Communist terrorism. The difficulty of this task has been surpassed only by the difficulties met by union leaders in attempting to organize

under such conditions. The British do not expect that all the principles and institutional forms which they have introduced will remain unaltered. Undoubtedly the extent to which industrial relations on the British model prevail will depend in large measure on the extent to which the unions find the British experience workable in dealing with employers. But whatever the future, the effort has been a laudable one, and with the help of able Malayan trade unionists it has been accompanied by a measure of solid achievement.

PROBLEMS AND PROGNOSIS

Malayan unions are still faced with several problems which will vitally affect their future development. The most serious problem is to bring Chinese plantation, mine, and factory workers, who are still alien in outlook, into the unions. These workers are prone to support Communist or militant trade unionism, and if they cannot be induced to accept the moderate leadership of the present trade union movement, dual and antagonistic trade union movements are a strong probability. In a struggle between moderate and militant (that is, Socialist and Communist) labor movements, the moderates would probably succumb either to the attacks of the militant unions or to the repressive measures of a Malayan government less inclined to discriminate between union ideologies than the British authorities.

The failure of past efforts to bring the Chinese into the unions suggests that the task may be impossible. In Singapore, this question has been resolved, for after seven years of quiescence many thousands of workers have again declared in favor of militant trade union leadership. Moreover, the moderate trade union leaders rather than the British colonial authorities now bear the burden of responsibility for the

suppression of militant trade unionism. Yet there seems to be no alternative to suppression, aside from social and economic reforms which would necessarily extend over many years. In the meantime, there is danger that genuine liberal forces may also be suppressed. In the Federation, Chinese workers may yet be brought into the moderate trade unions, although there are indications that a militant left trade union movement will emerge within a year or eighteen months.

Aside from the problem of the allegiance of the unorganized workers, which is actually a manifestation of Malaya's plural-society problem in the trade union movement, the trade unions are concerned with questions involving the Malayan economy.¹¹ With a population which may double in twenty-five years, Malaya requires an expanding economy if present relatively high living standards are to be maintained, and if demands for higher standards are to be met. Further expansion of Malaya's basic rubber and tin industries seems unlikely; the outlook for plantation rubber is especially uncertain in view of the steady development of the United States synthetic rubber industry. Nevertheless, Malaya is probably the most highly industrialized nation in Southeast Asia, and prospects for continued industrialization are on the whole good. Labor strife, Communist subversion, and doubts about future political stability, chiefly in Singapore, have resulted in some flight of capital. The present popularly elected governments have asked employers and unions for industrial peace in the interest of retaining and attracting investment capital.

The trade union movement alone cannot find the solutions to Malaya's eco-

¹¹ See The International Bank for Reconstruction and Development, *The Economic Development of Malaya*, Baltimore, 1955.

nomic and social problems, especially not the plural-society problem. Some of the problems will be resolved by events outside Malaya. But the trade union movement may be able significantly to influence the policies chosen by Malaysians in the direction of liberality and moderation. The target date for political independence for the Federation of Malaya is August 1957. Once independence is achieved, social and economic problems as well as the plural-

society problem will come into sharper focus. The trade union movement will have to be united and strong if it is to weather the political storms of the first years of independence. With this in mind, union leaders are continuing to improve their organization, conserve their financial resources, and extend their membership. With determination and luck, the trade unions may in time play a decisive and constructive role in Malaya's public affairs.

Problems of Indian Trade Unionism

By OSCAR A. ORNATI

Abstract: In India, labor had joined in the struggle for an independent state and was in sympathy with the aims of the new government. Soon, the deterioration of economic conditions led labor to employ traditional tactics to secure the goals of better wages and working conditions. The government was forced to consider whether these tactics were consistent with national needs of maximum production and self-sufficiency. A choice had to be made between free collective bargaining and state-controlled bargaining. India chose the latter as the best means of helping to bring about a socialist state. The political character of the major trade union federations has facilitated the operation of the system.—Ed.

INDIAN trade unions enjoyed in pre-independence days a crucial role in the country's political life. National independence and the victory of the Congress party brought about a series of new economic and social goals—now embodied in the governmental Five Year Plans—in which trade unions have no important independent functions. Current institutional arrangements for handling labor relations make unions subservient to the state. The labor movement is seeking new directions. Unless it can acquire a sense of economic and political identity, with sinews to match, it may be headed for atrophy.

The study of the role and impact of any labor movement, and particularly of labor movements in underdeveloped economies, requires raising the question of who participates in the establishing of rule-making relationships in the area of industrial labor, and how. Here this question is examined through a description and evaluation of the relationship evolving between the state and trade unions in the search for forms of labor relations viable in the Indian economic and political situation and con-

sistent with the structural characteristics of industrial management and of the labor movement.

AFTER INDEPENDENCE

All sectors of Indian opinion participated in the fight for independence. Organized labor was among the most vociferous.¹ Although Indian ideas as to the constitution of the new state were on the whole inchoate, there existed throughout a desire for some kind of socialist state. With this, too, labor went along enthusiastically. When independence came, there existed therefore broad areas of labor-government agreement. The unresolved core of the

¹ In a different context I have characterized Indian trade unionism as "nationalism with the union label." Cf. O. A. Ornati, "Organized Labor's Impact on Indian Industrialization" in Robert L. Aronson and John P. Windmuller (Eds.), *Labor, Management, and Economic Growth* (Ithaca, N. Y.: Cornell University, 1954), p. 149. For an analysis of labor's contribution to independence, see also S. D. Puneekar, *Trade Unionism in India* (Bombay: New Book Co., 1948) and O. A. Ornati, *Jobs and Workers in India* (Ithaca, N. Y.: Cornell University, 1955).

Oscar A. Ornati, Ph.D., Ithaca, New York, is Assistant Professor at the Industrial and Labor Relations School, Cornell University. He is author of *Jobs and Workers in India* (1955) and was recently a Fulbright Lecturer at the University of Trieste, Italy.

problem rested in the meshing of the needs and aspirations of organized labor with the broader needs of all India.

The fall in real wages, decreasing employment possibilities, demands for sharing, through "bonus payments," in the employers' wartime profits, and the extensive layoffs of 1947-49 and 1950 led to a deterioration of industrial relations and served to focus the issue.

For labor and government the central questions were: To what extent are labor's traditional goals and tactics, with concomitant strikes and losses of production, consistent with national needs for maximum production and economic self-sufficiency? How far can government permit or assist labor to shift the "internal terms of trade" to favor industrial workers?

The answers to these questions required, first of all, clarification of government and trade union policy on collective bargaining by choosing between free collective bargaining and state-controlled (tripartite) negotiations.

In facing the problem, organized labor, as usual, claimed to speak for all labor. Yet organized labor, three and a half million strong, represents only a minority of the economically active population, is unevenly organized, and is split among four competing confederations with differing structures and attitudes.

Structure and organization

Of the four major confederations that claim the allegiance of organized labor the Indian National Trade Union Congress (INTUC) is by far the largest, the most active, and the best organized. The Hind Mazdoor Sabha (HMS), the All-India Trade Union Congress (AITUC), and the United Trade Union Congress (UTUC) follow in order. The labor movement acquired its four-faced character in the period between 1947 and 1949 when, in the heady atmosphere

of political independence, each political group tried to capture the allegiance of the industrial proletariat. At present each confederation is linked to a political party and can be said to express the party's views in the field of labor. The INTUC, with about 1,400,000 workers, is the offspring of the National Congress party; the HMS, with about 800,000 members, is sponsored by the Praja-Socialist party; the AITUC is dominated by the Communist party of India (CPI); and the UTUC is tied to various Trotskyite refugee splinters of the CPI.

Worker organization, in spite of the fact that it is made up of about 35 per cent of the nonagricultural work force, is limited and uneven in its penetration.

Indian workers are, in most cases, attached to trade unions only during periods of strife. If aroused to action they follow the leader or the union which presents the most attractive program. They continue to pay dues only if immediate improvements are obtained. A union's strength is generally measured by the number of people it attracts to a rally or a strike.²

Among the states, workers in Bengal, followed by Bombay and Bihar, are the best organized. Among industries, textiles, where unionism has the longest history, have the largest percentage of organized workers. The majority of railroad workers are also organized, as are many of the workers in the mines and in transport. Confederation-wise, although the INTUC is the largest, it represents a plurality of organized workers only in Bombay, Uttar Pradesh, Assam, and Madhya Bharat; on an industry basis it enjoys a strong position only in non-jute textiles and among plantation workers.

Legal framework of collective bargaining

Postindependence India's legislative framework in industrial relations reflected British wartime legislation, which prohibited strikes almost entirely. The situation has not changed substantially since 1947.

The Indian government's representative at the 1955 International Labor Conference presented his country's policy on labor relations in the following words:

In an economy where development is planned to achieve a definite target under regulation of the State it would obviously be impracticable to leave the vital field of labor-management relations entirely to chance. . . . We have come to the conclusion that, though every encouragement should be given to collective bargaining and voluntary settlement of disputes, the State should be prepared to intervene whenever the voluntary machine fails to work. We believe that the best way of resolving labor-management differences which are not solved by mutual negotiations is not a trial of strength by strikes and lockouts but by an award of an impartial body. Besides during the Plan period, our country cannot afford loss of production consequent on labor-management disputes which can be solved by other methods. That is why the law on the subject in my country provides for compulsory adjudication when the process of negotiation, conciliation and voluntary arbitration fails.³

Implementation of the government's policy takes place through a variety of agencies operating on many levels. The government, either federal or state, may refer disputes to conciliation boards, boards of inquiry, industrial tribunals,

or other instrumentalities whose awards are binding for a fixed period. Such intervention may or may not be linked to an actual or threatening strike. Union participation in the settlement process may depend on whether it is or is not "recognized" by government as "representative." Present-day labor standards are essentially those set forth in a series of awards handed down between 1947 and 1950. To achieve uniformity in conditions a Labour Appellate Tribunal (LAT) was established in 1950. Since that date the Tribunal has handled a very large number of disputes and has been increasingly drawn into the process of determining working conditions.

In addition, to handle broader labor problems on a national level, the government of India built up the already existing tripartite consultative machinery. The Indian Labor Conference and the Standing Labor Committee, as well as several tripartite industrial committees, are the forums in which the parties discuss labor problems and in which the main lines of labor policy are determined.⁴

Evaluation of the system's efficiency is extremely difficult. Along with the recent record of relative industrial peace, one must also note staggering and frustrating delays in adjudication proceedings as well as conflicting decisions. In addition, the implementation of decisions is not easy, as all the parties involved try to use the existing machinery, whenever possible, to their own advantage.

The bank dispute

Some cases bring the governmental machinery into motion at all levels. The so-called bank dispute, for example,

³ "Speech on the Director-General's Report at the International Labor Conference, June 10, 1955," International Labor Conference, 38th Session, *Record of Proceedings* (Geneva: International Labor Organization, 1955), p. 143.

⁴ For a more complete description see O. A. Ornati, *Jobs and Workers in India* (Ithaca, N. Y.: Cornell University, 1955), pp. 157-77 and *passim*.

involved, over an eight-year period, the following: voluntary negotiations; conciliation; a strike; the award of an Industrial Tribunal (the Sen award); the award of another Industrial Tribunal (the Sastry award); a LAT decision; Parliament setting aside the LAT's decision; the resignation of the Minister of Labor, V. V. Giri; workers' demonstrations; the appointment of a special commission, the Gajendragadkar Bank Inquiry Commission; the partial restoration of the LAT's award; and finally an abortive strike.

The bank dispute is reported here—even though only in its barest outline—as an illustration of the interrelationship of labor problems with those of India's economic development. Indeed, when the federal government intervened to modify the Labour Appellate Tribunal's decision it argued that the implementation of this decision would impair banking in the rural areas in view of the additional wage burden imposed. Vigorous growth of rural banking, the government contended, was a necessary prerequisite for the development envisaged by the Five Year Plan.

To note the effect of this system on unions, suffice it to say that the INTUC approved seriatim the bank workers' demands, the Sen award, the Sastry award, the LAT, the government decision setting aside the LAT decision (although it grumbled editorially about the wisdom of interfering with the existing machinery), and the Gajendragadkar Commission, and ended by fulminating against the bank workers and alleged Communist intervention.

COLLECTIVE BARGAINING: PROS AND CONS

Three strands of thought have to be distinguished in explaining India's attitudes towards industrial relations. The first, which favors free collective bargaining and pure and simple trade unionism, is essentially British in origin.

Its advocates are the Western-trained intellectuals that are found scattered throughout the labor movement. Their views carry weight with many HMS leaders and influence the avowed policy of the UTUC. These are the men nurtured on the Webbs and spurred on by the roving ambassadors of the American labor movement and the International Confederation of Free Trade Unions (ICFTU). They find support in the unions of some strategically located industries, such as the railroads; they are occasionally hampered by too outspoken support of their views on the part of unnecessarily progressive employers. V. V. Giri, a devotee of labor unity and formerly a successful negotiator for the railroad workers, was their rallying point. Respected for his long record of trade unionism and for the forcefulness with which he had advocated free collective bargaining, his downfall weakened advocates of collective bargaining.

A second strand of thought, which favors collective bargaining without necessarily rejecting conciliatory and persuasive government intervention, stems directly from the basic faith of Indians in the reasonableness of men and in the ultimate power of the "right cause." There exists in India an ancient and deeply held belief that almost anything can be achieved by an "act of truth," *satya*. *Satyagraha*, "holding on to the truth," achieved India's independence, and many argue that the same approach will help bring the millennium in labor relations. Gandhi's views of labor relations—general though these may have been—are their strongest bargaining arguments. The Ahmadabad Textile Labor Association speaks for this group in clear and emphatic terms.

The third strand of thought speaks of the objective complexity of the issues, delights in macroeconomics, and concludes that India cannot afford to let

the forces of the market operate freely. In this group one finds a large variety of planners. Dedicated to the implementation of the "Socialist pattern," they argue among themselves as to who is more socialistic. They include most of the leadership of the INTUC and some of the theorists of the HMS.

The "Giri approach"

Immediately after independence, free collective bargaining was on the upswing. Forces favoring it appeared strengthened by the postwar increase in trade union membership and, for a while, it seemed that Indian industrial relations would take on a pattern similar to that of the United States and England. The "Giri approach" soon became popular. After his appointment as Minister of Labor, Giri spoke loudly and consistently of the advantages of mutual negotiations. Employers, in particular, seemed to support his approach.⁵ At the Labor Conference of 1952, official spokesmen for HMS, AITUC, and UTUC favored collective bargaining for an even wider area than did Giri himself. Even INTUC went along, declaring that "a stage has arrived when legislation should allow increasingly greater scope for voluntary agreements in preference to constant recourse to Tribunals. . . ."⁶

Giri found support in reasons other than ideological. Among non-INTUC unions there was resentment against government intervention, which appeared biased. Not only was INTUC the creation of the Congress party and thus to be viewed skeptically, but also the sight of the high echelons of government filled with former INTUC offi-

⁵ See, for example, speech by S. P. Jain of the All-India Organization of Industrial Employers at the Twelfth Indian Labor Conference, *Proceedings* (n. p., n. d.), p. 41.

⁶ INTUC, *Annual Report*, October 1951-52, p. 17.

cials added to the impression of government partiality. If the advantages of government support were to go only to INTUC unions, collective bargaining with all its limitations, so argued HMS and AITUC, was to be preferred, and arbitration was to be used only if mutual negotiations failed. Employers, long frustrated by bureaucratic inconsistencies, welcomed greater independence and felt that the removal of governmental interference would favor their position.

But early enthusiasm for free collective bargaining as well as union membership increases soon faltered, and Minister of Labor Giri's resignation in the bank dispute sounded the death knell of free collective bargaining. Opposition to Giri had developed in many quarters. At the highest level, the government was concerned with the implications collective bargaining might have for the economy. The alleged plight of category D banks—the rural banks—exemplified the way in which wage developments might affect the fulfillment of the plan. The Congress party objected to Giri for not being a Congress party member. The state Labor Ministers saw in collective bargaining a challenge to their power and influence in the states.

The greatest opposition to Giri came from labor. Unable to identify specific gains, labor abandoned the Giri approach. Indeed the very structure and orientation of the labor movement, as will be made clear below, limits the movement to giving only lip service to the ideal of free collective bargaining.

Trade union rejection of free collective bargaining

Indian organized labor views collective bargaining as a desirable future goal rather than a presently applicable policy. The causes of this attitude are two: in the first place, the unions are

primarily a labor *movement* dedicated to the establishment of a new society; in the second place, organized labor in India is very weak.

With rare exceptions, Indian trade unions do not accept the society surrounding them. They are engaged in a major effort to change it. In the past, change meant getting rid of the English; now it means bringing about a Socialist state. Indian trade unions are primarily interested in shaping the future; they bother less about pay and present-day working conditions. Trade unions represent the working classes, the broad society, rather than their own membership; consequently they are prone to consider social problems in a broader setting than trade unions in some other countries. The policies of the INTUC on collective bargaining exemplify this attitude most clearly. INTUC feels that compulsory arbitration need not necessarily stifle the effectiveness of trade unions or of the process of collective bargaining. Particularly in disputes in industries vital to the nation's growth and security and in disputes concerned with work force reductions government intervention is viewed favorably.

The same concern with the broader aspects of the problem leads INTUC not to oppose rationalization with great vigor.⁷ Similarly, INTUC favors a less inclusive program of implementation of the minimum wage legislation and, when necessary for the development of an in-

⁷ See the INTUC memorandum to the Planning Commission reported in the *Indian Worker*, July 2, 1955. INTUC's pronouncements on rationalization have, throughout the last five years, remained essentially schizoid. Against the milder form of the official memorandum one must also recall the more blunt pronouncements of some of its leaders, for example, S. R. Vasavada, who refer to the need to see that the "craze for machines should not be permitted to cause starvation among human beings." *Ibid.*, p. 5.

dustry, it is ready to support exceptions to implementation of minimum wage legislation.

The views of HMS, UTUC, and AITUC are of similar breadth. Their programs vary with their party allegiance. HMS and UTUC demand larger investments in the government sector of the economy, more nationalization of industry, more employment, and higher wages. On the other hand they are less concerned with stimulating worker participation in the government-sponsored Five Year Plan. The essential policy of the AITUC rests on the proposition that all wage labor is exploited labor. Consequently, it has little good to say about any government action short of its ultimate goal.

The breadth of trade union interests and demands diverts and limits their interest in bargaining at the plant or industry level. In addition, one of the most important limitations to successful collective bargaining lies in the fact that the employer cannot give the union what it wants, even were he willing to do so. It is because their needs transcend what the employer can contribute that the unions seek worker support in political as well as in economic action. No employer and no group of employers can, alone, give the Indian labor force the employment, the housing, and the higher standard of living it seeks and needs.

Limitations on the unions' bargaining power

The legal framework of collective bargaining provides, as has been seen, for governmental intervention without preempting the possibility of negotiating agreements without government. A few such agreements have been recently negotiated. Outstanding are the agreements in Bombay State Transport and at Tata Steel which provide for exclusive recognition, establish grievance ma-

chinery, checkoff, and job evaluation, and are of a fixed duration.⁸

Although more research is needed in this area, such developments appear to indicate that whenever unions and management reach agreement without government intervention they are able to do so because the economic position of the industry gives the unions greater bargaining power than is normally the case.⁹

Approval of agreements arrived at independently of government is not unmixed. The HMS, for example, criticizes collective agreements arrived at in Ahmadabad as weakening the competitive position of other textile industry employers and unions.¹⁰ In this criticism the HMS focuses on the lack of union bargaining power and, implicitly, underlines why unions are forced to rely on government.

Many factors limit the bargaining power of the unions. Union recognition is one of the most important. All four

⁸ For partial texts of the contracts see *Indian Labour Gazette*, Vol. 13, No. 8 (February 1956), pp. 605-7 and the *Indian Worker*, June 18, 1956.

⁹ Professor Myers' discussion of the relative ease with which rationalization is introduced in some areas seems to substantiate this point. See Charles A. Myers, "Labour Problems of Rationalization: The Experience of India," *International Labour Review*, Vol. 73, No. 5 (May 1956), pp. 431-50.

¹⁰ Frequent references in Indian and American literature dealing with the exceptionally fortunate pattern of labor relations of Ahmadabad fail to underline to what extent these are a result of what could well be called "tri-partite collusive agreements." In any analysis of the Ahmadabad situation it must be remembered that the Ahmadabad millowners are the beneficiaries of the government's lifting of the import ban on Egyptian cotton in those varieties in which it is the biggest consumer. The fact that in their indirect labor costs they do not have to calculate contributions to the Employees State Insurance Fund, which was not extended to Ahmadabad, is another example of how their competitive position is bolstered by government aid.

confederations are conscious of it. Their advocacy of legislation to compel union recognition varies with the hold they have over a given industry or area, since "recognition" or "representativeness," as presently interpreted, may lead to excluding competing unions from the industry or area. The INTUC, which approaches majority status in more situations than any of its competitors, is continually advocating such legislation. "The government should encourage trade unions . . . by recognizing only one union in one center, in an industry, on the basis of numerical strength . . . [with] the sole right to negotiate and settle with employers. . . ." ¹¹

Much more important than norecognition and plural unionism in limiting union bargaining power are the increasing number of unemployed, the dismal poverty of the masses, and employer opposition to unions. To achieve impact at the national level, collective bargaining requires much greater economic development and industrial specialization and a greater economic staying power among the workers, as well as the existence of employer personnel practices, if not "the presence of an enlightened outlook on the part of employer elements." ¹²

The most constant criticism of free collective bargaining appears to be voiced by the leadership of the HMS (although some union groups within this confederation, such as the railroad work-

¹¹ INTUC memorandum to the Planning Commission quoted in the *Indian Worker*, September 12, 1955.

¹² In the 1955 official presentation of the policy on collective bargaining at the International Labor Conference the Indian government delegate argued: "The success of voluntary negotiations and collective bargaining presupposes the existence of a united trade union movement and an enlightened outlook on the part of employer elements, which it has taken the advanced countries of the West long years to develop." See International Labor Conference, *op. cit.* (note 3 *supra*), p. 143.

ers, do not go along with it). It has noted the futility of employer-employee negotiations until the government grants unions freedom to strike and picket, and related rights. The situation was recently summarized by saying that "the private machinery of voluntary negotiation and arbitration is *irrelevant in the context of the situation of industrial relations in our country.*"¹³

POLITICAL WARFARE AND RELATIVE INDUSTRIAL PEACE

The unions' rejection of collective bargaining and the yielding of initiative in wage matters were made less difficult for them by government and party action. The government favored the workers through many decisions that satisfied some of their immediate short-range needs as well as many of the broader goals. Much was said about the exalted position of labor in the future of India. Some labor leaders were given social recognition and placed in important government positions. Such governmental activities helped assuage union demands and, at least in part, contributed to the relative stability in industrial relations of the last four years.¹⁴

Trade union gains and unfulfilled requests

Government did a good deal to satisfy trade union demands. "Safeguards" that unions demanded in connection with rationalization were introduced by legislation requiring employers to pay layoff compensation and regulating rehiring.

Industrial tribunals helped clarify areas of controversy with decisions that,

more often than not, satisfied labor. To provide a bonus—important in many disputes—was declared a permanent employer responsibility and understood to be the supplement by which minimum wages were brought up to the level of the "living wage." Much of the dispute legislation has been interpreted to permit unions to forestall unfavorable decisions. Skillful use of existing machinery thus is a form of economic pressure. In addition, to balance the union's inability to strike, the Labour Appellate Tribunal forbids employers to shut down—even for a single day falling between two holidays—while a dispute is pending.

Labor unions are exerting their influence also through the tripartite consultative machinery. Such efforts are often successful through the co-operation of the government representatives; for example, in the dispute following the 1953 crisis in the tea industry, labor received several concessions, in spite of the rigid opposition of the employers, through the "conciliatory" efforts of the government representatives.

Government intervention favoring trade union demands is also apparent in specific acts partially unrelated to trade union pressures. In one case, import licenses for new textile machinery were denied in order to avoid the unrest which threatened if employment were curtailed.

Yet unions do not meet with success in all their ventures, and they do not hesitate to be critical of government action. The unions' most concentrated fire was recently directed against the Labour Appellate Tribunal, with many of whose decisions the unions have been dissatisfied, and against the government's failure to pass legislation strengthening unions.

The LAT is viewed as incompetent in labor matters, as overly concerned with industry's needs for capital ploughbacks, and as displaying "... a consistent

tendency . . . to be anti-labour."¹⁵ In spite of mounting trade union pressures that it be abolished and government promises to do so, the tribunal is still going strong.

In their criticism of government action or inaction unions do not hesitate to remind the government of their own political strength. Even INTUC, generally committed to government support, likes to remind the state and the central government of its dependence on the vote of the industrial workers:

... on the revision of minimum wages . . . [the INTUC Assam Branch] considers the government notification as an instance of abject surrender to the industry by the Government at the cost of labour, whose vote alone contributed not less than 48 members to the Congress Party in the Assembly in a House of 108 members. . . .¹⁶

Other confederations highlight other government failings. HMS notices government failures in the field of housing; it notes how, in spite of continual demands, the cost-of-living allowance has not been integrated with the basic wage. In evaluating the tripartite machinery, the Socialists call it deadlocked and argue that "the pressures to break this deadlock must obviously be generated from the side of labour."¹⁷

The Socialist pattern of society

The essential payoff for union quiescence in demands for wage increases was in government action to help unions achieve their broader goals. The national impetus behind industrialization and commitment to the "Socialist

pattern of society" permits the government to substantiate its claim of working for the welfare of the masses. That the Indian economy has moved "off dead center"—indeed since 1951 a remarkable acceleration in the rate of growth has taken place so that total output has grown substantially faster than population—and that the second Five Year Plan leans heavily upon industrial development can be interpreted as another sign of interest in, and achievement favorable to, the industrial masses.

Nationalization of life insurance, steeper taxes on dividends, a new statement on the nationalization of mining, creation of a ministry of steel to control steel production, trade pacts with Communist countries—"so that our industrial and economic policies might reflect the philosophy of coexistence"—and taxation on bonds were all reported at the 1956 INTUC Congress as helping the lot of the worker. If non-INTUC unions are less prone to see labor's gain in all government action, they nevertheless recognize that government is moving in a direction consistent with the labor movement's avowed ends. The debate between the government and the trade unions in general and that between the INTUC and other confederations thus boils down to one about timing and methods rather than about goals and ends.

Worker participation in management

Potentially the most important gain of the Indian trade unions has been government encouragement of worker participation in management.

As was the case in Germany, "coparticipation" is hailed as industrial democracy's victorious climax. What "coparticipation" in India will mean is, as yet, unclear. It has been presented as meaning the "inclusion of workers' representatives in the management, i.e.,

¹³ R. Kulkarni, "Repercussions of Ahmadabad Bonus Agreement," *Janata*, July 10, 1955. (Italics mine.)

¹⁴ See "An Index of Industrial Relations," *Indian Labour Gazette*, Vol. 13, Nos. 7 and 8 (January and February 1956), pp. 483-90, 566-68.

¹⁷ *Janata*, May 22, 1955.

the Board of Directors, in all concerns," or as meaning that "workers are to acquire and hold shares in the establishment. . . ." It has also been understood to require that "workers be given proper training in the techniques of production . . . and administration of the industry." Other references, particularly a euphoric description of a plant in which "coparticipation" is already a fact, make it appear as no more than a multistep grievance procedure, topped by a meeting between the managing director and the union leader. Whatever form it will take, it is bound to contribute to the development of organization at the plant level where so little has been done and so much is needed.¹⁸

CONCLUDING OBSERVATIONS

Two central considerations emerge from this brief survey: First, it appears clear that the unions are not going to "go it alone" in the sense of independently setting, or trying to set, the rules regulating the labor-management-government relationship. Second, the government-trade union duologue is far from ended.

It is improbable that employers will in the near future have a greater influence than at present in setting the rules regulating industrial relationships. The wide acceptance of the Socialist ideology militates against the acceptance of the "employer ideology" at the broad national level. In addition, the fact that managerial practices in the area of personnel are so undeveloped handicaps management in initiating, at the plant level, policies which might both improve working conditions and lead to greater managerial influence in the rule-setting process.

¹⁸ On the limited role of the union in the plant see Van Dusen Kennedy, "The Role of the Union in the Plant in India," Industrial Relations Research Association, *Proceedings*, 1955 (Madison, Wis., 1956), pp. 249-64.

The last years have seen considerable improvements in the Indian industrial worker's standard of living. Indeed, real wages have increased, and comparisons of Indian average per capita income with that of industrial workers show the latter to be over three and a half times that of the former. Thus, industrial labor is rapidly becoming a privileged class.

To what extent improvement in the standard of life of the industrial worker is due to trade union action cannot easily be determined. That the pressures of organized labor have contributed is beyond discussion.

The strategy the labor movement has been forced to adopt is a difficult one. It requires continual development and implementation of the movement's broader aims as well as concern and recognition of current worker needs. It is here that one finds the essential dilemma of the Indian labor movement. On the one hand, unions have continually and persistently to cajole government and party to be aware of labor's needs. If this is to be effective, the unions must conduct extensive, continual, and repetitive ideological education in depth. On the other hand, workers are more responsive to action which will satisfy immediate shop level needs. To achieve the movement's broader aims, the unions must satisfy the more immediate needs. Structurally, the labor movement is better adapted to fulfill the first than the second half of its dual role.

The non-INTUC unions have a less difficult role in play. Not being saddled with the responsibility of ensuring worker co-operation for government schemes and with a thin, yet well-distributed membership, AITUC, HMS, and UTUC harass the INTUC unions continually by appeals to the workers designed to highlight contradictions between over-all and immediate member interest. By concentrating, literally, on

the quality of the cup of tea provided by the employer, the competing confederations capitalize on the perennial debate of how best to improve the workers' lot.

The problems of trade unions in the Socialist state thus do not appear to vary with the level of economic development. Either in economically advanced or in underdeveloped economies the task of the Socialist trade union is said to be "to awaken democratic consciousness among the workers and to ensure that the toiling masses get an equitable share of the new wealth that will be created." In trying to fulfill the first of these two tasks, unions closely connected with the dominant party run the risk of becoming pliant and subservient; their success in fulfilling the second task depends upon labor's bargaining power.

Interlocking of government, Congress party, and INTUC

This analysis has implicitly posited government and trade unions as separate and juxtaposed in their competition for a greater say in shaping the future framework of Indian industrial relations. Yet the fact that the crucial decisions in the area of industrial relations are made by a relatively small group of men who appear to manage the whole system of socioeconomic relations suggests the advisability of research in terms of alternative analytical frameworks. Indeed, the precise manner in which government policy is implemented through the multiple chains of command is not known. One is struck by the fact that the Congress party, the INTUC-

associated trade unions, and the government operate in close connection, and by the fact that key positions at all levels in the governmental structures are held by members or sympathizers of the Congress party. The technique by which responsibility is split among these chains of command is not clear. The fact that cabinet ministers participate in the discussions of the executive council of the INTUC beclouds the issue and underlines the risks of trade union subservience to party discussed above.

Lest this be misunderstood, it must be made clear that there is no reason whatsoever to assume that the small group of men who manage India's labor policy do so for obvious selfish interests. The exact opposite is the case. The formal aspects of democratic procedures are fully respected at all levels of party, government, and trade union. That the reality of democratic processes is absent in differing degrees is due not to a lack of desire on the part of the leaders but rather to the always reported, but never overemphasized, lack of preparation of the workers and to the pervasiveness of social and class distinctions.

In this context the fact that the Indian labor movement is divided among competing federations is a blessing in disguise. AITUC, HMS, and UTUC are the gadfly that prevents INTUC from becoming a passive labor-front type of organization and the check—strongly reinforced by India's commitment to constitutional democracy—to possible excessive government and party zeal.

Labor and Nationalism in the British Caribbean

By GEORGE T. DANIEL *

Abstract: In the British Caribbean territories, the labor movement and trade unionism have been vehicles for nationalist and home-rule sentiments. The first trade unions appeared after World War I, but their efforts to raise wages and living standards by legislation largely failed, owing to lack of adequate political representation. The depression of the thirties worsened the situation of the workers and led to widespread disturbances in 1937. As a result of recommendations by a Royal Commission in 1939, universal suffrage was introduced and good labor laws enacted. Since then labor leaders have gained political offices, and the labor movement has become increasingly respectable and effective.—Ed.

LIKE most underdeveloped areas today, the economic and social pattern of the British Caribbean territories is changing at a quickening pace. Among the factors affecting this change, the labor movement is the most dynamic. In countries where poverty is a chronic ailment, "freedom from want" shares top priority with "freedom to govern." Accordingly, the mass movement in the British Caribbean, as in some countries elsewhere, is pincerlike. Political control or sovereignty represent one arm, and economic sufficiency or independence the other. The demand for self-government can scarcely be separated from demands for higher living standards.

ECONOMIC AND SOCIAL STRUCTURE

The economy of the eleven islands and two mainland territories constituting the British Caribbean is almost entirely dependent upon agriculture. Crops for ex-

* The views expressed in this article are those of the author and do not necessarily represent those of the United Nations Trusteeship Secretariat.

port, chiefly sugar, requiring an abundance of low-cost labor, dominate the economy. Even where minerals exist, like oil in Trinidad or bauxite in British Guiana and Jamaica, most of the inhabitants are dependent directly or indirectly upon agriculture for their livelihood.

Following the tradition of African slave and East Indian indentured labor, large plantations or estates, utilizing the better land, still prevail. Landless laborers and small peasant farmers endeavor to exist on the remaining land, which is generally poor and distributed in family holdings uneconomic in size; their agricultural methods are invariably primitive. In consequence, the basic economic needs of the population are not met.

Socially, there are three classes. At the top there is an official and planter-merchant class, usually white and foreign. Next there is a less well-defined middle class, mainly professionals and mulattoes. Finally, a broad base is made up of the so-called working class of African and East Indian descent. As

a rule the upper classes live a life somewhat apart from the rest of the community, confining their role mainly to direction and supervision. Absentee landlords are not uncommon. However, the landowning class or their representatives (foreign or native) are identified with the government and the British colonial officials—the assumption being that the prime purpose of Crown Colony government is to protect and enhance British colonial investments.

Concerning allegiance to "King and country," all sections of the community are united in their loyalty to the throne, there being only one throne. But as regards country, there is some conflict. To the upper class "country" means Great Britain, in the middle class there is uncertainty, with opinions divided between the mother country and the territory, whereas to the working classes, by and large, the territory is the only country they know. Low wages, inadequate housing, malnutrition, the ravages of energy-sapping diseases, aggravated by the typical hierarchical pattern of decision making and dictation from the top and by remote control from London, all contribute to the urge for real democratic self-government at the local level. It was under these adverse circumstances that the labor movement in the British Caribbean was born and developed.

RISE OF TRADE UNIONISM

The labor movement received its start at the close of World War I, following the return of the British West Indian Regiment. To be exact, it was on January 11, 1919, that Hubert Nathaniel Critchlow, who has been called the father of the British Caribbean labor movement, organized the British Guiana Labor Union, the first labor union in the area. It was one of the first labor unions to be organized in the British

colonial empire. In 1920, the Trinidad Workingmen's Association, based on a previous "workmen's friendly society" founded in 1906, was reorganized under the leadership of Captain Andrew Arthur Cipriani and registered under the Companies Ordinance.

LABOR LEGISLATION

Until 1930, the only legislation in British colonies which gave a legal basis for trade union activity existed in British Guiana, Hong Kong, Jamaica, Malaya, and Northern Rhodesia.¹ The first pieces of labor legislation to be introduced in the Caribbean were Trade Union Law No. 37 of 1919 in Jamaica and Trade Union Law No. 17 of 1921 in British Guiana. Several years elapsed before the enactment (in 1933) of a comparable law in any other territory.

These laws, providing for the establishment of trade unions and defining their functions, powers, and responsibilities, were drafted on lines of sections 2 and 3 of the United Kingdom Trade Union Act of 1871. They were simple. They required the registration of every trade union, and the submission of annual accounts and balance sheets to the Registrar of Trade Unions. With respect to raising funds for political purposes, specified rules and the British method of "contracting in" were applied. However, the laws were seriously limited since they did not provide for peaceful picketing or protect union funds from liability arising from tortious acts. Trade unions, in consequence, were merely declared lawful for civil purposes. Strike action, the buttress of union bargaining power, was still paralyzed. The labor leaders strongly resented this and the leader of the Trinidad Workingmen's Association, Captain

¹ Walter Bowen, *Colonial Trade Unions*, Fabian Colonial Bureau Pamphlet (London: Fabian Publications Ltd., October 1954), p. 4.

George T. Daniel, M.S., New York City, is Acting Chief of the Caribbean Section in the Division of Information from Non-Self-Governing Territories of the United Nations Trusteeship Department. He was formerly general secretary of the Trinidad and Tobago Teachers' Union.

Cipriani, refused to register his organization under the Trinidad Trade Union Ordinance of 1933. Instead, he dissolved it and formed the Trinidad Labour party, the first political party to be established in the British Caribbean.

The obvious weakness of the early trade union laws, the fact that "employers and managers generally were strongly, and in some cases, even bitterly, opposed to trade unions . . .,"² and the fact that "the government also . . . adopted, to say the least, a cautious and ultra-conservative attitude . . .,"³ left labor leaders no alternative but to exploit to the full the British parliamentary processes in order to secure legislative solutions for their economic problems. Yet, with the limited representation at their disposal, even this approach proved painfully slow and frustrating.

DISTURBANCES OF THE 1930's

Meanwhile the world depression of the 1930's had knocked the bottom out of the "sugar basket" in which all the economic eggs of the area rested. Unemployment became rife and was increased by the return of many migrant workers from adjacent lands, such as the Panama Canal Zone and the United States. The steady natural growth in population worsened the situation. The pressures were cumulative. In the words of Major Orde Browne, "This severe trial was imposed upon a society ill-designed to withstand it; discontent and unrest culminating in disorder were the inevitable concomitants."⁴ Norman Manley, leader of the People's National

party of Jamaica, summed up the situation graphically:

. . . in this historical process of the Caribbean people, the common man, alive to these conditions, would no longer endure them and was prepared—and rightly so—to raise hell in his own way to call attention to his wrong.⁵

The following calendar of events⁶ involving considerable damage to property and loss of life indicates how drastic and widespread the revolt became:

May-June 1934	Disturbances on sugar estates in Trinidad
Jan. 1935	Disturbances in St. Kitts
May 1935	Strike of wharf labor at Falmouth, Jamaica, followed by disturbances
Sept.-Oct. 1935	Disturbances on various estates on British Guiana
Oct. 1935	Rioting in Kingstown and Campden Park, St. Vincent
June 1937	General disturbances in Trinidad (including strikes and riots in the oil fields and in sugar estates)
May 1938	Disturbances on Frome estate, Jamaica
Feb. 1939	Disturbances at Leonora plantation and neighboring areas in British Guiana

THE 1939 ROYAL COMMISSION

As a consequence, His Majesty's government in London in 1939 appointed a Royal Commission to investigate the widespread disturbances and to make recommendations. Included in the Com-

mission was Sir Walter Citrine, then the general secretary of the British Trades Union Congress.

Among its principal recommendations the Commission advocated (1) constitutional reform and (2) progressive trade union legislation. Reform, the Commission held, would ensure "that the elected element in the Legislative Councils shall be as truly representative as possible." Accordingly, it urged universal adult suffrage.

With constitutional advance and the advent of universal adult suffrage, the working masses came into the political picture for the first time in an effective way, especially as they were now reinforced by an increasing number of the "black intelligentsia." This popular emergence needed leadership, which the hitherto marginal mulattoes were willing to provide, as they had no choice but to ally themselves with the movement. The rising tide of nationalism thus tended to attenuate color and class differences within the British Caribbean community.⁷

In this social revolution, the labor movement played a major role. Concurrently with constitutional change came legislative provisions enabling trade unions to engage in peaceful picketing and exempting them from torts. The Commission had pointed out that "the Trinidad disturbances must be traced to the more or less general sense of dissatisfaction for which there was no adequate means of articulation through recognized machinery of collective bargaining."⁸ Labor Departments headed by British trade unionists were therefore quickly set up in most territories to foster trade union development and

establish collective bargaining machinery as a means of settling industrial disputes.

TRADE UNION ORGANIZATION AND MEMBERSHIP

Until 1938, labor fought for the proper establishment and legal recognition of trade unions. The era following the disturbances saw the rise of the trade union movement. There was a rush to join a union regardless of worker classification or even the aims of unions. Instead of fear or indifference to union membership, it now became fashionable for workers to belong. By 1939, about sixty-five trade unions with an estimated membership of 62,500 had been formed, of which fifty-nine were registered under the law.⁹

The names of such trade unions as The British Guiana Manpower Citizens Association, The Grenada Manual and Mental Workers Trade Union, The Bustamante Industrial Trade Union, The National Workers Trade Union of Jamaica, and the British Empire Workers', Peasants' and Ratepayers' Union of Trinidad indicate the all-inclusive nature of the membership and the political and nationalist character of the movement.

The introduction of legal provisions in support of trade unions resulted in an immediate and spectacular rise in the number and membership of trade unions throughout the British Caribbean, as Table 1 indicates.

However, membership figures of British Caribbean trade unions, like most statistics in underdeveloped areas, are open to question, particularly since the definition of trade union membership is still subject to a variety of interpretations. "Once a member, always a member" is applicable in some instances; in

others, supporters of the union, although not workers in the customary sense of the word, are considered members. Being in "good financial standing" is not a strict requirement in most unions for membership or even, in some cases, for the exercise of voting rights. This does not necessarily imply "padding the roll" but rather expresses a local identification of fellowship with membership, a probable carry-over of the extended family system. This phenomenon is not peculiar to trade unions. With increasing understanding of trade union practices, the trend is toward the acceptance of membership as a duty with rights, responsibilities, and benefits.

Because of the historical antecedents of the British Caribbean working class, it is understandable that there should be a universal need for protection and that workers should see the trade union as the means for providing it. Workers believe that the purpose of the union is not only to protect them from want by providing a job but also to protect them in the job, and even to protect them

against any problems arising outside the job. The union becomes an organization for protection anywhere and everywhere. To many workers, the union is also a protest organization, and union meetings become a sort of "grippers' concert." Frequently even nonworkers join unions to secure protection and to protest grievances.

World War II increased and regularized employment throughout the area. In addition, construction of United States Army and Navy bases in some of the larger territories provided employment at higher than accustomed wages and induced migration from the more depressed smaller islands. This measure of prosperity gave workers a sense of satisfaction with, and obligation to, trade union leaders, especially those who had played a prominent role in the disturbances of the 1930's and had suffered imprisonment. When constitutional reform allowed for a wider measure of representation, the workers made the "martyrs" of the disturbances the "heroes" of the ballot box.

LABOR LEADERS

In this way men like Alexander Bustamante of Jamaica and Uriah Buz Butler of Trinidad came to the fore in the British Caribbean labor movement. They provided the spark which set the revolt in motion and paid for it with imprisonment. This act of sacrifice made them heroes in the sight of their devoted followers. In the eyes of the workers, these men could do no wrong, and nothing that could be done for them was too much. The leaders capitalized on this allegiance and never failed to dramatize themselves in order to maintain their position.

Both Bustamante and Butler displayed qualities of the flamboyant demagogue, almost hypnotic in their influence over an illiterate following. Generally astute, they displayed at times exceptional religious fervor; extensive quotation from the Bible in support of their actions appealed strongly to followers whose only contact with literature was, at most, the Bible and the Book of Common Prayer. Instead of reasoning things out with their members, they preferred to determine the issues as if by Divine Right. Their words and deeds showed them no less committed to nationalism than their predecessors in the labor movement. Whatever may be said of Bustamante, he was first and foremost a Jamaican and wanted the best for Jamaica. His often expressed wish to be governor in his own country is evidence of this strong nationalist viewpoint.

Typical of the labor leadership actively engaged in the process of quickening this national consciousness, over some twenty-five years or so, was Captain Cipriani, President General of the Trinidad Workingmen's Association (later the Trinidad Labour party). Cipriani, a Corsican by birth, was educated in Trinidad and lived there most of his life. A man of intense national-

ism, he infused his sentiments into the working-class movement of Trinidad. The following extract, which is typical of his speeches in the Trinidad Legislative Council, exemplifies his nationalist feelings:

I am not concerned with what the Secretary of State's opinion is as to matters concerning my country; and whether it be Lord Milner or plain Jimmy Thomas, to me, they are only ordinary mortals and strike no fear in my soul.

But the oil in this country belongs to us; the whole of this country belongs to us, it is God-given; and it is for us to get the best and the most fair and reasonable share of the wealth of our own country. That, Sir, is only the natural aim and aspiration of honest and right thinking people, and if I have learned one lesson from the Englishman, and a lesson which will serve all in good stead, it is that "The Englishman's home is his castle," and in the same way and by the same process of reasoning and argument, my home, which is Trinidad, is my castle, and I look forward through that teaching and through that sentiment to the day when the British Government will say to us, and I know they will say it, no matter how difficult and no matter how long the trail, no matter how deep the sand or how steep the hill, one day, they will say to us yes, we agree you must hold and control the administration of your own country and we will give you what we have given to the other parts of the great Empire, a full measure of Dominion status. Until that time comes, we, like true, loyal, honest, and devoted members of the Great Commonwealth of Nations, must fight on and struggle on for the things that are ours, for the right to live in our own country and for the right to hold and control its own administration.¹⁰

In 1926, when elected representatives were admitted to the Legislative Council in Trinidad for the first time, Cipriani was chosen by an overwhelm-

¹⁰ *Trinidad Hansard, 1937* (Port of Spain: Government Printing Office), pp. 268-69.

ing majority; he held his seat in the Council until his death seventeen years later. The extent of his popularity may be gauged by the fact that he was seven times elected mayor of the city of Port of Spain. During his term of office as mayor he led to a successful conclusion the fight to have the municipality take over from a private foreign company the management and control of the production of electric power and the tramway service. As the mouthpiece of the "working man" he advocated self-government for Trinidad and West Indian Federation with Dominion status.

Like Cipriani, such labor leaders as Hubert Critchlow in British Guiana and T. Albert Marryshow in Grenada advocated self-government for their respective territories and West Indian Federation for the area. As early as January 1926, British Caribbean labor leaders met in British Guiana and established the British Guiana and British West Indian Labour Federation to co-ordinate their efforts. This organization, renamed the Caribbean Labour Congress (CLC) in 1945, developed into so powerful a regional organization that at the 1947 Closer Association Conference at Montego Bay, Jamaica, the President, Grantley Adams, could tell Mr. Creech Jones, then Secretary of State for the Colonies:

... it was a realization of the hopes and aspirations of the people of these colonies which has found its form in and has as its mouthpiece the Caribbean Labour Congress ... you hear the authoritative voice of the Caribbean when you hear the voice of the Caribbean Labour Congress.¹¹

This organization, comprising trade union representatives from nearly every British Caribbean territory, drew up a plan for West Indian Federation entitled "Charter for Caribbean Freedom."

¹¹ *Report of* ... (cited note 5 *supra*), pp. 37-38.

OTHER INFLUENCES ON NATIONALISM

It may be well to mention here two other factors not generally recognized as instrumental in the development of nationalism in the British Caribbean. The first was Marcus Garvey (himself a West Indian) and his Universal Negro Improvement Association; the second was the invasion of Abyssinia by Italy in 1935.

Marcus Garvey and his "Back to Africa" movement exploited the racial disabilities of American Negroes and the disillusionment of peoples of African descent, especially in the West Indies, following World War I, in which they too had fought "to make the world safe for democracy." By 1923 he had succeeded in organizing one of the biggest protest mass movements ever to sweep the New World. Though short-lived, it had made a great impact upon the West Indian working classes, who were mainly black. Branch organizations were established in the various territories to arouse the Negro to an awareness of his position, to take pride in self and country, and to demand his citizen's rights. Garveyism made a strong appeal to the working masses of the West Indies and sowed the first seeds of racial consciousness, which labor leaders were later to utilize as an incentive to nationalism. Democracy, in its Western context, had provided territorial labor leaders with the concept of majority rule and given them the idea of exploiting the voting power of the working-class majority for self-government, in the hope of securing ultimately a more equitable distribution of the wealth of the territories. Thus the labor movement became strongly identified with, and considered itself, the political expression of nationalist aspirations.

The Abyssinian war in 1935 institutionalized this sentiment. The failure of the League of Nations to apply effective

sanctions against Italy for its attack upon Ethiopia, symbol of black sovereignty, was widely interpreted in the West Indies as white indifference to black interests. When the Pope blessed the Italian troops on the eve of invasion, the Church too, Episcopalian as well as Roman Catholic, became identified with this indifference. The rise of many of the religious sects and indigenous groups and organizations now in existence in the British Caribbean may be traced back to this period. This new attitude reflected a growing indifference, if not resentment, toward the so-called "white" institutions and a growing interest in the indigenous culture. The result was the creation of new social institutions and the assumption of responsibility for their destiny.

TRADE UNION AND THE POLITICAL PARTY

To fill the role expected of it, the trade union has become in fact "union cum political party."¹² Differences in nationality and race provide an emotional element in the relationship between employers and workers that furthers the desire for mutual protection. Union leaders, often smarting under handicaps of race, color, and class, feel a strong sense of identity with their members. Frequently they exploit these handicaps not only to do something for the members but also for their own personal advantage, especially the enhancement of their social status and the attainment of political power. Consequently the leader very often becomes the embodiment of the union.

By 1946, universal adult suffrage was effective in Jamaica and Trinidad, and the franchise qualifications were lowered in Barbados, British Guiana, and the

smaller territories. Recognizing that the main body of voters was the working-class population, most political parties attached themselves to trade unions. Some trade unions submitted their own candidates where there was no party affiliation. Whether it was the opportunity that trade unions provided for the political advancement of the "middle class liberals," or whether this new type of leader was truly interested in the workers and the trade union movement as such, the fact remains that the trade union movement saw an influx of leaders from the middle classes. While there were those who made the trade union their exclusive business, many used the trade unions merely as a means of attaining political power.

Evidence of the emphasis placed on politics was furnished by the composition of the 1947 CLC Conference in Jamaica; most of the delegates were members of territorial legislatures and served also as delegates to the Montego Bay Conference on Closer Association, as representatives of the legislatures.

The attainment of political office has enhanced the social status of trade union leaders and provided them with additional power. Grantley Adams in his address to the Second World Congress of the International Confederation of Free Trade Unions (ICFTU) in 1951 stated:

In Barbados I am proud to say that we have gone so far as actually to have captured the government. Our trade union (The Barbados Workers Union) has a political branch (The Barbados Labor Party) and matters that we have not succeeded in attaining through bargaining we have had passed into law in our Parliament.¹³

The movement also has gained in respectability, but its solidarity has been

¹² See Simon Rottenberg, "Labor Relations in an Underdeveloped Economy," *Economic Development and Cultural Change*, Vol. 2, No. 4 (December 1952), pp. 250-60.

¹³ *Report of the Second World Congress (ICFTU) held at Milan, 4-12 July, 1951*, p. 215.

affected by the political rivalry of its leaders. Some opportunists have exploited the movement for personal political advancement, while others have been guilty of defection. When trade union loyalty and political expediency conflict, trade union leaders invariably do what is expedient. Furthermore, "in taking over the government," trade union leaders can overreach themselves, as in British Guiana, with disastrous results to the labor movement.

INTERUNION AND INTERTERRITORIAL CO-OPERATION

The development of associations or affiliations of trade unions in British Guiana, Jamaica, and Trinidad, which started in 1939, took the form of Colony Trade Union Councils. At the outset these went well, but their development was retarded by the personal rivalries and political jealousies of trade union leaders seeking political office. Within the territories, especially the larger ones, trade union leaders were trapped in a vicious struggle for political power. In promoting their own personal political ambitions, they failed to ensure the more significant and desirable objective, namely, the advancement of trade unionism as a powerful economic and social institution.

Significantly enough, political action, which split the leaders of the trade union movement in the individual territories, did not affect the movement adversely on a regional level. On the contrary, it did so much to strengthen its collective force that it became the official mouthpiece of labor in the British Caribbean.

In spite of these difficulties and inconsistencies, the intimate connection between trade unions and politics is strongly defended. Grantley Adams declares:

While it is true that some trade unions may take a wrong turning, . . . it is almost impossible in a colonial territory to dissociate trade unionism from political democratic socialism. We in the West Indies, for good or ill—and I am not absolutely convinced for good—whenever we have started a working-class union (in recent years at any rate) find that most of its followers and practically all its leaders are members of a democratic socialist parliamentary party.¹⁴

If the trade union movement has benefited only indirectly from this connection with politics, trade union leaders have reaped direct benefits. Since World War II, they have been receiving some of the highest honors in the land. An impressive honors list is headed by Sir Alexander Bustamante, president of the Bustamante Industrial Trade Union and leader of the Jamaica Labour party, who was appointed the first Chief Minister of Jamaica in 1944; in 1955, he had the distinction of being the first trade union leader to receive a knighthood. Next in line is Grantley Adams, president of the Barbados Workers' Union and head of the Barbados Labour party, who became the first Prime Minister in the British Caribbean and was made a Companion of the Order of St. Michael and St. George (C.M.G.). Then there is Albert Gomes, a Trinidadian of Portuguese descent, who came to power as president of the Federated Workers Trade Union and until recently was the Trinidad Minister of Labour, Commerce and Industry; he also has been made C.M.G. Hubert Critchlow of British Guiana, V. C. Bird of Antigua, and F. L. Walcott of Barbados are Officers of the Order of the British Empire (O.B.E.). These honors are symbols of status and prestige highly prized by most British citizens.

Political honors have brought with them additional responsibility. The in-

¹⁴ *Ibid.*, p. 215.

troductio of the ministerial system has meant full-time duties at handsome salaries for elected representatives. Yet trade union leaders elected to political office have continued to hold on to their trade union posts. This dual role poses a problem not only for trade union leaders but for the movement as well. Nevertheless, no other force has contributed more than the labor movement to realize the dream of British Caribbean Federation.

SUMMARY

An attempt has been made here to show that the labor movement and trade unionism in the British Caribbean territories are avenues through which nationalist sentiments and the urge for "self-determination" find expression. This is not unique to the British Caribbean but is symptomatic of a movement among the peoples of non-self-governing territories the world over.

The beginnings of this development in the British Caribbean became evident following World War I. The first leaders of the labor movement were men of strong character whose influence on the movement was considerable. For a number of reasons, especially those arising from economic and social conditions, an early tendency to secure improvements in the wages and living conditions of workers by legislative means was inevitable. However, the inadequacy of legislative representation made for painfully slow progress in economic improvements. One result was the general disturbances of 1937.

The Royal Commission of 1939 made important recommendations leading to the enactment of labor laws and to constitutional reform. The former not only made trade unions legal but also more effective in securing their demands, while the latter enfranchised the working classes and provided an opportunity for a more equitable representation. Subsequently, trade union leaders were voted into political office, and self-government found expression in and through the trade union movement.

Trade unions in the British Caribbean now enjoy general recognition. In nearly every local government body, municipal or borough council, and territorial legislature, trade union leaders hold prominent positions. Consequently, the influence of the movement has become far-reaching. This growing respectability will tend to strengthen labor's position at the bargaining table.

The point must be emphasized that the close alliance of the democratic legislative process with the rapid and aggressive development of the trade union movement was largely determined by the philosophy and stature of the pioneer labor leaders. These men were instrumental in creating among the peoples native to the territories an attitude of mind which made them respectful but not servile, aggressive yet not revolutionary. When it is remembered that the history of development is frequently a record of violent revolutions, this British Caribbean mobilization of democratic institutions (the trade union and the political party) for peaceful penetration of the barriers to national aspirations assumes increasing significance.

The Israeli Labor Movement

By NADAV HALEVI

Abstract: Labor in Israel is mostly organized into the General Federation of Jewish Labor in Israel (Histadrut), a general union in membership and functions. It includes all kinds of workers and their families and has trade union functions, mutual aid and social functions, and economic activities. It tries to satisfy all physical, cultural, and spiritual needs of its members. Its ideology is a synthesis of Zionist nationalism and socialism. The author describes the structure and organization of the Histadrut and considers what appear to be the basic problems facing the federation in its future development, problems arising from the very size and complex nature of the organization.—Ed.

ISRAELI labor, for the most part, is organized in the General Federation of Jewish Labor in Israel, commonly referred to by the first word in its Hebrew title—the Histadrut. The Histadrut is a general union in the widest sense of the word. It is general in its membership and in its functions. As to membership, the Histadrut embraces workers and their families: agricultural and industrial workers, manual laborers and intellectuals, wage earners and self-employed and members of co-operatives. Its functions may be grouped under three headings: trade union functions, similar to those performed by most unions elsewhere; mutual aid and social functions, ranging from comprehensive medical care to sports organizations and trade schools; and economic activities. Throughout its thirty-six-year history, the Histadrut has striven to concern itself with and satisfy all the physical, cultural, and spiritual needs of its members.

A second aspect of the Israeli labor movement is its ideological foundation,

which is a synthesis of Zionist nationalism and socialism. The nationalism called for a re-creation of a nation, the resettlement of Jews in Palestine, and the renewal of Jewish national life. The socialism, though not as clearly defined and widely accepted as the nationalism which it was supposed to serve, aimed not at overthrowing an existing social order, but at the creation of a new society of free workers where no sizable society existed at all.

A short article cannot hope to do justice to so complex a phenomenon as the Histadrut.¹ The following pages attempt rather briefly to describe the development and present structure and operation of this organization and to consider some of what appear to be basic problems facing the Histadrut in its future development, problems which arise from the very size and complex nature of the Histadrut.

¹ For this reason we must also abstain from any detailed consideration of Israel's labor parties, an equally important aspect of Israel's labor movement.

Nadav Halevi, Ph.D., Jerusalem, is an economist on the staff of the Falk Project for Economic Research in Israel. He is author of *Estimates of Israel's International Transactions, 1952-1954* (1956).

ORIGIN AND DEVELOPMENT OF THE HISTADRUT²

The development of the Jewish labor movement may be divided into three broad periods: up to the founding of the Histadrut, from 1921 until the creation of the state in May 1948, and from this date on. Although the history of practical Zionism, and consequently of the Jewish labor movement, begins with the First Immigration to Palestine (1882-1903), the more successful phase starts in 1904 with the Second Immigration, made up of Russian Jews steeped in Zionist and Socialist thought. These settlers, coming to a barren, sparsely populated land, faced the double task of turning themselves into workers and of competing for jobs with cheap Arab labor. Resolved to create a Jewish working class which would evolve into a nation, they attempted new forms of organization and communal living to "conquer labor."

The settlers first turned to agriculture. Work corps, labor exchanges, and collective settlements were formed to solve the problem of finding work, and mutual aid organizations, such as the Sick Fund, were organized to make the difficult life more bearable. These new functions were at first performed by political parties; later, unions common to the parties were set up. The first of these were agricultural workers' unions. However, party strife split the unions, and led to two party-unions and duplication of activities. In December 1920, the less than five thousand Jewish workers called a convention to remedy this situation. The Histadrut was organized to concentrate activity towards the goals accepted by the entire labor community.

² A survey of Histadrut development and structure available in English is Samuel Kurland, *Cooperative Palestine*, New York: Sharon Books, 1947. The figures are now dated.

Once founded, the Histadrut developed rapidly, undertaking new social and economic activities. Its object was to find work, absorb new immigrants, and build up itself and the working community. In co-operation with the Jewish Agency for Palestine, it directed the inflow of contributions from world Jewry towards the rebuilding of the Jewish national home. As immigration increased and urban centers grew, a Jewish urban proletariat developed and intensified the Histadrut's union functions. Large-scale strikes during the 1920's and 1930's won union recognition for the Histadrut. After a concentrated war effort during World War II, during which its economic activities flourished, the Histadrut turned once more to strengthening the working class and placing it in the forefront of the fight for national independence.

Membership

After the establishment of the state and the War of Liberation, the Histadrut found itself able to grow much more rapidly, primarily because of the large-scale immigration. As the Jewish population grew, so did the Histadrut, both absolutely and relatively. By the end of 1948, total membership was about 250,000, some 33 per cent of the Jewish population. By January 1956, it had risen to over 865,000, more than 50 per cent of the Jewish population. This total membership is composed of some 380,000 active members, 15,000 working youth, 170,000 members' wives, and 300,000 members' children.³ The total number of wage earners in the Histadrut was some 250,000 in 1955.⁴

³ Figures are taken from Histadrut Executive Committee, Statistics and Information Department, *Bulletin of Statistics and Occupational Information* (Tel Aviv; in Hebrew), No. 20 (August 1956), p. 10.

⁴ Histadrut Executive Committee, *Report for the Years 1954/55* (in Hebrew) (Tel Aviv, December 1955), p. 392.

close to 75 per cent of all Jewish wage earners.⁵ Adding members of co-operatives and self-employed to the number of wage earners, the Histadrut percentage of this total was almost 80 per cent by 1956.⁶

Changes and uncertainties

The Histadrut accepted the task of absorbing new immigrants and leading the economic development of the country; these tasks, and aid in undertaking them, were given to it by a labor-controlled government. However, new problems emerged which called for curtailing certain Histadrut functions, such as the Histadrut's network of schools which were turned over to the government. Moreover, once the great unifying goal had been reached, non-Histadrut parties gained in strength, and even in the Histadrut the question of the form which the new state should take and the Histadrut's role in it were widely debated. This period of change and development is still in its early stages.

HISTADRUT STRUCTURE AND OPERATION

Membership in the Histadrut is open to anyone who works and "does not exploit the labor of others" and who is willing to accept the authority of the Histadrut. Membership is direct, but it actually involves up to four different memberships: on a plant level, in a local union, in a local labor council, and general membership.

⁵ Computed from unpublished figures of the Government's Labor Force Surveys in June 1954 and November 1955.

⁶ Based on Labor Force Survey unpublished figures and Histadrut *Bulletin* (cited note 3 *supra*), p. 3. This *Bulletin* gives a higher ratio of Histadrut members (excluding wives) to total Jewish workers. However, the definition of "workers" appears not to be consistent for the numerator and the denominator of the ratio.

Workers' committee

The basic stage is a workers' committee at the place of employment, elected directly by all the workers. This committee handles daily matters of labor-management relations.

Local trade union

The next link is the local trade union, whose official functions are to set working conditions, observe contracts, and fulfill the tasks given to it by the local labor council. The workers' committee is under the authority of the local union whenever the employees of a particular establishment are all members of one trade union. Elections to local unions are sporadic and union secretaries are usually appointed functionaries.

Local labor council

The third aspect of membership is the local labor council, which is elected by all local Histadrut members from party lists on a basis of proportional representation. The local unions are under its authority, as are (theoretically, at least) all local Histadrut institutions. The labor councils allocate funds, which they receive from the Executive Committee.

National associations

Most of the local unions are organized in national unions and associations, many of which are industrial in form. These are generally run by officials appointed by the Histadrut executive bodies. Their funds are also received from the executive bodies. These federations are not an aspect of direct Histadrut membership. The national associations together with the Trade Union Department of the Executive Committee negotiate national collective labor agreements and decide on industry-wide strikes. All are more or

less under the control of the Executive Committee.

General Convention

The final and most important stage of Histadrut organization is the General Convention to which delegates are elected by the entire Histadrut membership, to part of whom the trade union aspects of membership may not be applicable (for example, wives of members and members of collective settlements). Here, too, voting is for party lists and on a basis of proportional representation. The Convention, elected once every few years, elects a General Council which is the supreme body between Conventions. The Council, in turn, chooses an Executive Committee, whose plenary sessions decide upon questions of principle. The functions of the Executive Committee are suggested by its departments: Trade Union, Education and Culture, Mutual Aid, Vocational Training, Organization, Legal, Statistics and Research, Municipal, and Tourist. There are the central administrative organs of the Histadrut.

Political parties and the Histadrut

Because the two most important functional organs of the Histadrut—the local labor councils and the General Conventions—are elected by the general membership, the Histadrut retains its "general" nature. For though a trade union member may feel that a particular party represents his own interests, neither his vote nor the party list are specifically related to a particular union. The parties' appeals concern ideological and general Histadrut policy. For many years the Histadrut has been dominated by MAPAI, which is more or less middle of the road for a labor party. Of the remaining parties, only two—MAPAM, much farther left than MAPAI, and Achdut Ha'avoda Poale Zion—somewhere between the other two

—are of significant size.⁷ Of the smaller parties, several consist of Histadrut members who in general elections are affiliated to nonlabor parties.

In addition to all these executive bodies, the Histadrut has local and central Supervisory Committees and Members' Tribunals to exercise supervision and arbitration in the fields of finance and membership, respectively.

Trade union activities and achievements

The Histadrut has managed to be recognized as the workers' sole bargaining agent in all significant enterprises and in a large proportion of smaller ones. Organizing difficulties have been felt particularly in the small crafts and industrial firms and among hired agricultural workers. Collective agreements, written or oral, are arrived at by means of negotiations at various levels: some are reached between individual firms and the local union and labor council; some, on an industry-wide basis, are between relevant national union (of course with the approval and the direction of the Trade Union Department of the Executive Committee) and national producers' associations. Finally, there are top-level agreements between the Trade Union Department and the Manufacturers' Association, such as the agreement for an automatic wage bonus tied to movements in the cost-of-living index.⁸

One basic provision of Histadrut con-

⁷ The new Executive Committee elected as a result of the General Convention held in March 1956 divided its 91 members as follows: MAPAI, 53; Achdut Ha'avoda Poale Zion, 13; MAPAM, 11; Haoved Ha'zioni, 6; Association of General Zionist Workers, 1; Israel Communist party, 4; Religious Workers, 2; Independent, 1.—*Davar*, March 29, 1956.

⁸ An interesting aspect of this latter agreement is that the government stands by until these two organizations come to terms and then agrees to grant similar terms to government employees.

tracts is that all hiring (except of higher grades) be done through the Labor Exchanges, which are operated jointly by the Histadrut and the independent labor organizations under the supervision of the Ministry of Labor. Their task is to find and distribute work according to a graded waiting list. The Labor Exchanges serve union members but do not require membership in a union. Thus, the workers hired through the Labor Exchange are not always organized or necessarily Histadrut members; nor are an employer's previously employed workers required to join the union.

The Histadrut attempts to increase its membership among nonorganized workers in organized plants by including in the contract "organization" dues to be paid by unorganized labor of about 2.5 per cent of the wage. It then becomes profitable to pay the extra 2 per cent or so required for Histadrut membership and enjoy the full benefits offered by the Histadrut, particularly membership in the Sick Fund. In addition, the Histadrut has succeeded in arranging for an automatic dues checkoff in the place of employment for close to 200,000 workers, that is, some 70 per cent of Histadrut dues payers.⁹

The main tool which the Histadrut uses in collective bargaining is the threat of the strike. Local strikes are called by the local trade unions with the consent of the local labor councils; larger strikes, called by national unions, require the consent of not only the relevant labor councils but also of the Executive Committee. Wildcat strikes occasionally break out without the approval of the official Histadrut executive bodies, but they frequently find the Histadrut arrayed against them. The Histadrut accepts mediation in labor

disputes, but it has always opposed compulsory arbitration.

The Histadrut has to a very wide extent succeeded in winning for its membership on eight-hour day and forty-seven-hour week; paid annual holidays, sick leave, and maternity leave; employer contribution to the workers' provident funds and Sick Fund; union consultation in firing and severance payments. Fringe benefits frequently amount to 30 per cent of wages. Although the Histadrut firmly upholds the idea of "equal pay for equal work," in many cases it has not succeeded in actual application of the principle. Thus, wages paid to female workers are consistently lower than payments to men in similar jobs.

The general standard of living of the Israeli worker compares favorably with that in many more amply endowed economies. In fact, a subject for recurrent arguments is the claim that the Histadrut has given the worker a standard of living much higher than his productivity and the present stage of Israel's economic development warrant.

Since the establishment of the state, the Histadrut has been successful in obtaining protective labor legislation. Also, Israel has ratified seventeen International Labor Conventions. Among the main measures of labor legislation are laws limiting hours of work and setting rates for overtime, requiring paid annual leave, and regulating conditions of employment for women and young workers under eighteen, and a national insurance law providing for accident and maternity insurance and old-age and survivors' pensions. Considering the power of the Histadrut, legislation for unemployment insurance is conspicuous by its absence. In fact, throughout its history the Histadrut has tackled the problems of unemployment not by paying insurance to the unemployed, but by encouraging make-work projects through

its own economic enterprises and public institutions and by setting up special funds which lend money to stimulate employment.¹⁰

The Histadrut economy

Perhaps the most unusual of the Histadrut's many functions is the development of a "workers' economy." The "Histadrut economy" is an extremely complicated and heterogeneous phenomenon. Its parts fall into two categories: a co-operative sector and a Histadrut sector in a narrower sense. The growth of both sectors is primarily due to the availability of external sources of finance.

The Histadrut plays a major role in fostering the formation of co-operatives, though a significant number of co-operatives are outside the Histadrut. Functionally, Israeli co-operatives can be classified as agricultural (marketing, processing, supply, and water); credit; housing; producers'; service and transportation; consumers'; provident and pension funds; audit unions; co-operative agricultural settlements; and a miscellaneous group.¹¹ Of particular interest are the agricultural co-operatives, which range from small-holders' villages based on co-operative marketing, purchasing, and social services to collective settlements where co-operation extends to production and even to consumption. The co-operative agricultural settlements supply some 70 per cent of Israel's agricultural produce and play a role in Israel's ideological and political life far out of proportion to their numerical importance. In addition, they

serve as the country's first line of military defense.

The legal garb of the Histadrut in its economic activities is *Hevrat Ovdim* ("Workers' Society, or Commonwealth"). Registered as a co-operative society, *Hevrat Ovdim* is made up of the entire Histadrut membership. Its executive bodies are almost identical with those of the Histadrut and it operates the economic enterprises which belong to the Histadrut as a whole. These enterprises are of many kinds, including a network of factories, construction contractors, financial organs, and central co-operatives. *Hevrat Ovdim* has representation in, and different measures of control over, the various co-operatives. Besides outright ownership of economic enterprises, *Hevrat Ovdim* has entered into partnership with private capital, public institutions, and co-operatives in operating numerous enterprises.

The economic enterprises actually controlled by *Hevrat Ovdim* accounted for about 8 per cent of Israel's net domestic product in 1953.¹² *Hevrat Ovdim*'s share of the value added in the "productive industries" (agriculture, mining, manufacturing, construction, transportation, communication, and utilities) amounted to over 10 per cent of the national total. Together with the co-operative sector, the total share of the collective economy¹³ in the national product in 1953 amounted to almost 22 per cent, and was over 35 per cent of the "productive industries." The fact that the government sector accounted

¹² These and the following figures on the Histadrut's share in Israel's national income are adapted from Daniel Creamer, *National Income of Israel, 1952-1954* (Jerusalem: Falk Project for Economic Research, forthcoming), Table 15.

¹³ This includes the agricultural co-operative settlements and the non-Histadrut co-operative but excludes enterprises in which *Hevrat Ovdim* has no more than 50 per cent control.

⁹ Histadrut Executive Committee Report (cited note 3 *supra*), p. 138.

¹⁰ There are some selected insurance funds which do provide some unemployment insurance benefits.

¹¹ A survey of Israeli co-operatives available in English is H. Viteles, "The Cooperative Movement in the Holy Land," *Scripta Hierosolymitana*, Vol. II (Jerusalem: The Hebrew University, 1956), pp. 53-97.

for 25 per cent of the national product accentuates the importance of the Histadrut's role in the economy.

Other services

The social service activities of the Histadrut are of two types: mutual aid organizations and cultural, social, and educational organizations. The most important mutual aid organization, perhaps the proudest achievement of the Israeli labor movement, is the Sick Fund (*Kupat Holim*), which provides medical facilities for almost two thirds of Israel's population on a basis of need without regard to amounts paid. Every active Histadrut member is automatically a member of the Sick Fund, and for a slight additional monthly fee the members of his family are included. Some non-Histadrut members, such as members of a religious workers' union (by special arrangement), Arab members of the trade unions, and policemen, also enjoy the benefits of the Sick Fund.

The cultural, educational, and social organizations include a Working Youth Organization and a Working Women's Council (both affiliated directly with the Histadrut), daily and weekly newspapers and periodicals, a sports organization, theater groups, a network of trade schools, and similar institutions. The cultural activities among new immigrants are particularly important.

PROBLEMS AND PROSPECTS

The Histadrut has come a long way in a relatively short period. During the process of growth, functions changed and organizational forms took shape. The influx of many thousands of new members, a substantial number of which were foreign to the ideology and principles of the Histadrut, and expansion in all fields, particularly economic, have brought about the development of a highly centralized, largely bureaucratic organization. The present organization

bears little resemblance to the movement of the 1920's, which was characterized by a close feeling of kinship, co-operation, and mutual responsibility of all members. Whereas a small, highly idealistic group could then raise the banner of common high purpose and solidify its ranks, the large union, and certainly the multipurpose labor organization, cannot now easily and indefinitely ignore serious internal friction and sectionalism.

*Intra-union friction*¹⁴

Within a particular Histadrut union, friction arises between various factions, for example, between skilled and unskilled workers. Elsewhere clashes of interest may lead either to compromise or to disintegration of the union, but the Histadrut is strong enough to minimize the possibility of the latter solution and impose some compromise. There are two aspects to this problem. The first relates to union democracy, the selection of union leadership which actually represents rank-and-file interests; this problem exists in Israel as it does in unions elsewhere. The second aspect relates to the amount of control over union policies taken out of the hands of the *directly* elected union leadership. Where basic questions, such as wage policy, are settled on the highest levels, after taking into account the various internal and external pressures, the results are likely to be neither understood nor welcomed by the rank and file.¹⁵ Pressures of this kind were not too important when the fundamental problems of the Histadrut and the individual member consisted of getting

¹⁴ Because it is a general union, the Histadrut's intra-union frictions include also what elsewhere would be regarded as interunion frictions.

¹⁵ For a specific example and discussion of intra-union revolt arising from this situation, see Nadav Halevi, "Israel's Wage Dilemma," *Midstream* (New York), Autumn 1956.

and keeping work, and of national issues. They are a relatively recent phenomenon.

Interenterprise friction

The economic activities of the Histadrut give evidence of deficiencies in central control and supervision. This is surprising in view of the structure of Hevrat Ovdim, which appears to give it considerable, if unequal, control over all Histadrut economic enterprises, including the co-operative sector. Nevertheless, there are numerous examples of lack of co-ordination between Histadrut institutions and of overlapping and competition in functions among economic enterprises. Several Histadrut Conventions have decried the independence from Histadrut control of various co-operatives and the lack of planning by Hevrat Ovdim. Resolutions have been repeatedly adopted, but the very recurrence of these resolutions bears witness to the meagerness of remedial steps taken.

It must be stressed that despite frequent friction between Histadrut enterprises, the Histadrut presents a generally united front against external enterprises. Thus, for example, a new Histadrut enterprise is assured of receiving aid and preference over non-Histadrut concerns from the various purchasing, marketing, and financial instruments of the Histadrut. This is the essence of Histadrut economic expansion.

Economic enterprises vs. the union

The Histadrut employs a significant percentage of Israel's workers; about half of the Histadrut active membership is employed in the two sectors of the Histadrut economy. There is a resulting clash of Histadrut functions, at least in those enterprises where hired labor is employed. There is a sharp distinction between the co-operative sec-

tor and the Histadrut-owned sector as regards employer-employee relations. It is quite possible that a dispute between a co-operative and its employed workers may lead to a strike if the Histadrut arbitration apparatus has failed to find a solution satisfactory to both the union and the co-operative. The less the co-operative is willing to accept Histadrut control, the greater is the possibility of such a development. In a Hevrat Ovdim-owned plant, on the other hand, a strike is almost unthinkable (though occasional "wildcat" strikes do take place). The Histadrut can settle disputes within its own plants by arbitration; it need not authorize a strike. Though the Histadrut can rightly boast that its workers enjoy equal if not better terms than do those in other plants, not all Histadrut workers will agree that since "exploitation" of the worker in a "noncapitalist" plant is precluded by definition, the basis for employee-employer disputes has been eliminated. The director of a Histadrut firm is to them like any other boss, and, as elsewhere, paternalism towards a company union is not appreciated by all the workers.

Relations between employer and employee and among the various echelons in the plant are similar in Histadrut and non-Histadrut plants. This was not always so. Originally, a close personal relationship existed in Histadrut institutions, a feeling of common sharing of a great task. In this sense there was little difference between managerial and other workers. This equality was exemplified by a system whereby wages were paid according to a family rather than a function scale: the size of the family rather than the work performed determined wages. Exceptions to this system developed, first by the acceptance of special professional pay rates and social bonuses, then by dropping the system entirely in the economic en-

terprises. Recently, all Histadrut institutions transferred to a professional wage scale.¹⁶ The breakdown of the family wage scale was a natural consequence of the growth of institutions, the bureaucratization of organizations, and the shift away from operation according to ideological principles.¹⁷

The problem of worker participation in management has not been satisfactorily solved either in Histadrut enterprises or in government industries. Committees have been appointed to work out ways of increasing workers' share in management, but the solution is yet to be found. Joint management-worker productivity boards have been set up, but the fact that these exist in non-Histadrut as well as Histadrut-owned plants suggests that they are limited to promoting *co-operation with management* rather than *sharing in management*. It is significant that whereas the present Histadrut tendency seems to be expansion by means of Hevrat Ovdim companies rather than through co-operatives, it is the co-operatives which present the greater degree of workers' control.

Producer vs. consumer interest

Almost half the consumers in the country are Histadrut members; consequently, the Histadrut producer interests must clash with consumer interests. The consumer co-operative movement has always been a cornerstone of the Histadrut, but there is considerable evidence to suggest that when consumer and producer interests clash, the former comes off second best. Though the Histadrut denies that its firms are

members of cartels, many undoubtedly employ monopolistic, oligopolistic, and monopsonistic techniques. Sharing of the market, price leadership, and price discrimination are commonplace practices not only between Histadrut firms but also between Histadrut and other firms. Furthermore, in bargaining for contracts, the Histadrut firm has a strong asset in its ability to promise smooth labor relations. The result of all this is undoubtedly higher prices to the consumer.

Evidence of monopolistic practice is not necessary to point out the clash between producer and consumer interests. Profits of Hevrat Ovdim-owned firms are reinvested; they cannot be distributed to the Histadrut membership. The existence of profits (unless they are fortuitous) presupposes that strengthening and expanding the enterprises—that is, producer interests—have been given preference over cheaper sales and better service—that is, consumer interests.¹⁸

Of course, all these frictions and clashes of interests can be rationalized out of existence by arguing that the given, apparently preferential, decisions will ultimately serve all interests.

THE FUTURE STILL TO BE PLANNED

The future development of the Histadrut will depend, to a great extent, on the relationship between it and the state. This relationship is complex, indirect, and not clearly defined. The political parties in the Histadrut are also active in general politics; in fact, MAPAI has been the dominant party in Israel since long before the establishment of the state. The Histadrut official who is also in the government is subject to party discipline in both institutions. Should he feel that what

¹⁸ One could of course argue that reinvestment will eventually lead to productivity and lower future prices.

is good for the Histadrut is good for the country, he will not be condemned by his colleagues as having perverted values, for the Histadrut has always been essentially a nationalist movement above all else, dedicated to what it believes to be national interests. The state has aided Histadrut development in several ways: by the awarding of contracts, by leaving the responsibility for the immediate medical care of new immigrants to the Sick Funds, and above all, by financial aid via the government budgets.

On the other hand, the state has taken over some functions previously performed by the Histadrut, such as the Histadrut nonvocational schools. The future responsibility for medical care is still a bone of contention. For while Socialist principles and visions of a new classless working society are basic to Histadrut ideology, there is no clear and accepted concept of exactly what kind of Socialist state is envisioned, exactly how it should be achieved, and what the relationship between the Histadrut and the state should be. Israel now has a mixed economy: nationalized industries, the many-faceted Histadrut economy, and private enterprise. Whether this pluralistic economy will continue in its present form, or whether it will become more socialized and, if so, how, are subjects on which there is disagreement among and even within the various Histadrut parties. Although the leftist elements may decry the pragmatic approach adopted by the majority party and the divergence from standard Socialist dogma, one cannot but feel that there is a wide basis of agreement among most Histadrut parties that the solid establishment of the state is the fundamental task, and any combination of Socialist-type developments is more or less acceptable, at least temporarily, if it serves this basic goal. Undoubt-

edly this pluralistic pragmatic approach must receive a great measure of the credit for the Histadrut's many solid achievements.

Histadrut solidarity

It remains to be seen how long this acceptance of a common immediate goal will continue to postpone more serious internal frictions. Clashes of interests, which are of more recent origin, are constantly mounting. One possible explanation of why no eruption has as yet taken place is that as long as Israel continues to receive large unilateral transfers of funds (for example, German reparations, contributions of world Jewry, United States grants-in-aid), and is thus able to invest in economic development without forgoing standards of living incompatible with its present productive capacities, all sectional interests can be served. Wages can be raised, even if they limit exports; subsidies can obviate the necessity of firing redundant workers and compensate for poor economic planning; rising incomes can compensate for rising prices. Another explanation is that Histadrut solidarity is the result of the belief that the common goal is still of greater importance than sectional differences. Furthermore, while the Histadrut's divergence from standard trade union form may make it appear to be unstable, it actually is a reasonable phenomenon within the context of Israeli society. The correctness of these explanations will probably be demonstrated in the not too distant future. The internal pressures will have to be relieved by some reform and reorganization of the Histadrut if breakaways are to be avoided. Many observers of social and economic development will watch with interest to see if the Histadrut can retain its unique nature and maintain an original course.

¹⁶ Elected Histadrut officials still retain the family scale, plus special function payments.

¹⁷ This development in Histadrut institutions is traced and analyzed in *Studies of Social and Occupational Mobility*, a forthcoming report of the Falk Project for Economic Research in Israel, supervised and edited by S. N. Eisenstadt.

Appendix

The United States and the International Labor Organization

A REPORT

IN May 1956 a committee was appointed by the United States Departments of State, Commerce, and Labor to advise them concerning the attitude which the United States should adopt with respect to its future relationships with the International Labor Organization, a question regarding the usefulness of that agency having been raised by the National Chamber of Commerce and the National Association of Manufacturers. The Committee was composed of Mr. Joseph E. Johnson, President of the Carnegie Endowment for International Peace; Howard C. Petersen, President of the Fidelity-Philadelphia Trust Company; Professor Robert D. Gray, California Institute of Technology; Professor Frederick H. Harbison, Princeton University; and Professor Charles A. Myers, Massachusetts Institute of Technology. The Committee interviewed many persons and has now presented a report which is being studied by the Departments which requested it.

In the following pages the specific recommendations of the Committee are reproduced. These recommendations are based on certain assumptions and general conclusions. The Committee assumed that the United States policy toward and participation in ILO must be considered primarily in terms of the goals of United States foreign policy. The Committee arrived at three general conclusions:

1. The rationale and the purposes embodied in the Preamble to the Constitution of the ILO written in 1919 and clarified in 1944 are consistent with

and expressive of American philosophy and ideals, and the promotion of these aims is in the national interest.

2. Employer dissatisfaction with ILO is due to the failure of the United States government to formulate a clear policy with respect to the Organization, to certain defects in the operation of the ILO machinery which have been to some degree magnified by critics with limited experience with international organizations, and to the quick turnover in the last decade of employer delegates and advisers from the United States.

3. The ILO is of great value to the United States. While it is not of great direct importance to the well-being of most American workers or for the improvement of the conditions of labor or for the promotion of good industrial relations in domestic industries, it does have a positive value to the United States in its foreign relations. To the extent that the ILO contributes to the raising of labor standards abroad, it improves the competitive position of American industry and serves the interest of American labor. Its promotion of industrial democracy and efficiency also advances American interests. It provides a means for showing the world the character and achievements of our labor-management relations. It can be an instrument in the ideological contest. All told, it is worth much more to the United States than the monetary contributions made by the government toward its support. Withdrawal from the ILO would cause severe damage to American interests in the larger sense, but continued participation must be

buttressed by the conviction of the United States government that the International Labor Organization is important.

Specific Recommendations

The Committee, convinced that the International Labor Organization can play an important and useful part in furthering United States foreign policy goals, and believing that United States participation in the ILO should be viewed as an integral part of our membership in international organizations, recommends continued but more effective and vigorous participation in the ILO, and to that end makes the following specific Recommendations:

1. *The Committee recommends that the Department of State, as the principal agency under the President responsible for United States foreign policy, take the leadership, in collaboration with the Departments of Labor and Commerce, in a clarification and elaboration of the place of United States participation in the International Labor Organization in furthering our broad foreign policy objectives.*

Many persons whom we interviewed were frank in stating that they did not fully understand the reasons for United States participation in the ILO. Some thought our Government probably had good reasons for wanting to continue in the Organization, even if such reasons had not been disclosed. Others, who held the view that the United States should withdraw, indicated that they might change their position if it could be demonstrated that our national interest would be served by continued participation. Nearly all the persons who appeared before the Committee were in agreement that most United States employers and the vast majority of American citizens were unfamiliar with the Organization and the work of the ILO and hence had very little interest in it.

For many years, United States participation in ILO was the concern primarily of the Department of Labor. Today, the Department of State and also the Department of Commerce have vital interests in the Organization. As we have stressed earlier in this report, the function and significance

of ILO have changed markedly during the last few years. The ILO is now a political forum as well as a technical body. It operates technical assistance programs and provides extensive consultation services particularly to economically underdeveloped countries. As a consequence of these and other developments, it has become a battleground in the cold war between the democratic and totalitarian regimes.

In the view of the Committee, it will be very difficult to persuade top-level persons to serve as United States delegates to the ILO unless the Government clearly indicates to American employers, workers, and the general public the reasons why continued and effective participation by our country is in the national interest. Unless it is made clear, as we are convinced can be done, the purposes to be served by continued United States participation in the Organization, then participation and interest will dwindle, and membership in the Organization might even become damaging.

2. *The Committee recommends that the appropriate agencies of the Government establish formal machinery for periodic discussion and development by government officers, employers and labor, of policy objectives for United States participation in ILO.*

Nearly all of the persons who appeared before the Committee indicated that there was a serious lack of coordination and communication between the interested government agencies, as well as between these agencies and employer and worker delegates, in the formulation of positions to be taken in ILO meetings. The Committee was gratified to learn, however, that some progress toward better integration was made in 1956. In a statement, issued by the three interested Departments on May 4, the following were proposed as objectives for United States participation in ILO:

- a. To develop and maintain United States leadership in advancing United States interests and those of the free world.
- b. To practice international cooperation and make the maximum use of the unique tripartite structure, the subject matter considered, and the forum ILO provides to pursue United States

- foreign relations objectives of international cooperation and world peace.
- c. To convince other governments, workers and employers of the values and benefits inherent in the American economic, social and political system and to make clear the functions of United States employer and worker organizations in meeting the social and economic needs of workers and of the Nation.
 - d. To develop friendly and cooperative relations with those countries with which the United States is allied and to strengthen relations with other non-communist countries.
 - e. To have included in ILO decisions and programs provisions which are acceptable and usable by Free Nations who look to ILO for help and guidance and which do not detract from the basic free society concepts and view of the United States.
 - f. To assist, through the International Labor Organization, in increasing the dignity and freedom of workers and in improving the welfare of workers throughout the world as a political, economic and humanitarian policy.
 - g. To encourage employers, workers and government representatives to take action in their countries which will contribute to a substantial increase of productivity as a means of accelerating rising levels of living and which will make democracy meaningful to workers.
 - h. To encourage, through the ILO, actions in member nations which will bring about, within the realities of their economic and social conditions, an increasing responsibility for labor and management to handle labor-management relations and working conditions problems and to keep government intervention at a minimum.
 - i. To make available to workers and employers throughout the world the technical and practical experience of the United States employers and workers on matters relating to industrial relations, productivity and the welfare of workers.

- j. To achieve economic benefits for United States workers and employers
 - (1) by creating markets for United States goods through raising standards of living in other countries; and
 - (2) by the elimination of sub-standard conditions that may be a factor in unfair competition in international trade.
- k. To strengthen the ILO to enable it to carry out programs and to achieve objectives which are consistent with United Nations principles.

Certainly the formulation of these objectives is a start in the right direction. But, there is need for further discussion, refinement and elaboration of policy objectives of this kind.

We feel that present informal arrangements for cooperation between the government and employer and worker groups should be supplemented by the establishment of an advisory policy committee composed of government, employer and worker representatives to review and appraise periodically long-range policy as well as to discuss the various positions to be taken in the committees and conferences of the ILO. Moreover, one of the functions of this policy committee should be to consider measures for better communication of information about ILO to United States employers, workers and the general public, so that there may be more widespread understanding of and interest in the activities of the organization.

3. The Committee recommends that the United States Government take urgently specific measures to improve the organization and staff responsible for United States participation in the ILO.

Three separable but related problems must be tackled.

- a. There must be continuous high-level United States governmental representation at Geneva. The Senior United States representative in Geneva should be an individual especially qualified to deal with international organizations, particularly in the economic and social fields, should be accorded ministerial rank, and should be re-

sponsible for United States relations with all intergovernmental organizations in Geneva, including the International Labor Organization. He should have a highly qualified staff to carry on the detailed and routine work under his direction.

With specific regard to the ILO, this representative should be responsible for year-round liaison with the International Labor Office, and with other representatives in Geneva concerned with ILO matters. He should, of course, report regularly to Washington, not only on matters of interest to government agencies, but for the benefit of employer and worker groups as well.

This representative might be one of the two governmental delegates to ILO General Conferences, but should in any case be a senior adviser to the delegation, and his office should be in a position to advise delegations to all ILO meetings in Geneva and elsewhere.

b. Delegations to ILO General Conference, to the Governing Body meetings and to various committees and other ILO gatherings work under high pressure over relatively short periods of time. If United States participation in these sessions is to be effective, account must be taken of four requirements,—the quality of the delegates and their advisers, continuity in representation, adequate staffing and thorough preparation.

Given the importance that the Committee believes ILO has for the United States, it is obvious that delegates must be competent, interested, high-ranking and skillful in working in international organizations in general and the ILO in particular. Our Committee has been impressed by the evidence presented to it of the effectiveness of representatives (both governmental and non-governmental) from other countries who have served for a number of years; we therefore emphasize the element of continuity most strongly.

The staffs of delegations should be chosen with a view not only to including persons with the needed technical competence in the subjects on the agenda, but also to providing staff members qualified to deal with the political aspect of ILO meetings; this is especially important with respect to the

General Conferences and sessions of the Governing Body. The delegations should, moreover, be large enough to cover all aspects of a meeting thoroughly, particularly the working committee sessions at which many of the important decisions of General Conferences are in fact made.

As for preparation, United States delegations to international conferences should be like a team, each member knowing his assignment and his fellows. While some steps have been taken in recent years to improve the briefing of delegations, both governmental and non-governmental, to ILO General Conferences, there is still a long way to go before the United States shows signs of taking these important international conferences as seriously as a mediocre football coach takes an early season game. To prepare delegates both governmental and non-governmental to the ILO as deeply and as broadly for what they will encounter at ILO meetings, representatives of the Departments of State, Commerce, and Labor should meet early and often with these delegates. We hope and believe there will be great improvement on this score.

c. The third problem is that of adequate and efficient organization and staffing in Washington. ILO meetings are short, but the preparation for them takes time, and the follow up is vital, particularly in view of the way the ILO works. The recent establishment of the Interdepartmental Committee on International Labor Policy, an important step in itself, is not enough. The Departments of State, Labor and Commerce especially, and perhaps other agencies as well, must have larger staffs and adequate budgets for them. In the last six months of 1956 alone, the ILO conducted no less than 15 meetings of various kinds. Without larger staffs our delegations must be ill-prepared, and our national interest ill-served.

Of course, it would be well if the employer and labor organizations that nominate delegations increased the permanent staff dealing with ILO matters; but the primary responsibility for improved staff work rests with the government.

4. The Committee recommends

a. *that the United States continue to work for decreased emphasis on the use of Conventions and Recommendations; but*

b. *that when, nevertheless, Conventions or Recommendations are under consideration by the General Conference, it should be United States policy to support or oppose them on their substantive merits, and not to oppose a proposal with which the United States is in agreement on principle simply because the measure is in Convention form or is thought not to be properly a subject of legislation under the American system.*

Although the United States has many laws in the labor-management area, in our more mature economy much less reliance is placed on law to effect social or economic improvement than is the case in the less developed countries of the world or countries with socialist concepts of government. Within the framework of our basic laws relating to labor and management, substantial reliance for improving labor conditions is placed on the collective bargaining process, a process which is non-existent or little developed in many countries of the world. Moreover, greatly increased productivity has been brought about in American industry through vigorous competition and the joint efforts of management and labor. Under our Constitution with the Federal Government possessing only delegated authority, many areas of legislation are not within the Federal domain but are exclusively within the jurisdiction of the several states.

The ILO has from the outset concerned itself to a preponderant degree with the preparation and adoption of Conventions and Recommendations. This so-called legislative process of the ILO has raised serious problems with respect to the application of ILO proposals to the United States.

At times our governmental delegates have felt constrained in the ILO to support Conventions which, however worthy their purpose, were not thought to be properly the subject of legislation under our system. This same constraint has been in evidence where the Conventions dealt with a subject over which our Federal Government

has no jurisdiction. Moreover, many employer delegates and organizations have condemned the practice of an international body "legislating" with respect to internal domestic affairs. In our judgment, much of this confusion and lack of consistent direction has resulted from concentrating too largely on matters of form and not on real substance.

Whether the actions of the ILO take the form of Conventions or Recommendations, even though the process may superficially resemble the legislative process, the instrument cannot accurately be compared to true legislation because no action taken by the ILO is binding on a member state without its assent thereto in accordance with its own constitutional processes. The use of the word "legislation," and the publication of ILO Conventions and Recommendations under the title "International Labor Code" have been unfortunately misleading in this respect. ILO Conventions adopted by the General Conference become draft multilateral treaties. But they differ from most other such draft treaties, such as was in 1945 the Charter of the United Nations, in that the United States Government members of ILO Delegations do not have plenary powers and do not sign the Conventions. While in the strict legal sense this difference may not be significant, there is a moral obligation on the part of the President to submit draft treaties duly signed by representatives with plenary powers to the Senate for its advice and consent, but there is not even a moral obligation to treat ILO Conventions in the same manner. Realistically, therefore, all of ILO's actions can be treated by the United States as no more than recommendatory resolutions, whether they are called Conventions or Recommendations, and most of them have been so treated. They recommend to the member states for their consideration and determination in their sole and absolute discretion adoption in accordance with their own constitutional processes. The Convention is a higher form of resolution than a Recommendation because the member state is obligated to transmit it to the appropriate national or state authorities for their consideration as to ratification or enactment of implementing legis-

lation. But, there is no obligation under the ILO charter even to recommend ratification of the Convention as a treaty or the enactment of domestic legislation.

Of the 104 Conventions passed by the ILO, seven have been ratified by the United States; most of the remaining ones were not proposed for ratification. Six of the seven relate to maritime labor, but not all of them are binding on the United States because ratification by a sufficient number of member states has not yet been effected. The Constitution of the ILO clearly provides that a federal state such as ours may treat Conventions that are not properly within the federal jurisdiction as Recommendations only. We are of the opinion that the ILO process, coupled with the provisions of our own Constitution, affords complete protection to the United States and reserves completely our power to act on all Conventions or Recommendations as our appropriate legislative authorities shall determine to be in our own best interests.

When the ILO Conventions and Recommendations are regarded as resolutions of an international body recommending legislative action to its member states, as we believe they may properly be regarded by the United States, and not as international laws, it is possible to approach less emotionally United States participation in the process of arriving at Conventions and Recommendations in the ILO. One can contend with great merit that it is improper for an international body to legislate on internal domestic affairs. If, however, as is the case, the so-called legislation is not in fact legislation because it has no binding effect on the member states without their assent under their own constitutional processes, the prop on which the argument is based falls. Given the condition of participation in the international body, there is little force to an argument that it is improper for such a body to recommend action to its members on internal domestic affairs.

Some of the difficulties incident to this area will recede with time for there are strong indications that ILO is shifting away from the emphasis on Conventions and Recommendations toward a program

of technical assistance and research. We heartily support this shift. But, the point cannot be made too strongly that this re-orientation will take time and that the United States cannot make the changes by itself. During the process of change, the United States must support ILO in its new direction and at the same time continue to work as effectively as possible within the framework of the existing ILO procedure. This we can do best if we determine our position on the basis solely of the substantive merits of ILO Conventions and Recommendations. We can never effectively participate in the ILO if we continue to become enmeshed in highly formalistic exercises in which we appear to the world to oppose high principles because of an unwarranted concern about the effect of ILO on our own legislative processes.

The Committee urges the United States Department of State to re-examine and recast its policy on deciding whether to support or oppose proposed Conventions. It is proper for the United States to urge that ILO action take the form of a Recommendation if the Executive Branch determines not to urge ratification if adopted by the ILO. If, however, the United States position on this is not sustained and the Convention form results, the United States Government delegates, making their position clear as to the action the Executive intends to take with its own legislative authorities, should support the Convention if the principles embodied therein are those which warrant our support. In this connection it should be borne in mind that such obligations as the United States has in relation to an ILO Convention or Recommendation stem from our ratification of the ILO Constitution, and are not affected by the way we vote on the adoption of the proposal.

To take a position other than that proposed here will result in the embarrassing, in fact almost impossible, situation which the United States is currently in on the draft Convention on Forced Labor. At this year's General Conference our Government took the view that it was immoral to support a proposal that the President had no intention of submitting for ratification. As a result, instead of the United States

leading the fight for a Convention against Forced Labor, an issue over which we fought a bloody war, we hedged ourselves around with reservations and amendments and gave the appearance in the propaganda outlets of the world of opposing the Convention. Moreover, our intractable stand against Conventions, in this case as in others, reduces our ability to negotiate a document more satisfactory to us.

The Committee recognizes the difficult problems posed for the United States Government by the Forced Labor Convention. On the one hand, the dominant belief in our Government seems to be that this Convention in its present form, if ratified by the United States, would run counter to the dictates of our Constitution. On the other hand, this country stands to suffer a major setback in terms of world public opinion if it opposes the measure on forced labor. It seems to us that the Convention on Forced Labor differs from other Conventions in its significance for the United States. For one thing, it appears to us as laymen that the 13th Amendment to the United States Constitution banning involuntary servitude places the forced labor issue within the realm of federal jurisdiction, and therefore not subject to the federal-state disability. Also, this whole issue arose primarily as the result of action taken by the United States in the UN. It was we who took the lead in bringing the problem before the world, and, even though it later took the form of an ILO draft Convention, we cannot without damage to our prestige ignore that fact.

The Committee believes that the United States should continue to work for re-drafting of this Convention so that it will not conflict with United States law. But if we are unsuccessful in this effort, we should nevertheless strongly champion it, making it clear that because of our own constitutional processes, and for that reason alone, we will be unable to ratify it.

Other proposals for Conventions are in prospect. Unless a new policy toward the Convention problem is developed, the United States may find itself, for example, flatly opposing a proposal to outlaw discrimination in employment simply because this issue came before the floor of the ILO

in the form of a Convention and despite the fact that our Government, and both our political parties, favor an anti-discrimination policy.

To recapitulate, the Committee believes that this country should decide to support or oppose this and like issues solely on their merits. The United States should not oppose a principle with which it is in basic agreement simply because the measure appears in the form of a Convention. The ILO Constitution affords us full protection for our constitutional processes. Our moral dilemma, if any, can readily be resolved by announcing that although the United States supports the issue involved, this country will treat the Convention, if passed, as a Recommendation in accordance with the provision in the ILO Constitution. The United States should also continue to urge in these cases that the measure be passed as a Recommendation instead of a Convention.

5. *The Committee recommends that the United States direct its most careful attention to the technical assistance programs, the field services, and the research and informational operations of the ILO, and that United States delegations take leadership in proposing positive suggestions for the improvement, better integration and possible expansion of these activities.*

As we have pointed out above, the ILO has become increasingly concerned with the problems of economically underdeveloped countries. The standard of living in these countries cannot be raised merely by passing Recommendations and Conventions. Their economic and social development will be more tangibly promoted by increasing their output and their productivity. In the area of competence of the ILO, this calls for the development of skills through vocational schools, on-the-job training, safety instructions, supervisory training and management development and worker education. It requires assistance to governments in the development of systems for the collection of labor statistics, employment services, labor departments, and social security programs, appropriately geared in each case to the differing stages of economic development in the respective countries. In some cases, it may call for

the study within a country of appropriate machinery for settlement of grievances and for building of cooperation between representatives of workers and management. In all of these areas, programs need to be designed to meet the *specific and often unique needs* of a particular country.

To perform effectively in these areas, the ILO needs to increase its fund of knowledge through its own research activities and through analysis of the rapidly increasing volume of research done elsewhere. It should be able to provide competent consultants to help the countries requesting assistance, and above all it should be in a position to recruit highly qualified people as members of the technical assistance missions.

From our interviews, we had the impression that the United States worker, employer and government delegates were not always fully aware of the extent, nature, problems and particular contributions of ILO technical assistance programs, for example, in Egypt, India, Pakistan, Turkey and many other countries. Nor did they appear to have opinions based upon full information on the extent to which these programs supplemented, duplicated, or conflicted with the related United States activities of technical assistance and similar programs operated directly by other countries. There has been little appraisal, moreover, of the kinds of closely related technical services which may be provided by private organizations, such as industrial companies, consulting firms, and labor union federations in various countries and how they related to the ILO sponsored activities.

The ILO now operates on behalf of the United Nations most of the multilateral technical assistance programs in the area of management and labor. If the United Nations continues to provide multilateral technical assistance, and the Committee believes that it should do so, the ILO will probably expand its fast-growing, and in many cases, highly successful programs in the managerial and labor area. The United States employer delegates, in particular, should be in a position to offer constructive suggestions for operation of supervisory and on-the-job training centers which

the ILO is presently operating. Here American management has perhaps greater experience and broader knowledge than any other group.

It has been apparent for some time that the major energies and interest of the ILO are shifting away from "legislative" concern to operational services of this kind. The Committee feels that this trend is most commendable. Therefore, it strongly urges that the United States delegations press for improvement and expansion of these services, and in particular that they take the leadership in developing plans for better integration and coordination of these services with other activities, both private and public, designed to increase output, improve productivity, and raise the dignity, worth and value of the individual in the industrializing countries.

In this connection the Committee commends the initiative taken by the ILO in exploring the possibilities of increased and more effective activities in the area of labor-management relations and human relations. We have in mind specifically the report prepared by Mr. David L. Cole in 1955 at the request of the Director-General, and the follow-up on that report by a committee of experts at Geneva in 1956. We believe the suggestions of Mr. Cole and the committee deserve the most careful examination by the United States.

The Committee suggests further, that when United States delegates find it necessary to oppose the adoption of Conventions or the promulgation of broad, sweeping Recommendations, they advance at the same time, wherever possible, well-formulated, specific suggestions for coping with the problems raised, through technical assistance, field service, and objective studies.

The Committee further suggests that the Departments of State, Commerce and Labor make available to all United States delegates information pertaining to non-ILO technical assistance and field service activities so that they may better appraise the present and potential contribution which the ILO can make in the field.

It is in the area of technical assistance and field services that the ILO can probably make its most tangible and constructive contribution to economic and social

development of the member countries, and it is here that we propose that the United States concentrate its major effort in formulating and promoting measures for positive action.

6. *The Committee recommends that the United States support maintenance of the tripartite structure of the International Labor Organization and utilize this structure to demonstrate the advantages resulting from the activities of free employers and free workers.*

The term tripartite, as it is used here, refers to the unique feature of ILO whereby not only governments, but "the employers and the work-people of each of the members" actively participate through delegates in the Organization's meetings. The Committee has studied carefully the operation and impact of the tripartite system of ILO in the light of the criticisms directed against it and the arguments advanced in its defense.

Although a strong undercurrent of opposition to the tripartite system existed prior to the re-entry of Russia and the entry of the Byelorussian and the Ukrainian Socialist Soviet Republics into ILO in 1954, that event sharpened criticism of tripartitism and gave this opposition a focal point. Russian membership in ILO raised in acute form important questions about the freedom from government control enjoyed by worker and employer representatives. The cornerstone of ILO tripartitism is the power to vote possessed by governmental and non-governmental delegates alike. In its conception, this system assumed that the worker and employer delegates would vote and act in the interests of their respective groups, thus insuring that each segment of society involved would have the chance to register its opinion. However, the freedom of Communist employer and worker delegates to act in any interest but that of the government was challenged. These delegates, it was charged, are merely extensions of the Russian government delegation.

The issue was brought to its present acute stage by American employer delegates. Some of them had already manifested a general dislike of ILO's tripartitism, stemming from experience with tri-

partite agencies in the United States during World War II, from frustrations caused by the need to act as representatives rather than as individuals, and from a feeling that this procedure tends to emphasize class distinctions between employers and workers. To this was now added an intense opposition to the very thought that men from Soviet Russia should be classed as employers, and particularly that Communist employers should be admitted to the councils of free employers. A strong—and understandable—emotional element was thus added both to distaste for tripartitism and to intellectual conviction that employer and worker representatives from Communist countries are not free or even truly non-governmental.

The discussion and disputes that arose from American employer attack led to the appointment by ILO of a special committee of jurists, under the chairmanship of Lord McNair, to inquire into the degrees of freedom of the non-governmental delegates from member nations. We are encouraged by the fact that the Governing Body, after considering the McNair report in November, 1956, decided to request the Director-General to submit to its next session "a report on the desirability and the practicability

(a) of establishing continuing machinery which would establish the facts relating to the freedom of association in member states of the International Labour Organisation and would report to the Governing Body and to the International Labour Conference;

(b) of improving the practical methods of working of the conference, including the committees of the conference."

We hope the Governing Body will see fit to install this machinery and will make sure that it is allowed to function freely.

But realistically we must recognize that this alone will not solve the problem. The preamble to the ILO Constitution proclaims the need for "recognition of the principle of freedom of association," and Article 3, Section 5, provides that the representatives of employers and workers shall be "*non-Government* delegates and advisers" (emphasis added). Unfortunately, however, there is no specific requirement that these

delegates and advisers be representative of *free* workers or of *free* employers.¹ Furthermore, while Article 4 guarantees that "every delegate shall be entitled to vote individually," there is no guaranty that this *individual* vote will be *independent*.

The Committee shares the view of American delegates, governmental and worker as well as employer, that the appointment of representatives of state-controlled labor associations and of state industries as non-governmental delegates and advisers violates the *spirit* of the ILO Constitution, but we are not convinced that the *letter* of the Constitution is so clearly violated that these representatives can on constitutional grounds be denied seats.

What is to be done?

As a practical matter, tripartitism is established in the ILO Constitution and any change in this principle at the present time is unlikely. Even if this change were possible, we believe that ILO's effectiveness would be decreased by abolition of the tripartite principle.

Tripartitism, an unique feature of ILO among international organizations, imparts to ILO an almost unique amount of pragmatism in its approach to the accomplishment of its objectives. The problems discussed by ILO have direct effects upon employers and workers. It seems consistent with American principles and philosophies to permit and encourage those who are directly affected to participate in the development of solutions which will be better because of the knowledge and experience contributed by these groups.

The problems raised by tripartitism are especially acute in connection with Conventions and Recommendations accompanied by the heavy emphasis on the voting rights of delegates. If, as we hope, Conventions and Recommendations come to play a minor role compared with the research and technical assistance function, many of these

¹ Article 3, Section 5, of the ILO Constitution provides: "The Members undertake to nominate non-Government delegates and advisers chosen in agreement with the industrial organizations, if such organizations exist, which are most representative of employers or work-people, as the case may be, in their respective countries."

problems will be reduced. In fact, it will be valuable to free nations to have representatives of their employer and worker groups take an active part in ILO activities along these new lines.

Since ILO seems likely, in any event, to continue to use the tripartite system, it is essential that the United States utilize this structure to the best of its ability. This cannot be accomplished by the withdrawal, as has been suggested, of American employer participation. If such a withdrawal should take place, the American worker delegate, under the ILO Constitution, would be stripped of his right to vote, thus leaving the two American government representatives as our only two voting delegates. We do not favor representation in ILO solely by governments, either for this country's delegation or as a principle to be adopted by ILO for all countries. We have stressed the need for participation by workers and employers in the solution of their problems. Of even more importance, perhaps, is our conclusion that representation only by governments would result in a loss to the United States. It does not seem likely that outstanding business or labor leaders would participate in ILO activities if they were limited to advisory roles. In addition, the United States would lose the opportunity of demonstrating before the world the fact that, under our economic and political system, it is possible for either or both the employer delegate and the worker delegate to disagree with the government, as they frequently have done in voting on ILO matters.

It is in the light of these considerations that we have examined the problem of the so-called employer and worker delegates from Communist countries.

One proposal which we have studied with great sympathy is to give each group in the ILO more autonomy to conduct its own affairs at the General Conference. Currently, the Standing Orders of the ILO provide that a delegate may appeal to the Conference if he is denied a seat on a Conference committee. This means that, if he wins his appeal, he may be seated as a worker or employer delegate over the opposition of the majority of other workers or employers who consider him not truly

representative. It has been proposed that this rule be replaced by that formerly in force, which allowed the employer and worker groups each to pass on the eligibility of its own members without appeal, as is done in the two Houses of the American Congress.

Ideally, this would be a very satisfactory solution. It would avoid in a clear-cut manner the problems that arise when free employers and free workers are forced to admit into their midst delegates adhering to doctrines that preach the overthrow of everything free men believe, and would help to make sure that the delegates seated in Conference committees were truly representative of employers and workers.

We believe, therefore, that it should be United States policy to advocate such a change *at the proper time*. But the timing is of vital importance and must be determined in the light of the probable propaganda impact. It would be most unfortunate, for example, if either the attempt to make the change, or the result of the change if made, were to give the Russians a new handle for propaganda appeals to the uncommitted workers, or to those who are already suspicious of the United States or critical of capitalism.

Pending such change, the United States delegations should challenge the credentials of employer and worker delegates from Communist nations, emphasizing repeatedly that to seat such delegates violates the spirit of the ILO, and utilizing every challenge to cast in a sharp light the contrast between freedom and oppression. We believe that, even though Communist employer delegates may, despite American objections, continue to be seated in the Conference and given deputy membership (without voting rights) on committees, the impact of relentless American attacks will be felt. In any case we are convinced, for reasons set forth above, that, unsatisfactory as it certainly is, this is from the viewpoint of American national interests a less deplorable state of affairs than would result from the withdrawal of the United States or the refusal of American employers to participate in the ILO.

With specific regard to the problem posed by participation of Communist em-

ployer delegates in meetings of the employer group, we believe ingenuity and imagination can find ways to circumvent many of the difficulties this presents.

We hope that, given a clear lead by the United States Government, American employers will participate vigorously, even enthusiastically, in the ILO. Its tripartite system, despite its weaknesses, presents a great opportunity—almost unparalleled in any other international organization—for continuously and vigorously challenging the Communist economic and political ideology. In ILO today, non-governmental delegates from a majority of nations can determine their own courses of action with little or no government interference. Certainly, this is not the case with the delegations from Communist countries.

Tripartitism makes possible constant and eloquent testimony to the fact that freedom, as it is enjoyed in most of the Western World, is not to be found in countries controlled by Communists.

7. *The Committee recommends that the United States work for a shift in the emphasis of ILO Industrial Committees away from deliberations leading to a vote on final action, toward an approach based on discussion and exchange of expert information; that the United States press for a policy calling for formation of Industrial Committees to meet specific problems rather than the present practice of perpetuating committees.*

We have heard confusing and conflicting testimony regarding Industrial Committees. However, emerging clearly from this testimony is the belief that committees functioning along the lines of the ILO Maritime Commission would be more beneficial to the participants than the existing method employed by the Industrial Committees. Since the maritime body meetings are attended by experts and have more the atmosphere of informational exchanges, this commission has won much greater approval from attending Americans than have the other committees.

We are encouraged that ILO's Governing Body is currently in the process of re-studying the operation of the Industrial Committees. In this connection, we believe that the effectiveness of these bodies

would improve if the Governing Body, in acting upon proposed agenda for committee meetings, endeavored to limit the agenda to problems peculiar to the industry involved.

We believe that Industrial Committees would gain favor in the eyes of American delegates if these committees were formed to meet special problems as they might arise. *Ad hoc* committees stand to gain much greater support from American employers, without losing the backing of worker delegates, than is now given the existing committees which, once created, continue to survive even though no pressing problems may confront them. Permanent committees have excluded from participation many important industries.

Also, the present method of reporting the results of committee voting often obscures real and substantial opposition to the majority decision. Present practice calls for the simple recording of the fact that a measure was carried or was defeated. This procedure tends to surround every winning issue with the aura of unanimity that, in fact, may be completely lacking. In order to correct this impression, we suggest that the United States seek a rule change that would provide for the recording and reporting out of the vote for and against each motion, along with the results of the final vote. We believe also that there would be a more healthy situation with regard to Industrial Committees, if the practice of having the Organization pay the costs of attendance at meetings were abolished.

8. *The Committee recommends that the United States work to improve the International Labor Office staff and to promote the highest degree of objectivity and competence of staff work.*

While serious charges of bias have been leveled at the staff of the International Labor Office, the Committee has no firsthand knowledge or experience that these charges are either true or false. We have heard testimony regarding a few specific instances which would indicate that members of the staff had acted in a manner that could scarcely be described as impartial.

However, we have the distinct impres-

sion from testimony we have heard, that, with few exceptions, such bias as may exist among members of the Office staff springs not from malice or malevolent design but, rather, results from the different backgrounds and environments from where the staff people come. A large share of the personnel is drawn from Europe, so may be prone to follow the lines of action common in that area, such as belief in a strong central government and the use of legislation as a balm for social ills. This approach runs counter to basic American beliefs, particularly to those held by American employers.

This predisposition toward a certain course of behavior is, of course, a bias, albeit an honest one. Given the present nature of the world, the make-up of the Office staff and whatever innate bias may be present are likely to remain substantially unchanged. But if Americans are forewarned of the existence of this inclination to a point of view and are familiar with its origin, they can view ILO papers and studies with these thoughts in mind. Also, ILO officials can be urged to take measures to prevent these predilections from creeping into ILO studies that should be absolutely impartial. Recognizing the extreme importance to an international organization of an objective secretariat, we believe that if American delegates are armed with an understanding of the situation and that if ILO officials strive to keep prejudice out of the Organization's work, the effect of whatever bias may exist on the Office staff can be greatly diminished.

If the American viewpoints are not adequately presented for inclusion in ILO studies and reports, the results may very well appear to reflect a bias running counter to American views. Implementation of our Recommendations No. 2 and No. 3 above should improve staff work in our Government to prevent this. Since much of ILO's research on current practices, proposed actions, and other studies is done with questionnaires, a country must answer the questions presented thoroughly and expertly if it is to have its position correctly stated in the final report. Sometimes in the past, the United States has failed to do an adequate job in this respect

with the result that several ILO reports have not fully reflected the United States position on a question.

As a more general method of insuring a balanced presentation of material by the Office staff, we hope the United States will urge the Director-General to make sure that his staff always permits employers and workers, as well as governments, equal opportunity to present their viewpoints on any issue.

We are sure that the present Director-General, Mr. David A. Morse, whose integrity is above question and who is fully alert to the importance of building a highly competent and objective staff, will welcome constructive suggestions dealing with this problem.

9. *The Committee recommends that the United States Government take the leadership and enlist the cooperation of American employer and employee organizations in undertaking expeditiously to formulate and to work for the adoption of proposals designed to improve the work of the General Conference and its committees.*

The Committee believes that the General Conference and its committees are not now well organized to conduct the business of the International Labor Organization most effectively. This is particularly true in relation to the new trends in the ILO that have been noted frequently in this report and that the Committee strongly endorses (see Recommendation No. 5 above).

The Committee notes with satisfaction that this view, shared by others, was embodied in a resolution passed by the Governing Body at its meeting in November, 1956, and quoted in Recommendation No. 6 above. From our inquiries and examination of the documents we believe that the General Conference is not now as well equipped as it should be to give the fullest possible attention to the Organization's work in the fields of technical assistance and research, and we hope that the review contemplated by the recent resolution will take this into account.

It has appeared to the Committee that, as presently organized, the machinery of the General Conference is such as to favor emphasis upon the drafting of Conventions

and Recommendations, which the Committee believes should be very much reduced. Moreover, the present provisions and practice tend to put the emphasis on Conventions as against Recommendations. We believe that the decision as to whether a proposed instrument should be a Convention or a Recommendation is one that should be taken by the General Conference in plenary session only after the fullest consideration of all aspects of the questions. It may even be that such consideration will lead on occasion to a decision to adopt simple resolutions rather than either a Convention or Recommendation. Because this matter is in our view so important, we hope that it may be possible to provide that decisions to use the Convention form should only be taken by an affirmative vote of more than a simple majority. This should, however, be considered by the United States Government and employer and worker representatives as merely a suggestion that should be carefully scrutinized in the course of a detailed examination of all the present Standing Orders relevant to the review proposed in the recent Governing Body resolution.

10. *Finally, the Committee recommends that the United States Government make vigorous and sustained efforts to call the attention of the American people to the purposes, objectives, and activities of the International Labor Organization, emphasizing that it is the sole specialized agency of the United Nations devoted to improving management and labor standards throughout the world.*

This recommendation stems from the Committee's belief, frequently expressed in this report, that the ILO is an important organization of which the fullest possible use should be made in promoting human welfare, particularly in the so-called underdeveloped areas of the world. We are convinced that, in this democracy of ours, full and fruitful participation can occur in international organizations, including the United Nations itself, only to the extent that the purpose of the organization and the interest of the United States Government in working in it are understood by the widest possible number of citizens.

In submitting to Congress on 18 July 1956 the annual report on United States participation in the United Nations, President Eisenhower said:

It is up to us and the other member states to see that the United Nations serves with increasing effectiveness . . . its central purpose of maintaining the peace and fostering the well-being of all peoples. To this end the United Na-

tions and the Specialized Agencies associated with it *deserve, and should continue to receive, our honest, intelligent and wholehearted support* (emphasis added).

The Committee wholeheartedly endorses this declaration and urges the Departments of State, Labor, and Commerce to take all possible steps to implement it, with respect to United States participation in the International Labor Organization.

Report of the Board of Directors to the Members of The American Academy of Political and Social Science for the Year 1956

DURING the calendar year 1956, which is also our fiscal year, there were no significant changes in the organization and functioning of the Academy. The staff continued to strive to realize the objectives of our society and to broaden its impact.

BYLAWS

Our basic instrument of government was amended a year ago and has served our purposes well since that time. No further changes are presently contemplated.

OFFICE AND EQUIPMENT

Our headquarters building continues to be adequate. No important alterations or acquisitions were made during the year.

OFFICERS AND STAFF

Otto T. Mallery, a member of our Board since 1918, was killed by an automobile in December. Since the Board has not met since his death, his place has not been filled. Jerome J. Rothschild, a member since 1950, resigned from this and several other responsibilities in October, because of increasing claims upon his energy. James P. Warburg, of New York City, long a friend and supporter of the Academy, was chosen by the Board for the interim, ending today.

Your President returned to his duties September 15, after a leave dating from January 1955, to serve as Secretary of Administration of Pennsylvania. During his leave, Dr. Thorsten Sellin served as Acting President as well as Editor. Our Assistant Editor, Dr. Richard D.

Lambert, went on leave in August, to conduct research for a year in India. Acting in his place is Dr. Marvin E. Wolfgang, like Dr. Lambert a member of the faculty of the Sociology Department of the University. E. Gordon Alderfer resigned as Executive Assistant and Assistant Secretary in October, to accept a more responsible position with CARE. His place as Executive Assistant was taken by Geneva Leach.

MEETINGS

The regular spring conference was held on April 20 and 21 at The Warwick Hotel in Philadelphia. The general theme was "Africa and the Western World." We are pleased to report that the attendance was very gratifying and that audience participation was well up to our standards.

Our next meeting, on April 5 and 6, 1957, at the same hotel, will have as its over-all subject "The Future of the Western Alliance." We expect to present at that time the same high standard of speakers as for 1956 and previous years.

We are continuing our policy of extending invitations to recognized cultural, educational, and civic organizations, in this country and abroad, to send delegates to the conference.

PUBLICATIONS

Volumes of *THE ANNALS* published during 1956 were:

January	<i>Russia Since Stalin: Old Trends and New Problems</i>
March	<i>Racial Desegregation and Integration</i>
May	<i>Agrarian Societies in Transition</i>

July	<i>Africa and the Western World</i>
September	<i>The Office of the American Presidency</i>
November	<i>Japan Since Recovery of Independence</i>

Volumes for 1957 are:

January	<i>Disasters and Disaster Relief</i>
March	<i>Current Issues in International Labor Relations</i>
May	<i>American Indians and American Life</i>
July	<i>The Future of the Western Alliance</i>
September	<i>Recreation in the Automation Age</i>
November	<i>The American City and Its Future Problems</i>

Suggestions have been made from time to time to change the basic editorial policy of *THE ANNALS*, to provide a glamorous format and a mixed content. Your Editors and Executive Board have given these proposals the most careful consideration, but have decided to maintain the distinctive contribution of *THE ANNALS*. It is still our intention to provide a high-level journal for the informed adult reader, with each volume devoted to a single subject and with the range of successive subjects covering the whole field of the social sciences.

MEMBERSHIP

During 1956, 2,462 new members were added to Academy rolls, and 2,827 members died or resigned. Total membership and subscriptions at the end of the year were 13,562, of which 3,344 represented libraries in the United States, 717 libraries abroad, and 712 members abroad.

FINANCES

Since the members are likely to be interested in the financial aspects of our

week-to-week operations, we present below a summarized statement of income and outgo:

INCOME

Dues and subscriptions	\$65,270.91
Sales	11,652.59
Advertising	4,196.68
Interest on investments	9,976.77
Royalties and donations	775.19
	\$91,872.14

EXPENSES

General office	\$11,362.12
Meetings	7,329.08
Accounts	6,076.36
New membership	12,569.18
ANNALS	48,886.74
Member records	5,429.89
Sales	4,165.73
Advertising	2,817.00
	\$98,636.10

DEFICIT FROM OPERATIONS

		\$ 6,763.96
Ledger balance at end of month	\$ 4,605.84	
Outstanding checks	8,502.55	\$13,108.39
LESS outstanding collection items		36.00
Balance agreement with bank statement		\$13,072.39
Pro-rated insurance	\$ 428.52	
Pro-rated depreciation expense	4,583.16	
		\$ 5,011.68

Respectfully submitted,
THE BOARD OF DIRECTORS

James C. Charlesworth, *President*
C. Arthur Kulp, *First Vice-President*
Raymond T. Bowman, *Secretary*
M. Albert Linton, *Treasurer*
Lewis M. Stevens, *Counsel*

Alfred H. Williams, Thorsten Sellin,

SOCIOLOGY AND ANTHROPOLOGY

JOSEPH B. CASAGRANDE and THOMAS GLADWIN. *Some Uses of Anthropology: Theoretical and Applied*. Pp. vi, 120. Washington, D. C.: Anthropological Society of Washington, 1956. \$1.50.

This series of papers deals with the implications and applications of anthropology in education, medicine (psychiatry, public health, clinical medicine), administration of dependent peoples, law. The volume concludes with an essay by Margaret Mead in which she surveys the general position of applied anthropology as of 1955. As always with symposia, the various chapters are of uneven quality, but in this case the general level is quite high.

John Bennett provides an extremely provocative discussion of the learning process, psychological reactions, and acculturation of overseas students. George Devereux reviews some of the literature and presents some fresh ideas of his own on psychiatric anthropology. Benjamin Paul sharply states the case summed up in his final sentence: "While it may perhaps be our duty to help people help themselves to better health, it is not necessarily our duty to make them over in our own cultural image." Thomas Gladwin (basing his presentation largely on his own experience in the Trust Territory of the Pacific Islands) urges that anthropologists engaged in administration should carry out as well as plan programs. William Kelly maintains that careful study of "the relationship between the purposes

and the actual results" of United States Government work among American Indians will lead to many new and constructive possibilities.

Adamson Hoebel makes an excellent case for the "invaluable contributions" that studies of law in culture can make to the understanding of law generally. W. Montague Cobb, with beautiful documentation, shows how much medicine and anthropology (both physical and cultural) have to give to each other. Margaret Mead comments upon the preceding papers and ties some threads together. (Indeed, to an unusual degree, all of the contributors link their papers to one or more of those given earlier.) Mead also considers the ethical problems involved in applied anthropology and inventories some of the areas in the applied field that were not treated in this particular series.

CLYDE KLUCKHOHN

Harvard University

LEWIS A. COSER. *The Functions of Social Conflict*. Pp. 188. Glencoe, Ill.: Free Press, 1956. \$3.50.

European influence upon early American sociologists is an accepted fact. In this thesis a European, George Simmel, is reincarnated. The introductory chapter reveals independent thinking. The others start with a "text" according to the Gospel of Simmel and meander through minutia calculated to validate Simmelian propositions pertaining to the role "conflict" plays in social interactions. Sixteen propositions are considered.

Acting both as prosecutor and defense attorney, the author exalts the cohesive against the disruptive value of the conflict process. The following major social functions of conflict, distilled from Simmel, are examined: that conflict preserves the group; serves as a safety-valve; sublimates hostile impulses; specifies the range of group structures; increases internal cohesion; maintains balance of power; and creates coalitions. In discharging these socially desirable functions, conflict forever searches for "enemies."

Conflict is defined as "struggle over values and claims to scarce status, power and resources in which the aims of the opponents are to neutralize, *injure* or *eliminate* (underlining mine) their rivals." Since the opponents are "enemies," the disruptive end result of conflict should not be so easily swept aside. Characterizing as "negativists" such writers as Talcott Parsons, George Lundberg, Elton Mayo, Lloyd Warner and Kurt Lewin, who have harped upon the disruptive role of conflict, Dr. Coser reiterates, in Mertonian vein, Simmel's dictum that "conflict is a form of socialization."

The verbal "negative-positive" battle is maggoty. Social interaction and social structure are inconceivable without nearness-distance relationships. And it is not paradoxical that the very same process of conflict serves both disruptive and cohesive masters. If the aim is to "injure" or to "eliminate" the rival, as the author claims, conflict becomes costly and disruptive; if it be the submission of the enemy—even temporarily—conflict performs a salutary mission by maintaining social equilibrium. In either instance these are value judgments and the appraisal depends upon the frame of reference. While conflict spells distance to the out-group, it construes intensified nearness in the in-group.

Perhaps it is regrettable that the term conflict is used by the author only in the generic sense. The application of Von Wiese's schematic classification of social processes would have given refined definitiveness to his concepts.

Dr. Coser's expository has practical value to controllers and distributors of status. Seekers of sustained or improved status

would gain much insight in formulating advantageous processes of conflict consistent with group solidarity.

The author's contribution is not merely the unfolding of the social functions of conflict. In his sporadic parenthetical observations on the manifestations of conflict are gleaned some rare insights. His scathing criticism of the current trend among sociologists who have shifted interest to "skills" and who are controlled by the dictates of their "clients" instead of choosing their own problems, fans an air of Veblenism. The "stability-minded administrators and bureaucrats" looking for "trouble-shooters" rather than for pure researchers may find Dr. Coser's observations of long-range value.

SAMUEL HAIG JAMESON

Los Angeles, Calif.

ROY G. FRANCIS and ROBERT C. STONE. *Service and Procedure in Bureaucracy: A Case Study*. Pp. vi, 201. Minneapolis: University of Minnesota Press, 1956. \$4.00.

This monograph opens with a summary of the classical theory of bureaucracy developed by Weber and Merton. From their descriptions are selected two salient features: impersonality and rule-following. Do those traits actually characterize bureaucratic organizations?

To answer this question, the authors studied intensively a local branch of the Louisiana Division of Employment Security. They analyzed samples of the agency's formal rules, observed its interviewing and clerical operations, sampled employee attitudes toward their jobs and their co-workers, and surveyed client attitudes toward the agency.

Their findings do not entirely sustain the classical theory of bureaucracy. Neither impersonality nor rule-following is an exclusive principle of organization in office activities. Both are present. But each is significantly modified by other factors, especially by the professional ethic of "service to clients." Additional influences are employee skills, the agency's tasks and clients, its southern and urban setting, and personal relations among employees.

The authors summarize a dozen other

studies of bureaucracy, the findings of which are similar to their own. They conclude that the principle of professional service is as important in large-scale organization as the principle of bureaucratic co-ordination. Conceived as principles, professionalism and bureaucracy may be combined in different concrete organizations (for example: the hospital, factory, army, university) to produce varying patterns of impersonality, rule-following, and so on.

This is a significant work. Space precludes listing all its virtues—its insight into fieldwork problems, for example (Chapter III). Its theoretical perspective, however, is not entirely clear. The authors seem uncertain as to whether they are demolishing or simply refining Weber and Merton. The latter were well aware that their analyses of bureaucracy involved aspects, not wholes. Their theories are oversimplified by Francis and Stone. Yet this critical attitude toward Weber is a good omen, despite its somewhat misdirected application. A deflation of the Weber cult in America is overdue.

Occasionally this book suffers from an occupational disease of American sociology—a humorless scientism which mistakes jargonized tautology for profundity. "As an organization increases in size and complexity the potential for internal conflict among the members increases . . . as the potential for conflict increases, so the potential for communication barriers and for the preservation of special limited interests increases" (pp. 159–160). Does this tell us anything we did not already know?

ARTHUR K. DAVIS

University of Vermont

ROBERT H. TALBERT. *Cowtown Metropolis: Case Study of a City's Growth and Structure*. Pp. xvii, 274. Fort Worth: Leo Potishman Foundation, Texas Christian University, 1956. No price.

Cowtown Metropolis is a compendium of information concerning the past and present of Fort Worth, Texas. It should be a useful handbook for Texans who wish to know more about one of their largest cities. Doubtless it is of particular interest to business and industrial executives, city planners, community leaders, and

others who need a reliable reference book of facts. There are chapters concerning the historical development of the city, population trends, ecological patterns, the economy of the community, housing, organized health and welfare activities, government, and education, with a final chapter on "What Makes a City Good." Most of the data are obtained from historical records, newspapers, census reports, and documents in the files of numerous local organizations. The volume includes fifty charts and sixty-two tables. Many of the charts show comparisons with other American cities of about the same size as Fort Worth. This fact gives the book a somewhat wider appeal than it would have if all the illustrations applied only to the Texas city.

The author is neither boastful nor critical of the city or its institutions. He is not a promoter. Nor is he particularly concerned with sociological generalizations, although there is clear evidence that he is aware of the theoretical implications of some of his data. The book is a good example of a meticulous factual study and should not be considered in any other light. Sociological theorists will find in it little of interest except cold facts, but the facts themselves may be useful in the construction of theories concerning urban life.

NOEL P. GIST

University of Missouri

FLOYD HUNTER, RUTH C. SCHAFER, and CECIL G. SHEPS. *Community Organization: Action and Inaction*. Pp. xvii, 268. Chapel Hill: University of North Carolina Press, 1956. \$5.00.

This is one of the most interesting community studies in the literature. It reports the process by which Salem, Massachusetts, organized itself to survey its health problems. This substantive material is inherently important as a case study in community behavior. But the methodological aspects of the report are equally important. A team of social scientists—with a Southern background at that—were on the scene to observe the behavior. They sat in ringside seats; they were not participants; they were objective observers. They could, therefore, view the processes with-

out involvement. They could see, for example, the ludicrous "images of recall" by which people used ancestors to gain social prestige; they could describe the social organization of the community from the exclusive sewing circles to the formal political set-up, and especially the voluntary organizations. In many ways, the chapter on "Persons Who Influence Decisions" is the most valuable one in the book. Using simple but apparently adequate techniques, they seined out forty persons in policy-making positions. They analyzed the thirteen factors which were associated with the personnel occupying such positions, including membership in a recognized power clique, the will to exercise power and leadership, a moderate amount of wealth or property. Equally significant were the six factors associated with a down-rating in a scale of power, such as having a reputation of being someone else's follower rather than a man with opinions of his own, failure, membership in certain ethnic groups. In the final chapter there is an incisive contrast between verbalized values and functioning values, between "Unreality and Reality." The authors say openly what residents of Salem could never say, namely that self-interest was a dominant value in the community, but that it had to be dressed up in more acceptable terminology in order to be tolerated. The authors do not blame anyone; this is what they found and this is what they report. This study will take its place among the musts in reading lists dealing with community behavior.

JESSIE BERNARD

Pennsylvania State University

JOSEPH B. GITTLER (Ed.). *Understanding Minority Groups*. Pp. xii, 139. New York: John Wiley & Sons; London: Chapman & Hall, 1956. \$3.25.

This little volume is a compilation of popular lectures given in the fall of 1955 under the auspices of the center for the study of group relations of the University of Rochester. The six lecturers form a galaxy of outstanding specialists, each eminent in his own field, although the basis for the selection of the minority groups to

be treated is a little obscure. One readily understands the inclusion of the American Indian, Jew, Negro, Japanese, and Puerto Rican but why the Catholic? Why not the Methodist, Unitarian or Bahai? Perhaps the explanation lies not in the logic of the selection but in the eminence and availability of the lecturers. Father John La Farge, the associate editor of *America*, is one of the broadest minded and ablest apologists of dynamic Catholicism in the world. His presentation certainly fulfills the purpose of the series "to reduce inter-group misunderstandings and remove the sources of irrational conflict."

John Collier, for many years Commissioner of Indian Affairs, points out that the American Indians, popularly thought of as a vanishing race, are as numerous today as in 1492 and that their culture is as varied and extensive. The intrepid champion of Indian rights frankly bids for a reversal of the present trend in government policy which, he insists, "departing unashamedly from its historic role, defying its contractual obligations and ignoring prior experiences is seeking to disinherit the Indians, materially and culturally, and to force upon them the dubious boon of 'anomie'—of homelessness, grouplessness and guidelessness." This latter observation was too much for Mr. Haas, formerly Chief Counsel of the Bureau, who read the paper. Mr. Haas offers a 2,000 word rebuttal with page and line authoritativeness.

Harvard's history professor, Oscar Handlin, outlines Jewish history from the dispersion to the European Pogroms: the reapproachment of Jewish groups of diverse national origins and the rise of antisemitism in the United States. He traces the development of political Zionism since 1930 and the significance to Jews everywhere of the establishment of the state of Israel.

Ira De A. Reid in his lecture on the Negro points out that none of the crises through which the American Negro has passed has produced a single outstanding race leader. Hence he confines himself to a discussion of the Negro movements which have come out of the ten crises faced by the American Negro in the current century. These he regards as the direction taken by the Negro "in his search for peace, equality,

security and that indefinable-something more."

Dorothy Swaine Thomas in a highly documented survey of the position of the Japanese in the United States during prewar, war and postwar days treats of the restrictions on their work opportunities, their ineligibility to citizenship, their educational and assimilation patterns.

The Puerto Rican in the United States is discussed by Clarence Senior of Columbia University. He feels that this group provides a highly desirable migratory labor force for the industries, orchards, and farms along the eastern seaboard. A net immigration increase of 400,000 Puerto Ricans has been added to our population during the past ten years. Dr. Senior points out the difficulties of adjustment experienced by this marginal labor group: cultural, urban, familial, linguistic, and in the matter of Negro stereotype.

As might be expected of six lectures, each restricted to a minority group, there is so little continuity, sequence or synthesis that they can scarcely be called a series. Recognizing this, the editor in a 5,000 word summary does a magnificent job of tracing the pale pattern which he sees running through the series.

The publication does bring into awareness the fact that America's melting pot problem is still in process of solution.

CHARLES W. COULTER

Dade City, Fla.

ANDREW W. LIND (Ed.). *Race Relations in World Perspective*. Pp. xix, 462. Honolulu: University of Hawaii Press, 1955. No price.

As a source of new ideas concerning race relations, as well as one which reviews existent data, this symposium is exceedingly valuable. These nineteen papers were prepared for the Conference on Race Relations in World Perspective held in Honolulu during July 1954. Financial support for this project was provided by the Ford Foundation and the McInerney Foundation.

No theory of race relations emerges from this book. Several of the writers, following H. Blumer's lead, think that only the formulation of "policy" theory in particular situations, but not "scientific" theory, is

possible. The reviewer is not convinced that it is impossible to develop a useful scientific theory of prejudice and discrimination, but this is not the place to elaborate such a point of view.

In these papers, a social conception of a race as a group of people who are regarded and who regard themselves as a race is followed. Changing definitions of race and hence of traditional racial orders are emphasized.

B. L. Hormann views the problem of race relations in demographic and ecological terms, that is, as one aspect of the transformation of the folk and peasant world to industrialized urban society. In his comparison of the racial groups of Hawaii and British Malaya, A. W. Lind points out that the native Hawaiian has penetrated to a far greater extent than the native Malayan virtually all occupational levels, and that the mixed Hawaiian has moved farther up the socio-economic scale than has the Eurasian. J. H. Boeke phrases his analyses of Indonesia and Uganda in terms of the competing values of precapitalism and capitalism, and the supplanting of the older colonialism by a new, indigenous colonialism. E. V. Hughes compares the problems of European national movements, for example, language, territory, boundaries, social structures, literature and art, with happenings in areas of the world where "new" peoples are arising (India and Israel). A. Hourani stresses the role of ethnic and religious differences in Near Eastern nationalism. G. Balandier sees the counter-racism of "negritude" in West and Central Africa as a reaction to colonialism.

J. A. Barnes, dealing with historical factors, concludes that South Africa is developing a social system "in which change will become as difficult and as dangerous as possible"; Absolom Vilakazi writes concerning theories, practices, proposals, and movements in the race relations field in the same country. According to W. J. Kolarz, the Communist policy of obliterating the national characteristics of the racial groups of the USSR may not succeed. J. S. Furnivall warns that some of the recent international agreements intended to promote welfare and improve racial relations may have contrary effects. C. E. Glick's paper deals with

the possibility of using the concepts of social roles and social types to illuminate the transformations taking place in racial-status systems. K. L. Little shows the importance of the relatively well-educated and well-to-do class, and of the new voluntary associations which have appeared in British West Africa, in the transition from the old to the new social orders of life. T. S. Simey compares the development and the functions of a cultural elite in Israel and in the West Indies.

E. F. Frazier indicates the changing economic, political, and social position of Negroes in the United States, and urges that more research be devoted to the relation of culture and personality. Yuzuru Okada describes the attitudes and policies of Japanese colonizers toward the Formosan Chinese and the Formosan aborigines. Maurice Freedman, using data from British Malaya, Indonesia, and Thailand to show the strengths and weaknesses of the Chinese position in Southeast Asia, suggests that assimilation, acculturation, and amalgamation may occur independently of each other. Ralph L. Beals concludes that problems of social differentiation are of primary importance in Spanish America; race relations are said to be involved in such problems in varying degrees but are seen as diminishing in importance. In tracing the shift from racial to class distinctions from the colonial period to the present time in Portuguese America, Donald Pierson emphasizes the importance of extensive miscegenation and of increasing urbanization and industrialization.

This book is indispensable to those who have a special or a general interest in contemporary world race relations.

GEORGE E. SIMPSON

Oberlin College

ALLAN B. COLE. *Japanese Society and Politics: The Impact of Social Stratification and Mobility on Politics*. (Boston University Studies in Political Science, No. 1.) Pp. 158. Boston, Mass.: Boston University, 1956. \$1.50.

This first issue of the Boston University Studies in Political Science falls midway between advanced research and an introductory text. For scholars, the promise is rich

but the fruit does not mature; the findings, based upon Professor Cole's exhaustive studies in the field, are important and valuable but they neither vary significantly from those already available nor are they of much wider range. Undergraduates would reap great harvest did not he ruthlessly shoulder aside the brief and rugged word whenever he could find technical, and usually multiple, polysyllables.

As a Ford-Fulbright research professor at The Institute of Social Sciences of the University of Tokyo, Professor Cole, of the Fletcher School of Law and Diplomacy, made full use of ample opportunities. He surveyed at first hand the effects of war, defeat, and reconstruction on the urban and rural populations of Japan. He interviewed innumerable labor leaders, bureaucrats, the newly risen managerial elite, and what was left of the formerly privileged nobility. He studied the effects of the military systems, both prewar Japanese and postwar American, to see their influence upon the new Japan. And, unique among most writers in the field, he checked his findings with the best Japanese social scientists. Unhappily for most American scholars, comparatively little has been published in English on the general subject in Japan, nor, apparently, much more in Japanese, but Professor Cole has drawn upon a stack of unpublished doctoral dissertations to reinforce his own investigations.

Now that foreigners, and what is more important, Japanese too, have outgrown the mystic idea that Japanese are somehow different from all other peoples, it is not surprising that Professor Cole discovers that the same forces which brought socio-economic changes in the West produced similar changes in the East. That older people tend to vote conservatively while the young clamor for reform, that woman suffrage fails to alter the ratio of political power, that wives and mothers dislike war, that financiers prefer the status quo, and that labor parties are unstable are, none of them, startling discoveries, nor is it surprising to be told that the old elites have been discredited.

It is no criticism of Professor Cole's labors nor of his analysis to say that he turns up no new material; he does a valued

service by aligning Japanese sociology with that of other areas. If one or two minor flaws, especially in reference to the Occupation policies, exist and if he be somewhat weak in treating of the educational, labor and, especially, the woman's realm, these may be pardoned in view of his strength and insight in studying the rising urban middle class.

The volume is compact and meaty and will be an aid to students who can concentrate.

HARRY EMERSON WILDES

New School for Social Research

GUSTAV SARON and LOUIS HOTZ (Eds.). *The Jews in South Africa: A History*. Pp. xvii, 421. New York: Oxford University Press, 1955. \$5.60.

Few countries in the world have so complicated a population structure as South Africa. Its non-European majority of some ten and a half million is divided between native Bantu or Africans, Colored (mixed blood), and Asians; its minority white population of nearly three million separates sharply between the Afrikaans-speaking, who are now not only numerically but also politically dominant, and the English-speaking. This work on *The Jews in South Africa*, edited skilfully by Gustav Saron and Louis Hotz, examines important facets of the history of South Africa from the point of view of a small but significant segment of the white population, those of Jewish faith and descent, who even today, despite assimilationist trends, form a distinctive group within that country. In so doing, the work throws new light on the fascinating panorama of South African development, particularly in the period prior to South African union in 1910, as well as on the distinctive contribution to that development of this particular racial group.

The first Jews to come to South Africa were from England and Western Europe. By the 1880's, however, Russian Jewry, especially from Lithuania, began the steady migration to South Africa which not only accounts for some 80 per cent of the more than 110,000 Jews in the Union today, but has provided the characteristic cast of

South Africa Jewishness. The Lithuanian Jews had a deep and fervent consciousness of both their religion and of a particular way of life; their numbers were sufficient for them to embody this in a cohesive community within South Africa. But they also had energy, drive, ingenuity, and endurance. Thus they participated in or directed most of the major developments in South African economic life in the period before union: diamond mining, gold mining, and, more exotic, the ostrich farming industry.

The major part of this book deals with the period from 1880 to 1910; only the relatively brief epilogue skims the forty-five year period since union. For those seeking an analysis of political conflicts and racial tensions even in the earlier period, there is comparatively little direct material except in relation to Jewish struggles against the discrimination suffered under the old Transvaal Republic, or subsequently through immigration restrictions. Yet the accounts of the formative period of the separate Jewish communities in the four provinces, and the more general essays which deal with Jewish educational and economic advances, and with the struggles within the Jewish community itself for unity, form absorbing stories from the South African as well as Jewish point of view. The more one knows of South Africa, the more meaning they are likely to have because they supplement familiar material, and approach it from new angles. But even for those who do not know South Africa well, the well-written and comparatively well integrated contributions in this book bring out vividly what a relatively small but vigorous and cohesive community can accomplish in helping to open up a country whose complexity of problems is matched by the richness and variety of its resources. The greatest of these resources, one realizes again on reading such a work, are the individuals and groups which have contributed so wholeheartedly to the making of South Africa; the greatest of the problems are the barriers which persist (all too often because of deliberate governmental policy) between its vastly varied peoples.

GWENDOLEN M. CARTER

Smith College

HOSPITAL COUNCIL OF GREATER NEW YORK. *Organized Home Medical Care in New York City: A Study of Nineteen Programs*. Pp. xvi, 538. Cambridge, Mass.: Harvard University Press for the Commonwealth Fund, 1956. \$8.00.

Despite increasing reliance of the individual physician on an expanding team of specialists, technicians, and therapists created by scientific advances, medical care outside of hospitals has remained singularly unorganized (but not disorganized). This lack of organization has interfered with effective utilization of the various elements of medical care, especially by the ill person who is confined to his home.

During the past decade, however, a promising new development has been the establishment of a number of limited medical care programs which offer comprehensive services organized specifically for the patient at home. *Organized Home Medical Care in New York City* is a report of a study of nineteen such programs presently serving a daily average of over 5,000 patients. Each of these programs limits service to patients who do not have resources to purchase medical care.

The report contains a detailed description and evaluation of these plans, and includes statistics describing the patients, their home environments, and their utilization of the various services. This material has been assembled with care, and will be invaluable to community or professional groups who may be considering the establishment of such programs. Many will be surprised to learn, for example, that 57 per cent of the home care patients were totally ambulant and only 4 per cent were totally bedridden.

The report concludes that organized home medical care is an "extremely desirable addition to the scope of available medical services." It is recommended that such programs be based in a general hospital with an active outpatient department, directed by a physician with administrative experience, and staffed with no less than two additional physicians, two physical therapists, three social workers, and one occupational therapist for each 100 patients. Nursing service should be provided

by the community nursing agency, and hospitalization should be immediately available to each patient.

Organized home care costs are estimated to be \$3.58 per patient day, inclusive of physician services, but exclusive of expenses of the patient and his family.

Some readers may be disappointed that the report is so studiously limited to programs serving medically indigent patients. Only fleeting references are made to the desirability of serving private patients, and to the existence in other cities of programs organized for the private practitioner and his patient.

Organized home care will probably come of age only if offered, like private and semi-private hospital service, in conjunction with private practitioners who will be willing to adapt to the organized program, but who will insist on managing their own cases and on avoiding "corporate practice of medicine."

ROBERT M. SIGMOND

Hospital Council of
Western Pennsylvania

ODIN W. ANDERSON and JACOB J. FELDMAN. *Family Medical Costs and Voluntary Health Insurance: A Nationwide Survey*. Pp. xix, 251. New York: Blakiston Division, McGraw-Hill Book Company, 1956. \$6.50.

With an estimated 110 million people currently enrolled in some form of voluntary health insurance, any exploration of the strengths and weaknesses of this phenomenon is manifestly important. In July 1953, the Health Information Foundation, utilizing the statistical and technical know-how of the National Opinion Research Center, University of Chicago, undertook a nationwide survey to seek an answer to the problem: "Given the present range of benefits offered by voluntary health insurance, what effects do such benefits have on spreading costs of personal health services and on the utilization of services?"

The first nationwide study of family medical costs to be done since 1933, its methodology reflects the tremendous advances in population sampling which have taken place in a brief score of years. (It

is since 1933, as well, that almost all the growth in voluntary insurance has taken place.) With modern techniques, a smaller sample, with resulting lesser cost, can yield more precise information from the standpoint of sampling than was obtainable twenty years ago. In the present study, a probability sample of 2,809 families was drawn from the general population, following the methods of the Bureau of the Census, and the families so drawn were subjected to a single interview covering, in addition to basic characteristics of the family, the extent of insurance, the utilization of medical services and the charges incurred, and the benefits received from insurance.

Only a few highlights can be given here. As all previous studies have shown, a relatively small proportion of all families bear a high proportion of total medical costs; here, 11 per cent incurred 43 per cent of the total charges for all families. Insured families found that their insurance covered 19 per cent of their charges for personal health services. Of the families incurring hospital charges and receiving insurance benefits, 59 per cent had 80 per cent or more thus covered. Some interesting contrasts appear between insured and noninsured families. To give one example, insured families incurred appreciably higher charges for uninsured services such as dentistry, indicating the presence of psychological and social factors as well as economic.

Implications for the need to expand both coverage of the population and the scope of benefits are clear. In terms of studies, we should like to know next the effect, if any, of insurance upon the general health; and we want to know more about the need for medical care and the extent to which that need is being met for both the insured and the noninsured.

ISIDORE ALTMAN

University of Pittsburgh

COMMISSION ON CHRONIC ILLNESS. *Care of the Long-Term Patient. Chronic Illness in the United States*, Vol. II. Pp. xv, 606. Cambridge, Mass.: Harvard University Press for the Commonwealth Fund, 1956. \$8.50.

This is Volume II of a series of four to be published by the Commission on Chronic Illness established in 1949 by the American Hospital, Medical, Public Health, and Public Welfare Associations to study and assess the problems of chronic illness.

This book deals particularly with the needs of patients with long-term illness and with suggestions of how the community can better meet them, including ways of better financing medical and related services. The concluding chapter lists eighty conclusions and recommendations dealing with a wide variety of aspects of this complex, but urgent health problem.

In describing the magnitude of the problem, and what is being done (or not done) about it and by whom, the book is in illuminating detail. But in dealing with ways and means of organizing and administering community programs to meet the obvious needs of persons with long-term illness, discussions turn principally to platitudes that no one would question but few could translate into definitive lines of action. This is a reflection of the seemingly extreme complexity of the problem.

On the other hand, the book is highly informative and can be recommended to all persons with a serious interest in the problem. Its great value is in the persuasiveness with which it presents a few fundamental concepts.

First, it emphasizes the great number and variety of services and facilities required for the restoration of the long-term patient to social usefulness; and while much more is needed than medical and nursing skills, yet the problem of chronic disease is as inseparable from general medical care as is acute illness.

Second, this diversity of needed facilities and services is such that they are outside the competence of any single agency in a community to provide, and indeed are not readily amenable to effective co-ordination. The issue of co-ordination and integration would be simpler if these diverse facilities and services were all provided under institutional auspices.

But a third important concept persuasively developed is that while institutional facilities are important, most long-term patients can best be cared for at home and

greater emphasis must be placed on planning for their care in and around the home. This compounds the problem of co-ordination because it introduces the myriad of community agencies oriented to "non-institutionalized" types of service. To anyone familiar with the degree to which fractionation of health and welfare services exists in a typical community, there is little wonder that the book concludes that "the lack of coordination of services is a major obstacle to progress."

A fourth concept that merits emphasis is that of the enormous potential (fiscal and social) of sound and aggressive efforts in rehabilitation.

While embracing the philosophy that the basic approach to chronic disease must be preventive, there's scarcely a single broad aspect of the problem discussed without reference to either the lack of or broad gaps in our knowledge that serve as deterrents to this approach. The chapter on research offers many excellent suggestions concerning the broad fields of inquiry, the pursuance of which is urgently needed.

Though bold with generalities and timid with specifics, the book is an extremely valuable contribution to a better understanding of the most complex and urgent problem in public health today.

JAMES A. CRABTREE

University of Pittsburgh

ECONOMICS AND GOVERNMENT

C. N. VAKIL and P. R. BRAHMANAND. *Planning for an Expanding Economy: Accumulation, Employment, and Technical Progress in Underdeveloped Countries*. Pp. xxx, 404. Bombay: Vora and Company, 1956. (Distributed in the United States by the Institute of Pacific Relations, New York.) \$4.50.

The first half of this volume is a basic and vigorous criticism of India's second Five Year Plan by one of India's outstanding economists; the second portion develops a significantly new theory of economic development applicable to underdeveloped countries.

For one interested in the broad prob-

lems of economic development, this book is a stimulating discovery. India's second Plan is criticized for placing too great an emphasis on heavy industrial investment, while neglecting the increase of consumer goods. Whereas the first Five Year Plan concentrated on increasing agricultural production, the second Plan now starting shifts the emphasis drastically to heavy industrial development. It is correctly pointed out that both the amount and nature of the investment activity will likely put too great a strain on resources and lead to inflation.

In the second portion of the volume the authors develop a new theory of economic growth for underdeveloped areas. The poverty of these areas is associated with unemployed labor and a scarcity of capital, whereas depression unemployment in advanced countries is associated with unemployed capital as well. Methods of raising income in a depression ridden advanced country are not applicable in underdeveloped countries with their lack of capital equipment. The problem is one of increasing capital available so as to employ usefully the large mass of disguised unemployed in rural areas. The unemployed labor force is a temporary drag on the economy, eating up potential savings and preventing needed investment. But these disguised unemployed are a potential source of productivity and wealth if only complementary capital can be created. Thus far most economists would agree with the authors. They proceed to analyze the bottleneck which prevents investment as a lack of consumer goods which in turn prevents employment of the idle labor force. Their formula for rapid growth would be to hire the unemployed to produce almost exclusively consumer goods until all the disguised unemployed have been absorbed. Only then would they shift to capital goods production.

The general idea is plausible enough. However, if one reads the central theoretical portions on a technical level many shortcomings are revealed. The language is distressingly imprecise and occasionally the simple mathematics faulty (pp. 262-63). It is fascinating yet exasperating reading as one feels he is being shifted between Keynes, Marshall, and Marx in turn.

The central model of the investment process developed in Chapter IX is deficient in that it neglects the necessity of creating capital equipment in order to draw the rural unemployed into industry. This is particularly strange since the whole discussion is directed toward capital accumulation.

Swarthmore College

RICHARD L. MEIER. *Science and Economic Development: New Patterns of Living*. Pp. xviii, 266. New York: Technology Press of M.I.T. and John Wiley and Sons, 1956. \$6.00.

This is a provocative, sensitive, and also able book. The author starts out boldly with the intention of recommending more sure and economical development programs than others. Nobody needs to agree with all his ideas to welcome this effort at joining the more recently developed resource technologies to current social goals in the more and less developed areas.

There are few places where Dr. Meier expressly says "Here is what Jones, Smith, and Brown offer, and by contrast here is what my contribution is, and here is why it is better." Consequently for a brief review it is probably best to sample some of his major thinking, skipping in that process much of his valuable work in measuring both needs and resources, as well as his consistently wide awareness of the difficulties that confront change in many cultures.

He foresees a world population of between 3 and 3¾ billions by the year 2000, not leveling off much until it reaches 5 billions. For the less developed areas he believes that there is little chance of adequate capital accumulation until low-cost ways of restraining population growth are found. For most of those areas, he believes rationing is necessary so that all incomes will cluster around a minimum adequate standard of living (MASL), put at about 330 dollars of the 1950 values. The required investment ranges between \$1,800 and \$3,500, Dr. Meier finds. An urbanization of 70 per cent or more of the population is considered desirable and necessary, with "urban villages" carefully planned in

advance, and with careful adjustment of agricultural immigrants to city ways. Not only new thinking about city planning but about housing and household equipment is held to be essential.

In addition new industrial complexes feeding on each others' waste products and centered around atomic energy plants are expected, at some distance from the cities, and also food producing and processing complexes centered around algae production pools.

The world food situation is expected to become critical in the 1960's or 1970's. Using as a landmark Salter's estimates of world food potential under present techniques of about 2.8 times prewar output, Dr. Meier foresees a protein expansion of food yeast, chlorella algae and blue green algae with costs per pound of protein respectively of 35 to 50 cents, 10 to 20 cents and 5 to 15 cents, comparable with the present cost of protein from pulses of 12 to 20 cents per pound. The investment requirements average respectively \$900, \$450 and \$450 per ton compared with \$1,500 for pulse-derived protein. Dr. Meier concludes that "a level of fat and protein production up to 50 times present levels is not at all unreasonable." Out of that 50 billion people could eat well, given high acceptance of new food forms.

The fuel and energy problems he takes as a much more serious limitation on the growth of human welfare than the food problems. He expects solar cooking in the tropics to develop fairly rapidly. Methane gas generated as a by-product of the photosynthetic production process of algae is counted on for some energy, also wind power, and tidal movement, but atomic energy at 1 to 2 cents per kwh is expected to take over a large part of the world's energy load. He foresees general steel production with hydrogen instead of coking coal. Since his figures show that 25 to 40 per cent of the world's energy is spent on moving materials and people around, he expects to see a considerable reorganization of work-centers in the future.

There is a great deal more to this book than can be indicated by a sampling of this sort. It is a conscientious effort to find what the new developments in the

physical sciences require by way of new social expression, and to measure both needs and the resources to meet them.

STEPHEN RAUSHENBUSH

Public Affairs Institute

JOE S. BAIN. *Barriers to New Competition: Their Character and Consequences in Manufacturing Industries*. Pp. x, 329. Cambridge, Mass.: Harvard University Press, 1956. \$5.50.

In 1955, the *Report of the Attorney General's National Committee to Study the Antitrust Laws* noted that "relative freedom of opportunity for entry of new rivals is a fundamental requisite for effective competition in the long run" (p. 326). Professor Bain's timely book reports on the nature and economic significance of entry conditions. The author seeks to determine the relation of this aspect of market structure to market performance and to measure the vitality of potential competition in a sample of twenty American manufacturing industries. Constant evidence of careful, thorough, and yet imaginative research appears throughout the book. Nevertheless, it becomes apparent that carrying analysis of the relation of entry conditions to performance very far is rather difficult. Accordingly, this reviewer would agree with Bain that "the major contribution . . . may well be that of developing data on the character of the condition of entry and its determinants, with particular reference to manufacturing industries" (p. vii). Such agreement is not meant to deprecate the quite considerable value of Bain's achievement. It merely echoes the honest realism of the book which consistently emphasizes the inadequacy of basic data and the consequent difficulty of testing theoretical generalizations. Neither received theory nor previous empirical investigations have gone very far into systematic analysis of alternative entry conditions in oligopolistic industries and the effect of such conditions on seller conduct and industry performance. Bain makes substantial progress in filling this gap.

The book restates and amplifies received theory about entry conditions. It then pro-

ceeds to consider the importance of scale economies, product differentiation advantages, and absolute cost advantages as barriers to entry. Over-all barriers are then treated and the market performance of industries with different entry conditions is analyzed. Conclusions about the effect of entry conditions are quite properly stated in tentative terms. It is suggested that high excess profits and output restriction appear greater when entry barriers are high. Product differentiation is assigned first place as a cause of effective entry barriers.

Bain concludes this excellent book with a chapter on public policy that seems an anticlimax. This perhaps results from the fact that only rather general suggestions are made about ways in which policy might deal with entry barriers in order to improve and maintain effective competition. These proposals call for precise economic measurements and judgments that appear unlikely to be implemented by the judicial process of antitrust enforcement. Additional research would be a prerequisite to development of adequate legislative standards on this subject. This reaction may only express a wish that Bain had done more than he set out to accomplish.

Barriers to New Competition should be widely read; it is a book that, in the words of an Advent Collect, one should "read, mark, learn, and inwardly digest."

ARTHUR D. LYNN, JR.

Ohio State University

PHILIP C. NEWMAN. *Public Control of Business: An International Approach*. Pp. iv, ii, 500. New York: Frederick A. Praeger, 1956. \$14.00.

"The reason for the appearance of the second part of a two-volume book first calls for some explanation," says Dr. Newman in his Preface. The reason is simple enough: the documents were collected but the treatise concerning them was taking a long time to write. The decision to publish the documents separately was sensible and the result is a very useful volume.

Except for brief introductory notes, this book comprises nothing but documents relevant to a study of the public control of

cartels, monopoly, and restrictive practices. United States materials run to some 200 pages—the basic legislation, major court decisions, a collection of consent decrees, and some Federal Trade Commission material—while about 300 pages are devoted to foreign and international documents. There are seven sections. First, as examples of international agreements based on patents we have the prewar arrangements between Dupont and Imperial Chemical Industries, Krupp and General Electric, and Standard Oil and I. G. Farben. The second section includes the international steel cartel agreement of 1926, the French-German potash arrangement, an interesting report on negotiations between Canadian and Scandinavian newsprint producers, documents concerning the International Air Transport Association, and prewar agreements on sulphur, steel rails, copper, and oil. International commodity agreements occupy the third section with texts on wheat, tin, tea, and rubber. The fourth section, dealing with national legislation, provides texts from Sweden, Britain, Canada, Brazil, Argentina, Germany, and the United States. The next two sections, on judicial interpretation and enforcement techniques, are made up principally of American documents, with a few from Britain. The book closes with three international texts: the relevant sections of the Schuman Plan Treaty and the proposed Charter of the International Trade Organization, and, in a different vein, the March 1939 agreement between the Federation of British Industries and the Reichsgruppe Industrie.

Some of these documents were already easily available. Others would have been much harder to find. A few have apparently been translated for the first time. So far as I know, this is the first time so substantial and representative a collection has been put between two covers. Many people should be grateful to Dr. Newman when they use it for ready reference, comparative study, or in courses. The brief notes would have been more helpful if they had told more of the setting in which each document is to be read. Not all sources are cited. There are a number of minor

typographical errors. But these are small blemishes in a very useful book.

WILLIAM DIEBOLD, JR.

Council on Foreign Relations
New York, N. Y.

SYLVIA KPALS SELEKMAN and BENJAMIN M. SELEKMAN. *Power and Morality in a Business Society*. Pp. ix, 192. New York: McGraw-Hill Book Company, 1956. \$4.00.

Concentrated economic power is per se immoral and irresponsible; it contradicts our basic ethos and engenders within our society a fatal malaise. Can such power, by any practicable and democratic means, be brought under social control, made moral and responsible, and directed toward socially desirable ends? The Selekmans, drawing on their extensive experience in labor and industrial relations, think it can be. In general they follow the negotiational model developed by the late John R. Commons—a case by case process of bargaining, compromise, accommodation and adjustment under a regime of constitutionalism. "Negotiation," they affirm, "constitutes the characteristic American activity for realizing this objective."

Economic power is defined functionally as "organized force or energy"—"those energies of forces harnessed to human capacity as a way of rendering more effective man's activities in the promotion of his purposes." This productive power "constitutes an essential of human life in society"—"an inescapable prerequisite of effective performance." There is, it is held, a "compelling drift in the technical instruments of industry toward large-scale organization." This technological determinism creates a serious dilemma—a conflict between the technical "must" and the ethical "ought." The moral crisis in American society stems from our failure to reconcile these two imperatives.

Various means are available to tame economic power, curb its destructive propensities, and direct it into useful channels. Reason, conscience, ethics, tradition, aesthetics, and countervailing power may all exercise some minor, but admittedly

inadequate, restraint. Principal reliance, however, should be placed on negotiation—a continuous integrative process by which conflicting powers and interests are neutralized and harmonized. This is the built-in principle of gradualism in negotiatory, or democratic, society. Governmental control should be eschewed, for political power is ultimately coercive and potentially more dangerous than limited economic power.

Negotiation is obviously valuable, even indispensable, at the *operational* level, as in ordinary business transactions and industrial relations, but it provides no solution whatever for the *structural* problem of concentrated economic power. The possessors of overweening power do not negotiate; they dictate. Hence, if their power is immoral and irresponsible, as the authors concede, it can never be transformed by negotiation. The true remedy lies in the systematic decentralization and diffusion of economic power. But the authors are precluded from this line of inquiry by their twin assumptions that concentration is technologically determined and that governmental control is inherently dangerous. On these premises no real solution is possible; one can only rationalize acceptance of the status quo or hope that some adventitious expedient, such as negotiation, will transmute evil into good.

HORACE M. GRAY

University of Illinois

JOAN ROBINSON. *The Accumulation of Capital*. Pp. xvi, 440. Homewood, Ill.: Richard D. Irwin, 1956. \$6.00.

This volume is an exercise in model building, by an outstanding model builder, for the purpose of throwing light on the causes and consequences of changes in the rate of capital accumulation. Book I, of 60 pages, covers introductory definitions, but the heart of the discussion is in Book II, of 115 pages, which is devoted to accumulation in the long run. The remainder of the volume contains six additional books, totaling 210 pages, which consider, in order: "The Short Period," "Finance," "The Rentier," "Land," "Relative Prices," and "International Trade." A final 50 pages are devoted to "Notes on Various Topics."

The basic analysis is conducted with the aid of drastic simplifying assumptions: there is no index number problem, workers are uniform and work for the same money wage, technical progress is such that the composite commodity representing the output of consumption goods is left unchanged, the stock of all sorts of capital goods needed to produce a given output is rigidly determined by the technique in operation, the economy is "tranquil" in the sense that future expectations are being fulfilled, land is unlimited, there are only two classes (workers who do not save and entrepreneurs who do not consume), strict laissez faire prevails, there are no economies of scale, and the economy is a closed system. The "chief concern is with the [long-run] relation between wages and profits, and the argument is conducted in terms of the relations of the stock of capital to the available labour force, the influence of competition, and the technique of production" (p. 70). The results obtained are neatly summarized in the twenty propositions which make up the four pages of Chapter XVIII.

No book which involves an extended exercise in theoretical reasoning is easy to appraise; the full implications take time to digest. Throughout, Mrs. Robinson handles her constructions with her usual skill and provides stimulating comments on important problems, especially in the second half when the implications of the simplifying assumptions are discussed. In fact, there can be no doubt that the mere listing of the assumptions required to permit easy theorizing is itself highly useful. The volume can, therefore, be recommended to professional economists without reservation. But if one asks for more than this—if one asks for the new and sudden "insight into the behaviour of the actual, complicated, economy" (p. 64) that sometimes results from theoretical work—I would have to confess that the core twenty propositions did not provide such insight for me. But then it may well be that I did not extract from Mrs. Robinson's mine all the riches that she has uncovered.

HENRY H. VILLARD

City College of New York

RICHARD N. GARDNER. *Sterling-Dollar Diplomacy: Anglo-American Collaboration in the Reconstruction of Multilateral Trade*. Pp. xxii, 423. London: Oxford University Press, 1956. \$6.00.

Sterling-Dollar Diplomacy is an excellent history and analysis of the issues of Anglo-American economic diplomacy during the period from the Atlantic Conference of August 1941 to the dramatic end, in December 1950, to the prospects of the International Trade Organization as an approved instrument of multilateralism in world trade. The Atlantic Charter had provided the first broad definition of Anglo-American postwar economic objectives; the ITO, conceived as the final of three international instruments for the reconstruction of multilateral trade, was stillborn and, unlike the Fund and the Bank, never had a chance for survival. The period represented "an era during which the United Nations embarked under Anglo-American leadership on the most ambitious programme in intergovernmental cooperation ever undertaken in the economic field."

Influenced by the costly lessons of peace-making after World War I, the United States policymakers, under the strong influence of Secretary Hull, set the goal of a postwar world in which the reconstruction of multilateralism and nondiscrimination in international trade would assure peace and economic well-being for all nations. The views, pro and con, on multilateralism threaded their way through all the debates on vital postwar issues. The historic negotiations on Article VII of the Mutual Aid Agreement; the dramatic debates over plans for financial collaboration the intensity of which was at times all the more marked by personality clashes between the ambitious Harry White and the proud Lord Keynes; the gains and losses for multilateralism at Bretton Woods; the loan agreement of 1945 and the final overthrow of its objectives; the misunderstandings born of the abrupt postwar termination of Lend-Lease; the British convertibility crisis of 1947—all were parts of the shaky framework within which the goals of freer postwar trade, through institutional devices of international scope, were sought

by negotiators often in agreement on economic principles but frustrated by the political realities of national interest. The controversial issues implicit in tariff preferences, quantitative restrictions, transitional exchange problems, and external aspects of domestic full employment policies, assumed a more troublesome character as they reflected the changes which, during recent decades, the two countries had undergone in their respective balance-of-payments positions as well as in the economic influence each was able to wield in world affairs.

The book is a scholarly and objective treatment of a story as fascinating as it is important. The author's access to documents not utilized before and his balanced analysis, supplemented by an exhaustive bibliography, assure the book a unique place in the historical and economic literature on Anglo-American relations during an eventful period. The concluding chapter reflects a degree of pessimism which may yet appear unwarranted, especially if the lessons of the decade are not lost in possible future crises that may call for real statesmanship and economic collaboration by the two great English-speaking nations.

AMOS E. TAYLOR

Pan American Union
Washington, D. C.

WILFRED OWEN. *The Metropolitan Transportation Problem*. Pp. x, 301. Washington, D. C.: Brookings Institution, 1956. \$4.50.

The difficulties faced by American cities arising from the almost unbelievable increase in automobile use are the despair of the authorities who struggle with the problem and of the millions who suffer from the cost, inconvenience, discomfort, and delay which have been forced upon them. Although these problems have been discussed in the literature dealing with city planning, highway development, the transit industry, and urban real estate, Owen's little volume fills a need in analyzing the over-all problem, bringing together diverse views, and discussing proposed remedies. The problem is that of too many people

swarming in and out of the congested industrial and commercial areas of our large cities, a large proportion of them insisting on using private automobiles for which streets, highways, and parking spaces are wholly inadequate.

The author recognizes that a basic question is "the relative roles that should be assumed by the automobile and by public carrier transportation." He concludes that in the downtown areas of most large cities, "land use is so intensive that the attempt to accommodate private transportation under all circumstances is not feasible," hence mass transport systems are required. In the low-density areas of the suburbs, however, public transportation cannot be expected to pay its way.

The worsening financial position of public transport in most cities and the deterioration of service are noted. Although recognizing that public transportation is necessary, and that there is a conflict "between the interest of the carriers in economic survival and the interest of the community in the availability of service," the author is unfavorably disposed toward the subsidization of transport operations. Various suggestions are made for improving the pricing of transport services, some of which might require further examination for possible repercussions on other parts of the total problem. The author recommends that a larger share of motor-vehicle revenues be used for urban streets and highways. Toll-financed expressways are advocated, and the author even suggests pooling of all transportation revenues from urban transport in an area to provide needed facilities and to support mass transport operations. Would this or would this not be subsidizing mass transport? Even so, it may be desirable.

To reduce the demand for urban transport the author suggests redevelopment of existing urban areas; changing zoning laws to permit modernized industrial, commercial and residential development in the same areas; and directing more urban growth to new towns and to the smaller towns.

D. PHILIP LOCKLIN
University of Illinois

STEPHEN WHEATCROFT. *The Economics of European Air Transport*. Pp. xxii, 358. Cambridge, Mass.: Harvard University Press, 1956. \$6.00.

A commendable addition to the literature on air transportation has been made by Mr. Wheatcroft in this volume. The author has drawn not only upon his knowledge of economic principles, but also upon wide experience in the long-range planning as well as the day-to-day problems of European airlines.

The book is divided into three parts. The first deals with the European airline industry, its pattern of traffic, economics, fare structure, and prospects. The second attacks the problem of competition and regulation. The third outlines his requirements for progress.

It is in the third section that the most controversial ideas are set forth, including a "fairly extensive and perhaps rather complex" (an understatement) organizational framework for the economic regulation of air transportation in Europe. The author also claims that his program of regulation "has the possibility of being developed into a full system of supra-national control and yet, at the same time, may operate effectively in the present conditions in which the States jealously guard their sovereign rights in air transport affairs." This is a good trick if it can be transformed from theory to practice.

The volume is stimulating and provocative. It is required reading for persons interested in the economics and regulation of air transportation.

CLAUDE E. PUFFER
University of Buffalo

REINHARD BENDIX. *Work and Authority in Industry: Ideologies of Management in the Course of Industrialization*. Pp. xxii, 466. New York: John Wiley and Sons; London: Chapman & Hall, 1956. \$7.50.

All industrial organizations have a common requirement—the establishment and preservation of industrial discipline. Each faces the perennial conflict between individual drives and collective demands. Purposive activity requires delegation of au-

thority; leadership and followership are the concomitants of a pattern of superordinate-subordinate relationships, and the problems arising from these relations constitute some of the most stubborn and persistent difficulties within the entire range of human activity.

Reinhard Bendix has analyzed these authority relationships both in the historical perspective of industrialization and in the contrasting social structures of East and West. He examines authority relations in England, the United States, Russia, and East Germany. The first three draw on previously collected material, but the last introduces information never before so collected. Bendix finds more or less distinct ideologies, traces their historical course, and examines the social consequences. Special attention is given to the analysis of Anglo-Saxon and Russian patterns of industrialization. These are said to be distinguished in the sense that English industrialization resulted principally from the struggle of a rising entrepreneurial class while in Russia industrialization was continually subject to autocratic intervention and government controls. The development of the industrial way of life has transformed this initial setting of entrepreneurial activity in Russia as well as in the West. The industrial way of life has become accepted, and there has been a change from entrepreneurial to managerial ideologies. The increasing size and complexity of industry have transformed the authority relationships between managers and workers, and the internal organization of industry. In modern industrial management the technical, financial, and marketing aspects of the enterprise have been supplemented by new demands arising from labor problems and organizational planning and control. As the delegation of authority and technical specialization have become more important, management has had to make sure of the good faith of its employees. In the West authority in industry is justified explicitly on the grounds that the employers' authority as well as their earnings and privileges are earned. For the people at large such similar rewards are held out as promises for them in the future if they but earn them. In Soviet Russia, success

is regarded as a collective accomplishment in which managers and workers alike have the right and duty to participate but which is attributed primarily to the leadership of the party. Only one goal is offered to the worker as a reward for increasing his efforts: that he perform out of loyalty to the cause.

These are the main themes of the book, and they are documented by historical materials, field observations and study by the author while in Germany in 1953-54, and some original research studies of "entrepreneurs, heirs, and bureaucrats."

To the social scientist seeking some pervasive uniformities there is an especially interesting section entitled *Industrialization and Entrepreneurial Ideologies in Sociological Perspective* (pp. 13-21).

Bendix tells us that the purpose of the present study is to contribute to a better *understanding* of what is generally known about work and authority in industry, and that he proposes to do this by exploring the historical and social preconditions which distinguish authority relations in industrial organization. The writer has succeeded in this aim, and the reader will secure an excellent historical background. But he will not find any scientific experiments or field studies focusing upon individual plants. He will not know how the different authority relations affect morale and productivity within given work organizations. In the United States varieties of "class" and "bureaucratic" ideologies exist in various work plants. The social scientist has an opportunity to examine these on his home ground. Laboratory experimentation is also possible. Bendix was so little concerned about the research studies dealing with authority relations that he failed to include any mention of Kurt Lewin's classic experiments on the social effects of authoritative, laissez faire, and democratic leadership. There is no mention of the extensive research on leadership conducted by Rensis Likert and associates of Michigan or of Carroll Shartle and associates at Ohio State. Bendix has held his discussion largely to historical cases. Hypotheses for research may be drawn from this study, but the reader must find them. For example, there is an excellent description of the "activist"

in Russian plants. Testing such a role is a challenging possibility for small group study.

DELBERT C. MILLER

University of Washington

SEYMOUR MARTIN LIPSET, MARTIN A. TROW, and JAMES S. COLEMAN. *Union Democracy: The Internal Politics of the International Typographical Union*. Pp. xxviii, 455. Glencoe, Ill.: Free Press, 1956. \$7.50.

This excellent study brings together a number of related topics: union politics, union structure, the relationships between union members and union leaders, and methodology in the social sciences. The central theme is the development, functioning, preservation, and social effects of the two-party system in the International Typographical Union, but with this main topic runs another of general significance; that is, may the two-party system as developed in the ITU have normative values for the entire system of union organization? The authors believe that there are these normative values in the two-party system; but they give due weight in this evaluation to the special circumstances surrounding the printer, such as the social behavior of the printer as a member of a specific industrial community, the development of leadership in the union, and the attitudes of the political groups toward one another when they are in and out of the administration.

The methods used to develop the study and the uses of the material are worthy of special attention. A lengthy interview questionnaire, supplemented with on-the-spot investigations, historical information, and follow-up mail questionnaires are the principal sources of information. The interview questionnaires is remarkable for its detailed questions and for the excellence of the responses. From these sources, the authors develop indexes of political attitudes, and measurements of the knowledge of members about political issues, and the degree of participation by members in political activities and in social groups. Many charts, tables, and diagrams supplement the text.

The development of oligarchic types of

union administration since 1900 has become a matter of public concern. Few would deny many of its undesirable effects: the autocratic powers of the higher officers, the subservient attitude of the lower officers, and the apathy of the members. It is a sad thing to see the idealism of youth crushed between the upper and nether millstones of administrative orders and the demand that these orders receive quiet acceptance. The older men have, at least, the inspiring remembrances of participating in building the union, but the young people, first entering the union, feel the lack of active participation in important matters and suffer the pangs of constant frustration.

The International Typographical Union is evidence that this apathy and these frustrations can be avoided. It is, however, a special case. Perhaps it should be considered as a model, and in its operations should be sought those activities and instrumentalities that are helpful toward the attainment of union democracy, and that may be adopted by other unions, even though their industrial structures differ from those of the printers. Few industrial structures have the homogeneity of the printers; few have the close social relationships that exist in that craft; few have an occupation that has a tradition of educational values associated with it as in the case of the printers. Nevertheless, many unions could make greater use of the referendum; many could make their journals organs of information for the members rather than for the dissemination of the ideas of the chief officers; more autonomy could be given to local unions; many more efforts could be made to cultivate and protect internal democracy in unions. It must be recognized, however, that these are the very measures that are likely to be fought tooth and nail by union leaders seeking to retain power. Perhaps, as the authors suggest, democracy may be forced upon the unions by national and international events which may break the rigid restrictions of business unionism, and which may bring within the orbit of the unions those vital issues that divide men everywhere.

FREDERICK L. RYAN

San Diego State College

A. A. ROGOW with the assistance of PETER SHORE. *The Labour Government and British Industry, 1945-1951*. Pp. vii, 196. Ithaca, N. Y.: Cornell University Press, 1955. \$3.00.

This book begins with the word "revolution" and ends with "evolution." This is because British Labour in the earlier years of the present century thought in terms of a violent fight against capitalism, whereas the leaders in the last two decades have come to realize that they must direct their campaign for reform against a leftward moving mixed economy. While some of the old war cries are still heard, the party objectives have been changed.

The study at hand is an analysis of the nature of the changes in objectives, not so much from announcements of policy as from achievements and failures of the Labour Government during the years of its control after the recent war. The author says that a pragmatic test of Labour's planning success shows that this planning was done with a view to maintaining the free enterprise economy, to bring about changes by evolutionary means, to furnish labor-industry development councils to regulate the private sector of industry, and to nationalize only certain basic industries such as those in the areas of fuel and power, inland transport, and in iron and steel. Some mention had been made by Labour planners of sugar, cement, chemicals, water, meat, and insurance; but these were not given high priorities.

In labor-management relations little of significance was achieved; in forming development councils in even those industries most ready for them success was limited; in its public relations there was notable weakness; and in the nationalization of iron and steel results were limited and brief in duration.

Despite these shortcomings, the author thinks that the Labour Government did demonstrate that economic planning could be carried on by government action in a mixed economy. He notes that Labour did get a degree of co-operation from the vested power groups—although he warns that the chances of recapturing this goodwill are reduced. Conservatives draw a fine line between the Welfare State and

Socialism, and while they will accept certain aspects of the former, they are in no mood to accept any further advances toward the latter. In fact, the indication is that the very success of the Welfare State has become a block to any movement toward socialism or communism in Britain. In view of this condition, Labour is faced with the necessity of again rethinking its objectives. It is within the realm of possibility that any future attempt to nationalize industry might create such a violent reaction as to endanger the very democratic basis of the economy. The danger is heightened by the tendency of the economic power interests increasingly to enter the political arena. For the time being, the power interests seem to be not wholly dissatisfied with the adjustments that have been reached as a result of the Labour Government's efforts between 1945 and 1951. As for Labor, it, too, is only partially satisfied, and the leaders surely realize that the gap between socialistic politics and socialistic theory has been made clear. This leaves them in a quandary as to next moves.

The reviewer finds the study well done and not out of line with the *New Fabian Essays* nor with the thinking of the writers of the Socialist Union Group.

W. HENRY COOKE

Claremont Graduate School
Claremont, Calif.

N. V. SOVANI, D. P. APTE, AND R. G. PENDSE. *Poona: A Resurvey*. (Publication No. 34.) Poona: Gokhale Institute of Politics and Economics, 1956. Pp. xx, 555. \$3.50.

The Poona Resurvey is a welcome addition to a long and impressive list of surveys conducted by the Gokhale Institute of Politics and Economics. Poona is a city of half-a-million population 119 miles southeast of Bombay city. It has long been an educational, intellectual, military, and administrative center. Except for a large government-operated munition works, its industries are mostly single-factory concerns engaged in light manufacture. In 1937 the Institute undertook an extensive survey of the economic and social life of

the city. Since that time the population of the city has almost doubled. Under a grant from the Research Programmes Committee of the Planning Commission, the Institute resurveyed the city in the spring of 1954 to determine the nature of the migration and its effects upon the economic condition of the Poona area.

The over-all picture is one of a deteriorating economic situation, or rather employment and earning levels not keeping pace with heavy in-migration and spiraling prices. In 1937 the Poverty Line was put at an annual income per adult equivalent to Rs. 150 (about \$46). A moderate estimate of inflation in food prices puts the level at Rs. 600 (about \$128) in 1954. Upon this basis in 1937, 65 per cent of the families fell below the poverty line and by 1954 more than three-fourths of the families were so listed. Setting a destitution line at Rs. 225 per annum (about \$48), one-fourth of all the families in Poona now fall below this level. The administrative and clerical jobs, particularly those associated with Government, are the only ones to show major increases. Overcrowding has increased as housing has not kept pace with population growth.

With the great mass of descriptive data which a survey provides, the authors must elect to emphasize some data and underplay others. Here the major emphasis is upon employment and earnings, and the data are presented in the form of two-way or three-way frequency distributions divided by occupation, city wards, and social groups. There are more specialized analyses of unemployment and the government-operated Employment Exchange, and of inter-generational occupational mobility. A final chapter draws attention to the significant contrasts between the 1937 and the 1954 survey.

At each stage of the presentation there are careful statements of the limitations of the data and precise descriptions of the nature of each dilemma and its resolution in the process of analyzing the data. The description of the difficulties of the household sample of the 1937 survey and the ration card sample of the 1954 survey are treated in detail. The book is a model for the student interested in problems of col-

lection and classification in survey methodology. The study should be of great interest to sociologists and economists at large as well as those whose primary interest is India.

RICHARD D. LAMBERT

University of Pennsylvania

RAYMOND ARON and DANIEL LERNER (Eds.). *La Querelle de la C.E.D.: Essais d'analyse sociologique*. Pp. xv, 216. Paris: Librairie Armand Colin, 1956. No price.

Politics and partisanship did not motivate the authors of this dynamic little book. But in the French National Assembly politics and partisanship were the very life pulse of the French multiparty system, playing with domestic and foreign policy, at a price France could hardly afford and risk.

The milieu in which French partisan politics had their all overshadowing play in Parliament revealed events, vital for France, leading to the proposal of M. René Pleven, President of the *Conseil*, for CED, Communauté européenne de Défense, European Defense Community.

The Preface presents a brief, lucid background of CED and the conflicting attitudes of French parliamentary opinions, delaying acceptance of CED during political party wrangling from June 1950 to the end of 1954.

An itemized chronology cites twenty-two dates registering the bitter party struggle during five years of ups and downs for CED—chief items are: the conference between "New York and Washington," resulting in a proposal for a European defense community, introduced by M. Pleven, in September 1950. In October the French Assembly accepted the eventuality of a European army, rejecting an autonomous army for West Germany. In December 1951 the Assembly approved the "institution of the European community," and in February 1952, the CED, with numerous reservations. In May M. Pinay, President of the *Conseil*, signed the treaty of CED. In April 1954 Marshal Juin, opposing CED, was released of his commands. In the same month, manifestants, upholding the

Marshal, caused the fall of M. Plevin. In June M. Mendès-France called for compromise, and on December 20, agreement for CED was reached in the Assembly.

There are eight trenchant chapters by nine authors: "Historical Study of a Grand Ideological Squabble," by Raymond Aron; "Birth and Death of a Treaty," by Jacques Fauvet; "Funeral Orations," by Stanley Hoffmann; "Search for a French-German Policy," by Alfred Grosser; "French Economy Prior to C.E.D.," by Jacques Vernant; "Public Opinion Preceding C.E.D.," by Alain Girard and Jean Stoetzel; "Tableau of the Press," by J. J. Marchand; "Reflections of a Stranger," by Daniel Lerner.

The bitter parliamentary struggle resulted from natural apprehensions of the rebirth of a sovereign West Germany with membership in the North Atlantic Treaty Organization and a NATO-sanctioned potential German army. The situation might have become explosive, if viewed by past experiences. But a Franco-German solution was found in reciprocal concessions, each recognizing the other's vulnerability in the European heartland and yielding in intelligent compromise to gain mutual security.

Johns Hopkins University

M. GARDNER CLARK. *The Economics of Soviet Steel*. Pp. xiv, 400. Cambridge, Mass.: Harvard University Press, 1956. \$7.50.

This is one of the most informative books on the Soviet economy that has ever appeared. It contains a considerable amount of factual data on the industry which is the cornerstone of modern political and economic power for the world's second largest steel-producing nation. But Professor Clark has written much more than a compendium of Soviet steel facts, useful as that might have been. He has woven together resource, technological, locational, and other facts into a fascinating account of an extremely important phase of economic growth.

The tremendous expansion of Soviet steel output within a relatively short period of

time was made possible by a single-minded concentration upon this industry, which stemmed in part from an ideological conviction that this was the only road to the advancement of communism. Many costly errors were made, for which the Russian people are still paying, but in the end, the Soviet Union was transformed from an underdeveloped area into an industrial nation. This example, one may be sure, is not lost upon the great countries of Asia which are today seeking their places in the sun.

According to Professor Clark, the principal error of the Soviet planners lay in their failure to give sufficient consideration to transportation in locating new facilities, particularly the grandiose Urals-Kuznetsk combine. The furnaces at Magnitogorsk had to be fired by coal from the Kuzbas, some 2,300 kilometers away, in the face of an inadequate railway system. It is almost as though great steel-making facilities were constructed somewhere in Colorado, dependent upon Pennsylvania coal, with only a single track connecting them. The inevitable result was a huge bottleneck, necessitating the expenditure of large capital sums for railway construction and the development of secondary, and not particularly satisfactory, coal supplies. An interesting chapter is devoted to a convincing demonstration that this locational pattern was not dictated in any substantial degree by military considerations, contrary to the assertions of Soviet apologists *ex post*.

What are the potentialities for further growth of the Soviet steel industry? Clark foresees many obstacles, among them the lack of good coking coal outside the Donets Basin and the depletion, by about 1978, at current consumption rates, of what was once believed to be inexhaustible iron ore reserves at Magnitogorsk. He concludes that "continued expansion of Soviet steel production at the current rate of three or four million tons a year is possible only by means of immense capital investments."

The Economics of Soviet Steel is a must for everyone who is seriously interested in the problems of economic development.

INTERNATIONAL AFFAIRS

INIS L. CLAUDE, JR. *Swords Into Plowshares: The Problems and Progress of International Organization*. Pp. xii, 497. New York: Random House, 1956. \$9.00 trade, \$6.75 text.

This is really an excellent book.

It views international organization pragmatically as a political process—a complex of national policy decisions reacting upon each other. It penetratingly challenges the quality of many of these decisions, using as a broad criterion whether or not they have contributed to the maintenance of peace and the growth of world community. The analytical approach which characterizes the whole treatise effectively blends historical, political, constitutional, and theoretical considerations. A vigorous, terse, at times epigrammatic style makes the book interesting reading.

The author is refreshingly free of dogma, whether of the utopian or *realpolitik* variety. In particular, he does not take all his cues from the State Department in determining what is correct conduct for and within international organization.

Contrary to prevailing shibboleth, Mr. Claude insists that the NATO-type of arrangement does not provide collective security but at the most *selective* security. NATO fails to meet a basic requirement of a comprehensive security system, namely the renunciation of national decision-making in regard to the use of force, in favor of international authorization and international supervision. American policy has thoroughly confused the concept of collective security by accepting its terminology, but rejecting its substantive meaning.

Appraisal of the constitutional problems of international organization is equally clearheaded. Claude believes that a sound resolution of such issues as membership, the veto, regionalism, and the role and competence of the General Assembly must recognize the essentially voluntaristic character of international institutions, creatures as they are of self-willed states.

The exclusion of important states from the councils of the United Nations for

whatever political, moral or other reasons, frustrates the intended functions of the organization to provide "a common meeting-ground, a common conference table, a common workshop, to which nations should bring their hostilities, conflicts, problems and aspirations."

On the other hand, the veto is not such an insuperable obstacle to the effective functioning of the institution. Granted that it is a "deformity," it can usually be circumvented by creative adaptation of the Charter. Where it cannot, as in putting armaments under international control, it merely expresses the political-military realities which dictate that no action will be effective unless the strong powers all agree upon it.

Regional association offers no real escape from the requirement of common consent for international action involving significant limitations of sovereignty. Claude is convinced that "if the road toward world order lies through the acceptance of majority voting, the creation of international executive authorities and administrative competencies, the submission of states to collective jurisdictions and the assumption by states of explicit responsibilities, the pioneers have more often been general than regional organizations."

The expanding role of the General Assembly is a case in point. In one decade, it has displaced the Security Council as the unrivaled principal organ of the United Nations.

Mr. Claude is cautiously optimistic about the future of international organization. The possibilities are "set by political forces operative within and among member states" and "structural apparatus cannot generate its own supply of political decency, discretion, wisdom, and moderation." But he feels that the world is demonstrably beginning to recognize that global problems require global solutions and international organization as an historical process represents "a secular trend toward . . . an enterprising quest for political means of making the world safe for human habitation."

University of Pennsylvania

SIR W. IVOR JENNINGS. *The Approach to Self-Government*. Pp. viii, 204. New York: Cambridge University Press, 1956. \$3.00.

In a broad sense the volume before us is an answer to Jeremy Bentham's somewhat naive belief that he could draw up in London a constitution for any country without the need of personal contact with its people, provided he was furnished with a minimum of information about its existing social, political, and economic conditions. The author, a jurist and a diplomat, shows us that it just cannot be done that way; that a constitution cannot be framed according to abstract principles, but that it must take into account the history of a people, its customs, the characteristics of its population, its economic and social development.

The successive chapter titles, ranging through the technical details of government, elections, bill of rights, legislature, administration, and executive department, might suggest a dry textbook treatment of the subject. But the volume is far from that. It is, in fact, an entertaining description of the practical problems in the making of a constitution; and the author's experience as advisor to the Governments of Ceylon and of Pakistan gives to his observations a concrete and authoritative character. Comparisons with conditions in the West are made on almost every page, and amusing illustrations are given to show why institutions that work in the West might not work in the East. So pleasant is the manner of presenting a technical subject and so wise the philosophy of government woven into the comments of the author that the reader finds himself well rewarded, even though constitution-making may be remote from his immediate interest.

Would that our numerous texts on government could be written with such a combination of scholarship and good humor!

C. G. FENWICK

Pan-American Union

RICHARD P. STEBBINS. *The United States in World Affairs, 1954*. Pp. xii, 498. New York: Harper & Brothers for the Council on Foreign Relations, 1956. \$6.00.

PAUL E. ZINNER (Ed.). *Documents on American Foreign Relations, 1955*. Pp. xxiv, 487. New York: Harper & Brothers for Council on Foreign Relations, 1956. \$6.00.

The appearance of these annual volumes, always a welcome event for the student of international affairs, has become doubly so since the co-ordination of both under the Council on Foreign Relations. The Council has continued the World Peace Foundation's documents series since 1952 and has introduced uniformity of organization in the two publications, facilitating cross-reference by both author and reader. Each thus supplements the other, the result being two authoritative series for current study and for later reference which are indispensable in the true meaning of an abused word.

As a constant user of both, the reviewer can only commend these additions as maintaining in every way the high quality of their predecessors. The new scholar or teacher in the field, who alone may not already know them, may rejoice that he can start his working library with such excellent tools.

Partly due to the greatly increased role of the United States in world politics, and partly thanks to the imaginative scope Stebbins and Zinner have given their tasks, these works have become with the years an American equivalent of the two comparable series published by the Royal Institute of International Affairs. Moreover their usefulness is greater because of the fact that they appear with less delay, thanks to the excellent staff of the Council and the prodigious effort of Richard Stebbins.

In both volumes the plan of presentation begins with general lines of American foreign policy, and continues topically with material on Europe (both West and East), the Far East, the Middle East and Africa, the Western Hemisphere, and the United Nations. The footnote apparatus is especially useful. The documents volume cites the most authoritative available source for each text, besides supplying references to related texts not included and much incidental information which would otherwise be hard to come by—the vote on United Nations resolutions, for example.

The Stebbins survey cites to last year's documents volume where pertinent, but is generous in other documentation as well, of both primary and secondary works. The Stebbins volume also appends a twenty-three page chronology, usefully arranged by topics.

A minor criticism is in order of the index of the documents volume. It is short, listing chiefly the persons connected with major documents. With only a brief expansion it could supply full names of all persons involved, especially where full names do not occur in the texts, with an enhanced value to the reference user.

It may seem a disadvantage that the books appear a year apart, and so cover different periods. Actually there is the compensation of seeing two years whole at once, one through the carefully chosen documents supplied by Zinner and the other through the lucid analysis which Stebbins always brings to his formidable task. This is the more emphatically true of the two years here covered, including as they do such major scenes of the postwar drama as the Indochina settlement, the creation of the South-East Asia Treaty Organization, the Quemoy crisis, the Austrian treaty, the Bandung Conference, and the Summit meeting. If a single theme could be set, it might be that of the general realization by the major governments of nuclear stalemate in 1954, and in 1955 the first groping responses to the new pattern of politics resulting. One sees clearly, in the retrospect here afforded, what Stebbins calls the "re-cuperative power of free societies," which now as in the two years reported still permits hope, even though it is not in the nature of such works as these to supply a happy ending.

OLIVER BENSON

University of Texas

JOHN A. HOUSTON. *Latin America in the United Nations*. Pp. 345. New York: Carnegie Endowment for International Peace, 1956. \$2.75.

This is an analysis of the Latin American contribution to the United Nations during its first decade. For specialists in Latin American studies it provides a survey comparable to Warren Kelchner's *Latin Ameri-*

can Relations with the League of Nations (1930), and students of international relations can find here a careful study of twenty regionally conscious nations in the United Nations. Its author, John A. Houston, is a recognized scholar in the field and is Chairman of the Department of Political Science at Knox College.

The book's five chapters deal with Latin America's participation in the San Francisco Conference, and in four significant areas of United Nations activities: peace and security, dependent peoples, higher standards of living, and human rights. Latin American initiative and support for what internationalists have called the "loop-holes" in the charter—that is, Part 7, Article II, and Article 51, together with their small-power enthusiasm for the veto-free General Assembly and the International Court of Justice was in part justified historically by the Russian abuse of the veto, the development of regional military pacts, and the United Nations for Peace Resolution. While their votes strengthened the United States position in the cold war, their implementation of enforcement procedures of the United Nations was less encouraging. Mr. Houston concludes, "Latin American states have demonstrated neither the ability nor the will to provide the means necessary to implement decisions in any degree proportionate to the voting power they can bring to bear in reaching those conclusions" (p. 147).

The Latin record on dependent peoples is an anomalous one; their Latin sympathy for the Italian and French colonial powers often moderates their enthusiasm for the emerging states. Likewise, their position on economic problems is characteristic of underdeveloped nationalistic areas; their demands for international assistance are not always balanced by a similar regard for their own economic responsibilities. The dichotomy between their strong endorsement of human rights and their frequent violation of these rights is also noticed.

Mr. Houston has undertaken a most ambitious task in tracing the record of twenty such individualistic countries; the result is a most successful delineation of the important Latin behavior patterns in

the United Nations. The author has not, perhaps could not, explore the Latin policy-making institutions which have determined their United Nations policies, and which might well influence future decisions. Are policy makers, for example, becoming more dependent upon a nationalistic public opinion, as their governments use persuasion rather than coercion and outside support from the United States to maintain themselves in power? Are the United Nations delegates from democratic governments like Uruguay, Costa Rica, and Mexico, less likely to succumb to "arm twisting" by the United States mission, and less given to "high flying" speeches without reference to their foreign offices, than are the delegates of dictatorial regimes in the Dominican Republic, Cuba, or Nicaragua? Will the new United Nations membership, which gives a twenty-six vote veto in the General Assembly to the African-Asian members, significantly lessen the strategic advantage Latin America has held during the past decade? It is to be hoped that Mr. Houston will explore the second decade of Latin American participation in the United Nations with the same objective impartiality he has used in this volume.

MARTIN B. TRAVIS, JR.

Stanford University

WILLIAM E. WARNE. *Mission For Peace: Point 4 in Iran*. Pp. 320. Indianapolis: Bobbs Merrill Co., 1956. \$4.00.

Mr. William E. Warne's book *Mission for Peace: Point 4 in Iran* is the fourth in a series written by Americans who have struggled with the problem of aiding Iran. The first was Morgan Shuster's *The Strangling of Persia*, then came two books by Dr. A. C. Millspaugh (published in 1929 and 1946). This fourth study is written against a background similar in some ways to the others—three factors being most prominent: the Russian-Communist drive to capture Iran, the seeming lack of sufficient dynamism within Iranian society to generate and harness its own latent energies, and the desire on the part of the United States to stimulate those capabilities inherent in Iranian life.

Mr. Warne's book is a personal narrative in twenty-one chapters, describing the pur-

poses of the United States Mission, its organization, and operations. It is a story of optimism. Mr. Warne gives warm praise to his Iranian hosts and to the members of his staff. He indicates some of the difficulties of working with Dr. Mossadegh, and there is a very interesting description of the day of the latter's fall from power on August 19, 1953. He describes incidents connected with various ones of the joint programs such as live stock improvement, public health, rural education, agriculture, redistribution of the Royal estates, the malaria campaign, and co-operation with other missions. His two interviews with the now infamous Mollah Kashani, who was then President of Parliament, indicate what strange forces operate in Iranian society. The rise of this charlatan to power is a Hajji Baba of Isfahan story. Anyone reading Mr. Warne's book will then get a broad glimpse of Iranian life as it existed in 1951-55. Mr. Warne breathes encouragement. Communism seems to have been defeated in Iran, standards of sanitation, productivity, and efficiency have been raised, and Iranians have shown great appreciation and co-operation. During the period covered by the book, Mr. Warne must have dispensed with a figure of nearly two hundred million dollars.

That the "crash" program of 1951-55 did produce temporary results cannot be gainsaid, but anyone long acquainted with Iran will retain a degree of skepticism as to how deep the changes go. Herodotus remarked that the Persians adapted to foreign ideas most rapidly—but remained Persians. The long Arsacid dynasty (180 B.C.-227 A.D.) always called themselves Philhellenes while they gradually eradicated most of the vestiges of Hellenism. Mr. Warne gives the impression that most of the criticism of Point Four came from the Soviet Union, but Iranians and Americans also contributed their fair share. Furthermore the book never touches on one of the most sensitive of problems—how American technicians without knowledge of the Persian language, living in the equivalent of the highest of Iranian luxury brackets, are able to really communicate ideas to the average Iranian who lives on a subsistence level of \$150.00 a year income.

Mr. Warne's book is an excellent summary of the activities carried on by the Point Four Mission. But no one will be able to assess what it really accomplished till another ten years have rolled by.

EDWIN M. WRIGHT

School of Advanced International Studies
Johns Hopkins University

J. S. FURNIVALL. *Colonial Policy and Practice: A Comparative Study of Burma and Netherlands India*. Pp. xii, 568. New York: New York University Press, 1956. \$7.50.

In the words of the author, this book is the result of "a request from the Government of Burma at the end of 1942 for my views on reconstruction, with particular reference to features of colonial rule in Netherlands India that might suitably be adopted in Burma." Completed early in 1945, the work was published in England in 1948 and now appears for the first time in an American reprint. The author was eminently qualified for the task set him. More than twenty-five years in Burma in the civil service, in business and banking, and more recently in educational labors, had given him a sympathetic understanding of Burma and the Burmese which has enabled him to write with a deep appreciation of their needs and problems. If any man may claim with justice to be known as the grand old man of Burma, it is he. Although less well acquainted by experience with Netherlands India, it is evident that his studies of Dutch policy and practice were both thorough and constructive. The book provides a rich source of useful information concerning Dutch and English methods of colonial operation in the nineteenth and twentieth centuries, up to about 1940. This concentration on a limited period has led to some repetitions in the text and is in a way unfortunate, since the foundations of Dutch and British policy were laid long before the opening of the nineteenth century and must be appreciated in order to understand later developments. The Dutch culture system of the nineteenth century, for instance, was a natural outgrowth of the much earlier system of forced deliveries, and both Dutch and English practices have been profoundly affected by the widely con-

trasting basic principles of indirect rule on the one hand and direct rule on the other which have marked their domination from the beginning. It must be remembered however that Mr. Furnivall was asked to do a particular job. This he has accomplished with conspicuous ability. It is to be hoped that he may be persuaded to draw further on his unique background and to write of the war years and the present decade, with perhaps even a look to the future. The result could not fail to have great value.

PHILIP W. THAYER

School of Advanced International Studies
Johns Hopkins University

EVRON M. KIRKPATRICK (Ed.). *Target: The World; Communist Propaganda Activities in 1955*. Pp. xxiv, 362. New York: Macmillan Company, 1956. \$5.00.

Congressmen and columnists have been warning us all along that the Kremlin was operating a world-wide propaganda system, but it remained to the great scholarship of Evron M. Kirkpatrick and his staff to present the documented case in persuasive, dispassionate language. Too much that has gone before has been emotional invective against the Communists with little factual support. Here now is an area by area report on the objectives, themes, tactics, organizations, and media employed by Moscow's agents in winning humanity to the Communist cause.

Editor Kirkpatrick is himself a powerful propagandist and freely admits that the purpose of the survey is to awaken the free world to its task of combating communism. If this exposé could be translated into fifty foreign languages and shipped to libraries and information centers around the world it would be the best "word weapon" we have yet devised to defeat Red propaganda.

The material on objectives, themes, and tactics is so meticulously organized that the reader fears Communist "Agitprop" leaders may use it as a handbook in their trade. For example, in the sections on the Far East, objectives are listed: to strengthen Communist base area, for example, USSR, Mongolia, China, North Korea, and Viet Minh; to eliminate United States power in free areas, for example, Japan and the SEATO countries; to maximize Communist

power in these and neutral areas, for example, India and Indonesia; and, finally, to shift from military to essentially political tactics.

To accomplish these aims in Asia certain Communist propaganda themes are repeated endlessly:

The United States has no fitting role in the economic growth of the new Asian countries. Instead, Asians have a tradition of common hostility to the West which stands for imperialist exploitation.

American alliances in Asia are a threat to the security of most Asian countries, but USSR, China, and India are the three stabilizing friends.

The five principles of peaceful coexistence pronounced by neutralists Chou En-lai and Nehru dovetail with Soviet socialist philosophy, providing the answer to internal and external problems.

Dr. Kirkpatrick provides with great detail the themes of Kremlin propaganda on every continent and major area of the world. Charts and graphs show Communist party organization and mass media employed. The most impressive information explains the great network of "front" organizations, particularly in the ranks of labor and "cultural" people, which do the bidding of the hard core of Communist leaders, painting black white and white black.

The West would not hope to imitate Moscow's ruthless machine, but in the face of such an avalanche of books, films, and broadcasts a vast and radical counterattack seems urgently needed.

D. LINCOLN HARTER
University of Pennsylvania

GERHART NIEMEYER, with the assistance of JOHN S. RESHETAR, JR. *An Inquiry Into Soviet Mentality*. Pp. 113. New York: Frederick A. Praeger, 1956. \$2.75.

In this brief study, Gerhart Niemeyer sets out to determine "whether the Soviets are reasonable in the sense that they pursue rational political ends, and whether they maintain a proportionality between their ends and the cost of attaining them which we can understand and share." After an examination of the Soviet doctrine, regime, and policy, he concludes that "there is, in

Soviet foreign relations, no intellectual or emotional basis for reasonableness, as non-Soviet countries understand it." He finds no reason to believe that the Soviet government is prepared to compromise any of the doctrinaire aims of communism, or that it would shrink at the cost of a global war in a situation where the doctrine indicated an ultimate Soviet success. Hence, American policies are likely to meet with disaster if they assume a careful Soviet calculation of costs and risks. The author believes that the gap between Soviet and Western thinking is so deep, that any policy of understanding or "peaceful coexistence" is bound to fail. Only if the West is prepared to attack the doctrine of Marxism-Leninism itself, and seeks to undermine the ideological basis of Soviet policy, can it break through the barriers that prevent understanding.

The value of this approach is that it instills a note of sober caution into the study of Soviet policy, at a time when many tend to assume that a rapid change is taking place in the mental processes of the Soviet government. There are nevertheless a number of limitations to the argument which weaken its impact. The term "rationality" is often used, but not always with sufficient precision or consistency. The influence of Marxism-Leninism on Soviet policy is touched on frequently, but the discussion of this important relationship is not sufficiently coherent to clarify the underlying problems. On the one hand, much is made of the freedom of Soviet policy from considerations of doctrine; on the other, the destruction of the doctrinal core is proposed as a major Western objective. These two positions are perhaps not irreconcilable, but they are not reconciled in this text. Most important of all, no attempt is made to see Soviet developments in a world perspective. The narrow concentration on Soviet-Western differences, sacrifices the insights which might be gained from a comparison of the Soviet with other non-Western approaches.

An Appendix by Reshetar draws on recent Soviet writings, and particularly the several editions of the *Short Philosophical Dictionary*, to illustrate the peculiarities of the Soviet ideology. He shows clearly the

flexibility of policy permitted by the planned contradictions of the dialectical method, and the extent to which Soviet policy still uses the messianic aspects of Marxism.

C. E. BLACK

Princeton University

JANE DEGRAS (Ed.). *The Communist International, 1919-1943: Documents*. Pp. xvi, 463. Vol. I, 1919-1922. New York: Oxford University Press, 1956. \$8.80.

The reviewer can have only the highest praise for the editor and others concerned with the publication of this volume. This is a collection of material indispensable to all students of contemporary international relations, particularly to those specializing in the study of Soviet Russia and international communism. Documents of four congresses of the Communist International, as well as of its executive committee, valuable bibliographical references, and a careful index make this publication an exceptionally useful research tool. The useful notes which precede each document deserve special mention. Based on a search of much material, some of it highly inaccessible, they contain a mass of fascinating data. The notes serve to remind the reader that this was a period when there were still differences of opinion and even some freedom of discussion among Communists. They relate the documents to the complicated, tempestuous era of revolution, chaos, and attempts at reconstruction of international order during which the Soviet-led world communist movement was born.

Specialists on particular questions might criticize individual notes, or the selection of documents, in particular cases. For example, the note preceding extracts from a manifesto of the executive committee of the Comintern on the Kapp putsch in Germany, dated 25 March, 1920, seems to fail to bring out fully either the ineffectiveness of German communist leadership in the first stage of this affair, or the complexity of the situation which followed it in Germany, and of the Russian reaction. Again, some readers might feel that a greater effort should have been made to arrange the documents in topical, as well as in chronological, order. Finally, it is possible that

the value of the collection might be enhanced by including a certain amount of noncommunist material.

However, it should be emphasized that any reader with a serious interest in the problems of 1956 cannot fail to benefit by acquainting himself with the material in this collection. Even today, too many students of international affairs depend on secondary sources for their information. One cannot understand the extremely important elements both of continuity and of change which link our own disturbed period with that which followed World War I without studying the documents and notes contained in this book. This is a publication of immense importance both to specialists and to the general reader.

Although this material cannot be fully understood without access to the basic sources reflecting policy within Soviet Russia itself, such as stenographic reports of congresses and conferences of the Russian Communist party, there is enough here to bring out some of the major characteristics and paradoxes of communism. Communism had, and to a lesser degree still has, its doctrinaire idealism and wild optimism. But there is also blind fanaticism and savage hatred. It would be interesting for a psychiatrically oriented social scientist to study the images which occur in these documents. One reads here about the "octopus" of British imperialism, about the efforts of the "imperialists" to "strangle" the revolution, about "cannibals," and so forth. Interesting is the ambiguity displayed toward the "working class." This "class" is destined to quickly create a bold new world, but the reader finds indications that the communists were exasperated by the inability of the workers to understand and appreciate what the party allegedly was doing for them.

FREDERICK C. BARGHOORN

Yale University

HENRY WEI. *China and Soviet Russia*. Pp. xvi, 379. Princeton, N. J.: D. Van Nostrand Company, 1956. \$7.75.

As the title suggests, the basic content of this study is a survey, principally in the diplomatic field, of Sino-Soviet relations from 1917 to the early 1950's. The field

itself is one in which the scope of the subject matter, the limited availability of reliable sources, and some rather well established presuppositions of partisanship have conspired to preclude definitive treatment. The present study though based principally on Western sources does use considerable Chinese material which, like the Western sources, are of very uneven value, a point recognized frankly by the author (see p. x). Within these limitations, Dr. Wei's survey is a useful one. It provides a convenient reference to a wide variety of subjects in the broad story of developing Sino-Soviet relations.

Beyond the telling of the bare diplomatic story, the study is concerned with presenting a number of interpretative theses which seek to explain the situation of 1956 in which "Soviet influence is paramount in China" (p. ix). Principal among these theses is the proposition that "the salvation of Soviet Russia can be traced directly to the Sian incident" (p. 319). If there had been no Sian incident, the argument runs, the Anti-Comintern Pact would not have been shattered, Japan would have continued to threaten Siberia, "Hitler might have taken Moscow," and Chiang K'ai-shek "would very likely have crushed the Communists." Since interpretations of this kind are based on an assumed sequence of events which did not happen, their significance in the evaluation of what did happen is perhaps open to some question. Moreover, while they fail to provide realistic answers to questions which confront the historian, they raise new problems of a wholly speculative character entirely beyond the range of history.

Where Dr. Wei deals with the realities of what did happen, he supplements our historical knowledge more successfully. While much of the story he tells is not new, he clarifies many details and fills in areas of the subject that have been neglected such, for example, as the complex Sino-Russian relationships in Sinkiang. His over-all thesis would appear to be that Russian policy and diplomacy was the most significant factor in determining the outcome of events in China.

Whatever the merits of this thesis may ultimately prove to be, its presentation in

this study is subject to serious limitations. No comparative evaluation is given of Russian policy as against the policies of the Western democracies or of Japan during these same years. In addition there is no basic evaluation of the twentieth century Chinese revolution itself or evaluation of its exploitation by either the Kuomintang or the Chinese Communists.

Duke University

ALEXANDER CRETZIANU (Ed.). *Captive Rumania: A Decade of Soviet Rule*. Pp. xvi, 424. New York: Praeger, 1956. \$6.00.

This impressive volume is a symposium of thirteen separate and connected essays ("studies") by a panel of experts who are Rumanian political exiles and contributors or editors of the newspaper *La Nation Roumaine* (Paris), attempting to give as thorough and as faithful a picture as possible of the impact of communism on Rumania during the last decade.

In the background chapter is given a brief outline of the long Rumanian history, starting from the second millennium B.C. The remotest forefathers of the Rumanians were the Daco-Getae, a branch of the ancient Thracians, who had established a powerful kingdom of Dacia which was subjugated by the Romans in the second century A.D. and thus were stamped with Latin character. Later a number of barbarian tribes invaded and plundered the country. "The Slavs, arriving in the seventh century, left deep influence upon the inhabitants" (p. 5). In the fifteenth century the Rumanian people fell under Turkish political domination (the Rumanian principalities of Moldavia and Wallachia becoming vassals of the Ottoman sultans) as well as under the cultural and spiritual domination of the so-called Phanariot Greeks.

Yet under the powerful influence of the French Revolution, the Latin character of the Rumanian people was re-emphasized. In 1862 the two principalities of Wallachia and Moldavia were united in one Principality of Rumania, its independence being later recognized by the Treaty of Berlin of 1878. Elevated to the status of a constitutional kingdom in 1881, Rumania made

a steady progress under the enlightened rule of a German dynasty until 1938, when King Carol II suspended the liberal constitution and established his "personal dictatorship" which was later superseded by the dictatorship of Marshal Antonescu and which, in turn, was overthrown by the *coup d'état* of August 23, 1944. The Soviet armies chased the German divisions out of the country; on December 30, 1947, King Mihai was forced to abdicate; and the country was renamed "Rumanian People's Republic" (RPR).

In the subsequent chapters or essays the various authors are painstakingly attempting to describe and analyze in detail all the available information concerning the economic field, financial policy, cultural life, religious life, education, press and radio, the constitution, the judiciary, foreign relations, the armed forces, labor, and the pattern of power of the Rumanian "people's democracy." Their belief is that "in presenting the most salient lessons to the Western readers" they are "contributing to an understanding of Soviet policies and perhaps helping to stimulate the defensive reflexes of the countries that are still free" (p. xii) and that "powerful as the weight of the Soviet subjugation assuredly is, the resistance thereto in the conscience and will of the Rumanian people is equally powerful" (p. xv). In addition there is a bibliography and an index.

THEODORE I. GESHKOFF

New York, N. Y.

STEPHEN D. KERTESZ (Ed.). *The Fate of East Central Europe: Hopes and Failures of American Foreign Policy*. Pp. xii, 463. Notre Dame, Ind.: University of Notre Dame Press, 1956. \$6.25.

In his Introduction to the present volume the editor makes the pertinent point that serious evaluations of the past and present of East Central Europe should be of great help in the framing of a workable American diplomatic policy. A considerable part of this objective has been achieved in this volume. Parts of the book deal with the way the Soviet empire was created, the course of American policy, the economic framework, and relations between east and west. Other chapters deal with Finland,

Austria and Yugoslavia, on the Soviet empire's peripheries.

In view of recent events in Hungary, the chapter on that country, written by Professor Stephen D. Kertesz, may evoke special interest. He recalls that non-Communist Hungarian political groups attempted to sound out the Western allies shortly after World War II as to how much help they would extend in the implementation of the Yalta commitments to set up democracies in the liberated regions. In Hungary it was Joseph Cardinal Mindszenty himself who approached the American Minister with this question and received the reply that no interference in the internal affairs of other nations was America's traditional policy. In the author's opinion, American diplomatic caution in this instance may have been merely the refuge of impotence, since decisive factors in Hungary at the time were the Soviets' leadership in the Allied Control Commission, the Red Army, and the key position of the Communists.

Turning to the influence of the Communists "cradle to grave" indoctrination in Hungary, the author seems to have foreseen the future: "... one must conclude that, thus far, Russification and Sovietization have had no significant impact on Hungarian society." The worst enemy of communism was, in his view, Russia itself, with its colonial policies, and also the behavior of the Red Army, suppression of freedom, forced industrialization and the neglect of consumer goods. Hungary had special reasons to dislike the Soviets. It was the only satellite country to have experienced a previous Red regime after World War I. Also, the Hungarians are neither Slav nor Orthodox, and their language and way of thinking are obstacles rather than means of communication in Russo-Hungarian relations.

A thoughtful chapter by Robert F. Byrnes traces the bewildering vagaries of American foreign policy: "Containment? Liberation? Coexistence?" The author attempts to untangle the new version of the containment policy as pivoted upon diplomacy, and the special endeavor to break up the tight relationship between Moscow and the satellites. He holds to the view that American

policy toward East Central Europe since 1947 has been courageous, generous, and as effective as American power and the world situation allowed.

Discussing the economic consequences of a divided world, Professor Gottfried Haberler reaches the conclusion that the free world need have no fear of Soviet economic aggression, and even if the present volume of East-West trade tripled in the next years there is little danger of political blackmail as long as no severe depression is allowed to develop in the West and the channels of trade within it are not blocked by protectionist policies.

Some of the chapters about the countries themselves have been written by highly effective writers as Professor Robert Lee Wolff. On the whole, however, it would have been desirable to place more emphasis on the economic factors in several chapters. After a while, the description of how the Communists grabbed power in one country after another becomes monotonous. Also, we ought to know more how such things as land reforms, collectivization and industrialization have affected the social structures of the East Central European nations.

EMIL LENGVEL

New York University

STAVRO SKENDI (Ed.). *Albania*. Pp. xiv, 389. New York: Frederick A. Praeger for the Mid-European Studies Center of the Free Europe Committee, 1956. \$7.50.

Since Albania is probably the least known of all European countries, and truly hidden "behind the Iron Curtain," this symposium, the only systematic summary in English of the available information on that country, is most welcome. The editor, with the assistance of four other specialists, has produced a survey of the historical background, the land and the people of Albania, the political and economic system, and cultural and social developments. They have also included an appendix composed of biographical sketches of leading figures of the Communist regime, a brief chronology (1944-55), and a list of agreements signed by the pro-Communist Tirana regime with the "people's democ-

racies." Of value is also the table of translations and equivalent values.

Much of the criticism which could be directed against the product is fortunately weakened by the frank admission of Robert F. Byrnes in his Foreword that the completion of the volume was hard going. To quote him: "this material is often fragmentary," and "each volume contains quantities of useful information, but lacks generally the kind of analysis one would find in studies of areas where American research has had a longer and richer tradition" (p. vi). One could also add that there are not so "few secondary studies available" as he claims, that the sections dealing briefly with the pre-Communist Albania are often out of focus, that some pre-war studies covering Albania during that period are obviously unknown to the authors, and that the total effect is not too refreshing since the encyclopaedic and legalistic approach offers no penetrating analytical approach.

In fact, as Byrnes admits, one can picture the editor harried by the press of events, striving to get his ideas quickly on paper lest the morning cables prove them wrong. Thus the book is not profound, but the editor cannot be blamed wholly for that. The work is a fairly valuable reference book which will be a good point of departure for further investigation and a wider and more profound social analysis. Above all, it is a volume which treats factually what communism has been doing to such a profoundly anti-communistically inclined country.

HISTORY AND BIOGRAPHY

HENRY S. LUCAS. *Netherlanders in America: Dutch Immigration to the United States and Canada, 1789-1950*. Ann Arbor: University of Michigan Press; London: Oxford University Press, 1955. \$10.00.

Every American schoolchild learns something of the *Mayflower*, but few ever come to know that there were dozens of *May-*

flowers—dozens of ships, that is, that carried a pioneer group of immigrants from each of the various countries of Europe. This is a chronicle of the bark *Southerner*, in which a band of 110 dissenting Calvinists sailed from Rotterdam to New York in the fall of 1846, of their subsequent trials and successes in the Michigan colony, and of those who later followed their courageous lead. The story is told with loving care, and no detail of this saga has escaped Mr. Lucas's painstaking research.

After an introductory chapter on "Dutch Immigration before 1846" in which New Amsterdam is passed over in a few pages, we begin the real story.

Every *Mayflower* story has its portion of myth, and this one is no exception. Like the English Puritans, these Dutch Separatists were persecuted at home, and they left in order to be able to worship God in their own fashion. Mr. Lucas relates the persecutions in appropriate detail, but he does not mention that they largely abated after 1848, when a new Liberal constitution was adopted in Holland; nor that the fresh upsurge of Dutch emigration in the 1880's, far from being induced by new persecutions, coincided with the establishment in Holland of the first Calvinist-Catholic cabinet. Mr. Lucas repeatedly acquaints us with "the fact that, excepting the Dutch Catholics, almost all Dutch immigrants" were Separatists (p. 472), and he deals with the contrary evidence (for example, Wabeke, pp. 89-90; Van Hinte, I, 195) in the simplest possible fashion—by ignoring it. Statistics in general are not his strong point. He accepts as given the notoriously inaccurate American immigration figures, which he neither attempts to correct himself nor amends with the help of such prior works as those of Willcox-Ferenczi or, for the specific Dutch case, Hofstee. He tells us that United States "census enumerators frequently failed to distinguish between Americans and those Hollanders whose grandparents and great-grandparents were of Dutch birth" (p. 328), apparently unaware that this practice was not only frequent but invariable.

Mr. Lucas has the love of a third-generation American for the Dutch language,

and he sprinkles his pages with Dutch words and phrases, all of which he has of course to translate immediately. The book ends with a discussion of Dutch as it is spoken in the Middle West, and of several novels about Dutch-Americans. Viewed as indices of acculturation, these would have been interesting topics; but Mr. Lucas saw them rather as occasions to take a stand for linguistic and moral purity. He has little sympathy with those who interpret the ultra-orthodox Calvinists that settled in Michigan and Iowa as a narrow, dull, and unlovable group; and he invites the reader to wonder why in each of the novels of Arnold Mulder, for example, "an important character had to be portrayed as a violator of the commandment against adultery."

WILLIAM PETERSEN

University of Colorado

FOSTER RHEA DULLES. *The Imperial Years*. Pp. ix, 340. New York: Thomas Y. Crowell Company, 1956. \$5.00.

The jacket of Mr. Dulles' volume carries a phrase that might well appear as a subtitle on the title page: "The history of America's brief moment of imperial fervor." The "imperial years" were those extending from the opening of Grover Cleveland's first presidential term to the close of Theodore Roosevelt's second, 1881 to 1909. These were the years in which the United States abandoned its traditional policy of avoiding overseas commitments and territorial acquisitions and embarked upon a career of empire building in the Caribbean and the Pacific and of limited participation in the international politics of Asia and Europe. Here we find retold the story of rivalry with Germany in Samoa, the annexation of Hawaii, the war with Spain, the conquest of the Philippines, the acquisition of the Panama Canal Zone, the initiation of the open door policy in China, Theodore Roosevelt's relations with Japan, the beginning of protectorates in the Caribbean, and American participation in the Algeiras Conference on the Moroccan question. The "imperial fervor" that supported these policies was, as Mr. Dulles sees the matter, short lived. Whatever enthusiasm the general public may have felt

for the "imperialism" of 1898 it soon evaporated. Mr. Dulles notes the fact that many Americans hailed John Hay's open door policy of 1899-1900 as an exemplification of anti-imperialist principles. Even President Roosevelt, one of the ardent expansionists of 1898, was hoping by 1901 that "the trend of events" would speedily justify the United States in leaving the Philippines. Yet Roosevelt, if he ceased to be an imperialist, was aware that the United States had become a world power and could not escape the responsibilities of its new position. In this he was far ahead of public opinion, which continued to view the power politics of Europe and Asia as if they had been phenomena of another planet. "It was the tragedy of the world as well as the tragedy of America," concludes Mr. Dulles, "that the immense power of the United States—physical and spiritual—could not somehow have been more effectively marshaled in defense of peace of liberty, without mankind having first to undergo all the savagery and cruelty of total war."

Scholars will find little that is new in Mr. Dulles' narrative. To the specialist the most interesting features of the book are the frequent citations of contemporary opinion and the analyses of the thinking of such intellectuals as Brooks and Henry Adams, Captain Mahan, and Roosevelt himself. That the book is designed for the layman rather than the scholar is indicated by the absence of footnotes and the selective bibliography. If the layman is inquisitive, he will not always find it easy to identify the monographs and articles representing the spadework on which Mr. Dulles' lively and interesting story largely rests.

JULIUS W. PRATT

University of Buffalo

H. DUNCAN HALL and C. C. WRIGLEY. *Studies of Overseas Supply: History of the Second World War. (Civil Series.)* Pp. xi, 537. London: Her Majesty's Stationery Office and Longmans, Green and Co., 1956. (Distributed by British Information Services, New York.) \$6.75 trade; \$5.40 library.

Overseas supply may become more than of academic interest if world events con-

tinue in their present pattern. This reviewer examined *Studies of Overseas Supply* in mid-December, when troops are being withdrawn from the Suez Canal area; when repression exists in Hungary; when the USSR satellites are increasingly restive; when NATO is in process of re-appraisal; and when large military concentrations are reported all along the eastern Asiatic coastline. All these events point up the timeliness of the present volume, which is in part a history, but likewise, a series of studies concerned with various facets of Great Britain's overseas supply system for munitions during World War II.

It is trite to say that: "the past is prologue," but in military matters and particularly in military supply matters, it often happens that: "the past is past." The lessons of history may well lie fallow for want of insight to take cognizance of both past mistakes and past achievements. Hence, for those who have insight, here is a book which can be most helpful, particularly should another serious overseas supply problem arise. Not because history will repeat itself, but because many situations, problems, and policies would be analogous.

This is a carefully written book of 537 pages, well-indexed and annotated, which deals with nine principal problems: North American munitions, problems of cash procurement in the United States, lend-lease procurement, allocations and programs, the combined boards, the combined raw materials board, British war organization in the United States, scientific collaboration between the United Kingdom and North America, and the Eastern hemisphere.

The book is one of the "War Production Series, United Kingdom Civil Series, History of the Second World War" and is complementary to Mr. H. Duncan Hall's *North American Supply*. A comparative treatment is to be found in certain volumes or portions thereof in: *United States Army in World War II*, particularly those which concern the supply services, transportation, and logistics.

One is struck with the teamwork displayed between the two countries so far as North American munitions supply is concerned. This is an important matter when

NATO is in process of re-appraisal. The book recounts many instances of such teamwork and thus gives us hope for the future. The book is not illustrated, nor need it be.

GEORGE P. BUSH

American University

ARTHUR A. EKIRCH, JR. *The Civilian and the Military*. Pp. xi, 340. New York: Oxford University Press, 1956. \$6.50.

It is ironic that Professor Ekirch, the first historian of the idea of progress in America, should have published in the last two years two gloomy estimates of our national future. Last year's account of *The Decline of American Liberalism* now has a companion in *The Civilian and the Military*, a history of our fading antimilitarist tradition. The theme in each case is the theme of paradise lost.

The author develops the story of anti-militarism concretely, not only in terms of periodic wars, but also in terms of peacetime debates over military appropriations, the size and nature of the armed forces, and the role of the military in civil affairs. He traces the preference for civil supremacy to England, shows how it was reinforced by colonial experience, and how it became part of the fundamental law of the land. So far so good. But from the time of the War of 1812, as Professor Ekirch sees it, the advocates of militarism had a downhill run, through the Mexican War, the Civil War, the Spanish-American War, and the three wars of the twentieth century. In our day the line between the civilian and the military has been completely obliterated; militarism is everywhere, in government, industry, education, even in scientific research. We now have a garrison state with the entire population either directly or indirectly enrolled in some military capacity. To Professor Ekirch this heralds the end of our free society, for he agrees with David Starr Jordan that "as militarism grows democracy must die."

This is a provocative thesis, ably stated, and supported by substantial but inconclusive scholarly evidence. *The Civilian and the Military* suffers not from lack of

evidence, but from lack of perspective. Though he does not say so directly, the author proceeds on the assumption that militarism is a devouring evil, war the ultimate madness, and that neither is defensible under any circumstances. He does not differentiate between the militarism that frees the slaves and the militarism that crushes a strike, between the militarism that conquers the Philippines and the militarism that defeats Hitler. By assuming that there is no moral alternative to peace he relieves himself of the necessity of facing the complexities of the war-peace issue. By implication, at least, he even seems to say that there has never been any real threat to our national security. His story, therefore, is the story of a people "driven by a series of irrational fears into the delusive security of militarism."

Even those who disagree with Professor Ekirch will commend him for calling attention to the problem of civilian-military relations, and for reminding us at this juncture of our history of the democratic implications of our antimilitarist tradition.

IRVIN G. WYLLIE

University of Missouri

EDMOND VERMEIL. *Germany in the Twentieth Century: A Political and Cultural History of the Weimar Republic and the Third Reich*. Pp. 288. New York: Frederick A. Praeger, 1956. \$5.50.

Edmond Vermeil is France's leading student of German history and thought, and any work of his in this field automatically commands respect and insures advance interest. *Germany in the Twentieth Century* is a brief survey of the Weimar Republic and the Third Reich. The major complaint is that the survey is much too brief. No other historian could have written a better short account of this fateful period of German history, but even Professor Vermeil is no magician, and as a result, the treatment leaves the reader under the impression that many issues are touched upon, but no more.

The Weimar Republic was Germany's first real try at democracy, and in the whole history of democracy there is perhaps no greater failure. The author pro-

vides us with the essential facts and data of the story, but the answer to the deeper causes of that failure remains largely unanswered. The diplomatic, political, and economic facts of the period of the Weimar Republic are generally known. In his last section on that period, the author brilliantly deals with neo-nationalism, existentialist philosophy, and literature—here we get a taste of what Professor Vermeil could have done if he had treated his theme in the breadth and depth which it deserves. But even in these short surveys he provides a great deal of information of German thought in the 1920's which even the specialist in German history and politics will read with considerable interest.

The Nazi regime occupies the second half of the book. Mountains of volumes have piled up on this subject in the last twenty years, and yet we do not seem to make much progress as to a true understanding of Nazism. It has no parallel in the history of modern barbarism, and perhaps in the history of any barbarism, ancient or modern. The conventional approaches of history, politics, and philosophy do not supply an adequate answer to the question of how all this could happen in the middle of the twentieth century in the heart of Europe; and other approaches (particularly that of social psychology and psychopathology) are perhaps not advanced enough to give us the answers we look for. Professor Vermeil is most interesting in his analysis of the background of the Nazi doctrine, based on his unusually intimate knowledge of German thought since Martin Luther. In his conclusion (pp. 260–78) the author summarizes his findings, and briefly discusses the prospects of present-day Germany. On the whole he is moderately hopeful, provided Germany's "eternal romanticism" (p. 278) does not induce her to plunge herself, and all of Europe, into new adventures leading to ruin and disaster.

WILLIAM EBENSTEIN
Princeton University

LAWRENCE HENRY GIPSON. *The Triumphant Empire: New Responsibilities with the Enlarged Empire, 1763–1766. The British Empire Before the American*

Revolution, Vol. IX. Pp. xxxix, 345, xlv. New York: Alfred A. Knopf, 1956. \$7.50.

Recent volumes of the author's penetrating studies of the older British Empire have concentrated on the period and problems of the French and Indian War. Here, once again, laborious application by Professor Gipson pays off in scholarly dividends. This volume of his series chiefly concerns the governing of the far-flung territories acquired in 1763.

Great Britain sought, so this detailed analysis well demonstrates, to give each new colony the government best suited to its location and circumstances. The general needs of the empire had to be considered also. In North America, the years 1763 to 1766 saw the recolonization of Nova Scotia and the creation of new governments for Quebec and the Floridas. To the West Indies came self-supporting British governments for Grenada, Dominica, St. Vincent, Tobago. In India, the East India Company increasingly involved itself in the affairs of Bengal and elsewhere.

Those primarily interested in the background of the American Revolution will find in this volume little aid and comfort, except by indirection: the new colonies depict the motives and spirit of the ministers, Parliament, and the governors for all British colonies of the time. Thereby a clearer view may be had of the relations of Great Britain with its older colonies.

The author's lines of inquiry may be illustrated, for general aspects, by his handling of the highly complicated governmental problems presented from the sudden and immense territorial expansion. For specific approaches an example would be his recounting that Britons in London, in a controversy over the acquisitions, debated whether to retain Canada or Guadeloupe. Consideration is given the recommendations and actions of the colonial governors who, because of isolated situations, often had to proceed upon their own initiative.

The Proclamation of 1763 is analyzed, the author turning for background to the Cherokee uprising of 1759–61 (considered as an episode of the moving American frontier) and the great Northwest Indian

uprising of 1763. That proclamation comes out rather well from this recent re-examination. Admittedly, the Proclamation of 1763 had defects and antagonized British colonials who wished to move farther west. But it created the promised Indian reservation, established new provinces (including Quebec), realigned the boundaries between Nova Scotia and Quebec, set what became the controversial boundary of East Florida, and altered the boundary of West Florida. In the ceded islands assemblies were established in accordance with it. Trade was opened up everywhere and, in certain areas, settlement was encouraged. The objectionable line that separated the Atlantic seaboard colonies from the Indian country was intended to be temporary.

VERNON J. PURYEAR

University of California
Davis

ERIC VOEGELIN. *Israel and Revelation: Order and History*, Vol. I. Pp. xxv, 533. Baton Rouge: Louisiana State University, 1956. \$7.50.

Israel and Revelation is the first in a series of six volumes, entitled *Order and History*, to be published within the next three years. The series is described as "a comprehensive study of the order of human existence in society and history, ranging in times from the Egyptian and Mesopotamian empires of the Ancient Near East to the modern national states and the contemporary conflict of civilizations."

[It is quite evident from the heavy German style of writing, which is carried over into the English, that Dr. Voegelin expected that this volume on *Israel and Revelation* would be read only by highly intellectual and erudite persons. But it denies to any number of general readers the advantages of becoming acquainted with the author's political philosophy concerning *Order and History*. It is assumed that the other five volumes will be written in the same style. Possibly "this monumental work" will later be deemed worthy of abridgment to be of service to a wider reading public.]

On page ten of the Preface, the plan or purpose of the book is stated as follows:

"The first volume, the present one on 'Israel and Revelation,' will explore not only the form of cosmological and historical order, but also the emergence of the Chosen People from the ambiance of cosmological empires. A truth about the order of being seen only dimly through the compact symbols of Mesopotamian, Canaanite and Egyptian societies, becomes articulate, in the formation of Israel, to the point of clarity where the world-transcendent God reveals himself as the original and ultimate source of order in world and man, society and history, that is, in all world-immanent being. Under this aspect of the dynamics of history, the otherwise autonomous study of cosmological order acquires the character of background for the emergence of history, as the form of existence in response to Revelation gained by Israel's exodus from civilization in cosmological form." This passage leads the present reviewer to observe that it has always been difficult for him to understand just who chose the Chosen People, in the commonly accepted sense of the term, and for our present-day cosmos. Of special value is the author's interpretation of Moses and the Prophets in Chapters XII and XIII.

Dr. Voegelin has done a remarkable piece of research on this volume, and has included not only a General Table of Contents, but also an excellent Analytical Table of Contents in the beginning of the book. The abundance of material is divided into an Introduction, The Symbolism of Order, and four parts, the titles of which are: Part I, The Cosmological Order of the Ancient Near East; Part II, The Historical Order of Israel; Part III, The History and the Trail of Symbols; and Part IV, Moses and the Prophets. Following the text there is a listing of Biblical References according to the Books of the Bible, a List of Modern Authors used, and a Subjects and Names Index. These aids to the reader in using *Israel and Revelation* are of course to be expected in the work of an able German-trained scholar. This volume should be of special interest to all serious students of Religion and the other social studies.

EDGAR J. FISHER

Amherst, Va.

DONALD E. WORCESTER and WENDELL G. SCHAEFFER. *The Growth and Culture of Latin America*. Pp. xvii, 963. New York: Oxford University Press, 1956. \$6.00.

This readable volume treating the history of the twenty Latin American nations is developed on a plan different from previous works on the subject. The slightly more than four and a half centuries are divided into seven periods, each given approximately the same space (120 to 145 pages). The suggestive titles for the periods are: 1. Genesis of Empire (16th century), 2. Consolidation of Empire (17th century), 3. Maturity of Empire (18th century), 4. The Revolutionary Era (1800-22), 5. The Struggle for Political Stability (1822-60), 6. The Few and the Many (1860-1930), and 7. The Contest for Hegemony and the Rise of Indigenous Nationalism (1930-55).

The treatment of each period begins with a survey chapter, pointing out the highlights and significant phases of the development. Then follow chapters which consider the outstanding aspects in various countries as they are indicated in their titles. For the early colonial periods, the various areas are taken up in the order of occupation by the Spaniards, with Brazil coming last. The last colonial period begins with New Spain, proceeds southward and concludes with Brazil; while the revolutionary period starts with the south, continues northward and finishes with Brazil.

In the parts devoted to the national periods, the various countries are not treated individually, but, after the introductory chapter, are arranged in varying groups according to the way they fit under the chapter headings. In the discussion any one country may appear in several places in the chapter and many of the countries receive only slight mention.

The organization of the parts, indicating the assignment of the countries to chapters, is as follows: Part V contains: II, "The Stability of Moderation—Chile, Brazil and Paraguay"; III, "Tyranny and Confusion—Argentina"; IV, "Caudillismo and Anarchy—Ecuador, Venezuela, Colombia, Peru and Bolivia"; and V, "The Age of Santa Ana—Mexico, with a little on Central America

and the Caribbean Islands." Part VI has: II, "Southern South America—Argentina, Uruguay and Chile"; III, "Indo-America—Peru, Ecuador, Bolivia and Paraguay"; IV, "Caribbean Borderlands—Venezuela, Colombia, Mexico, Central America and the Islands"; and V, "Brazil." Part VII comprises: II, "Mexico, a Study in Dynamics"; III, "Restless Caribbean—Central America, Colombia, Venezuela and the Islands"; IV, "Brazil, Destiny Not Quite Manifest"; V, "Argentina, Uruguay and Chile"; and VI, "Paraguay, Bolivia, Peru and Ecuador—Indo-America."

The authors have presented an interesting picture of Latin American growth and culture, under a new approach to an intriguing subject. No doubt many will criticize the lack of emphasis on all individual countries in the national period, nevertheless, it will be admitted that this plan has certain merits.

ROSCOE R. HILL

Washington, D. C.

R. F. LESLIE. *Polish Politics and the Revolution of November 1830*. Pp. xii, 307. London: University of London, Athlone Press; New York: John de Graff, 1956. \$7.50.

This is the third volume in the series of Historical Studies being sponsored by the University of London. In origin a doctor of philosophy thesis, it is built almost completely on Polish sources. The author, now Lecturer in History at Queen Mary College, University of London, was able to spend two terms in Poland where he "was granted free access to Polish archives and libraries."

The book is far more than an account of the Revolution of 1830. About a third of the study is devoted to the economic and social background of that struggle, and here the author ranges back and forth over events of the previous centuries. The analysis of the Polish *szlachta*, its division into greater and petty "nobility," the condition of serfs, and the slow growth of an industrial class is perhaps the best section of the book. The essentially conservative character of the Duchy of Warsaw is defined; here, as well as in the government of the

Congress Kingdom, the aristocracy continued to dominate.

With the outbreak of the revolt in November 1830 the account picks up detail, and the attempts of certain leaders to prevent a direct break with Russia is tortuously narrated. Emphasis is given to the internal bickering among the leaders, the indifference of the Polish serfs to the revolt, and the failure of the six governments which Poland had within ten months, to enact any basic land reforms. "The revolution . . . [was] the work of the Warsaw intellectuals and army officers of *szlachta* origin, a local insurrection at the seat of administration unaccompanied by widespread disturbances in the countryside or provincial towns" (p. 172). ". . . the mass of the population lacked both the means and the spirit to make any substantial contribution to the success of the national movement" (p. 177). The author sets the number of emigrés between 5,000 and 6,000 and describes briefly their centers of activity in exile, while deprecating the influence of these men on Polish affairs. More needs to be said on Russian-Polish policy after the Revolution, and this the author has reserved for a future volume.

This is not a book for the general reader, and even the well-intentioned professor will hardly find it stimulating. This may be due to a method which tends to reduce the events in 1830 in Poland to a series of incidents, full of details and replete with names of individuals. Even the author fails to list in his index all the names with which the text is cluttered. There is an excellent bibliography and an interesting note on the pronunciation of Polish words and names.

WILLIAM KLUBACK. *Wilhelm Dilthey's Philosophy of History*. Pp. 118. New York: Columbia University Press, 1956. \$3.00.

Wilhelm Dilthey is not regarded as being among the really first-ranking philosophers of the nineteenth century. Consequently it has been customary, among English-speaking philosophers anyway, to refer to

him as a neglected genius—and then to continue to neglect him.

Dilthey himself has been at least partially responsible for this. His writings are unsystematic, and his ideas are suggested rather than completely developed. However, for breadth of outlook and catholicity of interest he was unsurpassed, certainly in his own time. He deserves better at our hands.

Professor Kluback's survey, published in the Columbia University Studies in the Social Sciences, will help remedy this neglect. While it is much slighter in size than H. A. Hodges' *Philosophy of Wilhelm Dilthey* (Routledge, 1952), it packs a surprising wealth of solid material within its compass. For Dilthey, historical understanding is the key to the understanding of all human experience and of all philosophical systems. Therefore, Professor Kluback's title gives him an excellent opportunity to deal with the whole of his subject's thought.

It was Dilthey's aim to write a great critique of historical reason, which would save history from the positivistic historians of the nineteenth century, just as Kant had aimed at saving the natural sciences from the positivism of Hume. While this intention was never carried out, and while Dilthey did not himself succeed in escaping positivism completely, he did succeed in getting extraordinarily close to the heart of the philosophical problem of history.

Professor Kluback is especially thorough in his examination of the diverse roots of Dilthey's thought. His emphasis on the influence of Schleiermacher in particular, and of philosophical idealism and the romantic movement in general, is well placed.

On the debit side, Dilthey's own unsystematic presentation is reflected in the present work. To a certain extent, of course, this may be unavoidable. To oversystematize the unsystematized is to misrepresent it. However, a clearer organization of material here would have been of great help.

Finally, a publisher's advertising blurb to the contrary, the author does *not* show how Dilthey affected all later thought in the fields of history, literature, and culture. Philosophers such as Croce and Ortega y

Gassett, who derived much of their thought from Dilthey, are not mentioned. In the case of a more narrowly defined monograph this objection would be captious. But in the instance of a general introduction it is much more valid. The single final page Professor Kluback devotes to indicating something of Dilthey's influence is not enough.

CARL Y. EHRHART

Lebanon Valley College

ARTHUR HOLLY COMPTON. *Atomic Quest: A Personal Narrative*. Pp. xix, 370. New York: Oxford University Press, 1956. \$5.00.

Atomic Quest is the story of the atomic bomb project from the discovery of fission through the bombing of Japan and a little beyond, as it was lived, and to a considerable extent guided, by Dr. Arthur Holly Compton. Dr. Compton's part in the development of atomic energy began very soon after the discovery of the fission of uranium in 1939. He was at that time one of a small group of scientists who became personally convinced that fission had enormous military potential and who were willing to put aside all else in order to try to get its development started in this country as fast as possible. He continued to occupy a central position in the program as it moved from the experimental to the production phase and later into the area of international strategy. He was of course a party to the making of the important policy decisions. This inside knowledge of the bomb project, added to the personal knowledge of the scientists involved which Dr. Compton has as a result of a long and active career in physics, gives him an authority and penetration in writing the story of the bomb that few other writers could possibly have.

The book is nontechnical. Nowhere does it attempt to explain how a bomb works. It contains mainly information and anecdotes about the organizational and human problems of getting the atomic bomb project started and of carrying it through on an extremely tight time schedule. The last few chapters deal with the strategic and moral problems that had to be faced as the

new weapon neared completion and with the reactions of the Japanese leaders and people after its use. A large portion of the material comes from Dr. Compton's vivid memory. It is evident that he also had the privilege of drawing from official records, copies of correspondence, and transcripts of conversations and testimony where needed. The present-day classification of information relating to atomic bombs does not seem to have been a handicap, probably because the book deals primarily with the human struggles and foibles of accomplishing the job, rather than with technical methods of making fissionable materials and bombs.

The spirit of adventure and the feeling of the great importance and urgency of the task are well conveyed. Besides being a unique and valuable addition to the documentary material on the development of atomic energy, the story is one that moves at a lively pace. It is recommended to anyone who is interested in the birth of the Atomic Age.

University of Michigan

GEORGE WOODCOCK. *Pierre-Joseph Proudhon*. Pp. 292. New York: The Macmillan Company, 1956. \$5.75.

In France and on the Continent, Pierre-Joseph Proudhon's continuing actuality is shown by the many and notable authors, from Karl Marx to Daniel Halévy, who have written books about him. In Britain and the United States, Proudhon is familiar only to scholars, Marxist intellectuals who have dutifully studied *The Poverty of Philosophy*, and the comparatively few readers of a book on Proudhon written by Professor D. W. Brogan before he found his presently ample audience.

George Woodcock, a Canadian-born, English-bred poet and man of letters, himself a professed libertarian, has added to earlier studies of William Godwin and Peter Kropotkin a competent, readable biography of Proudhon. Mr. Woodcock has dovetailed a discerning chronological analysis of Proudhon's works with a perceptive, sympathetic narrative of his life. He believes Proudhon to be the dominant ancestor of the liber-

tarian, as opposed to Marx' and Lenin's authoritarian, tendency in modern radicalism: not only of anarchism and anarcho-syndicalism, but of the anticentralist, co-operative, "mutualist" side of socialism. Proudhon "remains among the small group of nineteenth-century social thinkers whose work still has meaning and relevance in our own age, when we are reaping the evil harvest of the very centralization and nationalism against which he made his loud-est protests."

The biographer fails (if he tries) to demonstrate much intrinsic worth, scientific or philosophical, in his subject's ideas. These are more persuasive at the level of slogan ("Property is theft," "God is evil," "Marx is the tapeworm of socialism") than of rational argument. But the outmoded vagaries of his ideas do not lessen the historical and human interest of the peasant-sprung Besançon printer. Proudhon was accurate in at least the second half of his remark to Charles Weiss, the scholarly librarian who was his first patron: "In my eyes you are the last incarnation of the eighteenth century. May you understand one day that I, for my part, am one of the incarnations of the nineteenth." And what he incarnated, in spite of all his protests against it, in spite of his sexual timidity, ponderous philosophizing, and social reforming, was a wild, wonderfully picturesque offshoot of the Romantic sensibility: a Chateaubriand in sabots, a peasant Harold in Italy. Who but a supreme Romantic could have got himself a wife by stopping an unknown girl on the street and asking her to marry him?

It is all condensed in the marvelous portrait by his friend Courbet, which Mr. Woodcock reproduces as his frontispiece.

JAMES BURNHAM

Kent, Conn.

FRANK FREIDEL. *Franklin D. Roosevelt: The Triumph*. Pp. 433. Boston, Mass.: Little, Brown and Company, 1956. \$6.00.

This third volume of Frank Freidel's monumental biography of Franklin Roosevelt is essentially an account of his record as Governor from 1929 to 1933 and as presidential candidate in 1932. There is a

natural crescendo in the Roosevelt story as it unfolds with each successive volume, increasing in interest, insight, and significance. If volume one and two may be described as prologue, volume three is a magnificent first act to the Roosevelt drama. Under the skillful hand of Professor Freidel, Franklin Roosevelt begins here to emerge as something more than an amiable member of the Hudson River squirearchy with an amateurish interest in politics—to become a formidable political leader of no mean dimensions. Henceforth his career becomes for all practical purposes synonymous with the political history of the United States during more than twelve crisis-packed years. This distinguished biography will be indispensable to those who seek to understand the emergence of America both as a mature social democracy and as leader of the free world. One cannot read this exciting record without again reflecting on the relation between great men and great events. To what extent were the tumultuous events of these years directed by the genius of Franklin Delano Roosevelt, and to what extent was he but the instrument of forces beyond his control or comprehension? Freidel wisely avoids this question, viewing it no doubt as on a par with the question as to whether the area of a triangle depends more on its base than its altitude.

In presenting Franklin Roosevelt to the critical gaze of his readers, he indulges in neither dithyrambs nor diatribes but, like the honest craftsman he is, offers a full-length portrait of the man—"moles and all." Franklin Roosevelt's idolators will not like to be reminded of the coy but ardent presidential aspirant denouncing Hoover for his extravagance and playing ducks and drakes with all manner of men and measures. Nor will the professional "Roosevelt haters" derive much comfort from the clear image that appears in this volume of a courageous, perceptive, and inspired statesman who out-thought, out-manuevered, and out-fought his enemies and his rivals to become not only a truly great governor but, as later events were to prove, a great president and a great man. How far wrong some of his contemporaries were in their estimate of his calibre and

character is painfully illustrated by Walter Lippmann's comment early in 1932 that "Franklin Roosevelt is no crusader. He is no tribune of the people. He is no enemy of entrenched privilege. He is a pleasant man who, without any important qualifications for the office, would very much like to be President." In retrospect it is hard to believe that so wise and experienced an observer as Lippmann could be so blind. For, even as he wrote, Franklin Roosevelt was proving, as Governor of New York, that he was a crusader, he was a tribune of the people, he was an enemy of entrenched privilege, and he had in abundance the qualities of leadership which have characterized all great presidents. No one can read this volume and come to any other conclusion. His first message as Governor foreshadowed policies later to be incorporated in both federal and state legislation as the "New Deal." His Old Age Commission in 1929, his passionate concern for the conservation of New York's natural resources, his courageous and head-on battle with the power trust, his fight for measures to extend and improve public education, public health, and welfare, are but a few items in a gubernatorial record that belies the belittling language of Lippmann. Moreover, his superb qualities as politician are revealed in the skill with which he outflanked the reactionary Raskob-Shouse-Michelson cabal within his own party and managed to grow in political stature as his quondam hero, Al Smith, declined. There is something sad and even a bit pathetic in the rift between Smith and Roosevelt, but anyone watching Smith's melancholy departure from Albany in January, 1929, should not have been surprised. The transformation of the "happy warrior" into the unhappy, unglamorous, and often mean critic of Roosevelt policies—policies for which Smith himself had once fought—does not make for pleasant reading. Yet under most trying circumstances and torn by sharply conflicting emotions on the sad and often scurvy affair, Roosevelt displayed rare qualities of personal loyalty and magnanimity.

By all means read this volume. It is a veritable pageant of American politics in which Franklin Roosevelt plays the leading

and dual role so felicitously described by James Burns as the "lion and the fox."

University of California
Berkeley

EDUCATION AND RELIGION

EMILE DURKHEIM. *Education and Sociology*. Pp. 163. Translated by Sherwood D. Fox. Glencoe, Ill.: Free Press, 1956. \$3.50.

As Talcott Parsons points out in the Foreword, the concepts of Durkheim have genuine significance in modern sociology and in education today. For example, Durkheim emphasized the internalization of cultural norms and pointed out that conflicts are aroused within the individual as a result of the inconsistency of the cultural norms of groups with which he identifies himself. The present writer, in a forthcoming book, emphasizes this same point of view but carries it a step further by pointing out that conflicts within the individual are dependent upon two factors: the degree of inconsistency of cultural norms and the extent to which the individual identifies himself with groups with differing value-norms.

Emile Durkheim (1858-1917) was Professor of Sociology at the University of Bordeaux and Paris. For many years he gave a weekly lecture on "pedagogy." This book is a translation of four of his essays: *Education, Its Nature and Its Role*; *The Nature and Methods of Pedagogy*; *Pedagogy and Sociology*; and *The Evolution and Role of Secondary Education in France*.

Throughout all of the essays, Durkheim stresses the fact, now increasingly accepted, that education directly reflects the culture of the community. It is the product of the interaction of the school and the various cultural groups which comprise the environment which the school serves. Specifically, he states, "Education is the influence exercised by the adult generations on those that are not yet ready for social life. Its object is to arouse and to develop in the child a certain number of physical, intellectual, and moral states as

a whole and the special milieu for which he is specifically destined."

In spite of the fact that a half century and more has passed since these essays were written, sociologists and educators will find in them stimulating food for thought. Certainly some of our modern concepts had their beginnings in the work of Durkheim and others of his contemporaries.

FRANCIS J. BROWN

American Council on Education

JOHN WALKER POWELL. *Learning Comes of Age*. Pp. xiv, 235. New York: Association Press, 1956. \$3.00.

This is a careful and comprehensive survey of the present extent of adult education in the United States of America made possible by the collaboration of the Adult Education Association and the Ford Fund for Adult Education and the able authorship of Dr. John Walker Powell. Mr. Powell has a background of experience and training that gives him a good framework from which to survey and evaluate present-day adult education activities. This personal responsibility for the contents of the book grows out of the agreement between him and the sponsors of the project. He was to survey the "present state and future prospects of adult education in this country," but was to be entirely free to write what he saw and thought. He was to write as he believed, and his sponsors would print it or not as they pleased. Since it has been printed it brings an endorsement by professionals in the field as well as by the Fund for Adult Education.

Mr. Powell limits the meaning of adult education as consisting of "planned and purposive adult learning occasions regularly provided under some organized scheme of guidance."

These adult learning occasions he breaks into two categories, those that relate to the acquisition of facts, skills, and so forth, and those that build or create "intelligence." By intelligence he does not mean a collection of skills or knowledge, but the individual passing judgment upon or relating his skills and knowledge to the further development of personality. Nowhere does the author define what maturity or "coming of age" in the field of education is but this

reviewer believes he means that in those situations where intelligence is born or improved adult education has "come of age."

Because the agencies now active in offering adult education were all created, staffed, and exist "for a primary purpose other than the education of adults," Mr. Powell does not believe that the present pattern for adult education can achieve the mature adult education for which they may strive. He further thinks the present pattern is a very insecure basis in times of financial stress. He calls for "an agency uniquely adult, independent of other concerns, staffed by its own professors and financed purely for what it is and does." He does not minimize anywhere in the book problems inherent in an education for maturity and refers more than once to the "long step" between what is and what might and should be.

JEROME BENTLEY

Aurora, N. Y.

A Design for Democracy. An abridgement of a report of The Adult Education Committee of The British Ministry of Reconstruction commonly called *The 1919 Report*. Pp. 222. New York: Association Press, 1956. \$3.50.

It is doubtless a commonplace to affirm that we are rapidly becoming an age or a period in which ever-larger numbers of our population are senior citizens. However, much of the concern of educators appears focused too exclusively upon the needs of youth. And yet, this reviewer is impressed by the transparent lack of genuine concern of educators for the imaginative quality of education, the adventure with ideas where young students struggle to forge concepts meaningful to their expanding frame of reference. Much of contemporary education is hardly differentiated from sheer indoctrination, the passive acquiescence of students in the preachments of educators, the lethargic waiting for the pronouncements of authority.

Institutionalized adult education, for the most part, is of the same stripe or is excessively vocational. Centers for adult education which were sufficiently courageous to enter the arena of political conflict either on the local or national level have

fares rather badly at the hands of self-appointed custodians of the commonweal. There are exceptions. One recalls the outstanding work in adult education by the International Ladies' Garment Workers Union.

A Design for Democracy endeavors to come to grips with a deeper concept of adult education. There is much sageness in its pages, and although authored almost forty years ago, the document has both relevance and insight for us at mid-twentieth century. To be sure, some of the material is dated. Between the completion of the report in 1919 and the present, there have occurred dramatic and notable changes—historical and political—which have affected the course of education at all levels. The authors of the report reach for the moon in almost reckless abandon so far as a realistic appraisal of the potentialities of education are concerned. Notwithstanding, anyone who is seriously concerned with the fundamental problems of adult education might well ponder the fresh wisdom of their utterance. Last but not least, there is a lucid and straightforward style of writing which puts to shame many contemporary books in the field of professional education.

FREDERICK E. ELLIS

University of Minnesota

W. KENNETH RICHMOND. *Education in the U.S.A.: A Comparative Study*. Pp. 227. New York: Philosophical Library, 1956. \$4.50.

In his *Democracy in America*, the perceptive De Tocqueville gave Americans an effective tool for both analyzing the American *ethos* and reshaping their thinking and acting as citizens of the new democracy. The fresh insights of De Tocqueville with respect to the values and risks of the democratic way of life are as relevant for our own day as when they appeared in print in the 1840's. Now as well as then we have much to learn from our friendly critics, in fact far more than we could ever hope to learn from our uncritical friends.

Contemporary American education has been subjected to the discerning eye of W. Kenneth Richmond, Lecturer in Education

at the University of Glasgow. As a "foreign" observer, Mr. Richmond will find himself open to charges of indulging in snap judgments, of attempting to support insupportable generalizations, in short, of grossly distorting and misinterpreting the American educational scene. To a degree these charges will be valid. Nevertheless, Mr. Richmond presents the reader with what is in the main a restrained, balanced though not always carefully controlled portrait of his subject. He has attempted too much in too short a compass. The book is concerned with problems such as: education in Americanism; the place of the teacher in American democracy; the American high school; and, finally, higher (and lower) learning in the United States.

The book has sufficient strengths to warrant its author *not* being decried as a "Cassandra" or his book heaped with question-begging epithets.

FREDERICK E. ELLIS

University of Minnesota

EDWARDS DUFF, S.J. *The Social Thought of the World Council of Churches*. Pp. xii, 339. New York: Association Press, 1956. \$7.50.

This is a study by a Jesuit scholar of the social thought of the ecumenical movement which has found its chief institutional expression in the World Council of Churches. Father Duff spent two years in Geneva and was given access to the records of the World Council. He was a very popular figure there and had an unusual opportunity through much conversation to fill in gaps in the written records.

As one who has been very close to the developments which Father Duff has studied I am glad to testify that he has had astonishing success in understanding the thought and the spirit of this movement which is largely Protestant in its inspiration and entirely non-Roman Catholic. He is able to understand this emerging pluralistic Christian community which has no organs of authority, which enables more than 160 denominations of the most diverse backgrounds to co-operate and to think together. He understands, as from inside, the difficulties of this religious movement that is

so different in structure from his own Church and he has great respect for what has been achieved in spite of these difficulties. There is not one word in this volume that is unfair to Protestant thought. Sometimes he is critical but he would usually find many Protestants who would agree with his criticisms. It should be said that he has written about those aspects of Protestant thought in which there is a good deal of common ground with the thought of many Roman Catholics.

Father Duff summarizes and interprets the social teachings which have come from the great conferences at Stockholm (1925) and at Oxford (1937) and from the first and second assemblies of the World Council of Churches at Amsterdam (1948) and at Evanston (1954). Since Oxford there has developed what may be called a broad ecumenical consensus on economic and social and international problems. There is no other book that gathers together this material so usefully. Father Duff is sometimes impatient that this consensus does not settle some of the most difficult questions, especially in regard to economic institutions. This is partly Catholic impatience with the refusal of Protestants to use natural law conceptions in solving these problems. One value of this whole ecumenical process is not sufficiently emphasized; it helps to deliver the Christians of each nation or culture from the forms of bias which are most natural to them. In this way it stimulates their minds and consciences even if it does not give them decisive answers.

JOHN C. BENNETT

Union Theological Seminary

KISHIMOTO HIDEO (Ed.). *Japanese Religion in the Meiji Era*. Translated by John F. Howes. Pp. xix, 377. Tokyo: Ōbunsha, 1956. 1,800 Yen.

Here is as good a comprehensive survey of the religions of Japan in the Meiji period as is to be found in English. One of the "Centenary Culture Council Series," of which another number, *Japanese Literature in the Meiji Era*, appeared in 1955, it is part of an ambitious effort, financed by the Japanese Government, to portray the de-

velopment of modern Japan. To it several experts have contributed chapters. The book was designed for Japanese readers, but the translator has had in mind undergraduate and graduate students having no knowledge of the Japanese language and only a general knowledge of Japan. Working with the authors, he has reduced the dimensions of the original by about 40 per cent and has omitted footnotes.

The volume begins with an excellent survey of Japanese religion under the preceding period, that of the Tokugawa Shogunate. It then goes on to sections on Shinto, Buddhism, and Christianity. The section on Shinto rehearses the disestablishment of Buddhism, and disentanglement of Shinto from Buddhism, the effort, relatively brief, to make Shinto the state religion, the achievement of religious liberty, and the growth of sect Shinto. The section on Buddhism covers the sharp decline in the status of that religion early in the Meiji period and its revival in the later decades of that era. Established by the Tokugawa, its inner vitality had suffered from an association which had led many to enter the priesthood as an easy livelihood and had undercut religious conviction. In the first reaction under the Meiji, with its disestablishment and separation from Shinto, more radical groups and officials sought to rid the country entirely of Buddhism. Many temples and shrines were destroyed and the lands through which they were supported were diverted to other purposes. Then came a renewal which made Buddhism more inwardly alive than it had been for several centuries. The longest chapter, nearly half the volume, is on Christianity. Unfortunately it is not as good as the others. It is confined primarily to Protestantism with only slight coverage of Roman Catholic and Russian Orthodox Christianity, although these together were almost as strong numerically as was Protestantism. The account of Protestantism is mostly what is available in other books in English: its chief value is the delineation of the background from which early converts came and the bearing of that background on their conceptions of Christianity.

KENNETH SCOTT LATOURETTE

Yale University

MATTHEW SPINKA. *The Church in Soviet Russia*. Pp. xi, 179. New York: Oxford University Press, 1956. \$3.25.

This compact, solidly written study provides a useful historical perspective in the light of which recent firsthand reports of a growing "religious revival" in the Soviet Union may be evaluated. Professor Spinka's account is factual and objective, although he pauses at appropriate points to criticize or condemn an individual or policy of the Church or government. In successive chapters, he traces the careers of the three Patriarchs who have headed the Russian Orthodox Church during the Soviet period—Tikhon, Sergei, and the present Patriarch Alexei, showing how their (at first) reluctant and piecemeal concessions eventually led to a situation in which "the Russian Church is subjugated to the state and exploited as a tool for the latter's . . . policies" (p. 153).

The author reminds us of the antireligious campaigns of the late 1920's and early 1930's. (For example, in May 1932 the Association of Militant Atheists had more than 5½ million members, and by 1933 at least half of the churches had been closed.) He goes on to review the reversal of government policy which followed (and was at least in part a result of) the Church's massive support of the Soviet war effort—expressed in such concrete gestures as the voluntary contribution of 150 million rubles to government coffers.

The period after 1943 was marked by substantial concessions: theological schools were reopened, ecclesiastical journals resumed publication, the militantly antireligious organs were suppressed, limited religious instruction was permitted. At the same time, Church leaders began to take an active part in furthering such political and propagandistic aims of the Soviet Government, as the "peace campaign" of the early 1950's. In the Mid-Eastern "pilgrimage" of Patriarch Alexei (1945) and the Church's condemnation of the Vatican and the World Council of Churches (1948), Professor Spinka also detects political overtones. While concurring with his analysis, one may ask whether he has not exaggerated

the importance of such political activities, at least in so far as they enter into the lives of ordinary Russian Orthodox believers. For, as he himself notes, the latter have been traditionally indifferent to politics, whether Tsarist or Soviet.

Professor Spinka cites statistics for 1914 which place the number of functioning parish churches in Russia at more than 40,000 and the number of monasteries and convents at slightly over 1,000. The comparative Soviet statistics which he offers are fragmentary and range in date from 1946 to 1953 (pp. 119 f). More recent figures (given me in Moscow in August 1956 by Nikolai Kolchitski, Chairman of the Educational Council of the Moscow Patriarchate) place the number of churches in the Soviet Union at "more than 25,000" and the number of monasteries and convents at 69. I cannot, of course, vouch for the accuracy of these figures, but my own (unsystematic) observations in Leningrad, Moscow, Kiev, Tula and their environs, including certain of the larger monasteries, give me no reason to suspect the statistics of being unduly high.

A minor objection might be raised concerning the title of this book, which suggests that it deals with churches generally, rather than with the Russian Orthodox Church exclusively, as it in fact does. One cannot quarrel with Professor Spinka's decision to exclude consideration of Roman Catholic, Protestant, Jewish, or Mohammedan groups. But one might wish he had made clearer to his readers the extent to which the Russian Orthodox Church enjoys a special and privileged position (though by no means a wholly enviable one), as compared to the non-Orthodox confessions, including the schismatic Old Believers. An indication of this position is afforded by the administrative structure of the Soviet government, which provides an entire Section for Affairs of the Russian Orthodox Church (headed by Minister G. G. Karpov) and only one Section to deal with the affairs of all other religious groups in the Soviet Union.

FOREWORD

White Americans seem continually to be rediscovering the Indians. In the last few years, a growing Indian population on a limited land base, a vigorous national controversy over desegregation, a turn in the Indian policy of the federal government, and world-wide attention to questions of colonialism and minorities have been among the forces renewing America's interest in her Indian citizens.

The student of Indian affairs recognizes that to some degree the status of Indians in American society is similar to the status of other minorities. To a significant degree, however, Indian experience has been different, for unlike any other minority group in the nation, they were here, living in unified societies, when the European settlers came. Their response to invasion may have as much in common with the minorities in Eastern Europe as with the willing and unwilling migrants to America, torn as they were from their cultural roots.

There is scarcely a major issue of policy in the United States that has not been involved in the relationships of Indians and whites. Questions of universal citizenship and franchise; of land use and conservation; of the "melting pot" versus pluralism; of prejudice, discrimination, and segregation; of colonialism; of the separation of church and state; of private property and communal property; and of the extent and nature of government responsibility for education—to mention several basic issues—have all involved policy questions concerning Indians.

We need scarcely stress the importance and value of a study of the place of American Indians in American life. To the social scientist, it offers a valuable field for the testing of theories of social and cultural change, of acculturation, of personality development, and the like. To the policy maker, "the Indian question" is a key test of democracy with which our society has struggled for generations. To the student of international affairs, it offers experience—much of it negative, of course—and an important testing ground for the study of the results of culture contact between highly industrialized and "underdeveloped" societies. And in its own right, as a problem with difficult questions of justice and equality involving a large group of human beings, the analysis of the status of American Indians challenges us all.

Clearly the authors of this volume do not agree on all aspects of the question of the place of American Indians in American life. There are some disagreements in interpretation of facts, in method, and even in objective. While we have not sought to have all possible points of view represented—for our aim has been a scholarly review of several aspects of Indian life today, not a policy debate—we nevertheless welcome the several points of view that naturally appeared as the various authors explored their subjects. Each author writes from a wealth of experience. The interaction of their views can bring us to a more adequate understanding of American Indians and toward a resolution of the difficult questions still before us in establishing full equality and freedom for Indians.

Indian and European: Indian-White Relations from Discovery to 1887

By D'ARCY McNICKLE

Abstract: When the American continent was settled by Europeans, they saw as a mission the conversion of the natives into Europeans. Needing their friendship and aid they treated them as free men, true owners of the land, but failed to understand their concept of land use and tenure. A policy of fair dealing soon faced the inexorable facts of a rapidly growing white population eager for land. The westward movement pushed the Indian farther and farther away from the Atlantic shore. Their land boundaries were no longer inviolate and with the Dawes Act of 1887, the final invasion of Indian homelands began.—Ed.

IT is a source of continuing surprise that the American Indians have not adjusted their lives to the national life, that their special problems persist, and that their ethnic identity does not dissolve. This surprise is not limited to the uninformed person who rarely has occasion to concern himself about such matters, but is particularly experienced by individuals who have an occupational interest in the fate of the American Indian: administrative officials, educators, legislators, missionary workers, and the like.

A review of the historical relations between the first inhabitants of the Western Hemisphere and the later coming Europeans may have an uncommon importance in our day, if in reconstructing this past we can identify and describe not the events alone but the attitudes and passions and judgments which lay behind the events. The value would consist in helping us to see ourselves as other people have seen us, and from our own performance—especially its failures—learn to improve our methods in the field of human relations. The pres-

ent review must be brief, but it can be suggestive.

THE PERIOD OF DISCOVERY

It was a fateful concurrence that the New World should be discovered at a time when Europe was awakening from its long medieval sleep and moving in many directions simultaneously to assert the mastery of Western man. In a single lifetime (1450–1520) spanning Columbus' momentous voyages, the printing press came into use in Europe, making it possible, in time to come, to spread knowledge to the masses; seafaring men overcame their fear of unknown land and water and pushed exploration westward into the Atlantic and southward along the coast of Africa; humanist scholars were translating the lost literature of classical Rome and Greece; and the Protestant Reformation was in full motion. In such events, and in others that preceded and followed, were the makings of the modern world.

What was beginning to emerge and

D'Arcy McNickle, Boulder, Colorado, member of the Flathead Tribe of Montana, and for sixteen years staff member of the Bureau of Indian Affairs, is Director of American Indian Development, a privately financed project devoted to leadership training and group development in a Navaho community.

would be more clearly defined in the years during which discovery and settlement progressed in the Americas, was a European society—varying in detail from country to country, but intrinsically similar—based on a belief in the perfectability of man. Exploration, invention, and discovery, working to reinforce each other, and to refute and confound an older society of static values, opened European minds to the idea of progress along an upward curve of goodness and happiness. It was a new idea in the world, a sharp departure from an earlier notion that man had been perfect in the past, in the Garden of Eden, and had fallen from grace; or from the still earlier belief that man moved through a series of descending phases from a golden age to barbarity, and back again.

In time the new belief would be vulgarized by equating progress with increased material conveniences and comforts, but in its beginnings it grew from a concern for the moral improvement of mankind, a seeking after heaven on earth, or (in the Calvinist interpretation) a seeking to be among the elected few who would find heaven hereafter. And it was more than an emotional out-reaching, for it had behind it the solid thinking of men like Francis Bacon, Descartes, Newton, and Locke: men who demonstrated the uses of reason in examining and explaining the physical world. "It was reason that would lead man to understand nature and by understanding nature to mold his conduct in accordance with nature."¹

MEN WITH A MISSION

Thus, the men who came out of Europe into what they pleased to call the New World were men with a mission.

¹ Crane Brinton, *The Shaping of the Modern Mind* (New York: New American Library, 1953), p. 121.

The mission might be secondary to their immediate needs of security, but it was never wholly absent and at times it was of dominating interest in the actions of individual settlers. The nature of the mission was variously phrased, but essentially it amounted to an unremitting effort to make Europeans out of the New World inhabitants, in social practices and in value concepts.

One of the first orders of the Spanish monarchs, Isabella and Ferdinand, to Ovando, first governor of The Indies (1501), was to require the Indians to be brought together in towns. "Each Indian was to be given a house of his own for his family and a farm for cultivation and cattle raising. . . . The Indians were to be persuaded to go about dressed, like 'reasonable' men. . . . The Indians were to be persuaded to abandon their ancient evil ways, 'and they are not to bathe as frequently as hitherto, as we are informed that it does them much harm.'"²

The mission theme is clearly stated by the Englishman, Robert Gray, in his *A Good Speed to Virginia* (1609): ". . . It is not the nature of men, but the education of men, which makes them barbarous and uncivil, and therefore change the education of men, and you shall see that their nature will be greatly rectified and corrected; seeing therefore men by nature so easily yield to discipline and government upon any reasonable shew of bettering their fortunes, it is every man's duty to travel both by sea and land, and to venture either with his person or with his purse, to bring the barbarous and savage people to a civil and Christian kinde of government, under which they may learn how to live holily, justly, and soberly in this world, and to apprehend the

meanes to save their soules in the world to come. . . ."³

IMPACT ON THE INDIANS

Wherever Europeans settled in the Indian world changes occurred, in living habits, in the use of tools and weapons, and in some nonmaterial practices. In the northern regions hunting tribes were induced to change from a subsistence to a commercial type of hunting, even though, with the greater killing power of the weapons they obtained from European traders, they threatened their own basis of livelihood. When beaver disappeared from northern New York and the Iroquois nations faced a total loss of a rich trade and the political power to which they were accustomed before the arrival of the Europeans, they turned to violence as a means of compelling the tribes farther west to bring their furs into Iroquois country rather than to Canada. "The great role of the Iroquois was that of middlemen between the 'far Indians' and the English, a role which enabled them not only to obtain material benefits, but to retain that position of superiority over the Indians of the eastern half of the United States which they . . . could no longer hope to hold by mere force alone, since their fighting men had so diminished in numbers and their enemies had obtained weapons as good as their own."⁴ Thus the long effort of the Iroquois people to build a League of Peace was destroyed in competition for the material goods which were part of

³ Quoted in: Roy Harvey Pearce, *The Savages of America* (Baltimore: Johns Hopkins Press, 1953), p. 10.

⁴ Peter Wraaxall, *Wraaxall Abridgment of the New York Indian Records, 1768-1751* edited by Charles H. McIlwain. Harvard Historical Studies, No. 21 (Cambridge: Harvard University Press, 1915), p. xlii. See also George T. Hunt, *Wars of the Iroquois* (Madison: University of Wisconsin Press, 1940).

the cultural baggage of the incoming white man.

EUROPEANS' MISUNDERSTANDING OF INDIAN WAYS

The efforts by Europeans to modify Indian practices with respect to land use and tenure profoundly influenced the relationship between the two races. Attitudes toward Indian rights of occupancy often reflected either total lack of knowledge or erroneous understanding of Indian custom. A common assumption was that the Indians were too primitive to have developed a property system. Thus, the Reverend Richard Hakluyt described them as "more brutish than the beasts they hunt, more wild and unmanly than that unmanned wild country, which they range rather than inhabit."⁵

Even more common was the notion that the Indians were hunters to the exclusion of all other occupations, a notion that gave comfort to those settlers who regarded agriculture as a higher use of land and so justified themselves when they encroached upon Indian lands. Some of the first settlements were located in areas of such low fertility that as a practical matter they might have been reserved for hunting only; yet wherever soil, moisture, and growing season permitted, the Indian inhabitants planted fields of corn, beans, squash, and tobacco. The passengers who went ashore from the *Mayflower* to settle on the Massachusetts coast found the Indians fertilizing the ground with the fish (alewives) that ran so plentifully in the early spring: "You may see in one township a hundred acres together set with these fish, every acre taking a thousand of them; and an acre thus dressed will produce and yield so much corn as three acres without

⁵ Quoted in Pearce, *op. cit.* (note 3 *supra*), p. 7.

fish."⁶ The place they chose for settlement was "a high ground, where there is a great deal of land cleared, and hath been planted with corn three or four years ago . . . and on the further side of the river also much corn ground [has been] cleared."⁷

Agriculture, like hunting, was for subsistence, hence operations were planned to meet the needs of consumption and to provide reserves against a lean year; but they were not on a scale to provide surpluses for commercial exchange or foreign export.

When European settlers encountered the Indians and dealt with them as if they were members of European political communities, they did so, in part, under the moral persuasion of their times. This moral concept was variously phrased, and in Spain it took the form of advice which Francisco de Vitoria prepared for the Emperor Charles V: That the Indians, though "unbelievers," were the true owners of their land; were entitled to their own customs and government; and might not be enslaved or despoiled of their property unless they should be so inconsiderate as to war against the Spaniard.⁸

THE BIBLE AS GUIDE

In the English-speaking countries, no individual spoke out so clearly and so specifically on the rights of the Indians, yet sentiments like those expressed by Vitoria were current by the beginning of the seventeenth century. An English phrasing of the moral principle might be taken from the first letter of

instructions from the Massachusetts Bay Company to Captain John Endecott (1629), in charge of the colonizing group sent out by the company: "Above all, we pray you to be careful that there be none in our precincts permitted to do any injury, in the least kind, to the heathen people; and if any offend in that way, let them receive due correction . . . if any of the savages pretend right of inheritance to all or any part of the lands granted in our patent, we pray you endeavor to purchase their title, that we may avoid the least scruple of intrusion."⁹ On occasion, the Bible itself was cited as authority for policy in dealing with the Indians, as in the case of a Virginia statute (1633) quoting Genesis, Chapter I, verse 28 ("And God blessed them, and God said unto them, Be fruitful, and multiply, and replenish the earth, and subdue it"), also Psalm CXV, verse 16 ("The heaven, even the heavens, are the Lord's: but the earth hath he given to the children of men"). This Virginia statute then provided that "what lands any of the Indians in this jurisdiction have possessed and improved, by subduing the same, they have just right unto"; while grants made to Englishmen, according to the act, were also based on the authority of Genesis, and on "invitation of the Indians." The last phrase would suggest that the Bible alone was not deemed a sufficient warrant for Englishmen to assume possession of Indian lands, unless there was Indian consent.¹⁰

Practices varied in the English colonies, but generally the first settlers negotiated with the Indians and, though there may not have been a meeting of

minds, a friendly exchange took place. The Europeans thought they were "purchasing" a title, the Indians as certainly thought they were performing their duty toward a stranger by sharing hospitality with him.

There were other considerations involved in these transactions. European law-ways required a man to have a piece of paper to show ownership; it was as important that this piece of paper change hands as it was that the real property pass from one to another. Even in the case of venturing companies to which grants of territory had been made by ruling heads of government (as in the case of Lord Baltimore and William Penn), the Europeans took the precaution of paying the Indians for the land, thus acquiring documentary title which other Europeans would recognize.

The consideration which probably overshadowed all of these, in determining the behavior of the first Europeans toward the Indians, was the very practical one of winning and keeping the good will of the tribes. It was a consideration which dominated much of the policy of individual colonies, and it continued to have critical importance in the policy of the United States until at least through the War of 1812.

BEGINNINGS OF A POLICY

The evolution of a policy which would meet at once the various needs and demands of the Indians as well as the requirements of the several colonies, was never completed by the British government, although the elements of such a policy had been under discussion for more than twenty years prior to the American Revolution. From the early days of settlement until the middle of the eighteenth century, each colony was allowed to deal directly with the Indians within its borders. Most of the colonies indeed had adopted measures

designed to regulate trade and land purchases. But practices between the colonies varied so greatly and the administration of their own rules was often so inadequate that Indians complained of their treatment and either threatened or actually resorted to armed resistance. In addition to these proper grievances, the French in Canada and in the West lost no opportunity to aggravate the fears of the Indians by insisting that the English would not be satisfied until they had completely removed the Indians. The French had not been colonizers, but had been satisfied to trade and to build fortified posts to thwart competition. Hence, they could assure the Indians that they were not competing with them for the land.

MEETINGS AND DECISIONS

One of the first efforts of the British to effect a consolidated policy for the American colonies was the calling of the Albany Congress in June 1754. The conference was attended by the governors of New York, Virginia, Maryland, Pennsylvania, New Jersey, New Hampshire and Massachusetts, under instructions of the British Board of Trade. Specifically, the colonies were directed to complete an agreement for a joint management of Indian affairs. Instead of working out such a plan, the representatives of the several colonies drafted a plan of union providing for a representative council or legislature, and an executive to be appointed by the Crown. The plan was rejected by the several colonial assemblies and rejected even more firmly by the home government, which then proceeded to appoint two officials, one for the northern tribes and one for the southern, and placed in their hands authority to exercise political control in Indian matters, leaving the control of trade in the separate colonies. The defeat of General Braddock (July 1755), recently appointed

¹⁰ Charles C. Royce, "Indian Land Cessions in the United States," *Eighteenth Annual Report of the Bureau of American Ethnology*, Part 2 (Washington: U. S. Government Printing Office, 1899), p. 602.

Commander in Chief of colonial troops, spurred the British to further efforts to bring order and responsibility in Indian affairs. Even more disturbing to the British ministers was Pontiac's success in achieving an alliance of the tribes in the Great Lakes-Ohio River Valley and the capture of the line of forts leading into the Northwest.

The growing crisis resulted in the issuance of the Royal Proclamation of October 7, 1763. The proclamation dealt with a number of questions, but of chief interest are its declarations on the relations of Europeans and Indians in the New World. These may be summarized as: (1) The Indians have a right to be protected in the peaceful possession of their lands, (2) Definite boundaries should be established and recognized, beyond which no settlement should occur except by mutual consent of the Indians and the King's representatives, and (3) Persons settled upon Indian lands the title to which had not been ceded by the Indians were ordered to be removed.

Even before the issuance of the proclamation negotiations with the Indians south of the Ohio River had established a boundary line between Indian holdings and the colonial settlements; negotiations were now entered into with the northern tribes, and by October 1768 a line had been agreed upon running from the eastern end of Lake Ontario all the way to the Gulf of Mexico in northwest Florida. This boundary, by agreement with all the tribes affected (some twenty-five or thirty in number) and representatives of the several colonies, was offered as a barrier against any further settlement westward except as the tribes might consent.

FAILURE OF PLAN

What the British did not succeed in achieving was the means of enforcing these agreements. Having failed to es-

tablish centralized control over Indian affairs and having no funds to pay the costs of such a centralized agency, the government had to fall back upon the several colonies to provide police power. By December 1773 it was reported that not less than sixty thousand people had settled between Pittsburgh and the mouth of the Ohio River, and the Iroquois complained bitterly that "the provinces have done nothing and the trade has been thrown into utter confusion by the traders being left to their own will and pleasure and pursuit of gain, following our people to their hunting grounds with goods and liquor."¹¹

TRANSFER OF RESPONSIBILITIES

United States policy in its beginnings had the same problems to meet as those which the British had faced and failed to solve. Generally, these were problems of understanding, or the lack of it; they stemmed from the inflexible habit of expecting Indians to act like Europeans.

The moral law, or natural law, which Europeans cited as the basis of Indian rights in the land, was itself the creation of European minds. The formal procedure of negotiated purchase had a legal meaning for Europeans which had no counterpart in Indian society. Land was not merchantable, in the European sense, among any of the North American tribes. Individual right of occupancy and use was recognized and protected, and under given conditions trespass could be punished; boundary lines

Mohr, *Federal Indian Relations, 1774-1788* (Philadelphia: University of Pennsylvania Press, 1933); and Helen Louise Shaw, "British Administration of the Southern Indians, 1756-1783," a dissertation presented to the faculty of Bryn Mawr College, 1931.

were respected, as between tribes, and between clans or other groupings within a tribe.¹² Such concepts were the cultural results of experiences which differed from the experiences of European men, concepts that were designed to serve a different kind of social purpose. They explain why it was that, in effort after effort, the early Indians tried to drive the settlers off land which previously they had "sold"; why tribes sometimes turned upon certain of their own headmen and destroyed them for giving away what belonged to the whole group; and they explain what lay behind the appeal of the Ohio River tribes, writing to the government at Washington in the winter of 1786: "Brothers: We are still of the opinion . . . that all treaties carried on with the United States, on our parts, should be with the general voice of the whole Confederacy (of tribes). . . . Any cession of our lands should be made in the most public manner, and by the united voice of the Confederacy. . . . Brothers: Let us pursue reasonable steps; let us meet halfway . . . we beg that you will prevent your surveyors and other people from coming upon our side of the Ohio River."¹³

THE INDIAN POSITION

If the Indians were to maintain their cultural integrity, and that was what they were demanding (the British had promised to protect this right on the eve of the Revolutionary War, and as a result of that promise Joseph Brant led his Mohawk people to the side of the British), it was essential that a boundary line be maintained. The At-

¹² Indian practices regarding land use and ownership are presented in numerous ethnological studies, particularly those of John M. Cooper, Loren C. Eiseley, Eleanor Leacock, Julius Lips, and Frank G. Speck.

¹³ *American State Papers*, Class II, Indian Affairs, Vol. I (Washington: Gayles and Seaton, 1831), pp. 8-9.

lantic coast had been such a boundary, at the beginning of the seventeenth century, between Europe and the Indian world. That barrier had been breached in a series of transactions which held certain meanings and served certain purposes for the European settlers; the same transactions carried quite different meanings for the Indian people and, for them, served no useful purposes. The result, after seven generations, was that the Indians found themselves in a position where they had to insist on fending off the incoming white man. Their continued existence, they thought, depended on it.

THE NEW MASTER

At the outset, the United States government tried with some firmness to adhere to the policy promulgated by the British government: a policy of recognizing Indian boundaries and providing legal machinery for the peaceful liquidation of those boundaries. Henry Knox, first Secretary of War under the Constitution and the first federal official in charge of Indian affairs, stated the position on June 15, 1789: "By having recourse to the several Indian treaties, made by the authority of Congress, since the conclusion of the war with Great Britain, it would appear that Congress were of the opinion, that the treaty of peace of 1783 absolutely invested them with the fee of all the Indian lands within the limits of the United States; that they had the right to assign, or retain such portions as they should judge proper.

"But it is manifest, from the representations of the confederated Indians at the Huron Village, in December 1786, that they entertained a different opinion, and that they were the only rightful proprietors of the soil; and it appears by the Resolve of the second of July 1788, that Congress so far conformed to the idea, as to appropriate a

sum of money solely to the purpose of extinguishing the Indian claims to lands they had ceded to the United States, and for obtaining regular conveyances of same. . . .

"The principle of the Indian rights to the lands they possess being thus conceded, the dignity and interest of the nation will be advanced by making it the basis of the future administration of justice towards the Indian tribes."¹⁴

A CHANGING WORLD

In the colonial period, it had been taken for granted that Indians would accept European ways and incorporate them into their own lives. They needed only the opportunity; and missionaries, educators, and statesmen labored mightily to make this opportunity clear and visible to the Indian people. Many strong souls, rapt in their vision of the beatitude of European institutions, accepted martyrdom at the hands of what seemed callous and unworthy savages (actually, men who valued life in their own way, who pursued quite different objectives) to bring Europe into the New World. As the colonial period closed, the mood changed. Possibly there were still as many men who believed Indians could be educated—that is, civilized—but their numbers were swallowed up in the waves of population that rolled westward after independence had been won. Moving westward, meant progress, growth, greatness.

A recent writer summarizes the changing situation: "The American solution [to the problem of the savage] was worked out as an element in an idea of progress, American progress. Cultures are good . . . as they allow for full realization of man's essential and absolute moral nature; and man realizes this nature as he progresses historically from a lesser to a greater good, from the sim-

ple to the complex, from savagism to civilization. . . . The Indian was the remnant of a savage past away from which civilized men had struggled to grow. To study him was to study the past. To civilize him was to triumph over the past. To kill him was to kill the past."¹⁵

Evidence for the manner in which these ideas came into American thinking will be found, for example, in the oration of John Quincy Adams before the Sons of the Pilgrims, December 12, 1802: "There are moralists who have questioned the right of the Europeans to intrude upon the possessions of the aborigines in any case and under any limitations whatsoever. But have they maturely considered the whole subject? The Indian right of possession itself stands, with regard to the greatest part of the country, upon a questionable foundation. Their cultivated fields, their constructed habitations, a space of ample sufficiency for their subsistence, and whatever they had annexed to themselves by personal labor, was undoubtedly by the law of nature theirs. But what is the right of a huntsman to the forest of a thousand miles over which he has accidentally ranged in quest of prey? Shall the liberal bounties of Providence to the race of man be monopolized by one of ten thousand for whom they were created? . . . Shall the lordly savage not only disdain the virtues and enjoyments of civilization himself, but shall he control the civilization of a world? . . . No, generous philanthropist!"¹⁶

METHODS AND DEVICES

In the forty-odd years between the enactment of the Northwest Ordinance of 1787 and Andrew Jackson's Second Annual Message, delivered December

¹⁵ Pearce, *op. cit.* (note 3 *supra*), pp. 48-49.

¹⁶ Royce, *op. cit.* (note 10 *supra*), p. 536.

6th, 1830, the United States moved away from the potential which was inherent in colonial attitudes, of allowing the Indian people a chance to maintain their integrity as a people. Boundaries could be in the minds of a people; they might not hold the Appalachian watershed, but they could still hold to a system of values they understood. They did not ask to remain static, but to grow into new conditions, as they became ready, while retaining their dignity in their own eyes. From the latter date onward, it became a question of how soon, and by what devices, the extinguishment of the Indian past would be effected.

In its Indian provisions, the Northwest Ordinance read: "Article III. . . . The utmost good faith shall always be observed towards the Indians; their land and property shall never be taken from them without their consent; and in their property, rights, and liberty, they never shall be invaded or disturbed, unless in just and lawful wars authorized by Congress; but laws founded in justice and humanity shall from time to time be made, for preventing wrongs being done to them and for preserving peace and friendship with them."

Here, once again, was the promise of fair dealing which Europeans since Francisco de Vitoria had urged as policy, which the British actually adopted but could not enforce; and now the United States had accepted it, and in its turn would discover that it had not the means of carrying it into force. The reasons it could not carry it into force are the real subject matter of President Jackson's Second Annual Message, though he appears to talk about other considerations. He said: "Humanity has often wept over the fate of the aborigines of this country, and Philanthropy has been long busily employed in devising means to avert it, but its progress has never for a moment been arrested, and one by

one have many powerful tribes disappeared from the earth. . . . But true Philanthropy could not wish to see this continent restored to the condition in which it was found by our forefathers. What good man would prefer a country covered with forests and ranged by a few thousand savages to our extensive Republic, studded with cities, towns, and prosperous farms, embellished with all the improvements which art can devise or industry execute, occupied by more than twelve million happy people, and filled with all the blessings of liberty, civilization, and religion?"¹⁷

Some months previously (May 28, 1830), President Jackson had signed the Indian Removal Act, which placed in the hands of the President authority to remove all Indians west of the Mississippi River. The proposal had been under discussion and indeed had been hotly debated for several years. Passage of the measure was precipitated finally by actions taken by the state of Georgia.

The state had insisted since its establishment that the United States purchase the lands occupied by Indian tribes (Creeks and Cherokees) within her borders. Some purchases had been made, but the time came when these Indians refused to sell any more of their land, on the grounds that they needed it for their own existence. Georgia retaliated against the Cherokees by enacting legislation which extended her laws over the Cherokee nation. The Cherokees challenged the right of Georgia to assume such jurisdiction, and in two famous cases (*Cherokee Nation vs. Georgia* and *Worcester vs. Georgia*) tested the ability and the willingness of the United States to protect an Indian tribe in its efforts at self-determination.

¹⁷ James D. Richardson (Ed.), *A Compilation of the Messages and Papers of the Presidents, 1789-1897*, Vol. 2 (Washington: U. S. Government Printing Office), pp. 520-21.

¹⁴ *Ibid.*, pp. 12-14.

The Cherokees lost, not because their cause was wrong, but because of a defect in the American system of government. The Supreme Court, with Chief Justice Marshall writing the opinion, held that the State of Georgia had no authority to extend its law over the Cherokees and therefore its action was a nullity. Georgia chose not to recognize the opinion, and the President of the United States refused to be disturbed by Georgia's position.¹⁸

The Removal Act of 1830 was a discretionary act, authorizing the president (not directing him) to negotiate treaties with the eastern Indians, the treaties to provide the following: lands would be offered west of the Mississippi; payment would be made for lands and improvements relinquished in the east; title to the new lands would be guaranteed in perpetuity, or so long as the tribe should exist; the right of self-government would be respected. The removal was to be based on agreement, but when the Cherokees and the Seminoles attempted to exercise the choice of remaining, they were answered with the United States Army; forced removal followed.

After 1830, Indian tribes continued to be moved, some of them three or four times, like inanimate pieces on the checkerboard of the nation's destiny. A writer has observed: "For a time the scheme of moving the Indians to lands west of the Mississippi seemed to offer a practical solution to their problem. Jedidiah Morse believed that the Indians possessed the capacity for making progress in the arts of civilized life if only they were given government aid and an education. . . . However, in most of the arguments for the removal

of the Indian tribes . . . the emphasis was placed on the advantages to the white man which would result from the displacement of the noble savage, and the idea of progress was invoked . . . to give a rationalization of inevitable justice to the forced migration."¹⁹

The decision by Congress in 1871, in the form of a rider to an appropriation act, that "Hereafter no Indian nation or tribe within the territory of the United States shall be acknowledged or recognized as an independent tribe or power with whom the United States may contract by trading," followed logically on the events that have been reviewed here. It was the recognition of a reality, that Indian friendship and support were no longer needed by the nation.

THE UNKINDEST CUT

It is fitting to close this brief review with mention of the General Allotment Act, also called the Dawes Act, of February 8, 1887. Here, again, was permissive legislation authorizing the President of the United States, in his discretion, to divide an Indian reservation into individual holdings, assign a parcel of land to each man, woman and child, and declare all remaining land surplus to the needs of the Indians. The "surplus" lands were then opened for homesteading and paid for at \$2.50 per acre, as and when the lands were taken up by homesteaders. By this and other devices contained in the Act, the Indians were relieved of some ninety million acres, or almost two-thirds of their land base, between the years 1887 and 1930. Without cost to itself, the federal government thus transferred large acreages from Indian to white ownership, even requiring the tribes to pay the costs of surveying and allotting. In every case

¹⁸ The events in Georgia are carefully detailed in U. B. Phillips, "Georgia and State Rights," *Annual Report of the American Historical Association*, 1901, Vol. 2 (Washington: U. S. Government Printing Office).

¹⁹ Arthur A. Ekirch, *The Idea of Progress in America, 1815-1860* (New York: Columbia University Press, 1944), p. 41.

where allotment was carried out, the Indian tribe objected; and in most cases the lands were covered by treaties in which the United States obligated itself to protect the tribe in its right of possession.

In the speeches in support of the bill while it was pending in Congress, are echoes of that sense of urgent mission which Europeans carried with them into the new world; which moved Queen Isabella and King Ferdinand to insist that the Indians be persuaded to dress up and to bathe less frequently, and led Robert Gray in 1609 to believe that the right education was all that was needed to make a European out of an Indian.

Now, in the 1880's, arguing for the legislation which would become the General Allotment Act, Senator Pendleton of Ohio declared: "They must either change their mode of life or they must die. We may regret it, we may wish it were otherwise, our sentiments of humanity may be shocked by the alterna-

tive, but we cannot shut our eyes to the fact that that is the alternative, and that these Indians must either change their modes of life or they will be exterminated. . . . In order that they may change their modes of life, we must change our policy. . . . We must stimulate within them to the very largest degree, the idea of home, of family, and of property. These are the very anchorages of civilization; the commencement of the dawning of these ideas in the mind is the commencement of the civilization of any race, and these Indians are no exception."²⁰

In the heat of such a discussion, it would not have occurred to any of the debaters to inquire of the Indians what ideas they had of home, of family, and of property. It would have been assumed, in any case, that the ideas, whatever they were, were without merit since they were Indian.

The Legal Aspects of Indian Affairs from 1887 to 1957

By THEODORE H. HAAS

Abstract: As the westward movement of the population proceeded, the demand for the Indians' land increased. Cultural assimilation became the slogan. "Americanized" Indians would be transformed from hunters and fishermen to farmers and cattlemen, communal ownership would yield to individual ownership, plenty of the tribal lands would be freed for white settlement. The culmination of this policy was the General Allotment Act of 1887. Another step toward integration was the Citizenship Act of 1924. The character and the effects of these policies are detailed by the author.—Ed.

HUNGER for Indian land and other resources has been the most important cause of many early conflicts between Indians and whites and federal and state governments.¹ Congress enacted the Indian Removal Act of 1830² under pressure from the states and with the active support of Andrew Jackson, the first President elected by popular vote and the first from the West. The removal policy was justified on the grounds that segregation would end the conflict between the races and that land would be provided for white settlement in the East. In exchange the Indians would be provided with land in the western territory where they would not be disturbed.

The land hunger was appeased but not satiated. As the settlement and development of the West gathered mo-

¹ "From the first discovery of America to the present time, one master passion common to all mankind, that of acquiring land, has driven, in ceaseless succession, the white man on the Indian." Statement by James Barbour, Secretary of War in 1826, to Chairman, House Committee on Indian Affairs (Nineteenth Congress, First Session (1825)), H. Doc. 102, p. 5.

² Act of May 28, 1830, 4 Stat. 411.

mentum in the 1880's, the remaining Indian lands were demanded. They consisted in 1887 of some 139,000,000 acres of land west of the Mississippi River, where virtually all Indian tribes under the Government's protection lived on some diminished areas called "reservations."³

As with the removal policy, ethical justification was soon found for the enactment of laws which would reduce the Indian land holdings and also achieve the new objective of the rapid assimilation of the Indian. A popular theme, the white man's burden to uplift native people, was given a theoretical base by interpretations of Darwin's view of the evolution of man and Spencer's of the evolution of society. Soon additional arguments would come from the advocacy of the submersion of the varied cultures of immigrants into an American way of life. To attain this conformity, it was, of course, necessary to destroy Indian cultures, which rested not only on different religions and lan-

³ Indian lands reached a peak of 150,000,000 acres in 1873. Oliver La Farge, *As Long as the Grass Shall Grow* (New York: Alliance Book Company, 1940), p. 30.

guages, but also on tribal organizations with their indigenous systems of communal ownership of land. All that was necessary to assimilate and make self-supporting quickly the slightly more than a quarter of a million Indians was to transform them from hunters and fishermen into farmers and cattlemen. By dividing the tribal estate among the members, they could gain the benefits of private or individual property.⁴ Since the new way of life would not require the use of as much land as the savage economy did, unneeded or surplus land would be available for white purchase and occupancy.

THE DAWES ACT

The policy found its expression in the General Allotment Act of 1887,⁵ sometimes called the Dawes Act, which became the keystone of federal Indian policy until the 1920's.⁶ Its momentum was largely lost by 1922 as a result of two unsuccessful attempts to expedite the fragmentation and alienation of Indian lands.⁷ The first was a campaign launched in 1917 to force the fee patenting of allotments, a method which was declared illegal by the courts. The second was an attempt of the Secretary of the Interior to secure the enactment of the Bursum Pueblo Bill which would transfer the Pueblo land titles to white squatters, and of the Indian Omnibus

⁴ Thus the Indian like the successful homesteader would attain economic independence and the ideal of a family farm.

⁵ Act of February 8, 1887, 24 Stat. 388. For the Act's background see Felix S. Cohen, *Handbook of Federal Indian Law* (Washington: U. S. Government Printing Office, 1945), pp. 206 ff.

⁶ Laurence F. Schmeckebier, *The Office of Indian Affairs: Its History, Activities and Organization* (Baltimore: Johns Hopkins Press, 1927), pp. 78-90. Some tribes were excepted from the Dawes Act, but most of them were covered by similar special laws.

⁷ Joseph B. Gittler (Ed.), *Understanding Minority Groups* (New York: John Wiley & Sons, 1956), pp. 42-43.

Bill of 1923, which would provide for the loss of all Indian property with a special status.

The Dawes Act authorized the individualization of the reservation lands to the tribal members whenever the President believed that the land might be utilized advantageously for agricultural and grazing purposes. The head of a family was to be allotted 80 acres of agricultural land or 160 acres of grazing land; and a single person over eighteen or an orphan child under eighteen, one-half of this amount. The United States retained title to the land until the expiration of a trust period of twenty-five years, or longer, if the President deemed an extension desirable. Then, the allottee was to secure a patent in fee; to be able to dispose of the land as he wished; and to be subject to the laws of the state or territory where he resided. The proceeds of the sale of surplus or land not needed for allotment were to be covered into the United States Treasury for the sole use of the tribe which had owned the land, and, together with interest at 3 per cent per annum, were to be subject to appropriation by Congress for the education and civilization of the membership.

Citizenship was granted to any Indian who had voluntarily taken up residence within the territorial limits of the United States apart from his tribe and adopted the habits of civilized life and to an allottee as soon as he received a paper, improperly called a patent, showing that at a future time he would secure a regular patent conveying the fee or full title.⁸ Among the various amendments which were subsequently made to the Dawes Act were the following: citizenship was deferred until the expiration of the trust period; provisions were made for the lease, sale, and condemnation of allot-

⁸ See *United States v. Rickert*, 188 U. S. 432 (1903); *Monson v. Simonson*, 231 U. S. 341, 345 (1913).

ments under administrative supervision; for the issuance by the Secretary of the Interior of a certificate of competency to an Indian which would permit him to dispose of trust or restricted property; and for the protection of allotted lands from any charge or encumbrance because of any debt of the allottee. Supplementary legislation provided for the apportionment of tribal funds among the members.

TAXATION

The General Allotment Act also had a marked effect on taxation. The original tribal land was exempt from state property taxation, and allotted land became subject to such tax when the patent in fee was granted. As in all other important questions of Indian law, much litigation has been necessary to interpret treaty and statutory provisions related to taxes. In 1956 a decision of the Supreme Court held that income derived from the sale by the federal government of standing timber on allotted lands was exempt from the federal capital-gains tax.⁹ Chief Justice Warren stated that the purpose of the allotment was to protect the Indians' interest and to prepare the Indians to take their place as independent, qualified members of the modern body politic, and to this end it is necessary to preserve the trust land and income derived directly therefrom. The Chief Justice concluded that it would be unreasonable to infer that Congress intended by enacting the income tax law to destroy the tax exemption afforded by the General Allotment Act, since such action would be a sorry breach of faith with the Indians. The importance of this decision is demonstrated by the fact that there are more than 100,000 tracts of individually owned Indian land totaling about 13,000,000 acres held in trust by the government,

⁹ *Squire v. Capoeman*, 351 U. S. 1 (1956).

most of which were allotted under the 1887 statute.

The widespread belief that Indians pay no taxes is one of the many myths concerning Indians.¹⁰ The area of Indian tax exemption has been confined by legislation and litigation to a narrow range. With a few exceptions Indians are now subject to the same taxes as non-Indians. The most important exception is the exemption from real property taxes of Indian land, which is protected by an express exemption in a federal treaty or statute, or by the taking of legal title to the land in the United States, as in the case of allotted land.¹¹

The members of certain tribes, including the Five Civilized Tribes, which were excluded from the General Allotment Act, were granted title to much of their lands in fee simple, subject to a restriction on alienation without the consent of the Secretary of the Interior. The purpose of keeping the land in a restricted status was the same as the retention in trust of lands divided under the General Allotment Act—the protection of the Indian from the loss or unwise use of his property. The sale or lease of these lands was also restricted. The Indians and the government officials concerned thought that these purchased tracts had the same status as Indian lands in which title remained in the federal government, and that tax exemption always accompanied restricted property, but the Supreme Court held the land and its income taxable because of the absence of an express tax exemption.¹²

One of the two references to Indians

¹⁰ The status of being an Indian does not create an immunity from the levy of the federal income tax. *Choteau v. Burnet*, 283 U. S. 691 (1931).

¹¹ Land subsequently purchased by the tribe which is not taken by the United States in trust is taxable.

¹² *Oklahoma Tax Commission v. United States*, 319 U. S. 598 (1943).

in the Constitution has become obsolete. Article 1, section 2, requires the exclusion of "Indians not taxed" from the decennial population count used in apportioning the number of representatives for a state. Beginning in 1940, the Census Bureau no longer follows its prior hoary custom, at least sixty years old, of computing by guesswork or divination the "Indians not taxed."

Allotment process

Reservations were allotted in Oklahoma, the Lake states, the Plains states, the Pacific Coast states, in fact in varying degrees almost all Indian reservations were allotted, except those in Alaska and most of those in the Southwest. Yet, despite its protective features the General Allotment Act did not fulfill the expectations of sponsors who considered the welfare of Indians. Indian men of many tribes, such as the Sioux, considered farming to be woman's work. The original acreage was usually insufficient for an economic unit, and fractionalization, due to division after the death of the allottee, usually to heirs intestate, added to the difficulty. As Senator Henry M. Teller of Colorado, a former Secretary of the Interior (1882–85), its leading opponent, predicted, most allottees soon lost their lands at bargain prices. By 1933, 91,000,000 acres or two-thirds of the Indian land base of 1887, and generally the most productive, was lost and some 90,000 Indians were landless.¹³ In the words of the task force investigating Indians for the first "Hoover" Commission,¹⁴ "If the ninety million acres lost

¹³ "Report of the Commissioner of Indian Affairs," *Annual Report of the Secretary of the Interior, 1933* (Washington: U. S. Government Printing Office), p. 68.

through the [allotment] process had remained in Indian ownership, the problem of poverty among most tribes could be solved with less difficulty and with more certainty today; and assimilation would take place at a satisfactory level with a minimum of public expense." The report also refers to

... the mistaken belief that the destruction of tribal organization and culture would bring about or at least hasten the acquisition of white "civilization." . . . People move from one base to another, and move slowly. The loss of an existing base before the new base has been consolidated means simply frustration and degeneration. The destruction of Indian tribal government, the liquidation of tribal organization and tribal property, and the hostility to all Indian ways and culture that characterized so much of Government policy now appear to have been a mistake which defeated rather than furthered the Government's ultimate objectives.

Effects of General Allotment Act

The significance of the General Allotment Act extends beyond its impact on Indian land. The law was passed over the strenuous objections of most Indians. Hence, it disregarded the principle of bilateralism or mutual agreement which had been followed in treaty making until 1871, and subsequently in the formulation of statutes. Moreover, prior laws had considered cultural differences among the numerous Indian groups, but the Dawes Act set an important precedent by imposing a uniform legal pattern for Indians generally.¹⁵ Following the new pattern of some provisions of a few prior treaties and statutes, the government henceforth bypassed to a large extent tribal organi-

¹⁵ In the 1880's a few other uniform laws of less importance were passed. While some important Indian groups, such as the Five Civilized Tribes, were excluded from the Dawes Act, most of them were soon subjected to somewhat similar laws.

zations and Indian leaders and dealt directly with individual Indians. To fill the vacuum caused by the law's weakening of the tribal governments, the authority of federal administrators over Indians was greatly expanded. This growth is evidenced by the multiplication of laws and regulations relating to Indian affairs. By 1949, Indian statutes exceeded 4,000, and by 1957 climbed toward 6,000 in number. Regulations and manual or letter instructions grew proportionately. Another effect of the law was graphically described by Theodore Roosevelt in his Presidential message to Congress of December 3, 1901. He characterized the law as "a mighty pulverizing engine to break up the tribal mass" whereby "some sixty thousand Indians have already become citizens of the United States."¹⁶

CITIZENSHIP

While prior to the Citizenship Act of 1924,¹⁷ the Dawes Act was the most important method of acquiring citizenship, there are several other general or special statutes and treaties which naturalized Indians. Indian women marrying citizens became citizens by an 1888 law,¹⁸ and a few Indian veterans in World War I were granted citizenship under a 1919 law.¹⁹ Some 125,000 native-born Indians who had not become citizens previously were made citizens in 1924. Although the contrary view was once held, it is now well settled that citizenship does not affect the authority of the government over the Indian.²⁰

As a consequence of attaining national citizenship, the Indians automatically become citizens of the state where they reside. Yet, a 1938 survey by the Department of the Interior disclosed that seven states refused to let Indians vote. By 1947, largely through the efforts of the federal government, the attorneys general of several states, and the Indians themselves, all the states with large Indian populations conceded the right of Indians to suffrage on the same basis as non-Indians, except the states of Arizona and New Mexico. In 1948, as a result of judicial decisions, these states withdrew their prohibition on Indian voting.²¹ In 1950, the Indians of Maine were denied the franchise, but this problem was corrected by legislation. In the Presidential election of 1956, the Indians of Utah living on reservations were denied the franchise by a ruling of the state Attorney General. The problem as of this writing is pending before the Supreme Court of the United States.

REPEAL OF DISCRIMINATORY LAWS

The enactment of the Indian Claims Commission Act of 1946 ended one discrimination against Indian groups, which originated almost a century earlier when the Act permitting the government to be sued on certain claims did not permit suits by Indian tribes.²² Unfair dealings in lands is the main source of such claims. Generally, judicial decisions have continued to strengthen early

²¹ *Harrison v. Laveen*, 67 Ariz. 337, 196 P. 2d 456 (1948); *Trujillo v. Garley*, D. Ct. New Mexico (1948), unreported. The Department of Justice filed briefs as *amicus curiae* in these suits. United States attorneys are required to render certain legal services to Indians by the Act of March 3, 1893, 27 Stat. 612, 631, 25 U.S.C. 175.

²² For further discussion see "Indian Claims Commission Act" in this issue of *THE ANNALS* by Nancy Oestreich Lurie.

recognition of Indian land title by virtue of aboriginal occupancy.²³

It is now well established that individual Indians may sue and be sued, make contracts, and enjoy all the civil liberties guaranteed to their fellow citizens. There is one exception to this general principle; namely, for the protection of this dependent people, Congress can and has imposed limitations on their disposal of trust or restricted property. Administrative or Congressional approval is required for the alienation of such property or the expenditure of certain trust funds. Moreover, until fairly recently, many discriminatory federal laws hampered freedom of speech and sanctioned various measures of military and civil control within the reservation boundaries. Most of these laws were repealed by the Act of May 21, 1934.²⁴ The most important and one of the oldest such laws was the Indian liquor Law, the first prohibition law of our nation. Many terms popular in the prohibition era, such as "bootlegger" and "whisky runner," originated in the illegal trade with Indians. President Thomas Jefferson, acting in response to a verbal plea by the Indian Chief, Little Turtle, recommended this law to Congress in 1802, which forthwith authorized the President to regulate the selling and distribution of spirituous liquors among the Indian tribes.²⁵ Frequent amendments to this act broadened its scope and made its enforcement easier. The most important of these

²³ Felix S. Cohen, "Original Indian Title," *Minnesota Law Review*, Vol. 32 (December 1947), p. 28.

²⁴ 48 Stat. 787. An old law prohibiting the selling of firearms to Indians was repealed by the Act of August 15, 1953, 67 Stat. 590. In almost all respects and places discriminatory practices with respect to the granting of social security benefits have ended. One exception is the crippled children's program in Arizona.

²⁵ Act of March 3, 1802, section 21, 2 Stat. 139. Cohen, *op. cit.* (note 5 *supra*), p. 352.

measures was the Act of July 23, 1892, as amended in 1938, which prohibited the sale or gift of intoxicants to Indians and their introduction into Indian country.²⁶ In 1918, the possession of intoxicants in the Indian country was made a separate offense,²⁷ but a 1948 law allowed the introduction in Indian country of intoxicants for mechanical, scientific, and medicinal purposes.²⁸

The Supreme Court several times upheld the validity of the Indian liquor law as a measure to protect Indians under the power of Congress to regulate commerce with Indian tribes.²⁹ In 1953, however, Indians were placed in the same status as non-Indians with respect to intoxicants when off the reservation, except in states which had an Indian liquor law, and the Indians were granted the right of local option with respect to their reservations.³⁰

STATE LAWS

Generally, an Indian while off the reservation is subject to state laws to the same extent as non-Indians. The United States, however, has plenary or full, though not absolute, authority over Indian affairs and has passed special laws, such as the Indian liquor law, applicable to Indians while off the reservation. Furthermore, state laws are not enforceable within the territory of an Indian tribe in matters affecting Indians unless and until the federal government

consents thereto or unless the state law aids in effectuating federal law and policy.

Since 1887, there has been a steady increase in the areas to which the Congress has granted its consent to the application of state laws to Indians. The first field in which state laws have been applied generally to Indians is inheritance. The General Allotment Act provided that after patents are issued to lands allotted to Indians, the lands shall be inherited by the heirs of a deceased Indian according to the laws of the state or territory where the land is located. State law was applied to such inheritance until 1910 when the Secretary of the Interior was granted full power to determine heirs and partition allotments, to administer the estates of the allottees, and to sell heirship lands. In 1913, the law was amended to permit an Indian to dispose of trust property, real and personal, by will or contract, approved by the Secretary of the Interior. Hence, a will, if approved by the Secretary, need not conform to state law.

By Congressional statutes the states of New York, Kansas, and Iowa have acquired jurisdiction over crimes committed by Indians against Indians on Indian reservations. North Dakota acquired the same power over one reservation. In 1953, a law granted similar jurisdiction to California, Nebraska, Oregon (except the Warm Spring Reservation), Minnesota (except the Red Lake Reservation), and Wisconsin (except the Menominee Reservation) and authorized the various other states to assume criminal and civil jurisdiction over crimes and transactions involving Indians on Indian land whenever such states wished.³¹

The federal jurisdiction over ten major crimes committed by Indians against Indians on Indian reservations, further complicates the administration of criminal law. The punishment of seven ma-

ior crimes was assumed by the federal government two years after the Supreme Court held in *Ex Parte Crow Dog* that in the absence of federal legislation granting jurisdiction to the federal courts, they could not try and punish an Indian for the murder of another Indian on an Indian reservation. The tribal governments alone had this authority.³² Three other crimes were subsequently added to the original seven crimes.³³

State laws are very important for Indians in the criminal field. In 1898, the Federal Assimilative Crimes Act made offenses by non-Indians against Indians or their property, or vice versa, punishable by the federal courts in accordance with state laws then in effect. Two of the major crimes, rape and burglary, committed by an Indian against another Indian on an Indian reservation are defined and punished in accordance with state laws. Eight other major crimes are subject to the same laws and penalties as if the offense were committed within the exclusive jurisdiction of the United States.

FEDERAL-STATE CO-OPERATION

The federal government has authorized the enforcement of the following state laws on Indian reservations: (1) sanitary and quarantine laws, under rules prescribed by the Secretary of the Interior;³⁴ and (2) compulsory school laws, with tribal consent.³⁵ Federal laws have applied also a wide variety of state laws to particular tribes and areas. For example, Oklahoma has been authorized to tax oil and gas production from Indian lands and mineral pro-

duction from the Five Civilized Tribal lands.³⁶

The most important law which provides for federal-state co-operation in Indian affairs is the so-called Johnson-O'Malley Act of April 16, 1934.³⁷ This law authorizes the Secretary of the Interior to enter into contracts with states, territories and private institutions "... for the education, medical attention, agricultural assistance, and social welfare, including relief of distress of Indians in each State or Territory, through the qualified agencies of each State or Territory." With the increase of attendance of Indians at public schools, the federal grants have increased considerably. State contracts for extension and social welfare services are also becoming more important. The Indian Bureau is in the process of transferring its extension work to the states and the Department of Agriculture. The Department of Health, Education and Welfare, to which were transferred, effective July 1, 1955, the federal government's Indian health services including authority previously exercised by the Department of the Interior,³⁸ has made several contracts with states and universities for medical attention, including health education. A 1952 law, which authorizes the transfer, with tribal consent, of federal hospital patients to state and local Indian hospitals, illustrates the increasing importance of federal and state co-operation in the rendering of Indian health services.³⁹ Contracts with universities for various research projects have been made by the Departments of Health, Education and Welfare and of Interior.

The most significant research project on Indian affairs was made by a private organization. In 1926, the Department

of the Interior invited the Institute for Government Research to make a survey of the social and economic conditions of the Indians. The report of this study, which was published in 1928,⁴⁰ helped to inaugurate a new era in Indian administration. On December 4, 1929, President Herbert Hoover took steps to implement the report by stating in his first message to Congress that the government had an obligation to raise the standard of living of Indians, to provide adequately for their health and education, and to advance their opportunity for profitable employment. There soon followed a substantial increase in appropriations for the Indian Bureau.

INDIAN REORGANIZATION ACT

Toward the beginning of the Franklin Roosevelt Administration there was enacted the Indian Reorganization Act,⁴¹ the most comprehensive law relating to Indians since the General Allotment Act. The IRA, as it is sometimes called, laid the foundation for a new Indian policy and has been hailed as a landmark in social science "because it brought to Indian affairs and to the United States Government for the first time, an explicit use of social science principles."⁴² The IRA became operative through the majority vote by members of a tribe at a formal election.⁴³ It ended the al-

³⁹ Act of April 3, 1952, 66 Stat. 935.

lotting of tribal lands and the process of terminating trust periods or periods of restricted alienability, after a fixed period of years. It also placed severe limitations on the operation of allotment in other respects.⁴⁴ It recognized the inadequacy of the Indian land base, authorized the appropriation of \$2,000,000 a year for the purchase of lands for tribes, and generally limited the disposition of restricted land to Indian tribes and their members. It also empowered tribes incorporated under the Act to make consolidations of fractionated lands, with the owner's consent, and provided for the purchase and restoration of land to Indians.

During the ensuing ten years Indian land was increased from about fifty-two million acres to more than fifty-six million acres by governmental and tribal land purchases and by the restoration of land to Indians under the Act and by supplementary legislation.

Another important feature of the IRA is that it directed the Secretary of the Interior to promulgate conservation regulations to prevent the erosion, deforestation and overgrazing of Indian lands.

Since 1948, however, there has been a resumption of the prior downward trend, accelerated by the issuance of patents in fee under the Act of May 4, 1948,⁴⁵ which authorized the Secretary of the Interior to sell individual Indian lands, and by special enabling acts.

The Act of August 9, 1955 (69 Stat. 539) greatly increased the term for which Indian-owned land may be leased.

The IRA sought to reinvigorate and stabilize the powers and organization of Indian tribes. It gave the official gov-

ernments standing by providing for the approval of constitutions and also of charters, if desired for business purposes. It vested also in tribes which adopted such constitutions the following new powers: approval or veto over the disposition of all tribal assets; the right to spend certain funds; to negotiate with the federal, state, and local governments; to employ legal counsel, only the choice of counsel and the fixing of fees being subject to the approval of the Secretary of the Interior; and to see appropriation estimates for the tribe's benefit prior to their submission to the Budget Bureau and Congress. Some of these powers were subject to various degrees of supervision by the Secretary of the Interior.

The constitutions add to, but do not detract from, the powers of an Indian tribe. The laws, customs, and decisions of tribal government control large areas of civil and criminal law, including questions of tribal membership, property, taxation, the conservation, development and use of tribal resources, social welfare, domestic relations, health, housing, inheritance, and the form of tribal government. The courts have fairly consistently upheld the Indians' right to home rule. One of the most recent decisions in this field sustained the right of the Oglala Sioux Tribe to pass an ordinance taxing a non-Indian lessee of a grazing allotment and a criminal ordinance covering offenses by Indians against Indians and enforced by the tribal court.⁴⁶

Program

The IRA authorized the establishment of a revolving credit fund which has enabled thousands of Indians to become rehabilitated by providing the means for them to apply modern technology in the

⁴⁶ *Iron Crow v. Oglala Sioux Tribe of Pine Ridge Reservation*, 231 F. 2d 89, 8th Cir. (1956).

use and development of their land and other resources. For the purpose of borrowing and lending money, many tribes adopted federal corporate business charters under the Act which enabled them to make contracts, to sue and be sued, and to relend to individual members.⁴⁷ Loans were also made to Indian credit associations and to individual Indians. While most loans have been made for agricultural, livestock, or fishing purposes, a variety of projects have been financed, including stores, salmon canneries, motels, and arts- and crafts-producing and selling organizations. In recent years, the number and amount of loans have decreased due in part to an increased availability of private credit.

The Act of March 29, 1956 (70 Stat. 62) authorized the execution of mortgages and deeds of trusts on individually owned trust or restricted land in order to stimulate an increase in such credit.

The IRA also authorized annual appropriations not exceeding \$250,000 for educational loans and directed the creation of an Indian civil service under which qualified Indians shall have the preference to appointment of vacancies in any position in the Indian Office.

The IRA encouraged cultural diversity, a part of the essence of democracy, in lieu of a pattern of Indian administration emphasizing undeviating conformity, the essence of the philosophy of communism. Each Indian group was able to administer its own assets, by leasing and conserving its land and spending some of its moneys, and to pass laws for local public services. As leases for oil, gas, uranium, and for other purposes have vastly increased the income of some tribes, several tribal councils have established revolving credit

funds with their own moneys and set up trust funds to provide college scholarships for their younger members. The total amount of tribal funds used for credit purposes now exceed the amount of federal funds so used.

Some of these functions have been performed in co-operation with federal, state, and local governments. The Indian civil and criminal laws have been influenced by federal and state laws; and their courts have granted bail, parole, probation, and suspended sentences and applied other features of modern laws. The Indians have gained experience in a transitional legal system between their unwritten laws and customs and the white man's more formalized system of justice. They have learned also of legislative and administrative procedures; written constitutions and laws; majority rule; budgets; accounting; public relations; and lobbying in the Congress, Indian Bureau, and Interior Department. They discovered too that despite differences in customs, histories, and organizations, many of the problems of one tribe are similar to those of other tribes, and that national, state, and local organizations are as necessary for Indians as for non-Indians. They gained some experience also in business organizations and methods by forming and dealing with corporations, co-operatives, and credit operations. They have been provided with stepping-stones toward more economic and governmental responsibilities through their own or other local governments.

The IRA demonstrated anew that local groups' activities help fulfill the individual's need for creativity and a feeling of worth, and that democratic methods offer the soundest way to bring people into the economic and political life of our nation of many diverse cultures and peoples. Some of the soundest ingredients of the IRA program have become a part of our foreign-aid pro-

⁴⁷ The benefits of the revolving credit fund have been extended to groups which did not adopt the IRA.

⁴⁴ Cohen, *op. cit.* (note 5 *supra*), p. 217.

⁴⁵ 62 Stat. 236. The General Services Administration in 1957 estimated that 53,100,000 acres of land was held in trust for Indians by the federal government. The Association on American Indian Affairs estimates that some 1,600,000 acres of Indian land have passed from Indian control in the last four years.

gram for underdeveloped areas. From Iran and Israel to India, Latin America, and the Philippines, former officials of the Indian Bureau are helping the people to achieve scientific and locally controlled programs. Exported technicians are thus working in some countries through IRA methods—not from the top down by bureaucratic coercion or paternalistic charity—but by a partnership with people, thus giving natives a sense of purpose, community co-operation, and human dignity.

A related law should be mentioned in passing—the Act of August 27, 1935,⁴⁸ which established an Indian Arts and Crafts Board composed of five Commissioners appointed by the Secretary of the Interior. The Board's main function is to promote the economic welfare of Indians through developing arts and crafts.

TERMINATION

It is well established that Congress has the authority to determine when the federal government shall terminate its special relationship with an Indian group⁴⁹ and when to extinguish Indian title to land.⁵⁰ A demand for expediting the termination process, which has often been linked with a demand for the liquidation of the Bureau of Indian Affairs, was especially strong in some periods of history such as the last decade of the nineteenth century and the years 1917–18 and 1922–24. Sometimes, the beneficiaries of federal services to Indians have been limited. For example, the Appropriation Act of May 25, 1918 and subsequent laws in general restricted attendance at federal schools to Indians of one-fourth or more Indian blood.⁵¹

⁴⁸ 49 Stat. 891; 25 United States Code, 1952 ed., sec. 305 ff.

⁴⁹ *Tiger v. Western Investment Co.*, 221 U. S. 286 (1911).

⁵⁰ *United States v. Santa Fe Pacific R. Co.*, 314 U. S. 339, 347 (1941).

⁵¹ 40 Stat. 561, 564.

The most recent expression of this policy was the passage in 1953 of House Concurrent Resolution 108,⁵² which declared that federal supervision should be ended as speedily as possible for the Indians of five named states and seven specified tribes located elsewhere. Subsequently, termination laws were enacted for two of these tribes, the Menominees of Wisconsin⁵³ and the Klamaths of Oregon,⁵⁴ the mixed-blood members of the Ute Tribe of Utah,⁵⁵ and a few other groups.

Contrariwise, Congress provided additional help for some Indian tribes. By the Navaho-Hopi Rehabilitation Act of 1950,⁵⁶ the appropriation of \$88,570,000 was authorized for a program to improve the educational and economic opportunities of these Indians, including relocation and resettlement, an activity which was subsequently extended to all Indians. While intensified or new functions may be assumed for tribes previously recognized, it is unlikely that new tribes will be recognized for the purposes of the federal government rendering services to them.⁵⁷

It is now apparent that since Indian groups differ widely in the degrees of their acculturation and educational, health, and economic conditions, it would be folly for the government to attempt to fit them into an identical pattern by a general law applicable to all Indian groups.

The Demography of the American Indians

By J. NIXON HADLEY

Abstract: Various estimates of the size of the aboriginal Indian population of North America exist, but there is agreement on a figure of less than a million and perhaps less than 750,000. By 1850, disease, dissipation, starvation, massacre, and maladaptation had reduced the population to a quarter million. This figure remained until 1900, but has since risen to about 400,000. Now the Indian net natural increase is higher than that for the total population of the country. The Indian population has a much higher proportion of persons under 25 years of age, which with other factors suggests that by 1975 there will be over 700,000 Indians in our country.—Ed.

A DISCUSSION of the demography of the American Indians is handicapped by the difficulties in defining who is an American Indian. To a certain extent this is a problem with any group of racially mixed ancestry and varying degrees of acculturation. The legal recognition of the American Indian as a group with special rights deriving from their aboriginal status, without the development of an over-all legal definition, makes for additional complications. Some analysis of the different totals involved under the varying definitions now used is given later, while a more detailed consideration of the problems involved in such variations has been treated elsewhere.¹ Throughout this chapter the term "Indian" unless otherwise specified will include all persons normally considering themselves a part of the Indian community, including both members of tribes not federally recognized and some persons not included in Census tallies.

¹ J. Nixon Hadley, "Problems in Determining the Indian Population of the United States," Paper presented at the Third Inter-American Indian Conference (La Paz, Bolivia, 1954).

ABORIGINAL POPULATION

The most widely quoted estimate of the aboriginal population of the United States is Mooney's figure of 849,000.² The figure is generally considered high, but except for Kroeber's lower estimate for California,³ no specific corrections have been proposed. Mooney's estimate is actually based on populations at the time of first contact with Europeans, so that data for various areas are not of the same time, but of dates varying from 1600 in New England to 1845 in the area of the upper Columbia and Snake Rivers. It is assumed that pre-Columbian population was about the same as at this period of first contact with Europeans; however, this is an unverifiable hypothesis. Certainly, the aboriginal population was less than one million

³ A. L. Kroeber, "Native American Population," *American Anthropologist*, Vol. 36, No. 1 (January-March 1934), pp. 1–25.

J. Nixon Hadley, Arlington, Virginia, is an applied anthropologist and demographer with the Public Health Service, Department of Health Education and Welfare, Washington, D. C. He is currently employed as Tribal Relations Officer for the Division of Indian Health.

people and may well have been less than 750,000.

Distribution

Using Mooney's figures except in California, Kroeber has made fairly detailed analyses of the density of the aboriginal population;⁴ the greatest concentrations of Indians were located along the Pacific Coast. He finds the area of the lower Columbia to have supported a population of 63.7 persons per 100 sq. km. and California to have had an average of 43.3. No other major geographical areas were so densely settled, although the Pueblo area is listed at 75.7 persons per sq. km., but the Apache-Navaho country surrounding them included only 2.3 persons. Other hunting areas had similar low densities: the Great Basin 2.5 and the northern Plains 2.6 persons. In the eastern United States densities were somewhat higher: the Southeast had 14.7 persons, and the Middle Atlantic 25.6 persons per sq. km.

HISTORY

The concept of the American Indian as a dying race was generally correct until the beginning of this century. By 1800 the aboriginal population, originally estimated by Kroeber at 720,000, was down to about 600,000.⁵ Fifty years later it was about 250,000.

The major causes of the decline are listed by Mooney⁶ as diseases, whiskey and attendant dissipation, removals,

⁴ *Idem*, *Cultural and Natural Areas of North America*, "University of California Publications in American Archeology and Ethnology," Vol. 38 (Berkeley: University of California Press, 1939).

starvation, and the adverse effects of unaccustomed conditions. Effects of war were minor and subsidiary to all of these.

The two major diseases affecting Indian population trends have been smallpox and tuberculosis, of which smallpox has the more dramatic historical record. For example, Schoolcraft⁷ reports that in the smallpox epidemic of 1837 the Mandan were reduced in numbers from 1,600 to 31, the Assiniboin lost whole villages, the Crow one-third of their population, while the total deaths among Plains tribes amounted to not less than 10,000 persons in a few weeks. Similar outbreaks are reported as early as 1633 for the Narraganset and as late as 1870-71 for the Assiniboin and Blackfeet.⁸ Tuberculosis has not exhibited such dramatic intensities but probably was of equal importance. Unlike smallpox, it still remains one of the major causes of death among Indians.

Other factors listed by Mooney can also be illustrated from the records. The virtual extinction of the Delawares is ascribed⁹ to their use of spirituous liquors and general dissipation. The reduction of the Indian population of California from a quarter of a million to 20,000 is chiefly ascribed to wholesale massacres perpetrated by miners and early settlers.¹⁰ The removal of the Cherokees to Oklahoma caused the death of one-fourth of the entire tribe.¹¹

For the period 1850-1900 the Indian population remained in the vicinity of 250,000. Shortly after the turn of the

century it began to rise. A number of factors were involved: the amelioration of Indian health conditions had begun; the period of first settlement on reservations and the major problems of first adjustment were over; the Indian wars were over. The result of all such factors was that the Indian population increased from about 250,000 in 1900 to a current total somewhere above 400,000.

CURRENT POPULATION

As was stated earlier, the major problem in arriving at the total number of Indians is to determine who is to be included. There are three federal agencies involved in Indian demographic statistics—the Bureau of Indian Affairs, the Bureau of the Census, and the Public Health Service. The inclusion of persons under the category "Indian" varies with the particular interest of these agencies.

The Bureau of Indian Affairs has the primary responsibility for the Indian problem as it affects the executive branch of the federal government. Its population statistics go back in a fragmentary form into the early 1800's when the Bureau was in the War Department. These early figures are usually estimates rather than actual counts. At all times the figures include only those persons entitled to services from the Bureau of Indian Affairs, that is, members of those tribes having treaty relations with the federal government.

Inclusion of those persons entitled to services from the Bureau of Indian Affairs results in occasional changes, mirroring shifts in policy. A résumé of the history of population statistics of the Five Civilized Tribes of Oklahoma illustrates this. Early population reports on this group normally included intermarried whites who had been formally adopted as members of the tribes. During the Reconstruction period ex-slaves

of tribal members given membership rights by Act of Congress were also added to the rolls and population count. Other additions were made during the preparation of final rolls used in distributing tribal land resources. Any person who could establish descent from a member of one of the Five Tribes was eligible for enrollment without stipulation as to minimum degree of Indian blood or place of birth. As a result, the final rolls as established in 1906 included a large number of persons of minimal Indian ancestry and some of no Indian ancestry. Each enrollee received an allotment from tribal lands, although those of half or more Indian blood were given restricted titles and remained in a wardship status. Since this was a final roll, the number of enrollees was used for the next twenty years by the Indian Bureau as the total population. However, no adjustment was made for births or deaths nor for the fact that allottees of less than one-fourth Indian blood were receiving no services from the Bureau. In 1930 an adjustment was made to arrive at an estimated total number of living persons of one-fourth or more Indian blood, and all subsequent figures have followed the same pattern. This history of the Five Tribes census is an extreme example, but not unique.

Indian Bureau counts

Indian Bureau counts have varied from time to time and from tribe to tribe to correspond with changes in definitions. Specific rolls made up for distribution of assets in land or money represent the most scrupulous efforts of bonded disbursing officers to attain accuracy, but comparison of any two such rolls must wait on an assurance that they were prepared in accordance with the same definitions. Under such circumstances, the Bureau currently lays little emphasis on routine reporting of

the total population under the Bureau's jurisdiction, although such reports were prepared on requests from Congress in 1950 and 1952. In theory there should be a listing of persons meeting standard requirements for special community services through Bureau channels, such as education or general welfare assistance. These requirements are tribal enrollment, residence on tax-exempt land, and possession of one-fourth or more Indian blood. However, to maintain such a listing on a current basis requires more clerical time than is usually available in an Indian agency; and on most reservations, the community is small enough and stable enough that the facts are routinely known for any applicant without need for verification by a specially prepared list of eligibles.

Bureau of the Census counts

The Bureau of the Census is interested in Indians as one of the minor races to be reported at decennial intervals. Previous to 1890 it did not include reservation Indians in its totals. From 1890 on, Census totals should include more than those reported by the Bureau of Indian Affairs since they purport to list any "person of mixed white and Indian blood . . . , if enrolled in an Indian agency or reservation roll, or if not so enrolled, if the proportion of Indian blood is one-fourth or more, or if the person is regarded as an Indian in the community where he lives." In practice, the enumerator usually determines race by inspection without asking a specific question, and many quarter-bloods, or enrollees of still lesser blood quantum, are not so recognized. This is particularly true in nonreservation areas. As a result, Census Bureau counts including Indians not under the jurisdiction of the Bureau of Indian Affairs have been lower in each Census from 1900 to 1950 than the Indian Bu-

reau's count of the same year of Indians under its jurisdiction.

A more detailed inspection of Census Bureau statistics on Indians shows a discrepancy from one decennial census to the next. Indian populations reported for 1900, 1920, and 1940 are apparently of a lower order than those for 1910 and 1930. For the latter two Censuses a special census was taken of all Indians, with the result that persons were included in the Indian total who presumably were not so counted on the intervening censuses. The 1950 Census is a special case. In terms of past patterns this should have been another special coverage of all Indians, but instead the special Indian schedule was employed only for residents of major reservations, the areas where the enumerator was least likely to miss enrollees of minor blood-quantums from his total. At the same time it was administratively determined that certain persons of mixed racial origin who had been included in the Indian count in previous censuses would be arbitrarily transferred to a residual category "all other nonwhites"; this transferral cancels out about three-fourths of the net increase which would otherwise have been reported between 1940 and 1950.

Public Health Service

The Public Health Service has a dual interest in Indian demography: the specific administrative concern of its Division of Indian Health and a more general concern of the National Office of Vital Statistics for one of the racial components of the United States. In the administration of the Indian health program the needs of the Public Health Service parallel those of the Bureau of Indian Affairs—the Public Health Service is dependent on Bureau records for determination of such basic facts of eligibility as tribal membership and

TABLE 1—COUNTS OF AMERICAN INDIAN POPULATION, 1950

Self-identification.....	75,000	45,000	30,000
Others.....	25,000	25,000	—
Totals.....	445,000	400,000	45,000

place of residence. In an effective way, this interest is limited to the service area of the Public Health Service's Indian health facilities. Recognition is given, however, to the possibility of return to the service area of tribal members living in other parts of the country.

In the field of vital statistics the interest is broader. Reports on births and deaths include all persons who normally report themselves as Indians. This includes members of tribes not under federal jurisdiction and persons from the mixed-blood groups excluded from the 1950 Census tally, but does not include all enrolled tribal members with minor amounts of Indian blood.

Distribution

No exact determination can be made of the number of persons in each of the categories indicated above, but some broad indications of 1950 distributions are possible.

The 1950 Census reported approximately 345,000 Indians, at least 15,000 of whom can be identified from their place of residence as members of tribes not under federal jurisdiction. An additional 75,000 persons would normally report themselves as Indians on such documents as birth and death certificates, including about 30,000 of the mixed-blood groups excluded from the 1950 Census. Most of the remaining 45,000 are enrollees in federally recognized tribes. In addition, there are at least 25,000 more persons entitled to legal recognition as members of tribes

with federal treaties who do not usually report themselves as Indians.

Most of these latter estimates are minimal. The mixed-blood groups excluded from the 1950 Census are counted in terms of Beale's report¹² that 32,856 such persons were listed as Indians in the original schedules for 1950 before editorial revision. The standard authority for these groups¹³ gave an estimate of 75,000 to 100,000 persons in 1930. The estimate of 25,000 enrollees in federal tribes not usually reporting themselves as Indians is based on the incomplete reports readily available to the Indian Bureau. Inclusion of all descendants of persons on the final rolls of the Five Tribes would greatly increase this.

Under any of the varying definitions, the states with the greatest number of Indians are Oklahoma, Arizona, and New Mexico (see Figure 1). They have held this rank for over forty years. During the period 1910–50 the Indian population of Oklahoma has decreased, according to the Census Bureau, from about 75,000 to about 54,000. During the same period the Indian populations of Arizona and New Mexico have in-

FIG. 1. INDIAN POPULATION OF CONTINENTAL UNITED STATES, 1950
Each figure represents 1,000 Indians (U. S. Census data adjusted for underenumeration)

creased from 29,000 to 66,000 and from 21,000 to 42,000 respectively. These increases are primarily increases in Navaho population. For reservation areas other than the Navaho in Arizona and New Mexico as well as other states, little increase is noted in resident population, and in some areas, as in Oklahoma, there are decreases. The increasing Indian population has been accommodated away from the reservation. During the decade 1940-50 the total Indian population increased by about 20 per cent, from about 360,000 to 420,000 (Division of Indian Health figures). The twenty-four states without federal reservations had an increase in Indian population of nearly 90 per cent. The greatest proportionate increases in the decade were in Virginia, Ohio, Alabama, and New Jersey.

Characteristics of the population

The Indian population is a young population. Half of the Indians are less than 20 years of age in contrast to the total population where only one-third of the people are under twenty.¹⁴ This age distribution reflects a high birth rate—32.1 per 1,000 population during the period 1949-53 inclusive compared with 24.5 for the total population in 1951—however this high birth rate is offset by a high death rate in childhood and early maturity. The result is a distribution differing markedly from the United States average; Indians have higher proportions at all age groups under 25 and lower proportions than the United States average at ages above 25. The deficiencies over age 25 are more marked among females than males.

Data on the amount of racial admixture in 1950 are available only for residents of major Indian reservations, excluding those in Oklahoma. Fairly de-

tailed discussions of this material have been presented elsewhere.^{15, 16} Tribes reporting the smallest proportions of mixed bloods were the Navaho, Pima-Papago, and most of the Pueblos. At the other extreme, the greatest proportion of persons listed as less than one-fourth Indian were found at the White Earth and Flathead Reservations, each having about 25 per cent in this category. No direct comparisons can be made with data for 1910 or 1930, when all Indians were included in the count, although it appears that while the proportion of mixed-bloods is increasing in each tribe, the large increase in full-blood Navahos may reverse this trend for the total Indian population.

FUTURE TRENDS

During the period 1900 to 1950 the Indian population increased by about 70 per cent, while the total population of the United States increased by about 100 per cent during the same period. The difference is partially accountable for by immigration, which has markedly increased the total population, but had little effect on the Indian population. At present the net natural increase for Indians is considerably higher than for the total population. For the period 1951-53 the Indian rate is given¹⁷ as 22 per 1,000 population, without correction for underregistration of births, compared with a United States rate in 1951 of 15 per 1,000. Correction of the Indian rate would undoubtedly be less than the 15 per cent of birth certificates not matched in the 1950 Birth Registration Test,¹⁸ but would still be an ap-

preciable amount, increasing the difference with the national average.

It may be reasonably assumed that current preventive health and medical care programs will reduce the present excessive Indian death rates in the lower age groups. While this will have the immediate effect of lowering the death rate at all ages, the increasing proportion of persons in the older age groups will presumably tend to level the crude death rate and, over a longer time span,

and Geographic Areas, 1950," *Vital Statistics—Special Reports*, Vol. 39, No. 2 (Washington: U. S. Public Health Service, 1954).

to decrease the birth rate. The most recent estimate of Indian population trends¹⁰ has given consideration to such factors and made the rather conservative assumption that a net rate of increase of 23 per 1,000 population in 1955 would gradually decrease to 20 per 1,000 by 1974, which would give an Indian population of about 720,000 in 1975. This constitutes an increase of over 50 per cent for the next twenty years for the Indians compared with an increase of less than 40 per cent for the general population of the United States.

The Role of the Bureau of Indian Affairs Since 1933

By WILLIAM ZIMMERMAN, JR.

Abstract: A new and dynamic administration took charge of the Bureau of Indian Affairs in 1933. In 1934 the Indian Reorganization Act was passed. The Act survived all attacks and remained the foundation of the policy of the Bureau at least until 1950. The sale of Indian land was halted, a loan fund created, a movement away from reservation schools to public schools started, and so forth. After 1950, policies have been followed which aim at a special social integration of the Indian and the termination of federal control or supervision as quickly as possible; but there are signs that Congress is giving a second look at these policies, which in many instances have proved detrimental rather than helpful.—Ed.

HAROLD L. Ickes became Secretary of the Interior and John Collier Commissioner of Indian Affairs in the new administration of Franklin D. Roosevelt. The new administration sounded a fresh note. The Commissioner was confronted, so he said, by a situation which was one of continuing drift of Indian physical assets and Indian life. This was due to no malice on the part of the government, but to a policy which took for granted the extinction of the Indian. Policies of a rigid institutionalized Bureau resulted in the alienation of Indian land, disintegration of Indian tribal and cultural life, and economic decline of Indians as groups and as individuals.

Even after twenty-four years it is still easy to relive the first months of the new administration. There were endless meetings, inside and outside of working hours. In the evenings we sometimes met at Collier's apartment, which was so sparsely furnished that some would sit on the floor. On a bright Sunday morning the meeting might be on a grassy point in Potomac Park. There was zest and fun in those

meetings, but also always a sense of urgency, of fighting time, of doing things now, before it should be too late; but there was always a feeling of accomplishment.

Very soon a new voice was strongly heard in Indian meetings. Felix Cohen did not come to Washington to make himself the foremost student and exponent of Indian law; he became that almost by accident. Yet he was soon heard not only on legal problems, as in drafting the original Wheeler-Howard bill, but also on the countless issues which involved both law and policy. Day after day, month after month, his thoughts and his voice kept the bureaucrats in line. Never were they allowed to lose sight of the ultimate objectives.

Another powerful stimulus was Harold Ickes. In those first months before the tentacles of bureaucracy took hold, it was almost a daily routine for Mr. Collier and the Assistant Commissioner, each morning before nine, to dash up two flights of stairs to the Secretary's office and tell him quickly about the newest problems or get an answer to a

William Zimmerman, Jr., Washington, D. C., is Field Director of the Association on American Indian Affairs, Inc. He was Assistant Commissioner of Indian Affairs from 1933 to 1950 and was then Associate Director of the Bureau of Land Management for four years.

vexing question. By the time Mr. Ickes became adequately insulated, the new bureaucrats, too, knew more about protocol and procedure; but they lost the fresh, friendly, informality.

What were the innovations or the reversals of policies and conditions for which the Collier administration deserves credit? As Mr. Collier saw them at the end of his first four years, they were five:

(1) The Indian Reorganization Act of 1934, with its Alaska and Oklahoma supplements of 1936.

(2) The attack on problems of physical conservation: of land, soil, water, and vegetation.

(3) An over-all endeavor to cause Indians to go to work.

(4) Stoppage of Indian land losses and restoration of some of the lands which had been lost. Also, the development of a credit system based on the principles of a credit union which would make possible the full utilization of all Indian lands.

(5) A shift in educational goals from white-collar to agrarian ideals, from routine grammar school to community school ideals, from a ban on native Indian culture to its encouragement and utilization. At the same time a new emphasis was put on technical and professional training.

WHEELER-HOWARD BILL

The original Wheeler-Howard bill was undoubtedly the most comprehensive single Indian bill ever introduced in Congress. Even so, it was only one of a number of acts to place a new foundation under the American Indians. The Johnson-O'Malley Act of 1934, the Indian Arts and Crafts Board of the same year, the extension of the Reorganization Act to Alaska and Oklahoma in 1936, and finally the Indian Claims Commission Act, which was not passed until 1946, were all in the new program.

While the Wheeler-Howard bill in particular expressed the philosophy of the administration, it was clear from the outset that many people, including many Indians, opposed it. In an effort to bring understanding to the Indians, a series of regional meetings was held at which the Commissioner and members of his staff explained the provisions of the bill, first in large public sessions and then in small discussion groups. Indians and their tribal attorneys laboriously studied the complicated proposals. After the bill became a law, the Indians again had to consider it, for the law provided that it should not apply to any reservation unless the Indians voted to accept it. The whole history of the legislation is another example of what John Collier has called the "bi-lateral, mutually consenting, contractual nature" of the government-Indian relationship.

To this relationship, the Eisenhower administration, by its adherence to "consultation" and its denial of the right of consent, has been oblivious. Recently Commissioner Emmons, in a statement to the Indian delegates at one of the regional meetings which he has been holding, advanced an extraordinary argument against this mutuality—namely, that consent is "insidious" and too costly. After stating the three essentials of consultation and after commending the Indians for sending as delegates such "fine men capable of leadership," Mr. Emmons went on:

I don't think the Indian people have a more sympathetic champion than I to your problems. Of course, we have to sift a lot of suggestions that are made as a number of them are not in good faith. Sometimes it can be a very insidious proposal that looks beautiful, but when you analyze it, it is the worst thing for the Indian people. I refer to the word 'consent.' . . . That word consent—I wonder if you know what that would involve. In any action taken regard-

ing Indian affairs, the council of the Indian people would be required to be there every time. Can you see what that would involve? You can see, too, the amount of money that would involve. The U. S. Government can't afford to pay that, and I doubt if the tribes in America could afford to pay this every week.

Although Mr. Emmons' remarks are here taken out of the 1956 context, they could have been said as appropriately in 1934; and they illustrate one of the basic disagreements between Indians and administrators—the difference between letting the Indians make decisions and having the bureaucrats, no matter how sympathetic they may be, decide what is best for the Indians.

INDIAN REORGANIZATION ACT

As an administrative vehicle, the Indian Reorganization Act was calculated to confirm in the tribes certain rights to decide and to act; it was also designed to restrain or curtail the Bureau's authority. When the constitutions and charters were drafted, still too many tribal actions were made subject to Departmental approval. On the other hand, most of the charters contained provisions for the termination of the various Secretarial authorities after a term of years and after a vote by the tribe. This was still another example of the right of the Indians not merely to advise and consult, but themselves to decide.

When the Indian Reorganization Act was finally approved it was very different from the original bill. Unfortunately there was still much confusion. Many Indians thought that they were voting on the original bill. Some tribes were influenced by their superintendents and other agency employees who saw threats to their security. Others voted against it either because they were distrustful, having in mind a long series of unsatisfactory dealings with the govern-

ment, or because they saw no quick way in which the Act would help them.

Almost immediately after the Act became law agitation began for its repeal. Yet the Act survived all attacks, and until 1950 it was certainly the foundation of policies formulated by the Bureau and the Department. At the risk of making a sweeping generalization to which everybody can take exception, I should conclude that the policy was beneficial to the Indians. Certain results can be documented. The sale of Indian land was halted, at least temporarily. Substantial additions to the Indian land base were made as the result of outright purchases, exchanges, and restoration of ceded lands. Other sources of money, notably appropriations to the Emergency Relief Administration and its successors, were tapped for the purchase of "submarginal lands"—mostly lands which had been farmed and ought to be restored to grass. Also carrying out the IRA policy of adding to the Indians' land, the Congress in four years added 1,200,000 acres by legislation.

One of the urgent needs of the Indians was capital and credit. The loan fund created by the Act and subsequently enlarged by the Oklahoma Indian Welfare Act was fully as important as the land fund. An outsider's appraisal of this activity in 1952 summarizes its success: "From June 30, 1936, to June 30, 1952, all types of loans by the Bureau totaled \$30,911,060, of which \$22,797,722 has been repaid, and \$91,268 has been charged off. Thus from 1936 to 1952, losses due to charge off amounted to 0.22 per cent. This is an excellent record when operational difficulties, types of loans, and quality of credit bases are considered."¹

¹ W. A. Schoenfeld, "A General Review of Credit Policies and Procedures of the Bureau of Indian Affairs," A Report to the Commissioner of Indian Affairs (January 3, 1953).

More land and more credit soon meant more extension work, more cattle, and more Indians farming. The control of grazing which had begun in the Rhoads administration was made more effective. For the first time a mass attack was made on soil wastage and bad land use. When the Soil Erosion Service, later Soil Conservation Service, was established in the Department of the Interior its first major operations were on Navaho and other Indian lands.

Conservation of forest resources began in 1911; it received new support from the language of the IRA directing "the operation and management of Indian forestry units on the principle of sustained yield management." In this field of resource conservation, great service was rendered by the Civilian Conservation Corps with its separate Indian unit and by the Public Works Administration. Public works money also made possible a rapid improvement in the medical and educational plants. Some twenty hospitals were repaired or enlarged and at least nine new ones were built.

In education the shift from boarding schools to public or federal day schools followed the recommendations of the Meriam report. The first state contracts for Indian education in public schools were with California and Washington for the fiscal year 1935. Contracts with Minnesota came a year later. New buildings and a new curriculum also appeared. Emphasis was placed on vocational training and on arts and crafts as a factor in Indian life and economy. The Arts and Crafts Board, working closely with the Education staff, labored to raise standards, to increase production and improve marketing; it also started many new enterprises. In the Eisenhower administration many of these programs have been shut down or abandoned, and Bureau

support and guidance have been withdrawn.

In March 1944, in presenting his last budget to the House Appropriations Subcommittee, Commissioner Collier, responding in effect to an attack on him by the Senate Committee on Indian Affairs (Partial Report 310), made what turned out to be a valedictory:

... We have tried to energize the individual Indian and the group, and to equip individual and group with knowledge and skills to enable them to go into the white world successfully if they want to or to hold their own and make their way where they are if they want to. That is the meaning of the Indian Reorganization Act and of all other major things we have been working at. . . . In brief, we have quit thinking about assimilation and segregation as opposite poles and as matters of "all or nothing." They are over-simplifications of thinking which do not connect themselves with the dynamic realities. Indians are more themselves than they have been for a long time, and they certainly are more assimilated than they ever were.

APPROPRIATIONS

In a different key, Mr. Collier made reference to the decline in appropriations for the Indian Bureau. The total for 1944, including both federal and tribal funds, was \$28,843,902 compared to \$30,445,092 for 1932. It was apparent in 1941 that the forward momentum of the Collier regime was slowing down. This was due to many causes. There was antagonism between the Commissioner and some members of the Congress. Most important, however, was the war, which compelled a reappraisal of policies involving expenditures and exiled the Indian Bureau to Chicago for five years. Although Mr. Collier remained in Washington, with a small liaison staff, administration became more difficult. There was the further loss in dealing with Congress. Staff members when they came to Wash-

ington were usually busy with advance appointments or with committee hearings. Certainly there was less Congressional understanding and interest as the war went on. One of the casualties of this period was the placement or employment unit. Congress said that every able-bodied Indian could now find a job and eliminated the appropriation.

When the next appropriation hearings were held a year later, Mr. Collier had been succeeded by William A. Brophy, Collier's own choice to succeed himself. Unfortunately, ill health kept Mr. Brophy away on leave through much of his tenure, which ended in June, 1948. Then came John R. Nichols who remained less than two years. It is no disrespect to these men to say that they did not significantly change the course of Indian affairs. Each made some changes in organization and personnel, but they were not in office long enough to alter policies materially.

NEW DIRECTION UNDER MYER

With the accession of Dillon S. Myer as Commissioner of Indian Affairs in May 1950, the Bureau began a new epoch. Mr. Myer was not informed about Indians, but he had experience with the Japanese as Director of the War Relocation Authority. He had his own ideas about the administration of the Bureau. There was never a question of Mr. Myer's integrity and ability as an administrator. He was responsible for a general "tightening up" in administration.

According to the Commissioner, his first year saw "a great change in the basic organization of the Bureau." The result of this change was a further delegation of authority to area directors and an increase in their authority over superintendents. Superintendents have become the servants or errand boys of

the area directors, for they have no control over funds or personnel.

New emphasis was placed on plans and programs. In particular, first steps were taken to start the Navaho rehabilitation program, which the Congress had approved before Mr. Myer became Commissioner. Other rehabilitation programs, such as the Papago, on which the tribal council had worked for several years, were not pushed. In connection with the Navaho education program, perhaps for the first time there appeared a flat statement by a Commissioner of Indian Affairs that "the Federal off-reservation education of Navahos is directed entirely toward the preparation of these children for permanent off-reservation employment." It is noteworthy that the utilization of the largest of the off-reservation schools, Intermountain School at Brigham City, Utah, was preceded by approval of the Navaho Tribal Council.

In the field of resources Commissioner Myer's own appraisal of his program read as follows:

Development of the latent physical resources of the Indians throughout the Country is being hastened. Indian land is being brought under irrigation to protect their water rights, as well as to increase yields and convert large blocks of grazing land into productive crops. They are being provided with increased economic opportunities through industrial and agricultural development of their resources and adequate training programs to fit them for employment in skilled occupations off the reservations. There is opportunity for a wide expansion of cattle herds, establishment of small businesses, initiation of sawmill enterprises to market Indian timber, and many other methods of increasing Indian income.

Mr. Myer also made one comment which deserves quotation here: "The Indians have demonstrated the progress they can make when financing and

technical and supervisory assistance are made available to them."

Under Commissioner Myer came a change in credit policy, which was extended under Mr. Emmons. Intensive efforts were made, Mr. Myer reported in 1952, in his last annual report, to obtain loans for Indians from banks and other types of credit institutions rather than from the Bureau. As a part of this new policy, the Bureau issued regulations permitting Indians to mortgage trust or restricted land, thus reversing both policy and legal opinion which had prevailed since allotment began.

Several years later, some insurance companies expressed doubt as to the legality of this regulation. The Bureau then supported legislation to validate mortgages already made and leave no doubt as to future transactions. If the Bureau follows the same easy policy on mortgages that it has followed recently on land sales and patents in fee, the mortgage will become just one more easy road to land alienation.

TERMINATION

The Bureau was also giving much attention to termination or withdrawal. Bills for the Indians of California and of western Oregon were presented to Congress, but were not enacted. Discussions were carried on about Klamath, Menominee, Osage, and other tribes. As to the Klamath and Menominee, Commissioner Myer's summary may stand as a model of understatement:

Although both tribes indicated some initial reluctance to contemplate the prospect of Bureau withdrawal, a number of consultations were held with them during the fiscal year and efforts were being continued to elicit their active cooperation in the development of constructive programs.

In 1952, in a letter to the Chairman of the Osage Tribal Council, Commis-

sioner Myer made three points about termination, the third of which has been subsequently ignored. As to tribes which desire to assume some of the responsibilities which the Bureau now carries, he was prepared, he wrote, "to work with such tribes in the development of an appropriate agreement, *without termination of the trusteeship relationship.*"

This was in effect a return to the plan proposed in 1947 by the present writer, who was then acting Commissioner of Indian Affairs, when he testified before the Senate Committee on Civil Service headed by Senator Langer. That testimony has since been repeatedly misquoted and misinterpreted. The Committee's announced purpose was to reduce the number of federal employees. The Indian Bureau was only one of many agencies to appear. Testifying under subpoena and replying to a demand from the Committee, the witness said that Bureau services could be curtailed or eliminated as to certain tribes and reservations, by groups. He specified certain criteria which the Congress should consider in such reduction in services, and he indicated that these criteria did not apply uniformly. In fact all four could not be applied to any one tribe.

The witness also submitted drafts of a number of proposed bills whose enactment would permit reduction in Indian Bureau personnel. A bill for Klamath Indians proposed a federal corporation with a life of fifty years and provided that "none of the property of the corporation shall be subject to taxation until otherwise provided by Congress." The Menominee proposal also called for a federal corporation, and it specified that the tribal lands should remain in trust, non-taxable, and inalienable for fifty years.

These proposals were very different from the termination bills which the

Klamath and Menominee Indians were finally constrained to accept. It was clear then, as it is now, that these tribes cannot survive economically if their tribal property is taxed.

The current scene

Let us now examine the current situation with Glenn L. Emmons as Commissioner of Indian Affairs. It is not easy to evaluate the present, partly because the trees are so close that the forest's outlines are not clear, but also partly because at so many points the actions of the Bureau are impossible to reconcile with announced policies. There is also disagreement within many tribes, as much disagreement about policies and personalities as there is on the outside. Much of the disagreement is the inevitable result of the ferment of the last twenty-odd years. Indians are more articulate now, and both the majority and the minority speak, vote, and occasionally fight for their opinions. Many Indians believe that the Bureau, instead of going along with a tribal majority, sides with the minority when the minority supports Bureau policy.

Sometimes, too, there is a break in the communication system. A Secretarial letter to a Washington, D. C. attorney made a basic decision about Blackfeet election procedures, but a copy of the letter was not sent to the tribe nor to the tribal attorney. Again, in a controversy at Fort Berthold, after two years of argument, a Departmental decision made possible the holding of an election; but public notice of the decision was apparently not given. One of the tribal factions learned of the decision which called for tribal action within a stated time limit from a private citizen, not from the Bureau. It is easy to argue that such lapses are inadvertent, but it is hard to persuade Indians that they are not all part of a pattern.

EDUCATION AND HEALTH

In two major fields, health and education, the Bureau has effected far-reaching changes since 1953.

First, in the field of health, on July 1, 1955, it completed the transfer of all medical work to the Public Health Service. The legislation requiring this transfer was sponsored by the Council of State and Territorial Health Officers and by numerous private organizations including the National Tuberculosis Association and the Association on American Indian Affairs. If any one person deserves major credit for this legislation it is the late Dr. A. J. Chesley, of Minnesota. The public record shows that it was initially opposed by the Department of the Interior and by the Department of Health, Education, and Welfare. Not until it became almost certain that the bill would pass did the Department of the Interior reverse its position.

The first result of the transfer was a large increase in appropriations; they rose from \$21,000,000 in 1953 to \$38,000,000 in 1956. For 1958, the Public Health Service is asking more than \$50,000,000. There certainly has also been some marked improvement in medical services. More doctors are on duty, perhaps totaling 100, who are almost all young men subject to military draft. More patients are in hospitals, even though there are no additional nurses. After a year and a half in control the Public Health Service is still side-stepping two basic issues: which Indians are eligible for medical care and which ones, if any, should pay for services. In a letter written in January, 1957, the Public Health Service comments: "No Indian, either on the reservation or off, has a legal entitlement to medical service under the Indian health program." If the Public Health Service should take the position that medical

care for Indians is given as an act of grace, as may be here implied, it is certainly headed for trouble.

The Bureau under Commissioner Emmons claims and deserves credit for getting more children, especially Navahos, into school. In three years as a result of truly herculean efforts by the staff, especially employees on the Navaho reservation, the Navaho school attendance was increased by about 10,000 children. Most of these are in boarding schools at long distances from home. Many are in public schools in the "peripheral" towns of Gallup, Holbrook, Winslow, and others and are housed in Bureau-operated dormitories. The Bureau pays tuition for these children, and the federal government also pays for additional school capacity on the theory that these are "Federally impacted areas."

The Bureau in 1955 launched a pilot program in adult education designed to make five tribal groups literate in English, and it supported legislation for a program of vocational training. Yet, at the same time it has eliminated or curtailed many activities which seem to involve vocational training. Most of the school-cattle herds, beef and dairy, have been abolished or greatly reduced. School farms have been abandoned. The school farm at Flandreau, instead of being turned over to the local Indians, was declared surplus and offered for public sale. Arts and crafts projects have been shut down or left to shift for themselves. Bureau guidance and support have been stopped, as for example, for the Qualla Cooperative at Cherokee, North Carolina; the Sequoyah weaving project in Oklahoma; and the pottery and weaving project at Pine Ridge, South Dakota.

INDUSTRY AND RELOCATION

A new program, which may have important results, plans to bring industry

to the reservations.² About ten small factories are now either in operation or expected to begin operation before the end of 1957. Cheap, stable, labor supply is the lure; although in some places the attraction may be free land or a suitable building. The Navaho Tribe, for example, is paying for the construction of a building to house a children's furniture factory at Gallup. Again, however, a seeming inconsistency exists. Indian-owned enterprises are being liquidated. The Flandreau garment factory, which made a small profit during each year of its existence, was closed. Here was a small plant in a small Indian community whose average family income was less than \$1,000 a year. The factory had a pay roll of about \$28,000 last year, or an average of nearly \$500 per family. On a very different scale is the Alaska fishing industry. After a profitable period of ten or fifteen years, the community-owned, Bureau-financed canneries lost large sums. The Bureau takes no share of the blame for mismanagement, but now plans to lease these canneries to private operators at nominal rentals. Presumably the non-Indian lessee will make a profit.

Two other major aspects or questions of policy remain to be considered; they are the attrition of the land base and the increased emphasis on relocation. The policy in the 1930's assumed a continuing increase in the land base. A real start was made. But World War II and the changes in policy since 1950 put an end to the purchase program. Recently a member of Congress, not himself opposed to wholesale land sales, said to me that if the present policy continued for another five years there

² A bill, Senate 809, has been introduced in the current session by Senator Langer and about twenty other Senators; its aim is to encourage the development of industries on reservations.

would be no Indian reservations in his state, only Indians. In the past four years approximately 1,600,000 acres of Indian land have gone out of trust. This is roughly 12 per cent of the allotted lands. The present Bureau policy emphasizes the right of the competent Indian to take fee title to his allotment. It ignores the fact that the allotment was received because the individual owner was a member of the tribe, and that allotments were often made over tribal opposition. Even if the sale is detrimental to the neighbors or to the tribe, the sale goes through; the Commissioner, however, has said that he will hold key tracts. Even if the wholesale issuance of fee patents is defensible, there is greater doubt about the supervised sale of land belonging to incompetents. The Commissioner's reports disclose that more land has been sold by supervised sales than has been patented. Generally, such sales provide money for living expenses for a period of months, perhaps years; after it has spent this money the family goes on some form of relief, or leaves the reservation.

To many Indians there seems no alternative to leaving the reservation, either voluntarily as thousands have already gone, as migrants, or now officially as "relocatees" receiving financial and other help. It is now just fifty years since the Bureau first made an effort to find off-reservation employment for Indians. In those fifty years thousands of Indians have left their homes, mostly for urban areas. Rapid City has 4,000 Indians. Nobody knows how many are in Minneapolis; estimates run from 3,000 to 8,000 or more. Seattle, Portland, Los Angeles, and Phoenix are centers of Indian migration. Smaller towns in many states have hundreds. Statistically there is no basis for saying that any certain percentage of migrant Indians will succeed. The same statisti-

cal lack exists for the officially relocated Indian. In the years when Dillon Myer was Commissioner of Indian Affairs, the placement service was revived under the new name; this was taken over from the War Relocation Service which concentrated Americans of Japanese ancestry in camps. Relocation in the present administration is being carried out on an increasing scale. Roughly, \$1,000,000 was appropriated in 1956 and \$3,500,000 in 1957 for carrying on this work. In 1955, 650 family groups and 800 single men and women were relocated, a total of 3,400 persons. Most of these required financial assistance. In 1957 approximately 10,000 persons will be relocated, of whom 80 per cent will need financial help. With increased appropriations, those who need help will receive larger, more nearly adequate sums: for transportation to the job, for a month's subsistence, for clothing, for furniture, and for a year's Blue Cross medical protection. Undoubtedly, some Indians are asking for relocation because they see no hope at home in the face of the current policies on land and credit. The Blackfeet to the contrary, as an example, recently advertised free sites to industries which would locate on the reservation and stated that 1,500 Indians available for work did not want to be relocated.

CONCLUSION

The history of government-Indian relations seems to be a succession of waves. One generation of Indian administrators seems to learn little from its predecessor. About thirty years passed, a generation, from the establishment of the Union to the beginning of the era of removal. About thirty years thereafter the planners and administrators began to argue for allotment. From 1857 to 1887 every Commissioner

of Indian Affairs, except one, urged allotment.

The General Allotment Act of 1887 set a national policy, which reached its high mark just thirty years later, in 1917. At that time, Secretary of the Interior Franklin K. Lane approved the policy of Commissioner Cato Sells of issuing "forced patents" to Indians who were competent in his judgment, even though the Indians had not asked for patents. Today, through an act passed by the Congress in 1956, the Secretary of the Interior has the same power over Indians of the Five Tribes in Oklahoma. The Lane-Sells policy stopped abruptly when Charles H. Burke became Commissioner in 1921. Although Burke had some understanding of the realities of Indian affairs as a result of his service in Congress as chairman of the House Committee on Indian Affairs, he did not move far enough or fast enough to silence bitter critics of his administration. The Meriam Report of 1928, the policies of the Rhoads-Scattergood era, the Collier administration and the Indian Reorganization Act, all moved along the line of greater service, opportunity, and protection for the Indian.

This wave receded with the appointment of Dillon Myer as Commissioner in 1950. Gradually, Mr. Myer eliminated from the Bureau most of the top men who had been close to John Collier. Certainly there was a shift in policy. Since 1950 not one of the termination bills submitted by the Bureau includes a provision for federal incorporation as provided in the Indian Reorganization Act and as proposed by the Bureau in sample bills submitted in 1947. On the contrary, for any tribe organized under the IRA or the Oklahoma Indian Welfare Act, the Bureau's bills have called for revocation of tribal constitution and charter. The Bureau relies, of course, on the declaration of Congressional in-

tent expressed in House Concurrent Resolution 108 of the Eighty-third Congress. That resolution said that certain tribes and the Indians in certain States are to be "freed from Federal supervision and control." It also included general language to the effect that Indians should be subjected as rapidly as possible to the same laws and entitled to the same privileges and responsibilities as other American citizens. The Eighty-fourth Congress gave some indication that it was not too sure about the Myer-Emmons wave. The only termination bills passed were at the request of tribes which specifically asked for the legislation. Not a single termination bill opposed by the tribe affected was passed.

At the beginning of the Eighty-fifth Congress, Senator Murray of Montana, Chairman of the Senate Committee on Interior and Insular Affairs, introduced Senate Concurrent Resolution 3 (the same text he had introduced in the Eighty-fourth Congress as Senate Concurrent Resolution 85). Representative Lee Metcalf, also of Montana, introduced the same language in House Concurrent Resolution 155. If adopted, this resolution would restate Congressional policy, for it directs the Bureau of Indian Affairs to carry out a Point-Four program for Indians and specifies that this program shall be offered "without exacting termination of Federal protection of Indian property or of any other Indian rights as its price."

Until the Congress does act, it is not likely that the Bureau of Indian Affairs will change its present policies. It is distressing, but impossible to ignore the conclusion voiced by employees as they cluster in two's and three's in the long corridors of the Bureau in Washington. They talk about the present "liquidation program." Let us hope that they will be proved wrong.

Termination of Federal Supervision: Disintegration and the American Indians

By OLIVER LA FARGE

Abstract: The problem of our Indian population is an old and continuing one. In this article the author outlines two alternative ways of dealing with it. One aims at quick and intensive attempts to break down the special status of Indians and integrate them into the mainstream of American life. These attempts are characterized as hasty, impatient, and often ill advised. The other alternative aims at maintaining Indian tribal integrity and special rights until such time as the Indians themselves are ready and willing to dispense with federal supervision and controls. The author pleads for the need to work calmly and thoughtfully toward a point where Indians are able to make a satisfactory adjustment to life in America without needing the prop of special status.—Ed.

FOR many years our Indians have been the subject of a continuing debate, an unusual one in that one side desires to exclude the Indians themselves from it—although in recent years this has ceased to be possible—and that both sides, whenever opportunity arises, will put their principles into effect by legislation or administrative action. The result has been a crazy quilt of conflicts, often producing confusion, sometimes disaster.

On one side, expressed or implicit, is the conviction that all Americans should be alike; that conformity to a somewhat imaginary American norm is the best thing for everyone; and that discrete communities having customs, legal rights, and restrictions not common to all Americans must be dissolved as rapidly as possible. In its starkest form, the argument is that Indians must be "assimilated" or "integrated" whether they like it or not and that nothing will speed up integration faster than to disintegrate their native communities. This thinking is usually reinforced by im-

patience with a large federal bureaucracy dealing with Indian affairs, which in 175 years has failed to integrate the Indians. The simple conclusion is that the Bureau of Indian Affairs' failure can best be solved by dissolving the Bureau.

On the other side is the belief that, since we have deprived the Indians of the excellent opportunity for life, liberty, and the pursuit of happiness that they enjoyed before the Europeans came, we cannot, as Americans, rest content until we have restored that opportunity to them at least to the degree that other citizens have it. Further, we have more specific obligations to them derived from the very fact of our having conquered them. Proponents of this view above all oppose haste and unilateral action from above, either of which can destroy human beings, and insist on the inherent right of Indians, as of all Americans, to be different and to group themselves as they prefer.

As to special Indian rights, since being Indian is hereditary, the rights at

Oliver La Farge, Santa Fe, New Mexico is President of the Association of American Affairs. He has been a field representative in the Indian Service and directed anthropological expeditions in the Southwest United States and Central America. His latest publication is A Pictorial History of the American Indians (1956).

first glance seem anomalous in a democracy; when we study them, however, the anomaly fades. They are part of a quid pro quo promised solemnly by us, in treaties, agreements, and laws and upheld over and again by our courts, in exchange for the whole area of the United States and for the ending of rightful independence by what Chief Justice Marshall called "irresistible power."¹

INDIAN STATUS

Indian special status consists mainly in the ownership of land—reservations and grants—and income therefrom held in trust for them and tax exempt. As in all trusts, the beneficiary is restricted in the use and disposal of the estate. Part and parcel of this ownership, and deriving from the original, lost, sovereignty, is home rule and exemption from state law within "Indian country." Secondary in origin but essential to our basic obligation is federal responsibility for what are usually local services such as education and health. That we have rendered these services stingily and stupidly is irrelevant. States, counties, and municipalities avowedly cannot administer them nor are their standard services suited to the needs of Indians striving, not for identity, but for equality.

Part of the argument against disintegration is that Indian special needs must be met until they have been eliminated and that elimination can be achieved through patience, respect for human rights and aspirations, and co-operation with the people concerned; not through authoritarian action upon those people. Indian status and the integrity of their groups are not only rights, but essential means of progress.

Those holding the opposing view claim that Indian status segregates them. Indians are dark-skinned. In

¹Worcester v. Georgia, 6 Pet. 515, 519 (1832).

many parts of the United States they encounter in varying degrees the discrimination and segregation we apply to all dark-skinned people. It occurs even in Salt Lake City, center of Mormonism with its special doctrine concerning the origin of Indians. Given communities of their own within territories that they govern, Indians will tend to withdraw into them. Most people in this world also like to live in their homelands, near their kin, and among those who share their ways. The argument that Indian status segregates Indians could be extended indefinitely to almost any ownership of land plus home rule or self-government in the world.

Intermittently for some seventy-five years proponents of disintegration have applied their theories by various processes: ending tribal ownership of property and encouraging the breakup of solid blocks of Indian land into fragments accompanied by measures to weaken or destroy tribal governments, frustrate Indian leadership, and in the past either to cut young Indians off from their cultures and languages or to instill in them contempt for their elders and their tradition. The similarity of these procedures to those of communism is startling, and, as with Communists, we have enforced them for the people's "own good." We did not, however, make the subjects over into white men, mentally, morally, or physically; what we did was nearly to destroy the Indian economic base, reduce tens of thousands to landless beggary, and prepare the desolate mess that many now want to sweep under the rug by means of "termination."

One cannot "equalize" people by depriving them of their property and of the going communities of their own kind that are their source of strength. Trying to do so is deeply un-American. Shall we say of this Amish colony, this concentration of orthodox Jews, these

villages of Spanish-Americans that they must be broken up so that they will stop being different? Here, again, we see the basic principle of communism; yet these groups, unlike the Indians, are at home in our culture and of amply proven competence to deal with it.

INDIANS OF THE SOUTHWEST

It would be hard to find Indians more "different," more "Indian" than those living on tribal grants and reservations between the Grand Canyon and Santa Fe. Most of them still prefer their mother tongues, and the majority profess the native religions; sixteen of the eighteen New Mexico Pueblos are still governed by their ancient theocracies. Almost any student of Indian conditions will agree that, with all their problems, the present life of these Indians is happier, their economic status, although low, is better, and their future much clearer than they are for the more "advanced," partially disintegrated tribes.

Neighboring them is an unusual zone of non-Indian acceptance extending along the Rio Grande Valley from Taos to Albuquerque and including Los Alamos. Tribal Indians move freely about the zone to work and study, some settle in the towns, some commute. They are found in skilled and semiprofessional positions, and in businesses of their own. They and the communities are ready for intermingling without talk of "assimilation." As a result the Indians are no more segregated than is anyone having the choice of either living on the farm or going to the city.

This happy, positive example could be overbalanced by innumerable wretched, negative ones. Both serve to emphasize a principle that disintegrationists usually ignore—that if, in whatever way, Indians are to be urged to leave home, *both the communities that receive them and the Indians* must be ready for each other. This condition rarely exists.

"DISINTEGRATION"

Highly significant is the experience of officials of the relocation program of the Bureau of Indian Affairs under which Indians are helped to settle and find steady employment in a few large cities. The "primitive" Indians from the intact, unallotted reservations of the Southwest are internally secure. They are able to make the great, difficult adaptations that their new life requires; and they show good percentages of successful, permanent relocations. Indians from broken, allotted northern reservations occupied by relatively disintegrated tribes are insecure and in inward conflict. They have lived long cheek by jowl with whites, and it has not profited them. They lose jobs, they find adaptation difficult, and have high percentages of relocated people who have given up and gone home.²

It would be tiresome and superfluous to recite here all the unsuccessful experiences we have had in the past with programs for de-Indianizing Indians, dissolving their communities, or destroying their cultural heritage. None of our efforts in that direction have borne good fruit nor have they enabled us to accomplish the goal on which everyone agrees—to put the Indians on such a footing in health, education, understanding of our world and economic opportunity that they can make themselves happy lives without benefit of special status.

One of our howling errors is ignoring the fact that you cannot make a people over against their will and contrary to their aspirations. We all recognize this simple fact eagerly and emphasize it when it comes to Hungarians or Poles, but somehow we refuse to apply it to

²LaVerne Madigan, *The American Indian Relocation Program* (New York: Association on American Indian Affairs, 1956), table, p. 6 and p. 9.

American Indians. Rather fatuously, we expect Indians to have the same aspirations as all our other minorities, despite the fact that their history is obviously quite different. The disintegrationists manage to ignore entirely the extraordinary record of the Indians in retaining their communities and their existence as Indians in the face of what look like impossible pressures, sometimes extending over centuries.³

Termination

"Termination" approaches disintegration from a new angle. Previous systems worked piecemeal but applied to a great number of tribes, as in the allotment system, which is still operating, or to all, as in systems of education designed to destroy a rising generation's tribal memories. Termination applies to one tribe at a time, but affects that tribe totally.

In theory, there is a kind of termination which those who believe in Indian progress through Indian integrity do not oppose; it is, in fact, the ultimate goal. This is the termination of Indian status of a tribe when its members have reached a point of competence at which they find that they will do better on their own, with full freedom to handle or dispose of their assets, than under established protections and restrictions. This situation requires, among other things, that the tribe has reached a state of social and political competence and the county and state within which it lives such a state of moral advancement that the tribe can be sure it will receive equal treatment in all matters, from law enforcement to service in restaurants. This appears to be the situation reached

³ John Provinse and others, "Wenner-Gren Supper Conference: The American Indian in Transition," *American Anthropologist*, Vol. 56, no. 3 (June 1954), pp. 387-94.

Oliver La Farge, "Assimilation—the Indian View," *New Mexico Quarterly*, Vol. 26, no. 2 (Spring, 1956), pp. 5-15.

by the Wyandottes, Peorias, and Ottawas who were terminated at their own request by the Eighty-fourth Congress.

There is no reason why termination of this sort should be "bought" by sacrificing all rights. There is no reason why it should not be so devised as to facilitate, if the tribe desires, common ownership of property and continuing group existence through organization into a corporation or into a suitable, modern political unit. The method of such termination can only be worked out at leisure between the tribe, the federal government, and the state consulting as equals.

Termination legislation was first seriously introduced in the Eighty-third Congress, partly in accordance with House Joint Resolution 108 of the previous Congress, partly on individual initiatives. It led to a storm of protest from tribes all over the country that left no possible doubt of Indian opposition. This strength of Indian expression explains why disintegrationists want to exclude them from the debate.

Of the bills introduced under the Resolution, those to terminate the Flatheads, Turtle Mountain Chippewas, and Florida Seminoles were killed in committee. Opposition from the tribes concerned was strong and well presented; the states they lived in also opposed the bills; the legislation was obviously ill conceived. The Turtle Mountain Chippewas are strong contenders for the title of the most destitute Indians in the United States; the Florida Indians have only recently had universal schooling and retain a large group of members who speak no English. It is difficult to conceive on what basis these two tribes were ever marked for termination. Several other bills never received a hearing.

SPECIAL CASES

There were a number of special cases. It is impossible here to discuss the curi-

ous act terminating the "mixed-blood" portion of the Utes of Utah. The situation among the Utes is and was confused (for instance, most "mixed-bloods" have no non-Indian blood). What is clear is that none of the Indians understood what they were agreeing to and that all concerned are now unhappy. Apparently, their consent was obtained more by persuasion than by explanation.

The Alabama and Coushatta of Texas were also partially terminated, but at their own request. The state took their reservation in trust and assumed certain other responsibilities; a few items of federal Indian status will be retained. This was the only termination proposal in the big drive that came near meeting the conditions laid down above.

Another bill proposed termination for five bands of Paiutes and Shoshones in Utah. The Department of the Interior testified that these bands were ready for termination and desired it, although it admitted that over 10 per cent were illiterate and that all but a few lived entirely or partially on relief and straight charity. The record of testimony gives a feeling of haste and one-sidedness. When private agencies got in touch with the bands, the official testimony as to their desires proved incorrect. Two groups, comprising a majority, lodged protests strong enough to get themselves eliminated from the termination list. Another tribe was too late and its members are included among the 232 persons who are now becoming competent non-Indians by act of Congress.

A Department of the Interior argument, used here and in relation to other proposed terminations, was that the groups should be terminated because they were almost totally neglected. In full context this seems to mean that since local Indian service personnel are withdrawn to a distant, central agency on grounds of economy, the outlying

Indians are then neglected and accordingly should be terminated.

TERMINATION ACTS

The two most important termination acts, both deriving from the Resolution cited, affected the Klamaths of Oregon and the Menominees of Wisconsin, progressive tribes who, it happens, possess very valuable timber. The bills contained no adequate provisions for handling tribal property, required the rapid ending of tribal organization, and set a short time limit of five years for a most complex transaction.

Both tribes expressed formal consent to the principle of some form of termination, but had no opportunity to pass upon the bills actually enacted. Both tribes were told that if they did not accept the principle, they could not have a distribution of moneys that belonged to them and without which their members would suffer hardship. When Klamath delegates in Washington still hung back, the then Secretary of the Interior followed the strange procedure of using Klamath tribal funds to bring on a tribesman, of no official status, to work for the bill.

The Menominees and Wisconsin are thoroughly unhappy about the Menominee act and are working for major amendments. Oregon feeling about the outcome of the Klamath act is so strong that the present Secretary of the Interior has asked amendments in the present Congress. The Klamath act encourages rapid selling of the tribes' fabulous timber and distribution of the proceeds, which leads Oregonians to prophesy a brief, wild spending spree by the Indians followed by the dumping on the state of a mass of paupers. There is also uneasiness about the blanket act terminating the western Oregon tribes.

About these bills, enacted or not,

there is an atmosphere of haste, of jamming through, of bad drafting, misrepresentation, and pressure. This in itself should make us suspect them. Suspicion grows stronger when we note other attempts by the administration to tie acceptance of termination to unrelated legislation desired by other tribes and the sudden presentation to some tribes of drafts of termination bills with limits of two months or less for discussion.

We begin to see that for practical purposes the present debate is not about "termination" as such, but about a par-

ticular kind of termination, something characterized by hasty impatience, to be applied to tribes who do not want it. Termination in itself got lost from the discussion. What termination should imply, the conditions that should be met in order to reach it, have been very briefly sketched in this article. We badly need a calm, unhasty consideration of the subject. The goal, the obstacles to be overcome, and the benefits to be brought to fellow citizens in overcoming them, should be a challenge every American would want to take up.

Termination of Federal Supervision: The Removal of Restrictions Over Indian Property and Person

By ARTHUR V. WATKINS

Abstract: Thinking constructively of the Indian as a fellow American we are now seeking to assure him of equality in the enjoyment and responsibilities of our national citizenship. Congress has called for termination of federal supervision over him as soon as possible. The proposed solutions vary in method. Seeking to be factual and informative rather than argumentative, the author discusses recent Congressional and related actions with a view as to what these establish for the present and portend for the future.—Ed.

VIRTUALLY since the first decade of our national life the Indian, as tribesman and individual, was accorded a status apart. Now, however, we think constructively and affirmatively of the Indian as a fellow American. We seek to assure that in health, education, and welfare, in social, political, economic, and cultural opportunity, he or she stands as one with us in the enjoyment and responsibilities of our national citizenship. It is particularly gratifying to know that recent years of united effort, mutual planning, and Indian self-appraisal truly have begun to bear increasing fruit.

One facet of this over-all development concerns the freeing of the Indians from special federal restrictions on the property and the person of the tribes and their members. This is not a novel development, but a natural outgrowth of our relationship with the Indians. Congress is fully agreed upon its accomplishment. By unanimous vote in both the Senate and the House of Representatives termination of such special federal supervision has been called for as soon as possible. Of course, as with any such major social concern, methods vary in proposed solutions and emotions sometimes rise as to how the final goal

should best be reached. A clear understanding of principles and events is necessary. Here the author seeks more to be factual and informative rather than argumentative and dogmatic. This article is largely intended to note recent Congressional and related actions with a view as to what these portend for the future as well as establish for the present. After all, the matter of freeing the Indian from wardship status is not rightfully a subject to debate in academic fashion, with facts marshalled here and there to be maneuvered and counter-maneuvered in a vast battle of words and ideas. Much more I see this as an ideal or universal truth, to which all men subscribe, and concerning which they differ only in their opinion as to how the ideal may be attained and in what degree and during what period of time. In the course of this chapter, then, I shall be primarily concerned with the main object and the degree of understanding which has come to us regarding its attainability.

THE SITUATION IN DECEMBER 1956

A little more than two years ago—June 17, 1954—President Dwight D. Eisenhower signed a bill approved by

Arthur V. Watkins, LL.B., Washington, D. C., is the senior United States Senator from Utah. He has served in the Senate since January 1947. During the Eightieth and Eighty-third Congresses he was Chairman of the Subcommittee on Indian Affairs and is now the ranking Republican member.

the Eighty-third Congress that signified a landmark in Indian legislative history. By this measure's terms an Indian tribe and its members, the Menominee of Wisconsin, were assured that after a brief transition period they would at last have full control of their own affairs and would possess all of the attributes of complete American citizenship. This was a most worthy moment in our history. We should all dwell upon its deep meaning. Considering the lengthy span of our Indian relationship, the recency of this event is significant. Obviously, such affirmative action for the great majority of Indians has just begun. Moreover, it should be noted that the foundations laid are solid.

Philosophically speaking, the Indian wardship problem brings up basically the questionable merit of treating the Indian of today as an Indian, rather than as a fellow American citizen. Now, doing away with restrictive federal supervision over Indians, as such, does *not* affect the retention of those cultural and racial qualities which people of Indian descent would wish to retain; many of us are proud of our ancestral heritage, but that does not nor should it alter our status as American citizens. The distinction between abolishment of wardship and abandonment of the Indian heritage is vitally important. I wish to emphasize this point, because a few well-intentioned private organizations repeatedly seek to influence Congress to keep the Indian in a restricted status by urging legislation to retain him as an Indian ward and as a member of a caste with social status apart from others, not basically as what he is—a fellow American citizen.

These organizations have presented some proposals to Congress impossible of accomplishment, but likely to produce argumentation and thus to protract debate beyond reasonable limits. In this

manner they apparently seek to justify a continued role as presumable spokesmen for Indian tribes. Likewise, it should be noted that in legislative considerations various other private organizations and serious-minded periodicals have been used as devices propagandizing viewpoints based upon assertions known to Congress to be contrary to the facts upon Indian conditions. Special interests are of course involved in other ways; thus commercial companies having specific reservation leases may be reluctant to see terminal programs proceed, feeling that their own economic interests may be jeopardized. And again, state co-operation in the assumption of responsibilities for their Indian citizens has not always been consistent. Historically, however, the Congress, although perhaps more or less ineffectively until recent years, has sought in the nineteenth and early twentieth centuries to free the Indian. A full study of Congressional actions will bear this out. Freedom for the Indian was the goal then; it is the goal now.

Unfortunately, the major and continuing Congressional movement toward full freedom was delayed for a time by the Indian Reorganization Act of 1934, the Wheeler-Howard Act. Amid the deep social concern of the depression years, Congress deviated from its accustomed policy under the concept of promoting the general Indian welfare. In the postdepression years Congress—realizing this change of policy—sought to return to the historic principles of much earlier decades. Indeed, one of the original authors of the Act was desirous of its repeal. We should recall, however, that war years soon followed in which Congress found itself engrossed in problems first of national defense and then of mutual security. As with many other major projects, action was thus delayed.

INDIAN FREEDOM

In 1947 significant facts were emphasized regarding the advisability of furthering Indian freedom during hearings of the Senate Post Office and Civil Service Committee. The then Acting Commissioner of Indian Affairs, William Zimmerman, Jr., testified that about 40,000 Indians were then ready for immediate freedom from further special federal control. Statements made by the Acting Commissioner vividly recalled Congressional attention to the fact that specific groups of Indians were then regarded as prepared for on-the-spot freedom from their wardship status. Later the same Mr. Zimmerman became an officer of one of the private groups interested in Indian affairs. This testimony at the 1947 hearings served as an effective stimulus toward renewed consideration of an end of wardship.

In the light of this background, the actions of the ensuing Eighty-third and Eighty-fourth Congresses offer profitable example and experience. As this federal policy is better understood, tribal and individual Indian interest in abolishment of special federal controls will continue to increase. Meanwhile we must be ever mindful that in broad terms and in many ways decontrol has already advanced for all Indians by and large. These federal restraints over Indians have been removed through related Congressional measures dealing with health, education, social welfare, economics, and kindred fields, the end result of which is to regard the Indians as any other American citizens.

The Indian freedom program will not be accomplished immediately in the case of more large and complex situations, but for most tribes it can be numbered in a few years. Emotional and practical concerns dictate careful but measurable progress toward the goal of complete

freedom. Complicated realty and other property problems, the careful clarification and protection of rights, these at times serve to make the process of decontrol lengthy. Meanwhile the Congress, through increased appropriations, is stressing the education of Indian children. The Bureau of Indian Affairs is expanding its adult education and vocational rehabilitation programs to help Indians earn a livelihood and to assume their responsibilities as citizens without special federal services. By action of the Eighty-third Congress Indian health concerns, previously in the Bureau's care, have been transferred to the Public Health Service. Simultaneously through the Bureau's relocation program increasing thousands of energetic, healthy, skilled Indians compete successfully in our cities, bring their families into new modern homes, and thus in effect remove many conditions of their earlier wardship. Where financial burdens of transition from guardianship to normal citizenship appear evident for a tribe, consideration is given; thus the Eighty-third Congress in precedent-setting legislation provided assurance of aid for the Menominee. When all factors are considered, numerous chain-reaction situations are evident which tend to stimulate the desire for freedom even more conclusively.

We may admit the it-takes-time view, but we should not allow it to lull us into inaction. Freedom of action for the Indian as a full-fledged citizen—that is the continuing aim. Toward this end Congress and the Administration, state and local governments, Indian tribes and members, interested private agencies, and individual Americans as responsible citizens should all be united and work constantly. The legislatively set target dates for Indian freedom serve as significant spurs to accomplishment. Congress steadily continues to

inform itself, to seek out, delimit, and assist those Indians most able to profit immediately by freedom from special supervision, and it acts primarily to speed the day for all Indian tribes and members to be relieved of their wardship status. A basic purpose of Congress in setting up the Indian Claims Commission was to clear the way toward complete freedom of the Indians by assuring a final settlement of all obligations—real or purported—of the federal government to the Indian tribes and other groups.

This picture we must keep in mind when considering the steps that will be taken during the Eighty-fifth and succeeding Congresses and in understanding the setting in which the Eighty-third and Eighty-fourth Congresses acted to directly further the freedom program.

Let us now briefly consider the work of these two recent Congresses.

Freedom program in the 83d Congress

In 1953 during the Eighty-third Congress the members of the Senate and the House unanimously endorsed a statement on Indian policy that has continued to be in its general terms the guiding course of Congress. This action taken in the first Session, designated as House Concurrent Resolution 108, should be carefully noted in full:

Whereas it is the policy of Congress, as rapidly as possible to make the Indians within the territorial limits of the United States subject to the same laws and entitled to the same privileges and responsibilities as are applicable to other citizens of the United States, to end their status as wards of the United States, and to grant them all of the rights and prerogatives pertaining to American citizenship; and

Whereas the Indians within the territorial limits of the United States should assume their full responsibilities as American citizens: Now therefore, be it

Resolved by the House of Representatives (the Senate concurring), That it is declared to be the sense of Congress that, at the earliest possible time, all of the Indian tribes and the individual members thereof located within the States of California, Florida, New York, and Texas, and all of the following-named Indian tribes and individual members thereof, should be freed from Federal supervision and control and from the disabilities and limitations specially applicable to Indians: The Flathead Tribe of Montana, the Klamath Tribe of Oregon, the Menominee Tribe of Wisconsin, the Potawatomi Tribe of Kansas and Nebraska, and those members of the Chippewa Tribe who are on the Turtle Mountain Reservation, North Dakota. It is further declared to be the sense of Congress that, upon the release of such tribes and individual members thereof from such disabilities and limitations, all offices of the Bureau of Indian Affairs in the States of California, Florida, New York, and Texas, and all other offices of the Bureau of Indian Affairs whose primary purpose was to serve any Indian tribe or individual Indian freed from Federal supervision should be abolished. It is further declared to be the sense of Congress that the Secretary of the Interior should examine all existing legislation dealing with such Indians and treaties between the Government of the United States and each such tribe, and report to Congress at the earliest practicable date, but not later than January 1, 1954, his recommendations for such legislation, as in his judgment, may be necessary to accomplish the purposes of this resolution.

Thereafter there were bills introduced and hearings held in 1954 on twelve Indian groups totaling 1,715 printed pages. As a result Congress enacted legislation providing for release of federal supervision over the property and individual members of the Alabama and Coushatta Tribes of Texas, the Klamath of Oregon (Klamath and Modoc Tribes and the Yakooskin Band of Snakes), the Tribes of Western Oregon (Grand Ronde, Siletz), the Menominee Tribe of Wisconsin, and certain tribes in Utah (Shiv-

wits, Kanosh, Koosharem and Indian Peaks Bands of Paiutes; the mixed-blood Uintah and Ouray [Utes]). All of the above except the Utah Indians were specified in House Concurrent Resolution 108.

Approximately ten thousand Indians were thus set on the road to complete citizenship rights and responsibilities.

Hearings were also conducted but no conclusive legislation was adopted by the Eighty-third Congress regarding freedom from special supervision of the following: the Kansas and Nebraska Tribes (Sac and Fox, Iowa, Potawatomi, Kickapoo), the Makah of Washington, the Flathead of Montana (Salish and Kootenai), the Seminole of Florida, the Turtle Mountain Chippewa of South Dakota, the Indians of California, the Nevada Indians (Ruby Valley, Shoshone, Yerington Paiute, Battle Mountain, Carson, Las Vegas, Lovelock, Reno Sparks and Yerington Colonies).

Completion of the Alabama-Coushatta program largely enabled the Bureau of Indian Affairs to wind up its activities in Texas, one of the goals expressed in the Resolution. Even before its adoption the Bureau had virtually concluded its activities in another state mentioned in the Resolution, that of New York.

Freedom program and the 84th Congress

During the Eighty-fourth Congress legislation resulted in approval of releasing federal control over the property and individual members of three tribes in Oklahoma—the Peoria, Ottawa, and Wyandotte. Each of these tribes voluntarily adopted a resolution requesting the introduction and enactment of terminal legislation.

Through action of the Eighty-fourth Congress the Council of the Confederated Tribes at Colville, Washington, will submit within five years to the Secretary of the Interior a proposed plan

providing for their decontrol. The Congress likewise adopted a special decontrol deadline in the case of the mixed-blood members of the Uintah and Ouray (Utes) in Utah. This provided a seven-year period or until fall, 1961, for completion of terminal proposals.

Secluded reservation life is a deterrent to the Indian, keeping him apart in ways far beyond the purely geographic. By way of preparation for future decontrol programs, the Eighty-fourth Congress also passed the Vocational Rehabilitation Act to assist Indians to adapt themselves more readily to off-reservation life. Self-reliance is basic to the whole Indian-freedom program. Through our national historic development the Indian was forced into a dependent position with the federal government more and more, as America advanced westward, tending to sublimate his natural qualities of self-reliance, courage, discipline, resourcefulness, confidence, and faith in the future. Congress has realized this, and has steadily acted more positively to restore to the Indian these qualities. But self-reliance demands opportunity to grow. The Indian must be given the conditions under which—and only under which—self-reliance can be wholeheartedly regenerated.

DECONTROL ACTIONS PRECEDENT TO THE 83D AND 84TH CONGRESSES

To further clarify understanding, certain actions taken earlier than these two Congresses should be noted. Long before the Eighty-third, of course, the matter of releasing Indians from federal controls had been an important concern for Congressional and Administration study and action.

During the early years of the century so-called "competency commissions" were intended to provide a means of determining the qualifications of Indians to manage their affairs independ-

ently of Bureau of Indian Affairs supervision.

A decisive step forward was the granting of legal citizenship in 1924 by Congress to all American Indians born in this country not hitherto made citizens. This clear indication of Congressional decision pointed toward the ideal of Indian freedom and complete citizenship.

The role of the Bureau itself in preparing the Indian for self-reliant status was emphatically phrased by the Institute for Government Research, The Brookings Foundation, in its major 1928 publication, *The Problem of Indian Administration*, commonly known as the Meriam Report. It stated:

The fundamental requirement is that the task of the Indian Service be recognized as primarily educational, in the broadest sense of that word, and that it be made an efficient educational agency, devoting its main energies to the social and economic advancement of the Indians, so that they may be absorbed into the prevailing civilization or be fitted to live in the presence of that civilization at least in accordance with a minimum standard of health and decency. . . .

Soon thereafter—from 1929 to 1934—a broad survey was conducted by a Senate subcommittee relating to the principles upon which Indian administration should be furthered.

The Meriam report had recommended the transfer of services performed by the Bureau of Indian Affairs to other agencies, both public and quasi-public. This principle was observed in 1934 in the passage of the Johnson-O'Malley Act, which enabled the Bureau to transfer some of its previous services, particularly in the welfare and educational fields. By thus integrating the Indians into service channels open to the common citizenry the way toward freedom from special controls was fostered.

During the late 1940's when the matter of federal decontrol was considered

it was proposed in theory that an impartial scientific approach was the best means to handle the terminal program. Thus, for those tribes definitely showing the greatest degree of advancement in education and economic self-sufficiency it was proposed that federal control be withdrawn immediately. For others, a graduated scale of dates was proposed depending upon the rate of advance indicated. In 1947 the Bureau developed yardsticks and opinions on the relative degree of acculturation of various Indian tribes based on 1930 data. Since that time a continuing effort has been and is being made to refine similar data by tribes and other groups. Many of these data appeared in detail in House Report No. 2503, Second Session, Eighty-second Congress, and in House Report No. 2680 of the Eighty-third Congress. These reports and other survey work and recommendations were conducive to legislative action, particularly in the Eighty-third Congress.

By thus integrating the Indians into service channels open to the common citizenry the way toward freedom from special controls was fostered.

ADMINISTRATIVE DEVELOPMENT OF 83D CONGRESS LEGISLATION

Experience developed in carrying out the legislation adopted by the Eighty-third Congress for freedom from special federal control over Indians will be a valuable guide in continuing to develop further freedom-program bills. Generally, this experience has shown that other factors being equal, the smaller and rather well assimilated tribes or other groups, having relatively minor and cohesive property or other value interests easily adjustable to individual shares, appear the more likely subjects for prompt release from federal controls. And conversely, rather unassimilated and/or large groups with quite ma-

jor or intricate property or other value interests require more time, patience, and mutual understanding in moving toward eventual freedom from their federal wardship status.

For example, in a case such as that of the Alabama and Coushatta Tribes in Texas, involving about 400 Indians, relatively few problems were involved. All administrative action under the measure signed August 23, 1954, is complete. In fact, federal supervision ended as of July 1, 1955, and responsibility for 3,100 acres of tribal lands has been transferred to the state of Texas. These Indian people continue to be eligible for admission to hospitals and schools, maintained by the federal government for Indians, on the same terms applicable to other Indians. However, only seven found it necessary to call upon Public Health Service hospitals for medical needs. During the fiscal year 1956 five Alabama and Coushatta students continued or completed their courses in Bureau schools.

Decontrol also proceeded smoothly with the so-called Western Oregon Tribes, including some 2,100 Indians, and was complete August 13, 1956. Here more than sixty tribes, bands, and communities in northwest Oregon were concerned. After its final membership roll was completed the Grande Ronde Tribe decided to dispose of the bulk of its tribal lands and such sales were initiated. A practical property settlement on the Siletz reservation was quickly effected and a per-capita distribution of \$500,000—\$400,000 of it from the sale of tribal lands—was made to the Siletz.

In December 1956 completion of decontrol arrangements for the Paiute bands in Utah was very near, assuring an additional 232 Indians freedom from any special controls by the federal government.

A practical solution of the full- vs. mixed-blood status of certain tribesmen

was effectively worked out in Utah in the case of 1,804 Indians—Utes of the Uintah and Ouray reservation. The Congressional Act of August 27, 1954 provided for the division of tribal assets between the full bloods (the Ute Indian Tribe of the reservation) and the mixed bloods (the Affiliated Ute Citizens of the State of Utah). The final roll published April 5, 1956, determined a membership of 1,314 full-blood Indians and 490 mixed-blood persons. On the basis of this last roll a ratio for the division of tribal lands was then worked out between full and mixed bloods. The mixed bloods have now adopted a constitution and by-laws approved by the Bureau, and a budget for fiscal year 1957 made provision for a \$4,500 per-capita distribution of assets of the Affiliated Ute Citizens. Meanwhile the full bloods have drawn up a long-range development program for their own property.

In the case of the Klamath the government has shown its willingness to review the program as a result of administrative problems that arose in applying freedom legislation. As a result of statements from both Indians and non-Indians who felt that enforcement of the act of August 13, 1954, might prove injurious to the valuable Klamath forestlands, the Secretary of the Interior has agreed to review the act with a view to possible amendment should it seem desirable. The act does not call for complete decontrol before August 13, 1958. However, other events moved forward auspiciously for the 2,118 Indians concerned. A proposed final roll for the Klamaths has been published, and plans have been proceeding for a suggested division of the tribal property as well as for management of tribal-held assets. A detailed case history of each tribal member is being obtained, and a special advisory service is open to those wishing its assistance.

Although the Menominee was the first decontrol act adopted by the Eighty-third Congress, on June 17, 1954, this act affecting the largest such group to date—3,225 Indians living in Wisconsin—provides for the longest transition period of those enacted by the Eighty-third Congress. In many ways the most interesting of the decontrol projects to date, it also marks a fine example of state and local interest and co-operation.

During the first year of the Menominee transitional program four steps were taken: To prepare for a final membership roll and to arrange distribution of \$4,885,500 among members; to set up a state-federal special educational program and to reorganize tribal and agency commercial activities with Menominee controls greatly augmented.

An enlarged tribal organization has taken over many service functions formerly performed locally by the agency personnel. The greatly reduced agency staff is now largely devoted to advisory and trust-management activities. For the balance of the transitional period it will be a "learn-by-doing" process for the Menominees with counseling and general trust supervision as the Bureau's interim role.

ADMINISTRATIVE DEVELOPMENT OF 84TH CONGRESS LEGISLATION

Through their voluntary request more than 2,000 Indians in Oklahoma, members of the Peoria, Ottawa, and Wyandotte Tribes, were placed upon the road to final termination of special federal controls by the Eighty-fourth Congress. For each group a complete membership roll was to be prepared early in 1957, and it was expected that decontrol would be complete by August 1959 for each. No large administrative problems appear evident.

During October 1956 a delegation of the Confederated Tribe of the Colville, Washington reservation met with Bu-

reau officials in Washington to prepare a five-year decontrol program for 4,189 Indians. The Eighty-fourth Congress had provided that the tribe should submit proposed decontrol legislation by July 24, 1961.

VOLUNTARY INDIAN ACTIONS TOWARD FEDERAL DECONTROL

The Commissioner of Indian Affairs, Glenn L. Emmons, has noted that one of the most helpful and promising courses toward termination is by voluntary request of the Indian groups themselves. In an informal statement on January 31, 1956, at a House subcommittee hearing on appropriations Emmons remarked:

... In a number of areas, tribes have taken the initiative in exploring the means of programming their way toward eventual self-determination, that is, the, Sisseton-Wahpeton Tribe in the Aberdeen (S. D.) area, the Makah and Colville Tribes in the State of Washington, several urban colonies in Nevada, the tribes in the Quapaw jurisdiction in eastern Oklahoma, . . .

... in order for projects to be meaningful to the tribal groups, they must be developed at the local level in consultation with the tribal groups affected, and there must be a continuous follow-through in the development and implementation of the program proposals.

On April 12, 1956, in a major memorandum to all of the Bureau area directors and superintendents, Commissioner Emmons again referred particularly to the value of voluntary Indian group action. He said in part:

A good program is one which results from the desires of and fits the needs of a particular group of Indians. In whole or in part the program should, if possible, be the work of the Indians themselves.

As to the question of legislation Emmons specifically noted that:

... In some cases, it may develop that special legislation will be necessary to forward a group's basic program. In other

cases the Indian group may feel that the group's cultural assimilation and integration into the community life about them has progressed to the point where they desire early congressional consideration of termination legislation. In either case, the Area Director should advise the Commissioner with a view to arranging for special guidance and assistance.

ROLE OF THE INDIAN CLAIMS COM- MISSION IN DECONTROL

Completely within the historic policy of Congress in working toward the elimination of special controls over Indians is its concept of the role of the Indian Claims Commission. The Commission assures legal settlement of long-standing claims for redress against the federal government, which many Indians believe should be a necessary condition precedent to effective decontrol consideration. The Commission, set up in 1946, was then empowered to accept petitions until August 13, 1951 and was directed to conclude judgments on all claims by April 1957. Because of the large number of claims filed it had become necessary to extend the life of the Commission, and Congress—intent on providing judicial determination of all claims—passed legislation in 1956 to continue the Commission until the spring of 1962. However, the fact that all

claims are not settled does not forestall present decontrol planning.

ACTION OF SUCCEEDING CONGRESSES TOWARD DECONTROL

The basic principle enunciated so clearly and approved unanimously by the Senate and House in House Concurrent Resolution 108 of the Eighty-third Congress continues to be the over-all guiding policy of Congress in Indian affairs. In view of the historic policy of Congress favoring freedom for the Indians, we may well expect future Congresses to continue to indorse the principle that "as rapidly as possible" we should end the status of Indians as wards of the government and grant them all of the rights and prerogatives pertaining to American citizenship.

With the aim of "equality before the law" in mind our course should rightly be no other. Firm and constant consideration for those of Indian ancestry should lead us all to work diligently and carefully for the full realization of their national citizenship with all other Americans. Following in the footsteps of the Emancipation Proclamation of ninety-four years ago, I see the following words emblazoned in letters of fire above the heads of the Indians—*THESE PEOPLE SHALL BE FREE!*

The Indian Claims Commission Act

By NANCY OESTREICH LURIE

Abstract: Awareness of the specific need for solving problems of jurisdiction and finance in Indian litigation, a growing feeling that Indian claims should receive more speedy and just attention, and administrative expedience combined to cause Congress to adopt the Indian Claims Commission Act in 1942 and to extend it ten years later to 1962. The author describes the types of claims that arise and discusses some of the issues involved with special reference to the role of expert testimony by anthropologists, whose views have been sought in order to clarify such matters as the identification of tribes and the original boundaries of their lands.—Ed.

THE Indian Claims Commission Act embodies a number of remarkable legal features as a reflection of problems that have arisen in dealings between the United States and the various Indian tribes. The actual prosecution of suits in accordance with the terms of the Act has led in turn to certain interpretations and procedural aspects of special interest to social scientists. The following discussion will consider these historical and recent phases in the development and application of the Indian Claims Commission Act.¹

The Act, approved August 13, 1946, was to remain in effect for ten years;

¹ It must be noted that many of the claims discussed are still pending. Thus, my analyses, apart from specific points duly cited, are my own views based on personal observation, experience, and research as an expert witness and are not to be construed as the views of the Indian tribes or attorneys by whom I have been employed. While maintaining my personal responsibility for this article, I would like to thank the many colleagues whose stimulating discussions of a variety of Indian claims have suggested factual and theoretical insights. I would particularly like to thank Dr. Angie Debo who had begun research for this study and graciously forwarded her notes for my use.

Nancy O. Lurie, Ph.D., Ann Arbor, Michigan, is lecturer in Anthropology, University of Michigan, and was Research Associate in North American Ethnology, Peabody Museum, Harvard University. She has written numerous articles on the American Indian for professional journals.

all claims had to be filed within five years from the date of approval. Due to the large number of cases that had not yet been heard or adjudicated by 1956, the Act was extended in all its details until April 10, 1962.² The Commission is presided over by a chief commissioner and two associate commissioners; Indian petitioners are represented by private attorneys; and the United States is defended against Indian claims by attorneys of the Department of Justice. The Commission has promulgated rules of procedure, but the rules of evidence applicable are comparable to any federal court.

The Act creating the Indian Claims Commission is of relatively recent date, but the need for such legislation had long been recognized for a variety of reasons. Primary among these was the problem of defining jurisdiction in Indian litigation. Although the United States Court of Claims was established in 1855 to permit suit to be brought against the government, by 1863 tribal claims based on treaties were excluded from the general jurisdiction of the

² C. 949, 60 Stat. 1049; 25 U.S.C. 70; P.L. 767, Eighty-fourth Congress, Second Session.

court.³ Like foreign nations, it was necessary for each tribe to obtain a special jurisdictional act from Congress in order to present its case in the United States Court of Claims. This arrangement was discriminatory in that tribes differed in the amount of political influence they could command and in having effective legislative spokesmen for their cases. It was also an expensive and time-consuming procedure, since each claim required a virtual trial in Congress whereby cause for granting a special act might be demonstrated. If such an act were granted, the provisions allowed the tribe as a basis of suit were frequently construed in such a narrow way that it was difficult to obtain a full consideration of tribal grievances in the Court of Claims. The result was that a majority of petitions was dismissed by the court.

PROBLEMS OF JURISDICTION AND FINANCE IN LITIGATIONS

A tabulation covering the years 1881–1950 revealed that of 118 claims presented by Indian tribes before the Court of Claims, only thirty-four were allowed recovery.⁴ Lawyers were understandably reluctant to represent Indian clients in light of the highly specialized na-

³ Act of March 3, 1863, 12 Stat. 765.

⁴ "Tabulation Showing Highly Speculative Nature of Indian Tribal Suits," Court of Claims Nos. 45585, 46640, 47564, 47566; affidavit of Ernest L. Wilkinson Respecting in The Above Captioned Cases, pp. ii, appendix 2, 3. This information was compiled in connection with the celebrated claim of the Ute Indians of Colorado which resulted in a compromise judgment of just over \$31,000,000. It was the largest award ever made in an Indian claim and larger than the total of all other awards made in Indian claims in the Court of Claims. Despite these spectacular aspects, it was typical of Indian litigation in other respects. The attorneys' fees were set at less than 9 per cent of the final judgment, and the case covered eighteen years from the time contracts were signed until the final amount was settled (1932–1950).

ture of the litigation and the small likelihood of recovery. Furthermore, many attorneys recognized that Indian grievances often arose out of concepts of a cultural and social nature not covered by customary interpretations of American law, but that these grievances deserved special recognition. For example, the *Winnebago* case, Docket No. M-421 in the Court of Claims, was begun in 1928 and finally dismissed in 1942. This time lag as well as the negative outcome was typical of a category of cases connected with the removal of tribes from one place to another.

The tribe claimed restitution on the basis that they had been removed from a reservation in Minnesota to one in South Dakota without their consent. The consequent hardships involving the death of many Winnebago by starvation and exposure forced the rest to flee from South Dakota if they hoped to survive. Ultimately, a majority of these Indians settled among the Omaha where their present reservation was granted to them. Their efforts to become acculturated in Minnesota had been interrupted, many of their older leaders had died in the removal, and their social and cultural life was disrupted and disorganized by the shift in reservations. Although the characterization of the government as "generous" in the final dismissal of the case may sound ironic, it was proper in legal terms. The Court of Claims measured cause for recovery in regard to comparable land values, and the last reservation in question was equal to the first reservation, if not exceeding it in value. The fact that the Winnebago for many years actually resided in the small timbered area of the reservation, being unable to utilize the agricultural lands placed at their disposal in Nebraska, was beyond the jurisdiction of the court. Likewise, the loss of the agricultural land through the machinations of vari-

ous white people could not be considered in the case. Situations of this nature illustrated that the real causes of Indian complaints were not being met in the Court of Claims.

Apart from the problem of jurisdiction was the matter of claims which were never pressed although they might have stood a good chance of recovery in the Court of Claims. These were the cases of tribes which had inadequate funds or no funds at all with which to prepare and prosecute their cases.

Along with the awareness of the specific need to solve the questions of jurisdiction and finance in Indian litigation, there gradually developed a public sentiment that justice was due the Indians which required attention. However, this component of conscience which led to the eventual passage of the Indian Claims Commission Act was underscored by two matters of administrative expediency. First, notwithstanding the discouraging statistics in regard to recovery in Indian claims, as Indians became increasingly cognizant of their rights before the law, Congress was petitioned with ever greater frequency for special jurisdictional acts. These cases exhibited certain common features that suggested the possibility of creating some general jurisdictional legislation, thereby saving time and money for both the government and the Indians.

Second, the unsettled claims were recognized as contributing to the difficulties attendant on the over-all administration of Indian affairs. As early as 1928 the situation was summarized succinctly in a special report dealing with Indian problems:

The benevolent desire of the United States government to educate and civilize the Indians cannot be realized with a tribe which has any considerable unsatisfied bona fide claim against the government. The expectation of large awards making all members of the tribe wealthy, the disturbing influ-

ence of outside agitators seeking personal emoluments, and the conviction in the Indian mind that justice is being denied, renders extremely difficult any cooperation between the government and its Indian wards. Besides these practical considerations, the simple canons of justice and morality demand that no Indian tribe should be denied the opportunity to present for adjustment before an appropriate tribunal the rights which the tribe claims under recognized principles of law and government.⁵

The insistence in the above report that legal steps of a judicial nature be taken points up another category of Indian claims besides those which could be dealt with in the Court of Claims if jurisdiction were granted by Congress. Cases in which Congress might grant direct relief will be given special consideration in the discussion of jurisdictional provisions in the Indian Claims Commission Act. It may be noted here, however, that such claims relied even more heavily on the caprice of Congress than did claims arising out of treaties.

FEATURES OF INDIAN CLAIMS COMMISSION ACT

As a result of the attempt to deal with the sundry issues raised in Indian litigation, the Indian Claims Commission Act contains several features unique in the history of American jurisprudence. It is important to study the Act in detail at this point since the interpretations and regularizations of procedure, which have grown out of the application of the law, are often mistaken for the law itself. Curiously, the general results of cases to date have tended toward a conservative interpretation of the substantive aspects. The procedure in the presentation of evidence and the evidence itself have taken a course that

⁵ Lewis Meriam and Associates, *The Problem of Indian Administration* (Baltimore: Institute for Government Research, 1928), p. 805.

was not within the scope of prediction or expectation of those responsible for the Act.

Apparently, the feature dealt with most easily was the financing of Indian cases. Section 15 of the Act sets forth in detail the arrangements regarding legal representation. Special reference to fees for Indians' attorneys points up two unusual matters. Where tribes are unable to invest in any expenses of litigation, and this is the usual situation, cases may be conducted on an entirely contingent basis. This provision is at sharp variance with ordinary regulations of legal practice. An attorney taking a case of this type risks losing his entire investment. Furthermore, any attorney winning a judgment in favor of his clients may receive no more than 10 per cent of the net judgment, aside from actual expenses incurred in the prosecution of the case. It should be noted that claims which do not involve Indians may result in attorneys' fees covering as much as 25 to 50 per cent of the final award. Despite these stringent regulations, Indians have apparently experienced little difficulty in finding attorneys to take their cases. This may be attributed in part to the huge land areas involved—conceivably the entire United States and a large portion of Alaska—so that even 10 per cent of a judgment appeared to be a sizable sum worth an attorney's efforts.⁶

⁶ Mention should also be made of those attorneys who for many years had been concerned about the discriminatory and complicated aspects involved in Indian claims cases. They greeted the Indian Claims Commission Act as a long needed legal measure and were ready to represent Indian clients under its provisions. No history of the Indian Claims Commission Act is complete without reference to the instrumental role of two attorneys. Ernest L. Wilkinson, as noted in note 4 above, was able to supply a full understanding of the difficulties to be overcome in dealing with Indian litigation, while the late Felix Cohen, Assistant Solicitor in the Department of the In-

Once cases began to be heard, the wording of the Act required interpretation, and, as a consequence, attention has centered on four primary problems. These are the identity of the petitioners, the grounds for suit, the presentation of specialized evidence, and the assessment of land values. The matter of evidence must be considered at the outset since it relates to the other problems. Section 13 (b) also of the Act states that the Commission shall establish an "Investigation Division" to search for evidence in the documents and records of the Court of Claims and the several government departments. Such information is to be submitted to the Commission and also to be made available to the Indians involved and to any interested federal agency. The division has never been established, presumably because it was not considered necessary, and funds were never allocated for this purpose. Section 13 (b) provides for the taking of depositions from aged Indians and other individuals having direct knowledge of claims to be presented.

However, it soon became obvious that evidence would consist of more than official documents or records and direct testimony of Indians or their neighbors. Such evidence required organization and interpretation by experts skilled in work of this type. Consequently, anthropological and historical analyses began to play an important part in claims litigation. Critical study of literature concerning given tribes was buttressed with ethnographic accounts. These offered more complete information and more accurate descriptions than the direct testimony of Indians taken according to the format of legal depositions. Archeological investigations provided information where documentary and ethnographic information was incomplete. Even the

terior at the time the Act was passed, concerned himself deeply with its provisions as a matter of federal duty.

assessment of land values required a background of historical understanding. Again, the Act makes no specific mention of anthropological or historical expertise, but the provisions of Section 18 regarding testimony and the Commission's rules of procedure are sufficiently broad to admit such testimony.⁷

ANTHROPOLOGICAL TESTIMONY

The Court of Claims had used anthropological testimony on only three occasions and no precedents in testimony had been established in this regard, so that the role of expert witness was a new one for archeologists, ethnologists, and ethnohistorians. When differing theoretical positions, analyses, and terminology began to loom significantly in the final outcome of the cases, anthropologists became upset and took little comfort from attorneys' assurances that even mathematicians and engineers differed in their expert testimony. Many anthropologists have suggested that the investigation division be activated and that it provide for the inclusion of testimony by anthropological consultants to deal with specialized information and interpretations. It has also been suggested that pretrial discussions be permitted between experts who felt that the differences in their testimony were more apparent than real and was due to the nature of questions put to them in a litigious situation. However, to date, standard legal procedure has been followed with both the Department of Justice and the Indians' attorneys examining their own experts and cross-examining their opponents' witnesses. The special problems usually considered by these witnesses then concern matters of

Indian identity and grounds for suit. Land values, which enter later into the proceedings, have been the special province of land assessors and historians and will be discussed in another connection.

Turning to the question of identity, Section 2 of the Act sets forth a description of the petitioners which is intended to include all likely claimants within the jurisdiction of the Commission: "any tribe, band, or other identifiable group of American Indians residing within the territorial limits of the United States or Alaska." Due to the reliance on anthropologists, these terms have given rise to unexpected semantic complications. One scholar's tribe is another scholar's band; some writers have used the terms synonymously; other anthropologists distinguish different types of tribes and bands depending on their historic origins. Thus, in the case of the Lower or Idaho Kootenai, the social identity of this populational entity was an initial point at issue. Docket 154 before the Indian Claims Commission describes the petitioner as the "Kootenai Tribe or Band of Indians of the State of Idaho," which is an admissible dual designation employed by attorneys to deal with the equivocal wording of the Act. Nevertheless, it was argued by the defense that perhaps the Idaho Kootenai had no right to bring a separate suit as a distinct social entity since the Kootenai in Docket 61 were already bringing suit in the claim of the "Confederated Salish and Kootenai Tribes of the Flathead Reservation, Montana." The similarity of names, and the fact that the area claimed was included in the treaty map which was the basis of the Montana tribes' claim, suggested that the Idaho Kootenai were but a geographic subdivision of a single Kootenai tribe. The Montana Kootenai recognized the separate tribal identity of the Idaho Kootenai and stipulated to that effect.

Documentary evidence along with ethnographic information indicated that only the historic accident of linguistic similarity accounted for the designation of the two tribes as "Upper Kootenai" and "Lower Kootenai" in a largely Salish-speaking area. Earlier literature indicated that completely different names were used for each tribe. The Idaho Kootenai had not only been absent from the treaty negotiations of 1855, but for many years were unaware that their lands had been included within the cession boundaries. Although specific definitions of groups must thus be adduced in each case on the basis of distinctive customs, genealogies, locations and the like, the question of a general definition is repeated over and over by attorneys for the petitioners and for the defense: "Now, Doctor, how would *you* define the word tribe? . . . In your opinion, do the petitioner Indians conform to this definition?"

DEFINITIONS OF INDIAN SOCIAL ENTITIES

The phrase "identifiable group of American Indians" appeals to anthropologists as having general utility in distinguishing a cohesive and recognizable social entity whereby the varied and special connotations of tribe and band might be bypassed. Unfortunately, this term has also been construed in different ways. It may have an ethnological and historical basis like tribes or bands. It may also have a legal basis in terms of groups derived as treaty entities or in terms of "statutory groups" created by Congress for administrative expediency, such as "The Indians of California."

The problem of identity goes deeper than simply defining a society, but implies factors of time and socio-cultural continuity. It is necessary to establish the historic relationship of Indians bringing suit as the rightful heirs to

recovery for claims originating one or more generations in the past. In a majority of cases the claims refer to a period from which there are no living survivors. Section 2 provides that all defenses except laches and statutes of limitations may be used by the United States, so that the time covered between the origin of a claim and the hearing regarding it may be a century or longer.

The complications arising in these instances are many and varied. A frequent historic accident was the geographic separation of what was once a single tribe, holding a common territory, into several smaller groups. Such is the case of the Sac and Fox, Ioway, Potawatomi, Winnebago, and many others. Another common situation is that of several tribes who signed a joint treaty and were located on a single reservation. These tribes now have a general tribal council which does not represent the component tribes. Thus, their separate histories must be disentangled, as in the cases of the Confederated Salish and Kootenai tribes already mentioned, the Confederated tribes of the Colville reservation, the Three Affiliated Tribes of the Fort Berthold reservation, and others.⁸

⁸ To the layman, the identity of petitioners' legal representatives becomes almost as complex as the identity of the petitioners themselves. According to section 10 of the Act, tribal organizations authorized by the Secretary of the Interior have the exclusive right to bring claims in behalf of their tribes. Where there is no such council, any member may bring a claim in behalf of his tribe. In some tribes different factions have retained different firms of attorneys who have had to make common cause in the Indians' interests. Sometimes a tribe has been divided into separate geographical enclaves, each having a council and its own attorneys who work together in bringing suit in a claim common to all of the branches of the tribes. Several firms may share the burden of preparing contingent cases with the understanding that all will share to an appropriate amount in any judgment which may be awarded.

⁷ Donald C. Gormley, "The Role of the Expert Witness," *Ethnohistory*, Vol. 2, No. 4 (1955), pp. 326-46, discusses expertise generally and with special reference to anthropological testimony in connection with the Indian Claims Commission Act.

On the Northwest coast another type of confusion may be seen in the fact that in the 1850's the treaty commissioners were directed to combine little tribes into big tribes and locate as many as possible on single reservations. The Quileute of the Olympic Peninsula offer an example of this situation. These people lived at the mouth of the Quileute River and in a few villages located further upstream. The question arose as to whether the various villages brought together on a single Quileute reservation represented separate little tribes which ought each to bring suit, or whether all formed an original tribe. There seemed to be little question, at least in the minds of the petitioner Indians and their attorneys, that all of the people on the Quileute River belonged to one tribe as indicated by genealogies and other cultural data. However, other villages located on the neighboring Hoh River also spoke Quileute and seemed to be part of the same tribe on the basis of kinship and common customs. They had been reluctant to move to the Quileute reservation and were eventually given a tiny reservation on the Hoh River. Since the claim embraced the watersheds of the Hoh and Quileute Rivers as one large tract, the identity of the petitioners was assured in Docket 155 with the complicated designation of: "The Quileute Tribe of Indians, on its own behalf, Quileute Tribe of Indians, on its own behalf and on behalf of the Hoh Tribe or Band of Indians; Hoh Tribe or Band of Indians, on the relation of and represented by Scott Fisher, on its own Behalf."

In other cases the attempt at consolidation of claims as a single tribe has been unsuccessful. A number of Chippewa brought a common suit as the Chippewa nation since they had been so designated in various treaties. When the claim, Docket No. 126, was first brought to the Court of Claims, the

Chippewa nation was directed to reduce the matter into the separate claims of the component bands of the Chippewa nation. Chippewa claims later heard by the Commission were likewise set forth on the basis of separate bands. The Commission took a similar view concerning the *Ottawa* Case, Docket No. 2, where the Ottawa were interpreted as comprising several bands notwithstanding treaty terminology concerning the Ottawa nation.

CLAIMS CATEGORIES

Similar to the difficulties raised in the latitude of jurisdiction in the description of petitioners are those involved in the broad grounds for claims. The five categories of claims as set forth in Section 2 of the Indian Claims Commission Act will be discussed in the order given.

(1) Claims in law or equity arising under the Constitution, laws, treaties of the United States and Executive Orders of the President; (2) all other claims in law or equity, including those sounding in tort, with respect to which the claimant would be entitled to sue in a court of the United States if the United States was subject to suit; (3) claims which would result if the treaties, contracts, and agreements between the United States were revised on the ground of fraud, duress, unconscionable consideration, mutual or unilateral mistake, whether of law or fact, or any other ground cognizable by a court of equity; (4) claims arising from the taking by the United States, whether as a result of treaty of cession or otherwise, of lands owned or occupied by claimant without payment for such lands of compensation agreed to by the claimant; and (5) claims based on fair and honorable dealings that are not recognized by any existing rule of law or equity.

The first two clauses admit of easy interpretation according to ordinary legal tenets, but clauses three, four, and five bear special notice as being peculiar to Indian litigation and without precedent in American law. In regard to the third

clause, the Chief of the Indian Claims Section of the Department of Justice has noted:

Treaties between the United States and foreign nations have been freely construed by our courts, but never before has any court had any jurisdiction to "revise" a treaty. This has always been considered a political matter completely outside the scope of judicial inquiry. And technically this separation of powers has been preserved for you will notice that the Commission and the courts are not given authority to actually revise the treaty but only to grant relief "as if" the treaty were revised.⁹

Clause four was the subject of much legal debate until it was finally settled that the Indian Claims Commission has jurisdiction over claims based on "Indian title," that is, title derived from the simple use and occupancy of a given land. The Department of Justice made strenuous but unsuccessful efforts to eliminate such aboriginal title claims from the Indian Claims Commission Act when the Act was under consideration for amendment to extend its tenure for five years beyond 1957. The question was settled on the outcome of two important cases which will be discussed. However, the historical circumstances underlying the legal reasoning in these cases must be reviewed.

The terms "time immemorial" and "Indian title" figure so prominently in discussions of Indian claims that it is surprising to note that neither phrase occurs anywhere in the Indian Claims Commission Act. Nor do the terms imply, as is often erroneously assumed, that Indian tribes must establish their claims as aboriginal holdings since "time immemorial." However, the theory of

⁹ Ralph Barney, "Legal Problems Peculiar to Indian Claims Litigation," *Ethnohistory*, Vol. 2, No. 4 (1955), p. 316. The total article, pp. 315-25, notes, among other matters, further instances in the difficulties of designating the petitioner Indians.

immemorial possession is fundamental to Indian claims to land in general since the United States' dealings with the Indians rested on precedents established by earlier governments such as those of France and England; and these governments recognized Indians as the original occupants of the American continent. France entered into various agreements with different tribes whereby French sovereignty was extended over Indian country, but it was understood that the Indians would remain in possession of the soil and retain its use as was their customary wont. England, being more interested in actual colonization, declared that land acquired from Indians should be paid for, although English sovereignty was already established in a territory as a replacement of Indian sovereignty or that of another European nation. The crown also reserved the right to enter into such purchases and denied private citizens the authority to buy land directly from the Indians.¹⁰

UNITED STATES TREATIES WITH INDIANS

The United States followed this reasoning in entering into treaties with Indians as if they were foreign nations. The Treaty of Greenville in 1795 is an outstanding early example in this connection, since the Indians had been soundly defeated and United States sovereignty extended over the Ohio Valley on the basis of conquest. Neverthe-

¹⁰ "Important Western State Papers," *Collections of the State Historical Society of Wisconsin*, Vol. 11 (1888), pp. 26-63, reprints an interesting series of rare documents and cites others illustrating this sequence of French, English, and American philosophies of sovereignty in regard to the Old Northwest. In this connection, Section 12 of the Trade and Intercourse Act of 1802 (2 Stat. 139) also enunciates the doctrine that land negotiations with Indians must be made pursuant to the Constitution and are not the province of private citizens.

less, the tribes concerned were paid for the cession of territory east of the line designated in the treaty to separate white settlement from Indian lands.¹¹ However, in some instances land was simply appropriated by white settlers and the Indians dispersed without compensation before treaties could be negotiated. In other cases, Indians remained on certain land which was later secured to them by Acts of Congress or Executive Orders of the President. Finally, some lands were held under Indian title, that is, without special recognition and often for long periods of time. Usually this was done with the understanding that some official recognition would eventually be made. In the last category was the case of the Tee-Hit-Ton Indians of Alaska which raised many questions and a good deal of consternation among Indians' lawyers in terms of possible relationships to claims before the Commission. In 1951 these Indians filed a claim before the Court of Claims for compensation for timber taken by the United States. Recovery was not allowed, and the case was brought before the Supreme Court which

¹¹ The Northwest Ordinance of 1787, re-enacted and confirmed in 1789 (1 Stat. 50), underlay such provisions as are illustrated in the Treaty of Greenville:

"The utmost good faith shall always be observed towards the Indians; their lands and property shall never be taken from them without their consent; and in their property, rights and liberty they shall never be invaded or disturbed, unless in just and lawful wars authorized by Congress; but laws founded in justice and humanity shall, from time to time, be made, for preventing wrongs being done to them, and for preserving peace and friendship with them."

These features were in effect extended to the Louisiana Territory in 1804 by an Act of Congress (2 Stat. 283).

The status of Indian tribes as nations was not only implied in the fact that treaties were negotiated with them but in the opinion of Chief Justice Marshall in 1823 in *Johnson v. McIntosh*, 8 Wheat, U.S. 543.

affirmed the negative decision of the Court of Claims.

The majority opinion, written by Mr. Justice Reed, begins with the observation that:

This is not a case that is connected with any phase of the policy of Congress, continued throughout our history, to extinguish Indian title through negotiation rather than by force, and to grant payments from the public purse to needy descendants of exploited Indians.

Indian title was then discussed in terms of sovereignty held over such land by the United States through conquest. It was decided that Indian title is merely the right of occupancy, not property, and places the government under no obligation to compensate Indians for such lands. This type of title is "unrecognized" in comparison to "recognized title" deriving from treaties or Acts of Congress; only recognized title would be compensable. Since the Tee-Hit-Ton Indians based their claims on the Fifth Amendment, the opinion concludes that in affirming the decision of the Court of Claims, "it leaves with Congress, where it belongs, the policy of Indian gratuities for the termination of Indian occupancy of Government-owned land rather than making compensation for its value a rigid constitutional principle." It was also stated in the opinion that Congress has power to take or use Indian title without compensation, but makes provision for tribes to recover for wrongs, "as a matter of grace, not because of legal liability."¹²

Taken as whole, the decision might have implied that all cases of Indian title would have to be recognized by Congress before being submitted to judicial processes. Applied to claims pend-

¹² Tee-Hit-Ton Indians v. United States, 348 U.S. 272, 273, 282, 291 (1955); the decision of the Court of Claims is reported in 128 Court of Claims 82 (1954).

ing before the Indian Claims Commission, it was questioned whether or not the decision might lead to exclusion of all cases of Indian title from the general jurisdiction of the Commission. A test was provided in 1953 when the *Otoe and Missouri* case, in which the Commission recognized the government liable under Indian title, was appealed to the Court of Claims.¹³

The Court of Claims sustained the decision of the Indian Claims Commission,¹⁴ and the Supreme Court declined to review the case.¹⁵ The phrase in clause four, "claims . . . as the result of treaty of cession or otherwise . . .," was finally clarified to include Indian title within the jurisdiction of the Commission. Congress, in passing a general jurisdictional act, had fulfilled provisions lacking in the *Tee-Hit-Ton* case which had reached the Supreme Court directly through the Court of Claims. The sigh of relief of Indian tribes and their attorneys was said to be audible for miles around.

JURISDICTIONAL PROVISIONS OF CLAUSE FIVE

The final jurisdictional clause concerning "fair and honorable dealings" has been the subject of much debate and has never been settled in the manner of Indian title. The government has argued consistently that it means moral claims and is not intended as an alternative method of securing relief in the event that a case is not proven under technical legal rules. However, in one case at least, the disparity between the price paid a claimant for lands and the then current market value of the lands was so great that the Commissioners entered a judgment for the difference on the basis of clause five. They stated that while there might not have been

sufficient basis for a claim on the grounds of unconscionable consideration, yet the evidence did demonstrate a lack of fair and honorable dealings with the *Otoe* and *Missouria* Indians on the part of the United States.¹⁶

Despite the broad jurisdictional provisions, especially in clause five, Indians' attorneys have found it expedient to base claims for restitution on tangible and measurable considerations. As a result, the majority of claims have centered in land to such an extent that the Commission is understandably, albeit erroneously, referred to as the "Indian Land Claims Commission." Although our courts have granted judgments for "mental anguish" and similar grounds, these have been individual claims and have thus apparently influenced the thinking of the Commissioners. One of the first claims decided by the Commission was that of the survivors of Geronimo's band of Apaches for unfair imprisonment, and it was dismissed as being based on individual claims whereas the jurisdiction of the Commission extends only to group or tribal claims.¹⁷

Nevertheless, within the framework of claims for land, the provisions of the Act allow inclusion of evidence which is peculiarly Indian in nature. As has been noted, the matter of treaty and nontreaty cases was finally settled, but further discussion is in order. Ostensibly, where the government outlined Indian holdings in treaties, the land in question would be more easily defined and accepted in any claim based on such treaty. Where no treaty was made, occupancy and use would have to be determined by historical and anthropological evidence. Actually, it is necessary to establish such use and occupancy whether or not boundaries were defined

by treaty. According to clause three, it is noted that claims may arise out of negotiations in which fraud, duress, and mutual or unilateral mistake may have played a part. When it is recalled that in many instances treaties were discussed through interpreters involving several Indian languages and perhaps French or Spanish, the possibility of misrepresentation or misunderstanding is apparent. Furthermore, Indian parties to given treaties were usually non-literate and dependent on their unlettered interpreters for understanding of the document they signed with an X. Both from the point of view of the Department of Justice and from that of the Indians' attorneys, it is desirable to review the circumstances regarding a claim at the time it originated.

It is in this respect that anthropological testimony has come into particular use and is the basis of some disagreement among various scholars. Indian tribes differed in their concepts of territory. Some groups have reliably clear-cut ideas about boundaries while others know only their customary habits which the ethnologist must collate and locate in terms of mapping village areas, hunting grounds, and the like. Concern over the problems of use and occupancy have resulted in several major discussions at professional gatherings of anthropologists wherein the points at issue have at least been clarified if not settled to everyone's satisfaction.¹⁸

"Anthropology and Indian Claims Litigation: Papers Presented at A Symposium Held at Detroit, in December, 1954" [Annual Meeting of the American Anthropological Association], *Ethnohistory*, Vol. 2, No. 4 (1955), pp. 287-375; Robert A. Manners, "The Land Claims Cases: Anthropologists in Conflict," *Ethnohistory*, Vol. 3, No. 1 (1956), pp. 72-81; and Nancy Oestreich Lurie, "A Reply to 'The Land Claims Cases: Anthropologists in Conflict,'" *Ethnohistory*, Vol. 3, No. 3 (1956), pp. 256-79. Discussion of Indian claims held at the Central States Meeting of the American Anthropological Society held at Bloomington,

TRIBAL BOUNDARIES

It is naturally to the interests of the Indians to claim as large an area as possible, whereas the Department of Justice is concerned with reducing or eliminating claims on the basis of evidence presented. Americanists have traditionally mapped tribal boundaries in terms of contiguous territories, and this concept has been generally accepted by Indians' attorneys with modifications of details of given lines suggested by more intensive study of specific tribes. The Department of Justice has questioned this approach insofar as different parts of a tribe's territory may have been used more intensively than others. This has given rise to a theory of land use and occupancy based on "nuclear areas" surrounded by vacuums of relatively little used and scarcely occupied land. A claim might be reduced significantly by this interpretation. As far as anthropologists are concerned, the question remains open whether the traditional techniques of tribal mapping are simply an established convention convenient for academic purposes, or whether such maps reflect the empirical conclusions of many independent researchers in regard to the proper designation of territoriality of human groups generally considered. This reassessment of tribal mapping suggests that neither system can be taken as *THE* theory of Indian use and occupancy, but that each case must be discussed in terms of the facts available.¹⁹

Indiana, in May 1955, as a follow-up of the Detroit Symposium is noted in the last two papers cited above.

¹⁹ Cf. Verne F. Ray, [a review of] Harold E. Driver, *et al.*, "Indian Tribes of North America" (Indiana University Publications in Anthropology and Linguistics: Memoir 9, International Journal of Linguistics, Vol. 19, No. 3, Supplement, Baltimore, 1953), in *American Anthropologist*, Vol. 57, No. 1, Part I, February 1955, pp. 145-46; and Harold E. Driver

The Department of Justice has tended to emphasize intensive economic utilization of land as the basis of use and occupancy, whereas attorneys for Indians have included in evidence both expert testimony and documentary information regarding seasonal and noneconomic factors. Game and plant life, it is argued, had to be allowed to multiply to assure a regular supply of food. Thus, given areas might be intensively used only for brief seasons. Or, certain areas of limited economic activities might have tremendous social significance for a group so that the loss of a particular tract of land worked a real hardship in the established life of the people. Thus, the gathering of certain plant foods such as berries in the Plateau area might not have meant economic necessity, but did represent an important seasonal activity which helped underscore an identifying characteristic of tribes in the area. It was also pointed out that in the Plateau given lands were prized simply because they were isolated and not intensively used, except in connection with the vision quest. For a group to exist in its customary manner, it was necessary for men to seek visions which required lonely retreats. Many tribes had areas that were considered dangerous or sacred and were thus seldom visited. These areas, however, held an important value in the ethos of such groups and caused a sense of loss in their desecration by white occupancy or by removal of the Indians from a familiar terrain.

Whether an interpretation of "bread alone" is to be made, or whether the broad jurisdictional provisions allowing of extraordinary claims will be interpreted to include loss in a total way of life, as real as the loss of the land, remains the province of the Commissioners. However, a certain selectivity of

[a reply to Verne F. Ray] in *American Anthropologist*, Vol. 58, No. 1, February 1956, pp. 184-85.

data in this regard is inevitable depending on which attorneys propound questions put to expert witnesses.

Various precedents have been adduced to insist that a claim must be based on exclusive use and occupancy by a particular tribe.²⁰ Generally, this would seem a reasonable demand. Temporary claims to disputed territories would lead to endless litigation, and, after all, the suits are brought against the United States, not between tribes. However, this circumstance has made attorneys reluctant to press any claims regarding shared lands. It is common knowledge among anthropologists that certain lands were known as neutral grounds, such as the immediate vicinity of given natural resources, or were areas reserved for intertribal games. Two or more tribes could conceivably hold an equity in such lands and derive a significant part of their sustenance or social identity therefrom. In other instances, the recognized owners of a given area permitted neighbors to visit and share in the local resources as occurred in the Celilo fisheries on the Columbia River. Sometimes, an apparent case of mutual land use cannot be taken at face value. The influence of such leaders as Tecumseh led to statements by Indians in treaty negotiations which are masterpieces of vagueness about tribal boundaries and an embarrassment to the speakers' descendants. The seeming obtuseness concerning boundaries or specific tribal areas was a ploy designed to hamper discussions that might lead to land cessions.²¹

²⁰ See *United States ex rel Walapai Tribe v. Santa Fe Pacific Railroad Company*, 314 U.S. 339.

²¹ This is admittedly an interpretation with which the Commissioners may choose to disagree, but it has the virtue of being an independent conclusion reached by at least one other ethnologist who has reviewed the data on various tribes in the Great Lakes region—personal communication of Anthony C. Wal-

The astonishing complications possible in regard to the location of given tribes are well illustrated in the case of the *Ioway, Sac and Fox, and Omaha*, Docket 138. On August 19, 1825, these tribes along with some Sioux and Otoes signed a treaty at Prairie du Chien whereby a designated area in northern Missouri and western Iowa, known as the "Trust Lands," was secured by the Ioway, Sac and Fox, and Omaha. It was understood that at some future date the government would enter into another treaty establishing lines between the tribes. Such a treaty was never effected, and the petitioner Indians claim that they were misinformed concerning the next treaty signed at Prairie du Chien on July 15, 1830. This was construed by the government as a treaty of cession, whereas the Indians believed that if they relinquished their common right to the land, the government would then designate the specific tribal areas within the "Trust Lands." Meanwhile, in the intervening five years, the three tribes began to work out their own areas of use and occupancy.

Documentary evidence was presented showing that the Indians divided lands in practice and did not wander over them haphazardly. The Indians' witness blocked out the tribal lands as had been done frequently in nontreaty cases. Thus, it was with some surprise that the expert found the propriety of his action challenged by the defense. The curious upshot was that other experts were then called in to testify to the good faith, scholarly conventionality, and academic correctness of the first expert's opinion.

INDIAN CLAIMS

The question of tribal replacements in given territories during historic times is exceedingly complex in such areas as the Ohio Valley-Great Lakes region. A

shift in locations was set in motion by the Iroquois wars of the seventeenth century, and further disturbance was produced when England and the United States contested for ownership of the country. This situation prompted the Department of Justice to finance a center for ethnohistorical study at Indiana University to do research in approximately 100 claims in the Great Lakes region.²² Just how long a tribe had to be using and occupying an area exclusively before it was lost to the United States has never been determined precisely in making claims for restitution. Generally, however, the Commissioners have been interested in materials relating specifically to the time of origin of a claim rather than to the prehistoric past.

After a tribe has actually proven a case of use and occupancy, a second phase of historical analysis comes into play. The actual value of the land must be determined, and gratuities granted a tribe in the past must be assessed for possible offsets against the eventual judgment. A certain reluctance on the part of Indians' attorneys to discuss Indian claims in the public prints reflects anxiety over the possible size of the still undetermined figure of the total amount of Indian claims. It is believed that what public sympathy might be aroused in the interests of the Indians would be more than offset by the average taxpayer's fears about the drain on the public purse. These fears seem somewhat groundless on the basis of figures available through January 5, 1956. Of the 102 claims decided by the Commission by that date, the Indians have been allowed recovery in 21 cases. The amount of money has been reduced from at least \$890,000,000 claimed to

²² See *Bulletin* of the American Anthropological Association, Vol. 2, No. 1 (1954), p. 17 for announcement and description of the Center.

\$13,283,477.25 awarded.²³ This is a percentage of awards to claims of 1.5 per cent.

It should be noted that the early cases tended to be reduced to a striking degree since the size of claims was necessarily estimated somewhat provisionally. It was uncertain at the outset what sort of legal theory ought to underlie the attorneys' preparations, and thus, in some instances, a practice common in other types of claims was utilized. That is, an excessive amount was set forth with the tacit understanding that the attorneys for the petitioners and for the defense would engage in a sort of legal haggling and reduce it to about what the Indians' attorneys had hoped to obtain in the first place. As more anthropologists took part in these cases and became more sophisticated in the operations of the law, they realized that they could exercise some control over phases of the cases that antedated the period in which their services were requested. Consequently, where a witness feels that a petition does not conform to the facts as he knows them, the petition can be amended to form an accurate statement of the claim on the basis of available data. In other instances, claims may be enlarged as anthropological evidence indicates the propriety of such a course.

NUMBER OF CASES

It may be noted that many of the illustrations used in this article are merely reflections of the problems raised and the types of evidence used in Indian claims without reference to the final determination of the cases. This

²³ These figures are based on a compilation made by the Commission. Of the total of 102 claims decided, only 78 claimed specific amounts giving the total of \$890,000,000. No definite amount was claimed in the rest of the cases, but the Commission has advised that the amount claimed, as estimated, was between \$1,000,000,000 and \$1,200,000,000.

circumstance is related to the huge number of claims filed, approximately 852, and the necessarily slow process of dealing with them. Since so many cases are still pending, it is rather early to attempt any sort of general assessment of the Indian Claims Commission Act. Nevertheless, certain trends may be noted. First, these claims will simply not be settled when the Commission expires in 1962, even though all of the cases may be heard and adjudicated by the Commission. Cases can be, and generally are, appealed to the United States Court of Claims by either party. They can then be taken to the Supreme Court, or at least a petition may be filed for that Court to hear them. Thus far, the Supreme Court has declined to hear any such appeals. However, the frequent application to the Court of Claims alone offers a certain reasonable basis for the somewhat jocular estimates expressed by anthropologists that they look forward to twenty-five years of employment in Indian claims.

While the amount awarded may not come close to the amount claimed in Indian cases, there remains the possibility that some tribes will be put in possession of large amounts of money. No definite arrangements have been made for this eventuality, although carefully planned economic and social programs have been developed by tribes which have been awarded judgments in the past, such as the Menominee and the Ute. Concern has been expressed by both Indians and interested white people that the result may be similar to the unfortunate experiences of the famous "oil Indians." Even where awards are small, they might have enduring value if invested for tribal benefits rather than simply divided among the individual members of the group. However, the Indians are understandably concerned with personal payments, associating the management of their re-

sources with part of their general grievances against the government.

The chances are that even the tribes that actually win awards will not be completely satisfied. As far as some tribes are concerned, the idea that the Commission would settle Indian grievances once and for all has already fallen short of its goal. Although an occasional Indian will recognize an unfortunate and sometimes unwarranted tendency to self-pity on the part of his fellows, lost claims or unregulated recoveries may contribute further complications and grievances despite the benevolent intent of the Indian Claims Commission Act. It is useless, however, to argue that the Act should have never been put into effect. Obviously, the same process would take place, and with less satisfactory techniques and results, by the earlier means of Acts of Congress and recourse to the Court of Claims. Although the Indian Claims Commission Act contains revolutionary provisions in the light of American legal history, it remains a legal instrument and must be assessed as such. It cannot be expected to work as a cure-all

for Indian complaints of a socio-historical nature involving intangible factors beyond any possible legal interpretation.

Through the provisions of the Act itself, Indians were informed by their superintendents of the existence of the Commission and of their right to bring claims. This educational function might be extended to prepare programs for those Indians likely to receive awards. Where recoveries may be small or nothing will likely be gained from a claim, Indians should be informed of what the Act can do and cannot do, and why this is the case. Anyone familiar with Indians knows that these are not easy tasks to carry out since it was the generalized sense of Indian discontent itself that led to efforts to satisfy claims as a means of furthering effective administration of Indian affairs. Nevertheless, the cases are being settled slowly, and with the increasing economic sophistication of at least the younger Indians, there is yet time to develop policies to further implement the fundamental philosophy of the Indian Claims Commission Act.

The Economic Basis of Indian Life

By WILLIAM H. KELLY *

Abstract: Many Indians are solving their economic problems by turning to off-reservation wage work in industry and business. However, most Indians continue to live on reservations where, for a number of reasons, agricultural income must be supplemented with wages from seasonal and periodic off-reservation wage work. The result is an income for Indian families generally lower than among neighboring non-Indians, with some localities suffering severe economic depression. The Indian attachment to reservation life is strong and hinders the normal absorption of Indians into the general population. Federal assistance programs include both an effort to develop reservation resources and to encourage Indians to relocate in industrial centers.

AN Associated Press story, dated Window Rock, Arizona, February 16, 1957, announced the payment of 33 million dollars to the Navaho Indians last November for the lease of oil lands on their reservation. Other tribes in Oklahoma, Montana, Wyoming, and elsewhere have received similar publicity in the past with respect to their income from mineral resources. During fiscal year 1955-56 the total payment to all Indian tribes in return for oil leases was 41 million dollars.¹

* The author wishes to give special thanks to Robert A. Hackenberg, Research Assistant in the Bureau of Ethnic Research, for his assistance in the preparation of this paper and for making available some of the results of his work on the Pima, as yet unpublished. Dr. Edward H. Spicer read the manuscript and offered many valuable suggestions. Thanks also go to Carol Gifford and Dorothea Kelly who assisted in the gathering of data and who did the final editing.

¹ Information not otherwise credited is from the files of the Bureau of Ethnic Research, University of Arizona, and was originally secured from reports and documents prepared by the Bureau of Indian Affairs, state departments of public welfare, state offices of employment, tribal councils, and similar offices.

However fortunate some tribes and individuals may be, the economic condition of American Indians in general has not been affected. The economic basis of Indian life is income from wage work, largely periodic and seasonal, which is used to support an uneconomic system of land ownership and land utilization. This is true even for the Navaho, presently enjoying the largest tribal income in the country, because oil income is not being paid per capita to the 80,000 tribesmen, but is being used for educational and resources development purposes.

Under ordinary circumstances, low income from a combined farming-wage work type of economic adjustment would not be a matter for special understanding when found among members of a folk society in a rural environment. Interest and concern for the Indians stem from the fact that they are not moving into the American economic system in the same way or on equal terms with other citizens, despite the fact that they represent the one minority group in this country whose economic and social well-

being has been the special responsibility of, and partly subsidized by, the federal government.

In 1887, about 240,000 Indians held 138,000,000 acres of land as tribal property. A federal plan adopted at that time called for the allotment of small farms and ranches to individual Indians, the disposal of the remaining lands to non-Indians, and the protection of Indian allotments under a trust arrangement to be continued for twenty-five years; at which time the Indians would be free to use or dispose of their land as they wished. Looking ahead, the federal government expected the Indian land base to provide the economic springboard by means of which the Indian could enter the American economy at a satisfactory level. It was expected that most would hold, or even expand, their farm and ranch properties while others, following the example of non-Indians, would gradually break their reservation ties and become assimilated into the general population.

As is now known, insofar as most American Indian groups are concerned, this expectation violated the basic principles of the relation of cultural systems to economics. If left undisturbed the outcome would have produced poverty and excessive hardship, through the rapid liquidation of Indian holdings, for the great majority of Indians.

Actually many reservations, particularly in the Southwest, were not allotted. On other reservations the period of twenty-five years during which Indian land was to be held in trust has been extended. Other efforts designed to assist and protect the Indians culminated, in 1934, in a new policy, the Indian Reorganization Act. The IRA called for the creation of tribal self-government, formation of tribal corporations, control of tribal financial resources, protection and development of Indian land, and the education and training of Indians

for eventual participation in the American economic system.

The new policy was effective in putting a temporary halt to the alienation of Indian landholdings but, as administered, created a serious dilemma. It attempted to train Indians for life in a competitive individualistic off-reservation society, but it failed to establish an Indian economic system on the reservation which would evolve toward the economic practices and institutions of such a society.

No one knows whether such evolution of tribal economics would have been possible, or might still be possible, in view of the relative inflexibility of federal management and the Indian interpretation of their own situation. Over and above their recognition of the obvious, immediate advantages in continuing Indian land in trust status, such as tax exemption and special services, Indians have sought to maintain a degree of social isolation and have made Indian land a symbol of Indian independence and group security.

Unlike immigrants, Indians have typically viewed the United States as a land of deprivation, and not as the land of opportunity. The original recognition of tribal sovereignty by the federal government—parts of which carry over into present federal-Indian relations—the tradition of “unjust” conquest, plus other similar factors, have operated to produce Indian resistance to the loss of tribal identity. Indians have fought against the tribal “death sentence” implicit in the concept of the melting pot, and they have resisted efforts to bring about their assimilation.

This brings us back to the general statement above. Indians identify themselves with Indian land and, if they are landless, they identify themselves with the land of relatives or fellow tribesmen. They prefer to live on Indian land and to attempt to make a living from the

land, even though this means economic hardship. The inevitable answer, given the Indian interests and experience, is a low income from a combination of agriculture and wage work, with wage work usually secured off the reservation on a periodic or seasonal basis.

INDIAN FAMILY INCOME

Indian families must support themselves, the same as non-Indians. For the United States as a whole, the 1950 Census reported a median family income of \$983 for reservation Indians.² This figure does not include the value of income “in kind,” such as food produced and consumed in the home (more than 10 per cent on some reservations), and free living quarters. Neither does it include the value of special economic advantages enjoyed by most Indians: freedom from property taxes and some income taxes, free medical care, free subsistence for children in boarding schools, and many free services found on some reservations such as water for livestock and domestic use.

The 1950 Census figure itself is probably low since enumerators, especially in the Indian case, could not be expected to secure knowledge of income from all sources. In any event, it is known that Indian income has risen, along with family incomes generally, during the past seven years. Recent estimates of income among Southwestern tribes suggest that those groups with extremely low incomes in 1949 have improved their position. The Navaho and Hopi are good examples. In both instances, the increased family income has come from new federal payrolls incident to a program of school, road, and similar construction on the reservation and to other wage work. In the Navaho case,

² U. S. Bureau of the Census, “Family Income of Reservation Indians by State Agency and Reservation.” Mimeographed. (Washington, 1953), p. 1.

there has also been new sources of wage income from mineral and oil development on the reservation. In 1949 the median family income, as reported by the Census, was \$526 for the Navaho and \$389 for the Hopi.³ In 1955 the Indian service calculation of the average family income among the Navaho was \$2,250, and among the Hopi, \$1,274, with some known sources of income among the Hopi not included.⁴

Other Southwestern tribes have had greatly increased incomes during recent years, but this has been due to per capita payments from tribal income derived from the settlement of claims cases and from oil and gas leases and bonuses. The Northern Ute on the Uintah and Ouray reservation in Utah, for example, had an average family income of \$4,400 in 1955 as opposed to a “normal” median family income of \$1,357 in 1949.⁵

Navaho family income is worth reporting in detail since it reveals an increased dependence upon off-reservation wage work. This dependence has marked the history of other reservation Indians when extreme isolation has broken down.

According to the above figures, Navaho family income from farming and stock raising, hitherto considered the principal source of Navaho income, is less than 12 per cent of the total. Since there is hardly a family on the reservation that does not have an interest in cattle or sheep, the Navaho reservation represents an extreme example of Indian dependence upon multiple sources of in-

^b U. S. Bureau of the Census. *U. S. Census of Population: 1950*. Vol. IV, *Special Reports*, Part 1, Chapter B, "Occupational Characteristics." (Washington: Government Printing Office, 1956), pp. 15-22.

States in low income jobs and in types of work which permit periodic and seasonal employment. Information is from the 1950 Census which does not list multiple sources of income, but gives a single occupation determined by the source from which the principal income was received during the census week. Statistics for both groups are based upon civilian males fourteen years of age and older.

These figures illustrate and document the assertion that Indian earning power is concentrated in unskilled and semi-skilled work. Almost 65 per cent of the Indian labor force is found in farming, farm labor, and unskilled industrial labor, as opposed to only 24 per cent of non-Indian civilian workers.

CHARACTERISTICS OF THE LABOR FORCE⁶

Wage work, in contrast with profit-earning enterprises where the Indian must accept non-Indian patterns and values, represents an acceptable mode of economic adjustment for all Indians. Indian interests and attitudes, however, stand in their way when there is an opportunity to step up to permanent skilled or semiskilled employment. One reason for this is that Indian values do not lead the individual to consider work, in itself, as a virtue or as a source of personal prestige. Wage work, in their eyes, is a means to an end; and the few things that an unacculturated Indian might buy have sufficient attraction to move him to seek a higher income by way of year-round jobs which call for an unbroken sequence of work days. Life for Indian men in aboriginal times

was often strenuous and periodically intense, but seldom routine.

Even wealth, as a symbol of success and prestige, which is so common in our society as a motive for economic activity, is not important to most Indians outside the north Pacific coast—in an extreme case, among southern California and southern Arizona tribes, wealth was, until quite recently, entirely meaningless. Indian Service administrators have spent much time and effort in an attempt to induce Indians to improve the appearance of their homes and farms. Where this is more symbolic than functional the Indians have not been interested.

Not all Indians, however, who would elect to improve their economic position are able to do so. Most reservations are isolated from industrial and trading centers. In Arizona, 66 per cent of the Indian population lives in counties containing 3.4 per cent of the non-Indian population. Under such conditions, relatively few Indian boys and girls have had the opportunity to secure training in the kinds of jobs which so frequently prepare other young men and women for skilled and semiskilled types of employment. Added to this is the general lack of education, formal and informal, in the skills and social patterns associated with permanent off-reservation employment.

Perhaps the greatest present deficiency in Indian training for permanent employment is the small number of students who receive an adequate formal education. During 1955-56 only 13 per cent of Indian children in Indian Service schools were in high school as compared with more than 23 per cent for the United States as a whole.⁷ Pres-

⁶ Indian tribes are no longer culturally homogeneous and for this reason behavior is not predictable on the basis of a knowledge of aboriginal patterns. The generalizations in this paper, however, are felt to hold true for the majority of Indians, especially on the larger reservations.

⁷ U. S. Department of the Interior, Bureau of Indian Affairs. *Statistics Concerning Indian Education, Fiscal Year 1956*. (Washington, 1956), p. 34. Figures on Indian students in public and mission schools are not available.

ent trends, however, indicate that there will be a considerable improvement in this situation in the next few years.

INADEQUATE RESERVATION RESOURCES

According to rough estimates by the Bureau of Indian Affairs, there are 20,534 "excess" families on Indian reservations.⁸ This is based upon an estimate of the number of families who, under present conditions, could earn their entire income on the reservation at a level comparable to the income of their non-Indian neighbors. The reason for this "overpopulation" is, of course, the inadequacy of reservation resources and the absence of industrial and business establishments. Another reason lies in the failure to increase the productivity of developed resources to their fullest potential. This traces to Indian work habits and to their lack of training and experience. Other factors are the lack of adequate capital and credit, the uneconomic system of land ownership, special limitations on individual Indian holdings, and other aspects of federal programs and the federal-Indian trust relationship.

This complicated system of interdependent factors is an outgrowth of Indian practices and the peculiar economics of trust management. On tribal land, Indians, unlike non-Indians, hold undivided economic as well as social and political rights on their reservations. The tendency in administration, therefore, has been to maintain an even dis-

⁸ House of Representatives, Report With Respect to the House Resolution Authorizing the Committee on Interior and Insular Affairs to Conduct an Investigation of the Bureau of Indian Affairs Pursuant to House of Representatives 698, Eighty-second Congress, Second Session. Union Calendar No. 790, House Report No. 2503. (Washington: Government Printing Office, 1953), p. 110. Indian families referred to are "reservation" Indians. The count therefore includes Indians who supplement their income or earn their entire income from off-reservation employment.

tribution of property, of federal economic help, and educational and social services among all Indians. A constant effort is made, as in agricultural extension work, to continue to attempt to help all Indians, including those who cannot be helped. On some reservations where stock is grazed on tribal land there are ordinances limiting individual holdings to the level of subsistence. On reservations where individual allotments are held in trust, Indians cannot bargain directly with each other; and the purchase of land from one Indian by another must be at an appraised value and approved by a federal official.

Under the assumption—which has come to have almost legal force—that all Indians are entitled to anything which any Indian receives, efforts to help the Indians who need and can benefit from economic help are obstructed. When, for example, new land is subjugated under an irrigation system, many of the Indians who are given land are Indians who have become successful off the reservation and return to take advantage of a better opportunity.

On most allotted reservations a great deal of Indian farm land lies idle or is used with minimum efficiency because of the existence of "fractionated heirship land," the most amazing example of economic obstruction found in the administration of Indian affairs. When Indian lands were allotted after 1887 it was expected that, at the end of twenty-five years, fee-simple titles would be issued and the matter of land ownership among the heirs of the original allottees could become subject to their own determination. However, when the twenty-five year period was extended, Indian heirs, except in the rare case of Indians who determined the disposition of their property by will, multiplied with each generation. With multiple ownership, and without a system for dictating land use and control among the heirs, eco-

nomic units became so fractionated as to be worthless except in some instances where land could be leased to a single operator and the income distributed among the heirs.

Allotted Indian trust lands, according to a 1952 tabulation, totaled 115,130 individual tracts; this included land in excess of 14,000,000 acres in twenty-one states and Alaska. By ownership status, these 115,130 tracts were held as follows:⁹

By living original allottee	43,537
By other single owner	16,919
Jointly, 2 to 5 owners	31,212
Jointly, 6 or more owners	23,462

As an example of what has happened over the country, an Indian who held a double allotment of twenty acres on the Gila River Reservation in Arizona died in 1926. By 1936, his estate had gone through eight probate actions. The direct and indirect heirship shares from this man's allotment amounted to seventy-three. These seventy-three heirs were found in two generations of descendants. The number has, by now, been augmented by the addition of another generation, perhaps two. In 1936, eight of the seventy-three heirs were entitled to a share of the original allotments reckoned at 87/573,300. This is a plot of land eleven feet square. The largest shares received by any of the heirs to this estate went to five direct descendants who each received 1/10 of the estate, or one irrigable acre each. Many attempts have been made to correct this situation through Congressional action but, to date, none have been successful.

TRIBAL INCOME AND EXPENDITURES

In spite of the allotment system, almost all reservations in the United States

⁹ U. S. Department of the Interior. *Survey Report of the Bureau of Indian Affairs*. (Washington, January 6, 1954), p. 19.

contain some tribally owned land and on a few reservations, all land is communally owned. In many instances tribal land is assigned rent free to Indian families, but where valuable resources exist, particularly timber or minerals, they are developed by a tribal corporation or, more commonly, leased to non-Indians. In addition, many tribes operate reservation stores, farms, ranches, packing plants, motels, and other tribal enterprises and derive revenue, in the form of taxes or fees, from industrial and business enterprises when operated by non-Indians on tribal land. Not all tribal enterprises show a profit, and none are conducted within the pattern of American business because of the restrictions imposed by the federal trust responsibility. Another serious hindrance to the development of tribal enterprises as an avenue for training in the American economic system has been tribal council control. This has resulted, in many instances, in operations that are dictated by Indian values and tribal politics. Where attempts have been made to operate enterprises along business lines, the council has most frequently employed non-Indian managers who, under instructions to show a profit, cannot spend the time and money necessary to train Indian successors.

In some instances, tribal income is passed along to members in the form of per capita payments, but in most cases it is used by the tribe for the support of tribal government, welfare programs, and for range improvement and other forms of resources development.

There are no published statistics on tribal income and expenditures. Attention has already been called to the tribal income from oil and gas resources. Reservations with the largest income from oil and gas leases are the Navaho in Arizona, New Mexico, and Utah; Osage in Oklahoma; Jicarilla Apache in New Mexico; Ute Mountain and South-

ern Ute in Colorado; Fort Peck, Blackfeet, and Crow in Montana; Wind River in Wyoming; and the Uintah and Ouray in Utah. Revenue from this source has increased from \$13,000,000 in 1951 to \$28,000,000 in 1955, to \$41,000,000 in 1956.

The Navaho income from oil, even if some of the revenue were to be distributed in per capita payments, is not likely to produce individual wealth among a population of 80,000 tribesmen. The Navaho, unlike some other tribes, have so far elected to use their tribal income for purposes of education and of resources and industrial development which, as capital investments, are expected to pay greater returns to more people in the long run. A recently announced Navaho tribal budget for 1957-58 calls for five million dollars for a scholarship fund, three million dollars for water development, and smaller amounts for a number of reservation projects.

The uneven nature of income from tribal resources across the country is illustrated by the situation in the Southwest for the fiscal year 1956. The Hopi, Papago, and Salt River Pima have tribal incomes of less than \$10 per year per capita.¹⁰ The Gila River Pima, Navaho (1955) and Taos Pueblo have incomes of less than \$50 per year per capita. Other incomes are: San Carlos Apache, \$103 (1955); Mescalero Apache, \$280; Uintah and Ouray, \$316; Southern Ute, \$660; and the Ute Mountain Ute, \$970. The last three tribes are distributing income from the settlement of a claims case.

ECONOMIC DEVELOPMENT PROGRAMS

The Bureau of Indian Affairs expects to spend \$87,737,500 for the benefit of

¹⁰ Bureau of Ethnic Research files. The per capita income is an index of tribal economy and does not imply availability or distribution in the form of per capita payments.

Indians in the United States and Alaska during the fiscal year 1957. More than \$50,000,000 will be spent for education and welfare services, including an off-reservation relocation program. The balance will be spent for resources development and management and for the construction of roads, irrigation works, schools, and the like. The Public Health Service expects to spend \$38,125,000, and an additional \$8,762,000 has been appropriated for construction of Indian health facilities.

These are by far the largest expenditures ever authorized for the social and economic benefit of Indians and, when added to tribal expenditures for the same purposes, indicate that a substantial effort is now being made to bring the Indian population to an equal footing with non-Indians in matters of education, health, communication facilities, and, on some reservations, land subjugation and development.

In resources development, however, including the establishment of industrial enterprises on or near Indian land, much remains to be done. Indian Service and tribal officials are now preparing long-range plans for such purposes under a directive issued by Glenn Emons, Commissioner of Indian Affairs. The National Congress of American Indians has declared as its primary objective for Indians the creation, with federal help, of an Indian "Point Four Program." The program is aimed at developing all of the resources on Indian reservations and in securing credit funds for Indians who wish to acquire training and equipment in order to become self-supporting in their home communities. In line with these objectives, the Eighty-fourth Congress passed Public Law 959 which authorizes the appropriation of \$3,500,000 each year for vocational training of adult Indians, and Senator William Langer of North Dakota has introduced a bill (Senate 809)

in the first session of the Eighty-fifth Congress which calls for an appropriation of \$200,000,000 to be used as loan and grant funds for the development of industries on reservations.

In almost every Congress, during the past twenty years, bills have been introduced to consolidate Indian lands and to undo the damage created by the division of allotments among Indian heirs. An heirship lands bill (House of Representatives 2787), introduced in the first session of the Eighty-fifth Congress by Representative E. Y. Berry of South Dakota, provides for the exchange or sale of Indian trust land for the purpose of achieving a solution to the inheritance problem.

Relocation

A greatly stepped-up relocation program for Indians is now being carried forward by the Bureau of Indian Affairs under an appropriation of \$3,472,000, which is three times the amount of funds spent for the same purpose in fiscal year 1956.

The program provides for employment and screening services on the reservations and for employment and social services at city centers in Chicago, Denver, Los Angeles, San Francisco, San Jose, and St. Louis. There is also provision for financial help, including transportation and moving costs, living expenses until earnings commence, and assistance in the purchase of homes and furniture.

According to official statistics, 12,625 individuals, including members of the families of relocatees, have been moved to the cities mentioned above since the beginning of the program in 1952.¹¹

¹¹ For a comprehensive analysis of the relocation program, see La Verne Madigan, *The*

Compared with the number of Indians who are considered "excess" on reservations, this does not represent a substantial solution to the problem. On the other hand, in addition to the larger numbers who will be relocated this year under the program, the Bureau of Indian Affairs anticipates a "snowball" effect when the advantages of jobs in larger cities become known, and when there is a sufficient nucleus of employed Indians in the cities to attract other Indians who would otherwise hesitate to leave their reservation homes.

During recent years, Indian Service officials and tribal officers, working together, have been attempting to bring about the establishment of industrial plants on or near Indian reservations. During the past year a special office has been established in the Indian Service for this purpose. Also, during the past year, the Navaho Tribal Council has authorized the expenditure of \$600,000 of tribal money for the purpose of assisting industries which might decide to establish manufacturing facilities in the vicinity of the Navaho country.

These combined tribal and Indian Service programs are in recognition of the fact that reservations are overcrowded, that not all Indians desire to become farmers or ranchers, and that, wherever possible, industrial jobs for Indians should be provided near the source of Indian labor. According to the Indian Service, the program, still in its infancy, has been in part responsible for the establishment of new industries near the Navaho, Hualapai, Cherokee, Pima, and Papago reservations.

American Indian Relocation Program. (New York: Association on American Indian Affairs, 1956).

Patterns of Health and Disease Among the Navahos

By JOHN ADAIR, KURT DEUSCHLE, and WALSH McDERMOTT

Abstract: Community patterns of our Indian citizens range from ordinary American communities to ways of life more comparable with those seen in parts of Asia or South America. In each type the disease picture can be expected to be different and the ways of dealing with it must necessarily be somewhat different. The Navaho tribe is the largest Indian tribe, a group whose ways of life perhaps differ the most from the rest of the United States. The broad principles revealed in an analysis of Navaho health are applicable to other tribes, although the particular health situation of another tribe would depend on the circumstances of its tribal life.

IT has long been recognized that the particular pattern of a community determines in large measure the particular diseases to which it is most subject. The community patterns of the United States Indian citizens range all the way from communities essentially the same as the rest of the United States to ways of life more comparable with those seen in many parts of Asia or South America. In each of these different types of community the disease picture can be expected to be different and the ways of dealing with it must necessarily be somewhat different. It has seemed reasonable, therefore, in attempting the present discussion of Indian health problems, to select a single tribe for primary consideration. The tribe so selected—the Navaho—represents by far the largest single tribe and is a group whose ways of life perhaps differ the most from the rest of the United States. It is believed that the broad principles revealed in an analysis of Navaho health are equally applicable to the other tribes, but the particulars of the health situation of another tribe would depend on

the particular circumstances of the tribal life.

The Navaho Indians live in northern Arizona, New Mexico, and southern Utah on a reservation extending over 15,000,000 acres—an area as large as the state of West Virginia. In 1868, when the Navaho returned from their forced captivity at Fort Sumner in eastern New Mexico, it was estimated that the tribe numbered around 10,000. It has expanded very rapidly in the last century, and today the population exceeds 80,000.

Large as their reservation is, it is no longer able to support the tribe; severe erosion has denuded much of the land and thousands of Navahos have sought employment out of the area. They work as itinerant crop pickers, on the railroads all over the western states, and at other jobs, which for the most part require only unskilled labor.

The reservation is located on the southern edge of the Colorado Plateau at an altitude ranging from 4,500 feet to over 10,000 feet on the crest of the mountain range which roughly follows

the New Mexico-Arizona border. The climate of this region, in contrast to that of the southern Arizona lowland desert, is temperate in the summer and cold in the winter, with a great range in the daily temperature the year around. There is little precipitation—from up to seven inches at the lower altitude to around twenty inches in a few mountain areas. However, during the last seven years the whole Southwest has been in severe drought and there has been only a fraction of even the customary small rainfall.

The Navaho are a Southern-Athabaskan-speaking people closely related linguistically, but not culturally, to the Apache and more remotely to the Northern Athabaskan tribes of Alaska and Canada. Centuries ago the ancestors of the Navaho and the Apache migrated southward and reached the northern limit of their present range by the sixteenth century, or earlier. The newcomers were hunters and gatherers; these occupations reflected a primitive way of life compared to that of the Pueblo Indians who already inhabited the more fertile regions of this plateau country. Even in the fourteenth century the Navahos were highly eclectic and adopted that which was to their advantage and rejected that for which they felt no need. They took over agriculture, pottery making, weaving, and other technologies from the town-dwelling Indians. But they rejected village living and the socioreligious structure of Pueblo society. The traits of Pueblo religion which they did borrow became modified to support a religion primarily concerned with curing practices rather than the fertility and rain making goal of Pueblo ritual.

All of Navaho history has been a succession of judicious borrowing from other peoples with whom they came in contact. During the subsequent centuries they took over the idea of using

horses, sheep, and cattle from the Spanish-speaking colonists in New Spain. As a result, their economic base shifted from primary dependence on agriculture to livestock raising and the raiding of settlements in the Southwest.

This history has a relevance to the present-day health picture, for the Navaho are still a changing people. Now, as earlier, they pick and choose what seems to "fit" with their way of life and pass up what does not. This process extends to their present-day attitude and behavior towards Western medicine, as well as to other aspects of twentieth-century civilization.

NAVAHO CULTURE

One of the remarkable features of Navaho life today is that the central core of Navaho culture, their religion, is still a vigorous and going concern. The Christian missionaries have not made the inroads they have made among Indian tribes in other parts of the United States.

The Navaho have also clung to certain other traditional ways; given their physical environment, these have proven very practical. For example, housing on most of the reservation is but a modification of the type of structure their ancestors brought with them from the North centuries ago. The hogan, a one room log house (in some places built of stone) remains hemispherical in shape with a mud floor. Cradleboards are still used by most mothers as a convenient way of carrying their babies and providing a secure place for sleep. Sheep and goats are still their most prized material possession. The pastoral economy has shaped the land settlement pattern, determined the course of daily life within the family, and provided credit for the families at the trading posts. Today many families possess only a small number of sheep and fewer goats. This stands in contrast to the

John J. Adair, Ph.D., is Assistant Professor of Social Anthropology in Public Health and Preventive Medicine; Kurt Deuschle, M.D., is Assistant Professor of Public Health and Preventive Medicine; and Walsh McDermott, M.D., is Livingston Farrand Professor and Chairman, Department of Public Health and Preventive Medicine, Cornell University Medical College.

situation twenty years ago before the livestock reduction program was carried out by the Bureau of Indian Affairs in an attempt to conserve the markedly over-grazed and eroded land.

The Navahos have retained the use of their own language. Even in families in which both English and Navaho are spoken, the native tongue is apt to be the language of the home and the community and English is used only in talking with non-Navaho people. A high percentage of the adults have no working knowledge of English, either spoken or written. This has been a major problem in rendering a good medical service, because it forces the doctors and nurses to depend on interpreters for effective communication with their patients.

In 1945, 6,543 of the 20,435 school-age children were in school. In 1955 there were 24,560 and only about 8 per cent were receiving no schooling.¹ This stepping up of the elementary education will, of course, have a tremendous effect on the tribe and will speed up the acculturation process. In addition, at the present time 246 Navahos are in universities and colleges. This tremendous drive for education in "the white man's way" should bring about marked changes in medical attitudes as well as knowledge of good medical practice during the years to come.

The Navaho tribe consists of a series of matrilineal clans, some sixty in number. These are exogamous units which function primarily to regulate marriage because marriage within the clan is still considered incestuous. Residence is matrilineal—a husband goes to live with the family of his wife, but a separate household is established in a hogan not too distant from those of her mother and sisters.

¹ *Navaho Year Book of Planning in Action*, Report No. 4 (Window Rock, Ariz.: Bureau of Indian Affairs, U. S. Department of the Interior, 1955).

The place of the woman in the Navaho family is central and remains so among most Navaho families. She has property rights—the sheep are usually passed down through the female line—and she has a great deal to say not only about family affairs but those of the community. Because the women tend to be retiring in public the government administrators (and non-Indians generally) have tended to bypass them, and many programs have suffered as a result. To be sure, the Navaho women do sit at the back of the room at public meetings and the men do most of the talking. But ultimately many decisions in Navaho society are made in the household, and there the men feel the force of their wives' opinions.

The trading post and the local school form a focus for community activity. Here too may be a chapter house, the community meeting place where local affairs are discussed by the Navaho from the surrounding area—a radius reaching out fifty or more miles on all sides. There duly elected officers preside, but the importance of the chapter organization and the frequency of meetings vary greatly from one community to the next.

CHANGES IN NAVAHO WAY OF LIFE

The social organization, especially the structure of the family, is undergoing rapid change. On the edge of the reservation—where contacts with the outside are much more frequent—and in areas immediately surrounding such communities as Ganado, Tuba City, or Chinle (where there have been many years of contact with the "white" world through government or mission channels) the extended family is no longer the principal functioning unit. In these areas, more and more the life revolves around the biologic family. Dependence on and reciprocal relations with collateral relatives—those of differing generations:

cousins, aunts, and uncles—are not as important as they once were. This means that the parents of the Navaho child, as in our society, have the sole responsibility for the family care of the younger generation; this pattern differs from the extended family system that used to be universal to all of Navaho society. Then there were many parent substitutes. Today there are not. The men are working off the reservation and far from home much of the time.

This change in parental pattern is causing strains within the family which are indicated by the growth of child neglect. This has become a problem in some of these most acculturated areas—by a greater incidence of drinking alcohol, and by other symptoms that may have a significant correlation with rapid culture change.

Problems of this sort would be classified in our society as those related to tension affecting mental health. But the Navaho traditionally makes no concrete distinction between his mental and his bodily health. He knows that he is ill and seeks the help of either his medicine man or the doctor. As somatic health may reflect such tensions, it is possible that the increased demand for medical service at hospitals and clinics may be related to this rapid series of changes in Navaho technology, social organization, and behavior.

In addition to the scattered local chapter organizations, the only other formal political groupings are on the tribal level. There is an elected Tribal Council, and an over-all legislative body, which was established as recently as 1923. For many years it remained a "puppet government" in the eyes of many Navahos, established to rubber-stamp the actions of the Bureau of Indian Affairs. This was especially true during the last half of the 1930's and early 1940's, when the government was enforcing the livestock reduction pro-

gram with which this body became identified in the eyes of its constituency.

This Council did not come into its own until after World War II and since that time has made rapid strides—perhaps the most outstanding example of development in self-government among any Indian group within the United States.

There are seventy-four councilmen chosen by the Navahos from that number of voting districts on the reservation. The Chairman and the Vice Chairman of the Council are the presiding executive officers who are elected directly by the voters on the same secret ballot that is used in the case of the councilmen. Within the Council there is an Advisory Committee that meets once a month and proposes legislation, establishes tribal budget, and draws up the agenda for the quarterly meeting of the Council.

In recent years, as tribal responsibility for their own affairs has grown, a series of special committees from within the council has been established in such fields as law and order, administration, welfare, education, and health. The tribal health committee today takes an active part in meeting with United States Public Health Service, state and local health officers, as well as tuberculosis sanatorium administrators and physicians who advise them on the health needs of the Navaho people.

This rapid development in self-government has come about with the encouragement and the guidance of the Bureau of Indian Affairs administrators at Window Rock. The Navaho tribe has been fortunate in having a series of administrators who have placed first priority on encouraging the development of self-government, and who have worked very closely with the council on problems of tribal legislation, administration, and financial responsibility.

Today, unlike twenty years ago, there is a Navaho political structure that can help the federal government in its public health programing. The Tribal Council and the health committee, if present trends are projected into the future, will play an ever increasing role in designing an effective health service that meets the needs of their own people. There is still much to be done in the development of communications between the federal government (United States Public Health Service) and the tribe, but with time these may be expected to grow more effective.

HEALTH FACILITIES

The responsibility for providing medical services to the Navaho and the other United States Indian Tribes rested with the Bureau of Indian Affairs from its creation until July 1, 1955. On that date this responsibility was transferred to the United States Public Health Service as a result of congressional action.

In the decade from the close of World War II to the assumption of responsibility by the United States Public Health Service, the central hospital facility on the reservation consisted of a 115-bed general hospital and a 100-bed tuberculosis hospital at the "government town" of Fort Defiance, Arizona. In addition there were four 35-bed field hospitals situated respectively at Winslow and at Tuba City in Arizona, and at Shiprock and Crown Point in New Mexico. At Keams Canyon in the Hopi reservation (which lies within the Navaho reservation) there was another 35-bed hospital which in actuality served both tribes. In addition to these government hospitals there is the 88-bed general hospital of the Ganado Presbyterian Mission (Sage Memorial) approximately thirty-five miles from the government general hospital at Fort Defiance.

With two exceptions (Shiprock and Tuba City) these hospitals were of good
