the animal cell. He has rendered important services to the Agricultural Research Council, especially in relation to the toxicity of insecticides, and to the nation in time of war by his studies of the physical effects of war gases. Two other Australians to be knighted are Major-General F. K. Norris, who served in a score of campaigns in both world wars and became Director-General of the Australian Army Medical Services, and Professor A. B. P. Amies, professor of dental surgery at Melbourne University. Professor G. W. Pickering, now Regius Professor of Medicine at Oxford, has brilliantly combined the pursuits of clinical medicine and research, most notably perhaps in his work on the blood pressure. In this work in clinical science he was inspired by the late Sir Thomas Lewis, under whom he worked at University College Hospital. Professor Pickering was professor of medicine at St. Mary's Hospital from 1939 until his appointment to the Regius Professorship of Medicine at Oxford University, where his many gifts will be brought to bear on both teaching and research. Other recipients of knighthoods for their medical services are Dr. R. Brunel Hawes, who served for many years in the Colonial Medical Service, and was formerly professor of medicine at the King Edward VII College of Medicine, Singapore, and Mr. J. H. Pierre, a distinguished consulting surgeon in Trinidad. The K.C.V.O. is conferred on Mr. Ralph Marnham, surgeon to the Queen. Two members of the medical profession are also knighted for political and public services; they are Colonel M. Stoddart-Scott, a Conservative Member of Parliament since 1945, and Mr. S. T. Irwin, consulting surgeon and member of the Northern Ireland Parliament; Mr. Irwin is a past president of the Northern Ireland Branch of the B.M.A.

INTERNATIONAL FEDERATION OF SURGICAL COLLEGES

Sir Harry Platt, P.R.C.S., recently presided at a meeting in London at which the decision was taken to establish an international Federation of Surgical Colleges. Representatives attending the meeting came from the Royal College of Surgeons of England, the American College of Surgeons, the Royal College of Surgeons of Edinburgh, the Royal College of Surgeons in Ireland, the Royal Faculty of Physicians and Surgeons of Glasgow, the Royal Australasian College of Surgeons, the Royal College of Physicians and Surgeons of Canada, l'Academie de Chirurgie de Paris, the Belgian Surgical Society, the Royal College of University Surgeons of Denmark, the Dutch Association of Surgeons, the Italian Society of Surgery, the Norwegian Surgical Society, and the Swedish Surgical Association. The members of the new Federation will not be individual surgeons but such national surgical institutions as may be elected to membership. The inaugural meeting is to be in Stockholm in July, 1958. The purpose of the Federation is an admirable one—to improve and maintain the status of surgery throughout the world. Launched under such favourable auspices and already assured of the support of many of the world's leading surgical colleges, the federation should soon be in a position to make a substantial contribution to the advancement of surgery.

THORACIC SURGERY IN CZECHOSLOVAKIA A RECENT VISIT TO PRAGUE

BY

B. J. BICKFORD, M.B., F.R.C.S.

Consultant Thoracic Surgeon, Liverpool Regional
Hospital Board

The dominating feature of the post-war scene in Europe is the sharp division between the "free" western and the Communist eastern states. In many people's thinking this has even led to the impression that the countries east of the iron curtain are not really European at all, but nothing could be further from the truth. Everywhere in Europe one recognizes a common culture based originally on the Christian religion. The general background is quite different from regions where other religions are followed, such as the Middle East or the Far East.

Invitation to a Medical Congress

During recent months there has been a notable relaxation of tension between east and west, although relations have undergone a sharp decline since the Hungarian rising. Nevertheless in certain directions, notably in Poland and Czechoslovakia, the relaxation of restrictions persists, and the present possibility of meetings between professional men seems likely to prove one of the most hopeful signs for the future health of the European Society of Nations that has appeared for many years. In Britain, it is true, we still look upon the eastern European countries with mingled apprehension and interest, and it was with a mixture of these feelings that I received last autumn an invitation to read a paper at a Czechoslovak national congress on lung resection in Prague. But as I could discern no political implications I resolved to go in spite of the turbulent events in neighbouring Hungary.

The congress was held in December under the auspices of the Czechoslovak Medical Association, an active body with a number of clinical Sections, of which the Pulmonary, Phthisiological, and Surgical were co-operating for the present occasion. The meeting was unusual in that foreign speakers had been invited. I found myself in the company of (among others) Professors Nuboer (Utrecht), Boris Ossipov (Moscow), Nicolai Amosov (Kiev), and W. M. Rzepecki (Zakopane, Poland). There were in fact a number of other guests from Poland, from Eastern Germany, from Bulgaria, from Yugoslavia, and one from distant Pekin. I do not know the exact figure of local physicians and surgeons who attended the congress, but the number must have been in the region of 250.

The proceedings were opened on December 9 by the Czechoslovak Minister of Health, to whom the guests were presented beforehand. He was followed by Professor Diviš (Prague)—the Grand Old Man of thoracic surgery in Czechoslovakia—who gave a historical survey of lung surgery. We were then treated to a show of medical films produced by the State Film Corporation which included a subject familiar enough in this country but unthinkable for a film—a warning to patients not to waste the time of doctors and hospitals! We also saw an excellent film on rehabilitation after spinal injury and a cartoon on the danger of alcohol for drivers.

Standard of Thoracic Surgery

A summary of the remainder of the proceedings will probably give the best indication of the scope of discussions and the level of attainment that has been achieved in thoracic surgery in Czechoslovakia. On December 10 and 11 the subject was resection for tuberculosis, and on December 12 bronchiectasis was the topic. The general sub-

ject of lung resection for tuberculosis was discussed in excellent papers by Professor J. Procházka (Hradec Králové) from the surgical standpoint and by Dr. Mydlil (Zámbek) from the physician's point of view. The papers summarized a nation-wide experience of 1,066 resections which had been performed by 16 Czechoslovak surgeons and followed up for a minimum period of twelve months. That this method of treatment is of recent application in general is shown by the fact that only 28% of the total number had a follow-up period of more than two years. The operative mortality (12.3% in men, 7.3% in women) seemed very high by current British standards, but 78% of patients followed for a least one year remained well. It was clear that many patients were operated on without the period of preparation by chemotherapy and rest that most workers in Britain consider essential for good results. Professor A. Fingerland (Hradec Králové) gave a masterly survey of the pathological features of resected specimens.

On the second day there was an interesting paper by Dr. E. Janěfk and two colleagues (Prague) on the fate of a group of 464 tuberculous patients who were discharged from hospital during 1951–2, and who would have been eligible for resection treatment on present standards. They were for various reasons treated by other methods. It was observed that 95.5% of the whole group were still alive; 66% were "clinically cured," 11% improved, and 18.5% unchanged or worse. It was shown that a selective pneumothorax gives good results in suitable cases, and the opinion was confirmed that thoracoplasty is on the whole a satisfactory operation. This type of survey, while subject to the limitation of all "might-have-been" thinking, is useful in providing a firm basis for the work of the thoracic physician and surgeon, whose viewpoint is changing constantly with new developments in treatment. Dr. M. Kubín and Dr. J. Kruml (Prague) made an interesting bacteriological study of resection specimens, and their paper and the previous one emphasized again the opinion that patients on the whole were not treated for sufficiently long before operation to give optimum results. Resistance to streptomycin was noted twice and to P.A.S. and isoniazid six times each in 152 positive cultures from resection specimens.

On the third day Professor Fingerland reviewed the pathological anatomy of bronchiectasis, and Professor K. Šiška (Bratislava) described the results of a national survey of the surgery for bronchiectasis in adults (over 15 years of age). This disclosed that only 269 resections for bronchiectasis had been performed at ten different centres in the country between 1947–55. That the surgical treatment of this disease still presents a considerable problem was evident from the fact that there was a large complication rate and an overall operative mortality of 8%, though this had been reduced to 2% in the hands of the most experienced surgeons. Professor Rapant and his colleagues in a paper on the surgical treatment of bronchiectasis in children reported a 4% mortality in 72 cases.

The procedure at the meeting differed from that current in Britain in that there was no opportunity for immediate discussion or comment on the papers. The afternoons were devoted to communications from the guests. Among these I reported a study from Aintree Hospital, Liverpool, of 399 cases of lung resection for tuberculosis which had been followed up for a minimum period of five years. Speakers from other countries described their own experiences and it became clear that, while conditions were less favourable for the wide use of resection for tuberculosis in Yugoslavia, Bulgaria, Russia, and China, the method is increasingly being used in all these countries. No doubt resection is not so often applicable as in Western Europe because of the poor living conditions, which make it necessary to treat patients with very advanced and active disease.

Visits to Hospitals

Apart from the congress itself a visit was organized to the military hospital at Hradec Králové, about 65 miles (105 km.) north-east of Prague. This is a large modern hos-

pital in which, despite its name, most of the staff and patients are civilians. Professor Jaroslav Procházka is the chief of the surgical clinic, which is well organized and equipped. There is a particular interest in thoracic and cardiac work, and full facilities for cardiac investigation are provided. We saw a mitral valvotomy most competently performed by Dr. Procházka using the modern technique. We were also taken on a ward round where an excellent selection of thoracic surgical cases was demonstrated. The pathological department under Professor Fingerland, and the x-ray department under Professor J. Baštecký were excellently organized and equipped.

Personal visits were made to the second surgical clinic in Prague, which is under the charge of Professor Diviš. This is an eighteenth-century hospital with massive walls and long gloomy corridors, though the wards I saw were small and cheerful enough. Not very much routine thoracic surgery seemed to be done here, however. I also visited the second surgical clinic at Brno, which is under the direction of Professor Jan Navrátil. In spite of the familiar difficulties of old buildings and insufficient equipment, the work done here is obviously first class. I saw a mitral valvotomy and a lobectomy performed with great skill. They have a large experience of mitral valvotomy—more than 300 cases—and success in a few of the more difficult types of cardiac operation, such as for aortic stenosis and atrial septal defect.

Impressions of the Medical Scene

The general impression I got of thoracic surgery in Czechoslovakia was that great interest is taken in all aspects of the subject, and that very great progress had been made during the last few years. Before the war the level of achievement seems to have been much as in Britain and Germany in 1938, but the German occupation put a stop to further advance until about 1947, when contact with Western nations was resumed. These contacts ended after the coup d'état in 1948. Nevertheless interest was maintained and progress made almost entirely through reading reports in the literature and applying the methods described therein. It is in fact remarkable and heartening to see how much practical progress can be made in this manner. Where instruments and apparatus have been lacking, the deficiency has been made up as well as possible from local resources. There is no lack of surgical skill and clinical acumen, and whatever else may be thought of the organization of the State there is no doubt that the medical profession has maintained its traditional standards intact. In fact, one may surmise that, beset by difficulties such as we in Britain can hardly appreciate, the doctors of Czechoslovakia have been thankful to belong to a profession to which they have always been able to give their wholehearted devotion.

We visitors were comfortably accommodated in a hotel, and those of us who did not speak Czech or German were provided with a personal interpreter, usually a doctor or a doctor's wife, who accompanied us everywhere. In the evenings we went to the Ballet and the Opera, and there was an official dinner. As a whole we were a very cheerful and friendly group, and conversation and inquiry were at all times free between us as far as the language barrier would permit. Many interesting facts emerged, such as the impression that there is no shortage of doctors in Czechoslovakia but a considerable difficulty in obtaining nurses of sufficiently high quality. This seems to be largely due to a ban on nursing by members of religious orders during the past few years.

The tuberculosis situation in the Balkan countries is evidently extremely serious, and I was told that the sanatorium beds in Czechoslovakia had been increased five-fold compared with before the war, yet many thousands of patients still wait for admission. It is evidently seldom possible to treat them long enough in hospital, while domiciliary treatment is severely limited by very primitive housing conditions. In Bosnia, it seems, housing conditions are such that there is on an average only one bed to every three and a

half persons in the population. Furthermore, it appears that the health insurance scheme is not always able to provide costly drugs for ambulant patients.

Life in Prague

Prague itself had a general air of drabness which almost hides the beauty of a city extremely rich in architectural treasures. All the shops were open on Sunday morning, but the goods for sale, though reasonably plentiful, did not offer very great variety, and were on the whole rather expensive and of distinctly inferior quality. Clothes were particularly expensive, a good suit costing £50 to £80, while cars and the electrical and mechanical goods in the shops were noticeably poorly made.

In conversation there were many interesting sidelights on professional life. In Czechoslovakia an experienced doctor, either in practice or in a hospital clinic, gets a monthly salary of about £105. The head of a clinic may earn as much as £160 per month. This seems certainly very much better than in neighbouring Poland, but when it is compared with the price of clothes and of motor-cars it is clear that the money would not go very far. It is small wonder that a distinguished physician said to me that the longer he had been qualified the less his salary became worth, and a doctor's wife said, on the subject of the general difficulties of life, "We breathe, we eat, and we have good jobs, so we really have nothing to worry about." The country is highly industrialized, and apparently about 60% of the women go to work, this being necessary to supplement their husbands' wages. The people in the streets seemed warmly clad for the winter, and the doctors I met were well enough dressed. Compared with any Western European city there was very little traffic in the streets. Indeed in Prague there are probably more really old cars to be seen than in any other capital city of Europe.

While I found little evidence of hostility to Russia (and indeed the Russians are frequently very likeable people), I did find a general scepticism about Russian methods in surgery. It was clear that much more interest was portrayed in Western techniques than in those from more eastern countries.

General Conclusions

It is not easy to sum up my impressions. The Czechoslovak people are industrious, intelligent, likeable, and friendly. They live and work under conditions very similar to ours, and the differences seem to be ones of degree rather than kind. Nevertheless they clearly live under many oppressive restrictions which must be hard to tolerate. Historically, however, this state of affairs is nothing new. The brief independence and maturity of Czechoslovakia during the 20 years between the world wars was the culmination of a 300-year struggle for freedom against the harsh subjection to the Austro-Hungarian Empire. Occupation of the country by the Germans in 1938-9, and the more recent Communist domination, have made conditions exceedingly difficult for those in the professions. Freedom of thought, however, is in the last analysis the necessary condition for the existence of the professions, and certainly in medicine and in the arts such as music ancient traditions are jealously safeguarded. The great Jan Hus, who became Rector of the University of Prague in 1402 and who was burned as a heretic in 1415 at Constanza, said, "Love the truth; defend the truth; speak the truth; and hear the truth." This spirit still lives, but its present state may be compared to the Alpine flowers hidden beneath the snow.

The Scientific Film Association has published a special issue of its journal, *Scientific Film Review*, Vol. 3, No. 2. The issue contains a list of 300 recent medical films, as well as a list of films on polar exploration and research. Brief details of each film are given. Copies of the issue are obtainable from the Scientific Film Association, 164, Shaftesbury Avenue, London, W.C.2, price 3s. 6d. net.

MEDICAL BIRTHDAY HONOURS

The names of the following members of the medical profession were included in a Birthday Honours List published in *Supplements to the London Gazette* on June 13.

Barony

Sir HORACE EVANS, G.C.V.O., M.D., F.R.C.P. Physician to Her Majesty the Queen.

K.C.V.O.

RALPH MARNHAM, M.Chir., F.R.C.S. Surgeon to Her Majesty the Queen.

K.B.E. (Civil Division)

FRANK KINGSLEY NORRIS, C.B., C.B.E., D.S.O., E.D., M.D., of Upper Hawthorn, Victoria, Australia. Major-General. For services to medicine.

Knighthood

ARTHUR BARTON PILGRIM AMIES, C.M.G., D.D.Sc., F.R.C.S.Ed., F.R.A.C.S., F.D.S.R.C.S. Dean of the Faculty of Dental Science, University of Melbourne, Victoria, Australia.
GORDON ROY CAMERON, D.Sc., M.B., F.R.C.P., F.R.S. Professor of Morbid Anatomy, University College Hospital Medical School.

RICHARD BRUNEL HAWES, C.M.G., M.B., F.R.C.P., D.T.M.&H. Consulting Physician to the Colonial Office.

SAMUEL THOMPSON IRWIN, C.B.E., M.Ch., F.R.C.S.Ed., M.P. Consulting Surgeon, Royal Victoria Hospital, Belfast. For political and public services in Belfast.

GEORGE WHITE PICKERING, M.D., F.R.C.P. Regius Professor of Medicine in the University of Oxford.

JOSEPH HENRY PIERRE, M.B., F.R.C.S.Ed. Specialist Surgeon, General Hospital, Port of Spain, Trinidad.

MALCOLM STODDART-SCOTT, O.B.E., T.D., M.D., M.P. Member of Parliament for Pudsey and Otley, 1945-50, and for Ripon since 1950. For political and public services.

C.B. (Military Division)

DAVID DUNCAN, O.B.E., M.D., D.P.H. Surgeon Rear-Admiral.

PHILIP FRANCIS PALMER, O.B.E., M.B., B.Ch., D.P.H. Major-General, late R.A.M.C. Honorary Surgeon to the Queen.

ARNOLD ASHWORTH POMFRET, O.B.E., M.B., Ch.B., D.O., D.O.M.S. Surgeon Rear-Admiral.

C.M.G.

FREDERICK ROLAND GEORGE HEAF, M.D., F.R.C.P. David Davies Professor of Tuberculosis in the University of Wales, and Consultant in Tuberculosis to the Colonial Office.

DAVID JAMES MASTERTON MACKENZIE, O.B.E., M.B., Ch.B., D.P.H. Director of Medical Services, Northern Region, Nigeria.

C.B.E. (Military Division)

JAMES HILL, M.B., Ch.B., D.P.H. Air Commodore, R.A.F.

C.B.E. (Civil Division)

ARCHIBALD SIMPSON ANDERSON, M.B., B.S., F.R.A.C.S., D.O.M.S. Honorary Consultant Ophthalmic Surgeon to the Victorian Eye and Ear Hospital, State of Victoria.

ALEXANDER KING BOWMAN, M.B., Ch.B., F.R.F.P.S. Senior Administrative Medical Officer, Western Regional Hospital Board, Scotland.

DAVID PATON CUTHBERTSON, M.D., D.Sc. Director, Rowett Research Institute, Bucksburn, Aberdeenshire.

BENJAMIN THOMAS EDEY, Ch.M., F.R.C.S., F.R.A.C.S. Honorary Consulting Surgeon to the Royal Prince Alfred Hospital and other institutions in the State of New South Wales.

SIBYL GERTRUDE HORNER, M.B., B.S., D.P.H., D.I.H. Deputy Senior Medical Inspector of Factories, Ministry of Labour and National Service.

DONALD HUNTER, M.D., F.R.C.P. Physician and Director of the Department for Research in Industrial Medicine (Medical Research Council), The London Hospital.

SAMUEL HORTON OLUWOLE JONES, O.B.E., M.B., Ch.B., D.T.M.&H. Director of Medical Services, Gambia.

EDMUND OLIVER LEWIS, D.Sc., M.R.C.S., L.R.C.P. Lord Chancellor's Medical Visitor in Lunacy.

ERNEST STEVEN MONTEIRO, M.D., F.R.C.P., F.R.F.P.S. Dean of the Faculty of Medicine and Professor of Clinical Medicine, University of Malaya.

M.V.O.

PETER GEOFFREY BURGESS, B.M., B.Ch. Surgeon Commander, R.N.

WILLIAM NEIL MACLAY, M.B.E., M.R.C.S., L.R.C.P.

O.B.E. (Military Division)

PETER HOWARD, M.B., B.S. Acting Squadron Leader, R.A.F.

JAMES LEES, M.R.C.S., L.R.C.P. Surgeon Commander, R.N.

ALEXANDER ROBERT TAYLOR LUNDIE, M.C., M.B., Ch.B., D.T.M.&H. Lieutenant-Colonel, R.A.M.C.

MAURICE IRVING SILVERTON, T.D., M.R.C.S., L.R.C.P., D.P.H. Lieutenant-Colonel, R.A.M.C., T.A.

ARTHUR JOHN WAINWRIGHT, M.B., B.S. Acting Squadron Leader, R.A.F.

O.B.E. (Civil Division)

JOSEPH ANTOINE HERMANN ANDRE, M.B.E., M.R.C.S., L.R.C.P. Deputy Director of Medical Services, Mauritius.

THOMAS JAMES BIGGS, M.B., Ch.M. Vice-chairman of the Board of Management, and senior physician, Mater Misericordiae Hospital, Sydney, State of New South Wales.

ARCHIBALD TURNER MACLEOD BLAIR, M.B., Ch.B., D.P.H. A medical practitioner at the Queen Elizabeth Hospital, Rotorua, New Zealand.

HUMPHREY MALOMO SAMUEL BOARDMAN, L.R.C.P.&S.Ed. Assistant Director of Medical Services, Sierra Leone.

ALFRED JOHN CRAIG, M.D., F.R.C.S. For medical services in Malta.

MABEL ALICE DOBBIN CRAWFORD, M.D., M.A.O., F.R.C.S.I. Medical Officer, Ministry of Supply.

MUTHIAH DORAISINGHAM, L.M.S. Deputy Permanent Secretary to the Ministry of Health and Deputy Director of Medical Services, Singapore.

MARY KATHERINE DOROTHY DOUGLAS, M.B., Ch.B. For political and public services in Fife.

JOHN RICHARD HERTSLET FULTON, M.B., Ch.B., M.R.C.P. Chairman of the Otago Hospital Board, Dunedin, New Zealand.

NOEL GERALD CARLETON GANE, F.R.C.S.Ed. Consultant Surgeon, Salisbury, Federation of Rhodesia and Nyasaland.

JOHN MARK, M.B., Ch.B., F.R.C.S. A medical practitioner and surgeon at Tauranga, New Zealand.

OTTO MASTBAUM, M.D. Malaria Medical Officer, Swaziland Medical Service.

FREDERICK LUBOVIVUS RICHARD, M.B., Ch.B. Commissioner, St. John Ambulance Brigade, Staffordshire.

THOMAS HAINES SIMS, M.B., B.Chir. Senior Medical Officer, Ministry of Pensions and National Insurance.

ROBERT STEWART SLESSOR, M.B., Ch.B. Senior Medical Officer, Falkland Islands.

ARTHUR WESLEY SUGUNARATNAM THEVATHASAN, M.R.C.P. For public services in Singapore.

WILLIAM WOOD, M.B., B.S. Head of Virus Research Unit, Glaxo Laboratories, Ltd.

M.B.E. (Military Division)

IRWYN MORSE PERKINS, M.R.C.S., L.R.C.P. Squadron Leader, R.A.F.

M.B.E. (Civil Division)

FREDERICK ORITSEATSEGHAN ESIRI, M.R.C.S., L.R.C.P., D.L.O. For medical services in the Western Region, Nigeria.

FRANK NEVILLE GRANNUM, M.B., Ch.B., D.T.M.&H., M.P.H. Lately Senior Medical Officer of Health, Barbados.

THOMAS PATRICK HOWKINS, M.R.C.S., L.R.C.P., D.P.H. Divisional Medical Officer, Southern Region, British Railways.

IVAN SAJA KADAMA, Medical Officer, Uganda.

MANCHERSHA MANEKJI KUTAR, M.B., B.S. Assistant Medical Officer, Aden.

PETRO SOLOMON BLANDINA MUGANWA, Medical Officer, Uganda.

VILIKESA RAMAQA, Senior Assistant Medical Practitioner, Medical Department, Fiji.

Military Cross

JOHN MALCOLM ELLIOTT, M.B., Ch.B. Captain, R.A.M.C. In recognition of gallant and distinguished services in the operations in the Near East, October to December, 1956.

The following have been mentioned in dispatches in recognition of gallant and distinguished services in the operations in the Near East, October to December, 1956: Surgeon Lieutenant John Gwyther Bradford, M.B., B.S., R.N., 45 Commando, Royal Marines, and Acting Surgeon Lieutenant Peter Gordon Harries, M.B., B.S., R.N., H.M.S. *Diana*.

Correspondence

Post-maturity

SIR,—I share Professor Dugald Baird's hesitation (*Journal*, May 4, p. 1061) at crossing swords over my article on post-maturity (*Journal*, April 13, p. 851), especially as he is the distinguished occupant of the chair of midwifery in my old university. Professor Baird records a reduction in perinatal mortality in Aberdeen from 45 per 1,000 births in the period 1938-47 to 28 per 1,000 in the years 1953-6, and claims that this is the result of "routine surgical induction of labour in the 42nd week and the greater use of caesarean section." But surely there might be other causes—for example, the greater use of antibiotics and blood transfusion. Besides, the years 1939-45 were war years, when British hospitals were largely depleted of skilled staffs. In the years 1938-45 the perinatal mortality in England and Wales was 59.5 per 1,000 births, and in 1955 40 per 1,000—a 33.3% reduction.

In hospital K in my paper, during the period 1938-47 the perinatal mortality was 41.8 per 1,000 births. In the period 1952-6 it was 23 per 1,000 births—a 47.7% reduction. This is 27% more than the reduction claimed by Professor Baird, and that without any increase in the number of terminations of pregnancy for post-maturity. "Unexplained deaths" have, I think, been sufficiently explained in my paper. I assure Mr. W. G. Mills (p. 1061) that all the hospitals quoted in my article admit mostly normal plus a fair proportion of abnormal cases, and in that respect differ not at all from the general run of British maternity hospitals.

Since my article went to press I have gratefully received two other hospital reports. One is that of the Birmingham Maternity Hospital, 1953, on the staff of which I find Mr. Mills's name. There were 1,762 births and 109 surgical inductions for post-maturity without any other indication (6.1%). That is twice the highest induction rate recorded in my paper. The perinatal mortality was 8.4% and the caesarean section rate 12.43%. This should be compared with 3.3% and 1.8% respectively in hospital K, when no inductions were done for post-maturity after 40 weeks. The other report received by me since my paper went to press is that of the Liverpool Maternity Hospital, 1953. There were 2,844 births, and not one induction for post-maturity is recorded. The perinatal mortality was 4.1%, and the caesarean section rate 9.1% (none for post-maturity). Is any further evidence needed of the uselessness, not to speak of the danger to mother and child, of surgical induction for so-called "post-maturity"?

I beg my younger colleagues, including Mr. Mills (the old ones being beyond hope), to think for themselves on this matter after studying with open minds the evidence I have adduced, and to cease letting themselves be led astray by the lure of great names.—I am, etc.,

Sydney, Australia.

F. J. BROWNE.

Stillbirth Rates in "Non-white" Women

SIR,—It is almost ungracious to pick even a small piece of gristle from the most digestible dish that Professor F. J. Browne served up in the *Journal* of April 13 (p. 851), yet the unqualified statement that, in comparison with white women, "it is well known that stillbirth rates are much higher among 'non-white' women," needs amplification if it is not to become just another mystical concept, quoted and requested as an excuse for high foetal loss in undeveloped areas.

That the rates are higher there is, of course, no disputing: that they should be so by virtue of some supposed racial trait is open to serious question. In Zululand, at any rate, a number of reversible factors play their part in the production of a high rate of perinatal mortality, notably maternal syphilis, lack of adequate hospital facilities, fatalism, and magic, and most of all a suspicion of medicine itself. It is possible to mitigate the ill-effects of these artificial barriers within quite a short space of time: by precept and by prac-

tice most prejudice can be broken down, as is witnessed by a fall in maternal syphilis rates, as judged by the Wassermann reaction, in our wards from 25% in 1950 to under 7% in 1955. Whether post-maturity can be blamed for foetal death is impossible to say in a community of women who never—or hardly ever—know the date of their last menstrual period and whose estimate of the duration of pregnancy varies from five months in one young woman to three years in another patient. The latter, a magician in her own right, claimed to have had a former gestation of five years, and, she triumphed, seeing our disbelieving glances, produced a live baby at the end of it.

The most important step in any attempt to reduce the needless loss of life in childbirth is the establishment of confidence, which stems from attendance at antenatal clinics. The services that can be rendered at out-station clinics, held often in sheds and garages, are necessarily but crude and imperfect, yet they materially alter the subsequent course of delivery. Between 1953 and 1955, 1,504 Zulu women were delivered at the Charles Johnson Memorial Hospital. Full details are available of 1,493 births which resulted in 1,557 babies, 91 (5.8%) of which were stillborn or died within the first ten days of life, supporting the contention of a high

	One or More Antenatal Attendances	No Antenatal Attendances	Total
Number of women	1,116	377	1,493
"babies"	1,156	401	1,557
Live births	1,126	340	1,466
Stillbirths and deaths	30	61	91
Rate %	2.6	15.6	5.8

Stillbirths and infant deaths within 10 days in 1,493 Zulu parturients.

stillbirth rate among such women. But 1,116 of these women were examined antenatally and their labours managed from the beginning: they produced 1,156 babies, of which 30 (2.6%) were stillborn or died within ten days compared with 61 deaths among 401 babies born to 377 women who had never been examined antenatally and whose labours were not so supervised, a rate of 15.6%. More than half the total stillbirths were from women who came into hospital from the district during labour, and in half of these again no foetal heart was audible on admission. One in ten of the stillbirths were from untreated syphilitic mothers.

These figures are quoted to underline the error inherent in the original generalization and to show that there is a reasonable expectation that childbirth may become as safe and as sure a process for Zulu women as it now is for their English sisters.—We are, etc.,

Nqutu, Zululand.

ANTHONY BARKER.

Women's Footwear

SIR,—Your correspondent (*Journal*, May 18, p. 1180), in suggesting a talk between the Minister of Health and the President of the Board of Trade with a view to new sumptuary laws, rightly calls attention to this health problem but fails to appreciate the wider and educational aspects of the problems involved.

First of all, it is not only women shopping for themselves who cannot find correctly designed footwear, but teenagers and adults of both sexes are in a similar position.¹ It is not therefore surprising that four out of five of those leaving school have acquired foot deformity or that foot discomfort is the commonest complaint of old age. The loss of time and money due to foot troubles must be enormous, and little of it at present comes within the range of the National Health Service. There is good evidence to show that, if correctly shod from cradle to the grave, most of our foot troubles would be avoided.

A formidable educational problem exists in this field. Many medical men either fail to appreciate the importance of foot health or are indifferent to it. It will be necessary first to educate the medical profession to appreciate the scandal of the present incidence of foot deformity, the need for early diagnosis, and the, often, inadequacy of treatment when deformity is well estab-

lished. The school medical service shows little awareness of the position. In most schools to-day physical education is performed in footwear that is not the shape of the normal human foot and does not allow the foot to function freely. The 1955 report of the school health service for the city and county of Newcastle upon Tyne, referring to orthopaedic defects, states: "Some difficulty was encountered here as we were not clear as to what is meant by the phrase 'normal feet.'" There is therefore an urgent need for a better understanding of normality and recognition of the early signs of deformity.²

The second part of the educational problem concerns the general public. They must be made appreciative of the faults of fashion footwear and its ultimate effect on their foot health. Such education has been highly successful concerning children's footwear—so much so that the trade has cashed in on it and uses foot health slogans for sales promotion. It is in this field that legislation may be necessary to safeguard the public from misrepresentation—for example, footwear that advertising suggests has a straight inner border may deviate from the "straight" as much as 18 degrees. There is a definite need for a better understanding by medical men of shoe trade terminology. Terms such as "short fit" have been misunderstood even by Ministers,³ and it is not without significance that, in the opinion of a shoe and trade journal,⁴ my request at a recent foot health convention for the platform to define "shoe-fitting," "disturbed the meeting."

To-day, those aware of the facts of foot health and footwear may seek all day and seek in vain for correctly designed, factory made, footwear—it does not exist. It seems, therefore, that action is required to get the shoe trade to manufacture for teenagers and adults footwear the shape of human feet. This is probably the most difficult task of all. The Ministry of Health has been asked repeatedly to take the initiative and has consistently refused. In 1953 the Ministry attributed the high incidence of foot deformity to wrong size selection by parents and pinned its faith on the shoe trade reforming itself. The first has been proved wrong⁵ and as for the second, the "fashion element" has since become firmly established in teenage styles and now begins to invade children's footwear. There is as yet no evidence of an effective foot health policy emerging from the Ministry.

Educating the Minister may therefore prove quite a formidable task, but, whatever has brought us to this sorry state of affairs, it is surely the duty of us all to see that the Minister of Health, without further delay,⁶ sets up a committee to inquire into the cause and incidence of acquired foot deformity and to make recommendations for its effective control and treatment.—I am, etc.,

London, S.E.15.

Medical Use of Hypnotism

SIR,—I was glad to see that Professor Alexander Kennedy (*Journal*, June 8, p. 1317) has given the weight of his authority to encourage the use of medical hypnotism. It would long ago have become a recognized therapeutic weapon if it were not for the fear the average doctor has of being regarded as a mountebank by his fellows, and even by the laity, if he were to make use of it. With regard to the latter there need be no fear, as the average patient accepts such treatment readily if it is explained beforehand. As regards the former, once the practitioner has overcome his inhibitions and made a start, he will quickly recognize his limitations and make a weapon against disease and that he has in hypnotism a weapon against neglect. I myself suffering which he must neither misuse nor neglect. I myself have used it spasmodically rather than systematically throughout the whole of my medical career, but am convinced that a scientific study of hypnotic suggestion could reveal much of the hidden mysteries of health and disease. While I still find many uses for it in psychological medicine, I regret I have now little opportunity of applying it in organic illness.

Professor Kennedy is doubtful about the use of hypnosis in childbirth because of "the great amount of time one has to spend with the patient," and also because he believes that someone trained in hypnosis must be present throughout. May I respectfully beg to differ? The command, "When your time comes you will go through labour without ex-

periencing pain," will be obeyed punctually like any other suggested post-hypnotic instruction. The patient need not be in a deep amnesic trance, and indeed may prefer not to be and will hold on to her normal consciousness throughout. This suggestion of painless labour is repeated with variations during the three or four weeks' training period which precede the labour, the number of sessions depending upon the suggestibility of the expectant mother. There are two alternatives with the trained subject. One is to hand her over to the doctor or nurse who intends to be present. The command then is: "You will obey Dr. S in the same way you obey me, and he will produce the trance condition to make labour painless." The other way is to make the subject herself responsible in some such way as this: "Any time you wish to pass into the trance state you can do so by counting slowly up to twenty." Professor Kennedy is right in saying that hypnosis is an ideal way of having children, and coming from him this should do much to popularize the method.

Hypnotism works through the dynamic of the imagination, and in using it as a therapy the practitioner must study his patient's psychology so that he can put himself mentally *en rapport* with his subject and phrase his suggestions accordingly. He will, for example, have a far stronger hold on an alcoholic addict if he makes an emotional appeal with the subject in a trance state than if his suggestion is merely, "Alcohol makes you ill." Creative work of this sort can be temporarily exhausting but immensely rewarding.

R. MACDONALD LADELL.

Scarborough.

SIR,—It is very satisfying to see the *B.M.J.* giving so much of its space to the subject of hypnotism, for this is a subject which has been sadly neglected in the recent past, particularly in teaching hospitals, where its inclusion in the curriculum and demonstration of the uses to which it can be put would be of great value.

As Dr. H. Stewart says in his article (*Journal*, June 8, p. 1320), hypnotism used in the correct manner will often produce good results in cases which have been abandoned as "incurable." I, too, have found a very satisfying success rate in many such cases. Dr. Stewart is to be congratulated on taking on such difficult cases, for he, like Dr. A. Fry (p. 1323), makes light of the skill required in using hypnosis, for it is not skill in producing the hypnotic state that is important but what is done with that state once obtained. Unfortunately, hypnosis is very time-consuming for the practitioner, as Dr. Stewart comments, for 30-45 minutes per session is usually needed, and the doctor must be prepared to work with his patient and help him in uncovering unconscious material. The results, however, are very worth while and satisfying to anyone who is prepared to put the time and effort into this most interesting aspect of medicine.

Wembley Park.

Vaccine Against Poliomyelitis

SIR,—The authors of the Medical Research Council's report (*Journal*, June 1, p. 1271) dismiss the possibility of bias in their younger vaccinated group (p. 1275). Possibly they have made further analyses of the defaulters which they have not published, but there are one or two which I think should be considered.

The first, and most obvious, is the exact age distribution (year by year) of the defaulters as compared with the volunteers. Certainly the volunteer rate varied considerably from year to year, as the authors comment. It seems possible then that the defaulter rate might also vary markedly. If this was the case one would have to consider the appreciable variation in the poliomyelitis attack rate between the years 1 to 5. Incidentally, the eight months' difference between the November and March births could then perhaps be of some importance. The second is whether the defaulter rate (for local authority areas) is in any way related to poliomyelitis experience in the area between January to June, 1956. It would also be interesting to know,

indicated. Treatment with reserpine was started. She was given a dose of 2.5 mg. on the first day, 5 mg. on the second day, and 8 mg. daily from the third to the seventh days. As there was marked Parkinsonism on the seventh day of treatment, the dosage of reserpine was reduced to 3 mg. daily. On the morning of the ninth day the patient was found to be in a condition of stupor. She could not be roused, but there was a little response to painful stimuli. She had a moderate pyrexia—temperature 100° F. (37.8° C.), and her general condition was poor. There was excess salivation and fine crepitations were heard, particularly at the bases of the lungs. We considered that she was suffering from acute pulmonary oedema, the result of excess secretion, plus stupor, associated with reserpine therapy. She responded to treatment with penicillin, atropine, nikethamide, and general nursing measures, and was fully conscious the next day. In addition, there was considerable improvement in her mental condition following recovery from stupor. After recovery, no gross lesion was detected on physical examination. X-ray chest, blood sugar, serum proteins, serum sodium, serum potassium were all normal. E.E.G. record was immature for her age, the response to hyperpnoea suggesting a mild instability. She has since received smaller doses of reserpine with definite benefit; she has become interested in her surroundings, occupied, and friendly, but there has been considerable restlessness, and the affect is childish and rather incongruous.

I am grateful to Dr. D. J. C. Dawson, resident medical superintendent of the Londonderry and Gransha Hospital, for permission to publish these findings.—I am, etc.,

Londonderry.

GEORGE A. KERNOHAN.

Abnormal Bleeding in Brucellosis

SIR,—Since the publication of an article on brucellosis in children (*Journal*, March 16, p. 617), I have received several interesting reports from doctors in different parts of the country which illustrate this complication. I should be very glad to hear from any other practitioners who may have met with such troubles—namely, abnormal bleeding (apart from epistaxis) occurring during the course of an attack of brucellosis in either adults or children.—I am, etc.,

Royal United Hospital,
Combe Park, Bath.

HUGH R. E. WALLIS.

Psychiatry in Africa

SIR,—As the *Journal* reaches me eight weeks after publication may I, even later than Dr. John A. Ewing (*Journal*, March 23, p. 703), offer my comment on the letter of Dr. A. Stewart Henderson (*Journal*, February 2, p. 283) which was in reply to Dr. T. A. Lambo's paper (*Journal*, December 15, 1956, p. 1388)? I find myself in agreement with what Dr. Ewing has to say about the magical element in some of our own methods which are labelled scientific. Or can Dr. Henderson offer a rational explanation of convulsion therapy, which is purely empirical and above all based on an accident? Out here in Africa we see and hear a great deal of magical cures, and some of them we can no more doubt than the psychotherapeutic cures effected in the temples of ancient Egypt or in medical centres which were dedicated to Asklepios, as at Epidaurus of great fame. Nor is it questionable that the Bantu himself considers the white man's medicine to be of the same nature as the one offered to him by his medicine-man, if of superior magic.

In a paper on observations on the psychology of the East African, which I am reading at the invitation of the Berlin Psycho-analytical Society, I make, *inter alia*, the point that it is not yet established whether our Western psychotherapeutic methods are a fit instrument for either the neuroses or psychoses of the Bantu. For once, his super-ego is, structurally and genetically, very different from that of the European; the aspects and the handling of transference and counter-transference require re-thinking. I am further of the opinion that proper understanding in this field of knowledge will depend a great deal on the research of our future

African colleagues, firmly based themselves on the cultural background of their countrymen and trained in Western modern psychological methods. For this reason I consider the contribution of Dr. Lambo as of great interest.—I am, etc.,

Tanga, Tanganyika.

ERICH SIMENAUER.

The H-bomb

SIR,—I would like to support Dr. Doris B. Jaffé's plea (*Journal*, June 1, p. 1307) that the Association should show some concern regarding the H-bomb tests: not only those by Britain but by America and Russia. Unfortunately the press and propaganda are in the hands of those with some vested interest in the continuation of the fission bomb development. We are told again and again that we must have a deterrent, but what value can it have if we know that a fission bomb war, with perhaps fifty or a hundred such bombs exploded simultaneously, would entail the possibility of life being wiped off the earth? At present H-bombs have been developed large enough to devastate areas wider than Wales. Such a thought must deter us as well as others. We are told repeatedly that when an H-bomb is exploded the fall-out is negligible, but such statements refer only to the heavy particles; the effect of the medium-sized fall-out, from one test after another done by different nations over weeks and months, must have effects not yet possible to calculate, particularly as the size of the bombs is not published. If these tests are so harmless why are they done in isolated areas?

Must we always be dominated by politicians (whom one knows by experience often to be stupid and unreliable people) and never have the courage to speak out and condemn things we know to be harmful to humanity? If we lack the courage to interfere in this mad race we shall ourselves be as responsible as those involved in it when the final disaster occurs and we are faced with millions dying or slowly expiring burned and blind. This is something which concerns us all, and neither the Association nor we as individuals can take an isolated attitude regarding it.—I am, etc.,

London, W.1.

CLIFFORD ALLEN.

Sir Victor Horsley

SIR,—I have one outstanding memory of Horsley and one which I am surprised none of your readers has recalled. I was one of a group of medical officers who sat on the beach at Gallipoli and heard him lecture on brain injuries in war. There was no cover and the Turks held all the heights. Not a shot was fired. They must have known Horsley was there.—I am, etc.,

Winchester.

J. F. MAYNE.

Sir Ronald Ross

SIR,—Dr. J. B. Gurney Smith inquires (*Journal*, June 8, p. 1365) whether the Ross Institute has in mind any celebration of the centenary of Ronald Ross's birth. Indeed it has. The standing committee considered that the occasion would be best marked by a statement from someone with outstanding influence on the present policy of malaria control and eradication. No one could be more appropriate than the Director-General of the World Health Organization, Dr. M. G. Candau, who kindly agreed to propose the memory of Sir Ronald Ross at a luncheon organized by the Ross Institute. Unfortunately preoccupation with the World Health Assembly which takes place in May made Dr. Candau's participation on the actual date, May 13, impossible, and it was decided that a slight delay in the celebration would be more than counterbalanced by the value of Dr. Candau's contribution to it. The celebration was held in the London School of Hygiene and Tropical Medicine on June 13.—I am, etc.,

London, W.C.1.

G. MACDONALD,
Director,
The Ross Institute.

Obituary

M. VAN DEN ENDE, Ph.D., M.B.

Professor M. van den Ende, dean of the faculty of medicine at the University of Capetown and professor of bacteriology there, died at Capetown on June 5, aged 45.

Marinus van den Ende was born on February 2, 1912, and graduated M.B., Ch.B. at the University of Capetown in 1933. Four years later he came to Cambridge to work in the department of pathology, and in 1939 he joined the staff of the Medical Research Council. In 1940 he took the degree of Ph.D. at Cambridge. At this time he was engaged in the development of vaccines against typhus, and during the war he served in the R.A.M.C. in North Africa and Italy, working mainly on the control of epidemic diseases. He returned to London after the war, but within a short time he was appointed professor of bacteriology at Capetown, and later he became dean of the medical faculty there. During the past few years he had been developing an important unit for virus research. Less than a year ago he was awarded the Silver Medal of the Medical Association of South Africa for his original research.

Dr. C. H. ANDREWES writes: Marinus van den Ende came to England shortly before the war. At first he did not understand us and was perhaps a little mistrustful. But that soon changed: in the end he became in himself a bridge of mutual help and understanding between British and South African medical sciences. He was a man of enormous energy and drive, and inspired others to push forward with him. In the early days of the war, at the National Institute for Medical Research at Hampstead, and during the blitz—which he hated—he achieved great things: in control of infection by suppressing dust, in typhus, and finally in scrub typhus. As a colleague he was a source of much joy and satisfaction, though hardly of peace and quiet. At times he would "hit the ceiling": "Why the blank dash does that so-and-so . . . ?" He also had moods of bleak depression. But most of us loved him, knew him capable of big achievement, and felt it fitting that he should go home to fill the chair of bacteriology at Capetown. I had the pleasure of visiting his home in 1955 and was most struck by the way his colleagues looked to him for an unfailing supply of the van den Ende drive and inspiration. This was shown not least when he knew he had a fatal illness. He did not try to pretend that things were otherwise, even made a joke about it, and strove to give his utmost as long as he had the strength to do it—and even after. South Africa's big loss is ours too.

C. F. T. SCOTT, M.B., Ch.B.

Dr. C. F. T. Scott died at Ryde in the Isle of Wight on May 3, aged 82. With his passing metropolitan medicine, and Willesden in particular, mourns the loss of a stalwart of the last generation, one of the band of "good B.M.A. men" who have done so much in the last forty years to advance the prestige and status of general practice.

Born at Greenisland, Co. Antrim, Charles Frederick Trousdale Scott was one of the many Ulstermen who have adorned English medicine. He studied medicine at Edinburgh University, where he graduated M.B., Ch.B. in 1907. After various hospital appointments, including that of resident medical officer at the Royal Isle of Wight County Hospital, he took up general practice in Willesden in 1911, and there for 36 fruitful years he played a full and active part in local medical affairs. There seems to be something in Willesden which provides an excellent nutrient medium for B.M.A. enthusiasm, and with the encouragement and active

co-operation of the late William Paterson (himself local honorary secretary for 25 years) Scott flung himself with zeal into the thick of B.M.A. activities. It became his hobby, and the "chain reaction" of committee work never became a burden to him, as a glance at the impressive list of his committees will show. He was a member of the old Insurance Acts Committee for 20 years, Public Health Committee for many years, the Medico-political Committee, Maternity and Child Welfare and many other subcommittees centrally, while at local level he was honorary secretary of the Metropolitan Counties Branch from 1926 to 1932 and president in 1934. In Willesden he was chairman of the Division and representative at the A.R.M. for 17 years.

It was perhaps in his work as a member of the Medical Services Committee that Scott found his true *métier*, and never was there a worthier champion on behalf of those who were called upon to appear in answer to complaints. He guarded their interests, in the face of overt anti-medical bias, with a pugnacious tenacity which earned him the respect of his fellow members and the gratitude of many Middlesex practitioners. He retired from practice in 1947. Dr. Scott married Margaret McDonald in Edinburgh in 1911. There were no children. After the death of his wife in 1956 he went to live in the Isle of Wight, where he died. We in Willesden will remember him with respect and affection.—M. M.

JOHN BRENNAN, M.B., Ch.B.

Dr. John Brennan died at a nursing-home at Cardiff on April 30 after a prolonged illness. He was 55 years of age.

John Brennan was born at Barrow-in-Furness in 1902 and was educated at Aberdeen University, where he graduated M.B., Ch.B. in 1931. After graduation he held several appointments in the North of England before going to the Merthyr General Hospital in 1932 as a house-surgeon. He then settled at Merthyr Vale (Merthyr Tydfil), where he soon built up an extensive practice. His charming manner gave great confidence to all those with whom he came into contact, and he enriched the lives of many. He took a leading part in the social and sporting activities of the town as a director of the Merthyr Tydfil football club and a member of the Welsh Football Association. He was a member of the executive committee of the North Glamorgan and Brecknock Division of the British Medical Association, and was a past president of the Merthyr and Aberdare Medical Society. A sincere Roman Catholic and a past president of the Catenian Society, he was also an active member of the Catholic Young Men's Society of Dowlais. He served as a major in the R.A.M.C. from 1939 to 1945 and was mentioned in dispatches in 1943 for his work in the North African campaign, during which he was wounded at Tobruk. To his widow, Dr. Catherine Brennan (formerly Clark), who also graduated at Aberdeen, and who was the first woman doctor to start a general practice in Merthyr Tydfil, the sympathy of all his friends goes out in her bereavement.—T. H. S.

C. H. MARSHALL, M.B., F.R.C.S.Ed.

Mr. C. H. Marshall, formerly surgical specialist to the Uganda Government, died at Mombasa, Kenya, on May 20. He was 73 years of age.

Claude Herbert Marshall was born at Twickenham on August 12, 1883, and was educated at Dulwich College and at Guy's Hospital, qualifying M.R.C.S., L.R.C.P. in 1908. Soon after qualification he went out to Entebbe to take up an appointment as medical officer in the Uganda Protectorate. A year or two later he was on special service as medical officer to the Anglo-German-Belgian Boundary Commission, and contributed a chapter on the habits and customs of the people of Ruanda to the report of the commission, which was published in 1913. In the following year he was appointed medical superintendent of the sleeping-sickness measures in the Uganda Protectorate. At this

time he wrote a number of articles on trypanosomiasis, three of which were published in this *Journal*. During the first world war he served as a captain in the Uganda Medical Service from 1914 to 1917 and, later, with the 4th London General Hospital. He obtained the London degrees of M.B., B.S. in 1921 and the F.R.C.S.Ed. in 1925, at which time he was senior medical officer and surgeon in charge of the European Hospital in Uganda.

He left the Uganda Medical Service in 1934 on his transfer to Kenya to become medical officer in charge of the Mines and Missions Hospital at Kakamega. On the outbreak of the second world war in 1939 he joined the R.A.M.C., but later transferred to the East African Army Medical Corps, in which he held the local rank of lieutenant-colonel. His services were recognized three times by mention in dispatches. After the war he went into private practice at Mombasa. A member of the British Medical Association for over forty years, he was president of the Uganda Branch from 1926 to 1929 and again in 1932-3, and he became chairman of the Mombasa Division in 1946.

A. R. W. writes: Claude Marshall died quietly in his chair at home. He was found next day, a book open on his knee. The pity is he had not written one. I knew him only in the last ten years of his life after he had drifted into a quiet backwater, when all that remained of the wider, stirring days were a few trophies and the occasional tales one could pry out of him, of witches and holy sheep, of a thin black line of Askaris against a charging mob, or of the parting of friends when the news of the first war came to the Boundary Commission. After the war he took his F.R.C.S.Ed., and became the first surgical specialist to be appointed by any of the East African Governments. He went on safari with the Prince of Wales and the Duke of Gloucester, and after many years in the Uganda service left to take over the hospital at the Kakamega Mines. The outbreak of the second world war found him in Mombasa and took him to Somalia, and so at last back to Mombasa. He had many friends who with many others felt that in his white suit and shoes, with a buttonhole of orchids or carnations, he stood for something good, of values and a way of life slowly being forced out. Claude was of the frontiers, a man of adventure and sport, who sailed his boat and played golf until he was 70. And yet also he was a man of books, of good talk and good food and drink. Ever ready for argument or new ideas, he remained young in spirit even after his health began to fail. There are many who feel they owe to him and his skill with the knife their lives, and they will remember him sitting at the bedside with a Mutalere cheroot in a short holder in his mouth as he reassured them and gave them hope and confidence. Others, numbered among his friends—to whom he was a gracious host with a ready wit and sympathetic ear—will long remember him and regret his passing.

THOMAS BREWIS, M.B., D.M.R.

Dr. Thomas Brewis, who died at his home at Scarborough on May 29, was the son of the eminent Edinburgh gynaecologist of the last generation, Dr. N. T. Brewis. Born on May 18, 1894, he graduated M.B., Ch.B. at Edinburgh in 1925, and, specializing in radiology, obtained the Diploma of Radiology at that university in 1926. After a year's work at the Hull Royal Infirmary he settled at Scarborough in 1928, when he became honorary radiologist to the Scarborough Hospital, and, in 1948, senior radiologist to the Scarborough, Bridlington, Malton, and Whitby group hospitals.

L. S. D. writes: Dr. Brewis had two objectives in life, his family and his work. He was a devoted husband and father; he was by nature fond of children and was blessed with four of his own, and they were fortunate in their father. To his work he gave all that he had and more. He raised the x-ray departments in his hospitals, and the standard of radiology in the area, from the primitive state that he found

them in 1928 to a level of modern effectiveness and accuracy. He was a man of few words, but those he used were kindly: his opinion was valued by us all, and we could always rely on his help in our problems. He never spared himself; whenever we had a night emergency we would see the light in the x-ray department burning in the small hours—Brewis was contending with the stacks of films and reports that would have swamped most men. He will be greatly missed, but his memory will live on. We extend our sympathy to Mrs. Brewis and her children in their loss.

EDGAR GOLDSCHMID, M.D.

Professor Edgar Goldschmid, pathologist and medical historian, died in Lausanne on May 26, aged 75.

Born in Frankfort-on-Main on December 14, 1881, Edgar Goldschmid graduated as a doctor of medicine at Munich in 1905. After holding clinical posts in Munich and London, he started his pathological career in Frankfort, and after a year in Berlin and a period in Geneva he returned to Frankfort, where in 1920 he was appointed extraordinary professor of pathological anatomy. In 1933 he resigned and removed to Lausanne, where he was appointed lecturer in the history of medicine at that university.

Dr. E. ASHWORTH UNDERWOOD writes: The death of Edgar Goldschmid is another grievous loss in the ranks of the older school of historians of medicine. His father, Eduard Goldschmid, was a banker and a collector of Italian paintings and works on art. From his early years Goldschmid was brought up in an artistic atmosphere. Educated at the Lessing Gymnasium at Frankfort, Goldschmid began his medical studies at Freiburg-im-Breisgau, passing thereafter to Kiel for a year. At Munich he was much influenced by Otto von Bollinger, the professor of pathology, under whom he later graduated in medicine with a dissertation on tuberculosis in infants. From his Berlin days he preserved many recollections of Ernst von Bergmann, the professor of surgery. From Berlin he returned for a period to Munich before graduating there.

After graduating Goldschmid was for a period an assistant in Posselt's skin clinic and in Lindemann's medical clinic at Munich, and he then spent some months as an assistant in the German Hospital in London. At the end of 1906 he became assistant to Eugen Albrecht at the Senckenberg Institute for Pathological Anatomy at Frankfort. He was devoted to Albrecht, whose early death was a great blow to him. Goldschmid next spent about a year at the Institute for Experimental Therapy in Berlin under Friedberger, with whom he published two papers. During the years 1910 to 1913 Goldschmid was assistant to Max Askanazy, the distinguished professor of pathological anatomy at Geneva. In 1913 he returned to a permanent post at the Senckenberg Institute, and after the foundation of the University of Frankfort in 1914 he became a Privatdozent. From then, and after his appointment as the extraordinary professor of pathological anatomy in 1920, he contributed to that subject, especially his articles on the size and weight of the heart in the *Handbuch der normalen und pathologischen Physiologie*.

Goldschmid's first notable work in the history of medicine was also his greatest. This was his *Geschichte und Bibliographie der pathologischen-anatomischen Abbildung* (1925), in which he dealt in great detail with the history of pathological illustration, and discussed fully medical works containing such illustrations. The numerous coloured reproductions in this book are especially fine. On several occasions in later years he returned to this subject, and he frequently lectured on it. His other writings dealt with the history of skin diseases and with the work of outstanding nineteenth-century pathologists and physicians. For about twelve years he gave regular courses on the history of medicine at Lausanne University.

I knew Goldschmid well for many years. To intimate friends he was a charming companion, full of reminiscences and amusing conversation on many subjects. At Lausanne he had a fine library, and his house was full of paintings and silver from his father's great collection. Art, music, and history remained the great passions of his life to the end.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending June 1 (No. 22) and corresponding week 1956.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available.

The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

CASES in Countries and London	1957					1956				
	Eng. & Wales	Land.	Scot.	N. Ire.	Eire	Eng. & Wales	Land.	Scot.	N. Ire.	Eire

Vital Statistics

Vaccine Against Asiatic Influenza

So far only one case of influenza due to the new strain of virus A has been confirmed in western Europe. This patient had recently arrived at The Hague from the Far East. The virus has also been isolated from patients in Australia, and the infection continues to spread in India, Pakistan, and other eastern countries.

The production of a vaccine made with the new Asiatic strain of virus A is proceeding at the Wright-Fleming Institute at St. Mary's Hospital. Dr. F. Himmelfeit is in charge of this work. Professor Robert Cruickshank, director of the institute, announced this week that the first trial batch of vaccine has been made and is ready for administration to volunteers. If antibody formation is satisfactory and the vaccine passes other tests, the Wright-Fleming Institute is ready to produce a regular supply of the vaccine. At present it seems that a monovalent vaccine is all that is necessary to give protection against influenza caused by this new strain.

Sir Macfarlane Burnet, speaking at Sydney before leaving for Europe last week, said that he believed that the virus of Asiatic influenza will spread to epidemic proportions in nearly every country in the world, flaring up in winter conditions. He thought that there would almost certainly be an epidemic in Australia.

Week Ending June 8

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 589, whooping-cough 1,523, diphtheria 4, measles 23,290, acute pneumonia 326, acute poliomyelitis 74, dysentery 657, paratyphoid fever 2, and typhoid fever 4.

Infectious Diseases

The largest increases in the notifications of infectious diseases in England and Wales during the week ending June 1 were 2,100 for measles, from 19,513 to 21,613, and 73 for scarlet fever, from 618 to 691; the largest decreases were 212 for whooping-cough, from 2,019 to 1,807, and 33 for dysentery, from 773 to 740.

The notifications of acute poliomyelitis numbered 67, and these were 12 more for paralytic and 3 more for non-paralytic cases than in the preceding week. The largest returns were Essex 6 (Colchester M.B. 2), Devonshire 5 (Exeter C.B. 4). 3 cases were notified in Bristol C.B.

The number of notifications of measles rose by 100 or more in 7 counties; the largest rises were 518 in Yorkshire West Riding, from 2,473 to 2,991, and 346 in Lincolnshire, from 450 to 796. The largest exception to the rising trend in measles was a fall of 178 in London, from 1,071 to 893. Towns with a large rise in the incidence of measles were 164 in Sheffield C.B., from 438 to 602, 124 in West Bromwich C.B., from 85 to 209, 123 in Bedworth U.D., from 79 to 202, 114 in Leeds C.B., from 193 to 307, and 99 in Grimsby C.B., from 116 to 215, and the largest decline in the cities was 111 in Birmingham C.B., from 961 to 850. Only small variations were reported in the returns of scarlet fever. The largest fall in the incidence of whooping-cough was 38 in Lancashire, from 180 to 142. Only 1 case of diphtheria was notified, compared with 3 in the preceding week.

The chief feature of the returns for dysentery was a rise of 72 in Lancashire. The largest returns were Lancashire 225 (Whiston R.D. 41), Manchester C.B. 35, Liverpool C.B. 23, Irlam U.D. 17, Stretford M.B. 12, Fylde R.D. 10), Yorkshire West Riding 137 (Bradford C.B. 33, Leeds C.B. 28, Sheffield C.B. 27, Selby U.D. 10, Thorne R.D. 10), London 47 (Bethnal Green 10), Durham 43 (South Shields C.B. 14), Northumberland 28 (Newcastle upon Tyne C.B. 21), Nottinghamshire 27 (Nottingham C.B. 9, Mansfield M.B. 9), Cheshire 27, Yorkshire East Riding 25 (Kingston upon Hull C.B. 21), Warwickshire 21 (Birmingham C.B. 11), and Southampton County 20 (Southampton C.B. 17).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases (deaths for influenza) of certain diseases notified weekly in England and Wales (great towns for influenza). Highest and lowest figures reported in each week during the years 1948-56 (influenza, 1952-6) are shown thus - - - - -, the figures for 1957 thus ———. Except for the curves showing notifications in 1957, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

The Working Population

The "Industry Tables" of the 1951 Census of England and Wales have now been prepared by the General Register Office and published by H.M. Stationery Office (price £7 7s. net). They show that the total number of persons working in all industries (including the Services) in 1951 was 19,940,024 (13,782,268 males and 6,157,756 females), compared with 16,655,236 (11,538,697 males and 5,116,539 females) at the previous census in 1931. Workers are classified under some 350 heads, of which the largest are building (with 1,045,000 workers), farming (786,000), and defence (711,000). In all of these men greatly outnumbered women. The largest numbers of women were employed in hospitals (294,000), education (285,000), and canteens (218,000), in all of which they outnumbered men. Comparative figures for 1931 are shown so far as the changes made in the classification since then permit. In some of the older industries numbers occupied had fallen; for example, coal mining (from 841,000 men to 667,000), cotton weaving (from 249,000 persons to 123,000), and boot-and-shoe making and repairing (from 187,000 to 162,000). The most striking fall was in private domestic service, in which the number of women occupied fell from 1,120,000 to 360,000 and the smaller number of men fell almost as sharply.

Medical News

Ross Centenary Luncheon.—The Ross Institute of Tropical Hygiene held a luncheon in London on June 13 to commemorate the centenary of Sir Ronald Ross's birth. Dr. M. G. CANDAU, director-general of W.H.O., proposed the toast to Ross's memory. On August 20, 1897—"Mosquito Day," as he later called it—Ross first observed malarial parasites in the gastric wall of an anopheline mosquito. Paying tribute to Ross, Dr. Candau said that like most geniuses Ross was ahead of his time: some 45 years before the advent of D.D.T. and other residual insecticides. Ross had established the basic principles on which W.H.O.'s malaria policy was to be founded. He had recognized the need to concentrate on prevention rather than cure, and that for antimalarial measures to succeed they must form an integral part of general sanitary work. Ross repeatedly declared that help from outside could be given only as "object-lessons," the rest being left to local endeavour. Dr. Candau felt sure Ross would have approved W.H.O.'s present approach to malaria control and eradication, particularly the concept of eradication. Discussing the place of research in malaria eradication, Dr. Candau paid tribute to the "outstanding study" by Professor G. Macdonald and Mr. G. Davidson, of the Ross Institute, on insecticide-resistance in mosquitoes, and he also mentioned a trial of chloroquinized salt, undertaken by the U.S. Public Health Service, as a means of mass malaria prophylaxis in special circumstances. A recent estimate of the population of the malarious regions of the world was 1,070 million, continued Dr. Candau. Of these, 680 million (57%) lived in the 63 countries where now eradication of malaria could be expected "within a comparatively few years." Replying, Professor G. MACDONALD, director of the Ross Institute, said that Dr. Candau, by his advocacy of a policy of malaria eradication in place of one of control at the eighth World Health Assembly in 1955, had himself accelerated W.H.O.'s programme in this field—a field where W.H.O. already had a most distinguished record. "By doing so, he has changed the policy of half the world," said Professor Macdonald, "and established a height of greatness for himself." Professor Macdonald then turned to the research at the Ross Institute on the inheritance of insecticide-resistance. That very day, by the purest of coincidences and as the culmination of a lengthy study, he said, he and Mr. Davidson had been able for the first time to demonstrate—and to Dr. Candau himself—the mechanism of the inheritance of resistance to D.D.T. by anopheline mosquitoes. This was

not claiming that they now knew all about resistance, warned Professor Macdonald, but it showed that the type of difficulties likely to be encountered in the field could at least be understood—though not necessarily eliminated—as a result of properly planned research.

Professor Gallie in Edinburgh.—Professor W. E. GALLIE, emeritus professor of surgery at Toronto, and 27 Canadian surgeons, members of the Gallie Surgical Club of Toronto, visited Edinburgh last week. On Friday, June 14, Professor Gallie was guest of honour at a dinner at the Royal College of Surgeons to celebrate his 75th birthday. The next day Dr. R. I. HARRIS, of Toronto, unveiled a plaque at Edinburgh University commemorating Professor James Syme and his pupil and son-in-law, Lord Lister.

International Association for Psychopharmacology.—At the International Symposium on Psychotropic Drugs, held in Milan last month, it was proposed that an International Association for Psychopharmacology should be formed. Preliminary discussions took place during the symposium, at which an organizing committee was elected, and it was decided that a definitive meeting should be held in Zurich at the time of the Psychiatric Congress in September, 1957. In the meantime, a representative of each country undertook to contact those who might be interested in the formation of such an association. Will anyone who is interested, or who has definite views regarding the scope and limitations of the proposed association, please write to Dr. P. B. BRADLEY, The Medical School, Hospitals Centre, Birmingham, 15.

W.H.O. Regional Office in Copenhagen.—On June 15 the Danish Government handed over a new building at 8, Scherfigsvej, Copenhagen, to W.H.O. It is to be used for the W.H.O. Regional Office for Europe, which up to the present has been in the Palais des Nations at Geneva. The new building adjoins W.H.O.'s tuberculosis research office. The Regional Office will direct and co-ordinate the Organization's work in Europe, and also in Morocco.

Royal College of Surgeons.—At the council meeting on June 13 Lord WEBB-JOHNSON, P.P.R.C.S., was admitted as a member of the Court of Patrons. The following were co-opted to the council for 1957-8 as representatives of various branches of medical practice: Dr. JOHN HUNT (general practice), Mr. A. C. H. BELL (gynaecology and obstetrics), Mr. C. GILL-CAREY (otolaryngology), Dr. FRANKIS T. EVANS (anaesthetics), Mr. A. B. NUTT (ophthalmology), and Dr. E. ROHAN WILLIAMS (radiology). Sir WILFRED FISH was invited to continue as the representative of dental surgery on the council. A covenanted gift of £45,000 from Messrs. Cerebos Ltd. was received with gratitude. The diploma of F.R.C.S. Ltd. was granted to 108 candidates (general surgery, 100 out of 334 candidates; otolaryngology, 8 out of 29 candidates; ophthalmology, 2 out of 16 candidates: two of the successful candidates have not yet complied with the regulations).

Registers of Medical Auxiliaries.—The Board of Registration of Medical Auxiliaries has recently published its registers of dispensing opticians, orthoptists, and operating-theatre technicians. In the registers of dispensing opticians and orthoptists the names are arranged geographically, so that the addresses of medical auxiliaries in any particular area can be quickly found. Alphabetical lists of names are also included. The Board also maintains and publishes registers of chiropodists and radiographers. A register of audiology technicians, who have recently been recognized as medical auxiliaries, is now being prepared. Copies of these registers will be supplied free to members of the medical profession on application to the registrar, Board of Registration of Medical Auxiliaries, B.M.A. House, Tavistock Square, London, W.C.1.

Hungarian Red Cross.—The Hungarian Red Cross organization is to be allowed to manage its own affairs again, according to a statement from the Hungarian Information Service in London dated June 6. During the October up-

rising the affairs of the Red Cross Society were placed under a government-appointed commissioner and "college" of five professors. The commissioner and the five professors are now being superseded by a new committee charged with re-establishing the Hungarian Red Cross's autonomy. The statement adds that the Hungarian Red Cross will resume its traditional work, "which has been neglected in the last few months."

Dermatological Essay Competition.—The American Dermatological Association offers prizes of \$500, \$400, \$300, and \$200 for original papers on "some fundamental aspect of dermatology or syphilology." Winning papers become the property of the American Dermatological Association, and the winner of the first prize may be invited to read his paper at the Association's annual meeting next year, his expenses being paid. The competition is open to all medical practitioners, and the closing date is November 15. Further details may be obtained from Dr. J. LAMAR CALLAWAY, American Dermatological Association, Duke Hospital, Durham, North Carolina.

Lady Tata Memorial Awards.—The Trustees of the Lady Tata Memorial Trust, on the recommendation of their (European) scientific advisory committee, have made the following new awards for research on leukaemia and allied conditions. The awards date from October 1. Dr. G. KLEIN (Sweden) and Dr. M. BESSIS (France), grants for research expenses; Dr. G. V. SEAMAN (department of colloid science, Cambridge), scholarship and grant for research expenses. In addition, two scholarships and four grants for research expenses are renewed.

F.R.C.P.I.—At a meeting of the Royal College of Physicians of Ireland on June 7, with the president, Dr. F. J. O'DONNELL, in the chair, the following members were admitted to the fellowship: W. A. GILLESPIE (Bristol), E. M. CHEFFINS (Papworth Everard, Cambs), J. D. KENNEDY (Blackrock, Galway), D. J. O'CALLAGHAN (Kilgarvan, Co. Kerry), and H. B. KELLY (Cleveland, U.S.A.).

Christine Murrell Fellowship.—The Medical Women's Federation has awarded the first Christine Murrell Memorial Fellowship to Dr. ANN MULLINS, for research on disability resulting from obesity.

Queen's Commendation.—Lieutenant-Colonel P. L. E. WOOD, D.S.O., R.A.M.C., has been awarded the Queen's Commendation for Brave Conduct. The citation states that Colonel Wood volunteered to be lowered from a helicopter into a boat in rough weather and successfully treated a dangerously ill soldier.

Royal College of Nursing.—Miss G. M. GODDEN, Matron of Hammersmith Hospital, London, has been re-elected president of the College for the coming year. Miss FRANCES GOODALL has relinquished her position as general secretary after nearly 30 years' service with the College. She was appointed assistant secretary in 1927, became secretary in 1935, and was made the College's first general secretary in 1942.

Sir Macfarlane Burnet, F.R.S., director of the Walter and Eliza Hall Institute, Melbourne, has come to Europe for the International Congress on Poliomyelitis in Geneva next month. While here he will also discuss the medical dangers of radiation with British authorities. Sir Macfarlane is chairman of the Australian national radiation advisory committee.

Professor J. H. Burn, F.R.S., professor of pharmacology at Oxford, received the honorary D.Sc. of Yale University on June 10.

Dr. D. M. Leiberman, consultant psychiatrist, Bexley Hospital, Kent, has accepted a W.H.O. appointment as professor of neurology at the All India Institute of Mental Health, Bangalore.

Dr. J. A. Scott, medical officer of health of the London County Council, has been appointed chairman-elect of the council of the Royal Society of Health. He will assume office on October 1.

COMING EVENTS

Irish Medical Association.—Annual meeting, July 2 to 5, at University College, Cork. Clinical discussions will include papers on "Dynamic Therapeutics in Chronic Disease," "The Prevention and Treatment of Pre-eclamptic Toxaemias and Eclampsia," and "Recent Advances in the Treatment of Duodenal Ulcer."

Oxford Graduates Medical Club.—Summer dinner at Trinity College, Oxford, July 5, 7 for 7.30 p.m., under the chairmanship of Dr. MAURICE CAMPBELL. Tickets (37s. 6d.) from Mr. R. MACBETH, F.R.C.S., department of otolaryngology, Radcliffe Infirmary, Oxford.

First Annual Ciba Foundation Lecture on Research on Ageing.—July 9, 5 p.m., at the Zoological Society of London, Dr. NATHAN W. SHOCK (Baltimore) will lecture on "Age Changes in Physiological Functions in the Total Animal." Admission by ticket from the assistant secretary, Ciba Foundation, 41, Portland Place, London, W.1.

Radiography and Medical Photography.—Exhibition by Messrs. Ilford Ltd., July 11 to August 23 (Monday to Friday, 10 a.m. to 5 p.m.), at Tavistock House North, Tavistock Square, London, W.C.1. Open to all interested.

International Society for Biological Rhythm.—Sixth conference will be held in Semmering, Austria, August 26-28. Details from Dr. A. SOLLBERGER, Anatomical Department, Caroline Institute, Stockholm 60.

NEW ISSUES

Archives of Disease in Childhood.—The new issue (Vol. 32, No. 162) is now available. The contents include:

BRAIN DAMAGE AFTER FEBRILE CONVULSIONS. Malcolm Fowler.
SOME INVESTIGATIONS ON THE METABOLISM OF PHENYLALANINE AND TYROSINE IN CHILDREN WITH VITAMIN C DEFICIENCY. T. H. J. Huisman and J. H. P. JONKIS.
THE ELECTROLYTE CONTENT OF THE SWEAT IN FIBROCYSTIC DISEASE OF THE PANCREAS. B. W. W. bb, P. T. Fluic, and M. J. H. Smith.
KERNICTERUS NOT ASSOCIATED WITH HAEMOLYTIC DISEASE. Wong Hock Boon.
HAEMOGLOBIN IN CORD BLOOD IN NORMAL AND PROLONGED PREGNANCY. Gösta Rooth and Sven Sjöstedt.
ATYPICAL CONGENITAL HAEMOLYTIC ANAEMIA. A. J. Brafield and I. Reef.
THE NATURAL HISTORY OF NEPHROSIS. R. McLaren Todd.
MALIGNANT HYPERTENSION IN A CHILD DUE TO UNILATERAL KIDNEY DISEASE. C. Isaacs and S. Wayburne.
PERTUSSIS ANTIBODY RESPONSE AFTER TRIPLE ANTIGEN. G. V. Feldman.
ADRENOCORTICAL FUNCTION IN HYPERCALCAEMIA OF INFANCY. John Anderson, E. G. Brewis, and W. Taylor.
ADRENAL NECROSIS IN GENERALIZED HERPES SIMPLEX. R. T. Brain, R. C. B. Pugh, and J. A. Dudgeon.
A CLINICAL STUDY OF THE ABDOMINAL SKIN REFLEXES IN NEWBORN INFANTS. Ole K. Harlem and Arve Lönnum.
CONGENITAL MALFORMATIONS OF THE HEART AND THE GREAT VESSELS ASSOCIATED WITH CONGENITAL ABSENCE OF THE SPLEEN. David Levy.
DUPLICATION OF THE PITUITARY AND STOMATODAEAL STRUCTURES IN A 38-WEEK MALE INFANT. W. R. M. MORTON.
IDIOPATHIC HYPERLIPIDEMIA. K. S. Holt.
SUBCUTANEOUS FAT NECROSIS OF THE NEWBORN WITH CALCIFICATION OF THE TISSUES. Margaret B. Martin and Eluned M. Steven.
RADIOLOGICAL CALCIFICATION OF INTERVERTEBRAL DISKS IN CHILDREN. I. S. Wallman.
INTERPOSITION OF THE COLON BETWEEN LIVER AND DIAPHRAGM (CHILADITI) SYNDROME IN CHILDREN. A. D. M. Jackson and C. J. Hodson.
BENIGN HAMARTOMA OF THE LIVER. R. E. Rewell.
HYDROCEPHALUS AFTER INTRA-UTERINE FUNGAL INFECTION. A. F. Barry.
BOOK REVIEWS.

Issued six times a year; annual subscription £3 3s.; single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

British Journal of Ophthalmology.—The new issue (Vol. 41, No. 6) is now available. The contents include:

RETINOPATHY OF PREMATURITY (RETROLENTAL FIBROPLASIA). Irene D. R. Gregory.
STUDIES ON THE ANTIGENIC STRUCTURE OF THE EYE USING THE FLUORESCENT ANTIBODY TECHNIQUE. D. St. C. Roberts.
SOEMMERRING'S RING. N. L. Stokoe.
ANTERIOR CHAMBER LENTICULAR IMPLANT. Harold Ridley.
SAFETY REQUIREMENTS FOR ACRYLIC IMPLANTS. Frederick Ridley.
THE RIDLEY LENS IMPLANT. Edward Epstein.
PROXIMAL MALIGNANT GLAUCOMA. H. L. Birge.
CORRESPONDENCE.
BOOK REVIEW.
NOTES.

Issued monthly; annual subscription £4 4s.; single copy 8s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Saturday, June 22

ASSOCIATION OF CLINICAL BIOCHEMISTS (SOUTHERN REGION).—At Adden-brooke's Hospital, Cambridge, 2 p.m., meeting. Scientific papers.

Tuesday, June 25

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Mr. A. K. Monro: Role of Surgery in Skin Diseases.

Wednesday, June 26

BIRMINGHAM MEDICAL INSTITUTE: SECTION OF PSYCHIATRY.—At Highcroft Hall Hospital, Erdington, 7 for 8 p.m., clinical meeting. Discussion: Concurrent Mental Disorders within the Family Group.
INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. R. W. Riddell: Mycological Routine in Dermatology.
INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Mr. J. R. Belcher: Emphysematous Cysts of the Lung.

Thursday, June 27

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. G. C. Wells: Keratinization.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. A. Macgregor: Haemochromatosis.

Friday, June 28

BIOCHEMICAL SOCIETY.—At Department of Chemistry, King's College, Newcastle upon Tyne, 11.15 a.m., 363rd meeting.
●INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. S. C. Gold: clinical demonstration.
INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. F. H. Young: clinical demonstration.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—10 a.m., Mr. L. Gillis: Amputations.

Saturday, June 29

ASSOCIATION OF CLINICAL BIOCHEMISTS.—At New Lecture Theatre, Royal Victoria Infirmary, Newcastle upon Tyne, 11 a.m., joint meeting with Biochemical Society. Papers and demonstrations, including a symposium on mucoproteins.

APPOINTMENTS

KENNEDY, WALTER P., Ph.D., F.R.F.P.S., F.R.S.Ed., Principal Medical Officer (Industrial Group), The Distillers Company Limited.
LIVERPOOL REGIONAL HOSPITAL BOARD.—D. P. A. L. Scott, M.B., Ch.B., D.P.M., Whole-time Consultant Psychiatrist at Rainhill Hospital; P. Pinkerton, M.D., D.P.M., Whole-time Consultant Psychiatrist in Child Psychiatry jointly between the United Liverpool Hospitals and the Regional Hospital Board, and Lecturer in Child Psychiatry in the University of Liverpool; M. M. Burrows, M.B., B.Ch., F.F.A.R.C.S., D.A., Consultant Anaesthetist (maximum part-time) at St. Catherine's Hospital, Birkenhead; W. R. Lamb, F.R.C.S.I., F.F.A.R.C.S., Consultant Anaesthetist (maximum part-time) in St. Helens and Warrington Groups; C. A. Hopkins, M.B., Ch.B., M.R.C.P., Whole-time Tuberculosis Medical Officer to Liverpool and District Eastern Hospital Management Committee.
MANCHESTER REGIONAL HOSPITAL BOARD.—D. W. Purser, M.B., Ch.B., F.R.C.S., Consultant Traumatic and Orthopaedic Surgeon, Lancaster and Kendal Hospitals; J. McHugh, M.B., B.S., D.P.H., Whole-time Deputy Medical Superintendent and Assistant Psychiatrist, Brockhall Hospital, Blackburn; A. J. Sims, M.B., B.S., F.F.A.R.C.S., Whole-time Assistant Anaesthetist, Bury and Rossendale Group of Hospitals.
NEEL, L. E., F.R.C.S., Consultant Thoracic Surgeon to Fr. Muller's Hospital, Mangalore, S. India.
O'DONNILL, SEAMUS, M.Ch., F.R.C.S., County Surgeon, Tipperary (N.R.), Eire.
ROLFE, M. G., M.B., B.Chir., F.F.A.R.C.S., D.Obst.R.C.O.G., Consultant Anaesthetist to the London Hospital.
SELLORS, T. HOLMES, D.M., M.Ch., F.R.C.S., Consultant Surgeon to National Heart Hospital, Westmoreland Street, W.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Hudson.—On June 16, 1957, at Liverpool Maternity Hospital, to Barrie, wife of Dr. Donald Hudson, The Firs, Ruff Lane, Ormskirk, Lancs., a son.
Sudbury.—On June 9, 1957, at Brentwood, Essex, to Mary (formerly Sadler), wife of Dr. J. R. Sudbury, a son.
White.—On May 26, 1957, at Bromsgrove, Worcs., to Frances Mary (formerly Cottam), M.B., Ch.B., and Henry Maxwell White, M.B., Ch.B., a daughter.

MARRIAGES

Christian—Needham.—On June 13, 1957, at Nottingham, Henry Thomas Christian, Ph.C., M.P.S., to Cecile Elizabeth Needham, M.B., Ch.B.

DEATHS

Braunwell.—On June 1, 1957, Charles Braunwell, M.R.C.S., L.R.C.P., J.P., of Bank Farm, Forest Row, Sussex.
Brewis.—On May 29, 1957, at 55 Esplanade Road, Scarborough, Yorks., Thomas Brewis, M.B., Ch.B., D.M.R.
Brown.—On May 3, 1957, at the home of his elder daughter, Chatham, Kent, John Brown, M.B., Ch.B., D.P.H., of Aberdeen.
Fonseca.—On June 6, 1957, at "Brynawel," Ebbw Vale, Mon., Frank Muller Fonseca, F.R.C.S.I., D.P.H.
Gornall.—On June 2, 1957, William Arthur Gornall, M.D., of Ulrik, Nailsa, near Bristol.
Stocks.—On May 25, 1957, Mary Sylvia Stocks, M.R.C.S., L.R.C.P., of 7, Garnett Road, Hampstead, London, N.W.
Wilkinson.—On May 31, 1957, at Kemerton, near Tewkesbury, Glos., Edward Aubrey Guy Wilkinson, O.B.E., M.R.C.S., L.R.C.P., Surgeon Captain, R.N. (retired), aged 81.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Indirect Contact with Rubella During Pregnancy

Q.—What precautions are necessary for a woman in the early stages of pregnancy who has not had rubella and whose husband has been in contact with the disease? He is believed to have had rubella. Is artificial immunization with gamma-globulin indicated?

A.—Rubella is not likely to be transferred by indirect contact, so that unless the husband develops the disease (which is not very probable since he already has had it) the chance of his wife becoming infected is not so high as to justify special prophylactic treatment. The supply of gamma-globulin is limited, and its use should be reserved until there has been direct exposure to infection. The most important step is for the wife to avoid contact with a sufferer from the disease until she has passed the 16th week of pregnancy—although the period of serious risk is probably restricted to the first 10 weeks.

Fertility after Mumps Orchitis

Q.—A few weeks ago a patient had a severe bilateral mumps orchitis, and the testicles are now smaller than previously and still tender. In a case such as this where the patient is anxious about his future fertility is a seminal analysis indicated, and, if so, how soon should it be done? Is there any point in advising against sexual intercourse until the testicular tenderness has gone?

A.—Though it would certainly be reasonable to have a seminal analysis done to assess the patient's likely fertility following bilateral mumps orchitis, it would be unwise to have this done too soon, since marked impairment of spermatogenesis would inevitably be shown. What is of far greater importance is the extent—if any—to which recovery of testicular function may proceed, and it would therefore be advisable to wait for, say, six months before doing the seminal analysis. In the meantime, the prognosis regarding future fertility should be very guarded.

Provided that coitus does not aggravate the testicular tenderness, there is no reason to advise abstinence until the tenderness has gone.

Rupture of Membranes in Concealed Accidental Haemorrhage

Q.—What are the indications for rupturing the membranes in concealed accidental haemorrhage? In particular what should be done in an acute case where the uterus is "woody hard" to the touch and is not contracting?

A.—Except in those cases where for some special reason (e.g., a live baby in an elderly primigravida) it is decided to deliver by caesarean section, artificial rupture of the membranes is indicated in all cases of concealed accidental haemorrhage and should be carried out as soon as the patient is in satisfactory hospital surroundings. The old fear that the uterine muscle may be so damaged that it will not contract is groundless. Moreover, if labour does not advance quickly an oxytocin drip infusion can be given as well. The main reason for rupturing the membranes is to ensure the delivery of the baby and placenta as soon as possible. Until the placenta and blood clot are delivered, the state of shock is unlikely to pass—even though morphine, blood transfusions, and the usual remedies are applied. It may be added that release of tension within the uterus may just possibly inhibit the utero-renal reflex which is thought to account for renal cortical necrosis.

There is now a further urgent reason for rupturing the membranes in these cases. One of the great dangers is the

development of afibrinogenemia or other coagulation defect. The best way of preventing or arresting this development is to rupture the membranes. The operation should be carried out simultaneously with resuscitation procedures and should not be delayed in the hope that the patient's general condition will improve, or until the uterus shows signs of spontaneous muscular activity. At the same time the blood should be studied for coagulation defects so that these can be corrected by concentrated plasma or fibrinogen as necessary.

Serum Amylase in Acute Abdomens

Q.—What is the value of the serum amylase estimation in the differential diagnosis of acute upper abdominal emergencies?

A.—The serum amylase estimation is of the greatest value in the differential diagnosis of acute abdominal emergencies in which acute pancreatitis is suspected. In acute pancreatitis the serum amylase is nearly always raised during the first few days of the illness, but may fall very rapidly again to normal levels, often by the fourth or fifth day of the illness. The other conditions in which the serum amylase level may be raised are in cases of perforated peptic ulcer or acute cholecystitis, but in these it is very unusual to find a figure of more than 500 units, whereas in acute pancreatitis levels above 1,000 units are not infrequently found. Thus, if the figure is over 500 units, and the case clinically seems to be one of acute pancreatitis, the test is very strong confirmation of the diagnosis. Any hospital treating acute abdominal emergencies should have facilities for carrying out this estimation at any time.

Acid Phosphatase in Prostatic Cancer

Q.—What is the value and reliability of the acid phosphatase estimation in the diagnosis, treatment, and prognosis of prostatic cancer?

A.—It is assumed that the question relates to the quantitative estimation of acid phosphatase in the blood serum. The amount of enzyme is determined by assaying the end-products of its catalytic activity (under prescribed conditions) on a known concentration of an organic substrate (usually phenyl phosphate). This forms the basis of the King-Armstrong method. The normal range of findings is generally accepted as being from 0-5 units. Modification of the test, however, is required to distinguish between the acid phosphatase elaborated by adult prostatic epithelium and similar enzymes derived from other sources. The latter are thought to be eliminated by the formalin inactivation technique of Abul Fadl and King,² and with this technique figures of over 2.5 units are suggestive of abnormal prostatic epithelial activity. Such levels commonly occur in cases of prostatic cancer where the malignant cells often retain a capacity for enzyme production.

In general it follows that the more widely disseminated the malignant process, the more likely is the serum acid phosphatase to be raised. With the modified test, values exceeding 5 units in fact show a high degree of accuracy in confirming the diagnosis, while conspicuously elevated figures of 50 units or more occur only in advanced cases of the disease. On the other hand, a number of prostatic cancers fail to make a significant contribution to the serum phosphate content owing to their smallness, site, or lack of secretory activity, and thus a normal value does not exclude the presence of cancer. In urological practice somewhat over two-thirds of cases with obvious metastases show a raised serum phosphatase as opposed to about one-third in which radiological evidence of dissemination is lacking. Diagnosis in many instances will already be assured on clinical grounds, so that the value of the phosphatase determination as a primary diagnostic method is comparatively small. Nevertheless the test serves a useful purpose in suggesting or confirming the condition if the nature of the primary lesion or of metastases is doubtful clinically, and it is helpful in the differentiation of some bone deposits from Paget's disease.

Raised serum phosphatase values commonly fall soon after the institution of endocrine therapy and may remain reduced indefinitely despite subsequent reactivation of the disease. Persistent or recurrent high values may indicate inadequate therapy and call for increased oestrogen dosage.

With regard to prognosis, nearly two-thirds of patients with normal levels at the time of diagnosis survive five years as opposed to one-third with raised initial values. It must be remembered, however, that normal levels are sometimes encountered with anaplastic tumours, and if metastases are already apparent the outlook is bad.

Epididymitis from Retrograde Passage of Urine

Q.—Is it possible to develop epididymitis, apparently due to the retrograde passage of urine along the vas deferens, as a result of lifting a heavy weight while the bladder is full?

A.—It is generally accepted that epididymitis can develop during an unusual exertion or violent strain whilst the bladder is full and that it is caused by urine being forced along the vas deferens. A similar condition can be produced by the injection of a small amount of sterile water along the vas at the time it is divided at operation. This condition of non-specific epididymitis occurred from time to time in young men during the last world war when they were doing unaccustomed physical exercise with a full bladder. If it should become recurrent, it may prove necessary to divide the vas in order to prevent it.

Pityriasis Rosea in Early Pregnancy

Q.—Is there any risk of foetal abnormalities following pityriasis rosea early in pregnancy? Some authorities consider the condition a virus infection.

A.—The evidence that pityriasis rosea is due to a virus infection is very scanty.

Pityriasis rosea and similar eruptions are not at all uncommon during pregnancy, and I am not aware that an association with developmental abnormality has ever been noted.

Fractured Clavicle and Venous Obstruction

Q.—It is argued that the standard method of splinting a fractured clavicle causes venous obstruction, and that the only support needed in such fractures is an arm sling. What is your expert's view of this?

A.—There are so many different ways of treating a fractured clavicle that it is difficult to be certain what the questioner means by "the standard method." None of the methods usually employed in Britain should cause venous obstruction, and no case of venous obstruction from the treatment of a fractured clavicle has been seen in at least one large British fracture clinic during the last 22 years. It would therefore appear that this complication is a very rare one, if, indeed, it ever occurs.

A sling would be an adequate support for an undisplaced fracture of the clavicle, an incomplete fracture, or a fracture in a young child, but the more usual cases of clavicular fracture in adults are much better treated by some simple device such as the old-fashioned three-handkerchief sling, which gives the patient much more comfort.

Biochemical Tests in Chronic Pancreatitis

Q.—What biochemical changes commonly occur in chronic pancreatitis and which are helpful in diagnosis? Is the blood cholesterol estimation useful?

A.—The most useful tests in chronic pancreatitis are those which aim at demonstrating inefficient digestion of food. These include microscopic examination of the faeces after a

meat meal, the estimation of faecal fat content, and fat and nitrogen balance tests. All of these are likely to yield abnormal results in established cases.

It is also possible to look for abnormal concentrations of pancreatic enzymes such as lipase or diastase in the blood, urine, or duodenal contents. The faecal trypsin estimation may also be of value, particularly in infancy. In many cases, however, these procedures will yield normal results. More recently the estimation of duodenal enzymes has been combined with the injection of secretin, which is a specific stimulant of pancreatic secretion, but this is not a routine procedure at most centres.

There is no general relation between pancreatic function and the blood cholesterol level, although this may of course be raised if obstructive jaundice is present.

Bulk-producing Laxatives and Intestinal Obstruction

Q.—Do laxatives, such as methyl cellulose, which depend for their action on increasing the bulk of the intestinal contents, predispose to intestinal obstruction? Is there any hazard in using such laxatives for prolonged periods in appropriate cases?

A.—This type of laxative can give rise to obstruction in patients with an ileostomy if too much is taken in the dry state, when an agglomeration may form in the intestine and impact at the inextensible stoma. The granules should be soaked in a little water before being taken.

Rarely constipation is due to failure of motility in the large bowel when considerable faecal masses stagnate and become inspissated, eventually leading to obstruction; this condition is usually seen in the aged. Methyl cellulose, or psyllium seeds, tend to increase the difficulty in these cases. Otherwise there is no hazard in the prolonged administration of these laxatives.

NOTES AND COMMENTS

Amateur Boxing.—Dr. JOHN CAHILL (Middlesbrough) writes: Your answer to the question under this heading ("Any Questions?" May 18, p. 1195) would have been more complete if you had added that the doctor in attendance has no authority to stop a contest. His function is to advise—a distinction with a difference.

OUR EXPERT replies: Under the rules of the Amateur Boxing Association the referee is in complete charge of the bout and only he has the authority to stop it. However, he is well versed in the medical indications for stopping a bout.

Gynaecomastia from Oestrogen Therapy in Prostatic Cancer.—Dr. J. M. SIMISTER (Medical Adviser, Ward, Blenkinsop and Co., Ltd., London) writes: I much regret that I overlooked a typing error in the letter I sent to you about stilboestrol diphosphate ("Notes and Comments," June 1, p. 1316). The initial intravenous dose should be 500 mg. and not 5 mg.

Books of "Any Questions?" and Refresher Course Articles.—The following books are available through booksellers or from the Publishing Manager, B.M.A. House. Prices include postage. *Any Questions?*, Volumes 2 and 3 (8s. each); *Refresher Course for General Practitioners*, Volumes 2 and 3 (26s. 6d. each inland, 26s. overseas); *Clinical Pathology in General Practice* (22s. 3d. inland, 21s. 9d. overseas).

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: Aitology, Westcent, London. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Director, B.M.A. House, Tavistock Square, London, W.C.1 (hours 9 a.m. to 5 p.m.). TELEPHONE: EUSTON 4499. TELEGRAMS: Medisecra, Westcent, London. MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the Association, TELEPHONE: EUSTON 4499. TELEGRAMS: Medisecra, Westcent, London. B.M.A. SCOTTISH OFFICE: 7, Drumsheugh Gardens, Edinburgh.

Achromycin^{*}

TETRACYCLINE BUFFERED WITH SODIUM METAPHOSPHATE

Absorption is faster... blood levels higher

ACHROMYCIN V is Lederle's latest contribution to medical science. It results from intensive research on methods of increasing the therapeutic potency of ACHROMYCIN tetracycline—already recognised as today's foremost self-sufficient broad-spectrum antibiotic. ACHROMYCIN V consists of ACHROMYCIN tetracycline buffered with sodium metaphosphate—believed to have the ability of binding certain metal ions present in the intestinal tract, which, when free, combine with some of the tetracycline and prevent its absorption. ACHROMYCIN V is now available to doctors who want the maximum benefits

from oral therapy with ACHROMYCIN. Initial clinical investigations show that ACHROMYCIN V possesses all the acknowledged clinical virtues of ACHROMYCIN tetracycline plus the following advantages:

It is more rapidly absorbed from the intestinal tract

It provides higher blood levels of tetracycline more rapidly

The high tetracycline levels attained with ACHROMYCIN V are noticeable even within the first hour or two after administration.

LEDERLE LABORATORIES DIVISION
CYANAMID OF GREAT BRITAIN LTD., LONDON W.C.2

ACHROMYCIN V can be used for the same wide range of infections for which ACHROMYCIN tetracycline has been employed. SUGGESTED DOSAGE: As for ACHROMYCIN i.e. for the average adult, 1 Gm, DAILY in divided doses.

ACHROMYCIN V is presented in capsules containing 250 mg. ACHROMYCIN tetracycline, and 380 mg. Sodium Metaphosphate.

Bottles of 16, 100 and 1,000 Capsules.

PHYSIQUE AND MENTAL BREAKDOWN IN YOUNG ADULTS

BY

R. W. PARNELL, D.M., M.R.C.P.
The Warneford Hospital, Oxford

A method is described of estimating body type by means of physical anthropometry in the form of a three-numeral index, similar to the somatotype index introduced by Sheldon (Sheldon, Stevens and Tucker, 1940). This index is related largely, though certainly not wholly, to genetic influence. In the second part of this report, disposition to breakdown in early adult life is shown by comparing the frequency of somatypes among patients and among healthy controls.

Estimating Body Type by Physical Anthropometry

The method of estimating body type presented here is similar to that described previously (Parnell, 1954a, 1954b). The same measurements are taken, but interpretation has been simplified. The method is basically the same as that used for 11-year-old children (Parnell *et al.*, 1955), but a different style chart is used. This contains all the necessary information, so that no extra tables are required.

Although the aim has been to correspond as closely as possible with Sheldon's estimates of somatotype, the components are here termed Fat (F), Muscularity (M), and Linearity (L) in place of his usual endomorphy, mesomorphy, and ectomorphy. (Bone development is included in the estimate of muscularity.) In using F, M, L ratings, primary dominance is indicated by capital letters, secondary dominance by small letters—for example, Fm, Fl, Mf, Ml, Lm, Ll. F, M, L nomenclature is used to emphasize that the scores are physical measurements and to avoid the assumption that the scores describe exactly the same entities as those rated photoscopically by Sheldon. The emphasis, therefore, is in the first place on phenotype, that which can be measured at a given time, rather than on Sheldon's somatotype.¹

A copy of the new chart, which is called the "Muscularity 4" or M.4 chart, is shown in Fig. 1. The basic measurements are those of young men aged 16–24 years. The ratings in the first and third components of the index can be determined directly from the chart.

¹ There are important distinctions here. A morphogenotype is presumed to exist because of the persistence of individual structure through life, just as genotypes are presumed to exist because human beings give birth to human beings, not to other species. It is impossible, however, to deal directly with the genotype, which is an abstract concept; only the phenotype can be measured. Sheldon's somatotype is defined as the best estimate of morphogenotype possible on the available evidence of phenotype or successive phenotypes. The term "somatotype" was introduced to indicate the path an individual may be expected to follow through life in relation to other people, assuming normal conditions of nutrition, exercise, and health.

The Fat scale is a logarithmic one, to correct for skewness in the male distribution of the sum of the three skinfold measurements, and is based, as previously, on the measurements of Oxford University students. Their mean "total fat" measurement is given a rating of 3½ to correspond roughly with the mean in endomorphy among students of 3.2 (Sheldon *et al.*, 1940) and of average man of 3.34 (Sheldon, 1954). The third component, Linearity, is given directly from the ponderal index, height in inches divided by the cube root of weight in pounds. It corresponds closely to the median of the range for each component given in Sheldon's tables (1954).

Instead of height, bone, and muscle measurements each at half standard deviation intervals, as in the earlier Deviation Chart (Parnell, 1954b), the new M.4 chart gives height at 1½-inch (3.8-cm.) intervals, and for each height a column of right-sided bone and muscle measurements appropriate to a rating of 4 in "Muscularity." These are calculated from the Oxford University student's average measurements (in the Height 70 in.—1.75 m.—column) making the assumption that for a given rating in Muscularity, bone and muscle measurements are proportionate to height; for example, a man of 67 inches (1.67 m.) with 4 in Muscularity has bone and muscle measurements 67/70, those of a man of 70 inches (1.75 m.) and the same Muscularity.

To determine the individual's score in this component, his bone and muscle measurements are ringed (Fig. 1) and the mean of their positions is found in relation to his height column. A provisional estimate for Muscularity is allotted according to the number of columns the mean score lies to the right or left of the appropriate height, counting each column passed as half a unit more or less respectively than 4. (The spacing of the height columns at 1½ inches (3.8 cm.) was chosen to make this possible.) A correction has then to be made for fat, since it is impossible to exclude this from muscle-girth measurements, and subcutaneous fat inevitably contributes something, though only a small amount, to "bone" measurements, resulting in an overestimate of muscularity where more than average fat is present. In this case allowance must be made by subtracting from the provisional estimate. Similarly, where there is less than average fat, the correction takes the form of adding. The amounts to be subtracted or added are proportional to the difference between an actual fat rating and the mean total fat, and are shown in Fig. 1. Phenotype 53½—see Fig. 1, is an example.

From the Universities of Oxford and Birmingham 2,063 men students were typed by this method, their distribution being shown in Fig. 2.²

Extremes in Muscularity

Anyone unfamiliar with the data might be excused for thinking that this distribution underestimates the muscularity of this population. Fig. 3, however, illustrates the distribution of candidates at a "Mr. Universe" physique competition. The median Mr. Universe has a phenotype, by this method, of 271, and even if the second component estimate is based on bone alone, to exclude the obvious muscle hypertrophy from weight-lifting and other progressive resistance exercises, his median type is 264. There can be no doubt that extremes in the second component exist, though not in the university population reviewed.

Comparison with Deviation Chart Typing

Comparison of the Deviation Chart and Table Typing method, previously reported (Parnell, 1954b), with the M.4 method of typing the student population is provided in Table I. It may be seen that the differences between the results, using these two methods, are slight. The differences between Table Typing and photoscopic interpretation have also already been reported (Parnell, 1954b); the differences between the present method and photoscopic interpretation are rather larger, not particularly in the first and third components, but in the second component discrepancies exceeding half a unit occurred in about one-third. The second component, however, is the most difficult to assess photo-

²Occasional plotting difficulties were encountered and dealt with by $\frac{1}{2}$ point reductions of secondary components while maintaining primary dominance—for example, phenotypes 633 and 336 were plotted as 624 $\frac{1}{2}$ and 242 $\frac{1}{2}$ respectively.

TABLE I.—Differences Between M.4 Chart Ratings and Table Type Ratings on 2,063 Healthy Young Men Aged 17-24 Years. (Difference Equals M.4 Minus T.T.)

Difference:	Percentage Distribution									
	-2	-1½	-1	-½	0	+½	+1	+1½	+2	
Component:										
I. F (endomorph)	0.0	0.1	1.5	20.9	57.0	18.2	2.1	0.2	0.0	
II. M (mesomorph)	0.0	0.5	6.7	27.4	42.9	19.1	3.2	0.2	0.0	
III. L (ectomorph)	0.0	0.2	1.9	10.4	41.9	38.1	7.5	0.1	0.0	

Discrepancies exceeding a half were found in 3.9% of F ratings, 10.6% of M ratings, and 9.7% of L ratings.

scopically, and discrepancies exceeding half a unit occurred in 17% of mesomorphic estimates reported by expert photoscopic somatotypists (Tanner, 1954). Nor is there any guarantee that this amount of agreement among experts with similar training could be obtained by observers with less training; indeed, experience seems to show it not infrequently worse.

Principal Advantages

It is therefore for reasons of consistency and objectivity that the M.4 method is recommended. It is less subject than photoscopic typing to variable interpretation by different observers, or by one observer on different occasions—a variability permitted by the range of choice in Sheldon's ponderal index tables. Inter-observer error with the M.4 chart depends only on the accuracy with which the measurements are taken, and probably inter-observer error in measuring approaches the column interval on the chart only in the case of bone measurements: even here it should seldom exceed 1 mm. with trained observers.³

³In fat subjects, outside curved callipers with rounded points are preferable to the straight-arm type, because they dip more closely to the bone.

FIG. 1.—Adult deviation chart for physique—M.4 style. Phenotype 5343 at age 18. Androgyny score (Tanner, 1951) 84.0 lies about halfway between mean values for men and those for women (in boxes).

The principal advantages of the M.4 chart over the Deviation Chart lie in speed and simplicity. Ringing measurements on the M.4 chart and estimating phenotype are now one operation, while, before, two tables had to be consulted and a calculation worked out for each individual.

It must be mentioned, however, that the increased objectivity is in some respects a drawback; clearly the M.4 chart

preliminary estimates of dominance when somatotyping with the help of Sheldon's tables. For this purpose, to discard the photograph altogether would be to rob oneself of a valuable permanent record and an additional source of instruction in such matters as dysplasia. The physical anthropometric estimates, however, undoubtedly sharpen the definition of typing, both by adding greater precision and by improving agreement between observers. In practice, one comes to rely greatly on this objective check to photoscopic impressions.

Weight Variation at a Given Age

Variation in the weight of Oxford students from one year to the next has been reported elsewhere (Parnell, 1954c). Among men, 83%, and among women, 91%, changed less than 10 lb. (4.5 kg.) in a year, roughly two-thirds gaining and one-third losing. Only 6% of students gained more than a stone (6.35 kg.); only about 1% lost more than this amount. Considerable variation occurs, therefore, though not very often in health. There is room on the Deviation Chart to enter differing weight or fat measurements recorded at one age or subsequent ages.

Extreme Weight Variation in Mental Illness

Extreme variation of phenotype estimates may be met in patients with anorexia nervosa who, when most emaciated, may have subcutaneous fat and ponderal index scores corresponding to phenotype 217. After insulin-coma treatment and recovery, these measurements may change so that they correspond with phenotype 524, and two months later settle close to 424, the only constant finding being a "dip" type of index with lowest rating in the middle component. Without knowledge of the history it would be impossible to grasp from the M.4 chart alone at the worst stage of illness that the somatotype probably lies within an orbit of ± 1 to 1 point from type 424. The photograph, however, may help directly, for it shows body width and length proportions, clearly indicating ectomorphy 4 ± 1 to the trained eye. Obvious loss of weight, clinically or photoscopically, prevents undue importance being attached to the excessively high ponderal index found at the height of this illness.

Women's Phenotypes

Women may be measured in the same way, their measurements plotted on the M.4 chart, and a phenotype estimate derived. Such estimates have been plotted for 671 women students entering Oxford and Birmingham Universities between 1950 and 1954 (Fig. 4). Their distribution differs to some extent from the distribution of women's somatotypes

FIG. 2.—Phenotype distribution of 2,063 men students from the universities of Oxford and Birmingham.

FIG. 3.—Phenotype distribution of 24 competitors at the 1955 "Mr. Universe" physique contest.

works best with healthy persons; exact allowances for changes in weight and subcutaneous fat brought about by underfeeding or illness may be difficult to assess, whereas evidence of the true rating in, say, ectomorphy is normally detectable in the photograph. It is not claimed that the M.4 method by itself is as suitable for Sheldon somatotyping as photoscopy. It is, however, an accurate and consistent way of phenotyping, and there is considerable scope in socio-medical surveys for a method of phenotyping healthy people by physical anthropometry alone, especially where photography is impracticable for lack of accommodation, equipment, or time, or again on grounds of expense or unwillingness to be photographed on the part of any of the subjects. But, in addition to phenotyping without photography, these phenotype estimates are here used and are recommended as

FIG. 4.—Phenotype distribution of 671 women students from the universities of Oxford and Birmingham.

published by Sheldon (1954, p. 13). Unfortunately, his photoscopic standards for women have not so far been published, and, although it will be a comparatively simple matter, when the time comes, to prepare conversion tables based on the percentile distribution in each component, the percentile distributions for this sample are not yet available either (Sheldon, 1956, personal communication). It is recognized that the adoption of an independent distribution for women might lead to some confusion, but if the differences in technique and nomenclature describing M.4 phenotypes are kept in mind, such confusion should be avoided. The M.4 scales are more precise in themselves and more easily grasped than photoscopic interpretation: these are distinct advantages.

Disposition to Breakdown

Disposition to breakdown in mental health is measured for individual somatotypes or groups of somatotypes by comparing the frequency of each type in a series of patients and a series of controls. The first series of patients here consists of 208 consecutive Oxford University students advised by their general practitioners to attend the Warneford and Park Hospitals during the last four years for consultant psychiatric opinion. The first 100 were mentioned in an earlier report (Davidson *et al.*, 1955). The control series consists of 405 Oxford students attending a pilot health service between

1947 and 1950, for which the volunteer rate was 70%. M.4 phenotype and independent photoscopic estimates were compared before settling the final somatotype to be used. Fig. 5 shows those somatotypes ringed which appeared more often in the patient series; Fig. 6 those somatotypes which appeared more often among the healthier controls. The actual frequencies may be compared in Table II. There is a highly significant difference between the distribution of the 208 patients and the 405 healthy controls ($\chi^2=24.25$, $P<0.001$). A comparative ratio in the third column of

the table—Comparative ratio = $\frac{\% \text{Patients}}{\% \text{Controls}} \times 100$ —indicates by higher figures which physiques show greatest disposition to breakdown. These are the linear or ectomorphic physiques, especially those in whom fat is more prominent than muscle (Lf), but high rates were also found in Fl types: briefly, muscular builds were least disposed to upset.

Similar conclusions concerning the significant association of comparative mental and muscular weakness in young men are reached if the student patients are compared with Sheldon's figures for somatotype frequency in a large American population ($n=46,000$) from 16 years of age upwards. Comparison of non-student patients under 30 years with student controls also yields the same general trend. The Oxford student population appears rather more

FIG. 5.—Somatotypes which appeared more often among Oxford men students under psychiatric care than among healthy students.

FIG. 6.—Somatotypes which appeared more often among healthy men students at Oxford than among patients.

Oxford student patients v. controls, $\chi^2=24.25$, $P<0.001$. Non-student patients v. controls, $\chi^2=27.66$, $P<0.001$. (Type 444 excluded.)

linear than the general population in the States, and this tends to lessen the contrast between non-student patients and student controls.

Individual phenotypes show striking contrast in disposition—for example, type 452 was five times more common in the healthy sample, type 325 six times more common among the patients.

The question may reasonably be asked whether this general trend could be due to mental patients losing weight. The answer is that careful weight histories were taken and allowance made for any weight loss recorded; secondly, the photographic check was used and a further independent check was provided by the ratio of height to chest width. Neither height nor chest width changes appreciably with weight loss, and although the mean ratio for samples of patients showed them to be more linear as a group than healthy persons, there was no excess of patients with ratios either more or less linear than the average for healthy persons of their own particular phenotype.

Disposition to Mental Illness in Young Women

So far 227 women patients under the age of 30 years have been phenotyped by combined M.4 chart estimates and photoscopy. Of these, 75 were attending at the Park Hospital for functional nervous disorders, the remaining 152 had been admitted consecutively to four mental hospitals. The distribution of their phenotypes by dominance is given in Table III, and may be compared with the figures for 671

TABLE III.—Percentage Distribution of Women Patients by Phenotype Dominance

Women patients under 30 years v. healthy students, $\chi^2=62.73$, $P<0.001$. (The three poorly populated sectors and type 444 were excluded.)

healthy women students at Oxford and Birmingham Universities. Once again the difference in distribution is highly significant ($\chi^2=62.73$, $P<0.001$), with the same Lf phenotypes showing the highest disposition to breakdown. Among fat but more muscular women belonging to the Fm sector there is a great excess of healthy students. Figs. 7 and 8 illustrate the contrast between phenotypes which are commoner in the patient and healthy samples respectively. There are too few women in sectors Mf, Mi, and Lm to justify comparison.

Somatotype and Psychiatric Diagnosis

No significant difference has been found so far in the physical distribution of patients admitted to mental hospitals and those attending the neurosis centre. An account of the relationship between physique and mental illness will not, however, be complete until the results are related to psychiatric diagnosis. For this purpose, psychiatric records are being collected, using certain well-defined clinical criteria for up to 200 patients of each sex in progressive age groups. This study is now well advanced, and in due course will form the topic of a combined report with Dr. Ian Skottowe, the psychiatrist concerned.

Summary and Conclusions

A method is described of estimating body type by means of physical anthropometry in the form of a three-numeral phenotype index, similar to the somatotype index introduced by W. H. Sheldon. The index is derived during the clinical interview by entering the measurements direct on to an M.4-style Deviation Chart. The F, M, L, phenotype index of Fat, Muscularity, and Linearity may be read from the chart without further tables, except that tables are most convenient for calculating the ponderal index of Linearity.

Comparison with the results of Deviation Chart and Table typing previously reported (Parnell, 1954b) shows that the differences between component ratings determined in this way and by the M.4 type chart are small. The M.4-style chart has notable advantages.

FIG. 7.—Phenotypes which appeared more often among women mental hospital patients under 30 years of age than among healthy students.

FIG. 8.—Phenotypes which appeared more often among healthy students than among women patients under 30 years of age.

Women's phenotypes may be derived from the M.4 chart, using the same absolute scales. Their phenotype distribution is reported. The possibility of subsequent correction of this distribution is discussed.

Weight variation at a given age is discussed in relation to phenotyping both healthy persons and mental hospital patients.

Disposition to mental breakdown is measured in terms of phenotype frequency in patient and control series. (The phrase "somatotype frequency" is reserved for the young men who were photographed and typed by Sheldon's criteria.) There was a highly significant tendency for mental disturbances to occur more often in Sheldon's endomorphic ectomorphs—that is, a linear build with proportionately more fat than muscle—type Lf. More muscular young men, especially endomorphic mesomorphs (type Mf), were much commoner in the healthy sample. For example, phenotype 452 was five times more common among healthy young men, phenotype 325 six times more common among patients.

The somatotype distribution of other young men patients, excluding students, showed similar significant trends.

Among women under 30, disposition to breakdown was once again significantly much greater in Lf phenotypes. In sector F1 there was about average expectation of breakdown. Lastly, in sector Fm there was a significantly higher proportion of healthy students.

APPENDIX : NOTE ON SUBCUTANEOUS TISSUE CALLIPERS

The subcutaneous tissue callipers ("Q") used throughout this work are no longer in production. Their specification, and that of the Harpenden callipers now available, are given by Tanner and Whitehouse (1955). Unfortunately, the equation they gave for transforming "Q" measurements to Harpenden equivalents is unworkable owing to an error. A set of Harpenden Total Skinfold measurements in millimetres is therefore provided in the table below for each age group to replace the "Q" figures given in Fig. 1 if Harpenden callipers are used.

Equivalent Skinfold Measurements Using Harpenden Callipers

Age	Total of Three Skinfold Measurements													
16-24	10	12	14	17	20	24	29	36	45	57	73	93	114	
25-34	12	14	17	20	24	30	38	48	60	74	94	114	+	
35-44	13	16	19	22	27	35	44	55	68	87	109	+	+	
45-54	14	17	20	23	29	37	47	61	74	95	118	+	+	
Estimate F	1	1½	2	2½	3	3½	4	4½	5	5½	6	6½	7	

Based on 180 duplicated measurements partially selected to cover the scale

The Harpenden callipers have two advantages—the spring loading varies relatively little as the jaw opens, and, secondly, the dial is capable of more accurate measurement. They have one serious disadvantage: the needle takes time to settle. Repeated studies with serial photographs of calliper dial and stopwatch show that even in the lower part of the scale the needle settles by variable amounts up to 1 mm. in the first 10 seconds after the callipers are applied, and continues to move for 30-45 seconds or so afterwards. In the upper part of the scale, it moves as much as 2-4 mm. in the first 10 seconds. The accuracy of the procedure should not be overrated.

I thank Dr. R. W. Armstrong, Dr. W. Ogden, Dr. S. L. Last, Dr. R. G. McInnes, Dr. Ian Skottowe, and Dr. P. Berkenau, together with other psychiatrists, who have kindly allowed me to measure patients under their care at hospitals in the Oxford Region. Dr. I. J. McQueen introduced me to contestants in the "Mr. Universe" physique contest organized by the National Amateur Body Builders' Association. Miss G. E. Peierls and Miss M. Caudwell provided statistical assistance and Mrs. N. V.

Hodder helped in the preparation of diagrams. The work was undertaken during tenure of a grant from the Nuffield Foundation.

THE CONCEPT OF MEDIASTINAL PAIN

BY

JOHN ANDERSON, F.R.C.P.

Physician, St. Thomas's Hospital, London

AND

C. R. BOUGHTON, M.B., M.R.C.P., M.R.A.C.P.

Senior Medical Registrar, St. Thomas's Hospital, London

The usual patterns of pain occurring in ischaemic heart disease, hiatus hernia, and pericarditis are well recognized. Many clinicians, however, will remember having seen patients with a history of sudden or severe chest pain somewhat similar to, or even identical with, that occurring in myocardial infarction, but in whom a subsequent diagnosis of carcinoma of the lung or other condition involving the mediastinum was ultimately proved. There is no doubt that chest pain can arise from the involvement of several different pain-sensitive structures in the mediastinum by various pathological processes, and the following case reports illustrate the fact that the patterns of pain resulting may cause considerable difficulty in diagnosis. Interesting variations in the sites of pain reference have also been noted.

Bronchial Neoplasm with Mediastinal Involvement

It is not rare for new growth of the bronchus to present with a sudden excruciating central chest pain which may be mistaken for the pain of myocardial infarction. It is similar in character, radiating up into the neck and jaw and down into the arms, but with the significant addition of a component of pain which radiates up into the head, scalp, face, and ears. Furthermore, the pain is repeated at longer or shorter intervals. In the first instance such a pain may be regarded as due to myocardial infarction, but with recovery and then repeated attacks without confirmatory electrocardiographic evidence, the diagnosis of myocardial infarction becomes untenable. Most physicians will have seen such patients who were regarded as having cardiac pain, and subsequently a neoplasm of the bronchus with mediastinal involvement has been found.

Interestingly, in one case of carcinoma of the left upper lobe bronchus referral of pain to the left side of the head occurred.

Case 1.—A man of 49 years was awakened from sleep one night with severe retrosternal pain followed in several minutes by left hemiparesis of considerable severity. He vomited. The pain then radiated to the left elbow and lasted about one hour. This recurred twice subsequently, and none of the attacks was induced by exertion or change of posture. An unproductive cough developed at about this time. Examination revealed a sthenic man with a dry cough. There was moderate hypertension. The percussion note was slightly impaired over the left lung apex anteriorly. An E.C.G. tracing was normal. A chest x-ray film revealed a mass in the region of the aortic knuckle (Figs. 1 and

2), which was subsequently shown to be a bronchial carcinoma. Six months later, necropsy revealed widespread carcinoma, originating in the left upper lobe bronchus, involving the mediastinum and with metastases in bones and brain. No myocardial infarction was found.

Case 2.—A woman aged 52 had a chest infection with an abnormal shadow in the left lower lobe. The shadow grew and the lung was excised. The lesion was found to be squamous-cell carcinoma with histologically proved lymph-node involvement. Later there were attacks of very severe retrosternal pain with radiation into the face and head, and, in particular, pain was felt in a premolar on the right side of the lower jaw; the pain also radiated into the left arm. A pleuro-pericardial friction rub was present with each exacerbation of pain. No electrocardiographic evidence of myocardial infarction was found in any of several tracings.

Fig. 1.—Case 1. X-ray film showing a mass in the region of the aortic knuckle.

Fig. 2.—Case 1. X-ray film taken three months after Fig. 1. The lesion was a carcinoma of the left upper lobe bronchus.

It seems certain that this pain originated in the mediastinal structures which were invaded by new growth and that mediastinal pleurisy was associated.

Case 3.—A seaman aged 38 developed severe aching pain in his chest in December, 1950. It was situated in the centre of his chest, radiating down the inside of his left arm and the outside of his right arm. It also went through into his back. The pain was so excruciating that it made him weep, lasted altogether four days, and then disappeared completely. He was thought to have an atypical myocardial infarction without E.C.G. changes. In June, 1951, the pain recurred and he was a little short of breath. In July, 1951, the pain recurred again; it was felt between the shoulder-blades and went up into his neck. In February, 1952, he had another attack of a very severe pain which lasted a week. At this time it included his shoulders and his neck, and reached up to his right cheek. Immediately before admission to hospital the pain in his arms started again, and was very severe. An x-ray film of the chest showed a large mediastinal tumour. Biopsy showed a poorly differentiated carcinoma, the origin of which was doubtful.

Mediastinal Gland Involvement by Reticulosis, Sarcoidosis, Tuberculosis, or Secondary Neoplasm

When mediastinal glands are involved in these conditions the patient may present with pain which is identical with the pain described above. A significant diagnostic feature again is the radiation into the head and face. Here also the diagnosis may be obscure until obvious glandular enlargement is found in the chest x-ray film, and this development may be delayed for weeks or even months.

Case 4.—A woman aged 36, 3½ months pregnant, complained of cough of two years' duration and intermittent attacks of pain of varying degrees of severity which were felt in the left side of the face. The pain came first in the upper jaw, spread into the lower jaw, then into the face below the left eye and finally to the scalp on the left side. There was a gradual spreading of the pain until all the sites mentioned were involved. It had been present intermittently for three months, but then became continuous. In addition, she noticed increasing shortness of breath, and for two months she had increasing "indigestion." This was a nasty burning sensation deep inside the chest, unrelated to food or posture and not relieved by powders. An x-ray film of the chest showed a mass in the left lower lobe with a paramediastinal mass in the upper part of the left hilum. At thoracotomy malignant glands in the mediastinum and a massive invasion of the left lung by growth were found. The patient died eight months later following the birth of a normal child. Necropsy showed multiple metastatic carcinoma, histologically very anaplastic, the primary growth being probably in the breasts.

Case 5.—A man of 55 developed dull persistent pains in the right shoulder followed by malaise and then pains in the left shoulder. One morning he experienced sudden agonizing pain in the back and around the chest which spread widely up into the throat, jaws, face, ears, especially the left ear, to the top of the head and down both arms to the elbows. The pain persisted severely for about two weeks and then less severely for about three months, and was accompanied by shortness of breath and hoarseness of the voice. Physical examination revealed loss of weight and breathlessness. The left vocal cord was found to be paralysed. The blood pressure was normal and there was no inequality of the pulses. Chest x-ray examination revealed widening of the superior mediastinum and a small indefinite shadow in the left lower lobe. Bronchoscopy was normal, apart from the paralysed left vocal cord. An E.C.G. tracing was normal. Wassermann and Kahn reactions of the serum were negative. A course of palliative deep x-ray therapy was given to the superior mediastinum with relief of pain, but the patient died five months after the appearance of the first symptoms. Necropsy revealed carcinoma of the lung with secondary deposits in the mediastinal glands.

Case 6.—A man of 37 developed an intermittent fever with nocturnal sweats, lassitude, and pain in the left buttock. He then suffered from a constant ache in the upper part of the left side of the chest, which passed to the shoulder and scapular region. This was accompanied on occasions by a sharp needle-like pain felt deeply behind the sternum, shooting up to the left side of the neck synchronously with each heart beat, the attacks lasting several minutes and dying away slowly. He also noticed itching of the skin. Chest x-ray films revealed widening of the

superior mediastinum (Fig. 3), and bronchoscopy was normal. A blood count showed a polymorphonuclear leucocytosis (84% of 16,000 leucocytes per c.mm.) and an E.S.R. of 80 mm. per hour (Westergren). A provisional diagnosis of malignant lymphoma was made and a course of deep x-ray therapy instituted, which resulted in considerable relief of the pain. Several months later, however, irregular fever recommenced and several rubbery non-tender glands appeared in the left supra-clavicular region. Biopsy of these glands showed Hodgkin's disease. The patient's condition steadily deteriorated and he died three years after the appearance of the first symptom. Necropsy revealed extensive deposits of lymphadenoma tissue in almost all viscera, including bone marrow.

FIG. 3.—Case 6. X-ray film showing widening of superior mediastinum, found to be due to Hodgkin's disease.

Cardiac Pain

Cardiac pain occurs with angina pectoris and with myocardial infarction, and both these are sufficiently well recognized not to require detailed description here. Pain of ischaemic cardiac disease may, of course, be experienced at first in one of the peripheral sites of radiation, such as the thumb, hand, or elbow, and it is only later, perhaps after months, that it is felt in the typical central position.

Apart from the commonly recognized sites of pain reference, pain may be felt in the head, and, as the following cases show, it is not possible to say that face and head pain occurs only in those cases where the mediastinum is involved in a neoplastic process.

Case 7.—A man of 52 was admitted to hospital having experienced a severe occipital headache which persisted for some hours and was followed 18 hours later by severe retrosternal pain which was worse on coughing and breathing. He was restless and short of breath. He was found to have an anterior myocardial infarction with early heart failure. No friction rub was heard at any time and no evidence of subarachnoid haemorrhage or cervical spondylosis was found.

The fact that respiratory movements very occasionally aggravate the pain of myocardial infarction may be a source of confusion. Not only may pain be referred to the occiput, as in the above case, but also to the vertex of the head, without any pain being experienced at the same time in the neck or jaws.

Case 8.—A man aged 46 had several attacks of angina pectoris with pain retrosternally, followed immediately on each occasion by headache at the top of the head. There was no sense of pain or constriction in the neck or jaws at any time. The last attack was associated with myocardial infarction, a typical pattern of through-and-through postero-lateral infarction being obtained on electrocardiography. Vertical headache was a feature of this attack also.

The absence of evidence of cervical spondylosis in the above two cases is stressed because spondylosis may cause occipital pain which can be referred to the vertex of the head or even as far forward as the forehead. Furthermore,

radiation of pain in the fourth to eighth cervical dermatomes arising from spondylosis may superficially resemble the pain of myocardial ischaemia. Careful history-taking and physical examination, however, will almost invariably enable the clinician to arrive at the correct diagnosis. In this connexion, Case 9 is of interest.

Case 9.—A man of 61 was referred to hospital with a provisional diagnosis of arthritis of the left shoulder. Two weeks previously he experienced retrosternal pain which came on after moderate exertion and which spread to the left shoulder and down the arm to the fingers. It was relieved by rest and recurred on slight exertion, but he stated that the ache in the arm itself was almost continuous. An E.C.G. tracing showed the changes of posterior myocardial infarction. He was treated with rest in bed, analgesics, and anticoagulants. The chest pain was relieved but that in the arm persisted. It was found that this pain could be aggravated by lateral flexion or rotation of the neck and that the movements of the latter were limited. An x-ray film of the cervical spine revealed gross osteoarthritic changes and disk degeneration in the lower part of the cervical spine with angulation between the fourth and fifth cervical vertebrae (Fig. 4). The patient experienced considerable relief from the pain in the arm when the neck and back were kept extended, and a cervical collar was fitted.

FIG. 4.—Case 9. X-ray film of cervical spine. Gross osteoarthritic changes are present, with narrowing of disk spaces and angulation between the fourth and fifth cervical vertebrae. A cervical collar had been fitted when this film was taken.

Pericarditis

This condition is often painless, and in uraemia, for example, a loud pericardial friction rub may be present without the patient being aware of any discomfort. Acute non-specific pericarditis, however, may be very painful, and the distribution of pain is similar to that of myocardial infarction. On occasion it is described as a tight constricting band round the lower chest. Frequently the pain is aggravated by respiration. Where there is a large effusion, a dull retrosternal discomfort or pain is often described.

Case 10.—A man of 45 was admitted to hospital with a severe chest pain of eight hours' duration. He had been quite well previously until he was awakened from sleep at about 3 a.m. one day, with sudden severe chest pain felt retrosternally, radiating up towards the neck. The pain was burning in type and was aggravated by deep breathing and movement. The pain was eased only when he lay still with a hot-water bottle on his chest. On physical examination he did not look ill, but respiration was shallow. Both the temperature and the pulse were slightly raised, no pericardial friction rub was heard, and other findings, including chest x-ray examination, were normal. An electrocardiogram showed elevated ST segments in leads I, II, and III. The pain subsided in the next two days and a repeat electrocardiogram five days later was almost normal.

Case 11.—A man of 31 with established aortic stenosis of rheumatic origin was admitted to hospital with history of listlessness for one week and retrosternal pain for one day. The pain came on gradually and was constant, but was aggravated by deep breathing. It did not radiate. Three weeks previously he had had a sore throat. He was found to have an acute rheumatic exacerbation with a high remittent fever but a fixed pulse rate of 60 beats a minute due to complete heart-block. Three days later the pain, which had persisted, suddenly became very severe, jabbing, and, as before, was greatly aggravated by respira-

tion. A harsh leathery pericardial friction rub was audible. The blood urea concentration was normal. He died suddenly several days later. Necropsy revealed widespread acute fibrinous pericarditis and calcific aortic stenosis. Numerous Aschoff nodules were found in the myocardium.

Aneurysm of the Aorta

Fusiform or saccular aneurysm of the thoracic aorta may give rise to pain in the chest, especially if it enlarges rapidly or presses on pain-sensitive structures (Case 12). Intense boring pain may be experienced where pressure on spine or ribs occurs and erosion of bone results. In syphilitic aortitis the coronary ostia may be partially occluded, and this, combined with the frequently associated aortic incompetence, may give rise to intractable angina pectoris at rest, with or without myocardial infarction.

Case 12.—A man of 40 was seen at hospital with a two-months history of a dull aching pain across the front of his chest, with malaise and shortness of breath on exertion. The pain was

FIG. 5.—Case 12. X-ray film showing a large aortic aneurysm.

constant, but was eased by his walking "round-shouldered." It was aggravated by coughing and deep breathing but not at that time by exercise. At times it spread to both axillae, shoulders, and back. A history of previous venereal infection was obtained. Physical examination revealed evidence of aortic incompetence, and an area of diffuse systolic pulsation and dullness to percussion was found to the left of the upper half of the sternum. The blood Wassermann reaction was strongly positive and an aortic aneurysm was demonstrated on chest x-ray examination (Fig. 5). Penicillin was given in large doses and a thoracotomy was performed. As the aneurysm could not be excised, it was wrapped in "orlon" cloth. Post-operative recovery was satisfactory and complete relief from pain was obtained.

Dissecting Aneurysm

Dissecting aneurysm is, in most cases, an excruciatingly painful condition, the pain, depending on the site of the initial intimal tear, starting in the chest or abdomen and spreading through to the back between the shoulder-blades and often down the arms and elbows. Paraesthesiae may be felt in the limbs, probably due to interference with the blood supply to nerves and nerve plexuses. Inequality of the pulses is a valuable sign where this condition is suspected.

Oesophageal Pain

Oesophageal Spasm.—Many normal persons have experienced the short-lived but extremely unpleasant sensation which is usually brought on by swallowing liquids, especially

cold liquids, or solids rapidly. An acute sensation of pain develops deep in the chest and spreads round the thorax. It is constricting in character and may radiate into the back and into the neck and arms down to the elbow. It rises rapidly in a crescendo to considerable discomfort and then dies away slowly. It is likely that such pain originates in muscle spasm of the oesophageal wall. A similar longer-lived sensation is sometimes felt by patients who have cardiospasm (achalasia) in the early stages of the disease, and then it may be the major symptom and overshadow the discomforts of dysphagia.

Oesophageal Irritation and Superficial Erosion.—In many persons, drinking very hot liquids causes an acute or dull burning sensation felt at the lower end of the sternum deep in the chest. This spreads laterally round the thorax and sometimes upwards into the root of the neck. It is a pain similar to that which occurs with established oesophagitis due to reflux of gastric contents in the presence of a hiatus hernia. In such a case hot liquids and solids may all cause a similar pain which is described as occurring as the food passes over what seems to the patient to be a "raw area" in the gullet. Such a sensation is not uncommon for a few days in a patient who has swallowed aspirin tablets the last thing at night; these may lie in the lower oesophagus and there produce a localized oesophagitis giving rise to a sensation of deeply situated pain in the chest with an exacerbation on swallowing.

Oesophageal Ulceration.—Deep ulceration as opposed to superficial oesophageal inflammation will produce similar pain, but often with radiation into the back, neck, head, and sometimes to the left ear. If, however, the ulcer penetrates into the laterally placed structures of the mediastinum—for example, the lung root—then the pain is felt laterally in the axillary region on the side which is involved.

Spontaneous Perforation of the Oesophagus.—When the oesophagus is torn by violent efforts to vomit and there is extravasation of oesophageal contents into the mediastinum and usually into the pleural cavity, a sudden and severe pain is felt in the lower chest and epigastrium and sometimes in the shoulder. The pain is intense, there is collapse and shock, the abdomen is found to be rigid, and a diagnosis of perforated intra-abdominal viscus is usually made and acted upon accordingly (Moynihan, 1954). The pain in this case originates in irritation of the lower mediastinal structures and the diaphragmatic pleura, and it is noteworthy that it is felt mainly in the epigastrium. Gas escapes into the mediastinal tissues and tracks upwards, producing subcutaneous emphysema over the root of the neck within a few hours of the initial acute episode (Barrett, 1946; Eliason and Welty, 1946).

Mediastinal Pleurisy and Emphysema

These conditions are not often recognized clinically. A patient who has experienced sudden and usually severe pain retrosternally with radiation into the neck and arms will say that the pain is made worse by taking a deep breath or coughing. Crepitations are heard near the sternum on auscultation, and these may be synchronous with the heart beat or with swallowing, and vary in number and intensity with alteration in the patient's posture. Frequently subcutaneous emphysema above the clavicles and suprasternal notch develops.

Chest x-ray examination will sometimes reveal air in the mediastinal tissues, especially in the lateral view, and invariably reveal subcutaneous emphysema when this is present.

Acute mediastinal emphysema associated with interstitial emphysema of the lungs may occur during a bout of coughing, on strenuous physical exertion, and sometimes in states of dehydration (Macklin and Macklin, 1944).

Case 13.—A man of 64 had been chesty for a few days with cough and fever. He suddenly developed a severe retrosternal pain in the upper part of his chest. The pain was sharp and tight and radiated up into the root of the neck to the level of the jaws; it also radiated into the left shoulder and upper part of the left arm. It was acutely aggravated by his trying to take a deep

breath, which was cut short as is characteristic with pleural pain. On examination showers of crepitations were heard over the manubrium sterni. No subcutaneous emphysema was found. The temperature did not exceed 99° F. (37.2° C.). An x-ray film of the chest showed a moderately enlarged heart. Three electrocardiograms showed no evidence of myocardial infarction or pericarditis. The pain and pleural signs rapidly disappeared on rest and antibiotic therapy. A similar attack occurred two months later; again there was no evidence of myocardial infarction, and the patient recovered on the same treatment.

In Case 13 the pain closely simulated the pain of myocardial infarction in character and distribution, but crepitations were heard over the sternum and the pain was clearly related to respiration, which suggested the correct diagnosis.

Case 14.—A youth of 19 experienced a sudden severe pain in the chest while heaving some bricks into a truck. He became breathless and distressed. The pain spread to the root of the neck and to both shoulders and arms. The classical signs of air in the mediastinum were found on his admission to hospital, and there was subcutaneous emphysema of the upper part of the chest wall (Hamman, 1939, 1945). The condition cleared up spontaneously in a few days.

Case 15.—A boy aged 14 had been unwell for some days. He developed moderately severe discomfort in his chest, situated retrosternally and without radiation; it was worse on breathing and on effort. On examination a loud pleuro-pericardial friction sound was heard over the front of the chest, and subcutaneous air was noted over the clavicles. He was found to be in diabetic pre-coma. A chest x-ray film showed the typical appearance of mediastinal emphysema with subpleural air separating the mediastinal parietal pleura from the mediastinal structures. There was no pneumothorax.

There is no doubt that in Case 15 the pain was caused by escape of air into the mediastinum, and it is likely that the severe central chest pain which is sometimes felt in spontaneous pneumothorax has a similar origin.

Spontaneous Pneumothorax

Occasionally it may be difficult to distinguish clinically between spontaneous pneumothorax and myocardial infarction. In the former, retrosternal pain may occur with radiation to the neck, jaw, and arms as in coronary occlusion. Possibly this is due in some cases to concomitant mediastinal emphysema, as mentioned previously. It is not only in cases of tension pneumothorax that this distribution of pain occurs, but sometimes in cases where the amount of air in the pleural cavity is small and is difficult to detect clinically. The following case is of this type.

Case 16.—A man of 30 experienced a sudden pain in the left side of his chest anteriorly while preparing his breakfast. It was not particularly severe at the time. He then started cycling to work, when the pain became more severe, was worse on deep respiration, and radiated to the left shoulder and base of the neck, making him breathless. He also noticed weakness, pallor, and coldness of the left arm and hand which lasted about an hour. When seen eleven hours after the onset of the trouble he was not distressed. The left chest wall moved slightly less than the right, and pleuro-pericardial friction sounds and a loud precordial systolic click were heard. A chest x-ray film revealed a small pneumothorax on the left side.

There is little doubt that air had escaped into the mediastinum as well as into the left pleural cavity. The transient pallor and coldness of the left arm was presumably due to arterial spasm, which may have been induced by air in the tissues surrounding the left subclavian artery.

Discussion

No attempt is made to consider the possible mechanisms of referred pain. It is evident that similar pain distributions can be produced by different pathological lesions involving the mediastinal tissues, but it seems that malignant growths in that region give rise more frequently to referral of pain to face and head than do other mediastinal lesions such as myocardial infarction. The whole clinical picture must of course be taken into account in diagnosis, and the value of radiographic and electrocardiographic study is obvious.

Not infrequently, however, it is only after watching the patient over a period of time that the cause of mediastinal pain becomes apparent.

Summary

A wider concept of mediastinal pain is suggested from the study of a number of clinical conditions.

The commoner causes of mediastinal pain are briefly discussed and illustrative cases quoted.

Similarities and differences in pain patterns are noted.

The value of a careful clinical approach is stressed and the use of special investigations indicated.

We thank Dr. J. S. Richardson for helpful criticism and permission to report one of his cases, and the records and photographic departments of St. Thomas's Hospital for their help.

A MILDLY AFFECTED FEMALE HAEMOPHILIAC

BY

KEITH TAYLOR, D.M.

AND

ROSEMARY BIGGS, M.D.

From the Nuffield Department of Medicine and the Department of Pathology, Radcliffe Infirmary, Oxford

Haemophilia, a disease controlled by a sex-linked recessive gene, is naturally very seldom encountered in women. There are a few well-authenticated female haemophilic patients; a family described by Merskey (1951) included three affected females, the daughters of a cousin marriage in a haemophilic family. Israëls, Lempert, and Gilbertson (1951) record another case, that of the daughter from the marriage of a haemophilic patient and a known carrier. In both of these instances later work has shown that the patients had classical haemophilia. In addition, it is occasionally found that female carriers of haemophilia have some unusual tendency to bleed (Fantl and Margolis, 1955); it is presumed that the abnormal gene is only partially recessive in these patients.

The girl whose case is described here is unusual because when first encountered she had no knowledge of any other affected member of the family. The case is worth recording because it illustrates features in the management of haemophilic bleeding.

Case Record

On July 7, 1956, a 19-years-old girl, who was dangerously ill with uncontrollable post-operative bleeding, was flown into the centre of Oxford by helicopter from Bournemouth and admitted to the Radcliffe Infirmary under the care of Professor L. J. Witts.

When the patient was 3 years old her mother and father separated and she was subsequently brought up by her father. On questioning she said that she knew of no other instances of abnormal bleeding in the family. Her childhood had been uneventful, and the only indications of an abnormal bleeding tendency were rather heavy periods and three weeks' bleeding from a tooth socket following extraction of a single tooth in her early teens. The bleeding

was not severe enough to prevent attendance at school. Another extraction two years later was uneventful.

In August, 1955, she was delivered of a healthy full-term male child and following delivery there was continuous bleeding from a vaginal laceration, despite repeated suturing and packing of the vagina. After two weeks the right internal iliac artery was ligated, but bleeding continued for another three days. She was in hospital three months, and was transfused with 37 pints (21 litres) of blood. At that time laboratory tests gave the following results. Bleeding-time: 2½ minutes; clotting-time, 11 minutes (Lee and White); prothrombin time, 14 seconds; prothrombin index, 100%; platelets, 195,000 per c.mm. All these results were normal and the cause of bleeding remained obscure.

She was well until five weeks before her transfer to the Radcliffe Infirmary, when she was admitted to a Bournemouth hospital with a heavy vaginal haemorrhage and epis-taxis. A diagnosis of incomplete abortion was made. On dilatation and curettage quantities of placental tissue were removed. Vaginal bleeding persisted, and four weeks later a further curettage was done, but this failed to improve her condition and blood was transfused almost continuously. Ten days before she came into our care she underwent an emergency abdominal hysterectomy and right salpingo-oophorectomy, following which blood loss per vaginam continued and abdominal bleeding started. The day before her transfer she had a brisk vaginal haemorrhage. The vagina was packed and she was given 180 ml. of fibrinogen solution, followed by 2 pints (1,140 ml.) of blood. It was then found that there was a large tender mass in the abdomen arising out of the pelvis.

When she arrived in Oxford she looked much fitter than we had expected, and her chief complaint was of colicky pains in the lower abdomen. Physical examination revealed a vertical midline incision in the lower abdomen 11 cm. long, already partly healed. The clips and sutures were still *in situ*. The lower abdomen was tense and tender, and there appeared to be both a thickening of the layers of the abdominal wall under the scar and also a large mass rising out of the pelvis. It was thought that both abnormalities were due to haematoma. A slight loss from the vagina of dark offensive-smelling blood was noted. The patient was incontinent of small quantities of rather turbid urine. Passage of a catheter did not reveal any residual urine.

Investigation of the Bleeding Tendency

Routine tests on admission gave the following results: haemoglobin, 84% (12.4 g. per 100 ml.); W.B.C. 6,700 per c.mm.; E.S.R., 32 mm. in 1 hour (Westergren); platelet count, 606,000 per c.mm.; bleeding-time, normal; tourniquet test, negative; clotting-time (Lee and White), 6 minutes (normal); prothrombin consumption index, 16–31% (abnormal); one-stage prothrombin time, normal; two-stage prothrombin, 90% (normal).

The only definitely abnormal result was the raised prothrombin consumption index. Further investigation revealed an abnormal thromboplastin generation test, inability of the patient's plasma to correct the clotting defect in known haemophilic blood, and a level of antihemophilic globulin (A.H.G.) of 18–25% of normal.

These results showed without doubt that the patient had a mild degree of classical haemophilia, a conclusion so unlikely in the absence of any family history that the patient's father was asked to attend the hospital as soon as possible (the whereabouts of her mother was not known).

FIG. 1.—Family history of the patient, who is III 17. Her brother's blood was tested. The other clinically affected members (II 12 and III 1 and 4) are all dead.

From him and, later, from the patient's mother, who was traced and interviewed, the true family record was obtained (Fig. 1). It was then clear that the family included four severely affected male haemophiliacs, including the patient's own brother, and that the patient's mother was a carrier of haemophilia.

The patient's mother, father, brother, and baby son were tested and the following results obtained:

	Patient's Mother	Patient's Father	Patient's Brother	Patient's Son
Clotting-time	8½ min.	5 min.	More than 40 min.	2½ min. (capillary blood).
Level of A.H.G., 71%	Normal	Normal	0	17%

The brother's blood gave the results of a severely affected haemophiliac and his history of repeated bleeding episodes confirmed the diagnosis. No abnormality was detected in blood samples from the mother and father. The father had experienced no abnormal bleeding. The patient's mother gave a history of menorrhagia and bleeding for one week following the removal of seven teeth, and later for one to two weeks following the removal of 21 teeth. Delivery of her children was uneventful, and an abdominal operation was not followed by excessive bleeding. Clearly the

FIG. 2.—Diagram to illustrate the possible hypothesis to explain the clinical and laboratory findings in the patient and her relatives. The patient's mother is a carrier of severe haemophilia. The father is normal. It is assumed that a mutation for mild haemophilia has occurred in the sperm carrying the father's X chromosome to the patient. The patient's son is assumed to have inherited the X chromosome which carries mild haemophilia.

It is difficult to suppose that the patient is a carrier of an incompletely recessive haemophilic gene. Were this the explanation her mother might be expected to be equally severely affected. Moreover, the patient's son should be either a normal male or a severely affected haemophiliac. The level of 17% of A.H.G. recorded in his blood is similar to that of his mother. The only obvious explanation is that the patient is a carrier of severe haemophilia and that the remaining gene has been modified to produce mild haemophilia. The son has fortunately inherited the gene for mild haemophilia (Fig. 2).

Progress While in Hospital

On July 11 a large clot appeared at the vulva and oozing continued. During this day her pulse rate rose and her blood pressure fell gradually, and she continued a low-grade pyrexia of 99–100° F. (37.2–37.8° C.).

On July 12 a limited vaginal examination was carried out by Professor Moir, who found a firm mass in front of and above the vagina, and a large clot coming through the wound in the vault. There seemed to be an extensive haematoma, partly in the abdominal wound but probably also extending round the bladder and into the lower pelvic peritoneum. It was decided to open the abdominal incision and attempt to evacuate the underlying clot, following a fresh plasma transfusion.

Next day she was given 1 litre of fresh plasma in 70 minutes. This raised her A.H.G. level to 50% and the prothrombin consumption index fell to 13%. At the end of the transfusion and under general sedation and local

analgesia a 3-cm. incision was made in the lower part of the scar and 3-4 oz. (85-114 ml.) of clot was removed; but this made little difference to the contour of the abdomen, and it was felt that most of the bleeding was interstitial and generalized, as it so often is in haemophilia. A fuller vaginal examination was done, a large offensive-smelling clot was removed, and a swab was taken for bacterial culture. The impression of a large haematoma in the pelvis was confirmed.

On July 14, following the examination of the previous day, there was little vaginal bleeding, but her haemoglobin level had fallen from 13.3 g. per 100 ml. on July 10 to 7.1 g. per 100 ml. It should be mentioned here that it was never possible to measure the rate of bleeding either from the vaginal loss, which was mainly of days-old clot, or by palpation of the lower abdomen, in which the size of the haematoma fluctuated from day to day. The pulse and the patient's own well-being proved the most useful guides to therapy.

She was given 1 litre of fresh plasma and 1 litre of fresh blood, and from this time on frequent similar transfusions were given. Large clots were passed with almost unchanging frequency (about four clots a day) per vaginam, and the haemoglobin level was maintained at an average of 10 g. per 100 ml., falling as low as 5.9 g. on July 20, and rising to 13.5 g. on August 6. The presence of vaginal clots caused her great discomfort and removal always gave relief. A culture of *E. coli* was obtained from clot and urine. The organism was insensitive to penicillin V, which she had been taking, but sensitive to chlortetracycline, which was started on July 15. She became afebrile, but her temperature rose again on July 26, when the chlortetracycline was stopped. From then on sulphadimidine and penicillin V were given and she remained afebrile up to the time of discharge. Her general condition improved with the control of infection, and from July 15 there was a steady reduction in the apparent size of the pelvic mass, as judged by abdominal palpation, and micturition returned to normal in spite of continued bleeding.

During her treatment in Oxford she was given 13½ litres of fresh plasma, 9 litres of fresh blood, and 5 litres of stored blood. On average the A.H.G. level was raised to 45% by the transfusion of 1 litre of fresh plasma.

On July 29 she had a minor rigor after plasma transfusion, and this recurred on July 30 after plasma. There were fortunately no further similar reactions. On July 31 she woke up to find the eyelashes of all four lids had fallen out on to the sheet in the night. There were no signs of local inflammatory change, and we have not been able to explain this. Fortunately, new growth soon started again.

On August 6 the amount of clot passed seemed to be less and it again had a foul smell. We were inclined to take the pessimistic view at this stage, and assumed that she must be forming an infected pelvic haemorrhagic "cyst." To our surprise and satisfaction she improved from then on. Transfusions and clots became less frequent and smaller, and her haemoglobin slowly rose. The abdominal wound was completely healed.

On August 11, six weeks and three days after operation, the bleeding finally stopped, and from then she improved rapidly and finally left hospital in good health one month later, her only complaint being of some urgency of micturition. Her abdomen was quite normal on palpation.

Discussion

In the absence of any clear indication of haemostatic defect, excessive bleeding in a female is particularly disconcerting. There is the natural tendency to attempt to control the bleeding by methods known to be effective in haemostatically normal people. In this patient the defect was haematologically so slight that it was unlikely to be detected in any but a specialist laboratory, and the patient's ignorance about her own family prevented any specific search for haemophilia.

Had the diagnosis been clear from the onset the general management of the case would undoubtedly have been different. Haemophilic bleeding cannot be controlled without restoring a normal clotting mechanism. Had the true problem been appreciated, the first curettage would have been preceded by a big transfusion of fresh plasma. Thereafter the local bleeding site would have been left alone to heal and bleeding treated by transfusion of fresh plasma and whole blood. Any extension of the bleeding area by operation can only increase bleeding in a haemostatically abnormal patient.

It may be wondered why the patient's bleeding was so persistent and rapid even after her haemostatic mechanism was virtually controlled by transfusion. When first seen at the Radcliffe Infirmary she was bleeding from an inaccessible secondarily infected site. In such a wound the vessels are not normally contractile and, unless local pressure can occlude the blood flow temporarily, normal coagulation cannot arrest the bleeding. In such adverse circumstances it is necessary to have great patience and to recollect that haemophilic bleeding is usually finally arrested by healing.

Summary

A female patient, apparently suffering from mild haemophilia, was admitted to hospital with severe post-operative bleeding. Her progress and treatment in hospital are described. A study of her near relatives was made.

We thank Professor L. J. Wits for permission to publish the case; Mr. J. W. Nankivell for referring the case; and Drs. O. Gunnery, E. R. Jones, and N. M. Parkes for help in obtaining samples of blood from relatives. We also thank the Oxford Regional Blood Transfusion Service, whose very helpful co-operation was largely responsible for the patient's recovery. Miss Ruth Anderson carried out the laboratory tests on which the diagnosis was based. Dr. R. G. Macfarlane and Professor L. J. Wits kindly read the manuscript.

VENO-OCCLUSIVE DISEASE OF LIVER IN AFRICAN CHILDREN

BY

H. STEIN, M.B., M.R.C.P.Ed., D.C.H.
 Baragwanath Hospital and the University of the
 Witwatersrand

All the publications on veno-occlusive disease of the liver have originated from Jamaica, where it is reported as occurring predominantly in children (Jelliffe *et al.*, 1954a, 1954b; Bras *et al.*, 1954) and more rarely in adults (Stuart and Bras, 1955). The authors who observed this condition in Jamaica had never seen it while working in equatorial Africa, in Indonesia, or in the temperate zones (Jelliffe *et al.*, 1954b). However, cases of this nature are said to have occurred in Egypt (F.A.O.-W.H.O.-Macy Foundation, 1955, p. 76).

In 1953 Hill *et al.* described a hepatic syndrome in Jamaican children clinically identical with veno-occlusive disease of the liver. They termed this syndrome serous hepatitis on the basis of certain histological observations. However, on reviewing their cases subsequently they found that these showed the histological picture of veno-occlusive disease of the liver (Addendum to Jelliffe *et al.*, 1954b; Bras and Hill, 1956).

Veno-occlusive disease of the liver occurs most commonly in children between the ages of 1½ and 3 years,

although adults, older children, and even younger infants may be affected. Bras believes that he has seen lesions of this nature in the newborn (F.A.O.-W.H.O.-Macy Foundation, 1955, p. 70). Clinically the condition has been divided into three overlapping phases (Jelliffe *et al.*, 1954b). The acute phase starts suddenly with hepatic enlargement, which is usually associated with ascites. This phase may be of short duration and complete recovery may occur; on the other hand, the disease may progress over a variable period to the subacute phase. A small proportion of the patients die in the acute phase of liver failure or intercurrent infection. During the subacute phase there is persistent firm hepatomegaly, which is often asymptomatic, but recurrent attacks of ascites may occur. It is doubtful whether any of the subacute cases recover completely, although they may improve clinically with subsidence of ascites and disappearance of hepatomegaly. Most of these cases progress to the chronic phase of liver failure and cirrhosis. Splenomegaly may occur in the chronic phase, but is an uncommon feature in the acute and subacute phases. Jaundice is unusual except terminally. Liver-function tests show progressive liver damage as the disease progresses. Serum protein levels are low, with a relatively high globulin level.

The histology of the liver in veno-occlusive disease has been thoroughly investigated by means of serial liver biopsies (Jelliffe *et al.*, 1954b; Bras *et al.*, 1954). The feature common to all phases is an occlusive process involving the smaller branches of the hepatic venous tree. This occlusion is either partial or complete, and is due to endophlebitis causing concentric intimal padding of the vessel wall. In the early phase the intima is greatly swollen by oedema, but later connective tissue is laid down. Thromboses are rare. The occlusion of the veins gives rise to intense centrilobular congestion with widening of the sinusoids, which may then rupture and coalesce to form blood "lagoons." The pressure of the blood lagoons produces necrosis of the surrounding liver cells. Finally, there is replacement fibrosis which distorts the liver architecture and progresses to centrilobular cirrhosis.

Macroscopic examination in the early phase of the disease shows that the liver is smoothly swollen and turgid with blood, but that later it becomes finely granular, with the development of a collateral circulation and varix formation. This condition differs from the classical Chiari's syndrome (Thompson, 1947) by the total absence of thromboses in the major hepatic veins.

Three cases of veno-occlusive disease of the liver in African children at this hospital are described.

Case 1

A female African child aged 14 months was admitted to hospital on March 15, 1955. The history was of swelling of the legs and abdomen for one month and rapid respiration for four days. She had been breast-fed until 4 months of age and since then had been fed on maize porridge, small quantities of skimmed milk, and vegetables. She had never been taken to a witch-doctor or given herbs of any type. She had had no previous illnesses. One older sibling and her mother and father were quite well.

On admission the child was very dyspnoeic and oedematous, with marked abdominal distension. There was a mild degree of pallor but no jaundice. Her state of nutrition was poor; she had sparse fine hair and depigmented skin. The heart was not enlarged and there were no murmurs. Jugular venous pressure was not raised. Crepitations were heard at the bases of both lungs. The edge of the liver was

palpable three fingerbreadths below the costal margin in the mid-clavicular line and there was much free fluid in the abdomen. There were dilated veins around the umbilicus.

On chemical and microscopic examination the urine showed no abnormalities. A blood count showed: haemoglobin, 9.5 g. per 100 ml.; leucocytes 15,200 per c.mm. (33% neutrophils, 61% lymphocytes, 5% monocytes, 1% eosinophils). The Wassermann reaction was negative. Liver-function tests showed: thymol turbidity, 5.5 units; thymol flocculation, + + + +; colloidal red, + + + +; Takata-Ara, + + +; alkaline phosphatase, 18.2 units; prothrombin index, 92%. The total serum protein level was 3.5 g. per 100 ml. (globulin 2 g., albumin 1.5 g.).

Mantoux tests (1/1000 and 1/100) were negative. X-ray examination of the chest showed consolidation of the right lower lobe and collapse of the left lower lobe and a lamellar effusion in the right pleural cavity. The heart was not enlarged, and on fluoroscopy was shown to be pulsating normally. Barium swallow examination revealed no oesophageal varices. The electrocardiogram was normal.

Paracentesis abdominis was done on several occasions, yielding considerable quantities of straw-coloured fluid. The fluid had a total protein content of 1.5 g. per 100 ml. and a specific gravity of 1008. Culture of the fluid did not reveal *Mycobacterium tuberculosis*.

Biopsy of liver and peritoneum and a portal venogram were done through a small abdominal incision (Mr. L. Stein). The peritoneum was healthy and the liver appeared swollen and plum-coloured, and on microscopic examination

FIG. 1.—Case 1. Showing areas of centrilobular congestion of the liver (low power).

FIG. 2.—Case 1. Showing endophlebitis of a central vein of the liver with centrilobular congestion and a blood lagoon (high power).

revealed marked centrilobular congestion. The portal venogram suggested obstruction to the intrahepatic blood flow.

During her stay in hospital the patient's condition steadily deteriorated. Ascitic fluid re-formed at frequent intervals, causing distress. Paracentesis abdominis produced only brief relief, and four weeks after admission the patient died of bronchopneumonia.

Necropsy Findings (Dr. R. V. Dando).—The right pleural cavity contained a small amount of straw-coloured fluid. The lungs showed the features of bilateral bronchopneumonia. A branch of the right pulmonary artery was occluded by ante-mortem thrombus. Microscopical examination of this vessel showed no abnormality of the wall. The heart and pericardium were normal. The liver was smooth and intensely congested. Neither the hepatic veins nor the inferior vena cava contained ante-mortem thrombi. Microscopical examination of the liver showed well-marked centrilobular congestion with atrophy of liver cords and merging of adjacent sinusoids. Many of the sublobular and centrilobular veins showed acute oedematous intimal thickening with almost complete occlusion of the lumina. There were no ante-mortem thrombi in these vessels. Pathologist's comment: The histological features are those of veno-occlusive disease of the liver. Death was due to veno-occlusive disease of the liver and bronchopneumonia.

Case 2

A female African child aged 5 months was admitted to hospital on August 8, 1955. The history was one of abdominal swelling for 10 days. She had been breast-fed since birth, and this had been supplemented with three daily feeds of porridge, milk, and water for the month before admission. No herbs or witch-doctors' medicine had been given. Pregnancy and delivery had been normal and there was no history of previous illnesses. Mother, father, and three siblings were all well.

Examination on admission revealed a small child with gross oedema of the body, particularly affecting the abdomen and lower limbs. There was no pallor or jaundice or any obvious signs of malnutrition. The heart and lungs were normal. The liver edge was palpable at the umbilicus and the spleen was just palpable at the costal margin. There was much free fluid in the abdomen.

Chemical and microscopical examination of the urine showed no abnormalities. A blood count revealed: haemoglobin, 11.6 g. per 100 ml.; leucocytes, 9,800 per c.mm. (32% neutrophils, 67% lymphocytes, 1% monocytes). The Wassermann reaction was negative. Blood urea was 22 mg. per 100 ml. Liver-function tests showed: thymol turbidity, 2 units; thymol flocculation, + + + +; colloidal red, + +; Takata-Ara, negative; prothrombin index, 75%. The total serum protein level was 4.2 g. per 100 ml. (globulin 2.4 g., albumin 1.8 g.).

Mantoux tests (1/1000 and 1/100) were negative. X-ray examination showed normal heart and lungs, and no evidence in bones of congenital syphilis. Intravenous pyelography showed normal renal excretion and normal renal calices. Barium swallow examination revealed no oesophageal varices.

Paracentesis abdominis on several occasions yielded considerable quantities of straw-coloured fluid. The specific gravity of the fluid was 1007 and the protein content was 0.9 g. per 100 ml. Neither *M. tuberculosis* nor any other organism could be cultured from the fluid.

Laparotomy was performed through a small abdominal incision (Mr. L. Stein). The liver was found to be congested and very swollen. The peritoneum was healthy. A portal venogram showed marked delay in the blood flow through the liver. The hepatic artery was ligated in the hope of relieving the hepatic congestion. Microscopical examination of a biopsy specimen of the liver showed marked centrilobular congestion.

During the child's stay in hospital her abdomen became distended with fluid, necessitating repeated paracentesis.

Blood and plasma transfusions were given. Five weeks after admission she became febrile and dyspnoeic, and was found to have bilateral bronchopneumonia. In spite of antibiotics she died four days later.

Necropsy Findings (Dr. R. V. Dando).—Both lungs showed numerous atelectatic areas and the features of a well-marked bronchopneumonia. The pulmonary arteries, the heart, and the pericardium were normal. The cardiac end of the oesophagus contained numerous small varices. The liver was greatly enlarged and mottled owing to congestion. The inferior vena cava and hepatic veins contained no thrombi. The spleen was congested and slightly enlarged. Microscopical examination of the liver showed diffuse centrilobular congestion and marked dilatation of the sinusoids. In many of the sections the centrilobular and sublobular veins showed striking oedematous thickening of the intima with almost complete occlusion of the lumina of these veins. Pathologist's comment: The histological features are those of veno-occlusive disease of the liver.

Case 3

A female African child aged 1 year was admitted to hospital on March 2, 1956. The history was of swelling of the legs and abdomen for four months. She had been fully breast-fed for three months, and on admission was still being breast-fed as well as receiving maize porridge, vegetables, and small quantities of meat. There was no history of medicines or herbs having been given. She had had no previous illnesses, and her mother, father, and two siblings were quite well.

Examination on admission revealed an undernourished child. The skin showed patchy depigmentation but no nutritional dermatosis. The hair growth was moderate. A mild degree of pallor was present but no jaundice. The lungs were healthy and no evidence of cardiac failure was found. The abdomen was distended and there were several dilated tortuous veins filling from below over the epigastrium. The liver had a firm rounded margin palpable three finger-breadths below the costal margin in the mid-clavicular line. There was a small amount of free fluid in the abdomen. The legs were mildly oedematous.

No abnormalities were found in the urine, chemically or microscopically. A blood count showed: haemoglobin 8.2 g. per 100 ml.; leucocytes, 21,400 per c.mm. (69% neutrophils, 28% lymphocytes, 1% eosinophils, 1% monocytes, 1% basophils); reticulocytes 5%. Erythrocyte sedimentation rate was 28 mm. in one hour. Red-cell fragility test was normal. Coombs and Schumm's tests were negative. No malaria parasites were seen on blood smears. Eagle's test was negative. Liver-function tests showed: thymol turbidity, 5.5 units; thymol flocculation, + + + +; colloidal red, + + + +; Takata-Ara, +; alkaline phosphatase, 15.5 units; prothrombin index 76%; serum bilirubin, 3.1 mg. per 100 ml. Total serum protein level was 6.1 g. per 100 ml. (globulin 3.6 g., albumin 2.5 g.).

A bone-marrow smear showed an erythroid reaction, normoblastic in type. Platelet genesis was normal. The myeloid series showed no abnormality.

Mantoux test 1/1000 strength was negative, but 1/100 strength was positive. X-ray examination of the chest revealed clear lung fields and the presence of hilar glands. The heart and pericardium were normal.

Paracentesis abdominis yielded only a very small quantity of straw-coloured fluid.

Treatment consisted of blood transfusion, streptomycin and isoniazid, and vitamin K. Three weeks after admission a liver biopsy and portal venogram were done through a small laparotomy wound (Mr. L. Stein). The liver was smooth and intensely congested, and numerous venous collaterals were seen. The venogram showed a striking hold-up of the blood flow through the liver.

About six hours after operation the patient had a severe haematemesis and died in spite of blood transfusion.

Section of the liver biopsy showed extremely severe centrilobular congestion with destruction and loss of parenchymal cells and condensation of the stroma. In one area of the section fibrous intimal thickening of a small venous channel with partial obstruction of the lumen was seen.

Necropsy Findings (Dr. J. Shapiro).—Lungs were congested and oedematous. Hilar glands were enlarged and caseous; microscopical examination of these showed tubercle follicles. Heart and pericardium were normal. Several dilated varices were found in the oesophagus. Dilated veins were seen in the wall of the stomach. Spleen and kidneys were congested. Liver was enlarged, rubbery and plum-coloured. There were no thrombi in the firm, and plum-coloured. There were no thrombi in the hepatic veins. On section large quantities of dark red blood exuded from the cut surface of the liver. Microscopical examination of the liver revealed very marked congestion of the sinusoids with compression and atrophy of the parenchymal cells. The centrilobular veins showed intimal thickening with fibrosis and in many cases complete occlusion. The portal tracts showed scanty infiltration by lymphocytes and plasma cells. Pathologist's comment: The features suggest those of veno-occlusive disease of the liver.

Discussion

The three cases reported above were in all respects typical of veno-occlusive disease of the liver as originally described in Jamaica, except that our patients were all less than 18 months of age and were thus younger than the average of the Jamaican cases. Cases 1 and 2 were of the acute fulminating variety of the disease, and death was due to intercurrent infection after a relatively short illness. Case 3 corresponded to the description of the subacute phase of veno-occlusive disease of the liver with a longer history of swelling of the legs and hepatomegaly and more advanced liver disease, and finally death from haematemesis. There were marked disturbances of liver-function tests in all our cases, and serum proteins showed inverted albumin globulin ratios. Jaundice was not detectable clinically in any of the patients, but the serum bilirubin was raised in Case 3. The livers of all three patients were intensely congested, and microscopical study of necropsy specimens showed endophlebitis of the smaller venous radicles, with centrilobular congestion and associated cellular atrophy and stromal condensation in Case 3. There were no thrombi in large hepatic veins or inferior vena cavae. Case 3 had a primary tuberculous lesion in the lungs, but there was no evidence of tuberculosis in the abdomen or liver.

The aetiology of veno-occlusive disease of the liver is unknown. All the cases seen in Jamaica occur in the poorer economic groups, and, although clinically there is no striking evidence of malnutrition, the dietary histories in these cases suggest that malnutrition or subnutrition forms the unvarying background to this disease (Stuart and Bras, 1955). However, in veno-occlusive disease of the liver there is a remarkable rarity of fatty infiltration of the liver, which is the common hepatic manifestation in malnutrition (*British Medical Journal*, 1953). In a series of 150 cases of serous hepatitis (later found to be veno-occlusive disease of the liver), only 5 had associated fatty infiltration of the liver (Hill *et al.*, 1953). It has been suggested that veno-occlusive disease of the liver is caused by bush teas which are consumed by the poorer classes in Jamaica, and that these teas, which consist of various herbs, seeds, and roots, may be especially toxic to malnourished individuals (Jelliffe *et al.*, 1954b; Stuart and Bras, 1955).

None of our patients were strikingly undernourished, although two showed some evidence of malnutrition. At this hospital we see very many severely undernourished African children, and although fatty infiltration of the liver is a very common finding on biopsy or at necropsy, veno-occlusive disease of the liver is very rare. In our experience it would appear almost certain that malnutrition alone is not the cause of the disease.

In South Africa, Selzer and Parker (1951) reported a condition identical with veno-occlusive disease of the liver. They

described 12 cases in European and coloured adults and children. No liver biopsies were done, but six of the patients died and necropsies were carried out on them. Selzer and Parker present strong evidence that the condition observed by them was caused by the consumption of bread made of inadequately winnowed wheat and contaminated with senecio, or ragwort, a common wild plant.

Although there was no evidence to suggest that our patients had taken any herbs or plant substances such as senecio, it is common for African children to be given witch-doctors' medicines, this fact usually being concealed when the child is brought to hospital.

Thus it appears that although malnutrition was very unlikely to have been the only or even the primary cause of veno-occlusive disease in our patients, we cannot exclude the possibility that toxic substances, especially witch-doctors' herbs, were important aetiologically.

Summary

1. Clinical and pathological features of veno-occlusive disease of the liver are briefly reviewed.

2. Three cases of veno-occlusive disease of the liver in African children are described. All were less than 18 months of age, the first two presenting in the acute phase of the disease and dying from intercurrent infection, and the third in a subacute phase and dying from a haematemesis.

3. Our cases are discussed in relation to those described in Jamaica, particularly with regard to aetiology.

ADDENDUM.—Recently a further case of veno-occlusive disease of the liver was diagnosed on liver biopsy in a female African child aged 2 years with hepatosplenomegaly. She had a history of abdominal distension for two months and a previous history of having been given witch-doctors' herbs on several occasions.

I thank Dr. E. Kahn, senior paediatrician, and Dr. S. Wayburne, paediatrician, for access to their case records and for help and advice in connexion with this paper; Dr. J. Higginson, senior pathologist, and Drs. R. V. Dando, J. Shapiro, and I. W. Simson, pathologists, Baragwanath Hospital and South African Institute for Medical Research, for biopsy and necropsy examinations on the cases; the medical superintendent, Baragwanath Hospital, for permission to publish the cases; and Mr. M. Ulrich, of the South African Institute for Medical Research, for the photomicrographs.

The Alcoholic and the Family is introduced by these words: "This booklet is not a medical handbook, nor does it set out to cover all the many aspects of alcoholism. Its purpose is to show that, by a true understanding of his problem and his position, the family of an alcoholic may do much to help him when he wishes to recover." The booklet is issued by the Church of England Temperance Society. It discusses some of the reasons why a person may become an alcoholic and how to help him. In outlining various forms of treatment, emphasis is placed on the need for co-operation between the alcoholic himself, his family, and his medical adviser. The booklet may be obtained from the Church of England Temperance Society, 4, Palace Gate, London, W.8, price 6d. net, together with another, *Alcohol and Drug Addiction* (free), which lists hospitals, institutions, and nursing-homes where such cases are admitted.

DUODENAL ULCERS IN CHILDREN

BY

H. M. GOLDBERG, M.B., F.R.C.S.

Surgeon, Booth Hall Hospital, Manchester

The occurrence of peptic ulcers in infancy and childhood has been known for over 100 years. Its frequency has not been realized until recently and does not seem to be generally recognized. Several specialized textbooks on children's diseases give it scant mention, and only discuss the acute perforating and bleeding ulcers of the neonatal period.

Apart from its surprisingly high incidence in children, when looked for, peptic ulcers in childhood differ in a number of respects from the textbook picture of ulcers in adult life. Below, therefore, some of the literature on this subject is reviewed and a series of 20 cases of duodenal ulcers in children between the ages of 7 and 15 seen at Booth Hall Hospital in the last five years is presented.

Incidence and Classification

Proctor (1925) found only 2 children among 8,260 cases of peptic ulcers in the records of the Mayo Clinic, and Guthrie (1942) found 9 cases in 6,059 post-mortem examinations at the Glasgow Children's Hospital between 1914 and 1941. Karlström (1949), reviewing the incidence of peptic ulcers in 26 paediatric clinics in Sweden, found 30 cases in a five-year period. On the other hand, Girdany (1953) reported 45 children with ulcers between the ages of 1 and 11 during only one year at the Children's Hospital, Pittsburg, and Alexander (1951) found 30 duodenal ulcers among 254 x-ray studies of the gastro-intestinal tract in children.

The history of ulcer pain in adults may go back to childhood. Proctor found in a series of 1,000 adult patients with duodenal ulcers that 26 dated the onset of their symptoms to childhood, even to the age of 4 or 5. Our series in Booth Hall shows a suspicious yearly increase in the incidence of duodenal ulcers since our interest in the problem. It appears that "those who seek shall find."

Cases of peptic ulcer in children are classified into primary, or secondary to burns, infection, or other illnesses. Another classification divides them into neonatal, infantile, childhood (1-9), and adolescent types. Gastric ulcer is much less frequent. Its ratio to duodenal ulcer has been estimated between 1:7 and 1:3. Our cases were all primary. They include only childhood and adolescent cases, and the younger age group is therefore not discussed. Only cases of duodenal ulcers are included.

Although from the literature the sexes appear to be equally susceptible to duodenal ulcers, 14 of our 20 cases

were males. At the time of diagnosis four were aged 7, one 8, one 10, five 11, three 12, and two aged 13, 14, and 15 respectively (Fig. 1). The length of the history varied from 2½ years to one day, with an average of 10 months. The delay was longest when the presenting symptom was pain and shortest when haematemesis was early. In four of our patients there was a family history of duodenal ulcer in one of the parents.

Clinical Picture

In infancy duodenal ulcer is an acute condition characterized by rapidly developing pathological changes and showing little tendency to repair. Perforation and haemorrhage are therefore commoner in this age group. In older children the disease tends to conform more and more to the adult pattern. As in 10% of adults the clinical picture is atypical, a much higher incidence of obscure presentations must be expected in children.

In our 20 cases the presenting symptom was pain in 14. In five of these the character, location, and time relation to meals or relief by milk suggested duodenal ulcer. In nine the pain was not typical of duodenal ulcer. Five patients gave a history of haematemesis on admission and one was admitted with a perforated ulcer.

In children the course of duodenal ulcer can be divided into three phases: acute, atypical, and typical. At the onset ulcers commonly present as acute conditions. The abdominal pain may be severe, generalized, or localized to the umbilicus, right hypochondrium, or right iliac fossa. The children may scream and double up with pain. Vomiting is usually associated with it and occasionally the temperature is elevated. It is therefore not surprising that the literature abounds with reports of patients who had an appendicectomy prior to the establishment of the correct diagnosis. The severe colicky pain may also raise the suspicion of intestinal obstruction. Haematemesis and perforation may occur at this stage—as they may at any stage—and so help in diagnosis. We wrongly operated under the mistaken diagnosis of appendicitis three times.

Case 1.—A boy was first admitted to hospital when he was 14 with a year's history of colicky central abdominal pains which were very severe while they lasted. They occurred at infrequent intervals, at first lasting several hours. Later they occurred almost daily. There was definite tenderness in the right iliac fossa. Subacute appendicitis was diagnosed. At laparotomy through a Battle incision, the appendix was removed. A Meckel's diverticulum 2 in. (5 cm.) long was found and excised. Immediately after he left hospital the colicky abdominal pain recurred. It was now centred just above McBurney's point and was so severe that it made him roll about in bed. A diagnosis of subacute obstruction was entertained but could not be substantiated. Hospitalization again led to quick subsidence of the pain. When, however, the pain soon recurred at home he was admitted for laparotomy, when a large duodenal ulcer of the anterior wall was found. Medical treatment was instituted with temporary success. Frequent relapses necessitated vagotomy and gastro-enterostomy at the age of 18, since when he has been symptom-free.

During the second phase the history is still atypical but symptoms are less acute. The abdominal pain is often generalized, central in position, or in the right hypochondrium. It may be associated with vomiting, but is frequently not relieved by vomiting, food, or alkalis. Although there is no time relationship to meals the pain is often worse at night. The attacks may last from a few minutes to several hours and may occur at odd and sometimes infrequent intervals. Direct questioning may occasionally elicit a more typical history. The association of the pain to food may not have been noticed but may be present. Particularly important is the pain which wakes the child at night or gives rise to distress in the morning. Other symptoms include pallor, loss of appetite, and loss of weight. Local tenderness may be absent, particularly if the ulcer is on the posterior wall. The suggested diagnosis during this phase is commonly mesenteric adenitis, periodic disease, food allergy, cyclical vomiting, etc.

FIG. 1.—Age incidence of the series.

Case 2.—A boy aged 14 was sent to us with a provisional diagnosis of tabes mesenterica. He gave a 4-months history of central abdominal pains of constant nagging type which bore no relation to meals. They tended to come on at no particular time but were worse at night. Recently, vomiting occurred with the attacks and he had had some diarrhoea. Although his appetite was good he had lost weight. Apart from his unhealthy appearance physical examination was negative. The night pains suggested the possibility of a peptic ulcer. Barium-meal examination showed some pylorospasm. The duodenal cap was irritable, with a slight deformity of its lesser curve. There was a suspicious fleck of barium in some of the serial films. There was occult blood. His haemoglobin was 64%. A fractional test meal was normal. He was treated medically in hospital for five weeks with gratifying result. He has had no recurrence for the past two years.

During the third phase symptoms more closely resemble the adult pattern. It is the older child who is more commonly seen in this phase.

Case 3.—This boy was first seen in 1949 at the age of 7 with a severe attack of pain in the right hypochondrium and vomiting. There was diffuse tenderness in that area. A diagnosis of hepatitis was made but could not be proved. Short attacks of abdominal pain continued. In 1953 he had a severe attack of right-sided abdominal pain and tenderness when a normal appendix was removed. Intermittent attacks of pain lasting about 10 minutes continued. In May, 1955, when he was first admitted to Booth Hall Hospital in a severe attack, it was noticed that these pains were eased by milk, and the diagnosis of duodenal ulcer was established. Five months later the attacks became typical. There was a definite relation to meals, and symptoms were relieved by food and alkalis. It was only now that tenderness over the duodenum was noticed. When last seen, 18 months later, there was still duodenal tenderness and occasional pain.

Case 4.—This case shows well the progression from atypical to more typical symptomatology and the difficulty of diagnosis. In May, 1955, a girl aged 10 first attended hospital with a fortnight's history of severe recurrent pains in the right iliac fossa associated with vomiting. Her temperature had been raised at the beginning of the attacks. As there was tenderness in the right iliac fossa appendicitis was diagnosed and a normal appendix was removed. A month later the pain recurred. This time it was situated higher up in the right side of the abdomen, and was on occasion so severe that it made her roll on the floor. Full investigations including barium meal, intravenous pyelography, cholecystogram, etc., were negative. Her symptoms improved on propantheline. In September, 1956, the pain was first noticed to be present mainly in the mornings. She felt better when she had frequent meals. There was now tenderness in the epigastrium. Barium-meal examination showed an irregularity of the duodenal cap with a small ulcer.

Complications

Children are liable to the same complications as adults, apart from malignancy, which has not been reported. Haematemesis is more common than melaena. Melaena without haematemesis is rare, and occurred only twice in our series, although occult blood is frequently present in the faeces. In spite of the absence of overt bleeding the children can be very anaemic. Haematemesis can be massive.

A boy of 12 who had a six-months history of typical abdominal pain had no haematemesis. The benzidine test was negative. His haemoglobin on admission was 50%. Another small boy of 7 who had a two-weeks history of abdominal pain and a haematemesis three days before admission had a haemoglobin of 30%.

The ulcer perforated in two children in this series. One was a boy of 15 who had a year's history of attacks of colicky abdominal pain. Closure of the perforation resulted in cure. The other was a girl of 11 who was first admitted with haematemesis. She gave a year's history of abdominal pain unrelated to food. The barium meal examination showed a deformed and tender duodenal cap but no ulcer. She settled on medical treatment. She was readmitted nine months later with a perforation following recurrence of the pain for three weeks. Closure of the perforation again resulted in loss of symptoms.

Pyloric stenosis has been reported in about 25% of cases, more frequently in older children. There is, however, a

large spastic element which is reversible. One gets the impression from the literature that some of these cases have been operated on after too short a trial of medical treatment. Gross pyloric obstruction can usually be relieved medically, as it is caused more by massive oedema or spasm than fibrosis.

Case 5.—A boy of 12 had a 2½-year history of intermittent intense epigastric pains and vomiting two hours after meals. I first heard of him when our radiologist rang me up to tell me that he had done a barium-meal examination requested by the child's practitioner. He found a large duodenal ulcer and about 80% residue of barium in the stomach after six hours. After six weeks' treatment in hospital the residual barium in the stomach was negligible at 1½ hours, although tenderness and pain were still present.

Diagnosis

The realization that a duodenal ulcer is not a rare condition in children may be the first step in arriving at this diagnosis. In the acute and atypical phase there may be

FIG. 2.—Free acid curves of 10 children with duodenal ulcers. Shaded area represents the average normal limits of hydrochloric acid.

no indication in the history or from the physical signs that the underlying condition is an ulcer. In following up these patients with recurrent abdominal pains it is important to go into the symptomatology again at each interview, and sometimes ask leading questions about the time of day the pain mostly starts.

The only aid which established the diagnosis beyond doubt was a barium-meal examination. The fractional test meal is of little help, as it is usually normal in these cases. Ten of our cases had this investigation. Only one patient (Case 5) showed marked hyperacidity (Fig. 2). The benzidine test is often positive but is not diagnostic. Even at laparotomy an ulcer, even when specifically looked for, can easily be overlooked. There is very little fibrosis and the outer coat of the duodenum may appear normal. It is impracticable and probably unwise to carry out a barium-meal examination on every patient with obscure or recurrent abdominal pain. It is commonly of no help in the early phases of the disease and becomes positive only after several months, usually when the clinical picture contains some suggestive features. A premature barium-meal examination may therefore lead to failure to find the correct diagnosis.

The demonstration of the niche of a duodenal ulcer in children is difficult. Barium frequently passes the duodenal cap so rapidly that a niche cannot be demonstrated. The gross deformities of adults are rarely seen. Some bulbar deformity can usually be shown. This should, I believe, be accepted as confirmation of the diagnosis as it has been

borne out by the subsequent course of our patients. Often there is irritability of the cap and intermittent pylorospasm during the early part of the examination. This may be present in children, anyhow, and cannot be accepted as diagnostic evidence unless the clinical picture and course strongly suggest an ulcer. A repeat barium-meal examination a few months later may establish the diagnosis. The x-ray changes appear to be related to the chronicity of the lesion. In this series the average length of the history of cases showing a definite ulcer was 23 months; of those showing a deformed duodenal cap 7 months; and of those showing only irritability 4 months.

Two of our 20 patients did not have a barium-meal examination, one because the ulcer was found at laparotomy, and the other because of admission with a perforated ulcer. Four showed a definite ulcer; two of these, however, had a negative examination six months previously. Nine patients showed deformity of the duodenal cap. Five had pylorospasm and an irritable cap only. These had or developed a typical ulcer history later, as well as epigastric tenderness. One had haematemesis as well.

Treatment

Except for closure of perforations all our patients were controlled on medical treatment during childhood and adolescence. One required surgery at the age of 19 for frequently recurring attacks of pain. Two more may require surgery later. The indications for surgical treatment are, according to various writers, the same as for adults. Cameron (1953) found only 13 examples recorded in the American literature up to 1953. This small number is to be expected, as the bleeding vessel is not sclerosed and fibrosis of the ulcer bed is not callous and should respond to medical treatment. After the age of 17 stenosis or frequently recurring attacks of pain may occasionally demand surgery. At that age vagotomy and gastro-enterostomy may result in fewer growth and nutritional disturbances than partial gastrectomy. Gastro-enterostomy alone has been followed by an anastomotic ulcer in several instances. Medical treatment to be effective must be prolonged with four to six weeks' stay in hospital, not too frequently interrupted by such "terrifying investigations" as fractional test meals or barium meals in a dark room. Apart from routine treatment of rest, alkalis, sedatives, and propantheline, this should include, where necessary, psychiatric treatment.

Psychiatric Considerations

The pros and cons of an emotional background have been hotly debated for some time. Proctor and Alexander state that worry and stress play no part in the aetiology of duodenal ulcers in children. Aye (1953) and Chapman *et al.* (1956) found emotional trauma in all their patients. Our psychiatric unit is at present engaged in the psychological evaluation of our patients, so that I only want to summarize some of our experiences. These agree with Girdany's statement that these patients "are usually bright and tense and characterized by their parents as nervous. They often seem to be lacking in outward emotional ability and tend to keep things to themselves."

A typical example was a girl of 11 whose mother told me that the girl did not show grief like her sister when their father died. According to her mother her worries go inwards.

Our experience also agrees with the conclusions of Chapman *et al.* that the common factors in these patients are: "(1) their marked inability to be comfortable with expressions of any hostile or aggressive feelings, and (2) their resultant passivity and subnormal assertiveness with a strong need to attempt to obtain endless amounts of affection and approval by being servile and obliging to all persons around them." They are the children who hand you their temperature charts during the ward round.

It seems that when circumstances develop which bring strain in family relationships in children of this mental

make-up, a duodenal ulcer may develop. In our experience two of the most important precipitating causes appear to be the death of the father and worry over school examinations, particularly if an exaggerated importance is instilled into them of the necessity of passing the 11+ examination.

Six of our 20 patients had lost their father. These children, although not unduly disturbed outwardly, try to make up to their mothers for their loss by attempting to take the paternal role.

In 7 of the 14 patients in whom, owing to age, worry over the 11+ examination could be operative we found a significant relationship of the development of symptoms to intensive preparation for the examination, worry over the approaching examination, or over failure to pass it.

Case 6.—A boy started intensive coaching 18 months before the examination. Three months later symptoms developed. Six months prior to the examination he had to be admitted to hospital with severe symptoms. Significant improvement occurred only when the scholastic pressure at home was relaxed, but minor exacerbations continued with each examination he had to sit.

Case 7.—This boy, the son of ambitious parents, failed his 11+ examination. The full implications of failing again were constantly explained to him. He started extra coaching at home. A month later symptoms developed.

Case 8.—A girl was expected to pass her examination but as the date approached her work fell off. Her parents kept on reiterating that she must do well and "this examination settles your entire future." While waiting for the result her symptoms developed.

Case 9.—A girl failed her 11+ examination. Within a fortnight of starting at a technical school her symptoms began. She told us she was very worried over her failure to pass, as this meant she would not be able to go on to the university and would have a poorer job in consequence.

Case 10.—A boy was coached for the examination. Symptoms began before he sat for it but became worse after he started in his new school, where he had difficulty in keeping up with the other children. Since transfer to an easier school symptoms have subsided.

Prognosis

The prognosis for duodenal ulcer cases appears to be good. Children of the 7-9 age group responded well to treatment and symptoms did not on the whole recur. In children aged 10 to 15 years symptoms tended to recur more frequently, but could be controlled at least over the adolescent period.

Summary

A series of 20 children between the ages of 7 and 15 with duodenal ulcers is presented. The clinical picture can be subdivided into an early acute and later atypical and typical phases. Barium-meal examination often becomes diagnostic only when the clinical picture shows some features suggestive of peptic ulceration. Surgical treatment is rarely required except for perforations. The influence of home stresses in the aetiology is discussed, particularly loss of the father and pressures put on the child with regard to school examinations.

I thank Dr. W. H. Patterson, Dr. M. L. Thomson, and Dr. A. Holzel for allowing me to include their patients in this series; Dr. J. Fawcitt, without whose radiological skill some of these cases would not have been diagnosed; and Dr. A. A. Cashmore, who is at present engaged in a psychiatric study of these patients.

SYMPTOMATIC DYSTONIA AS A COMPLICATION OF ENCEPHALOPATHY IN AFRICANS

BY

T. ADEOYE LAMBO, M.D., D.P.M.

From Aro Hospital for Nervous and Mental Diseases,
Abeokuta, Nigeria, and the Psychiatric Clinic,
University College Hospital, Ibadan, Nigeria

This paper describes five cases of symptomatic dystonia complicating encephalopathy with mental defect in indigenous Africans. In the original description of his case Thomalla (1918) used the general term "dystonia lenticularis" to include double athetosis, pseudosclerosis (Westphal-Strümpell), Wilson's disease, and torsion spasm. Under this general term I present two cases of torsion spasm, two with double athetosis, and one with Westphal's pseudosclerotic clinical features, all showing mental defect and a clinical mixture of related syndromes. In these patients dystonia, their predominant feature, was symptomatic of a definite illness such as encephalitis lethargica or other affection of the basal ganglia; unlike Ziehen-Oppenheim disease, dystonia musculorum deformans, which is of unknown aetiology.

Dystonia is not uncommon as the presenting symptom in some cases of Wilson's disease, and C. de Lange in 1945 (quoted by Reese, 1946), stated that torsion spasm has also been encountered in a case of tuberculoma of the fronto-parietal region. But Wilson's disease and torsion dystonia have never been described outside Europe and America, and certainly not in indigenous Africans.

Torsion spasm is a condition of comparative rarity. So far as I can trace, some 62 cases have been recorded, mostly in Germany and America, since Schwalbe (1908) and Ziehen (1911) first drew attention to it. Blandy (1920) described the first case in England, admitted to the National Hospital, Queen Square, London. However, with the exception of Wimmer (1921), who described the mental condition of his patient as "very slightly impaired," and of Taylor (1920), who noted "progressive mental enfeeblement" in his Case 2, all authors have failed to mention the coexistence of mental defect and dystonia lenticularis. Brain (1955) stated that psychical changes are absent, and Wechsler (1947) observed that mentality is normal. Also Purves-Stewart and Worster-Drought (1952) pointed out that there is no mental impairment.

Most of the earlier cases and opinions supported a conception of a nosological entity, consequent upon familial or racial degenerative process, *ab origine* in the corpus striatum. But in this connexion Meyer and Cook's (1936) cases are important. They described two personal cases of status marmoratus (*état marbré*), both of which were said to be the subjects of a severe degree of mental defect and quadriplegia from infancy. Their first patient suffered also from generalized fits, torsion dystonia, and choreo-athetosis. These observations favour the conception of multiple aetiological factors causing similar syndromes rather than the existence of separate nosological entities.

Four of the five cases presented here were post-encephalitic and had a noteworthy degree of mental defect. The existence of an infective process is doubtful

in the last case, but the clinical features were similar to those of myoclonic encephalopathy. The first case is typical and was characterized by bizarre and grotesque contortions of the trunk and limbs, a marked degree of motor agitation, and alternation of hypotonicity and hypertonicity.

Torsion Spasm

Case 1

A girl aged 5 came under observation in April, 1956. She was the youngest of six children, three of whom died in infancy. The father was aged 39 and the mother 29 at the time the patient was born. The family history revealed no familial or hereditary nervous or mental disease. The grandparents are alive and well.

The patient was normal at birth. In 1954 she had a febrile illness which was followed by a localized rash on the

Fig. 1.—Showing the opisthotonos in Case 1.

right side of the abdomen and on the lateral side of the right leg (? herpes zoster). The rash, which eventually coalesced, first contained clear fluid which later became purulent. The child was described as "very ill" at this stage, lying "immobile and unconscious."

When she got better she had lost most of the previously acquired functions: she could not stand or walk, speech was lost, and she could not understand spoken words. After an interval of a year it became apparent that the child's mental development was retarded; at the same time her movements had become automatic. Eighteen months from the onset of her febrile illness she started to exhibit opisthotonos with complex, purposeless, and predominantly tonic movements (Fig. 1).

When lying she made silly, bizarre, and rather grotesque wriggling movements of the body and limbs with spasmodic twistings of the arm. When efforts were made to lift her up or get her to walk (Fig. 2) she showed characteristic hypertonicity and a curious torsion of the body. The whole picture, which fluctuated and varied from minute to minute, presented at irregular intervals an admixture of athetosis, spasmus mobilis, and chorea, and yet there was evidence of differentiation from these conditions. Definite physical signs included irregular pupils with relative dilatation of the right pupil. She had squint of the right eye, and on passive manipulation of the limbs tonic-clonic movements were felt.

She showed a marked degree of emotional instability, had temper tantrums, and made odd unintelligible noises. One feels that her mental development had been arrested. The condition at present seems stationary.

Fig. 2.—Case 1. Showing characteristic hypertonicity and torsion of the body in the effort to walk.

Case 2

This case showed features of paralysis agitans in addition to peculiar spasmodic twisting of the trunk, extension and pronation of the left arm, and copious salivation.

This patient was a boy of 6½ years with a negative family history. His mother was aged 30 and his father 37. His early development was uneventful even though his birth was unduly prolonged and difficult. He walked and talked before he was 16 months.

Three years previously the patient had a febrile illness with a generalized diffuse rash ("ekitigbi," measles). When he seemed to be getting better he suddenly became worse. He was stuporous for two days, during which he could be aroused only with great difficulty, and even then for only

FIG. 3.—Case 2. Showing characteristic posture.

a short while. Shortly afterwards, when he seemed to have recovered, he started to show speech difficulty, grimacing, and intellectual retardation.

When first seen he was like a young child of 3, with peculiar involuntary movements, a facile smile, and a spasmodic grin. His posture was characteristic, with a moderate degree of lordosis and irregular twistings of the spine, yet his occasional posture of flexion and his rigidity resembled those of paralysis agitans. The left arm was frequently though transiently extended and hyperpronated at one time and almost normal at another (see Fig. 3), and the involuntary movements were tic-like, with great motor restlessness, resembling choreo-athetoid movements of Oppenheim and Vogt, and of Freund and Vogt. Hypertonicity seemed to be the predominant tone.

Although he had lost his speech after the illness, by the time he was seen he was able to utter some words occasionally with comparative ease but indistinctly. Tendon reflexes were difficult to elicit but seemed to be normal. Both pupils showed miosis and there was squint in both eyes. His head was a peculiar shape.

Both this case and Case 1 were still under observation at the time of writing.

Double Athetosis

In the following cases double athetosis, with poor mentality associated with pyramidal lesions, was the most predominant aspect of the clinical picture. Distal muscles of the extremities showed constant involuntary movements. The combination of the athetoid movements with associated movements, and the preponderance of severe motor agitation over paralytic symptoms, were noticeable features in Case 3. Both Cases 3 and 4 showed variable tonic muscular spasms.

Case 3

A Yoruba boy aged 14 was seen at Aro Hospital Clinic in November, 1955. Four years previously he had complained of vague rheumatic pains, fever, and sore throat; these were followed by a short period of delirium. A state of profound prostration ensued, finally giving place to a brief period of insomnia. Soon afterwards he was said to have had what seemed to be myoclonic convulsions, especially of the abdomino-diaphragmatic region. He appeared to have recovered from this condition, but after a lapse of three months he complained of slight fever and was noticed to be drowsy for about two days. Later he was dragging his leg, and the left arm was described as "weak."

On his admission to hospital there were definite physical signs of a positive Babinski reflex on the left, slight tremor, and athetoid movements of both hands, more marked in the left hand. His articulation was a bit impaired, and though he was alert and amiable he showed definite dullness intellectually. He was simple and euphoric. The liver was slightly palpable.

The most prominent features here were the severe tonic muscular spasms, hyperaesthesia of the soles of both feet, moderate twisting of the pelvis, and lordosis. For a long time the patient was obviously incapacitated by the extreme spasticity in both legs and had to be carried in and out of the clinic. Later, his condition improved and he could walk about but with some difficulty. The athetoid hands also showed marked incoordination and extension-hyperpronation of the distal portion of both arms. The face, head, and neck escaped. There was no opisthotonos and no head retraction. A marked degree of athetosis predominated. His condition seems to be improving and the pelvic contortions are now less marked.

Case 4

The next case is one of progressive dementia with behaviour of a low-grade mental defective. Perseveration is present. Myostatic disturbance is a prominent feature. She is untestable.

A girl aged 9 was referred for "nervousness and fidgeting." She was a second child of the mother and had a normal early history. Her father is aged 43 and her mother 27. Another child of the family (by another wife), a half-brother to the patient, has been admitted to Aro suffering from organic psychosis. The father is a nervous, unstable person. The mother, who is mentally dull, has a young baby of 9 months.

Nothing noteworthy happened to the patient until a year ago. She was then supposed to have a mild attack of small-pox, and a week after the onset of the illness she became very excited for about three days, during which she was visually hallucinated. She was taken to the native medicine-man in Ijebu, after whose treatment the child "became normal again." A few months later she had a severe convulsion, just "out of the blue," and from that time, according to her mother, she began to act like an imbecile. She had to be dressed, washed, and her toilet habits had become lax.

On admission she was dull, mute, apathetic, and had no interest in anything around her. She was very dependent on her mother. There was bilateral athetosis, which was more marked in the left than in the right hand (Fig. 4) and which her mother said was the latest symptom to appear and the most troublesome. There were residual signs of hemiparesis on the right side.

Careful analysis of the child's behaviour—for example, withdrawn regressed condition and complete lack of emotional rapport—has occasionally aroused one's suspicion with regard to the presence of psychosis coexisting with bilateral athetosis. Her present state is one of deterioration.

Pseudosclerosis

Pseudosclerosis of Strümpell (1898) as a nosological entity has been greatly disputed. The better-known authors on the subject have failed to agree and the present trend is to consider this condition as a subgroup of the syndrome of hepato-lenticular degeneration with all its clinical variants

FIG. 4.—Case 3: bilateral athetosis.

The question remains whether the same aetiological factors apply.

The following case was referred to us first diagnosed as neurotic and later as schizophrenic. At this stage the clinical picture, which in some ways reminded one of the early phase of disseminated sclerosis, was later superseded by definite signs and symptoms of striatal disease and a widespread organic damage to the brain.

Case 5

An illiterate Yoruba adult aged 32 was brought in by his mother in May, 1955. She complained of his generalized tremor, progressive dementia, and inability to walk properly; also that he wandered aimlessly about the room most nights and slept the best part of the day. According to his mother his illness started a year before his admission, "the day he shook hands with a friend with whom there was a long-standing quarrel." The right hand started to shake slightly without any progression for three months, after which it spread to the entire body, including the face and head. At this time he found it difficult to sleep and for several weeks lay awake all night.

The difficulty in speech and the signs of mental deterioration did not come into the picture until five months later. The mental symptoms, which included occasional hallucinatory experiences, memory defect for recent and remote events, disorientation for time, place, and person, appeared insidiously and have since dominated the somatic component.

The mother, aged 55, has not been well for several years. There was "nothing significantly wrong" except for a feeling of being unwell. She had corneal changes in her left eye; otherwise physical examination revealed nothing abnormal. The father died eight years ago of a protracted illness of which the mother gave such a poor description, including her own interpretation of the cause, that nothing important could be adduced from it. The patient is the eldest of three children. The other two siblings—a boy of 12 and a girl of 27 years—are alive and well. No family history of nervous and mental illness.

On admission the patient showed generalized tremor, with choreiform twitches all over the body, and these were exaggerated when he attempted to perform any act like shaking hands—that is, marked intention tremor. He could understand spoken words after a long repetition, but was typically staccato in speech when he made an attempt to answer questions. He was disoriented for time, place, and person, and showed complete memory defect for recent and past events.

He was ataxic in all limbs and generally sluggish. The area of hepatic dullness was greatly diminished. There were no physical signs of pyramidal involvement. Although his mother gave a history of mood fluctuation at the onset of the illness, he was apathetic on admission and has since remained so. His face was expressionless and mask-like, and there was the characteristic extreme slowness of movements and increased muscle tone.

His condition is one of progressive deterioration of physical and mental power. Whilst certain features of the physical picture approximate disseminated sclerosis and the mental picture resembles that of organic psychosis, there are certain qualities to the two components of the clinical picture which resist any attempt to explain one component as typical or true and its association with the other as one of essential concomitance. Clinical evaluation of the dyskinetic phenomena, however, places the total picture in the category of lenticular degeneration of a fairly rapid onset (probably toxic-infective), with a pronounced degree of progressive dementia. In spite of the genetic association of pseudosclerosis with hepato-lenticular degeneration, the history of "a slight febrile illness" is regarded here as being more than casual. It would not be unlikely if this proved to be a slight encephalitic attack, as evidenced by its clinical residuum. Campbell and Morse (1924) described a case (including necropsy findings) of pseudosclerosis following erysipelas. These authors also quoted A. Westphal and

Sioli, who in 1922 produced evidence of the infective origin of the pseudosclerotic process. In their case the syndrome followed what was probably an encephalitic attack (cf. Denny-Brown, 1946).

Discussion

In all five cases clinical and laboratory findings support the exclusion of "functional" and organic psychoses, especially juvenile G.P.I. (slight clinical evidence of organic psychosis in Case 4 as indicated above).

It seems that variations in the sequelae of encephalitic process are possibly due to individual variations in the relative susceptibility of different levels of the cerebrospinal axis, and it can be suggested that racial or familial vulnerability and/or previous disease may be an important factor in the focal predominance of the underlying pathogenetic factor.

The clinical interrelationship of these syndromes is of great theoretical interest, especially when one considers the clinical admixtures, in most cases manifesting features of pseudosclerosis, spastic pseudobulbar palsy with contractures and choreo-athetoid movements of Oppenheim and Vogt, and Freund and Vogt, Oppenheim's dystonia musculorum deformans, double athetosis, von Bechterew's hemitonia apoplectica, status marmoratus, Hunt's striatal syndrome, and other ill-defined clinical states which Strümpell (1913) thinks belong to his amyostatic syndrome—for example, the paramyoclonic type of lethargic encephalitis. The relatedness of the clinical syndromes is also reflected in the histopathology of the lesions of the basal ganglia, and earlier investigators placed emphasis upon the manifold pathological findings which may be encountered in the study of the lesions of the basal ganglia.

All the five cases presented here show the "amyostatic symptom-complex" of Strümpell as a sequel to encephalopathy. The maintenance of posture was impaired in all our cases. Involuntary activities varied, showing features of alternating tremor or of choreoid, athetoid, or dystonic movements. Critical analysis of the symptomatology and repeated examinations revealed the fact that although these clinical states are variable, mixed, and could be better understood as a conglomeration of syndromes of the basal ganglia rather than clear-cut disease entities, acquired illness could give rise to clinical states which are indistinguishable in certain respects from those whose aetiological factors are associated with familial and/or racial predilection. There is no doubt that this condition of dystonia musculorum deformans, originally described by Ziehen and Oppenheim, is very rare when compared with the number of patients showing dystonia as a symptom of brain disease.

In considering the constitutional aspect of the clinical syndromes, this material is not large enough, nor could it be sufficiently carefully studied in this respect for one to come to definite conclusions. Kehrer (1928) and Guttmann (1936) have, however, produced evidence of constitutional factors in chorea and athetosis. Kehrer coined the name "choreopathic personalities" for the abnormal individuals in the family of these patients.

It may also be cautiously assumed that there is in these patients a certain *somatic vulnerability* which may be, in part, an expression of genetic-constitutional predisposition to dystonic disease. Also, the same factor may be of aetiological significance in the true dystonia musculorum deformans of unknown aetiology.

Summary

Five cases of symptomatic dystonia, complicating encephalopathy with mental defect, have been described in *native Africans* and the clinical similarity between these related syndromes has been emphasized. The youngest patient (aged 5) with dystonia musculorum deformans of acquired origin has also been added to the literature on the subject.

I am grateful to the Director of Medical Services, Western Region, Ibadan, and Professor Alexander Brown, Department of

Medicine, University College, Ibadan, for permission to publish these cases. I thank Drs. Hans Neudecker and Willy Bernhard, of the Universities of Innsbruck and Frankfurt respectively, and both of the Catholic Mission Hospital, Abeokuta, for their invaluable help and for the great effort made not only to obtain most of the foreign literature on the subject but to discuss and evaluate these cases with me from time to time. They also took photographic illustrations and cine-films of the cases described for Aro Hospital clinical record section. I acknowledge with thanks the helpful criticism and comments made by Professor D. E. Denny-Brown, Department of Neurology, Harvard University, U.S.A., who read the original draft.

TREATMENT OF A CASE OF COMPULSIVE SWEARING

BY

RICHARD P. MICHAEL,* M.B., B.S., D.P.M.
Registrar, the Maudsley Hospital, London

Coprolalia as a symptom occurs in the major psychoses leading to personality deterioration and disintegration. Compulsive utterances of an obscene nature are, however, an unusual occurrence where the personality remains intact, and generally form part of a wider clinical syndrome originally described by Itard (1825), mentioned by Trousseau (1867), and delineated by Gilles de la Tourette in 1885. The essential features of the syndrome now bearing the latter's name include a childhood onset with multiple motor tics, a vocal tic developing later into vulgar utterances, and sometimes also a compulsion to repeat both the words and the actions of others. Frequently the motor component is impulsive and very bizarre, bearing a relationship to the latak which used to be seen in the Malay peninsula (O'Brien, 1883). But it is usually the uncontrolled audible obscenities that force the sufferer into an increasing social isolation, providing, some writers feel, the basis for an eventual psychotic withdrawal.

These uncommon cases are acknowledged to be extremely difficult to treat; the lack of success may be judged from the multiplicity of remedies tried. The physical restraint, isolation, skimmed-milk baths, and static-electricity treatments of an earlier era have given place to modern psychotherapeutic procedures, yet there are few well-authenticated cases in the literature that have lost their tics. None of the patients of Gilles de la Tourette, five of whom were followed over some years, showed any sustained improvement. Itard's old woman, who was seen by Charcot, began ticking as a child of 7 and died at 85, still pouring forth the grossest obscenities. Guinon (1886) and the other older writers

*Holder of a Medical Research Council Fellowship in Clinical Research.

(Prince, 1906; Gilles de la Tourette, 1899) were uniformly gloomy upon the likelihood of recovery. Kinnier Wilson (1955) gives the syndrome a sinister outlook, characteristically "ending in insanity," and though accurate information on prognosis is sparse most authorities describe a progressive worsening of symptoms. One of the three cases collected by Ascher (1949) from the Phipps Clinic developed schizophrenia; while his two personal cases did not improve with psychotherapy. Of Heuscher's (1953) three cases one also became schizophrenic. Mahler and Rangell (1943) had a boy of 11 under continuous psychotherapy for 30 months, and agreed with the previous authorities that the prognosis was unfavourable.

The following case is described because of the satisfactory response to therapy.

Case Report

A salesman aged 28 was admitted to hospital on June 11, 1954, and discharged on November 26, 1954.

His father, aged 61, was healthy, a printer in charge of a composing department. He was a quiet man, even-tempered, and somewhat ineffectual, who made few demands on the family. The mother, aged 56, was also healthy, but house-proud, hot-tempered, strong-willed, and close to the patient. There was one healthy married sister aged 24. There were no familial illnesses and no history of chorea or tics.

Personal History

The patient's birth on August 2, 1926, was normal, but he was over one month premature and under weight. There were initial feeding difficulties, and the frenulum of the tongue required freeing at 2 weeks. He was convulsed at 2, had measles and chicken-pox at 2½, and pneumonia at 4. (These incidents are mentioned because of the possible aetiological importance of brain damage.) Though his speech was retarded the other milestones were normal. A timid shy child with temper tantrums, night terrors, and many minor compulsive rituals, he attended elementary school at 5, secondary school at 12, leaving at 14½ to work in the father's print-shop for two years before becoming a hat salesman. At 18 he was called up for the Army (B1) and served for two years in Egypt before being discharged with the rank of sergeant at the age of 22. He then joined his present firm and has since risen progressively to the position of a senior salesman who covers an important territory.

Play with his sister and other children continued normally until the age of 9, but from that time on he made attachments with boys only. Masturbation began before 15 and continued. At 18, when in the Army, he became the active partner in anal intercourse, and his relationships have remained exclusively homosexual. There is a well-marked madonna-prostitute split in his love objects. There are those men whom he admires and feels love for and also, as he says, the casual pick-ups with whom he has intercourse. Always a good worker, he is money-conscious, ambitious, and successful, yet anxious and tied to the home. Both selfish and sensitive, his manner is ingratiating with superiors, for he is afraid of "the big man in business."

Present Illness

At the age of 7 he developed tics originally thought to be St. Vitus's dance but later diagnosed at Great Ormond Street as habit spasms. The wriggling of his body, facial contortions, and sensitivity to noise subsided gradually over the next two years. But at 9 he began making noises, and these soon developed into the swearing which persisted with such distress to his family until he was 13. Reading *Tom Sawyer* made a deep impression on him and he began to say "huckleberry fuckleberry fuck fuck." He was reported to his teacher for using "dirty words" and scolded severely at home, but the pronouncements had developed an

involuntary, repetitive, explosive quality and, despite everything, persisted. He was symptom-free while in the Army, but at 22 some noises reappeared in the form of a vocal tic, resembling a hiccup, which he found difficult to suppress. At 23 he felt a compelling urge to swear along with the noise, and six months later began to do so. A short crow was made by a sharp Valsalva manoeuvre with first the sound "uck" and later the word "fuck" superimposed. Simultaneously there would be a violent jerk of the head, arms, and eyes, almost seizure-like, resembling rather a Moro reflex and giving him a strikingly infantile appearance. Though slowly increasing in severity his symptoms had been present four and a half years.

In the few months prior to admission the exclamation "shit" had been added to the original one. The frequency of utterance was by then from 10 to 40 an hour. He was usually free for half an hour on awakening, and at his best when alone and occupied by some task. He was regularly worse at home in the evenings, in the time before his father's return from work, when the family learned to anticipate a regular barrage. Attempts at suppression led to tremendously increased tension and subsequently an increased discharge. These exclamations occur whether he is silent or speaking, but he is free from them during sleep and they have never invaded his writing. It eventually became quite impossible for him to suppress or disguise the convulsion and noise even when conversing with clients. He was obliged to stop working, and for the first occasion sought help. By this time both his mother and his sister were refusing to accompany him out of the house, and it had become impossible for him to ride upon a bus or visit a restaurant or a cinema because of the volume and frequency of his utterances. He was becoming a recluse, professionally disabled and virtually unable to leave the home.

Investigations

He was of somewhat boyish appearance with prominent eyes, but general physical and neurological examination revealed no abnormality, though the symptom was very much in evidence. He was co-operative and friendly, admitting to several minor compulsive rituals and showing a tendency to both echolalia and pallilalia. Orientation was perfect, he was not depressed, and there were no delusions or hallucinations. Memory and attention were normal, there was good superficial insight, and he was observed to be symptom-free during sleep.

The blood count, W.R., B.M.R., and chest film were all normal. The E.E.G. was within normal limits, there was no change with overbreathing, and the responses to photic stimulation were regular and symmetrical. There were no paroxysmal features and no evidence of a focal lesion. The record was repeated with bilateral sphenoidal electrodes and intravenous thiopentone without revealing any abnormality. Psychological testing failed to reveal any dysfunctionality. In the verbal sphere, his vocabulary was average, and the Wechsler gave a full-scale I.Q. of 114. An attempt was made to observe and count his tics, using cinephotography and an electromyograph and then time-sampling the film. He was then interviewed and the tics were counted while supposedly stressful and neutral material was discussed with him. No detectable change in the rate, intensity, or form of his tics and respiratory grunts was observed.

Treatment and Outcome

On June 25 psycho-analytically orientated psychotherapy, in 50-minute sessions four times a week, was begun under the supervision of Dr. Kräupl-Taylor. It had been decided that the immediate aim of our treatment was to attempt to alter the form of the compulsive utterance and restore the patient as rapidly as possible to social life, despite a residual respiratory tic which in itself might perhaps not have been crippling and for which there was possibly an organic basis. No attempt was made to treat his inversion. He was unable to give up any defences and could never free-associate. Little progress was made and no alteration in the frequency or content of the vocal tic had been observed after 40 inter-

views. Carbon dioxide treatment (70% CO₂) was then begun and carried out four times a week. While apparently still inaccessible he quite frequently made the most striking and violent sucking movements, and those dreams that he was able to recall afterwards were full of obvious phallic imagery.

In the following weeks a gradual decrease in tension ensued, and a lessening in the frequency of the utterances was both reported subjectively by the patient and noted in the record maintained by the nursing staff. He received 30 treatments, increasingly spaced out, over a period of two months and was discharged from hospital, having been shown before a hospital conference, on November 26. The coprolalia had disappeared, so had the muscular tic. He retained an inconspicuous vocal tic, resembling a soft hiccup, occurring three or four times a day, but this could be controlled and cleverly concealed. He became apprehensive when due to leave hospital, and received chlorpromazine, 25 mg. twice daily, in the 10 days before and after discharge.

He has now been working for 15 months with no further treatment and is leading the life of a busy and successful sales representative. He is relaxed and at ease in interviews, in itself a striking change, and only an observer familiar with this case could detect the vocal tic. "It is better than it has ever been, but I am not without the desire or the occasional noise." Some sort of sound is made three or four times a day, concealed in a stutter or slight hesitation in his speech. He has just completed, as he himself says, "a successful and profitable 4,000-mile trip for the company."

Discussion

This case appears to be a good example of the Gilles de la Tourette syndrome, showing the childhood onset with multiple tics and coprolalia, a latent period, and the return in adult life of a convulsive muscular tic, a vocal tic with at first "mental" and later again actual coprolalia. Though never showing echopraxia, there were pallilalic and echolalic features; he developed, for example, the compulsion to shout repeatedly the name of another patient in the ward who had at one time made fun of his disability. The psychotherapeutic approach was fruitless. Heuscher (1953) suggested that the difficulty and danger of this approach rests in the role of the tic as the last "desperate defence against psychosis." Mahler and Luke's (1946) view and that of Mahler, Luke, and Daltroff (1945) were somewhat similar: of nine children followed up by them, though mostly still in their teens, two had already become psychotic. They viewed the adolescent condition as an organ neurosis only indirectly accessible to psychotherapy, and concluded that there was no direct correlation between recovery and the length of treatment or psychotherapeutic method tried. Weisman (1952) has dealt along psycho-analytic lines with respiratory tics in adults, which he also regarded as a defence against something worse. Unfortunately, he gave no clear indication of the outcome.

The aetiology of the syndrome is probably multiple and is imperfectly understood. There is a prevalent feeling that a substratum of organic brain damage exists upon which psychodynamic factors can operate, determining the form that the tics and utterances take. Though it remains difficult to separate tics from motor compulsions (Abraham, 1921), and whatever the symbolic meaning of the former, whether regarded as a pre-genital conversion or not, there is no problem here. In this case the patient largely abandons symbols and informs us quite overtly what he means by his choice of hostile and "dirty" words.

The coincidence in time between the CO₂ treatments and the amelioration of symptoms of 4½ years' standing was dramatic. But it is quite impossible to exclude the possibility of spontaneous improvement, particularly in a condition where the intensity of symptoms is known to fluctuate. It was seen that, during a period of relatively successful sexual adjustment (when in the Army), he had been symptom-free. If we assume that the change was not merely a chance one, for CO₂ inhalations to precipitate a 15-months

remission is interesting. This improvement appears to have continued of its own accord, and the occasional out-patient "maintenance" treatment which had been envisaged has been unnecessary. This simple decrease and disappearance of symptoms, as Meduna (1953) has indicated, is seen quite as often as a cathartic emotional release, which did not occur in this case.

Suppose there did exist in the genesis of these tics and this repetitive speech disturbance a self-perpetuating process by which the muscular and vocal discharges themselves provide the stimulus for a further discharge. In these circumstances a manoeuvre designed to interrupt this process, by lowering the excitability of the system, then seems less empirical than it first appears. After inhalation of CO₂ the disturbance in the plasma hydrogen-ion concentration is very considerable (pH 7.2→6.7—A. Bartholomew, personal communication). Adrian (1930) noted that the hyper-excitability and spontaneous firing in peripheral nerve preparations was prevented by transfer to an atmosphere of 5% CO₂, and Lorente de Nó (1947) has shown that a similar concentration of CO₂ raises the demarcation potential (4 millivolts, approximately 60%) and also the threshold for stimulation in peripheral nerve.

It is, of course, not possible to argue directly from results obtained in isolated amphibian core conductors when attempting to understand phenomena in the multisynaptic systems which must be concerned in the reverberating neuronal networks that are postulated in higher mammals (Ashby, 1952): though there is evidence that the synapse is the more sensitive to changes in hydrogen-ion concentration (Eccles, 1953). Speculation on the mode of action of any apparently successful but empirical therapy is especially tempting in a condition whose outlook has been regarded as so grave. Whatever this mode of action and in whatever terms, whether neurological or psychological, it is stated, the fact remains that the CO₂ inhalations appear to have initiated in this case a return towards normality.

Summary

A classical case of Gilles de la Tourette's disease is described in which coprolalia, gradually increasing in severity over a period of four and a half years, had forced the patient into becoming a recluse, confined to the home in a state of almost complete social isolation. Though psycho-analytically orientated psychotherapy produced no change in the frequency or form of the patient's utterances, carbon dioxide treatment initiated an almost immediate improvement in symptoms which made discharge from hospital and rapid return to work possible. This improvement has been maintained over the 18-months period of follow-up. The difficulties encountered by the author and others in the psychotherapy of this condition are discussed, and some speculations are made upon the possible neurophysiological basis for the interruption of these repetitive and apparently self-perpetuating speech disturbances.

I thank Dr. Kräupl-Taylor for his advice and for kind permission to publish this case

AGE AT WHICH THE DECIDUOUS TEETH ARE SHED

BY

E. M. B. CLEMENTS, M.B., B.S.

E. DAVIES-THOMAS, M.R.C.S., L.R.C.P.
L.D.S. R.C.S.

AND

KATHLEEN G. PICKETT, B.Sc.

(From the Department of Anatomy, University of Birmingham)

The age at which the milk teeth of children are shed is a subject which has been relatively little studied. In 1923 Hellman gave figures based on a survey of American boys and girls from poor and wealthy homes. In this country, a survey of children at an institution was made by Stones, Lawton, Bransby, and Hartley in 1951. This gap in our knowledge is surprising, for there is good reason to believe that the age at which the deciduous teeth are shed may influence the age at which the succeeding permanent teeth erupt (Leslie, 1951).

The statistics presented in this report have been obtained by new methods which allow a more accurate assessment of mean shedding times to be made than has hitherto been possible.

Method

The analysis has been made from data relating to a sample of 1,427 boys and 1,365 girls aged 5 to 13 years, attending infant, junior, and secondary modern schools in Birmingham. The children were examined during the course of the Birmingham Anthropometric Survey, and are fully representative of the elementary-school population of the city.

At the examination a series of anthropometric measurements and dental observations were made on each child, the latter by the same observer throughout (E. D. T.). An account of the information recorded and the way in which it was prepared for analysis was given in a previous paper (Clements, Davies-Thomas, and Pickett, 1953).

For the purpose of this analysis, all deciduous teeth seen in the jaw were coded as "present" and missing teeth as "shed," the latter category including teeth either shed or extracted. The space might be empty or be filled by a permanent tooth.

The coded records in the form of punched cards were sorted into order of ascending age and then formed into groups with an age range of three months. Within each of these age groups the proportion of children with a particular deciduous tooth present was calculated. This was done for each deciduous tooth in turn. The proportion gradually decreases with age until all the children have shed the tooth.

The observed and expected shedding frequencies of boys' upper first deciduous molar tooth.

The age at which 50% of the children have the tooth and 50% have not may be accurately calculated from such a series of observations by a statistical method recently devised (Finney, 1952). The standard deviation of the distribution, which is a measure of the range, may also be obtained. This technique of probit analysis has been used throughout, and the close correspondence of observed and expected shedding frequencies derived from the analysis confirmed that it is applicable to the data. The Chart on the previous page is a diagrammatic representation of these frequencies in the upper first deciduous molar tooth. An account of the method of analysis, applied to similar observations on permanent teeth, has been given in an earlier paper (Clements *et al.*, 1953).

Results

The statistics have been computed for the right and left sides of the upper and lower jaws of boys and girls separately. Comparison shows no difference between the sides other than would be expected to arise from random errors of sampling. For this reason the data presented here relate only to the right side of the jaws.

Mean Time at Which Teeth are Shed.—The mean times at which teeth are shed in the right upper and lower jaw are given in Table I for both sexes, with the standard error of

the mean, the standard deviation, and the 5 to 95% fiducial limits of the distribution: 90% of children fall within these limits. Outside them are only the earliest 5% and the latest 5%.

Effect of Socio-economic Background on Time at Which Teeth are Shed

The shedding times given in Table I are obtained from data relating to children of all types of socio-economic background. It was possible that variation in these times might be associated with differing socio-economic backgrounds. The children have therefore been divided into three groups, each varying in this respect. Their allocation to each group depends upon their parents' occupation, and is based on the classification used by the Registrar-General (1951). The first group includes his social classes I and II, formed of professional and intermediate workers. The second is equivalent to his social class III, consisting of skilled

workers. The third includes his social classes IV and V, and consists of semi-skilled and unskilled workers.

The mean ages at which the deciduous teeth were shed were computed for these three socio-economic groups whenever sufficient data were available. In the first group, satisfactory estimates could be obtained only for the lower first deciduous incisor, the upper and lower first deciduous molar, and the lower second deciduous molar teeth of boys. Although the evidence is incomplete, these indicate that, on the average, deciduous teeth are shed earlier in children from the first socio-economic group than in those from the second. The lower first incisor teeth show a difference of 4.65±3.68 months in mean shedding age between these two groups. The upper first molar teeth show a difference of 20.22±2.72 months, the lower first molar teeth one of 18.99±4.17 months, and the lower second molar teeth one of 20.68±5.70 months. The differences shown with the molar teeth are large and statistically significant. No significant differences were found to exist between the mean times at which teeth are shed among children from the second and third socio-economic groups.

Hellman (1923) provides estimates of the mean shedding times for deciduous teeth in samples of wealthy and poor children. These indicate an earlier shedding time for the first and second incisors and canine teeth in both boys and girls from the wealthy group, with the exception of the girls' lower first incisor and the boys' upper canine. The differences are very small, and none is statistically significant, but their relative consistency may indicate a trend. Hellman found that, unlike the incisor and canine teeth, the first and second molar teeth were shed, on the average, later in wealthy than in poor children. This is not in accord with our data, and it seems evident that these teeth show very variable mean shedding times. Differences in extraction rates may be involved.

Difference in Mean Times at Which Teeth are Shed

Boys and Girls.—The difference between the mean shedding times of the deciduous teeth of boys and girls is given in Table II. Without exception, boys show a later mean

TABLE II.—Differences Between Mean Shedding Times, with Standard Errors, of Teeth of Boys and Girls in Right Upper and Lower Jaws, and Between the Upper and Lower Jaws in Same Sex

D	+3.19±1.69	+2.90±1.93	+6.24±1.80†	+5.95±1.83†
E	+2.77±1.63	+4.75±1.84†	+8.54±1.78†	+10.53±1.71†

† Indicates a probability of less than 1%. Teeth A, B, C, D, and E represent 1st and 2nd incisors, canines, and 1st and 2nd molars respectively.

shedding time than girls. These differences are statistically significant for the upper and lower first and second incisors, canines, and second lower molar teeth. The variation between the sexes in the canines is particularly pronounced. The average difference is 4.91±0.97 months, and compares well with Hellman's finding that girls shed their teeth 4½ months earlier, at an average, than boys. A similar conclusion was reached by Stones *et al.* (1951).

Upper and Lower Jaws.—The difference between the mean shedding times of corresponding teeth in the upper and lower jaws are given in Table II for boys and girls separately. In both sexes the mean times are later in the upper jaw than in the lower jaw, and the differences are all statistically significant. The average difference is 8.51±0.82 months, and is very near to Hellman's estimate of 7 months. Stones *et al.* (1951) also found that the first and second upper incisors and upper canines were shed later than the corresponding teeth in the lower jaw, but that the lower molar teeth were shed later than the upper ones.

Sequence in Which Deciduous Teeth are Shed

The usual order in which the deciduous teeth are shed has been determined from the mean times given in Table I. The order is the same in the upper and lower jaws of both boys and girls, and the sequence may be represented as follows:

i_1	i_2	c	m_2	m_1
i_1	i_2	c	m_2	m_1

The sequence in which the incisor teeth are shed is the same as that found by Hellman (1923) and by Stones *et al.* (1951), but this is not so for the canines and molars. In the two latter surveys the order in which these teeth are shed differs between boys and girls.

Time Between Shedding Deciduous Teeth and Eruption of Permanent Teeth

Estimates of the time interval between the shedding of the deciduous teeth and the eruption of the corresponding permanent teeth are given in Table III. The mean shedding

TABLE III.—Time Interval in Months Between Mean Time of Shedding Deciduous Teeth and Mean Time of Eruption of the Permanent Teeth

Teeth A, B, C, D, and E represent 1st and 2nd incisors, canines, and 1st and 2nd molars respectively.

times in Table I have been combined with mean eruption times obtained from the same sample of Birmingham children (Clements *et al.*, 1953). Estimates derived from the data of Hellman (1923) and of Stones *et al.* (1951) have also been made, and are included in Table III.

The average intervals of time between shedding the deciduous upper and lower first and second incisors and canines and the eruption of corresponding permanent teeth are small and very similar in all three surveys. The intervals between shedding and eruption of molar teeth, however, are generally greater and differ between the surveys. The Birmingham data show the largest intervals here, followed by Hellman's sample of children from poor homes. All the estimates indicate, however, that the average interval between shedding and eruption of molar teeth is greater in the lower than the upper jaw.

Discussion

On the average, the children in the Birmingham survey shed their teeth earlier than did either wealthy or poor American children in 1923 (Hellman, 1923). Their mean shedding times are also earlier than those estimated from a sample of English children living in an institution (Stones *et al.*, 1951). The discrepancies between the two English surveys may be due in part to the inevitably more restricted nature of the institutional data, which are based upon smaller numbers and a greater homogeneity of material than occurs in the Birmingham sample.

The average time at which teeth are shed is also linked with the extraction rate, where extracted teeth are included in the data. Stones *et al.* (1951) show that there may be as much as twelve months' difference between the average shedding time of the molars when extracted teeth are included and excluded. This may account for many differences

between the surveys, particularly where the molars are involved. The incidence of caries, which has been shown to occur most often in these teeth (Mellanby and Mellanby, 1950) may vary greatly between one group and another. It is, in fact, known to be lower in the teeth of children at an institution than in those living at home (Mellanby and Mellanby, 1951).

Both Hellman's data (1923) and the Birmingham Survey material indicate that there is at least a tendency towards an earlier mean shedding time for the deciduous teeth of children with a superior socio-economic background compared with the teeth of children less well placed. This may be another factor leading to heterogeneity between the English surveys. It also suggests that environmental factors such as living conditions and nutritional standards are of great significance to the life of the teeth. Earlier shedding of milk teeth leading to earlier eruption of permanent teeth may be another aspect of the well-known trend towards an earlier maturity as standards of life improve.

Summary

The mean times at which the deciduous teeth are shed have been computed from a sample of 1,427 boys and 1,365 girls aged 5 to 13 years, attending elementary schools in Birmingham.

Children with a superior socio-economic background tend to shed their milk teeth earlier than others.

Boys shed their milk teeth an average of 5 months later than girls. The teeth in the upper jaw are shed an average of 8½ months later than corresponding teeth in the lower jaw.

The sequence in which the deciduous teeth are shed is given, and is the same for boys and girls.

Estimates of the interval between shedding deciduous teeth and the eruption of corresponding permanent teeth have been made. The interval is greatest for the molar teeth.

We gratefully acknowledge the receipt of a grant from the Medical Research Council. We thank Professor Sir Solly Zuckerman for his helpful advice, and express our gratitude to the City of Birmingham Education Committee for its co-operation in the conduct of this survey.

A new "practical training" centre for mentally handicapped persons was opened at Acton Lodge, Isleworth, earlier this month. Mr. J. VAUGHAN-MORGAN, Parliamentary Secretary to the Ministry of Health, in congratulating the Middlesex County Council on their work in this field, said that in the country as a whole there were still 3,000 children and 5,000 adults suitable for special training who were not yet receiving it. This lack of suitable training facilities was also recently stressed by the Minister of Health, Mr. DENIS VOSPER, at the opening of a new occupational centre for mentally defective children at Mapperley, Notts, in May. "So far," said the Minister, "we have only found it possible to give priority to the needs of children. But there are already over 5,000 boys and girls over 16 who are reported by local health authorities to be suitable for, but are not receiving, senior training."

TIME OF ERUPTION OF PERMANENT TEETH IN BRITISH CHILDREN AT INDEPENDENT, RURAL, AND URBAN SCHOOLS

BY

E. M. B. CLEMENTS, M.B., B.S.

E. DAVIES-THOMAS, M.R.C.S., L.R.C.P.
L.D.S.R.C.S.

AND

KATHLEEN G. PICKETT, B.Sc.

(From the Department of Anatomy, University of Birmingham)

In 1953 an account was given of the time of eruption of permanent teeth in a sample of schoolchildren from Birmingham between the ages of 5 and 13 years (Clements, Davies-Thomas, and Pickett, 1953). The dental observations were made in the course of the Birmingham Anthropometric Survey between 1947 and 1948, when children attending urban elementary schools were examined. Between 1949 and 1952 the survey was extended to include boys and girls in grammar and technical schools in Birmingham and independent and rural schools within a 30-mile radius of the city. Children at urban elementary schools between the ages of 14 and 15 years were also examined. By this means schoolchildren up to the age of 19 years and of very varied background were included in the survey population.

This paper provides an account of the times at which the permanent teeth of children attending different types of school erupt. Children from independent schools form a sample whose economic background is particularly good. Those from rural elementary schools are of mixed economic background; their comparison with children at urban elementary schools gives an indication of the effect of rural as opposed to urban life on the age of eruption.

Method and Material

A full description of the methods of examination, the preparation of the records, and the technique of analysis were given in the earlier paper (Clements *et al.*, 1953).

Previous analysis has shown that there is no significant difference in the eruption times of teeth on the right and

left sides of the jaw (Clements *et al.*, 1953). The statistics have therefore been computed from data relating to the right side only throughout.

Table I gives the total number of boys and girls examined at each type of school for each year of age. The numbers of children examined at independent schools in each age group are not large, particularly in the girls' sample, and it was not possible to obtain estimated eruption times for all teeth.

The samples of children from grammar and technical schools have been combined with those of the 14- and 15-year-old children at urban elementary schools, for none contain sufficient numbers to be considered alone. They do not include any children below the age of 11 years.

Results

The following abbreviations have been used: I_1 for the central incisor, I_2 for the lateral incisor, C for the canine, Pm_1 for the first premolar, Pm_2 for the second premolar, M_1 for the first molar, M_2 for the second molar, and M_3 for the third molar tooth.

Mean Eruption Times in Different Types of School

Table II gives the mean time at which the permanent teeth erupt for boys and girls separately in the three school groups. The mean eruption times previously computed for children at urban elementary schools are also included. Estimates of the eruption times of each tooth except M_3 can be given only in the rural elementary school group. The age range of the urban group lies outside the age at which I_1 , I_2 , and M_1 erupt, while the small numbers in the independent school sample are responsible for gaps in the table here.

Comparison of Mean Eruption Times in Different Types of School

Table III provides a comparison of the mean eruption times of the teeth of children in the three school groups examined here and also those of children at the urban elementary schools previously visited. Differences at the 1% and 5% level of probability have been indicated.

Differences between the two purely urban groups are of doubtful significance, for small numbers are involved. The children at rural elementary schools show a trend, most marked in the boys' sample, towards an earlier mean age of eruption than occurs in urban elementary schools.

The teeth of boys at independent schools also show a relatively constant trend towards earlier eruption times than are found in those of children at urban elementary schools, although upper and lower M_2 are an exception to this. Only two estimates of eruption times can be made from the girls' data; both are earlier in the independent-school sample, but neither is significantly so.

In the previous study of children at elementary schools a comparison was made between the eruption times of the teeth of children whose parents were in professional or managerial occupations with those whose parents were skilled or unskilled workers (Clements *et al.*, 1953). This showed a very consistent trend towards earlier eruption in the first group, but the numbers involved were small and no significant differences arose between mean eruption times of individual teeth, although the mean differences over all the teeth was 3.36 ± 1.13 months. It is therefore interesting that the tendency towards earlier eruption found in the teeth of these children is also evident in the teeth of children at independent schools, whose socio-economic background may be regarded as at its most favourable.

There are no significant differences between the mean eruption times of the teeth within the three school groups latterly visited. No consistent trends between them are obvious, although this may be due to the small numbers involved.

Although the general tendency is towards earlier eruption in children at these schools, the mean eruption time of M_2 is exceptional. In the upper and lower jaws of boys in each

group, in the upper and lower jaws of girls in the mixed urban group, and in the upper jaw of girls in rural elementary schools this is later, although with one exception not significantly so, than in children at urban elementary schools. It has been suggested by Leslie (1951) that the time at which the milk teeth are shed affects the time of eruption of subsequent corresponding permanent teeth. This suggests that the second deciduous molar teeth, which are known to be particularly subject to caries (Mellanby and Mellanby, 1950), have been kept longer by children at these schools.

Discussion

The 1947-8 sample of children at elementary schools who form the basis of the previous Birmingham Anthropometric Survey report (Clements *et al.*, 1953) was more representative of the child population as a whole than is the sample of children analysed in the present paper. The latter, however, serve to confirm tendencies apparent in the earlier data and may throw some light on the factors involved.

The mean eruption times of the permanent teeth of the children at elementary schools first examined tended to be earlier than those given by other authors, most of which were the result of dental surveys made some years ago. This, taken in conjunction with the well-marked trend towards earlier eruption in children from a rural and from a superior socio-economic environment indicated in the results

of the present analysis, corresponds to the trends towards earlier development shown by overall body growth.

An apparent reversal of this tendency in the case of the second molar teeth may be a consequence of the susceptibility of the milk molars to decay. It may be assumed that the more satisfactory the nutritional conditions, the longer will these teeth be kept. As the time of eruption of the permanent teeth is influenced by the time at which the milk teeth are shed, this will lead to later eruption of the permanent molars by children living in better conditions.

Summary

The mean times at which the permanent teeth erupt are given for children attending three groups of schools. These are (a) independent schools, (b) rural elementary schools, and (c) urban grammar, technical, and elementary schools, the latter including children aged 14 and 15 years only.

The eruption times of the teeth of children at these schools is compared with those of children previously examined at urban elementary schools.

The permanent teeth of children at independent and rural elementary schools tend to erupt earlier than do those of children at urban elementary schools.

* Probability of less than 5%. † Probability of less than 1%.

The mean eruption time of M₂ shows a reversal of this tendency. It is suggested that this is due to the susceptibility of the milk molars to caries and their consequent earlier loss in less favourable conditions.

We gratefully acknowledge the receipt of a grant from the Medical Research Council. We thank Professor Sir Solly Zuckerman for his advice, and express our gratitude to the City of Birmingham education authorities, without whose co-operation the survey would not have been possible.

ATTEMPTED SUICIDE WITH MEPROBAMATE TREATED WITH LEPTAZOL

BY

P. HEBERDEN, M.B., B.Ch.

AND

W. COOPER, M.B., B.Ch., M.R.C.P.Ed.

From the Coronation Hospital and the University of the Witwatersrand, Johannesburg

Meprobamate (2-methyl-2-N-propyl-1,3-propanediol dicarbamate; "miltown"; "equanil") was synthesized by Ludwig and Piech in 1950, and is widely used as a tranquilizer in the treatment of anxiety states and other psychoneurotic disorders. It has received wide acclaim as a most promising and relatively non-toxic drug offering many advantages over the usual sedative preparations prescribed in the treatment of these conditions. As there are few reported instances of meprobamate overdosage, we describe the following case, and draw particular attention to the effective therapeutic response to leptazol.

Case Report

A 30-year-old man, weighing 103 lb. (46.7 kg.) was admitted to hospital in coma. He had attended the outpatient department some days prior to admission, where meprobamate, two 400-mg. tablets four times daily, had been prescribed for an anxiety neurosis. He had, however, taken two tablets every four hours for a period of three days, and finally on the night before admission had ingested 20 tablets (8 g.) as a single dose. The following morning he was found unconscious in his room and was admitted to hospital.

Examination revealed a poorly developed comatose man insensitive to stimuli. Respirations were shallow at 20 a minute, pulse rate 84 a minute, axillary temperature 97° F. (36.1° C.), and blood pressure 80/60 mm. Hg. Other findings of particular interest were marked flaccidity of all limbs and an inability to elicit any tendon reflexes. He appeared to be in a state of hibernation combined with muscle relaxation and profound depression of the central nervous system. Gastric lavage was performed and an intravenous infusion of 5% glucose in saline instituted; at the same time it was decided to administer an intravenous injection of leptazol as an antidote to meprobamate. The effect of leptazol was dramatic. Within a minute of injecting 3 ml. the patient regained consciousness and responded to questioning although still drowsy, and he was able to give a relatively clear account of events leading up to his ingestion of the excessive dose of meprobamate the previous day. An examination of the nervous system 10 minutes after the

restoration of consciousness revealed extremely brisk tendon reflexes. His blood pressure had risen to 90/60 mm. Hg, and he complained of feeling intensely cold. Progress from this stage was uneventful, and by the following morning he appeared to have made a complete recovery.

Discussion

In 1954 Berger published a detailed account of the pharmacological properties of meprobamate. It produces a reversible flaccid paralysis of skeletal muscle with the abolition of tendon reflexes. Smaller doses produce muscle relaxations and sedation, without the stimulating effect common to most sedative drugs. Meprobamate, like mephensin, acts on the central nervous system as an interneuronal blocking agent, but is more effective and better tolerated than the latter.

When administered in the usual dose of one to six 400-mg. tablets daily, it is generally regarded as being an extremely safe drug. Selling (1955), in the study of 187 patients, described certain minor adverse effects. The first patient had two fainting attacks and fever of 102° F. (38.9° C.) following the administration of two tablets. A second developed urticaria after four days' treatment. Angioneurotic oedema developed in a third, and five patients complained of gastric discomfort. Selling describes two cases of meprobamate overdosage. One patient ingested 20 g. over a 24-hour period, became extremely sleepy, and developed a bradycardia of 40 a minute. The patient was made to walk about, and hot coffee was given in an attempt to keep her awake. She finally slept soundly for a period of 10 hours. Another patient consumed 40 g. of meprobamate within 24 hours and suffered no ill effects.

In his article Berger reported that meprobamate protected animals from E.C.T. seizures, and appeared to act as an antagonist toward leptazol and strychnine-produced seizures, and we therefore decided in this instance to use leptazol as a specific antidote to meprobamate overdosage.

Meprobamate seems to be a most valuable drug with a potentially wide field of application in clinical medicine. Its uses are not confined to the treatment of anxiety states. The anticonvulsant action suggests further study in the treatment of epilepsy, and the rigidity of Parkinson's disease might also benefit from its muscle-relaxant effect. With the ever-widening field of application one must anticipate an increased incidence of overdosage. Here we suggest leptazol as a specific antidote to meprobamate overdosage.

Summary

A case is described of attempted suicide with meprobamate and a dramatic restoration to consciousness following the intravenous injection of leptazol. The literature is briefly discussed, and a wider application of tranquilizers is envisaged. It is suggested that leptazol be used as the antidote to meprobamate poisoning.

We thank Dr. M. E. L. Tonkin, Superintendent of Coronation Hospital, for permission to publish this report.

Mr. JOHN WILSON, the Director of the British Empire Society for the Blind, who is himself blind, has recently returned from a 15,000-mile tour of British territories in the Mediterranean and West Africa. The society by working with governments, local organizations, and missions is endeavouring to reduce the prevalence of preventable blindness. Mr. Wilson writes in the society's news bulletin that "Detailed surveys have now confirmed the appalling fact that there are 400,000 blind people in Nigeria, Ghana, Sierra Leone, and Gambia." The society also aims at training blind people to work and earn their living, rather than beg for it, and encourages blind children to attend school.

Medical Memorandum

Chlorpromazine as a Suicidal Agent

The increased use of chlorpromazine may result in suicidal attempts or accidental poisoning. There is little guidance concerning treatment, as few cases have been reported (Aubertin *et al.*, 1954; Vallat and Lepetit, 1954; Beal, 1955; Fontan *et al.*, 1955; Langeron *et al.*, 1955; Sinha and Mitra, 1955; Sykes, 1955). The main interest in the following case is the large dose ingested and the quick recovery despite chronic bronchitis.

CASE REPORT

A woman aged 52 consumed 390 25-mg. tablets of chlorpromazine. One hour later she was drowsy, confused, ataxic, and shocked. Gastric lavage—18 pints (10.2 litres) of warm water—and anti-shock measures were carried out. Methedrine, 60 mg. intravenously, repeated in one hour, and penicillin, 500,000 units six-hourly, were given. Respiratory collapse developed three hours later; this responded to atropine, 1/100 gr. (0.65 mg.) intravenously, and amphetamine sulphate, 20 mg. two-hourly, and picrotoxin, 2 mg., intramuscularly. Further improvement followed mucus extraction from the trachea by intranasal catheterization. The patient was regarded as being out of immediate danger six hours after ingestion.

In view of possible liver damage and white blood dyscrasias with therapeutic doses of chlorpromazine in the early weeks of treatment, the diet was augmented for one week with vitamin B₁₂, vitamin-B complex, glucose, fruit juices, soluble insulin (5 units twice daily), choline, methionine, and high-protein foods. White blood counts and urine examinations were performed daily and liver-function tests twice weekly for six weeks.

Gastric analysis showed the equivalent of 67 25-mg. tablets of chlorpromazine, and a just detectable positive reaction was found in the C.S.F. (undertaken after a lapse of five days).

Tachycardia, myalgia, and increased auditory and visual hallucinations (present for the first time) remitted in two days. Mist. pot. brom. was given three times a day and soluble barbitone, 10 gr. (0.65 g.) at night, neither being detoxicated by the liver. A congested fauces showed four necrotic patches, which cleared in two weeks. Low-grade pyrexia, and congestion and effusion of the left base, persisted for three weeks despite antibiotics. Gradual leucocytosis with toxic granulation during the first week reached 22,800 on the tenth day, subsequently returning to normal. Liver-function and urine tests were normal throughout.

COMMENT

Death from acute chlorpromazine poisoning has not, to our knowledge, been recorded. Our patient recovered dramatically as in other reported cases (Vallat and Lepetit, 1954; Sinha and Mitra, 1955). In treatment we had six main objectives: to remove the maximum quantity of drug from the stomach, to prevent hypotension, respiratory collapse, and depression of C.N.S., to combat shock, and to avoid damage to hepatic and haemopoietic systems. Chlorpromazine is very soluble in water, which is therefore a suitable medium for gastric lavage and should be continued until fluid returns clear. A wide-bore tube is recommended to avoid blockage, as returning fluid may contain sediment. Chlorpromazine diminishes gastro-intestinal motility, therefore lavage should always be undertaken despite a considerable lapse of time after ingestion. An explanation of the small quantity of chlorpromazine found in the lavage fluid may be due to breakdown in solution on standing. An experiment showed that 100 mg. of chlorpromazine in 200 ml. of water after five days had lost 20% of its strength. The drug's anti-emetic properties appear to render administering emetics a doubtful procedure.

Hypotension has been reported in three cases (Beal, 1955; Fontan *et al.*, 1955; Vallat and Lepetit, 1954). In our case

the blood pressure remained at 102/80 as on admission. The use of amphetamine is controversial, as the makers state that "pressure amines should not be used to counteract this hypotension," but in a case of Sykes (1955) dexamphetamine was taken with what was regarded as a toxic dose of chlorpromazine without ill effects. Azima and Ogle (1954) describe two cases of persistent hypotension returning to normal with concomitant administration of oral methedrine. Methedrine was administered intramuscularly to a case of chlorpromazine poisoning by Sinha and Mitra (1955), who claimed good results without hypotension. The *British Medical Journal* (1955) queries animal experiments by Dasgupta and Werner (1954) to demonstrate loss of pressor response after chlorpromazine. We consider amphetamine helped to maintain blood pressure in our case and to prevent depression of C.N.S. The latter did not present a serious problem until one and a half hours after the second methedrine injection, and showed improvement when amphetamine was reinstituted. The makers, however, suggest noradrenaline as the pressor agent of choice (personal communication). It is given intravenously and requires dilution. The makers of "levophed" (L-noradrenaline) recommend a dilution of 1 ml. to 250 ml. of isotonic saline. Intravenous fluids were contraindicated in our case, however, because of the risk of pulmonary oedema.

If bronchial obstruction is a prominent feature administration of noradrenaline appears to carry risk. The most alarming period in our case was four hours after ingestion, when respiratory collapse occurred. Fontan *et al.* (1955) report a case in which "gross bronchial obstruction" was a marked feature. Hypothermia, reported in three cases (Aubertin *et al.*, 1954; Fontan *et al.*, 1955; Sinha and Mitra, 1955), was not observed in our patient. The makers state that neutropenia is more common than leucocytosis, but that the latter occurs. In view of our patient's chest condition it is not possible to state definitely that leucocytosis was related to administration of chlorpromazine, although it is noted that pulmonary congestion was not evident until the white count approached normal.

The congestion and necrosis of the fauces bear comparison with those of another case of Vallat and Lepetit (1954), who described stomatitis and "buccopharyngeal lesions." In our case picrotoxin was stopped after one dose, as in excess it can cause convulsions. Chlorpromazine has known epileptogenic properties (Lomas *et al.*, 1955), so that there was risk of potentiation. Riddell (1955) suggests that high-protein diet, choline, and methionine may precipitate hepatic coma, so it may be unwise to use them. Three of the seven cases (Beal, 1955; Fontan *et al.*, 1955; Sykes, 1955) of chlorpromazine poisoning occurred in children, possibly because tablets are small and sugar-coated, therefore palatable and readily swallowed. Aggravation of psychiatric symptoms has been noted in one case (Vallat and Lepetit, 1954) but increased frequency of auditory and onset of visual hallucinations have not been reported. These are probably toxic phenomena of chlorpromazine, as hallucinosis remitted in a few days, although amphetamine might have been responsible.

We thank Dr. J. S. McGregor, medical superintendent, for permission to publish; Mr. D. C. Hubbard and Miss Rockley for technical assistance; Mr. Fox, Forensic Laboratory, Nottingham; and the nursing staff for invaluable co-operation.

Reviews

COLLECTED PAPERS OF EHRLICH

The Collected Papers of Paul Ehrlich. Volume I—Histology, Biochemistry, and Pathology. Compiled and edited by F. Himmelweit, M.D., Ph.D., F.R.C.P.Ed., with the assistance of Martha Marquardt. Under the editorial direction of Sir Henry Dale, O.M., G.B.E., F.R.S., M.D., F.R.C.P. (Pp. 653 + viii; illustrated. £12. Set of 4 volumes £28.) London and New York: Pergamon Press. 1956.

The publication of the first volume (and the following three volumes) of the collected papers by "this man of rare genius," as Sir Henry Dale calls Ehrlich in the introduction, was made possible by the unique co-operation between the Wellcome Trust, the Pergamon Press, Sir Henry, Dr. Himmelweit, and Miss Marquardt, Ehrlich's personal secretary. And what a worthwhile co-operation it is! Nobody but another man of genius could have described so vividly the main stations in Ehrlich's life and summarized so lucidly his principal activities and achievements: Dale, looking as a scientific cosmopolitan on the research world of the late nineteenth century, must have felt strongly the close relationship of their two minds. The contributions by Himmelweit and Miss Marquardt, though less apparent, were nevertheless considerable. The impression one receives on reading some of the papers, theses, notes, and lectures, as presented in the first volume, is their incredible freshness and vigour, although their time-bound form, content, arguments, and in certain instances even erroneous conclusions, should place them as purely historic documents. There are the contributions to histology and haematology (pp. 19-113 and pp. 114-277), which are to everybody's knowledge part of textbooks since the beginning of the century. Nevertheless, to workers, say, in the field of modern leukaemia research it must come as an inspiration to follow the original description of the rational approach and critical evaluation of results. But not only the haematologist is given this pleasure of rediscovering through Ehrlich the vitality of what one may be inclined to take for granted; the pharmacologist, the biochemist, and the iatro-chemist have the same opportunities, and may even find in famous papers like "The Requirement of the Organism for Oxygen" (pp. 433-97) and "The Relations Existing between Chemical Constitution, Distribution, and Pharmacological Action" sources for better or new ideas. I am looking forward to the next volumes, which together with Volume I should adorn every medical scientist's bookshelf.

F. BERGEL.

TRACE ELEMENTS IN NUTRITION

Trace Elements in Human and Animal Nutrition. By E. J. Underwood. (Pp. 430; illustrated. \$9.50.) London: Academic Books Ltd. 1956.

The diseases which can result from the absence of trace elements from the diet have always been a live problem in Australia, where extensive tracts of the country are unsuitable for sheep-raising because of deficiency of the soil in copper or cobalt. The author of this admirable new textbook, however, does not restrict his subject-matter to his own Dominion, but reviews the effects of trace elements, either in deficiency or excess, throughout the world. Moreover, his interests cover not only naturally occurring diseases as seen by the clinician or practical farmer, but laboratory experiments in which other mineral deficiencies, unknown in nature, have been produced. He discusses the role of cobalt in the formation of vitamin B₁₂ of molybdenum in the enzyme xanthine oxidase, and of zinc in carbonic anhydrase. He tells us how excess of selenium causes "alkali disease" and "blind staggers" among farm stock in parts of America, and how excess of molybdenum, unless balanced by extra copper, causes diarrhoea in parts of Somerset. The medical reader can hardly fail to be intrigued by the whole story which the author so skilfully unfolds,

but certain topics must receive his special attention as vitally affecting human health. Thus iodine is important in regard to the incidence of goitre, fluorine in regard to dental caries, and cobalt in regard to vitamin B₁₂ and pernicious anaemia. Although iron is perhaps not strictly a trace element, its discussion is wisely covered by a long chapter. An item which may surprise the non-expert is the prominence of tea as a rich source of manganese and fluorine. We are told, moreover, that human blood plasma contains three times more zinc than iron. The book is excellently printed, illustrated, and indexed, and it can be strongly recommended.

T. MOORE.

THOUGHT CHANGES IN SCHIZOPHRENIA

The Collected Works of C. G. Jung. Volume 5—Symbols of Transformation: An Analysis of the Prelude to a Case of Schizophrenia. Translated by R. F. C. Hull. "Collected Works," edited by Sir Herbert Read, Michael Fordham, M.D., M.R.C.P., and Gerhard Adler, Ph.D. (Pp. 567 + xxix; illustrated. 35s.) London: Routledge and Kegan Paul. 1956.

In 1911 Jung, then 36, made an important contribution to the study of schizophrenia which appeared in translation as *The Psychology of the Unconscious*. Jung has now revised the volume, bringing in much of his later work, and the English translation, with the title *Symbols of Transformation*, is the latest addition to his "Collected Works." It contains an analysis of the prodromal stages of thought changes in schizophrenia. The fantasy material of a young American woman, whom Jung never met, was submitted to him by the late Théodore Flournoy, whose patient she had been. Later an American psychiatrist who had read Jung's commentary on her reflections, and was then treating the patient for a schizophrenic illness, informed him that personal acquaintance with her had not taught him "one iota more" of her mentality than Jung had already deduced. The fantasies were mainly concerned with personal themes, often of a mythological character. In an attempt to understand this strange material Jung collated it with analogues from the art and literature of classical and modern workers. A striking series of parallels is presented and in particular the recurrence of autonomous symbols. The relevance of these to the patient's mental state was unmistakable. As a study of the deeper layers of the mind the book is unrivalled.

The objective phenomena observed in this research were very different from the personalism which characterized the writings of Freud and others. The publication of the book, including as it did the theory of the collective unconscious and its symbolism, ended the collaboration of Freud and Jung. The new translation—a great improvement on previous editions—is enriched with a unique collection of plates and text figures.

E. A. BENNET.

THE INNER EAR

Die Ortho- und Pathobiologie des Labyrinthes. Als Grundlage der dystonischen und dystrophischen Erkrankungsprozesse des Innenohres. By K. Wittmaack. Edited by H. Rollin. (Pp. 294 + xii; illustrated. D.M. 36.) Stuttgart: Georg Thieme Verlag. 1956.

Edited by Professor Rollin, this book is a condensation of the results of Wittmaack's life-long work on the inner ear. As such it should find a place in the libraries of departments of otology, but it will mainly be of value to the histopathologist rather than the clinician, since the clinical aspects of inner-ear diseases occupy only 60 pages out of a total of nearly 300. Discussion of the functional examination of hearing covers eleven pages, and that of labyrinthine function only four. Nearly half the book deals with the pathological anatomy and physiology of the inner ear, whilst the remainder is concerned with the normal anatomy and physiology of this organ. As one would expect from Wittmaack, there is a good section on histopathological results from experiments on animals; this covers about 80 pages. The inclusion of at least two types of endolymphatic hydrops—acute and chronic—in the classification of dysfunc-

tional inner-ear disorders may not find general acceptance. However, it is interesting to note that acute endolymphatic hydrops is the most likely explanation for many cases of sudden perceptive deafness. The book is well illustrated with over 180 photomicrographs of the inner ear and is printed on excellent-quality paper. The full table of contents at the front compensates largely for the lack of an index.

TERENCE CAWTHORNE.

CLINICAL RHEUMATOLOGY

Rhumatologie Clinique. By Pierre P. Ravault and Georges Vignon. (Pp. 604; illustrated. 4,600 fr.) Paris: Masson et Cie. 1956.

This is a large and well-produced book on the rheumatic diseases written chiefly from the clinical angle by two general physicians who have obviously an extensive, but not exclusive, interest in this branch of medicine. Many of their views would not meet with universal acceptance from rheumatologists, but their approach is a practical and systematic one which should encourage other clinical professors of medicine to interest themselves more in this field.

The sections which are of the most interest are those concerned with the soft-tissue lesions known variously as panniculitis, tendinitis, etc., and other non-articular tissues and organs; the section on gout; and the chapter on the differential diagnosis of acute and subacute articular "rheumatism." There is a useful and rather unusual chapter on secondary rheumatic or arthritic manifestations in the course of other disease syndromes—infective, endocrine, collagen, haematological, allergic, cardiovascular, and associated with disorders of the central nervous system. This makes the point that the competent rheumatologist can be no narrow specialist. References are given at the end of each chapter, but almost without exception to French literature, and very few recent. A notable feature of this volume is the excellence of the reproduction of radiographs.

W. S. C. COPEMAN.

APPLICATION AND INTERPRETATION OF LABORATORY TESTS

Clinical Pathology: Application and Interpretation. By Benjamin B. Wells, M.D., Ph.D. Second edition. (Pp. 488 + xvii. 59s. 6d.) Philadelphia and London: W. B. Saunders Company. 1956.

Much of the progress in medicine during the last two decades is the fruit of increased accuracy of diagnosis and improved control of treatment—advances due largely to widespread availability of laboratory facilities. Yet the physician who depends upon the laboratory for the diagnosis is usually clinically inexperienced, whereas he who spurns its usefulness is denying himself and his patient the benefits of modern knowledge. The narrow path separating these extremes requires an intelligent compromise between science, art, and practice. Much help in bridging the gap between medicine and clinical pathology is given by books such as this which deal with the application and interpretation of laboratory tests without being concerned with their technical aspects. The author writes with authority and wisdom, dealing chapter by chapter with the different systems of the body, and discussing for each the value and limitations of the most commonly used and readily available tests. Particularly praiseworthy is his reasoned dismissal of various tests which have been copied from textbook to textbook and long since discarded as being without clinical value.

R. I. S. BAYLISS.

TUBERCULOSIS RESEARCH

Ergebnisse der Gesamten Tuberkulose-Forschung. Edited by St. Engel, L. Heilmeyer, J. Hein, and E. Uehlinger. Band XIII. (Pp. 659 + viii; illustrated. D.M. 96.) Stuttgart: Georg Thieme. 1956.

This beautifully produced 13th volume of the "Advances in Tuberculosis Research" is to be the last one by this title. As tuberculosis is getting less important as a disease, the

next volume will deal with "Advances in Tuberculosis and Diseases of the Lungs." Appropriately this last volume deals entirely with the chemotherapy of tuberculosis, which led to this recent change in policy. After three chapters on general aspects of chemotherapy, the chemotherapy of tuberculosis in each organ is separately presented, and there are three chapters on, respectively, the treatment of infants, the treatment of children, and tuberculous meningitis. This method of presentation unfortunately results in a good deal of repetition, and one feels that the book is swamped with detail and too much attention is paid to methods of treatment which are now out of date. The book is a treasury of reference, especially to the German literature, but many important British and American references have been omitted. Altogether some 2,500 authors are included, but their work is not analysed critically and many of the authors' conclusions are accepted on their face value. One would like to have seen a better integration of established knowledge in a more concise manner. The editing is not quite up to the usual German thoroughness; for example, in the author index one Smith combines all the many persons by that name referred to in the text.

JOHN LORBER.

COLLAGEN DISEASES

Collagen Diseases. By John H. Talbott, M.D., and R. Moleres Ferrandis, M.D. (Pp. 232 + xv; illustrated. \$6.50.) New York and London: Grune and Stratton. 1956.

This monograph is divided into five sections: systemic lupus erythematosus, polyarteritis, dermatomyositis, systemic scleroderma, and thrombotic thrombocytopenic purpura. It is really a series of reviews of current literature—there are 540 references—and comparatively little of the authors' own material is described or analysed. The section on systemic lupus erythematosus is the most complete, and it is of interest to note the diagnostic significance given by the author to false-positive serological tests for syphilis in this condition. The separation of dermatomyositis and systemic scleroderma has not proved entirely satisfactory. It would surely have been better, in the present state of our knowledge, to accept that there is a wide range of conditions between the extremes of acute dermatomyositis and chronic systemic scleroderma. The inclusion of thrombotic thrombocytopenic purpura is an interesting feature, but is not easy to justify when a much commoner condition like temporal arteritis receives only a passing mention. The book is well written and well produced, although unfortunately some of the coloured photomicrographs have reproduced badly.

J. D. N. NABARRO.

ELECTROCARDIOGRAPHY

EKG-Fibel. By R. Heinecker. Foreword by F. Hoff. (Pp. 200; illustrated. D.M. 19.80.) Stuttgart: Georg Thieme. 1956.

This primer of electrocardiography gives a short and clear introduction to the subject. The print is good, and as a variety of types are used the facts are easy to find. The matter is systematically arranged. The standard three leads still come first, then the unipolar and precordial leads of Wilson, and finally the thoracic leads of Nehb—dorsal, anterior, and inferior. The description of the P waves is lucid and useful. The general method is descriptive, and but little interpretative; not that this is always possible, but it is what is really needed for beginners, where it can be done. The illustrations are clear as a rule, though some are rather small. The heart sounds are often shown recorded with the electrocardiogram, which the author calls an important advance; but there is no account of their interpretation and they are often far from distinct. The accounts of the illustrations are well set out. There are no references. Altogether an informative but very condensed little book.

TERENCE EAST.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 29 1957

INFLUENZA VIRUS VARIANTS

Since April of this year successive outbreaks of influenza have occurred over a wide area of the Far East. The epidemic was first reported from Hong Kong and Singapore in April, then Japan, Indonesia, Formosa, the Philippines, Borneo, and Indochina were involved during May, and towards the end of this month and during June outbreaks have occurred in Madras, Bombay, Delhi, and Karachi. The usual attack rate has been between 10% and 20% of the various populations, though some areas such as Manila have suffered even more severely. The illnesses have been said to be typical of mild influenza, there have been few complications or deaths, and recovery has been rapid.¹ Outbreaks have also occurred among the passengers and crews of ships calling at affected places, and such ships have arrived at ports on the west coast of the U.S.A., Australia, and the Netherlands.

The dominant antigens of the viruses recovered from the Asian outbreaks show no obvious relationship to those of former years, though soluble complement-fixing A antigen has been demonstrated. The Asian influenza A virus thus seems to be one which has not been found since 1933, and it may in fact never before have been experienced by the world population. The discovery has revived speculation on the origin of variant influenza viruses and of epidemics, a subject recently considered in detail by C. H. Andrewes.² The network of laboratories established by the World Health Organization has now been in existence for some ten years, and during this time the viruses recovered from many local and nation-wide outbreaks have been studied. In one such epidemic there was a relatively rapid spread from the Mediterranean to Britain,³ but the others have usually been simultaneous prevalences over wide areas of the world's surface and have not spread from place to place in any regular sequence. Yet, as

Andrewes² emphasizes, the viruses recovered from such simultaneous epidemics have usually been closely allied antigenically and sometimes have clearly differed from previous strains. He favours the view that many antigenic variants may arise which fail to survive because they lack the capacity to spread, and that the successful variant possesses not only a new antigen but also the ability to spread and to displace other influenza viruses.

The theory of origin of influenza virus variants which is acceptable both to Andrewes² and to K. E. Jensen⁴ is that variation is a form of mutation "directed" by the effect on the virus of its sojourn in human hosts possessing antibodies resulting from previous epidemics. It has been found that virus cultivated in the presence of specific antibody undergoes a change and that a new antigen appears which is less well neutralized by the antibody of the medium than that formerly present. This holds for growth in eggs⁵ and also in immunized mice.⁶ Such antigenic variation tends to occur in small steps, a fact resembling the minor antigenic variation met with naturally in the past ten years with the so-called A-prime viruses. Jensen⁴ indeed believes that an almost continuous spectrum exists in the influenza A viruses from those recovered in 1933 and 1934 (W.S. and PR8 viruses) to the most recent strain of 1956. This view is not accepted by all authors, and A. Isaacs⁷ particularly has shown that some of the variant A-prime viruses are widely different from each other. Nevertheless the Asian virus is reported to be more remote from the A-prime family than this was from the older "A" viruses, and it is this sudden jump in antigenic structure which is so hard to explain. Indeed, some have already pointed out that mutation among viruses is similar to animal mutation and may therefore be influenced by the environment and by radioactivity.⁸ If genetic mutation is the explanation, then it is odd that new antigenic variants arise during inter-epidemic periods, when, as Andrewes² remarks, times are hard for the virus and it is difficult to locate. In contrast, when the virus is multiplying enormously during an epidemic and by all the rules the chance of a mutation should be greater, the antigen remains obstinately constant. The plain man may perhaps draw an analogy between virus variation and the antibiotic resistance of bacteria. Cultivation of an organism in a medium containing an antibiotic often gives rise to progeny with an increased resistance to the antibiotic. Mostly the resistance develops in successive small steps, but sometimes, as happens with *Haemophilus influenzae* and streptomycin, a big jump in resistance occurs and the new variant rapidly replaces its susceptible brethren in the culture or in the patient. The influenza virus will clearly be in its

most precarious position at the end of an epidemic, when the human susceptibility is least and the stimulus to modify may then be at its greatest.

What then are the prospects for areas not thus far affected by epidemics? The Asian virus has probably already reached Britain by air (see p. 1536) if not by sea, and if past experience is a guide it will be some months before the colder weather brings about the usual setting for an epidemic. But the scale of the impending outbreak cannot be foretold. A virus possessing a novel antigenic make-up should have a good start, but herd immunity is a complex affair and may not depend entirely on specific antiviral antibodies. The most serious possibility which has to be considered is whether the mild virulence of the Asian strain will remain at its present level or will alter. One has to go a long way back into the past before encountering nation-wide epidemics with an unusually high mortality, but it is a fact that both of the lethal waves of 1891 and 1918 were preceded by milder epidemics. It is also thought that the 1889-90 epidemic originated in Bokhara in central Asia, but there were other foci in northern Canada and Greenland. The 1957 Asian virus appeared first of all in Hong Kong in a refugee camp and may have travelled from the interior of China. Its virulence has everywhere been mild, but the stability of this biological property is just as important as its antigen. Meanwhile it seems sensible to explore our own immunological situation by looking for evidence of neutralizing antibodies in people of different ages. For, as F. M. Davenport and his colleagues⁹ were the first to show, the antibody response formed in early childhood by exposure to the strains of virus then current is indelibly imprinted on the antibody pattern throughout life. It is therefore possible that just as persons over 35 to-day possess antibodies to the swine influenza virus, perhaps because the latter's antigen is similar to a previous human pathogen, some imprint of the Asian virus may also be found in sera from certain age groups.

Finally, the possibility of providing protection against our future enemy is one which has received much attention in the lay press. Most of the comment has assumed that an influenza vaccine can be prepared which will give substantial protection. But experience with inactivated vaccine against influenza has been very variable, and immunization is still an experimental procedure. Whatever steps are taken by our health advisers it is much to be hoped that if a vaccine is developed it will receive as careful a scientific trial as can be devised, in spite of the somewhat threatening situation and the short time which may be available.

DANGERS OF CIGARETTE-SMOKING

The Medical Research Council has now advised the Government that a direct causal connexion exists between tobacco-smoking and lung cancer. It has set out its conclusions in a statement published at p. 1523 of the *Journal* this week, and they may be summarized thus: the death rate from lung cancer has greatly increased in Great Britain and other countries during the last 25 years; evidence from many investigations agrees in showing that a major part of the increase is associated with tobacco-smoking, particularly of cigarettes; the most reasonable interpretation of this evidence is that the relationship is one of direct cause and effect. As the Council points out, the decisive evidence is not based on the observation that the increase in the national mortality followed an increase in the national consumption of cigarettes. It is derived from two types of inquiry. In the first type a comparison of the previous histories of lung-cancer patients with those of patients not suffering from that disease has shown that the group of patients with lung cancer contains more smokers and fewer non-smokers than the other group, and that there is "a steadily rising mortality as the amount of smoking increases": evidence in support of this comes from nineteen inquiries published in this country, the U.S.A., Finland, Germany, Holland, Norway, and Switzerland. The evidence thus provided by this retrospective investigation has been confirmed by prospective inquiries conducted by Doll and Hill in this country and Hammond and Horn in the U.S.A. In this second type of inquiry persons in a defined group of the population were asked to give details of their smoking habits, and their fate is being followed. Doll and Hill, whose first five-year follow-up of the fate of British doctors was published in this *Journal* last year, found that there is a higher mortality from lung cancer in smokers than in non-smokers, in heavy than in light smokers, in cigarette than in pipe smokers—and that the mortality was higher in those who continued to smoke than in those who gave it up. The evidence to date suggests that 1 in 8 of lifelong heavy smokers die of lung cancer, against 1 in 300 of non-smokers.

¹³ ——— *Surg. Gynec. Obstet.*, 1939, 68, 438.

Evidence that other diseases are associated with, and possibly in part caused by, tobacco-smoking is gradually accumulating. These diseases include respiratory tuberculosis in adults,¹ coronary thrombosis,^{2,3} cancer of the mouth and oropharynx,^{4,5} cancer of the larynx,⁶ and chronic bronchitis,⁷⁻⁹—and, some would add, a delusion that smoking is harmless. On less secure or slighter evidence various observers claim to have detected association between smoking and post-anaesthetic respiratory complications, cancer of the bladder, emphysema, and some vascular (including Buerger's) diseases. The latest report to be published comes from E. C. Hammond and D. Horn.¹⁰ On behalf of the American Cancer Society they have analysed death rates in relation to smoking in a population of 187,783 men aged 50-69; the follow-up period averaged 44 months. Apart from providing confirmatory evidence of an association between smoking and lung cancer, coronary artery disease, and pulmonary disease other than cancer, as well as several other diseases, the study showed that the general death rates of smokers greatly exceeded those of non-smokers. The death rate of men in this population who regularly smoked less than half a "pack" of cigarettes a day was 34% higher than the death rate of men who never smoked. The rate for men smoking one to two packs a day was 96% higher, and for men smoking two or more packs a day 123% higher. These figures refer to general mortality from all causes.

One argument against accepting a causative connexion between smoking and lung cancer derives from the old axiom that correlation does not mean causation. The same type of person, it is said, might be both liable to develop lung cancer and subject to the strong desire to smoke. But, as more evidence accumulates, much of it reliable, showing an association between smoking and not only lung cancer but several other diseases, it becomes harder to believe that the liability to fall victim to one of these diverse disorders could be constitutionally associated with a desire to smoke. A considerable group of the diseases, too, affect a part of the body—namely, the respiratory tract—with which inflammatory and carcinogenic substances in the tobacco smoke come into direct contact. There is evidence that atmospheric pollution plays some part, but a relatively minor one, in the causation of lung cancer—but there is no excess mortality from this in those especially exposed to risk, as transport workers, garage hands, and policemen. Some have maintained that cancer of the lung has increased at the expense, so to say, of cancer in other sites; but there has been no such reduction in cancer of other parts of the body. Sub-

stances known to be carcinogenic have been found in tobacco smoke (e.g., 3:4-benzpyrene); and the Medical Research Council's annual report (see p. 1524 in this issue) refers to the observations by Dr. I. Lasnitzni that small quantities of 3:4-benzpyrene induced hyperplasia of epithelial cells in human foetal lung-tissue grown *in vitro*.

As the M.R.C. points out, our knowledge of the cause of lung cancer is still incomplete, and factors other than smoking tobacco produce it. There is need for continued research on this as well, of course, as on the whole problem of cancer. The Council has set up two committees to co-ordinate the experimental work now being done, being greatly helped in this by funds put at its disposal by the British Tobacco Manufacturers Association. Further work on previous lines, coupled with fundamental work on the chemical analysis of tobacco and its products of combustion, should in time yield more precise data which will enable us to penetrate through the smoke-screen to the final cause of lung cancer. In addition to its financial support of the M.R.C.'s investigation, the Imperial Tobacco Company is carrying out research in its own laboratories, and last year the Tobacco Manufacturers Standing Committee—as announced in its first annual report—was set up "to assist research into smoking and health questions, to keep in touch with scientists and others working in the U.K. and abroad, and to make information available to scientific workers and the public": Sir Alfred Egerton, F.R.S., and Sir Ronald Fisher, F.R.S., have agreed to become its scientific consultants.

In the presence of the painstaking investigations of statisticians that seem to have closed every loophole of escape for tobacco as the villain in the piece, it is as well to remember that now for a great many years clinicians have been convinced of a causal connexion between cigarette-smoking and lung cancer. In their paper¹¹ of 1950 Ernest L. Wynder and Evarts A. Graham referred to the fact that I. Adler in 1912 "was one of the first to think that tobacco might play some role . . ." In 1941 Ochsner and DeBakey¹² expressed their "definite conviction that the increase in the incidence of pulmonary carcinoma is due largely to the increase in smoking, particularly cigarette-smoking, which is universally associated with inhalation," thus reiterating a conclusion they had arrived at in 1939.¹³ The testimony of the clinician thus adds force to this conclusion of the M.R.C.: "The evidence for an association between lung cancer and tobacco-smoking has been steadily mounting throughout the past eight years, and it is significant that, during the whole of

this period, the most critical examination has failed to invalidate the main conclusions drawn from it."

Last year 18,000 died of cancer of the lung. The disease is on the increase. The evidence against cigarette-smoking is now so overwhelming that, in the absence of contrary valid evidence or of some means of excluding the carcinogenic factor from what used to be called "the yellow peril," it is incumbent on doctors to do all they can to dissuade the young from acquiring a habit so deleterious to health. Smoking is a widespread and pleasurable social habit, and unfortunately the appetite for it grows with what it feeds upon. But the hazards to health and life are undeniable, hazards which must be brought home to the public by all the modern devices of publicity: none of these, however, is likely to be so effective as the personal advice of the family doctor, and of the school doctor, to those in their care. Some of the evil effects of alcohol were brought under some sort of control by restricting the hours of its availability to the public. There is, therefore, something to be said for prohibiting smoking in such public places as cinemas and theatres—and even, dare we say in these columns, in the meetings of the Representative Body of the B.M.A. In the meanwhile those who enjoy smoking will wait anxiously for the research work now in hand to discover some way of making a world-wide social habit safe.

SOMA, PSYCHE, AND SELECTION

How much is the chance of an applicant for a job determined at an interview by his or her body build? People differ in appearance and in the way they think and behave, but can we predict the one from the other? Some of us think we can by a process that we should find difficult to describe in measurable terms, yet we look at a man and from his appearance expect certain things of him. Throughout medical history there have been attempts to put this clinical impression into measurable terms by the classification of body build and the correlation of this with temperament or liability to disease, all claiming some measure of success, and all mistrusted by the majority. In recent years the lead has been taken by Sheldon and his associates,^{1,2} who relate body build to temperament and propensity to mental illness. But their assertions have been sceptically received by many, partly because there is some natural resistance to being told that such qualities as aggressiveness, leadership, and sociability can be estimated from physical measurements. The chief criticism of Sheldon's work is that his assessment of physique is by no means entirely objective, and the qualities of

temperament that he describes are not capable of measurement. Medical officers of student health services are becoming more seriously interested, however, in the possibilities of estimating temperament and the likelihood of mental breakdown from some simple objective measurements of the body which can be made in a few minutes without embarrassment to the subject. In the opening pages of this issue we publish an article by Dr. R. W. Parnell, who, as a follower of Sheldon, has improved upon his master in technique, and, on the basis of objective measurements, has been obtaining interesting results in his attempts to correlate physique with mental processes.

The problem confronting all students of this subject has been to decide what to measure and how to express the measurements in the form of a scale. The Sheldonian technique is the basis of modern assessment of body build, but is laden with esoteric terminology and symbolism that inevitably clutter the fruits of an enthusiast's work. Parnell has decided that the three components of body build worth measuring are fatness, muscularity, and what he calls "linearity." The measurements of fatness and muscularity seem reasonable enough, but his linearity component is open to criticism and appears to be little different from a scale of height. It is a notable advance, however, to simplify the classification of physique by using a few measurements which can be made quickly and accurately by anyone. On the basis of these measurements each component—fatness, muscularity, and linearity—of the body is given a score on a seven-point scale. This "three-dimensional" classification can be plotted on a triangular-shaped chart in which each corner has the highest score for a particular component and the opposite side the least score for that component. Distribution maps can be prepared on these charts for visual or statistical comparison of the body builds of groups of subjects. It may come as a surprise to many that the body features measured in this way have any relation to temperament or mental disease, yet Parnell's results are arresting.

He finds a highly significant difference between the body build of 405 healthy students and that of 208 students who were advised by their general practitioners to seek psychiatric care. Some particular body builds showed striking differences in distribution between the two groups—for example, the averagely fat, rather muscular, short man was five times more common in the healthy group, and the slightly under averagely fat, poorly muscled, tall man was six times more common in the group of patients.

¹ Sheldon, W. H., Stevens, S. S., and Tucker, W. B., *The Varieties of Human Physique*, 1940, London.
² ———, Dupertius, C. W., and McDermott, E., *Atlas of Men*, 1954, New York.
³ Parnell, R. W., *British Medical Journal*, 1953, 2, 473.
⁴ ———, *ibid.*, 1954, 2, 491.
⁵ ———, *J. Hyg. (Lond.)*, 1954, 52, 369.

Generally speaking, the tall men, especially those with a higher score for fat than for muscle, were more likely than other men to go to their general practitioners and be advised to see a psychiatrist, whilst the muscular builds were least likely to do so. The difference in the two physique groups may be a difference in the incidence of mental breakdown or may be simply that the muscular type prefers not to consult his doctor when his mind is disturbed. Whatever the explanation, a difference of behaviour clearly exists between the two groups. Very similar results have been obtained in the comparison of 227 women patients with 671 healthy women students, with the same tall, fat rather than muscular builds predominating among the patients. In previous reports Parnell³⁻⁵ has compared the body build of students with their smoking habits, sporting activity, academic performance, and choice of faculty. Each time he has compared body build with a quantity which can be reasonably precisely measured and which is independent of subjective assessment. Some remarkable correlations have appeared, interesting enough to warrant further work and exploration along these lines.

Certain questions need to be answered, however. Does body build vary with nutrition, age, or illness, and what features of the body are most reliable as an index of the basic body type? Subcutaneous fat and therefore weight can be altered at will and thereby one can change one's scores for fatness and linearity and so disguise one's character—or does one's character change too? Claims are made that the basic body build is determined by the age of 5 and that changes in nutrition do not alter it, yet it is hard to believe that Parnell's simple measurements will not reflect changes in growth and size of calorie reserves. How far personality assessment from body measurements will be of value in the selection of students for university education or applicants for jobs remains to be seen. The present information is totally inadequate and could be harmful if misused: what is a statistically established likelihood in a large group is not necessarily the truth about the individual. Present results indicate, too, some awkward inter-correlations. For example, the body build which gets the highest proportion of first-class honours at Oxford is the same build as that of the student who is most likely to be attracted to the chemistry faculty and to go to a general practitioner for advice about mental illness. Medicine appears to attract those with the same body build that is associated with good all-round achievement in sport and academic life and with the least likelihood of having to consult a general practitioner about mental illness.

GENERAL-PRACTITIONER OBSTETRICS

In spite of all that is said about hospital confinement, it is certain that many pregnant women will insist on remaining under the care of their own family doctor, either at home or in hospital beds at his disposal. The specialist may fail to obtain a proper perspective on domiciliary midwifery because he sees most of the family doctor's failures and very few of his successes. A recently published survey of general-practitioner obstetrics is therefore to be welcomed.¹ It is a review of 4,277 deliveries in the year ending May 31, 1955, among the patients of 116 family doctors belonging to the South-west of England Faculty of the College of General Practitioners. Rather less than half of these doctors had held postgraduate resident hospital appointments in obstetrics, but only 10% had been practising domiciliary midwifery for less than five years. The standard of care given and the good results obtained are praiseworthy, but they must not be taken to reflect the picture of general-practitioner obstetrics throughout the country or even in the south-west of England. Not all the family doctors in that area participated in the survey. The presumption that those who volunteered were particularly keen on obstetrical practice is supported by the fact that each of the participants averaged 30 maternity cases during the year, of which roughly one-third were delivered in general-practitioner maternity hospitals. Moreover, nearly all of the doctors had direct access to laboratory and radiological facilities, and almost two-thirds had general-practitioner hospital beds at their disposal—figures that will be envied by many of their colleagues in other parts of the country. This survey must therefore necessarily offer a biased sample, yet the details of the report will repay study by consultants, general practitioners, and administrators alike.

The survey shows what good work can be done under the present system, and hints how much better the results could be. For example, it is shown that the perinatal mortality for deliveries under general-practitioner supervision—23.5 per 1,000 total births in this series—can be reduced by more careful selection of cases. In particular, hypertension, prematurity, breech presentation, multiple pregnancies, and high parity were noted so adversely to affect the perinatal mortality as to be regarded as requiring the services of a specialist maternity hospital; in fact about 18% of the 4,277 deliveries were in such hospitals. Other clinical comments centre on various complications such as delay in labour and the place for forceps in domiciliary midwifery; but it is apparent that there is much scope for the wider use of local analgesia and of the prophylactic administration of ergometrine by the general practitioner. As to changes in the maternity services, the survey, perhaps wisely in an objective report, offers no criticisms and tenders no suggestions, but does remark that the National Health Service at present does not encourage

¹ An Obstetric Survey by Members and Associates of the South-west of England Faculty of the College of General Practitioners, 1957. Price 6s.
² Report on the Obstetric Service under the National Health Service by the Royal College of Obstetricians and Gynaecologists. Revised November, 1956.

the general practitioner to provide a full maternity service. It may be relevant that, of the confinements in this survey under his supervision, the general practitioner attended 63% and was present at the delivery of the baby in only 48%. The revised report² of the Royal College of Obstetricians and Gynaecologists to the Cranbrook Committee recommended that a way should be found of enabling the general-practitioner obstetrician to devote sufficient time to his obstetric work. This might entail a restriction in the number of patients on his list, but if so, far from there being any financial loss to him, he should command for the added responsibilities an increased income, perhaps by way of an adequate fee for each maternity case.

TUBERCULIN REACTIONS

The spontaneous appearance of a positive reaction at the site of a previously negative Mantoux test is a well-recognized phenomenon. It may follow primary tuberculous infection, but it is more commonly noted as a sequel to B.C.G. vaccination. It provides evidence that the injected tuberculin has remained at the site of inoculation for a long time, since it may become apparent several months later. The many factors governing the tuberculin skin test have been admirably surveyed by Pepys,^{1,2} who drew particular attention to the availability and persistence of the antigen, tuberculin, at the inoculation site. Its fixation and persistence depend partly upon the local vascular supply, and this may be influenced by drugs such as histamine, adrenaline, and the steroid hormones. An increase in lymphatic absorption, especially if associated with increased capillary permeability, may reduce the retention of tuberculin and be followed by decreased reactions. Conversely, adrenaline vasoconstriction prolongs the persistence of tuberculin and may enhance the tuberculin patch-test reactions.³

The incorporation of tuberculin in an oily vehicle increases the persistence of tuberculin, since this material will resist lymphatic absorption. The response to depot tuberculin provides a rough means of distinguishing patients who are truly tuberculin-insensitive from those who have, because of disease, a depression of the normal skin-test response.⁴ The combination of a negative Mantoux reaction with a positive depot tuberculin test occurs in sarcoidosis, Hodgkin's disease, and leprosy, in all of which skin sensitivity to tuberculin may be depressed. In these subjects depot tuberculin appears to reveal a degree of tuberculin sensitivity too low to be elicited by aqueous tuberculin. This greatly increased potency of depot tuberculin has been confirmed by K. M. Citron,⁵ who obtained positive reactions to 5 T.U. of depot tuberculin in tuberculous patients who had been desensitized by repeated intramuscular tuberculin until they had failed to react to 100 T.U. of intradermal aqueous tuberculin.

D. G. James and J. Pepys⁴ also showed that successful B.C.G. vaccination was signified by a positive conversion

at the site of a previously negative depot tuberculin site, and it is not too much to hope that it may act as a similar indicator for the recognition of natural infection. The need for such a long-acting tuberculin test has been emphasized by C. T. Dotter⁶:

"Currently, the tuberculin test reveals only those individuals who have been infected with tuberculosis at least four weeks prior to the time of testing. Hypothetically, children now being tested for tuberculosis can be infected immediately before or soon after the test is performed. Ironically, in such cases failure to disclose that the disease had been contracted would give a false sense of security. . . . An antigen should be sought which, placed in the body, would be quiescent but potent. Upon the subsequent appearance of tuberculin sensitivity, the antigen should produce a clinically recognizable response, thus drawing attention at the earliest possible moment to the onset of infection. . . . Ideally, a 'tuberculin test' should be developed with life-time potency."

In recent studies, using aqueous tuberculin, F. O'Grady⁷ has also drawn attention to the "revivescence reaction." A positive reaction may appear at the site of a previously negative tuberculin reaction when further intradermal tuberculin is given. The belief that this is due to an increase in sensitivity to tuberculin is supported by the finding that, after a positive response, a reaction can often be obtained to doses which were previously ineffective. The response to these small doses of tuberculin is frequently of a kind which may occur in patients with tuberculosis. By measuring the depth and diameter of induration each day, O'Grady⁸ had previously noted that some patients with tuberculosis showed striking differences in the Mantoux reaction from healthy subjects. Though many patients with active tuberculosis responded in similar fashion to normal subjects, over one-half of them gave a response which was never encountered in the absence of active tuberculosis. This was characterized by transience of the induration. It may be likened to the accelerated response of smallpox vaccination in the partially immune. O'Grady regards this "tuberculous" response as a step on the road towards desensitization, since it appears to be a modified response, possibly due to the antigenic stimulation of the coexisting tuberculous focus or due to repeated serial tuberculin inoculations.

The interrelationships of antigen, antibody, and the inflammatory response, all of which play a part in the production of the revivescence reaction, are as yet too complex to permit an accurate immunological explanation for its occurrence. Our lack of knowledge of the immunological basis is matched by our ignorance of the biochemical basis, and a combined immunological and biochemical approach is important to an understanding of the mechanism of tuberculin hypersensitivity. It may also resolve some of the long-standing speculations surrounding allergy and immunity in tuberculosis.

TOBACCO SMOKING AND CANCER OF THE LUNG

STATEMENT BY THE MEDICAL RESEARCH COUNCIL

The Increase in Lung Cancer

In its annual report for 1948-50* the Council drew attention to the very great increase that had taken place in the death rate from lung cancer over the previous 25 years. Since that time the death rate has continued to rise, and in 1955 it reached more than double that recorded only 10 years earlier (388 deaths per million of the population in 1955 compared with 188 in 1945). Among males the disease is now responsible for approximately 1 in 18 of all deaths. Although the death rate for females is still comparatively low, it also has shown a considerable increase in recent years, and the disease is now responsible for 1 in 103 of all female deaths.

Three comments may be made on these figures. In the first place, the trend over the last few years indicates that the incidence has not yet reached its peak. Secondly, the figures are not to be explained as a mere reflection of the introduction and increasing use of improved methods of diagnosis but must be accepted as representing, in the main, a real rise in the incidence of the disease to an extent which has occurred with no other form of cancer. Thirdly, only a small part of the rise can be attributed to the larger numbers of older persons now living in the population; in the last ten years the lung cancer death rates among both men and women have risen at all ages from early middle life onwards.

Possible Causes of the Increase

The extent and rapidity of the increase in lung cancer point clearly to some potent environmental influence which has become prevalent in the past half-century and to which different countries, and presumably also men as compared with women, have been unequally exposed. The pattern of incidence of the disease rules out any possibility that the increase can be due, in a substantial degree, to special conditions, such as occupational hazards, affecting only limited groups. It is necessary to seek some factor or factors distributed generally throughout the population, and in considering the possibilities it must be borne in mind that a very long period, 20 years or more, may elapse between exposure to a carcinogenic agent and the production of a tumour. From the nature of the disease attention has focused on two main environmental factors: (1) the smoking of tobacco, and (2) atmospheric pollution—whether from homes, factories, or the internal combustion engine.

Smoking as a Cause of Lung Cancer

(a) Epidemiological Surveys

The evidence that heavy and prolonged smoking of tobacco, particularly in the form of cigarettes, is associated with an increased risk of lung cancer is not based on the observation that the substantial increase in the national mortality followed an increase in the national consumption of cigarettes. It is derived from two types of special inquiry. In the first, patients with lung cancer have been interviewed and their previous histories in relation to smoking and other factors that might be relevant have been compared with those similarly obtained from patients without lung cancer. The results of nineteen such inquiries (in this country, the U.S.A., Finland, Germany, Holland, Norway, and Switzerland) have been published. They agree in showing more smokers and fewer non-smokers among the patients with lung cancer, and a steadily rising mortality as the amount of smoking increases. In the second type of

inquiry, information has been obtained about the smoking habits of each member of a defined group in the population and the causes of the deaths occurring subsequently in the group have been ascertained. There have been two such investigations, one in the U.S.A. covering 190,000 men aged 50-69, and the other in this country covering over 40,000 men and women whose names appeared on the *Medical Register* of 1951. In both the results have been essentially the same. The investigation in this country, which has now been in progress for more than five years, has shown with regard to lung cancer in men:

- (1) a higher mortality in smokers than in non-smokers;
- (2) a higher mortality in heavy smokers than in light smokers;
- (3) a higher mortality in cigarette smokers than in pipe smokers;
- (4) a higher mortality in those who continued to smoke than in those who gave it up.

It follows that the highest mortalities were found among men who were continuing to smoke cigarettes, heavy smokers in this group having a death rate nearly 40 times the rate among non-smokers. Although no precise calculation can be made of the proportion of lifelong heavy cigarette smokers who will die of lung cancer, the evidence suggests that, at current death rates, it is likely to be of the order of 1 in 8, whereas the corresponding figure for non-smokers would be of the order of 1 in 300. The observation on the effect of giving up smoking is particularly important, since it indicates that men who cease to smoke, even in their early forties, may reduce their likelihood of developing the disease by at least one-half.

It should be noted that the excess of deaths from lung cancer among smokers was not compensated for by any corresponding reduction in the number of deaths from cancer of other sites in the body; in other words, there was a total incidence of cancer in the smoking groups in excess of the incidence that would have prevailed in the absence of smoking.

It will be apparent from what has been said that the evidence from the many inquiries in the last eight years, both in this country and abroad, has been uniformly in one direction and is now very considerable. It has been further strengthened recently by the observation from several sources that the extent of the relationship with smoking differs for different types of lung tumour which can be distinguished only by microscopic examination.

(b) Laboratory Evidence

From the physical and chemical point of view there is nothing inherently improbable in a connexion between smoking and lung cancer. Tobacco smoke consists largely of microscopic oily droplets held in suspension in air, and these droplets are of a suitable size to be taken into the lungs and retained there. Over a hundred constituents have so far been identified, and, among these, five substances have already been found which are known to be capable, in certain circumstances, of causing cancer in animals. Some workers have succeeded in producing tumours in animals by painting concentrated extracts of tobacco tar on the skin. Known carcinogens are present in tobacco smoke in very small amounts, however, and there is no certainty that such low concentrations could be harmful to human beings. Nevertheless, the finding of carcinogenic agents in tobacco smoke is an important step forward, in that it provides a rational basis for the hypothesis of causation.

Atmospheric Pollution as a Cause of Lung Cancer

It has been known for some years that mortality from lung cancer is greater in urban areas than in the countryside. This fact, together with the identification of carcinogenic substances in coal smoke and in motor vehicle exhausts, has led to the supposition that exposure to atmospheric pollution may be concerned with the increase in lung

*Cmd. 8387. H.M.S.O., 1951.

cancer. The role of atmospheric pollution is particularly difficult to investigate however, and the evidence is neither so consistent nor so extensive as that relating to tobacco smoking. On the one hand, no excess mortality from lung cancer has been observed in persons who would be especially exposed by the nature of their work to atmospheric pollution—for example transport workers, garage hands, and policemen. On the other hand, the results of a number of investigations have suggested that a relationship does exist between atmospheric pollution and lung cancer. Perhaps the best evidence for this relationship comes from studies of the small number of deaths from the disease among *non-smokers* in different types of residential district; in these studies higher death rates have been observed among non-smokers in large towns than among those in rural areas. On balance, it seems likely that atmospheric pollution plays some part in causing the disease, but a relatively minor one in comparison with cigarette smoking.

Assessment of the Evidence Relating to Smoking and Lung Cancer

Knowledge of the causation of lung cancer is still incomplete. Many factors other than tobacco smoking are undoubtedly capable of producing the disease; for example, at least five industrial causes have been recognized. Nevertheless, the evidence for an association between lung cancer and tobacco smoking has been steadily mounting throughout the past eight years, and it is significant that, during the whole of this period, the most critical examination has failed to invalidate the main conclusions drawn from it. It has indeed been suggested that the fundamental cause may be some common factor underlying both the tendency to tobacco smoking and to the development of lung cancer some 25 to 50 years later, but no evidence has been produced in support of this hypothesis.

In scientific work, as in the practical affairs of everyday life, conclusions have often to be founded on the most reasonable and probable explanation of the observed facts, and so far no adequate explanation for the large increase in the incidence of lung cancer has been advanced save that cigarette smoking is indeed the principal factor in the causation of the disease. The epidemiological evidence is now extensive and very detailed, and it follows a classical pattern upon which many advances in preventive medicine have been made in the past. It is clearly impossible to add to the evidence by means of an experiment in man. The Council are, however, supporting a substantial amount of laboratory research which may throw more light on the mechanism by which tobacco smoke and other suspected causative factors exert their effect, and which may thus eventually add to the degree of proof already attained as a result of studies of human populations. It must be emphasized, however, that negative results from work with animals cannot invalidate conclusions drawn from observations on man.

Conclusions

1. A very great increase has occurred during the past 25 years in the death rate from lung cancer in Great Britain and other countries.
2. A relatively small number of the total cases can be attributed to specific industrial hazards.
3. A proportion of cases, the exact extent of which cannot yet be defined, may be due to atmospheric pollution.
4. Evidence from many investigations in different countries indicates that a major part of the increase is associated with tobacco smoking, particularly in the form of cigarettes. In the opinion of the Council, the most reasonable interpretation of this evidence is that the relationship is one of direct cause and effect.
5. The identification of several carcinogenic substances in tobacco smoke provides a rational basis for such a causal relationship.

MEDICAL RESEARCH COUNCIL

ANNUAL REPORT, 1955-6

The growth of the Medical Research Council during the last decade has been remarkable. At the end of the second world war the Council administered, besides the National Institute for Medical Research and the (Emergency) Public Health Laboratory Service, 21 research units and groups and had an external scientific staff of five.¹ Its parliamentary grant-in-aid for the year 1945-6 was £295,000. Last year, according to the Council's latest report,² there were 57 research units and groups and 58 external scientific staff, as well as the enlarged National Institute and the Public Health Laboratory Service³; the Council also had the major responsibility for the Institute of Cancer Research at the Royal Cancer Hospital. The parliamentary grant-in-aid had risen to £2,329,500 for ordinary expenditure and £49,500 for non-recurrent items.⁴ At the end of the period the Council was employing a staff of 1,802 for its own purposes and a further 1,031 in the Public Health Laboratory Service.⁵ Administration and central expenses accounted together for only 5.7% of the Council's budget.

Research Establishments

TABLE I.—National Institute for Medical Research, Mill Hill: Director, Sir Charles Harington, F.R.S. The Institute was Established in 1915

Division	Head of Division	Research Programme
Biochemistry	Sir Charles Harington, F.R.S. Dr. J. Walker	The work of the Institute is generally designed to cover as wide a field as possible in basic non-clinical medical research, and most investigations are of a long-term character. Occasionally, as with the research on the common cold, the work verges on the clinical field; and members of the Institute's staff commonly collaborate in clinical developments arising from their discoveries. Certain major themes, such as chemotherapy and virus diseases, are constantly under study; sometimes, as in the division of human physiology where the main task is to investigate the effects of low temperatures on human performance, a fairly closely defined field of research may be allotted; for the rest, the direction that the work takes is largely determined by the particular interests of the senior members of the staff

³ Administered by the M.R.C. on behalf of the Ministry of Health.

⁴ These consisted of special apparatus and buildings. Owing to the Government's policy of curtailing public expenditure, the Council in fact limited expenditure on this account to £19,500.

⁵ The 1,802 M.R.C. workers comprised 511 scientific staff (of whom 172 were medically qualified), 676 technical, 343 administrative (including clerical), and 272 maintenance staff. In addition there were 55 African staff in the Gambia. The corresponding breakdown of P.H.L.S. staff was 151 scientific (of whom 125 were medical), 474 technical, 174 administrative, and 232 maintenance.

⁶ The Committee of Privy Council for Medical Research consists (*ex officio*) of the following: The Lord President of the Council (*chairman*), the Secretary of State for the Home Department, the Secretary of State for Commonwealth Relations, the Secretary of State for the Colonies, the Secretary of State for Scotland, the Minister of Health, the Minister of Labour and National Service, and the secretary of the Medical Research Council (*secretary*).

their research programmes, are listed in Tables I and II. The new research groups established last year were those for the experimental investigation of hereditary diseases and of behaviour; and those for research on the occupational aspects of ageing, atmospheric pollution, the epidemiology of respiratory diseases, viruses, and trachoma. After

October 1, 1956, and therefore not included in the present report, three further research groups were constituted: namely, for work on metabolic disturbances in surgery (Leeds), for research on carcinogenic substances (Exeter), and for research into the general effects of radiation (Edinburgh). In the Public Health Laboratory Service a new

regional laboratory was opened at Leeds and a new laboratory at Chelmsford; associated laboratories at Maidstone and Swansea were also taken over. In addition to the support of these establishments and its external scientific staff, the Council aided with grants nearly 300 other research workers.

Administrative Structure

The present composition of the Medical Research Council is given below (Table III). Two new members were appointed during the year, Professor G. PAYLING WRIGHT and Dr. J. D. N. HILL replacing Professor G. R. CAMERON, F.R.S., and Professor AUBREY LEWIS. The Council is responsible to a Committee of Privy Council¹ under the chairmanship of the Lord President, the EARL OF HOME.

TABLE III.—Present Membership of the Medical Research Council

The Earl of Limerick, <i>Chairman</i>
Sir Geoffrey Vickers, V.C., <i>Treasurer</i>
Mr. Richard Fort, M.P.
Professor R. Platt (professor of medicine, Manchester)
Professor E. T. C. Spooner (professor of bacteriology and immunology, London)
Professor G. W. Pickering (Regius professor of medicine, Oxford)
Professor A. Bradford Hill, F.R.S. (professor of medical statistics, London)
Professor G. F. Marrian, F.R.S. (professor of biochemistry, Edinburgh)
Professor R. C. Garry (Regius professor of physiology, Glasgow)
Mr. H. J. Seddon (clinical director, Royal National Orthopaedic Hospital)
Professor G. Payling Wright (professor of pathology, London)
Dr. J. D. N. Hill (senior lecturer in clinical neurophysiology, London)
Sir Harold Himsworth, F.R.S., <i>Secretary</i>
Sir Landsborough Thomson, <i>Second Secretary</i>

The Council is assisted in its work by three boards and numerous research committees. The boards are the Industrial Health Research Board, under the chairmanship of Sir HAROLD HIMSWORTH, F.R.S., the Council's secretary; the Public Health Laboratory Service Board, under the chairmanship of Sir LANDSBOROUGH THOMSON, the second secretary; and the more recent Clinical Research Board, whose membership is set out in Table IV.

TABLE IV.—Clinical Research Board

Sir Geoffrey Jefferson, F.R.S., <i>Chairman</i> (emeritus professor of neurosurgery, Manchester)
Professor Dugald Baird (Regius professor of midwifery, Aberdeen)
Lord Cohen of Birkenhead (professor of medicine, Liverpool)
Professor Sir Charles Dodds, F.R.S. (Courtauld professor of biochemistry, London)
Dr. J. D. N. Hill (senior lecturer in neurophysiology, London)
Professor C. F. W. Illingworth (Regius professor of surgery, Glasgow)
Professor G. W. Pickering (Regius professor of medicine, Oxford)
Professor R. Platt (professor of medicine, Manchester)
Mr. H. J. Seddon (clinical director, Royal National Orthopaedic Hospital)
Dr. W. P. H. Sheldon (physician, Hospital for Sick Children, Great Ormond Street)
Professor B. W. Windeyer (professor of radiology, London)
Dr. F. J. C. Herrald, <i>Secretary</i>

Assessors to the Board

Sir John Charles (Ministry of Health)
Dr. K. Cowan (Department of Health for Scotland)
Dr. F. F. Main (Northern Ireland Ministry of Health and Local Government)

Clinical Research

The now customary review articles on "Some Aspects of Medical Research" in the Council's report are preceded this year by two on policy. The first concerns clinical research, the second the development of research in genetics. In the

clinical field the Council sees its role as the support of work which because of its specialized nature, novelty, scale, or urgency is beyond the accepted scope of university or hospital departments. The Council has always taken the view that it should complement, but not supplement or replace, research programmes in the medical schools, universities, and hospitals. To help decide on the merits of research schemes put up to it the Council now has its Clinical Research Board. The Board is expected to advise the Council on such matters as the establishment and siting of new research units and the reorganization of existing ones, the scientific policy of individual units, choice of staff, and the award of research grants. When the Board was appointed three years ago there were already 21 clinical research units and another forming. Since then new units have been established for research on obstetric medicine (Aberdeen), the general effects of radiation (Edinburgh), atmospheric pollution (London), the epidemiology of respiratory diseases (Sheffield), and metabolic disturbances in surgery (Leeds). During this three-year period 86 new research grants for clinical research and 36 training awards in this field have also been made.

The Council has also taken over certain major clinical research projects, financed by Exchequer funds and conducted up to now within the framework of the N.H.S. These include the unit for juvenile rheumatism at the Canadian Red Cross Hospital, Taplow, and the neuropsychiatric research centre at the Whitchurch Hospital, Cardiff. Other developments are the formation of a clinical neuropharmacology research unit at Birmingham, a clinical genetics research unit at Great Ormond Street, and a psychiatric research group at Graylingwell Hospital, Chichester. The Council has also assumed responsibility for Dr. R. W. PARNELL'S programme of research on the constitutional aspects of psychiatric medicine at the Warneford Hospital, Oxford, hitherto supported by the Nuffield Foundation. The Council is also concerned with three clinical research establishments in the tropics—at Fajara in the Gambia, at Kampala in Uganda, and at Kingston, Jamaica.

Research in Genetics

The Council has a long and distinguished record in this field, particularly in the biological study of heredity, but the recent developments in nuclear science have underlined the need for much greater knowledge of genetic processes in man. The Council has therefore stepped up its programme to meet the need. In 1951-2, £18,000 was being spent on human and experimental genetics; in the current year the figure is over £50,000; and by 1960 the amount committed from a wide range of basic disciplines to this field is urgent, and the Council wishes it to be known that it can offer specialized training in genetical methods through its scholarship and clinical fellowship schemes. "There are now good opportunities," states the report, "for research careers both in university departments and as members of the Council's own scientific staff."

Other Aspects of the Report

The Council's review of selected fields of medical research emphasizes the ever-growing importance of its activities. And indeed the report as a whole is a most valuable source of reference and information for anyone practising medicine, in whatever field. Here only the titles of the subjects reviewed can be given. The first is a review of the aetiology of cancer of the lung, which gives the scientific background to the Council's statement on tobacco smoking and lung cancer (see p. 1523). The other subjects reviewed are research on poliomyelitis and whooping-cough vaccination, filariasis, protein deficiency, growth and renal function, abnormal haemoglobins, microbial genetics, radiation and transplantation immunity, radiation and leukaemia, the chemistry of peptides and proteins, chemical aspects of

antibiotics, and the mass spectrometer for respiratory gas analysis described in our pages last month (May 25, p. 1205).

The remainder of the annual report deals with the work of the Council's various research establishments, external staff, and grant holders. A special section is given to the Public Health Laboratory Service, directed by Dr. G. S. WILSON. Besides its central laboratory at Colindale, the Service now has regional laboratories at Cambridge, Cardiff, Leeds, Liverpool, Manchester, Newcastle, Oxford, and Sheffield, and there are also 50 area laboratories in England and Wales. The Service also maintains "reference" laboratories for enteric fever, dysentery, malaria, fungus diseases, venereal disease, and for the investigation of salmonellae, streptococci and staphylococci, and viruses. Other specialized laboratories are the air hygiene, food hygiene, and epidemiological research laboratories at Colindale; the National Collection of Type Cultures and the standards laboratory for serological reagents, both also at Colindale; and the epidemiological research unit at Cirencester under the part-time direction of Dr. R. E. HOPE SIMPSON.

The report lists the Council's publications and also the members of its principal research committees. The names of all the research workers and others mentioned in the report are indexed.

A SYMPOSIUM ON GOITRE

[FROM A SPECIAL CORRESPONDENT]

The annual meeting of the American Goiter Association was held in New York, from May 28 to 30, under the chairmanship of Dr. BROWN DOBYNS, of Cleveland.

Thyroid Cancer

The first papers were concerned with thyroid cancer. Dr. VIRGINIA FRANTZ (New York) described the production of tumours in a series of rats which had been treated by radioactive iodine or an equivalent dose of external irradiation. She described the carcinomas which appeared both in the thyroid and in other organs, and also noted a number of fibrosarcomas, probably the same as those described by previous workers as of thyroid origin, although clearly these were not so. Dr. B. J. DUFFY (Washington, D.C.) followed with a review of the whole subject of radiation as a cause of thyroid cancer in man. There seemed incontrovertible evidence that irradiation of the thymus in infants had led in many cases to the development of a thyroid carcinoma in children and young adults, and there was much experimental evidence to support such a view, he said. Dr. I. DONIACH's view that irradiation might both initiate and promote malignant changes in the thyroid was also adumbrated. Dr. WILLIAM MEISSNER (Boston) described a number of patients in whom there was histological evidence of thyroid carcinoma being present for periods of from ten to twenty-five years. There was no doubt that a small group of such tumours grew very slowly and that their presence was compatible with long life. A group of workers from Ann Arbor gave some encouraging reports of radioactive iodine therapy in the treatment of thyroid carcinomas in cases in which treatment had previously been abandoned because they were thought unsuitable. Dr. COLIN THOMAS (Chapel Hill, North Carolina) stressed the value of using L-triiodothyronine for the suppression of thyrotrophic hormone in patients with thyroid cancer, its advantages over ordinary dried thyroid medication being the quickness of response and duration of action.

Dr. PAUL STARR (Los Angeles) described the use of triiodothyronine in forty patients with goitre over a period of three to eighteen months. Reduction in size occurred in nearly all, and in about one-third the goitre was eventually invisible. Certain nodules, however, appeared unaffected, and this was taken as evidence that they were malignant. In the discussion that followed, others had not been so fortunate in reducing the size of simple goitre, either with

triiodothyronine or with dried thyroid. Dr. D. P. RALL (Bethesda) reported on eighteen patients with cancer of the thyroid and pulmonary metastases who had been treated with large doses of radioactive iodine. The resulting pulmonary fibrosis had been responsible for the death of two, and there was evidence in five others that the pulmonary reserve had been reduced. In general it seemed that, if less than 90 millicuries of ¹³¹I was deposited in the chest, pulmonary fibrosis did not develop.

Malignant Exophthalmos and Nodular Goitre

Dr. E. P. McCULLAGH (Cleveland) reported some fascinating results in the treatment of malignant exophthalmos. Three different techniques had been used: the first was the well-tried one of giving thyroid, or preferably large doses of triiodothyronine; the second was the use of intravenous corticotrophin in large doses; but the third and by far the most interesting was section of the pituitary stalk. Eight patients treated in this manner had shown remarkable improvement, and certainly the coloured photographs of them were very striking.

A number of papers related to investigations into the nodules of non-toxic goitre. Dr. BROWN DOBYNS in his presidential address reviewed a histological and autoradiographic survey of some 350 thyroid tumours removed at operation. He related the size of cell and follicle to function, and made the interesting point that, if tall follicular cells were also broad, the fact that they were functioning was often overlooked, although they might indeed represent extreme hyperplasia. Mr. SELWYN TAYLOR (London) described a series of tissue slice experiments using the Warburg technique, in which material had been obtained from patients at operation, and compared the relative sensitivity of nodules and non-nodular tissue. Dr. R. V. PITT-RIVERS, F.R.S. (London), described a chromatographic study of the distribution of radioactive iodine in the nodules and non-nodular tissue from patients with non-toxic nodular goitre. Many of these patients were found to have relatively large amounts of moniodotyrosine and relatively little thyroxine. Dr. JEFFRIES (Cleveland) commented that in such patients there was evidence that they were under extreme stimulus from the anterior pituitary, and additional thyrotrophic hormone by injection had little effect.

The outstanding paper of the meeting was the Van Meter prize essay, which had been awarded to Dr. D. DONIACH and Dr. I. ROITT (London) for their paper on the auto-immunological changes in Hashimoto's disease. This work has already been reported in London, and it made a profound impression on the meeting in New York. There were a number of other outstanding papers. Dr. N. FREINKEL (Boston) reported a study of the effect of thyrotrophic hormone on thyroid tissue *in vitro* in augmenting ³²P uptake. Under these conditions the radioactive phosphorus was incorporated mainly in the cephalin and phosphoinositide components, and this selectivity was discussed in relationship to the enzyme changes it presumably accompanies. Clearly we are going to hear much more about the enzyme systems in the thyroid in the near future.

Goitrogenic Diets

Dr. L. VAN MIDDLESWORTH (Memphis) gave an amusing paper on some goitrogenic diets which he had used in the rat. Soya bean flour was definitely goitrogenic and he had found it accompanied by increased faecal excretion of thyroxine. Commenting, Dr. J. H. MEANS (Boston) suggested that the word thyroxinorrhoea might be coined for the occasion. It is not surprising that this was the paper which was reported in the newspapers next day.

There were many other excellent papers, and the last half-day's programme was held in conjunction with the annual meeting of the American Endocrine Society. The latter is a huge body and more than 1,000 of its members were present, as contrasted to some 300 representing the Association. There was a goodly representation from Great Britain

on this occasion, for, in addition to those mentioned above, Dr. RAYMOND GREENE (London) presented a paper on the serum protein abnormalities in Hashimoto's and other diseases and Dr. W. R. TROTTER (London) took an active part in the discussions.

APPROVED NAMES

On March 16, 1957 (p. 642), we printed the last supplement (dated February, 1957) to the consolidated list of "approved names" selected by the British Pharmacopoeia Commission. Below is the latest, dated May, 1957. We have added a brief note on the main use of each drug. Communications relating to "approved names" should be addressed to the secretary, British Pharmacopoeia Commission, General Medical Council Office, 44, Hallam Street, London, W.1.

Approved Name	Chemical and Other Names	Notes
Amisometradine	6-Amino-1-methylallyl-3-methylpyrimidine-2 : 4-dione "Rolicton"	Diuretic
Florantyrone	7-Fluoranthren-8-yl-γ-oxobutyric acid "Zanchol"	Cholagogue
Halothane	2-Bromo-2-chloro-1 : 1 : 1-trifluoroethane "Fluothane"	Volatile general anaesthetic
Norethandrolone	17α-Ethyl-17-hydroxy-19-norandrost-4-en-3-one "Nilevar"	Anabolic agent
Pentacynium	4-(2-[N-(5-Cyano-5 : 5-diphenylpentyl)-N-methylamino]ethyl)morpholine dimesylate "Presidal"	Ganglion-blocking agent
Prochlorperazine	1-[3-(2-Chloro-10-phenothiazinyl)propyl]-4-methylpiperazine "Compazine"; "stemetil"	Treatment of nausea and vomiting
Tolpronine	1-(1 : 2 : 3 : 6-Tetrahydropyridino)-3-o-tolylloxypropan-2-ol "Proponesin" is the hydrochloride	Anodyne

Nova et Vetera

NATIONAL HEART HOSPITAL 1857-1957

The National Hospital for Diseases of the Heart first opened its doors on July 1, 1857. It owed its foundation to Dr. Eldridge Spratt, who in the hospital's early years showed himself to be a physician of skill and foresight, but aggressive in character and resentful of any form of control. Spratt was born in 1825 and qualified L.R.F.P.S. Glasgow in 1853, becoming M.D., 1859. He died on September 14, 1902.

The hospital was first established at 67, Margaret Street, Marylebone, with Spratt as its physician, chairman, secretary, and treasurer. During the first three years 1,475 patients had been treated, but by 1864 they averaged 100 a week. In-patients were first admitted in 1859. The early years produced little except recurring financial crises and dissatisfied committees. In 1868 the hospital moved to larger premises at 85, Newman Street. Improvements followed the appointment in 1871 of Captain W. F. P. Dadson as honorary secretary. Over the next few years he considerably reduced the debts and ensured the continuance of the active work of the hospital.

A further move was made in April, 1874, this time to 32, Soho Square, a house originally built for Sir Joseph Banks,

F.R.S., by the Adam brothers. Here the hospital remained for the next 40 years. In this same year trouble arose between the committee and Dr. Spratt over his annexation of hospital collecting-boxes and their contents; it was also disclosed that Spratt's private patients had been supplied with drugs from the hospital stock. On January 18, 1875, the committee requested his resignation as physician. Having passed their resolution to get rid of Spratt, the committee "doubtless went home to bed breathing sighs of relief and congratulating themselves that their troubles were now over. They little knew their founder. Dr. Spratt also left the meeting, but, unlike the committee, he returned, and not alone, for in the early hours he brought with him a large removal van and a party of sturdy removal men. To open the front door was the work of a moment for Dr. Spratt, and once inside the hospital it did not take long for his well-trained helpers to place in the van every portable article which Dr. Spratt indicated. Furniture, instruments, books, and pictures disappeared, together with an organ, which had been presented to the hospital by a supporter. In addition, Dr. Spratt gave orders for the removal of a large quantity of lead, and all this was duly stowed away in the van. The party then drove off in triumph." Some of these articles were later returned. For many years afterwards Spratt continued to describe himself in the *Medical Directory* as physician to the hospital.

By 1912 the increasing numbers of patients and the pressure of a progressive medical staff combined with other factors to emphasize the need for larger premises. It was found impracticable to rebuild in Soho Square, and eventually a suitable site was found in Westmoreland Street, Marylebone, where the present building was formally opened in January, 1914. Another notable event in 1912 was the appointment of Captain Robert Whitney as secretary, a post which he continues to hold to-day. In 1919 postgraduate courses in cardiology were inaugurated, and in 1926 Lady St. Cyres endowed the annual lecture which bears her name and which has since been delivered by eminent cardiologists from all over the world.

The last thirty years have shown continual progress and increasing work, both clinical and academic. The threat of war in 1938 indicated the necessity for a country branch which could maintain an adequate service for cardiac patients without the risk of exposure to bombing, which would be the case in London. Maids Moreton Hall at Buckingham was accordingly acquired, and when war was declared in September, 1939, it was fully occupied. Throughout the war postgraduate teaching continued, and in 1947 the Institute of Cardiology, an institution of the British Postgraduate Medical Federation, was established in association with the hospital; the following year the hospital was designated a teaching hospital, with the new title "National Heart Hospital." By 1950 the lease of 47, Wimpole Street was acquired, where accommodation was found for angiocardigraphic and phonocardiographic sections, as well as additional accommodation for nurses. The present accommodation in Westmoreland Street is proving inadequate for the steadily increasing demands of all departments. Plans for the extension of the hospital, including the provision of two operating theatres and additional beds, are now before the Ministry of Health.

From modest beginnings the National Heart Hospital has become an outstanding centre of cardiological teaching and practice. This year Princess Alexandra of Kent honoured the hospital by consenting to become its Patron, continuing the tradition of royal patronage inaugurated by the Duke of Albany and maintained by the Duke of Cambridge and the Duke of Connaught. The centenary celebrations will include a dinner at the Apothecaries' Hall in October, at which it is hoped to welcome many eminent cardiologists together with past and present workers at the hospital, and the Minister of Health.

Correspondence

Poliomyelitis and Pregnancy

SIR,—I have been most interested in your annotation re the above (*Journal*, June 8, p. 1352). During the 1950 poliomyelitis epidemic, in the area in which I practise, nine adult females were affected, and of these five were pregnant. These cases have been reported elsewhere,¹ and, while not of themselves statistically significant, I was able to collect references in the literature to a further 234 cases of poliomyelitis in pregnancy out of a total of 881 adult women suffering from the disease—an incidence of 26.6%. The figures of Bradley and Gale² referred to in your annotation were compiled from questionnaires sent to a number of hospitals. The incidence of pregnancy revealed would therefore tend to be on the low side, as pregnancy, if early, might well be missed clinically unless an accurate menstrual history were taken, and even obvious pregnancy might go unrecorded. It does seem reasonable that the increased metabolic strain of pregnancy would predispose to a more severe attack of poliomyelitis, in the same way that excessive exertion is known to do—quite apart from any endocrine factor.

Priority for poliomyelitis immunization is a difficult question, but it is worth pointing out that in the case of the pregnant woman two lives and not one are at stake.—I am, etc.,

Dartmouth.

Toxicity of Promazine Hydrochloride

SIR,—It has been observed in the Hospital for Mental and Nervous Diseases in St. John's, Newfoundland, that severe local reactions have occurred following the use of intravenous "sparine" (promazine hydrochloride). As this drug is now being used more freely for the control of excited states, and nothing has appeared in the literature to date concerning these reactions, I would like to cite a few instances.

Patients have been observed following admission to have extreme swelling of the forearm with a red indurated area around an injection site. Investigation revealed that the patients had received an injection of 100 mg. of sparine on the day prior to their arrival in hospital. This has occurred in four cases. It was assumed that the drug had leaked into the tissues due to faulty technique. Although no tissue necrosis occurs with the intramuscular use of the drug, however, it is known that if leakage occurs into the subcutaneous tissue necrosis develops. Further observation revealed that when the technique of giving the intravenous injection was strictly supervised and appeared faultless the same reaction occurred: thus the following technique is recommended. When giving 100 mg. (2 ml.) of the drug, make sure the needle is inserted firmly in the vein, then draw up 2 ml. of blood. Proceed with the injection slowly, retracting the plunger slightly following the administration of each ½ ml. The same precaution should be used as when administering intravenous iron.

Since this technique has been practised no case of local reaction has occurred. It is therefore suggested that, unless the precautions outlined above are followed, the routine use of intravenous sparine should not be practised.—I am, etc.,

St. John's, Newfoundland.

E. A. MOORE.

Choledochoduodenostomy

SIR,—Mr. John Hosford's advocacy of external choledochoduodenostomy (*Journal*, May 25, p. 1202) raises an off-recurring problem. No doubt, when fibrosis or strictures resulting from long impaction of stones at the lower end have occurred, some sort of short-circuit is desirable in

preference to dilatation or blind sphincterotomy. Nevertheless, I have been struck with the occurrence of a cicatricial narrowing at the actual ostium of the papilla itself and have adopted a policy of circumcising the papilla, with suturing of the duct wall to the duodenal mucosa. When the duct is dilated above, this procedure gives an adequate opening and allows dependent drainage. It is preferable, I think, to the oblique split suggested in standard textbooks, and has the advantage over external choledochoduodenostomy in that complete drainage is afforded of the distal part, and if any retained calculi have been overlooked there is every opportunity for them to pass.

This "cicatricial papillitis" is to my mind more than an occasional finding if it is searched for. When a urethral sound is passed into the duct and the papilla inspected from within the duodenum it has all the appearance of a diminutive penis with cicatricial phimosis. Hence my advocacy for "circumcision" of the ampulla. On occasions minute granulations may even be detected on the margins of the ostium. These findings, after all, are only what one would expect when stones have been lying for a time in the common duct. The trauma and associated infection as stones attempt successfully or unsuccessfully to pass through the papilla would result in inflammation at the narrowest part—that is, the ostium—which on healing leads to cicatricial narrowing.

To undertake a short-circuit above, when a lesion which may be easily remedial is actually present below, would seem, therefore, to be begging the question.—I am, etc.,

Bath.

C. PATRICK SAMES.

Operative Treatment of Coronary Insufficiency

SIR,—Your reference to my contribution to the symposium on the coronary circulation in the Harvey Tercentenary Congress (*Journal* June 15, p. 1413) requires correction. I did not express the opinion that "external collaterals were more important than intercoronary anastomoses."

Having recorded my experiences—with 45 patients treated by similar operations—in support of Dr. Claude S. Beck's advocacy of operative treatment of coronary insufficiency, I merely expressed "the belief that in some measure the collaterals established by surface grafting or inflammation may, on occasion, play an appreciable part in the relief of coronary insufficiency." Dr. Beck had advanced the view that the benefit from such operations derived almost completely from improvement in the intercoronary communications, developing after operation. My own experience in this field having been almost entirely clinical it would have been presumptuous for me to dispute—or indeed criticize—views which he has formed as a result of a vast experimental and clinical experience.

The short film shown at the conclusion of my remarks demonstrated indisputably that two patients—previously severely crippled by coronary disease—were able, after surface grafting operations, to perform severe exercise and undertake heavy work. No one would seriously suggest that comparable benefit could have been obtained from any known drug or other medical treatment. While the nature of the disease for which they are undertaken may well make the outcome of these operations unpredictable in individual cases, Dr. Beck has shown that suitable cases can be undertaken with an almost nominal mortality, and that the functional result in the great majority of cases is good.—I am, etc.,

Newcastle upon Tyne, 2.

GEORGE A. MASON.

Transaminase in Myocardial Infarction

SIR,—Attention has recently been focused on the value of serum glutamic oxalacetic aminophase (transaminase) estimations in the differential diagnosis of myocardial infarction (annotation, *Journal*, March 9, p. 573). There appear to be few published reports of transaminase levels in cases of dissecting aneurysm of the aorta. In the inves-

tigation reported by Kattus *et al.*¹ there was one case in which the level was 16 units, though the time after onset at which this estimation was made was not mentioned.

It may be of interest to report that this finding of a normal level was also noted in a recent case in the Belfast City Hospital in which the diagnosis was confirmed at necropsy. The transaminase level 9 hours after the onset of pain was 11 units, and 12 hours later was 9 units.—I am, etc.,

Belfast.

Hospital Confinement

SIR,—Dr. J. P. O'Dwyer (*Journal*, June 8, p. 1364) should not think that I would regard it the least discourteous of him to argue with me his thesis that hospital confinement is safer than home confinement. I would feel complimented. I still await proof that the statement is an established fact. A hospital achieves nothing. It is the obstetricians in the hospital who achieve. If a hospital obstetrician is prepared to go out into a patient's home there is no procedure he cannot carry out there, and I know of no facilities he cannot take with him. It is less economic in time and money for him to do so, but it can be done. It is not the hospital that makes good results but the man in attendance. By propaganda it is being spread that merely by being in hospital a patient will secure the best attention, when what is really meant is that good attention can be given to a greater number of patients by a certain number of doctors if their patients are all gathered together in one place. It is so much less trouble to a consultant if he can have his patients in a hospital, and by being less trouble the patient releases him to attend to a greater number of patients.

What indeed does hospital confinement mean? It means that breech delivery, forceps delivery, manual removal of the placenta, perineal repair, and so on are done by a recently qualified house-surgeon or by a registrar under training. It is said that these are done "under supervision," but the truth is rather that they are done by remote control. Hospitals get puffed up with admiration for their own cleverness. They publish figures to show how much better results they are getting than their predecessors, but never do they stop and compare their results with those obtained by the same men in patients' houses. I have in front of me the report of an English hospital where one-sixth of the patients are delivered by caesarean section. Is it true that the betterment of mother and baby is secured by the thousands of premature inductions of labour that are done in hospital?

So far as the newborn baby is concerned, in spite of the much more meticulous attention in hospital, infection is common because of the gathering together of a large number of people in one building. Every paediatrician will agree that a baby is safer once it returns to the more secluded surroundings of its own home. The isolation and aseptic handling babies are given in hospital are necessary because there the baby is at so much greater risk of infection. If a man, consultant or general practitioner, is prepared to take the time and trouble, and prepared to take his "facilities" with him, I have no hesitation in declaring that he will have better results in the patient's home. I could name several skilled and careful family doctors whose results for both mother and child are (exasperatingly) as good as any comparable series from a hospital. I wish these inarticulate men would publish their results over, say, ten years. It is not because they do domiciliary confinements that their results are so good but because they are conscientious, experienced, careful doctors. Hospital doctors see the mistakes and mishaps of family doctors—good ones and bad ones—and lump them together as being due to the fact that the patient was not in hospital. How many hospitals in their annual reports list the cases of failed forceps in hospital? They are glossed over as "trial forceps," and yet

if a family doctor had sent in such a case it would gleefully be included in the table for "failed forceps." It is the man that counts, not the place where he works.

However, properly conducted home confinement is uneconomic; it is hard and exacting work, and I have no doubt the present trend towards hospital confinement will continue.—I am, etc.,

Newcastle upon Tyne, 2.

FRANK STABLER.

SIR,—Unlike Dr. J. P. O'Dwyer (*Journal*, June 8, p. 1364) I see no harm in a little controversy on this subject. He is too ready to generalize. In this part of the country early discharge from hospital would be no answer to the shortage of hospital beds. Here hospital confinement is rightly reserved for selected groups of women—namely, primiparae, multiparae for whom the G.P. has found reason to expect difficulty or danger, and those admitted on "social grounds." These last form an important group who cannot be disposed of by early discharge. They are, in my experience, booked for hospital confinement not so much to ensure good conditions for actual delivery as to provide adequate rest and freedom from anxiety during the puerperium. Early discharge in these cases would defeat the object of admission. The same is often true of those of the first two groups where admission has in fact been justified by complications at delivery. Dr. O'Dwyer's simple solution can really only be applied to those who need not have been admitted to hospital at all. The real answer to the shortage of hospital beds—and this applies to medical cases as well as to midwifery—is not to send into hospital people whom we can care for adequately at home.—I am, etc.,

Credition, Devon.

K. P. ISSERLIS.

Sign of Rain

SIR,—I learnt the poem, "Signs of Rain" by Edward Jenner, about 1889 when a very small boy in Ireland. Jenner was a country practitioner, and only a countryman accustomed to the sounds and sights of the countryside is likely to have written:

"Loud quack the ducks, the peacocks cry.
The distant hills are looking nigh.
How restless are the snorting swine!
The busy flies disturb the kine."

There are thirty-one signs of rain in the poem, and the two last lines are:

"'Twill surely rain—I see with sorrow
Our jaunt must be put off to-morrow."

A few years ago I got a copy from the late rector of Bowness-on-Solway written in long-hand by the local schoolmaster and headed "by Edward Jenner": it is mentioned in Jenner's biography, but not in Erasmus Darwin's. Jenner wrote another poem, "Address to a Robin," which is said to be better poetry, and "The Natural History of the Cuckoo." He must have been one of the early bird-watchers. I shall be glad to send a copy of "Signs of Rain" to anyone interested.—I am, etc.,

Itchen Abbas,
Winchester.

J. F. MAYNE.

SIR,—I was doubtless wrong in assigning the lines about old Betty's joints being on the rack to Dr. Edward Jenner (*Journal*, May 18, p. 1181). But my excuse is that they were given to him in a cutting which I have in my possession, and which I think must have been taken from a copy of *John o'London's Weekly*. I was a little uncertain about the possibility of Erasmus Darwin being the author, and looked up the *Oxford Dictionary of Quotations*, edited partly by Bernard Darwin, but no quotation from his ancestor Erasmus Darwin is included—1941. I am most obliged to Dr. J. C. Burne (*Journal*, June 1, p. 1305) for his correction.—I am, etc.,

London, N.W.1.

F. PARKES WEBER.

Women's Footwear

SIR,—Many doctors must have been delighted to see Mr. Reginald T. Payne's letter (*Journal*, May 18, p. 1180) on the subject of the fashionable high heels displayed in shops which deal with footwear for women. Some years ago a considerable amount of correspondence on the subject of footwear appeared in the *Journal*. I was surprised to find no reference to the work of the late Dr. James Mennell. He gave a long address in the Physical Medicine Section of the Royal Society of Medicine on November 17, 1939. As I always had difficulty in finding shoes suitable for walking, much depending upon the height and the angle of the heel, I consulted Dr. Mennell. He sent me to a firm which manufactured shoes according to his measurements; Dr. Mennell ensured that his prescription was followed. From that date I have worn only the footwear which they make on a last made specially for me. Many friends and patients did I send to Dr. Mennell during the war; every one was provided with comfortable and durable footwear.

Do modern orthopaedic surgeons to-day work on similar lines? Dr. Mennell taught that the correct height of the heel varied. Some men require a heel $2\frac{1}{2}$ in. (6 cm.) high; some women find comfort only with heels $\frac{1}{2}$ in. (1.9 cm.) high. Those who prefer the unnatural appearance of the fashionable very high heel must suffer pain when walking and standing. Later, they develop backache and round shoulders. Surely the graceful appearance of an upright posture is more attractive than the slanting forward pin-point heels. Unfortunately one sees these in many of the photographs of a number of women in fashionable gatherings.—I am, etc.,

London, W.1.

AGNES SAVILL.

Acute Amphetamine Poisoning

SIR,—I have read Dr. George Newbold's letter (*Journal*, June 1, p. 1303) about amphetamine resinate tablets with great satisfaction, as this has fully endorsed my own experience with "barbidex" and "dexten." The principle involved in these preparations appears to me to surpass the mentioned potentialities, as it presents a new mode of oral therapy which is unique in being quite independent of individual and physiological changes. The employment of resins for controlled drug absorption offers not only a great margin of safety for drug-resinates, but should, in my opinion, also present a stable and readily available remedy for the treatment of many kinds of drug poisoning, even if taken in the form of ordinary or enteric-coated tablets. Would it not be expedient for casualty departments, G.P.s, and ambulances to keep a small amount of resin as first-aid equipment, and thus to be able to gain sometimes life-saving time?—I am, etc.,

London, N.W.2.

H. MARGULIES.

Coal-gas Poisoning

SIR,—The subcommittee on coal-gas poisoning welcomes all criticism of its report, including that of the medical officers of the Gas Council (*Journal*, June 8, p. 1361), though it is somewhat surprising considering the help the committee received from the Gas Council. The medical officer of one of the largest gas boards was a full and valuable member of the committee, even if his views, like my own, were not always accepted. The real point at issue is, as the second sentence makes plain, the question of emphasis. Their outlook is essentially concerned with workers in the gas industry; our report was mainly to bring facts to the Council which were, we felt, of most importance to a wider public.

With regard to their specific criticisms on the use of air-lines and canister masks, I, in my ignorance, would have agreed with them; but we had definite evidence that these appliances are in fact used in industry with success, and we did not feel capable of taking issue with industry and the manufacturers on this matter. This is something which they might well undertake. Each canister has stamped on

it the length of exposure for which it is effective, and as these are only likely to be available for industrial workers their industries can, on the whole, be trusted to see they are properly used and up to date.

Our remarks on treatment were, in the main, addressed to first-aiders whose first instinct is always to apply artificial respiration in case of failure of breathing, and I am sorry if we did not stress this sufficiently. To those who are not first-aiders it would have been necessary to appraise the value and applicability of the various methods of artificial respiration, and this we did not think was within our province. The value of compressed air was discussed, but we thought that, to the general public, a reference to it was likely, on balance, to cause more harm than good, and the specialized equipment using it is only likely to be in the hands of those trained in its use and value. For this reason we stressed the value of mechanical oxygen respirators which are becoming available and give a strictly controlled and alternating positive and negative pressure. It seemed to us, though we had not got all the data we wished, that this type of apparatus was likely to be more generally useful and efficient than one which used air instead of oxygen. Though we tried to learn from industry we stated clearly that our report did not refer to gas poisoning in industry, which is well looked after by H.M. Inspector of Factories. For our purpose I still believe our emphasis was broadly correct, and I think that if Dr. Hughes and his committee reconsider it in this light they might agree. But we are grateful for his letter nevertheless, and hope it may further the purpose we all have—to reduce the amount of coal-gas poisoning.—I am, etc.,

Winsford, Ches.

W. N. LEAK,
Chairman, B.M.A. Coal-gas
Poisoning Subcommittee.

Is This a Record?

SIR,—I cannot supply Dr. G. I. Watson (*Journal*, June 8, p. 1362) with competitive figures, but when x-ray was the luxury of the wealthy rather than the just "must" of all a patient of mine, a grocer's boy, bolted 1s. 2½d., a customer's change he was carrying between his teeth, when his bicycle hit the kerb. That was on a Monday. On Saturday he passed one shilling; on Sunday one halfpenny; and on the Tuesday two pennies. In this case, at least, the rate of travel was roughly in ratio to the size of the object.—I am, etc.,

Morpetn.

G. B. STENHOUSE.

The H-bomb

SIR,—Why is no mention made of Russian fall-out, when ours is causing such great concern? Russian fall-out contaminated the land hemisphere, ours the sea hemisphere. Was it recent Russian fall-out that disturbed my background count readings here in London 16 days after they exploded their bomb in Siberia? The background count varied between the normal reading of 10 counts per minute to double that figure here in London on April 31. Could we have confirmation or denial of this from other observers? Or is this matter now so political that we are not even allowed to know the truth about Russian fall-out?—I am, etc.,

London, W.1.

M. ASH.

Two Stray Hairs

SIR,—Two unusual minor cases seen in my practice in the past year may interest your readers.

A girl in her twenties complained of intermittent tinnitus of three days' duration, which was aggravated by movement of the head. The noise was similar to the rushing sound heard when a sea-shell is placed over the ear. Auriscopy revealed a hair about 1 in. (2.5 cm.) long in the external auditory canal with the tip touching the drum. Movement of the hair caused the tinnitus, and its removal effected a cure.

A young man of similar age complained of an eye-lash in the conjunctival sac. Inspection at first did not reveal it, but the patient indicated a small fair hair $\frac{1}{4}$ in. (0.3 cm.) long projecting from the upper lid margin at the inner canthus. Traction on this trebled the hair's length and

changed its colour to black. Further traction removed an eye-lash similar in shape and colour to the patient's $\frac{1}{2}$ in. (1.2 cm.) long, curved, black, and with a fair tip. It was then realized that the tip of the hair had projected from the lacrimal punctum.—I am, etc.,

Birstall, Leics.

J. J. McMULLAN.

Scapulo-thoracic Crackling in Youth

SIR,—The last paragraph of Dr. Guy Beauchamp's letter (*Journal*, June 8, p. 1362) contains the good sense which makes him such a successful practitioner; but, having said that this disorder is due to hypermobility of the scapula and that it is associated with faulty posture, he then refers to the correction of the mechanical disability by manipulation. Faulty posture is by its nature not correctable by manipulation, and it is difficult to understand how hypermobility of the scapula can be altered. Manipulation is such an excellent method of treatment in so many conditions that it seems unfortunate that it should be recommended for disabilities, such as faulty posture and hypermobility, in which it appears unlikely to produce any effect whatever.—I am, etc.,

London, N.W.1.

W. D. COLTART.

Gardening Hazard

SIR,—The following gardening hazard seems to be worth reporting.

A patient was recently brought to me suffering from extensive burns of her fingers. She had been about to start a bonfire and removed one of her gloves to strike a match. No sooner had she done this than there was a series of small explosions and intense pain in the gloved hand. Thinking the whole box of matches had caught fire, she threw it away and tore off the glove. In so doing she also burned the ungloved hand. Later, the box of matches was picked up intact. The gloves had been cleaned several times in Germany and were evidently thoroughly impregnated with some highly inflammable chemical.—I am, etc.,

Farnham, Surrey.

E. M. TOWN-JONES.

Slippery Hospital Floors

SIR,—Dr. R. A. Spalding (*Journal*, June 15, p. 1419) rightly draws attention to the danger of over-polished hospital floors. Another and perhaps equally dangerous matter is the modern "lady cleaner" who sprinkles lots of washing powder on the dry floor surface and then creates a slippery emulsion by spreading this over the floor surface by means of a damp cloth. The intention is to wash the floor, but light dusting is the vocation of this modern type of "help," and on stone-surfaced floors or inlaid tiles the result is almost fatal. In the case of linoleum and polished surfaces there is the so-called non-skid floor polish, but for the other type of the supposed washed floor, perhaps a damaged coccyx and one day someone claiming heavy compensation from the Ministry.—I am, etc.,

London, W.1.

NORMAN P. HENDERSON.

Medical Classicism

SIR,—As one involved in the minutiae of medical editing, I was struck by two phrases which appeared on page 841 of the April 13 issue of the *British Medical Journal* (my italics): "At a certain stage of infection, host cells may contain no virus demonstrable by the classic method of breaking up the cells and inoculating the product into other susceptible cells" (column 1); and "The epidemiology of these conditions in nature is consistent with the transfer of virus from one host to another by one of the classical methods" (column 2).

After pondering long over these I came to the conclusion that, aside from the euphonious aspect, there might also be semantic justification for use of the different words "... no virus demonstrable by the (first class, standard) method of breaking up the cells ..." and "... transfer of virus

from one host to another by one of the (time-honoured?) methods." My complacency over reaching this, as I thought, plausible explanation of the choice of terms was shattered when I reached the final paragraph on page 844 (again my italics): "Equally relevant is the classical account (M.R.C., 1956) of the occurrence of bone sarcomata in technicians using radium paint in the manufacture of luminous watch-dials, etc." "1956" hardly satisfied the requirements of the concept of "classical" that I had just settled in my own mind—for example, I firmly believe in the rightness of the expression "classical caesarean section" and, to quote from the "secular" press, "classical liberalism" as opposed to "social liberalism."

From the recklessness with which the word "classical" usually appears in the medical literature, it would appear that authors believe an article needs only to appear in print to assume the stature of a "classic" and merit the descriptive adjective "classical." Does not such looseness rob both of the words of any significance, or wherein does it lie, and specifically what is it?—I am, etc.,

Philadelphia.

JEAN HUSTED.

Sterilization of Dressings

SIR,—That there are many chinks in the "aseptic line" has been emphasized recently by the work of Dr. J. H. Bowie¹ and Professor Howie² and others. Tulle gras or petroleum-jelly gauze is very widely used, particularly in the treatment of burns where asepsis should be so important. In many hospitals autoclaving is the routine method of sterilization, as hot-air ovens are not usually readily available. Authority for this practice is given by the B.P.C., 1954, in which two methods of sterilization are recommended: (1) heating at 150° C. for one hour; (2) autoclaving at 125° C. for half an hour. Owing to the lack of penetration of steam into the tulle gras or petroleum-jelly gauze the second method can only be the equivalent of dry heat at 125° C. for half an hour. It would seem probable, therefore, that in many hospitals burns and other wounds are being treated with non-sterile dressings.—I am, etc.,

West Hartlepool.

Herpes Zoster and Poliomyelitis

SIR,—Prior to 1939, if I saw more than two or three cases of herpes zoster in the course of a year it was a fact worthy of remark. Since about 1942 I have noticed that in the early part of each year I have been treating more and more cases of herpes, until now I expect to see three or four dozen such cases between January and June each year. Occasionally the number has well exceeded three or four dozen, and in those years I have noticed that I have invariably had more cases of poliomyelitis to treat later in the year than I usually do. This year my cases of herpes have amounted to a number very much above normal—most of them having occurred during the last six weeks—and I am uneasily wondering now whether I am to see a correspondingly heavy rise in the poliomyelitis rate later on.

It may be pure coincidence, but the increase in the incidence of both herpes and poliomyelitis appears to me to troops were stationed in the country. Did they form a reservoir of carrier-borne infection? I have wondered whether the virus causing herpes zoster is an early development in which the incidence of both diseases is high merely provide good conditions for the development of any virus. The is quite a lot of chicken-pox, and here the connexion between the viruses is close indeed, I suppose. Can a virus mutate and cause different diseases at different stages of mutation? Does an attack of one virus disease ever con-

fer any immunity to other virus diseases? I have yet to see a case which has recovered from herpes zoster develop poliomyelitis later in the same year. As a humble G.P. these questions have often occurred to me, but I am afraid I have not found the answers.—I am, etc.,

Wolverhampton.

VICTOR RUSSELL.

Trichomonas Vaginitis

SIR,—The paper by Dr. Josephine Barnes and her colleagues (*Journal*, May 18, p. 1160) on the use of a culture medium for the clinical detection of trichomoniasis seems to have aroused considerable controversy.

I cannot comment on the merits of the Kupferberg medium, or modifications thereof, for this purpose, but should like to add a word to Dr. R. F. Jennison's letter (*Journal*, June 8, p. 1365) describing his experiences with a modification of my former medium.¹ Since publishing the formula for my original medium I have been able to simplify it very much further and to bring it within the scope of constituents readily available to any laboratory or clinic. Furthermore, by resorting to Seitz filtration for sterilization any adverse effect of overheating is avoided. Thus prepared, all batches appear uniform in their ability to sustain growth of *Trichomonas vaginalis*.

This new-formula medium has been given extensive clinical laboratory trial by Dr. M. Joan Whittington at the Whitechapel clinic, in both male and female patients. The new medium was found markedly superior to wet smear examination for the detection of both trichomoniasis and moniliasis. The medium formula and results obtained in this trial on over 1,000 specimens have been reported by us.²—I am, etc.,

Televised Operations

SIR,—As I know you are aware, there has been considerable publicity in the lay press recently regarding the colour television demonstrations carried out by an American firm at the Royal College of Surgeons and at St. Bartholomew's Hospital. Several of the papers have given accounts which strongly suggest that colour television has never previously been used for this purpose in England, but this is far from the truth. Indeed, we were the pioneers, having employed colour television at St. Thomas's Hospital in 1949 and demonstrated operations at the International Congress of Ophthalmology in 1950.¹ I think the publicity obtained by the Americans in this case is a blow to British prestige and very unhelpful to the British radio industry, and particularly to Pye Radio, who co-operated with us freely and with no cost during our experiments.

The advantages of colour television of operations is marked in cases where the audience is expert and to whom it is necessary to demonstrate details of technique, but for undergraduate training the advantages are much less evident, for the student should be in the theatre to see all that is happening and not just the details of operation.—I am, etc.,

HAROLD RIDLEY.

POINTS FROM LETTERS

Smoking and Cancer of the Lung

Dr. LOUIS LINNELL (Manchester) writes: The *Manchester Guardian* of June 15 contained this remark in its stock exchange report, "Tobacco shares rose on a report from America, which was at first exaggerated by the market, of a new cure for cancer." Surely this decisively clinches the connexion, previously suspected on statistical grounds, between smoking and cancer of the lung!

Obituary

H. S. DE BOER, C.M.G., M.C., M.R.C.S., L.R.C.P.
D.P.H., D.T.M.&H.

Dr. Henry S. de Boer, who until his retirement in 1947 had been a member of the Colonial Medical Service and had served in four of the East African territories, died suddenly at Hemel Hempstead on June 7. He was 68 years of age.

Henry Speldewinde de Boer was born at Colombo, Ceylon, on May 10, 1889, and studied medicine at the London Hospital, qualifying M.R.C.S., L.R.C.P. in 1913. From 1915 to 1920 he served as a captain in the R.A.M.C., and was awarded the Military Cross in 1918, being also mentioned in dispatches. After the war he obtained the Cambridge D.P.H. in 1920, and went to Kenya, where he served as medical officer. He took the London D.T.M.&H. in 1923. He was appointed senior health officer in East Africa in 1926, and served as medical officer of health both at Kisumu and at Mombasa. At Kisumu, where he made himself beloved, his memory is kept green not only by the trees he planted in order to dry swampy patches, but also by the street which bears his name. Incidentally, he was the local tennis champion. A mosquito, *Aedes de boeri*, also commemorates his work at Kisumu. At Mombasa he organized a notable health and baby welfare exhibition which brought the award of the shield of the National Baby Week Council.

In 1931 de Boer moved to Northern Rhodesia to take up the appointment of deputy director of sanitary services. This post he held for only two years before he was appointed D.D.M.S. of Uganda. He moved again in 1938 to become D.M.S. of Nyasaland, and he remained there until 1942, when he returned to Uganda as D.M.S. He was president of the Nyasaland Branch of the British Medical Association in 1938-9.

De Boer retired in 1947, having been appointed C.M.G. two years previously, and on his return to England became a temporary medical officer at the Ministry of Health, later being appointed airport medical officer at Northolt. In 1947 he was elected a county councillor for the Hemel Hempstead division of Hertfordshire. He married Frances Ethel Bartholomeusz in 1920 and had two sons, one of whom is a doctor. He will be remembered with affection and respect by all those, of whom the writer is one, with whom he worked in East Africa, and in England after his retirement.—J. L. G.

J. C. R. B. writes: Dr. Henry de Boer had a long and distinguished career in the Colonial Medical Service. His dynamic energy and his forceful personality were for many years a by-word in East and Central Africa. It is not too much to say that countless people of all races owe their lives and health to his foresight in initiating public health measures many years ago in the countries in which he served and to the personality and drive with which he carried them through. Henry de Boer was a fighter, and in peacetime, as in the 1914-18 war, he did not know the meaning of fear. He fought not for himself but for his department, his friends, his staff, and above all for his principles. These were attributes, and they gained him the respect of all with whom he came in contact: but it was his genuine humanity, his friendliness, and his kindness of heart that endeared him most to those who knew him best. Countless acts of personal kindness and unfailing loyalty will remain a loving memory with his hosts of friends. He always had the interests of his staff at heart, and he would support them and defend them in all cases of difficulty with a truly paternal care. He set himself the highest standards and expected the same of others: but even those who had transgressed and received the admonition from him which they undoubtedly deserved would leave with the knowledge

that they had been fairly treated and that, so far as their chief was concerned, they could regard themselves as off to a new start.

I have written of Henry de Boer's life in Africa, but after his retirement it was typical of the man that he did not rest in seclusion. He quickly found an outlet for his ability and enthusiasm, and by public-spirited voluntary work in community and health affairs proved himself again, in a different sphere, an outstanding citizen and a true Christian. Always throughout his married life he had the blessing of a happy family life and a home which was open to all. To his widow, in her bereavement, there will be the knowledge that she was part of the pattern, and to his sons there will be the proud memory of a truly great father who served his country well.

H. C. LUCEY, M.D., D.P.H.

Dr. H. C. Lucey, consultant pathologist to the Metropolitan Hospital, died on June 8 at Eastbourne. He was 73 years of age.

Herbert Cubitt Lucey was born on November 15, 1883, the son of Dr. W. Cubitt Lucey, who practised in north London. From University College School he went on to Guy's Hospital, qualifying M.R.C.S., L.R.C.P. in 1909 and graduating M.B., B.S.(London) later in the same year. After earlier house appointments he became obstetric resident at Guy's, and proceeded to the M.D. in obstetrics and gynaecology in 1911. Dr. Lucey was then attracted to bacteriology and pathology, and was appointed assistant in the bacteriological department at the hospital. He continued to work in this capacity until he joined the R.A.M.C. shortly after the outbreak of the first world war. At first he was posted to the Royal Herbert Hospital, Woolwich, where in addition to working in the laboratory he had charge of the department of venereal diseases, and later he served in France. On demobilization from the R.A.M.C. he took the D.P.H. and became pathologist to the Metropolitan Hospital, where he continued to do admirable work until the outbreak of the second world war, when he was transferred in the E.M.S. to Haymeads Hospital, Bishop's Stortford, as pathologist. At the end of the war, and much to the regret of the staff of the Metropolitan Hospital, Dr. Lucey decided to remain at Haymeads Hospital, especially as he had now made his home in the district. He continued at Haymeads Hospital until his retirement to Eastbourne in 1955. His wife, one son, and one daughter survive him.

C. W.-D. writes: I first met Herbert Lucey in 1911, when he held the appointment of "charity" or obstetric resident at Guy's Hospital, and I was serving as an "extern." I can well recall how his kindness and consideration to his junior externs impressed me, and how ready he was with the utmost cheerfulness to help at any time, even when called out to assist on the district in the middle of the night. Consequently I was delighted to meet him again as a colleague, firstly for a time at the Royal Herbert Hospital in the R.A.M.C., and after the 1914-18 war at the Metropolitan Hospital, London, to which he had been appointed pathologist. Our happy association here continued for twenty years until the outbreak of war in 1939.

Dr. Lucey was a very sound and reliable pathologist, although knowledge of this fact probably did not extend much beyond those coming into personal contact with him. He was quite content to work quietly in his laboratory, and very seldom attended meetings even in his own specialty. It was equally difficult to persuade him to record and publish any of the most interesting observations he made from time to time, and consequently his contributions to medical literature were few and far between. In one important article in 1950 he pointed out the "fortuitous factors affecting the leucocyte count in blood from the ear."

The outstanding factor in Lucey's personality was his invariable cheerfulness, and in our long association I never knew him otherwise. One had not the slightest hesitation at any time in seeking his help and advice, as one always knew

any request would be received with courtesy and understanding and help ungrudgingly given. Lucey will be very much missed by his friends.

T. VICARS OLDHAM, M.B., B.Ch.

Dr. T. Vicars Oldham died at Harrow Hospital on May 31 at the age of 68.

Thomas Vicars Oldham was born on January 31, 1889, the son of Dr. Hugh Falconer Oldham. From Rugby School he went on to King's College, Cambridge, but for most of his time as a medical student he lived in Dublin, graduating M.B., B.Ch. at Dublin University in 1914. Entering the R.A.M.C. on the outbreak of the first world war, he served mostly in the Middle East, having previously taken part in the Gallipoli landings. When the war ended he remained as a regular R.A.M.C. officer until he retired with the rank of major in 1928 to join his father in general practice at Morecambe. He was chairman of the Lancaster Division of the B.M.A. in 1929-30. In 1934 he came south to Harrow-on-the-Hill, where he took over the practice of the late Dr. W. A. Wilson-Smith. At the outbreak of the second world war in 1939, and within a month or two of completing his period as a reservist liable to recall, he was recalled to the R.A.M.C. and served throughout the war, first at Newport, then as liaison officer for South Wales, and finally in the medical supplies department at the War Office. On his return to Harrow after the war, in addition to re-establishing himself in general practice, he was responsible for the medical care of the boys of Malvern School, who shared the premises of Harrow School during the war, working in close contact with Dr. O. R. Tisdall, the then medical officer to Harrow School.

A colleague writes: Having thoroughly re-established himself in general practice, but looking forward to retirement in the near future, Tom Oldham was struck down with tragic suddenness while doing his evening surgery on May 31 and died from a coronary attack shortly afterwards in Harrow Hospital. Although he did not hold any of the more prominent offices in public life, he could always be found doing a lot of the drudgery and less spectacular jobs with cheerfulness and marked efficiency. He was for many years a member of the hospital staff at Harrow and a member of the hospital committee. He was interested in all forms of sport and at one time was a first-class golfer and a strong supporter of medical golfing societies, particularly that of Harrow and Wembley hospitals. It has been said of a man, rather as a compliment, that "he did not suffer fools gladly." It was rather the reverse with Tom Oldham, and therein lay his charm and his success in general practice. Only those of us who took on some of his work on the rare occasions on which he took a holiday knew to what extent he devoted himself to his patients, particularly the very young and the very old. It is not given to us all to show the patience and attention which he did to his patients and which went far beyond his "terms of service." He died, as he would have wished, quite suddenly, after a life blessed by good health. He will be sadly missed, not only by his widow and two daughters, but also by his many patients and his medical colleagues in Harrow.

LILIAN M. BLAKE, L.R.C.P.&S.Ed.

Dr. Lilian M. Blake, one of the first women doctors to practise in Stockport, died on May 12, 11 days after her 86th birthday.

Lilian May Blake was born on May 1, 1871, and received her medical education at the London (Royal Free Hospital) School of Medicine for Women, taking the Scottish triple qualification in 1895. In the same year she settled in practice at Stockport, but owing to ill-health had to move to Colwyn Bay in 1906, and there she was for a time medical officer to Penrhos College, a boarding-school for girls. She returned to general practice during the first world war, and

in 1924 moved to Northampton, where she continued to work until she retired in 1935. Her popularity was widespread, and wherever she lived and worked she made many friends. Dr. Blake is survived by an adopted daughter.

W. A. GORNALL, M.D.

Dr. W. A. Gornall died suddenly at his home at Nailsea, Somerset, on June 2, at the age of 55.

William Arthur Gornall was born on August 19, 1901, and was educated at Bristol University, where he graduated M.B., Ch.B. in 1924, proceeding to the M.D. five years later. He was in general practice in Bristol for a short while before moving to Nailsea in 1929. It was at this little Somerset village that his life work was performed.

A colleague writes: Arthur Gornall bequeathed his eyes to the Bristol eye bank and his body for medical research. This action was so much in character with the whole of his life that it seems the obvious beginning of a tribute to him. He was a good clinician, painstaking and conscientious, and kept himself up to date by reading and attending postgraduate lectures, as well as holding a clinical assistantship at Bristol General Hospital. But to this clinical acumen he added an intense devotion to his patients and to all mankind, so that his profession became a welcome accepted vocation. He was so integrally a part of the village community that for many doctors in Somerset and Bristol the words Gornall and Nailsea were synonymous, and after his death the village, as it was said, was in consternation. A lifelong Methodist, he was one of the mainstays of the little church there, and all good works commanded his sympathy and devoted service. Foreign missions and the National Children's Home were his special interests, and to them was added his work for the British Red Cross. In spite of all these demands on his time he was an active and keen member of the British Medical Association, having been chairman of the East Somerset Division in 1953-4 and a representative at the Annual Representative Meeting for several years. At the inception of the National Health Service he became honorary secretary of the Somerset Local Medical Committee, and his calm and knowledgeable advice was always helpful to his colleagues and to the executive council. It was at the Cardiff meeting of the B.M.A. in 1953 that he first admitted he had coronary pain, but he stayed to the end of the meeting. Then came a long illness, faced with characteristic courage and a gaiety of spirit which sprang from his simple Christian faith and assurance. Later he was able to return to the work he so loved, and was in active practice when the end came with tragic suddenness. To his multitude of friends it seems almost unbearable, but to him it meant, as we sang at his memorial service,

"Now I have found the ground wherein
Sure my soul's anchor may remain."

He married Mary, daughter of Mr. Osborn Appleby, of Nailsea, and they had three sons, all still at school.

WALTER PATEY, M.D.

Dr. Walter Patey died at Newton Abbot Hospital on June 2 at the age of 74.

Walter Patey was born on February 9, 1883, and was educated at Dulwich College and at St. Thomas's Hospital, qualifying by taking the London Conjoint diploma in 1907. In the same year he obtained the London degrees of M.B., B.S., proceeding to the M.D. two years later. After serving as a clinical assistant in the ear department at St. Thomas's and house-physician at the Norfolk and Norwich Hospital, he entered general practice at Newton Abbot. During the first world war he served in the R.A.M.C. in France. At the time of his retirement in 1951 he had been an honorary medical officer at Newton Abbot Hospital for forty years.

G.M.T. writes: Walter Patey enjoyed his work, and he was a keen sportsman in a quiet and an unassuming way. He

sailed a dinghy, fished for trout, and enjoyed badminton and lawn tennis—he played a good game at the latter until two or three years before his death. In both work and games he was a kind and loyal partner and a courteous and scrupulously fair opponent, and he was always on the best of terms with his colleagues in practice. He leaves a widow, two sons, and a daughter.

Sir COURTENAY MANIFOLD, K.C.B., C.M.G. M.B., C.M.

The obituary of Sir Courtenay Manifold was published in the *Journal* of June 15 (p. 1422).

We are indebted to Mr. A. DICKSON WRIGHT for the following appreciation: The bare recital of the wonderful career of General Sir Courtenay Manifold does not suffice in the mind of many to bring back to us the picture of this wonderful old man. At the age of 93 he published a small volume of his life, reaching back into the far distant past—resembling in this respect another famous nonagenarian, Dr. Parkes Weber, who has published two books after passing the age of 90. In Sir Courtenay's memoir he remembers sailing round the Cape in a sail transport to India at the age of 4 with his father, who was going out to a military appointment. He maintained that he was the only person living who had done this, and recalled the captain shooting an albatross and presenting the little boy with the dried skin and feathers.

Particularly sad will be those of us who enjoyed the delightful hospitality of his charming home, Harbour Heights, in Kyrenia, with its wonderful view of the old Venetian harbour and the distant Turkish shore. It was indeed an occasion then to be conducted round the antiquities of Cyprus, climbing the hills to Hilarion and clambering over Roman ruins and ancient monasteries, with no signs of physical fatigue from the old man to match one's own. In the evening, far into the night, he would recall his old days in India and China, and bring out the old route maps of his exploration of the Han River in China and other things too wonderful to relate. Next morning at seven we would be taken to swim below the old fort, with the jackdaws cawing above and Lady Manifold calling from the shore, because she was convinced that with his sight almost completely gone he would one day swim far out to sea and disappear. Then back to breakfast under the pomegranate tree in his beautiful garden; and so the delightful days would pass by, either at Kyrenia or up in his villa in the pine trees of the mountains at Troodos.

Nearly every year he would come back to England, always with his faithful Cypriot servant, George, and he would make long motor drives over the country, visiting old friends and relations of his wife's and his own. It was always a joy to see him and enjoy the simplicity and charm of his deportment. Lady Manifold, always by his side, provided a spectacle filling one with admiration as she gently steered him along in those last remarkable years of his life: to her must go a very special sympathy.

L. W. HEFFERMAN, M.D., F.R.C.S., F.R.C.S.Ed.

Dr. L. W. Hefferman, who was a well-known general practitioner in Swansea, died at his home at Swansea on June 20. He was 62 years of age.

Leslie William Hefferman was born on March 7, 1895. As a pupil at Epsom College he was awarded the Freer Lucas entrance scholarship to the Middlesex Hospital, where, later, he gained the Lyell scholarship and gold medal. After qualifying M.R.C.S., L.R.C.P. in 1920 he held the appointments of house-surgeon and assistant demonstrator in anatomy at the Middlesex, and then went to Burma as assistant chief medical officer to the Burma Corporation at Namtu, where he also acted as surgeon to the general hospital. Returning to the United Kingdom in 1924, he

settled in practice at Swansea, where he was for a time assistant surgeon to the general hospital, and where he remained until his death. An interesting feature of Hefferman's career was his acquisition of several higher qualifications in middle life. In 1941 he obtained the Diploma in Obstetrics of the Royal College of Obstetricians and Gynaecologists; two years later he graduated M.B., B.S. from London University, being granted a distinction in anatomy; in 1944 he became a Fellow of the Royal Colleges of Surgeons of England and Edinburgh; and in the following year he proceeded to the M.D.

Dr. Hefferman had served on the council of the Medical Practitioners' Union for some years before he was elected president of the union in 1938, an office he continued to hold until 1948. A member of the Swansea borough council for about a quarter of a century, he was also a commissioner of the St. John Ambulance Association, an honorary life member of the Priory of Wales, and a commander of the Venerable Order of St. John of Jerusalem.

G. F. BUCHAN, M.D., F.R.C.P., D.P.H.

The obituary of Dr. G. F. Buchan was printed in the *Journal* of June 15 (p. 1422).

We are indebted to Dr. J. AUBREY IRELAND for the following appreciation: As one who had the privilege and pleasure of serving on the Public Health Committee of the B.M.A. alongside Dr. Buchan for a number of years, I recollect the way in which he approached every subject under discussion with such clear-minded intelligence; he seemed to be able to get quickly to the heart of the matter and was never at a loss in expressing his opinions, which, based on sound common sense, were always valuable contributions to arriving at decisions. When the meetings of Committee C of the Whitley Council were being held his presence was always looked forward to, and he certainly pulled his full weight on those occasions. He was a man of great charm, wit, and efficiency, and I am sure the Public Health Committee of the B.M.A. will feel that a most valuable member, really liked and trusted by everyone, has left behind him memories that will be long held by his fellow members.

AUGUSTO S. BOYD, M.D.

Dr. Augusto Samuel Boyd, a former President of the Republic of Panama, died in Panama City on June 18, at the age of 77.

Having graduated in medicine at Columbia Medical School, New York, in 1899, he held a surgical appointment at the New York City Hospital before becoming chief surgeon at Santo Tomás Hospital, Panama. From then on he took an active part in political affairs, serving on the Panama municipal council, of which he was president from 1906 to 1908. A member of the National Assembly for many years, he was president of the Panama National Committee of Hygiene and a prominent figure at Pan-American medical congresses. In December, 1939, he was elected President of the Republic of Panama, but he retained this office for only nine months.

Universities and Colleges

UNIVERSITY OF LONDON

The degree of M.D. was awarded to J. H. Evans and P. K. Thomas on April 10.

The following candidates have been approved at the examinations indicated:

ACADEMIC POSTGRADUATE DIPLOMA IN PSYCHOLOGICAL MEDICINE.—At Institute of Psychiatry, H. R. Alderton, A. A. Bartholomew, D. T. F. MacSorley, C. M. B. Pare, A. C. R. Skynner, H. J. Walton. The following have passed in Part I only: J. S. Bearcroft, A. A. Black, M. R. Chaudhry, L. J. Klein, S. I. Cohen, R. H. Culpan, B. M. Davies, J. Erulkar, R. H. Fox, N. B. McDiarmid, W. J. Nicholson, C. M. Parkes, E. W. Poole, C. J. Wardle.

ACADEMIC POSTGRADUATE CERTIFICATE IN TROPICAL MEDICINE AND HYGIENE.—At London School of Hygiene and Tropical Medicine, M. A. Aslam, A. H. Dehkan.

Medico-Legal

INSANITY AND DIVORCE

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

Section 6 (2) of the Divorce (Scotland) Act, 1938, provides that in any action for divorce on the ground of incurable insanity the defender is not to be held to be incurably insane unless it is proved that he has been for five years immediately preceding the raising of the action under care and treatment as an insane person. Where it is proved that he has been under such care and treatment he must be presumed to be incurably insane unless the contrary is shown to the satisfaction of the court.

Recently an undefended divorce action was brought in the Court of Session¹ by an Edinburgh husband on the ground of his wife's incurable insanity. The wife had been detained under care and treatment in a mental institution in England for more than five years immediately preceding the action except for a period of 12 days during which she had been at large after an escape. The question was whether the 12 days during which she had escaped from lawful detention prevented the court from holding that she had been for the necessary five years under care and treatment.

Lord Guthrie in his judgment said that the case was a difficult and important one, and involved the construction of the relevant English statutes as part of the law of Scotland. Section 85 of the Lunacy Act, 1890, provided that, if any person detained as a lunatic under the Act escaped, he might be retaken and detained without a fresh order and certificate at any time within 14 days after the escape. Lord Guthrie held that, as the order for the wife's detention remained in force for 14 days after her escape and she had only been absent for 12 days, her absence, although not authorized or incidental to her care and treatment, could not be held to be a breach of its continuity. It was sufficient that the order remained in force throughout her absence.

Lord Guthrie's decision is consistent with a decision of the Court of Appeal in England² on the interpretation of the words "continuously under care and treatment" in s. 2 of the Matrimonial Causes Act, 1937. The court then held that a patient's discharge from an institution in England and removal to an institution in Scotland did not interrupt the continuity of the period of care and treatment.

Vital Statistics

Influenza in Great Britain

Some cases of influenza in Pakistanis due to virus A have been detected in London. At the time of going to press the strain had not been identified as the epidemic Asiatic strain. 57 Pakistanis who had flown from West Pakistan, where outbreaks of the disease are occurring, arrived in England on June 13 to man a ship bound for Pakistan. They were kept under daily surveillance, and on June 15 one became ill with influenza. On June 17, 11 more fell ill, and subsequently 2 further cases were reported. The patients were isolated at the Port of London Isolation Hospital, Denton, Gravesend. These men had some contact with the crews of other ships, so that it is possible for the Asiatic influenza to have been introduced into Britain in this way, though this is not confirmed.

Influenza has since been reported in the crews of two ships at Bristol. The men were in the Port of London at the relevant time and could possibly have been infected by the Pakistanis. Again, virological tests are not yet complete.

Late News: On going to press we learnt that the strain of virus isolated from one of the Pakistani patients is antigenically related to that causing Asiatic influenza (A/Singapore/1/57).

Poliomyelitis Vaccines

Last week Glaxo Laboratories Ltd. announced plans for a 50% increase in the production of poliomyelitis vaccine during the next year. New laboratories are to be built to manufacture it. The firm hopes to produce enough vaccine to provide a double dose before next spring for all children already registered.

The United States public health service has announced that about six million doses of Salk vaccine are being re-tested after failing to meet minimum requirements for potency.

Week Ending June 15

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 547, whooping-cough 1,371, diphtheria 8, measles 21,793, acute pneumonia 308, acute poliomyelitis 83, dysentery 457, paratyphoid fever 3, and typhoid fever 7.

Infectious Diseases

The only large increase in the incidence of infectious diseases in England and Wales during the week ending June 8 was a rise of 1,677 in the number of notifications of measles, from 21,613 to 23,290. The largest decreases were 284 for whooping-cough, from 1,807 to 1,523; 102 for scarlet fever, from 691 to 589; 83 for dysentery, from 740 to 657.

74 cases of acute poliomyelitis were notified, and these cases were 6 more for paralytic and 1 more for non-paralytic cases than in the preceding week. The largest returns were London 9 (9 boroughs with 1 case), Devonshire 8 (St. Thomas R.D. 5, Exeter C.B. 2), Sussex 7 (Brighton C.B. 4, Hailsham R.D. 2), Southampton 7 (Havant and Waterloo U.D. 5, Portsmouth C.B. 2).

The increase in the incidence of measles was confined to the Midlands and the south, and 9 counties had an increase in the number of notifications of 100 or more. The largest rises were 265 in Essex, from 570 to 835, and 253 in Wiltshire, from 367 to 620. In the northern section of the country the incidence of measles declined; the largest falls in notifications were 302 in Yorkshire West Riding, from 2,991 to 2,689, and 145 in Durham, from 1,053 to 908. In Norfolk the number of notifications in the urban areas fell by 42, from 299 to 257, the largest fall being 97 in Kings Lynn M.B., from 177 to 80; but in the rural areas the number of notifications rose by 186, from 218 to 404. The towns with the largest increases in the incidence of measles were Nottingham C.B. 218, from 198 to 416; West Ham C.B. 104, from 127 to 231; and Swindon M.B. 87, from 132 to 219. The largest decline in the incidence of whooping-cough was 50 in Yorkshire West Riding, from 149 to 99. Only small variations in the local trends of scarlet fever were recorded; the largest was a fall of 24 in Essex, from 66 to 42. 4 cases of diphtheria were notified, being 3 more than in the preceding week; 2 of these cases were notified in Birmingham C.B.

Both the cases of paratyphoid fever were notified in London, and 2 of the 4 cases of typhoid fever were notified in Essex, Thurrock U.D.

The chief centres of dysentery were Lancashire 182 (Liverpool C.B. 32, Irlam U.D. 27, Swinton and Pendlebury M.B. 20, Manchester C.B. 14, Blackpool C.B. 12, Whiston R.D. 10), Yorkshire West Riding 73 (Leeds C.B. 25, York C.B. 13, Sheffield C.B. 12), London 68 (Bethnal Green 10, Southwark 10), Surrey 40 (Croydon C.B. 23), Durham 34 (South Shields C.B. 11), Northumberland 33 (Newcastle upon Tyne C.B. 18), Cheshire 33 (Stalybridge M.B. 15), Warwickshire 24 (Birmingham C.B. 13), and Southampton 21 (Southampton C.B. 9).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases (deaths for influenza) of certain diseases notified weekly in England and Wales (great towns for influenza). Highest and lowest figures reported in each week during the years 1948-56 (influenza, 1952-6) are shown thus -----, the

figures for 1957 thus ———. Except for the curves showing notifications in 1957, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending June 8 (No. 23) and corresponding week 1956.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

§ Includes puerperal pyrexia.

Medical News

Central Health Services Council.—Lord COHEN OF BIRKENHEAD has been unanimously elected chairman of the Central Health Services Council, in succession to Sir FREDERICK MESSER. Lord Cohen was previously vice-chairman of the council.

Fairley Laboratories.—The laboratories of the London Hospital for Tropical Diseases, St. Pancras Way, have been named "The Fairley Laboratories." At a simple ceremony at the laboratories on June 21 Sir HENRY DALE, O.M., F.R.S., unveiled a bronze plaque, near the main entrance, recording that this was done in recognition of Sir Neil Hamilton Fairley's "outstanding services to research in tropical medicine and pathology." Sir Henry Dale recalled how, as a young medical officer with the Australian forces in the Middle East during the first world war, Sir Neil Hamilton Fairley had laid the foundation of his expert knowledge of tropical diseases and how by his research on a number of them he had been able to suggest improved methods for their treatment. He was one, said Sir Henry, they were proud to honour as a great citizen of the British Commonwealth. Sir NEIL HAMILTON FAIRLEY, F.R.S., then expressed his deep appreciation, and Sir GEORGE McROBERT, on behalf of the hospital's medical staff, spoke of their pleasure at this permanent reminder of the work of one of the greatest of Australians.

Ionizing Radiations in Hospitals.—Advice on the protection of hospital staff occupationally exposed to ionizing radiations is given in the *Code of Practice for the Protection of Persons Exposed to Ionizing Radiations* (H.M.S.O., price 8s. net), published this week. The *Code of Practice* has been drawn up by the standing committee, of which Sir CHARLES DARWIN, F.R.S., is chairman, and appointed for the advice of Ministers under the Radioactive Substances Act, 1948. The *Code* is a loose-leaf booklet to allow later amendment, containing sections on the use of x rays in diagnosis and of x rays and γ-ray beam units for therapy, and on the use of radioactive isotopes; there is also a supplement giving fundamental data on radiation protection for those concerned with the design of radiological or radiotherapy departments. The *Code* does not deal with the protection of patients. Commending the *Code* to all hospital authorities, to whom it has been sent, the Minister of Health, Mr. DENNIS VOSPER, states that it is not his intention at present to use his powers under the Radioactive Substances Act to make Regulations safeguarding the health of exposed hospital workers. Instead, he asks hospital authorities to see that practice in their radiological and radiotherapy departments conforms with the minimum safety recommendations of the *Code*.

British Orthopaedic Association.—The Robert Jones centenary meeting was held at Shrewsbury and Oswestry last month, under the chairmanship of the association's president, Mr. PHILIP WILES. On the first day a series of scientific papers were read and discussed. The second day was devoted to a visit to the Robert Jones and Agnes Hunt Orthopaedic Hospital, Oswestry, where clinical demonstrations had been arranged by the staff, over 200 patients attending for the purpose. Tributes were paid to the memory of Sir Robert Jones, and a film of him working at St. Thomas's Hospital was shown by Mr. S. A. S. MALKIN. On the last day, under the chairmanship of Mr. H. J. SEDDON, three members of the Medical Research Council's committee on poliomyelitis vaccination addressed the meeting and answered questions: Professor C. H. STUART-HARRIS (Sheffield) spoke on field trials of poliomyelitis vaccine, Dr. W. L. M. PERRY (National Institute for Medical Research) on the preparation and testing of the vaccine, and Professor G. W. A. DICK (Belfast) on vaccination with live virus. Afterwards further scientific papers on orthopaedic subjects were read and discussed.

Royal Society of Tropical Medicine and Hygiene.—At the society's fiftieth annual meeting, held at Manson House, London, on June 20, Brigadier J. S. K. BOYD, F.R.S., was elected president for the next two years. The Chalmers medal for 1957 was presented to Dr. A. J. HADDOW, of the Virus Research Institute, Entebbe, Uganda.

Hospital for Harlow New Town.—The accompanying picture shows a model of the new hospital, costing about £2m., it is proposed to build in Harlow new town. Speaking at a press conference on Wednesday, Sir GRAHAM ROWLANDSON, chairman of the N.E. Metropolitan Regional Hospital Board, said that work on the first stage of the hospital—the out-patient, radiology, and casualty departments, some residential buildings, and site clearing, principally—was expected to start next year, and be completed

early in 1960. The final hospital, which was to be built in four stages, would have 244 beds. A notable feature of the hospital's planning is that the radiology and pathology departments are designed to be big enough to accept work direct from local general practitioners. It was now widely recognized, said Sir Graham Rowlandson, what an important role out-patient diagnostic and consultative facilities could play in reducing the need for admission to hospital. Harlow is in process of expanding from a rural area, with a population of about 5,000, to an urban community of 80,000. The architects of the new hospital are Messrs. Easton and Robertson, in association with the regional board's architect, Mr. W. G. PLANT.

Southern General Hospital, Glasgow.—On June 21 Mr. J. NIXON BROWNE, Joint Parliamentary Under Secretary of State for Scotland, opened three new units at the Southern General Hospital, Glasgow. The units were a twin operating theatre unit, a chest clinic, and a psychiatric clinic. These units, said Mr. NIXON BROWNE, were only a part of the general development of Glasgow's hospital services which the Western Regional Hospital Board was now undertaking, though each was important in its own way. Other work being planned included such major schemes as a new maternity hospital for Glasgow and a radiotherapy institute, complementing the one recently opened in Edinburgh, to serve the West of Scotland. The cost of the three units at the Southern General Hospital was £175,000.

Medical Libraries and the Copyright Act.—The Copyright Act, 1956, came into force on June 1. Among the Regulations issued by the Board of Trade under the Act, and also coming into force on June 1, were the Copyright (Libraries) Regulations, 1957 (S.I. No. 868, of 1957). These Regulations exempt certain teaching and research libraries, including those concerned with medicine and science, from the provisions of the Act so far as the copying of copyright works is concerned, where this is done for research, private study, or to supply other libraries. The Regulations prescribe the conditions under which such copying may be done. The Copyright (Libraries) Regulations, 1957, are obtainable from Her Majesty's Stationery Office, price 3d. net.

"Journal of Aviation Medicine."—A "microcard" edition of volumes 1 to 27 (March, 1930, to December, 1956) of the

Journal of Aviation Medicine is now available. Subsequent volumes will be published on "microcards" early in the year following their appearance. The *Journal of Aviation Medicine* is the official journal of the Aero Medical Association of the United States. The 180 cards on which the 27 volumes are recorded are obtainable from the Microcard Foundation, Box 2145, Madison 5, Wisconsin, U.S.A., price \$45.

Perinatal Mortality Survey.—The National Birthday Trust's survey of perinatal mortality has been postponed from November this year until the first week of March, 1958 (see the note in our issue of May 18, p. 1192). A further pilot survey on perinatal mortality will, however, be carried out in November: a pilot survey in Nottingham has already been completed. The main survey, besides the one-week survey of all births in England, Scotland, and Wales, will now include an inquiry by health visitors eight weeks later into the "health, fate, and feeding" of some of the babies born during the survey week, and a pathological assessment of all infant deaths occurring within three months of the start of the survey week. It is estimated that about 4,000 infant deaths will be available for pathological study during the three months.

F.R.C.S. (Eng.).—At a council meeting of the Royal College of Surgeons of England on June 13 the following were admitted fellows:

J. W. Garraway, W. J. L. Harries, E. J. Hargadon, M. D. Lord, W. K. M. C. Watkins, G. R. Benett, P. S. Watson, D. H. Nixseaman, G. Kazantzis, B. L. Whitaker, M. W. F. Dunning, H. E. D. Griffiths, H. B. Eckstein, P. E. Huddy, P. H. E. Courtenay, P. Goodall, J. W. Goodfellow, G. P. C. Orlay, K. M. Fussell, E. Kirz, C. R. Griffin, B. T. Hammond, A. Charan, G. Goswami, A. M. Ahuja, M. Husain, N. K. G. Mendis, D. D. Beard, J. H. Hodgson, A. R. Kirby, M. K. Marchant, M. K. Senapati, C. V. Wijesinha, J. A. Wilkinson, N. A. Allouba, A. G. Bond, A. K. Chaudhry, H. D. P. Goonatillake, G. A. D. Lavy, B. K. Madden, A. M. Mendis, B. Nolan, G. J. Smart, O. Wesley-James, E. Bader, R. Basu, R. G. K. de Castro, M. H. Flint, J. R. W. Gleave, S. Z. Haider, C. D. Levis, I. J. MacQueen, S. K. Mukhopadhyay, D. Sengupta, D. C. Vora, B. M. Andrea, S. K. Bulchandani, K. V. Chaulal, H. Collinson, K. B. Cornwell, A. Litton, J. R. McQuaide, G. M. Nunn, R. A. Patel, J. P. Richardson, A. G. G. Robson, N. Samuels, B. D. Sharma, K. N. Sharma, T. Stack, H. Sunderland, J. G. Sweeney, C. Toker, R. O. Wise, F. C. O. Allen, J. R. Badger, K. S. Brearley, M. R. Chaudhary, H. J. Done, H. L. Duthie, W. J. Eskdale, R. K. Greenwood, R. S. M. Ling, D. C. Mackenzie, B. R. Meyerowitz, J. F. Newcombe, I. C. Patel, V. M. Rao, F. P. Soonawalla, D. W. Whiteway, C. A. Cass, J. A. Evans, N. J. Jackson, P. R. Knight, P. Knipe, A. B. Oliveira, R. C. Varma, J. Ludbrook.

F.R.C.S. (Otolaryngology and Ophthalmology).—At a council meeting of the Royal College of Surgeons of England on June 13 the following were admitted fellows: *In otolaryngology.*—R. A. Williams, R. V. Tracy Forster, G. O. Clark, R. K. Roddie, A. W. Morrison, B. W. M. Bushell, I. H. Jafri, and V. T. Hammond. *In ophthalmology.*—P. A. Graham and R. Pararajasegaram.

W.H.O. Executive Board.—Sir JOHN CHARLES, chief medical officer to the Ministry of Health, was elected chairman of W.H.O.'s executive board at the opening of its 20th session. Dr. P. E. MOORE, director of Indian and Northern Health Services in the Canadian Department of National Health and Welfare, was elected one of the two vice-chairmen.

Editor of "Chemistry and Industry."—Mr. W. E. DICK has been appointed editor of *Chemistry and Industry*, the weekly journal of the Society of Chemical Industry. He was previously for many years editor of *Discovery*.

London University.—Dr. M. J. H. SMITH, Ph.D., senior lecturer in chemical pathology at King's College Hospital Medical School, has been appointed to the university readership in that subject tenable at the School.

Sheffield University.—The following new appointments were among those announced after a meeting of the university council on June 21: Dr. G. R. HERVEY, lecturer in physiology; Dr. H. ECKERT, temporary assistant lecturer in therapeutics; and Dr. G. HOLMES and Dr. W. J. C. WILKINSON, demonstrators in anatomy.

Dr. D. B. Jelliffe, visiting professor of tropical medicine at Tulane University, New Orleans, and formerly W.H.O. visiting professor of paediatrics at the All India Institute of Hygiene and Public Health, is making a survey of comparative methods of preventive paediatrics in the Caribbean. The survey is being conducted under the auspices of the China Medical Board of New York.

COMING EVENTS

Industrial Medicine for General Practitioners.—Intensive course at the London School of Hygiene and Tropical Medicine, September 23–29. Apply by July 1 to the registrar, London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1, from whom further details may be obtained.

Royal Medico-Psychological Association.—116th annual meeting, Oxford, July 2–5, under the presidency of Dr. R. W. ARMSTRONG. Meeting open to members and guests. Further details from the secretary of the association at 11, Chandos Street, Cavendish Square, London, W.1.

M.R.C. Open Lecture.—July 5, 5 p.m., at the National Institute for Medical Research, Mill Hill, London, N.W.7. Dr. GEORGE W. CORNER will speak on "The Rockefeller Institute for Medical Research; its Founders and its Achievements."

Second International Congress of Psychiatry.—Zurich, September 1–7. The main theme will be a review of our knowledge of the schizophrenias. Details from the general secretary, 28, Lenggstrasse, Zurich, 8, Switzerland.

NEW ISSUES

Journal of Clinical Pathology.—The new issue (Vol. 10, No. 2) is now available. The contents include:

- A SPECTROPHOTOMETRIC METHOD FOR THE RAPID ESTIMATION OF BLOOD OXYGEN SATURATION, CONTENT, AND CAPACITY. I. C. Roddie, J. T. Shepherd, and R. F. Whelan.
- THE ESTIMATION OF NORADRENALINE IN URINE AND ITS EXCRETION IN NORMAL AND HYPERTENSIVE SUBJECTS. W. J. Griffiths and Susanne Collinson.
- A MICRO-METHOD FOR SERUM CALCIUM AND SERUM MAGNESIUM. R. H. Wilkinson.
- A NEW COLORIMETRIC MICROESTIMATION OF SUGAR IN BLOOD AND BIOLOGICAL FLUIDS. I. St. Lorant.
- THE ESTIMATION OF CATECHOLAMINES IN URINE BY A CHEMICAL METHOD. H. Weil-Malherbe and A. D. Bone.
- A PAPER-CHROMATOGRAPHIC TECHNIQUE FOR THE DETERMINATION OF PLASMA CORTICOSTEROIDS. Barry Lewis.
- HYPERNATRAEMIA IN EXTRARENAL URAEMIA. Joan F. Zilva and J. N. Harris-Jones.
- A METHOD FOR DEPROTEINIZATION OF BLOOD AND OTHER BODY FLUIDS. G. Hunter.
- PORPHYRIN METABOLISM AND BARBITURATE POISONING: OBSERVATIONS ON CASES OF ACUTE AND CHRONIC POISONING. Torben K. With.
- A CASE OF ANURIA DUE TO DESTRUCTION OF GLOMERULI. John C. Dick.
- LYMPH-NODE CHANGES DUE TO POLYVINYL PYRROLIDONE. Robert P. Towers.
- IMPROVED METHODS FOR DETECTING α , ϵ -DIAMINOPIMELIC ACID IN LUNG LESIONS. R. Condon and A. Howard.
- THE PATHOLOGY OF SICKLE CELL HAEMOGLOBIN C DISEASE AND SICKLE CELL ANAEMIA. G. M. Edington.
- LOCAL INFECTION WITH *Pasteurella septica* AFTER A DOG BITE. H. E. Emson.
- ESTIMATION OF NUCLEOTIDE CONTENT OF RED CELLS. N. C. Hughes Jones and Margaret A. Robinson.
- Neisseria pharyngis* BACTERIAEMIA IN A PATIENT WITH SUBACUTE BACTERIAL ENDOCARDITIS. Reginald Hudson.
- THE SENSITIVITY OF *Proteus* TO NITROFURANTOIN *in vitro*. P. W. Kippax.
- SURVIVAL OF BLOOD GROUP FACTORS AFTER DEATH. J. B. Enticknap.
- TECHNICAL METHODS:
 - AN AUTOMATIC DISPENSER FOR MULTIPLE SEROLOGICAL TITRATIONS. B. Weitz.
 - A SLIDE RULE FOR HAEMATOLOGICAL CALCULATIONS. J. W. Nicholas.
 - THE DETERMINATION OF ESTERIFIED (UNPLIT) FAT IN FAECES. S. L. Tompsett.
- ASSOCIATION OF CLINICAL PATHOLOGISTS: 58th General Meeting.

Issued quarterly; annual subscription £2 2s.; single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

Ophthalmic Literature.—The new issue (Vol. 10, No. 4) is now available. It contains a comprehensive selection of abstracts of the literature on ophthalmology and related subjects. Six issues and a volume index each year; annual subscription £4 4s. (or in combination with *British Journal of Ophthalmology*, £7 7s.); single copy 25s.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Monday, July 1

INSTITUTE OF NEUROLOGY.—5.30 p.m., Professor J. C. Eccles (Australia): Central Action of Afferent Impulses from Muscle Spindles.

Tuesday, July 2

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5 p.m., Imperial Cancer Research Fund Lecture by Dr. I. Berenblum (Israel): Some Recent Advances in Skin Carcinogenesis.

Wednesday, July 3

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Mr. O. S. Tubbs: Surgery of the Pericardium.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—5 p.m., Dr. N. Rh. Blegvad (Copenhagen): A Modern View of the Treatment of Sinusitis. 6 p.m., Dr. B. T. Withers (Houston, Texas): Combined Operation of Submucous Resection and Rhinoplasty (with colour film).

Thursday, July 4

LEBANON HOSPITAL FOR MENTAL AND NERVOUS DISORDERS.—At Winter Garden, Cora Hotel, Upper Woburn Place, W.C.1, 5 p.m., 58th annual meeting.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5.30 p.m., Otolaryngology Lecture by Dr. W. H. Kelleher: Modern Approach to the Treatment of Respiratory Defects in Polymyositis.

Friday, July 5

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. F. H. Young: clinical demonstration.

APPOINTMENTS

DUTTON, W. A. W., M.B., Ch.B., M.R.C.O.G., M.M.S.A., Tutor in Obstetrics and Gynaecology, Queen's University, Kingston, Ontario.
NORTH-WEST METROPOLITAN REGIONAL HOSPITAL BOARD.—*Consultants*, Margery G. Blackie, M.D., F.F.Hom., Homoeopathic Physician, Royal London Homoeopathic Hospital; Ben Cohen, M.B., F.R.C.S., D.L.O., Ear, Nose, and Throat Surgeon, St. Mary's Cottage Hospital, Hampton; F. A. Binks, M.D., M.R.C.P., Assistant Physician, Edgware General Hospital; J. W. Lewis, M.B., F.F.A.R.C.S., Anaesthetist, Clare Hall Hospital; Philippa E. I. M. Southey, M.B., D.M.R.D., Radiologist, St. Charles' Hospital, Senior Hospital Medical Officer, W. W. Campbell, M.B., Ch.B., Assistant Psychiatrist, Leavesden Hospital.
REINHOLD, J. D. L., D.M., M.R.C.P., D.C.H., Assistant Professor of Paediatrics in the University of Colorado from July 1, 1957.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Gordon.—On June 10, 1957, in Adelaide, Australia, to Nesta (formerly Lewis), wife of William Fleming Gordon, F.R.C.S., a daughter.

DEATHS

Adamson.—On June 6, 1957, at Ellinge, Alkham, near Dover, Kent, Charles Henry Adamson, M.B., F.R.C.S.Ed., aged 86.
Beattie.—On June 8, 1957, at Levuka, Fiji, Ivor Hamilton Beattie, L.M.S.S.A.
Blake.—On May 12, 1957, Lilian May Blake, L.R.C.P.S.Ed., L.R.F.P.S., of Woodland Avenue, Northampton, formerly of Colwyn Bay.
Cawthorn.—On May 31, 1957, at Mooroonpa, Victoria, Australia, Frank Raymond Cawthorn, O.B.E., M.B., B.S., Colonel, I.M.S., retired.
Cons.—On June 5, 1957, Dennis Neville Cons, M.B., B.S., of Perry Vale, London, S.E.
Crooke.—On June 6, 1957, William Crooke, M.R.C.S., L.R.C.P., of Woodhome, Willaston-in-Wirral, Cheshire, formerly of Wallasey.
Hewitt.—On June 7, 1957, at Summerlea, Sandown, Isle of Wight, Robert Morton Hewitt, M.D., aged 86.
Lucey.—On June 8, 1957, at Eastbourne, Sussex, Herbert Cubitt Lucey, M.D., D.P.H.
Mandy.—On June 5, 1957, at Cornerways, Tanners Hill, Hythe, Kent, Percy Stephen Mandy, M.R.C.S., L.R.C.P., aged 85.
Morgan.—On June 5, 1957, at the London Hospital, Henry Lewis Morgan, M.D., F.R.C.S., of Hindhead, Surrey, late of Bishop Auckland, Co. Durham, and Valparaiso, Chile.
Oesterlein.—On June 12, 1957, at his home, "High Point," Ripley Road, Knaresborough, Yorks, William Henry Oesterlein, M.B., Ch.B., D.Obst.R.C.O.G.
Patey.—On June 2, 1957, at Newton Abbot, Devon, Walter Patey, M.D., aged 74.
Ritchie.—On June 3, 1957, in London, Theodore Francis Ritchie, D.S.O., M.B., Ch.B., Lieutenant-Colonel, R.A.M.C. (retired), aged 80.
Robertson.—On May 29, 1957, at his home, 613, Newark Road, Lincoln, Daniel Robertson, M.B., Ch.B., aged 52.
Stewart.—On June 13, 1957, George Herbert Stewart, O.B.E., M.B., Ch.B., Lieutenant-Colonel, I.M.S., retired, of Le Beau Côté, St. Saviour's, Jersey, Channel Islands, aged 82.
Slessor.—On June 9, 1957, at 24, Saltoun Place, Fraserburgh, Aberdeen-shire, Robert Alexander Slessor, M.B., Ch.B., D.P.H., aged 80.
Thomson.—On June 8, 1957, at the Royal Northern Infirmary, Inverness, Edward Russell Thomson, M.B., Ch.B., of 39, St. John Street, Hanley, Staffs.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Early Symptoms of Parkinsonism

Q.—What are the earliest symptoms in Parkinson's disease? Is dysuria one of them?

A.—It is usually true to say that in Parkinsonism physical signs precede symptoms, and the neurologist will often recognize early evidence of Parkinsonism in a patient who is being examined for some other reason. If the patient does seek advice because of symptoms, he will usually complain of tremor (which he will probably have had for a considerable time and may well be fairly advanced) or slowness of movement either in one hand or of the body in general. At an early stage a patient with Parkinsonism may become unsteady and will sometimes present himself because he has, in fact, fallen when trying to turn quickly. Only rarely will early changes involve alteration in the voice or in the handwriting. Dysuria of any kind is no feature of Parkinsonism even in its advanced stages, and the presence of dysuria in a patient clearly suffering from Parkinsonism will certainly have some other origin, such as prostatic enlargement.

Chlorpromazine Rashes

Q.—What skin rashes occur with chlorpromazine, roughly in order of frequency? Are any characteristic of the drug? Should its administration be stopped if a rash appears?

A.—Skin rashes occurred in 27 (5.5%) of 412 patients treated with chlorpromazine mainly for psychiatric conditions.¹ The majority of these gave a history of allergic responses to other drugs. The rash occurred usually in the second week of treatment. Only two patients were receiving less than 100 mg. a day. Above this level there was no correlation with dosage or duration of treatment. When the drug was stopped the rash usually cleared within a week and did not recur if treatment was started again. In some cases the rash disappeared in spite of the continued administration of chlorpromazine. The types of rash recorded were generalized dermatitis (6), maculopapular (2), generalized erythema multiforme (2), generalized exfoliative dermatitis (2), and acneiform lesions of the face (1). The remainder appear to have suffered from a dermatitis localized to the arms, chest, neck, and forehead. Pruritus, often persisting after the rash had disappeared, was common, and one patient remained sensitive to light for some time.

V.D. Prophylaxis

Q.—Apart from abstinence or the use of a condom, what is the best means of prophylaxis against venereal disease? I have in mind the type of man who, if he uses a condom, has difficulty in performing the sexual act.

A.—Micturition and the use of soap and water immediately after coitus are probably the most effective anti-gonococcal measures. The gonococcus is not motile but is deposited at the meatus in a droplet of mucus, whence it infects the meatal mucous membrane by progressive colonization. If this droplet is washed away and the glans and mucous surface of the prepuce can be carefully cleansed, the odds are against infection taking place.

The use of treponemacidal creams containing mercury or arsenic, and especially those containing penicillin, is not recommended, nor is the swallowing of penicillin tablets

before or after exposure to infection. Syphilis is far too serious a disease to risk masking it with insufficient treatment without follow-up, for that is what such chemoprophylaxis really amounts to. Occasionally the disease develops silently, and the promiscuous man or woman is well advised to submit to a periodic blood test.

Value of Dieting in Gout

Q.—What is the value of dietary restriction in gout? What foods are worth avoiding, and is it possible to obtain appropriate diet sheets?

A.—The value of dietary restrictions in gout is less now that such potent uricosuric agents as probenecid are available. This drug can be administered for long periods, and by its use the level of uric acid in the serum of gouty subjects can be lowered to within the normal range. In patients who are prone to frequent attacks of gout it is wise that in addition they should avoid foods with a high purine content. The following contain large amounts of purine: sweetbreads, kidneys, liver, sardines, whitebait, herring roes—and, in smaller amounts, ham, bacon, pork, goose, duck, and all shellfish. Diet charts for gout can be obtained from Messrs. H. K. Lewis & Co., Ltd., 136, Gower Street, London, W.C.1.

Effect of Amputation of Cervix on Child-bearing

Q.—What complications may be anticipated during pregnancy and labour in a woman who has undergone amputation of the cervix uteri?

A.—It is well recognized that the higher the cervix has been amputated, the higher the incidence of abortion and premature labour in subsequent pregnancies. According to the figures collected by Hunter¹ there is also an increased incidence of antepartum haemorrhage, probably due to tears in the cicatricial lower uterine segment.

If only amputation of the cervix was done at operation, then a conservative attitude to labour may be adopted provided that the amputation was not high and that the cervical rim has softened to some degree with advancing pregnancy. However, the patient must be confined in a fully equipped maternity unit, for if the cervical stump fails to dilate in labour, caesarean section will be necessary; while if vaginal delivery is effected a cervical laceration may require suturing.

If the cervical amputation has been performed as part of a pelvic floor repair, obstetricians are somewhat more inclined to perform elective section. In 100 women delivered after the 36th week in Hunter's series, the section rate was 18%, two-thirds being performed electively and one-third after the cervix had failed to dilate in labour. One relevant factor is that the patient may express concern lest vaginal delivery be followed by recurrence of prolapse with the need for a further operation. But the physiological effects of pregnancy, and not the method of delivery, alone determine the outcome to the pelvic floor in the individual case, and even elective section cannot be a guarantee against recurrence of the prolapse. If vaginal delivery is envisaged, a liberal episiotomy should be performed.

Diesel Oils and the Skin

Q.—Is it true that diesel oils are particularly apt to cause skin lesions in those exposed to them, and, if so, why? What is the best protection for the hands for those working in garages, etc.?

A.—Diesel oils are a frequent cause of skin lesions. These oils are often produced by the direct distillation of crude oil without subsequent refining and may contain up to 1.5% of organic sulphur compounds, which are recognized skin irritants. Diesel oils have a high viscosity and consequently are difficult to remove from the hair follicle by ordinary washing once skin contamination has occurred. The oil

tends to remain in the hair follicle, where the continued irritation gives rise first to comedo formation. Subsequently acne-like lesions may develop and, if rupture of the dilated sebaceous gland into the dermis occurs, a sterile abscess may form. This may later become infected. Since the oils are difficult to remove, powerful cleansing agents such as paraffin or petrol are frequently used. These, of course, are also apt to cause dermatitis.

Gloves are the best protection for the hands, but where fine manipulations are required gloves may not be usable. Barrier creams are of relatively little value. They prevent the oil from filling the cracks by the nails and the skin creases, but do little to prevent penetration of the hair follicle or to assist removal from the follicle. Where contamination with diesel oils has occurred the use of one of the more powerful industrial cleansing agents is justifiable. After using such a cleansing agent the skin should be thoroughly rinsed, dried, and anointed with an emollient cream.

"Liver Palms" and Vascular Spiders

Q.—What is the clinical significance of "liver palms" and vascular spiders? Does the presence of either of these signs in an otherwise normal person presenting himself for life insurance examination indicate a need for further investigation, and, if so, what should be done?

A.—Erythema of the palms may signify liver disease but is also found with pregnancy, rheumatoid arthritis, certain cancers, especially bronchial, and in some normal people often familiarly. Vascular spiders, likewise, may indicate liver disease, particularly cirrhosis, but may also occur in normal pregnancy, in rheumatoid arthritis, and in normal people, especially children. The finding of a few vascular spiders is not sufficient to diagnose liver disease, but the development of many, with increasing size of old ones, should not be dismissed lightly, and cirrhosis must definitely be excluded before life insurance. Both signs occurring together are more significant than either alone.

A past history of acute hepatitis, especially if severe or relapsing, or of heavy alcoholic intake should be elicited. The most important corroborative evidence clinically is hepato-splenomegaly. The urine should be examined for excess of urobilinogen, and the serum bilirubin, albumin, and globulin, and the thymol and zinc sulphate tests performed. If the diagnosis remains in doubt the patient should not be accepted for life insurance until further assessment in hospital has been undertaken. This may include the bromsulphthalein excretion test and aspiration liver biopsy.

Toxicity of Paint Strippers

Q.—What are the principal chemical constituents of paint strippers, and what hazard do they entail for the professional and the amateur decorator?

A.—There are several methods of paint removing. The blowlamp, caustic liquids, solvents with wax to delay evaporation, all have their uses. Caustic liquids are damaging to skin, eyes, and clothes, but otherwise are not harmful, unless of course they are swallowed. It is the solvent group of paint removers which present the major hazard to both professional and amateur users. The following solvents merit special care in that their fumes should not be inhaled; benzene, methylene chloride, and methyl alcohol (methanol).

The risks to health from benzene are twofold. In high concentrations it is a powerful and swift narcotic, while exposure to lower concentrations over a period of time causes serious damage to the bone marrow, showing itself in blood changes. The narcotic effect of methylene chloride is less than that of chloroform, but its local irritant effect is somewhat greater. In lower concentrations over a period, damage to liver and kidneys has been described. Methylene chloride decomposes in the presence of heat and moisture to form phosgene and hydrochloric acid. Phosgene is a cause of pulmonary oedema. Methanol is none other than wood alcohol, and its main toxic effect is on the optic nerve; it

also has narcotic properties. As well as the inhalation risk with the solvent strippers there is also a risk of skin damage which calls for suitable measures to minimize contact.

The fire risk of solvents in paint removers merits as serious consideration as do the risks to health from inhalation. Paint stripping with a solvent should never be done in a poorly ventilated, confined space. In other situations the amateur decorator may avoid trouble by opening windows and doors, but for the professional, who may have repeated exposures, local mechanical exhaust ventilation is a better protection.

Ease of Ophthalmoscopy in Girls

Q.—When examining the optic fundus I find it much easier to get a good view in the case of young women and girls than in youths or older people of either sex. The reason appears to be that their pupils are larger. Is this a well-recognized fact, and, if so, what accounts for it?

A.—It is well known that the pupils of children and adolescents are larger and more active than those of adults, the pupil becoming smaller and less active with increasing age. Women also tend to have larger pupils than men.

Apart from the obvious variations in pupil size due to variations in the amount of light entering the eye, emotion may also have marked effects. Almost any strong emotion, pleasant or unpleasant, can cause pupillary dilatation, and anxiety or fear are the commonest causes of this. It is probable that the anxiety associated with the approach of an unfamiliar instrument in a patient predisposed by age and sex to a large labile pupil accounts for the pupillary dilatation in young women during ophthalmoscopic examination.

Protruding Ears

Q.—What treatment is advised for a female baby with very large protruding ears. Will binding the ears back have any effect? Alternatively, if a plastic reconstruction is advised, when should this be undertaken?

A.—No treatment is advised for a female baby with very large protruding ears. Binding the ears back will have no effect whatever. There will be a natural tendency for the ears to fall back on their own, and there must be many girls about to-day who conceal some degree of aural deformity under their hair. Plastic surgery is advised only after the age at which the ears have ceased to grow. This is probably at or after 8 years of age. In my opinion operation should not be undertaken even then unless the child is anxious to have the deformity corrected.

Books of "Any Questions?" and Refresher Course Articles.—The following books are available through booksellers or from the Publishing Manager, B.M.A. House. Prices include postage. *Any Questions?*, Volumes 2 and 3 (8s. each); *Refresher Course for General Practitioners*, Volumes 2 and 3 (26s. 6d. each inland, 26s. overseas); *Clinical Pathology in General Practice* (22s. 3d. inland, 21s. 9d. overseas).

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: *Atiology, Westcent, London*. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Director, B.M.A. House, Tavistock Square, London, W.C.1 (hours 9 a.m. to 5 p.m.). TELEPHONE: EUSTON 4499. TELEGRAMS: *Britmedads, Westcent, London*. MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the Association. TELEPHONE: EUSTON 4499. TELEGRAMS: *Medisecra, Westcent, London*.

British Medical Association

PROCEEDINGS OF COUNCIL

The Council met on Wednesday, December 19, at B.M.A. House, with Dr. S. WAND in the chair.

The Council received with deep regret the report of the death of Sir Lionel E. H. Whitby, President of the Association from 1948 to 1949, and of Dr. John Irvine Milne, of Manchester, member of Council from 1950 to 1956. The CHAIRMAN said that Sir Lionel Whitby and Dr. Milne had a great deal in common; both were popular and kindly men. Sir Lionel Whitby played a great part in the field of science, and he carried out his duties as President of the Association faithfully and scrupulously. Since his Presidency he had done a great deal for the Association in connexion with medical education. Dr. Milne was a very good member of Council and a good friend to the Association.

The members stood in silent tribute.

B.M.A. Honour

A letter was received from Sir Henry Dale expressing his appreciation of the honour which had been conferred upon him by the award of the Gold Medal of the Association. It appeared that the medal had not before been awarded to a research worker who had never been engaged in any form of actual practice, and this, said Sir Henry Dale, increased his sense of the exceptional honour done to him.

The Council unanimously agreed to record in the Association's Book of Valour the name and action of Lieutenant Stanley Grahame Sutton, R.A.M.C. Lieutenant Sutton, who is a National Service medical officer in the R.A.M.C., had displayed great gallantry and devotion to duty in Cyprus last June in rescuing and treating injured men trapped in a forest fire.

Part-time Work for Local Authorities

The CHAIRMAN reported that a special Subcommittee of Committee C of the Medical Whitley Council met in November to review the part-time fees payable by local authorities. The negotiations were based on the proposals for a new agreement drawn up by the Association's Liaison Committee and subsequently approved by the Council, and agreement was reached on all items in the claim. A new agreement was drawn up for England and Wales, and consultations are proceeding for Scotland. The new scale

of fees (see *Supplement*, December 29, p. 228) was formally approved by Committee C on December 12. The agreement would replace the 1947 and 1951 agreements. The Chairman added that this successful outcome was due in no small measure to the work of Dr. A. V. Kelynack, Assistant Secretary of the Association.

Remuneration Claim

The CHAIRMAN said that at the recent meeting of the Negotiating Committee he invited the Joint Chairmen, Sir Russell Brain and Dr. A. B. Davies, Acting Chairman of the General Medical Services Committee, to attend the Council meeting. Sir Russell Brain had felt unable to do so because of his constitutional position, but Dr. Davies had accepted.

Dr. A. B. DAVIES, at the Council's invitation, gave an account of events in connexion with the remuneration claim. The Negotiating Committee received and studied the report of the debate at the Council meeting held on November 7. At that time they were all awaiting the Minister's reply to the Memorandum sent to him on September 12. On October 18, addressing the Conference of the Executive Councils Association, the Minister said, "It is not true that we have considered the details of the claim." That was five weeks after he had received the Memorandum, and on November 3 the Minister wrote to Dr. Macrae that he would reply "shortly." The reply, received on November 22, consisted of two terse paragraphs cursorily rejecting the claim. After the Minister's original rejection of the claim in July, the Negotiating Committee put forward legal representations, and the Minister promised a reasoned reply based on the arguments of his legal advisers. No such argument was contained in the letter of November 21.

The suggestion that the matter should or could be brought before the Courts was a red herring. The Minister knew that the doctors' individual contract was not related in any direct way to the financial provisions of the terms of service. A medical practitioner applied "to take service in an area upon the terms and conditions for the time being in operation in that area and for admission to the Medical List." The terms and conditions in operation in any area at any particular time were on the overriding

contractual obligation which the Government had with the profession. It was not only a contractual obligation—it was a moral obligation and it was an act of faith. The profession came into the service on the Government's assurance that it would accept Spens. The Minister was now trying to cast that act of faith aside.

The profession had built its house upon a rock, said Dr. Davies, the rock of Spens. It seemed firm and indestructible, but underneath that rock there were shifting sands, the shifting sands of ministerial trickery. The Minister said, "We have no contractual obligation"; and the profession had been betrayed. The Negotiating Committee was stunned, and the profession was shocked.

But the reply was not accepted. The same day letters were prepared and sent to the Minister and to members of the General Medical Services and Joint Consultants Committees. Dr. Davies authorized the sending out of a similar letter to local medical committees, and a statement was sent to the press. Because of the national situation the statement did not receive the publicity it might have done.

The Negotiating Committee had not retreated one inch from its position, nor had it surrendered one farthing of its claim. There had been several letters backwards and forwards trying to get the Minister to make a reasoned reply on the legal argument, but his replies were evasive. His last reply was that the Ministers found it difficult to see what they could usefully add to the correspondence, but they would be willing to meet the Negotiating Committee if it thought any good purpose would be served thereby. Dr. Davies said that after consultation with Sir Russell Brain he had authorized the publication of these later letters (*Supplement*, December 29, p. 227), and they would be found quite enlightening on ministerial views. In the middle of the correspondence Sir John Hawton elected to divide the Ministers' reply into two parts. The first part dealt with the validity of a claim, although the Minister had said that the Government had not considered the claim. On November 21 he had written that the claim had now been fully considered, and on December 4 he said that on the first part of the claim—namely, the merits of the case—the Ministers had decided that under present economic circumstances they could not consider it. The second part of the claim was on the matter of the contractual obligation, and again Sir John Hawton wrote, "It is our confirmed opinion that no such contractual obligation exists."

This, concluded Dr. Davies, brought the matter up to date.

To Dr. J. C. ARTHUR'S (Gateshead) question whether the Minister had ever been asked straight out, "Do you or do you not repudiate Spens?" Dr. DAVIES replied that he had not been asked that direct question.

Dr. E. C. DAWSON (Derby) also spoke on the question of the contractual obligation of the Government to act in accordance with the Spens Report. He understood that the profession had a cast-iron case on legal grounds as well as moral grounds. The Minister had challenged the profession to take the matter into court for adjudication, and Dr. Dawson could not see why the challenge should not be accepted. Had the Negotiating Committee considered taking it to court? To back out now would be a defeatist move.

The CHAIRMAN said that the obligation was subject to a "general overriding obligation to the profession." There was no written contractual obligation in the terms of an ordinary form of contract.

Dr. J. A. L. VAUGHAN JONES (Leeds) said that this was a serious position. A leading article in the *British Medical Journal* had spoken of the need for unity, and he would like the Negotiating Committee to feel that it had the profession behind it. He also wanted the profession to be satisfied that the Negotiating Committee was completely tied together and had a united purpose. He would like an assurance that there were no difficulties in the Negotiating Committee and that there was the unity spoken of in the *Journal*. The profession was considerably stirred up by

these happenings and was behind the Negotiating Committee all the way, but it should be organized fairly soon for action.

Dr. A. V. RUSSELL (Wolverhampton) said that the law was inclined to settle disputes on the letter rather than the spirit, and the outcome of a recourse to the courts might be doubtful. Dr. Davies had said it would be useless to proceed on their own contracts. The Danckwerts Award had set out clearly what should be the doctors' deserts in the light of the Spens recommendation. Spens, up to the moment, had been the profession's anchor. The profession entered into a gentleman's agreement which it had loyally supported, but the politicians were ruled by expediency and nothing else.

What was to happen now? There was a question of mass resignation, but they must be perfectly sure that the profession was united on that issue. The press was not friendly to the profession. But it seemed to the speaker that this unfortunate position offered a great opportunity. Dr. Dain had said in 1948 that they would be able to shape the Service from within, and all had worked extremely hard to do this, but because of political obstruction they had not been able to shape it as completely as they would like. If, as a result of this betrayal of faith—for it was nothing else—they were drawn into the position of rejecting the National Health Service, it might be that there would be an opportunity to frame a health service which would work more efficiently and more economically than at present, and at the same time give to doctors a return more commensurate with their responsibilities and status.

Dr. DAVID BROWN (Liverpool) said that many practitioners still felt confused about the matter. It was a blow to find that there was not the legal obligation on the Government that most of them had thought that there was. Was it possible to get the Government to agree to arbitration under the chairmanship of the man who set the standard, Sir Will Spens? Negotiations had been going on since February 7, and he did not know of any other profession or trade union which would be so complacent. If there was no satisfactory reply from the Ministry the Council should call a Special Representative Meeting before the end of January, and a meeting of Council should be held in the first half of January.

Dr. H. H. D. SUTHERLAND (London) said that many practitioners thought that the Danckwerts interpretation of Spens held for all time. Could the Secretary remind the Council of the statements made to the profession about May 7, 1948, when the Council determined to advise the profession to enter the health service on a series of statements and guarantees made by the then Minister of Health? The opinion was expressed then that these guarantees were insufficient and might be quite worthless, and the statements by succeeding Ministers of Health had confirmed that opinion.

Dr. ARTHUR said that they must be realistic. The courts might prove that there was a promise from the Minister in 1948 to honour Spens, but this could not bind the present Minister. His policy was decided by Parliament, and Parliament had to take regard of changing circumstances. The Minister was faced with the problem of stopping inflation, and he had reversed the policy of his predecessors in order to do so. If there was repudiation of Spens it might be the best rallying point for the profession one could possibly have. It might be better to ask the Minister the direct question.

Dr. H. GUY DAIN (Birmingham) said that when the Negotiating Committee met the Minister on January 4 he would probably say that the Government was not prepared to pay any more to doctors, that the claim had not been considered on its merits, that there might be a good case but the Government had not got the money and was not prepared at the moment to look at it. That was the sort of answer the Negotiating Committee was likely to get, and he thought it would be wise not to talk about taking legal action or going to arbitration. He was sure the Minister would not agree to arbitration.

What we should look at now, he said, was what steps we are going to take when we get a final "No." That was the problem to be studied now. Were mass resignations from the Service to be pressed for if there was a definite refusal of Spens by the Minister? If so, the profession would come out on a question of principle, not a question of money. Mass resignations were unnecessary. If doctors resigned in a body in a few areas of sufficient size it would be equally effective. He did not think it essential that consultants should resign. It was the general practitioners who could make or break the Service, and general practitioners were strong enough to do so.

Dr. G. W. IRELAND (Midlothian) asked whether it was possible to keep this issue isolated. He wondered if it could be looked at as something bound up with the whole structure of the National Health Service and with the professional status of the doctor in society. If this broader context was kept in mind there would be a different response from the Government and from the public. The Association must have a policy which covered the whole Service and not dealing merely with isolated events.

Dr. I. M. JONES (Sunderland) directed attention to a resolution of the Representative Body which said that the Council should assume greater responsibility for all claims by the profession, and he thought the Council should accept this fuller responsibility. Some clear-cut plan for the future should be adopted that day. He agreed with Dr. Dain on what the Minister's reply would be, but it was the Negotiating Committee's reply which had to be considered. Should it ask for independent arbitration? If the Minister refused, the profession would be faced with an issue which would affect the social and economic status of the doctor not only now but for many years to come. There should be a Council meeting early in January to decide what its attitude should be.

Quite apart from remuneration, many practitioners were concerned with the overall pattern into which medicine was drifting. An alternative to the present Service was being considered, and no doubt this would come to the Council in due course, but he could not agree that because such a plan was being developed it was a reason for delaying something which should have been done some time ago. The Government, this very summer, granted supplements to civil servants to cover increases in the cost of living in the last twelve months. The profession could not accept a proposition to wait another two or three years. The Divisions must know that the Council meant business and was making an effort to proceed with haste.

Mr. S. F. LOGAN DAHNE (Reading) said that the Council was being realistic and must continue to be so. This did not mean it would do anything to undermine the position of the Negotiating Committee, but it supported it. It seemed to him that there must be a Council meeting early in January. The British Medical Guild must be put into operation, and it must be got across to the Minister that the profession was prepared to fight. Whatever was eventually done must be done by the whole profession. The politicians must be made to realize that doctors were exceedingly important in the community and that the community would be in great difficulty without them. They had all done their best to make the Service work. They must win this time, for if they did not the profession was finished for ever.

Future Action

The CHAIRMAN said that it was clear that the Minister's reply did not satisfy the Council. He thought also the Council was agreed that not a lot of positive action could be taken until the outcome of the meeting with the Minister on January 4 was known. There remained the question of what could be done now. He would ask the Council not to be precipitate. Arbitration was a very good thing, but it could happen at the wrong time. It could be at the right time before the wrong man; it could be at the wrong time before the right man. The point was being reached where they had to decide on their general tactics. Could

anything be done in advance of the meeting on January 4? In view of what was likely to happen, should the weapons be sharpened now? ("Hear, hear.")

The plan of campaign perhaps should not be debated now, but there was one decision which could be taken, and that was whether the Guild machinery should be got going.

Dr. SUTHERLAND asked if it was possible to have the statement for which he had asked earlier, and the SECRETARY replied that there was a letter dated July, 1946, from the Permanent Secretary of the Ministry of Health to the British Medical Association in which it was said that the Minister fully accepted the Spens recommendations with regard to remuneration. In January, 1949, there was a statement in the House by the Parliamentary Secretary to the effect that when the final accounts for the period July 5, 1948, to March 31, 1949, had been made it would be possible to see whether the remuneration of general practitioners did in fact accord with the Spens recommendations. If it did not it would be gone into to see what adjustments were necessary. This statement referred to the General Practitioner Spens Report. With regard to the consultants and specialists, the Minister stated on June 3, 1949, that the report on the remuneration of consultants and specialists would be available the next day, and that "the Government accepts the recommendations in principle."

Dr. DAVIES, replying, said that the Negotiating Committee was absolutely united in purpose. On paper there were constitutional difficulties, but in fact they did not exist. It had been agreed when the Negotiating Committee was set up that neither the Joint Committee nor the General Medical Services Committee would act without the other, and that any decisions should be referred to the parent committees in each case. From the beginning the Council had endorsed the setting up of the Committee, and 50% of the members were members of Council. He could not commit either Committee on future action, but he would assure the Council he would do all he could to weld the different branches of the profession together.

With regard to resorting to the courts, Dr. Davies said that the Chairman of Council had answered Dr. Dawson. Other possibilities had been discussed, but these were matters for the Negotiating Committee, which would be advised on the views of the Council. He would assure the Council that there had been no delay on the part of the Committee.

Dr. F. GRAY (London) said that the Guild machinery should be put into operation immediately. This would take some time. In the past the Guild had been concerned with G.P.s only. It was now essential that all sections of the profession should be organized. This was not the time for passing resolutions or calling special meetings; it was a time for getting down to quiet preparation in readiness for every eventuality. Dr. Gray was quite certain that the Ministers would continue to say "No." The Guild had to reach members who never thought of attending an ordinary B.M.A. meeting, and it also required information from these members. It would be unwise to hold a special meeting of Council or a Special Representative Meeting until the Guild machinery was working. The energies of members of Council would be better employed in their areas than coming to London for a special meeting.

Dr. R. G. GIBSON (Winchester) thought the Divisions were ahead of the Council and the Guild machinery should be got to work now. Dr. J. A. L. VAUGHAN JONES said that in the area of the Yorkshire Branch the machinery was already working and the group leaders were meeting on January 9.

It was agreed to leave it to the Chairman to make the necessary decision about a special meeting of the Council. In any case the next meeting of Council was fixed for January 30.

It was also agreed, on the motion of Dr. A. BEAUCHAMP, that the Joint Chairmen of the Negotiating Committee be invited to attend the next meeting of Council.

Position of Negotiating Committee

In reply to Dr. I. M. JONES, who asked for a definition of the position of the Negotiating Committee *vis-à-vis* the Council, Dr. DAVIES said that the Negotiating Committee consisted of an equal number of members appointed by the General Medical Services Committee and the Joint Committee of Consultants and three public health members co-opted after the first meeting. The Committee's remit was to prepare the case, negotiate, and report to its parent committees. The Negotiating Committee had no funds whatever.

The CHAIRMAN added that the Negotiating Committee was an independent body representing the General Medical Services Committee and the Joint Committee. Only half of it was responsible to the Council, and it must be regarded as completely independent.

Dr. I. M. JONES commented that the Negotiating Committee had no power to accept any settlement without reference back to the two committees. Surely the General Medical Services Committee was responsible to the Council.

Dr. BEAUCHAMP thought the Negotiating Committee's job was to get the 24%, and if they failed they must inform their parent bodies and future action would have to be taken by the Association.

Dr. GRAY, speaking as a member of the Negotiating Committee, agreed with this view.

Dr. DAVIES said that it was essential that they should keep together, and there was a danger in drawing hard-and-fast rules on who was responsible for this or that.

Dr. R. HALE-WHITE (London) asked if the principle was accepted that if the 24% was not achieved the Negotiating Committee would report back to the Council.

Mr. A. LAWRENCE ABEL (London) did not think it was quite clear to the Joint Committee what they would do in the event of refusal. The G.M.S. Committee part of the Negotiating Committee would report back to the G.M.S. Committee, and the consultant members of the Joint Committee would undoubtedly report back to the Central Consultants and Specialists Committee. But the representatives from the Colleges on the Negotiating Committee would report back to the Colleges, who would make their own decision whether they would pull their weight with the Association. He was worried about that little gap.

Mr. H. H. LANGSTON (Winchester) agreed mainly with what Mr. Abel had said. The view was that the Negotiating Committee would report back to its constituent bodies. He hoped that the next step would be that the Joint Committee would fall in with any action that the Association felt it appropriate to take.

The CHAIRMAN said that the process of negotiation was very diverse, and it was only when one got into an impasse that one considered sanctions. He thought they had better be left for the moment.

Dr. J. G. M. HAMILTON said that it had been implied that the Royal College of Physicians, Edinburgh, had repudiated the remuneration claim. That was false. The College had believed that it was inexpedient and unwise to make the claim when the claim was made, but, having made its point, it did not resign from the Joint Committee and it had worked loyally with it. He had every reason to suppose that it would continue to do so.

General Medical Services Committee

It was agreed that the Acting Chairman of the Committee, Dr. Davies, should present the report. Dr. DAVIES then moved that the report be received.

Dr. R. FORBES (Hendon) raised a question on the provision under the protection-of-practices scheme that during an "emergency" a doctor absent from his practice would remain on the medical list and be expected to make deputizing arrangements to enable his practice to be carried on. The scheme departed from the scheme previously in operation in that it was proposed, on the absent doctor's return, that patients who had transferred to the list of another practitioner should be given the option of returning to his list or remaining on the list of the deputizing doctor. Those

who chose to remain on the deputizing doctor's list would be at liberty to do so, but he would not be paid for them for 12 months, the money being given to the practitioner who had returned, and from whose list the patients had been taken. Dr. FORBES asked if this agreed with Sections 31 and 36 of the Act, and whether it amounted to the buying and selling of a portion of a practice. Were the Association's solicitors consulted on this matter?

Dr. DAVIES replied that the Committee was asked to confine itself to minor emergencies, the Ministry refusing to consider any other type. The number of practitioners concerned was 9 or 11, and the Committee was anxious to preserve and protect the interests of these absentee practitioners. Patients would be informed that their own doctor had returned, but there remained the freedom of choice of the patient. The Ministry's lawyers had gone into the legal aspect, and the Committee was assured that there was no infringement of the Act.

Dr. W. M. KNOX (Glasgow) said that this provision was taken out of the scheme in operation in Scotland during the last war.

Dr. FORBES said he was concerned about the fact that the deputizing practitioner might be acquiring a certain number of patients from someone else at the price of a year's wages.

Dr. W. E. DORNAN (Sheffield) said that the basic principle of transfer of goodwill was that a man had something to transfer. If these patients were no longer prepared to adhere to him he had nothing to sell. He did not think any charge of breach of the provisions of Section 35 could be maintained in these circumstances.

Dr. FORBES asked for an assurance that something in writing would be obtained from the Ministry that this proposal was not an infringement of the Act, and Dr. DAVIES replied that it was now embodied in an Act of Parliament.

Dr. I. M. JONES raised the question of the Committee's comment on the resolution of the Annual Representative Meeting that précis of the evidence of witnesses before service committees should be prepared and signed by the witness, and that proceedings against a doctor before a service committee should be only in respect of a breach of the regulations, and that the doctor be notified in advance of the inquiry of the regulation of which he was alleged to be in breach. The Committee's comment was that the tribunal it was possible to seek further amendments at this stage. In any case this particular resolution was contrary to a decision taken by the Annual Conference of Local Medical Committees last year. He moved the reference back of this part of the report, but it was not seconded.

Dr. DAVIES said that the matter would be kept in mind, and when an opportune time came it would be gone into again.

Asked if the protection-of-practices scheme contained any reference to the purely private practice, Dr. ALEXANDER BROWN said that it did.

Dr. DAVIES moved that the remainder of the report be approved, and this was carried.

Dr. GIBSON said that there was an increasing shortage of radiographers, and he asked that the General Medical Services Committee should consider it, because the shortage was affecting the services available to the general practitioner.

Central Consultants and Specialists Committee

Mr. A. HOLMES SELLORS moved the reception of the report. Speaking to a recommendation that representations be made to the Ministry of Health that a national scheme for the training of mental health officers should be formulated and put into operation without delay, Dr. H. D. CHALKE said that there was already a working party on this. The recommendation was agreed to.

Arising out of the Waverley Report, the Committee had considered the concern of the Psychological Medicine Group Committee at the recommendation of the Waverley Committee that, although the directors of Army medicine and surgery should be up-graded to the rank of major-general, the directors of pathology and psychiatry should remain in

a lower rank. The Committee recommended that the Council should approve the principle that the directors of Army psychiatry and pathology should have equal status with the directors of medicine and surgery, and that representations should be made to the Minister of Defence accordingly.

Major-General J. C. A. DOWSE asked the Council to reject this recommendation. It was the custom in the Services to make senior appointments largely on the grounds of responsibility. The principle suggested by the Waverley Committee was that there should be three leaders of treatment in the armed Forces, and that the directors of surgery, medicine, and Army health should be major-generals. He understood that these recommendations had not yet received the great favour with the armed Forces, who were at the moment discussing the recommendations of the Waverley Committee. It was desired to improve the professional status of officers in the Army, Navy, and Air Force, but they did not consider this method of establishing posts for various professional people necessarily to be the correct one. It must be for the Service to decide whether rank should be given automatically, and he hoped it would be left to the Services to decide the appropriate ranks for the various branches of the profession.

Mr. LOGAN DAHNE said that the position of pathologists was very important. With regard to pathologists, he believed a great deal of our success in the Burma campaign was due to the high rank of the pathologists, who were thus able to get their advice adopted.

Mr. HOLMES SELLORS said that the Committee had not had the advantage of the information which Major-General Dowse had now given, and he felt a little uneasy about the recommendation.

The recommendation was not accepted.

Mr. HOLMES SELLORS, speaking on hospital medical staffing, said that the position was causing great anxiety and there was no immediate solution to the problem.

Mr. E. A. GERRARD (Manchester) said that there was a good deal of unhappiness in the junior hospital staffs. The registrar problem did not seem to be sorting itself out. This problem did not concern only the senior registrars. Registrars, senior house officers, and surgeons were all affected. The problem might appear beyond solution, but something should be done, and, if only they could get away from the idea that all consultants must be equal and that it was a disgrace to be an assistant physician or surgeon, it would be an advantage. He believed the Association should take a lead in this matter. The Council and the Central Consultants and Specialists Committee should try to sort it out and relieve this log jam. If something was not done he did not know what would happen.

Dr. HAMILTON said that the present position was deplorable. It was eighteen months since the Strachan Committee's report was put forward and accepted as Association policy, and now the principles of that report seemed to be dead. Everybody who looked at this matter in a realistic way realized that the hospital service must have another career grade. No service could be run by major-generals alone; there must be colonels. He would like to ask if the Chairman of the Committee could give an assurance that the proposals of his Committee contained the essential principles of the Strachan report, including that of a second career grade; if so, where were they?

Dr. DAVID BROWN said that a large part of the work in the hospitals to-day was carried out by senior registrars, and some of them even at the age of 40 were paid a ridiculously small salary for the work they were doing. They were discontented—and some were leaving the country for posts abroad.

Mr. LANGSTON said that the Ministry would not look at one of the main recommendations of the Strachan report, and that was why the Committee had not gone any further. Before any new form of grade was introduced as a permanent feature there had to be a review of the consultant and other needs of the regions. Until this had been done it was impossible to move the Ministry.

Mr. A. DICKSON WRIGHT said that under the old system there were assistant surgeons and full surgeons, and there should be something like that now. Much of the work was being done by registrars, and at present a man went straight from being a senior registrar to full consultant, and that was not right. If the consultant body could be increased by an influx of people of assistant standard it would not increase the number of full consultants. The position was arising now that when people over 40 years of age applied for a position they were considered on compassionate grounds, and the brilliant young man had to be content with a post as registrar. The great opponent to the assistant grade had been the B.M.A., because it felt that the Government would use these men in order to economize. But the right thing was to have some intermediate stage between full consultant and registrar. It was a criticism of the hospital service that so much was being done by the registrars.

Mr. HOLMES SELLORS said that it was continually being pointed out to the Ministry that there was a shortage of consultants. It had always been Association policy that there should be more consultants. On the question of the assistant consultant grade, had they not been warned by what had happened in the S.H.M.O. grade? Many had not a clear idea of what they meant by an assistant consultant. If registrars were doing more work than they should, was it not time for the consultant to ask for more help? He was very unhappy at the idea of a new grade being created.

Dr. ARTHUR asked if Mr. Holmes Sellors would agree that, if a consultant was a consultant for 20 years and a registrar was a registrar for ten years, there must be twice as many registrars as consultants.

Mr. GERRARD moved "That the Council expresses its concern at the lack of progress which has been made in solving the problem of hospital medical staffing." The CHAIRMAN said that the debate would be reported, and suggested that this would indicate that the Council's mind was seriously exercised about this problem.

Mr. LOGAN DAHNE, referring to the visit of Lord Moran to the committee to give an account of the work of the Minister's Advisory Committee on Distinction Awards, said that he had no doubt that the people who received distinction awards deserved them, but this Committee was dispensing public money in strict secrecy. No one knew who received what or why. They were entitled as taxpayers to know a little more about how and why this public money was dispensed.

Mr. D. S. PRACY (Atherstone) moved that this paragraph of the report be referred back.

Mr. DICKSON WRIGHT said that it would be contrary to ethics to publish this kind of information: it could be regarded as advertising.

Dr. DAVID BROWN seconded the reference back. He did not think anybody was very satisfied about a committee which worked in secrecy. The money should be a responsibility payment, as the Representative Body had said.

Dr. I. D. GRANT asked if some consideration could be given to the question of responsibility payments. If a consultant was of sufficient value to the community to be appointed in charge of wards then he had sufficient standing to merit an award or a responsibility payment for the work he did. The ordinary practitioner could see very little to choose in the men who were in charge of the wards. They were all equally good.

Mr. HOLMES SELLORS said that the Committee went into the question of responsibility payments. He did not claim that Lord Moran's Committee was right every time, but it was nearly always right, and anyone who felt that he should have a merit award could apply to the Committee. The fact that there were a number of vacancies was periodically notified. If the profession decided that they did not want the merit award system it would be abolished and the money would be lost.

Dr. WRATHALL ROWE thought that the Central Consultants and Specialists Committee could produce a tentative alternative scheme on which the Representative Body might

give its views. The point of the general practitioner having some say in merit awards was very important.

Mr. LANGSTON said that the point not brought out in the Committee's report was that this was the first major discussion it had had on this question for a long time. Lord Moran was invited to attend the Committee and give as much information as he felt able to. The paragraph in the report, "The Committee does not consider it desirable to take any action which would result in the abolition of the distinction award system, and it has reaffirmed its confidence in Lord Moran and his advisory committee," was actually passed in the form of two resolutions. If a reference back was accepted, the Council would be passing something contrary to the consultants and specialists' own resolution arrived at after a full discussion. It would be a serious matter in the eyes of the Committee. There was no question at all but that the entire Committee, representing all the consultants in the country, expressed an overwhelming vote in favour of the merit award system as it now stood.

Dr. J. A. PRIDHAM (Weymouth) said that this was a matter for the consultants themselves, and it would be unfortunate if the Council turned this down.

The reference back was defeated.

Dr. D. BROWN, referring to the Committee's comment on a resolution of the Annual Representative Meeting stating that the Council had failed to implement a resolution passed at the 1955 meeting relating to the Bradbeer report on the internal administration of hospitals, said that his Division's resolution was carried overwhelmingly by the Representative Body and yet the same evasive reply was received from the Committee. The resolution had expressed the belief that the lay and ancillary services must be subordinate to the medical and that the equal tripartite administration recommended by the Bradbeer Committee was not in the interest of the patient.

Mr. HOLMES SELLORS said that the Committee had made a careful commentary on the Bradbeer report, which was adopted by the Joint Committee.

Mr. STAVELEY GOUGH said that he had a great deal of sympathy for the attitude of the Representative Body. This was the one part of administration where the overall responsibility of the doctor stood out. The doctor-patient relationship was involved.

The CHAIRMAN said that the resolution was not mandatory and he wondered if the Committee would look at it again.

Dr. BROWN said he wanted the Council to consider this matter. A policy-making resolution had been passed by the A.R.M. and an autonomous body was flouting it.

It was agreed that the matter should be referred back to the Committee. A paragraph dealing with resolutions of the Representative Body on general-practitioner beds in hospital was also referred back. A further paragraph commenting on a resolution of the Representative Body recommending that all medical grades of so-called "whole-time" hospital staff should be allowed to pursue the practice of their profession in their off-time duty, and which after consideration was opposed by the Committee, was withdrawn.

The remainder of the report was adopted.

Private Practice Committee

Dr. ALEXANDER BROWN presented the report, which included a report on the negotiations with the Treasury on fees for part-time services by general practitioners for Government departments. One outstanding matter, the fee for a full examination and report in a single case, remained to be settled. The Committee recommended that the Treasury be informed that the Association considered that the fee for a comprehensive medical examination should be at least £2 2s., but would accept the offer of 37s. 6d. for this service without prejudice to the reopening of negotiations at an early date. The recommendation was agreed to.

Dr. HALE-WHITE asked if there was anything to report on the question of drugs under the National Health Service for private patients.

Dr. BROWN replied that there had been a joint meeting of the Private Practice Committee and the General Medical Services Committee, and a report of this meeting would be considered by each Committee at its next meeting. What the result would be he could not say at the moment.

The report was approved.

Finance

Mr. L. DOUGAL CALLANDER, Treasurer, presented the financial report. He said that finance was running more or less in the way he predicted at the last meeting, and he was still hopeful that there would be a surplus of £12,000 as against £47,500 last year. The Brighton meeting was very successful, but the cost of Representative Meetings was becoming from some points of view very high. The income from the exhibition depended on the size of the hall, and it might be necessary to consider seriously resorts where there was ample accommodation. It was never possible to accommodate all the people who wanted to exhibit. The position was more difficult than ever with the scientific exhibition. It was most undesirable to charge a registration fee, but the cost of the meeting was increasing very markedly. It had been suggested that he should be consulted on all proposals of the local executive committee involving expenditure of funds provided by the Head Office.

The report was agreed to.

Long Service of Staff

The CHAIRMAN OF COUNCIL, presenting the Office Committee report, drew attention to the retirement of Mr. W. Fish, of the accounts department, who had been in the service of the Association for fifty years. The Council agreed that suitable recognition should be made of his long and faithful service. The Committee had also considered a memorial to Miss M. E. Gregg, and was arranging for the purchase of a clock to be placed in Committee Room A in her memory.

It was also reported that Major D. D. Milne, a nephew and residuary legatee of the late Sir Ewen Maclean, had presented to the Association the silver trowel used by Sir Ewen when he laid the foundation stone of B.M.A. House in Sydney in September, 1939. The gift was accepted with gratitude and had been placed among the collection of things of historical interest at B.M.A. House in London.

Association's Publications

Dr. J. G. M. HAMILTON presented the report of the Journal Committee. He said that, for the ten months to October 31, the increase in the cost of production and dispatch was 7½% over the corresponding period in 1955. It was expected that there would be an overall net deficit on the publications for 1956 of about £900. This figure was reached after writing off stocks of the third collection of *Refresher Course for General Practitioners* published in October. £900 represented 0.2% of the turnover.

In response to a request, the Committee had decided to make the *Journal* available to dental and veterinary students at cost price.

Following a complaint by the Breconshire Local Medical Committee regarding the reporting of medical matters in the national press on the same day as the *Journal* was published, a representative of the local medical committee attended a meeting of the Journal Committee by invitation. He stated that his committee felt strongly that the *Journal* should not be released to the press until Friday, the day that day would be aware of the contents of the *Journal* before press comment appeared. The Journal Committee decided to reaffirm its previous decision to take no action which would be likely to harm the Association's relations with the press.

Dr. ANNIS GILLIE presented the Family Doctor Committee report. She paid a warm tribute to the lay assistant editor, Miss Joyce Ward, who was leaving in March to take

up a new appointment with one of the large publishing houses. Dr. Gillie said that it seemed there would be a net financial surplus at the end of the year, and that once again the magazine had been conducted at no cost to the general funds of the Association.

Other Committees

Mr. H. H. LANGSTON, presenting the report of the Constitution Committee, recommended that an extra day be added to the 1957 Annual Representative Meeting for discussion on the final report of the Committee. The recommendation was that the A.R.M. should commence on Wednesday, July 10, and the report form the first item of business of the meeting.

This was agreed to. Mr. Langston added that the final report would be presented to the Council at its January meeting.

Dr. J. A. PRIDHAM, Chairman of the International Relations Committee, presented the report which contained the suggested revised constitution for a British Supporting Group for the World Medical Association, to stimulate interest in and provide financial support for the World Medical Association. Membership would not be confined to medical practitioners, and would confer certain benefits according to the type of membership taken up. The recommendation to accept the constitution was agreed to.

The Annual Representative Meeting, 1956, had instructed the Council to continue to press the Government to ratify the Geneva Conventions of 1949, and it was agreed to send this resolution to the Foreign Office.

It was also agreed that two delegates and two alternate delegates, Dr. S. Wand, Dr. I. D. Grant, Dr. J. A. Pridham, and the Secretary, be appointed to represent the Association at the General Assembly of the World Medical Association in 1957.

Dr. H. H. D. SUTHERLAND presented the report of the Amending Acts Committee. He said that the Committee had discussed with Dr. J. B. Mathieson, Chief Medical Officer, Australia House, the various schemes which formed the Australian Health Service, and the information which he had given would be fully studied at the next meeting.

The CHAIRMAN OF COUNCIL presented the report of the Rehabilitation of Disabled Persons Committee in the absence of the chairman and any members of the Committee. The Committee had studied Recommendations 1, 2, and 32 of the Percy Committee's report, and sought for authorization to discuss the matters raised therein with the Ministry of Health, together with such representatives of other Government departments as the Ministry of Health considered desirable. This was agreed to. Other recommendations (which were agreed to) dealt with the way in which the Committee proposed that the subject of rehabilitation might be brought to the notice of general practitioners. The Committee wished to explore the possibility of publishing a series of articles in the *British Medical Journal* on aftercare in various conditions, and recommended that the attention of the British Postgraduate Medical Federation and of postgraduate medical deans be drawn to it. It was also recommended that the General Medical Council be approached on the possibility of rehabilitation being included in their recommended subjects, and that papers on the medical and social aspects of aftercare be included in the annual scientific meetings of the Association. Lastly, that consideration be given to the possibility of the Annual Meeting in Birmingham in 1958 having as a central theme the medical and social aspects of aftercare, with special reference to the rehabilitation of the disabled.

All these reports were accepted. The reports of the Film Committee, the Central Ethical Committee, and the Maternity Services Committee were approved.

Other Business

From the observations of members of Council it was obvious that there is a good deal of unevenness in the

allocation of petrol to doctors. The Ministry of Fuel and Power is to be asked to look into it and to issue uniform instructions to the petroleum officers in all areas.

It was reported that Sir Tudor Thomas had accepted nomination for election to the council of the British Red Cross Society to represent the Association. Dr. H. D. Chalke and Dr. J. B. Tilley were appointed to represent the Association at the 1957 Congress of the Royal Society of Health, and Dr. A. Barker was elected to serve on the Joint Committee of the Association and the Magistrates' Association in the place of the late Dr. Denis Carroll. A report was received from Dr. F. A. Belam on the conference on supplements and additives to feeding-stuffs for animals held by the British Veterinary Association in November.

Plans for a study tour to Denmark in 1957 were announced. The tour is being arranged by the representative of the Danish Institute in Great Britain and will take place from September 1 to 12.

The CHAIRMAN OF COUNCIL said that he was authorized at the last meeting to make an appeal through the columns of the *Journal* for Hungarian refugee doctors if he felt it necessary. He had kept in touch with the Office throughout, and the problem was a difficult one. There were about 36 such doctors here; some wished to remain, others did not. Some of the doctors had already been helped financially, others would need help to qualify. It was proposed that a conference of the various interested bodies should be held to examine the problem in all its aspects. There were also some British doctors now in this country who had been turned out of Egypt, and these also were being assisted where needful. The fund used was the Charles Hastings Fund. It was agreed that the profession should give such assistance as it could to the Hungarian refugee doctors.

BRITISH MEDICAL GUILD

A meeting of the Board of Trustees of the British Medical Guild was held at B.M.A. House on December 19, with Dr. S. WAND in the chair.

The Board of Trustees considered whether, in view of the present position of the remuneration claim, the local machinery of the Guild should be put into operation.

Dr. J. A. L. VAUGHAN JONES moved that the Guild machinery be put into operation, and this was seconded by Dr. A. V. RUSSELL and carried unanimously.

In reply to Dr. H. H. D. SUTHERLAND, Dr. MACRAE, Secretary, said that "setting the machinery in motion" meant inviting the hon. secretary of each local Division of the British Medical Association to act as convener of a meeting of the whole profession in his area, in order to set up a local committee of the Guild. The local committees would then arrange convenient groups of doctors and appoint conveners of groups, meetings of which would be held for discussion on the position.

It was agreed to inform the trustees of the various defence trusts of this decision, and that the Negotiating Committee should also be informed of the action which the Board was taking.

HUNGARIAN DOCTORS

Members who know of Hungarian doctors needing advice or help should get in touch with Brigadier H. A. Sandiford, Medical Director, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1. The majority of the 45 doctors known to have arrived here have been interviewed at the Bureau and advised on registration and the prospects of practice in this and other countries. A few have obtained temporary registration for hospital work. The B.M.A. has given each a small donation. Several doctors and their families are receiving hospitality from British medical hosts for a few weeks.

OPHTHALMIC GROUP COMMITTEE

A meeting of the Ophthalmic Group Committee was held on December 14 at B.M.A. House, with Mr. O. GAYER MORGAN in the chair.

Spectacles for Hospital Patients

The Committee has several times discussed the tendency of patients to leave the hospital eye service because of the narrow range of spectacle frames provided, and their inability to have National Health Service lenses fitted to private frames. The matter was again raised with the Ministry on the revision of the Supplementary Ophthalmic Service regulations. The Ministry replied that it was well aware of this problem, which had been repeatedly considered. There were two serious difficulties, the first being that there was no power under which hospitals could purchase and supply to patients frames outside the National Health Service ranges—hospitals could only supply and charge in accordance with the statement of fees and charges, unless special frames or lenses outside that statement were prescribed by the hospital ophthalmologist as clinically necessary for a particular patient. The second difficulty was a practical one. New types of commercial frames were constantly appearing, and the department could not examine them all and fix a charge appropriate to the hospital eye service. It was doubtful, concluded the Ministry, whether a charge could be fixed for a single type of "private" frame which could preserve the principle that the hospital service did not seek to make a profit nor to compete unfairly with commercial firms.

The opinion was expressed that all that was necessary was to extend the hospital range by two or three further frames—for instance, the "library" frame. If this were done hospitals would be able to retain many of their patients. A survey had been carried out in one hospital, and it was found that 75% of patients chose from two types of frames; 10% chose one particular frame; and 10% chose one out of six other frames, so that ten types of frames were in demand to suit 75% of hospital cases. Last year this particular hospital dispensed 54% of its ophthalmic prescriptions. It was suggested that the Ministry should be informed of these figures and asked to agree to the provision of a limited number of additional frames. A wider range had been agreed to for children.

Another point which had arisen under the revision of the Supplementary Ophthalmic Service regulations related to the remission of charges where glasses were repaired or replaced, to which the Ministry had replied pointing out that glasses supplied privately, but of a type suitable for repair with parts supplied under the Supplementary Ophthalmic Service, could in principle be repaired free of charge at the discretion of the Ophthalmic Services Committee. Only glasses supplied under the Supplementary Ophthalmic Service could be replaced free of charge.

Rehabilitation of Disabled Persons

At the request of the Association's Rehabilitation Committee the Committee considered recommendations contained in the Piercy report relating to blind persons. The Piercy Committee recommended that the provision of work for the blind under section 29 of the National Assistance Act should be a duty of the local authorities, carried out under the powers to be given to them by the Disabled Persons (Employment) Act. Expenditure incurred by local authorities for social rehabilitation should rank for a grant. It further considered that the provision of a placement service specially for the blind led to a patchwork of administration resulting in a service for the blind inferior to that available for other classes of disabled persons. The Piercy Committee recommended, however, that the Ministry of Labour should assume full responsibility for ensuring that the placing of the blind was put on a satisfactory footing and should provide the placement service, thus relieving local authorities of the responsibility. Local authorities and voluntary organ-

izations were at present carrying out the work satisfactorily, and should continue to do so if they wished, at any rate for the time being.

The Ophthalmic Group Committee expressed the view that it would be better not to mix services for the blind with those for other persons, and that the employment by local authorities of voluntary organizations to care for blind people was working satisfactorily. The personal contact made possible by the present arrangements for co-ordination of facilities should be preserved.

Lenses for Reading-glasses

As reported at the last meeting of the Committee, the Ministry of Health had been considering the policy to be adopted now that production of flat lenses had ceased. It was reported to the Committee that a letter had been received stating that the existing provision for the supply of flat lenses for reading-glasses under the N.H.S. would continue until December 31, and from January 1, 1957, curved lenses would be provided for all glasses without extra charge, except in cases where flat lenses were desirable in the interests of the patient. Where flat lenses were provided in such cases the charge would be the same as for curved lenses. The statement of fees and charges would be amended to give effect to this policy.

The CHAIRMAN reported that the Joint Committee of the Ophthalmic Group Committee and the Faculty of Ophthalmologists had finished its series of meetings on future policy. The report was practically ready, and copies would be sent out to its constituent bodies early next month for discussion.

MEDICAL WAR RELIEF FUND
SIXTEENTH ANNUAL REPORT

The year ended August 31, 1956, is the sixteenth since the formation of the Fund. Looking back over the early years, it is well to record that it was due to the foresight of the late Dr. G. C. Anderson (Secretary of the British Medical Association) that the Fund was established. It was realized that as a result of the war medical practitioners and their dependants might find themselves in unexpected financial difficulties. Not only was there risk to life during active service with the armed Forces, but there was risk also in civil life from air raids. In addition, evacuation of patients brought great changes to many practices.

Dr. Anderson sought the experience gained by the Royal Medical Benevolent Fund from the War Emergency Fund, which was established during the 1914-18 war.

An appeal was issued by the Presidents of the British Medical Association, the Royal Colleges, and the Royal Medical Benevolent Fund. Contributions quickly reached the office from members of the profession, and great generosity was shown by those overseas. A total of £84,643 was subscribed; the total distributed to date in gifts and loans amounts to £83,245.

For the year ended August 31, 1956, the amount awarded in gifts was £2,407 9s. 8d., of which were:

15 Awards for education (schools and universities) ..	£1,276	0s.	0d.
8 Awards for maintenance ..	£887	0s.	0d.
6 Awards for special gifts ..	£244	9s.	8d.
	£2,407	9s.	8d.

All the children who have been helped have done well, and their reports are satisfactory. It is gratifying to know that one boy has just completed his medical training, and it is anticipated that another student will qualify during the coming year. A girl has been accepted as a student at University College and a boy has gained a Foundation Scholarship at Epsom College.

It is not possible to forecast the exact figure which will be needed to meet future requirements for school fees, but

it is hoped that the present available funds will enable those boys and girls now receiving assistance to complete their education.

Awards for maintenance have been made to ensure continuity of help in needy cases, and this year six special grants were given, all being for unexpected emergencies.

The Committee has received continued and much-appreciated help and advice from the Royal Medical Benevolent Fund and the Royal Medical Foundation of Epsom College. The Committee wishes particularly to refer to all the work undertaken by Mr. Pennefather, of the R.M.B.F., Secretary of the Distribution Subcommittee. He has held the office since the inception of the Fund, and it is with sincere regret but most grateful appreciation of all his work that the Subcommittee bids him farewell on his retirement.

The Secretary of the Fund (Dr. A. V. Kelnack) will take over the Distribution Subcommittee, and all correspondence should be addressed to her at B.M.A. House.

The Committee wishes to express its gratitude to the officers of many benevolent funds, secretaries of B.M.A. Divisions, and other friends for their helpful advice and co-operation, and particularly to Messrs. Price, Waterhouse & Co. for their services as Honorary Auditors.

The audited statement of accounts for the year ended August 31, 1956, is appended to this report.

E. A. GREGG,
Chairman.

STATEMENT OF ACCOUNT—AUGUST 31, 1956

	Accumulated Totals to August 31, 1955	Transactions of Year ended August 31, 1956	Accumulated Totals to August 31, 1956
	£ s. d.	£ s. d.	£ s. d.
Income:			
Donations received ..	84,633 15 11	9 9 0	84,643 4 11
Interest on investments ..	7,326 19 7	174 15 3	7,501 14 10
Total Income ..	£91,960 15 6	£184 4 3	£92,144 19 9
Expenditure:			
Loans, less repayments and amounts converted into gifts ..	13,226 10 0	(2,051 10 0)	11,175 0 0
Gifts ..	68,148 14 11	3,869 5 7	72,018 0 6
Total Awards ..	81,375 4 11	1,817 15 7	83,193 0 6
Administration expenses ..	2,775 4 8	214 2 10	2,989 7 6
Losses on realizations of investments ..	324 11 2	437 5 3	761 16 5
Total Expenditure ..	84,475 0 9	2,469 3 8	86,944 4 5
Surplus (subject to depreciation in value of investments):			
Balance at August 31, 1955 ..	7,485 14 9		
Excess of expenditure over income for the year ..		(2,284 19 5)	5,200 15 4
Balance at August 31, 1956 ..	£91,960 15 6	£184 4 3	£92,144 19 9

NOTES:

1. The surplus of £5,200 15s. 4d. at August 31, 1956, was represented by:

	£ s. d.
Investments at book values at August 31, 1955 ..	6,985 18 9
Less: Sold during year ..	2,000 0 0
	4,985 18 9
(Market value at August 31, 1956—£3,975)	7 4 1
Sundry debtor ..	207 12 6
Balance at bank ..	
	£5,200 15 4

2. At August 31, 1956, gifts amounting to £1,275 had been approved for future payment over a period of years.

Report by the Honorary Auditors.—We have examined the above statement with the books and records of the Fund and have found it to be in accordance therewith. We have not obtained independent confirmation of the balances of loans outstanding amounting in total at August 31, 1956, to £11,175.

3, Frederick's Place,
Old Jewry, London, E.C.2.
December 13, 1956.

PRICE, WATERHOUSE & CO.,
Chartered Accountants.

The Ministry of Health's booklet, *National Health Service Superannuation Scheme (England and Wales): An Explanation*, has been revised again to take account of changes made by the N.H.S. (Superannuation) Regulations, 1955, and Superannuation (Local Government and N.H.S.) Interchange Rules, 1955. The booklet deals, as simply as possible, with contributions, benefits (including examples), reckoning of service, and special provisions for doctors and dentists in the general-practitioner services. New entrants to the scheme get a free copy; it is also on sale at the Stationery Office, price 1s.

GENERAL MEDICAL SERVICES COMMITTEE

The General Medical Services Committee met on December 20, with Dr. A. B. DAVIES in the chair. Also attending the meeting were Dr. S. Wand, Chairman of Council, Dr. I. D. Grant, Chairman of the Representative Body, and Mr. L. Dougal Callander, Treasurer of the Association.

Dr. H. Guy Dain Honoured

The Annual Conference of Local Medical Committees, having approved the proposals for the institution of the Claire Wand Award for outstanding services for general practice, the Trustees of the Claire Wand Fund recommended that the first award be presented to Dr. H. Guy Dain. With the present session Dr. Dain will have completed 40 years' service on the G.M.S. Committee and its predecessor, the Insurance Acts Committee, of which he was chairman for 11 years. This long period of devoted and outstanding service had contributed so much to the cause of the general practitioner and his work that the Trustees felt that such recognition as they could bestow could not be more highly deserved.

Dr. W. M. KNOX, one of the two remaining members of the Committee who were also members of the old Insurance Acts Committee, said that he was a member of that body when Dr. Jonas died suddenly and Dr. Dain took over the duties of Chairman. He congratulated Dr. Dain and thanked him for the great services he had rendered.

Dr. F. GRAY said that he also was a member in the interim period, and he particularly remembered the struggle with the Ministry of Health under Dr. Dain's leadership. He would add his tribute to Dr. Dain, who was then laying the foundations of work which had since been carried to fruition.

The recommendation was carried with acclamation. Dr. DAIN, in response, said that it was difficult to say anything at all; it was rather overpowering to find this item at the beginning of the agenda. He was not unappreciative of what had been said, but he had enjoyed it all. The work had been an interesting experience over the years. To have the first award of the Claire Wand Fund was very gratifying, and he thanked the Committee for the way he had been received that morning.

The CHAIRMAN welcomed Dr. Harding, a new member of the Committee.

Central Pool

The Ministry of Health having contended that the Committee should now suggest some means of arriving at a reliable estimate of the earnings of general practitioners in the National Health Service from private practice, a meeting was held by officers and officials of the Association with Professor Allen and the Association's accountant to discuss the matter. The Ministry, it was reported, have now been informed that the Committee would not agree to any inquiry into this matter which relied upon any sort of self-selected sample or which involved the use of figures derived from any source other than an inquiry designed solely for the purpose. The Committee was anxious to obtain a more up-to-date assessment of private earnings, since it was convinced there had been a steady decline since the issue was decided by Mr. Justice Danckwerts in 1952, but it was essential that a large-scale inquiry must be undertaken if the figure was to be assessed at anything like a reasonable degree of accuracy. The view was that a sample of less than 75% of all general practitioners would give a distorted figure. In addition it must ascertain how widely varied was the distribution of private-practice earnings and how much of what private practice remained was undertaken by older practitioners. The accounts on which the inquiry would be based would need to be related to the actual earnings for the year in question.

Drugs for Private Patients

A report of the joint meeting between the Private Practice Committee and the G.M.S. Committee held in November was received and discussed, and it was agreed that it

the Private Practice Committee decided to set up a sub-committee to go further into the matter the G.M.S. Committee would afford full support.

Publication of Annual Report

The Committee considered suggestions which had been received from the Editor of the *British Medical Journal* with regard to the publication of the Committee's Annual Report in the *Supplement*. The Editor expressed the view that it would be in the interests of the Committee if a much shorter version of the report was published, which would include the features of particular interest to the profession at large and those which the Committee wished to have stressed. The Editor thought that if the editorial staff could feel free to present in attractive fashion the outstanding portions of the report in about eight pages of the *Supplement* the work of the Committee would become more widely known. The work would be done in closest collaboration with the Secretary and with the approval of the Chairman of the Committee.

After a short discussion it was agreed to accept the Editor's suggestion, and it was left to the Chairman and the Secretary to determine in consultation with the Editor how best to distribute the full report to those for whom it was essential.

Remuneration Claim

The CHAIRMAN said that on the invitation of the Chairman of Council he had attended the Council meeting the day before and had addressed the meeting in order to bring the Council up to date on this important matter. He hoped that his action would be approved in view of the importance and urgency of the issue. (Agreed.)

Dr. Davies then gave an account of his speech to the Council (see "Proceedings of Council," at page 1). He added that when general practitioners came into the Service they did so on the promise of the Minister that both the Spens reports would be implemented. The Minister's statement was recorded in *Hansard*. The letter from Sir John Hawton stating that no contractual obligation enforceable in law existed was beside the point, and there had been several letters backwards and forwards asking the Minister for more details which had not yet been forthcoming (*Supplement*, December 29, p. 227). In a letter dated December 3 Sir John Hawton stated that the issue was twofold—one a general claim for increased remuneration and the other the contractual obligation. On the first, the Minister had decided that under present economic circumstances he could not at present consider it, and on the second he said there was no contractual obligation enforceable in law.

There was a moral as well as a contractual obligation between the Minister and the profession. The Negotiating Committee had not retreated one inch from its position nor surrendered a farthing of the claim. The Negotiating Committee would meet on January 3 and a deputation would see the Minister the next day.

Dr. S. WAND (Chairman of Council) said that the Minister promised a reasoned reply based on the advice of his legal advisers to the Committee's supplementary memorandum. This had not come. He did not think, however, that anybody had believed the question would be solved immediately, and so far the Minister had not been willing to discuss the merits of the case. It was clear that decisions would have to be made in the near future on the kind of action to be taken, and the Council of the Association had decided to call a meeting of the British Medical Guild, which had the necessary power to carry out the fight. The Board of Trustees of the Guild had decided that the machinery of the Guild should be prepared, and instructions were now going out to all secretaries to overhaul the machinery in the various areas. Neither the Council nor the Guild could take any further action at the moment. It was in the hands of the Negotiating Committee, which was a Joint Committee.

Dr. O. C. CARTER, speaking as a member of the Spens Committee, said it was agreed that the Spens Report should be binding on the profession and the Govern-

ment, and the greatest possible care was taken in forming the recommendations. At the time the profession was told that Spens was the yardstick for all time for adjusting remuneration. Although as a purely private practitioner he was not directly concerned in the dispute, he thought the strongest possible steps should be taken to see that the promises made in 1947-8 were implemented.

Dr. KNOX, as another member of the General Practitioner Spens Committee, agreed with what Dr. Carter had said. The Spens Committee reviewed the remuneration of the general practitioners, and the Danckwerts award provided the means of adjusting it to particular times.

Dr. J. C. ARTHUR reminded the Committee, as he had reminded the Council, that the Minister was bound by Parliamentary policy which was affected by present inflationary trends. Extra money awarded to any profession would produce that much more inflation, but in his desire to combat inflation the Minister was degrading the status of the doctor. Spens must be re-established.

Dr. B. CARDEW said that Parliament had not repudiated Spens, but one had to accept that Parliament had been compelled to override all sorts of previous decisions. Whatever happened, Spens must not be allowed to slip. If the Government were allowed to adopt the position that Spens was no longer the yardstick, the profession would be in an intolerable position. The moment was approaching when action and timing would have to be clearly thought out. Was the Negotiating Committee thinking ahead?

The CHAIRMAN said that the remit of the Negotiating Committee, which was composed of members from the Committee, the Joint Committee, and three public health members as observers, was to prepare the case and conduct the negotiations.

Dr. I. D. GRANT pointed out that the attitude of the Royal Colleges and the Joint Consultants Committee in case of a fight was not known, and Mr. NICHOLSON LAILEY, speaking as a private individual, said that it was essential that the Guild machinery should adequately represent consultants and general practitioners. It would be the opinion of the consultants at the periphery which would affect the central consultants.

Dr. M. SORSBY pointed out that the longer the matter went on the lower would become the doctor's remuneration in relation to the cost of living, and more and more practitioners would get deeper and deeper into financial difficulties. What did the Negotiating Committee propose to put before the profession?

Dr. A. BROWN said that if the Negotiating Committee had reached an impasse it became a question of what the profession was going to do, and information as to what the profession thought would be obtained through the Guild.

Dr. H. C. FAULKNER said that the Committee could not afford to wait for the machinery of the Guild; general practitioners were expecting a clear lead now.

Dr. B. BURNS did not see why the profession should indulge in this bickering with the Ministry for three or four years. He could not see that anything had been done to improve relations between doctors and their patients. The reply of the Minister gave the opportunity to look into the Service as a whole; terms of service were wrapped up with the terms of remuneration. He did not think the Committee was as familiar as it should be with opinion at the periphery. Doctors were far more concerned with the nature of the Service than they were with the question of remuneration. This might be the last opportunity to effect an alteration in the Service.

Dr. A. M. MAIDEN said that the lead had to come from the British Medical Association. The average practitioner did not understand the set-up of the Negotiating Committee, but he understood the British Medical Association.

The CHAIRMAN said he gathered that the Committee supported the actions of its representatives. He did not think the Negotiating Committee should be rushed with a resolution urging precipitate action. He would suggest a resolution on the lines that the G.M.S. Committee, having heard a report from its acting chairman on the progress of

negotiations to date, and having learned that a further meeting of the Negotiating Committee and a meeting with the Minister were due to take place, pledged its full support to its representatives on that Committee, and asked to be informed without delay of the outcome of the meeting with the Minister so that it might consider subsequent action.

This resolution was carried unanimously, and it was decided to send copies to the Negotiating Committee, to local medical committees, and to the *Journal*.

Action of the N.I.D. Trust

A meeting of the Trustees of the National Insurance Defence Trust was held during the day. It was reported that the Council of the Association was setting the machinery of the Guild into operation but that the Guild had no funds of its own. It was right that the Trust should be the first to make a contribution to the Guild's funds, said Dr. KATE HARROWER, the Hon. Treasurer. At the moment it would be a guarantee of money which could be drawn on as and when desired, and she suggested that £10,000 should be made available from the Trust funds if it was needed.

This was agreed to unanimously.

The Trustees also agreed to bear the cost of subsistence allowances attributable to the G.M.S. Committee and members of the Conference, in conformity with the decision of the Representative Body to pay subsistence allowances to members attending central meetings.

Rural Practice

Dr. C. F. R. KILLICK presented the report of the Rural Practices Subcommittee. He said that the Subcommittee considered the resolution of the A.R.M. which stated that doctors found it impossible to co-operate fully in the economy in prescribing drugs because of advertising methods. But the Subcommittee felt that there was little purpose in going to the pharmaceutical industry and that the resolution should be referred to the Association's committee appointed to go into the matter of prescribing. The list of specially expensive drugs should be left as it was at present.

The most important item of the report was the interim report of the Mileage Committee. The Subcommittee expressed its concern at the manner in which a minority report had been sent to the Ministry without prior consultation and after the report had been agreed.

The Mileage Committee recommended that none of its recommendations should be implemented until the final report was available and had been given to the medical profession, to local medical committees, to the G.M.S. Committee, and to the Conference, and only after it had been agreed upon by these bodies should any recommendations be implemented. The present report was only an interim one, and the Subcommittee felt that the Minister should be informed that the Committee could not at this stage discuss these recommendations with officials at the Ministry. Provisionally, and pending the final report on the matters still outstanding, the proposals contained in the interim report should be approved.

In reply to a question on the delay, Dr. Killick said that the problems of mileage were very big. They had not been dealt with for many years, and to get a scheme to suit all areas was almost impossible.

It was agreed that the interim report should be received and that no exception should be taken to the proposals. Dr. Killick was warmly thanked for his patience and perseverance in a difficult matter.

Prescription Charges

The CHAIRMAN reported that a press conference was held on the action of the Minister in imposing the 1s. per item charge on prescriptions. It was well attended and good publicity resulted. It was reported that the Rural Practices Subcommittee supported the action of the Committee, and that several letters opposing the imposition of the charge had been received.

Elimination of Inflation

The CHAIRMAN OF COUNCIL reported that the Distribution Committee had been informed that the Minister had agreed to set up an alphabetical register in an endeavour to eliminate inflation of doctors' lists. It was said that the cost of any register other than an alphabetical register would be prohibitive.

It had been agreed at an earlier meeting to ask an outside firm of business consultants to look into the problem, and a question was raised whether these inquiries should be pursued. It was decided to ask the Ministry to confirm that the Minister had agreed to the formation of an alphabetical index, and, if so, that the outside inquiries be discontinued.

Trainee General Practitioner Scheme

A report was given of a meeting at the Ministry of Health at which the report of the Trainee General Practitioner Subcommittee, which had been approved by the Committee and the Conference, was discussed. Mr. D. C. BOWIE, who led the deputation, said that the Ministry asked that they might have an observer on the advisory body which was to be set up to review the future of the scheme, and the representatives thought there would be no objection to that. The second point was that where any question of appeal arose, unless both parties agreed to a local hearing, the appeal should be heard under the regional organization proposed. Thirdly, the Ministry were quite in agreement with the lowering of the present minimum list of 2,000 patients, provided that the circumstances of the practice enabled sufficient training to be given. Fourthly, the Ministry undertook to bring to the notice of every university throughout the country the value of the courses for trainers organized by the British Postgraduate Medical Federation in London. The Ministry were sending out a letter to executive councils asking them to study the report and consider how best the recommendations might be adopted locally. A letter would also be sent to local medical committees from the Secretary of the Committee amplifying the section of the report relating to appeals.

The CHAIRMAN said that it was most satisfactory that the Ministry had accepted the recommendations practically *in toto*. The report was accepted and the draft letters approved. It was also agreed that the Committee should pay the expenses of G.M.S. Committee members who sat on the appeal body in the same way as for other tribunals. The Committee expressed its appreciation of Mr. Bowie's chairmanship of the subcommittee.

Payment for Examination of Employees

The Joint Consultants Committee had been considering the operation of paragraph 14 of the Terms and Conditions of Service of hospital medical staff which excluded from the National Health Service the examination and reporting upon employees or prospective employees at the request of the employer. Consequently fees could be claimed and retained by hospital medical staffs for this work, except where the patient was referred to hospital by a medical practitioner for a second opinion, when no fee could be charged. This created a difficulty, and the Joint Committee took the view that in such cases the consultant should be entitled to a fee as he would be if the employee was referred to him direct. The Ministry, however, took the view that if the general practitioner required a consultant opinion the latter must do the work within his contract. The Joint Consultants Committee decided to seek the views of the G.M.S. Committee before taking the matter further.

Professor CLOAKE explained that the general practitioner was not necessarily a practitioner in the National Health Service, and he understood this was a service paid for by the employer. The general practitioner should give the report asked for on the basis of his own examination and responsibility. If in the course of his examination he found grounds for a more extensive examination, and if that included obtaining the opinion of a consultant, he should do it later after sending in his report. The obtaining

of the opinion of a consultant was obviously to the advantage of the patient, and consultants would have no objection to giving an opinion if that was all they were asked for. It was where an opinion was asked for and used in the report to the employer that unfairness arose.

After a little discussion the CHAIRMAN said that there were two lines of action for the general practitioner. Either he felt that for his own benefit, as the patient's doctor, the consultant's opinion was necessary before he committed himself, or that it was in the patient's interest. Where a consultant's opinion was desired purely from the point of view of compensation or for an employer's information a fee should be paid to the consultant. This view was concurred with by the Committee, and it was agreed to so inform the Ministry and the Central Consultants and Specialists Committee.

Other Business

A letter was received from the Ministry of Health stating that further consideration had been given to the question of the payment of expenses of candidates for appointments attending interviews at a distance from their homes, and that it was agreed that general practitioners in contract with an executive council would be reimbursed at the rates payable to Health Service officers in the higher subsistence category when attending interviews for hospital appointments, and the same rates would apply in respect of applicants for general-practitioner vacancies. This was accepted.

It was also reported that the Department of Health for Scotland had agreed to the appointment of a separate committee to investigate prescribing in Scotland. The Committee would also investigate the question of hospital prescribing.

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

A meeting of the General Medical Services Subcommittee (Scotland) was held in the Glasgow Regional Office on Tuesday, December 11, with Dr. C. J. SWANSON, of Aberfeldy, in the chair.

Membership of the Subcommittee

The Subcommittee received with regret the news of the death of two of its senior members, Dr. Benjamin Hutchison, of Cambuslang, and Dr. D. Dale Logan, of Newmains. Tribute was paid to the valuable services rendered by these two practitioners during their terms of office.

Dr. D. Livingston Kerr, of Lanarkshire, Dr. James Watson, of Thornhill, and Dr. D. M. F. Batty, of Edinburgh, were welcomed to their first meeting.

Mileage

The news that the Mileage Committee for England and Wales had published its report was received with interest, and it was agreed that, although this report applies only to England and Wales, it would be very helpful if it could be seen by the Subcommittee's Rural Practitioners' Subcommittee.

Prescribing Costs

The Subcommittee received with satisfaction information from the Department of Health, in connexion with the proposal to appoint a United Kingdom Committee to examine prescribing costs, that, following representations from the Subcommittee, a separate committee would examine the position in Scotland, and that its terms of reference will cover prescribing in the hospital service as well as in general practice.

Prescribing

It was reported that, following a request from the Subcommittee, the Department had agreed to add tube gauze to

the schedule of prescribable appliances, provided it was restricted to prescribing on form E.C.10A. The Subcommittee agreed to the Department's suggestion.

Smallpox Vaccination Publicity

The Subcommittee considered a proposed circular from the Department to executive councils drawing attention to a vaccination publicity poster which might be obtained for general practitioners who wished to display it in their consulting-rooms. The Subcommittee agreed both with the contents of the circular and with the poster.

Scottish Medical Practices Committee

The Subcommittee agreed to nominate Dr. James Watson, of Thornhill, for appointment to the Scottish Medical Practices Committee in place of the late Dr. Benjamin Hutchison.

Elimination of Inflation

The CHAIRMAN reported that this important subject had been discussed with representatives of the Department at the last routine meeting, and that it had been agreed that the Department would request the Ministry of Health to arrange for a joint meeting with the Minister of Health and the Secretary of State, when representations could be made regarding the urgency of introducing measures to combat the apparent increase in inflation. It had also been agreed that the representatives of the Subcommittee would ask the General Medical Services Committee to approach the Ministry with a similar request.

Sickness among Hospital Staffs

The Subcommittee considered a letter from the Dundee Local Medical Committee about a departmental memorandum dealing with the general question of sickness among hospital staffs, and issued by the Eastern Regional Hospital Board to boards of management. The Dundee Local Medical Committee was concerned about the possibility that, if certain of the arrangements suggested are enforced, the position of the general practitioner attending the sick member might well be undermined. It was reported that the memorandum had not been seen by the Joint Consultants Committee (Scotland), and it was agreed, therefore, that before further consideration was given to the matter the views of that Committee should be obtained.

HOSPITAL MEDICAL STAFF BOARD-AND- LODGING CHARGES

The agreement in Committee B of the Medical Whitley Council on a scale of charges payable by resident medical staff in the hospital service, of which preliminary notice was given in the Ministry's circular letter to hospital authorities dated July 25, 1956 (see *Supplement*, August 11, p. 99), has now been published in detail in a Ministry memorandum (H.M.(56)107) and M.D.B. Circular No. 34.

The memorandum points out that various questions relating to board and lodging are still under consideration by a subcommittee of Committee B. The most important of these is the question of accommodation standards, and this is now under active discussion by the subcommittee.

N.H.S. STAFF PAY INCREASES

National Health Service administrative and clerical staff earning up to £1,200 a year have been awarded a 3% increase in salary on the basis of the rise in the cost of living since February 1, 1956. Another industrial court award gives an immediate increase of 5% on the basis of the rise in the cost of living since September 1, 1955, to N.H.S. dispensing assistants. Medical laboratory technicians in the Service will also receive an immediate 5% increase in salary.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Reform of Health Service

SIR,—It is evident from the many letters written by practitioners from all over the British Isles that there is growing dissatisfaction with the working of the National Health Service and that "leadership by the B.M.A." is being demanded. I believe that the initiative for change must come from the periphery, so that "the B.M.A." can know the numbers and views of those they will have to represent. The practitioners need a standard round which to rally, an alternative scheme which they can discuss and vote upon in the Divisions and then instruct their representatives accordingly.

I hope to offer a scheme which will serve as a basis for discussion and amplification. In doing so I am assuming that it is the policy of both the "great" political parties that a National Health Service free to all users should exist, and it can also be assumed that the majority of the patients also think so—for complaints from the public are few. For this reason the National Health Service will have to be modified, and in such a way as to (1) be in the best interests of the patient, (2) ensure professional freedom from pressure of, or allegiance to, a "third" party, and (3) maintain a fair form of remuneration. Best interests of the patient would be served if they were permitted to attend the doctor of their choice as required and not to have to "register" with one particular doctor. It would help restore the doctor-patient relationship if the choice of doctor were free each time advice was sought, and the patient would then be that doctor's "patient" only as long as he consulted him, as has always been the case in private practice. Administratively, this would mean that the patient would be regarded much as the "temporary" patients are at present, and a duly completed record card would be forwarded to the executive council promptly and fully completed (for the remuneration would depend on it). Professional freedom can only be ensured by the return of ownership of goodwill to all practitioners. When filling vacancies the successful applicant would have first option on the purchase of the goodwill of the practice. In this way an industrious, good practitioner could, by his work and skill, increase his practice and its value to him, and his wife would more willingly devote her life to a tangible asset rather than feel herself the unpaid servant of an impersonal State service.

A fair form of remuneration would be ensured by means of payment per item of service. It can be envisaged that a global sum allocated out of general taxation funds to a new National Health Service might be no larger than the present sum, but that its distribution would be in accordance with the services rendered professionally, as shown on the "temporary" patient cards submitted, and not necessarily, as at present, to those with the most "heads" on their list. An even more effective way of restoring the doctor-patient relationship would be for the doctors to render accounts direct to their patients on an appropriate E.C. form on which could appear an approved scale of charges, and the patients could present these accounts when duly receipted by the doctors to an authority for repayment, in full or in part, depending on their incomes. This would supply an incentive for a doctor to work secure in the knowledge that he was still in that patient's confidence and was not by his enthusiasm and availability at all hours going to decrease the value of his capitation fee. The patient would also feel that he was rewarding his doctor personally and would feel that he was obtaining something worth paying for, for many regard free advice and attention as suspect of "utility" and offer to pay for private advice when really worried.

In a letter of this length I cannot enlarge upon the many benefits to both doctor and patient offered by such a scheme. I had hoped that some more eminent member of our pro-

fession would have attempted to crystallize the feelings of the practitioners in order to produce, in the widest possible terms, a standard to which all who wished for a change could rally, but none has been forthcoming and I have ventured to submit this scheme before the ardour of the many displeased practitioners is dissipated in a host of resolutions. May I ask that all those who feel that they are for such a scheme should say so without qualification at this stage?—I am, etc.,

Hildenborough, Kent.

C. GLAISHER.

Unity of Purpose

SIR,—If your readers will swallow Dr. Bruce Cardew's final paragraph (*Supplement*, December 29, 1956, p. 230), they will swallow anything. Almost the only resolution of the 1956 Conference of Local Medical Committees which expressed a decision of the conference against the will of the platform was designed to mitigate the injustice of an absent principal's responsibility for the acts and omissions of his deputy. It was passed by a substantial majority, but only the vigilance of its movers resuscitated it after attempted infanticide by way of an unfortunate error of reporting in the *Journal*. The G.M.S. Committee later made no mistake about smothering the infant, however, and it was quietly laid to rest in the Committee's report, among a collection of trivia which "called for no action."

As Dr. Cardew figured prominently among the assassins, he owes it to your readers to explain how he reconciles this procedure with his brazen pieties about "considered decisions of conferences" and "the whole basis of democratic representation." Turning to Dr. Cardew's second paragraph, it is clear that he and I keep different company. It is rare for me to meet a doctor who has a good word to say for the existing system. And how could it be otherwise? A mass of regulations designed to provide sanctions against the doctor, and not a single provision for dealing with the delinquent patient. The entire fabric of capitation fee, certification, and prescribing calculated to annihilate the dignity of a great profession and the sense of responsibility of a great nation. Is it surprising that no other country has lowered itself to this level?

Your leading article "Unity of Purpose" (*Journal*, December 15, p. 1417) acknowledges the rising tide of discontent in the profession. Your call for constructive planning of a better service rather than for precipitate action is sound common sense. All must surely approve the unity achieved in our attempt to prevent the State from ratting on its promises in the matter of remuneration. But whether any useful purpose would be served by insisting upon unity between the various sections of the profession in an attempt to resolve the injustices peculiar to the general medical section is a matter upon which I am open to conviction. Experience has shown that, in the matter of remuneration, we can count upon superb leadership from the B.M.A. But yours, Sir, is almost the only B.M.A. voice we have heard raised on the subject of terms of service and the fundamental problem of the relationship of medicine to the State—surely of the greatest ultimate importance to the profession. In this respect, I have seen no evidence of spontaneous leadership by the Association, and no deference to the considered decisions of conferences by committees which are elected democratically enough, but which are thereafter exclusively autonomous.—I am, etc.,

Sheffield, 10.

B. BURNS.

SIR,—In your leading article under this heading (*Journal*, December 15, 1956, p. 1417) you draw the conclusion from recent correspondence that dissatisfaction with the National Health Service as it is to-day is as great as the grievance over pay. That may be so, but if these two causes are to be considered together we shall not achieve "unity of purpose" in the profession, and through lack of the strength which comes from this we may well fail to obtain improvement at all. The remuneration claim is becoming increasingly urgent especially in relation to country practitioners, whose costs in

transport, drugs, and telephones have all risen steeply of late. The B.M.A. must represent the general agreement over our claim based upon Spens, and it must be pressed home to the Government now by stronger measures. The profession is as united over this as it can be over anything.

No reform of the N.H.S. can be considered until the financial status of the doctor in relation to society is re-established. Spens was our yardstick at the outset, and later in the hands of Mr. Justice Danckwerts. That is now being challenged again, and this challenge must be met before we dare consider changes in the National Health Service which would now confuse this vital and straightforward issue. Moreover, there is by no means a comparable unity of purpose in relation to what changes in the Service should be made. If the B.M.A. doubts this let it issue another questionnaire to ascertain members' views on the manifold proposals that are being made. Let us recall the time that elapsed between the issue of the first questionnaire and the final acceptance of the present Service that was practically thrust upon us individually while the B.M.A. as a team was still stonewalling every over from the Government.

We are not going to drop our claim to maintenance of financial status. So that, if we are also going to sue for changes in other respects, the two issues are bound to become interwoven and confused as they are in the leading article, prejudicing the success of both. No doubt Government circles would be highly delighted by such a policy. We should soon be told that remuneration was dependent upon the type of service that was finally to be decided, and the Government would be encouraged to argue about this for ever, if only to stave off a financial show-down before that ever-receding date when inflation will have been halted for ever. In spite of 1911 and 1948 I think we can overlook the "long history" of the B.M.A. if that body will now apply itself with vigour to the urgent question of the restoration of our financial position. When that is done we may well embark upon reform of the N.H.S., with all the debate and disunity that this is likely to engender amongst doctors and the public. In the meantime reform is a red herring, and those who allow it to be dragged across the trail of our degradation will be suspect. Does the B.M.A. want to encourage a diversion of attention from its failure to date on this long-outstanding and now most pressing problem of the sanctity of Spens? We cannot dodge Government bad faith by simply remounting in the old stable. It is time that the B.M.A. or some other leadership put a stop to this persistent policy of Governments consulting with our patients and their representatives the lowering of our relative status step by step. For that, from our point of view, is exactly what happens every few months when further wage claims come before Government tribunals. Everyone gets a rise except a minority, including doctors, who are apparently scheduled for ruin along with the general economy of the whole nation. The argument of a few who say that we should set an example of restraint is completely discredited by now. We have been doing that for a year or so, and there is still no sign that it amounts to anything but saving money for the Government to spend on elevating the status of nearly everyone else in relation to ourselves. By all means let us retain unity of purpose in this matter and see it through now. No Health Service will work until doctors can establish honest relations with the Government, and no such service will continue to serve the public, or retain the type of men it needs for the purpose, if we now relax our claim to equality of respect beside those who serve it in most other occupations.—I am, etc.,

Eye, Suffolk.

J. SHACKLETON BAILEY.

SIR,—The leading article (*Journal*, December 15, p. 1417) headed "Unity of Purpose" is very disturbing. Hitherto the policy has been to settle the issue of remuneration first as a matter of principle, and then to consider the reform of the National Health Service. Now the position seems to be reversed, and the question of remuneration appears to be only a side issue. Then withdrawal from the Service, except

—as the leading article puts it—into an alternative service, is deprecated. Now the whole point of withdrawal is that it is the only effective weapon we have if negotiations fail. If it was right to consider it before the Danckwerts Award, when there is no doubt that the threat of it was a factor in bringing things to a head, why is it wrong now? What argument is the Negotiating Committee going to use to exert pressure?

The leading article speaks of divisions in the profession which already exist. Do they exist? Are we really divided on the question of our claim? Have our leaders any evidence that the profession would be divided over a proposal to withdraw? Have we had meetings throughout the country to consider any action whatever? If there are rifts in the profession, let us know what they are, and let us discuss them and settle them. It is true that the question of remuneration is only one of a number of important questions, but it is the one with which we are concerned at the moment, and I am sure that there is no lack of unity in our purpose concerning it, only increasing anxiety at the delay. We will not help by making it part of much wider issues, however important they may be.—I am, etc.,

Interden, Kent.

B. W. WYLLIE.

Distribution of Consultants

SIR,—The recent appointment of a new paediatrician in this area has served to emphasize the apparent, and possibly real, disparity in the distribution of consultants throughout the country.

The Health Service is called "National," and central supervision by the Ministry of Health should produce the advantage of correlating the number of consultants in each specialty with the distribution of the population, particularly if that number is limited. This does not, of course, apply to certain consultants, such as plastic and thoracic surgeons, who can only operate efficiently from special centres.

The new paediatrician appointed to this area replaces two part-time consultants, who have been given duties in other areas. This new appointment has been made at a time when the whole of Cornwall is without a consultant paediatrician. A recent paper, summarized in the *British Dental Journal*, illustrates a similar uneven distribution of consultant dental surgeons.—I am, etc.,

Wroughton, Wilts.

W. L. CALNAN.

REFERENCE

Brit. dent. J., 1956, 101, 198.

Was it a Drug?

SIR,—I seem to remember that one of the first tenets of the National Health Service was the free availability of any drug to any patient who required it. Apart from the fact that free drugs now cost 1s. per item, the Government is attempting to restrict further the patients' rights by classifying all sorts of increasingly unlikely preparations as food-stuffs or toilet requisites.

Silicone creams, medicinal shampoos, and liver extract tablets are the latest to be charged back to the prescriber. Once charged back, one must give up an afternoon's engagements and take up the valuable time of one's colleagues to prove to them (1) that everything else in the *Pharmacopoeia* has been tried, and (2) that this was the only substance which had ever done the patient any good. Moreover, there is the ludicrous position that even one's colleagues may be deluded into finding that what is a drug for one patient becomes a toilet preparation for the next. In any event the prescriber will give up using the preparation in case he is caught again, and this is presumably what is intended.

Any cream with a lanoline base or anything which might later could be condemned in this same way, and I see no end to this further Ministerial interference. This particular wedge is only being lightly struck as yet, but heavier blows will follow.—I am, etc.,

Pelsall, Staffordshire.

T. R. GILCHRIST.

Increased Prescription Charge

SIR,—Dr. Peter A. Walford (*Supplement*, December 22, 1956, p. 225) hits the nail on the head. In common justice the whole prescription charge should be waived in the case of all over pensionable age—they have difficulty even in fetching their medicine, let alone running around claiming refunds. I would say these are the only people who have cause to complain of the increased charge. I am in the happy position of practising between a chemist's shop and a sweet-and-tobacconist's. The enormous sums poured out week by week in the latter make nonsense of the bitter complaints of hardship in the former. If the Government had provided free of charge tea, bread, sugar, or any other necessity, there would have been equally loud complaints if a shilling tax were then imposed.

This is not to say I admire this clumsy and cumbersome device for checking extravagance. The whole Health Service is obviously creaking at the joints and needs re-modelling "from the ground upwards," but that is another story.—I am, etc.,

London, E.2.

D. E. PEAKE.

SIR,—I presume the increased charges for medical prescriptions are an endeavour by the Chancellor to economize and save money. Allow me to suggest a better way of achieving this object—namely, by abolishing the old-age pensioners' tobacco token scheme. I believe that £15m. are spent (wasted) annually on this useless weed. If these old people smoked less or, better, not at all, there would be less illness, and in consequence less expenditure on cough medicines and expensive antibiotic drugs to relieve them of their chronic bronchitis, asthma, pulmonary tuberculosis, and neoplastic diseases, which are often brought on and aggravated by their smoking habits.

It is a well-known fact that if one of the partners is a non-smoker the other purchases the double quantity at a reduced rate and re-sells to younger members of his family. This is a shameful racket and we pay the bill. If these old folk must smoke, let them pay the full price—give them extra food, but not tobacco.

While on the subject of smoking, may I appeal to the Minister of Health to place "smoking prohibition" notices in all ambulances, sitting cars, and taxis used for the transport of patients? The absence of such notices makes it impossible for patients suffering from chest diseases to voice their objections. Recently a chronic bronchitic patient refused to travel in an ambulance unless a non-smoking journey could be guaranteed, threatening to get out if anyone attempted it. Another case was brought to my notice of a very sick man who was conveyed from his home to the Leeds General Infirmary. The smoky atmosphere made him so dyspnoeic that he refused to return by the same form of transport. He unfortunately died a few weeks later. Surely smokers could forgo their objectionable habits while being conveyed to and from hospital. It would be necessary to enforce the non-smoking rule under all circumstances, whether the vehicle was full or empty, imposing a fine for infringement.—I am, etc.,

Leeds.

DAVID A. HERD.

Merit Awards

SIR,—I congratulate you on featuring Santa Claus in your Christmas number, although it was only in eight lines under the heading of "Distinction Awards" (*Supplement*, December 22, 1956, p. 222). The picture of Lord Moran making his annual distribution of a million and a quarter pounds of the taxpayers' money in the form of life annuities, pensionable sinecures, and whatnot to unnamed persons for unspecified services is indeed seasonable. It is also unique in the sense that this is the only public money spent in this country which is arbitrarily and secretly doled. But is "distinction" the right word? Can anonymous recipients be distinguished for unnamed achievements? I can think of several better words. What was originally an inane piece

of mediaeval paternalism can easily degenerate into Hitlerism in high places with its entourage of bought men and silenced sycophants.—I am, etc.,

Beckley, Rye.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Captain D. H. Kernohan has retired.
Surgeon Commanders H. M. Darlow and A. L. Moorby have retired.
Surgeon Lieutenants J. G. H. Sheppard, G.M., C. O. L. Hughes, and W. A. N. Mackie, D.S.C., to be Surgeon Lieutenant-Commanders.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant-Commander (Retired) H. G. Rees, O.B.E., has been removed from the Retired List on transfer to the S.A.N. (War Reserve).
Surgeon Lieutenant W. I. H. Bourne to be Surgeon Lieutenant-Commander.

HER MAJESTY'S OVERSEA CIVIL SERVICE

The following appointments have been announced: G. Buchanan, F.R.C.S., Surgeon Specialist, Western Nigeria; A. J. Evans, M.B., B.S., D.A., Senior Specialist, Western Nigeria; J. L. T. Graham, L.R.C.P.&S.I., R. J. Hayhurst, M.B., B.S., and E. J. McArdle, M.B., B.Ch., B.A.O., Medical Officers, Northern Nigeria; A. Hargreaves, M.B., Senior Medical Officer, Kenya; I. K. Hay, M.B., Ch.B., D.P.H., D.T.M.&H., Senior Medical Officer, Sleeping Sickness Service, Northern Nigeria; K. K. Kapadia, M.B., B.S., D.T.M.&H., Medical Officer, Western Nigeria; F. X. Letellier, M.R.C.S., L.R.C.P., D.P.H., Deputy Director of Medical Services, Mauritius; D. A. W. Nugent, M.B., B.S., D.P.H., D.T.M.&H., Specialist Hygienist, Ministry of Health, Gold Coast; C. Nwokolo, M.R.C.P., Specialist (Physician), Eastern Nigeria; R. E. Onwumere, M.R.C.S., L.R.C.P., D.O., Specialist (Ophthalmology), Eastern Nigeria; C. H. Parkin, M.D., C.M., D.P.H., Senior Radiologist, Jamaica; Joan M. Curtis, M.B., B.S., D.O.B.R.C.O.G., Temporary Medical Officer, Falkland Islands; M. W. T. Gedroye, M.B., Ch.B., Medical Officer, Sierra Leone; A. St. F. Henley, M.B., F.R.C.S., Surgeon (Public Hospital), British Guiana; I. A. Key, M.B., B.S., Medical Officer, Tanganyika; F. O. Mueller, M.D., Temporary Medical Officer, Gambia; E. Onori, M.D., Temporary Medical Officer, Gold Coast; P. Paratian, M.B., Ch.B., Medical Officer, Mauritius; C. S. Rajagopal, M.B., B.S., D.C.H., Temporary Medical Officer, Sierra Leone; W. S. Snow, L.R.C.P.&S.I., Medical Officer, Barbados.

Branch and Division Meetings to be Held

BARNET DIVISION.—At Old Fold Manor Golf Club, Thursday, January 10, 7 for 7.45 p.m., dinner. Speaker: Mr. C. D. Read. Medical guests are invited.

BELFAST DIVISION.—At Upper Lecture Theatre, Institute of Clinical Science, Grosvenor Road, Belfast, Thursday, January 10, 8.30 p.m., meeting. B.M.A. Lecture by Dr. J. B. Firth: "Forensic Problems of Medical Interest." Members and senior medical students are invited.

BROMLEY DIVISION.—At Queen Mary's Hospital, Sidcup, Wednesday, January 9, 8.15 for 8.30 p.m., meeting. Dr. R. V. Gibson: "Indications for Surgical Treatment in Heart Disease."

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, January 8, 8.30 p.m., general meeting, followed by B.M.A. film: "The Conjoined Twins of Kano."

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, January 10, 7.30 p.m., dinner; 8.45 p.m., Dr. D. Curran: "Psychiatric Approach to Crime." Members are invited to bring a Justice of the Peace or an interested member of the legal profession as a guest.

EAST YORKSHIRE BRANCH.—At Quern House, 68, Park Street, Hull, Wednesday, January 9, 8.30 p.m., meeting. Presidential Address: "An Ancient Breed."

HALIFAX AND TADMORDEEN DIVISION.—At Board Room, Royal Halifax Infirmary, Tuesday, January 8, 8.30 p.m., meeting. Lecture by Mr. E. Gledhill: "Use and Abuse of Sex Hormones in Gynaecology and General Practice."

HENDON DIVISION.—At Hendon Way Hotel, N.W., Tuesday, January 8, 8.45 p.m., medico-legal evening. Dr. A. K. Mart and Superintendent Hannam: "The Towpath Murder." Members' friends are invited.

LEWISHAM DIVISION.—At St. John's Hospital, Lewisham, S.E., Sunday, January 13, 10.30 a.m., clinical meeting.

LONDONDERRY DIVISION.—At Londonderry City and County Hospital, Friday, January 11, 8.15 p.m., meeting. Films: "Some Aspects of Accessible Cancer," Part I, Skin; Part II, Lip, Tongue, and Mouth.

NORTH BEDFORDSHIRE DIVISION.—At Library, Bedford General Hospital, South Wing, Thursday, January 10, 8.30 p.m., general meeting.

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, January 8, 8.30 p.m., meeting. Address by Mr. L. H. Savin: "The Differential Diagnosis of Headaches."

SCUNTHORPE DIVISION.—At Board Room, Scunthorpe and District War Memorial Hospital, Wednesday, January 9, 8.30 p.m., meeting. Dr. C. D. Cormac: "The School Medical Service."

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Thursday, January 10, 8.30 p.m., meeting. Talk by Dr. E. G. Sita Lumsden: "Bronchial Carcinoma."

STIRLING BRANCH.—At Golden Lion Hotel, Stirling, Sunday, January 6, 3 p.m., general meeting to discuss rejection of remuneration claim. Address by Dr. C. J. Swanson and Dr. E. R. C. Walker. All medical practitioners in the area of the Branch are invited.

STRATFORD DIVISION.—At Board Room, Queen Mary's Hospital, Stratford, E., Tuesday, January 8, 8.45 p.m., general meeting and discussion.

WANDSWORTH DIVISION.—At South London Hospital for Women and Children, Clapham South, S.W., Friday, January 11, 8.30 p.m., meeting. B.M.A. Lecture by Dr. Philip Ellman: "Management of Rheumatic and Allied Diseases in General Practice" (illustrated by slides).

Meetings of Branches and Divisions

CHELSEA AND FULHAM DIVISION

The annual B.M.A. lecture was delivered by Mr. A. M. A. Moore on November 20, 1956. Colonel Harnett was in the chair, and 40 members and guests from neighbouring Divisions were present. The title of Mr. Moore's lecture was "Painful Conditions of the Hand and Foot."

STRATFORD DIVISION

The annual general meeting was held at King George Hospital, Ilford, on October 23. Dr. N. J. Lawler was in the chair and 35 members were present. The following officers were elected:

Chairman.—Dr. R. Peters.
Vice-chairman.—Dr. H. R. England.
Honorary Secretary and Treasurer.—Dr. A. Elliott.
Assistant Honorary Secretary.—Dr. I. M. Segal.
Dr. D. P. Stevenson, Deputy Secretary of the Association, gave an address on "Current Events at Headquarters," which was followed by a discussion in which Drs. M. Lewis, W. S. Macgowan, I. M. Segal, C. E. Fenton, J. W. Digan, and A. Elliott took part.

WINCHESTER DIVISION

The annual meeting was held at the Royal Hotel on October 27, 1956. Dr. P. A. T. Lowden was in the chair, and 35 members and their guests were present. The following officers were elected:

Chairman.—Dr. J. T. Rowe.
Vice-chairman.—Dr. J. R. Bodington.
Honorary Secretary and Treasurer.—Dr. J. M. Forbes.
After dinner, the President of the Association, Dr. Alexander Hall, addressed the meeting on the subject of the B.M.A.

REMUNERATION CLAIM
OFFER OF FURTHER MEETING

Four representatives of the Negotiating Committee, Sir RUSSELL BRAIN and Drs. A. B. DAVIES, J. D. S. CAMERON, and S. WAND, met the Minister of Health and the Joint Parliamentary Under-Secretary of State for Scotland on January 4.

The Minister of Health explained that he had not given a reasoned reply to the Committee's supplementary memorandum because he had been advised that there were constitutional objections to his doing so. All that he could say about the legal aspect of the remuneration claim was that, according to the advice he had received, the Government was not under any legal contractual obligation to the profession. As to the merits of the claim, he could not even begin to examine these in the present economic circumstances of the country, since this, in his view, would start a "chain-reaction" in other quarters which would endanger the country's financial stability.

The representatives of the Committee vigorously opposed the Minister's attitude and emphasized, in particular, that it was not merely a dispute about money but a crisis of confidence which went to the roots of the relations between the medical profession and the Government. At the end of a fruitless discussion the Minister offered to meet the Committee's representatives again after he had given further thought to the problem and discussed it again with his colleagues. This offer was accepted, and it was agreed that the further meeting should take place before the end of January.

After the meeting with the Ministers the Negotiating Committee met and unanimously expressed approval of the action taken by its representatives. Later on the same day these representatives held a press conference. By this time the Ministry had issued its own press statement, in which it had again given the figure of 137% as representing the increase which had already taken place in the average war-time remuneration of general practitioners. The Committee's representatives explained to the press that this was an unfair and misleading statement, since it concealed the fact that the Spens Committee had found the actual pre-war incomes to be too low. The increase over the figure agreed with the Ministry, in the light of the Spens report, as the correct average in terms of the value of money in 1939 was only 100%.

VISIT TO CARIBBEAN BRANCHES*

BY

IAN D. GRANT, M.B., Ch.B.

Chairman of the Representative Body

Our colleagues in the British West Indies are faced with many difficulties. Within two years there will probably be a Federation of the West Indian Islands, but the politicians have not yet been willing to include the medical services in the proposed Federation, although the Caribbean Council of the B.M.A. has unanimously agreed that such a co-ordination would benefit both the doctors and the communities they serve.

Barbados

In Barbados, the most densely populated of the islands, the Government service medical officers were very dissatisfied with their working conditions. They are responsible for districts with a population of about 8,000 patients, and receive a salary of £900 per year. Private practice is allowed, but in the country areas the number of patients who can pay fees is very limited. The hospital in Bridgetown is old and ill-equipped. It has 470 beds, but the wards were so overcrowded that occasionally two adult patients lay in one bed, and frequently two, and sometimes even three, children in one cot. When I visited the hospital the surgeon was on leave in Britain. There was no consultant physician, radiologist, or otorhinolaryngologist, and only a part-time anaesthetist who was in private general practice. The staff of the hospital at that time consisted of one surgical registrar, who was paid £1,200 per year, full-time, and one house-surgeon with a year's experience. These two men were in full charge of 250 surgical beds, and in addition saw some 200 out-patients daily. They were so grossly overworked that only urgent cases could be admitted and the out-patient department was closed in the mornings.

In Barbados, the B.M.A. had been completely ignored by the Government, but, as a result of talks at the highest levels, we received an assurance that the Association would be consulted in all medical problems and that an effort would be made to improve the medical services as regards both terms of service and remuneration. Reasonable

*Dr. Grant paid a good-will visit to the Caribbean Branches, on behalf of the Council of the Association, during September and October.

incomes are made by private practitioners, but there does not appear to be much scope for additional private practice, and the Government appointments are so unattractive, except for the clinical experience they offer, that only those with a strong sense of vocation should consider them.

British Guiana

From Barbados I proceeded to British Guiana, where I found the Government medical services very unsatisfactory. The staff were inadequately paid, and the co-operation between practitioners and the hospital staff poor. Patients were admitted to hospital on the recommendation of a priest or a policeman, and general practitioners were not informed of what treatment was given. Consultants stated, with justification, that they had no secretarial assistance, and that they were so overworked that they personally had no time to write letters. Both general practitioners and consultants agreed that admission to hospital should be only through a doctor's letter, but, for political reasons, the Government would not accept this contention. The hospital is old, ill-equipped, and has no air-conditioning. Medical, surgical, and even dental cases are all huddled together in a common out-patient waiting-shed, and each doctor sees about 200 out-patients daily. The best they can do is try to focus attention on the genuinely serious cases and give them what care is possible. One surgeon and one houseman were responsible for 150 beds and all the operations in addition to their daily quota of 200 out-patients. The surgeon was paid £2,000 per year with the right to a very limited amount of private practice, but physically he was unable to do much after his hospital work was finished. Consultants may retain only half their private fees, the other half being kept by the hospital. Tax is deducted at the rate of 50% from the half they are allowed to retain, so that in fact they personally get only 25% of the fee. District medical officers receive a salary of £900 to £1,200 per year on a full-time basis. If they wish to undertake private practice in addition they must refund £300 a year, and hope to recoup that amount or more from private fees. Private patients occupy pay-beds (usually £1 per day) in hospital.

The situation in British Guiana is becoming critical. Many districts have no medical officers, and hospital consultants are not renewing their contracts. The Government discriminates between male and female medical officers, and between married and single medical women.

Many private practitioners in Georgetown have well-equipped consulting-rooms and give a high standard of medical care. A popular general practitioner can earn £4,000 to £5,000 gross per year, but he, of course, has no leave and no pension rights, and he works just as hard as any general practitioner in our National Health Service.

The Minister of Health for some years has had no contact with the local Branch of the B.M.A., and the doctors were not consulted before legislation was introduced. We received a promise that in future the Association would be consulted and be regarded as the mouthpiece of the profession. Under present conditions I could not advise a British graduate to apply for a post in the British Guiana Government service.

Caribbean Conference

The Caribbean Conference met in Trinidad and discussion was lively, statesmanlike, and realistic. It was agreed that the Conference should take place normally every second year, but that special meetings might be necessary in view of the imminence of the West Indian Federation. It was decided to press for the removal of the medical services from the civil services, and that terms and conditions for the medical services should be outwith ordinary civil service rates. The Conference recommended that the medical services should be recruited and maintained on a federal basis, and that when shortages arose there might be interchange of medical officers between the different islands. Each Government should ensure that the B.M.A. would be consulted before changes were introduced in its medical

services and that the Association, representing the profession, should have right of access to Ministers and their officers on any medical subject they desired to bring to their notice.

Trinidad

Trinidad appeared to have fewer difficulties in recruiting hospital staffs than the other islands. The hospital in Port of Spain, though old, was efficient and well staffed, and that in San Fernando modern and well equipped, as was also the Sanatorium at Caura. A thoracic surgeon from the United Kingdom was arriving shortly.

The Trinidad Branch has been studying the initiation of a modified health service for the lower-income groups. A capitation system of payment is suggested, with a maximum list of 2,500, and private practice in addition. On a contributory basis, the worker would pay 10% of his wages to the scheme, and the employer and the Government a similar amount. Dependents could be included, but for them the contribution would be increased. No sickness benefit would be paid, but drugs would be given free of charge. The scheme is still very nebulous, and many of the doctors dislike the capitation method of payment and insist on a fee-for-service payment. Trinidad has more wealth than the other islands, and it is quite possible that some type of health service will be evolved in the near future. The oil companies and some other commercial concerns have built modern and well-equipped hospitals which are staffed by full-time salaried doctors, all of whom appeared satisfied with their working conditions.

Antigua

In Antigua conditions were much less satisfactory. The Government, without previous discussion, threatened to abolish all private practice for Government medical officers, and to pay them a salary of £1,400 per year. At present they receive a maximum of £960, but may undertake private practice. Each doctor provides free care for about 4,000 Government patients but is at risk for up to 8,000, many of whom claim inability to pay fees. The doctors refused the suggested new salaries and now demand a minimum of £1,450, rising to £2,100 after seven years, with the right to private practice in their own districts. At present almost all the doctors come into St. John—the principal town—where they have private consulting-rooms. The districts are therefore often left without a medical officer for several hours daily.

We met the governor, the administrator, and the chief medical officer, all of whom agreed that the B.M.A. would be consulted fully before further suggestions were made. They also agreed the suggested salary scales were not unreasonable, but foresaw many political repercussions if they were accepted. The doctors of Antigua are in good heart, and will, I think, find a satisfactory solution to their problems. During my visit the Government agreed to provide for each district medical officer a nurse, a dispenser, and the full cost of drugs. Prior to that the doctor received £10 12s. 6d. monthly with which to pay for and dispense all necessary drugs to all Government patients.

The hospital in Antigua had been built as a prison camp during the Boer War, but was never used as such. The building is now crumbling. It has 140 beds. There is no air-conditioning in the operating theatre, and only recently have they obtained an adequate x-ray plant. A new ward, very badly designed, has just been completed and it is hoped soon to build a second.

Jamaica

From Antigua I went to Jamaica—the oldest overseas Branch of our Association. The new West Indian University is situated in a beautiful campus. The medical school is well equipped and has an excellent teaching staff. About 15 to 20 doctors graduate each year.

The Government medical officers in Jamaica, numbering about 130, are very restless and unsettled. They formed, a few years ago, the Government Medical Officers' Associa-

BIRMINGHAM CONSULTANTS AND SPECIALISTS

CENTRAL COMMITTEE CHAIRMAN'S ADDRESS

Mr. T. HOLMES SELLORS, Chairman of the Central Consultants and Specialists Committee of the B.M.A., was invited to address the annual meeting of the consultants and specialists of the Birmingham region on November 28. Dr. G. E. OWEN WILLIAMS was in the chair.

A State medical service, Mr. Holmes Sellors thought, had come to stay. On the credit side it had probably led to improvement in the general standard of hospital practice, particularly on the periphery. Consultants and specialists had greater security and superannuation rights. The greatest danger to-day lay in the risk of the hospital medical services being relegated in importance to a minor branch of the Civil Service, and Mr. Holmes Sellors appealed to all consultants and specialists to take a more active interest in medico-political matters. Only by positive effort could the traditions of the profession be safeguarded. The Joint Consultants Committee was accepted by the Ministry as an advisory machine, and relations in the main were friendly. By contrast there was no medical advisory machinery of a freely elected kind at regional board level.

Current Problems

The Joint Committee, said Mr. Holmes Sellors, was shortly to have further discussions with the Ministry on the problems of junior hospital medical staffing. He thought that both the Ministry and the profession realized the difficulties involved. They were well aware, and both sides agreed, that absorption and not dismissal must be the answer to the still-unsolved senior registrar problem.

Of Whitley negotiating machinery, the speaker said it was admittedly slow and ponderous, but he thought its safeguards outweighed its drawbacks. Neither side could go to arbitration without the other agreeing, and this might not always be disadvantageous. He emphasized that Whitley bargaining could not be done in the open.

Finally, Mr. Holmes Sellors called for a good response to a further appeal which was shortly being made for contributions to the Hospital Medical Staff Defence Trust. He stressed the need for adequate funds to cover expenses incurred in the interests of hospital medical staff as a whole, and instanced the cost of the recent successful appeal, now the subject of a further appeal to the High Court, to the Special Commissioners of Income Tax on part-time consultants and Schedule E. The B.M.A., the defence societies, and the Regional Hospitals Consultants and Specialists Association had contributed towards the cost of this.

INCIDENCE OF VENEREAL DISEASE

B.M.A. INQUIRY

On the recommendation of the Venereologists Group Committee of the Association, the Council has authorized a sample inquiry in certain B.M.A. Division areas into the extent to which venereal disease is being treated outside hospitals. There has been a striking fall in the number of new cases attending clinics. The Council thinks it probable that this represents an apparent rather than a real decline in the incidence of venereal disease, and that the simplicity of penicillin treatment has led to a considerable number of cases being treated outside clinics.

General practitioners and consultants in the selected Division areas will be asked to fill in a questionnaire on the number of cases they have treated during 1956 without reference to a venereologist. The inquiry will be strictly confidential. The names of patients will not be required, nor will the names of doctors providing information be disclosed in any report on the inquiry.

tion because they considered the B.M.A. was inept and did nothing to further their interests. Since the advent of a new, very Socialistic, chief minister, Government medical officers have been threatened with a full-time salaried service at a remuneration they think would be considerably less than they receive at present, although no actual salary range has yet been postulated. The consultants also have been threatened with a full-time salary of about £2,000 per year. Both general practitioners and consultants are united in their opposition to this new scheme. I discussed the problem with the Chief Minister, who agreed in principle that the B.M.A. would be consulted before any changes were made, and who was willing to consider the possibility of sessional employment for Government medical officers, leaving them free to undertake private practice after their sessions finished. It was obvious that, although this might be financially satisfactory to both sides, politically the Chief Minister did not like it.

A special meeting of the Government Medical Officers' Association was convened before I left, and it was finally agreed that all representations to the Government should be made by a joint committee of the British Medical Association and Government Medical Officers' Association; and that the latter recognized the B.M.A. as the mouthpiece of the profession. The meeting passed unanimously a resolution urging all their members also to become members of the B.M.A.

Private Practice

The standard of private practice in the West Indies is high. The doctors' offices are well furnished, attractive, and well equipped. Many do their own surgery and have a good stock of instruments. Many have an E.C.G. Some undertake anaesthetics, ophthalmology, or otorhinolaryngology, and provide all the necessary equipment for their specialty. An intending practitioner would require to expend about £5,000 to £6,000 on his office and equipment. He would not, as a rule, earn enough to pay his way during the initial 4 to 5 years, but after that he should earn between £3,000 and £5,000 a year, but income tax would take away a great deal. The normal fee range is from 10s. to £2 2s. Getting away for holidays or study leave would be difficult. Education might present problems. The schools in Barbados, Jamaica, and Trinidad are of good standard. The climate is enervating and the constant sunshine is not very compatible with the arduous work which successful practice entails.

Conclusion

I wish to thank all the Branches which I visited for their great personal kindness and hospitality, to both Mrs. Grant and myself, and for the enthusiastic welcome they extended to us. I would also express my sincere gratitude to the Governors, the Ministers, and the administrators and chief medical officers for the courtesy, sympathy, consideration, and interest with which they heard our arguments and discussed our problems. With a continuance of such good will on both sides it is my hope that a very real improvement will take place in the Government-doctor relationship and that this in turn will lead to a much more efficient medical service for the people.

MEDICAL DISPUTE IN CEYLON

A report from Ceylon states that the Government Medical Officers Association called off its threatened strike, due to start on January 7, pending the outcome of negotiations with the Government. The Prime Minister of Ceylon, Mr. S. W. R. D. Bandaranaike, is personally undertaking the negotiations. The main bones of contention are the Government's proposals for the abolition of private practice and the readjustment of salary scales arising out of the recommendations of the Canekaratne Report on the medical services of the island.

MEDICAL MEMBERS OF HOSPITAL BOARDS AND COMMITTEES

A circular (H.M. (56) 111) to hospital authorities states that the Minister of Health proposes to follow the recommendation of the Guillebaud Committee that medical membership of regional hospital boards should normally not exceed 25%, and he has asked the boards to do the same when making appointments to hospital management committees. Special considerations apply to boards of governors, where provision has to be made not only for nomination of members by the hospital medical staff but also by the university (whose nominees may also be medical). Nevertheless, the Minister asks that regional hospital boards should secure a "reasonable balance" of lay representation when making nominations for membership of boards of governors.

N.O.T.B. ASSOCIATION

At the National Ophthalmic Treatment Board Association council meeting on December 14 members learned with regret of the death of Dr. R. Gordon Simpson, whose work for the association had been of great value. The council received the medical secretary's preliminary report on the subject of medical eye examination in industry. It approved the taking of a stand at the B.M.A. exhibition in Newcastle in 1957. The second annual general meeting will be held on June 14 at B.M.A. House.

PART-TIME LOCAL AUTHORITY WORK IN SCOTLAND

The new scale of fees for part-time local authority work (M.D.C. circular No. 32) reported in the *Supplement* of December 29 (p. 228) applies only to England and Wales. Scales of fees for part-time local authority work in Scotland are now being negotiated and will be announced when agreement has been reached.

HUNGARIAN DOCTORS

The International Medical Visitors Bureau would like more offers of accommodation, for at least one month, for Hungarian doctors and their families, especially in or near London. Any offers should be sent to the Medical Director of the Bureau, Brigadier H. A. Sandiford, British Medical Association, Tavistock Square, London, W.C.1.

HOSPITALITY

A German doctor would like her daughter, aged 12, to arrange a holiday exchange with a British doctor's daughter. The British girl could stay for as long as she likes in a villa in the Hamburg suburbs, and if necessary take a holiday course at Hamburg University or elsewhere.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correction.—The report of the proceedings of Council (*Supplement*, January 5, p. 4) should have stated that it was agreed that a paragraph on the integration of medical officers of health with the hospital service, which formed part of the report of the Central Consultants and Specialists Committee, should be referred to the Public Health Committee for its comments.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR,—It would indeed be surprising if a prototype National Health Service, original in its conception and experimental in its design, did not require substantial modification after eight years of operational service. It would be disastrous for its prospects of success if those concerned in its development did not read the lessons of experience. The failure of the Service as an export model underlines its shortcomings. It is abundantly clear that unless it is refashioned satisfactory performance will not be achieved.

The profession will echo Sir Russell Brain's words at his press conference: "This is not merely a pay claim, but a crisis of confidence. It goes to the roots of the relations between the medical profession and the Government." Eight years of uneasy working have at least served to indicate the particular roots that need pruning before the Health Service will bear fruit.

A new charter for a national health service would therefore pay special attention to the following points: (1) The removal of the Service from politics and the creation of an independent authority for its administration. (2) The formulation of a new agreement precise in its terms and clear in its legal implications to replace the recommendations of the Spens Committee upon which the Government has defaulted. (3) Reappraisal of the overwhelming powers vested in "the Minister" under the National Health Service Acts. The interests of the individual doctor are not adequately safeguarded. The virtual absence of employment outside the confines of the Service makes his position especially precarious. (4) The substitution of a payment related to items of service in place of the present capitation fee system in general practice. This would provide better medical care for the patient and give added interest to medical work. It would relieve the pressure of work in hospital out-patient and casualty clinics. (5) The pay of consultants should be directly related to their responsibilities. The secret payment to unknown specialists of substantial sums of money for unspecified services—the ingenious idea of Lord Moran—should stop. Ethically objectionable, it has disrupted the original salary pattern in the National Health Service. These large pensionable increments are not available even to the most efficient and conscientious general practitioner. This evil plan has destroyed the unity of the profession and grievously damaged the mutual confidence of its members.

You, Sir, in a leading article (*Journal*, November 17, 1956, p. 1165) have truly stated that "virtue has gone out of the profession." It will need courageous and imaginative leadership to restore it.—I am, etc.,

Sudbury, Suffolk.

H. BATHURST NORMAN.

SIR,—The Minister of Health has made it clear that in his view the future of medicine must be subject to political expediency, not policy. His repudiation of Spens leaves us no rights nor guarantees for the future. The worse the present inflationary tendencies become, the less expedient will it be to meet our claims, and thus we can hope for nothing from the future except increasing poverty and degradation. He has invited our representatives to meet him again, but with what object, except as a trick to further delay our taking action? He has given us no reason to trust him further.

Let our negotiators refuse to meet him again: there has been too much talk, too much delay. Give us the strong lead we need for universal resignation from the Service at three months' notice: it is the only dignified reply. To refuse to sign certificates or other such paltry measures savours of strike action and can only bring us into public contempt. If, before the notice has expired, our claim be

met in full, then let us continue in the Service for a specified period only, say one year, until an alternative scheme, generally approved by our representatives, can be worked out and put before Parliament, and, if the Minister will not accept this, let us resign again, and finally.

We are not dependent on the Government for a job, nor can the Government provide for the medical care of the people. We do that. The politicians merely arrange a system by which the people pay for it, and it is an unsatisfactory one. What doctor worthy of the name could not make a better living, with time for better medicine, in private practice if there was no free alternative? The terms under which we serve at present must eventually result in the utter degradation of medical practice in this country, to the ultimate detriment of the public interest, and we owe it to the public no less than ourselves to dictate the future policy of the National Health Service: the politicians have had their chance, and they have proved unable and unworthy.—I am, etc.,

Gloucester.

W. R. BLATCHLEY.

SIR,—The Conservative Government, while dividing the nation by its failure to find a common foreign policy with Her Majesty's Opposition, has repeatedly shown a common policy with the Labour Party in regard to its dealings with the medical profession. The present Government has accepted the National Health Service Act of 1948, and has made little or no attempt to modify this Act. In 1951 the Conservative Party gave a pledge that it would remove a grave abuse, introduced by Mr. Aneurin Bevan with the apparent object of forcing a full-time medical service on the public. I refer to the clause in the Act which denies those patients who prefer to remain outside the National Health scheme the facilities for medicines, drugs, etc., accorded to patients receiving treatment under this scheme. It must be common knowledge that such medicines, etc., are paid for out of taxation, and all members of society should be equally entitled to such benefits. The Minister of Health, however, has repeatedly refused in Parliament to remove this gross injustice, or to honour his party's pledge.

It is most unfortunate that the medical profession should be urging a claim for financial adjustment at a time of national economic embarrassment, for the public cannot fail to associate such conduct in their minds with the demands of civil servants and members of nationalized services and industries, who are clamouring for further pay increases. The leaders of the profession in 1948 appear to have been brilliantly outmanoeuvred by Mr. Aneurin Bevan, and the profession can have little hope of an equitable financial settlement from politicians in general or the Government of the day. The medical profession would be wise to remember that our present Government has the inestimable advice of Dr. Charles Hill, who must have learnt many useful political devices when, as Secretary to the British Medical Association, he was in almost daily contact with Mr. Aneurin Bevan at the time of the passing of the National Health Service Act. It would surely be wiser to press for a complete revision of this Act, rather than antagonize the public by insisting on an increase in pay at this most inopportune moment.—I am, etc.,

London, W.1.

W. FERGUSON HANNAY.

SIR,—Your readers might be interested in the measures a businessman would use if he were in our position. One such was in my surgery the other night, and he said: "Doctor, your opponent is the Treasury, so you must concern yourself only with money and power:—(1) Prescribing: Give the patients what they ask for and stop acting as a watchdog for the Treasury, incurring the displeasure of your patients in so doing. (2) Hospital investigations: Don't say 'I can treat you quite well here'; send all those to hospital who want to go. (3) Resignation from the Service: Here you must be very careful, as you cannot afford a failure. Select areas where you can be sure of 100% backing. Action in only a few areas will be enough to make your opponents co-operative. (4) Politics: Finally, you must play politics.

In the Lewisham by-election let all doctors have large banners 'Vote Labour' on their surgeries, and let them say the hard word against the Government. Though the standing of doctors is lower than it was, patients still take notice of what they say. These are the measures that I, as a businessman, think will win you the day. And of course the political lesson will not be wasted on the other side when they get into power."—I am, etc.,

London, S.W.6.

G. ROSEMONT.

SIR,—It seems an extraordinary thing to me that, during these protracted arguments with the current Minister of Health, no one has suggested obtaining the views of the Minister who was in office when the Act came into force. It is a well-recognized fact that the Opposition almost always tries to reverse any decision given by the Government in power. This being the recognized pattern of approach to any problem, it follows that Mr. Aneurin Bevan must inevitably support the medical profession in their claim.

Again, Mr. Bevan, as a staunch protagonist of the down-trodden classes, must speak in our favour. Apart from all that, it would be interesting to know what was his interpretation of the Spens Report in 1948. He, surely, is the one person who should know most about it. On the other hand, a Minister in charge of a Government department may not really be conversant with what is going on, and is only used as a mouthpiece for the permanent Government officials.

Mr. Bevan was the surgeon who conceived the original operation carried out on the medical profession. Mr. Turton, who was only a house-officer in 1948, appears to be suffering from muddled thinking in his interpretation of the Bevan operation, and it stands to reason that Mr. Bevan would be the best man to show him why the operation scar is now showing signs of inflammation, and to explain that a 24% dose of the appropriate antibiotic would immediately stop this dangerous spreading cellulitis. I might add that, in my opinion, the original operation was a badly bungled affair, and that the above treatment can only be palliative, and cannot cure the ghastly mass of obstructive adhesions inside the professional abdomen.—I am, etc.,

Pontypridd.

R. HODKINSON.

SIR,—In your correspondence columns of the last few months we have read many letters of indignation concerning the recent refusal of our claim for an increase in remuneration. Many have expressed the desire to force the Government to yield to our demands. As a professional body we are about to decide what we shall do. Before we commit ourselves irrevocably to action which we might regret later, let us dissect the situation and expose the bones of the matter.

We are a hard-working and conscientious group of middle-class people devoted to the care of the sick. Our service to the community, often taken for granted and sometimes abused, is a difficult one. We feel that the remuneration is not enough for the responsibility we have undertaken, and that the Government (alias taxpayer) is under an obligation to increase it to keep abreast of the rise in cost of living. This claim has been rejected, and now, in order to enforce it, we talk of depriving the people of this country of a health service which, imperfect as it is, at least makes available to everyone the best treatment in the world.

This is a serious step, and before taking it we must be absolutely sure of our moral right to do so. For a moment let us consider what are our "rights." I believe we have two: the right to live until we die, and, during that life, the right to choose between good and evil. The other so-called "rights," such as the freedom of speech, worship, thought, to withhold labour, etc., are, in reality, privileges. In addition to these privileges common to all there are many pertaining to our profession. Among them we must include a high standard of education acquired by our parents' money or our own intelligence (both also privileges), the possession of a special knowledge of healing, a standard of living far higher than vast masses of humanity, both in this country

and abroad, and the privilege of helping people who, in one way or another, are worse off than ourselves. As a profession we have repeatedly emphasized that these unfortunates are the main object of our concern. Yet apparently we are prepared to jettison this ideal in the furtherance of our own personal interest. Hypocrisy, Sir, is an ugly word, but it is the only one that fits.

Unfortunately this point of view will have no appeal to the materialist, who measures his value in terms of money. So let us look at a more practical aspect. Most of us agree that a health service in some form is desirable. Most of us feel that it is not unjust for the healthy to pay for the sick, and the rich to contribute towards the healing of the poor. The economic situation of this country is precarious, and the people who pay are already groaning under a heavy burden of taxation. If we obtain our demands then this burden will necessarily be increased. If we institute a separate service of our own the same result will ultimately follow. How much would we gain? Some of us who are junior partners or who have small practices will gain something, but those in the high-income groups will gain very little. We shall certainly lose much more in the respect of our patients for putting self-interest before service and for using threats to enforce this.

If, then, we are to be charitable towards the people whom we serve, how can we dispel the worries and frustration of the National Health Service that assail us? First, we must apply the same remedy to our anxieties as we recommend to our patients. Each one of us will then get the treatment he deserves. Secondly, we must accept a lower standard of living as the inevitable consequence of a levelling of this standard throughout the world and be grateful for our privileges. Thirdly, we could approach the Government for an additional allowance to cover the rise in cost of practice expenses only, which should be distributed in proportion to our expenses irrespective of partnership shares. Fourthly, if this is not forthcoming, the wealthier doctors might be prepared to help the poorer members of the profession by contributing some of their highly taxed earnings to a pool for redistribution.

When this country is at war most of us are prepared to sacrifice a lot for the benefit of the community. Let us, then, be prepared to sacrifice something in the much greater war we are now waging against poverty, disease, and ignorance.—I am, etc.,

Hoxne, Norfolk.

D. G. A. WESTBURY.

SIR,—We need not convince the public of the detailed merits of our claim. The simple fact is that we are the only section of the working population denied the right to arbitration. Once the public understood this their sense of fair play would ensure their support.

Nor is it necessary to plan an alternative health service before using forcible language, the only kind understood by politicians. An alternative scheme would take years to prepare, and even if the Minister were in agreement he would probably dishonour it later, unless we had already shown him that bad faith and broken promises were not to be tolerated. If we do not succeed in enforcing arbitration on our present claim we will not succeed in anything else.—I am, etc.,

London, E.3.

D. D. ROSEWARNE.

Reform of the Health Service

SIR,—As one of the younger generation of general practitioners with perhaps 25 more years to serve, may I express my views on the National Health Scheme? The present wage dispute is only a symptom of our dissatisfaction with the whole structure of the Health Service. The remedy lies not in grousing and piecemeal arbitration but in the design of a practical and clear-cut alternative scheme.

Four points which I would like to see incorporated in such a scheme are: (1) the freeing of medicine from politics by entrusting its financing to independent insurance companies with which all our patients would be compelled to

insure; (2) the re-establishment of the buying and selling of practices; (3) the cessation of free drugs apart from long-term illnesses—e.g., diabetes—and certain other deserving cases—e.g., old-age pensioners; (4) the free access of every doctor to the tools essential in this age to his trade—e.g., x-rays and E.C.G.s—to enable him to look after his patients within the limits of his ability rather than, as now, within the limits of his resources.

During 1957 the B.M.A. should design such a new scheme in consultation with the profession. Then, on the appointed day, we could withdraw our services from the scheme which has proved to be a miscarriage—inevitable, I hope.—I am, etc.,

Ringwood, Hants.

JOHN INNES.

SIR,—In the present arguments with the present Minister we should realize two main facts. The first, that the N.H.S. began as a political "knight," then became a help towards "full" employment, and is now a headache from which both parties would gladly be free if they could escape from the electoral penalties involved. Such welcome escape would be offered if the doctors "struck," for the odour would then attach to us. To this end each party will continue to make our lives unpleasant, both by major worries, such as leaving us behind in the social stakes, and by minor pin-pricks, such as settling the final debt for 1954 early in October but leaving it unpaid until December 31, 1956. The second fact is that the big club practices, and many poverty-stricken ones, are vastly better off than they dared to dream of pre-war, for the N.H.S. has spread the evils of pre-N.H.S. South Wales contract practices over a lot of the British Isles. The opposite of Bevan's dreams. This sort of practice tends to fight a price war where each doctor or group hopes to hang on longer than the rest and "scoop the pool." The fallacy is that having done so the winner cannot recoup, as would a business, except by lowering his standard of care.

To demand a full-time salaried service with regular office hours, etc., would not frighten the Government: an artificially large pool of unemployed reserves would soon frighten us. My answer is, reward for skill. Permit the private patient to have his drugs off his taxation—I am sure the public would co-operate by coming off N.H.S. lists—and also permit fees for minor operations, excluding circumcision, which all cost the G.P. money to perform.—I am, etc.,

Cromer.

A. HENRY GREGSON.

Confidential Medical Reports

SIR,—A female patient of mine who recently proposed for life assurance to one of the leading "life" companies was telephoned by a female member of the company's Belfast branch office staff and asked: "We have your medical report here and we note that you had a miscarriage early this year. Will you please give us the name of your G.P. so that we may make further inquiry?"

That an inquiry of such a confidential nature should be permitted to be made by an insurance clerk through the notoriously unsafe medium of the telephone system rather shocks me. But, on further inquiry, I learn that at this particular insurance office it is the practice for copies of all medical reports to be made before the original is forwarded to head office. Thus confidential medical reports are available to curious junior clerks, etc., at any time. I understand that several Belfast branch offices follow this deplorable practice, and it would be well if Northern Irish practitioners were apprised of the facts.—I am, etc.,

Bangor, Co. Down.

P. J. WARD.

Unity of Purpose

SIR,—Your leading article (*Journal*, December 15, 1956, p. 1417) rightly emphasizes the need for unity in the profession at this crisis in our affairs. There is little doubt that this end will be best achieved by the Negotiating Committee pressing the Minister to a conclusion on the remuneration issue.

It is obvious from the correspondence in the *Supplement*

BRITISH MEDICAL GUILD

Meetings to be Held

ALDERSHOT AND FARNHAM.—At Northfield Hospital, Aldershot, Wednesday, January 16, 8.30 p.m.
BROMLEY.—At Royal Bell Hotel, Bromley, Sunday, January 20, 6 p.m.
DUMFRIES AND GALLOWAY.—At Cresswell Maternity Hospital, Dumfries, Sunday, January 13, 2.45 p.m.
EAST HERTS.—At County Hospital, Hertford, Tuesday, January 15, 8.30 p.m.
GUILDFORD.—At Mitchell Hall, Royal Surrey County Hospital, Guildford, Thursday, January 17, 8.30 p.m.
HARROW.—At Tithe Farm House, Eastcote Lane, South Harrow, Monday, January 14, 8.30 p.m.
NORTH-EAST ESSEX.—At Out-patient Hall, Essex County Hospital, Colchester, Sunday, January 13, 11 a.m.
NORTH STAFFS.—At North Stafford Hotel, Sunday, January 13, 2.30 p.m.
NUNEATON AND TAMWORTH.—At Three Tuns Hotel, Atherstone, Sunday, January 13, 3 p.m.
ROCHESTER, CHATHAM, AND GILLINGHAM.—At Gymnasium, St. Bartholomew's Hospital, Rochester, Sunday, January 13, 3.30 p.m.
SOUTH BEDFORDSHIRE.—Friday, January 18.
SOUTH MIDDLESEX.—At Casino Hotel, Tagg's Island, Hampton Court, Monday, January 14, 8.45 p.m.
SOUTH STAFFS.—At Medical Lecture Hut, The Royal Hospital, Wolverhampton, Tuesday, January 15, 8.30 p.m.
SOUTH-WEST WALES.—At St. David's Hospital, Carmarthen, Sunday, January 13, 2.30 p.m.
TUNBRIDGE WELLS.—At Royal Mount Ephraim Hotel, Tunbridge Wells, Sunday, January 13, 3 p.m.
WEST MIDDLESEX.—At Nelson Room, Ealing Town Hall, London, W., Monday, January 14, 8.30 p.m.
WESTMINSTER AND HOLBORN.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Wednesday, January 16, 8 p.m.

during the past months that there are other issues quite as important as the claim for increased pay. The question of compensation should be tackled, and the Government should be pressed to reconsider its attitude to those who have large overdrafts as a result of either improving their premises or building new ones. There has been much talk by the Minister of Health of the need to improve our surgeries, but we must be helped and not hindered in carrying this out. Is it right and equitable that we should receive 2½% interest on compensation moneys yet pay the current bank rate of 6% to 6½% for an overdraft incurred in such improvements?

Such injustices should be given wider publicity, if necessary in courts of law. Our publicity organization for ventilating these grievances is non-existent, as one discovers when they are discussed with one's patients. It is common knowledge that many people believe that all or most of their weekly contributions go to the doctors, and, when they are told that the doctor gets about fourpence gross per week for each individual, one is greeted with cries of incredulous amazement. A much better Health Service can and must be built, but first get public opinion on the side of the medical profession by stressing the faults of the present Service, using the press, the radio, and television services, and by pamphlets in our waiting-rooms, etc.—I am, etc.,

Boston, Lincs.

M. J. SHEEHAN.

S.H.M.O.s and Consultant Appointments

SIR,—Without seeking to minimize the injustice suffered by most S.H.M.O.s, to which Dr. C. B. V. Walker (*Supplement*, December 22, 1956, p. 226) and others have drawn attention, it is, I think, worth pointing out that for a small number this grading does allow the combination of general practice with the practice of a specialty. For them this is a great advantage and one which would be lost if the S.H.M.O. grade were completely abolished.—I am, etc.,

Southwold, Suffolk.

J. C. LEEDHAM-GREEN.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

Short Service Commission.—Major-General W. E. Tyndall, C.B., C.B.E., M.C., late R.A.M.C., from Retired Pay List, to Short Service Commission, in the rank of Lieutenant.
Lieutenant-Colonel E. A. Smyth, O.B.E., has retired on retired pay (Reserve Liability).
Captain A. V. Forage to be Major.

REGULAR ARMY RESERVE OF OFFICERS

Major-Generals K. A. M. Tomory, C.B., O.B.E., and J. C. A. Dowse, C.B., C.B.E., M.C., late R.A.M.C., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers.

ROYAL ARMY MEDICAL CORPS

Colonel G. T. Hankey, O.B.E., T.D., from A.E.R.O., to be Colonel.

Major (Honorary Lieutenant-Colonel) H. R. Hartnell, M.B.E., has ceased to belong to the R.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Major R. M. Lang, from Active List, T.A., to be Major.

Major J. M. Wilson, from Active List, to be Major.

Captain (Honorary Lieutenant-Colonel) H. L. Connor has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel.

Class III.—Major J. B. Dancer has ceased to belong to the Reserve of Officers, retaining the rank of Major. Captain (War Substantive Major) (Honorary Lieutenant-Colonel) G. G. Black, from Reserve of Officers, to be Captain (War Substantive Major) (Honorary Lieutenant-Colonel). Captain (War Substantive Major) (Honorary Lieutenant-Colonel) G. J. Harrison, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel.

Captains (Honorary Majors) C. E. Brown and G. M. Barling, from Reserve of Officers, to be Captains (Honorary Majors).

Captains (Honorary Majors) A. T. Rogers and M. Headlam, having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers, retaining the honorary rank of Major.

Captain (Acting Major) A. S. C. Peden, from A.E.R.O., to be Captain, relinquishing the acting rank of Major.

Captain (Honorary Major) W. Thomson has ceased to belong to the Reserve of Officers, retaining the honorary rank of Major.

Association Notices

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1957

The Council of the British Medical Association is prepared to consider the award, in 1957, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "Medicine is an Art as well as a Science."

In awarding the prizes due regard will be given to evidence of personal observation and experience. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1957. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

OCCUPATIONAL HEALTH PRIZE

The Occupational Health Prize was established by the Association for the purpose of encouraging interest and research in the field of occupational health. The Council of the British Medical Association is prepared to consider the award of this prize, which consists of a certificate and £50, in the year 1957. Any member of the Association who is engaged in the practice of occupational health, either

whole-time or part-time, is eligible to compete for the prize. Candidates may select their own subject.

Entries should be submitted in a form suitable for publication and must include personal observations and experiences collected by the candidates in the course of their work. If no entry is of sufficient merit no award will be made. Candidates should confine their attention to their own observations rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.

Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1957. No study or essay that has been published in the medical press or elsewhere will be considered eligible for the prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A previous prizewinner is not precluded from entering. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final.

Preliminary notice of entry for this competition is required on a form of application to be obtained from the Secretary. Each entry must be typewritten or printed on one side of the paper only, and accompanied by a note of the candidate's name and address. No definite limits are laid down as to the length of essays, but the Council anticipates that, for this competition, essays should consist of between 3,000 and 10,000 words. Inquiries relative to the prize should be addressed to the Secretary.

A. MACRAE,
Secretary.

Diary of Central Meetings

JANUARY

15 Tues.	Estates Committee, 11.30 a.m.
15 Tues.	Central Consultants and Specialists Executive Committee, 2 p.m.
15 Tues.	Finance Committee, 2 p.m.
16 Wed.	Occupational Health Committee, 10 a.m.
17 Thurs.	G.M.S. Committee, 10.30 a.m.
17 Thurs.	Radiologists Group Committee, 11 a.m.
21 Mon.	Editorial Subcommittee, Joint Formulary Committee, 11 a.m.
22 Tues.	Staff Side, Committee B, Medical Whitley Council, 10.30 a.m.
22 Tues.	Alternative Edition Subcommittee, Joint Formulary Committee, 11 a.m.
22 Tues.	Full Committee B, Medical Whitley Council, 2 p.m.
24 Thurs.	Rural Practices Subcommittee, G.M.S. Committee, 2 p.m.
25 Fri.	Drug Addiction Committee, 2 p.m.
28 Mon.	Staff Side, General Whitley Council (at 14, Russell Square, W.C.1), 10.30 a.m.
28 Mon.	Full General Whitley Council (at 14, Russell Square, W.C.1), 2 p.m.
29 Tues.	Arrangements Committee (Edinburgh, 1959), 12 noon. (Change of time.)
29 Tues.	Subcommittee on Medical Reports, Joint Committee of the B.M.A. and the Magistrates' Association, 2 p.m.
30 Wed.	Council, 10 a.m.

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At Machynlleth Chest Hospital, Sunday, January 13, 3 p.m., meeting. Short papers by Dr. J. Berian Thomas: "Trauma in General Practice"; Dr. J. Anderson: "Some Reminiscences in General Practice"; Dr. E. D. Clifford-Jones: "Anaesthesia in General Practice."

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Tuesday, January 15, 8.30 p.m., meeting. Lecture by Dr. E. R. Bickerstaff: "Modern Views on Minor Strokes."

BRIGHTON AND MID-SUSSEX DIVISION.—At Hove General Hospital, Sackville Road, Wednesday, January 16, 8.30 p.m., clinical meeting on genito-urinary disease.

CAMBERWELL DIVISION.—At B.M.A. House, Tavistock Square, London, W.C.1, Tuesday, January 15, 5 p.m., meeting. Dr. Roger Bannister: "Physiology of the Mile."

CHESTERFIELD DIVISION.—At Walton Sanatorium, Friday, January 18, 8.45 p.m., meeting. A Brains Trust. Panel: Mr. F. J.

Milward, Dr. A. C. S. Courts, Dr. R. T. Gaunt, Dr. T. A. Blyton, and Dr. P. Tait. Question Master: Dr. Malcolm Graham.

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, W.C.1, Tuesday, January 15, 8.30 p.m., meeting. Debate: "Are Health Visitors Necessary?" For the motion, Dr. S. King and Dr. J. Greenwood Wilson; against the motion, Dr. M. J. Fitzgerald and Dr. A. Rezler. Any B.M.A. members, but especially those of St. Pancras Division, are invited, together with husbands or wives or other guests.

DUMFRIES AND GALLOWAY DIVISION.—At Cresswell Maternity Hospital, Dumfries, Sunday, January 13, 3 p.m., annual general meeting. Lectures, (1) Dr. Sheenah Russell: "The Infant who Vomits." (2) Mr. J. C. Campbell: "The Misuse of Antibiotics in E.N.T. Work." (3) Dr. James Harper: "Alcoholism as a Medical Problem."

ENFIELD AND POTTERS BAR DIVISION.—At the Firs Hall Ballroom, Green Lanes, Winchmore Hill, N., Saturday, January 19, 6.45 for 7.30 p.m., annual dinner. Guests of Division, Dame Enid Russell-Smith, Dr. Hugh Clegg, Dr. F. J. Fowler, and Dr. A. N. Mathias. Ladies and medical guests are invited.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Barrow-in-Furness, Tuesday, January 15, 8 p.m., meeting. B.M.A. lecture by Professor T. N. A. Jeffcoate: "The Adreno-Genital Syndrome."

KESTEVEN DIVISION.—Thursday, January 17, 7.15 for 7.30 p.m., dinner; 9 p.m., address by Professor C. G. Rob: "Recent Progress in Vascular Surgery" (illustrated by lantern slides).

LAMBETH AND SOUTHWARK DIVISION.—At Nurses' Lecture Theatre, Lambeth Hospital, Brook Drive, S.E., Tuesday, January 15, 8.15 p.m., meeting. Dr. D. S. Cadman: "Modern Developments in Pulmonary Tuberculosis."

LEWISHAM DIVISION.—At St. John's Hospital, Lewisham, S.E., Sunday, January 13, 10.30 a.m., clinical meeting.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C.1, Tuesday, January 15, 5 p.m., meeting. Mr. Eoin Aberdeen: "A Flying Doctor in North-west Australia" (illustrated by colour photographs). All students and recently qualified practitioners are invited.

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, January 17, 8.30 p.m., meeting. Lecture by Mr. M. C. Oldfield: "Plastic Surgery" (illustrated by lantern slides).

SOUTH BEDFORDSHIRE DIVISION.—At Board Room, Luton and Dunstable Hospital, Friday, January 18, 9 p.m., meeting. Dr. J. H. Cyriax: "Backache, with Special Reference to Manipulation."

SOUTH SHIELDS DIVISION.—At X-ray Department, South Shields General Hospital, Wednesday, January 16, 8.30 p.m., meeting. Address by Dr. J. McKee: "Public Relations."

SWANSEA DIVISION.—At Morriston Hospital, Swansea, Thursday, January 17, 7.30 p.m., clinical meeting; impromptu discussion of members' questions by a panel representative of the various specialties.

TODMORDEN DIVISION.—At Abraham Ormerod Medical Centre, Todmorden, Friday, January 18, 4 p.m., annual general meeting.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Wednesday, January 16, 8.30 p.m., meeting. B.M.A. Lecture by Professor D. M. Dunlop: "New Drugs."

WILLESDEN DIVISION.—At Rehabilitation Department, Willesden General Hospital, Harlesden Road, N.W., Tuesday, January 15, 9 p.m., meeting. B.M.A. Lecture by Dr. F. E. Camps: "Murder?—or Suicide" (illustrated). Members of Wembley and Hampstead Divisions are invited.

Meetings of Branches and Divisions

FOLKESTONE AND DOVER DIVISION

The annual general meeting was held at the Esplanade Hotel on November 7, 1956. Dr. A. D. Broatch was in the chair and 14 members were present. The following officers were elected:

Chairman.—Dr. A. D. Broatch.
Vice-chairman.—Dr. C. P. K. Toland.
Secretary.—Dr. M. Paxton.
Treasurer.—Dr. J. Barham.

A resolution "that the Division resolves to continue full support to the Negotiating Committee in its dealings with the Minister and urges the Committee to accept nothing less than an award according to the Spens report" was carried. Dr. Broatch gave a lecture on "The Medical Aspects of Atomic Warfare."

KESTEVEN DIVISION

At a meeting of the Kesteven Division held on October 25, 1956, considerable dissatisfaction with the rate of progress on the remuneration claim was expressed. The meeting stressed that: (1) the Association should have in readiness the full machinery for taking action if the claim is rejected; (2) a Special Representative Meeting at an early date should be called so that the Minister may be in no doubt as to the result of his refusal of the claim; (3) publicity should be given in the press, at the appropriate time, if necessary, by advertisement; (4) the Association should consider the advisability of giving the Minister a time limit for the completion of negotiations.

AUSTRALIAN HEALTH SERVICE STATE-SUBSIDIZED BENEFITS

[FROM A CORRESPONDENT]

The Australian National Health Act became fully operative in 1953, its several parts having been introduced gradually since 1949. Its provisions, which are sponsored by the Federal (Commonwealth) Government, consist of the following: A national tuberculosis service for the diagnosis, treatment, and rehabilitation of tuberculous patients, introduced in 1949; a free-milk scheme for schoolchildren, introduced in 1950; a pharmaceutical benefit scheme, also introduced in 1950; a pensioner medical service, introduced in 1951; a hospital benefits scheme, introduced in 1952; and a medical benefits scheme, introduced in 1953.

These services provide free medical and hospital treatment and medicines for pensioners, amounting to about 10% of the population. For the rest of the population they provide a Government subsidy towards the cost of medical and hospital treatment to those who have voluntarily joined prepaid insurance schemes operated by approved organizations. The insurance schemes operated by approved organizations, and pharmaceutical benefits are available to all people irrespective of income. Apart from those in the preventive health services and a small number in salaried hospital appointments, the large majority of doctors in Australia are in independent private practice and are paid on an item-of-service basis. The population of Australia is about 10 million, and there are some 9,000 doctors.

The considerations which decided the Federal Government to base its National Health Service on a system of State-subsidized voluntary medical and hospital insurance for the majority of the people were stated in an address to the World Medical Association in 1953 by Sir Earle Page, at that time Minister of Health for the Commonwealth. The Australian Government believed, Sir Earle Page said, "that a partnership of the medical profession, the community, insurance organizations, and the Government can evolve a method of retaining all the existing traditions and advances on the medical side and still bring the cost of a first-rate medical service within the means of the people."

Pharmaceutical Benefits

This part of the service provides, free to every member of the community, drugs classified as either life-saving or disease-preventing, or both. It consists of: (1) an official list of items numbering 186, all single substances, compounds not being included, originally compiled and amended by a statutory pharmaceutical benefits advisory committee, the majority of whose members are British Medical Association nominees appointed by the Minister for Health; (2) a contract between the Government and registered pharma-

cists for the supply, at a fixed price to the Government, free of charge to patients, of all items on the official list; (3) prescription forms supplied by doctors themselves and bearing their name and address.

There are no penalties for doctors for breaches of the regulations, the only offences for which a doctor can be charged being either a crime or misdemeanour—e.g., fraud. Form of prescriptions (size and shape), quantities prescribable, and number of repeats are defined in the regulations.

When the pharmaceutical scheme was first introduced the indiscriminate prescribing of certain antibiotics by a small percentage of the profession threatened to raise costs inordinately. As a result, the profession and the Government drew up a list of specific diseases for which those antibiotics should be prescribed, which doctors are now required by regulation to observe.

The percentage expenditure on major drugs is: penicillin, 19%; other antibiotics, 28%; sulphonamides, 14%; all other items, 39%. The following table shows the number of scripts, the average cost of each script, and the cost to the Government since 1951:

	Number of Scripts	Average Price s. d.	Amount £
1951-2	6,518,283	20 6	6,712,147
1952-3	6,855,708	18 1	6,199,786
1953-4	7,044,613	20 4	7,160,186
1954-5	9,268,369	17 4	8,048,612

Pensioner Medical and Pharmaceutical Service

The pensioner medical service provides general-practitioner services free of charge to all persons receiving an age, invalid, widow's, or Service pension, or a tuberculosis allowance, and their dependants.

In addition to medicines under the pharmaceutical benefits scheme, which are available to every member of the community, pensioners and their dependants are provided free of charge with all medicines contained in the *British Pharmacopoeia*, together with other specified drugs. These are made available on the prescription of a medical practitioner in accordance with regulations.

The number of prescriptions written for pensioners and their dependants in 1954-5 was 4,418,661 at an average cost of 5s. 11d.

To be eligible for treatment the pensioner must possess an entitlement card issued by the Department of Social Services. This card is the authority for the doctor to provide free medical attention and must be presented to the doctor on each occasion that medical treatment is rendered. The doctor initials and dates the card at the time of each consultation or visit. The patient, or other responsible person, signs a voucher at the time, and this provides the basis of the doctor's claim for payment from the Commonwealth for the services rendered. The voucher also contains a

¹ *British Medical Journal Supplement*, 1953, 2, 93.

statement by the patient authorizing payment for the service rendered to be made directly to the medical practitioner concerned. The contract for service is between patient and doctor and not the Government and doctor.

Any registered medical practitioner may participate in the service. Since the scheme was started there has been a progressive increase in the number of services given by participating doctors, and there has also been a steady increase in the number of pensioners and dependants entitled to the service.

In June, 1955, the number of doctors participating was 4,567, and the average yearly payment per doctor, including mileage, was £552. Medical practitioners are paid at the rate of 10s. per surgery consultation and 12s. per visit. A small extra fee may be charged for an after-hours service or for travelling more than three miles from the surgery. The rates represent a concession of 33½% on ordinary private charges.

It has been stated that a very small section of the profession has abused the pensioner medical service. In a few cases doctors' incomes from the service, as a result of excessive services, have amounted to as much as £3,500 compared with the average of £552. To deal with charges of abuse the Government has constituted committees of inquiry composed entirely of doctors appointed by the Minister for Health from a panel recommended by the Council of the British Medical Association in each State. The committees hear complaints against doctors referred by the Department of Health, and they may recommend to the Minister for Health that a doctor be compelled to refund amounts received for excessive visiting, and/or that he be warned, or that he be suspended from the pensioner medical service for periods of up to a year.

Hospital Benefits

The hospital benefits scheme is based mainly on the principle of Government subsidization of benefits received by way of contributions to voluntary insurance organizations. The Commonwealth Government, however, makes a grant of 8s. per occupied bed per day to all hospitals in all States, whether the occupant is insured or not, and in addition subsidizes the benefit which a contributor receives from a voluntary organization by 4s. a day. In effect the Commonwealth's subsidy is 12s. a day for all persons in hospitals who belong to voluntary insurance organizations.

Rates of contribution to the voluntary organizations vary from a minimum of 3d. a week for a single person and 6d. a week for persons with dependants to 1s. 6d. and 3s. respectively. The smaller contributions qualify for a weekly benefit of £2 2s., which, when the Government grant of £4 4s. is added, amounts to a total of £6 6s. a week; and the larger contributions qualify for a benefit of £12 12s. a week, which, with the Government grant of £4 4s., makes a total of £16 16s. a week.

The hospital benefits scheme has placed public hospitals on a sound basis. Before its introduction all public hospitals, including teaching hospitals, were in debt and working on large overdrafts. In 1954-5 almost £12m. was paid to hospitals from the hospital benefits scheme, and 56% of the population was covered by the scheme.

Australia has approximately 750 public hospitals and 860 private hospitals. Public hospitals generally have three sections—public, intermediate, and private. There are set weekly charges for the private and intermediate sections, and the charge for the public section is generally in accordance with the patient's ability to pay. If the patient cannot pay, there is no charge. The basic charge is £12 12s. a week.

Consultant and specialist hospital appointments are honorary so far as the public wards are concerned, but fees are charged to patients in private and intermediate wards.

Medical Benefits

As with the hospital benefits scheme, the principle of the medical benefits scheme is that the Commonwealth pays a benefit to a person who has voluntarily insured himself. As with the hospitals benefits scheme, the administrative costs of the medical benefits scheme are borne in the main by the

voluntary organizations, no allowance whatever being made by the Commonwealth for administrative costs. The National Health Act provides for two schedules of benefits, schedule 1 including in the main those services normally rendered by a general practitioner, and schedule 2 being a schedule of specialist services, including radiological, pathological, urological, neurosurgical, etc. Schedule 1, apart from consultations and visits, contains 120 items of service, while schedule 2 contains 288 items.

The Commonwealth benefit ranges from 6s. for a consultation to £11 5s. for an operation, and the voluntary organization, which must be non-profit-making and approved, is required at least to match the Commonwealth benefit. The contributor to a voluntary insurance organization, therefore, receives at least 12s., usually a little more, towards the cost of a consultation (generally 15s.) and up to £22 10s. towards the cost of a major operation. The benefit payable by the Commonwealth for a consultation when the patient is referred to a specialist by a general practitioner is £1, the voluntary organization paying at least an equivalent amount.

The weekly rates of contribution vary according to the amount of organization benefit payable. Examples are: single person—9d. for minimum coverage, 1s. 6d. for maximum coverage; family groups or persons with dependants—1s. 6d. for minimum and 2s. for maximum coverage.

There are several hundred voluntary insurance organizations, the largest being the Medical Benefits Fund of Australia, which was established by the medical profession in 1947, when it was threatened with nationalization. Its membership is over 600,000 and its coverage approximately 1,300,000.

A criticism of the medical benefits scheme has been its failure to cover pre-existing disease. As voluntary insurance is the basic principle, pre-existing illness is not permitted to attract a benefit from the date of joining, as otherwise the incentive to insure would be destroyed. However, this restriction applies only to insurance organization benefit. Pre-existing disease ranks for full Commonwealth benefit immediately a person registers with an insurance organization. Also, to meet the case of persons with pre-existing disease, the insurance organizations have now agreed to pay benefits in respect of the particular disease after two years' membership.

Another criticism has been the failure of the voluntary organizations to pay benefits reasonably promptly. In the early days there was considerable delay owing to the rapid growth of the organizations. However, now that the growth is not so rapid and staffs have been trained, payment is more prompt and in many instances payment is made over the counter.

Still another reported criticism is that, whereas with some services—e.g., consultations and visits—the total benefit payable approaches 90% of the doctor's charge (a fundamental principle of the scheme being that the total benefit must not exceed 90%), with a considerable number of services the benefit does not exceed 60%, and in some cases 40%. It is anticipated that, once the organizations have established themselves on a sound actuarial basis with adequate reserves, it will be possible to increase the benefits payable for a number of services.

In 1955 there were 4,154,103 members (45.4% of the population) of voluntary organizations. In 1955 the £13,443,952 cost of medical treatment was met by £4,562,320 from organization benefits, £4,155,086 from Commonwealth benefit, and £4,726,546 from insured members.

In a memorandum to the World Medical Association in September, 1955 (from which much of the information in this article was obtained), Dr. John Hunter, secretary of the Federal Council of the B.M.A. in Australia, wrote that "the medical profession is very happy with the scheme, for it conserves all the principles for which the profession has fought over the years—professional freedom and no alteration in the doctor-patient relationship—and at the same time lays down an economic foundation such as the profession never before possessed."

British Medical Association

ANNUAL MEETING—NEWCASTLE UPON TYNE, JULY 10-19, 1957

President-Elect: WELDON WATTS, A.F.C., M.S., F.R.C.S.

Local General Secretary: G. W. ANDERSON, M.B., B.S., 21, Lyndhurst Road, Benton, Newcastle upon Tyne, 12.

Science Secretaries: IAN RANNIE, M.B., Ch.B., Department of Pathology, Royal Victoria Infirmary, Newcastle upon Tyne, 1; J. I. MUNRO BLACK, M.D., M.S., F.R.C.S., 47, Clayton Road, Jesmond, Newcastle upon Tyne, 2.

Executive Clerk: Miss B. E. MIDDLEMISS, B.M.A. House, Tavistock Square, London, W.C.1.

PROVISIONAL PROGRAMME

The 125th Annual Meeting of the British Medical Association will be held in Newcastle upon Tyne from Wednesday, July 10, to Friday, July 19, inclusive.

The Annual Representative Meeting will be held in the City Hall and will begin on Wednesday, July 10, and will continue on Thursday, Friday, Saturday, and Monday, July 11, 12, 13, and 15.

On the evening of Tuesday, July 9, there will be a Cocktail Party for Representatives and their Ladies, arranged by the Newcastle upon Tyne Division, with the co-operation of the North of England and the Tees-side Branches. This will be held in the Old Assembly Rooms.

A combined Dinner for Representatives and their Ladies will take place at the Old Assembly Rooms on Thursday, July 11, followed by a Dance.

The Overseas Luncheon has been arranged for Friday, July 12, at 1 p.m. in the Old Assembly Rooms.

On Sunday, July 14, there will be three excursions: (1) All-day excursion to the Roman Wall which will be accompanied by guides from the Department of Roman-British Archaeology, King's College, University of Durham. (2) All-day trip to the Farne Islands. (3) Half-day excursion to Durham Cathedral. In the evening a Symphony Concert, sponsored by Abbotts Laboratories Ltd., will be given in the City Hall.

The Adjourned Annual General Meeting and President's Address will take place in the City Hall on the evening of Monday, July 15, and the President's Reception which follows will be held in the Old Assembly Rooms.

The Annual Scientific Meeting and associated functions occupy the period from Monday, July 15, to the evening of Friday, July 19.

The Official Religious Service will be held in St. Nicholas' Cathedral on the afternoon of Tuesday, July 16. The address will be given by the Right Reverend the Lord Bishop of Durham.

There will be a Roman Catholic Service on the same day.

A Jewish Service will be held on Saturday, July 13, at 10 a.m. at the Leazes Park Road Synagogue.

The Annual Dinner of the Association will be held in the Old Assembly Rooms on Tuesday, July 16.

There is to be a full social programme, including a Civic Reception on Wednesday evening, July 17, and a University Reception on Thursday evening, July 18.

The Annual Breakfast of the Christian Medical Fellowship will be held on Wednesday, July 17, at 8.15 a.m.

Several special visits and excursions are being arranged for ladies accompanying members.

The usual Golf Competitions will take place on July 17 and 18.

The Overseas Conference will be held in the afternoon of Wednesday, July 17.

The Reception Bureau for Registration will be open in the Stephenson Buildings, King's College, on Monday, July 15, at 9 a.m.

Each day there will be a programme of surgical operations and clinical demonstrations in the Victoria Royal Infirmary

shown by colour television on a closed circuit. The technical arrangements will be sponsored by Smith, Kline and French Laboratories Ltd.

Three Plenary Scientific Sessions have been arranged as follows: Wednesday, July 17, at 10.30 a.m., subject "The Management of Hypertension"; Thursday, July 18, at 2.30 p.m., subject "The Present Status of Prophylactic Immunization"; Friday, July 19, at 9.30 a.m., subject "Care of the Dying."

In addition, Round-Table Conferences will be held concurrently on Wednesday, July 17, from 9 to 10 a.m. Subjects to be arranged.

The nineteen Scientific Sections will hold meetings, including a special session of the Sections of Obstetrics and Gynaecology and of General Practice on "Obstetrics and General Practice" to be held on Monday, July 15, at 3 p.m.

The provisional arrangements are as follows:

Medicine		July 16 (a.m.), July 18 (a.m.)
Surgery		July 16 (a.m.), July 17* (p.m.)
Obstetrics and Gynaecology		July 15* (p.m.), July 16 (a.m.)
.. ..		July 17 (p.m.), July 18 (a.m.)
Anaesthetics		July 17 (p.m.), July 18 (a.m.)
Cardiology		July 16* (a.m.), July 17 (p.m.)
Child Health		July 17* (p.m.), July 18* (a.m.)
.. ..		July 19 (p.m.)
Dermatology		July 17 (p.m.)
General Practice		July 15* (p.m.), July 17* (p.m.)
.. ..		July 18* (a.m.)
History of Medicine		July 16 (a.m.)
Neurology		July 17 (p.m.), July 18 (a.m.)
Occupational Health		July 16 (a.m.)
Ophthalmology		July 16 (a.m.)
Orthopaedics		July 17 (p.m.)
Oto-rhino-laryngology		July 18 (a.m.), July 19 (p.m.)
Physical Medicine		July 19 (p.m.)
Plastic Surgery		July 17 (p.m.)
Preventive Medicine		July 17* (p.m.)
Psychiatry		July 16 (a.m.)
Radiology		July 17* (p.m.)

*Combined session.

Individual programmes for these Sections will be published in a later issue of the *Journal*.

The Scientific Exhibition will be held in the Stephenson Buildings and will be open daily on July 15 to 19. Demonstrations will be given at fixed advertised times, and a wide field of medical interests will be covered. Further details will be published later.

The Annual Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications will also be in the Stephenson Buildings. The Exhibition will be open from 9 a.m. to 6 p.m. on July 15 to 19.

The Ladies' Club will be situated in the Medical School, King's College, and will be open throughout the Meeting.

HOTEL ACCOMMODATION

The following is a preliminary list of hotel accommodation available in Newcastle upon Tyne and district. Members

wishing to reserve accommodation are asked to write direct to the hotel, stating that they are attending the B.M.A. Meeting. The Association cannot accept responsibility for any of the prices stated below. These are the tariffs ruling at the moment and are subject to alteration without notice. Applicants should therefore verify the tariffs when making their reservations. Early application for accommodation is recommended. For hostel accommodation all requests should be made to the Executive Clerk, B.M.A. House, London, W.C.1, and not direct to the hostel.

SUPPORTING GROUP FOR WORLD MEDICAL ASSOCIATION

A meeting to inaugurate a British supporting group for the World Medical Association is to be held at B.M.A. House on January 29 at 3.30 p.m. The President of the B.M.A., Dr. Alexander Hall, will preside, and the speakers will be the Chairman of Council, Dr. S. Wand, and the Chairman of the International Relations Committee, Dr. J. A. Pridham. Representatives of medical organizations and of lay bodies traditionally associated with medicine have been invited.

PUBLIC HEALTH COMMITTEE

The Public Health Committee met at B.M.A. House on December 28, with Dr. JOHN B. TILLEY in the chair.

It was reported that the Council had approved the Committee's recommendations on the marriage bar for women doctors in public health appointments, typhus immunization, health visitors and other matters. The resolution of the Annual Representative Meeting on air pollution had been submitted to the Ministries concerned, and replies were received stating that it was the intention of the Minister of Housing and Local Government to fix an appointed day for many of the provisions of the Act, including those dealing with smoke control areas, before the end of the year. The Ministry of Fuel and Power had replied that a scheme was in preparation for considering smokeless fuel supplies and for ensuring that the plans of local authorities did not get out of step with those of the producers of smokeless fuels. The Ministry of Health stated that the Minister was keeping in touch with the Minister of Housing and Local Government on this matter.

As a result of the discussion at the November Council meeting regarding a special committee on "milk," the Chairman of the Committee had suggested that, while the Public Health Committee was directly interested in the administrative aspects of the provision of pure milk, the resolution of the Annual Representative Meeting appeared to be directed towards the scientific side. The Chairman of Council agreed with this view, and the matter had been referred to the Science Committee with a recommendation that it should appoint a special subcommittee to consider the matter and that the subcommittee should include nominees from the Public Health Committee.

Negotiating Machinery

It was reported that the negotiations for appeals machinery in Northern Ireland had broken down but that *ad hoc* arrangements would be made for the outstanding cases to be dealt with.

The Council had approved the Committee's recommendation that the suggestion that public health doctors should join with other local authority employees in negotiating machinery should not be accepted. A letter was received from the negotiating committee for clerks of local authorities concurring with this view.

Ingleby Committee

Representations were made to the Home Secretary following on the November Council meeting that the medical membership of the Ingleby Committee should be increased to include a representative of the public health service, but the Home Secretary replied that he did not feel justified in adding to the membership of the Committee. It was reported that the Chairman of Council, in consultation with the Chairman of the Committee and such other committees as appeared to be concerned, had decided that the membership of the committee appointed by the Council to prepare the Association's evidence to the Ingleby Committee should consist of the Association's side of the Joint Committee of the B.M.A. and the Magistrates' Association, with two representatives each from the General Medical Services, Private Practice, and Public Health Committees, and the Central Consultants and Specialists Committee be invited to nominate its own ranks, in order to provide further expert medical representation.

Remuneration Matters

The Secretary of the Committee reported that every local authority in the United Kingdom had now implemented the Industrial Court Award 2565 (M.D.C. circular 24). Ninety per cent. of all local authorities had implemented the more recent agreement (M.D.C. circular 27) on the remuneration of public health medical officers. Although 12 authorities had at first refused to implement this agreement, only one was still standing out.

The Committee heard with pleasure that agreement had been reached on all items in the claim for increased remuneration for medical practitioners undertaking part-time work for local authorities. A summary of the agreement (M.D.C. circular 32) was published in the *Supplement* of December 29 (p. 228). It was agreed to recommend to Council that the *British Medical Journal* should continue to accept advertisements offering remuneration under the old scale for the next four months, and that all health authorities should be so informed.

The CHAIRMAN reported that, in spite of repeated requests, no reply had been received from the Ministry of Health to the proposal that an independent committee of inquiry—a public health "Spens"—should be set up to consider the range of remuneration of medical officers in the public health services. The Committee voiced its concern at the delay and asked that the Association should continue to express for a reply. Some members of the Committee expressed the disappointment of public health officers in not being associated in some way with the other two parts of the profession in the present remuneration claim; it was explained that the answer to that criticism was that the general practitioners and consultants were asking the Minister for the betterment which public health officers had received in their last award and agreement. Public health officers were concerned with a much greater issue—namely, the whole basis of remuneration in the public health service.

Appointment Without Advertisement

It was reported that a county council had tried to appoint medical officers to "mixed appointments" without advertising the vacancies. A note had been sent by the county council to its medical officers drawing attention to the vacancies and inviting applications. It was understood that the town clerks concerned had sought the Minister's approval to this procedure and the Minister had dispensed with the requirement to advertise. Subsequently one of the vacancies was advertised, the other was not. The same thing happened later in the year in another area, and letters of protest had been received by the Association.

The matter had been taken up with the county council concerned, which replied that it felt that until there was some settled policy on the proposal that certain maternity and public health responsibilities should be returned to borough councils, the needs of a borough would be adequately met by a part-time medical officer of health. The officer appointed would spend 45% of his time on the duties of medical officer of health and the remainder in the service of the county council.

The CHAIRMAN emphasized that the policy of the Association was that all posts should be advertised. Applicants who might wish to apply for posts were prevented from doing so unless they were advertised. It was agreed that the matter should be reported to the Council of the Association so that it could be taken up vigorously with the county council and the Ministry of Health.

Integration of Medical Officers of Health with Hospital Service

The Council at its meeting on November 7 had been informed of the Committee's grave concern that the Joint Consultants Committee should have presented a definite opinion on this matter to the Ministry of Health before the views of the Association (one of the bodies represented on the Joint Consultants Committee) had been formulated. The Central Consultants and Specialists Committee had reported to the Council at the same meeting that it agreed with the view of the Joint Consultants Committee. It did not believe that liaison between the hospital and public health services would be obtained by the medical officer of health becoming a member of the medical staff and of the hospital medical committee.

After reconsidering the matter, the Central Consultants and Specialists Committee had reported again to the Council

on December 19. It recalled that in June, 1956, the Public Health Committee had submitted a resolution to the Consultants, General Practice, and Public Health Liaison Committee that it (the Public Health Committee) agreed with the principle of medical officers of health being appointed honorary consultants of hospital groups and serving on medical advisory committees, and recommended that regional hospital boards should be urged to consider such appointments. Two of the representatives of the Public Health Committee on the liaison committee had, however, dissented from the view of their committee when this resolution was being discussed, and the liaison committee referred the matter back to the Public Health Committee. In the meantime the Joint Consultants Committee had been asked by the Ministry for its views on the recommendation of the Guillebaud Committee on the integration of M.O.H.s with the hospital service. The views which the Joint Consultants Committee gave the Ministry were expressed with the agreement of representatives of the Public Health Committee. It did not appear to the Central Consultants and Specialists Committee, therefore, that the criticism of the Public Health Committee was well founded. Further, the Central Consultants and Specialists Committee reported to Council, it adhered to its policy that the constitution of a hospital group committee is ultimately a matter for the senior medical staff in the group to decide, and that the medical officer of health should serve as a member by invitation and not by right. The Council did not come to a decision on this part of the report of the Central Consultants and Specialists Committee, but referred it to the Public Health Committee for its comments.

Dr. H. D. CHALKE expressed regret that it should have been necessary for this matter to come before the Public Health Committee once again. He noted that the Central Consultants and Specialists Committee had not given any reasons for taking an opposite view to the Public Health Committee, and had merely pointed out that the opinion given to the Ministry of Health by the Joint Consultants Committee had been supported by the members of the Public Health Committee present by invitation at the meeting of the Joint Committee.

Dr. LLYWELYN ROBERTS, as one of those who attended the meeting of the Joint Consultants Committee, said that he was sorry a misunderstanding had arisen. He could not accept the statement that the public health representatives present at the meeting of the Joint Consultants Committee had supported the view put to the Ministry by that committee. There had been an informal discussion, but he certainly did not intend to give the impression that the Public Health Committee, or indeed its representatives present, was in agreement with the Joint Committee in this matter.

The CHAIRMAN stated that the main objection of the Committee was, surely, that the Joint Consultants Committee had expressed a definite opinion to the Ministry when it was known that the Association, one of the bodies represented on the Joint Consultants Committee, was still discussing the matter through its Consultant, General Practice, and Public Health Liaison Committee, and that no final conclusions had been agreed or approved by the Council of the Association.

Dr. H. D. CHALKE pointed out that, while it was true that the Joint Consultants Committee had been asked specifically by the Ministry for its views, the Society of Medical Officers of Health had also been asked for an opinion on this question, but the Society had not yet replied to the Ministry's request. Under its reciprocal arrangements with the Association on medico-political matters, the Society had forwarded a statement to the Association in the hope that the two bodies would be able to formulate an agreed policy. The Society's memorandum had been accepted in principle by the Public Health Committee. This had been done a considerable time ago, and the Society was reluctant to delay longer before reporting to the Ministry. The action which the Society had taken was in direct contrast to the precipitate action of the Joint Consultants Committee.

Dr. J. F. WARIN pointed out that the basis of the decision of the Joint Consultants Committee appeared to be that it was opposed to the suggestion in the report of the Guillebaud Committee that the medical officer of health should be appointed a consultant and serve on the hospital medical staff committee "as a right." He stressed that the policy of the Public Health Committee did not make any reference to medical officers of health having a "right" in these matters. He moved:

That the Public Health Committee does not accept the full implications in the report of the Central Consultants and Specialists Committee to the Council, and considers that it would be helpful if the matter could again be discussed in the Liaison Committee.

The following amendment by Dr. H. D. Chalke to the motion by Dr. Warin was carried, also as the substantive motion:

That the Public Health Committee does not accept the full implications in the report of the Central Consultants and Specialists Committee to the Council and reaffirms to the Council its views as already reported to Council.

The Committee accepted a suggestion by Dr. A. BARKER that, in reaffirming its views to the Council, the Committee's recommendations should be in two parts:

(1) That the Council agrees with the principle of medical officers of health being appointed honorary consultants of hospital groups, and recommends that regional hospital boards should be urged to consider such appointments in the interests of all concerned; (2) that the Council agrees with the principle of medical officers of health serving on medical advisory committees in the interests of all concerned.

Trade Unionism Within the Profession

The Committee considered a report of a meeting between representatives of the B.M.A. and the Association of County Medical Officers, held at the request of the latter, to discuss the question of trade unionism within the profession. The CHAIRMAN said that the matter turned on the fact that there were certain medical officers of health whose salaries were discretionary, and who had little hope of any appeal being accepted by their authorities, who felt that they should have access to the Industrial Disputes Tribunal and not only, by agreement, to the Industrial Court. There were other officers, members of other organizations which, being trade unions, could take disputes to the tribunal and get a binding decision. The suggestion was that if a trade union for county medical officers of health could be formed it could have a seat on Committee C, which was responsible for negotiating salaries, and would then have the right to notify a dispute under the Industrial Disputes Order instead of reference by agreement under the Industrial Courts Act. There was no doubt, continued the Chairman, that there would be an advantage in being able to go to the tribunal, but it had been put to the Association of County Medical Officers that, while the Committee was not entirely satisfied with all the results of the large number of individual appeals which had been taken up by the B.M.A., not one had been lost. The dangers of fragmentation of the profession had been pointed out, but some county medical officers still felt that their problems were unique. The Committee, after a full discussion, felt that, while there was much to be said for obtaining the right to go direct to the Industrial Disputes Tribunal, it did not consider the time was opportune at present. The views of the Committee passed in April, 1956, were reaffirmed—the maintenance of unity in the public health service was as important as the Association's policy of unity within the profession as a whole.

Other Business

The Committee considered draft proposals for amending and consolidating the Milk Regulations. A small sub-committee was set up to go into the proposed amendments and report in time for the next Council meeting.

It was agreed to support a suggestion from the Ministry of Agriculture, Fisheries, and Food that legislation relating to the anaesthetizing of pigs in slaughterhouses should be

amended to give the Minister power to permit by regulation the use of any method of anaesthetizing (as distinct from slaughtering) animals at slaughterhouses and knackery yards. Corresponding action in relation to Scotland was being considered.

A report of a meeting of members of the Committee with representatives of the Society of Medical Officers of Health to discuss the appropriate method of securing nominations for medical officer of health representatives on regional hospital boards was considered. It was agreed to accept the proposals and to recommend them to Council.

Other matters discussed included coastal sewage disposal, public health laundry service, and bacterial rodenticides.

A formal meeting of the Trustees of the Public Health Service Defence Trust was held during the day.

RETIREMENT PENSIONS FOR SELF-EMPLOYED

PROVISIONS OF FINANCE ACT, 1956

[FROM A SPECIAL CORRESPONDENT]

Under the Finance Act, 1956, persons with earned income derived from non-pensionable employment are enabled to provide pensions for themselves under the same favourable taxation terms given to contributors to approved pension schemes (*Supplement*, September 29, 1956, p. 139). From a recent Board of Inland Revenue ruling on the application of the 1956 Act to the medical profession it is now clear that many practitioners will be able to include National Health Service earnings in calculating the contributions which can be made to personal pension policies. The position of those outside the National Health Service remains unaltered by the ruling.

Broadly, practitioners under the N.H.S. can be divided into two classes for the purpose of the 1956 Act. The first comprises those who hold "an office or employment" and are therefore taxed under Schedule E. These practitioners are not eligible to take advantage of the provisions of the 1956 Act. They already receive full tax relief on their contribution of 6% of remuneration to the N.H.S. Superannuation Scheme. This is authorized by Section 378 of the Income Tax Act of 1952, and it is consequently a statutory allowance. All full-time salaried employees in the N.H.S. scheme fall into this group. The second group includes those practitioners who are self-employed and taxed under Schedule D. They contribute 6% of their assumed net earnings to the N.H.S. Superannuation Scheme. Their contributions do not, however, rank for statutory relief of tax under any provisions of the Income Tax Acts, though such relief has in practice been allowed as a concession. The Board of Inland Revenue states it does not intend that the conditions of this concessionary relief shall be altered except as stated below.

Net Relevant Earnings

The second group, which appears to consist largely of general practitioners, is, by statute, allowed to contribute to personal retirement policies under the terms of the 1956 Finance Act, and N.H.S. earnings can be taken into account in computing the "net relevant earnings" on which reliefs are allowed within the limits of that Act. If, however, a practitioner's contribution to such a policy, together with his contributions for the year to the N.H.S. Superannuation Scheme, exceed the maximum permitted allowance under the 1956 Finance Act, having regard to his net relevant earnings for the year, then he will lose the concessionary relief on that amount of his superannuation contributions by which his total payments exceed the maximum permitted allowance under the Finance Act.

It is not at present known into which category part-time consultants will fall in respect of their remuneration, since the question whether these earnings should be assessed for income tax under Schedule D or Schedule E is at present the subject of an appeal to the High Court. If the ultimate

decision is that they should be taxed under Schedule D, then, as regards personal retirement policies, their earnings will be treated in the same way as the N.H.S. earnings of general practitioners.

A practitioner who originally "opted out" of the N.H.S. Superannuation Scheme and maintains policies by arrangement with the Ministry of Health, under the conditions laid down by the Minister, will be entitled to full relief up to the statutory limit in respect of his contribution to a retirement pension policy effected under the terms of the 1956 Finance Act. He will be permitted, if he wishes, to substitute the 1956 Act benefits for his present arrangements, but the conversion procedure to be adopted for such optants is not yet quite clear and is under discussion with the Ministry of Health. However, it must be appreciated that, in the case of either a new policy or a conversion, the 8% at present granted to such a practitioner for the upkeep of existing policies will not rank as part of his "net relevant earnings" for the purposes of the Act.

Further information on individual problems can be obtained from the chief office of the Medical Insurance Agency at B.M.A. House, Tavistock Square, London, W.C.1, and the Scottish office at B.M.A. House, 6, Drumheugh Gardens, Edinburgh, 3, or any of the Agency's branches.

REINSTATEMENT OF SERVICE MEN ON DOCTORS' LISTS

The Ministry of Health has asked executive councils to remind Service men discharged from the Forces that if they wish to be reinstated on the list of the doctor who attended them before their call-up they must communicate with him. Executive councils have been instructed to write to all those who have not signed on with a doctor within three months of their discharge. This instruction follows discussions with the representatives of the G.M.S. Committee.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR,—If any of us hesitated to support the claim to have Spens implemented at this time, surely he need hesitate no longer after the announcement that N.H.S. administrative and clerical staffs have been granted a 3% increase in salary on the basis of the rise in the cost of living since February 1, 1956. How do these people get their increases each year while we have spent months of negotiations over a rise due since 1952? One wonders if the Government is deliberately provoking us to abandon the N.H.S. in order that it may be relieved of its ever-increasing financial burden, and yet, by putting the blame on us for walking out, avoid the political setback which any party renouncing the scheme would suffer.

There is some talk of lack of unity in the profession. Surely this is really a lack of unified aim; we know of many faults in the present scheme but are not agreed on how best to effect improvement. How many of us know the details of the Australian, New Zealand, and other health schemes? Informative articles in the *Journal* laying out the pros and cons of these schemes and the difficulties experienced in their administration would help us in deciding between the capitation system, salaried service, and payment for services. Thereafter discussion at the forthcoming local Guild meetings could assist in formulating a unanimous national policy.

It is obvious that we must make a firm stand in this present dispute. If we give way now we may as well forget Spens for good. It is most regrettable that medicine has to be mixed with politics and that we have to haggle over

terms with successive Governments, but at least we could minimize this by getting the Spens agreements on a binding contractual basis now, with automatic annual adjustments, and so prevent repetition of this degrading niggling every few years. If the Minister will not agree to the conditions under which we entered the scheme, let us abandon it altogether and negotiate a new contract, bearing in mind the lessons learnt from the present situation. Seldom has a professional body been treated as we have by Mr. Turton. Anger and dissatisfaction are widespread throughout the profession. Now is the time to take our stand and have all matters of dispute settled once and for all.—I am, etc.,
Edinburgh, 9.
W. A. ELLIOTT.

SIR,—How unfortunate it is that the doctors' claim should be presented so maladroitly as to appear to the public as an ill-timed demand for more money. Although as a hospital doctor I see only one aspect of general practice, it is obvious that many good G.P.s are grossly underpaid at present rates. Conversely, some, judged by the slipshod practices revealed in their hospital referrals, are giving the public less than their money's worth—a dangerous habit. The fault lies in the Gilbertian stupidity of a system of payment which not merely encourages superficiality but actually penalizes professional enterprise and devotion. The remedy would be to provide more money for general practice, if necessary, but to make its acquisition by the individual doctor competitive and conditional on the quality of the service provided. This would reward those who have a sense of vocation, stimulate those who have not, and perhaps encourage a salutary system of financial inequality based on effort and worth. A good deal of the increased cost would be saved by a reduction in the flood of trivialities at present swamping out-patient and casualty departments, and general practice would once more become a worth-while alternative for the unplaced registrar, as well as a great vocation in its own right.

Unfortunately the damage is done. The remuneration claim in its present form is not gaining public support and thus is likely either to fail or at best to win only qualified and grudging concessions. I must concede that some of my own mild antagonism stems from a wry comparison between the tempest aroused by the Minister's rejection of the remuneration claim and the smothered ripples emanating from the agonised threshings of ageing senior registrars. Must the profession persist in inviting the political gibe that it is motivated most forcefully by cupidity?—I am, etc.,
Newcastle upon Tyne, 2.
ERIC G. HARDY.

SIR,—I wonder how many of your readers read the announcement tucked away at the bottom of page 12 of the *Supplement* of January 5 with fury?

N.H.S. administrative and clerical staff are to have a 3% salary increase because of the rise in the cost of living since February 1, 1956. N.H.S. dispensing assistants get a 5% increase because of increased cost of living since September 1, 1955. Medical laboratory technicians receive a 5% salary increase. These increases have been given because of an increase in the cost of living in the past 11 to 16 months. Yet the Government has so far refused a salary increase both to general practitioners, who last had a pay increase in 1951, and to hospital medical staff, who had a meagre increase early in 1954. What is the Public Relations Department of the B.M.A. doing? Our case, due to faulty presentation, appears slender to the general public. If some negotiating bodies can get a salary increase from the Government at the present time, despite the need for "restraint in wage demands," why cannot the Negotiating Committee succeed? Many young practitioners must be seriously wondering if the B.M.A. is of any use at all in negotiating salaries and conditions of service, especially for young doctors.—I am, etc.,
Birkenhead.
BRIAN W. COLE.

SIR,—Up till recently many practitioners felt despondent and irritable about the apparent impotence of the B.M.A.

over the remuneration claim. At this eleventh hour there appears to be a glimmer of light, with the bristling of our representatives' fur in their dealings with the Ministry. The question now arises what practical measures can be taken, rather than theoretical and almost impossible steps. May I suggest the following?

A whole county—e.g., Yorkshire—would have its practitioners resign from the N.H.S. on a certain date (all adjacent areas being asked to co-operate in that they would not accept new patients during the crucial time). In this way the "strike fund" would be adequate. If after several days the Government did not see reason the resignation could be extended to a neighbouring county, and so on. During the time that negotiations are taking place doctors would charge their patients a nominal fee and refuse to sign any Government certificates whatsoever. I am sure that if such a system were adopted it would not be many days before the "chisellers" at Whitehall would come to heel.—I am, etc.,

Birkenhead.

M. SNELL.

SIR,—Publicity in the national press in regard to our case for increased remuneration has been limited to the bald statement that our average income is over £2,000 a year and that we are asking for an additional £500 or so each year. Since most of my patients earn £500 or less each year they view our case with absolute lack of sympathy, if not with antipathy.

I have recently been asking some of my patients how much they think we should receive each week for looking after them. Their guesses range from 5s. to £5 per week, with an average of 12s. a week for each patient. Their unanimous reaction to the true figures was great surprise and sympathy towards our case. With very few exceptions they believe that their weekly purchase of National Insurance stamps is a direct contribution to the cost of the National Health Service.

I was prompted to write this letter by reading the front-page headlines in the newspapers of December 28 about the reinstitution of the British Medical Guild (this was not mentioned in the *B.M.J.* received on the same day). I hope the Guild will institute publicity in the national press to correct the misbeliefs of the public and to arouse their sympathy towards our case.—I am, etc.,

London, W.11.

DAVID SLOVICK.

SIR,—In the present remuneration controversy most doctors feel they are not being adequately recompensed for the hours of work undertaken. Many of us feel the situation would be much improved if we were not "on call" 24 hours out of 24. The G.P.'s day should end with his evening surgery (except in cases of home confinements), and a night service set up to deal with all subsequent calls. This would relieve the harassed G.P., absorb the unemployed doctors, and eliminate the problem of finding someone to wait by the telephone when the doctor's wife goes out. In country districts this would be impracticable, but if a log book were kept and the country G.P. paid an adequate fee (plus mileage in these days of expensive petrol) the scheme should work. This suggestion should not interfere with the doctor-patient relationship any more than does the hospital casualty department, as all late and night calls should be emergencies.—I am, etc.,

Aberdeen.

DOROTHY E. ROBERTSON.

SIR,—When I saw the headline "Minister: We can't afford doctors' pay claim" I was dismayed but not surprised. As I continued to read the article in the *Yorkshire Evening Post* of January 4 my dismay gave way to great anger, for there was a statement by a Ministry spokesman claiming that in addition to a net income of £2,222, the doctor received on average £1,110 practice expenses. There must be many readers like myself who do not remember receiving any such practice expenses, and yet the public will no doubt accept this statement as being true.

Surely this further underlines the pressing need for a virulent publicity campaign to present the true facts to the

public and to dismiss this sort of inaccuracy once and for all. From my own personal experience I find that the vast mass of patients have no idea of the ratio of essential practice expenses to income. Once the bare facts concerning practice expenses are pointed out to them, they have been, without exception, amazed and in full support of our claim.

If this could be done on a nation-wide scale I have every confidence that the overwhelming mass of the public would willingly suffer whatever inconveniences they may be subjected to, in order that pressure may be brought to bear in order to make our claim succeed. Without a publicity campaign, there will be general agreement with a statement in the *Daily Express* that "there can be little sympathy for a £2,000 per year man asking for a £10 per week increase."—I am, etc.,

Dewsbury, Yorks.

D. C. TWIST.

SIR,—On perusing recent correspondence in the *Supplement*, I am perturbed by the numerous side-issues which are being raised. The largest of these is reform of the N.H.S. It is tempting to discuss this at present, but I believe it will lead to protracted discussions, disagreement, etc., which the Ministry will use to good advantage. Discussion of alternative schemes, should we decide to withdraw from the N.H.S., threatens to become another dangerous side-issue. Some such scheme must be—and I hope is being—worked out, but it is best done in "the back room." Presumably the profession will have a large measure of control over such a scheme, and therefore any undesirable features could be quickly and easily changed.

Finally, let us not cloud the main issue in presenting our case to the public. Parading our budgets in the press is, in my opinion, definitely harmful. It is time we realized that whining about overdrafts, hardship, and debts is never likely to gain public sympathy. In spite of our lowered financial status we are still (and rightly so) better off than the average member of the public whose sympathy we seek. Instead, let us dwell first on Spens, secondly on Spens, and thirdly on Spens, so that the emphasis is shifted from the fact that we need more money to the fact that we were promised more money.

When the Minister said "No" again, I drafted this letter, which I later scrapped. However, after watching the presentation of the dispute on the B.B.C.'s television programme "Panorama," in which five doctors (two of them members of the Negotiating Committee) failed to mention Spens, my anger was rekindled.—I am, etc.,

Larkhall, Lanarks.

JOHN JAMIESON.

SIR,—I think it very unwise of individual doctors to allow themselves to be drawn into correspondence in the lay press on the subject of remuneration, etc. Very few people are sufficiently interested in the wage claims of others to attempt to understand them. Therefore let us quietly strengthen our Guild, come to reasonable decisions, and then take the necessary steps to see that these are carried out.

One other point to remember is that after the Dankwerts award the Government was surprised to learn that this was for G.P.s only; and in their dudgeon over the award refused the specialists' separate request for arbitration, for reasons which are obvious but not very honourable. I hope that the Negotiating Committee will make this matter perfectly clear on the present occasion, so that the Spens recommendations for specialists may at long last be put into effect.—I am, etc.,

Birmingham, 15.

ROBERT EVANS.

SIR,—It is difficult to understand the Minister's attitude of pleading national poverty. A very reliable friend of mine tells me we are, as taxpayers, a fairly godmother to the world. For instance, here are just a few items of expenditure he noted in Africa, while visiting his former pupils as a retired headmaster: to Sierra Leone, £10,000 for books for library, £400,000 for university extension; to Nigeria, £4½m. for a hospital—it has still to be staffed,

equipped, and maintained; to the Cameroons, £10m. for new roads—not bad for a place that has no motor transport.

But the British Government has not forgotten the British people entirely in its largesse. Here in Shropshire, as in many other counties, those who would like a Third Programme week-end can be put up in style at one of the stately homes of England at half-price, the other half coming from the Welfare State. There is a long waiting-list.

These are a few samples. Whether these are proof of our prosperity, or an explanation of our alleged poverty, is a matter of opinion. My own is that, having regard to the lavish gifts the Exchequer makes to all and sundry, he must have so much money he could quite easily pay us out of the petty cash.—I am, etc.,

Shrewsbury.

ALBERT E. NICHOLLS.

Unity of Purpose

SIR,—The letter of Dr. Bruce Cardew (*Supplement*, December 29, 1956, p. 230) is a welcome change from the scores of letters published, the majority of which are non-constructive and contain non-specific grumbles and grouses about the N.H.S. In discussions with colleagues one is struck by the lack of justified complaints, apart from remuneration claims, and by the vague idea of what changes are required to make the Service satisfactory to doctors and patients. We have heard of the New Zealand scheme, the Australian, and the Canadian, but the advantages of these are not at all clear, at any rate to the majority of the profession. I am aware of some of the disadvantages, since some patients who emigrated to these parts have returned to this country, being unable to afford the fees demanded for medical treatment, especially if they had several children. Would it not therefore be wise to produce a symposium of comparative medical services, in place of the usual issue of the *B.M.J.*, similar to the issues on medical education? We would then have the opportunity of assessing our own Service. There should also be included a summary of alternative methods of practice payment—e.g., item of service pay, State-salaried service, etc.—and also a statement culled from the massive amount of correspondence as to the main faults (not mere rumblings) of the present Service.

The profession should by now be in a position to state a positive case for either an alternative Service or major alterations in the present one which would produce satisfaction to the majority. As Dr. Cardew says, the vast majority of resolutions at conferences have been concerned with matters of detail, and apparently have not had the desired effect in improving the Service. If we have as yet no definite alternative scheme, is it not time we set about actively to produce one, as I believe was done in 1933 and again in 1939? We could set up a commission of our own, consisting of 7 or 11 just men capable of sorting the wheat from the chaff, and producing within 12 months a loaf of good bread to present to the Government as a necessity for the preservation of medical practice. Such a commission might be paid for from the Defence Fund, as we all understand that this is very large, and £100,000 spent on producing our own requirements for service would be well spent. This reminds me of another point which could be made clear in your symposium, and that is a statement as to our funds available, where they are, and for what they may or may not be used. The majority of members, judging by the remarks of those who attend meetings, do not have any clear knowledge as to our resources.

Finally, it appears that the main criticism of the N.H.S. is the fact that it is tied up with politics and the vagaries of successive Ministers of Health. This being so, should we not cease to talk loosely about withdrawing from the Service and press for a divorce of the profession from politics, perhaps on the lines suggested by Miss Maud Forrester-Brown (*Supplement*, December 15, p. 219), this being one of the few letters containing a constructive policy?—I am, etc.,

Brierfield, Lancs.

H. C. PALIN.

SIR,—Before setting up more committees and wasting months on elaborating an "alternative" Service, let us stress certain principles. The principle of free medical services is absolutely right in our overcrowded, industrialized island with its low standard of living. Higher piecemeal individual contributions to subsidize the profession can only work in smaller and economically stabler societies such as the Scandinavians, New Zealand, etc. In a reality where our Government is spending a large part of the national income on rearming, prestige wars, etc., the funds available for welfare are of necessity deplorably and tragically depleted. Let us direct the bulk of our grievance and frustration against this stark fact on wider political platforms.

So how can we, with the limited funds available for the whole social welfare and progress structure, including housing, education, and medicine, rearrange matters for the greater satisfaction of the greatest number, acting as guardians for those still on the school benches? I believe that every working doctor on the *Register* should be assured a minimum income of £1,000, rising by instalments of £100 per annum for each year on the *Register* to a maximum of, say, £2,500. We could then stop seducing patients on to our lists, seniors for promotion, and management committees for personal privileges, and devote all this time and energy to improving our stature as human beings and thereby the level of our work and of society.

I can hear the dismayed cry of "Full-time salaried service," but the alternative is a perpetuation of the degrading wrangle for personal material betterment. Let those who are unwilling to do their best work on a salary close the gates of the medical vocation behind them. There are enough of a coming generation waiting, grateful for the opportunity of devoting their lives to fascinating, many-rewarding work in conditions of financial security. Are the full-time, salaried hospital staff diletanting for lack of financial incentive? Can the human spirit only rise to the hook loaded with the promise of individual reward?

Any uprising on the strength of a collective wish for genuine human progress will succeed. Not so this schizoid approach. Every movement gets the leaders it deserves. And, in case anyone suspects I am writing from the heights of personal satisfaction, let me explain that I "squatted" this week, and that at the age of 31, eight years qualified, my family are once again having to subsidize me while I wait for a list to grow, frustrated by this enforced idleness.—I am etc.,

London, W.11.

ELEANOR ETTLINGER.

Shortage of Physiotherapists

SIR,—The letter from Mr. R. R. I. Baxter headed "Shortage of Radiographers" (*Supplement*, December 22, 1956, p. 226) will have the support of members of other professions supplementary to medicine. As reference to page 222 of the same issue will show, there is a grave shortage of physiotherapists. This is due mainly to the fact that their remuneration bears no relation either to the time and money spent in obtaining their qualification or to the value of their work in the National Health Service.—I am, etc.,

London, W.C.1.

M. J. NEILSON,
Secretary,
Chartered Society of Physiotherapy.

The Doctor's Week

SIR,—I object most strongly to the appearance in the *Daily Telegraph* of December 28, 1956, of a statement that an investigation by one doctor showed that he worked a 30-hour week. It caused me to keep a record of my working hours during the past week, which was not an unduly busy one, and which may be fairly termed an average week. This showed a 42½-hour week, which did not include hours "on call." I suggest that I am more typical of the "average G.P." belonging to a partnership of three in an industrial area. The publishing of statements in the daily press gives the public an entirely erroneous impression of the "doctor's lot" and does not help our remuneration claim.—I am, etc.,

Swansea.

TREVOR DAVIES.

BRITISH MEDICAL GUILD

Meetings to be Held

CITY.—At Committee Room A, B.M.A. House, Tavistock Square, W.C., Tuesday, January 22, 8.30 p.m.
 CORNWALL.—Sunday, January 27.
 DORSET.—At the King's Arms Hotel, Dorchester, Friday, January 25, 8.30 p.m.
 EAST AND WEST SOMERSET.—At Out-patient Department, Taunton and Somerset Hospital, East Reach, Taunton, Sunday, January 20, 3 p.m.
 EASTBOURNE.—At Princess Alice Memorial Hospital, Eastbourne, Thursday, January 24, 8.30 p.m.
 ENFIELD AND POTTERS BAR.—Saturday, January 26.
 GREENWICH AND DEPTFORD.—At Miller General Hospital, Greenwich High Road, S.E., Tuesday, January 22, 8.30 p.m.
 HAMPSTEAD.—At Board Room, Hampstead General and North-west London Hospital, Haverstock Hill, N.W., Thursday, January 24, 8.15 p.m.
 HENDON.—At Hendon Hall Hotel, N.W., Tuesday, January 22, 8.30 p.m.
 HEREFORD.—Tuesday, January 22.
 LAMBETH AND SOUTHWARK.—At Nurses' Lecture Room, Lambeth Hospital, Brook Drive, S.E., Thursday, January 24, 8.15 p.m.
 LEEDS.—At Leeds City Museum, Sunday, January 20, 2.30 p.m.
 LEWISHAM.—At Small Hall, Lewisham Town Hall, Rushey Green, S.E., Tuesday, January 22, 8.30 p.m.
 MONMOUTHSHIRE.—At St Woolos' Hospital, Newport, Sunday, January 20, 3 p.m.
 NORTH GLAMORGAN AND BRECKNOCK.—At Boot Hotel, Aberdare, Sunday, January 20, 3 p.m.
 NORTH MIDDLESEX.—At Committee Room, North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, January 22, 9 p.m.
 NORTH-EAST SUFFOLK.—At Nurses' Lecture Room, Lowestoft and North Suffolk Hospital, Sunday, January 20, 6 p.m.
 PLYMOUTH.—Tuesday, January 22.
 REIGATE.—At Redhill County Hospital, Tuesday, January 22, 8.30 p.m.
 ST. PANCRAS.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Wednesday, January 23, 8.30 p.m.
 SHROPSHIRE AND MID-WALES.—At Lion Hotel, Shrewsbury, Sunday, January 20, 2.30 p.m.
 SOUTHAMPTON.—At Royal South Hants Hospital, Thursday, January 24, 8.30 p.m.
 STRATFORD.—At Board Room, Queen Mary's Hospital, E., Tuesday, January 22, 8.45 p.m.
 SUTTON COLDFIELD.—At Sutton Coldfield Hospital, Monday, January 21, 9 p.m.
 WANDSWORTH.—At Wandsworth Town Hall, High Street, S.W., Friday, January 25, 8.45 p.m.
 WEST HERTS.—At Crown Hotel, Garston, Watford, Tuesday, January 22, 8.30 for 9 p.m.

Association Notices

COMPETITION FOR MEDICAL FILMS

The Council of the British Medical Association is prepared to consider the annual award of two prizes of fifty guineas each, with certificates, for 16-mm. medical films. One prize will be for commercial and the other for non-commercial film producers. The first competition will be held this year, the closing date for receipt of entry forms being June 30, 1957, and for the receipt of films September 30, 1957.

The choice of subject is left to the competitor. The judges will pay special regard to the value of the film to the B.M.A. Film Library, and the likelihood of its frequent use. For example, a film showing a broad clinical presentation of a subject is likely to be more acceptable than one limited to a demonstration of operative technique.

Full details of the competition may be obtained from the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

Diary of Central Meetings

JANUARY

21 Mon Editorial Subcommittee Joint Formulary Committee, 11 a.m.
 22 Tues Staff Side, Committee B, Medical Whitley Council, 10.30 a.m.
 22 Tues Alternative Edition Subcommittee, Joint Formulary Committee, 11 a.m.

22 Tues Full Committee B, Medical Whitley Council, 2 p.m.
 22 Tues Journal Committee, 2 p.m.
 23 Wed Scientific Exhibition Subcommittee, Arrangements Committee (Newcastle, 1957) (at B.M.A. Regional Office, 7, Windsor Terrace, Newcastle upon Tyne), 10 a.m.
 23 Wed Negotiating Committee, 2 p.m.
 23 Wed Registrars Group Executive Committee, 2.30 p.m.
 24 Thurs Rural Practices Subcommittee, G.M.S. Committee, 2 p.m.
 25 Fri Drug Addiction Committee, 2 p.m.
 28 Mon Staff Side, General Whitley Council (at 14, Russell Square, W.C.), 10.30 a.m.
 28 Mon Full General Whitley Council (at 14, Russell Square, W.C.), 2 p.m.
 29 Tues Arrangements Committee (Edinburgh, 1959), 12 noon (Change of time.)
 29 Tues Subcommittee on Medical Reports, Joint Committee of the B.M.A. and the Magistrates' Association, 2 p.m.
 30 Wed Council, 10 a.m.

FEBRUARY

5 Tues Planning Subcommittee, Occupational Health Committee, 10.30 a.m.
 8 Fri Ingleby Evidence Committee, 2 p.m.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Northfield Hospital, Aldershot, Tuesday, January 22, 8.30 p.m., meeting. Lecture by the solicitor to the Medical Defence Union: "Doctors and Litigation."
 BARNSELY DIVISION.—At Queen's Hotel, Barnsley, Thursday, January 24, 8 p.m., meeting. B.M.A. Lecture by Dr. F. E. Camps: "Medical Adventures and Misadventures."
 BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, January 25, 8 for 8.15 p.m., meeting. Address by Dr. P. M. F. Bishop: "Intersexuality."
 BRADFORD DIVISION.—At Medical Societies' Room, Bradford Royal Infirmary, Wednesday, January 23, 8.15 p.m., meeting. Address by Mr. I. Simson Hall: "Restoration of Hearing, the Aim of Modern Otological Surgery."
 BRISTOL DIVISION.—Wednesday, January 23, 8.30 p.m., visit to one guest.
 DONCASTER DIVISION AND DONCASTER MEDICAL SOCIETY.—At Danum Hotel, Doncaster, Tuesday, January 22, 7.30 for 7.50 p.m., dinner. Paper by Professor Digby Chamberlain: "Treatment of Peptic Ulceration."
 FINCHLEY DIVISION.—At Finchley Memorial Hospital, Granville Road, N. Finchley, N., Friday, January 25, 8.30 for 9 p.m., meeting. Talk by Dr. J. J. F. Merry on elementary principles of therapy with cortisone. A film in colour and sound will follow.
 HALIFAX DIVISION.—At St. John's Hospital, Halifax, Wednesday, January 23, 8.30 p.m., clinical meeting.
 HAMPSTEAD DIVISION.—At Hampstead General and North-west London Hospital, Haverstock Hill, N.W., Thursday, January 24, 8.30 p.m., clinical meeting.
 MERSEYSIDE BRANCH.—At Mecca Sefton House, Exchange Buildings, Liverpool, Friday, January 25, B.M.A. buffet dance.
 MIDLAND BRANCH.—At Children's Hospital, Ladywood Road, Birmingham, Friday, January 25, 8.15 p.m., meeting of clinical and pathological section.
 OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, January 21, 9 p.m., meeting. Dr. J. J. F. Merry: "Use of Joint Aspiration and the Injection of Hydrocortisone."
 OXFORD DIVISION.—At Beit and Jameson Room, Rhodes House, South Parks Road, Oxford, Wednesday, January 23, 8.15 p.m., meeting. Sir Geoffrey Jefferson, F.R.S.: "Medical Impressions of My Recent Russian Visit."
 ROCHESTER, CHATHAM, AND GILLINGHAM DIVISION.—At St. Bartholomew's Hospital, Rochester, Thursday, January 24, 8.30 p.m., meeting. Lecture by Dr. R. Forbes: "Recent Developments in Medical Litigation." All medical practitioners in the area of the Division are invited.
 SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Wednesday, January 23, 8.30 p.m., meeting of Clinical and Pathological Section. Lecture by Dr. K. W. Donald: "Man as a Diver."
 SOUTH-WEST ESSEX DIVISION.—At Out-patient Department, Thorpe Combe Maternity Hospital, Forest Road, Walthamstow, E., Wednesday, January 23, 8.30 p.m., meeting. B.M.A. Lecture by Dr. Felix Post: "Mental Disorders of the Elderly in General Practice—A Psychiatrist's Grumble."
 SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Monday, January 21, 8.30 p.m., business meeting.
 WEST BROMWICH AND SMETHWICK DIVISION.—At Sandwell Hotel, West Bromwich, Wednesday, January 23, 8.15 p.m., meeting. Talk by Dr. P. H. Addison: "The Law as it Affects the Doctor."
 WIGAN DIVISION.—At Lewis's Restaurant, Wallgate, Wigan, Thursday, January 24, 8 p.m., supper meeting. Dr. Robert Coope: "Obiter Dicta—Some Practical Problems which Interest

MEDICAL PRACTICE IN CANADA

BY

A. D. KELLY, M.B.

General Secretary, Canadian Medical Association

Canada is a country growing in many directions and is well along the road of transformation from an agricultural to an industrial economy, with the consequent trend towards urbanization. At the same time, the development of the natural resources of the northern hinterland is producing small communities where none previously existed, and the frontiers are still expanding. The population of the country is now greater than 16 million, an increase of 20% since the last census. The effect of a high birth rate and low infant mortality makes natural increase more important than immigration in adding to the population.

Opportunities

Canada is served by slightly more than 16,000 doctors, the physician-population ratio being approximately 1:950, which is not dissimilar to that in the United Kingdom. This ratio has been maintained with remarkable constancy since 1900, the growth of the profession keeping pace with steadily increasing population.

The distribution of physicians is uneven among the provinces, British Columbia and Ontario and Quebec being more adequately supplied than the remainder, but it is erroneous to assume that Canada is experiencing a shortage of doctors. Such a statement is at variance with the views of certain non-medical authorities in Canada and is contrary to the optimistic prospects portrayed by certain official agencies abroad. I make it, however, on behalf of the executive officers of responsible medical organizations who are experiencing increasing difficulty in advising well-qualified immigrants where they may establish themselves. The annual output of the nation's twelve medical schools exceeds 900, a figure which is considerably greater than the annual losses occasioned by death, retirement, and emigration.

Forty per cent. of Canada's medical force is classifiable as "specialist," the remainder comprising the large body of general practitioners, the physicians employed in industrial, institutional, and administrative work, and the medical graduates completing their training. Urban communities are well supplied with general practitioners and specialists, all conducting private practice. Opportunities arise most frequently in the more sparsely settled rural areas and in the new communities which open up as the natural resources

are progressively developed. A well-qualified general practitioner who is prepared to accept the rigorous conditions and the scant amenities of such locations can establish himself in practice. The scope of general practice is considerably broader than is usual in the United Kingdom to-day, and Canadian doctors working in relative isolation assume responsibilities in diagnosis and treatment which demand a high degree of resourcefulness and training.

Examination and Registration

A degree in medicine or any similar qualification does not *per se* confer the right to practise in any part of Canada. To acquire this right, physicians from Canada or elsewhere must present registrable qualifications to the medical licensing authority of the province in which they elect to practise. The licensing of physicians is a function of statutory bodies set up by the Medical Acts of each of the ten provinces. These licensing authorities are usually known as the College of Physicians and Surgeons of (name of province), and each of them maintains a *Register* in which are enrolled the names of those qualified to practise in that province.

Health and education being constitutionally and traditionally within the sphere of the provinces, each of these medical licensing authorities is autonomous, and registered practitioners in one province have no inherent rights in any other province. Admission to the *Register* was formerly accomplished by passing the examinations conducted by the several provincial licensing authorities, but all of them now accept candidates who have passed the examinations of the Medical Council of Canada, which is purely an examining body and which provides the only tangible link between the provincial agencies.

Since the admission of British physicians to the *Registers* maintained by the provincial medical licensing authorities in British Columbia, Ontario, Quebec, and New Brunswick may be gained only by passing the examinations of the Medical Council of Canada, the following general statement of requirements may be of interest. It is emphasized, however, that the application of the rules to any individual candidate should be cleared with the registrar of the medical licensing authority of a province.

Candidates for the examinations of the Medical Council of Canada are required to forward to the Registrar of the Council, at least three weeks before the first day of the examination: (1) a completed application form (obtainable from the Council); (2) an Enabling Certificate from a provincial medical licensing authority (the Enabling Certificate is issued when the candidate satisfies the provincial

requirements of preliminary education, matriculation, education in the basic sciences, medical curriculum and graduation); (3) a statutory declaration of identity; (4) evidence of having served a year's internship in a hospital acceptable to the provincial medical licensing authority; (5) examination fees of \$100; (6) two unmounted photographs.

Examinations of the Medical Council of Canada in medicine, surgery, obstetrics and gynaecology, and public health are conducted in English or French at several Canadian centres in May and October. Successful candidates can register without further examination in any Canadian province on complying with the provincial regulations, including the payment of the provincial registration fee.

Reciprocal registration privileges exist between the General Medical Council of Great Britain and the medical licensing authorities of the following provinces: Alberta, Saskatchewan, Manitoba, Nova Scotia, Prince Edward Island, and Newfoundland. This reciprocity is extended to registered medical practitioners of the United Kingdom and does not necessarily include persons registered on the Commonwealth or foreign lists. In the remaining four provinces registration is obtainable only with the Medical Council of Canada certificate. In either event, consultation with the registrar of a provincial medical licensing authority is a first requirement. Doctors whose medical qualifications were obtained outside the United Kingdom should particularly inquire, as these general statements do not necessarily apply.

Conditions of Practice

The identification of specialists in Canada is a function of the Royal College of Physicians and Surgeons of Canada, and examinations for candidates for fellowship or for certification are conducted annually among those who meet the requirements for graduate training. The higher specialist qualifications and diplomas of Great Britain are well regarded, but they are not necessarily considered the precise equivalent of comparable Canadian qualifications. Since the latter are recognized publicly and professionally as indicating a high level of competence, newcomers aspiring to practise as specialists would be well advised to meet the requirements of the Royal College of Physicians and Surgeons of Canada at the first opportunity.

Independent private practice, either alone or in partnership, is the rule throughout Canada. Group practice in privately sponsored clinics is increasing, but openings for newcomers are infrequent. It is apparent to this transatlantic observer that the National Health Service, or some other influence, has accustomed doctors in the United Kingdom to think of medical work in terms of "posts," "appointments," or other words which carry the connotation of full-time, salaried employment. While it is true that in public health, in teaching, in industrial medicine, in institutional pathology and radiology, and in medical administration such positions exist, they engage such a small proportion of the medical population that newcomers would be well advised to disregard them and to think in terms of private practice.

The sale of practices is practically unknown, and when one doctor succeeds another the transaction usually amounts to the transfer of the house or other real property involved. There is no bar to any licensed physician establishing himself in private practice in the community of his choice.

Salaried hospital appointments are uncommon, but contract practice exists in certain industrial operations such as mining and lumbering and in certain municipalities in the prairie provinces. Health insurance under Government auspices is not in effect anywhere in Canada, but universal hospital-care insurance applies to the citizens of two provinces and may be extended to additional provinces. Health insurance under plans of prepaid medical care sponsored by the medical profession and by insurance companies and co-operatives is making rapid headway and is receiving widespread public acceptance. Freedom of choice of doctor prevails, and the profession is remunerated on the basis of fee-for-service-rendered.

Look First

Information concerning openings for practice, assistantships, institutional appointments, and other forms of medical employment can best be obtained after arrival in Canada by consulting the registrars or the secretaries of the provincial divisions of the Canadian Medical Association. Classified advertisements relating to medical openings appear regularly in the *Canadian Medical Association Journal*, but medical agencies do not exist. Advertisements, however, are an unsatisfactory means of determining the potential openings for practice, and applicants are at a considerable disadvantage when they are separated by time and distance from the source of information. Information must be current if it is to be accurate and useful, and desirable openings are apt to be filled if protracted correspondence ensues. For these reasons, and because there is no substitute for personal investigation, it is recommended that actual examination of opportunities for practice be deferred until after arrival in Canada. There is unquestionably an element of risk in such a course, but the alternative is so unsatisfactory that intending immigrants would be well advised to undertake a preliminary reconnaissance. Under such circumstances dependants should be left at home until arrangements for their reception can be completed.

It is not possible to arrange in advance for attending staff or administrative hospital appointments in the case of senior physicians of specialist or consultant status. Junior house appointments at the level of intern and resident are, however, sometimes available and many of them do not require the incumbent to be fully licensed. This provides a means for young doctors to familiarize themselves with conditions of practice in this country while preparing for the examinations of the Medical Council of Canada. Internships in teaching hospitals are very difficult to obtain, but a number of approved internships in non-teaching institutions are available. Those latter appointments frequently carry with them a small remuneration, in addition to maintenance, which is sufficient to support a single man. A list of hospitals approved for internship will be supplied on application, but all details of appointment should be taken up with the superintendent of the hospital concerned. Doctors interested in a possible internship should inquire whether full provincial registration is a requisite of the post.

Many recent inquiries have been received from senior medical students about the possibility of taking in Canada the pre-registration internship required by the General Medical Council. Such a question, of course, is not answerable by any Canadian agency, and these students have been advised to consult the deans of their medical schools or the appropriate licensing body to determine whether they will recognize a pre-registration internship taken in Canada. Canadian hospitals approved for junior internship by the Canadian Medical Association provide a one-year rotation with adequate staff supervision and instruction.

The cost of living and practising is high in Canada, and immigrants should provide themselves with all capital resources which are exportable in order that they sustain themselves while awaiting returns from private practice. No Canadian medical organization is in a position to assist financially by loans, assisted passages, or other aids.

Conclusion

It is unnecessary to state that the decision to emigrate should not be taken lightly. Such a step involves the attitude of the doctor's wife and affects the future of his children, and in many instances these factors rank equally in importance with the prospects for a satisfactory professional milieu. Transplantation of all living things is likely to be more successful before the roots are firmly imbedded, and it is our experience that after the age of 40 the uprooting process is a questionable procedure.

The Canadian medical profession since its earliest days has been strengthened and enriched by additions to its numbers from Britain, and the post-war and post-N.H.S. arrivals

have maintained the high standards set by their predecessors. Customs and conditions in Canada are different. Whether they are better is a matter of personal opinion. Entry into practice is not automatic but requires considerable investigation and effort on the part of a newcomer. A determined young doctor willing to adapt himself to circumstances as he finds them and to help us improve them as he grows up with the country, can always make a place for himself. To assist this resolute immigrant, I append a list of addresses which will be useful to him as he pursues his career in a new environment.

Provincial Medical Licensing Authorities

The Registrar, The Newfoundland Medical Board, P.O. Box E-5121, St. John's, Nfld.
The Registrar, Medical Council of Prince Edward Island, 170, Fitzroy Street, Charlottetown, P.E.I.
The Registrar, Provincial Medical Board of Nova Scotia, 196, Atlantic Street, Halifax, N.S.
The Registrar, Council of Physicians and Surgeons of New Brunswick, 182, Princess Street, St. John, N.B.
The Registrar, College of Physicians and Surgeons of Quebec, 1896, Dorchester Street W., Montreal, 25, P.Q.
The Registrar, College of Physicians and Surgeons of Ontario, 174, St. George Street, Toronto, 5, Ont.
The Registrar, College of Physicians and Surgeons of Manitoba, 604, Medical Arts Bldg., Winnipeg, Man.
The Registrar, College of Physicians and Surgeons of Saskatchewan, 932, Spadina Crescent East, Saskatoon, Sask.
The Registrar, College of Physicians and Surgeons of Alberta, 501, Alexandra Building, Edmonton, Alta.
The Registrar, College of Physicians and Surgeons of British Columbia, 1807, West 10th Avenue, Vancouver, 9, B.C.

National Bodies

The Registrar, Medical Council of Canada, 77, Metcalfe Street, Ottawa, 4.
The Honorary Secretary, Royal College of Physicians and Surgeons of Canada, 150, Metcalfe Street, Ottawa, 4.
The General Secretary, Canadian Medical Association, 150, St. George Street, Toronto, 5, Ont.
The Editor, *Canadian Medical Association Journal*, 150, St. George Street, Toronto, 5, Ont.

Provincial Divisions of the Canadian Medical Association

Secretary-Treasurer, Newfoundland Division, C.M.A., 11, Forest Road, St. John's, Nfld.
Honorary Secretary, Prince Edward Island Division, C.M.A., 200, Queen Street, Charlottetown, P.E.I.
Executive Secretary, Nova Scotia Division, C.M.A., Dalhousie Public Health Clinic, Halifax, N.S.
Secretary, New Brunswick Division, C.M.A., East Riverside, King's County, N.B.
Honorary Secretary, Quebec Division, C.M.A., 718, Medical Arts Bldg., Montreal, 25, P.Q.
General Secretary, Ontario Division, C.M.A., 244, St. George Street, Toronto, 5, Ont.
Executive Secretary, Manitoba Division, C.M.A., 604, Medical Arts Bldg., Winnipeg, Man.
Secretary, Saskatchewan Division, C.M.A., 932, Spadina Crescent East, Saskatoon, Sask.
Honorary Secretary-Treasurer, Alberta Division, C.M.A., 501, Alexandra Bldg., Edmonton, Alta.
Executive Secretary, British Columbia Division, C.M.A., 1807, West 10th Avenue, Vancouver, 9, B.C.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.

Dangerous Drugs Act: Restoration of Authority

The Home Office announces that the authorities granted by the Dangerous Drugs Regulations under the Dangerous Drugs Act, 1951, have been restored to Dr. Thomas Campbell (Airdrie, Lanarkshire).

PRIVATE PRACTICE COMMITTEE

The Private Practice Committee met at B.M.A. House on January 9, with Dr. ALEXANDER BROWN in the chair.

The Committee was informed that if the new Rating and Valuation Bill was passed the rates of surgery premises, rated as business premises, would be reduced by one-fifth and those of combined premises, used partly for surgery and partly for domestic purposes, by one-seventh.

Fees

It was reported to the Committee that a new fee of 37s. 6d. for a full examination and report in a single case for a Government department is to come into force on February 1. With regard to the implementation of the revised scale of fees for police calls, it was stated that the local authority associations took the view that the adoption of this scale by police authorities was essentially a matter for discussion locally between the authorities and the profession. The Committee agreed that the revised scale should be circulated to Hon. Secretaries of Divisions, with a request that they should bring it to the notice of those members concerned. In view of the new agreement on fees for part-time local authority work, it was decided to ask the British Red Cross Society and the St. John Ambulance Association to increase their fees for first-aid lectures to £2 2s. for a one-hour lecture to the lay public.

Accidents to Doctors

It was reported that the Association's solicitor had been consulted on the resolution of the Annual Representative Meeting instructing the Council to discuss with the Government the matter of compensation for doctors who were injured or lost their lives in attending accidents. The Committee was alarmed at the position revealed as a result of its inquiries. It agreed to recommend to Council that doctors be advised: (1) of the financial risks often occasioned by the lack of adequate cover from compensation and superannuation schemes in the event of death or disablement as a result of attending an accident in the course of medical practice; (2) that the only way by which these risks can be completely and adequately covered is by an appropriate accident insurance policy; and (3) that it would be advisable for those in contract with an employing authority to ensure that there is a suitable clause in the contract covering the payment of compensation in the event of death or disablement which is attributable to the nature of their duties.

GENERAL-PRACTITIONER TUITION IN MEDICAL SCHOOLS

Twenty-two of the twenty-seven medical schools in the United Kingdom have schemes whereby senior students may see something of the general practitioner's work. The present position is set out in a survey made for the British Medical Students' Association, and is a follow-up of a similar survey made in 1953. At that time ten only of the medical schools arranged general-practitioner courses. The present schemes vary from the health centres run by Edinburgh and Manchester Universities for teaching students to those in which the student spends a day with a general practitioner. In between are the residential type of scheme, in which the student lives with a general practitioner for a period and watches his work, and the alternative in which the student is attached to a general practitioner in the morning only for a week or two. The arrangements are said, in the main, to be working satisfactorily and are received enthusiastically by the participants.

REMUNERATION CLAIM

At a meeting of the Stirling Branch of the B.M.A. on January 6, attended by 119 doctors practising in the counties of Stirling and Clackmannan, the following resolutions were passed:

(1) That if the Ministers finally refuse to continue negotiations or if, by March 31, 1957, negotiations are not satisfactorily concluded, this meeting is of the opinion that the Council of the British Medical Association should recommend mass resignation from the National Health Service forthwith. (2) That this meeting urges that the Government be requested to accept the contractual obligation implied in the Spens Reports as the basis of all future negotiations. (3) That this meeting urges the Council of the British Medical Association to set up a committee to inquire into State medical services operated in other countries; to recommend to the Representative Body whether an alternative form of health service to that provided for in the National Health Service Acts and the regulations pertaining thereto would be to the advantage of patients and doctors in the United Kingdom and, if so, the form that such health service should take.

EXCHANGE VISITS WITH CANADA

The scheme for exchange visits between members of the British and Canadian Medical Associations, which has the approval of the Bank of England, will be continued during the financial year April 1, 1957, to March 31, 1958.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada. Each doctor from Britain will be required to make all his own travelling arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada he will receive the equivalent of his deposit in Canadian dollars. Similarly, each Canadian doctor on arrival in Britain will receive the sum deposited in sterling.

Duration of Visits

The duration of the visits is left to the discretion of the doctors concerned. The British and Canadian Medical Associations do not accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. who wish to take part in such exchanges. Medical practitioners in all branches of the profession, including general practice and public health, are eligible. Each applicant must state the object of his intended visit, and should also give the approximate date on which he hopes to depart (successful applicants will in due course be required to furnish exact dates and details of travel). Applications must be received by the Secretary of the British Medical Association by March 1, 1957.

MEDICAL ACT, 1956

The Committee set up by the Council to examine and report on the working of the Medical Acts held its first meeting recently under the chairmanship of Mr. A. DICKSON WRIGHT. It was decided that the Committee should examine the Consolidated Medical Act of 1956 and any parts of previous Medical Acts still in operation. In the first place, consideration was given to the difficulties which had been reported in connexion with provisional registration.

A preliminary survey was made of the procedure of elective representation of the profession to the General Medical Council. At a subsequent meeting the Committee will examine the disciplinary procedure of the General Medical Council, especially in relation to difficulties which have arisen since the Medical Act, 1950, came into operation.

GENERAL MEDICAL SERVICES
COMMITTEE

The Committee met at B.M.A. House on January 17, with Dr. A. TALBOT ROGERS in the chair. Also present were Dr. S. WAND, Chairman of Council, and Mr. L. DOUGAL CALLANDER, Hon. Treasurer.

The Chairman

This was the first meeting of the Committee which Dr. Talbot Rogers had attended since his illness and he was greeted with acclamation. Dr. Talbot Rogers said that he was very glad to be back. His illness had shown him how many friends he had, and he had particularly valued the messages of sympathy and kindness which he had received. He thanked Dr. A. B. DAVIES for his excellent work as acting chairman during the past four months.

The CHAIRMAN OF COUNCIL said that he wished to express his delight at seeing the Chairman in his place and seeing him look so wonderfully well. He thought it would be proper to show by resolution appreciation of the excellent work carried out by Dr. Davies as acting chairman. Dr. Wand said that he could speak not only as a member of the Committee but also as a member of the Negotiating Committee and of the small group who had been seeing the Minister, and no one better than Dr. Davies could have taken the Chairman's place. Dr. Davies had borne the work of the Committee in a way which did him the greatest credit.

Dr. A. BEAUCHAMP (Chairman of the Conference of Local Medical Committees) seconded. He had never seen anyone do a better job. He had always respected Dr. Davies: now his admiration for him had increased by leaps and bounds.

The motion was carried by prolonged applause, and Dr. DAVIES, in acknowledgment, said that he found the job remarkably easy because of the sincere support of every member of the Committee.

It was reported that Dr. A. S. Howie Wood was now well on the road to recovery. Dr. H. F. Hollis was reported to be ill in hospital. Messages were sent to both invalids.

Remuneration Claim

Reports were received of the meeting of four members of the Negotiating Committee, Sir Russell Brain, Dr. A. B. DAVIES, Dr. J. D. S. Cameron, and Dr. S. Wand, with the Minister of Health and the Joint Parliamentary Under-Secretary of State for Scotland on January 4.

Dr. A. B. DAVIES said that within three or four hours of the deputation leaving the Ministry not only every doctor but every citizen in the Kingdom knew the result of the interview. The Committee might like to have some personal impressions. First of all, the Minister was annoyed over the matter of publicity, which, he said, did not make negotiation any easier. In point of fact, Dr. Davies added, there had not been any negotiations, and on the Ministry's side only a curt refusal to negotiate. The Minister had stated that the claim had not been rejected, and that Spens had not been rejected, but, he had added, the position of Spens in relation to doctors' remuneration was that all relative circumstances must be taken into account, of which Spens was only one.

The Minister had given a categorical answer on the merits of the case: he had not, nor had the Government, considered the merits of the case at all because of the economic position of the country. On that point Dr. Wand had asked whether there had been any time when it would have been possible for the profession to submit a claim, and the Minister in reply had quoted first a period of two months in the last 10 years, and later on he had said that there might have been four months during which the profession could have submitted a claim which the Government could reasonably have entertained.

Dr. Wand had then asked if the Government had realized that increases of pay were going to other sections of the community, and that it was under an obligation to the

medical profession. The Minister had been unable to give a satisfactory reply to this question. Dr. Davies paid tribute to the great ability of Dr. Wand in his handling of the situation. Towards the end of the meeting, Dr. Davies continued, he himself had put specific questions. He told the Minister that, as a Negotiating Committee, they had come to negotiate and so far they had negotiated nothing. He had asked if the Minister agreed with this statement, and he did agree. It had been entirely the Minister's suggestion that they should meet him again.

Dr. Davies added they had not progressed very far, but the claim had not been rejected. Spens was not entirely discarded, and there had been an invitation to meet the Minister before the end of the month.

Invitation to Meet Again

The CHAIRMAN OF COUNCIL, corroborating what Dr. Davies had said, stressed that the Minister had invited the Committee to meet him again. On the legal side the Minister had stated that he had been advised that there was no contractual obligation enforceable in law. He apologized for not issuing a reasoned statement, but found himself unable to do so for constitutional reasons. Dr. Wand had re-read the legal opinion given to the Association, and he could not see how the Government could possibly argue that Spens and Danckwerts together did not mean that periodic adjustments would have to be made to the central pool.

He was not sorry the meeting had been postponed. It meant they had got a little further away from the crises of the autumn and the credit squeeze, and that at a later meeting the door would be opened to negotiations.

The CHAIRMAN expressed the Committee's gratitude for the two reports.

The CHAIRMAN OF COUNCIL said that he thought more stress should be laid on the date when notice of the claim was given; that was February, 1956. The details were submitted in June and the legal opinion was furnished in September, after the Minister had asked for it.

In reply to Dr. H. H. D. SUTHERLAND, who asked if their allies the consultants and specialists were in agreement with the theme which had been expressed, Dr. DAVIES assured the Committee that the Negotiating Committee was completely united. Sir Russell Brain had led the opening of the discussion with the Ministers with the dignity and efficiency one expected from him.

Dr. BRUCE CARDEW said that there had been an extremely favourable reaction to the matter from the responsible press. The primary function of the Negotiating Committee was to secure the future of the profession, and the latter must never allow itself to be placed at the mercy of a shrinking pool.

Asked the meaning of the words used by Sir Russell Brain at the press conference and at the television interview, that the dispute went far deeper than the question of pay, Dr. DAVIES said that Sir Russell used the phrase both to the Minister and at the interviews afterwards, meaning that it was a crisis of confidence between the profession of medicine and the Government. However the Government might determine the question of contractual obligation, it could not escape the moral obligation which depended upon the degree of confidence between gentlemen in a bond.

What Next?

Dr. F. GRAY, speaking as a member of the Negotiating Committee, also referred to the publicity which had been secured as a result of the action taken by the Council of the Association in setting the Guild machinery to work. There might well be a longer interval before they met the Minister again, because of the change of Government, but this was not a waste of time. In the interval a good deal could be done to see that the Guild machinery was set up and was working satisfactorily—that is, that every doctor was brought into one of the Guild groups.

Members of the Committee then gave accounts of meetings which had been held in their area. One point which

came out most clearly at these meetings was the question of confidence. Members of the profession were getting more and more concerned about obvious defects in the Service. There was a feeling that if the Government continued to be awkward about remuneration this might be the opportunity for considering all aspects of the Service.

The CHAIRMAN said that it was true that doctors were dissatisfied with the Service as a whole, but the two matters should not be confused at this stage. There was no doubt that doctors had been badly underpaid.

Dr. SORSBY asked that members of the Committee should be supplied with the documents sent out to Divisions, and when members expected to address meetings it would be helpful if they could be given speakers' notes. Copies of the documents were later circulated at the meeting. It was stressed that the interim period should be used to help the local B.M.A. Divisions and the Guild Divisions.

Dr. P. BURNS said that there was a very great deal of dissatisfaction and much of it arose out of the capitation fee method of payment. He thought that should be discussed. Dr. A. BEAUCHAMP pointed out that the Negotiating Committee was set up to negotiate a claim, not to go into alternative forms of service.

The CHAIRMAN OF COUNCIL said that there was no doubt that many people thought some further investigation should be made into the machinery of the National Health Service. This had not been lost sight of, but the betterment claim must be determined first.

In view of the present position and the large number of meetings being held in the country, further discussion on future action was deferred until the next meeting. It was also referred to the Central Committee of the British Medical Guild.

Income from Local Authorities

A letter from the Ministry of Health was considered regarding the taking into account in the calculation of the central pool of the income derived from local authorities by doctors providing unrestricted general medical services. In view of the vast amount of work involved the Ministry stated that, as a result of discussion, the local authorities' associations had suggested that the amount of the payments for 1953-4 which had been used in calculating the pool for 1954-5 should be used for the 1955-6 calculation, and that local authorities should be told now that annual returns would be required for the five years 1956-7 to 1960-1 so that arrangements could be made in advance. Towards the end of the five years consideration should be given to the matter of whether the percentage of the total payments by local authorities to general practitioners was sufficiently stable to obviate the necessity of frequent returns in the future.

It was reported that Professor Allen had been consulted. He advised that the suggestions could very well be accepted, and the Committee agreed.

Capitation Fee

The next item relating to remuneration was a suggestion from Middlesex that, because of the inordinate delay in the payment of the final settlement, the Ministry's interim payment, excluding loadings, should be not less than 18s. per annum per caput in place of the present figure of 17s.

Points brought out in the discussion were that the profession was asking for a revision of the betterment factor because many of its members were in a state of economic distress. The final settlement money belonged to them, and they received it a year and nine months after they should have it. The Government by this action saved itself an enormous amount of money in interest. It was suggested that the basic rate should be retained at 17s., and that 1s. should be paid towards practice expenses. Since this rate was fixed money had become of considerably less value, and the Government was withholding an increasing amount of the doctor's remuneration each year. The position might be met by a percentage addition each year, made in advance,

so that the doctor would get a bigger proportion of what he was entitled to have, at the time he was entitled to it.

It was expressed strongly that it would be wiser not to press such a procedure just now, and a resolution proposed by Dr. S. WAND, that the Committee was sympathetic with the terms of the Middlesex resolution but felt that steps to implement it should not be taken at the present time, was carried. Dr. Wand said it should be kept as a continuing matter and discussed at an appropriate time.

Matters Discussed with the Ministry

Dr. A. B. DAVIES, reporting on the discussions with the Ministry at the end of November last on a variety of matters, said that the question of the filling of practice vacancies was raised, the particular point being the position when a doctor who had previously carried on a practice returned to the locality and commenced practice again. Although not frequent, cases did arise where a doctor wished to resume practice at his former surgery address, and, provided the area was not closed, the application to do so was granted more or less automatically. The appointed successor should be made fully aware of the position when he was appointed, and, where appropriate, of the possibility of return of the previous doctor.

It was pointed out that it was not only vacancies caused by a doctor's erasure which caused difficulty but those who left of their own accord and then wanted to return. The view was expressed that where a doctor had been removed from a list because of misdemeanour the executive council should have the right to refuse him permission to practise in the same area. If this required amending legislation this should be sought.

The situation, it was agreed, was extremely difficult and both sides are to consider the matter again.

Arising out of the filling of practice vacancies and the hearing of appeals from doctors who were not appointed, Dr. SORSBY raised the point of principle of the Minister disregarding the recommendations of an appeals tribunal. He quoted a recent case in which the appeals tribunal reached a unanimous decision, which was not upheld by the Minister. His opinion was that a precedent had been created.

The CHAIRMAN OF COUNCIL said that the point was that the Minister could or could not take the opinion of the appeals body as he wished, and if he did so he became the person who determined the appointment.

The DEPUTY SECRETARY (Dr. Stevenson) said that the statutory position of the Minister was set out in the regulations; he might decide whether there should be an oral hearing, and where he so decided a panel was set up. The panel hearing the case made a report stating the relevant facts and their conclusions, which was sent to the Minister, who then made his decision. The wider issue was why were members sitting on the tribunals if no one took any notice of their decisions.

It was agreed that strong representations should be made to the Ministry on this matter. It was added that appeals committees should be informed of the reason for the rejection of their decision.

Among other matters discussed with the Ministry was the trainee practitioner scheme. The Ministry suggested a regional advisory type of appeal rather than the local appeal envisaged by the Committee.

A strong case was made for monthly advance payments. The Ministry was sympathetic, and said it would make inquiries on whether it would be possible. It was agreed to press the matter. With regard to the reinstatement on doctors' lists of patients returning to the United Kingdom, the Ministry asked for more information. Arising out of the Committee's report to the Annual Conference on the Supplementary Ophthalmic Services and the suggestion that form O.S.C.1 should be used on every occasion that a patient visited an ophthalmologist or an ophthalmic optician. The Ministry agreed to examine the problem further and comment later in writing.

It was promised that the Ministry would expand paragraph 22 of the Handbook for General Medical Practitioners so as to prevent misunderstandings with regard to the remuneration payable to a locumtenent on a death vacancy.

Also discussed was the question of general-practitioner representation on boards of governors of teaching hospitals, and a promise was given that general-practitioner nominations would be given full consideration when further appointments were made. Local medical committees and Branches and Divisions of the British Medical Association were being invited by the Association to provide suitable general-practitioner nominations for appointment to boards of governors for submission to the Minister.

The question of general-practitioner beds in hospitals was considered, particularly that of general-practitioner maternity beds, and the Ministry undertook to provide figures which would illustrate the overall situation. In connexion with this the situation at Portway Hospital was again before the Committee; an unsatisfactory reply had been received to the Association's letters, and it was agreed that other action would have to be taken if no satisfactory reply was forthcoming.

Practice Accommodation

An interim report was received from the Practice Accommodation Subcommittee which was set up to consider the problems associated with movement of population and redevelopment generally. It was felt that, if hardship among the general practitioners involved in such movements of the population was to be minimized and the continuity of the medical service achieved, certain principles must be established which should be carried into effect not only by the administrative bodies in the health service but by the planning and housing authorities, upon whom in most cases practitioners relied for practice facilities and accommodation. The subcommittee put forward two recommendations: First, that when redevelopment took the form of demolition and rebuilding on the same site all possible steps should be taken to protect existing doctors against encroachment by newcomers, and this could be achieved only by a total closure of the area by the Medical Practices Committee until the situation was stabilized; similar action should be taken in redevelopment which dispersed a centre of population. Secondly, in new housing centres, the estate must be declared closed to prevent an influx of "squatters" in cases of doubt whether the housing authority would provide practice premises only to doctors selected by the Medical Practices Committee.

It was obvious from the replies received to a questionnaire that this is a national problem, and the subcommittee recommended that there should be early consultation with the Ministry. It was stated that there was a similar subcommittee considering the problem in Scotland. It was agreed to accept the interim report and to explore the matter with the Minister.

A discussion took place on the question of surgeries being closed while a doctor was on holiday and a notice being exhibited directing patients to another doctor's surgery. A local medical committee had drawn up a memorandum laying down conditions on which this could be done, but the Committee felt that, although the proposals were not unreasonable, it was a matter for local discretion.

Agreements for Assistants

Dr. F. GRAY presented a report of the Assistants and Young Practitioners Subcommittee. A recommendation that the car allowance of £150 under the trainee practitioner scheme should be raised, as it had been fixed at this amount for over eight years, was accepted.

The most important item of the report dealt with agreements between principal and assistant. The subcommittee felt that the executive councils' power periodically to review such agreements, while fair, did not cover the principal who refused to give his assistant such an agreement. It was recommended that a written agreement between

principal and assistant should be compulsory. This should state the salary, no definite minimum figure being laid down, the holiday period (not less than 21 days a year), the period of sick leave (14 consecutive days, with a total limit of 28 days in any one period of 12 months), off-duty period (any off-duty period forgone should be made up subsequently), and both principal and assistant should be members of recognized medical defence organizations. Lastly, the subcommittee recommended that the consent of the executive council should be contingent upon an assurance from the local medical committee that the proposed agreement was satisfactory.

There was a long discussion on these proposals. The Committee has long thought such agreements to be desirable, but the view was expressed that it was impossible to make them compulsory. Some members suggested that if a principal consistently refused an agreement to an assistant the local medical committee should take this into account when deciding whether the principal should be permitted to have an assistant in future. The Committee had a duty to see that the way to assistantship was made easy, but there were objections to these proposals.

It was agreed to refer the matter back to the subcommittee for further consideration.

Other Business

It was reported that the Minister had agreed to make an alphabetical index of the population in the next financial year. This would be used in combating the increasing inflation of doctors' lists, about which there has been a great deal of discussion in recent years.

The Private Practice Committee's proposal to set up a joint subcommittee to discuss further the question of drugs for private patients was accepted and representatives were appointed.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Arbitration

SIR.—The present great discontent which is being expressed regarding the settlement of our remuneration claim was rightly summed up by Sir Russell Brain at a pay press conference. He said that it was not merely a pay claim but a crisis of confidence that went to the roots of the relations between the Government and the medical profession. I would add that it is much more than a crisis of confidence. The dispute involves certain grave constitutional issues to which you and I drew attention in 1951.¹⁻⁴ It is quite clear to me that a salutary clearance of verbal rubble is necessary if the profession is to understand the difficulties of the problem and the dangerous situation which confronts it. The profession has still not obtained the right to submit any dispute to independent arbitration. For the enlightenment of many of the younger members of our profession it is well to recall the sequence of events during the last seven years.

At the time when the National Health Service (Amendment) Bill was before Parliament the late Sir Lionel Whitby wrote to *The Times* (June 20, 1949) expressing his grave disquiet at the sudden turn of events. Writing on behalf of the profession (he was then President of the B.M.A.), he recalled that in October, 1947, before the N.H.S. began to operate, the then Government had given a pledge to the profession when it set forth its proposals for the establishment of Whitley machinery in the National Health Service. It had stated that it was "anxious to afford the fullest rights to arbitration, subject to the Government's prerogative. A code of conduct is unlikely to be arbitrable, but a simple proposal for a change in wage or salary rates almost certainly is." Sir Lionel stressed that this promise was

repeated by the Ministry in March, 1948, and supplemented by verbal assurances during the discussions which preceded the Act. Yet Clause 13 of the National Health Service (Amendment) Act, 1949, made it painfully clear that the right to independent arbitration was not to be granted. Sir Lionel asked why doctors should be singled out in this way when large sections of the workers in industry enjoyed the right to compulsory arbitration in disputes arising out of their employment. A short time later the matter came up for discussion at the Annual Representative Meeting at Harrogate. On June 24, 1949, Dr. Guy Dain (Chairman of Council at that time) received loud applause when he said, "We must have the right to go to arbitration even though it is the Government which is the employer. It is essential to us, if we are to continue the Service, that freedom to go to arbitration should never be in question." Why is Dr. Dain afraid of arbitration now (*vide Proceedings of Council, Supplement, January 5, p. 2*)?

At the Harrogate meeting I stressed the constitutional issues which would arise when the impersonal State "without a soul to damn or a body to kick" as employer attempted to use its prerogatives against its employees in repudiation of its pledges. Writing on arbitration in the *Manchester Guardian* on July 8, 1949, a leader writer made the following comment: "There is a good deal in what the doctors say, but it does not apply only to themselves. With the great spread of public services, there is a strong case for reconsidering the method of settling differences in regard to which a Minister is indirectly a party to the dispute as well as a judge." The principle conceded by the Government in the 1949-50 period, when it caused to be enacted Section 13 of the 1949 Act and concurred in setting up the Medical Whitley Council, was that the right method for settling the remuneration and conditions of service would be by collective bargaining, backed by arbitration in the event of disagreement. Both the main constitution of the Whitley Councils for the Health Services (Great Britain) and the constitution of the Medical Whitley Council contained a provision to this effect. In spite of the statements made by the Government spokesmen in both the House of Commons and the House of Lords on the second reading of the 1949 Bill regarding arbitration in the case of disagreement, the intended arbitration agreement as far as I am aware has never come into existence, and that is really what has gone wrong.

On February 13, 1951, the Amending Acts Committee obtained a considered opinion on arbitration from an eminent counsel who is now a High Court judge. This was embodied in the first report to Council by the Amending Acts Committee in September, 1951, and considered by a Special Representative Meeting on December 13, 1951. Four recommendations requesting the establishment of a National Health Service court of arbitration were submitted to the S.R.M. by the chairman of the Committee, Dr. H. H. D. Sutherland, and passed. These resolutions became, and they still remain, the policy of the Association. In August, 1951, under Statutory Instrument 1376, entitled the Industrial Disputes Order, 1951, the medical profession was excluded from referring any dispute to the Minister of Labour on terms and conditions of service because the B.M.A. was not a trade union. Whether we were excluded by accident or design is a matter of conjecture. As a result of certain discussions (initiated by the Council of the B.M.A.) it was hoped that the order would be amended in such a manner as to include the medical profession, so that it would be possible for the profession to refer matters in dispute between the Management Side and the profession to the Minister of Labour for arbitration. On July 30, 1951, Statutory Instrument 1373 was made by the Minister of Health and became operative on August 13, 1951. It permitted the Minister of Health to vary the remuneration or other conditions of service of the medical staff of hospitals without reference to either the Whitley machinery or to Parliament. This order was made within the powers given to the Minister of Health by s. 66 of the N.H.S. Act, 1946. On a strict legal construction of s. 66 it could be upheld.

but the method which has been adopted has the effect of removing from Parliament all effective control over the remuneration and conditions of service of the hospital doctors concerned. It leaves them to be settled by the arbitrary decision of the Minister. So far as I am aware, no action was taken to have these statutory instruments annulled under Section 75 of the N.H.S. Act, 1946, or Section 5 (2) of the Statutory Instruments Act, 1946.

The Joint Consultants Committee came up against this problem in its claim for increased remuneration for hospital staffs. In default of agreement, normal Whitley procedure permits a case to go to arbitration. But the medical Whitley machinery does not allow this. As Sir Russell Brain stated in his letter to the *Supplement* in May, 1954,⁴ because the consultants have to submit their claims through Whitley procedure "arbitration [was] unobtainable except with the consent of the other side, which was refused. We are thus left with a moral claim which the Management Side refused to meet, and which was completely unenforceable." The general practitioners had foreseen this possibility when making their claim for betterment. The General Medical Services Committee did not submit its claim to the Whitley machinery but insisted on submitting it direct to the Minister, as the Negotiating Committee is now doing. Under a threat of withdrawal of service the claim was submitted to independent arbitration by Mr. Justice Danckwerts, and, as is well known, the general practitioners obtained a much greater measure of justice.

I am not concerned whether the dispute is in connexion with remuneration or other terms of service. The profession must stand firmly on its right to submit a dispute to an independent court of arbitration. This has been the established policy of the Association since December 13, 1951, but it is quite clear that it has not been pressed on the Government. It is the duty of the Council to act on the instructions of the Representative Body, to press with all the force it can command for the establishment of such an independent court of arbitration and to remedy the injustices of S.I. 1373 and S.I. 1376. We need constitutional guarantees against the assumption into the hands of the executive of wide and arbitrary powers. Even if again the threat of withdrawal of service succeeds in obtaining for the profession the increase in remuneration which we justly demand, our safety as an independent profession is jeopardized if we still have to confide our destinies to the dictatorship of a bureaucratic executive which can only say, "Test it in the courts."—I am, etc.,

London, W.8.

The Way Out

SIR,—Your excellent *Journal* comes out here a little late, but you can have no conception of the entertainment it affords. I mean the letters from frustrated and exploited registrars. After having been qualified for 15 years, having done six years of voluntary Army service, and having been a senior registrar for another six years, I came to the conclusion that senior registrars were being badly treated. I wrote to you, Sir, and to another journal; some of these letters, the less virulent ones, were printed; others, growing perhaps monotonous, were not. Those printed anonymously obtained some sympathy but no action; those I signed drew on me the suspicions of several of my seniors; "Elmhirst's a trouble-maker," the word went around. I wrote to the national newspapers and the suspicion became a certainty: "Elmhirst is becoming a nuisance." Kindlier seniors warned me that I was doing myself no good. The news spread to a selection committee. I wrote to successive Ministers of Health, who sympathized on several occasions and said it depended on the profession. I wrote to successive presidents of a Royal College and got, first, more sympathy, and then the information that something would soon be done, it was

hoped. I twice went in person to the Ministry of Health and was interviewed by sympathetic gentlemen with crumbs on their waistcoat creases. I wrote and talked to my local M.P., who forwarded everything to the Ministry of Health and got the usual understanding and sympathy. The B.M.A. had faith, which I had reason not to share, in the proper channels for negotiations.

I, at last, was forced to realize that sympathy was sorry, sterile stuff, and began to try to organize my fellow sufferers. They answered thus: "Why should I want to upset my chief—there may be a job coming up next year?" "Why stick your neck out, old man?" "What about the Registrars Group?" "Why be rash? Something's bound to happen soon." "Why make yourself a marked man?" I tried to organize a procession of sandwichboard-men outside the Ministry of Health—not one volunteer came forward; I wanted a deputation to tour the Royal Colleges and Parliament—not one colleague could I persuade. In short, Sir, I wanted action, any action, to draw attention to injustice and tyranny. I never broke that window in Downing Street; I crossed the Atlantic instead, to a happy exile where I no longer have to pick my subservient way between administrative clerical officers and part-time consultants. Perhaps by now, Sir, you will understand the sour entertainment afforded by your correspondence columns. Are those mealy-mouthed worms really turning at last? Or will they be overgrown by a new generation of senior registrars (for only the adaptable survive), the offspring of long lines of mean and flabby ancestors, suckled by State milk, educated in competitive State schools, and converted into servile technicians by alternate threats and promises? Can these really be my countrymen?—I am, etc.,

Bermuda.

EDWARD ELMHIRST.

SIR,—When this letter reaches you I shall be on my way to Canada. Why? My father, after telling me that I would be better off in business with him, and that I was a fool ever wanting to be a doctor, put me through college and I graduated in 1954. Enthusiastic and healthy, I set about the task of becoming a competent doctor and obtained good posts in medicine, surgery, and obstetrics, and finally became a trainee assistant. In all these I was fortunate enough to have chiefs who were willing to teach and give me the benefit of their experience. Throughout this time there arose from G.P.s, consultants, registrars, and S.H.O.s cries which were to become all too familiar: "This is a fool's game"; "There's no future in medicine"; "Can't live on this pay"; "If I were you I would go abroad"; "Emigrate"; "Go abroad."

I thought that these were the normal grumbles that go with any job and began to look for another appointment. Three months before my traineeship ended I began writing one to four letters a week in answer to advertisements. For my efforts I acquired two typewritten strips of paper without signature or address telling me the posts had been filled. The postmark showed the locale. One gentleman with whom I spoke by telephone asked me for a letter, but was evidently too busy to acknowledge it. Somewhat dispirited, I applied for and was given a post in Canada, whither I now travel.

Mine is not an isolated case. I have with me the names of five people who are coming to the same dead end; I hope I can help them. Why has this state arisen? (1) Overcrowding of the universities, which inevitably led to an excess of under-trained doctors (dentists beware!), thence to provisional registration, and the housemen being made subject to a body which could only see medicine as another line in the wages book. Meanwhile in practice it became usual to receive 40–60 applications for a vacancy—cheap labour was the natural outcome. (2) Much discontent arises in all branches of the profession because of—money. Who is to blame for this? Mr. Turton? No. The blame can only be laid at the feet of those principals and their advisers who were established when the N.H.S. was inaugurated. For a supposedly intelligent section of the community the vagueness of the conditions under which they went to work

makes one wonder if they had been on a glorious binge prior to the appointed day. As for moral obligations, one has only to look into the daily press to see what value they have in civilized communities.

This tirade may not justify emigration, but one cannot live on nothing or one's parents for very long. I am going to a small, isolated settlement, and expect to have a rough time, but at least I have a job and a reasonable salary.—I am, etc.,

Gateshead, 9.

G. H. HODGSON.

Remuneration Claim

SIR,—Having attended a meeting in Harrow this week to reorganize the Guild, I was dismayed at the complete lack of constructive ideas. The answers to questions from the floor were ambiguous and vague—particularly when the junior members of the profession asked if they were to be fairly treated if they supported the seniors and gained our financial objective. There seemed to be no leadership from the top, and those of us who went there to find out what was to be expected from us in our efforts to stand firm together were unable to get any idea of any proposal. There were the usual vague statements about getting out of the N.H.S. into a better service, but nobody was prepared to define this.

In my opinion, unless the B.M.A. give a strong guide soon, the average G.P., whose fighting spirit is being stirred up by the Government's lack of faith in honouring Spens, will sink back into apathy and await his financial doom under the impression that there is no leadership strong enough to convince the Treasury of the justice of our claim. The teachers have their Burnham scale with the obligation of the Government to review this every three years. Let such a definite term be included in any agreement which may be concluded at this time to avoid a repetition of the mess in which we find ourselves now.—I am, etc.,

Northwood, Middx.

J. DAVID SWAN.

SIR,—“A pleasant surprise,” said the Minister when he announced the amount owing to general practitioners for practice expenses for the year 1954–5, and which they would be receiving on January 1. I had not expected to be unduly surprised by getting something for which I had waited the best part of three years, but I was quite open to being pleased. Then consider what happened. I received a sum rather more than 10% of the net personal income alleged by the Minister to be mine, did some thinking, and my pleasure faded. If 10% represents my outlay, and I have had for the past 21 months a similar outlay—I assume that costs have not decreased in that time—then I am still out of pocket some 17½% of my supposed income. Add to that a figure of 5% to represent the average over the year preceding. I come to the conclusion that I am at all times 22½% of a year's income out of pocket. To diminish the pleasure still further, conceive that I might be one of a large group of general practitioners who are living on overdraft and who therefore, at the dictation of a colleague of the Minister's, require to borrow this 22½% at 7% rate of interest.

It is fortunate for his Health Service that the Minister, though he considers the country cannot afford to honour its obligation to the medical profession, does believe that the profession can afford to subsidize the Service with such a capital outlay.—I am, etc.,

Buckie, Banffshire.

J. F. CAMERON.

SIR,—A threat of resignation from the N.H.S., without any intention to do so, is useless. Any government will know this and will merely call our bluff. At the inception of the scheme we saw the pious resolutions of the majority who were against it followed by an ignominious retreat as it became evident that the Government had well-prepared plans and that those who did not join would quickly be put out of business by those who did. This local medical guild cannot achieve a unanimous vote in favour of a resolution

threatening to resign. One can only guess at the numbers who would be prepared to resign in face of blood, sweat, and tears. A possible solution is for small local groups of practitioners with mutual confidence in themselves and in their public health, hospital, private, and Service colleagues to pledge themselves to action should the need arise. They would be “the few,” the martyrs perhaps, but they would make history. There must be some such areas after nine years of N.H.S.

The main issue, the implementation of Spens, should be linked with an issue of even greater importance—our terms of service. This is quite vital, because, when the battle is joined and when our forces are mobilized, we shall be in a position of strength, which may not recur. Circulars should sound our opinions on these points. Plans should be drawn up now. Then we can follow up a Spens victory with a better service for the public and for ourselves, perhaps payment by service, perhaps capitation, but at least away from the politicians. We cannot afford to risk another defeat and relapse into another decade of hoping for the best. Let there be no mistake—if this is to be a fight, to win it we must be prepared for sacrifice, we must have an efficient general staff, know exactly what we are fighting for, and have groups prepared for action.—I am, etc.,

Rosyth.

JAMES CAMPBELL.

SIR,—That doctors should receive an increased reward and enjoy a better living standard than other white-collared workers in return for a greater load of responsibility is recognized as one of the bases of our claim by the vast majority of our profession. It is disconcertingly apparent, however, to those of us who have perhaps 30 to 40 years' hospital service ahead of us, almost inevitably whole-time, that there are those, seemingly part-time, consultants who, supporting the view of *The Times*, which would place our status at no greater than, say, the teachers, consider that the present remuneration is adequate. Can they not be persuaded to realize that an acceptance of this viewpoint must call for immediate abolition of the system whereby public money is distributed secretly and with personal lobbying—the merit award?—I am, etc.,

Harbury, Warwicks.

J. C. A. RAISON.

SIR,—Whatever may be the pros and cons of the argument about the interpretation of Spens, it is difficult not to agree with the Minister that this is no time to press for a 24% increase in pay. Wages are things for which, from the employer's point of view, the time may never seem quite right, but I think it is true to say that at no time since the war has this country been in such obvious and immediate economic danger as it is now, and many eyes will be watching to see if we are prepared to modify our approach in the light of this fact. This is indeed more than a pay claim, “it is a crisis of confidence,” and the confidence issue will be better served if we abandon the other and less important one for a definite period and state very clearly why, in spite of our rights, we are doing so.—I am, etc.,

Sherborne.

T. H. BARRIE.

SIR,—If the Government refuses to implement Spens I suggest we recognize the 4s. 3d. a quarter as the basic retaining fee which it is, and make an extra cash charge for minor surgery, night calls, visits made in response to messages received after 10 a.m., week-end work, and attendance at surgery outside normal surgery hours. In this way we shall be able to meet our extra expenses, and the patient will be reminded that our services deserve a fair reward.—I am, etc.,

Frinton-on-Sea

W. H. SCOTT-EASTON.

Reform of Health Service

SIR,—In spite of the criticism of the capitation fee under the National Health Service, I fail to see how the small practitioner is going to be any better off under any other arrangement. Our armature in the treatment of all forms of sickness, and especially of acute conditions, has developed

out of all proportion since the pre-war years, and even since 1948. Where, in the treatment of a case of average severity, a doctor could count on ten to fifteen visits and charge a fee commensurately, he would rarely nowadays be justified in more than four or five visits. It would be necessary to charge four or five times as much per visit nowadays if the general practitioner intends to bring his income anywhere near the level of that which he was earning prior to 1948.

My main criticism of the National Health Service is the system of allocating practices. After the war I took a derelict country practice, and was in the process of building it up when the National Health Service came into operation. Since then two death vacancies have occurred alongside of me. In the pre-Service days I would have been able to buy either the one or the other of these practices in order to boost my income. Under the National Health scheme, however, although I applied for both vacant practices, pointing out in my application the ease with which I would be able to run either in conjunction with my own, they were allocated to somebody who did not have a practice at all. One or other of these practices, attached to mine, would have given me a list of approximately 3,000, which I could quite easily have managed, instead of wasting half my day as I do now. Also, the cost to the Ministry would have been at least £400 to £500 less per annum.

I think it is correct to say that an influx, at about the same time when the National Health Service came into operation, of doctors previously employed in the Indian Medical Service was the main reason why there was a large surplus of doctors, all of whom were clamouring for practices. I do not know what the answer is for those doctors who have not got practices, and I suppose that the surplus still does exist, but I feel that a better distribution of the patients would, in the long run, prove more satisfactory to the practitioners and be immeasurably cheaper on the Ministry. In my country practice I have a list of 1,600. I could quite comfortably cope with another 1,000. The urban practitioner should be able to cope comfortably with 3,000. In order, however, to give him an income equivalent to a country practitioner with 2,500 on his list, the urban practitioner would require about 3,500, but against this must be considered the fact that the urban population on the whole is never so healthy as the country, and that epidemics are liable to be much more severe in the towns, and especially big towns. A gradual redistribution along these lines is, in my opinion, the only real solution. As things are at present, a practitioner who was caught with a small list when the scheme came into operation is trapped, unless he is lucky enough to have some large development scheme take place in his area. No matter how conscientious, painstaking, or efficient he is, he stands very little chance of increasing his list to any marked extent, and, as far as I can see, no chance at all of getting rid of his small practice in exchange for a larger one somewhere else.

Finally, and with reference to my opening remarks, I cannot see how the practitioner with the small list can possibly agree to resign from the Service as a protest, in spite of all promises of financial recompense from money available to the Guild. My memory is still too ripe with the knowledge of the total loss of my practice within six months of being recalled to the Services in 1939, despite the B.M.A. protection-of-practices scheme, and I certainly have no intention of taking any part in any scheme aimed at forcing the Minister's hand. My commitments in respect of the education of my children simply will not permit it, quite apart from the fact that I have only now recovered from the loss I incurred as the result of the war and my recall to the Services.—I am, etc.,

Diss, Norfolk.

J. H. CULLINAN.

SIR.—Amid all the clamour for increased remuneration for doctors, it is important that we in general practice should have a plan ready to make sure that the pay should be so distributed that good medicine is encouraged and yet time is not wasted in excessive form-filling.

Here is a plan which would be simple and economic to operate. The small-list practitioner would benefit, and yet it would give scope to the conscientious doctor with a full list. The amounts of money are suggestions, as the exact amount would have to be worked out. (1) Every doctor who is employed by an executive council as a principal should be given a basic allowance of about £600 to cover essential surgery expenses, which are almost the same for a big-list man as a small-list man. (2) The capitation fee should be smaller than at present—about 12s. a patient, weighted by an extra 10s. for patients between 500 and 1,500. This should cover all the usual visits and surgery attendances. (3) Payment by service should be paid for all work that involves considerable extra effort and time. This would act as an incentive for conscientious effort. A possible scale of remuneration might be: Minor operations (sebaceous cysts, whitlows, ingrowing toenails), £1 10s.; regular injections for pernicious anaemia or rheumatoid arthritis, £2 for a course of 12 injections; patients who are chronically ill and require regular visiting, £5 a year per patient; attendance at a confinement £2, in addition to usual fee.

The above scheme is only a suggestion, but I hope it will stimulate further correspondence to help shape a plan which will give us all a square deal.—I am, etc.,

Kidderminster.

RICHARD H. GRIFFITH.

SIR.—I hope the profession will not lightly throw over the capitation fee form of payment. It served well in the old N.H.I. days, and, by and large, has served well up to the present in the N.H.S. It is a useful compromise between a salaried service on the one hand, with its risk of impersonal relations between doctor and patient, and on the other hand an item-by-item form of payment with its looser bond between doctor and patient, its increased clerical work, and its risk of carrying a "vested interest in disease" for the doctor. The most useful thing the Minister could do to increase the efficiency of the general-practitioner service would be to increase substantially the capitation fee, while at the same time limiting doctors' lists to 2,500 patients.—I am, etc.,

Blandford.

C. E. LANGLEY.

SIR.—Letters appear occasionally advocating payment by item of service—e.g., Dr. W. N. B. Parker's letter (*Supplement*, December 29, 1956, p. 231). I wonder what this would entail. Presumably huge sheets with columns for, probably, name, address, age, diagnosis, consultation or visit, etc. What a pest this would be during the consulting hours. Every night scores of visits would have to be written up. How many would be missed?

As an elderly practitioner I have vivid recollections of the rendering of bills prior to the N.H.S. days. Quarterly bills were sent out in February, May, August, and November, and half-yearly bills in January and July. I see from my records that I sent 642 to 793 quarterly bills per annum, taking two random years. The highest number for one quarter was 239. Half-yearly bills: highest number, 119 for half-year; average of two random years, 89 for the half-year. Practice: about 2,500. This would be a mere flea-bite to the endless records necessary for items of service.

Dr. C. A. Roberts (p. 231) writes that "there is hardly a qualified man who is able to enjoy his work to-day." This certainly does not apply to me. King George V wrote on the fly-leaf of a friend's Bible: "The secret of happiness is not to do what you would like to do, but to learn to like what you have to do."—I am, etc.,

Currie, Midlothian.

H. MAITLAND MOIR.

Crisis of Confidence

SIR.—Over the past months you have published a considerable volume of correspondence relating to our pay claim. Some has been violent, some practical, some pathetic, some seeking to appease, some aimed at sabotaging our cause, and some patently ridiculous. You have even been kind to me, Sir. You will appreciate that many humble,

practical doctors have found in the airing of their views a useful safety-valve, and that they have also felt that they might be contributing to the common good. Dr. Bruce Cardew (*Supplement*, December 29, 1956, p. 230), speaking from the security of his chairborne eminence, condemns these doctors out of hand, commending recourse to more democratic channels. But what has persistent use of these channels achieved in our cause? How much real improvement has there been in the National Health Service as the result of democratic action over the past 8½ years? The answer, Sir, is, "Precious little."

May we not ask why? We cannot deny the ability of those of our number who have been concerned with the fashioning of the Service from within; we would hesitate to question their integrity. Yet the fact remains that, for all their efforts, our position worsens fast. And this in spite of the fact that we, as a profession, are quite irreplaceable in the economy of the nation. As I see it, three categories of established general practitioner exist: post-1948, with acute anxiety as to income; pre-1948, with perhaps less immediate worry, yet with their capital confiscated by the Government; and those of retiring age, who (because of Governmental pressure) feel obliged to hang on for a further eighteen months in order to qualify for their pensions. The implication is as obvious as it is unkind, but if we are to achieve any true independence we must consider these matters when electing our democratic representatives. Perhaps then we may achieve something more concrete within the democratic structure. The present crisis is the more vital the longer the period of service we contemplate.

While offering no positive proposals as to the cure of our present political ailments, the British Medical Association does not invite its members to make suggestions, and certainly affords us little evidence of having seriously considered those which have been volunteered. Again, it might be thought pertinent to ask why, or even to wonder quite how widely your "crisis of confidence" may be found to go. Referring to the letter from Dr. Anthony Walker and myself (*Supplement*, December 29, p. 230), the Minister most graciously informed us that our views had been noted, yet my subsequent sincere offer of hospitality to him or his representative, with a view to informal discussion of our problems with a few of those most vitally concerned (a course which could have done nothing other than to acquaint him the more forcibly of our present plight), has been turned down with about as much concern over our claim as was shown in the original refusal to negotiate. As has been said before, negotiation requires good faith in a minimum of two parties.

The difficulties besetting the busy family doctor in preparing a plan for an alternative health service are legion. Yet this is what we are reduced to. We can only hope that this may be done in time. Beyond being a crisis of confidence, this is a challenge to the family doctors of tomorrow. I therefore appeal to those of the profession bearing the responsibilities of parenthood, to those with the prospect of many years' useful work ahead of them, to review recent events in the light of past failures, and to approach current problems with a show of determination as yet occult. Let us see our bolder spirits militant in support of a better service, rather than seeking refuge outside their own country, and let us see this spirit appreciated by our elders.—I am, etc.,

Upton, Hunts.

JOHN K. PATERSON.

Approaching M.P.s

SIR.—We live in a democratic State. Our Association prides itself on being run on democratic lines. Let us therefore take immediate steps to make use of one of the main advantages of such a system and approach every Member of Parliament in this country to inform him or her of the true plight of the profession—and I am not merely thinking of remuneration and the disastrous faults of the Health Service. It is my firm belief that these men and

women are honest people with the good of the country at heart. I further believe that they are not fully aware of the state of affairs which exists. If groups of doctors in every constituency could meet their own M.P. and convey to him or her the salient facts, I am confident that matters would be put right.—I am, etc.,

London, S.W.16.

D. G. ALLEN.

Remuneration of Radiographers

SIR.—We are gravely concerned by the financial position of radiographers as disclosed in Dr. Duncan Irving's letter (*Supplement*, October 13, 1956, p. 157).

In these days of high wages it is strange that such a skilled occupation is so poorly paid in all grades in comparison to other medical technicians, especially those in the pathological departments. We suspect that this is due to the fact that they are members of a society, and not trade unionists, and so have not been able to have their claim treated with the consideration it would have received otherwise.

In view of this we are not surprised that there is a steady drift from the profession, and are only amazed that it is not greater. As a result of the increasing understaffing of the radiology departments, we can only see a slowing-down of the work done, and so steadily increasing out-patients' waiting-list as a direct result.

As general practitioners in this district enjoy full access to the radiology department of the local hospital, we have an apprehensive view of the future. Higher pay for the radiographers comparable with that paid in the other departments will stop the wastage, and with the resulting full staffing of the radiology departments throughout the country our local favourable conditions with regard to x-ray investigations will be general.

While we are ourselves having to negotiate for increased remuneration, we think that the medical profession should as well support the claim of those on whom we depend so much to help us in our work.—We are, etc.,

W. M. CROSBIE HALLINAN.

R. G. B. WIGODER.

R. LL. MEYRICK.

H. G. JEFFS.

J. N. KERR.

C. BENN.

J. R. M. SANGSTER.

London, S.E.13.

Salaries of Part-time Radiographers

SIR.—In order to alleviate the national shortage of radiographers their salary scale has been revised. This has been done in an attempt to attract new entrants into a dwindling profession. To bridge the gap until new entrants have been trained, it would surely be expedient and just to remunerate part-time radiographers in accordance with their qualifications, status, and experience, on the same terms as full-time employees. In small hospitals it may well be that only part-time radiographers are an economic proposition. At the recent revision of the scale no consideration at all was given to this category. If the potential services of part-time radiographers, especially among married women, were to be fully exploited, the present serious position could be conceivably relieved. Some are highly qualified ex-superintendents or senior radiographers, who are holding back from resuming work for which they are now paid a salary proportionately lower than that of a newly qualified junior. If the radiological service is to continue satisfactorily, it is hard to understand why this reserve of experts is not used. To say their number is small is based merely on the fact that hardly any are willing to serve in face of the present humiliating remuneration.—I am, etc.,

St. Albans, Herts.

F. FRIEND.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. William David Thompson (Haverfordwest, Pembrokeshire) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

H.M. Forces

Surgeon Captain R. Wear, V.R.D., R.N.V.R., has been appointed an Honorary Physician to the Queen, in succession to Surgeon Captain H. M. Willoughby, V.R.D., R.N.V.R.

A Supplement to the *London Gazette* has announced the following awards:

Fourth Clasp to the Territorial Efficiency Decoration.—Major R. H. Mortis, T.D., R.A.M.C.

Second Clasp to the Territorial Efficiency Decoration.—Major F. J. Fowler, O.B.E., T.D., R.A.M.C.

ROYAL NAVY

Surgeon Commanders L. G. Yendoll and M. H. Adams to be Surgeon Captains.

Acting Interim Surgeon Commanders S. G. F. Linton, M.B.E., and R. S. McDonald to be Surgeon Commanders.

Surgeon Lieutenant-Commanders G. H. Gunson, A. P. M. Nicol, M.V.O., and J. M. Hanson to be Surgeon Commanders.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commander G. L. Foss, O.B.E., V.R.D., to be Surgeon Captain.

Surgeon Lieutenant-Commander R. A. McKeown to be Surgeon Commander.

Surgeon Lieutenants J. L. Hadley and A. S. Douglas to be Surgeon Lieutenant-Commanders.

ARMY

Colonel R. T. P. Tweedy, late R.A.M.C., has retired on retired pay.

TERRITORIAL ARMY**ROYAL ARMY MEDICAL CORPS**

Colonel M. MacEwan, D.S.O., O.B.E., D.F.C., T.D., has relinquished the appointment of Honorary Colonel, 16 AB Div. R.A.M.C.

Lieutenant-Colonel C. H. Imrie, T.D., has been granted the acting rank of Colonel.

Lieutenant-Colonel C. W. Healey, M.C., T.D., has retired, retaining the rank of Lieutenant-Colonel.

Major J. Newall has been granted the acting rank of Lieutenant-Colonel.

Majors L. F. Richmond, M.B.E., T.D., and E. C. Ellis, T.D., have retired, retaining the rank of Major.

Major M. A. Watson, T.D., has resigned his commission, retaining the rank of Major.

Major J. H. Challenger, from A.E.R.O., to be Major.

Captain (Acting Lieutenant-Colonel) C. Wymes to be Major.

Captain (Acting Major) D. O'Brien to be Major.

Captains I. C. Jones, R. Harrison, D. T. Jones, D. St. J. D. Rees, A. E. M. Sieger, J. Humphreys, R. J. Vale, A. J. Heber, D. M. G. Myles, and E. J. Mann have been granted the acting rank of Major.

Captains R. J. Belas, J. Campbell, R. N. Theakston, and J. E. Bevis to be Majors.

Captain J. Prentice, from Reserve of Officers, Class III, to be Captain, and has been granted the acting rank of Major.

Lieutenant (War Substantive Captain) R. W. Hutchinson, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.

HER MAJESTY'S OVERSEA CIVIL SERVICE

The following appointments have been announced: Ho Hung Chiu, M.R.C.P., D.M.R.D., D.M.R.T., F.F.R., and J. Cook, F.R.C.S., D.P.H. Senior Specialists, Hong Kong; T. S. Derola, M.B., Ch.B., D.T.M.&H., Medical Officer, Zanzibar; J. F. B. Edeson, M.D., Specialist Officer, Grade B, Malaria Research Division, Federation of Malaya; D. W. Ellis-Jones, M.B., Ch.B., D.T.M.&H., D.O., Specialist Ophthalmologist, Uganda; T. R. Jones, M.B., B.S., D.P.H., Health Officer, British Guiana; D. H. Mackay, M.R.C.S., L.R.C.P., Assistant Director of Medical Services, Kenya; J. P. F. Whelan, M.B., B.S., D.T.M.&H., Dip. Bact., Specialist Officer, Grade B, Bacteriological Division, Federation of Malaya; W. S. Crawford, M.B., B.Ch., B.A.O., and J. K. Young, M.B., Ch.B., Medical Officers, Kenya; Freda B. Bonner, M.B., B.Ch., B.A.O., and T. P. Jupp, D.F.C., M.R.C.S., L.R.C.P., Assistant Medical Officers, Bahamas; J. W. Markham, M.B., B.S., Assistant Health Adviser, Aden; H. A. H. Melville, M.B., B.Ch., D.R.C.O.G., Medical Officer, General Hospital, Barbados; R. E. E. Pocock, M.B., Ch.B., D.R.C.O.G., Medical Officer, Southern Cameroons, Federation of Nigeria; A. Popovic, M.D., Temporary Medical Officer, Western Nigeria; D. Stewart, L.R.C.P.&S.Ed., D.P.H., Medical Officer of Health, Jamaica; J. Stügelboud, M.D., Medical Officer, Northern Nigeria; P. B. Thompson, M.B., B.S., Medical Officer, South Pacific Health Service, Fiji.

BRITISH MEDICAL GUILD**Meetings to be Held**

COVENTRY.—At Out-patients' Department, Coventry, and Warwickshire Hospital, Tuesday, January 29, 8.30 p.m.

DUDLEY.—At Grammar School, Dudley, Tuesday, January 29, 9 p.m.

Branch and Division Meetings to be Held

CARDIFF DIVISION.—At Park Hotel, Cardiff, Wednesday, January 30, 7.45 p.m., supper meeting. Address by Dr. I. Harvey Flack: "Telling the Public About Medicine." Ladies and guests welcome.

DORSET DIVISION.—At Chest Clinic, Dorchester, Friday, February 1, 8.30 p.m., general meeting.

DUNDEE BRANCH.—At Nicoll and Smiber's Restaurant, Nethergate, Dundee, Friday, February 1, 8 for 8.30 p.m., annual dinner and dance.

NORTH MIDDLESEX DIVISION.—At Committee Room, North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, January 29, 8.30 for 8.45 p.m., meeting. Lecture by Dr. C. H. Andrewes, F.R.S.: "Influenza, Colds, and All That." Medical guests are invited.

PADDINGTON DIVISION.—At St. Mary's Hospital, Paddington, W., Monday, January 28, annual general meeting. To follow meeting of British Medical Guild.

SOUTH STAFFS DIVISION.—At Victoria Hotel, Wolverhampton, Thursday, January 31, 7.45 for 8.15 p.m., annual dinner. Guest of honour: Mr. Leslie Thomas. Members' wives and non-medical guests are invited.

STIRLING BRANCH.—At Stirling Royal Infirmary, Wednesday, January 30, 8.30 p.m., clinical meeting. Lecture by Professor G. L. Montgomery: "Clinical Pathology and the General Practitioner."

SWINDON DIVISION.—At St. Margaret's Hospital, Stratton St. Margaret, Wednesday, January 30, 8.30 p.m., joint clinical meeting with Swindon Medical Society. Films: (1) "Special Problems in the Management of Peptic Ulcer"; (2) "The General Practitioner and Rheumatic Disease."

WANDSWORTH DIVISION.—At Berkeley Rooms, Zeeta House, Upper Richmond Road, Putney, S.W., Friday, February 1, 8.30 p.m., joint meeting with South-west London Chemists' Association. Lecture by Dr. A. A. Mason: "Uses of Hypnosis in Medicine" (illustrated by film).

WEMBLEY DIVISION.—At Board Room, Wembley Hospital, Tuesday, January 29, 9 p.m., combined meeting of all denominations of the Wembley clergy and members of the Division. Address by Dr. Ernest White.

REMUNERATION CLAIM**MEETING WITH MINISTER ARRANGED**

A meeting between the Minister of Health, Mr. D. F. Vosper, and representatives of the profession's Negotiating Committee has been arranged for February 20. The Negotiating Committee will meet in the afternoon of the same day.

Guildford Meeting

A meeting of the Guildford and District Area Branch of the British Medical Guild was held on January 17 and was attended by 103 doctors in the Guildford area. Dr. Alexander Hall, President of the B.M.A., and Dr. D. P. Stevenson, Deputy Secretary of the B.M.A., addressed the meeting. The following resolution was carried by an overwhelming majority:

This meeting has learned with dismay that the negotiations have at present reached an apparent deadlock, following a meeting of the representatives of the profession and the Minister of Health on January 4. This meeting urges the Negotiating Committee to make immediate plans for direct action and, if necessary, arrange for withdrawal from the Service.

OCCUPATIONAL HEALTH COMMITTEE

A meeting of the Committee was held on Wednesday, January 16, with Dr. J. A. L. VAUGHAN JONES in the chair.

The Committee heard with deep regret of the death on December 11 of Dr. H. Wyers. Dr. Wyers had recently resigned from the Committee because of ill-health, and the CHAIRMAN paid tribute to his immense experience, knowledge, and pleasing personality.

The Committee offered its congratulations to Professor R. E. Lane on his appointment as Commander of the British Empire in the New Year Honours List.

It was reported that the Conference of Advisory Councils on Occupational Health would be held at B.M.A. House on April 9, the subject to be discussed being the employment of disabled persons in industry. The question of the establishment of new advisory councils in areas where there are none as yet is being explored.

Postgraduate Courses in Occupational Health

Arising out of the replies received from deans of medical schools, the Training Subcommittee has considered the most suitable type of course for general practitioners wishing to take up part-time occupational health appointments or wishing to attend refresher courses in occupational health. It has appointed a working party to prepare a specimen syllabus for such courses and to make suggestions on methods of teaching. The CHAIRMAN said it was impractical that

there should be a course in every university and it would be better to concentrate on a few medical schools. The subcommittee would report more fully later.

Certificates for Short Illnesses

The Committee again considered the A.R.M. resolution, which had been referred also to other committees, that industry should be asked to abolish the requirement of medical certificates for short illnesses.

The opinion was expressed that difficulties arose mainly in one-day illnesses, and that it was a matter primarily for industry to sort out. The demand for certificates was tied up with payments, sick benefits, and so on. There were many firms which did not require certificates for less than three days' absence. Organizations running sick-pay schemes had to have some sanctions. It was always assumed that there was a great deal of abuse, but 50% of workers never took a day off, and 25% might be able to stay away up to three days without a certificate. It did not seem possible to cover all the problems by a general ruling, except to point out that if too many certificates were asked for they lost their value. The one-day certificate should be abolished. It was agreed that the course proposed at the last meeting of seeking the views of various employing bodies should be pursued.

Remuneration

The Committee received a report from its Remuneration Subcommittee on the fees paid to appointed factory doctors. The majority of the fees paid at present were fixed in 1947 and it seemed reasonable that there should be an increase. The subcommittee's proposed increases were accepted as recommendations for adoption by the Council of the Association.

The subcommittee had reviewed the Association's recommendations on the remuneration of part-time industrial medical officers in the light of the agreement just concluded on the remuneration of part-time medical officers to local authorities, and the Committee decided to recommend to Council that the rates be revised.

Similar action was taken on the range of remuneration recommended for whole-time industrial medical officers, having regard to the 10% increase in the cost of living since early 1955, when these salaries were last revised, and that public health medical officers had received two cost-of-living increases since then and that general practitioners and hospital medical staff were pressing for an increased betterment factor. An increase in the scales of fees for lectures given at courses for disablement resettlement officers and for services on panels of disablement advisory committees was recommended. The recommended rates conform closely to those agreed in Committee C of the Medical Whitley Council for sessional work for local authorities.

Several points were raised in the discussion on conditions of service, superannuation, and so forth which it was agreed should be remitted to the subcommittee for consideration. Dr. D. L. GULLICK, chairman of the subcommittee, was congratulated on the work which had been accomplished.

Administration of Morphine and Antibiotics

The Committee accepted a report from its Industrial Nursing Subcommittee on the administration of morphine and the use of antibiotics or chemotherapy by nurses in industry. The Annual Representative Meeting had passed a resolution expressing astonishment at the refusal of the Home Secretary to legalize the administration of morphine by competent nurses in serious industrial accidents, and instructed the Council to press for this essential medical service to industrial workers. The Annual Representative Meeting had stated that nursing staff employed in industry should follow hospital practice and not use antibiotic or chemotherapeutic drugs without instructions in writing in each case from a registered medical practitioner.

The subcommittee, after considering these two points very carefully, decided, so far as the administration of morphine was concerned, that it should be recommended to Council that the resolution of the Annual Representative Meeting should be sent to the Home Office to show what the profession thought. On the use of antibiotics, it was said at the Annual Representative Meeting that it was the practice for nurses to accumulate stocks of these and use them rather liberally. The subcommittee felt that the matter could be dealt with by the exercise of care by doctors who had been in the habit of authorizing supplies of drugs for nurses working without the supervision of a medical officer.

Other Business

A letter was received from the chief inspector of factories about the cautionary notice on dermatitis, in which the Committee had recommended the inclusion of advice that the worker should report to a doctor. The chief inspector thought this might result in less reporting rather than more, especially in the smaller factories. It was agreed to suggest that the alternative words "seek medical advice" might be used instead.

The Committee received a manual on first aid in coal-mines published by the St. John Ambulance Association. A new manual, *Occupational First Aid*, was soon to be published.

It was decided, on the recommendation of the Subcommittee on the Schedule of Prescribed Diseases, that the Council should be recommended to submit no evidence on a revision of the terms of prescriptions of diseases Nos. 7, 8, 9, and 28, 29, and 30.

N.H.S. SUPERANNUATION SCHEME

CONCESSION TO INSURANCE POLICY HOLDERS

The Ministry of Health states that it has agreed that general practitioners and part-time specialists who elected to receive a contribution of 8% of their superannuable remuneration towards payment of premiums on their insurance policies, under the arrangements explained in Leaflets S.D.D. and S.D.D.A. issued by the Ministry of Health in 1948 and 1949 respectively, instead of participating in the Health Service Superannuation Scheme may now be allowed to substitute for the original policies recognized for purposes of the option annuity policies which would qualify for the new income-tax relief afforded under Section 22 of the Finance Act, 1956 (see *Supplement*, January 19, p. 30). Recognition of the substituted policies and payment of the Minister's contribution in respect of them will be subject to the following conditions additional to those under which the option was allowed:

(1) Where the original policy is made into a paid-up policy, that policy shall not be assigned or otherwise surrendered before maturity date. A breach of this condition would lead to the discontinuance of the 8% contribution.

(2) Where the original policy is surrendered all the money derived therefrom shall be used in the purchase of the substituted policy.

Applications for approval to substitute policies in accordance with these arrangements should be sent to the Health Services Superannuation Division, Government Buildings, Honeypot Lane, Stanmore, Middlesex, and full details of the proposed transaction should be given. Substitution of new policies cannot be agreed where it is proposed to continue to maintain the policy or policies originally recognized for purposes of the option.

Scottish News

TOUR OF DENMARK FOR SCOTTISH DOCTORS

Following the successful visits to Denmark in 1953 and 1954 of a number of Scottish doctors, the Scottish Committee has accepted another invitation from the Danish Institute to form a party to visit Denmark from August 24 to September 6, 1957. The tour will include visits to hospitals, universities, medical departments, medical institutes, and other places of interest to doctors, as well as sightseeing excursions. Where possible, alternative programmes will be provided to meet the visitors' particular interests. The cost will be approximately £44, including travel Newcastle-Copenhagen-Newcastle and hotel accommodation throughout the tour.

Doctors in Scotland who are interested in joining the party should communicate with the Scottish Secretary, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR,—As a consultant since 1947 I become more and more depressed as each year the purchasing power of my income becomes less and less. Each year it is a case of "buy less" and "do less," reasonable pleasures must be strictly rationed, and major essential replacements only carried out by courtesy of hire purchase. All this because we have never received a salary envisaged by the Spens Committee.

The Danckwerts Award brought a ray of hope for those in the hospital service, but this was rapidly extinguished by Mr. Butler, since when "the time has never been ripe" for justice to be applied. In 1952 even some members of our own Joint Committee did not think "the time was ripe for negotiation." Nevertheless, they were stimulated into half-hearted activity, and achieved as a result an adjustment of salary which was more than neutralized in the case of part-timers by what may prove to be an irregular change in tax assessment from Schedule D to E. As a result, in many cases the net income after income-tax deduction only is less to-day than it was in 1948—but what of the purchasing power of what is left? It would appear that "the time will be ripe" for consideration of our eight years' underpayment when the economic situation is stabilized and the cost of living reduced, but can anyone other than a moron believe that, at a time of falling prices, any claim for increased remuneration, even when it is morally a debt of years' duration, would have any hope of success? The £24m. quoted as the amount of this claim gives a misleading picture of the cost to the country, because anything from £12m. to £16m. would be repaid in taxation. But the residue would be distributed in large to those who are in need—i.e., junior hospital staff and specialists who are unable to augment their incomes by private practice, etc.

The attitude of the Government as regards implementation of betterment will reflect very seriously on the amounts of pensions payable at the end of the 10-year period, and it could be argued that this is a deliberate policy to keep down the pension payments on which tax reclaim would be less. Should the Negotiating Committee need convincing proof that "the time for action is ripe now or never," include in a circularized questionnaire the item "Is your bank statement ever in red?" However, judging from recent letters in the *Supplement*, hardship has been stressed, and it is up to the profession as a whole to stand solidly behind the Negotiating Committee both individually and in Divisions. In this way we can "give them the arms with which they should be able to do the job."—I am, etc.,

Southampton.

BERNARD SUGDEN.

SIR,—Must it be assumed that the "1939 values" envisaged in the Spens Report can be assessed only in terms of the official cost-of-living index? Could they not be reckoned rather in relation to the national income, as given by the total of all incomes assessable to Inland Revenue? Surely the main objection to any claim based on the price of consumer goods is that it is inflationary, for if the price index rises such claims tend to be increased, whether or not the real resources of the nation increase at the same rate. But the national income figure should indicate a sum actually accounted for by the citizens—partly as income tax, partly as savings, and the remainder as personal expenditure. Would it not be more reasonable to claim that a fair proportion of this sum should be devoted to medical services, rather than seem to be claiming like any trade union that, whoever goes short, it should not be our members?—I am, etc.,

Carlisle, Lanark.

M. B. LEITCH.

SIR,—Dr. Geoffrey Bourne, in a letter to the *Daily Telegraph and Morning Post* of January 17, suggests "that the State should at the present juncture ask the profession to help reorganize the Health Service, stating honestly how much it can afford to expend." Further on in his letter he states: "The present State Service costs more than the nation can afford." That, in my view, is the kernel of the problem, and, while wishing Mr. Vosper all good luck in his appointment as Minister of Health, we should remember that he will have to cut down rather than expand.

Our politicians are beginning to realize that Government spending will have to be reduced by about £600 million per annum, for our national debt is approaching £30,000 million with an annual interest rate of £900 million. What sort of legacy is this to leave our children? No wonder the emigration offices are busy. We could get out of our difficulties if we had 15% increased production in coal and other essentials. This means we would all have to work harder, but doctors cannot work harder than they do at present. Therefore we must reduce the pressure on the N.H.S. and increase the volume of doctors coming forward by making general practice more attractive.

We can only do this by bringing back a certain measure of private practice. Why not modify the N.H.S. to exclude all persons and their families with incomes of £1,000 a year and over? National Insurance cards might present some difficulty, but any of the big five industrial insurance companies could be left to unscramble the scheme. I have often heard it said that they could offer better pension cover for less money than the Government's present scheme, which has no roof to it. I was in business before taking up medicine, and I noticed that the people who got rises were not those who deserved them but those who asked for them at the right time, and, in my opinion, this is definitely not the time to press a claim for higher remuneration.—I am, etc.,

Glasgow, C.3.

A. C. GORDON ROSS.

SIR,—When the national press concerns itself with what we know intimately, we realize how inaccurate, biased, or downright misleading it can be, with its catch-phrases, its items taken out of context, and its generalization. It fol-

lows, therefore, that we can never get the facts presented for us this way. We should use the disgusting method, as follows.

On the mantelpiece of our waiting-rooms we must put up printed placards (issued to us by our own organization) and point these out to patients. The placard should bear (1) a short account of the circumstances and the date concerned in our claim; (2) the gross and net capitation fees per patient per year and an indication that we pay surgery and telephone attendant, cleaning and travel expenses, etc.—these expenses are not paid for us as many think; (3) the size of a well-established practice in the doctor's district—for example, in Stepney this is 1,500; (4) private practice is now almost non-existent. The placards can be numbered and changed as the situation demands to give further facts. This will give our patients—that is, our public—the knowledge that our case did not come up in 1956, at a time of crisis, but has been under consideration for four to five years at least. It will also tell them exactly how little we get for so much service. In 1957 we must use 1957 methods.—I am, etc.,

London, E.1.

DOUGLAS WAYNE.

SIR,—What a pleasure it is to see the letter from Dr. D. G. A. Westbury on the remuneration claim (*Supplement*, January 12, p. 21). Why cannot we all think more of "giving" rather than "getting," of service rendered rather than of status? Let us reform this Health Service by all means, so that we can give better value to our patients, but not this scramble for money only.—I am, etc.,

Chasetown, Staffs.

GEORGE H. PEARSON.

Medical Broadcasts

SIR,—While listening to a broadcast on alcoholism on the B.B.C. Home Service on January 17 I was astounded to hear the speaker recommending his listeners to change their doctors, and to continue to do so, until they found one who was prepared to carry out the form of treatment which he had just described. Even coming from a person whose views may be regarded as authoritative in his specialty, such a suggestion to the general public is surely scandalous. It is just another smear across the once-respected name of the G.P. If we must have these medical broadcasts, is it not possible that some ethical control of the script could be exercised to prevent the expression of self-glorifying, if not fanatical, views by the few at the expense of the many?—I am, etc.,

Burnley.

W. STODDART.

Organizing Medicine

SIR,—It is indeed a grievous thing to note the trials and tribulations being faced by the British medical profession in these days, and for that matter the very serious problems being faced by the British people as a whole. Their indomitable courage and wonderful determination is ever to be admired. That politics or political influences, however, should enter into the relationship between patient and physician in any manner whatsoever is such a frightening thing to the American medical profession that every endeavour is being made here to avoid any repetition of the errors made in Great Britain. That there is much that is good, especially from the patient's point of view, in the British National Health Service cannot be denied, but in the overall scheme of things the broader considerations must also be borne in mind. A dissatisfied and disgruntled medical profession can only mean, in the final analysis, that half-hearted efforts are made in providing the best service, and that a resulting deterioration of service is most likely to occur.

Adequate medical care for all of the people, as a prime necessity of life and obtained within the means of the people, is an ideal being striven for in most, if not all, countries of the West. It is surely therefore a wise step to consider all of the possibilities for approaching a solution to the problem. The means, particularly of meeting the economic burden of the catastrophic illnesses, present a

special and tantalizingly difficult problem. Most planners of attack find themselves in a quandary, for to protect the central fund and avoid disturbing abuses entails a maximal co-operation not only of the patients but also of the medical profession. Those who would control the purse-strings have found it easier to achieve this through the direct control of the medical profession in some organized plan which enslaves the profession as the servant of government, rather than to work out the more difficult solution which would leave the profession free and untrammelled.

As one of those to whom you refer in your leading article (*Journal*, December 15, 1956, p. 1417) who left Great Britain for parts unknown because of a basic inability to accept the new order in Great Britain, I may say I personally have not regretted that step. To be the prisoner of a system which was anathema to me, and of which I had a great personal fear, and to lose a much-loved freedom of action, rendered emigration as the only solution for me. In my new country, however, I am not one of those who will fight willy-nilly against soundly developed plans for providing adequate medical care to the public, but I will fight to the death on one issue—any attempt to enslave the American medical profession as the British plan has enslaved the British medical profession. The Americans are working hard seeking for solutions to their own medical care problems. I believe that in the native ability of the American people and the American way such a solution will be found, and in the not too distant future—a solution which will make no attempt at enslaving the American medical profession.

In closing, I wish to draw attention to one word in your otherwise excellent leading article which has bothered others as it bothers me. The word is a carry-over from those days of yesteryear when Great Britain owned and governed vast colonies and tracts of the world. The new Britain should drop this word, because I know it annoys a majority of Canadians as it probably also annoys Australians and New Zealanders. That word is "Dominion." Surely there is some other word that can be used. Commonwealth is better, but may not be sufficiently explanatory. Englishmen should learn that although England (as distinct from Great Britain) is a great, honoured, and honourable land, and has given very much to the world, not the least being democratic forms of government, Scots, for example, are not Englishmen, nor for that matter are the Welsh. As a Scotsman born, I am reminding you of this, for by getting some inkling of how others feel about being called what they are not it will be so much the easier to understand why such words as the word "Dominion" can annoy.—I am, etc.,

Worcester, Mass., U.S.A.

KENNETH I. E. MACLEOD.

Unity of Purpose

SIR,—The policy of the B.M.A. is to oppose the introduction of a whole-time salaried service, but that is, of course, no reason to refuse publication of letters from those, such as Dr. Eleanor Ettlinger (*Supplement*, January 19, p. 33), who welcome the idea, but it would be well if you controlled the statements of supporters as well as of antagonists. Dr. Ettlinger mentions this island "with its low standard of living" and a Government that spends a large part "of the national income on rearming, prestige wars, etc." One of the aims of the great majority of doctors is to keep the medical services out of politics; and Dr. Ettlinger, who clearly takes the opposite view, will only strengthen the feeling of the majority that politics is a dirty game: neither of her two statements is true, but any stick will serve.

Dr. Ettlinger's suggestions as to the appropriate scale of salaries is ludicrous unless she also feels that the "medical vocation" should involve taking an oath of poverty, chastity, and obedience (to the medical civil service). What is degrading about working for "personal material betterment," and do whole-timers find no such impulse in their minds, even if they do not spend their time "dilettanting" (at least we are indebted to Dr. Ettlinger for something

constructive—a neologism)? Would Dr. Ettlinger's parents have been able to subsidize her again if somebody had not indulged in the degrading wrangle for personal material betterment? And, having been qualified only eight years, Dr. Ettlinger need not talk about "enforced idleness": even the very young have still something to learn.—I am, etc.,

London, W.1.

A. PINEY.

Practice Expenses

SIR,—I should like to bring to your notice a few points about this so-called "Christmas box" which has figured in our recent statements of remuneration. This, I understand, is arrived at as a result of calculations based on the amount by which the expenses element in the capitation fee falls short of the amount shown by subsequent statistical analysis of the actual expenses. How this is done we are not told. All we are told is the sum received by the executive council and available for distribution. This sum is then distributed as a percentage of the capitation fee for treatment. As this money is directly related to expenses, it seems to me inequitable that no account is taken of the mileage payments and dispensing capitation fees, where the expenses element is so much higher (for superannuation purposes 50% in each case, against 30% for the basic capitation fee). Surely this is grossly unfair to the country practitioner, whose expenses are already proportionately above average.

I calculate roughly, ignoring the six places of decimals which vary from area to area, that the individual country doctor would have received from £80 to £100 more if this had been done, which is about equivalent to the amount by which the supplementary payment to a country practitioner with an average rural list falls short of the amount received by a town doctor with an average urban list, whose expenses are proportionately lower.—I am, etc.,

Crawley, Sussex.

C. R. PALMER.

Reform of Health Service

SIR,—Colleagues in general practice owe thanks to Dr. C. Glaisher's suggestion (*Supplement*, January 5, p. 13) that initiative must come from the periphery. I sincerely respect his own initiative, but sadly disagree with most of the points he describes. With your permission (and, I hope, his forgiveness) may I detail my objections?

The doctor-patient relationship: Twice in his letter Dr. Glaisher assumes (without explanation) that his relationship has been destroyed through the machinery of the N.H.S. Yet the doctor-patient relationship can be a product only of the consulting-room or bedside manner, of the approach by the doctor to his patient's clinical or social problem. If it is sincere, then it can never be altered by the method which brought doctor and patient together.

Patients should "register temporarily" whenever they seek advice: Dr. Glaisher suggests that then the doctor would send "a duly completed record card" to the executive council, and do it "promptly" each time, to get his remuneration. In the first place, it is already quite easy for a patient to change his doctor, either within a fortnight of his decision, or at once if he gets the previous doctor's consent (which is most unlikely to be withheld). In the second place, consider the practitioner who retains his patient over several years. Unless he made his notes in duplicate he would be constantly parting with his data which make up the picture of the patient's past medical and social history. This long retrospective view of a patient is too valuable a characteristic of general practice to be lost. In the third place, what does "duly completed" mean? Is this when both sides of a card have been covered according to the size of the doctor's handwriting? Is it when an illness has been finally cured—easy enough to judge for measles or influenza, but problematic in anaemia or carcinoma, and impossible to assess for chronic bronchitis or diabetes?

The doctor's wife feels herself the unpaid servant of an impersonal State service: Does she? She works, and

devotedly, for her husband, his practice, and his patients. Whether or no this is paid depends on arrangement between the doctor and his wife.

Remuneration by act of service: The idea is worth considering, but not, as suggested, by presenting patients with accounts on E.C. forms bearing an approved scale of charges (like a laundry book). Dr. Glaisher describes this as "an even more effective way of restoring the doctor-patient relationship." Would it not be both infallible and ignominious as a move to lower medical prestige?

Patients are suspicious of free advice: Nearly all patients know that they are paying for what they receive. The real difficulty is to get them to realize how small is the proportion of the insurance stamp costs which goes to the medical services. But well above this is the fact that they value the advice they get according to their judgment of a doctor's skill and interest in their cases.—I am, etc.,

Cambridge.

A. S. PLAYFAIR.

SIR,—The most serious defect in the general practice situation is that good practice has a poorer reward than bad practice. The group practice form, which gives the fullest opportunity to the development of fully responsible general practice, is expensive to run. Its ancillary help must be adequately paid. Its premises and equipment are costly; its overheads—telephone, postage, car expenses, mortgage interest, repairs and renewals, etc.—are all heavy. Its capitation units are restricted in number because the individual is fully dealt with. By contrast, the practitioner who makes do with the minimum of help and equipment, and spends but little time on the individual, is considerably better off. He refers all but the simplest problems to the neighbouring hospital, and can give his limited individual attention to more capitation units.

Payment for services rendered is a solution open to abuse. A tax-free grant, on the other hand, for all reasonable practice expenses which have been incurred, together with a reduction of lists to 2,500, would raise the standard of practice all over the country. If the Ministry of Health espoused some such scheme as this it would have no difficulty in regaining the confidence of the general practice side of the profession.—I am, etc.,

Teignmouth.

GEORGE A. F. QUINNELL.

SIR,—It is time that the myth of a "free health service" was exploded for good. If the country cannot afford to pay the doctors then it cannot afford to finance the nation's health as at present organized. Through modern medicine the incidence of killing diseases has been considerably reduced, though not in the public mind, which is fed on high-pressure publicity of dramatic diseases and spectacular surgery. Also, extreme poverty is a rarity, and in many homes to which I go I see patent medicines advertised on T.V. and costing 10s. and more. It should be considered a luxury for a patient to consult a doctor about minor upper respiratory tract infections and fibrositis, and it is fantastic to burden the taxpayer with the cost of removing a harmless sebaceous cyst. It was said that a free service would result in earlier diagnosis, but this is not true in practice. People still come in late stages and when questioned say: "I know you're so busy, I didn't want to bother you, Doctor."

To my mind a plan for a better health service requires an exposing of such anomalies in the light of the local and contemporary situation rather than a journey to Australia. Many doctors believe that general practice is at its best where patients have complete free choice of doctor, so I would abolish the panel system and have patients pay doctors for consultations and be repaid through friendly societies according to the illness, or credit could be given to reduce next year's premium. For this purpose—note, no dictation by a Minister—illnesses could be graded by a nationalized, non-political medical corporation as follows: Grade 1: for illnesses endangering life, full cover and maximum benefits. Grade 2: for illnesses merely preventing employment, reduced cover. Grade 3: for illnesses causing no loss of working capacity, least or no cover. Individual societies might vary the degree of cover for the

last two according to the premium. There should be big concessions for children up to school-leaving age and pensioners. G.P.s would welcome the opportunity to do minor surgery once again. The onus of obtaining free service would be on the patient to obtain a receipt from doctor and chemist where appropriate on a form provided by the society. All premiums should be tax-free, and the Exchequer would provide only a fraction of the present sum as a grant to hospitals, who should have local autonomy, the central corporation acting in an advisory capacity only, and receive funds from taxes, societies, and by provision of amenities.

One thing is certain. Doctors everywhere want release from ministerial control, and will only achieve it by taking the initiative and resigning in a body in favour of a service of their own choice.—I am, etc.,

Harrow, Middx.

D. J. B. MAKINS.

SIR,—I have every sympathy with most of the views expressed in the letter from Dr. John Innes (*Supplement*, January 12, p. 22). I agree equally that in backward areas, where this does not yet apply, the general practitioner should have direct access to specialists in ancillary subjects as well as to those practising the older skills. However, unless he is prepared to undertake departmental as well as individual responsibilities, and also years of specialized training with appropriate examinations, you will perhaps pardon me if I suggest that x-rays and E.C.G.s are the tools of the radiologist and cardiologist respectively rather than the general practitioner. I am sure that radiologists and cardiologists ask nothing better than to help all their colleagues, including those in general practice, but loose thinking of that kind cannot be condemned too hard or too often.—I am, etc.,

Southport.

J. G. BENSTEAD.

Prescription Charges for Diabetics

SIR,—The Medical Subcommittee of the British Diabetic Association has now clarified with the Ministry of Health some financial alleviations for diabetic patients on the new prescription regulations. To be brief, a Ministry letter of November 27, 1956, states that supplies of needles, spirit, testing tablets, and—most important—insulin can be prescribed for three months or more, depending on the doctor's view in the individual case. One shilling only per item would be payable *irrespective* of the quantity ordered. This helpful fact has been publicized to patients in the January issue of the *Diabetic Journal*, but not, so far as we know, to the medical profession at large. This has led to confusion between doctors and patients, and I therefore hope you will, by publishing this letter, inform doctors through your widely read journal.—I am, etc.,

London, W.1.

R. D. LAWRENCE,
Chairman, Medical Subcommittee,
British Diabetic Association.

Arbitration

SIR,—The letter from Dr. J. A. Gorsky (*Supplement*, January 26, p. 41) is most timely. It clearly sets out a problem which confronts everyone working in the N.H.S.—doctor, nurse, physiotherapist, pharmacist, and administrator alike. In fact the problem confronts every group of men and women, inside and outside the N.H.S., who are not members of a recognized trade union. During negotiations prior to the N.H.S., in October, 1947, the Government stated that it was "anxious to accord the fullest rights to arbitration, subject to the preservation of the Government's prerogative." In spite of this promise, as Dr. Gorsky has pointed out, the Industrial Disputes Order (1951) withdrew from any organization which was not a recognized trade union the unilateral right to submit a dispute on remuneration or on terms of service to the Minister of Labour, and through the Minister to an independent court of arbitration. The Annual Report of the Council of the Association (1955) stated that the Minister had "given little hope of an early amendment of the Order": at the same time the Management Side of the General Whitley

Council refused to agree to the right of unilateral reference to arbitration.

In December, 1951, the Special Representative Meeting of the B.M.A. met to consider reform of the N.H.S.¹ The first and the most important resolution passed stated "That an Amending Act should provide for the establishment of a N.H.S. Court of Arbitration to which could be referred by the Ministers or representatives of the Management or Staff Side of Whitley Council disputes on the terms of service, including remuneration, without the consent of either party, whether existing terms or new terms affecting any section or individual member of the profession. But that the proposed arbitration on remuneration should be carried to a conclusion without waiting for the passing of any Amending Act." The second resolution passed stated "That the Court should have power to settle such disputes." These resolutions automatically became the policy of the Association and binding on the Council of the B.M.A. to see that they were implemented. In spite of these instructions and without taking heed of the danger of Industrial Disputes Order (1951) the Council of the B.M.A. in April, 1955, was so satisfied with the results of the Danckwerts adjudication that it advised the Representative Body later that year that "the profession would be well advised to rely for the present on *ad hoc* arbitration arrangements when disputes occur."²

Sir, many of us who have been concerned with this problem since 1948 believe that the Council of the Association should now carry out the instructions of the Representative Body and see that an independent court of arbitration is established forthwith on the lines of the instruction given in December, 1951. If such a court had been established the present impasse with the Minister could not have arisen. Some members of the Council of the Association have argued that such a court is potentially dangerous because the arbitrator might be someone who was not cognizant of the medical problems involved. But surely the person appointed would have to be agreed on beforehand—as was Mr. Justice Danckwerts.—I am, etc.,

London, N.W.1.

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At Belle Vue Hotel, Aberystwyth, Saturday, February 9, 7.30 p.m., dinner. Talk by Professor A. S. Duncan: "Obstetrics." Wives of members and guests are invited.

BLACKPOOL AND FYLDE DIVISION.—At Small Ballroom, Norbreck Hydro, Friday, February 8, 8 for 8.30 p.m., dinner and dance.

BROMLEY DIVISION.—At Orpington Hospital, Wednesday, February 6, 8.15 for 8.30 p.m., meeting. Dr. Frank Hartley, Ph.D., F.R.I.C., F.P.S.: "Sex Hormones and Therapy."

CUMBERLAND DIVISION.—At County Hotel, Carlisle, Thursday, February 7, 8 for 8.15 p.m., meeting. B.M.A. Lecture by Sir Walter Mercer: "Surgery in the Soviet Union." Film taken in Moscow will be shown. Members of Dumfries and Galloway Division are invited.

EAST SOMERSET DIVISION.—At Weston-super-Mare General Hospital, Tuesday, February 5, 8.30 p.m., general meeting. Lecture by Mr. W. R. Black: "Some Aspects of Crohn's Disease."

GLASGOW DIVISION.—At Hall of Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, Glasgow, Thursday, February 7, 8.30 p.m., meeting. Address by Dr. K. Cowan: "Tuberculosis Problem in Scotland."

GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Thursday, February 7, 8.15 p.m., joint meeting with Guildford and District Branch of B.D.A. Address by Dr. A. H. Galley: "Ambulant Anaesthetics." The meeting will be preceded by dinner at the Angel Hotel at 7 p.m.

HALIFAX DIVISION.—At Alexandra Hall, Halifax, Wednesday, February 6, 8 for 8.30 p.m., annual dinner-dance.

HARROW DIVISION.—At Tythe Farm House, Eastcote Lane, South Harrow, Tuesday, February 5, 8.30 p.m., clinical meeting. Dr. F. Avery Jones, Mr. J. D. Fergusson, and Dr. J. B. Randall: Symposium on Peptic Ulcer.

LEWISHAM DIVISION.—At Lewisham General Hospital, Tuesday, February 5, 8.30 p.m., meeting. Mr. W. G. Cross: "Teeth."

MAIDSTONE DIVISION.—At Royal Star Hotel, Maidstone, Thursday, February 7, 8.30 p.m., meeting. Lecture by Dr. Robert Forbes: "Medico-Legal Aspects of General Practice."

NORTHERN IRELAND BRANCH.—At Upper Lecture Theatre, Institute of Clinical Science, Grosvenor Road, Belfast, Thursday, February 7, 8.30 p.m., meeting. B.M.A. Lecture by Dr. J. H. Cyriax: "Anatomical Factors in Diagnosis." Members and senior medical students are invited.

NORTH STAFFS DIVISION.—At North Stafford Hotel, Stoke-on-Trent, Thursday, February 7, 7 for 7.30 p.m., annual dinner-dance.

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherton, Tuesday, February 5, 7.45 for 8 p.m., informal supper followed by meeting. Members and their wives are invited.

PORTSMOUTH DIVISION.—At Queen Alexandra Hospital, Cosham, Tuesday, February 5, 7.45 for 8.15 p.m., dinner; 9 p.m., lecture by Sir Heneage Ogilvie.

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, February 5, 8.30 p.m., meeting. Dr. Christopher Hardwick: "Recent Advances in the Treatment of Diabetes."

SCUNTHORPE DIVISION.—At Board Room, Scunthorpe and District War Memorial Hospital, Thursday, February 7, 8.30 p.m., meeting. Mr. J. Gordon Napier: "Toxaemia of Pregnancy."

STRATFORD DIVISION.—At East Ham Memorial Hospital, Shrewsbury Road, E., Tuesday, February 5, 8.45 p.m., meeting. Film: "Acute Abdominal Problems," followed by talk by Mr. Roy Parkinson.

TEES-SIDE BRANCH.—At Stockton and Thornaby Hospital, Tuesday, February 5, 7 p.m., clinical meeting.

Meetings of Branches and Divisions

DUMFRIES AND GALLOWAY DIVISION

A meeting was held in the Cresswell Maternity Hospital on November 4, 1956. Dr. R. N. Rutherford was in the chair, and 26 members and four guests attended. Mr. D. W. Cole gave an account of how atomic energy is produced. Dr. R. N. Rutherford again took the chair at a meeting in the Dumfries and Galloway Royal Infirmary on December 6, when 12 members attended.

NORTH WALES BRANCH

The autumn meeting was held at the Town Hall, Llandudno, on November 3, 1956. Dr. A. Maddock Jones took the chair and 46 members attended. Professor Charles Rob gave a lecture, illustrated by lantern slides, on progress in arterial surgery as it affects general medicine. Drs. Emyr Jones, P. M. Anderson, Wyn Jones, and A. H. Holmes took part in the ensuing discussion.

SOUTHAMPTON DIVISION

At a meeting on November 13, 1956, the executive committee of the Southampton Division resolved: "While fully supporting the Negotiating Committee, and appreciating the work it has done on behalf of the profession, it was felt that the protracted negotiations were causing increased restlessness and dissatisfaction within the profession, and that the time has now come when the placing of a time limit on the negotiations should be considered."

British Medical Association

PROCEEDINGS OF COUNCIL

The Council of the British Medical Association met at B.M.A. House on January 31, with Dr. S. WAND in the Chair.

The CHAIRMAN was authorized to convey the congratulations of the Council to the 34 members of the Association upon whom Honours were conferred by H.M. The Queen in the New Year Honours List.

The Council stood in silence in memory of Dr. Hardy Vesey Wells, member of Council, 1937-8.

The new Minister of Health, Mr. D. F. Vosper, M.P., was entertained to a fork luncheon during the day.

President of the Association, 1958

In accordance with the nomination of the Midland Branch Council, Dr. A. BEAUCHAMP (Birmingham) moved that Professor A. P. Thomson, Dean of the Faculty of Medicine, University of Birmingham, be nominated to the Representative Body for the office of President of the Association, 1958-9. Mr. D. S. PRACY (Atherstone) seconded, and the motion was carried with applause.

Second World Conference on Medical Education

A communication was received from the World Medical Association stating that plans were now under way for the holding of the second world conference on medical education in Chicago from August 30 to September 4, 1959. The theme for the conference was "Medicine—a Lifelong Study." Suggestions were invited on specific topics to be discussed. A small committee was set up to consider the matter.

Remuneration Claim

Dr. A. TALBOT ROGERS, Chairman of the G.M.S. Committee, who was received with applause on his return to the Council after his illness, said that, as he saw the position, and as his Committee saw it, the delegation which met the Minister on January 4, although it did not come away with any offer from the Minister beyond the fact that he would see them again, did a great deal of good. It appeared that the Minister felt that what the Government had said should be sufficient for the profession to accept that it was impossible to do anything at all about the claim. But by the time the interview was over it seemed as if he was looking for some way whereby the Government could meet the

profession in some respect. Of his own accord he suggested another meeting during January. There had been a change of Ministers since, and it was not unreasonable that the new Minister should ask for a little longer time. A date had been fixed for February 20. The Negotiating Committee had discussed the matter and members of the delegation had been chosen: Sir Russell Brain and himself as Joint Chairmen, Dr. S. Wand, the Chairman of Council, Dr. A. B. Davies, and Dr. J. D. S. Cameron. The delegation would be accompanied by legal and economic advisers. The Negotiating Committee was to meet the same day to receive a report, and Dr. Rogers hoped there would be something more concrete to report at a later date.

The CHAIRMAN added that there was little to say in addition to the report published in the *Supplement* (January 26, p. 38) of the discussions in the General Medical Services Committee. He thought some progress had been made; one had to proceed step by step in these matters.

A large number of resolutions were received from Branches and Divisions supporting the Negotiating Committee.

Report of Constitution Committee

Mr. H. H. LANGSTON (Winchester), Chairman of the Constitution Committee, presented the final report on the Association's constitution which would be before the Representative Body next July. The draft report had been considered by the Council in May, 1956 (*Supplement*, May 19, 1956, p. 300).

Mr. Langston put forward a recommendation of the Committee "that a special committee be appointed under the title of the 'Young Practitioners Committee' to consider all matters affecting medical practitioners not yet fully established in a defined field of practice, including questions referred to other committees or subcommittees, and to make recommendations." He said that it was becoming increasingly obvious that young practitioners felt there was difficulty in bringing their needs before the Association. There were at the moment three bodies within the Association's organization which dealt with young practitioners: the Registrars Group Council, reporting to the Central Consultants and Specialists Committee, the Assistants and Young Practitioners Subcommittee, reporting to the General Medical Services Committee, and the Medical

Students and Newly Qualified Practitioners Subcommittee, reporting to the Organization Committee. There was no co-ordinating body to which problems of the young practitioner could be brought for central discussion and reference to the Council.

Mr. Langston then quoted figures relating to the numbers of young men joining the Association: in 1945 74% of newly qualified men joined in their first or second year; in 1948 87.9% joined in the first or second year, and since then there had been a steady decline; in 1953 the figure was 68.9%, in 1954 it was 67.8%, and last year 66.3%, so that relatively few of the young men qualifying joined within two years of doing so, and there was a drop of 20% in six years.

Having considered these matters, the Constitution Committee therefore put forward the recommendation for a central committee for young practitioners.

Dr. J. A. L. VAUGHAN JONES (Leeds) said that he found the practical application of this suggestion difficult. How were young practitioners defined? His Division started a young practitioners' group. They were very enthusiastic at first and two of them were co-opted on to the Division's executive committee, but by the time they got to know anything about the machinery of the Association they were no longer members of the group. He failed to see that anything worthwhile could be achieved during the period these young practitioners served on this committee.

Dr. BEAUCHAMP said he understood there was difficulty in getting representatives to serve on the Assistants and Young Practitioners Subcommittee of the G.M.S. Committee. If the young practitioner was keen he would attend his Divisional meetings and make his presence felt. His experience was that this would not work.

Dr. TALBOT ROGERS agreed with the previous speakers. He had sympathy with the scheme but he did not think it was practical. He thought it would be unwise to make a quick decision. The G.M.S. Committee had discussed the matter with two representatives from the Assistants and Young Practitioners Subcommittee. Their feeling was that they would like to take it to their own subcommittee and discuss its implications. The mechanism of how it would work was not clear; was it intended that the existing subcommittees should report not to the parent committees but to the co-ordinating committee, or direct to the co-ordinating committee and then to the other committees? More thought should be given to this problem, and young practitioners should be given the opportunity to say whether this was what they really wanted before the recommendation was presented to the Representative Body.

Dr. W. E. DORNAN (Sheffield) agreed that a little more thought was needed, but he did not agree that because young doctors were birds of passage a young practitioners committee should not be tried. As Chairman of the Organization Committee's subcommittee, from which this idea sprang, he could say that it was the young members of that Committee who put it forward. Also on that subcommittee were two medical students nominated by the British Medical Students' Association. The B.M.S.A.'s nominees served on the Subcommittee for one or two years as students and continued after qualification. They served for three or four years and became very useful members.

There were two points to consider, Dr. Dornan said. There was the view of the Finance Committee that the proposed committee was unnecessarily large and likely to be costly; and the point that if the proposed committee included representatives of the British Medical Students' Association and also representatives of the deans of medical schools, the Newly Qualified Practitioners Subcommittee of the Organization Committee could be abolished and this would be a financial saving. The recommendation postulated an entirely new committee in addition to the other subcommittees. In that sense he would ask Mr. Langston to have another look at the matter in consultation with the Organization Committee.

Dr. F. GRAY (London) supported the plea for further consideration of the matter. The Assistants and Young

Practitioners Subcommittee of the G.M.S. Committee, of which he was chairman, was very anxious to have a look at this proposal. Everyone agreed that something should be done, but not all agreed that it should be done in this way. He suggested that it should be deferred until the next meeting. He moved accordingly.

The motion was seconded from the meeting.

Dr. J. L. MCCALLUM (London) said that although the proposed committee might not be the best solution the principle behind it should be accepted in principle. It was a most hopeful sign to the young members of the profession. He hoped that Dr. Dornan's suggestion for enlarging its membership would be considered. He understood that in Australia officials of the Branches went to medical schools to talk to fourth-year students, and they obtained a 90% membership.

Mr. A. LAWRENCE ABEL (London) asked if every consideration had been given to more being done in the local Division meetings. A large number of the newly qualified practitioners who were provisionally registered, or doing their third or fourth resident appointment, or who were assistants felt isolated from the main body of the profession, and he thought more consideration could be given to ways in which senior doctors could get together with their juniors. He did not see otherwise how these men could get their representatives properly elected. Mr. Abel supported the suggestion that consideration should be deferred.

Mr. LANGSTON said that the Committee would accept the deferment of approval of details, but he hoped the Council would approve the proposed committee in principle.

The amendment that consideration be deferred so that the recommendation could be referred to the appropriate committees, including the Organization Committee, was carried.

On the question of approving the principle of the formation of a Young Practitioners Committee, Dr. R. G. GIBSON (Winchester), Chairman of the Organization Committee, said that there was a considerable amount of frustration and unhappiness among young doctors. The fundamental thing they wanted was a forum or parliament which had direct access to the Council. Why should not the young practitioners feel that he had this right? "Let the young practitioners have somewhere where they can talk and know that we shall hear them direct." He hoped the Council would approve this committee in principle.

The CHAIRMAN said that he thought the proposal to approve in principle the setting up of this Committee was out of order. Council had decided to defer making a decision on the recommendation. It was now suggested that a decision should be made on all except the details. He must rule the present discussion out of order. Everybody would have the opportunity of putting their point of view in the future.

Mr. LANGSTON moved that the Report of the Constitution Committee as a whole be approved for presentation to the Representative Body. Before making its Report in final form the Committee had taken into consideration Council's views on the draft Report and suggestions from many quarters.

The final Report did not differ in any major recommendation from that presented to the Council last May, but much time had been spent in clarifying the Report, and he hoped Council considered that ambiguities had been cleared away and that the Report was now a suitable document to go forward to Divisions and to the Representative Body.

Dr. VAUGHAN JONES said that this Report was asked for by the Representative Body and should go direct to that Body. It would not normally go to the Representative Body without comment from the Council.

The CHAIRMAN replied that this was a report from the Constitution Committee to the Representative Body, and all the Council was asked to do was to approve its transmission to the Annual Representative Meeting. The Council accepted no responsibility for it but was at liberty to comment on it.

Dr. VAUGHAN JONES then moved that the Report be approved for presentation to the Representative Body. The CHAIRMAN pointed out that the Council should only approve

the fact that it went to the Representative Body, and Dr. VAUGHAN JONES altered his motion to read: That the Report should be sent to the Representative Body without comment.

Dr. E. C. DAWSON (Derby) said that the Report was a long and interesting document and should be circulated when the mind of the profession could be given to it and was not diverted by the remuneration issue. He would suggest that the timing of the presentation of the Report should be dependent upon the state of the negotiations with the Ministry.

Dr. BEAUCHAMP hoped that it would not be assumed that every Division or every doctor had a one-track mind. He hoped they would go on with it. Dr. J. A. PRIDHAM (Weymouth) agreed.

Mr. LANGSTON hoped the Council would not prevent the matter going forward. He thought the Representative Body would expect to see the Report soon. It had already taken nearly three years to complete. Dr. DAWSON still did not agree.

The amendment that the presentation of the Report be deferred until the time was opportune in the opinion of the Chairman of the Council was lost. The motion approving the presentation of the Report to the Annual Meeting was carried.

It was agreed that the Report should be published in the *British Medical Journal* in advance of the Report of the Council and that Divisions be asked to consider it as soon as possible.

Dr. VAUGHAN JONES congratulated Mr. Langston on the work which he and his Committee had accomplished. The CHAIRMAN added his appreciation of Dr. L. S. Potter's work in preparing the Report.

Hungarian Refugee Doctors

The CHAIRMAN reminded the Council that at the last meeting he was empowered to take steps to issue an appeal to the profession for financial help for doctors from Hungary. The situation had been most confused. He asked for Council's views on the matter in the light of all the circumstances. After some discussion it was agreed that the Chairman should publish a letter in the *British Medical Journal* asking for contributions to provide for the immediate necessities of their Hungarian colleagues.

A letter was received from the Austrian Medical Association asking for assistance. All its available funds had been expended in helping Hungarian refugee doctors, and the Council agreed that any surplus remaining from any fund raised from the profession in this country should be sent to Austria.

It was reported that over 50 Hungarian doctors were known to be in this country, many of whom had been interviewed by the medical director of the International Medical Visitors Bureau of the B.M.A. Financial assistance to the amount of £530 had been given where it was needed.

Finance

Mr. L. DOUGAL CALLANDER, Hon. Treasurer, presented the report of the Finance Committee.

Mr. Callander said it must be obvious from the revenue and capital budgets for 1957 that the situation was not what one would like. He thought it advisable to give the Council the financial background of the Association from two years ago to the present. The Council could then discuss how trends could be remedied.

In 1955 the year finished with a balance of £55,000, £30,000 of which was invested in such a way that the capital would be returned intact with some interest. £5,000 was set aside for the Edinburgh meeting, £5,000 for special legal costs, and £15,000 was carried to the Accumulated Fund. During 1956 there was extra printing, paper, and postage costs for the *Journal* which reduced the surplus on the journals to the region of £1,000. Increases in salaries had been given to the staff. Subsistence expenses to members attending Council and centrally arranged meetings cost

£1,100 in 1956, and in a full year would cost £6,000 including the Annual Representative Meeting. There were increased capitation grants for Branches—and then one came to inflation. Inflation affected everything in the running of the Association, and, although the membership reached the highest figure ever in the history of the Association, the surplus in 1956 would be in the region of only £12,000.

The budget for 1957 showed there would be an estimated surplus of only £702 on the year's working. There was no provision for contingencies in this budget, no provision for the Edinburgh meeting, and no provision for a Special Representative Meeting, which might quite easily be necessary with the remuneration claim now proceeding. Provision had, however, been made for the extra day during which the 1957 Annual Representative Meeting would discuss the report of the Constitution Committee. The budgeting was extremely accurate, and there was no hope that the end of the year would see a larger surplus than was budgeted for.

Mr. Callander then dealt with the measures which could be taken to offset this trend. If all the activities were continued, with no provision for contingencies, and even if the membership increased, it would not be possible to show the £12,000 surplus of last year. Had the membership not increased very considerably during the last two and a half years a loss would have been shown in 1956. It would be appreciated that the membership saturation point was coming nearer.

The Finance Committee had made certain recommendations and suggestions. Inflation was still present and the trend of increased costs was continuing. It was imperative that economy with reasonable efficiency must be effected, otherwise a considerable loss would be shown in 1957, and so far as the Treasurer could see the Association would be faced with the same prospect in 1958, as there was no reason to suppose that inflation was going to end. In two years this could result in an overdraft, and no one wished to have a repetition of what occurred some five or six years ago.

He hoped the Council would agree to a communication being sent to chairmen of committees and subcommittees by the Treasurer, asking that the number of meetings should be kept to a minimum consistent with efficiency. It was suggested that an internal investigation should be conducted by the heads of departments and the Treasurer, in consultation with the various chairmen, so that every possible day-to-day item could be gone into in each department.

The Journal Committee hoped to turn the loss estimated in its budget to a possible surplus of between £8,000 and £9,000. This was not enough for the whole Association, but the Treasurer thought it wrong that whenever the Association was in difficulty the *Journal* should be relied on to put it right. The publications department must, of course, bear its share, but others must also. The Finance Committee suggested that economies in the region of £20,000 must be made. Already the Science Committee had agreed to a saving of £1,000 on postages on books from the library, and the Estates Committee had increased rents, which would produce over £2,000 in a full year. The National Insurance Defence Trustees had agreed to bear all but £500 of the cost of the General Medical Services Committee last year. A recommendation that the British Commonwealth Medical Conference should not be held this year would save £2,500.

Alternative

No doubt, continued Mr. Callander, some members of Council were asking what was the alternative. It was as simple as this: to launch a scheme to increase the subscription by £2 2s. £1 1s. would not be enough, because there would possibly be a decrease in membership if the subscription was raised. He was the last person to want to recommend an increase in the subscription, and he

trusted he would have the help and co-operation of all members of the Council, Chairmen of Committees, and the staff in an endeavour to make the economies he had outlined. This was not the time to panic, the Treasurer concluded, but for serious thought.

Dr. J. G. M. HAMILTON (Edinburgh) said that the Council must approach the question of an increase in the subscription in a realistic way. The increase in the cost of living not only affected the individual but the Association. The remuneration claim was for 24% increase, and if this was applied to the subscription it should be £7 17s. 6d. Did the Council really believe that with an organization of this size, which purported to give the service which it did, it could continue to do so reasonably and adequately for as small a sum as £6 6s.? The *Journal* cost members nothing, and the whole of that £6 6s. was used on the secretarial side of the House. He was not making any motion, but could not an organization of this magnitude with its enormous diversity of activity reasonably expect that its members could pay a subscription of £10 10s. or £12 12s.? He suggested that members should look at their golf club subscriptions.

The CHAIRMAN said that he understood the subscriptions of other professional bodies were to be raised. Did the Council feel that a warning of the necessity to raise the subscription should be given? Dr. Hamilton had emphasized that if the Association was to do the job which the members expected it would cost money.

Mr. A. STAVELEY GOUGH (Watford) said that the membership had been considerably increased and the cost of living was not the only factor; the Association was doing more and must put its affairs in order.

Dr. WRATHALL ROWE asked if he understood the Hon. Treasurer to say that £30,000, which was surplus to income, would be repaid in October.

Mr. CALLANDER replied that that money was the beginning of a reserve fund of £200,000.

Dr. I. D. GRANT (Chairman of the Representative Body) said that the Representative Meeting had to be shown that the Council was doing everything in its power to run the Association as efficiently and economically as possible.

Two years ago it was agreed that £5,000 should be set aside each year for the Edinburgh meeting. It was his impression that the money would be taken out of Association funds and put into a separate account, but he now gathered that that was not the case. The money had been allocated but was included in the £30,000. If this was so, he thought the £10,000 already allocated should be taken out of the £30,000 and put into a separate account for the Edinburgh meeting.

Mr. CALLANDER replied that the allocation for the Edinburgh meeting had not been put into a special account, it was left in the running accounts of the Association.

Dr. GRANT reiterated his view that this money should be put into a special account. It should be invested and then used for the Edinburgh meeting, not for the ordinary purposes of the Association.

The CHAIRMAN said there were two accounts—capital, which included the saving of previous years, and the current account. The capital account might be lumped up in a big figure or it might be divided up into the items for which it was earmarked. The money for the Edinburgh meeting had not been earmarked, but if it was the wish of Council that could be done in the accounts to be presented at the next meeting.

Dr. GRANT said he would be quite happy if it was done in that way. Dr. TALBOT ROGERS said that the Treasurer had stated that nothing had been earmarked in this budget for Edinburgh. The CHAIRMAN said that was so, and Dr. ROGERS said that, having decided to set aside £5,000 each year for Edinburgh, there was a moral obligation to include that £5,000 in the budget.

The CHAIRMAN said that the £5,000 could be included, and there would then be a deficit.

Dr. TALBOT ROGERS said that it had been said that the profession must be prepared to pay more to the Association, and that the activities of the Association had increased.

There was probably an idea at the back of people's minds that extra expense had been incurred in view of the remuneration claim. The National Insurance Defence Trust Fund had paid everything except £500 towards the costs of the G.M.S. Committee and towards the cost of the Negotiating Committee, so that the general practitioner section paid nearly 15s. extra per year.

Dr. I. M. JONES (Sunderland) said that surely the difficulty in 1957 could be met by an overdraft. It was the duty of Council members to point out to their constituents that the Association could not be run properly on the present subscription. The Council must face the issue now and tell the truth to the Representative Body.

Mr. CALLANDER agreed with Dr. Hamilton that it was essential that the money for Edinburgh should be found. He would do everything he could to see that the £5,000 each year until 1959 was put aside. Replying to Dr. Jones, he said the trend for increased costs was still there, but there was no knowing what might happen between now and December.

Dr. CATHERINE HARROWER (Glasgow) pleaded for a complete balance sheet and budget which would show the contribution which had been made to the expenses of the G.M.S. Committee, which cost £10,000 or £12,000 per annum to run, by the National Insurance Defence Trust. The proposal to include the allocation of £5,000 for the Edinburgh meeting in the 1957 budget was carried.

Mr. LAWRENCE ABEL thought that ways and means could be found of making up the deficit. Dr. J. C. ARTHUR (Gateshead) thought the Council should concentrate at this moment on economies.

Dr. BEAUCHAMP said that the average member would expect the Association to cut its coat according to its cloth, and he thought that they must try to economize; Dr. PRIDHAM thought it would be extremely foolish to try to increase the subscription at the moment, although the subscription was cheap. He was chairman of the Organization Committee when the last increase was made and knew the worry which it caused. He suggested that the question of the payment of subsistence allowances should be looked at again.

The CHAIRMAN said that it was obvious that the general view was that no precipitate action should be taken, but that the whole question must be borne in mind.

Public Health

Dr. JOHN B. TILLEY presented the Report of the Public Health Committee. The Committee's recommendations that advertisements from local health authorities should not be accepted after April 30 next unless the authority had accepted and implemented M.D.C. Circular No. 32, and that the Ministry be pressed for a reply to the request for a Public Health "Spens," were accepted, together with a recommendation that a protest should be sent to the Ministry of Health on its action in dispensing with the requirement to advertise medical officer of health appointments in a county council area.

The most important matter in the report, said Dr. Tilley, related to the question of the integration of the medical officer of health with the hospital service. It had been before Council earlier and had been the subject of some discussion. One body had already expressed its views on the matter to the Minister, but the Society of Medical Officers of Health had delayed sending its views forward in the hope of getting an agreed policy with the Association.

The matter arose out of the Guillebaud Report, which recommended that a medical officer of health or a member of his staff should be given an honorary post in a hospital which would encourage the development of a closer link between the hospital and local health authority service. The Guillebaud Committee went on to suggest that he should of right be a member of the medical advisory committee. But the Public Health Committee was not asking that he should be there of right. It did feel, however, that the views of the Guillebaud Committee, which had given

careful consideration to the facts, had put forward something which might be of great value in improving the co-ordination of the National Health Service. He therefore put forward the recommendation of the Committee that the Council should agree with the principle that medical officers of health or a member of their staff should be appointed honorary consultants of hospital groups and that regional hospital boards should be urged to consider such appointments in the interests of all concerned, and that the principle of medical officers of health serving on medical advisory committees should be agreed to.

Mr. STAVELEY GOUGH said that there might be more than one medical officer of health in the region served by the hospital group; not all of them could be consultants.

Dr. H. D. CHALKE said that there was no question of that. All they wanted was that a medical officer of health should be the consultant in epidemiology to a group of hospitals. If there was more than one, presumably one would be selected to serve. Mr. STAVELEY GOUGH replied that the recommendation did not say that; the Guillebaud Report suggested a representative. Dr. TILLEY said that it was not intended that every medical officer of health in any area should be on the staff of any hospital. That was not feasible.

Dr. DORNAN said that the converse occurred in big cities where there were several hospital groups and only one medical officer of health, and even if he had one or more deputies who might be of sufficient calibre to qualify as a specialist in epidemiology it would not be practicable for them to be on every hospital group committee in the area or attached to the staff.

Dr. GRAY said that an admirable report on a difficult and controversial matter had been put forward. The Council was being asked to agree on the principle, not to say that this should be done in every case everywhere. Surely it could be agreed that it was a good principle that a medical officer of health should be appointed as a consultant if there were suitable people available for the post. Dr. BEAUCHAMP hoped boards of governors could be included in the recommendation.

This was agreed to, and the recommendation was carried. A further recommendation that the Council should agree with the principle of medical officers of health serving on medical advisory committees in the interests of all concerned was carried. It was also agreed, on the motion of Dr. CHALKE, that the Ministry of Health and the Society of Medical Officers of Health be informed of the Council's views.

With regard to the procedure for securing nominations for medical officer of health representatives on regional hospital boards, Dr. GRAY said that the principle was admirable but the proposed method was bad. Surely there should be consultation in the first place and any disagreement should be ironed out. He hoped Dr. Tilley would look at this again.

Dr. TILLEY said that the matter was closely discussed with the Society, and this was the agreement which had been reached. He thought there would only be occasional difficulty and he did not think they could go back and ask for anything else.

The remainder of the report of the Public Health Committee was approved.

Private Practice

Dr. A. BROWN (Cambridge) put forward the report of the Private Practice Committee. It was agreed that a strong protest be sent to the Home Office on the appointment of a whole-time local authority employee as coroner for a county borough. Arising out of the question of compensation for doctors injured or killed while attending accidents, the Council adopted the Committee's recommendation that practitioners be advised of the financial risks entailed by the lack of adequate cover, that they could be covered only by adequate accident insurance, and that it would be advisable for those under contract with an employing authority

to ensure that there was a suitable clause in their contracts covering the payment of compensation in the event of death or disablement attributable to the nature of their duties.

A further recommendation that remuneration of practitioners appointed to undertake special routine medical examination of children at boarding-schools and to advise the school authorities generally on matters of health and hygiene should not be less than £1 15s. per scholar per annum was also carried.

General Medical Services

Dr. TALBOT ROGERS, presenting the report, said that there were no recommendations. He drew attention to the agreement of £44m. as the amount for the central pool for practice expenses for 1954-5. This was three times the amount for the previous year. This gave some impression of the way practice expenses had increased, and reinforced the argument with the Minister that remuneration should be adjusted.

Dr. WRATHALL ROWE said that he had been approached by many of his constituents who were dissatisfied with having to wait so long for their practice expense money. Could not the General Medical Services Committee come to some arrangement with the Ministry so that there was an automatic payment on account?

Dr. TALBOT ROGERS said that that idea had been put forward in the Committee and had been discussed. The difficulty was that the size of the settlement varied every year, and it was hoped to maintain the total pool in such a way that there would always be more than £2m. to distribute. A most important factor was the earnings from private practice, which stood at the moment at £2m.

The remainder of the report was approved.

Occupational Health

Dr. VAUGHAN JONES presented the report. Recommendations relating to the remuneration of whole-time industrial medical officers, to be presented to the Representative Body for adoption, were accepted, together with recommendations relating to fees under the Mule Spinning (Health) Special Regulations, and fees paid to appointed factory doctors. The Committee's suggestion that the resolution of the Representative Body relating to the administration of morphine by nurses in industry be sent to the Home Office was accepted, as well as a recommendation that interested bodies be informed of the Representative Body's view that nursing staff should never use antibiotics or chemotherapy in industry without the express instructions of a registered medical practitioner in writing in each case. Other recommendations which were adopted dealt with the assistance which a local authority could give in the employment of older workers by providing suitable premises and supervision for simple assembly work arising out of a resolution passed by the Conference of Advisory Councils on Occupational Health last year and which it was agreed should be sent to local authorities for possible implementation; with the sending of pharmaceutical advertisements to welfare officers of industrial concerns; and with the terms of prescription relating to several industrial diseases. In the one case suitable communications were to be sent to the pharmaceutical industry and to the Industrial Welfare Society, and in the other the Industrial Injuries Advisory Council would be informed that the Association did not wish to submit additional evidence.

Organization

Dr. R. G. GIBSON presented the report of the Organization Committee, which put forward proposals for the amendment of Standing Orders, the term of office of Chairmen of Council, and the method of filling vacancies on the Council. Dr. Gibson said that the term of office of Chairman of Council had been the subject of considerable discussion. There were two points of view: that it could be left to the common sense of Council or that there should be a definite term of office laid down. Common sense might be swayed by sentiment, loyalty, and good manners, and the

Committee felt that it would be wise to lay down a definite term of office, suggesting a maximum of five years at any one time. There were also recommendations on the period of office of chairmen of committees and subcommittees.

Dr. DAWSON thought the recommendation should specify five years' total or continuous service. The CHAIRMAN said that this was only set up for the guidance of Council, it would be a standing order and could be altered; Dr. TALBOT ROGERS commented that once something got into standing orders it became rather a law of the Medes and Persians.

Dr. F. M. ROSE (Preston) thought they were forging chains for themselves. If a chairman was not reappointed at the end of the initial three years it would be felt that there was some reflection on him which might not at all be the case. It would be better left to the good sense of the Council.

Dr. R. FORBES (Hendon) thought there would be some encouragement to younger men coming into the central work of the Association if some offices were limited in time.

Dr. GRAY said that the chairmanship of Council was not a reward for services rendered; the Council knew when the chairman had been in office long enough. He hoped the Council would adhere to its previous practice.

Dr. G. W. IRELAND (Midlothian) supported the recommendation. It enabled the Council to have the chairman they wanted for as long as they wanted him.

Dr. H. H. D. SUTHERLAND (London) pointed out that in 123 years there had been 23 Chairmen of Council, who had served an average of 5.3 years each. He did not think they could improve on that.

Dr. GIBSON said that legal opinion would have to be sought on whether a term of office could be renewed, and with this proviso the recommendation was carried.

With regard to the proposal to limit the term of office of chairmen of committees, Dr. TALBOT ROGERS said that the position here was a little different, particularly with regard to the autonomous committees, who should be able to elect their own chairman. This proposal took away that right.

Dr. GRAY supported Dr. Talbot Rogers. This was not a matter of extreme urgency, and he thought the Committee might be asked for their observations on this proposal. He would move that consideration of this proposal be referred to the committees concerned for their views. Dr. SUTHERLAND seconded. Dr. GIBSON accepted the proposal.

A recommendation was adopted that, in the event of one of the 13 members of Council elected by the Representative Body being appointed as Chairman of Council, a vacancy among the 13 should be deemed not to have arisen, and By-law 70 should be amended accordingly. A recommendation to fill a casual vacancy by a postal vote was withdrawn, and recommendations for amendment to the Articles of Association and the By-laws in relation to previous decisions of the Council were accepted.

The Committee reported that the membership on December 31, 1956, was 70,152, compared with 68,926 at the end of 1955. The membership included over 80% of the working profession in the United Kingdom. A proposal that a full-time secretary for Northern Ireland should be appointed was considered by the Committee, but it was felt that the existing arrangements in respect of regional medical secretaries was preferable to the appointment of medical secretaries resident in the regions.

The report was adopted.

"British Medical Journal"

Dr. J. G. M. HAMILTON, presenting the report of the Journal Committee, said that an extra meeting was held at the invitation of the Finance Committee in order that the Council might be given a more up-to-date estimate of the budget predictions for 1957. The Committee estimated that the advertising revenue for 1957 might be greater than at first anticipated, and costs slightly lower.

With these considerations in mind the Journal Committee was prepared to suggest that the various publications would together provide a gross surplus in 1957 in the region of

£8,000 to £9,000, but the forecast might be upset by circumstances outside the control of the Journal Committee. The Report was adopted.

Science Committee

Mr. J. R. NICHOLSON LAILEY moved the adoption of the Science Committee report. The Committee recommended, in view of the financial position of the Association, that payment of outward postage on books borrowed from the library should be discontinued as a temporary measure; that the Minister of Transport be requested to receive a deputation on the subject of the introduction of legislation requiring motor-cyclists to wear helmets of an approved pattern; and that foreign corresponding members of the Association be appointed. These recommendations were accepted. The Committee also recommended that the Public Health Committee should deal with the question of clean milk, and that the problem relating to the question of attributable illness should be referred to the Committees of the Association dealing with the various aspects of the profession of medicine. The Council decided to refer the latter problem in the first instance to the Compensation and Superannuation Committee.

The Report was adopted.

Other Committees

Dr. W. M. KNOX presented the report of the Scottish Committee. He said that the new Scottish House would be opened on May 2 next.

Mr. L. DOUGAL CALLANDER, moving the report of the Estates Committee, said that consideration had been given to the question of a B.M.A. House in Belfast. It was suggested that a house should be purchased and adapted, but negotiations had been proceeding with the Methodist organization, who were erecting a new building and who would be very pleased to receive the Association as tenants. The Belfast members thought it would be ideal. The present accommodation in Belfast was somewhat indifferent. The Committee recommended that a lease be accepted for a term not exceeding seven years, and this was accepted by the Council after questions as to the accommodation had been answered by Dr. N. S. DICKSON.

Recommendations by the Office Staff Superannuation Fund Committee for a new Trust Deed for the Fund was accepted. Counsel's advice had been taken, and the new deed had been drawn up in accordance therewith. The Chairman of the Council, the Treasurer, and the Financial Comptroller were appointed to act as Trustees of the fund. Professor D. E. C. MEKIE presented the Overseas Committee report.

A recommendation that a loan should be sympathetically considered for the Jamaica Branch to build a hall for its own use on land already in its possession was withdrawn for further consideration.

Dr. TALBOT ROGERS said he thought the Trustees of the N.I.D.T. Fund would like to consider this matter so that they might help their colleagues in Jamaica, and he asked that the recommendation be deferred to enable them to do so.

Dr. HARROWER, Hon. Treasurer of the Fund, seconded the proposal. The matter could be considered at the next meeting of the Trustees.

This was agreed to, the CHAIRMAN expressing thanks to Dr. Talbot Rogers and Dr. Harrower for the suggestion. The report was accepted.

Dr. R. FORBES, moving the report of the Central Ethical Committee, put forward advice to be tendered to the British Rheumatic Association in regard to the list of specialists in rheumatic diseases kept by that body and issued to doctors of persons who became members of the Association who desired to have a private consultation at a reduced fee. The recommendation for advice to be given to the British Rheumatic Association was accepted.

Mr. A. DICKSON WRIGHT, presenting the report of the Medical Act Committee, which was set up to consider a resolution of the Annual Representative Meeting to consider

the working of the Medical Acts 1858-1950 in view of the proposal to set up a consolidating Act, said that the Committee was interpreting its terms of reference, now that the consolidation measure had received the Royal Assent, as if the motion referred to the Medical Act, 1956. An initial survey had been made of the difficulties attendant upon provisional registration, and the procedure for electing direct representatives to the General Medical Council, and the question of disciplinary procedure was to be considered. The Defence Societies had been invited to prepare a memorandum on the difficulties which had arisen since the operation of the 1950 Medical Act.

The report was accepted.

Dr. H. H. D. SUTHERLAND moved the Amending Acts Committee Report. The Committee felt that the resolution of the Brighton meeting stating that the attention of the Government should be drawn to the need for continuous education of the public in the use of the National Health Service was very useful. It recommended that a letter be sent to the Ministry of Health drawing attention to this matter.

This recommendation was accepted.

Dr. Sutherland added that the question of a code of conduct for patients had been considered several times. The Committee believed that there were a number of people in the country who caused annoyance to the doctor and who wasted his time, which must cause misuse of public money. It was extremely difficult to decide how best to deal with this. Parliament would not stand for serious penalties, but in view of the malicious complaints laid against doctors by members of the public two suggestions had been made. One was that when a person made a complaint he should be expected to lodge a sum of money—the Committee made no recommendation on the amount—which would be returned if he proved his complaint. If he failed, the money would be withheld. Secondly, if a doctor found that there were people who continually wasted his time he should be entitled to make representations to the executive council, who would refer it to the appropriate committee. A letter could be sent to the patient, which would be very useful in dealing with people who made a habit of vexatious annoyance.

Dr. TALBOT ROGERS said that both these suggestions had their dangers. The point had been made, whenever the regulations had been discussed, that it should be made as easy as possible for complaints to be put forward. In London, if the chairman did not feel that there was a prima facie case, no more was heard of it. He did not think that the Ministry or Parliament could be converted to the idea that "conduct money" should be asked for in the way suggested. Secondly, it seemed to him that, if a doctor had the right to communicate with the executive council in this way, that body would have to ask the patient what he had to say, and there would be further inquiry before the medical services committee. He thought the dangers in both suggestions would make it unwise for them to be adopted.

Dr. PRIDHAM said that if the chairman knew that there was a "fine" if a complaint was not substantiated he might feel that it must be considered by the medical services committee.

Dr. GRAY said that it was possible for chairmen to rule that there was no prima facie case on a frivolous complaint. The report used the words "savage penalties." It was unfortunate that words used at the Representative Meeting should be incorporated in the Committee's report. Dr. Dain had had a committee which had gone through all the regulations, and no evidence was ever brought to it that savage penalties were being inflicted. All the bodies concerned had declared that they were satisfied with the present machinery.

Dr. SUTHERLAND said that the Representative Body used these words and his Committee was instructed to look at it. It had done so and brought the matter back for action. No stated recommendation had been made. If the suggestions were to be referred back he hoped Council would give some definite instructions.

Dr. DORNAN moved that this paragraph be not approved, and that the Council should inform the Representative Meet-

ing that there was no evidence before it of savage penalties being imposed.

This was agreed to.

Dr. Sutherland reported that the Committee was studying the Australian Health Service. The Committee would like to know if the Council wished it to proceed with this study, and to study the medical services of other parts of the Commonwealth.

The Council agreed that this study should continue as part of the work of the Amending Acts Committee.

The remainder of the report was approved.

The reports of the Maternity Medical Services, the Edinburgh Meeting, and the Joint Formulary Committee were received and adopted without discussion.

The Council elected 26 new Members and the proceedings concluded at 7 p.m.

BRITISH MEDICAL GUILD

A meeting of the Board of Trustees of the British Medical Guild was held at B.M.A. House on January 30, with Dr. S. WAND presiding.

It was reported that a circular letter was issued on December 24, 1956, to all Honorary Secretaries of Divisions and Branches of the British Medical Association in the United Kingdom inviting them to convene early meetings of the profession for the purpose of arranging the appointment of local committees of the Guild. Since then some 150 Divisional areas had either held meetings or had arranged meetings out of a total of 219, so that the great majority were acting. A reminder is to be sent to those who had not yet notified any action being taken.

Resolutions were reported suggesting various methods of procedure, but it was decided to defer consideration of these until after the next meeting with the Minister, it being left to the officers to decide on any action which might become urgently necessary in the meantime.

TEMPORARY TRANSFER OF TELEPHONE CALLS

The Post Office has stated that at some telephone exchanges it will shortly be able to arrange for doctors to have calls from patients temporarily transferred to another number while at the same time enabling the reception of private calls to continue. A second number will be allocated, which will not normally be shown in the *Telephone Directory* or disclosed to inquirers. Calls made to the second number will by-pass the transfer arrangements when these are in force for the main number.

The charge will be 10s. a quarter. If the second number is to be shown in the directory—say against the name of another member of the doctor's family—a small additional charge will be made. Any doctor who is interested, and who uses the temporary transfer of calls service at the regular user or "contract" rate, should get into touch with the local telephone manager, who will let him know if it is possible to provide the service.

REMUNERATION CLAIM

MEETING IN CORNWALL

Some 80 doctors, members and non-members of the B.M.A., in the Cornwall Division area attended a meeting at Truro on January 27. All branches of the profession were represented. The following resolution was passed unanimously:

That this meeting of the medical profession in Cornwall fully approves the action taken by the Negotiating Committee of the British Medical Association to obtain the increased remuneration owing to the profession under the terms of the Spens agreements. It urges the Committee to redouble its efforts and press the claim by all possible means.

WORLD MEDICAL ASSOCIATION BRITISH SUPPORTING GROUP

A representative gathering of doctors and of the ancillary professions, held at B.M.A. House on January 29, decided the time was suitable for the formation of a British Supporting Group for the World Medical Association.

A Steering Committee—consisting of Dr. Alexander Hall, President of the B.M.A.; Dr. S. Wand, Chairman of Council of the B.M.A.; Dr. Ian Grant, Chairman of the Representative Body of the B.M.A.; Dr. J. A. Pridham, Chairman of the International Relations Committee of the B.M.A.; Dr. J. Beynon; Dr. R. L. Luffingham, of Hull; Dr. J. Hazleton, of Reading; Dr. J. G. McCrie, Dean of the Faculty of Medicine, Sheffield University; Mr. H. Parker Buchanan, of the British Dental Association; and Miss C. M. Hall, of the Royal College of Nursing—was appointed, with powers to co-opt, to do the necessary work precedent to the formation of the group.

World Medical Opinion

Dr. A. HALL, who presided at the meeting, said that 125 years ago the sense of a growing need for doctors to have an organization to act as a clearing-house for ideas and information directly concerning their profession had led to the formation of the British Medical Association following a meeting at Worcester. Now New York and Moscow were much nearer London than had been Worcester, and the need to embrace a wider area had led to the formation 10 years ago of the World Medical Association. To-day that body had become a recognized authority for the expression of world medical opinion. Its activities had become diverse and far-reaching in playing its part as the mouthpiece of doctors. It was felt that many would be interested in furthering the activities of such an association by the formation of a British supporting group.

Dr. S. WAND, who briefly referred to the formation of the W.M.A. at the close of the war, said it had done a great deal of work for the practising doctors of the world through their national organizations. It was an association of national medical associations of the world and in that way represented the doctors of a large number of countries. To-day, when there were bodies like I.L.O. and Unesco and similar organizations representing governments, it was very necessary there should be some association to represent the views of the practising doctor, the more so because there had been many cases in the past where the views of governments had been quite different from those of the doctor. In many ways the W.M.A. was a clearing-house for ideas, and over the past few years its influence had increased considerably.

Attempts to Subjugate Doctors

The W.M.A. had been able to help in those countries in which attempts had been made to subjugate the doctors to the State, said Dr. Wand. In many ways the W.M.A. had an impact on the everyday lives of doctors, but it did even more than that in that it brought together people who had a common interest. It was important that its influence should be widened. The idea of setting up a supporting group was to spread an appreciation of the importance of doctors getting to know each other's problems in the international field. Such groups already existed in Australia, Canada, the U.S.A., Sweden, and Italy. In this country we seemed to have fallen a little way behind.

Dr. J. A. PRIDHAM, who spoke from experience as a member of the W.M.A. Council for seven years and as Chairman of its Education Committee, and who had attended the General Assembly each year, said he thoroughly believed in it. International organizations existed, they functioned, they were powerful, and they could not be ignored. All over the world peoples were interested in and demanding health schemes, and that meant politicians were interested also. It was as important in the international sphere as it was in the national that there should be some body to support the doctors. In another direction the W.M.A. was

now trying to get recognition of an emblem for civilian doctors in the event of war which should have a similar standing to that of the Red Cross with the military.

Small Resources

Dr. Pridham said that at present the W.M.A. worked through a small council of about a dozen members and on a budget of less than £50,000 a year, of which about three-quarters came from one source, the U.S.A. It had a tiny secretariat with one doctor as secretary-general—part-time. Constantly there was work which had to be left untouched because of the smallness of the resources available.

A discussion which followed was opened by Dr. J. G. McCrie, who said that from the point of view of engaging the interest of non-medical educational bodies, which was apparently one of the objects in forming the group, much more might be made in the literature of the W.M.A.'s educational activities. There was also the question of the corporate subscription. There were no doubt bodies to which a subscription of £25 would hardly seem adequate to the needs of the work, but to a university that sum might be rather large.

In answer to questions about the use of the funds which might be collected by the group, it was explained that in other countries such funds had been used for work of particular interest to the country concerned. In Sweden it had been directed to finance social security research, a matter which particularly interested Sweden. In Canada it had gone to financing the visits of medical teachers to undeveloped countries. In America the funds went largely to financing the New York offices of the organization and to subsidize the production of the *World Medical Journal*.

Mr. PARKER BUCHANAN mentioned that for 58 years the dentists had had an international organization which had proved most successful. They held an annual conference in some big capital city. Although the British Dental Association had a membership only one-fifth to one-tenth the size of the B.M.A. it had about 1,000 members subscribing to the international body, and for that subscription they got nothing but the pleasure of attending the international conference and supporting the International Federation.

S.H.M.O.s IN CONSULTANT POSTS

CLAIMS FOR REVIEW INVITED

Following discussions in Committee B of the Medical Whitley Council on a claim by the Staff Side that S.H.M.O.s in posts of a consultant nature should be paid on the consultant scale, the Management Side, though not accepting the general principle, has agreed that the Committee should examine the circumstances of individual posts which the Staff Side may put forward.

Three considerations will govern the Committee's examination of such cases—i.e., duties, responsibilities, and quality of the service given.

S.H.M.O.s in one or more of the following categories who feel they can claim to be considered are invited to apply for a form on which to give details of their posts: (1) Those who hold posts that are established as consultant posts; (2) those who hold posts that for the purpose of replacement would be graded as consultant posts; and (3) others who carry out consultant work with full and independent responsibility.

It is pointed out that many S.H.M.O.s in categories (1) and (2) will be those who held hospital staff appointments before July 5, 1948, but were not given consultant grading in the National Health Service, and have continued in the same appointments.

Requests for forms should be sent to the Secretary of the Association, B.M.A. House, Tavistock Square, London, W.C.1, as soon as possible, and completed forms should be returned to the Secretary not later than March 2.

ANNUAL MEETING, NEWCASTLE

CARAVAN PARK

Arrangements have been made at Newcastle for a special caravan site for members attending the annual meeting with their caravans. The site will be at King's College Athletic Union Ground, Cochrane Park, Newcastle upon Tyne, 6. Apart from a limited amount of hard standing and some on rough grass, there will be facilities for obtaining water and disposing of refuse. Hot and cold washing facilities and showers, with dressing-rooms and drying-rooms, will be available in the pavilion, where there will be a children's play-room and light refreshments can be ordered. The site, which is near Henderson Hall, one of the hostels of the University of Durham, is close to shops and a frequent bus service into the centre of the town.

Applications for space should be made in advance to Dr. W. Hunter, c/o B.M.A., North of England Branch Office, 7, Windsor Terrace, Newcastle upon Tyne, 2, stating name and address, registration number of car, and date of arrival and departure. The charge is 6s. a night, which must be paid at the time of application. Alternative accommodation is available for Caravan Club Members at Whitley Bay Club site on the sea front at Old Hartley, 10 miles from Newcastle.

STUDY TOUR OF DENMARK

INVITATION TO ENGLISH DOCTORS

The Danish Government, through the Danish Institute in Manchester, has invited the B.M.A. to organize a party of English doctors for a study tour of Denmark in September. The programme will be arranged by the Danish Institute and the Danish Medical Association, and a guide will be placed at the disposal of the party. The Danish Government will pay travelling expenses in Denmark. The cost of the tour from Harwich back to Harwich (first class throughout) will be £48.

The party will leave Harwich on September 1, and will visit Copenhagen, Elsinore, Hillerød, Roskilde, Aarhus, Vejle, and Esbjerg, returning to Harwich on September 13. There will be visits to medical institutions and sightseeing. Further details may be obtained from the Secretary of the B.M.A., B.M.A. House, Tavistock Square, London, W.C.1, to whom applications to join the tour should be sent before April 30.

HOSPITALITY

An Austrian doctor's daughter, aged 14, would like to arrange a holiday exchange with a British doctor's daughter; the Austrian doctor's sons, aged 17 and 16, would also like an exchange in July or August, 1957.

A French doctor's daughter, aged 17, would like to spend two months during the summer holidays with a British doctor's family on an *au pair* basis.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

S.H.M.O. Group

SIR,—This letter is addressed to all S.H.M.O.s, whether members of the B.M.A. or not. The S.H.M.O. Group is the largest in the B.M.A., and is by far the most active. In just over a year since the official formation of the Group its executive committee has put the whole case for S.H.M.O.s (in terms of remuneration, status, grading injustices, and the very existence of the grade) in all quarters and at all levels. Representation has been secured on vital central and regional committees on which S.H.M.O.s were not previously represented. The executive committee has gained some improvement (£75 per annum) on the unfair award of 1954. Most important of all, a further drop in the previous steadily declining status of the S.H.M.O. has been prevented. Much support has been gained for the Group's policy of improving the salary of the S.H.M.O. by bringing this up to 80% of the consultant's salary throughout the scale. Active efforts, not without some hope, are being made on behalf of those S.H.M.O.s doing consultant work.

The future needs utmost vigilance. The Ministry may in its hospital medical staffing proposals present conditions unfavourable for present S.H.M.O.s, and which may lead to a worsening of their position. Therefore the executive committee needs the active support of every S.H.M.O. The award of £75 by the Industrial Court was a small one, but without the S.H.M.O. Group, and the full support of the B.M.A. as a whole, there would have been no award. As chairman of the executive committee, I beg any S.H.M.O.s who are not members of the B.M.A. to use a small part of this award to join the B.M.A. and the S.H.M.O. Group. The B.M.A. is made up of the committees within it, and it is the only effective negotiating machinery. Every new member strengthens the Association, and every addition to the membership of the Group will ultimately benefit all S.H.M.O.s. I would like to appeal especially to S.H.M.O.s in Northern Ireland, whose interests are also equally the concern of the Group. There has been no change in the Group's policy of throwing open all regional meetings to all S.H.M.O.s, whether B.M.A. members or not.

Application forms for membership, which is free to B.M.A. members, may be obtained from the secretary of the Group, B.M.A. House, Tavistock Square, London, W.C.1, from regional representatives, or from myself.—I am, etc.,

G. WARING ROBINSON,

53, Stoneygate Road,
Leicester.

Chairman,
S.H.M.O. Group Executive Committee.

S.H.M.O.s and Consultant Appointments

SIR,—Mr. J. C. Leedham-Green (*Supplement*, January 12, p. 23) is concerned that the Health Service of the future shall provide for the combination of general practice with the practice of a specialty, and in this we are at one. He expresses a fear, however, that this advantage is conditional on the retention, in some guise or other, of a vestige of the S.H.M.O. grade, and here I cannot go with him.

The general practice of medicine is older than the specialties, all of which grew out of general practice, while the S.H.M.O. grade was unknown until 1949, and is peculiar to this country. Whatever may have been the purpose in the mind of whoever devised it, one of its effects has been to procure specialist services at less than the rate accorded to "consultants" doing the same work. The original S.H.M.O.s of 1949 were classified on a personal basis, and the Terms and Conditions of Service of Hospital Staffs (document dated June 7, 1949) defines them as "senior officers performing clinical duties who are not of consultant status, but are not registrars." There was no suggestion that the duties differed from those of "consultants,"

or that the S.H.M.O.s carried them out less competently. The idea of S.H.M.O. posts was a conception first defined in circular R.H.B.50(96) published in October, 1950. Some posts held by S.H.M.O.s are now recognized by regional boards as consultant posts within the boards' establishment, and some have not been designated to this day.

The effect of the existence of the grade, which comprises one-third of all specialist hospital staffs, has been to cause widespread discontent among those so de-graded, and to create a class working at substandard rates alongside their more favoured colleagues, a sort of "minus merit award" as it were. The aim of the S.H.M.O. Group is to remove the cause of the discontent, and to abolish the substandard classification. I deny that a man who has acquired proficiency in a specialty is one whit the less competent to practise it merely because he devotes part of his time to general practice, and to suggest that he should be paid less than his exclusively specialist colleague on this ground alone seems as illogical as to suggest that his general practice should be paid at a cut rate because he is partly occupied in a specialty. On the contrary, I said previously (*Supplement*, November 24, 1956, p. 199) and I repeat now, that, where a practitioner "has shown by the quality of his work and the respect of his neighbours that he is able to act as their adviser in consultation, he should receive the reward to which he would have been entitled if he were not also devoting part of his energies to the wider field of general practice."

I feel sure that, when Dr. Leedham-Green has reflected further, he will agree that the general practitioner who also holds a specialist hospital appointment may render services to the patient at least as valuable as those of the specialist who follows his specialty exclusively. A man is appointed to a hospital staff in virtue of having been adjudged by the appointments committee to be competent to carry out the duties, and to be the best candidate applying. In the terms of circular 50/96, paragraph 3, boards may appoint general practitioners as part-time assistants in certain specialties at S.H.M.O. rates, but in the major specialties, such as Dr. Leedham-Green's own, this course is not open to them unless nobody of consultant status has applied and the post cannot be left vacant (paragraph 2). It is the view of the S.H.M.O. Group that these provisos open the way to the gradual formation of a sub-consultant class which would ultimately prove harmful, first, to the patients in the hospitals where they occur, and, secondly, to the specialist body as a whole, by providing a temptation to employing authorities to exploit the distinction between the two classes. The Group holds firmly that when a candidate is considered by an appointments committee to be fit to be appointed to a post he should be entitled to the salary attaching to that post.—I am, etc.,

Woman Consultant for Women's Hospital

SIR,—In the South-eastern Region of Scotland a situation has arisen which not only has implications for the public and for the medical profession but also serves as an example of the ill effects of centralized bureaucratic control in the administration of the National Health Service. The Edinburgh Southern Hospitals Group Board of Management is at present concerned with the medical staffing of four hospitals, two of which were established more than half a century ago with moneys raised by women to provide hospital facilities for women desiring the services of women consultants. The medical consultant appointment in the women's hospitals is vacant, and there is a coincidental medical consultant vacancy in the other two hospitals of the group. The Southern Hospitals Board has advised the maintenance of the *status quo*—namely, a woman consultant for the women's hospitals, and an open appointment at the other two hospitals. This advice has not been accepted by the regional hospital board, which has decided to link the vacancies into one appointment—a decision which will, no doubt, appear attractive to the administrator sitting at an office desk, though little or no economy accrues from it.

The Southern Hospitals Group Board of Management has appealed to the Secretary of State for Scotland against this decision.

There is a possibility that this appointment, if advertised, will pass to a male applicant. This would mean, among other things, that any woman desirous of attention from women doctors only is deprived of the services of a woman consultant physician. There is none other available in the region. That this decision of the regional board is contrary to opinion within the region can be judged by the reaction from medical and lay quarters. Professional support for the appeal has come from the regional consultants and specialists committee, the Edinburgh local medical committee, and the Medical Women's Federation of Great Britain. A petition to the Secretary of State, launched spontaneously and unorganized, gathered over 26,000 signatures within three weeks, and was signed by a remarkable cross-section of the public. The basis of the petition is to "stress the necessity of there being available, for the women and children in Edinburgh, the services of a woman consultant physician in Bruntsfield and Elsie Inglis Hospitals." Additionally, there is support from the Edinburgh Executive Council, the Edinburgh Association of University Women, the Edinburgh Professional and Business Women's Club, the Soroptimist Club of Edinburgh, Co-operative Women's Guilds, Townswomen's Guilds, and many other bodies.

It would appear from this wide and forceful public reaction that here we have a regional hospital board out of touch with medical and lay opinion—underestimating the valuable part played by the smaller hospitals in the medical service. Surely no State bureaucracy should assert its authority against such expressed wishes of the people by whom the National Health Service is financed and for whom the National Health Service exists.—We are, etc.,

Psychiatric Out-patient Departments

SIR,—Most general hospitals throughout the country now have psychiatric out-patient departments to which patients are referred by general practitioners and others, and which are doing much to relieve the vast amount of minor mental disturbance existing in the community. The majority of patients seen in these departments do not and probably never will need admission to a mental hospital, and many are in full employment or are in other ways useful members of society. This usefulness is often maintained only with the help which they can receive from the out-patient clinic. Many of these departments are staffed wholly or in part by whole-time consultant psychiatrists from neighbouring mental hospitals, and it is this fact which has given rise to the impression which exists in some places that the psychiatric out-patient department does not really belong to the rest of the general hospital; indeed, there are hospitals where it is little better than a barely tolerated lodger; psychiatric consultants, although often asked to give opinions on cases in the wards, are not invited to attend medical staff committees; accommodation is usually inadequate and grudgingly provided; and facilities for physical treatments, such as E.C.T. or abreaction, may be non-existent.

Blame for this state of affairs can be more or less equally apportioned between the hospitals concerned and the regional hospital boards. The general hospitals complain that they have virtually no say in the appointment of psychiatrists who are to work in their hospitals, and may not even know their names; consequently they regard the psychiatric department as something quite separate from the rest of the hospital. The mental hospitals maintain that their filing and appointments systems are superior to the general hospital and they therefore retain all clinical records, and even make out-patient appointments at the mental hospital. Some regional boards have failed to appreciate the growing importance of out-patient psychiatry, and in the

planning of new out-patient departments insufficient attention is paid to the need for specialized accommodation—for example, sound-proof consulting-rooms, treatment and recovery rooms, as well as room for psychiatric social workers and psychologists.

The days when local authorities paid rent for a room in the general hospital to be used by their mental hospital as a follow-up clinic for discharged psychotics have gone for ever, but the attitude of mind which this arrangement engendered still persists in many places. The psychiatric department of a general hospital, whether it be staffed from a mental hospital or not, is nowadays at least as important as that of any other specialty. The doctors serving that clinic should be full members of the staff and be accepted as such by their colleagues. It is therefore important that the hospital management committee of the general hospital should be represented when senior psychiatric appointments to a mental hospital are being made, and appointment to the staff of the general hospital should be included in the contract. Clinical records should be kept in the hospital and appointments made directly through the general appointments office. In this way the psychiatric services will be integrated into the work of the general hospital as a whole and given proper recognition by the medical staff, administrators, and not least by the psychiatrists themselves, some of whom seem quite happy in their isolation. This result has already been achieved in most hospitals where part-time psychiatrists are employed, and there can be no doubt that it is of immense advantage to all concerned.—I am, etc.,

London, W.1.

J. C. SAWLE THOMAS.

Remuneration Claim

SIR,—The Government, through the former Minister of Health, having found that it acted too brusquely in its complete discard of the Spens recommendations, now seems to have adopted the well-known device of the semi-withdrawal and partial discard prior, we presume, to the gentle, unobtrusive final drop. If, by default, we allow the standard of Spens to be lowered we shall have lost our position, and in the future will have to go with our caps in our increasingly decrepit hands begging for a rise and receiving a rebuff. In order to get our position firmly established and to avoid recurring disputes our first resolve should be: "We demand from the Government the immediate recognition of the Spens recommendations as the legal contractual basis for determining our remuneration in the National Health Service."

Industrial sections of the community demand annual pay increases by strikes or threat of strikes, and get their compound increments. It appears never to be the right time for us of the middle classes to apply for any increase of remuneration, and if we do propose to take the only form of direct action open to us, such as withdrawal of service, this action is liable to be called "blackmail and holding the community to ransom." We have every wish not to be forced into this position, but we should be very determined to see that Government promises are kept, and our second resolve should therefore be: "We demand the immediate implementation of the Spens recommendations and their future implementation at periods no longer than every three years." The third resolve (for arguments see the letter by Dr. J. A. Gorsky, *Supplement*, January 26, p. 41) might be: "In the event of any unsettled dispute with the Government we demand the right to submit our claim to independent arbitration." The fourth resolve might be: "Preparation should be made for the reform of the National Health Service in such parts as may be agreed with the Government and among the medical profession." This latter is a long-term issue perhaps not too easy to achieve, but it might crystallize after July, 1958, when a considerable number of practitioners could, if forced to do so, withdraw from the Service, collect their compensation, and with many more become entitled, quite legally, to a very small pension.—I am, etc.,

London, N.8

G. W. M. MACKAY.

SIR,—It is quite apparent that the Government regard the doctors as easy money; in other words, they rely, first, on the fact that the doctors will not let the patient suffer, which of course is quite true, and, secondly, on the fact that the doctors are not sufficiently united yet to stand together, and the Government therefore feel that they can ignore the medical profession and its plea for what it rightly considers to be a recognition of the original agreements made between the medical profession and the State.

The suggestion was made to me the other day that perhaps the first thing we should do is to stop paying our income tax. Another point that has been made apparent is that there is obviously a vast difference in the eyes of the inland revenue between the doctor and the businessman or farmer. The businessman can have jamborees, etc., in the best hotels all over England at the expense of his firm and the inland revenue; the farmer can build a plush pigsty or cowhouse and claim it against the inland revenue. The doctor, however, if he builds a surgery on to his house, or alters it to make it more pleasant for his patients, does not get a stiver off his income tax, and his house agent will tell him at once that by enlarging his house he is reducing its value in the event of his selling it. Not only does he not get a stiver off his income tax, but in fact the stivers are added by an immediate increase in rates. I must admit that, as a humble taxpayer, the logic and fairness of all this are quite beyond me.—I am, etc.,

Harrogate.

GORDON BAILEY.

The Doctor's Week

SIR,—It was with considerable astonishment that I read Dr. Trevor Davies's letter (*Supplement*, January 19, p. 33) headed "The Doctor's Week." I had not realized that there was a G.P. left in England who led such a leisured life. My husband is in a partnership in a mixed residential-rural community with fewer than the average number of patients per doctor. We have considered ourselves fortunate this winter to be seeing so much of each other, as he now works an average of 72 hours a week compared with 80-84 hours a week last winter. These are actual hours worked and do not include nights "on call."

We have a small cottage hospital, and this undoubtedly occupies a great deal of the local G.P.s' time. However, it is a branch of their work which makes them feel that perhaps life is worth while after all in these days of thoughtless misuse of the doctor by a large section of the community.—I am, etc.,

Leatherhead, Surrey.

C. M. WILLIAMS.

Rural Practitioners' Remuneration

SIR,—I have been a principal in a rural dispensing practice for six years, and during that time am supposed to have been compensated for the disadvantage of not being able to attract a large list of patients, and the loss of remunerative time caused through travelling in comparatively scattered areas, by payments from the mileage fund. When, following the Danckwerts award, increased payments on capitation were applied to all practitioners alike, it followed that the rural doctors' "loading" was automatically lessened in proportion; but during the past six years the value of a "mileage unit" in this area has dropped from 4.3d. to 3.7d.—I disregard the lesser significant figures, but the decrease is about 15%—so not only is there a further lessening of the rural loading, but, in this area at any rate, there is a definite fall in the remuneration of the individual doctor under this heading.

Some of the necessary expenses in this type of practice may be of interest, presented to the nearest penny per patient on my list. For each, I pay annually: 5s. 11d. on motor expenses (before the petrol increase); 1s. 4d. on postages, stationery, and telephone; 1s. 6d. on cleaning, heating, lighting, maintenance and rates of my surgery premises (not my house); total, just about half the standard capitation fee.

Let it be thought that the dispensing doctor can quietly make it up on his drug account, let me draw attention to

the annotation on "Vaginitis" (*Journal*, January 19, p. 155). For the two main forms of this distressingly common complaint the writer recommends certain courses of treatment; none of the drugs mentioned is on the specially expensive list for which the dispensing doctor can reclaim payment, yet the net cost for each type of treatment is approximately £4. The dispensing capitation fee is 9s. 9d. I have already expressed myself on the subject of dispensing (*Supplement*, April 9, 1955, p. 163), and there has been no change since then either in the system or my views thereon.—I am, etc.,

Chieveley, Berks.

JOHN RICHARDS.

BRITISH MEDICAL GUILD

STRATFORD DIVISION

The following resolution was passed at a recent meeting of the Stratford Division, British Medical Guild: "That this meeting of the B.M.G. in the Stratford metropolitan area pledges its full support to the trustees of the Guild in any action taken to resolve the present issue to the satisfaction of the profession."

Meetings to be Held

DARTFORD.—At Wedgewood Hall, Royal Victoria and Bull Hotel, Dartford, Wednesday, February 13, 8.30 p.m.

EAST DENBIGH AND FLINT.—At Wynnstay Hotel, Wrexham, Sunday, February 10, 3 p.m.

NORWICH.—At Nurses' Lecture Theatre, Leicester Home, Norfolk and Norwich Hospital, Wednesday, February 13, 8.15 p.m.

Association Notices

ADJUSTMENT OF AREAS OF BARNET AND WEST HERTFORDSHIRE DIVISIONS

Notice is hereby given by the Council to all concerned that it is proposed to transfer from the West Hertfordshire Division to the Barnet Division the area of the Civil Parish of Elstree.

Any member affected by this proposal and objecting thereto should write to the Secretary of the Association not later than March 9, 1957.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, Blackpool, Wednesday, February 13, combined meeting with Fylde Section of B.D.A. 7.15 p.m., dinner; 8.30 p.m., Dr. R. Forbes: "Recent Developments in Medical Litigation."

BURTON-ON-TRENT DIVISION.—At Stanhope Arms Hotel, Bretby, Tuesday, February 12, 7.15 for 7.30 p.m., supper meeting. Lecture by Dr. R. A. A. R. Lawrence: "Paediatric Problems in General Practice."

CITY, NORTH MIDDLESEX, BARNET, AND ST. PANCRAZ DIVISIONS.—At Beales Restaurant, Holloway Road, N., Tuesday, February 12, 8 for 8.30 p.m., joint meeting with North London Pharmaceutical Association. Address by Dr. R. E. Ford: "Some Prescribing Problems as Seen at the Ministry." All medical practitioners and pharmacists in the area are invited.

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, February 12, 8.30 p.m., general meeting. Address by Sir Zachary Cope: "The Regional Diagnosis of Acute Abdominal Disease."

DONCASTER DIVISION AND DONCASTER MEDICAL SOCIETY.—At Danum Hotel, Doncaster, Thursday, February 14, annual dinner and dance.

EAST KENT DIVISION.—At Manston R.A.F. Station, Thursday, February 14, 7 for 8 p.m., dinner; 9 p.m., symposium. Members will be guests of the medical officers of the U.S.A.F.

EAST YORKSHIRE BRANCH.—At Quern House, 68, Park Street, Hull, Wednesday, February 13, 8.30 p.m., meeting. Lecture by Dr. R. D. Lawrence: "Diabetes—Old and New Things."

HENDON DIVISION.—At Edgware General Hospital, Tuesday, February 12, 8.15 p.m., clinical evening. Members of Wembley and Harrow Divisions are invited.

KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, February 12, 8 p.m., meeting. Address by Dr. P. J. Kerley: "Tumours of the Lung."

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, February 12, 8.30 p.m., meeting. Address by Mr. B. H. Dawson: "Neuralgia."

NORTHERN IRELAND BRANCH.—At Woodbourne House Hotel, Suffolk, Dunmurry, Thursday, February 14, 7.30 for 8 p.m., presidential dinner.

PRESTON DIVISION.—At Sharoe Green Hospital, Fulwood, Preston, Tuesday, February 12, 8.30 p.m., combined meeting with Preston Medico-Ethical Society. Clinical demonstration.

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Thursday, February 14, 8.30 p.m., meeting of Clinical and Pathological Section. Dr. J. J. Merry will show films and give a talk on "Cortisone."

SOUTH BEDFORDSHIRE DIVISION.—At Out-patient Department, Luton and Dunstable Hospital, Thursday, February 14, 9 p.m., meeting. Mr. E. H. Tong (Superintendent, Whipsnade Zoo): "Some Aspects of Zoo Management." Members' wives are invited.

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Sunday, February 17, 10.30 a.m., clinical meeting.

SOUTH STAFFS DIVISION.—At Medical Lecture Hut, Royal Hospital, Wolverhampton, Tuesday, February 12, 8.30 p.m., meeting. Lecture by Mr. N. W. Goodchild (Chief Constable, Wolverhampton): "Forensic Science."

TOWER HAMLETS DIVISION.—At Bearsted Theatre, London Hospital, E., Tuesday, February 12, 5.30 p.m., meeting. Film show.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Wednesday, February 13, 8.30 p.m., meeting. Dr. W. G. Oakley: "Diabetes and its Treatment."

WALLASEY DIVISION.—At Hotel Victoria, New Brighton, Tuesday, February 12, 8.30 p.m., annual general meeting.

WINCHESTER DIVISION.—At Board Room, Royal Hampshire County Hospital, Winchester, Thursday, February 14, 9 p.m., meeting. B.M.A. Lecture by Sir Heneage Ogilvie: "The Care of the Dying."

Meetings of Branches and Divisions

GIBRALTAR BRANCH

The annual general meeting was held on November 13, 1956, at the Colonial Hospital, Gibraltar, when 15 members were present. Dr. James A. Durante, the retiring president, reviewed the events of the past year, and commented on the poor attendance, especially of Service members, although the B.M.A. had in the past done more for them than for most of its members.

The following officers were elected:

President.—Mr. R. Scott Stevenson.

Vice-president.—Major R. K. Pilcher.

Honorary Secretary.—Dr. E. A. Imossi.

Honorary Treasurer.—Dr. S. H. Triay.

Mr. D. J. Toomey opened a discussion on pain in the right iliac fossa in which Captain Burwell, Dr. Imossi, Mr. J. M. Hastings, Dr. Ruggeri, and Dr. Cochrane took part. Mr. J. M. Hastings demonstrated an interesting series of cases of renal malformations, illustrated by x-ray films, etc.

JOINT CONSULTANTS COMMITTEE

A meeting of the Joint Consultants Committee was held at the Royal College of Surgeons on January 23, under the chairmanship of Sir RUSSELL BRAIN.

Medical Membership of Hospital Boards

Among the matters under consideration was a circular issued by the Ministry on December 31 informing hospital boards that the Minister of Health had accepted the recommendation of the Guillebaud Committee that the medical membership of regional hospital boards should not exceed 25% of the total membership save in quite exceptional circumstances, and advising boards to observe the same principle in making appointments to hospital management committees. The Joint Committee had previously urged the Ministry that the membership of a regional board should include at least five consultants actively engaged in the region concerned, and in addition a general practitioner and a medical officer of health, all nominated by the profession. In a letter from the Ministry informing the Committee of the Minister's decision it was stated that the Minister could not accept this proposal, but that he fully shared the Committee's view that the medical members of the regional boards should consist primarily of active members of the consultant staff in the region, together with a general practitioner and a medical officer of health.

The Joint Committee was profoundly disturbed at the Minister's decision, the more so as it appeared inconsistent with his acceptance of the principle that the medical membership should consist primarily of active members of the consultant staff in the region, who are by no means well represented on regional boards at the present time. The Committee thought it inevitable that the small number of consultants representative of those working in the regions must be still further reduced if the overall number of medical members was to be reduced, while still including representatives of the universities and medical schools, and in addition a general practitioner and a medical officer of health.

The Committee felt strongly that any reduction in the medical membership of hospital boards would of necessity affect adversely the valuable part played by the profession in the administration and planning of the service, and that to place upon a smaller number of doctors the responsibility of serving on the boards and their various committees would make the burden intolerable.

The Committee decided, therefore, to ask the Ministry for an early opportunity of discussing the matter further.

It decided also to discuss with the Ministry again the question of medical advisory machinery at regional board level, in the light of the recommendations of the Guillebaud Committee, while making it clear that it did not regard such machinery in any way as an alternative to adequate representation on regional boards.

Hospital Medical Staffs

Representatives from the Registrars Group of the British Medical Association attended the meeting to put before the Joint Committee their views regarding the problems associated with hospital medical staffing as they affected the prospects of registrars and senior registrars. They pointed out that the salary scales recommended by the Spens Committee had been formulated on the assumption that consultant status would normally be reached at 32 years of age. At the present time, however, senior registrars in the main specialties did not usually obtain their first consultant appointment until several years later than this, with a consequent loss in their total life earnings of £1,700 for every year promotion was delayed beyond the age of 32. They urged that the introduction of a new career grade below consultant status would not provide a satisfactory solution of the problem, since it would permanently lower the total life earnings of a proportion of new entrants into the hospital service. They recommended that there should be a gradual run-down in the number of senior registrars which would ensure reasonable prospects of promotion after an average training period of four years. Pending such a balance being obtained, and as a purely temporary expedient, they suggested that the tenure and salary scale of time-expired senior registrars should be extended, and newly appointed consultants given seniority on the incremental scale for every year over 32 at the time of appointment.

Appointments in Venereology

A deputation from the Venereologists Group Committee also attended the meeting to discuss with the Committee the difficulties experienced in the staffing of venereal diseases departments in areas where there is insufficient work to make a consultant appointment in the specialty practicable.

Moral Obligation

The Committee agreed to a proposal from the Ministry that the Appointment of Specialists Regulations should be amended to allow a consultant or S.H.M.O. whose sessions are reduced, or whose contract is terminated through redundancy, to be offered an alternative appointment without the necessity to apply for the vacancy in open competition.

Hospital Private Beds

The question of the steadily rising charges for hospital private beds was discussed, and the Committee decided to prepare a case for the introduction of a moderately priced private bed. Reference was also made to the many anomalies in the schedules of operations contained in the Pay Bed Regulations, and instances were quoted of the way in which these schedules operated to the disadvantage of the patient rather than to his advantage. It was agreed to submit a reasoned case to the Ministry for the abolition of the schedules.

Other Matters

Among other matters discussed were the shortage of radiographers and physiotherapists, domiciliary consultations by pathologists, the attendance of chairmen of hospital group medical advisory committees at meetings of hospital management committees, and the payment of fees for the examination of prospective employees at the request of employers.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

The Central Consultants and Specialists Committee met at B.M.A. House on February 7, Mr. T. HOLMES SELLORS in the chair.

Executive Committee Report

The executive committee reported its action with regard to income-tax relief in respect of the professional expenses of whole-time hospital medical staff. It was decided to ask the Joint Consultants Committee to press the Government to implement the recommendation of the Royal Commission on the Taxation of Profits and Incomes regarding the rules governing the professional expenses of persons in salaried employment.

Consultations with the Staff Side of Committee B regarding the remuneration of S.H.M.O.s in consultant posts were reported. The Management Side had stated it could not entertain generally the suggestion that S.H.M.O.s occupying such posts should be remunerated on the consultant scale, but would be prepared to discuss circumstances relating to individual posts which the Staff Side brought forward. It was suggested by the executive committee that a notice be inserted in the *British Medical Journal* inviting S.H.M.O.s who came within the scope of the review to apply for a form on which they would give the information necessary for their claims to be examined; that a panel be set up by the central committee to examine the applications and submit to Committee B the names of those who appeared to have a prima facie case to be remunerated on the consultant scale; and if Committee B referred the final selection of cases to a subcommittee an S.H.M.O. representative should be co-opted to that subcommittee. It was emphasized that the only people concerned were S.H.M.O.s worthy of consultant grade and carrying out consultants' work.

These recommendations were agreed to.

A report was received of the action of the Council at its last meeting with regard to the integration of medical officers of health with the hospital service (*Supplement*, February 9, p. 56). The executive committee had considered the matter, and reiterated its view that it could not be accepted that a practitioner should be appointed to the consultant staff of a hospital as of right by virtue of his status and office in some other sphere of medicine and without consultation with the hospital staff. Such an appointment would presumably involve duties and responsibilities which might affect the position of other consultants in relation to treatment and beds, and this could not be accepted without consultation with the hospital staff. With regard to membership of the hospital group medical committee, the Ministry had agreed with the Joint Committee that this was a matter for the hospital medical staff to determine, and this principle could not be waived.

There should be the closest liaison between the hospitals and the public health service. There were considerable advantages in inviting the medical officer of health to serve on the hospital group medical committee, but the invitation to do so should be made by, or with the approval of, the medical staff concerned.

The Committee agreed with the views of its executive and that they be transmitted to the Council.

It was agreed that the Joint Committee should be asked to make a strong protest to the Minister on his decision to reduce the overall medical membership of regional hospital boards to a maximum of 25% of the total membership, and to press that each board should include not fewer than five consultants actively engaged, at least one general practitioner, and one medical officer of health.

Administration of Drugs by Injection

Dr. Robert Forbes, secretary of the Medical Defence Union, attended the Committee for the discussion of this item, which arose out of a fatality after an injection of penicillin, as a result of which the regional hospital board had issued an instruction that intrathecal injections must not be administered until the quantities had been checked by another doctor, a State-registered nurse, or a student nurse, and a signature obtained that it had been done.

Dr. FORBES said that his society had been asked for advice on this rule, and its counsel instructed it to tell members who asked for guidance that this was a rule which they should not operate, on the ground that it was a serious interference with clinical responsibilities. It related at the moment to intrathecal injections, but in a short time it might relate to many other forms of injection.

The matter was referred back to the executive for further consideration, the view being expressed that regional boards should not be able to tell medical people how to do their work.

Administration of Hospitals

The Committee again considered, after the reference back of its report by the Council, the questions of equal tripartite hospital administration, recommended by the Bradbeer Committee. The Committee had expressed the view that hospital medical staff must have the final authority in the clinical care of patients, but, subject to this, it supported the system of tripartite administration in the general running of a hospital.

The opinion was expressed that tripartite administration had worked successfully in some of the larger hospitals. Did the doctor wish to take charge of the catering department or to engage wardmaids and other staff? The criticism that the Ministry was trying to take away from the doctor the charge of the patient was not justified. There was a considerable body of opinion which did not accept this view and regarded these proposals as the thin end of the wedge.

Members of the Committee said that tripartite administration was not working so well as seemed to be indicated. It was very difficult to get what was required, and the doctor was not asked what he was going to spend—all this was done by administrative staff without adequate consultation with matrons and consultants. Tripartite administration worked where there were first-class men, but everybody wanted to be completely independent, and it would be multipartite before long.

The CHAIRMAN pointed out that all this was considered by the Bradbeer Committee. The Committee agreed to a statement that tripartite administration was successful in some cases but where it was unsuccessful there should be an investigation, and that there should be no lay dominance over the nursing and medical professions.

Young Practitioners

Mr. H. H. LANGSTON, chairman of the Constitution Committee, explained the proposals of his committee with regard to the setting up of a young practitioners' committee. He explained that the need for this committee was strongly

felt; the matter was considered by Council at its last meeting (*Supplement*, February 9, p. 53); and it had been referred to the standing committee for approval. The proposals were sympathetically received, and it was agreed that the Committee should give provisional support.

At the same time there were recommendations before the Committee for reconstitution of the Registrars Group drawn up by its executive committee, and these would be considered at the next meeting of the Group Council. The Committee supported the proposals.

A resolution from a regional committee stating that hospital junior medical staffs should be represented at all levels of the negotiating machinery, particularly in Whitley Committees, was discussed. It was pointed out that members of these committees represented everybody, that there were many groups, and when the affairs of any particular group were being discussed representatives of that group should be invited to attend at the appropriate stage.

Joint Consultants Committee

Dr. ROWLAND HILL, deputy chairman, presented a report on the work of the Joint Consultants Committee and Committee B of the Medical Whitley Council. The question of the statutory registration of medical auxiliaries was again before the Committee, which adhered to its decision that its acceptance of the scheme was conditional upon the co-ordinating council being given effective control over the registration boards and that medical members of the boards should be appointed from names submitted by the appropriate medical organizations and from no other source. It now seemed certain that the scheme would go through and that medical influence would be in the minority even on the co-ordinating council. The auxiliary bodies proposed to call themselves "professions supplementary to medicine." The opinion was expressed at the last meeting of the Committee that if the Minister implemented the scheme the medical profession should dissociate itself from it.

Strong feelings were expressed on the dangers of allowing medical auxiliaries to treat patients without medical supervision of any kind, some members expressing the view that the profession should have nothing to do with the scheme, and that specialties should engage their own auxiliary staff and train them themselves. A resolution was passed unanimously that the Joint Committee be recommended to dissociate itself from the recommendations made by the Ministry of Health in regard to the auxiliary service. It was also agreed that the resolution should be communicated to the various faculties.

With regard to hospital medical staffing, the Registrars Group suggested that as a long-term plan the number of senior registrars should be allowed to run down until there was a better ratio between the senior registrar establishment and the number of expected consultant vacancies. In the meantime the Group endorsed the view that existing time-expired senior registrars should be given security with an extending salary scale.

It was once again stressed that the real answer to the problem of hospital staffing was a review of hospital establishments starting at the periphery and working towards the centre. The most important point was the possibility of well-trained registrars being put out of employment, for it seemed that there was no solution to the problem unless the number of senior registrars was drastically reduced. It was pointed out that there could only be a reduction of senior registrars if their work was done by consultants and the matter came back to a review of establishment. The Ministry's suggestion of the creation of an assistant consultant group was opposed by the Joint Committee and the Central Consultants and Specialists Committee.

Standards of Board-and-Lodging Accommodation

The Committee received a statement from the Registrars Group executive on minimum standards of accommodation for hospital residents. That body also considered that regular inspection of the accommodation should be carried

out on a regional basis by inspecting committees appointed by the regional hospital boards. The Registrars Group asked the Committee, if it approved, to forward the proposals to the Board and Lodging Subcommittee of Committee B. The CHAIRMAN said that a subcommittee of the Whitley Committee was discussing what methods were best for establishing throughout the country satisfactory standards of board and lodging. Quite apart from the cost, if the standards were bad there should be a right of appeal against them to the Whitley machinery.

It was agreed that the standards set by the Registrars Group should be put before Committee B.

Future of the Chest Services

The memorandum of the Chest Services Subcommittee, which was set up in January, 1956, to consider and report upon special problems affecting the chest services, was received. It had already been considered by interested committees, which had endorsed the general principles contained in it. The attitude of the Ministry was that tuberculosis was finished and that nothing more need be done about it. Chest physicians did not agree with that view, and put forward proposals for maintaining an organized tuberculosis service based on area clinics. It was agreed that the document should be forwarded to the Joint Consultants Committee.

Remuneration for Part-time Work

The recent agreement for the remuneration of medical practitioners undertaking part-time work for local authorities was reported, and a schedule submitted by the Treasury of fees for work for Government departments not covered by this agreement was considered. The proposals were considered to be satisfactory except in relation to the proposed fee for attendances at pensions appeals tribunals, which should attract a fee of £10 10s. for a day and £5 5s. for half a day's attendance.

The Committee also considered a report from a subcommittee of the Non-Professorial Group Committee relating to the remuneration of university medical teachers and research workers. A memorandum had been prepared by the subcommittee, which had adopted the resolution of the A.R.M. that the remuneration of medical men and women should be that of doctors and should not be related to that of lay personnel. The medical teacher was at a disadvantage because of the later age at which he could commence work, and his salary should be weighted to offset this disadvantage. The figures put forward related to the present time and without prejudice for the near future. The differential between clinical and non-clinical staff was also considered.

The executive committee was authorized to study the memorandum and to transmit it to the Council of the Association for approval so that it could be sent to the university authorities.

The question of fees for examinations carried out in prisons was discussed. It was felt that such examinations could not be classified as domiciliary examinations and that they should carry a minimum fee of £5 5s. for each examination.

Defence Trust

During the day a meeting of the Hospital Medical Staffs Defence Trust was held. The honorary treasurer, Mr. L. DOUGAL CALLANDER, reported that subscriptions amounting to £19,349 were received up to the end of 1956, and interest yields amounted to £411, against a total expenditure of £5,326. The Fund's investments totalled £10,866, and there was on deposit and current accounts £3,568. The last appeal had resulted in a considerable number of cash payments and new bankers' orders, substantially increasing the annual income of the Fund. It was suggested that further appeal letters should be sent out and that action might be taken through the regional committees to stimulate support for the Trust Funds.

Mr. CALLANDER then reported on the action taken by the British Medical Guild in relation to the present remunera-

tion claim. The finances for the Guild had to be found by the defence trusts, and the General Medical Services Committee had already made a very large allocation to the Guild's funds. Not a great deal had been used so far, but if there was an *impasse* after the forthcoming meeting with the Minister there was no knowing what expense would be incurred. He would like to ask for power to transfer £1,000 of the Trust Fund to the Guild funds if required.

After some discussion the proposal was agreed to, subject to consultation with the chairmen of the Joint Committee.

INTERIM REPORT OF MILEAGE COMMITTEE

CHANGES RECOMMENDED

A committee was appointed by the Minister of Health in 1950 to "examine in detail the distribution of the Central Mileage Fund for England and Wales and to make recommendations." The committee, on which were representatives of rural practitioners, has now published an interim report.

The mileage fund is a fund used to recompense rural general practitioners for the loss of earning time incurred in visiting National Health Service patients in country districts over and above that incurred by an urban practitioner for the same number of patients. At present about 87% of the fund goes to meet those expenses that can properly be measured by distances travelled, and about 13% goes to provide additional remuneration where the difficulties of the district are of an exceptional nature.

A scheme for mileage payments was introduced into the National Health Insurance scheme in 1914. It continued as part of the arrangements under the National Health Service in 1948. Until the present committee was set up the scheme had not been comprehensively reviewed since 1924. The committee's report, the preparation of which involved much detailed inquiry, has been sent to all local medical committees and will be part of the G.M.S. Committee's report to the Annual Conference of Local Medical Committees, where it will be open to debate.

Recommendations

The committee anticipates that its recommendations, being of an interim nature, may need amending after experience. In summary, some of the main changes in the present mileage fund scheme proposed are as follows. The fund should be distributed as a whole and called the Rural Practices Fund. Executive councils and local medical committees together should advise the Minister whether they wish the whole or any part of their areas to be included in the mileage scheme. Borough and urban district council areas with populations of more than 10,000 should normally be excluded and rural district areas normally be included. Variations on this should be allowed with the Minister's consent, and a central body should be set up to enable the Minister to consult the B.M.A. and other bodies on whether special requests for variation should be accepted. Patients in designated rural areas should count for payments from the Rural Practices Fund if they live not less than three miles from the doctor's main surgery, except that no doctor should receive any payments unless 10% of his patients live in a designated area and not less than three miles from his surgery.

Units of mileage should be credited on a new scale of one unit for not less than three miles and not more than four miles, and two units per mile thereafter. A model mileage scheme should be prepared by the Minister of Health and the B.M.A., and no variations on this should be allowed without the Minister's approval after consulting the B.M.A. No change is recommended in the present scheme for payments for visiting maternity cases.

The three representatives of executive councils on the committee recorded in the report their "keen disappointment" at the inconclusive results of the committee's deliberations.

PUBLIC HEALTH MEDICAL OFFICERS

INCREASED CAR ALLOWANCES

Committee C of the Medical Whitley Council has agreed on increased rates of motor-car allowances for public health medical officers in England and Wales in view of the circumstances resulting mainly from petrol rationing and the increased price of petrol. The allowances should operate until the end of the month in which petrol rationing stops, and will then be reviewed again. The revised rates take effect from January 1, 1957, and are set out in the appendix to M.D.C. circular No. 33.

The following casual user allowances replace those set out in paragraph 1 of the appendix to M.D.C. circular No. 29: Not exceeding 10 h.p. or 1,199 c.c., 94d.; exceeding 10 h.p. or 1,199 c.c. but not exceeding 12 h.p. or 1,399 c.c., 104d.; exceeding 12 h.p. or 1,399 c.c. but not exceeding 14 h.p. or 1,599 c.c., 114d.; exceeding 14 h.p. or 1,599 c.c., 1s. 04d. The essential user allowances, replacing the lump sum allowances and rates per mile in paragraph 2 of the appendix to M.D.C. 29, are as follows:

	Not Exceeding 10 h.p. or 1,199 c.c.	Exceeding 10 h.p. or 1,199 c.c. but Not Exceeding 12 h.p. or 1,399 c.c.	Exceeding 12 h.p. or 1,399 c.c. but Not Exceeding 14 h.p. or 1,599 c.c.	Exceeding 14 h.p. or 1,599 c.c.
Lump sum allowance	£66	£72	£78	£84
Rate per mile for first 7,200 miles p.a.	52d.	62d.	7d.	8d.
Excess over 7,200 miles p.a.	4d.	44d.	44d.	54d.

An "essential user" temporarily stopping duty journeys as a result of petrol rationing should get the lump sum allowance in full up to April 30. If rationing continues after that 50% of the lump sum should be paid for the following three months, further payment after that being at the employing authority's discretion.

CIVIL SUPPLEMENTARY ESTIMATES

LARGE HEALTH SERVICE INCREASE

Provision for an extra £26,900,000 net for the National Health Service is made in the Civil Supplementary Estimates for the current financial year. Of this, £15m. is required for hospital running costs, £8m. for drugs, appliances, and medicines (after taking into account an extra £1,200,000 received from patients as a result of the 1s. for each item prescription charge), £2,900,000 for payments to doctors, and £1,600,000 to dentists. Welfare foods, including milk, account for another £1,400,000. An annotation on the Supplementary Estimates appears on page 394 of this week's *Journal*.

REGISTRARS GROUP

PROPOSALS FOR RECONSTITUTION

Thirteen out of the 16 regional registrars groups have approved in principle the Registrars Group Council's proposal that the Registrars Group should be reconstituted to represent all grades of hospital junior medical staff (see *Supplement*, December 8, 1956, p. 209). Three regional groups are opposed to it, and three have not replied to the request from the Group Council for their views. The effect of the Group Council recommendations would be that all hospital staff of the grade of senior registrar and under would be able to take part in regional activities, and that their special interests would be represented at central meetings. The group would be renamed the Hospital Junior Medical Staffs Group. Representatives of the regional registrar groups will discuss the recommendations in the Group Council meeting in May.

GOVERNMENT'S OBLIGATION

Two meetings held on February 8 passed resolutions drawing attention to the Government's obligation to stand by the Spens reports.

The Glossop Division of the B.M.A. resolved that "this Division is firmly of the opinion that the Government has a moral obligation to implement the recommendations of the Spens Committee. The Division further deplores the Minister's evasion of this responsibility. A copy of this resolution to be sent to our Member of Parliament." It was the unanimous feeling of the meeting that all other Divisions in the country should bring similar resolutions to the notice of their respective M.P.s because it was only by such action by individual Divisions that the attention of M.P.s generally could be focused on this urgent matter.

At a very well attended meeting of the British Medical Guild in the Hexham Divisional area the following resolutions were passed: (1) that this meeting is firmly behind the B.M.A. in pressing the Government to discharge its obligations to maintain the standard of medical remuneration in accordance with Spens (passed with one dissentient); (2) that this meeting is prepared to support any action considered necessary even to the extent of withdrawal from the N.H.S. (passed with two dissentients).

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Unity of Purpose

SIR,—During the past weeks, doctors have held meetings throughout the country to prepare the way for action on behalf of their case against the Government. It is opportune, then, to discuss what measures are available to us. Most doctors would carry out measures such as refusing to sign certificates, pay income tax, and withdrawing from committees, since these would not inconvenience us much and would provide a practical demonstration of our discontent. But these would very likely prove ineffective, as the inconvenience caused could be suffered or lessened by emergency legislation without major disruption of the Service. Failure would leave the profession open to ridicule. The public would suffer considerable irritation and would be likely to be more antagonized than by the adoption of stronger measures. Small measures and small cause for discontent are synonymous to them.

Resignation would be effective if carried out by the majority. We have an excellent case to present to the public in support of resignation. There would be no refusal to treat the sick, or "strike" action. If resignation was associated with appropriate publicity, public opinion would probably rebound against the Government. But unity of action as against promise of action cannot be relied on. There is a fear that those who resigned would be martyrs to a lost cause. To sum up, the profession would be demoralized by the adoption of paltry, undignified measures doomed to failure. On the other hand, the case for resignation is strong, and the mood of the profession shows that the time is opportune.

There has for long been grave discontent among young doctors, who find it financially crippling to specialize and now almost impossible to establish themselves in general practice. Little wonder that the more ambitious—and often the best—emigrate. There is a very real danger of unemployment in the profession under present conditions, and a pool of unemployed or underpaid doctors would leave the rest completely at the mercy of the Government. It is only now that established doctors are beginning to feel the pinch that unrest is widespread and action is considered.

We are not going to get a general 24% pay rise without action. For action to succeed we must have unity. It is doubtful whether unity can be attained on the remuneration aspect alone. There are many doctors who are not prepared to resign over remunera-

tion *per se*, but who cannot see any future for themselves under the present scheme or are constantly irritated by aspects of it. Thus two groups have arisen—those who wish to press the present claim without mention of revision of the Service, and those who wish to revise the Service and hope to improve remuneration and other grievances in so doing. Any course of action must appeal to as much of the profession as possible, for in unity lies our strength. Now that we have travelled so far along the remuneration road let us proceed to the end and the inevitable *impasse*—and then call for revision of the Service. I do not believe that a new Service would take long to organize. What works in Australia, with evident satisfaction to all concerned, could just as easily work here. If the Government refused to operate a new scheme resignations could be called in; the refusal of the Government to co-operate with us on both remuneration and modification of the Service would strengthen our case. There is much to be said for killing two birds with one stone.

It is most important to study the Government attitude. Assuming that its main interest is in economy and votes, its reaction to a threat of resignation will be to attempt to split the profession. It will, therefore, either postpone matters with an evasively worded comment on Spens and a promise to review the claim when the economic position improves, or offer less than the amount asked for to the whole or part of the profession. Recognition in advance of the motives behind such moves and an alternative scheme, practical and better than the present one, offer the only sure defence against such temptations. Those of us who are content under the N.H.S., and may even have benefited from it, should pause for a moment and consider whether it is not their bounden duty to make medicine an attractive career once more, and not a vocation only.—I am, etc.,

C. ALWYN SHARPLES.

Stockport.

SIR,—Two outstanding grievances are noticeable from the correspondence: underpayment and underemployment. The voice of the latter has the handicap of not being effectively heard, and the consequent amount of National Health fodder continues to grow unchecked. Many other causes of dissatisfaction outside these headings exist.

It therefore follows that those who seek redress in one direction alone are unlikely to have the backing of others whose claims are to them equally in need of recognition. If medicine is to survive, and I say this advisedly, for the nature of its present appeal will come to be recognized as ground-bait ultimately and consequently to be shunned, then these serious disaffections need remedying. It is obvious that importuning or legal pressure is not the answer. A system has been created whose members can only be protected by their unity of action. Such unity is impossible to secure unless major causes for dissatisfaction are redressed. It behoves us therefore to recognize each and every reasonable cause of complaint, and not to use the system of committees to silence them. Until we secure a charter of our rights subscribed to by at least 95% of the profession we will continue to be held to ransom. Thereafter, with this unity of purpose defined and agreed, its implementation would turn on a plan drawn up on some such lines. Every member (at least 95%) of the profession would pledge himself without equivocation to support such a charter. He would guarantee such action, practically, by entering into a contractual agreement to back it by as large a subscription as possible—in the nature of a strike fund—if called upon to make it; further, he would agree to forfeit a substantial sum should he default in supporting any action taken to insist on the observance of any clause of the charter.

The suggestions above incorporated have a strict parallel in the trade union movement, so far as I can appreciate it, and are specially drawn to cover (1) the conflicting interests within medicine, and (2) its special need of large funds to meet the circumstances of the doctor's station in life. Dog eating dog and "the orl right Charley" attitude are anachronisms when the profession as a whole is faced with mounting disaster.—I am, etc.,

JOHN SOPHIAN.

Worthing.

Medicine and Politics

SIR.—When membership of the Cabinet is changed the papers carry formal letters to and from the Prime Minister. In one of these (*The Times*, January 17) the phrase appeared: "Some changes would be good in order to give experience to those who have not had ministerial appointments." Of course the oncoming politician must be trained and tested, but it is not pleasing to think that the Health Service, we who serve and the patients we treat, may be used as guinea-pigs for this purpose. Is this another argument for the reorganization which will get us all out of politics?—I am, etc.,

Lewes.

NOEL H. M. BURKE.

Reform of the Health Service

SIR.—At a crowded gathering of the profession convened to form a local committee of the Guild I was saddened to see how little my colleagues were affected by the *depth* of the crisis facing us. Pay was the great topic. When I warned members of the danger of taking such an unrealistic view of our troubles I was told I was an idealist and that the important thing was to "rake in the lolly." It seems quite tragic that now, when the profession is united and strong (because it is angry), we should waste our powers on the exclusive problem of pay.

I was told that to confuse the reform of the Service with the problem of pay would only cause disunity in the ranks. I cannot see how this can be so. I believe the following basic principles of reform would command the approval of the majority: (1) the removal of the Service from the expedient fingers of the politicians; (2) the immediate payment of compensation at present values; (3) an "item of service" payment; "free" advice has never been thought good advice; (4) return of goodwill—giving back to us a measure of professional freedom; (5) only essential drugs free to all; (6) payment for minor operations and extra payment for being present at a birth; (7) freedom of choice of doctor restored to the patient. Reform is far and away our more important problem. The serpent is writhing on the staff, but an apple will not keep it quiet.

By our calling we are individualists and not given to group loyalties; but who knows when we shall be united again? The future is in our hands, and in this great crisis the eyes of the young in the profession are watching us with hope—and perhaps with fear. This tide in our affairs must be taken at the flood.—I am, etc.,

Lancaster.

FRANK S. RICKARDS.

SIR.—I feel that it is a tragic blunder that battle should have been joined with the Minister of Health on the narrow issue of a common wage claim alone, differing in no manner at all from that of our fellow labourers the railwaymen and the dock-workers, etc. What shred of prestige was left the poor general practitioner after Aneurin Bevan had finished with us has now been gratuitously cast away by our ill-chosen and much-publicized approach to the Minister of Health. Not only have we lost status by our methods of approach, but, whereas our brethren of the railroad and dockyards in their wisdom have seen to it that they have previously armed themselves with an iron fist before they have attempted to shake it in anger, we have, in our folly, resorted to precisely the same methods without any power at all to back up our attitude. By the exercise of but a small amount of art, grace, and wisdom, we should most probably have gained all, and certainly more than we are now seeking, and also have exalted our status in the eyes of public opinion, with its manifold advantages, if we had approached the Government at this time with a determined demand for a thoroughgoing and long overdue overhaul of the many defects and injustices of the Service. It could have been made publicly known that it was being done in the interests of both the profession and the public alike, instead of advertising ourselves merely as the hawkers of just another dreary wage claim.

I suggest, however, that Sir Russell Brain has already at this late date opened the door to a wider and wiser approach, and it is my suggestion that the strongest measures possible should be adopted to enforce if necessary, not a wage claim alone, but a demand to the Minister for a reorganized Service, using as a spearhead for our demands changes that will result in a better service to the public and fairer terms with a far wider scope of paid work for the general practitioner than is at present possible. On the other hand, conscientious doctors as a whole do not want the National Health Service Act repealed, they want it drastically overhauled. A mere increase of the present capitation fee would mean that the G.P. with little to offer would then be overpaid again at the expense of his colleague with more to offer. What is required is scope for payment to those practitioners with the training and equipment to increase their service to their patients which would reduce the hospital shambles and facilitate a reduction of the money squandered in this direction. General practitioners do not want their lost status restored by Act of Parliament; the general practitioner will regain honour where honour is due if he is given the opportunity to render work to the best of his ability.—I am, etc.,

Audley, Staffs.

JOHN F. JENKINS.

Remuneration Claim

SIR.—May I make an attempt at some constructive criticism in order to help solve some of the difficulties with remuneration? The present system of loading, which makes the 501st patient worth 10s. more than the 499th, could be altered in favour of payment more suited to modern trends. We all know that modern medicine is becoming more a matter of increased work in both geriatrics and paediatrics. Therefore, let us have the scales loaded in favour of those patients who take most of our time—namely, the under twelves and over sixty-fives. As an example (to be worked out in detail by the actuaries), we should be paid 25s. per patient in this group and 20s. for every other patient. Administrative difficulties could be helped by the use of a different-coloured card for this group in their record indexing system. If any further loading is considered possible, any doctors with more than 1,000 coloured cards would be entitled to a loading of 5s. per additional patient. This will encourage doctors to take more elderly patients on their lists.

I hesitate to make any further suggestion with the object of saving the country money, but I do feel that a charge for stay in hospital of £1 per adult and 10s. per child per week is not beyond the average pocket to-day, and there is always the public assistance for those who really cannot afford the charge. Furthermore, a charge for night calls from 10 p.m. to 6 a.m. of up to 10s. 6d. would discourage those who wait as long as possible before sending for the doctor. This charge could be made at the discretion of the doctor—who could waive or lower it according to the circumstances he knows the patient to be in. These ideas are put forward for constructive discussion at future meetings, as I feel they may have some value.—I am, etc.,

Woodford Bridge, Essex.

L. M. RUBENS.

SIR.—It is to be hoped that the machinery now being taken out of mothballs includes an effective public information service, lest our preparation for action be met by a nasty popular reaction. Wherefore are we proposing to strike? As I see it, we are proposing to withdraw our services in support of one or other of three alternative demands.

(1) We are claiming a straightforward pay increase of 24%. If this is refused we shall strike—just like any other trade union. If that is our position I, for one, remain a dissident, since I regard it as an open invitation to other unions to do the same. Unhappily, I believe many lay people regard it as our true position. It is an invidious one, which we must disclaim with all the cogency at our command; for it is inflationary and contrary to the public

interest at this present time. Indeed, we should be setting a better example were we to ask for a pay decrease.

(2) We demand that the Government honour its pledge by implementing the Spens recommendations, wherein our pay was tied to the cost of living. But the Government denies the existence of any such contractual obligation, and, unhappily, legal opinion is divided on the matter. Therefore we cannot say irrefutably that the Government has broken its pledge; we believe it has done so, we may swear passionately that it has done so, but when all is said and done we are in no better position than the plaintiff in a civil action for breach of contract. We may not strike on such an issue, we can only offer to go to arbitration.

(3) We are not claiming a mere pay increase; we are claiming an entirely new method of payment per item of service, a method which is an incentive, not a disincentive as at present. We are pressing this claim in the interests of our patients as well as ourselves. Every day I am embarrassed by patients who apologize for having called me out, who apologize at troubling me for what they regard as minor complaints. That is bad, my friends; it is the reverse of positive medicine. It is distressing to the humble and considerate patient. It is to the disadvantage of the meek.

Dr. C. Glaisher (*Supplement*, January 5, p. 13) has put forward suggestions for a scheme which would, I believe, appeal to the general public, and it is to the general public that we must appeal at this time; for if we win their support we shall not have need of strike action. Public opinion is a mighty force; it is the force that moves governments.—I am, etc.,

Bournemouth.

F. ROLAND WILDE.

SIR.—Is it absolutely essential that settlement of our claim should take the form of a proportionate increase all round to offset the reduced value of money? It is all very well to say that redistribution can be considered after our claim has been met, but this line of argument ignores the fact that the lower-paid members of our profession are really up against it and require special consideration now. I sincerely hope that negotiators on both sides of the table will keep this fact uppermost in their minds and will see that justice is applied where it is most needed.—I am, etc.,

Belfast.

H. J. CRONHELM.

SIR.—Might it not be that the Minister agrees the moral justice of our claim, but cannot, at this juncture, either economically or politically, accede to any large increase in pay from whatever source the demand comes? Such a course would inevitably lead to the devaluation of the pound, with all its subsequent ills. That the Service is unsatisfactory and in part degrading cannot be denied, but I cannot help thinking that the removal of the financial barrier as between the sick and their treatment is one of the greatest blessings that this country has ever received. Many would have us resign from this *en masse*. Where would we go from there? Would we go back to bills, and the cutting of treatment down to the minimum so as to avoid hardship to the patient? One correspondent writes that we are the only nation which has been crass enough to institute such a health service. Might we not be the only nation (except Russia) which has had the courage to do so?

Some advocate payment per item of service. Would this not be again erecting the financial barrier? From where is the extra money to come so that the doctors may be better off? Presumably, in part, out of their own pockets in the form of extra taxation. Have we not enough taxation already? This would force more people to apply for public assistance. Already one person in every fifty in this country is supported by public assistance. I must disagree with Dr. W. R. Blatchley (*Supplement*, January 12, p. 20) when he writes: "What doctor worthy of the name could not make a better living . . . in private practice?" My answer to him is that thousands of doctors are to-day financially better off than they were pre-N.H.S.

I believe that eventually we shall find that the only real solution is a salaried service, provided that the public can

be sufficiently safeguarded. We should then be in a position where we could afford to be united in pressing our claims: we should not be imprisoned in one practice for the whole of our professional life: we should not have to provide our own surgeries: we should work an eight-hour day: our pay would be secure and not at the mercy of a more proficient competitor.—I am, etc.,

Cheriton Bishop, Devon.

F. E. GRAHAM-BONNALIE.

SIR.—I suggest we stop these threats of strikes to secure our just demands. Instead let us embarrass the Government by economies. The first of these should be our telephones. On a fixed date we should inform the Postmaster-General we wish to have our telephones removed. The confusion within the Service would be considerable, yet at no loss to us. This last factor will be appreciated by those, like myself, who cannot afford to strike.—I am, etc.,

Irvine.

ANDREW A. GARVEN.

P.A.Y.E. and Surtax

SIR.—Not so very long ago many members of the consultant staffs of the hospitals of this country were transferred, willy-nilly, to the P.A.Y.E. system of tax collection. The system has some virtues, but as applied to this body of men and women it contains an injustice. With surtax at its present level a large proportion of these people are liable to this specific tax, which is levelled upon the total taxable income above £2,000 per annum. Now a man subject to P.A.Y.E. never handles his total earnings—he cannot invest it or put it to work for him in any way. In fact part of his income is a polite fiction. Surely he should only pay surtax on that part of his income over and above £2,000 which he does actually receive. The coexistence of P.A.Y.E. and surtax, as applied to the same individual, cannot be defended in equity or ethics.—I am, etc.,

Birmingham.

L. T. CLARKE.

Medical Trade Union

SIR.—One of the weaknesses of our present negotiating position is that we have no access to arbitration except as a concession from the Minister of Health. Our relative success with the Danckwerts award makes it unlikely that the Minister will agree to arbitration again.

At a recent meeting of doctors in Manchester called to reorganize the Medical Guild a speaker pointed out that if the Guild were a trade union then it could have our present dispute referred to an industrial disputes tribunal, and in this way could secure arbitration. However, we learned from the platform that the Guild is not a trade union in a legal sense and cannot take this action. We all know that by its Articles of Association the B.M.A. is precluded from acting as a trade union, but I do not know of anything in those articles which would preclude it from sponsoring a trade union. It would be a relatively simple procedure to circularize members with a form of application to join the British Medical Union, if we decided to call it that, and it could be organized in a very short time using the B.M.A. offices and staff. I visualize such a union as being a legal device to secure arbitration if negotiations break down, and I do not suggest that any of the more undesirable of trade union activities should be contemplated.

At present we are trying to fight a battle without weapons, and I have no confidence in threats of mass resignation and so on, nor do I agree with the confusion of reforms in the N.H.S. with the question of remuneration. We should have one objective at a time and should make certain we gain the first objective before going on to the second. The proposition I have outlined above seems to me well worth considering, and I would welcome comments on it from a B.M.A. representative and, even more, from a legal expert.—I am, etc.,

Manchester 8.

C. J. GRIFFIN.

H.M. Forces

A Supplement to the *London Gazette* has announced the following appointment and mention in dispatches in recognition of distinguished services in Cyprus for the period July 1 to December 31, 1956:

O.B.E. (Military Division).—Lieutenant-Colonel K. F. Stephens, R.A.M.C.
Mentioned in Dispatches.—Captain I. R. D. Reid, R.A.M.C.

ROYAL NAVY

Surgeon Lieutenant-Commander C. E. Wells has terminated his commission.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenants M. Wickham, M. G. D. Davys, A. F. Murphy, W. A. Copland, P. W. Harvey, R. L. H. Barnard, C. V. Kaula, M. W. Eddings, and W. J. C. Scott to be Surgeon Lieutenant-Commanders

ROYAL ARMY MEDICAL CORPS

Captains J. P. Crowdy and A. P. B. Harston to be Majors.

REGULAR ARMY RESERVE OF OFFICERS

Major-General J. M. Macfie, C.B., C.B.E., M.C., late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

ROYAL ARMY MEDICAL CORPS

Captain (Acting Major) I. L. Gregory, from A.E.R.O., to be Captain, and has been granted the honorary rank of Major.

Class III.—Captain (War Substantive Major) (Honorary Lieutenant-Colonel) W. G. MacDougall, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel.

BRITISH MEDICAL GUILD**Meetings to be Held**

MARYLEBONE.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Friday, February 22, 8.45 p.m.
TOWER HAMLETS.—At Recreation Hall, Mile End Hospital, Bancroft Road, E., Thursday, February 21, 8.30 p.m.

Association Notices**Diary of Central Meetings****FEBRUARY**

- 20 Wed. Representatives of Negotiating Committee to meet new Minister of Health (at 23, Savile Row, W.), 11 a.m.
- 20 Wed. Catering Committee, 12 noon.
- 20 Wed. Arrangements Committee (Birmingham, 1958), 2 p.m.
- 20 Wed. Negotiating Committee, 2.30 p.m.
- 21 Thurs. G.M.S. Committee, 10.30 a.m.
- 22 Fri. Staff Side, Committee C, Medical Whitley Council, 11 a.m.
- 22 Fri. Public Health Committee, 2 p.m.
- 22 Fri. Subcommittee on Medical Reports, Joint Committee of B.M.A. and Magistrates' Association, 2.30 p.m.
- 28 Thurs. Compensation and Superannuation Committee, 2 p.m.
- 28 Thurs. Non-professional Group Committee, 2 p.m.

MARCH

- 1 Fri. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
- 4 Mon. Alternative Edition Subcommittee, Joint Formulary Committee, 11 a.m.

- 8 Fri. Overseas Committee, 2 p.m.
- 21 Thurs. G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At General Hospital, Aberystwyth, Sunday, February 24, 3 p.m., business meeting.
BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, February 19, 8.30 p.m., meeting. Lecture by Professor W. Melville Arnott: "Drugs—Their Uses and Abuses."
BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, February 22, 8.15 p.m., meeting. Address by Mr. P. W. Clarkson: "Contribution of Plastic Surgery to the Treatment of Endocrine Disorders."
BRADFORD DIVISION.—At Medical Societies' Room, Bradford Royal Infirmary, Tuesday, February 19, 8.15 p.m., meeting in

conjunction with Bradford Medico-Chirurgical Society. Symposium on cortisone.

COVENTRY DIVISION.—At Grosvenor Room, Hotel Leofric, Tuesday, February 19, 7.30 for 8 p.m., combined supper meeting with members of local dental profession. Address by Dr. R. W. H. Tavenner: "Osteomyelitis and the Acute Alveolar Abscess."

DARLINGTON DIVISION.—At Darlington Memorial Hospital, Tuesday, February 19, 8.30 p.m., meeting. B.M.A. Lecture by Mr. R. B. Zachary: "Surgery in Infancy."

EAST HERTS DIVISION.—At Mayflower Hotel, Hertford, Tuesday, February 19, 8 p.m., meeting of Hertford and District Branch of Pharmaceutical Society to which members of the Division are invited. Talk by Dr. J. J. F. Merry: "Therapy with Cortisone." A colour film will be shown.

FINCHLEY DIVISION.—At Board Room, Finchley Memorial Hospital, Granville Road, N. Finchley, N., Friday, February 22, 8.30 p.m., meeting. B.M.A. Lecture by Dr. H. Neville Stafford: "Some Unusual Cases in a Coroner's Experience."

GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Thursday, February 21, 8.30 p.m., meeting. Lecture by Mr. N. C. Lake: "Problems of Foot Disorders."

HUDDERSFIELD DIVISION.—At George Hotel, Huddersfield, Thursday, February 21, 8 for 8.30 p.m., inaugural dinner.

LONDONDERRY DIVISION.—At City Hotel, Londonderry, Saturday, February 23, 8 for 8.30 p.m., dinner.

MID-ESSEX DIVISION.—At Out-patient Hall, Chelmsford and Essex Hospital, London Road, Chelmsford, Sunday, February 17, 10.45 a.m., meeting. Discussion: "The Menopause." Opening speaker, Mr. A. C. Pearson.

MIDLAND BRANCH.—At Selly Oak Hospital, Birmingham, Friday, February 22, 8.15 p.m., meeting of clinical and pathological section.

MONMOUTHSHIRE DIVISION.—At 20, Stow Hill, Newport, Thursday, February 21, 8.30 p.m., meeting. Address by Professor A. S. Duncan: "Importance of the Placenta in Obstetric Practice." Guests are invited.

NORTH MIDDLESEX DIVISION.—At Committee Room, North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, February 19, 8.30 for 8.45 p.m., meeting. Paper by Dr. G. I. M. Swyer: "Use of Hormones in General Practice." Medical guests are invited.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, February 19, 8 p.m., supper meeting. Lecture by Dr. E. M. Donaldson: "The Dermatitis Myth."

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, February 18, 9 p.m., meeting. Dr. C. S. Don: "Treatment of Diabetes—Some Recent Advances."

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Wednesday, February 20, 8.30 p.m., meeting. Lecture-film-demonstration by Dr. P. Sattin: "General Practice Organization." Hospital officers, general practitioners, and members of the City Division are invited.

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, February 21, 8.30 p.m., meeting. Lecture by Dr. R. E. Bonham-Carter: "Acute Cardiac Illness in Children."

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, South Shields, Thursday, February 21, 8.30 p.m., meeting. Address by Dr. E. Grey-Turner (Assistant Secretary, B.M.A.): "Present Medical-Political Situation." All medical practitioners in the area of the Division are invited.

SOUTHAMPTON DIVISION.—At Conference Room, Civic Centre, Southampton, Wednesday, February 20, 8.30 p.m., general meeting. Address by Dr. Keith Simpson: "What to do with a Dead Body." Members are invited to meet the speaker at dinner in the Polygon Hotel at 7 p.m.

SOUTH-WEST ESSEX DIVISION.—At Langthorne Hospital, Langthorne Road, E., Wednesday, February 20, 8.30 p.m., general meeting. Discussion to be opened by the Bishop of Barking and Dr. Eric Ashton: "Divine Healing and Co-operation Between Doctors and Clergy." Clergy resident in the area of the Division are invited.

SWANSEA DIVISION.—At Osborne Hotel, Langland, Thursday, February 21, 7.30 for 8 p.m., dinner. Address by Dr. G. D. Kersley: "Trends in Treatment of Rheumatic Diseases."

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons Road, Bow, E., Friday, February 22, 3 p.m., meeting. Mr. A. J. Walton: "Surgery of the Neck."

WEST MIDDLESEX DIVISION.—At Feathers Hotel, Ealing Broadway, W., Tuesday, February 19, 8 p.m., joint meeting with West Middlesex Chemists' Association and Branch of the Pharmaceutical Society. Lecture by Dr. F. E. Camps: "Some Problems in Toxicology."

WEST SUFFOLK DIVISION.—At Ball Room, Everard's Hotel, Bury St. Edmunds, Tuesday, February 19, 8.30 p.m., annual general meeting. Talk by Dr. Walter Hedgcock (Assistant Secretary, B.M.A.): "Current Affairs."

Dangerous Drugs Act: Withdrawal of Authorities

The Home Office announces that Dr. John Galbraith Mackay Anderson (Birmingham) and Dr. Esmond Millington (Hove) are no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

VII. The Powers of the Autonomous Bodies	87		
VIII. Constitution and Organization of Special Groups	87		

PRELIMINARY

1. The Constitution Committee was established, on the instructions of the Representative Body, in 1953, with the following terms of reference:

To examine and report on the present structure of the Association, with special reference to the reorganization of the Representative Body.

2. The demand for a review of the Association's constitution arose originally from widespread doubt about the ability of the Representative Body to discharge its functions efficiently. The Representative Body is the Parliament of the Association, and on the efficient conduct of its business the welfare of the Association depends. Misgivings, which were widespread, were summarized and circulated to Divisions by the Winchester Division in 1953 together with constructive, if somewhat drastic, suggestions for reform.

3. In an earlier memorandum, the Winchester Division had referred to Representative Meetings "as a shambles—too many members discussing too many resolutions." The last phrase sums up the factors which have contributed to the present situation. Firstly, the increase in membership, which has almost doubled since before the war, has caused

*Although this is the report of a Special Committee, it will be discussed on the first day of the Representative Meeting as an appendix to the Annual Report of Council, which will be published shortly. Every member is asked to keep this Supplement, which contains matters referred to Divisions, until the subjects have been discussed by his Division.

a proportionate increase in the size of the Representative Body. The question of accommodation has in itself become a major problem, apart from the comfort and convenience of Representatives attending the Meetings. Secondly, the political events of the post-war era were of such vital concern to the profession that the business facing Representative Meetings, both annual and special, grew so great that severe strain was apparent.

4. Although the over-long agendas which accompanied the discussions on the National Health Service Bill and resulted in many important matters being referred to Council with little or no debate are now matters of past history, and although steps have been taken to streamline the agenda to some extent, many members have felt that the Representative Body still has too much to do and is too large in size to conduct its business with despatch and efficiency. It was these factors that caused the Representative Body in 1953 to instruct the Council to form an *ad hoc* Constitution Committee "to take evidence, consider, and report on a reorganization of the Representative Body and such other constitutional matters as Council may decide" (Minute 249). In appointing the Committee the Council had regard to the decision of the Representative Body that not more than 50% of the members should be members of the Council and also to the need to include representatives of all the main fields of practice and of differing types of area with a balanced geographical distribution. This aim has been achieved, but it has necessitated a large committee of some 33 members (see Appendix A).

5. The main objects of the Association, as stated in its Memorandum, are "to promote the medical and allied sciences, and to maintain the honour and interests of the medical profession." Its history has proved that the only certain way of achieving these objects is through a constitution based on sound democratic principles, under which the individual member can (a) freely voice his views and make these views felt in the policy of the Association and (b) satisfy his needs—scientific, social, and material. On this foundation the existing Association structure has evolved. Under this structure the Representative Body (representative, as the name implies, of members throughout the Association) is the Parliament of the Association, formulating policy. The Council has the duty of directing the business of the Association under the control of the Representative Body, and in the discharge of that duty is responsible not only for implementing decisions of the Representative Body but for formulating policy for its consideration. It carries out these duties through the medium of Committees, elected as to part by the Representative Body and as to part by the Council itself. The Branches are territorial units with defined duties, which include the election of the majority of members of the Council. Lastly, the Branches are divided into Divisions, each with autonomous powers in regard to its management, subject always to the provisions of the Articles and By-laws. The Divisions are the basic units of the Association and complete the circle by appointing, in accordance with their numerical strength, the members of the Representative Body. In this way individual members can make their influence felt, through their Representatives, in determining Association policy.

6. With this constitution and with a membership comprising the great majority of the working profession at home and abroad, the Association has been in a powerful position to carry out its objects. It promotes the medical and allied sciences in various ways—through a Standing Science Committee, the *British Medical Journal*, the Library, the scientific activities of the Annual Meetings, which have increased in scope in recent years, and through functions of scientific interest arranged by the Branches and Divisions. Its medico-political activities and its influence in health legislation since the turn of the century have grown with the strength of its membership. The developments affecting medical practice which are referred to in later paragraphs of this Report and in particular the ramifications of the National Health Service have, however, raised the question of whether the constitution in its existing form is such as to enable the Association to continue to function efficiently in the new conditions. The Council has therefore liberally interpreted the instruction of the Representative Body and has so framed the reference to the Committee as to cover an examination of the constitution from the ground up, and, if necessary, to restore the balance between the medico-political and the other manifold activities of the Association summed up in the phrase "to promote the medical and allied sciences." It is from these aspects that the Committee has drafted its Report.

7. Mr. H. H. Langston, of Winchester, has been Chairman of the Committee. At an early stage in its deliberations the Committee delegated a great deal of detailed work to a Chairman's Subcommittee, which has met frequently to examine statistics and other evidence, to collect information, and to correlate the data on which the main conclusions and recommendations of the Committee are based.

General Considerations

8. As a prerequisite to the examination of the several parts of the Association's constitution, the Committee has reviewed the developments affecting medical practice during the past 50 years. In trying to assess the extent to which the constitution may have succeeded or failed as an instrument in furthering the objects of the Association, the Committee has been impressed by the essential soundness of a structure which, designed half a century ago, has served its purpose well and has withstood two major political crises

affecting the basic principles of medical practice; the disruptive effect of two world wars; and the less dramatic but equally important gradual extension of the State's responsibility for health and welfare. In spite of strain and stress and in spite of the increase of specialism which has tended to create gaps between and, indeed, within the main fields of practice, the claim of the Association to speak for the whole profession is stronger now than at any time previously, and is generally recognized. This cannot be attributed to the increase in membership alone, but is in large measure due to the fact that the Association's constitution (as set out in para. 5) is based on a federation of geographical units rather than an alliance of craft groups. In spite of immense differences between these units, both at home and overseas, in size, geographical area, and the nature of the predominant type of practice, it has been possible during the past 50 years to preserve unity of aim and purpose.

9. Though in essentials the constitution has not changed since 1902, there have been many adaptations to changes in the political environment and to changes within the profession itself. Two of these adaptations are important as forming precedents, the implications of which were not foreseen at the time. These were the establishment in 1913 of the Conference of Local Medical and Panel Committees and its executive the Insurance Acts Committee, and the formation in 1927 of the first Special Groups. The reason in both cases was to prevent the formation of separate organizations with the conflicting loyalties arising therefrom.

10. The changes following on the introduction of National Health Insurance and the evolution of machinery for dealing with special groups has resulted in both cases in compromises. In each it is possible in theory for non-members of the Association to influence, if not to direct, Association policy. The stresses and strains inherent in these constitutional compromises have become much more apparent and potentially dangerous now that virtually the whole profession is subject to terms and conditions of service under some form of contract. The division of the administrative structure of the National Health Service into separate compartments and the extension of medical practice under contract to cover the whole community has exaggerated, though it did not cause, the divergence of interests within the profession which had been gradually increasing throughout the whole period. This is reflected in the Association's Committee and Group structure, which, though adapted to meet these problems, cannot be absolved from contributing to some of the difficulties it was designed to cure.

11. In 1938 the Medico-Political Committee was replaced by two standing committees, the Special Practice Committee and the General Practice Committee (now the Private Practice Committee). Each represented a defined field of practice. This emphasized the differing interests between the two groups and also gave undue prominence to the fact that both in the Divisions and in the Representative Body general practitioners were in a majority. This fact above others has created the desire for independence and the defining of spheres of interest. The distinction between sectional interests is largely artificial and its effect on the Representative Body has been exaggerated, but it is nevertheless a factor of importance. The formation of each new special group also fosters the feeling of "being in a minority" among the members of the Group, together with the tendency to seek the right of independent action. Nor is the problem of minorities confined to the Representative Body. It occurs in the Central Consultants and Specialists Committee, where each new group, as well as such categories as whole-time specialists, medical administrators, etc., is in a minority. It occurs, though to a lesser extent, in the Committees dealing with general practice problems. The practitioner in wholly private practice, the unestablished or small-list practitioner, and the rural practitioner may at times feel at a disadvantage in the Private Practice and General Medical Services Committees. The fact that the Council has overriding control over these Committees does not entirely relieve the misgivings felt by members of minority groups; direct access

may be difficult, and they are conscious that their point of view can be expressed only through the major Committee concerned.

12. In the sphere of general practice, the extension of contract practice to the whole community has increased the field of work and consequently the relative importance of the General Medical Services Committee and the Conference of Local Medical Committees. This has caused serious misgivings in some quarters. At the Representative Meeting in 1953 there were 44 resolutions under the heading "General Medical Services," in contrast to 6 in 1927 and 5 in 1935 under the heading "National Health Insurance." The effect of this change is not, however, very important in the Representative Body, because general practitioners are in a majority and because the representatives in the Representative Body and in the Conference of Local Medical Committees are, in the main, the same practitioners. It is in the Consultant and Specialist field that major constitutional problems arise, and these are due mainly to four factors:

(1) The area and structure of Regional Consultants Committees bears no relation to that of the Association's Divisions and Branches, and there is no provision for formal representation of Association units on the Regional Committees.

(2) Consultants and specialists form a minority in the Representative Body.

(3) The need for joint negotiating machinery to maintain a united front in the hospital service field.

(4) The multiplication of Special Groups.

13. Nevertheless, a special committee which was established in 1949 to consider the situation created by the formation of autonomous bodies within the Association and their relationship to the Representative Body found that the difficulties and dangers were more apparent than real and recommended that the existing arrangement should continue.

14. With due regard to past history and appreciating that the newly qualified and as yet unestablished member is in a very different environment and facing entirely new problems, the Committee has examined in great detail each part of the constitutional structure of the Association. It is recommending few radical changes, but these are important and controversial. Briefly they may be summarized as follows:

(1) A new conception of the Branch. (2) A substantial reduction in the size of the R.B. (3) Extension of representation of special interests in the R.B. (4) Revision of the programme of Scientific Meetings. (5) A new approach to the problem of Special Groups.

15. In addition, the Committee is recommending many changes of lesser magnitude, which it is hoped will increase the value of membership to the individual doctor and improve the conduct of business at Representative Meetings. Some of these changes will appear as recommendations, some have already been effected, including the proposal to establish an Annual Conference of Regional Consultants Committees (para. 133); the use of Association funds for social purposes (para. 32); liaison between Divisions and other local bodies (paras. 29 and 31).

16. The proposals made in the Report do not in every instance express the unanimous view of members of the Committee. Membership of the Committee will, however, in no way preclude members from expressing in the Council, in the Divisions, and in the debate in the Representative Body their personal views where these differ from those of the majority of the Committee. In this way it has been possible to avoid minority reports.

I. PERIPHERAL ORGANIZATION

17. The Committee has considered the peripheral organization of the Association under the following headings:

(a) the place of the Branch and Division in the framework of the Association;

(b) the effect on the Branch and Divisions of developments in recent years resulting from health legislation and reorganization of Branch and Division machinery to ensure that local units will be able to reconcile fully within their framework the interests of all members of the Association and to establish effective liaison with other local administrative bodies—statutory and non-statutory;

(c) the geographical distribution of the units.

It has confined its attention to the Home Branches and Divisions, and has not attempted to discuss the organization overseas. The latter is largely dependent on local law and custom, and the constitution of the overseas units of the Association, as set out in the Articles and By-laws, appears to be satisfactory.

1. THE BASIC UNIT—THE DIVISION

(A) The Function of the Division, its Numerical Strength and Area

18. In a democratic institution of the nature of the Association the member as an individual is primarily a member of the Division in the area of which he resides and with which his main contact must be. *Ipsa facto*, he is a member of the whole Association. It follows that the Division must be the basic unit of the Association, so constituted as to serve the essential needs of its constituents. Its area should be such as to provide every one of its members with a reasonable opportunity of attending every important meeting, and its numerical strength such as will allow of efficient organization and reasonable contact between members. The duty of election to membership of candidates within its area should, as advocated in para. 23, rest with the Division and not with the Branch as at present. These basic principles having been accepted, the Committee makes the following observations:

(i) Function of the Division

19. The function of the Division should be to foster and maintain personal contact between its members; to provide these members with opportunity for scientific discussion; and to provide a forum for discussion of their problems.

Personal Contact: The importance of social occasions—formal and, more particularly, informal—as a factor in promoting the success of a Division is emphasized. The provision of opportunities for personal contact must depend largely on local circumstances.

The Young Practitioner: The introduction of the young practitioner to B.M.A. work should be regarded as an integral part of this function.

Scientific Activities: The type of Scientific Meeting will depend to a large extent on local circumstances.

Medico-Political Field: The function of the Division in this field should be:

(a) to implement central and local policy;

(b) to take action on behalf of its members individually or collectively and to co-ordinate the views of those engaged in the different branches of the profession. This aim cannot be achieved by merely duplicating the function of, or attempting to compete with, the various statutory or functional bodies which have specific duties within defined fields. The main object should be to co-ordinate local professional opinion and to pool knowledge and ideas for the common good.

20. The success of a Division must ultimately depend upon the loyal co-operation and support of all its members, no matter in what branch of the profession they may be engaged. Participation in the activities of the Division by its consultant and specialist members is equally as important as that of the general practitioner, and this is true also of the young and unestablished practitioner, whether in the hospital service or in general practice. The public health medical officer, whose work cannot satisfactorily be divorced from that of his colleagues in the other services, has his place in the Division organization. It is the duty of the

Executive Committee to impress upon all members of the Division the importance of regarding themselves as members of *one* body, with closely interrelated interests.

21. In discussing how this integration of the profession could most effectively be achieved the Committee has considered a suggestion that the Division should invariably be coterminous in area with the Executive Council and that it should, through its Executive Committee, operate as the Local Medical Committee. The Committee does not favour this proposal. While there are advantages in a close alignment between the Division on the one hand and the Local Medical Committee and Local Government area on the other, the Division should not necessarily be coterminous with any one statutory or functional body, whether Regional Consultants Committee, Local Health Authority, or Local Executive Council. The function of the B.M.A. Division is by no means confined to the interests of those in contact with the Executive Council. If the area of the basic unit is to be such that every member thereof shall have a reasonable opportunity of attending every important meeting, whether scientific, social, or medico-political, the Division must have considerable autonomy in determining its own area. Within this principle the aim should be to include all the interests represented by the local statutory and functional bodies.

22. So far as the relationship of the Division to the Local Medical Committee is concerned, there is at the present time a considerable overlap in membership, and this overlap should make it possible to ensure that the Division is kept fully informed at its meetings of Local Medical Committee activities.

23. There is a further function—the election of candidates for membership of the Association—which the Committee believes should in future be transferred to the Division. At the present time this duty rests with the Branch Council, and this procedure has given rise to criticism on the ground that it may lead to considerable delay. It has also been suggested that the Division Executive is in a better position to judge the candidates' suitability for membership of the Association. The Committee is recommending the transfer of this function to Divisions subject to certain reservations which are set out in para. 48 of this Report. Its recommendation is contained in Recommendation 6 on page 79.

(ii) Size of the Division

24. In order to carry out its proper functions, the Division should be large enough to include in its membership all the main fields of medical practice. It follows that there is a point below which a Division may be too small numerically or geographically to achieve this, since it is essential that the Executive Committee should, where possible, include representatives of statutory local committees, the Public Health Service, hospital staffs, and other groups within the profession. On the other hand, the Division should not be so large that it is virtually impossible for Honorary Secretaries and Chairmen, together with the members of their Executives, to maintain personal contact with the members of their Divisions.

25. The Committee has found it impossible to arrive at any definite conclusion regarding the optimum size of a Division. 150–200 has been suggested as a possible standard, but it is realized that there must be considerable flexibility to allow for geographical differences, association with hospitals, universities, etc. The very large Division, though compact geographically, presents special difficulties of organization and administration which may sometimes prove a handicap to efficiency. These difficulties have in some instances been overcome by the establishment within the Division of a "ward" system, each with its own organization and officers, but subject to the overriding control of the Executive of the Division.

(iii) Area of the Division

26. As stated in para. 21 the Committee holds strongly to the view that there should be no arbitrary determination of boundaries, but that within the limits of a generally de-

fined policy the unit should have the right to determine its own area, having regard to the convenience of its constituents. The area of the Division should be such that every member has a reasonable opportunity to attend meetings, bearing in mind the revolutionary change in methods of transport since the present Division structure was originally established.

27. To summarize: (a) The autonomy of the Division in determining its boundaries should be preserved. (b) In this determination the importance of a close relationship between the Division and other local bodies—e.g., medical societies, hospital groups, etc.—should not be overlooked. (c) Large units covering, in the main, County areas might well operate more efficiently if divided into smaller areas covering parts of the County. In large Divisions covering urban areas, the "ward" system might be preferable.

(B) Activities of Divisions

28. The answers to a questionnaire, issued to Divisions and Branches as part of the Committee's procedure, suggested a number of ways in which Divisions might improve their efficiency and their service to their members. The Committee considers that it should be for the Divisions themselves to implement the suggestions made in the following brief summary:

(i) Liaison with Local Medical Societies

29. Where active local medical or clinical societies co-exist with B.M.A. Divisions there is adequate liaison or some working arrangement in only about half the cases. The difficulties are appreciated, but much could be done by concerted action to improve the amenities offered to members. Among methods suggested are:

Representation of the Division on Local Medical Societies; joint meeting or meetings called alternately by the Division and Medical Society; invitation to members of the Division to meetings of the Society and vice versa; advertisement of meetings of medical societies through routine notices of Division meetings; the use of the B.M.A. Lecture for bringing local Medical Societies within the sphere of the Division's scientific activities.

(ii) Representation on Executive Committee of Divisions

30. The Committee stresses the importance of representation on Division Executives of all the sectional interests for which provision is made in the Model Rules of Organization framed by the Council of the Association. For instance, even if one or more members of hospital staffs are elected members of the Executive, there should be, in addition, formal representation of the Hospital Advisory Committee or Committees.

(iii) Local Liaison Committees

31. The Committee regards it as the function of every Division to see that effective liaison is maintained with recognized statutory and functional bodies in its area. In certain areas this may be achieved only by forming special liaison committees; in others the existence of such committees may well be unnecessary and the Division Executive Committee, suitably constituted, will be adequate for the purpose. The method of establishing liaison should be left to the discretion of the individual unit in the light of local conditions and circumstances.

(iv) The Use of Association Funds for Social Purposes

32. Many Divisions are handicapped and even embarrassed by the limitations imposed on them in the use of Association funds. The difficulty of collecting and maintaining voluntary funds for the provision of social amenities and hospitality is appreciated, and these funds have no permanent basis. It has become increasingly evident that the local units must be given more latitude in the expenditure of Association funds, particularly in respect of hospitality to guests and the provision of light refreshments at ordinary meetings of the Association. Action has accordingly been taken to provide Divisions with the necessary means for this purpose.

33. The Committee recommends:

Recommendation 1: That the Divisions as at present constituted should form the basic unit of the Association's constitution and that no change of area should be effected except on the initiative or with the consent of the Divisions themselves.

Recommendation 2: That while ease of access for members is of paramount importance in determining Division areas, the importance of maintaining a close relationship with local statutory or functional bodies and other local professional groups should not be overlooked.

2. THE BRANCH

34. Having confirmed the position of the Division as the basic unit of the Association's organization, the Committee turned its attention to the existing Branch structure. Its conclusion is that the present method of peripheral organization—namely, the Branch with its component Divisions—is that most suited to the needs of the Association and should be retained. This conclusion is supported by the replies received from Branches and Divisions to the Committee's questionnaire. The Committee feels, however, that the Branch structure requires to be varied so as to adapt it to the changes in medical practice which have occurred.

35. In 1901, when the present constitution, consisting of a two-tier structure composed of autonomous Divisions grouped to form Branches, was established, the division of medicine into separate branches—general practice, public health, and hospital service—had scarcely begun. Nowadays, the existence of separate fields of practice—accentuated by the National Health Service—has formed one of the main problems facing the Constitution Committee.

36. The Division caters for the individual member and his particular needs and provides a place for the discussion of his problems, whatever his form of practice. In the Committee's view, however, a further unit of sufficiently large functional area is needed, capable of co-ordinating the opinions of all sections of the profession within that area and of mobilizing its forces behind any section needing support.

37. The present Branch structure does not meet this need. The policy of grouping Divisions into Branches based on Local Government areas is unrealistic now that the functions of Local Authorities have changed considerably. In particular, it is doubtful whether many of the small Branches are capable of coping adequately with present-day problems, and, since the control of hospitals has passed out of the hands of the County and County Borough Councils, the main reason for the organization of the Branches, and particularly Division-Branches, on a County basis no longer exists.

38. Accordingly it is proposed that the Branches shall be so reorganized that they are capable of taking effective action in the new circumstances. As indicated in the "Preliminary" section of this Report, so far as the General Medical Services under the National Health Service and the Public Health Service are concerned, there has been little difficulty, under the existing machinery, in arranging for effective co-ordination of local professional opinion. It is in the field of the Hospital and Specialist Service, with its regional organization on a wide basis, that difficulty has arisen. The Branches, as at present constituted, cover widely differing areas and it is by accident rather than by design if the area bears any practical relationship to the views of members employed in the Hospital Service in the Regions can be co-ordinated with the views of their colleagues in the other two sections of professional work. This weak point in the organization must be overcome if the Association is in practice to substantiate its claim to represent the whole profession at local level. With a view to achieving the necessary strength and stability the Committee recommends that the Branches shall be reorganized on a basis corresponding in the main with the areas of the

Regional Hospital Boards. It realizes that this will involve major changes in many areas which may conflict with long-established local tradition and loyalties, but it regards this as an inevitable accompaniment of change designed to bring the whole profession together in one B.M.A. unit of sufficient size.

The Aims of Reorganization

39. The main functions of the Branch would be to co-ordinate the activities of its constituent Divisions and to provide mutual support for the views of the various units and sections of the profession within its area—Divisions, Regional Consultants Committees, Local Medical Committees, etc. In effect, in its new form the Branch would operate as a Branch Council, representative of its constituent units, with functions similar to those of the present Branch Council, modified and extended to meet present-day needs. It would hold regular meetings, though these would not be numerous, and, having important duties to perform, its meetings should attract adequate attendances.

40. The Branch Council should contain in its membership representatives of all the organized bodies in its area, and so be able to speak with authority on behalf of the profession as a whole. It would, as occasion demanded, call together *ad hoc* groups of Divisions for the purpose of discussing matters of interest to the members of the Association within the group. The grouping would vary according to the circumstances for which the combination was used.

41. As a direct result of the modification of function the Branch itself would not have individual membership as at present. Nor would it be under obligation, as is the case at present, to call general meetings, either annual or ordinary, of members of the Association in its area. It would, however, reserve the right to call a general meeting of the members of the Divisions within the Branch area should this be deemed necessary, and the members, by virtue of their membership of the Divisions, would be entitled to attend any such meeting.

42. The Branch should maintain a close relationship with the member(s) representing the constituency in the Council and should take steps to ensure that he receives copies of all notices of meetings issued by the Branch and its Divisions and a special invitation to attend when any matter of import is under discussion or an important social function is taking place. This contact is most important as providing a ready means for keeping the Branch and its Divisions informed of central policy and action and with a channel through which they can make their views known to the Council and its Committees.

43. It is an accepted principle that an effective public relations machinery is essential to the success of any organized body, and this is equally true in the case of the local units of that body. From time to time questions arise in a particular locality which, though of little national interest, are of considerable concern to the profession. It is essential, therefore, that in all areas there should exist a public relations machine in good working order. The need for this will be felt more particularly in the Divisions, but, as the immediate parent body, the Branch should accept the responsibility for seeing that the machine is there and efficiently maintained. Moreover, the Branch should be prepared, if necessary, to set up its own public relations machinery, in effective contact with the central public relations department. In this way the Branch or its Divisions, as circumstances may determine, will be in a position to deal effectively and promptly with local matters as they arise.

44. Reorganization of the existing Branch system on a hospital regional basis would have important advantages. The profession as a whole over a large functional area would be able to speak with one voice and representatives of the different groups within the area could meet to discuss common interests. A closer link would be formed between hospital staffs and the Association, while not interfering with the existing regional machinery through which

consultants and specialists make their views known to their central negotiating bodies. It would help the member of Council representing the area and the member of the Headquarters medical secretariat appointed for the area to keep in close touch with their constituencies. It might be argued that there would be difficulty in arranging effective meetings in such large areas as hospital regions. This difficulty has, however, been overcome in the consultant field and there are good records of attendance at meetings of Regional Consultants Committees. Presumably other members would be prepared, on occasion, to travel relatively long distances, particularly as most regions are based on a university city, which is also a centre of communications. The proposed reorganization would, as indicated previously, have certain disadvantages, the chief of which is the inevitable conflict with long-established local tradition and loyalties. It is believed, however, that as in the past these difficulties will be overcome in the interest of the efficient working of the Association machine.

Function of the Branch

45. Implementation of the proposals for revision of the Branch organization involves a restatement of the functions of the Branch. At present these functions, as defined in By-law 25, are: (1) Co-ordination of the work of Divisions; (2) management of affairs of inactive Divisions, and their reactivation; (3) reporting to Council as to local conditions; (4) election of new members to the Association; (5) provision of Divisional funds out of grants from Headquarters.

46. The first of these functions—the co-ordination of the work of the Divisions—is an essential corollary to the main function of the proposed new Branch—namely, to unite the three branches of the profession into one body.

47. In pursuance of this duty (and following the majority view of the Divisions as ascertained by the Committee), the Branch should retain the responsibility for managing the affairs of inactive Divisions and facilitating their revival; it should also continue to report to the Council on conditions within the Branch area, without prejudice to the passing of information to Headquarters through other existing channels of communication, namely, through the Division, the local member of Council, and the Assistant Secretary assigned to the area.

48. As regards the other functions mentioned, many Divisions feel that the election of new members should be in their own hands and that in financial matters they should deal direct with the Central Office. The Committee has accepted in principle that the election of candidates for membership of the Association should rest with the Division, subject to certain reservations. These are, (a) that in the event of objection by the Division to the election of a candidate the matter should be referred to the Branch Council; and (b) that the election of newly qualified candidates for membership should be carried out by the Central Council. There are good reasons for placing the election of newly qualified candidates in the hands of the Central Council. These candidates are "birds of passage" during the first years of their professional career and particularly during the pre-registration year, which they must spend in two or more hospital appointments. It is essential that they should be brought within the sphere of the Association immediately on qualification and that their election to membership should not be subject to unnecessary delay. For this reason the Committee is strongly in favour of central election.

49. The Committee does not accept the suggestion that the existing method of financing the Divisions should be changed. It feels that so long as the Branch retains certain functions in respect of co-ordination of activities and the resuscitation of inactive units, it should retain the responsibility for financing the Divisions.

50. Stated briefly, the functions of the Branch under the revised constitution would be: (1) *To foster and maintain the unity of the profession within its area by means of exchange of views*; and, with this end in view, (2) *To take*

appropriate and immediate action in support of any section of the profession within its area when requested to do so. (3) *To report such action to Headquarters with a view to active measures by the whole profession if necessary.* (4) *To co-ordinate the work of the Divisions within its area.* (5) *To manage the affairs of inactive Divisions and promote their activity.* (6) *To organize special groups of Divisions for special purposes.* (7) *To provide the Divisions with funds, out of grants from Headquarters.* (8) *To be responsible for maintaining efficient public relations machinery, including the setting up of such machinery in any part of its area where the efforts of the Division have proved not to be effective.* (9) *To report to Council as to local conditions, without prejudice to other existing channels of communication.* (10) *To maintain an effective liaison with the members of Council representing the constituency.* (11) *To elect members of the Association when, and only when, referred by a Division within its area.*

Scheme for Reorganization

51. Accepting the assumption that change is needed to meet changed conditions, the form of organization suggested retains the two-tier peripheral structure which has in the past formed such a successful part of the Association's constitution. In general, the regrouping of Divisions to form Branches conterminous with part or the whole of a hospital region presents no great difficulty, but flexibility is necessary to deal with the few exceptional circumstances. For instance, where, under the proposed scheme, a Division is not wholly included in one Branch area, it will have the right to choose to which of the two Branches concerned it will belong, but it will also be represented on the Council of the other. Also where, as in some areas, Divisions form a natural and clearly defined geographical unit, it may be necessary to regroup them either within or side by side the new Branch structure.

52. It is difficult in some areas to avoid a three-tier organization. This already exists in the case of the Scottish and Welsh Committees, but these Committees have special functions additional to those ascribed to the Branch in the preceding paragraphs. Wales is perhaps the simplest example of the need for compromise. Because of the difficulty of communication between north and south, the existing Branches may have to remain, while the Welsh Committee will assume the role of Regional Council. The Border Counties and the Metropolitan Counties Branches are also examples of a problem which cannot be solved by adherence to a rigid two-tier structure.

53. Further, where established Branches within a region wish to retain their identity they should be given the opportunity to do so, in spite of the fact that this may necessitate, on rare occasions, the setting up of Liaison Committees. Examples are: North of England and Tees-side Branches within the Northern Region; South-Western Branch within the South-Western Region; and Sussex and Border Counties Branches, which are each divided by regional boundaries.

54. The formation *ad hoc* of Liaison Committees for concerted action by the two Branches within a Region would not necessarily imply a three-tier organization. The Liaison Committee would not be an organized unit, but could be called together if and when need arose. If therefore, as seems unavoidable, a modified three-tier structure should be needed in certain areas—that is, Division: *existing Branch*: Regional Council—the question arises, which of the latter should take over the functions now envisaged for the Branch?

55. Clearly, for the sake of consistency, the word "Branch" should be retained to describe the new Regional unit. The problem remains to find a designation for the intermediate organized group of Divisions in those instances where the existing Branch wishes to retain its identity. This has proved very difficult, but in the detailed scheme appended the word "Group" has been used to indicate the retention within the new Regional unit of an existing Branch rather than an *ad hoc* functional group of Divisions formed for a specific purpose. In the main these Groups retain

the titles of the original Branches from which they are derived.

56. The proposed plan for reorganization of the Branches is appended (Appendix B). It will be seen that its effect is to reduce the number of Branches in Great Britain and Northern Ireland from 46 to 42. In Scotland there will be little change except for the elimination of the Division-Branch. In Northern Ireland there will be no change. The Groups may, or may not, prove to be permanent structures, depending on a number of factors such as tradition, ease of access, local options, etc.

57. The Committee recommends:

Recommendation 3: In order to maintain the unity of the profession within the Association in the changed circumstances created by the establishment of a National Health Service, the second tier unit—i.e., the Branch—should be reconstituted on a regional basis. The regions should, as far as possible, follow those of the Regional Hospital Boards under the National Health Service.

Recommendation 4: That the Branch, as reconstituted, should have as its main object the fostering and maintenance of the unity of the profession within its area. Its functions should, in effect, be those of the present Branch Council, modified and extended to meet present-day conditions. For this reason the Branch would not ordinarily hold meetings of the individual members in its area. Its main duty would be to call together its constituent Divisions, or the professional groups within its area, for an exchange of views. It would reserve the right to call a meeting of individual members on a particular occasion if deemed necessary or expedient.

Recommendation 5: That the functions of the Branch, as reconstituted, should be as follows, and that the necessary amendments to the By-laws be made to give effect to these proposals:

(1) *To foster and maintain the unity of the profession within its area by means of exchange of views.* (2) *To take appropriate and immediate action in support of any section of the profession within its area when requested to do so.* (3) *To report such action to Headquarters, with a view to active measures by the whole profession if necessary.* (4) *To co-ordinate the work of the Divisions within its area.* (5) *To manage the affairs of inactive Divisions and promote their activity.* (6) *To organize special groups of Divisions for special purposes.* (7) *To provide the Divisions with funds, out of grants from Headquarters.* (8) *To undertake responsibility for the establishment and the maintenance of efficient public relations machinery in the Divisions within its area; and if necessary to establish Branch machinery.* (9) *To report to Council as to local conditions, without prejudice to other existing channels of communication.* (10) *To maintain an effective liaison with the member(s) of Council representing the constituency.* (11) *To elect members of the Association when, and only when, referred by a Division within its area.*

Recommendation 6: That Article 3 and By-laws 5, 6, and 7 be altered to provide that the election of new members shall ordinarily be by Divisions with the right of reference to Branch Councils, save that in the case of newly qualified applicants election shall be by the Council.

Recommendation 7: That the (provisional) scheme for regrouping of Divisions to form Branches on a regional basis be approved.

Constituencies for Election of "Forty" Members of Council

58. The Committee has considered the effect of its proposals for reorganization of the Branch structure on the procedure for the election of the "forty" members of Council. Under By-law 55 the election is now carried out by constituencies formed by grouped Branches or Divisions. This procedure has proved satisfactory and there seems no

logical reason for change, as the proposed Regional Scheme would continue to provide a rational grouping. The constituencies could be adapted to the proposed Branch structure with very little change and without altering the existing criteria, namely: one member of Council for a constituency of up to 1,600, two for a constituency of up to 2,600, etc. There is one exception. Because of the size of the area and particularly its peculiar geographical difficulties, it is proposed that the South-Western Branch, which on a strict numerical basis would be entitled to elect two members to the Council, should have a quota of three, one of whom will be elected by the Divisions in Devon and Cornwall. The effect of this variation will be to increase the number of directly elected members of Council from 40 to 41, and it will necessitate amendment of By-law 53, which specifies the constitution of the Council. The suggested regrouping is appended (Appendix C).

59. The Committee recommends:

Recommendation 8: That the revised grouping of Home Branches to form constituencies for the direct election of members of Council (Appendix C of Report) be approved; and that By-law 53 be amended so as to increase the number of such directly elected members from 40 to 41.

II. THE REPRESENTATIVE BODY

A. Constitution

(i) Size of the Representative Body

60. The terms of reference of the Constitution Committee conclude with the phrase "with special reference to the reorganization of the Representative Body." Paragraphs 3 and 4 of the Report set out in some detail the reasons which have led to the conclusion that this reorganization is due, if not overdue. Summarized they are:

(i) That the great increase in membership of the Association without alteration of the numerical basis of representation in the Representative Body has caused that Body to grow to a size which, in itself:

(a) hampers efficiency and makes it more difficult to complete, within the allotted time, an Agenda which has lengthened considerably following political developments affecting the profession; (b) severely limits the choice of place at which the Annual Meeting can be held, thereby depriving many Divisions of the privilege of acting as host to the Representative Body; (c) increases the number of potential speakers at the Meeting, thereby interfering with the conduct of business.

(ii) That with the growth in size the representation given to the larger Divisions under By-law 39 appears to be disproportionate in comparison with that of the smaller constituencies.

61. By-law 39, which determines on a numerical basis and with no maximum the number of Representatives to be returned to the constituencies, was drawn up when the membership of the Association was much smaller than it is to-day. In the circumstances then existing there was no danger of the Representative Body reaching a size which might hamper its efficiency or which might give rise to practical difficulty in the matter of accommodation. The present picture is entirely different—in 1956 the size of the Representative Body was approximately 500, as compared with 366 in 1938. In the view of the Committee the situation is now such that the Representative Body is unwieldy in character, with detriment to the efficient conduct of its business and with the risk that matters of vital importance to the profession may not receive the consideration they merit. Bearing in mind the debate in the Representative Body which preceded its formation, the Constitution Committee, after considerable discussion, has reached the conclusion that in order to secure maximum efficiency in the conduct of business a reduction in the size of the Representative Body is essential.

62. The Committee has given due weight to the following arguments which have been put forward in opposition to this view:

(i) Reduction in size with, in a large number of cases, reduction in the number of Representatives which a constituency may return, would exclude from participation in the Meeting younger members of the profession whom it is desirable to attract to central work. These members, while willing and anxious to accept appointment as Representatives in association with senior members of the Divisions, would not be willing to compete for appointment with their senior colleagues. Further, members of the Central Council and Committees are largely recruited from the ranks of the Representative Body, and restriction in size would limit the field of recruitment of central workers to the Association.

(ii) Reduction in size would not be accompanied by a comparable reduction in the number of speeches, for it is unusual for more than one Representative from a constituency to speak to a Motion.

(iii) The statement that the size of the Meeting leads to a loss of efficiency in the conduct of the business can be challenged, though an advantage in reduction in cost to the Association must be conceded.

(iv) The difficulty of finding accommodation is not sufficiently serious to warrant a reduction in size.

(v) Reduction in size would lead to a greatly increased demand for use of the Card Vote.

63. The Committee appreciates the argument that there might be some loss of educational opportunity through restriction in the size of the Representative Body, though it is not willing to accept the contention that such loss is inevitable. The proportion of younger members of the Representative Body has increased considerably in recent years, and there is no evidence that these members are appointed in the main by the large constituencies. Moreover, the Representative Body is not the only source of recruitment to central work. A substantial proportion of the members of Committees are elected by the Council and Branches, and Divisions should accept the responsibility for seeing that their representatives on the Central Council are kept informed of suitable candidates for appointment and should arrange for their nomination. Finally, the increase in size of the Branch Council which will result from the revised constitution of the Branches recommended by the Committee will provide increased opportunity for the keen younger member to become acquainted with the work of the Association, and to pass from peripheral to central work. The Committee does not admit the validity of the other arguments, and so far as the card vote is concerned the Committee proposes safeguards governing its use which it considers would obviate any risk of abuse of the procedure.

64. The Committee has reached the conclusion that the most suitable size for a body with an Agenda of the nature of that presented each year to the Representative Body is approximately 350. This number represents a satisfactory mean between an overlarge body and one which is too small to provide adequate representation. The Committee has examined alternative methods of representation of the U.K. Divisions within the suggested figure of 350, and it does not propose any alteration in the present system of basing constituencies on individual Divisions. Indeed, it maintains the view that, so far as possible, each Division of the Association in the U.K. should be a separate constituency and that reduction in the size of the Representative Body should not be brought about by an extension of the practice of combining Divisions to form constituencies. Having accepted this principle, the Committee has suggested an alteration of the numerical basis of representation to provide a Representative Body with a membership of approximately 350.

65. The Committee has considered various methods of proportional representation within the proposed overall membership, and the scheme finally adopted is shown in Appendix D, with the 1956 figures for comparison. Under existing Regulations each constituency is entitled to elect one Representative for a membership of less than 150, with one

additional Representative for every extra 100 members or part of 100 above that number. The proposed scheme provides for one Representative for the first 200 members in a constituency and one additional Representative for every 250 members or part of 250 above that number. Allowing for Overseas Representatives and for the normal absentee rate, estimated to be in the region of 10%, this scheme would produce a Representative Body with a membership of approximately 350. The Committee is convinced that its proposals provide the only satisfactory way in which a suitable reduction in the overall size of the Representative Body can be achieved.

66. It may appear at first glance that adoption of the revised scheme of representation would entail considerable sacrifice on the part of the large Divisions, with no commensurate sacrifice on the part of the smaller Divisions. This is not so, for, as is shown in Appendix D, with the exception of the small constituency of under 150 members, sacrifice is entailed in every group. The Committee recommends:

Recommendation 9: (a) That the number of Representatives of Home Divisions in the Representative Body be reduced by an amount which will ensure an overall membership of that body of approximately 350. (b) That the Scheme for the formation of Home Constituencies for the appointment of Representatives to the Representative Body, set out in Appendix D, be substituted for that laid down in By-law 39; and (c) That By-law 39 be amended accordingly.

(ii) Voting Strength

67. In approving the scheme, the Committee has considered the possibility of dissatisfaction which might occur in large constituencies as a result of reduction in the number of Representatives which such a constituency might return, and also a suggestion made by one large Division that, in order to maintain proportional voting strength, the use of the card vote under By-law 49 should be extended to include not only matters of policy but also the election of Standing Committees. The Committee does not consider that its proposed scheme would seriously affect voting strength, but is of the opinion that the existing provisions for vote by roll call or by card should be retained.

(iii) Card Vote

68. Arising from this decision, the Committee has considered whether the demand for the card vote should be taken before or after the vote on a motion by show of hands. It was pointed out that in the latter case a card vote would probably be demanded only where the majority in favour of a motion on a straight vote had been a narrow one. It was further contended that the use of the card vote after the taking of an ordinary vote might, by reason of the voting strength of the large Divisions, result in a decision of the majority of the members of the meeting being reversed and action being taken which the Representative Meeting as a whole had declared by straight vote that it was not prepared to take.

69. Before coming to a decision, the Committee has examined the procedure adopted by other large bodies (e.g., the T.U.C. and the N.U.T.) in conducting their annual meetings. In most cases use is made of the card vote only as a challenge to a vote taken. After full consideration the Committee has decided that a similar system would be preferable in the case of the B.M.A., and that the card vote should be taken after the vote on the motion, on a demand by one-third of the Representatives present and voting. It is also the view of the Committee that the existing procedure in the By-laws for conducting the card vote, although time-consuming, is eminently satisfactory for the purpose for which it was designed and should be retained. The Committee recommends:

Recommendation 10: That By-law 49 be amended to provide that if, on a vote having been taken, a vote by card is demanded by one-third of the Representatives present, the vote shall be taken by card.

(iv) Representation of Special Interests in the Representative Body

70. The Committee has considered a request from the Central Consultants and Specialists Committee that it should appoint representatives to the Representative Body.

71. The main points submitted in favour of special representation are:

(i) It would increase confidence among consultants and specialists in the responsibility and authority of the Representative Body. The Representative Body is composed in the main of Representatives elected by Divisions with a majority of general practitioners in their membership. Consequently, the Representative Body is not fully informed of the problems confronting those engaged in the hospital and specialist service under the N.H.S. Act. On the other hand, the Central Consultants and Specialists Committee, whose duty it is "to consider and act" on matters affecting those engaged in the Hospital Service, draws its peripheral members (42 out of a total Committee membership of approximately 74) from the Regional Consultants Committees. These members, well versed in the problems arising in the Regions, have no direct access to the Representative Body, other than by "accidental" appointment as Representative by a Division.

(ii) Direct representation would enable the consultants and specialists to feel that they are taking a greater part in the framing of Association policy.

(iii) The burden on the Chairman of the Committee in presenting his report to the Meeting would be eased if he had the support and assistance of a small number of representatives appointed by his Committee. It may be argued that the Chairman of the General Medical Services Committee, who holds an analogous position in the field of general practice, finds no difficulty in obtaining adequate assistance from members of his Committee who represent Divisions in the Representative Body. For the reasons given this assistance is not available in the same way to the Chairman of the Central Consultants and Specialists Committee. Moreover, although there might be a small number of members of the Committee appointed to the Representative Body as Representatives of Constituencies, they might feel handicapped in dealing with consultant and specialist questions, being bound to some extent by the instructions of their Divisions.

(iv) There is a precedent for special representation in the Public Health field.

72. Against these arguments it has been claimed:

(i) That there is no evidence that the Representative Body is not effectively informed regarding questions relating to the hospital and specialist services.

(ii) That the Central Consultants and Specialists Committee itself represents many diverse interests and special Groups whose views could not be more effectively presented by the addition to the membership of the Representative Body of a very small number of members appointed by the Committee.

(iii) That extension of the principle of sectional representation would inevitably lead to demands from quite minor groups for representation of their special interests.

(iv) That there is no evidence that the representation in the Representative Body of those engaged in the hospital service or in specialist practice is inadequate. At the Glasgow Meeting in 1954 there were 75 consultant members, as compared with 281 general practitioners, thus giving adequate opportunity for expression of the consultant and specialist view. In these circumstances there could be no justification for special representation of consultants.

73. The Constitution Committee has discussed the need for special representation on a sectional basis with the Standing Committees which are concerned with defined fields of practice—namely, the Central Consultants and Specialists, General Medical Services, Public Health, Private Practice, and Occupational Health Committees. There is already provision for special representation of Public Health Service

members, and the Public Health Committee regards the present position as satisfactory. Of the other Committees, the Central Consultants and Specialists Committee alone feels the need for appointment to the Representative Body of members who would speak as members of the Committee and not as representatives of their Divisions.

74. After protracted discussion, in which the Chairman of the Central Consultants and Specialists Committee has taken part, the Committee sees no reason to modify the principle that the Representative Body must be one predominantly representative of the Divisions. In the course of the discussion it has, however, become clear that the problem is one of presentation of special points of view rather than increase in the voting strength of a minority group. Numerical strength and voting power are secondary considerations, and in a body the size of the Representative Body a very small addition to the number of members would make no significant difference. The right of the specially appointed Public Health Service representatives to vote as members of constituencies has never been challenged.

75. The Committee feels that a strong case has been put forward, and that the advantages to be gained by acceding to the request of the Central Consultants and Specialists Committee outweigh possible disadvantages. Bearing in mind that a precedent for special sectional representation already exists, and that the chief aim is to effect a closer integration of an autonomous Committee with the Representative Body, the Constitution Committee suggests that provision should be made for the appointment of four Representatives by the Central Consultants and Specialists Committee. Accordingly, it recommends:

Recommendation 11: That By-laws 38-44 (which deal with the composition of and election to the R.B.) should be amended to provide for the election of four members of the Association by the Central Consultants and Specialists Committee as Representatives in the R.B.

B. The Quorum of the Representative Body

76. The quorum of the Representative Body is at present "one-half of the number of representatives appointed to attend the meeting" (By-law 50). It has been suggested that, owing to the great increase in size of the Representative Body consequent upon the increased membership of the Association, this By-law is now unrealistic and is, in fact, honoured in the breach rather than in the observance. The Committee concurs with this view, and recommends:

Recommendation 12: That the quorum of the Representative Body (at present "at least one-half of the number of Representatives appointed to attend the Meeting") should be reduced to 75 such Representatives.

C. The Conduct of Business at Representative Meetings

1. Functions and Powers of the Agenda Committee

77. *Constitution of Committee.*—The constitution of the Agenda Committee, as laid down in S.O.21 of the Representative Body, has been reviewed, and it is considered that no alteration is necessary. Under the Standing Order the Agenda Committee is composed of the Chairman and Deputy Chairman of the Representative Body, the Chairman of Council, and four members elected by the Representative Body. The Committee has power to co-opt up to four Chairmen of Standing Committees, having regard to the nature of the business coming before the Representative Body. The Committee recommends:

Recommendation 13: That the existing constitution of the Agenda Committee, as laid down in S.O.21 of the Representative Body, is satisfactory and should be retained.

78. *Meetings of Agenda Committee.*—S.O.21 of the Representative Body provides that the Committee "shall meet at intervals during the Meeting to examine the progress made, and, if necessary, to make recommendations to the Meeting." The Committee is of the opinion that S.O.21 should be amended to provide that the Committee should

meet at a convenient time each day to review progress and business outstanding and to advise the Chairman. The Committee recommends:

Recommendation 14: That S.O.21 of the Representative Body be amended to provide that the Agenda Committee shall meet during each day's session of the Representative Body, at a time to be arranged, to review progress and the business outstanding, and to advise the Chairman.

79. *Grouping of Motions.*—Under the Standing Orders, the Agenda Committee is empowered to group motions or amendments which cover substantially the same ground and to mark with an asterisk the motion in the group on which it proposes that the discussion should take place. The Representatives of the constituencies concerned may select this motion or an alternative motion in the group for discussion, or may agree on a common form of motion to cover the group. The Committee considers that the powers of the Agenda Committee should be extended to enable it to submit a common form motion in cases where it considers that the principle covered by the motions in the group is not adequately stated in any single motion. This would be without prejudice to the right of any Representative to speak to his original motion as an amendment to the common form motion. The Committee recommends:

Recommendation 15: That the powers of the Agenda Committee under S.O.21 of the R.B. in respect of the grouping of motions or amendments be extended to enable it to submit a motion in a common form in cases where it considers that the principle covered by the motions in the group is not adequately stated in any single motion; such extension of power to be without prejudice to the right of any Representative to speak to his original motion as an amendment to the common form motion.

80. *Priority Motions.*—The Committee has discussed a proposal for the institution of "priority motions" which would be debated at stated times in the proceedings. Where a motion related to a Committee Report was given priority it would be taken at the time stated and the remainder of the Report in its due order at a later stage in the proceedings. The priority motions would be printed on a separate sheet in addition to appearing in their appropriate place in the main Agenda. Against the proposal, it was suggested that the breaking up of the work of a Committee into priority motions and "the remainder" might embarrass the Chairman of the Committee concerned and the continuity of his work, with detriment to the proceedings of the Meeting.

81. The Committee has decided, therefore, not to recommend any hard and fast rule, but that provision should be made for the introduction, as necessity requires, of a scheme of priority motions on the lines indicated to deal with questions of outstanding importance. The Committee recommends:

Recommendation 16: That the Agenda Committee be empowered, as necessity arises, to give priority to motions on questions of outstanding importance and to arrange for these to be debated at specified times.

82. *Pruning of Agenda.*—The possibility of elimination from the Agenda of motions submitted by Divisions on matters which had already been the subject of action by Central Committees has been discussed. It was suggested that the Agenda Committee should be given power to inform a Division submitting a motion of this kind of the action already taken, and that, unless the Division wished to oppose that action or could offer a reason satisfactory to the Agenda Committee for proceeding with the motion, it would be excluded from the Agenda. However, considerable doubt was expressed in the Committee regarding the wisdom of so curtailing the liberty of the Divisions in this way. The number of such motions must in the nature of things be small, and there is much to be said for their inclusion in the Agenda in order that the Division concerned may be given an opportunity to ventilate some matter which it considers important. A proportion of the motions might

be eliminated by reference to the appropriate member of the central secretariat, who would inform the Division of the action already taken, or by consultation during the course of the Meeting with the Chairman of the Committee, as a result of which the motion might be withdrawn. The Committee recommends:

Recommendation 17: That elimination from the Agenda of the Representative Meeting of motions submitted by Divisions on matters which have already been the subject of action by Central Committees is not advisable; and that Divisions should retain the right to submit to the Representative Body motions on any matters which they consider of sufficient importance for debate.

83. *The Order of the Agenda.*—Standing Order 21 lays down the procedure for the placing of motions on the A.R.M. Agenda. The Standing Order instructs the Agenda Committee

"... so to arrange the Agenda that only those motions by Divisions and Branches strictly relevant to the several paragraphs of the Annual or Supplementary Reports of the Council be considered with such paragraphs; and that all motions by Divisions or Branches on matters not strictly relevant to any paragraphs of the Annual or Supplementary Reports of the Council be placed in appropriate order on the Agenda after the motions proposing final approval of the Annual and Supplementary Reports of the Council have been considered. Provided always,

"(A) That motions by Divisions or Branches which call for reports on matters previously referred to Council shall be placed on the Agenda before motions proposing the approval of Annual or Supplementary Reports of Council. . . ."

84. In giving effect to the Standing Order, it has been the practice so far as this is possible to relate all motions submitted for the Agenda to individual paragraphs of the Annual Report of Council. As in a number of instances the relationship is extremely vague, this procedure involves the expenditure of considerable time and ingenuity. The Committee recommends:

Recommendation 18: That the procedure laid down in S.O.21 of the Representative Body should be strictly observed.

2. *Time Limit of Speeches and Presentation of Report by Chairmen of Committees*

85. The time limit of speeches is laid down in Standing Order 31 of the Representative Body—15 minutes for a Chairman of a Committee in presenting his Report; seven minutes for the mover of a resolution; five minutes for other speakers. There is no provision for extension of time, but it has been the custom to allow a Chairman of a Committee to overrun the time limit, at the discretion of the Chairman of the Representative Body and with the permission of the Meeting. In order better to control the proceedings, the Committee is of the opinion that S.O.31 should be amended so as to limit the amount of extended time given. It therefore recommends:

Recommendation 19: That the Chairman of a Committee may on request to the Chairman, before presenting his Report, and with the permission of the Meeting, be granted an extension of time up to half the period allowed under S.O.31 for presentation of the Report, save that in exceptional circumstances he may be granted such further extension of time as the Meeting itself shall predetermine.

It is not proposed that there should be any alteration in the times of other speeches as laid down in the Standing Order.

86. In connexion with the foregoing, the Committee has considered the custom which has grown up in recent years of allowing a Chairman, on the motion for reception of his Report, to speak to the whole of the Report, notwithstanding

ing the fact that there might be included in the Agenda motions relating to particular paragraphs on which he would have a further opportunity of speaking. Further, where amendments to particular paragraphs of the Report are concerned, it is necessary (under present practice) for the Chairman of the Committee to move the adoption of the relevant paragraph before the amendment is put to the Meeting. As he also has the right to speak to the amendment if he so desires, both the Agenda and business of the Meeting are lengthened.

87. The procedure laid down in S.O.24 of the Representative Body in respect of the presentation of Reports is as follows:

"24. Presentation of Reports.—The Report of the Council or of a Committee shall be presented by the Chairman, or, in his absence, by a Member, of the body submitting such Report, who shall move: (i) that the Report be received; (ii) that the Recommendations, if any, be adopted; (iii) that the rest of the Report be approved. The adoption of each Recommendation shall be the subject of a separate motion. The approval of the rest of the Report shall be moved as a whole, unless the Chairman rule, or the Meeting resolve, that the approval of each paragraph, or of any specified paragraph, be the subject of a separate motion."

The Committee recommends:

Recommendation 20: That the procedure laid down in S.O.24 of the R.B. for presentation of Reports should be adhered to strictly and that the practice of moving the adoption of individual paragraphs of the Report of Council to which amendments are proposed, before the amendment is moved, should be discontinued except in the circumstances indicated in the Standing Order.

3. *Public and Private Sessions of the Representative Body*

88. The Committee has reviewed the practice of some other bodies of holding both public and private sessions. It considers, however, that the existing method of "going into Committee" by the Representative Body on the rare occasions when it is desired to exclude the Press is adequate, and that no action is necessary.

4. *Other Proposals*

89. The Committee's attention has been drawn to the difficulty experienced by the Chairman while conducting the Meeting in dealing with amendments handed up to the platform, in that his attention may be, and often is, distracted from an important debate in progress. In order to facilitate the proceedings of the Representative Body arrangements are to be made for a member of the medical secretariat to be available to the Representatives to receive amendments submitted from the body of the Hall, to examine and advise upon them in the first instance and to pass them to the Chairman.

90. Other suggestions for reducing the burden of work now falling on the Representative Body have been considered. These include a proposal that there should be two meetings of the Representative Body—the first at the London Headquarters at a fixed time each year to deal with motions relating to domestic matters; and the second in conjunction with the Annual Meeting to deal with matters of major Association policy. After careful examination the Committee does not consider such a proposal to be practicable or advisable and is firmly of the view that the existing procedure whereby the Representative Body meets in one complete session should be retained. Similarly the Committee has rejected a proposal that in order to make it possible for the A.R.M. to take place on a prescribed date each year it should invariably be held at Headquarters in London.

III. GENERAL MEETINGS OF THE ASSOCIATION

91. These Meetings, which are prescribed in the Articles of the Association, fall into two categories—(a) the Annual General Meeting, and (b) Extraordinary General Meetings.

Annual General Meeting

92. As the name indicates this meeting must be held in each calendar year in addition to any other General Meetings held, and not more than fifteen months must elapse between the date of one Annual General Meeting and the next. The notice to be given and the business to be transacted is clearly defined in the Articles and it is the duty of the Council to arrange the order of the items of business and the times at which they shall be transacted.

93. The Committee has scrutinized in detail the terms of the relevant Articles and is of the opinion that they do not call for revision.

Extraordinary General Meetings

94. These are all General Meetings other than the Annual General Meeting of the Association. Under the Articles the Council has power to call an Extraordinary General Meeting at any time at its discretion and must call such meeting upon a requisition in writing, made under conditions prescribed in the Articles, by 100 or more members. The requisition and notice must state the object for which the meeting is called.

95. In May 1953 an Extraordinary General Meeting was called on requisition on a matter arising out of the Distribution Scheme which followed the Danckwerts Award. The circumstances revealed an anomaly in the Articles of the Association. It appeared that a resolution of an Extraordinary General Meeting called on requisition under the terms of Articles 24–26 which was opposed to a policy resolution adopted by the Representative Body would be invalid and ineffective under the terms of Article 37. Article 37 vests in the Representative Body "the general control and direction of the policy and affairs of the Association." This interpretation of the Articles was confirmed by Counsel as correct, and in these circumstances he was asked to advise as to the possibility of so amending the Regulations as to make it impossible for an Extraordinary General Meeting to be requisitioned for consideration of a matter within the province of the Representative Body as defined by Article 37. Counsel's opinion is that the Articles can validly be altered as suggested and he has advised as to the form of resolution to be used. This is incorporated in the recommendation which follows. In expressing his opinion, Counsel has pointed out that there might be difficulty in interpreting the Article as amended in a particular case.

96. The Committee feels that the existing position is quite illogical and that any possible difficulty of interpretation in a particular case should not be allowed to stand in the way of regularizing the situation. Moreover, it should not be overlooked that it is within the power of members of the Association who are dissatisfied with Association policy to demand the calling of a Special Representative Meeting. By-law 46 reads:

"46 (1) Representative Meetings, other than the Annual Representative Meeting, shall be styled Special Representative Meetings, and shall be convened at any time by the Chairman of the Representative Body on the requisition of the Council, or on the requisition of not less than twenty Constituencies. (2) At least fourteen days' notice of such Meeting shall be given in the *Journal*, and such notice shall indicate the object for which such Meeting is convened. (3) No business shall be dealt with by a Special Representative Meeting other than that for which it is specifically convened."

97. The Committee recommends:

Recommendation 21: That the Articles of the Association be altered by adding at the end of Article 24 the following words:

"for the purpose of considering any matter other than a matter which affects the general control and direction of the policy and affairs of the Association."

(As amended the Article would read: "24. The Council may whenever it thinks fit and (without prejudice to the provisions of the Companies Act, 1948) it shall upon a requisition made in writing as hereinafter provided by any one hundred or more Members convene an Extraordinary General Meeting for the purpose of considering any matter other than a matter which affects the general control and direction of the policy and affairs of the Association.")

IV. THE ANNUAL SCIENTIFIC MEETING

98. Article 30 instructs the Council to arrange at least once a year a Scientific Meeting: one such meeting to be convened at the same place as the Annual General Meeting of the Association but so as not to conflict with it. By long custom this Annual Scientific Meeting has followed immediately upon the Annual Representative Meeting. It has been suggested that this custom detracts from the importance of the Scientific Meeting in that the attention of the press is focused on the medico-political proceedings, with possible restriction of the publicity given to the scientific activities of the Annual Meeting and a loss of prestige to the Association as a body having as one of its main objects the "promotion of the medical and allied sciences." Further, the Annual Representative Meeting in 1955 requested the Council (Minute 270) "to investigate the possibility of combining the Scientific Meeting and the Annual Representative Meeting so that all members of the Association might have the opportunity of taking part in both the scientific and the medico-political activities of the Association."

99. Two possible methods of dealing with the problem have presented themselves to the Committee, and these have been examined in considerable detail. They are: (a) that the Scientific Meeting should be held concurrently with the Annual Representative Meeting, and (b) that the present order of the two meetings should be reversed and the Annual Scientific Meeting be held immediately preceding the A.R.M.

100. There are practical difficulties in the way of adopting the first suggestion, and these fall mainly into two categories: (i) the time factor; (ii) the additional accommodation required. The effect of holding the two meetings concurrently would be to lengthen the period of the proceedings, and to ensure success all those attending, whether at the A.R.M. or at the Scientific Meeting, would be compelled to remain for the whole period. Quite apart from the expense involved, it is extremely unlikely that many Representatives would find it possible to be away from their practices for so long, and the strain on the hotel accommodation, already acute in most of the places in which the Annual Meeting is held, would be such as to make the situation extremely difficult.

101. This avenue having been exhausted, the Committee next turned its attention to the proposal that the Annual Scientific Meeting should precede the A.R.M.; but here again it was faced with insuperable difficulties. It has examined various schemes for rearranging the major events of the Annual Meeting—business, scientific, and social—but has been unable to find one which would meet the convenience of those attending the Scientific Meeting and the Annual Representative Meeting but would not at the same time jeopardize the success of some of the events considered indispensable to the Meeting and of the various evening functions.

102. The Committee has reluctantly been forced to the conclusion that any attempt to vary the present order of the proceedings of the Annual Meeting would create more anomalies than it would solve, and that the difficulties inherent in arranging a satisfactory programme are such as to outweigh any possible advantages. Its considered view is that the existing arrangements should be retained. Another possible method of bringing the scientific activities of the Association into their right perspective is, however, dealt with in the following paragraph of this report.

A Second Scientific Meeting

103. It is proposed that there should be held annually a second scientific function, short, concentrated, and of high professional standing. The meeting would occupy a long week-end, would take place midway between Annual Meetings as the most suitable time (i.e., early in December) and would normally be held only in those towns which could not accommodate the Annual Meeting of the Association. The number attending would vary with the town chosen, but it is estimated the average would probably be in the region of 250 visitors, with an equal number from the area.

104. The programme might take the following form: One Plenary Session. One General Session. Two Round-Table Conferences. Clinical Demonstrations in hospitals, clinics, etc. Medical films, or possibly clinico-pathological conferences.

105. Speakers at the plenary and general sessions would be chosen on a national basis. There would be no individual Scientific Sections. Sessions would not be permitted to overlap, in order to ensure a good audience. Clinical demonstrations would be staged in small batches by the local profession.

106. There would be an initial social evening function, but no further social events. Those attending would make their own hotel arrangements, and it is hoped that private hospitality would be available for those desiring it.

107. As the requirements of the meeting would be modest in nature the cost to the Association would be moderate—possibly an average of £200 or even less. Equally the cost to those attending, apart from travel, would be low and within the means of the majority of practitioners, including the young and less well-to-do.

108. The advantages of the Meeting would be considerable:

(a) to the Association in an increase in scientific status, both within the profession, with the professional organizations, and through the press with the public;

(b) to B.M.A. members in the provision of a concentrated meeting of high scientific attainment at lost cost;

(c) to the local B.M.A. units, in demonstrating to members and others living in the area that the Association has a direct interest in the individual member and in his clinical activities. The member would be afforded the opportunity to meet and hear some of the most eminent in the profession and also of making contact with practitioners from other parts of the country. The importance of the local Division would be enhanced, and a closer and more intimate relationship would be established between the Division and Headquarters. Local interest in the activities of the Association would be stimulated and the various branches of the profession in the neighbourhood would be brought into closer contact in organizing the programme.

109. The Committee strongly supports the proposal for a second Scientific Meeting on an experimental basis and for a limited period.

110. The Committee recommends:

Recommendation 22: That modification of the existing arrangements for holding the Annual Meeting of the Association having been examined and found impracticable, the existing arrangements be retained.

Recommendation 23: That a Second Scientific Meeting of the Association be held at an appropriate time during the year; and that the Council be empowered to draw up and to put into operation a scheme for such a meeting.

V. THE COUNCIL

Constitution

111. The Council is the executive of the Representative Body and is required under By-law 64 to meet not less than four times in each year. The Council elects its own Chairman, who holds office for such period as the Council itself determines.

112. Until 1949 the Council was composed of 66 members elected as follows:

(a) 10 members *ex officio*—namely, President, Immediate Past-President, and President-Elect of the Association, Chairman, Immediate Past-Chairman, and Deputy Chairman of the Representative Body, Chairman and Immediate Past-Chairman of the Council, Treasurer and (during the year immediately following his period of office as Treasurer) the Past-Treasurer.

(b) 22 members elected by members of the Branches in Great Britain and Northern Ireland grouped for the purpose.

(c) 8 members similarly elected by the Branches not in Great Britain or Northern Ireland.

(d) 12 members elected at the A.R.M. by the grouped Representatives of the Constituencies in Great Britain and Northern Ireland.

(e) 8 members elected at the A.R.M. by the Representatives acting together.

(Total $d+e=20$.)

(f) 3 Service members, representing respectively the Royal Navy, Army, and Royal Air Force Medical Services elected by the A.R.M.

(g) 2 members elected by the Public Health Service members of the Association.

(h) 1 woman member elected by the women members of the Association.

Total : 66 Members.

113. In 1948 there was evidence of a fairly widespread feeling that the Council was to some extent out of touch with the rank and file of the profession and a demand arose for its reconstitution in order to ensure more effective representation of the periphery. Accordingly, in 1949 changes were made which had the effect of almost doubling the number of members directly elected by constituencies, while reducing by nearly half the number elected by the Representative Body. The present constitution of the Council (77 members) is as follows:

(a) 11 members *ex officio*—namely, President, Immediate Past-President, and President-Elect of the Association, Chairman and Deputy Chairman of the Representative Body, Chairman and Deputy Chairman of the Council (in the year following the year in which he ceased to be Chairman of Council), Treasurer, in which he ceased to be Chairman of Council, *Chairman of Central Consultants and Specialists Committee, *Chairman of General Medical Services Committee, *Chairman of Journal Committee.*

(b) 40 members elected by the members of the Branches in Great Britain and Northern Ireland grouped for the purpose.

(c) 7 members similarly elected by the Branches not in Great Britain or Northern Ireland (one less than formerly).

(d) 2 members elected by Representatives of Constituencies in Scotland

(e) 1 member elected by Representatives of Constituencies in Wales, including Monmouthshire.

(f) 10 members elected at the A.R.M. by the Representative Body as a whole.

(Total $d+e+f=13$.)

(g) 3 Service members, representing respectively the Medical Branch of the Royal Navy, the Army Medical Service, and the Medical Branch of the Royal Air Force elected by the Representative Body as a whole.

(h) 2 members elected by the Public Health Service members of the Association.

(i) 1 woman member elected by the women members of the Association.

Total : 77 Members.

114. The Constitution Committee has endeavoured to assess the results of the changes introduced in 1949. These have not been in operation long enough to determine whether they have been wholly successful in achieving the objects desired, but the evidence available to the Committee suggests that there is both sufficient continuity of membership and that there is both sufficient continuity of membership and that the present constitution of the Council is satisfactory. It is now possible for a member of Council elected by a constituency to keep in touch with all the units he represents; this was frequently quite impossible before the changes were introduced.

115. The Committee has examined several suggestions submitted with the object of increasing the representative

*Additions. The Past-Chairman of the Representative Body and Past-Treasurer are no longer members of Council *ex officio*.

character of the Council. For instance, it was proposed that, to ensure that the members were elected by a well-informed electorate, the majority of the members should be elected by the Representative Body. The Committee does not think this would be acceptable in view of the recent change nor that it would bring members of Council in closer touch with members in the Divisions.

116. The Committee has considered the possibility of direct representation of young practitioners. It feels that it would be extremely difficult to provide an electorate for such a category and that suitable nominees might not be able to spare the necessary time. Young practitioners already take a part in the central work of the Association through at least three of the Standing Committees—the General Medical Services, Central Consultants and Specialists, and Organization Committees, and by this means their views do reach the Council. For these reasons the Committee does not recommend that young practitioners should have a seat in the Council. It is making proposals through another channel for solving the special problems of this section of the Association's membership.

117. The Committee has considered a return to the rule which limited the tenure of office of members of Council elected by constituencies to six years. This was abolished in 1949, when an alternative method of securing continuity was discontinued. The Committee sees no reason for reintroducing the limitation.

118. Lastly, the Committee has reconsidered a suggestion, made on more than one occasion in the past, that the procedure operative in Local Government circles should be adopted in the Council of the Association. Under this procedure, three members would be elected by each constituency, each would be limited to a tenure of three years, one retiring each year. After careful consideration the Committee has decided that any advantages to be gained by such a proposal are insufficient to justify the radical changes in the constitution which would be required. It recommends:

Recommendation 24: That no change should be made in the constitution of, and the methods of election to, the Central Council of the Association.

Presentation of Committee Reports to Council

119. By-law 78 provides that each Standing Committee shall elect a Chairman, and, if the Chairman is not a member of the Council, a Deputy Chairman who is a member. Standing Order 10 of the Council places the duty of presentation of the Report of a Committee on the Chairman of that Committee, or in his absence on a member of the Committee. Where the Chairman is not a member of the Council, the duty of presentation falls upon his Deputy.

120. Representations have been made to the Committee that Chairmen of Committees (Standing or Special) who are not members of the Council should be allowed, if they so wish, to present their Committee Reports in person. The Committee does not favour this proposal. Under existing procedure it is within the discretion of the Chairman of Council, on the request of a Committee whose Chairman is not a member of the Council, to invite the Chairman of the Committee to introduce and speak to the Committee Report in the Council. The Constitution Committee feels that this procedure adequately meets the situation and that there is no necessity for a special rule.

VI. COMMITTEES AND STANDING COMMITTEES

121. Committees are appointed by the Representative Body or by the Council or both jointly. The chief officers of the Association are members *ex officio* of all Committees. This provision places a heavy burden on the officers concerned. The number of Committees is very large and tends to increase and it is manifestly impossible for them to attend all meetings. Nevertheless the Committee is firmly of the opinion that the provision should be retained, as it places at the disposal of the officers useful information regarding all fields of the Association's work.

122. Committees are divided into two classes, Standing Committees and Special Committees. At present there are 18 Standing Committees and approximately the same number of Special Committees. Under the By-Laws certain Standing Committees have authority to include in their membership persons not members of the Association. By implication and practice this authority is also extended to Special Committees.

123. The Standing Committees are, under the Articles and By-laws, an integral part of the Association's constitution. Their composition, powers, and duties are defined in a Schedule to the By-laws. The majority of their members are, in general, appointed as to part by the Representative Body and as to part by the Council. They have power to call to their assistance for special purposes persons specially qualified to assist in any matter coming within their purview. They are required by the By-laws to report to and act under the instructions of the Council and their meetings are held according to a schedule prescribed at the beginning of each session.

124. Special Committees are appointed annually *ad hoc*, and their number may vary from time to time according to the creation of new Committees or the completion by others of their terms of reference. The majority of these special committees (for example, Compensation and Superannuation, International Relations) are more or less permanent in character, but the specialized nature of their work makes it advisable to keep them as special committees rather than Standing Committees, with the emphasis on selection rather than election of their members. In addition, there are a number of Joint Committees, such as the Joint Committee of the Royal Colleges, the Royal Scottish Corporations, and the Central Consultants and Specialists Committee; the Joint Formulary Committee of the B.M.A. and the Pharmaceutical Society; the Joint Committee of the B.M.A. and the Trades Union Congress, etc.

125. The Constitution Committee, which is itself an example of a special committee established by the Council and the Representative Body for a specific and limited purpose, has reviewed the constitution and terms of reference of all the Committees of the Association. It is satisfied that the present Committee machinery is, in general, adequate and suitable for the purpose for which it has been established, and that no alteration in the structure is called for. It has, however, ascertained the views of the Committees regarding the details of their composition and references, and certain of the Committees have made proposals for modifications of their constitution as follows:

Charities: This Committee is composed of members elected as to 4 by the Representative Body (including 1 from Scotland and 1 from Wales) and 2 by the Council; together with the representatives of the Council of Epsom College and the Committee of Management of the Royal Medical Benevolent Fund.

It is desired to make the membership more comprehensive by adding 2 representatives of the younger members of the profession, nominated as to 1 each by the Central Consultants and Specialists and General Medical Services Committees; and the duly appointed representative of the B.M.A. on the Joint Committee of Epsom College.

Finance and Journal: These Committees include in their membership in each case 4 appointed by the Representative Body. Under Standing Order 52 of the Representative Body only Representatives may be nominated for appointment in this category. This restriction applies in only one other Committee—the Organization Committee, which has raised no objection. The Finance and Journal Committees desire that the restriction should be removed, in order that the Representative Body may have a free field in electing its members to these Committees.

Private Practice: The reference to this Committee as at present worded is: "To consider and report on matters affecting the profession in the field of private practice not specially referred to other Committees, etc." The Com-

mittee feels that its reference could with advantage be amended to make it clear that the phrase "private practice" includes private consulting as well as private general practice; it also suggests that as it is the only Committee appointed by the Association to consider matters affecting the profession in the field of private practice the words "not specially referred to other Committees" should be deleted.

Public Health: The Committee desires to extend its reference, at present restricted to "consideration of and report on questions relating to the Public Health services," to include the field of preventive medicine.

126. The Constitution Committee supports the above proposals and recommends:

Recommendation 25: That steps be taken to amend the Schedule to the By-laws in respect of the following Standing Committees in the manner indicated:

Charities Committee: To add to the membership 2 representatives of the younger members of the profession nominated as to 1 each by the Central Consultants and Specialists and General Medical Services Committees; and the duly appointed representative of the B.M.A. on the Joint Committee of Epsom College.

Private Practice Committee: To substitute for the first sentence in the existing reference the following: "To consider and report on matters affecting the profession in the field of private general or consulting practice."

Public Health Committee: To substitute for the first sentence in the existing reference the following: "To consider and report on questions relating to preventive medicine and the Public Health services."

Recommendation 25: That steps be taken to amend Standing Order 52 of the Representative Body by the deletion of the reference to the Finance and Journal Committees.

Scottish Committee

127. The Scottish Committee seeks to change its title to "Scottish Council." The Committee is satisfied that it would be an advantage to the Association in Scotland if this change could be effected, and that it would be in a very much stronger position in relation to the autonomous bodies in Scotland and also to the Department of Health. At present exchanges between the Scottish Committee and the Scottish Department of Health and other bodies are carried out mainly by special subcommittees of the Scottish Committee, and the name "Subcommittee" is a disadvantage in that it suggests inferior status. These subcommittees would be in a much more advantageous position as Standing Committees of a Scottish Council. It is claimed that the Scottish Committee differs from other Standing Committees in that it is, in part, elected by the Divisions in Scotland, and is therefore analogous to the Federal Council in Australia. The Committee states emphatically that the proposed change of title, while it would increase the prestige of the Association in Scotland and give great satisfaction to Scottish members, would not affect in any way the status of the Committee *vis-à-vis* the Council of the Association, nor need there be any confusion through the use of the word "Council"; this being always qualified by the prefix "Scottish." The proposed change would not affect the relationship between the General Medical Services Committee and the General Medical Services Subcommittee (Scotland). This is and would remain a Subcommittee.

128. The Committee recommends:

Recommendation 27: That the proposed change of title from "Scottish Committee" to "Scottish Council" be approved and that the Schedule to the By-laws be amended accordingly.

Liaison Between Committees

129. Under existing references it is possible for two or more committees to consider and take different action upon one

and the same subject, which may be one involving policy. This is particularly so in the case of resolutions of the Representative Body referred by the Council to more than one committee. The normal procedure is for the Committees concerned to consult one another before reporting to the Council or taking action, but such consultation is not mandatory. By-law 80 provides that any Committee may, in respect of any matter before it, consult or make any report or suggestion to another Committee of the Association, etc., but there is nothing in the By-law to preclude unilateral action by one Committee in a matter of import to another.

130. The Consultation Committee proposes that the situation should be safeguarded by amendment of the By-law and it recommends:

Recommendation 28: That By-law 80 be amended to provide that every Committee *shall*, in respect of any matter before it which is of special interest to another Committee of the Association, consult that other Committee. In the event of disagreement no action shall be taken without reference to the Council.

VII. THE POWERS OF THE AUTONOMOUS BODIES

131. The Constitution Committee has reviewed the position of the autonomous committees and in particular the position of the Central Consultants and Specialists Committee in relation to the joint negotiating machinery for hospital and specialist services.

132. The term "autonomous bodies" derives from the fact that the Council and Representative Body have delegated to the two Committees concerned, the General Medical Services and the Central Consultants and Specialists, certain powers and the Central Consultants and Specialists, certain powers of independent action within their terms of reference. The effect of this is to give them a measure of autonomy not enjoyed by the other Standing Committees. This situation has been brought about by the need to adjust the Association's medico-political machinery to the changes, previously referred to in this report, due to the extension of the responsibility of the State for health and welfare. In 1950 the Representative Body reviewed the situation, and after full consideration of all the circumstances, reached the conclusion that no useful purpose would be served in disturbing the existing arrangement. In doing so it declared that the autonomous powers of the two Committees, in so far as they derived from the Representative Body, should be subject to specific renewal by successive Annual Representative Meetings. This policy has been strictly observed.

133. Notwithstanding their autonomous powers, the Committees remain an integral part of the Association machinery. They report regularly on action taken or proposed to the Council of the Association and, through the Council, to the Representative Body, where their Reports are subject to criticism or approval, as are the Reports of other Association Committees.

134. The Constitution Committee considers that present practice, under which the autonomy is subject to annual renewal, provides a sufficient safeguard against divided counsels and disunity in matters of policy in the profession. It notes with satisfaction the decision of the Central Consultants and Specialists Committee to convene an Annual Conference of Regional Consultants Committees and believes that this Conference, if so constituted as to be truly representative of consultants and specialists and hospital staffs throughout the country, will lead to a closer relationship between the organized body of consultants and the Council and Representative Body of the Association and to a mutual increase of confidence.

135. The Committee takes the view that, as the Representative Body has given the various sections of the profession autonomy not only of discussion but of action, its role in relation to these sections should be to consider a report of action taken or proposed, to measure this against

the problems of other sections of the profession, and to use the whole weight of the B.M.A. in carrying out that action as policy of the Association and not merely that of a negotiating committee. The opinion of the profession as a whole, exerted through the Association, is the prevailing factor in negotiations with the Government.

136. The Committee considers that the partnership between the Royal Colleges and the Association in joint negotiating machinery in connexion with the hospital services should continue. The Joint Committee as at present constituted is recognized by the Government as the negotiating body for hospital staffs, and in Whitley Committee B a working arrangement with the Royal Colleges is essential. The Committee considers that there should be no change at present in the existing joint machinery for consultants and specialists.

137. The Committee recommends:

Recommendation 29: (a) That the existing relationship of the autonomous bodies to the Association should be continued, subject to ratification annually by the Representative Body of the powers of these bodies. (b) That the arrangement under which the Joint Committee between the Central Consultants and Specialists Committee of the B.M.A. and the Royal Colleges and the Scottish Royal Medical Corporations acts as the negotiating body with the Government in respect of those engaged in the hospital and specialist service under the N.H.S. should be continued.

VIII. THE CONSTITUTION AND ORGANIZATION OF SPECIAL GROUPS

138. The Council is empowered under By-law 37 and in accordance with Article 21 to form (and to dissolve) special groups of members "having distinctive professional interests and being, by reason of their paucity of numbers or of their local distribution, unable to obtain adequate representation of these interests through the Divisions and Branches." The first special Groups were established in 1927 and numbered two, Pathologists and Spa Practitioners Groups. Since then the number of groups has steadily increased and they now number fourteen. With the possible exception of the Non-Professorial Teachers Group, all are closely linked to the Hospital and Specialist field and except for the Registrars and Senior Hospital Medical Officers are aptly designated "Clinical Groups," in that they deal with questions peculiar to particular specialties.

139. Since the establishment of the National Health Service there has been a departure from the original principle underlying the Group structure. Problems arising in the Hospital Service have led to applications for the formation of "Non-clinical Groups" of officers employed in that Service. The Constitution Committee regards with some favour the Scottish practice of dealing with special problems arising in connexion with the Hospital and Specialist Service through special subcommittees of the Central Consultants and Specialists Committee (Scotland), subject, as in Scotland, to adequate representation of the practitioners concerned at regional level. It realizes, however, that there is a risk in this procedure of the establishment of "splinter specialist societies" if the formation of a Group, which the members concerned considered essential to the effective protection of their interests, should be refused.

140. There are already precedents for a different method, analogous to the Scottish arrangement, for dealing with special interests. The assistants and unestablished practitioners, who, under the existing Rules, had a *prima facie* case for the establishment of a Group, have accepted an arrangement whereby the members of a special subcommittee of the General Medical Services Committee are elected on a regional basis and regard themselves as to some extent responsible to their constituents. The advantage of this procedure is that representatives of the parent Committee are members of the Subcommittee and take part in its discus-

146. The Committee is of the opinion that Federal Councils as at present constituted are a useful part of the constitution of the Association and should be retained. Accordingly it does not wish to submit any recommendation on this particular item of its report.

APPENDIX A

MEMBERSHIP OF CONSTITUTION COMMITTEE

Sixteen Council Members

Officers of the Association—ex officio

Dr. Alex. H. Hall, Hove (President).

Dr. S. Wand, Birmingham (Chairman of Council).

Dr. I. D. Grant, Glasgow (Chairman of Representative Body).

Mr. L. Dougal Callander, Doncaster (Treasurer).

Chairman of Organization Committee—*ex officio*

Dr. Ronald Gibson, Northleigh, Kings Worthy, nr. Winchester.

Dr. J. Cottrell, Grimsby

Dr. H. Guy Dain, Birmingham.

Dr. F. Gray, London.

Dr. E. A. Gregg. London.

Dr. R. Hale-White, London.

Mr. H. H. Langston, Shawford, nr. W.

Dr. J. C. Macarthur, Carlisle, Lanark

Mr. J. R. Nicholson-Lailey, Taunton.

Dr. J. A. Pridham, Broadway, Weymouth.

Dr. A. Talbot Rogers, Bromley.
Sir, I wish to thank you for the

Sir J. W. Tudor Thomas, Cardiff.

Eighteen Non-Council Members

Mr. Gordon N. Bailey, Harrogate.

Dr. J. T. Baldwin, Penicuik, Midlothian.

Dr. T. S. Blaiklock, Morpeth.

Dr. H. J. Browne, Barlaston, nr. Stoke-on-Trent.

Dr. Joan Chappell, Edmonton, Middx.

Dr. R. Cove-Smith, London.

Dr. H. J. Cronhelm, Belfast.

Dr. A. B. Davies, Walsall.

Mr. J. L. Kilks, Bournemouth

Dr. D. L. Gullick, Stevenage, Herts.

Dr. J. Kelman, Perth.

Dr. P. Lyle, Southport.

Sir John McNee, Kings Worthy, nr. Wi

Mr. A. M. A. Moore, Upminster, Essex.

Dr. J. H. E. Moore, Leeds.

Mr. J. D. R. Murray, Boldre, Lymington, Hants.

Dr. D. F. Whitaker, Guildford (*deceased*).

Dr. Morgan G. Williams, Cardiff.

APPENDIX B

PROVISIONAL PLAN FOR REORGANIZATION OF BRANCHES ON REGIONAL BASIS

N.H.S. Hospital Region		Proposed Regional Branch	B.M.A. Structure	
			Divisions in Proposed Branch	Divisions in Existing Branches and Proposed Groups (Underlined)
ENGLAND AND WALES				
1. NEWCASTLE	NORTHERN (17 Divs.)	{	Bishop Auckland	<u>North of England</u> (12 Divs.)
			Blyth	
			Consett	
			Durham	
			Gateshead	
			Hexham	
			Morpeth	
			Newcastle upon Tyne	
			North Northumberland	
			South Shields	
			Sunderland	
			Tyneside	
			Cleveland	<u>Tees-side</u> (4 Divs.)
			Darlington*	
			Hartlepoons	
			Stockton	<u>Bo der Counties</u> (1 Div.)
			Cumberland	

* Darlington Division includes the following R.D.s: Aysgarth, Leyburn, and Whitty, which are in the Leeds R.H.B. area. It is suggested that they remain with Darlington.

† The Border Counties Branch consists of the Cumberland Division (Newcastle R.H.B.) and the Dumfries and Galloway Division (Western R.H.B. Scotland). Both look to Carlisle as the medical centre and should remain an entity—Border Counties Group.

N.H.S. Hospital Region	Proposed Regional Branch	B.M.A. Structure
		Divisions in Existing Branches and Proposed Groups (Underlined)
2. LEEDS	YORKSHIRE (12 Divs.)	Bradford Dewsbury Goolse and Selby Halifax Harrrogate Huddersfield Leeds Scarborough Todmorden Wakefield, Pontefract, and Castleford York East Yorkshire Yorkshire* (11 Divs.) East Yorkshire (1 Div.)
* It is suggested that the following Divisions of the existing Yorkshire Branch be transferred to the East Midland Branch (Sheffield R.H.B. area): Sheffield, Doncaster, Rotherham, Barnsley.		
3. SHEFFIELD	EAST MIDLAND (16 Divs.)	Buxton* Chesterfield Derby Glossop* West Derby Nottingham Leics and Rutland Grimsby Holland Kesteven† Lincoln Scunthorpe Sheffield Doncaster Barnsley Rotherham Derbyshire (5 Divs.) Nottingham (1 Div.) Leics and Rut- land (1 Div.) Lincolnshire (5 Divs.) Yorkshire (4 Divs.)
* The Buxton and Glossop Divisions are in the County of Derbyshire but in the area of the Manchester R.H.B. It is suggested that these Divisions should remain with the East Midland Branch (Derbyshire Executive Council and County Council areas). † Part of Kesteven Division (S. Kesteven R.D.) is in the Cambridge R.H.B. area. It is suggested it should remain in the Lincolnshire County area as part of the E. Midlands Branch.		
4. EAST ANGLIAN	EAST ANGLIAN (9 Divs.)	East Norfolk Norwich West Norfolk Suffolk Cambs and Hunts Isle of Ely Peterborough Norfolk (3 Divs.) Suffolk (3 Divs.) Cambs and Hunts (3 Divs.)
5. N.W. METROPOLITAN	NORTH-WEST METROPOLITAN (18 Divs.)	Barnet East Herts* Mid-Herts West Herts N. Beds S. Beds Finchley Hampstead Harrow Hendon Kensington and Hammersmith Marylebone Paddington St. Pancras S. Middlesex Wembley W. Middlesex Willemston Hertfordshire (4 Divs.) Bedfordshire (2 Divs.) Metropolitan Counties (12 Divs.)‡
6. N.E. METROPOLITAN	NORTH-EAST METROPOLITAN (10 Divs.)	Mid-Essex† N.E. Essex S. Essex S.E. Essex S.W. Essex City Enfield and Potters Bar N. Middlesex Stratford Tower Hamlets Essex (4 Divs.) Metropolitan Counties (6 Divs.)‡

N.H.S. Hospital Region	Proposed Regional Branch	B.M.A. Structure
		Divisions in Existing Branches and Proposed Groups (Underlined)
7. S.E. METROPOLITAN	SOUTH-EASTERN (14 Divs.)	Bromley Dartford East Kent Folkestone and Dover Maidstone Rochester, Chatham, and Gillingham Tunbridge Wells Brighton and Mid-Sussex Eastbourne Hastings Camberwell Greenwich and Deptford Lewisham Woolwich Kent (7 Divs.) Sussex (3 Divs.)§ Metropolitan Counties (4 Divs.)‡
8. S.W. METROPOLITAN	SOUTH AND WEST METROPOLITAN (10 Divs.)	Chelsea and Fulham Lambeth and Southwark Wandsworth Westminster and Holborn Croydon Guildford Kingston Reigate Richmond West Sussex Aldershot and Farnham Metropolitan Counties (4 Divs.)‡ Surrey (5 Divs.) Sussex (1 Div.)§ Southern (1 Div.)
	SOUTHERN (10 Divs.)	Guernsey Jersey Portsmouth Salisbury Southampton Winchester Bournemouth Dorset Southern (7 Divs.) Dorset and West Hants (2 Divs.)

* East Herts Division is divided into two parts by the boundary between N.E. and N.W. Metropolitan Regions. It is suggested that the Division should remain associated with the Herts County area.

† Mid-Essex Division. Saffron Walden U.D. and R.D. are within the area of the East Anglian R.H.B. It is suggested that this area remains with Essex.

‡ Metropolitan Counties Group. It is suggested that membership of Group Council and constituencies for representation on B.M.A. Council be based on four quadrants and that the existing Metropolitan Branch Council reconstituted as a Group Council continue to act as a unit covering Divisions in London, Middlesex, etc. The position is so exceptional that the question of retaining the title "Branch" for this Group should be considered. Some Divisions—namely, Kensington and Hammersmith, Lambeth and Southwark, Westminster and Holborn—are in two R.H.B. areas. No change in their areas is suggested.

§ Sussex Branch. The Sussex Branch is in two R.H.B. areas; the dividing line also separates two Executive Council areas. The West Sussex Division has therefore been included in the South and West Metropolitan Branch and this implies the discontinuance of the Sussex Branch as a unit. There is no reason why liaison should not be maintained on an ad hoc basis for scientific and social meetings or it may become a Group.

|| South-West Metropolitan R.H.B. Area. The Channel Islands will naturally be attached to the reconstituted Southern Branch.

9. OXFORD	SOUTH-MIDLAND (5 Divs.)	Northants Oxford Buckingham* Reading* Swindont Northants (1 Div.) Berks, Bucks, and Oxon (3 Divs.) Wiltshire (1 Div.)
-----------	----------------------------	---

* A small area in the South of the County of Buckinghamshire and a small part of Berkshire are in the N.W. Metropolitan R.H.B. area (Slough, Maidenhead, Windsor). The existing Division boundaries should be retained.

t The greater part of Swindon Division is in the Oxford R.H.B. area, whereas the greater part of the Trowbridge Division of the Wiltshire Branch is in the South-Western R.H.B. area. The Salisbury Division, formerly in the Wiltshire Branch, opted for transfer to the Southern Branch (S.W. Metropolitan) area some time ago. It is suggested that the Wiltshire Branch be dissolved and that the two remaining Divisions should be given the option to join one of the new Regional Branches. It should not be difficult for one Division Executive (possibly Salisbury) to be responsible for arranging for a joint meeting to deal with any matters at County or L.M.C. level. Alternatively the northern half of the County can remain within the Gloucester and Somerset Group.

N.H.S. Hospital Region	Proposed Regional Branch	B.M.A. Structure	
		Divisions in Proposed Branch	Divisions in Existing Branches and Proposed Groups (Underlined>
10. S. WESTERN	SOUTH-WESTERN (11 Divs.)*	Gloucestershire†	Gloucestershire (1 Div.)
		Trowbridge	Wiltshire (1 Div.)
		Bath, Bristol, East Somerset, West Somerset	Bath, Bristol, and Somerset (4 Divs.) (Gloucestershire and Somerset Group)
		Barnstaple, Cornwall, Exeter, Plymouth, Torquay	S. Western (5 Divs.) (Cornwall and Devon Group)

* Owing to the extensive area and the difficulties of communication the Branch should be divided into two groups: the Devon and Cornwall and the Gloucester and Somerset Group. The two Divisions in Wiltshire may be attached to the latter (see above).

† Part of the Gloucestershire Division Branch is in the Oxford R.H.B. area (Cirencester R.D. and U.D., Northleach R.D., and N. Cotswold R.D.). These have been included with the greater part of the County in the S.W. area.

11. WELSH	WELSH COMMITTEE (9 Divs.)	E. Denbigh and Flint, W. Denbigh and Flint, N.W. Wales	North Wales (3 Divs.)
		Aberystwyth, Cardiff, Monmouthshire, N. Glamorgan and Brecknock, S.W. Wales, Swansea	South Wales and Monmouth (6 Divs.)
12. BIRMINGHAM	WEST MIDLAND (15 Divs.)	Birmingham, Coventry, Dudley, Nuneaton and Tamworth, Rugby, S. Warwickshire, Sutton Coldfield, W. Bromwich and Smethwick	Midland (8 Divs.)
		Shropshire and Mid-Wales	Shropshire and Mid-Wales (1 Div.)*
		Burton-on-Trent, North Staffs, South Staffs, Walsall and Lichfield	Staffordshire (4 Divs.)
		Hereford, Worcester and Bromsgrove	Worcestershire and Herefordshire (2 Divs.)

* A small part of Mid-Wales (Radnorshire and part of Montgomery) is included with the Shropshire and Mid-Wales, and the Worcester and Hereford Branches. It will be "no change" from the point of view of B.M.A. organization if despite the national boundary these areas remain with the existing Branches.

13. MANCHESTER	NORTH-WESTERN (21 Divs.)	Blackburn, Blackpool and Fylde, Burnley, Furness, Lancaster*, Preston, Westmorland†	North Lancs and Westmorland (7 Divs.)
		Ashton-under-Lyne, Bolton, Bury, Crewe, Hyde, Leigh, Macclesfield and E. Cheshire, Manchester, Mid-Cheshire, Oldham, Rochdale, Salford, Stockport, Wigan	S. Lancs and E. Cheshire (14 Divs.)

* The R.D.s of Sedburgh, High Bentham, and Bowland in the Leeds R.H.B. area have been included, as at present, with the Lancaster Division.

† Part of the County of Westmorland is in the Newcastle R.H.B. area but has been retained with the Westmorland Division.

N.H.S. Hospital Region	Proposed Regional Branch	B.M.A. Structure	
		Divisions in Proposed Branch	Divisions in Existing Branches and Proposed Groups (Underlined>
14. LIVERPOOL	MERSEYSIDE (7 Divs.)	Birkenhead and Wirral, Chester, Liverpool, St. Helens, Southport, Wallasey, Warrington	Merseyside (7 Divs.)
15.	ISLE OF MAN	Isle of Man	Isle of Man

SCOTLAND

A. NORTHERN	NORTH OF SCOTLAND (6 Divs.)	Orkney, Caithness, Inverness, Ross and Cromarty, Sutherland, Outer Isles	Aberdeen (1 Div.) Northern Counties of Scotland (5 Divs.)
		Shetland, Aberdeen City, Aberdeen and Kincardine	Aberdeen (3 Divs.)
B. NORTH-EASTERN	NORTH-EAST OF SCOTLAND (4 Divs.)	Banff, Moray, Nairn*	Northern Counties of Scotland (1 Div.)
C. EASTERN	EAST OF SCOTLAND (3 Divs.)	Perth, Dundee, County of Angus	Perth (1 Div.) Dundee (2 Divs.)
D. SOUTH-EASTERN	SOUTH-EAST OF SCOTLAND (5 Divs.)	Fife, City of Edinburgh, East and Mid-Lothian, S.-Eastern Counties, W. Lothian	Fife (1 Div.) Edinburgh and S.E. Scotland (4 Divs.)
E. WESTERN	WEST OF SCOTLAND (9 Divs.)	Argyll, Ayrshire, Dunbartonshire, Glasgow, Lanarkshire, Renfrew and Bute, W. Wigtown	Glasgow and West of Scotland (7 Divs.)
		Stirling, Dumfries and Galloway†	Stirling (1 Div.) Border Counties (1 Div.)

* It is suggested that the County of Nairn should remain with the N. Scotland Branch while Moray and Banff should be transferred to N.E.

† Dumfries and Galloway should remain in Border Counties Group but integrated with the W. of Scotland Branch.

NORTHERN IRELAND

NORTHERN IRELAND HOSPITALS AREA	NORTHERN IRELAND (7 Divs.)	Belfast, County Armagh, Fermanagh, Londonderry, North-East Ulster, Tyrone, West Down	Northern Ireland (7 Divs.)

C. ALLAN BIRCH.

SIR,—I support strongly Dr. J. C. Sawle Thomas's plea (*Supplement*, February 9, p. 62) for the development of psychiatric departments in general hospitals and for their closer integration with these hospitals. We lag far behind several European countries and parts of North America in this respect. For example, in Scandinavia it is the rule for general hospitals to have large psychiatric departments with about 100 beds available for psychiatric patients. In the new Montreal General Hospital there is an excellent arrangement in which various diagnostic and therapeutic psychiatric facilities are used by out-patients, day hospital patients, and ordinary in-patients alike. I have a vivid recollection of

wartime service in R.A.F. hospitals in which the most fruitful collaboration developed between the psychiatrists on the one hand and on the other the general surgeons and physicians, of whom some said that they had never realized the possibilities in this direction before. The psychiatric departments of general hospitals are usually much better situated geographically than mental hospitals for the development of day hospitals, night hospitals, and other services designed to maintain and further contact with the community.

Disused wards and other hospital buildings, adjoining old houses, and similar premises can readily be adapted for outpatient, day hospital, and other therapeutic uses, so that expansion need not wait on a large programme of capital works, but could proceed apace given the will and enthusiasm from hospital staffs and management authorities and fairly moderate financial encouragement from the Ministry.—I am, etc.,

Crockham Hill, Kent.

A. HARRIS.

Salaries of Part-time Radiographers

SIR,—As a radiographer who has recently resumed part-time employment, I can most heartily endorse the criticisms expressed in Dr. F. Friend's letter (*Supplement*, January 26, p. 45).

In order to be able to work away from my home it is necessary to employ a competent "baby-sitter," and her wages, combined with the cost of travelling and of lunch, leave little out of the meagre salary now paid to part-time radiographers. Other correspondents have stressed the lack of radiographers and the fact that this has resulted in some departments only being able to operate under conditions of extreme difficulty. There must be many of my profession who gave up their posts after marriage and would now be glad to resume their work if this offered a reasonable reward. The lack of consideration given to the remuneration of part-time radiographers is an example of the short-sighted policy that has characterized the recent negotiations of salary scales for medical auxiliaries.—I am, etc.,

Ruislip, Middlesex.

V. M. GORDON.

Remuneration Claim

SIR,—At this vital stage in the negotiations with the Minister over the adjustment of our remuneration I find myself quite intolerant of the views expressed by your correspondents Drs. A. C. Gordon Ross and George H. Pearson (*Supplement*, February 2, p. 49).

Dr. Ross suggests that this is not an opportune moment to press our claim. I wonder if Dr. Ross is aware that the Minister himself admitted to the Negotiating Committee that during the past ten years there has only been a period of two to four months when a claim could have been submitted without causing the Government financial embarrassment? Has Dr. Ross any reason to suppose that conditions will be any more propitious during the next ten years? Dr. Pearson makes an even more preposterous remark when he suggests that the profession is "scrambling for money." After waiting patiently for nearly six years and exercising admirable restraint, this point of view defies understanding. Dr. Pearson then exhorts us to improve our service to our patients, and give them better value, rather than this "scrambling for money." We all admire idealism and self-sacrifice, but at this juncture Dr. Pearson's brand is pure humbug.

Let us face the hard fact that the future of medicine under the N.H.S. is at the cross-roads. Weakness now may well be disastrous. It will be a hard struggle to persuade the Government that it must honour its obligations, and never have tenacity of purpose and complete unity in the profession been more important than at the present time. We owe this not only to ourselves but to the future generations who will follow after us. Our immediate objectives must be: (1) to secure the unconditional acceptance of Spens by the Government, with adjustments to the central pool at agreed

regular intervals; (2) to insist that politics be divorced from the Health Service. Later, further refinements can be introduced. When our claim has finally been implemented may I suggest that the salary adjustments of registrars and junior hospital staffs, not forgetting practice expenses of the small-list practitioners, be given first priority?—I am, etc.,

Caerphilly.

D. R. V. PRYS-JONES.

SIR,—Let us cast aside all personal and selfish interests to join forces for the good of the profession as a whole, now and in the future. Since 1951 the value of the pound has fallen 25% and the salaries of our secretaries, cleaners, etc., have increased as have all other unavoidable expenses. There is no reasonable argument against the justice of our claim.

Two questions seem to have arisen: (1) Should we set an example to the community in not asking for an upward adjustment to our remuneration? (2) Can the country afford it? On the first issue, does anyone still believe our example would be followed? We have refrained for four years in tendering a claim, and what section of the community has done likewise? Financial experts differ in their analysis of the monetary situation. A view supported by Sir Stafford Cripps was that by increasing the tax on tobacco he would curb inflation. Events proved this to be completely false, and in fact this resulted in what he hoped to avoid most, because workers demanded and received more money to meet the rise in their cost of living; not, mark you, to meet the Government's cost-of-living index, as this excluded tobacco in its calculations. Governments themselves are mostly responsible for inflation. High direct and indirect taxation may be deflationary in theory by mopping up spending power, but in practice the effect is the exact opposite, as people demand more money to pay for these taxes.

Regarding (2) above, of course the country can afford it. Fortunately, the cost of the whole Health Service will soon be saved by cutting down the appalling waste on conventional weapons. With a little imagination and determination a similar sum could be saved by more careful budgeting. One of the curses of this country to-day is that there are too many people spending with scant care other people's money. The people are having the Health Service on the cheap, at the doctor's expense. Massive withdrawal from the Service could result in the patients having to pay 5s. per consultation and 10s. per visit. This would almost double our incomes and possibly cause widespread strikes in industry. The Government must honour its obligations to the medical profession. I am optimistic about the outcome, as I have faith in the spirit and determination in the interests of justice of the majority of the medical profession.—I am, etc.,

Chesterfield.

KENNETH E. MCIVER.

SIR,—I am whole-heartedly with the Negotiating Committee in maintaining that there is a moral obligation implied in the Spens reports to maintain in the future a proper social and economic status for general medical practitioners and specialist practitioners. That a definite contractual obligation exists to agree to increased remuneration is not, of course, accepted by the Government. And we are not so sure ourselves that this obligation could be enforced by action in the courts. Realization of this comes rather late in the day. That being so, and considering the present economic circumstances of the country, it would seem that we are not on very secure ground. That this may be an unpalatable view to many I am well aware, but this is a time for honest expression of all shades of view. The times are crucial and we cannot afford to blunder into defeat.

There is much brave talk these days by our leaders about "being on the eve of severe conflict with the State," about the profession getting "geared for action," about "weapons sharpened now," etc. And our negotiations with the

Government are being conducted under the threat of withdrawal from the Service. I shudder when I hear that the view is held that withdrawal (resignation or strike action) would force the Government to capitulate within a week. This is dangerous advice. No Government can allow itself to be bent to the will of any section of the community. Furthermore, do our negotiators really believe, as they profess, that general practitioners would resign from the Service if called upon? Do we general practitioners really mean that we would resign, refuse our patients sickness certificates, leave them to pay for their medicines, suffer all the attendant discomfitures of our action? Of course we would not. And the Government knows it. High time that our negotiators did.

What is to be done, then? Depart at once from all talk and threats of withdrawal or we will end in disaster. Strike action is gutter talk, unworthy of our profession. Let us negotiate without threats. And let us never mention withdrawal again until we have an alternative and better service to offer. The practice of a little self-criticism at times would do us all a lot of good.—I am, etc.,

Perth.

R. RITCHIE.

A Layman's View

SIR,—As a non-medical professional worker whose standard of living has been declining at least as rapidly as the average doctor's, I read the weekly correspondence in the *Supplement* with interest and a good deal of sympathy. Perhaps you will forgive me making a comment from outside, bearing in mind that as a member of the public I shall in due course pay my share of whatever increased remuneration you are able to obtain.

I suppose most patients look on doctors, as I do, as being relatively well paid, and the average figures quoted seem to bear this out, even though they may conceal pockets of real hardship. (Many of us have to make do on much less than £1,000 a year, let alone £2,000.) But as patients we are also aware that doctors are usually overworked, often harassed by lack of facilities, and frequently frustrated. I therefore welcome letters such as Dr. G. A. F. Quinnell's (*Supplement*, February 2, p. 51), advocating reduction of lists to 2,500, tax-free allowances for practice expenses, and extension of group practice. Of course, these and similar changes will take time, and you cannot be expected to drop your claim for more pay immediately. But, if your campaign could be shown to touch on these wider aspects as well as the £500 a year, I feel sure you would gain as much greater public support—and that may make all the difference in your negotiations with the powers-that-be.

I think most people at the receiving end value the N.H.S. as a great achievement. Perhaps it is natural that its weaknesses are brought home more forcibly to doctors than to others. To sum up, in my view confidence between doctor and patient can be benefited by practical efforts to improve the N.H.S., but is certain to be impaired by attempts to abolish it or to replace it by some untried alternative.—I am, etc.,

Stanmore, Middlesex.

C. H. R. MEREDITH.

Saving on Prescribing

SIR,—Might one who retired from practice over ten years ago make some criticism, and offer a means of bringing the Minister of Health and the profession more closely together on the vexed question of increased remuneration? When I was in practice I remember being sternly reproved by our regional medical officer because the average cost of my prescriptions was a fraction over 5d. each. I was urged to use cheaper ingredients of equivalent therapeutic value—or else. To-day I am informed that the average cost is about 5s. per prescription. I know that in the bad old days the chemist was disgracefully paid, but the present increase in their remuneration and the extra cost of B.P. preparations does not account for such a disparity as we see to-day.

If I might offer an opinion, I am convinced that the practice of ordering expensive proprietary preparations, which are usually labelled with incomprehensible names and guaranteed to perform miracles, in lieu of careful diagnosis and advice has magnified the drug bill beyond all reason. I would exclude antibiotics from this discussion, but the use of these, too, is grossly abused. If these proprietary preparations are essential to the well-being of the public one ought to use them, but do most of them cut short illness or preserve life any more effectively than simpler remedies such as are listed in the B.P.C.? A case in point. A child suffering from a small spot of impetigo on the corner of his mouth had prescribed for it $\frac{1}{2}$ oz. (15.5 g.) of cortisone ointment which cost about 30s., when a pennyworth of white precipitate ointment would have done just as well. Let our teachers, both in hospital and in lectures, lay special stress on the utmost economy with efficiency.

Hospital research is a different matter; medical science must advance. I am discussing the average prescriptions issued by the profession to the tune of millions per annum to N.H.S. patients. Why not observe a self-denying ordinance for a period of, say, 12 months, restrict expensive prescribing to a necessary minimum, and then ask for an increase in pay, which will have been well earned, instead of recriminations and threats of strike action which will become us? The medical profession has a genuine grievance, but this is shared by all professional classes, especially the salaried groups. The underlying cause is inflation and excessive taxation. Let us not forget that the health section of our welfare scheme is not covered by weekly contributions, but directly by taxation. If we are extravagant we are spending our own money as well as that of our neighbours. A drive for economy in prescribing and in many other branches of the medical service would be of great benefit to our whole community.—I am, etc.,

Holyhead.

HOWARD ENGLISH.

Drugs for Private Patients

SIR,—It is manifestly absurd that private patients should be deprived of the right to receive drugs for which they pay by enforced contributions to the National Health Service. And yet one of the frequently reiterated complaints about the Service is that it has given rise to an enormous and quite unnecessary, if not actively harmful, increase in the consumption of medicine by the populace at large. Any right gained by private patients to receive their drugs under the National Health Service would still further add to this undesirable feature of the Service, and I venture to think that the solution lies in the opposite direction and that National Health Service patients should, except when under hospital treatment, be made to bear a substantial part of the cost of *National Formulary* medicine (say 50%) and the entire cost of proprietary preparations. In this way it might be possible to remedy an obvious injustice without further adding to an already undesirable state of affairs.—I am, etc.,

London, S.W.7.

J. N. LORING.

Item-of-service Payment

SIR,—Let those who advocate a "payment for item of service" beware. They may not be aware of the current practice of executive councils in dealing with forms E.C. 24 (rev.). In addition to a preliminary scrutiny these are later compared with records at local maternity hospitals. Add to this the fact that municipal midwives now complete a form stating whether the G.P. was actually present during labour. The situation is fraught with bureaucratic possibilities—little bowler-hatted men carefully inspecting Granny Smith's *derrière* to make sure that she has, in fact, had her weekly gold injection in her right buttock and not in her left, as claimed in some form or other.

The capitation system has glaring defects, but let us not abandon it in favour of something much worse.—I am, etc.,

Barrow-in-Furness.

J. H. C. CORR.

S.H.M.O.s and Consultant Appointments

SIR,—I thank the many S.H.M.O.s who wrote to me following my letter (*Supplement*, February 9, p. 61). S.H.M.O.s who are doing consultant work have the opportunity of having their posts considered for payment at consultant rates as mentioned in the notice "S.H.M.O.s in Consultant Posts (p. 60). All S.H.M.O.s should bring this notice to the attention of their colleagues whether B.M.A. members or not. Application forms duly completed must be returned to the Secretary, British Medical Association, by March 2, or it may be too late.—I am, etc.,

G. WARING ROBINSON,
Chairman,
S.H.M.O. Group Executive Committee.
Leicester.

H.M. Forces**ROYAL AIR FORCE**

Air Vice-Marshal P. B. L. Potter, C.B.E., Q.H.S., has been granted the acting rank of Air Marshal.
Air Commodores L. M. Corbet, C.B.E., and A. F. Cook, C.B.E., Q.H.P., have been granted the acting rank of Air Vice-Marshal.
Group Captain T. C. Macdonald, A.F.C., to be Air Commodore.
Group Captain J. Kemp has retired.
Wing Commanders H. L. Willcox, P. A. Cooper, G. H. Stuart, P. A. Lee, A. S. Amsden, J. R. R. Jenkins, H. P. R. Smith, A.F.C., A. R. C. Young, O.B.E., and R. C. Jackson to be Group Captains.
Squadron Leader K. Bazarnik, A.F.C., to be Wing Commander.
Flight Lieutenants I. A. McIntosh, J. A. Hill, J. P. McRory, and P. R. Wagner to be Squadron Leaders.
H. B. Kelly to be Squadron Leader.
Flight Lieutenants C. P. Handforth, P. M. Healy, A. Lyon, A. G. May, M. C. Batchelder, R. Stalker, and R. D. Merson have been transferred to the Reserve, retaining the rank of Squadron Leader.
Flight Lieutenant F. J. Davies has resigned his commission, retaining the rank of Squadron Leader.

ROYAL AUXILIARY AIR FORCE

Squadron Leader E. R. Spicer has resigned his commission, retaining his rank.

BRITISH MEDICAL GUILD**PLYMOUTH DIVISION**

A meeting representing all branches of the profession within the Division area was held in Plymouth on January 22. The attendance numbered over 150. Dr. Noy Scott was elected to the chair. A resolution was passed unanimously that "this meeting supports with confidence the Negotiating Committee in the steps already taken to maintain the implementation of Spens terms for settlement of the remuneration claim."

Branch and Division Meetings to be Held

BLACKBURN DIVISION.—At White Bull Hotel, Church Street, Blackburn, Tuesday, February 26, 8.15 p.m., meeting. Address by Dr. P. H. Addison: "The Law as it Affects the Doctor."

CARDIFF DIVISION.—At B.M.A. Welsh House, 195, Newport Road, Cardiff, Wednesday, February 27, 8.25 p.m., general meeting; 8.30 p.m., B.M.A. Lecture by Dr. V. D. Allison: "Changing Face of Infection."

DEWSBURY DIVISION.—At Board Room, General Hospital, Moorlands Road, Dewsbury, Friday, March 1, 8.30 p.m. B.M.A. Lecture by Dr. J. D. Allan Gray: "Antibiotics."

DORSET DIVISION.—At Chest Clinic, Dorchester, Friday, March 1, 8.30 p.m., general meeting. Mr. A. Alexander, D.V.S.M.: "Veterinary Medicine, with Special Reference to Communicable Diseases." A film on foot-and-mouth disease will also be shown. All veterinary surgeons in Dorset are invited.

EASTBOURNE DIVISION.—At Hellingly Hospital, Tuesday, February 26, 8 for 8.30 p.m., clinical meeting. Papers by (1) Dr. D. Krausz: "Some Aspects of E.C.T."; (2) Dr. H. V. W. Elwell: "Psychotherapy"; (3) Dr. R. M. Ellison: "Drugs for the Elderly."

EAST DENBIGH AND FLINT DIVISION.—At Wynnistay Arms Hotel, Wrexham, Thursday, February 28, joint meeting in conjunction with Wrexham Clinical Society. 7 for 7.30 p.m., dinner; 8.15 p.m., B.M.A. Lecture by Professor A. G. Watkins: "Paediatrics in the West Indies."

ENFIELD AND POTTERS BAR DIVISION.—At King's Head Hotel, Market Place, Enfield, Wednesday, February 27, joint meeting with Enfield Solicitors' Association. 8.15 p.m., reception; 9 p.m., B.M.A. Lecture by Mr. Norman Richards, Q.C.: "The Doctor's Contact with the Law." Medical and legal guests and members of the North Middlesex and Barnet Divisions are invited.

LEWISHAM DIVISION.—At Lewisham General Hospital, Friday, March 1, 8.30 p.m., meeting. Dr. C. A. Holman: "Treatment of Haematological Problems in General Practice."

MAIDSTONE DIVISION.—At Royal Star Hotel, Maidstone, Saturday, March 2, 3 p.m., illustrated lecture by Mr. Ronald B. Haynes: "Studies of Bird Life in Kent."

MANCHESTER DIVISION.—At Fallowfield Hotel, Wilbraham Road, Manchester, 14, Tuesday, February 26, 8.30 p.m., meeting. Medical Forum—subject for discussion: "That Medical Education To-day Does Not Adequately Prepare Students for Medical Practice." To be introduced by Drs. H. W. Ashworth, L. D. Harris, R. F. Logan, W. T. Westwood, and M. P. Winstanley.

MARYLEBONE DIVISION.—At Medical Society of London, 11, Chandos Street, W., Thursday, February 28, 8.45 p.m., meeting. Address by Dr. W. D. Nicol: "Tranquillizers—Their Use and Abuse." A general discussion will follow. Members of Paddington, St. Pancras, City, and Hampstead Divisions are invited.

NORTH GLAMORGAN AND BRECKNOCK DIVISION.—At East Glamorgan Hospital, Church Village, Pontypridd, Thursday, February 28, 7.30 p.m., joint meeting with Rhondda Medical Society. Symposium: "Pneumoconiosis." Panel of speakers: Professor J. Gough, Dr. A. L. Cochrane, Dr. A. Caplan, and Dr. J. D. Ball.

ROCHDALE DIVISION.—At Turner Hall, Birch Hill Hospital, Littleborough, Rochdale, Wednesday, February 27, 8.30 p.m. B.M.A. Lecture by Mr. A. Lawrence Abel: "Common Diseases of the Rectum."

SOUTH ESSEX DIVISION.—At Nurses' Lecture Theatre, Oldchurch Hospital, Romford, Friday, March 1, 9 p.m., meeting. B.M.A. Lecture by Dr. Hugh Clegg (Editor, *British Medical Journal*). Dr. Clegg will give a short lecture on the Publishing Activities of the B.M.J., and invites questions on the *Journal*, and all its works, after the lecture.

SUTTON COLDFIELD DIVISION.—(1) At Town Hall, Sutton Coldfield, Wednesday, February 27, 9 p.m. to 1 a.m., annual dance. (2) At Good Hope Hospital, Rectory Road, Sutton Coldfield, Friday, March 1, 9.15 p.m., meeting. B.M.A. Lecture by Sir Walter Mercer: "Surgery in Russia" (illustrated by cine-film and lantern-slides). Members are invited to take lay guests.

WEMBLEY DIVISION.—At Board Room, Wembley Hospital, Tuesday, February 26, 9 p.m., meeting. Talk by Mr. David Trevor: "Backache." Members of Hampstead, Harrow, Hendon, and Willesden Divisions are invited.

WEST BROMWICH AND SMETHWICK DIVISION.—At the Sandwell Hotel, West Bromwich, Tuesday, February 26, 8 p.m., meeting. B.M.A. Lecture by Mr. Harold Dodd: "Venous Disorders of the Lower Limb."

WESTMINSTER AND HOLBORN DIVISION.—At Board Room, St. George's Hospital, Hyde Park Corner, S.W., Wednesday, February 27, 8.15 p.m., meeting. B.M.A. Lecture by Dr. Hugh Gainsborough: "Psychosomatic Medicine."

WIGAN DIVISION.—At Lewis's Restaurant, Wallgate, Wigan, Thursday, February 28, 8 p.m., meeting. Lecture by Dr. F. M. Rose: "The Place of the College of General Practitioners in Modern Medicine."

Meetings of Branches and Divisions**ENFIELD AND POTTERS BAR DIVISION**

Dame Edith Russell-Smith, Deputy Secretary, Ministry of Health, was the guest of honour at the annual dinner of the Division held on January 19. Dr. G. G. Doel, chairman.

GENERAL MEDICAL SERVICES COMMITTEE

The General Medical Services Committee of the B.M.A. met on February 21 at B.M.A. House, with Dr. A. TALBOT ROGERS in the chair. The Committee spent the whole day discussing the position arising out of the rejection by the Government of the profession's claim for an increase in remuneration.

Mr. Harry Cooper

The CHAIRMAN referred to the death of Mr. Harry Cooper, and paid a tribute to the accuracy of his work in reporting the Committee's proceedings and those of its predecessor, the Insurance Acts Committee, for the *British Medical Journal* for so many years. The last occasion that Mr. Cooper attended a meeting was in November last.

REMUNERATION CLAIM

The CHAIRMAN, reporting on the interview between representatives of the Negotiating Committee and the Minister of Health on February 20, said that the deputation had had a very disturbing day. He agreed with Dr. Wand's view that in all his years of negotiations with different Ministers he had never met with such a stubborn and blank refusal to listen to the profession's point of view.

The Government had refused to consider the merits of the claim at all. The Minister during a two and a half hours' discussion was driven at one time to admit that there was justice in the doctors receiving something further for their services, but in spite of that the Minister kept harping on the economic situation of the country, and because of this the Government could not look at the merits of the claim.

When the deputation entered the Minister's room, Dr. Rogers continued, it knew nothing about the proposed Royal Commission. "We reacted unanimously and strongly against the whole idea of a Royal Commission, pointing out the many disadvantages. We asked that the Joint Chairmen should be able to see the Prime Minister, and that was refused."

Announcement of Royal Commission

The announcement of the Royal Commission was made in Parliament in such a way as to suggest that by this means the Government was really offering something worth while for the future. In effect, said the Chairman, the present claim had not been considered, and would not be considered until the Royal Commission had sat and deliberated as long as a Royal Commission might deliberate. The Minister was asked why the Royal Commission could not look at the future methods of payment while in the meantime an adju-

cator was appointed to decide the merits of the case and allow of some adjustment of doctors' remuneration within a reasonable time and which could, if necessary, be re-adjusted after the Royal Commission had reported. That was said to be impossible. The terms of reference of the Royal Commission were not yet known, but it appeared that it would be asked to look at the method of payment of doctors and the level of their payment in comparison with other professions.

Departure from Spens

This, said the Chairman, was departing a very long way from Spens. The Spens Agreement covered two things. The first was the alteration in the value of money. The Minister said that this would not be mentioned in the Royal Commission's terms of reference, but if and when the Association gave evidence before the Commission it could bring forward arguments on the change in the value of money. Secondly, Spens was concerned with changes in the remuneration of other professions, and if it could be shown that other comparable professions had gained on the medical profession it was a strong argument for adjustment. There was no suggestion, said Dr. Rogers, that that was what the Royal Commission was going to look at. It was being asked to examine the absolute incomes of the different professions, and the doctors' incomes would be compared, together with their responsibilities and training, with other professional classes, including teachers, clergymen, and other small-income groups which the Government cared to stress.

"All the things which we thought we had won through our careful work in the Spens Committee and through our subsequent explanation to Mr. Justice Danckwerts—our agreements—have gone into the melting-pot. Many questions which we thought were settled, and which we have fought to retain as rights, will have to be considered *de novo*." The dependence of the Pool upon the number of doctors would have to be considered again, Dr. Rogers continued. The whole machinery of the Central Pool would have to be reconsidered.

The Minister had admitted that the Royal Commission would not necessarily recommend an increase in doctors' remuneration. It might quite well be that there would be a recommendation in the opposite direction.

Whitley Machinery

Sir Russell Brain, continued the Chairman, was concerned about the question of negotiation under Whitley B. At the present moment, although there were grumbles about the Whitley set-up, it contained one very important provision

which often worked against the profession, but occasionally could be made to work in its favour, and that was that unless there was complete agreement in Whitley B the *status quo* continued. Unless both sides agreed, a matter could not be taken to arbitration, and therefore the present consultant remuneration, including the merit award system, was bound to go on if consultants wanted it to do so. In answer to a question from Sir Russell Brain, the Minister had said that the Whitley machinery would be washed out if the Commission so reported.

There was no guarantee that the Government of the day, probably not the present Government, would accept the Commission's advice. The Minister had said he could not commit his Government or any other Government to accept beforehand any finding of the Royal Commission. Royal Commissions were set up to advise the Government, and the Government decided how much of the advice was acceptable, or how much was practical in the circumstances then obtaining. The addendum to the Prime Minister's statement, arising out of a question from Mr. Gaitskell, that the Commission would be empowered to advise retrospective payment was of little value. The Government could say that the economic climate was such it could not afford to give £60m. or whatever it was to adjust doctors' back claims.

Grave Warning

It was a very grave note he was sounding, said the Chairman, but it had to be sounded. This was no way for a reasonable government to suggest settling a pay claim.

The Royal Commission's remit was being extended to include the pay of public health medical officers and dentists. In the public health officers and dentists, two of the most controversial sections of the whole Health Service were being brought in, both of whom had considerable problems to solve. The consideration of these problems would add months, if not years, to the work of the Commission.

There was one other point, Dr. Rogers added. The Government was willing to help, in advance of the Royal Commission's findings, the junior hospital staffs, which meant staff up to and including the rank of senior registrar. The delegation took the attitude, and the Minister agreed, that this was a separate matter from the setting up of a Royal Commission.

JUSTICE IN THE CLAIM

Dr. S. WAND, Chairman of Council, said that, without going into the history of the happenings yesterday, there were perhaps two points he could mention. One was that he asked the Minister, if the economic climate was the same when the Royal Commission reported as it was to-day, would the findings be implemented? The Minister had replied that if the economic climate was the same "we would have to consider that." It was clear from this that if the economic climate was the same the report, even if it was accepted, might not be implemented. The second point was that towards the end of the meeting the Minister had said that no one could dispute that there was justice in an increase for the doctors. "I took that up and said, 'Minister, I have copied this out and I am going to quote this, but I want to be sure that I have this right . . . do you agree that you said that?'" The Minister, said Dr. Wand, tried to side-step by saying that some such words would appear in the statement in the House. But, since these words were not included in the statement in the House, he felt justified in quoting them.

"When I came away from that meeting," went on Dr. Wand, "I was as angry as I have ever been after a meeting with any Minister. The discussion that we were expecting to have with the Minister did not take place. He presented us, as you have seen from this morning's papers, with a *fait accompli*. What does that mean? It means that the Government is going to use . . . a particular type of weapon with which to destroy all that has gone before. The Danckwerts award was made by an independent judge,

and the Royal Commission is the one method which the Government can use to destroy that by its own nominees and with terms of reference which no one can discuss except the Government itself."

The Commission would be a very long-standing one, while we had no guarantee that its report would be implemented if it was in the profession's favour; if it were not in the profession's favour it was obvious that the Government would want to implement it. Had the profession any guarantee that the Royal Commission would not recommend a full-time salaried service?

Broken Pledges

"We came into this service," continued Dr. Wand, "with certain pledges and promises; we accepted them because they came from a British Government. Supposing the Royal Commission finds in our favour and suppose the findings are accepted, can we rely on those promises? (No.) I am going to ask you, and this is a very serious question, that we have to consider very carefully, not merely whether we can go on working for such an employer now, but whether we can go on working for such an employer in the more distant future. The whole basis on which doctors enter service of this kind depends on trust. Can we any longer trust the Government? If we cannot trust the Government it is not a matter of resigning now, it is a matter of saying we will have nothing to do with any service which is run by any Government. That is, as I see it, the issue before us. The issue is no longer one only of remuneration for the immediate future. Even if the Government gives us our 24% we have still got to consider very carefully whether any professional person can work for a Government which can behave in this fashion."

In the Discard

Dr. A. B. DAVIES said that little remained to be added. There had been no negotiation at all. The Government would not listen to the claim, they had indicated that they never would; there had been no suggestion of arbitration, either on the money or an interpretation of the back promises, no adjudication on Spens or Danckwerts or any of the understandings on which they came into the Service; there had been no consultation—they were told that it was never the custom to consult a negotiating body on setting up Royal Commissions.

"All this means, as Dr. Wand had said, that everything that we ever had, anything that we ever won, anything that was ever agreed on coming into the Service is now in the discard. That means Spens, that means Danckwerts, even Whitley. There is no promise that our claim will ever be considered, although the Minister admits there is some justice in it." The only thing which came out of it, which was quite separate from the claim, was the indication that the Management Side of Whitley would be advised to consider the claim of hospital staffs up to the rank of senior registrar.

The CHAIRMAN said that it was interesting that the Minister said "that the Government was willing to instruct," giving away the fact which had always been disputed, that that was exactly what the Government did, it instructed the Management Side of Whitley.

Dr. DAVIES said that one satisfactory thing was that the public health officers would be considered in the constellation of medicine.

The Negotiating Committee

Dr. H. GUY DAIN asked what happened at the Negotiating Committee which met in the afternoon.

The CHAIRMAN replied that it was determined at that meeting that without any avoidable delay all the different constituents of the Negotiating Committee, the G.M.S. Committee, and the Joint Consultants Committee, should discuss the matter and decide what their views should be. The

Negotiating Committee had no longer the task of negotiation; there was no one to negotiate with. When the Council of the Association met next week it was hoped that the views of the different constituent bodies would be available to it. When the Council met the Guild met; the Council could constitute itself into the Guild.

The Negotiating Committee had decided that a letter should be sent to the Prime Minister, signed by Sir Russell Brain and himself, which would be in the form of an appeal to the Prime Minister, even at that last moment, to do something. Nothing could be done about the Royal Commission, but the intention was to suggest that the Royal Commission should be more concerned with the basis of doctors' pay rather than the amount. It was felt that the two issues could still be separated, and that when the terms of reference of the Commission were announced they could be directed to the future rather than to the present. It might still be possible, if the Government wished, for the profession's present dissatisfaction to be referred to an arbitrator. That was the note which would be sounded in the letter to the Prime Minister.

Repudiation of Spens

Dr. H. N. ROSE asked if it was understood that the Government did not repudiate Spens until the Royal Commission reported.

The CHAIRMAN replied that the Government had said all the way through that the Spens Report was a suggestion as to how they should start in the Health Service, and that it did not have any continuing validity. Up to now the Government had said that the Spens recommendations were one of the things which should be taken into consideration when assessing the future, but yesterday they could not even get that, there was no suggestion that the word "Spens" would appear anywhere in the terms of reference of the Commission.

Dr. ROSE asked if it should be taken then that the Government had abandoned Spens and repudiated it entirely.

The CHAIRMAN replied that they had repudiated it entirely, and the representatives of the profession when they gave evidence before the Royal Commission must say that this was where they came in and ask the Commission to agree with its interpretation and reject the Government interpretation.

Dr. O. C. CARTER, a member of the Negotiating Committee in 1948, said that Spens meant far more than remuneration to general practitioners. He could not see any virtue in a Commission, because if the Government dishonoured Spens it could still more easily disregard the findings of a Commission. There were other things which might come in, such as a State-salaried service.

The Platform

Dr. WAND said that they must decide on what platform they were going to fight. The platform should be the simple fact "that we ask for adherence to Spens by the Government by agreement or arbitration. The Government having agreed that, we will consider with the Government the question of looking into the whole structure of the National Health Service." He would throw that out for discussion. He did not attach himself to it completely, but he put it forward to get something concrete; "our demands are the adherence to Spens, brought up to date by agreement or arbitration. If the Government showed that they were willing to keep to their bargain by doing that, we can proceed to discuss with them any further step which may be required to follow."

On the question of propaganda, now was the time to make it clear that sooner or later this must be taken out of party politics altogether. It seemed to him that a good deal of the attitude of the present Government was based on a fear of controversy in the House and repercussions from the Opposition. On the other hand, if the Opposition got back into power the profession could not expect to get much help from it, and therefore the only way to get a health

service which would be satisfactory was to make it clear to the population at large that it must be divorced from political control—that is, Parliamentary control—so that no party came into it, and now was the time to start that.

Dr. STEVENSON, in response to a question from Dr. WAND, produced a letter from Sir William Douglas written on May 2, 1950, which stated "that the Minister agrees that the Spens Report remains the basis of remuneration of general medical practitioners until such time as after the usual consultation some other basis is found."

Dr. J. C. ARTHUR said that this went beyond Spens. All Spens did was to fix the social status of the doctor in 1939, and that was reaffirmed in 1948. That was the point on which they were slipping, and if that could be got over to the profession they might be stimulated to do something effective. The social pattern was changing, and in that lay the very grave danger of this Royal Commission. They were liable to be judged by other professions, and some of these other professions had for many years been envious of the doctor. . . . That was where Spens and Danckwerts had been so important; they had held them up, and he thought that it must be made clear to all the profession that what they were fighting for was not the immediate award but their status in comparison with other professions. If they lost now, they were lost for ever, they would drop in the social scale, and if that could be got over to the profession clearly and simply they would respond to an appeal to do something really drastic.

Action

The Committee then proceeded to discuss what action it should take. After a debate, in which nearly every member of the fully attended meeting joined, it was decided, with only two abstentions, that an emergency Conference of Local Medical Committees should be called in April, and that it be recommended to the conference that general practitioners should be advised to resign from the Health Service unless the Government agreed to an immediate and satisfactory settlement of the profession's claim or to arbitration.

A proposal that general practitioners who were members of administrative bodies should be advised to cease co-operating in the administration of the Health Service was not agreed to as a matter for immediate action, but as one which should be considered at the appropriate time.

The Committee set up a small subcommittee to prepare as a matter of urgency an alternative scheme for the organization of general practice outside the N.H.S.

The following statement was issued by the Committee at the conclusion of the meeting:

"The General Medical Services Committee, representing some 21,000 family doctors in the National Health Service, has learned with anger and resentment of the Government's cynical disregard of the Committee's just claim for an adjustment in remuneration, the level of which has not been changed since April, 1951. Not only has the Government clearly repudiated its obligations, but, by the appointment of a Royal Commission, it has destroyed the very basis upon which the profession agreed to enter the National Health Service only nine years ago. Indeed, as recently as 1950, an assurance was given by the Ministry of Health that 'the Spens Report remains the basis of remuneration of general medical practitioners until such time as after the usual consultations some other basis is substituted.' The Government, by appointing another body without any form of consultation, has committed a flagrant breach of trust which creates a position totally unacceptable to the profession."

"Thus the profession is in the position that, after waiting six years for the Government to implement its pledge to alleviate the effects of the steady decline in the value of its remuneration, it now faces a further and indefinite delay. It is difficult to believe that any other section of the community would be expected to submit to such cavalier treatment and to wait for up to ten years for the effect of rising prices to be mitigated—and without any assurance that this will be the ultimate outcome."

"The Committee is therefore summoning an emergency Conference of Local Medical Committees throughout the country at an early date and is recommending to that Conference that, unless the Government agrees to an immediate and satisfactory settlement of the profession's claim or to arbitration, general practitioners throughout the country will be advised to send in their resignations from the Service. An alternative scheme for the organization of general practice will be issued at the appropriate time."

REMUNERATION CLAIM EXCHANGE OF LETTERS WITH PRIME MINISTER

At its meeting on February 20 the Negotiating Committee authorized its joint chairmen to write a personal letter to the Prime Minister (see *Journal*, February 23, p. 471). The following is the text of the letter signed by Sir Russell Brain and Dr. A. Talbot Rogers and dispatched to Mr. Harold Macmillan on February 21.

The members of the Negotiating Committee of the medical profession at their meeting yesterday afternoon asked us, their joint chairmen, to write to you to express their profound dissatisfaction at the Government's decision on the remuneration claim which you announced in the House of Commons. The Government has refused to honour its obligation to apply the terms of the Spens Committee's reports, as interpreted by the Dankwerts award. It has thus broken its agreement with the doctors when they entered the Health Service. It has been made clear that the Government does not recognize this obligation, but the late Minister of Health, Mr. Turton, said that it would not be right for him to be judge in his own cause.

We agree that the method of adjusting medical remuneration to changing circumstances may benefit by being looked at, and if that stood by itself we should welcome the opportunity of assisting the Government in every way possible. But a Royal Commission is no answer to the present claim, and it is manifestly unfair that doctors who have had no compensation for the rise in the cost of living for six years should await the result of the slow deliberations of a Royal Commission, and meanwhile be expected to go on loyally and ungrudgingly maintaining the Health Service though their real incomes remain grievously depressed.

We therefore ask that the present dispute between us should be submitted to an independent arbitrator without delay.

Your decision causes the gravest anxiety to those who have at heart good relations between the medical profession and the Government and the welfare of the Health Service.

Prime Minister's Reply

The following letter from the Prime Minister was received by Sir Russell Brain on February 25, a similar letter being received by Dr. Talbot Rogers at the same time.

I have to acknowledge the letter of February 21 signed by yourself and Dr. Talbot Rogers regarding the difficult situation that has arisen in connexion with the remuneration of doctors in the Health Service.

Naturally I am very sorry that it has not been possible to arrive at an agreed solution of this problem. The Government feels that the Royal Commission is the only way in which a permanent system can be devised which will stand the test of time. I want to assure you that the purpose of the Royal Commission is not to waste time. On the contrary, I shall certainly urge its chairman to proceed without delay. Moreover, the work of the Royal Commission would not preclude some interim adjustment.

I must also repeat the Government's offer to deal with certain classes, that is hospital officers up to senior registrars, immediately.

While I realize the disappointment of your members at any delay I am convinced that in the long run this procedure is likely to improve the relations of the medical profession with the State and the public whom they serve so loyally.

The Scottish Association of Medical Administrators held its first meeting of the year in Stobhill Hospital, Glasgow, on February 1. The following officers have been appointed for the year: Honorary President, Sir Andrew Davidson; Chairman, Dr. S. G. M. Francis; Vice-Chairman, Dr. C. Bainbridge; Honorary Secretary and Treasurer, Dr. P. W. R. Petrie.

PUBLIC HEALTH COMMITTEE

SUPPORT FOR REMUNERATION CLAIM

The Public Health Committee of the B.M.A., at its meeting on February 22, pledged "the full support of doctors in the Public Health Service for their colleagues in general and hospital practice in the serious crisis with which the whole profession has been faced."

OPHTHALMIC GROUP COMMITTEE

The Ophthalmic Group Committee of the B.M.A. met on February 15, with Mr. O. GAYER MORGAN in the chair. The Committee spent the entire day discussing and revising the draft report of the Joint Subcommittee of the Group Committee and the Faculty of Ophthalmologists on the future of the ophthalmic services. The report will be circulated to members of the Committee in order that they can call their constituents together to obtain their comments on it in time for the Committee's meeting in May.

HOSPITAL MEDICAL STAFF

INCREASED MILEAGE ALLOWANCES

The General Whitley Council has agreed on temporary increases in mileage allowances payable to hospital medical staff and which apply to journeys made on or after December 5, 1956, and will cease when the increased customs duty under the Hydrocarbon Oil Duties (Temporary Increase) Act, 1956, no longer has effect. The increases are as follows: cars up to and including 10 h.p., 1d. on each rate per mile; cars over 10 h.p. 1d. on each rate per mile; motor-cycles over 150 c.c. but not more than 500 c.c., 1d. per mile; cars and tri-cars of 500 c.c. or less, motor-cycle combinations, and motor-cycles over 500 c.c., 1d. per mile.

MATERNITY SERVICES COMMITTEE

ROYAL COLLEGE OF MIDWIVES' EVIDENCE

In a memorandum of evidence to the departmental committee on maternity services, now sitting under the chairmanship of Lord Cranbrook, the Royal College of Midwives states its view that there should be more careful selection of general-practitioner obstetricians. To raise the standard of domiciliary maternity care to that obtaining in the best practices, all general practitioners should be required to have postgraduate experience in a maternity hospital or unit, and should attend refresher courses at regular intervals.

NORTHERN IRELAND HOSPITALS AUTHORITY

ANNUAL REPORT

No outstanding developments are recorded in the eighth annual report of the Northern Ireland Hospitals Authority for the year ended December 31, 1955. The net expenditure increased steadily and in the financial year 1954-5 exceeded £8,000,000. The scheme introduced in 1954 in which an annual block allocation of money is made to each management committee by the Authority was continued and met the approval of the committees. A slight decrease in the demands on the hospital and specialist services is reported.

Scottish News

REGISTRARS GROUP COUNCIL FOR SCOTLAND

A meeting of the Registrars Group Council for Scotland was held in Edinburgh on February 1 with Dr. HAMISH WATSON in the chair.

Great dissatisfaction was expressed with the terms of the agreement on the recent changes in residential charges for hospital medical staff, and with the fact that such an agreement had been reached without prior consultation with those most affected. It was agreed that the following resolution should be forwarded to the Chairman of the Joint Consultants Committee (Scotland) with copies to the Central Joint Consultants Committee and the Central Registrars Group Council:

That the council regrets the terms of the recently issued M.D.B. circular No. 34 on residential charges and that agreement on them was reached without adequate consultation with those who would be affected by them, and urges that early consideration be given to their revision.

Constitution of the Group

A long discussion took place on the proposals from the executive committee of the Central Registrars Group Council for the reconstitution of the Group. It was resolved that the principle be accepted that the constitution of the Registrars Group Council for Scotland be extended down to and including senior house officers. No decision was reached on the best method of ensuring adequate house-officer representation on the registrars groups. This matter was referred to the regional groups, and is to be discussed further at the next meeting of the council.

Other matters discussed were the question of hospital junior medical staff being represented on the Central Joint Consultants Committee and the Staff Side of Whitley Committee B; senior registrars undertaking domiciliary consultations when no consultant was available; and promotion prospects of senior registrars and registrars in Scotland during the next 15 years. This latter subject is to be given further consideration at the next meeting of the council.

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

A meeting of the General Medical Services Subcommittee (Scotland) was held in Edinburgh on February 14, with Dr. C. J. SWANSON (Aberfeldy) in the chair.

Trainee General Practitioner Scheme

The Subcommittee considered a letter from the Department of Health suggesting that discussions might be held about the operation of the Trainee Practitioner Scheme in the light of the report of the Trainee Practitioners' Subcommittee of the G.M.S. Committee.

While appreciating that there were essential differences in the scheme in England and Scotland, the Subcommittee agreed that the report should be discussed with the Department in so far as it applies to the operation of the scheme in Scotland.

Mileage

The CHAIRMAN reported that the Rural Practitioners' Subcommittee was considering the interim report of the Mileage Committee for England and Wales, and that the Department had been asked to arrange for a meeting of the Scottish Mileage Committee at an early date to resume consideration of the position in Scotland.

Elimination of Inflation

It was reported that the liaison committee with the Scottish Association of Executive Councils had recently considered general measures to be taken to combat inflation

and the proposal of the Ministry of Health to introduce an alphabetical index. The Subcommittee agreed that a meeting between representatives of the Department, the Scottish Association of Executive Councils, and the Subcommittee should be arranged to consider the situation.

Prescription Changes

The following proposal from Dundee Local Medical Committee was considered by the Subcommittee:

That the money paid for prescriptions should be returned to old-age pensioners not in receipt of supplementary pensions on presentation of receipts at the post office along with their old-age pension books.

The Subcommittee was in sympathy with the views of the Dundee Local Medical Committee, and agreed to suggest to it that, since this is a United Kingdom matter, it should arrange for the proposal to be considered at the Annual Conference of Local Medical Committees in June.

Medical Records of National Service Men

The Subcommittee considered proposals from the Department on arrangements for the custody of the medical records of men called up for National Service and for reinstatement of Service men's names on doctors' lists. The essential points of the new arrangements are, first, that when a man is called up his medical record will in future be retained by the executive council for a period of two years and three months; and, secondly, that when two years and three months have elapsed from the date when a man was removed from the list on call-up the council will write to him at the address from which he was called up, explaining to him the position regarding registration with a practitioner.

Other Items

Other subjects considered by the Subcommittee were drugs and appliances; initial practice allowances; accidents in the home; mass radiography campaigns; medical service committees and tribunal procedure; protection of practices scheme; and fees for superannuation examinations.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR,—There must be few doctors now who are not angry at the treatment we have received from the Government in respect of our wage claim. As far as I can judge from the information available, the Ministry more or less agrees that there is justification behind it but that the country cannot afford it. So we are to go on being exploited and, in effect, subsidizing the Welfare State. This is indeed an extraordinary relationship between employer and employee.

Of course all this dispute is only bringing to the surface the long-standing loss of confidence between ourselves and successive ministries since we were beguiled into the National Health Service in 1948. As far as the doctors are concerned, it has been a very one-sided bargain with self-restraint and self-sacrifice on our side and exploitation of our traditional loyalty on the other. A complete rearrangement of the N.H.S. is required, removing it from the intimate control of party politicians.

Our whole professional status is at stake and we have an opportunity now, as never before since 1948, to free ourselves from political serfdom. By determined action we can still preserve for the future all that is best in the tradition of medicine. Let us make sure that this time we are not diverted from our purpose by the professional politician.—I am, etc.,

J. S. TAYLOR.

Guildford, Surrey.

SIR,—Yesterday the Minister of Health behaved in the way the majority of us expected. He has employed further

delaying tactics, assuming, no doubt, that politically the medical profession is unimportant and divided in its views.

The time has now come for us to unite wholeheartedly, putting aside all personal anxieties, to make it abundantly clear to the people of this country, and to the politicians, that our primary concern is not for an increase in salary but for complete reform of the National Health Service. We have a duty to those who will follow us in our great tradition to raise medicine out of the bureaucratic bog in which it is now so sickeningly floundering. We must impress upon the nation that we are above politics, and that those whose duty it is to organize and control the Health Service must be unaffected by the ebb and flow of party popularity. Our predecessors handed to us a great tradition which, owing to the conditions forced upon us by the ill-conceived Service which controls us to-day, we shall be unable to pass on to those who follow us. The era of vocation is dying; the doctor of to-morrow will be a poor descendant of the great men of the past.

Let us not talk of "striking" or refusing to sign certificates. We have one duty before us, and that is a unanimous mass resignation at once. If we delay now our chance will have gone for ever and we will be guilty of betraying all that we have inherited.—I am, etc.,

Bewdley, Worcs.

DAVID E. SARGENT.

SIR,—As one temporarily exiled from my country and profession, I have followed with the greatest concern and interest the present controversy on professional-Governmental relations. From the enforced, oversimplified viewpoint of a vacuum certain facts stand out.

Our own medical politicians are also in a vacuum but through no fault of their own. This is partly because, as yet, the profession has not spoken with a single voice, and partly because the present structure of the profession makes this extraordinarily difficult on a part-time voluntary basis, when our leaders cannot get out into the highways and by-ways. This is not to be interpreted as meaning we need paid medical politicians. Most of life is a shade of grey, but very occasionally at any given moment, by the best current standards of any society, a definite black or white occurs. The profession could try to make up its mind whether this is or is not now occurring. Accepting that only those with a chip on their shoulder, like myself, write to papers, then the profession appears to be divided in this controversy into three groups: those who wish to change the health scheme; those who are concerned with remuneration; and those who see this as a breach of faith. The first thing that our leaders might do is to find out from the profession which of these points is the basic current issue. When they have discovered this, they then could discover how large a majority is of this opinion. They could then give the leadership to allow the profession to decide what action, if any, is to be taken. If action is to be taken, then more than a 51% majority is required—say 66% or 75%.

Now, depending upon what is found, action could be as follows. If we wish to change the health scheme we are not entitled to take action unless we have something better with which to replace it. Have we at the moment? If so, let us proclaim it. If not, then we should proceed as we are until we have. Then and only then is it correct to start action. Is this a remuneration claim? If it is, there is a time-honoured method for staking this—the strike. But what a time to strike. How have we been engineered into such a position at a time when the economy of our country is endangered, so that no one can look favourably on this action? In spite of all our sacrifices we still have a greater buffer of cash than most of our patients. If this is an ethical problem of professional-Governmental relations in which the Government has broken faith, we have three alternatives: accept what has occurred and adjust our future actions so that it does not occur again; let the Government have its own way continuously; or fight now. If we fight now we have decided we are dealing with a black: this must not be returned with another. This must be explained to the nation. We must establish favourable public relations

and tell why and what we are going to do. Ensure that a large majority of the profession is agreed on a course of action. This might be divided into, say, three monthly time periods in which we (1) stopped writing anything, (2) worked to rule—going slow, (3) only treated emergencies. Under no circumstances could we be prepared to negotiate on this plan. If our demand had not been met at the end of a time period we would move to the next. At all costs we would have to see it through to the bitter end, unrelenting, and always explaining to the nation that this was in their benefit.

This letter may well be out of date when it reaches you, but I am willing to stake my reputation as a tipster that if this really is a breach of faith, then, because our Government are honourable men, they would give way somewhere around the introduction of the second time period. If there is no breach of faith, then we have no right to even start along this path.—I am, etc.,

Chicago, U.S.A.

RICHARD G. DUNNING.

SIR,—The Minister of Health has now finally rejected the Spens recommendation and our claim for reasonable adjustment of remuneration, and as the costs of running practices are steadily rising the profession has no alternative to pressing their claim in no uncertain manner and with no more procrastination.

The Minister has prolonged negotiations with the Negotiating Committee by the age-old method of dangling a carrot before a donkey, and assuming that the medical profession was too proud and too disunited to take any drastic action. Perhaps he thought the medical profession sufficiently softened up and ready for the kill? The promise of a Royal Commission is simply a follow-up of the delay tactics which have really only been political trickery. By all means let us have a Royal Commission to get the future on a firm basis, but in the meantime an increase in remuneration for the middle and lower lists must be granted, for while Nero fiddles Rome burns. The standard of living of doctors with the middle and lower panels is rapidly going down, causing increasing financial worries, inability to afford reasonable holidays, and social anxieties and inability to educate their families to the standard of previous generations of medical men; these factors must lower the standard of general practice and of the efficiency of the Health Service.

As mass resignation from the Service involves the payment of compensation and loss of pension rights—although if the Government were so minded these matters could be held over until agreement had been reached and our resignations rescinded—perhaps the quickest and best action would be a token strike involving refusal of all certificates, except death, cremation, and certificates required for emigration. It should be made quite clear to the people that this action was made necessary by the unreasonable attitude of the Government. The action should be taken with the least possible delay, and I would suggest that April 1 be zero hour. As an interim measure by the profession to give immediate relief to the lower-income groups, I would suggest that the present loading of 500 to 1,500 be given to the first 1,000 with effect from April 1, 1957.

If adequate remuneration was given immediately and permanently to all groups of the profession, the ethics and standard of medicine would improve. If we do not succeed in our efforts now the decline and fall of the general practitioner will be well and truly launched.—I am, etc.,

Wetherby, Yorks.

S. T. PYBUS.

SIR,—After attending the local meeting of the British Medical Guild we, as young practitioners, are worried about the way in which the coming crisis in the National Health Service is being handled. It seems to us that the important points are: that the Spens Reports are repudiated by the Government; that there is no method of legally forcing the Minister to abide by his agreement; and that the official B.M.A. or Guild policy seems to be that, if a large number of doctors threaten to resign from the Service, then the Government will agree to our claims and resignation will not be necessary, and that this process can be repeated every few

years. We think that this policy cannot succeed, and that the Minister has already decided to await our attempts at resignation.

It should be explained to the public that all we are asking is for the Minister to be made to keep his promises and that we want independent arbitration. We think that some sort of health insurance plan is to-day essential, and that, apart from a small section of the community, private practice is, for several reasons, now finished. As we cannot possibly in future trust any Minister's verbal promises, any doctor in the early or middle years of his career cannot hope for a reasonable future in a health scheme controlled by the Government. Therefore our only possible step is first to set up a nation-wide health insurance scheme, and after that resign from the present health scheme on the grounds that the Minister will not go to arbitration.

No doubt an alternative scheme could be made ready in a year from now. There are about 20,000 G.P.s—£10 from each one would produce £200,000, and this sum, or double if necessary, would surely provide a team of accountants, statisticians, insurance experts, etc., with enough funds to bring into effect by next January a complete scheme, preferably based on capitation payment. Possibly, just as we are about to change over to our own scheme, the Minister would offer various compromises; but the only offer we should even consider would be a legally binding contract based on the Spens Reports.

We suggest that further discussion with the Minister is useless, except, perhaps, to make the point that we think he ought to go to arbitration, but threats of resignation asking for more money do not frighten the Minister, but do antagonize the public. We ask all who are interested in a plan of this type to press for a further meeting of the British Medical Guild by contacting their colleagues locally and by writing to the B.M.A.—We are, etc.,

A. J. CLARKE.

E. G. McCLEAN.

M. J. EVERTON.

J. S. NELSON.

B. KENDRICK.

N. E. STEBBINGS.

Nottingham.

Resignation

SIR,—Two points should be considered in the event of a mass resignation of general practitioners from the National Health Service. On resignation each general practitioner who is owed his compensation money will be entitled to it. As he only gets 2½% interest, and interest rates are now about double that, it will be of great advantage to him, and each of the recipients might be willing to loan part of it to the Medical Guild. It will cost the Government about £50 million, but this cannot be helped. The other point which is not mentioned enough—and should be point one in any settlement—is no victimization. Every general practitioner who has resigned must have the right, if he wishes, to be admitted to the National Health Service in his own practice again, as he was before. This is absolutely essential and unnegotiable.

I think certificates should be given as now so that the patient does not lose. I think a fee should be charged for each service and a receipt given to the patient. Until normal service is resumed the Ministry of Health will save millions in fees, and may perhaps repay patients. Attendances will be confined to the necessary ones, and there are few who cannot afford a fee. Those who cannot will be treated as they used to be—free. Prescriptions can be issued on E.C.10 with "Executive Council" crossed out, and the problem of paying for them resolved between the patient whom it concerns and the Ministry.—I am, etc.,

J. RICHARDSON.

Colwall.

Item-of-service Payment

SIR,—Now that we are to have a Royal Commission, let us hope that it will blow a breath of common sense into our affairs. Could any system of payment be more utterly absurd than the present, which rewards more work with less pay? Under the capitation system I lose money every time my telephone rings. Is it to be wondered at that most of us answer the night telephone these days with a snarl?

Not only have we to suffer the discomfort and inconvenience of getting out of bed, but we actually have to pay for the privilege, and the further away the patient lives the more it costs us. Small wonder that so many of us are punished for not giving adequate attention to patients, when in fact the system actively encourages this very thing.

When the capitation system was introduced, it covered only a minority of patients. Most were still private; busy times meant more pay, not less; and we were free to make our own adjustments to the cost of living, to our patients' circumstances, and other relevant factors. In my opinion the capitation system is outmoded. It was workable when applied to a minority, but it was never meant to cover the whole population, and in making it do so we are accentuating its disadvantages, with a result which is impractical to say the least. For goodness' sake let us have payment per item of service. The telephone will then be a merry tinkle, night calls almost a pleasure, and we shall hear no more of these miserable fines for inadequate attendance which so degrade us to-day.—I am, etc.,

E. Grinstead, Sussex.

E. J. DENNISON.

Senior Registrars and Consultant Appointments

SIR,—After reading the report of the Central Consultants and Specialists Committee submitted to the Council on December 19, 1956 (*Supplement*, January 5, p. 1), I was disturbed that so little consideration was given to the question of hospital staffing, particularly the position of the senior registrars. It was evident by the remarks of Mr. E. A. Gerrard, Dr. J. G. M. Hamilton, and Mr. Dickson Wright that the Council was very uneasy about the whole situation and is looking for a lead from the Chairman of the Central Consultants and Specialists Committee. I know from experience that this Committee has always a very full agenda and often a long time is spent on trivial problems. Surely it should concentrate on really important issues.

The hospital service has come to stay, and one cannot deny that since the appointed day it has been vastly improved. Many doctors decide that they would like to make hospital work their career. They obtain a house appointment, and at the same time study for a higher diploma. They may hold an appointment of S.H.O. for one year, then become a registrar for two. The best of these obtain posts as senior registrars. Many of them have now occupied this position for four years or more and have contributed in no small way to the hospital service. What is to happen to these men? It would appear that there are not enough consultant posts to absorb them. In certain specialties not only have they acquired a knowledge of their subject but also considerable technical skill. If these appointments are to be terminated, what a loss it would be, and, indeed, after having been trained to such a high degree, they would have no alternative means of employment except in the hospital field.

It is obvious from the information which I have that many boards consider that the problem has become chronic and the retention of these senior registrars after four years is blocking the promotion ladder, and they are contemplating terminating their appointments. Surely the Central Consultants and Specialists Committee should view this with deep apprehension. It alone can give a lead to the Ministry, which I am sure is deeply concerned about the problem. A simple solution would be to absorb these senior registrars of four years or more as assistant consultants (the terms and conditions to be a subject of negotiation), and at the same time the intake of senior registrars in certain specialties should be reduced for a period of years.

I hope the Central Consultants and Specialists Committee will give its earnest attention to this pressing problem. Its remit, I would suggest, should not be confined to senior registrars alone, but should include the pattern of hospital staffing for the future. The B.M.A. is a powerful body, and if it were to give a constructive and unbiased opinion I am sure it would be treated with respect by the Ministry.—I am, etc.,

Manchester, 13.

R. L. NEWELL.

BRITISH MEDICAL GUILD

BOURNEMOUTH DIVISION

At a meeting of the profession in the area the following resolution was passed unanimously: "That this meeting of the medical profession in the Bournemouth, East Dorset, and West Hants area approves and supports the action of the Negotiating Committee to obtain adjustment of the remuneration of the profession under the terms of the Spens Committee's recommendations."

ISLE OF ELY DIVISION

At a recent meeting arranged by the Division, to which all medical practitioners in the area were invited, the following resolution was passed: "That this meeting fully approves and endorses the present claim for increased remuneration for all medical practitioners engaged in the National Health Service."

WEMBLEY DIVISION

A meeting was held at the Century Hotel on February 5. Sixty medical practitioners from the area attended. The following resolution was carried unanimously: "That this meeting is unanimous in pledging its support of the Negotiating Committee and hopes that it will have strengthened that Committee's hand in taking a strong line with the Minister."

Meetings to be Held

BIRMINGHAM.—At Birmingham Medical Institute Library, 154, Great Charles Street, Thursday, March 7, 8.30 p.m.
CHELSEA AND FULHAM.—At Fulham Town Hall, London, S.W., Friday, March 8, 8.30 p.m.
ENFIELD AND POTTERS BAR (ENFIELD EAST GROUP).—At 2, Crescent Road, Enfield, Middlesex, Monday, March 4, 9 p.m.
ENFIELD AND POTTERS BAR (ENFIELD WEST GROUP).—At Chertton, 14, The Ridgeway, Enfield, Sunday, March 3, 8 p.m.
EXETER.—At Library, Royal Devon and Exeter Hospital, Thursday, March 7, 8.30 p.m.
RICHMOND.—At Recreation Hall, Royal Hospital, Richmond, Sunday, March 3, 11 a.m.

Branch and Division Meetings to be Held

BARNET DIVISION.—At Middlesex Arms Hotel, Barnet By-pass, Saturday, March 9, 8 for 8.30 p.m., meeting. Short talk by Dr. Walter Hedgcock (Assistant Secretary, B.M.A.): "Recent Events." Members' ladies are invited.
BOLTON DIVISION.—At Bolton Royal Infirmary, Tuesday, March 5, 8.30 p.m., meeting in conjunction with Bolton Medical Society. B.M.A. Lecture by Dr. R. A. J. Asher: "Face Values."
BOURNEMOUTH DIVISION.—At St. Ann's Hospital, Canford Cliffs, Bournemouth, Monday, March 4, 5 p.m., psychiatric clinical meeting.
BRIGHTON AND MID-SUSSEX DIVISION.—At Hotel Metropole, Brighton, Friday, March 8, 7.30 for 8 p.m., B.M.A. annual dinner.
BROMLEY DIVISION.—At Nurses' Recreation Room, Beckenham Hospital, Wednesday, March 6, 8.15 p.m., meeting. Address and discussion introduced by Dr. R. I. S. Bayliss: "Cortisone in General Practice."

CHESTERFIELD DIVISION.—At Walton Sanatorium, Friday, March 8, 8.45 p.m., meeting. Lecture by Mr. E. A. Nicoll: "The Knee Joint."

GLASGOW DIVISION.—At Hall of Royal Faculty of Physicians and Surgeons of Glasgow, 242, St. Vincent Street, Glasgow. Thursday, March 7, 8.30 p.m., meeting. Address by Dr. A. F. Maclean: "Medical Hypnosis."

HALIFAX DIVISION.—At Board Room, Royal Halifax Infirmary. Wednesday, March 6, 8.30 p.m., meeting. B.M.A. Lecture by Professor J. M. Webster: "History of Forensic Science in Britain."

HARROW DIVISION.—At the Rest Hotel, Kenton Road, Kenton. Tuesday, March 5, 8.30 p.m., clinical meeting. Dr. Donald Hunter: "Diagnosis and Treatment of the Anaemias, including Industrial Hazards." Members of Wembley and Hendon Divisions are invited.

HARTLEPOOL DIVISION.—At Staincliffe Hotel, Seaton Carew. Wednesday, March 6, 8.30 p.m., meeting. Lecture by Dr. M. H. Armstrong Davison: "The Maladies of Mary Queen of Scots and Her Husbands."

HASTINGS DIVISION.—At Royal East Sussex Hospital, Tuesday, March 5, 8.15 p.m. B.M.A. Lecture by Mr. A. Dickson Wright: "Vascular Disorders of the Extremities."

HOLLAND DIVISION.—At White Hart Hotel, Spalding, Friday, March 1, 7.30 for 8 p.m., supper; 9 p.m., address by Dr. Robert Forbes: "Medico-Legal Problems in Practice."

LEWISHAM DIVISION.—At Langley Rooms, the Green Man, Bromley Road, S.E., Thursday, March 7, 7.15 for 7.45 p.m., dinner dance. Members may invite two non-medical guests besides their wives/husbands and four other medical guests and their wives/husbands.

READING DIVISION.—At Large Chemistry Lecture Theatre, Reading University, Tuesday, March 5, 8.30 p.m., meeting. B.M.A. Lecture by Dr. W. R. S. Doll: "Cause of Lung Cancer."

ROCHESTER, CHATHAM, AND GILLINGHAM DIVISION.—At St. Bartholomew's Hospital, Rochester, Thursday, March 7, 8.30 p.m., meeting. Lecture by Dr. F. E. Camps: "The Emmett-Dunne Case." All medical practitioners in the area of the Division are invited.

SOUTH ESSEX DIVISION.—Thursday, March 7, visit to May and Baker, Dagenham. 2.30 p.m., meet at factory; 5 p.m., leave by coach for London; 6 for 6.30 p.m., dinner at Charing Cross Hotel; 8.30 p.m., Wyndham's Theatre; 10.45 p.m., return by coach to Dagenham.

SOUTHPORT DIVISION.—At the Prince of Wales Hotel, Southport, Friday, March 8, 8.30 p.m., meeting. Lecture by Dr. P. C. P. Cloake: "Mental Symptoms in Organic Cerebral Disease." Open to members of the medical profession.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—At Morriston Hospital, Swansea, Thursday, March 7, 3 p.m., joint clinical meeting with Swansea Division. Cases on view from 2.30 p.m.

SOUTH-WEST ESSEX DIVISION.—At Langthorne Hospital, Leytonstone, E., Wednesday, March 6, 8.30 p.m., meeting. Mr. W. D. Coltart and Dr. J. H. Cyriax: "To Manipulate or Not to Manipulate." Questions and a discussion will follow.

STIRLING BRANCH.—At Falkirk Royal Infirmary, Wednesday, March 6, 8.30 p.m., clinical meeting. Lecture by Dr. R. G. Somerville: "Polio-myelitis and Polio-myelitis Vaccination, the Present Position."

SWINDON DIVISION.—At Goddard Arms Hotel, Swindon, Thursday, March 7, 8.30 p.m., annual dinner meeting. Chief guest, Dr. Katherine Williams.

WEST MIDDLESEX DIVISION.—At Acton Technical College, High Street, Acton, W., Tuesday, March 5, 8 p.m., conjoint meeting with B.D.A. (Middlesex and Hertfordshire Branch): Acton, Ealing, and Chiswick Section). Programme of sound films: "General Anaesthesia in the Dental Chair." Dr. T. H. S. Burns will answer questions in the discussion to follow.

Meetings of Branches and Divisions

CITY DIVISION

The inaugural meeting of the 1956-7 session was held in the Old Library, B.M.A. House, on October 16, 1956. Over 100 members and their guests were present. Dr. Keith Simpson gave the B.M.A. lecture on "It Looks Like Crime."

DUNDEE BRANCH

The annual B.M.A. lecture was held in the Queen's Hotel on November 30, 1956. Mr. A. Buchan, vice-president, was in the chair and 86 members, guests, and friends attended, including representatives of the legal profession and the police. Dr. F. E. Camps spoke on "Dumb Evidence: The Interpretation of Injuries Due to Road Accidents." Dr. J. Scott Innes, Mr. J. R. S. Paterson, and Dr. A. A. B. Scott took part in subsequent discussion. A collection was taken for the Hungarian Relief Fund.

HOLLAND DIVISION

A meeting was held in the White Hart Hotel, Boston, on November 24, 1956. Thirty-five members attended. After dinner Dr. W. A. S. Falla gave an address on "Changes in Psychiatry in the Last 20 Years." It was arranged that the local medical profession should make an immediate donation of 50 guineas to the Mayor of Boston's Hungarian Relief Fund.

PROCEEDINGS OF COUNCIL

REMUNERATION CLAIM

A special meeting of the Council of the Association was held on February 28 to consider the situation resulting from the decision to set up a Royal Commission on medical and dental remuneration.

Dr. S. WAND was in the chair, and there was an almost full attendance of Council members.

Meeting with Minister

The CHAIRMAN said that when the delegation from the Negotiating Committee met the Minister of Health on February 20 it was confronted with a statement from Mr. Vosper that the Government proposed to set up a Royal Commission, and that it would be prepared to instruct the Management Side of Whitley Committee B to negotiate a settlement for junior hospital medical staff up to senior registrar. The Government's proposal, which was decided on without any discussion at all, caused extreme anger on the part of all members of the delegation. Mr. Vosper made it clear that there was no obligation on the Government to accept the findings of the Royal Commission, or to implement them if it did, if the economic state of the country was as it is now. He did admit later that there was justice in an increase for the doctors.

Dr. Wand said that he had expressed the feelings of the delegation to the Minister in such a way as to leave him in no doubt about them. The G.M.S. Committee and the Public Health Committee had passed certain resolutions, which had already been published (see *Supplement*, March 2, pp. 97 and 100), and at its meeting that day the Joint Consultants Committee had passed a resolution advising those it represented to support the general practitioners in every possible way. In the event of the general practitioners being compelled to withdraw from the National Health Service the Joint Consultants Committee would advise its constituents fully to support this withdrawal by refusing to permit the hospital and specialist services to be used in any way as a substitute for the family doctor service. The Committee had also agreed to recommend to the Negotiating Committee that the Government's proposal immediately to increase the remuneration of junior hospital medical staff should be accepted (see page 109).

Dr. Wand pointed out that there were two issues: the immediate claim, and the purpose for which the Royal Commission was set up. At some stage it might be neces-

sary to separate the two issues or bring them together. Either course would be quite proper, and it was for the Council to decide which to adopt. Later in the meeting Council would probably wish to pass resolutions; in the meantime, however, the meeting was open to free discussion.

Dr. J. G. M. HAMILTON asked if it was true that the Government would be announcing the terms of reference of the Royal Commission that afternoon; if so, would it be possible to send a telegram to the Prime Minister if thought advisable?

The CHAIRMAN said that Dr. Talbot Rogers would deal with that question.

Question and Answer

Dr. A. TALBOT ROGERS, Joint Chairman of the Negotiating Committee, said that after the meeting with the Minister there was a meeting of the Negotiating Committee at which it was agreed that there was a need for consolidation between the different sections of the profession in the future. The next day the General Medical Services Committee met, and spent the whole day discussing the matter. It agreed unanimously to call an emergency Conference of Local Medical Committees at the earliest possible date, and to recommend that unless the Government agreed to an immediate and satisfactory settlement of the profession's claim or to arbitration general practitioners throughout the country should be advised to send in their resignations from the Service. It was added that an alternative scheme for the organization of general practice would be issued at the appropriate time. Dr. Rogers was confident that it would meet with the approval of the G.M.S. Committee, of the Council, and of the practitioners.

As would be known, Sir Russell Brain and he had sent a letter to the Prime Minister, and a reply had been received stating that the Royal Commission would work as fast as a Royal Commission could, and that the setting up of the Royal Commission would not preclude an interim adjustment.

A further meeting between the Minister and Sir Russell Brain and himself took place that morning. The Minister did not know the terms of reference of the Commission, nor did he know anything about its composition. It was understood the terms of reference were to be announced that afternoon in the House of Commons.

At the interview, said Dr. Rogers, Sir Russell and he tried to obtain some information on what was meant by

the phrase of the Prime Minister "that the work of the Royal Commission would not preclude some interim adjustment." First, the Minister assured them that in his view there was no constitutional objection to negotiation or discussion on a matter already referred to a Royal Commission while the Commission was sitting, and that he himself would not advance any argument that such discussion could not take place.

Next, if there was to be an interim adjustment, there were, Dr. Rogers told the Minister, four main ways in which it could be agreed upon in the present circumstances, and he asked him to indicate which might be chosen. First, the Government might make an offer of so much money as an interim settlement; secondly, there might be negotiations with the officers of the Ministry about the right and proper sum to be allocated; thirdly, it might be put to arbitration, either to a single arbitrator to be agreed or to a court of arbitration; and fourthly, it might be dealt with by the Royal Commission as a matter of first priority before going on to consider future methods.

The Minister listened with patience, and said that in his view the Government did not look favourably on arbitration, that there were difficulties for both sides in referring it to the Royal Commission, and that it was probable the method would be by negotiation with the Ministry itself. The Minister, in his first words, had pointed out the difference which had been detected in the Prime Minister's letter, in which two adjectives were used, one an "interim" adjustment for the whole profession, and the other an "immediate" adjustment for junior hospital medical staff. He said it meant that it was felt there were good reasons for looking straight away at the question of junior hospital staff, but there was no such urgency with regard to the whole of the interim settlement, and it seemed unlikely that conversations about an interim adjustment could begin before the end of April.

It was pointed out to the Minister that the General Medical Services Committee had pledged itself to call a special Conference of Local Medical Committees which was likely to take place in April, and that nothing had happened to justify alteration of this plan. Dr. Rogers thought the Minister was left with the idea that if the Government wished to suggest to the Conference that they were in earnest about an early interim adjustment there should be a definite date fixed for conversations to commence within a very short time of the calling of the Conference. The Minister said he did not wish to commit the Government, because it would depend upon the economic situation at that time, and he did not wish to suggest an adjustment which it would not be possible to carry out. He felt that there were certain trends which would be more clear by that time.

The Minister was also pressed to indicate whether these negotiations would be separate negotiations as they had always been in the past—that is, between general practitioners and the officers of the Ministry on the one side, and the consultants and Whitley on the other. He, Dr. Rogers, had pointed out that for the last year the profession had come together and would wish to put their case together. The Minister replied that it could be dealt with as one claim, and if it was decided that a percentage increase should be given in order to meet this interim adjustment it could be negotiated for both sides of the profession.

On the question of whether the Royal Commission could make retrospective awards, the Minister said that it was open to the Commission to make recommendations. Dr. Rogers had gained the impression that the delay which had occurred since the claim was first made last year would not be counted against the profession.

The last question was whether, in view of the difference of opinion about the validity of the Spens and Danckwerts findings, the Royal Commission would be able to receive arguments based upon the profession's interpretation of Spens. The Minister replied that they would be able to put this forward, and the Royal Commission would hear their views and it would be part of the duty of the

Commission to decide the right and proper way to interpret it.

His own feeling, continued Dr. Talbot Rogers, was that the decision of the General Medical Services Committee, which was undivided in its view that the matter should be put to the Conference and that the Conference should be asked for the strongest possible action, still stood. The situation had to some extent changed since the meeting of the Committee. He knew that the Committee would wish to discuss these developments, but until the terms of reference were known it would not be decided whether the Committee should be called in advance of its regular meeting. He assured the Council that the work of the Committee in preparation for resistance to the Government was going on without any let-up; at the moment judgment was reserved, "but we are keeping our powder dry."

Dr. W. WOOLLEY asked if the findings of the Commission would be mandatory, to which the CHAIRMAN replied that no part of the Royal Commission would be mandatory.

Greatest Crisis

Mr. S. F. LOGAN DAHNE, after congratulating the joint Chairmen on the work they had done, said he was sure the Council would support the Negotiating Committee, the G.M.S. Committee, and the Joint Consultants Committee. This was the greatest crisis the profession had ever had, and he believed that if it did not win this fight the profession would be depressed in status and remuneration to the level of artisans. They must hold firmly to the unity which they had, they must hold on to their dignity and the fact that theirs was a learned profession, and they must hold on to their courage.

What should be their short-term and long-term strategy? The Guild must be kept fully alert and informed and ready to act; secondly, they must have plans for action in the event of resignation, so long as such plans were Guild action. They must endeavour to put their case to the public and prove to the public and to the Government that it was not merely remuneration they were worried about. A British Medical Association planning commission on improvement of the National Health Service must be set up. The main object must obviously be to get immediate justice, and second to set up a permanent court of arbitration on all aspects of remuneration and terms of service, otherwise this trouble might be recurrent. Endeavours should be made to set about obtaining reasonable and reasoned amendments to the Act to make it a real health service and not, as it was at the moment, a sickness certification servitude. The Health Service must be removed completely from being a plaything of party politics; medicine should never be used for vote-catching. This was one of the things which worried the profession equally with the question of remuneration.

The Prime Minister must be told that temporary adjustments for the junior hospital staff would be accepted without prejudice to their cause, and the Royal Commission would only be accepted provided it could be told how the National Health Service should be organized and run. Finally, direct negotiation with the Minister must be demanded straight away, or an immediate *ad hoc* independent arbitration on the present issue.

Dr. A. V. RUSSELL said that the remuneration issue was the one to keep to the fore; anything else would confuse it. Remuneration was not the only subject which caused discontent, they all knew that. It was a matter of broken pledges; the profession had had enough of broken pledges over the years, and it was coming to the point where they might not be content to serve an employer they could not trust.

Was it sufficient to have a Royal Commission which was not mandatory? The Prime Minister had opened the door a little; he might open it a little more or close it quickly. They should not be content with a Royal Commission; what they must have for a reasonable settlement of the claim was an arbitration whose findings would be binding upon both sides.

It was very important to have the outlines of an adequate alternative service to put before the profession, and he was glad to hear that the framework of something of that kind was being prepared. Dr. Russell thought the next step was to call a Special Representative Meeting and to put before it a very definite recommendation for action.

Dr. A. BARKER said it was difficult to discuss the terms of reference of the Royal Commission before they were known, but the Queen's Commission must be accepted. Evidence must be placed before it on the points to which Mr. Logan Dahne had called attention, and with which all were agreed.

The immediate problem was the problem of remuneration. Dr. Russell had said they should insist on arbitration, but he understood the Minister had ruled out arbitration. Dr. Talbot Rogers had left an impression that there would be direct negotiations between the Government and the Association. He hoped the General Medical Services Committee or the Negotiating Committee or whatever body went forward would be supported in its efforts to secure an interim payment now, and meanwhile evidence to be given to the Royal Commission would be planned which would not only help remuneration but would produce a service worth while.

Dr. H. GUY DAIN said he thought that the terms of reference might be concerned not only with the amount of remuneration but the methods by which it was paid. If the Association gave evidence to the Commission it should be stated that the question of methods was a matter for private argument, agreement, and arrangement between a good employer and a willing servant. It should be made clear that a Royal Commission was regarded as an improper body for arranging terms of service or remuneration. That was fundamental.

As far as an interim adjustment was concerned, this should be argued with Ministers of the Crown, not with officials of the Ministry. He was entirely opposed to discussion at that level. Discussion was now at the Prime Minister's level and it should remain there.

Dr. F. M. ROSE said they could not anticipate their participation in the work of the Royal Commission until the terms of reference and personnel were known. Did Dr. Talbot Rogers obtain from the Minister any undertaking about the other part of Spens, the allowances for private practice, the increase in the pool on the number of new doctors coming in, and other factors?

Dr. TALBOT ROGERS replied that the Minister was asked whether the Royal Commission was intended to look at the distribution of money, and the reply was that the matter of distribution would be discussed with the Minister's officers as before; he gathered that it was mainly a question of deciding the global amount to be paid to general practitioners which the Royal Commission was concerned. It seemed that it was believed that even after the Royal Commission had reported there would still be discussions between the Ministry officials and themselves on the right and proper way of distributing the pool each year. He felt that once the Royal Commission had reported the Government would come forward with some entirely different method of calculating the pool.

The CHAIRMAN said that until the terms of reference, which might be available some time during the afternoon, were announced it would be better to confine comments to the appointment of a Royal Commission rather than on the terms of reference.

No Immediate Settlement

Dr. IAN D. GRANT, Chairman of the Representative Body, said he hoped Dr. Talbot Rogers would be invited to ask the Prime Minister for a categorical reply to the question whether he was willing to give an interim adjustment in remuneration forthwith. He saw no justification for the Minister's statement that negotiations on this matter could not be opened immediately, and the Prime Minister should

be informed that the Council wished this adjustment to be made forthwith.

It was absolutely vital that if constituents were to be asked to send in their resignations the nature of the alternative service should be available at the earliest possible moment. It was no use having meetings until constituents could be told what was proposed and invited to comment upon it.

Dr. TALBOT ROGERS said that it was likely that the answer to a demand for immediate negotiations would be that the Government would not make any offer until May. That seemed quite definite from the way the Minister spoke. The Prime Minister had intimated the possibility of an interim adjustment, and Mr. Vosper had stressed that this meant an interim and not an immediate settlement, intimating that the Government was not in a position to offer an immediate settlement except for the small section of junior hospital staff. He did not think the economic situation on which all the Government's arguments were based had altered or was likely to alter in the next ten days, and he thought the suggestion that something might be done after the end of April was the best which could be got. They should continue to be ready to take advantage of this. The Negotiating Committee was meeting again to consider this new situation. He did not think an offer from the Government should be asked for; it should be done by negotiation. The Government did not favour arbitration. Ever since Danckwerts the idea of a single arbitrator had been anathema to the Ministry. The Ministry was seized of the importance of not wasting time.

Dr. GRANT asked if the offer of an interim adjustment could be obtained in writing from the Prime Minister.

Dr. E. A. GREGG said that he had great sympathy with the words of Dr. Dain and Dr. Grant, and it was undoubtedly a hopeful element that the Prime Minister should have written as he did. He would plead that any alternative form of service in the event of resignation should be made as simple as possible. The Council and profession must take the advice of those who had been in contact with the Minister of Health and the Prime Minister. The profession had never before been face to face with the Prime Minister, and that was a great improvement in their position.

Dr. WOOLLEY referred in appreciative terms to the support given by the Public Health Committee to the claim. The Royal Commission must be accepted, and evidence would have to be given by the Association. He had not heard anything which would seem to justify the watering down of the report of the General Medical Services Committee and the action recommended. He hoped the Council would support the Committee and concentrate on that for the rest of the afternoon.

Dr. J. A. PRIDHAM said he thought the profession realized that it was now or never. It was not just a question of money; it was a question of faith, confidence, and broken pledges. He believed the profession was as angry and as united as it had ever been. In all his experience he had never known the press and the public so behind the profession, and unless they stood and fought they would lose the respect of the country. They must continue with their preparations. There was plenty of time for the Government to make some offer more concrete than at the moment.

Dr. R. HALE-WHITE said he was perfectly certain that it was the firm attitude which had been taken by the profession which had brought about the slight improvement and which had brought them into direct contact with the Prime Minister. He was sorry that Dr. Talbot Rogers did not feel that he could for the time being press ahead with that contact. He also thought that preparations for action should proceed without delay. He would ask Dr. Talbot Rogers one question. He gathered that if resignation from the Service was eventually advised, all else having broken down, it would be timed in such a way that it would be most favourable for people to get compensation. The Government having completely ignored one contract, was it certain that they could not go back on the matter of compensation?

Dr. TALBOT ROGERS said that Dr. Macrae had put the question of compensation to the Minister at the first interview. The Act said quite distinctly that a doctor now in the Service would receive compensation when his resignation became effective. The Minister stated that he did not contemplate promoting any other legislation in order to make it possible for him not to deal with compensation. Dr. Rogers said that if the Council felt he should ask the Prime Minister for an assurance in writing with regard to an interim adjustment he would suggest that the Negotiating Committee should be asked to consider whether a further letter should be sent to the Prime Minister by Sir Russell Brain and himself.

G.M.S. Committee Decisions Supported

The CHAIRMAN said he gathered from the debate that the action of the G.M.S. Committee in making recommendations for refusal of service in certain events had the approval of Council. ("Yes.") Did Council approve the proposals that the preparations for refusal of service should be continued? ("Yes.")

The Chairman then asked whether the Council wished to discuss what action it would take in relation to the appointment of the Royal Commission, and whether it wished to discuss the question of giving evidence to the Royal Commission. He would remind the Council that, as the Government need not approve the Royal Commission's findings, nor need the profession approve the findings.

Dr. I. M. JONES said that the Council had not yet discussed the appropriateness of referring a claim of this nature to a Royal Commission. They could not object to the Queen setting up a Royal Commission, but they could legitimately object to that Royal Commission being used for this purpose. Such a method would not be accepted in industry or any other walk of life, and he hoped nothing had been said on the profession's side which implied acceptance of a major issue being referred to a Royal Commission. He thought Dr. Grant's suggestion about a letter going to the Prime Minister was eminently sound, and in that letter it should be made clear that the intended use of a Royal Commission was not accepted and that arbitration was insisted upon. Once a Royal Commission was accepted Spens and Danckwerts would be gone.

The CHAIRMAN read a letter received from Sir William Douglas in June, 1950, which stated that the Ministry agreed that the Spens Report remained the basis of remuneration of general practitioners until such time as, after consultation, some other basis was found.

Dr. J. G. M. HAMILTON asked what would be the position with regard to superannuation if general medical practitioners withdrew from the Service.

The CHAIRMAN said that if there was a break in a doctor's service, and he did not ask for a return of his superannuation contributions and he returned to employment within 12 months, his rights were secure and he continued from where he left off.

Dr. HAMILTON asked if it was possible for an expression of the Council's views on the terms of reference to be sent to the Prime Minister.

The CHAIRMAN replied that at its interview with the Minister the deputation was told categorically that it was not in a position to discuss terms of reference of the Royal Commission or to influence them.

Dr. HAMILTON expressed disagreement with speakers who had said that it was not appropriate to discuss action in relation to the Royal Commission and that the Council should confine itself to immediate action. The Royal Commission offered a notable opportunity for looking at the Health Service as a whole. Even if, as it seemed likely, its terms of reference would be restricted to the remuneration question, the Royal Commission would be prepared, presumably, to accept evidence from the Association, and that would be an opportunity it would be criminal to neglect. If it turned out to be quite inappropriate to give evidence on widely based terms of reference he hoped the Council

would decide to set up a broadly based planning commission which would look at the fundamentals of the Service and not merely at the remuneration problem.

Dr. F. GRAY said that it was obvious that all decisions could not be taken that afternoon and there was much which must be left over. Council had agreed to support the action of the G.M.S. Committee, and flowing from that decision there were certain others. The Government had two main objects in view; one was to postpone for three years or more the settlement of the claim, and the other was to get rid of Spens and Danckwerts. With regard to the claim the Royal Commission was irrelevant. The G.M.S. Committee decision did not in any way depend on what the Royal Commission did, what its terms of reference were, or who were the people appointed to it.

The other question was what reply went to the Prime Minister. He submitted they had given the best possible reply by saying that they supported the G.M.S. Committee. As a member of the Negotiating Committee he had been struck by the fact that slight progress on two occasions had been made after definite action had been taken—in December after the Council decided to put the Guild machinery into action, and again after the G.M.S. Committee had made its decisions last week. The only thing which had impressed the Government was the strength of the profession. They had to fight now or sink, and whatever reply was made to the Prime Minister it must make clear that the fight would be continued until it was won.

Dr. A. BEAUCHAMP said that perhaps it would be possible for Sir Russell Brain and Dr. Talbot Rogers to see the Prime Minister and ask him what he meant and get an agreed statement from him.

Dr. H. H. D. SUTHERLAND supported the suggestion.

Terms of Reference

The CHAIRMAN then read the terms of reference of the Royal Commission which had just been received.

To consider:

- (1) how the levels of professional remuneration from all sources now received by doctors and dentists taking any part in the National Health Service compare with the remuneration received by members of other professions, by other members of the medical and dental professions, and by people engaged in connected occupations;
- (2) what, in the light of the foregoing, should be the proper current levels of remuneration of such doctors and dentists by the National Health Service;
- (3) whether, and if so what, arrangements should be made to keep that remuneration under review, and to make recommendations.

The CHAIRMAN said that the terms of reference were so vague and carried so many dangers that more information was needed before the Council could determine its attitude towards them. They seemed to contain inherent dangers for the profession's future, and seriously to endanger the conditions on which it came into the Service and the status of the whole profession in the future. He felt that the Royal Commission should not be welcomed at this stage, but that answers to some questions should be sought.

Dr. Wand thought that if they adhered strictly to the claim, and deferred judgment on the Royal Commission, the two things could be quite safely separated.

Dr. A. BEAUCHAMP stressed that having seen the terms of reference it was important that representatives should interview the Prime Minister on questions on which there was doubt—first of all on the interim settlement, and secondly on the meaning of the terms of reference—and get an agreed statement.

Council's Resolutions

The Council proceeded to adopt the following resolutions.

- (1) The Council fully supports the decision of its General Medical Services Committee to convene a special conference of representatives of local medical committees and to recommend to that Conference that, unless the Government agrees to an immediate and satisfactory settlement of the

profession's claim or to arbitration, general practitioners throughout the country will be advised to send in their resignations from the Service.

(2) The Council has heard a report of the interpretation by the Minister of Health of the Prime Minister's statement that the possibility of interim adjustment was not precluded. On the evidence before it, the Council can see no fundamental change in the situation which would justify any alteration in the course of action recommended by its General Medical Services Committee.

(3) The Council has noted the statement made by the Prime Minister in Parliament that he is prepared to clarify his statement at the appropriate moment. The Council believes that the present is the appropriate time and is inviting the Negotiating Committee to approach the Prime Minister for immediate clarification.

(4) The Council has noted with great satisfaction the assurances of support given by the Public Health Committee of the Association, representing medical officers in the public health service, and the Joint Consultants Committee, representing hospital medical staffs.

(5) The Council resolves that the convening of a Special Representative Meeting be requisitioned at an appropriate time to consider a report and a recommendation of the Council concerning the further action to be taken by the Association in the present dispute with the Government on medical remuneration.

In addition the Chairman of Council and the Secretary were asked, with the assistance of legal advisers, to seek clarification of the terms of reference of the Royal Commission.

BRITISH MEDICAL GUILD

A meeting of the Trustees of the British Medical Guild was held immediately following the meeting of the Council of the British Medical Association on February 28, with Dr. S. WAND in the chair.

It was reported that Guild machinery had been set up, and honorary officers appointed in most areas in England and Wales, Scotland, and Northern Ireland.

A recommendation was accepted from the General Medical Services Committee asking that all possible steps be taken to ensure that no area in this country was without an effective local unit of the British Medical Guild, and a report was received of the discussions which had taken place in the Council meeting preceding the meeting. It was agreed that appropriate action should be taken with a view to completing the setting up of the Guild machinery as quickly as possible.

Expenditure up to date was noted, and the Trustees expressed their gratification at the financial support afforded by the General Medical Services, Hospital Medical Staffs, and Public Health Service Defence Trusts.

THE HYPOCRITIC OATH

Let's appoint a Royal Commission,
A sort of super Inquisition,
A splendid democratic wheeze
And emphasize the credit squeeze.
We'll make those doctors toe the line
And give them our own medicine.
We'll get our (radio) Dr. Hill
To administer and gild the pill,
And show that under Mr. Vosper
Their practices might thrive and prosper.
If we judiciously procrastinate
They can cool their heels till '58.
Thus, by tactics rather questionable,
Enough will soon be pensionable
And we'll have no moral obligation
To that awkward generation.

JOINT CONSULTANTS COMMITTEE

STATEMENT ON REMUNERATION CLAIM

The Joint Consultants Committee met on February 28 under the chairmanship of Sir Russell Brain to receive a report from the Negotiating Committee on the present state of the remuneration claim. After the meeting the Committee issued the following statement.

"It is unreasonable that the Government should have refused to examine, in association with the doctors, in the light of all circumstances which seem relevant to each side, the merits of their claim to safeguard their standard of living. Such an examination does not necessarily mean that the claim would be agreed either in whole or in part, but it does mean that the Government, by undertaking the examination, would show that spirit of co-operation necessary to maintain trust and confidence inside the National Health Service.

"The public will appreciate that they will obtain the best and the most economical Service, in which the traditions of medicine are fully devoted to the welfare of the sick, if Governments encourage a spirit of true partnership between themselves and medicine.

"We hope that the Prime Minister's statement that he does not rule out an interim adjustment of medical remuneration will lead to an early invitation from the Minister of Health to negotiate this with him.

"The need of hospital patients for continued care and emergency treatment can only be maintained within the Health Service, and this work will not be interrupted. But the Joint Consultants Committee will advise those whom it represents to support the general practitioners in every possible way. In the event of the general practitioners being compelled to withdraw from the National Health Service the Joint Committee will advise its constituents fully to support this withdrawal by refusing to permit the hospital and specialist services to be used in any way as a substitute for the family doctor service.

"The Committee agreed to recommend to the Negotiating Committee that they should accept the Government's offer to propose an immediate increase in the remuneration of junior hospital staffs in the Whitley Committees."

PUBLIC HEALTH COMMITTEE

The Public Health Committee met on February 22 at B.M.A. House, with Dr. JOHN B. TILLEY in the chair.

The Committee offered its congratulations to Dr. H. M. Cohen on his appointment as Commander of the Order of the British Empire in the New Year Honours List.

Remuneration Claim

Dr. J. F. WARIN, one of the Committee's representatives on the Negotiating Committee, reported on the position to date of the remuneration claim by hospital medical staff and general practitioners. The setting up of a Royal Commission had been announced, but at the moment nothing was known of its terms of reference or membership. So far as medical officers of health were concerned, they regarded themselves as doctors, not as public health service employees, and this was the opportunity to align themselves fairly and squarely with their colleagues in the profession.

Dr. H. D. CHALKE said that the situation had to be thought of in two parts—their whole-hearted support for the rest of the profession, and, secondly, the fight to secure the adoption of the principle that the salaries of public health doctors should be regarded as payment to them as doctors and not as local authority employees. They must not give up their idea of an inquiry into public health remuneration. The General Medical Services Committee had passed a resolution saying that it would recommend withdrawal from the Service to a special conference of Local

Medical Committees unless there was an immediate and satisfactory settlement of the claim or arbitration. This must be supported. Dr. LLYWELYN ROBERTS said that public health medical officers must keep in line with the other sections of the profession. They should give all their strength and power to support them in the action they were taking. If the Council agreed to co-operate with a Royal Commission, then public health doctors would wish to be included.

After some further discussion along the same lines Dr. W. G. HARDING moved a resolution:

That the Public Health Committee pledges the full support of doctors in the public health service for their colleagues in general and hospital practice in the serious crisis with which the whole profession has been faced.

This was carried unanimously.

A further resolution expressing grave concern that the Prime Minister's statement in the House of Commons on February 20 suggested that doctors in the public health service might be excluded from a comprehensive review of medical remuneration by the Royal Commission was carried unanimously.

Other Business

It was reported that the comments of the *ad hoc* subcommittee which considered the proposed amendments to the Milk Regulations were agreed to by the Chairman of the Committee and forwarded to the Ministry of Agriculture, Fisheries and Food. It was also agreed to await the coming into action of the new regulations before taking any action on preparing a report for the Representative Body on the subject of pure milk for the nation.

The Assistant Secretary reported that 91% of local authorities had notified implementation of the agreement on the remuneration of public health medical officers from April 1, 1956, in accordance with M.D.C. circular No. 27, and that 59% of local authorities had notified implementation on the remuneration of medical practitioners undertaking part-time work for them from January 1, 1957, as promulgated in M.D.C. circular No. 32.

A letter was received from the Ministry of Health stating that there was at present no evidence that there was a risk to the health of the nation arising out of the entry of immigrants into this country, and it was agreed to recommend to the Council that a further approach be made to the Ministry calling attention to the dangerous situation arising out of the importation of tuberculosis into this country by refugees and immigrants. The view was expressed that there should be compulsory x-rays taken of all immigrants.

EXCHANGE VISITS WITH THE U.S.A.

The scheme for exchange visits between members of the American and British Medical Associations, which has the approval of the Bank of England, will be continued during the financial year April 1, 1957, to March 31, 1958. Two doctors from Britain may visit the U.S.A. in exchange for two doctors from the U.S.A. Medical practitioners in all branches of the profession are eligible. Further information may be obtained from the Secretary of the Association, B.M.A. House, Tavistock Square, London, W.C.1.

The Department of Health for Scotland has reminded regional ambulance committees that long-distance rail travel is often better for patients than ambulance, as well as saving petrol. The Department states that under arrangements between the ambulance service and the railways compartments can be reserved for patients and their escorts, the patients being conveyed to and from the station by ambulance. The entire responsibility for train-ambulance journeys rests on the ambulance service, including cost of tickets. The general practitioner only needs to inform the service that travel by train would be suitable.

Questions Answered

Compensation and Superannuation after Resignation

Q.—Under what conditions does a general practitioner who terminates his contract with an executive council receive his compensation and superannuation?

A.—*Compensation.* The National Health Service Compensation Regulations, 1948, provide (Regulation 13.1.) that "The compensation payable to a practitioner . . . shall be paid to the practitioner . . . on the retirement from practice or death of the practitioner concerned, whichever shall first occur. . . ." Regulation 13.3. is as follows:

For the purpose of paragraph 1 . . . of this Regulation, retirement from practice means retirement from practice as a medical practitioner giving general medical services under Part IV of the Act or under Part IV of the N.H.S. (Scotland) Act, 1947.

It follows, therefore, that once a practitioner's resignation from the list of an executive council (or councils) becomes effective he has retired from practice within the meaning of Regulation 13.1. without prejudice to his continuing to practise privately or in some form of salaried appointment under another employing authority in the N.H.S. Hitherto this has been the interpretation placed on this Regulation by the Ministry, and compensation has been paid with little or no delay immediately the contract with the executive council is terminated. Even in cases where there has been a possibility that the doctor might re-enter the list in the not-too-distant future the Ministry has made payment. Payment may be withheld only if it is known at the time of application that a doctor is merely changing from one area to another.

Superannuation. Doctors who cease superannuable employment under an employing authority in the N.H.S. (and there is no need to talk about retirement in this connexion) do not receive any benefit under the superannuation scheme unless (1) they have paid contributions for at least five years (for a pension or widow's pension 10 years), and (2) have reached the minimum retiring age of 60. In all other cases, except attributable injury or disease, they receive a return of their own contributions, less tax, but with compound interest at 2½%.

If, however, there is a break in service and the doctor does not receive a return of contributions and returns to superannuable employment within 12 months, his rights are secure and he continues from where he left off. It would be confusing to quote all the regulations dealing with this point, as they deal with a variety of approved employment outside the Health Service—for example, National Service, service with a university, courses of study, and so on. However, the relevant regulations are Regulations 18 and 19, which may be summarized as follows:

When a person enters the employment of an employing authority within 12 months of ceasing superannuable service under an employing authority, and has not received a return of contributions, he can count all his previous contributing service towards future benefits. He must notify his new employing authority within three months. Even if he has received a return of contributions he can recover his lost period of service by repaying to the authority "an amount equal to any sum paid to him by way of return of contributions on or after his ceasing to hold that other employment, together with an amount equal to any income tax which was deducted from his contributions in respect of such payment."

Under normal circumstances the Superannuation Division of the Ministry does not offer to repay contributions until there has actually been a disqualifying break in service—that is, after 12 months. In certain circumstances, even after a disqualifying break, a doctor may buy back previous contributory service by making additional contributory payments. The answer to the superannuation part of this question applies also to hospital medical staff in the N.H.S.

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR.—The decision of the Government to set up a Royal Commission to inquire into the remuneration of doctors, having regard (as reported by the B.B.C.) to the income levels of other professional classes, prompts certain observations. Why was this important decision made without prior consultation with the profession? Surely consultation in such an important step would have been reasonable. As it is, the Government not only lays itself open to the charge of delaying the claim on remuneration but also of obscuring even more important issues.

There can be no doubt that the present discontents go much deeper than problems of remuneration, and this has repeatedly been made very clear to the Minister of Health and to the Secretary of State for Scotland. The medical profession would welcome the immediate creation of a Royal Commission if its task were to examine the whole structure and working of the National Health Service in the light of nearly ten years' experience. This broadened inquiry by a Royal Commission should be carried out quite independently of the present remuneration claim, which should be settled now on its own merits. Lord Salisbury has recently stated that an interim review of the salaries of junior medical and dental staff in hospitals would be undertaken. If this is intended to remedy the plight of the underpaid members of the profession, it is impossible to understand why senior hospital medical officers are to be omitted from this review.

It seems that as a profession we are faced with the following alternative paths of professional degradation. On the one hand we can stand on our dignity and decline to ask for more pay. We then go steadily downwards financially, with loss of status and ultimately loss of suitable recruits to the profession. Or, on the other hand, we can abandon our professional dignity and continually clamour for what we were promised. We will then have still further opportunity for observing that, while the militant trade unions secure annual increments for their members, we, who cannot strike, are ignored. In either case the outlook for the Health Service is gloomy indeed. Now that we are all in this present unhappy position the only solution to our difficulty, in my opinion, is for the Government to let the present claim go to arbitration, and for the Royal Commission with a broad remit to set to work immediately.—I am, etc.,

Lochmaben, Dumfriesshire

CHRISTOPHER CLAYSON.

SIR.—One of the most perplexing problems in the remuneration fight is the exact income of general practitioners from capitation fees, excluding dispensing or mileage. The Ministry of Health and the B.M.A. appear to differ on this point. Looking through the practice vacancies advertised in the *B.M.J.* over the last year it appears that the average number of patients on a list is somewhat between 1,500 and 2,000. I would like to suggest, to clear up this controversial point, that a list be issued showing the gross amount a doctor receives from his National Health Service patients—e.g., how many individual G.P.s receive over £3,000, between £2,000 and £3,000, between £2,000 and £1,500, and under £1,500. This would give, in my opinion, a much fairer picture of the G.P. pay than showing what "Dr. Average" earns.

I also notice that when a trade union applies for an increase it applies on behalf of the lowest-paid person and on the basic rate. It does not say that the average person earns so and so. Nor does it take any notice of the person's overtime pay. Why should doctors not apply on the same lines?—I am, etc.,

London, S.E.6.

R. G. WIGODER.

SIR.—As a doctor holding Conservative views I am naturally reluctant to take action against this Government. Nevertheless, I feel we have had a raw deal, and must take all steps to win our just claim. I think most of us will support the Government's endeavour to cut the high level of its own expenditure in order that the penal level of direct taxation may be reduced. Such reduction in taxation must prove a great help to us and the country at large. It must be obvious that if the Government concedes our £20m. claim it is in a bad position to resist other claims from many sources. Could we not help the Government to help ourselves by, on our part, offering to agree that some part of this, or a larger sum, should be used to improve the conditions and efficiency of the N.H.S. (1) by upgrading S.H.M.O.s in the hospital service to full consultant status where they are doing consultants' work, (2) by taking the increase on the smaller numbers of a doctor's list and so make it economically worth while for a larger list to be voluntarily reduced, leading to less harassed and rushed work, and greater opportunity for the newcomers into practice? I have great sympathy with the layman's views expressed by Mr. Meredith (*Supplement*, February 23, p. 95). The Government, I feel, is sympathetically disposed. Can we give it the loophole to escape from its general policy in the instance of our claim?—I am, etc.,

South Shields.

JOHN MCKEE.

SIR.—I noted with interest the large number of letters in the *Supplement* of February 16 expressing the wider causes of dissatisfaction than the implementation of Spens. As a recently qualified doctor I can well remember the time spent as a hospital resident, both in the wards and in the casualty departments, with cases that could equally well have been treated at home. It has required only a short time in general practice to understand the reason for this. The keener you are, the harder you work, the less pay you get and even less time to enjoy it. Could there possibly be anything more ridiculous? Surely now is the time to press for major alterations in the Service. The lesson to be learned from the remuneration claim is to put in a demand for an increase in remuneration commensurate with the rise in the cost of living each year. A 4% rise each year would antagonize the Exchequer less and get more public sympathy than a 24% rise after six years of poverty.—I am, etc.,

Old Hill, Staffs.

D. WATTON.

SIR.—The ethical correctness of mass resignation from the National Health Service in order to exert pressure on the Government seems to me to be gravely open to doubt. I hope the profession will not be stampeded into such collective action, and so become guilty of "unprofessional conduct" in the eyes of the general public, which certainly is not with us in this matter. Far better to negotiate for arbitration now on a smaller interim award, and then await with patience the findings of the Royal Commission. After all, we might regret tying ourselves to Spens if the cost-of-living index were to fall.—I am, etc.,

Blandford, Dorset.

CHARLES E. LANGLEY.

SIR.—In spite of the Minister of Health's admission of the justice of the doctors' recent claim for more money, the claim was turned down out of hand and the Government declined to allow this matter to go to arbitration.

It has been suggested that there should be a mass resignation of general practitioners from the N.H.S. This would create a great many difficulties for the bulk of doctors concerned, and as a result many doctors might decline to take this action and the plan might very well fail. However, G.P.s as a group have a very powerful weapon at their disposal. They are among the relatively small group of people who do not pay their income tax under the P.A.Y.E. scheme. If a large number, but not even necessarily all G.P.s, declined to pay any income tax at all, there would indeed be a serious problem for the Government to face. It certainly could not commit about 20,000 doctors to prison, because

(1) there would not be room for them; (2) the N.H.S. would be completely disorganized, as there would be no G.P.s to work it; (3) it would make the Government appear even more stupid than it is. If this plan were adopted, no G.P.s taking part in the scheme would need to worry about the effect on their patients of their resignation from the N.H.S.

This scheme could also be extended to the refusal to pay telephone bills—it would be little hardship to have one's telephone cut off, and it would certainly create a disproportionate amount of trouble.—We are, etc.,

Pontefract.

ROBERT G. FORSTER.
PETER J. REYNOLDS.

SIR,—I especially agree with Dr. K. E. McIver's letter (*Supplement*, February 23, p. 94), where he says: "One of the curses of this country to-day is that there are too many people spending with scant care other people's money." Is it not possible that, if greater care was taken over prescribing, then there might be sufficient money in the kitty to give us that rise in pay which we think we deserve?—I am, etc.,

Ipswich.

M. W. GONIN.

SIR,—It would seem that we are now faced with the possibility of mass resignation from the N.H.S. It seems that we are then to treat our patients privately. I think it is high time that we faced reality and considered just what this means.

Dr. K. E. McIver (*Supplement*, February 23, p. 94) thinks that if we charged our patients 5s. per consultation and 10s. per visit our incomes would be doubled. So they might be, on paper. But would we ever see the money? If I were a patient, I certainly would not pay. And supposing we booked the fees and sent accounts. Would that make any difference? Of course not. Most of us would be lucky if we recovered the cost of rendering the accounts.

The issue, to me, is quite clear and simple. Let us face it. Are we prepared to treat our patients for an indefinite period for nothing and live on our savings, if any, until the Government capitulates? If we are, then by all means let us resign. But do let us realize exactly what this entails. When David faced Goliath he did have a stone for his sling. I doubt whether we shall have even a sling.—I am, etc.,

West Drayton, Middx.

A. COYER.

SIR,—Now that we are approaching a decisive battle between the profession and the Ministry, the end of which is unpredictable, we must be sure exactly what our aims are and how far they can and should be achieved.

Every week the *Supplement* contains letters demanding that politics should be divorced from the Health Service. What does this mean? That Parliament should renounce interest in the measures taken to preserve the health of the nation, including the expenditure of several hundreds of millions of public money annually? Even if a Minister or a Parliament could contemplate this for five minutes, are your correspondents so ignorant of the constitution as to imagine that such a self-denying ordinance could apply to future Parliaments and Ministers? Let our would-be politicians abandon this parrot-cry and save us from becoming ridiculous. Our quarrel with the Minister is over remuneration, and some of us who may be prepared to co-operate in collective action to secure fair treatment in this respect may be deterred if it is assumed that we consent to being used in an attempt to destroy a Health Service of which we are proud.

Once the principle of an adjustment to our payment in respect of rising prices has been conceded, I do not believe we should be wise in opposing a searching and impartial inquiry into the fairest basis for future payment, such as is presumably to be undertaken by the Royal Commission. Nor do I believe we should cling too obstinately to a uniquely privileged position in which we are completely protected against the effects of national economic adversity

if the Royal Commission should oppose that position. We cannot divorce ourselves from the community and expect to retain its sympathy and support.—I am, etc.,

Scarborough.

F. V. SIMPSON.

Registration of Medical Auxiliaries

SIR,—On page 67 of the *Supplement* of February 16 it is reported that the Central Consultants and Specialists Committee, in discussing the Ministry's proposals for the statutory registration of professions supplementary to medicine, referred to "the dangers of allowing medical auxiliaries to treat patients without medical supervision of any kind, some members expressing the view that the profession should have nothing to do with the scheme." This statement implies that the scheme does not provide for those professions who already work under medical direction to continue to do so. However, the introduction to the scheme states that one of the functions of the registration body would be to regulate "discipline."

The Chartered Society of Physiotherapy has always required its members to take patients only from medical practitioners, and this it will continue to do. The society has therefore asked the Minister of Health on more than one occasion to ensure that the legislation setting up the State registration body should contain a requirement that physiotherapists admitted to the State register should only take patients from doctors. The Chartered Society is glad to know that it will have the support of the Central Consultants and Specialists Committee on this point.—I am, etc.,

London, W.C.1.

M. J. NEILSON,
Secretary,
Chartered Society of Physiotherapy.

Opportunities in Australia

SIR,—Sir Stanley Davidson (*Journal*, May 14, 1955, p. 1171) stated that the annual production of doctors in Australia exceeded the national requirements and that Australia was rapidly becoming over-doctored. A recent visit to Australia revealed that his opinion was not shared there at the time nor is it shared there now. Australia is still short of doctors, and because of this she is admitting doctors who were educated outside the Commonwealth, though in general doctors educated in Great Britain would be preferred. For the next few years, at any rate, there are great opportunities for young English doctors in Australia, and they will have the satisfaction of feeling that they are helping to grapple her to us with hoops of steel.

Australia is a great country, and the Broken Hill Proprietary Company, the Snowy River Hydro-Electric Scheme, the discovery of immense deposits of bauxite and other minerals in Queensland, and the expansion of agriculture by improved conservation of water, the addition of trace elements to the soil, and the reduction of the rabbit population, illustrate its achievements and potentialities. The basic wage is high, and, although it is not possible in Australia to accumulate great fortunes like Rockefeller, Ford, and Nuffield, there are still people who have incomes of £30,000 a year after payment of tax, people who can pay £20,000 for a seaside cottage or £100,000 for a country property. Incomes like this are not likely to come the way of medical men, but a number of doctors in Australia take an active interest in farming, business, or racing, and some become permanent truants in these fields.

Australia accepts British qualifications for registration. It is an advantage for a man to have a higher qualification in medicine or surgery and experience of obstetrics. There are B.M.A. offices in all the capital cities from which information about opportunities can be obtained. A short period as an assistant will enable a man to learn the Australian "know-how." Some men then work for some years in a one-doctor town to accumulate experience and capital, but eventually a man with a higher qualification should be able to join a group practice with a hospital connexion and have increasing opportunities of developing his own special interest.

It is not yet possible for members of the Royal College of Physicians of London to be incorporated in the Australasian College or *vice versa*, but this may come in the future. The Royal Australasian College of Physicians combines the functions of the Royal College of Physicians and the Association of Physicians in this country, and members take a full part in the activities of the College. No one who has visited a man with his membership in successful general practice in Australia can gainsay the fact that this is one of the most rewarding lives which medicine offers to-day.—I am, etc.,

Oxford.

L. J. WITTS.

Naming of Health Centres

SIR,—In reply to a question in the House of Commons this month, the Parliamentary Secretary to the Minister of Health named the health centres so far provided in the country under the N.H.S. These are seven in number, and of these three are named: thus in Sunderland there is the Alderman Jack Cohen Health Centre. Most of what we dislike in the Health Service to-day results from the intrusion of politics into medicine. Whatever our views on health centres are, let us at least beware of their possible use as objects of individual or party political advancement. I do not suggest this to be the case in the health centres provided so far, but if titles are to be given to what are, after all, public and not private enterprises, then what could be more appropriate than the illustrious names from our own profession who have contributed so much more to mankind than all the politics in the world?—I am, etc.,

Rugeley, Staffs.

STANLEY DILLON.

Unity of Purpose

SIR,—I was very interested to read the letter from Dr. C. Alwyn Sharples (*Supplement*, February 16, p. 69). While agreeing wholeheartedly with him on the necessity for unity of action in pressing our remuneration claim, I feel quite sure that to combine this with a call for the revision of the whole structure of the Health Service would be the worst possible way of achieving our aims. Reports of the resolutions passed at meetings of the B.M.A. and the British Medical Guild up and down the country indicate that the profession is indeed firmly resolved to take united action if the remuneration claim is again dismissed by the Government. Such unity cannot, however, be expected on the much wider and more complicated issue of revision of the Service as a whole.

The Government would, I am sure, be delighted to have the opportunity of obscuring the issues of our claim with prolonged discussions and arguments over quite unrelated matters concerning the Health Service in general. The setting up of a Royal Commission could well cause a delay of two years or more, and would put us in a very weak position indeed. We could scarcely expect public sympathy for strike action taken while the justice of our claim was under examination by an independent body, and we certainly could not expect any increase in our remuneration until their report had been completed. Let us therefore keep the issues at stake as simple and clear-cut as possible, lest by attempting to achieve too much at once we end by achieving nothing.—I am, etc.,

Ascot, Berks.

JOHN F. NEWCOMBE.

Medicines for Nursing Staff

SIR,—The Ministry of Health has ruled that the nursing staffs of our hospitals should pay for medicines, should they require them, in the same way as other members of the public. This of course should never have been done for two obvious reasons, among many others: (1) because of the nature of their professional calling, and (2) that it is difficult enough to get nursing staff, without insulting them when you have got them. The Ministry has surely forgotten

the Mosaic law, "Thou shalt not muzzle the ox which treadeth out the corn," a liberal translation of which might be: "You must not withhold a mouthful of food from the ox which is spending its time and energy in preparing food for you"—an excellent and, if I may say so, a very obvious and acceptable rule.

The country spends somewhere in the nature of £600m. annually on a health service, a large proportion of which goes in administration, and this vast expenditure will not be lessened by adding to it the cost of auditing a pernicious rule of this nature; which cost will surely greatly exceed the number of shillings collected from the nursing staffs. There is a point at which officialism can cause revolt, but long before this stage is reached there is produced, in those against whom it is practised, means of deception and evasion of a highly undesirable nature. In this case some will make no attempt to enforce the rule, others will evade it with stimulating cunning, and a third class, while outwardly adopting it, will then, to save their consciences, be tempted to prescribe larger quantities of the medicines required, half of which will probably be wasted. This financially sterile and morally indefensible measure should be withdrawn without delay.—I am, etc.,

Oxford.

C. J. L. WELLS.

Where the Money Goes

SIR,—Mine is a rural practice, and I dispense on a capitation basis. I have trained my household to be most punctilious about the collection of the shilling prescription tax when I am out, and when in my surgery I make a point of ostentatiously filling in one of the spaces on Form E.C.61 in front of my patients for every shilling that I take. At the same time I have spent a lot of time in explaining to them that these shillings all go to the executive council every month to swell the Exchequer funds. In spite of this, my cook, whose family lives locally, tells me that a great many of my patients believe that the doctors all keep these shillings for themselves, and although I have gone to great pains to explain the position I very much doubt whether I have yet convinced her that this is not the case. I have not convinced her family or her neighbours. The time I have taken in explanations seems to have been wasted.

Is the time not now opportune for the Council of the B.M.A. to undertake a widespread campaign to instruct the public how the N.H.S. is really financed? I am sure that many doctors would co-operate in their surgeries if suitable posters in pictorial or diagrammatic form were issued, and replaced with fresh ones monthly, setting forth the proportionate cost of the hospital services, the drug bill, and the doctor's average payments. The doctor's receipts could further be broken down to show the approximate cost of running his car and his surgeries. Other posters could show how little of the weekly insurance contributions ultimately pay the doctors. No doubt the dentists would be willing to join forces now that we are together concerned in the proposed Royal Commission.—I am, etc.,

Wivenhoe, Essex

WALTER RADCLIFFE.

Salaries of Part-time Radiographers

SIR,—The letter from Mrs. V. M. Gordon (*Supplement*, February 23, p. 94) raises a wider issue than the current underpayment of trained radiographers. There must be many women trained to skills in the professions and industry who would like to work, but cannot afford to pay out of their taxed income for the substitute care of dependants in the home. An important inequity here is surely the failure of the Inland Revenue system to allow the proper price of a "baby-sitter," nurse, or housekeeper to be set against income tax as an expense of the work of a woman with children or other helpless dependants. Such an allowance would release skilled persons for work in many fields to the advantage of the national economy.—I am, etc.,

London, N.W.11.

Branch and Division Meetings to be Held

COVENTRY DIVISION.—At Out-patient Department, Coventry and Warwickshire Hospital, Tuesday, March 12, 8.30 p.m., meeting to take the form of a "Spot Diagnosis" Evening.

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, March 12, 8.30 p.m., meeting. B.M.A. Lecture by Sir Heneage Ogilvie: "Peptic Ulceration."

DARTFORD DIVISION.—At Bexley Mental Hospital, Thursday, March 14, 8.30 p.m., meeting. Lecture and clinical demonstration by Dr. L. C. Cook and hospital staff: "Tranquillizers." Clinical cases will illustrate early diagnosis of some common psychoses.

DEWSBURY DIVISION.—At Prospect Hall, Cleckheaton, Friday, March 15, 7.45 for 8.15 p.m., annual dinner dance.

DUDLEY DIVISION.—At Victoria Hotel, Old Hill, Tuesday, March 12, 7.45 p.m., meeting of Dudley, Stourbridge, and District Branch of Pharmaceutical Society to which members of the Division are invited. Film and lecture by Dr. J. J. F. Merry: "Therapy with Cortisone."

DUMFRIES AND GALLOWAY DIVISION.—At Cresswell Maternity Hospital, Dumfries, Sunday, March 10, 3 p.m., meeting. Address by Professor D. M. Dunlop: "New Drugs."

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, March 14, 7.30 p.m., dinner, 8.45 p.m., Mr. A. L. Gunn: "The New Look in Antenatal Care."

EAST YORKSHIRE DIVISION.—At Quern House, 68, Park Street, Hull, Wednesday, March 13, 8.30 p.m., meeting. Lecture by Mr. A. E. Roche: "Some Genito-urinary Reflections."

GLASGOW AND WEST OF SCOTLAND BRANCH.—At Institution of Engineers and Shipbuilders in Scotland, 39, Elmbank Crescent, Glasgow, Wednesday, March 13, 4 p.m., meeting. Lecture by Sir Geoffrey Todd: "Prognosis of Pulmonary Tuberculosis in the Light of Modern Treatment, with Special Reference to Midhurst Sanatorium." (Under the joint auspices of the Glasgow and West of Scotland Branch and the N.A.P.T.). All medical practitioners in the area of the Division are invited.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, March 14, 8.30 p.m., meeting. Lecture by Dr. R. E. Hope-Simpson: "Common Infections in General Practice."

HENDON DIVISION.—At Hendon Hall Hotel, N.W., Tuesday, March 12, 8.45 p.m., meeting. Dr. Michael Ward: "The Ascent of Everest."

ISLE OF WIGHT DIVISION.—At Wheatsheaf Hotel, Newport, Thursday, March 14, 8.15 p.m., meeting of Isle of Wight Section of B.D.A. to which all members in the area of the Division are invited. Talk by Mr. A. C. Kerr: "Fluoride and the Teeth."

KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, March 12, 8 p.m., meeting. Address by Dr. E. R. Cullinan: "Medicine in East Africa."

LANCASTER DIVISION.—At Clarendon Hotel, Morecambe, Saturday, March 16, 7.30 p.m., annual dinner. Guest of honour, Professor A. G. Ross Lowdon.

NORTH-EAST ESSEX DIVISION.—At Nurses' Recreation Room, Colchester Maternity Hospital, Lexden Road, Tuesday, March 12, 8.30 p.m., meeting. Brains Trust to discuss questions on dyspepsia.

PRESTON DIVISION.—(1) At Sharoe Green Hospital, Fulwood, Preston, Tuesday, March 12, 8.30 p.m., meeting. Selection of medical films. (2) At Chorley and District Hospital, Wednesday, March 13, 9 p.m., meeting. Further selection of medical films.

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, March 14, 8.30 p.m., meeting. Lecture by Mr. G. K. Tutton: "Epilepsy."

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Friday, March 15, 8.30 p.m., general meeting.

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Thursday, March 14, 8.30 p.m., meeting. B.M.A. Lecture by Mr. J. C. Ainsworth-Davis: "Urological Symptoms—Their Significance and Investigation."

STRATFORD DIVISION.—At King George Hospital, Eastern Avenue, Ilford, Tuesday, March 12, 8.45 p.m., meeting. Discussion: "The Care and Rehabilitation of the Aged Sick in the Home." On the platform: The Rt. Hon. Lord Amulree, Dr. S. Lell, and Dr. H. C. Faulkner. Members and Associates of local faculties of the College of General Practitioners, together with resident hospital officers, are invited.

TEES-SIDE BRANCH.—At Spark's Café Royal, Middlesbrough, Thursday, March 14, 8.30 p.m., meeting. Lecture by Professor M. L. Rosenheim: "Treatment of Nephritis."

TUNBRIDGE WELLS DIVISION.—At Edenbridge and District War Memorial Hospital, Wednesday, March 13, 8.30 p.m., meeting. Mr. A. Dickson Wright: "Patients Who Have Deceived Me."

Meetings of Branches and Divisions

DORSET DIVISION

A meeting was held at the chest clinic, Dorchester, on December 13, 1956. Dr. T. V. Cooper took the chair and 28 members were present. Dr. S. G. Graveson gave a lecture on "Some Aspects of Neurology To-day." A resolution was passed urging the B.M.A. to take immediate steps to obtain an increase in mileage allowance for those not directly compensated for the increased price of petrol.

DUMFRIES AND GALLOWAY DIVISION

A meeting was held in the Cresswell Maternity Hospital on January 13, 1957. Dr. R. N. Rutherford was in the chair, and 51 members attended. Short lectures were given by Dr. Sheenah Russell, on "The Infant who Vomits," Mr. John C. Campbell, on "The Misuse of Antibiotics," and Dr. James Harper, on "Alcoholism as a Medical Problem."

MACCLESFIELD AND EAST CHESHIRE DIVISION

The annual meeting was held at the Macclesfield Arms Hotel on November 25, 1956. The following officers were elected:

Chairman.—Dr. A. Holmes Smith.
Vice-chairman.—Dr. W. E. Thomas.
Immediate Past Chairman.—Dr. R. W. Harte.
Honorary Secretary and Treasurer.—Dr. M. B. Casey.
Assistant Honorary Secretary.—Dr. C. Shiero.
Public Relations Secretary.—Dr. F. E. Lomas.

SOUTH MIDDLESEX DIVISION

The annual general meeting was held on December 17, 1956, at the Casino Hotel, Taggs Island. Thirty-five members attended. The following officers were elected for 1957:

Chairman.—Dr. R. P. K. Coe.
Vice-chairman.—Dr. C. D. Meadowcroft.
Honorary Secretary and Treasurer.—Dr. G. C. L. Woodroffe.
Honorary Social Secretary and Public Relations Officer.—Dr. W. A. de C. Shearman.

HER MAJESTY'S OVERSEA CIVIL SERVICE

The following appointments have been announced: J. D. Arneaud, M.B., B.S., D.C.P., Superintending Medical Officer (Specialist), Bacteriological Laboratory, Health Department, Trinidad; H. S. A. Bishop, M.B., Ch.B., Medical Officer Grade "B," Health Department (Institutions), Trinidad; P. I. Boyd, M.D., M.P.H., Deputy Director of Medical Services, British Guiana; A. Gray, M.B., B.S., Deputy Chairman, Silicosis Medical Bureau, Northern Rhodesia; V. W. J. Hetreed, M.B., B.S., T.D.D., Senior Specialist, Federation of Nigeria; W. H. McDonald, M.B.E., M.B., B.S., D.T.M.&H., Deputy Director of Medical Services, Fiji; K. Sivam, L.M.S., D.P.H., Senior Port Health Officer, Singapore; J. L. Beecher, L.M.S.S.A., Resident Medical Officer, Kenya; R. C. Morgan, M.R.C.S., L.R.C.P., Assistant Medical Officer, Princess Margaret Hospital, Bahamas; J. Telfer, M.B., Ch.B., Medical Officer, Northern Nigeria; J. E. Walcott, M.B., Ch.B., D.T.M.&H., Bacteriologist and Pathologist, Barbados; Mary M. Bools, M.B., B.Ch., Assistant Bacteriologist, Barbados.

ANNUAL MEETING: NEWCASTLE UPON TYNE, JULY 10-19

LIFE AND WORK OF THE MERCHANT
NAVY SURGEON*

BY

ALEXANDER DUFF, M.D., F.R.C.S.Ed.

The ship surgeon is of fairly respectable ancestry and antiquity, and has gradually emerged from the mists of time in the same way as his counterpart on land. Men of action have always required the assistance of philosophers to have always required the assistance of philosophers to administer to their spiritual and physical needs, to act as navigators at sea, as geographers when strange lands were encountered, as lawgivers if these were inhabited, and as historians on returning home, and among these philosophers medical men, or men whose medical activities predominated, have stood high.

Professor T. K. Monro in a fascinating work¹ lists under the heading "Piracy" 12 names of medical men who were distinguished in that sphere of action. These were in the seventeenth century, and include Thomas Dover, of Dover's powder fame, and it is related that surgeons were privileged not to have to sign the pirates' articles when captured, but to be replaceable by the next surgeon captured—that is, to be liberated. At this time military and naval surgery formed one of the most important branches of the craft. Textbooks were devoted to it—for example, *The Surgeon's Mate*, by J. Woodall (1617), which I recently found quoted in an article.

The eighteenth century saw the inception of regular shipping routes, and the East Indiamen of that day regularly carried surgeons. The explorer Mungo Park was at one time surgeon in the East Indiaman *Worcester*. Towards the end of the nineteenth century we find Sir A. Conan Doyle making two voyages. He did not enjoy the second and determined to leave the sea, giving as his reasons the lack of work, the low pay, the bad climate, and the torpor induced by too many drinks with the passengers.

In modern times a series of Merchant Shipping Acts regulates the carriage of doctors on board, and the present position is that a doctor must be carried in every foreign-going vessel if the number of persons on board is 100 or over, or if the number of steerage passengers is 50 or more, which makes it officially an emigrant ship. There are no regulations for any upper limit over which an assistant surgeon is required, but some of the largest liners do carry assistants. The number of British ships carrying surgeons at the present time is said to be about 300.

*Part of an address given to the Southern Branch of the B.M.A. on May 26, 1956.

Entry into the Merchant Navy

The first necessity is to secure a job, and the kind of job with which a man begins will naturally be in a vessel of one of the secondary lines or in what is called an "intermediate" ship of a larger line.

Three types of posts are available in the British M.N. First, there is the regular surgeon in the large passenger liners. These companies have in recent times made efforts to secure a satisfactory medical service, and to this end have made these posts permanent, offering continuous contracts with provision for holidays, study leave, and, in some cases, pensions. Obviously this is a very specialized type of medical career, especially on the shorter transatlantic routes, with a complete change of passengers every few days, though the crews are under the surgeon's care for a little longer. The remuneration, including as it does private fees from the passengers, may be quite attractive.

Secondly, there is the long-term contract in such ships as cable ships, whalers, exploratory expeditions, foreign-based pilgrim ships, and the like. These posts are comparable to the contracts for one or a few years offered weekly in the *B.M.J.* by industrial concerns on land in various parts of the East—they offer a longish interlude in one's career.

Thirdly, and much the most numerous, are the posts in secondary liners, where the voyages are fairly long and conditions comfortable though not luxurious, remuneration modest, fees few, and employment casual. The surgeon ranks as the head of a department.

Materia Medica

The ship surgeon is the only true G.P. left, a remark I can make with impunity now that general practice is recognized as a specialty by the Royal Society of Medicine: moreover, once at sea there is no N.H.S. The surgeon is employed by the owners on a salary to look after their crew and steerage passengers, if any, and is permitted to engage in private practice among the first-class passengers. It will be evident that his professional activities will be limited in respect of what equipment is carried on board, and this is regulated by the Ministry of Transport's "Medical Scales" or schedules of requirements.

There are pharmaceutical chemists in dock areas whose job in life is to go through ships' dispensaries and top up the various materials carried to comply with the scales. Most shipowners will allow the surgeon to include such additional supplies as he wishes—the cost of drugs, though it may be causing alarm in some circles, being a flea-bite to most of the costs of running a ship. Internal medicine is

catered for by a classical collection of galenicals and the necessary dispensary equipment. One might think that an apothecary's balance ranks with a billiard-table or shooting-stick in unsuitability for use at sea, but this is not the official view. The supply may be augmented by a consignment from the host of samples one has accumulated, with the benefit to the bursting drug-cupboard at home.

Surgery is now quite adequately provided for by a recently revised list of instruments, including oxygen-administering apparatus. One might question the wisdom indeed of providing a long-handled flushing curette, or the likelihood of anyone using the little dental niblicks provided.

Books

Chief among the works of help to a ship surgeon is an official publication, *The Ship Captain's Medical Guide*, which is intended for the guidance of captains of ships without surgeons, but is very helpful to any doctor without recent maritime or tropical experience. The doctor would do well to read this volume, and indeed make any marginal notes he may feel required, since he may reflect that if anyone is going to be treated in his ship by the captain, with the sole aid of this book, it will be himself. The book includes one item not usually found in medical books—that is, a short form of the burial service, approved by the Archbishop of Canterbury.

Burial at sea is not acceptable to the Chinese. The custom is for the deceased's fellow countrymen to have a whip-round to raise the amount necessary for the doctor's fee for embalming. Anyone, therefore, contemplating sailing with a Chinese crew should provide himself with the necessary knowledge, though I believe that better organization and stricter supervision ashore make it less common than formerly for more or less dying men to be shipped in crews.

I know of only one unofficial textbook for the ship surgeon, that written by the late Dr. Vavasour Elder,¹ and it is very much out of date. Dr. Chalmers Parry has published a book² on Lascar Hindustani for ship surgeons, which is simply a sailors' phrase book with the Hindustani rendered phonetically in Roman characters. A number of British lines employ Lascar crews as being better able to stand tropical conditions, and these men speak Luscani Bât—a very low ungrammatical Hindustani.

Another work by Dr. Parry is *A Polyglot Medical Questionnaire*,³ with a digital system of communication. In this the doctor chooses the question in his language and points to the corresponding text in the patient's. The patient, who must be able to read his own language, picks out the reply, which is numbered and which enables the doctor to translate it back into his language. The text of this work exists in 27 languages, but unfortunately only 12 are at present published, all European.

Present Condition of M.N. Medical Service

Even the large companies have difficulty in securing sufficient good men, and it cannot be denied that the ramshackle service that at present supplies the needs of secondary ships, that large section of the M.N., could be improved.

I have no wish to wear the gown of the planner, but I fear that unless something is done it will only be a matter of time before the planners do get round to the M.N.M.S., and we may find one day that it is a branch of the N.H.S., or supplied entirely by men seconded from the Royal Navy. It behoves the two most interested bodies, the Shipping Federation and the B.M.A., to formulate a policy. At present there is none at all.

Two alternatives present themselves—to attempt to extend and consolidate a service of permanent sea-going doctors or to accept that a constantly rotating service of men who are doctors first and seafarers second is better. The permanent men are in favour of the first, seeing in the temporary seafarer a threat to their position. Indeed, one has recently stated that free holidays and cheap gin are the chief factors that lure the latter to sea.

The shipping companies are also much in favour of the permanent man. They have to provide a crew for each ship that sails, and it is obviously much more convenient not to have to search for a doctor every time. Also they have the captain's opinion on the previous voyage, and would not offer a really bad man another voyage. The crews themselves, however, think differently, and it is with this knowledge that I express myself in favour of a better part-time service.

Conclusion

The difficulty in securing a better service ought not to be great, being chiefly one of organization. Many men would go to sea if they could get a ship, and many ships would be glad to have them if they could get them at the time they are required. I trust that the maritime subcommittee of the Private Practice Committee of the B.M.A. may exert itself in the direction I have indicated.

Some men are deterred from going to sea by the feeling that they are inadequately equipped in the matter of operative surgery. This emerged in some recent correspondence in the *B.M.J.* The paucity of articles and textbooks for the ship doctor extends also to postgraduate courses. And yet the requirements are not great, they are merely dissimilar to those for any other branch of practice. The number of individual operations that might be performed at sea is small, but includes one or two from almost every branch of surgery. I commend to the bodies responsible for postgraduate courses the peculiar requirements of the ship surgeon.

WOMAN CONSULTANT FOR WOMEN'S HOSPITAL

BOARD'S DECISION TO STAND

The Secretary of State has decided not to interfere with the decision of the South-eastern Regional Hospital Board in Scotland not to restrict the consultant post in medicine at the Bruntsfield and Elsie Inglis Hospitals to women candidates. The Board's decision was the subject of a letter to the *Supplement* of February 9 (p. 62).

The Secretary of State received a number of representations on the matter, including a petition signed by 20,000 people. In a letter to the Board of Management for Edinburgh Southern Hospitals he records that the Regional Hospital Board had two part-time consultant vacancies for the Southern Hospitals Group—the first of three half-days for adult work at the Bruntsfield and Elsie Inglis Hospitals (this post was previously held by a woman doctor), and the second for four half-days at the Deaconess and Longmore Hospitals (this post was previously held by a male doctor). The board decided that the two posts should be combined into a single one for the whole group, open to either sex, because a new appointment of this kind would have a substantially higher remuneration and would thus attract a consultant of the highest calibre. It emphasized that should a woman candidate prove worthy in open competition she would be appointed to the combined post with its fullest confidence.

The Board of Management, however, represented that a woman candidate might not be successful in open competition; there would then be a break with the long-standing tradition at the Bruntsfield and Elsie Inglis Hospitals, and women in the South-eastern Region would be deprived of the services of a woman physician of consultant rank. If a woman was available who could be regarded as suitable she should be appointed, even if she might not be successful

Royal Commission

SIR,—At the present time there is, I believe, a greater degree of unanimity in the profession than has been present for some years. I think we would be very wise not to lose sight of essentials in the present dispute. Our claim, when made, was for an increase of 24% backdated to April last year, when there was already several years of accumulating loss of purchasing power. We need to be careful that an interim settlement does not upset the unity, for we have asked either for the 24% or arbitration. A Royal Commission report is suspect from the outset, for the history of these reports shows clearly that their findings may be discarded by the Government or selectively accepted. All whole-time and many part-time consultants know to their cost the drawbacks of being assessed under Schedule E when there is already a Royal Commission report advising that the Schedule E rule governing deductible expenses should be amended to permit the allowance of expenses reasonably incurred for the proper performance of the duties of the office, as is the case under Schedule D. Subsequent to the Danckwerts award to G.P.s, minor but arbitrary and uneven changes were made in the hospitals. Registrars and house-officers got an increase of £75, most consultants received £350 (based on the full-time rate), but a consultant with an "A" merit award received only £50. I am not entering the arena to argue about merit awards except to express a personal opinion that something comparable seems desirable in the G.P. field, preferably organized among themselves. Payment by counting of heads makes no allowance for outstanding quality of service.

The terms of reference of the Royal Commission would appear to be calculated to reduce the actual buying power of the whole profession, as they do not specifically include a reference to the conditions upon which the profession agreed to enter the Health Service. It seems, therefore, that we would be wise to approach the interim settlement circumspectly, as what we seek is a cure and not a placebo. I think that most of us resent the appointment of a Royal Commission to settle in part something we thought was settled in 1948. Its findings will only be acceptable if they produce a solution which maintains the status of the doctor in the community under Government monopoly employment conditions. The *Lancet*, in its leading article of March 2, includes the following sentences: "What has been unfair about the attitude of successive Governments is that in seeking economies they have expected a special contribution from people who get their livelihood from public funds: when the Civil Servant or the person working in some national undertaking is denied the proper rate for the job, because the Government 'cannot afford it,' he is in fact being forced to make an additional contribution to the Exchequer, supplementary to what he pays in taxes; and the same is true of the doctor who is asked to accept uncompensated depreciation of his income when (even in the National Health Service itself) the need for compensation of other groups is freely recognized. What is unjust is also in the long run unwise, and grave damage to the Service will be averted only if the Government demonstrate that they are not as uninterested or as cynical as they appeared."

It is, I think, unfortunate that the same article, while frowning upon mass withdrawal from the N.H.S., does not indicate what steps the profession could take to secure redress from injustice. Sweet reason has been shown to be a failure. It would be tragic for the future if we allow exploitation of the differing difficulties in the various branches and age groups among us to deflect our aim from the main purpose—24% or arbitration. Other problems must be settled later. Lastly, why were the terms of refer-

in a competition for a consultant post open to either sex. It therefore proposed that the two posts should be kept separate, and that the post at the Bruntsfield and Elsie Inglis Hospitals should be advertised as restricted to women only. The Board of Management was supported by the regional consultants and specialists committee, the Edinburgh Local Medical Committee, and the Medical Women's Federation of Great Britain.

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

The Assistants and Young Practitioners Subcommittee of the G.M.S. Committee met on March 1 with Dr. F. GRAY in the chair. The following resolution was passed unanimously:

The Assistants and Young Practitioners Subcommittee of the British Medical Association, representing assistants and unestablished practitioners throughout the country, fully supports the action of the General Medical Services Committee in convening a Special Conference of Local Medical Committees to consider a recommendation that, failing an immediate and satisfactory settlement of their claim for increased remuneration, or the submission of that claim to arbitration, general practitioners should withdraw from the National Health Service.

The view was put forward by more than one speaker that the remuneration claim also offered an opportunity to examine the Health Service as a whole. Dr. R. M. S. MATTHEWS moved that the G.M.S. Committee should be asked to draw the Council's attention to the Subcommittee's request that any increase in remuneration should be the occasion for a more equitable distribution of present and future work in general practice, whereupon Dr. F. G. TOMLINS moved an amendment

That any increase in remuneration should be the occasion for a change in the method of remuneration designed to give an incentive to a more equitable distribution, and a higher standard, of work in general practice.

This amendment was carried by the young-practitioner members of the Subcommittee only voting, but there was an even division when the vote was put to the whole Subcommittee. It was agreed that discussion on Dr. Matthews's substantive motion should be postponed to the next meeting.

The Subcommittee considered a request from the G.M.S. Committee for its views on the recommendation of the Constitution Committee that a special committee of the Association be appointed under the title of "Young Practitioners Committee" to consider all matters affecting medical practitioners not yet fully established in a defined field of practice, including questions referred to other committees or subcommittees, and to make recommendations.

The Subcommittee saw no reason to establish this new committee and thought that any difficulties could be overcome by more efficient liaison between existing committees.

HOSPITALITY

A French doctor's daughter, aged 19, would like to stay with a medical family near Oxford or Cambridge on an *au pair* basis for a few months. She would help with children or teach them French, Latin, or Greek. A son, aged 13, of the same doctor would like to stay as a paying guest in the same neighbourhood, or arrange an exchange with a British boy of similar age.

A Norwegian doctor's daughter, aged 17, would like to arrange an exchange with a British girl. The British girl could spend the summer of 1957 or 1958 among the fiords with opportunity for fishing, bathing, and mountaineering.

A French doctor in the Department of Vendée would like his son (12) and daughter (13) to arrange a holiday exchange with two children during July and August.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

ence of this Royal Commission not discussed and agreed with our leaders before publication? To be confronted with the appointment of a Royal Commission was affront enough.—I am, etc.,

Dorchester.

T. V. COOPER.

Reform of Health Service

SIR,—It is held by some, perhaps the more senior members of the profession, that to seek revision of the National Health Service and an adjustment in pay would be fatal to both causes. Long experience of dealings with Government departments no doubt prompts this opinion. The opinion is open to at least two criticisms. It misrepresents the facts, for surely the majority of practitioners would not be satisfied with the proposed extra pay, but with no revision of the Service; and it is extremely bad publicity. There is no easy way to correct the misapprehension which we should create in the mind of the public. Quite possibly both these criticisms carry less weight with the seniors than with those who have their professional lives ahead of them. A strong undercurrent of desire for reform is undoubtedly flowing, although, as yet, it flows in many separate channels. The need for brevity here demands some oversimplification of the issue. I would propose the following.

The health and sickness of the individual and the family unit should be the direct concern of the general practitioner, and all relationships involved therein should be completely outside party politics or any form of State control. The State, then, must not be our employer or pay our fees. It is clear that the vast majority of the population cannot meet the cost of individual serious illness out of current income, and that insurance cover is essential. Could we not explore the question of health insurance with the big insurance companies in this country, who are so well versed in this business? Could it not be made compulsory for every individual to carry minimum cover in the same way as third-party motor insurance is compulsory? Unless there is compulsion at this point, the man who is never ill, never bothers to put himself on a doctor's list, would not be paying his essential bit to the pool. Increased premium would provide for additional cover. Health propaganda would be in the interests of the insurance companies. The general practitioner would be paid by fee for service, giving a receipt which would be handled by the insurance companies for partial refund.

Now that a revolution in the distribution of income has taken place in this country, there should be a small and diminishing number of cases where payment of cash really caused hardship. If the co-operation of the highly efficient insurance companies (with which I have no connexion) could be obtained along these lines, I believe that a vast improvement in the status and performance of the general practitioner could be expected. On the other hand, if our pay claims were met to-morrow, what hope would there be of salvation for most of us beyond a temporary period of solvency?—I am, etc.,

Andover.

JOHN W. EVANS.

SIR,—May I fish in our troubled waters for answers to two objections to existing arrangements? Nowadays a G.P. is stuck where he starts. There is much to be said for lifelong marriage to a locality. But family circumstances, health considerations, economic factors, or professional developments may make moves desirable. And certainly a man stays put better of choice than of necessity. At present, G.P.s, old or young, receive level payment for patients, rich or poor; and the more assiduous doctor receives relatively less pay. There is need for salutary realism in this aspect of the doctor-patient relationship. Surely now is the time for us to plan boldly and swiftly to relieve politicians and civil servants of responsibility for family doctors' arrangements.—I am, etc.,

London, W.1.

WILLOUGHBY CLARK.

SIR,—No reasonable person can deny that the N.H.S. is grossly abused by a large proportion of patients and regretably, but understandably, by many doctors. Because of the compulsory contribution system the general attitude of the lay public is, "We must get as much as we can out of the N.H.S.," and the doctor is called in or attended for the most trivial complaints, such as the common cold, a small scratch, or a bruised finger. If the patient had to pay out of his own pocket for each service this abuse would largely cease. A majority of patients no longer come to their doctor to seek advice but to demand service. Frequently the patient's opening words are, "I want a prescription," or, "I want a certificate," or, "I want an x-ray," and there is a temptation, under pressure of numbers, to give way to their demands. Our advice is often ignored, particularly if it involves any personal effort on the patient's part. Influenced by the popular press and by certain speakers on the radio and television, we are often regarded as incompetent and negligent.

Witness the results. A once-noble profession is degenerating into a lowly form of shop assistant. We are finding it increasingly difficult to practise good medicine in this Utopia for the malingerers, fools, selfish neurotics, and barrack-room lawyers. The only solution, if we are to restore the fallen status and standards of our profession and at the same time to protect the interests of genuine patients, is to withdraw completely from the N.H.S. Let there be a Government-financed scheme with payment per item of service for the disabled, the chronic sick, and persons receiving National Assistance. Essential and life-saving drugs, and only such drugs, might well be subsidized by the Government. Hospital services could also be financed by the Government, but the patient must pay according to his means. The claim for increased remuneration must not be allowed to cloud the vital issue—the fate of the medical profession under the N.H.S.—I am, etc.,

Kingsbridge, Devon.

R. D. FRANCE.

SIR,—It seems a pity that the recent negotiations between the profession and the Government should have been overshadowed by the question of remuneration. The main issue is surely the impossibility of running an efficient Health Service under present conditions, and that doctors, under any circumstances, should refuse to prolong this monstrously extravagant system. By implying that salaries are the real contention, they will find themselves a little embarrassed, if their demand is acceded to, in persisting in withdrawal from the N.H.S. For, *au fond*, no salary increase can compensate the frustrations of present-day practice. I suppose the only saving hope is that no Government can afford to spend more than £600m. with economy and social morality at its present ebb.—I am, etc.,

London, N.21.

D. O. HANCOCK.

SIR,—May I state with the greatest possible emphasis what I and many colleagues are convinced is the fundamental evil of the present Health Service? The question put by Dr. S. Wand to the G.M.S. Committee (quoted in the leading article "Action and Reaction," *Journal*, March 2, p. 508), "... whether we can go on working for such an employer..." touches on it, but not strongly enough. We must not go on working for any employer.

The inescapable truth is that the essential doctor-patient relationship is impossible if the doctor is an employee, above all if the employer is any politician or political body—whether minister (Prime or Health), or executive council, or any other power group. We must be in direct contact with our patients, with no third party intervening. We can and should run our own Health Service, making it clear that it is for the benefit of the patients—not ourselves. It would be cheaper and far more effective than the mess that the professional politicians have forced on the country. I am in agreement with the ideas expressed in the letter from the younger practitioners of Nottingham (*Supplement*, March 2, p. 102).—I am, etc.,

London, N.W.3.

A. DALBY.

Remuneration Claim

SIR,—It is being suggested that our remuneration should be compared with that of other professions. May one make an urgent plea that it should rather be compared with the pay of manual workers and artisans? There was a time when one could employ a full-time maid for a weekly wage equal to what oneself received for a single night visit. Two such maids and one was able to have full service in one's home. To get the same service to-day one would have to pay out weekly one's gross income for looking after ten or a dozen patients for a whole twelvemonth. Once upon a time a man would do a day's work in one's garden gladly for the amount which one received for a single visit to a patient. To-day the gardener will expect more for his day's work than the doctor receives for a year's attendance on one patient. A man would readily clean a car for an amount equal to that received for a single surgery consultation. To-day he expects for the same service more than half a doctor's gross income for tending one patient for one year. As a result one can no longer afford to pay for these services, but must carry them out for oneself. The time not spent actually in the care of patients is filled with these chores—alone or helping a hard-pressed, overworked, and quite unpaid wife. There is no proper time for the sort of recreation needful if one's mind—the chief instrument of one's work—is to be maintained at concert pitch. There is no time for the professional reading which is absolutely necessary if one's efficiency and skill in work are to be kept at a proper standard. Small wonder that we succumb so easily to the blandishments of the drug advertisers—to the great loss of the country's purse, and even at times to the direct detriment of the individual patient.

Since we are members of a learned profession there must be a dependence between our standard of living and our efficiency. If the community insists on lowering the one, then it automatically lowers the other, to its own great loss.—I am, etc.,

West Bromwich.

D. SAKLATVALA.

SIR,—May we deplore the continued use of the word "strike" by the lay public, and even by members of the medical profession, when discussing the question of resignation? We are surprised that the B.M.A. has ignored the repeated references to "the doctors' strike" in the daily press. By allowing this inaccuracy to persist, the B.M.A. condones misrepresentation of our case and thus encourages alienation of public opinion. Our threat is one of resignation. We should take care to see that it is always described as such.—We are, etc.,

Salisbury.

C. J. R. ELLIOTT.
D. M. STIBBS.

SIR,—Amid all the clamour and publicity surrounding the dispute between the doctors and the Government, a most important point has not been given due emphasis either in broadcasting or in the press. The Prime Minister, in the House of Commons, denied any "contractual obligation" to the profession. This statement removed the only form of contract that ever existed between the two parties. Would anybody be prepared to work under these conditions?—I am, etc.,

Chandlers Ford, Hants.

J. S. BROCKET.

SIR,—We seem to be holding a pistol to the head of the Minister of Health, but have we made sure that it is loaded? My newspaper informs me that there will be a unanimous withdrawal of services, but I know this to be untrue, as I shall not withdraw mine.

An important point, perhaps overlooked, is that the most active co-operation of our patients will be needed if charges for services are to be made (as suggested by many of your angry correspondents), and I see no indication that our arguments have such force that the public will support them with their own money until the Minister is brought to heel. I am still serving my apprenticeship in general practice, and

have no direct knowledge of conditions prior to 1948, but many of the complaints of older established practitioners seem to me quite unwarranted. I should like to take up one or two. Of course we should like more money, so would everyone, but the need is not so urgent. Most practitioners appear to me to live quite well, and much of the extra money will simply be transferred from the Minister of Health to the Chancellor of the Exchequer. We all know that our comparative standard of living has fallen, but it gives some pleasure to see miners and farm workers living more reasonable lives; most of our patients do not wish to return to pre-war ways, even if we do. The doctor-patient relationship is said to have altered, and, while remembering that such a state is not brought about by one of the parties alone, it is also well to realize that there has been a general levelling up in society and that it is salutary if patients keep us alert, and occasionally have the impertinence to ask questions without accepting our every remark as oracular. And it cannot be other than to the general good that adequate advice and treatment are no longer even partially dependent on a patient's having an adequate income.

The amount of correspondence that the wage claim has produced is evidence of great unrest in the profession, and it would seem reasonable that the incontrovertible claims of junior hospital staff should be met forthwith (these are in danger of neglect by being associated with a debatable claim); and that the Royal Commission should have wide terms of reference to include an inquiry into the whole structure of the Health Service—the case for removing it entirely out of the ambit of politics seems very strong. I see no good reason for pursuing a bald wage claim, like a narrow-minded trade union, and hope that many other new and young doctors feel the same, and do not wish to imperil the very great national achievement of the Health Service.—I am, etc.,

Warboys, Huntingdon.

R. R. CHARLWOOD.

SIR,—Surely the time has come for plain thinking in this matter of remuneration: it is not a question of whether the nation's purse can stand a further twenty million pounds a year but whether Mr. Everyman's pocket can stand a penny or so a week, and the ample grounds for believing that the answer is "yes" have recently been strengthened by the knowledge (as a simple calculation from recently published figures will reveal) that every person in this country contributes about three pounds per annum towards the prosperity of his bookmaker. Since the question has been vulgarized by open discussion in the lay press (which I am sure none of us would have wished in the first instance) one marvels that the profession prefers to remain secretive rather than turn such publicity to good account by seeking to ensure that the public are better informed of the true facts. If we were strong and silent we could forgive ourselves, but, as a body, we would appear to be weak and silent.

Why have we not tumbled to the fact that our claim would be met were public opinion on our side? This it most certainly is not. I have yet to meet anyone outside the profession who knows how much of his weekly contribution goes to his doctor, or how much his doctor receives for looking after his health for a year; I have yet to meet the man who has not sympathized entirely with our claim when confronted with the answers. Even the thinking-classes are often under the impression that the much-vaunted "average salary" is a net income, and when they are told of the remuneration of hospital officers their response is one of amazement, not to say incredulity. Why have we failed to mobilize this great force? One would like to think that Dr. Wand's words over the wireless the other evening struck at the consciences of millions of our non-televueing patients. Can we help to prevent a repetition of public under-information by insisting that N.H.S. contributions and those for National Insurance are receipted by two separate weekly stamps?

The *per capita* fee is ludicrously low—could it be that my senior colleagues who accepted it at the inception of the

Public Health Service Members

Two members of Council are nominated and elected by members of the Association employed in the public health service as defined in By-law 1 (3). Candidates must be members of the public health service as so defined.

One Woman Member

One woman member of Council is nominated and elected by women members of the Association.

Nominations

The nominations must be on the prescribed forms, copies of which can be obtained on application to me. In the case of the 40 members to be elected by Divisions and Branches, the nomination may be by a Division or Division-Branch as such, or by not fewer than three members of any Branch in the Group.

A notice will be published by the Council in the *Supplement to the British Medical Journal* of April 27, 1957, of the candidates nominated. Where contests occur, voting papers containing the names of all duly nominated candidates will be issued on April 27, 1957, from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group, or to the public health service members, or to women members. A notice will be published by the Council in the *Supplement* of May 18, 1957, giving the results of the elections where there have been contests.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Cambridge Hospital, Thursday, March 21, 8.30 p.m., clinical meeting.

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, March 19, 8.30 p.m., meeting. Lecture by Dr. B. C. Tate: "Some Common Skin Disorders in Infants and Children."

BRIGHTON AND MID-SUSSEX DIVISION.—At Hotel Metropole, Brighton, Thursday, March 21, combined meeting with Pharmaceutical Societies of Brighton and Hove, 6.30 for 7 p.m., informal dinner; 8.30 p.m., discussion to be opened by Dr. Raymond Greene: "Hormone Therapy."

BRISTOL DIVISION.—At Main Physics Lecture Theatre, Royal Fort, Wednesday, March 20, 6.30 for 7 p.m., dinner; 8.30 p.m., meeting. Dr. Doris M. Odum: "Medical Aspects of Homosexuality." Members are invited to take one guest. Members of Bristol Law Society, the probation service, and senior members of the police are also invited.

CITY DIVISION.—At Mildmay Mission Hospital, Austin Street, E., Tuesday, March 19, 8 p.m., clinical meeting. Any B.M.A. members, but especially those of St. Pancras Division, are invited.

DONCASTER DIVISION AND DONCASTER MEDICAL SOCIETY.—At Danum Hotel, Doncaster, Tuesday, March 19, 7.30 p.m., dinner. B.M.A. Lecture by Professor D. M. Dunlop: "Changing Fashions in Therapeutics."

DUDLEY DIVISION.—At Station Hotel, Dudley, Thursday, March 21, 8 for 8.30 p.m., dinner dance.

EAST HERTS DIVISION.—At Hertford County Hospital, Tuesday, March 19, 8.15 for 8.30 p.m., meeting. Films presented by Dr. J. Currie.

ENFIELD AND POTTERS BAR DIVISION.—At Nurses' Recreation Room, Chase Farm Hospital, Enfield, Friday, March 22, 8 for 8.30 p.m., meeting. Clinical demonstration by Dr. R. M.

Mason: "Some Aspects of Rheumatoid Arthritis." Members of North Middlesex Division are invited.

GLASGOW DIVISION.—At Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Friday, March 22, 8.30 p.m., annual meeting.

GLOUCESTERSHIRE BRANCH.—At Cheltenham General Hospital, Thursday, March 21, 6.15 p.m., meeting. B.M.A. Lecture by Dr. Peter Bishop: "Endocrine Therapy."

GRIMSBY DIVISION.—At Board Room, Grimsby General Hospital, Tuesday, March 19, 8 p.m., clinical meeting.

HARROGATE DIVISION.—At Leeds Regional Hospital Board Headquarters, Park Parade, Harrogate, Friday, March 22, 8.30 p.m., meeting. B.M.A. Lecture by Dr. S. T. Anning: "Common Skin Diseases."

HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, March 20, 8.45 p.m., scientific meeting. Talk by Dr. W. S. Brindle: "Midwifery in General Practice," to be followed by film: "Low Forceps Delivery—Using Pudendal Block Anaesthesia." Mr. T. B. Fitzgerald will make a few remarks on the film.

KESTIVEN DIVISION.—At George Hotel, Grantham, Thursday, March 21, 7.30 for 7.45 p.m., annual social evening. Guest speaker, Mr. A. Dickson Wright: "Oliver Cromwell's Head."

LAMBETH AND SOUTHWARK DIVISION.—At St. Thomas's Hospital, S.E., Tuesday, March 19, 7.30 for 8 p.m., clinical meeting.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Cheadle Royal Hospital for Mental Diseases, Wednesday, March 20, 8.30 p.m., meeting. Talk by Dr. W. V. Wadsworth: "The Modern Mental Hospital."

MARYLEBONE DIVISION.—At Committee Room B, B.M.A. House, Tavistock Square, London, W.C., Tuesday, March 19, 8.30 p.m., meeting.

MONMOUTHSHIRE DIVISION.—At St. Mellon's County Club, Thursday, March 21, 7.45 for 8.15 p.m., dinner. B.M.A. Lecture by Professor W. Grey Walter: "The Human Engine." Members and their wives and guests are invited.

NORTHAMPTONSHIRE BRANCH.—At Board Room, Northampton General Hospital, Sunday, March 17, 8 p.m., meeting. B.M.A. Lecture by Dr. J. D. N. Hill: "Epilepsy."

NORTH MIDDLESEX DIVISION.—At Committee Room, North Middlesex Hospital, Silver Street Edmonton, N., Tuesday, March 19, 8.30 for 8.45 p.m., meeting. B.M.A. Lecture by Professor H. Scarborough: "Staphylococcal Fever."

NUWEXON AND TAMWORTH DIVISION.—At Newdegate Arms Hotel, Nuneaton, Saturday, March 23, dance.

OLDHAM DIVISION.—At Affion Club, Queen Street, Oldham, Monday, March 18, 9 p.m., meeting. Mr. A. N. Guthkelch: "What Use is Neurosurgery?"

ROCHDALE DIVISION.—At Carlton Ballroom, Rochdale, Friday, March 22, 8 for 8.30 p.m., annual dinner and dance.

SHEFFIELD DIVISION.—At New Lecture Theatre, Sheffield Royal Infirmary, Sunday, March 24, 3 p.m., meeting of North Midlands Faculty of College of General Practitioners. First Pfizer Postgraduate Lecture by Dr. H. R. Vickers. All medical practitioners in the area of the Division are invited.

SHROPSHIRE AND MID-WALES BRANCH.—At Lion Hotel, Shrewsbury, Friday, March 22, 7.30 for 8 p.m., annual dinner dance.

SOUTHAMPTON DIVISION.—At Polygon Hotel, Friday, March 22, 7.30 for 8 p.m., annual dinner and dance.

SOUTH MIDDLESEX DIVISION.—At Anchor Hotel, Shepperton, Wednesday, March 20, 9 p.m., meeting. Talk by Dr. A. K. Mant and Detective-Inspector Hannan: "The Tow Path Murders" (with lantern slides). Members may bring one guest of either sex at their own risk.

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, South Shields, Wednesday, March 20, 8.30 p.m., meeting. Address by Mr. L. P. Lossman: "Headache."

SOUTH-WEST WALES DIVISION.—At Stepney Hotel, Llanelli, Thursday, March 21, 7.30 for 7.45 p.m., dinner-meeting. Dr. Sheila Sherlock: "Acute Liver Failure."

SWANSEA DIVISION.—At Osborne Hotel, Mumbles, Thursday, March 21, 7.30 for 8 p.m., dinner. B.M.A. Lecture by Mr. J. Ivor Griffiths: "Upper Respiratory Sepsis."

WEMBLEY DIVISION.—At Gymnasium, Wembley Hospital, Tuesday, March 19, 9 p.m., meeting. B.M.A. Lecture by Dr. C. Keith Simpson: "Crime and the Doctor" (illustrated). Members of Willesden, Hendon, Hampstead, and Harrow Divisions are invited.

WEST BROMWICH AND SMETHWICK DIVISION.—At "The Red Cow," High Street, Smethwick, Friday, March 22, 8 p.m., annual dinner dance. (Dinner at 9 p.m.)

WIGAN DIVISION.—At Haigh Hall, Wigan, Thursday, March 21, 8.15 p.m., joint meeting with Wigan Law Society. Buffet supper. Address by Mr. W. J. H. Palfrey: "Organization of a Murder Investigation in a Country Force."

The annual general meeting of the Oxford Region Registrars Group will be held in the Committee Room, Radcliffe Infirmary, Oxford, on Wednesday, March 20, at 8.15 p.m.

Correction.—In the report of the meeting of the Public Health Committee (*Supplement*, March 9, p. 109), the remarks ascribed to Dr. Llywelyn Roberts should have been ascribed to Dr. J. B. Morgan.

**GENERAL MEDICAL SERVICES COMMITTEE
REPORT TO SPECIAL CONFERENCE**

Members are asked to keep this Report, which contains matters which will be referred to Divisions.

The General Medical Services Committee's report to the special conference of local medical committees to be held on April 30 to consider the remuneration claim has been sent to all local medical committees.

History of Claim

Recalling the history of the present remuneration claim on behalf of hospital medical staffs and general practitioners, the Committee emphasizes to its constituents that the reports of the two Spens Committees are the foundation of the claim. The profession entered the Health Service in the belief that the Government's acceptance of the Spens recommendations would end the arguments that had taken place in the past over medical remuneration.

That Governments of the day accepted the Spens Reports was amply proved by various ministerial statements from 1946 onwards, the most recent being in a letter dated May 22, 1950, from the Permanent Secretary of the Ministry of Health to the B.M.A.:

The Minister agrees that the Spens Report remains the basis of the remuneration of general medical practitioners until such time as after the usual consultations some other basis is substituted.

In spite of the Danckwerts award, which laid down a betterment factor appropriate to the year ending March, 1951, the profession some five years later found its remuneration was again substantially below the standards laid down in the Spens Reports. The Committee states in its report that it "had been reluctant, in view of the national situation, to press its case, but by January, 1956, it felt compelled to seek an adjustment in remuneration to enable doctors to keep abreast of the steep and continuing rise in the cost of living since April, 1951." The profession's claim in its final form (see *Supplement*, July 28, 1956, p. 75) was submitted to the Minister of Health and Secretary of State for Scotland in June, 1956. It asked for an increase of not less than 24%.

Moral and Contractual Obligation

The G.M.S. Committee points out that the profession's Negotiating Committee, on the advice of Sir James Millard Tucker, Q.C., was doing no more than to seek the fulfilment of the Government's promises made to the profession when

Report of the Interdepartmental Committee on Remuneration of General Practitioners, 1946. H.M.S.O.
Report of the Interdepartmental Committee on the Remuneration of Consultants and Specialists, 1948. H.M.S.O.

it agreed to enter the National Health Service in 1948. In other words, the Negotiating Committee maintained that the Government not only had a moral obligation to the profession but also an overriding contractual obligation on account of its acceptance of the Spens Reports. To this the Ministers replied in July that the Government could not accept the premises on which the claim was based.

The Government took the view that "the remuneration of the medical profession, like that of others, must be determined from time to time in the light of all relevant circumstances," and "that in present circumstances it would not feel justified in giving consideration to any claim for a general increase in medical remuneration."

This reply was quite unacceptable, the G.M.S. Committee states in its report, for the country's economic position over the period covered by the claim suggests that the Government could have advanced the same argument at any time. Against a background of substantial increases in many other fields, including the Civil Service, the answer was particularly unconvincing. It seemed that the Government was evading its obligations by maintaining that the very cause of the profession's claim—inflation—had itself created a situation which prevented even the merits of the case being considered.

Legal Memorandum

The Committee's report goes on to record discussions with the Minister of Health in August, in which he said that the Government took the view that the Spens Reports merely established a starting-point for entry into the Health Service and they did not entail the automatic and periodic adjustments envisaged by the profession. Nevertheless the Minister invited the Negotiating Committee to submit a supplementary memorandum amplifying the legal aspects of its claim.

This memorandum (see *Supplement*, November 3, 1956, p. 173) was sent to the Ministers in September. It pointed out that the terms of reference of the general-practitioner Spens Committee required it to pay due regard "to the desirability of maintaining in the future [G.M.S. Committee's italics] the appropriate social and economic status of general medical practice and its power to attract a suitable type of recruit to the profession." That the recommendations in the Spens Committee's report were in fact framed with this intention is corroborated, in the opinion of the G.M.S. Committee, in numerous parts of the Spens Report. It was also significant that on no occasion throughout the proceedings before Mr. Justice Danckwerts did the Government attempt to controvert the principle of periodic and continuing adjustment, and if further evidence was needed it could be found in the Ministry's own handbook, published in 1955, which states:

The central pool is now calculated on the basis of the estimated net remuneration appropriate for general practitioners

in 1939 (as recommended by the Spens Committee in 1946) together with a betterment factor taking account of the changes in the value of money since that time.

The Ministers' answer to this memorandum was that they were still of the opinion that no contractual obligation existed, but if the Negotiating Committee did not accept this view the matter could be tested in the courts.

The Negotiating Committee replied that it had never alleged the existence of a contractual obligation which could be enforced by legal proceedings in the ordinary way. What, however, was vital to the profession's case was that the contractual obligation existed, whether or not it was enforceable in the courts, and that implicit in that obligation was the Government's moral obligation to give effect to the recommendations of the Spens Committees and to implement the promises which were made to the profession when it entered the National Health Service.

Fruitless Discussions

At a further meeting with the Negotiating Committee's representatives on January 4 the Minister repeated that, according to legal advice he had received, the Government was under no contractual obligation to the profession and the Spens recommendations did not require periodical adjustments of remuneration in the way that the Committee contended. As to the merits of the claim, he could not even begin to examine these in the present economic circumstances of the country, since to do this, in his view, would start a "chain reaction" in other fields which would endanger the country's financial stability.

At the end of a fruitless discussion, in which the Negotiating Committee's representatives emphasized that it was not merely a dispute about money but a crisis of confidence which went to the roots of the relations between the medical profession and the Government, the Minister invited the Committee's representatives to meet him again after he had given further thought to the problem and discussed it with his colleagues.

The Negotiating Committee's representatives met the new Minister of Health, Mr. D. Vosper, on February 20. Mr. Vosper reminded the deputation that his predecessor had made it quite clear that in present economic circumstances the Government could not consider the claim on its merits. He pointed out that the economic position had not changed since January and therefore there could be no question of reversing the decision. He then said that the Government had decided that the time was opportune for a full review of medical remuneration through an independent inquiry which would take into account the position of the medical profession in relation to other professional classes in the community. Accordingly the Queen had approved that a Royal Commission should be appointed for this purpose.

Attitude to Royal Commission

This unilateral decision on the part of the Government was received, the G.M.S. Committee report states, with dismay and anger by the members of the deputation. "The profession," it declares, "was confronted with a *fait accompli* which would precipitate the gravest crisis in the profession since the National Health Service began, and the Minister must be responsible for the consequences."

The report goes on to record that the Minister made it clear that the Government could not agree in advance to accept the recommendations of the Royal Commission. Indeed, he admitted that, if the Commission reported in the profession's favour and at the time of the report the economic position in the country had not improved, the Government would hold the same view as it did to-day. "In other words," states the report, "the Government's attitude was that, despite increases given to other sections of the community and substantial increases in the cost of the N.H.S. itself, doctors must wait indefinitely for justice to be done." Negotiations had been refused.

Following this deadlock the Negotiating Committee requested its joint chairmen to send an immediate letter to

the Prime Minister asking that at this late hour the possibility of arbitration be considered. The Prime Minister replied and the letters were published (see *Supplement*, March 2, p. 100).

Meanwhile, the G.M.S. Committee met on February 21 and considered the implications of the Royal Commission. In its report to the special conference, the Committee states that the Government's decision meant that it had repudiated its promises to the profession when it entered the Service. In other words, Spens, and all that it means to the profession, was in danger of being lost and with it the basis of the Danckwerts award—a judicial interpretation of the Spens formulae.

Resignation Advised

The Government's decision meant that the adjustment of the present rates of remuneration, which are related to conditions obtaining in April, 1951, was to be postponed for an indefinite period. Even then there was no guarantee that any increase would be recommended, or, if recommended, accepted by the Government of that day.

Above all, says the Committee, it meant that the profession could have no further trust in the Government. As recently as 1950 an assurance was given by the Ministry of Health that the Spens Report remains the basis of remuneration of general medical practitioners until such time as after the usual consultations some other basis is substituted. No such consultation had taken place. The Government, by its unilateral decision, had repudiated this promise, broken its contract, and committed a flagrant breach of faith.

The General Medical Services Committee goes on to report its decision that, unless the Government agreed to an immediate and satisfactory settlement of the profession's claim or agreed to refer the dispute to arbitration, general practitioners throughout the country should be advised to send in their resignations from the Service.

Interim Adjustment

The Prime Minister's letter in reply to that of the joint chairmen of the Negotiating Committee was the first indication that the Government did not preclude some interim adjustment of doctors' remuneration. The joint chairmen interviewed the Minister of Health on February 28, but the Minister could give no indication of what the interim adjustment might be, nor on what premises it could be based. He again stressed the Government's offer to make an immediate adjustment in the remuneration of junior hospital staff, up to and including the rank of senior registrar, and he hoped that discussions in Whitley Council would proceed without further delay.

It appeared to the G.M.S. Committee that the Prime Minister's statement meant little more than an offer to make some interim adjustment in remuneration at a later date, but the Government was not prepared to commit itself on the amount of the adjustment, or its relationship to the main tenets of the profession's claim. There was nothing to indicate that there was any possibility of an immediate and satisfactory settlement, nor that the claim would be sent to arbitration.

Meeting on February 28 (see *Supplement*, March 9, p. 105), the Council of the Association received a report of the action taken by the G.M.S. Committee. It endorsed the Committee's decision to convene a special conference and to recommend to that conference that, unless the Government agreed to an immediate and satisfactory settlement of the profession's claim, or to arbitration, general practitioners would be advised to send in their resignations from the service.

Terms of Reference

In its report the G.M.S. Committee records the terms of reference of the Royal Commission as follows:

To consider:

(1) How the levels of professional remuneration from all sources now received by doctors and dentists taking any part in the National Health Service compare with the remuneration received by members of other professions, by other members

of the medical and dental professions, and by people engaged in connected occupations;

(2) What, in the light of the foregoing, should be the proper current levels of remuneration of such doctors and dentists by the National Health Service;

(3) Whether, and if so what, arrangements should be made to keep that remuneration under review.

And to make recommendations.

Commenting on these, the Committee gives an opinion by the Association's legal advisers:

(1) On these terms of reference there are three points of outstanding significance:

(a) The Government have taken it upon themselves to prescribe and limit the considerations which the Royal Commission should take into account instead of leaving it to the Commission to consider all the relevant factors. (b) The limitations which the Government have imposed will arbitrarily and drastically restrict the considerations which the Royal Commission are permitted to take into account. (c) The limitations are likely to be gravely detrimental to the future economic and social status of the medical profession if not of the professional classes generally.

(2) As to the first point, it is sufficient to say that the Government, by themselves prescribing the considerations which are relevant to doctors' remuneration, are prejudging the very issue which ought to be left to the Royal Commission to consider. The terms of reference, in order to be fair, clearly should have enabled the Royal Commission to take into account all relevant factors. By depriving the Royal Commission of the right to take into account all relevant factors, the Government are depriving the Royal Commission of the power to act in accordance with the principles of justice and are setting themselves up as a judge in their own cause.

(3) The extent of the limitations which the terms of reference impose can be simply illustrated by comparing them with the terms of reference of the Spens Committees. Each of the Spens Committees was instructed to obtain whatever information and evidence it thought fit and to have regard to the desirability of maintaining the proper social and economic status of the type of medical practice with which the Committee was concerned, and the power of that type of practice to attract suitable recruits. The social and economic status of doctors should obviously be considered, not only in relation to other doctors, or other professions, or other persons employed in the National Health Service, but also in relation to farmers, business men, civil servants, and all the many other non-professional classes who form part of the social and economic structure in which the doctors have to live. In the wide field of comparison which ought to have been left open to the Royal Commission, the Royal Commission might well have come to the conclusion that some comparisons were more cogent than others; but those are matters which should have been left to the Royal Commission to consider for itself.

(4) If one ignores for the moment the reference to "connected occupations," which cannot by itself have the effect of materially widening the scope of the Commission's inquiries, it is obvious that the purpose of the terms of reference is to put the professions into a self-contained group and to exclude consideration of the relationship between that group and other sections of the community. If, therefore, the professions are losing ground in their social and economic status as a whole, these terms of reference are calculated to intensify that process by precluding an appeal to external standards. The process for which a precedent is here created could react most unfavourably on the terms of service of other professional men in public employment.

Joint Chairmen Meet Prime Minister

The joint chairmen of the Negotiating Committee, Sir Russell Brain and Dr. A. Talbot Rogers, met the Prime Minister on March 12.

They pointed out to the Prime Minister that the terms of reference of the Royal Commission had been interpreted as excluding from consideration many factors which had been placed before the Spens Committees. The Prime Minister thought that this view was based on a misunderstanding, and agreed that an exchange of letters should remove doubts on their right interpretation.

The joint chairmen reported that it was clear to them that the Government did not regard immediate arbitration as an appropriate method of settling the present claim. The Prime Minister told them that he hoped very much that the

Royal Commission would recommend a method of adjusting remuneration inside the Health Service for the future.

The Prime Minister went on to say that the interim adjustment raised more complex issues than the immediate award to the junior hospital staffs. He was giving it his personal consideration, but could not commit himself at the moment to a date for the announcement of the Government's intentions. The joint chairmen stressed the desirability of these being made known in advance of the Special Conference of Local Medical Committees in April.

Repudiated Promises

The G.M.S. Committee says in its report that the results of the meeting with the Prime Minister are disappointing and lead to no fundamental change in the situation. "The most that can be said is that, from stating that an interim adjustment was 'not precluded,' the Prime Minister has now agreed to make a statement at some indefinite date in the future about the amount and method of carrying out the adjustment."

"The Government's insistence upon still further delay before making any offer which might lead to a satisfactory settlement, coupled with the fact that the terms of reference of the Royal Commission are detrimental to the profession's interests, creates a very serious situation. Indeed, all the disastrous events of the past few months lead the Committee to the inevitable conclusion that the Government is determined by the device of a Royal Commission to rid itself of the embarrassment of the Spens Reports and the Danckwerts award and to replace them by a new basis of remuneration less favourable to the profession. That this entails the repudiation of promises made in 1948 and again in 1950 seems to have caused the Government no concern but has angered the profession to the point of resignation. *The Government has refused to discuss the merits of the claim, refused to negotiate, and refused to arbitrate.* The issue is now far more than one of money."

It is possible, says the Committee, that the Government will come forward with some kind of offer before the Special Conference meets on April 30, but it holds the view that the profession would be wise to examine any such offer in the light of the wider issue involved—namely, the Government's clear and ultimate intention to discard the recommendations of the Spens Report and the Danckwerts award.

Recommendations

The Committee recommends to the special conference that:

As there has been neither a satisfactory settlement of the profession's claim nor the submission of that claim to arbitration (1) the resignations of all N.H.S. general practitioners be collected forthwith and held, and (2) the Committee's plan for a progressive withdrawal of general practitioners from the National Health Service (as outlined in the appendix) be put into effect until such time as a satisfactory settlement is achieved or the dispute is referred to arbitration.

ORGANIZATION OF GENERAL PRACTICE IN EVENT OF RESIGNATION FROM SERVICE

The following document has been sent to all local medical committees as an appendix to the G.M.S. Committee's report to the special conference.

THE PLAN

Progressive Withdrawal

The British Medical Guild will take steps to obtain the resignations of all N.H.S. general practitioners. These resignations will be collected and held and put into effect initially in a number of selected areas. The number of selected areas will be progressively increased if the need arises.

Practitioners in the areas selected—and in these only—will be asked to notify executive councils on July 2 of their

intention to withdraw from the Medical List from October 2. They will not be asked to withdraw from the Obstetric List.

This means that from October 2, with the exception of maternity medical services, general practice under the National Health Service will *cease* in these areas. General practitioners will continue to treat their patients under the following arrangements:

During the month of October former N.H.S. patients will be treated *privately* but no private fees will be asked of them. The public will be informed that doctors in these areas are anxious to give the Government one last chance to honour the promises made to the profession when they entered the N.H.S. in 1948, and that they are doing everything possible to avoid a position in which their patients suffer financially.

Nevertheless, if the Government still declines to agree to a satisfactory settlement or to arbitration it will be necessary after November 1 for general practitioners in those areas to charge their patients a *standard token fee* which it is recommended should be:

- 5s. 0d. a consultation ;
- 7s. 6d. a visit.

Patients should be given receipts for these fees, and advised to take them to the nearest National Insurance office in order that the Government may have an opportunity of refunding the sums involved. Doctors will, of course, have discretion to waive or modify these fees in special cases such as old-age pensioners, and in rural areas it may be necessary to increase the fees in cases where excessive travelling is involved, or drugs are provided by the doctor. These arrangements do not, of course, preclude the introduction of contributory schemes for medical treatment in areas where such arrangements may be practicable.

If a settlement is not reached within a reasonable time, general practitioners will be compelled to make full economic charges for their services.

Provision of Drugs

General practitioners who resign from the Service can no longer issue prescriptions on Form E.C.10.

They will, therefore, be advised to issue prescriptions on private forms for the duration of the emergency.

It will be explained to the public that although the Government has broken its contract with the doctors it still has an obligation to the public. It is, therefore, for the Government to decide whether it will refuse to accept prescriptions issued in this way.

Certification

No National Insurance certificates will be issued. General practitioners will issue their own private certificate forms.

Maternity Services

It will be explained to the public that the profession is determined that no expectant mother will suffer in any way by the withdrawal of her doctor from the National Health Service.

General practitioners in the selected areas will be advised not to resign from the Obstetric List, and all doctors will be advised to continue to provide maternity medical services, and to claim the appropriate fees from the executive council in the ordinary way.

Financial Position of the Doctor

General practitioners in the selected areas who resign from the Medical List will be given *financial support*, and their remuneration will be supplemented from the Defence Trusts in accordance with the amount of their last quarterly cheques from the executive council *less* the total amounts received from private practice and maternity fees.

The Defence Trusts have agreed to use their reserves to provide the required financial supplement, but doctors in *all areas* are now being asked to agree to an *additional levy* of 3d. per patient per quarter. This will be paid into a special

account and any balance not used will be repaid when the dispute is settled.

In this way *all doctors* will have an opportunity of contributing to the fight and of ensuring that resignations can be put into effect in an increasing number of areas.

How the Plan will Work

General practitioners in *all areas* will be asked to support the plan and be invited to give an undertaking that they would be prepared to *send in their resignations to be held for use at any time* if required to do so. With these conditions additional resignations in the Committee's hands an early announcement will be made that a number of areas have been selected and that, after three months' notice and with effect from October 2, N.H.S. general practice will cease in those areas. The identity of the areas will not be published until July 2. The Government will be informed of the overall figure of resignations held and that general practitioners in an increasing number of areas will be advised to tender their resignations should this prove necessary. In this way, large areas of the country will eventually be outside the N.H.S. and the doctors concerned will have their remuneration supplemented from the Defence Trusts through its reserves and from contributions received from the other areas.

Compensation

Hitherto, the interpretation placed on the N.H.S. Compensation Regulations by the Ministry has meant that compensation has been paid with little or no delay immediately a general practitioner's contract with the executive council is terminated. Even in cases where the Department have suspected that the doctor might re-enter the list in the not too distant future they have made the payment. Only if it is known at the time of application that a doctor is merely changing from one area to another has payment been withheld.

There is some reason to believe that the Government—during the emergency—might seek to withhold compensation by drawing a distinction between *retirement* and *temporary withdrawal* from the Service.

In the plan now recommended whereby the doctors concerned are given financial security, it is doubtful whether the payment of compensation is of great significance.

Further information on this subject will be issued later, but for the time being general practitioners in the areas selected are advised *not* to submit a claim for the immediate payment of any compensation due to them.

Superannuation

Those doctors in the selected areas who remain on the Obstetric List will retain their superannuation rights. In the case of other doctors, the position is that, if, during a temporary break in service, a doctor does not receive a refund of contributions and returns to superannuable employment *within 12 months*, his rights are *secure* and he continues from where he left off.

It can, therefore, be said that so far as the present plan is concerned, doctors' superannuation rights are completely safeguarded.

Additional Safeguards

The date of resignation in the first selected areas has been planned to ensure that the doctors concerned will have at that moment just received payment from the executive council for the preceding quarter.

In addition, it is aimed to pay out the final settlement in respect of the financial year 1955-6 around this time.

Doctors employed by local authorities and hospitals have given an assurance that they will refrain from any steps which might embarrass their general practitioner colleagues.

Industrial medical officers will be asked to give a similar undertaking.

Finally, doctors situated in the fringes of the selected areas will be asked to give an undertaking that they will *not* accept new patients from the selected areas on their lists, or to treat them as temporary residents under the N.H.S. for the duration of the emergency.

No Detriment Clause

A number of difficulties will inevitably arise during the course of the emergency.

No settlement with the Government will, therefore, be agreed unless it contains a general no detriment clause.

Summary

It is becoming increasingly clear that the Government will not yield unless the profession is not only firm in its intentions but also demonstrates beyond all doubt that it has a workable plan.

The Committee is confident that the plan submitted is workable.

It ensures a progressive withdrawal from the Service with financial support for the doctors concerned. It demonstrates that the profession has no intention of submitting itself to Government dictation, and is fully prepared to organize an alternative service until such time as it can be certain that the Government is prepared to fulfil its obligations.

Full details about the number and method of selecting the areas to take part in the progressive withdrawal will be announced at the appropriate time.

GENERAL MEDICAL SERVICES COMMITTEE EMERGENCY MEETING

An emergency meeting of the General Medical Services Committee was held at B.M.A. House on March 14 in order to discuss the remuneration claim, and to decide on the advice to be given to the Special Conference to be called in April.

Pointing out that basically he did not consider that the situation had changed at all since the previous meeting, the Chairman, Dr. A. TALBOT ROGERS, said he proposed to speak fairly fully about the meeting which he and Sir Russell Brain had with the Prime Minister.

Meeting With Prime Minister

That the Prime Minister had agreed to see them in such a short time had given considerable satisfaction to the profession, whatever may have been the outcome of the meeting. The fact that for the first time in the history of the negotiations it had been possible to go right to the head of the Government and to have an interview on a friendly and sympathetic basis, without any questions being barred or sidestepped, should not be discounted.

They were also told that registrars and junior hospital staffs were to be offered 10% as from April 1, and that it would be offered immediately without going through the Whitley machinery. No objection was raised to that, said Dr. Rogers, because both Sir Russell Brain and himself took the view that if that limited group were to be given some much-needed relief, the sooner it received it the better, and the advantage of having a definite date on which it started was very considerable. They made it clear that the offer was regarded as being without prejudice to the future claim on behalf of the whole profession. It was probable that in any correspondence there might be between the Joint Consultants Committee and the Ministry, that would be put in black and white.

The Prime Minister was left without any doubt that the special conference would be called in April and would be advised by the Committee what course of action it should take. There was no suggestion that the Prime Minister's offer of an interim settlement was in any way going to influence the Committee in calling the profession together to discuss the whole situation, and to advise strong action unless their rightful demands were settled.

The Chairman took the view that the emphasis had shifted a little, for three weeks earlier Mr. Vosper, the Minister, said that he was not in favour of any arbitration or interim settlement, but the Prime Minister had taken the matter a stage further by saying that an interim settlement was not precluded. It was true that it was vague and did not go very far, because it was not known when and how it would

happen; but at least it was something positive rather than negative. The Prime Minister was seized of the necessity for the Committee to know something more before the April conference, and Dr. Rogers hoped that the Government were in no doubt of the need for not delaying the matter indefinitely.

"I do not see anything in the discussion we had with the Prime Minister that in any way suggests to me that I should say to you that you should delay or alter your plans," continued the Chairman.

Exchange of Views

The Chairman said that it was an unhurried meeting. The Prime Minister was accompanied by Mr. Vosper and one of his private secretaries. There were no civil servants present.

Sir Russell Brain and he had put forward the oft-stated views of the profession that it came into the Service on the basis of Spens, and had believed, until resistance was encountered the previous year, that Spens provided a yardstick on which claims for changes in remuneration could be based. Sir Russell Brain brought in many of the arguments, and the Chairman said that he had taken the line that it seemed particularly unfair on the profession because patience and restraint had been exercised, and they had not come forward, as might well have been the case after the Danckwerts award, to the Government of the day, year by year, and said, "This year we need another 3% or 4% to catch up with the inflation which is taking place." The Prime Minister said he believed that if it had been possible year by year to make an adjustment it might have been easier to do so. That, of course, overlooked the fact that when Mr. Macleod was Minister the profession would have been unlikely to get that year-by-year adjustment.

The Prime Minister pointed to the economic position. Everything possible was being done to stop inflation getting worse. He went on to say of the Spens agreement that it could not be regarded as something akin to the Tablets of the Lord brought down from the mountain and valid for ever and a day. Dr. Rogers said that his reply to the Prime Minister was that the profession was composed of reasonable people, and it was realized that it might be necessary to re-adapt an agreement from time to time after ten years in the light of circumstances. He also pointed out that, until the Royal Commission had sat and until a different form of remuneration had been negotiated, if it were found necessary, there was still reason to hold to Spens, and the position was not altered even although, it was agreed, in any inflationary period it was difficult for any government to pin its obligations for ever.

The opportunity then arose, continued the Chairman, to speak about the terms of reference of the Royal Commission, and to point out that they had given rise to a great deal of disquiet in the profession. They were too restricted and prejudged the issue before the Commission started. The Joint Chairmen stressed the fact that they felt that, before any arbitration or Commission could decide upon what was right and proper so far as amounts of remuneration were concerned, all the different factors which made the profession of medicine very different from other professions had to be taken into consideration. In particular they mentioned the length of time of the doctor's training, the length of time it took the young doctor to establish himself after training, the hours he worked, and so forth, and expressed the view that many of those factors were not admissible under the present terms of reference of the Royal Commission.

The Prime Minister replied that he believed that all the points mentioned, together with others mentioned afterwards, such as the change in the value of money and the validity of the Spens Report, could be brought before the Royal Commission. It was pointed out to him that if that were the case it was not clear to the profession; and the Prime Minister, realizing that those fears were real ones, said he was willing for there to be an exchange of letters between himself, Sir Russell Brain, and the Chairman in

which there would be set out as fully as desirable all the points on which it was considered important to be certain that evidence could be given by the profession. If those points were admissible, he would say so in writing, and would do that with the full knowledge of the Chairman of the Royal Commission. That would materially alter the amount and type of evidence which the profession might be able to give to the Royal Commission.

Public Health Service

The Chairman said that the main discussion then really concluded, but one matter of vital importance came out, which he confirmed later by direct question to Sir John Hawton. It was not intended that the remuneration of any doctors employed in the Public Health Service should be considered by the Royal Commission. The only way in which that particular group of doctors would come in would be as one of the comparable professions, but not as one of the professions whose remuneration the Commission was set up to consider. That, said Dr. Rogers, would be a great disappointment to public health colleagues, who had hoped that their remuneration and future would have been discussed with the remainder of the profession and not as a separate group. It was felt, however, that the inclusion of the public health practitioners' remuneration would bring with it the necessity for so much more discussion and the calling of so much more evidence from other sources that it would inevitably delay the work of the Commission quite considerably.

Finally, the Chairman said he gained the impression from the Prime Minister that, although he was trying to hurry the Commission, it was unlikely that the Commission's work would take less than nine months or possibly a year.

Dr. A. BROWN asked whether in fact the Association or the General Medical Services Committee had yet decided to give evidence. The CHAIRMAN replied that no decision had been taken whether evidence would be given or not.

Dr. S. WAND, Chairman of Council, said he desired to know whether a Commission appointed by Her Majesty had necessarily to have regard to an exchange of letters which were not contained in the terms of reference. He raised the point because it was reported in the press on March 12 that Mr. Vosper, in a written reply, stated that the Royal Commission would normally be concerned with levels of remuneration and not with methods as such. Whether or not questions such as that referred to were within its terms of reference must rest with the Commission itself to decide.

In reply, the CHAIRMAN suggested that Mr. Vosper's written reply was something prepared in advance. Mr. Vosper had been present when the question was raised, and neither he nor the Prime Minister seemed to see any constitutional difficulty in the particular amplification of the interpretation of the terms of reference. As he had understood the Prime Minister, Mr. Macmillan said that if the profession would submit its letter he would consider it in consultation with the Chairman of the Commission and his reply would be made known to the Chairman of the Commission. That being so, one would have thought that it would be adhered to by the Chairman when advising his Commission on what evidence it was able to hear.

Replying to Dr. B. CARDEW, the CHAIRMAN said that Mr. Vosper had agreed that the whole of the Spens arrangement was something pertinent to be put in the letters.

Dr. W. G. HARDING asked whether, in view of the statement contained in the terms of reference of the Royal Commission that all doctors taking any part in the National Health Service should be considered, the point had been taken up with the Prime Minister.

The CHAIRMAN, in reply, said that he saw Sir John Hawton and asked him whether the public health doctors were going to be brought in, and he replied that he thought that the terms of reference had been framed to exclude them. The Chairman pointed out that surely the terms of reference brought in a high proportion of public health officers, to which Sir John replied that it must have been an error.

Dr. W. G. HARDING said that those engaged on the public health side considered themselves to be doctors. "We told you that a week or two ago in our statement of support," he added, "and we would deplore it if we were to be sacrificed on the altar of expediency."

Interim Payment

Dr. F. GRAY suggested that there was nothing which altered the decision that had already been taken, and asked whether a statement could not be made to the effect that the profession was going ahead.

Dr. H. GUY DAIN said it would appear that the Joint Chairmen had come back from their interview with the Prime Minister without an answer to the question when the interim payment would come on and how much it would be.

The CHAIRMAN, in reply, said that the Prime Minister had sidestepped them. It was simple to say straight away that the junior hospital staff should have a 10% increase, but the position of the remainder of the profession was more complicated than that. There had to be further study of it. When the Prime Minister was pressed on when that would be he left little doubt that it would not be before April, but he would not be tied to a definite date. All he would say was, "I shall make a further statement in due course."

It was a fair inference to draw, said the Chairman, that, having fixed 10% for the group which the Prime Minister had all along said was in most need, it was unlikely that he would be thinking in terms of a larger percentage when it came to the remainder of the profession.

Dr. A. MACRAE said that the Prime Minister, when asked in the House whether the terms of reference were sufficiently comprehensive, replied that he thought they were, but that if they were not he would have to do something about it.

Dr. F. M. ROSE asked whether the Prime Minister gave any indication whether, if there were an interim settlement, it would be applied to any particular section of general practitioners, or whether it would be coupled with any conditions in connexion with distribution.

The CHAIRMAN replied in the negative.

Dr. O. C. CARTER recalled the Chairman's opening words that there was little or no change since the last meeting, and said that in his view there was a profound change in the political and economic climate of the country. "I have a feeling," he continued, "that it may affect the attitude of the public towards us unless great care is taken to see that we are not lumped in with engineers and others."

There were two main interests. One was the immediate interest of those doctors who were finding it difficult to carry on at their present level of remuneration, and the second, and more serious, interest was the future of medicine. "I should like to be certain that there is no possibility of selling our heritage for a mess of pottage," said Dr. Carter. "I should be in favour of informing the Government that, although we have no control over its action in appointing a Royal Commission, we are not particularly interested in it because we have an agreement about the methods of fixing the remuneration of doctors." It would be a difficult situation if the profession had to disown the Commission's findings, and it would be better from the beginning for the profession to dissociate itself from it and not give evidence before it.

The CHAIRMAN said it would seem that the Committee had decided that no fundamental change had taken place, and that it had to go forward with its own preparations. (Agreed.)

Recommendations to Conference

The Committee then went on to discuss action to be taken, and the recommendations that it would make to the special conference of local medical committees on April 30. A summary of the Committee's report to the conference, together with its recommendations and the proposed plan for the organization of general practice in the event of withdrawal from the Service, appear in the opening pages of the Supplement.

PUBLIC HEALTH COMMITTEE

EMERGENCY MEETING

An emergency meeting of the Association's Public Health Committee is being held on March 22. The chairman, Dr. J. B. TILLEY, called the meeting to discuss the Government's intention that the remuneration of public health medical officers should not be considered by the Royal Commission. This intention had been confirmed by Sir John Hawton, Permanent Secretary to the Ministry of Health, in answer to a question from Dr. A. T. Rogers, joint chairman of the Negotiating Committee, as reported at page 128 in this Supplement in the proceedings of the G.M.S. Committee. Dr. W. G. Harding, representing the Public Health Committee on the G.M.S. Committee, protested that doctors in the public health service considered themselves doctors, and he told the Committee that they would deplore being separated from their colleagues.

Scottish News

TOUR OF DENMARK FOR SCOTTISH DOCTORS

Doctors in Scotland who are interested in joining the party being formed by the Scottish Committee in response to the Danish Institute's invitation to visit Denmark from August 24 to September 6 should communicate with the Scottish Secretary, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3. The tour will include visits to hospitals, universities, medical departments and institutes, etc., and sightseeing. The cost will be approximately £44, including travel Newcastle-Copenhagen-Newcastle and hotel accommodation.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Doctors or Technicians?

SIR,—As diagnosis should precede treatment, so appreciation of a situation should precede action. Friends of mine who know the new Minister of Health intimately agree in assuring me that he is entirely honest and anxious to do the right thing, the sort of man who might be expected to appreciate the doctors' claim even if he could not quite agree with it. It is therefore important to realize that our claim has been dealt with almost entirely by the Prime Minister. This suggests that wider issues are involved than the medical implications of the Spens agreement. What are they? I attempt a diagnosis without judging the validity of the political issues.

The Prime Minister is known rightly to regard the halting of inflation as of paramount importance. He also—probably rightly from the material point of view—considers that the future of the country depends on developing its scientific resources. As a business man he aims at technical efficiency, though he does not strike one as an expert on personnel management. With these aims, how does he view the doctors' case? Quite simply he is likely to view them as making a large demand on the type of intellectual capacity and scientific training that he is anxious to canalize into technical engineering. From the national point of view he is concerned that medicine, as a whole, should not be so attractive or well paid that, in order to compete with it, the salaries of his new engineers and technicians would have to be raised too high, for this would be immensely inflationary. This I think explains the setting up of the Royal Commission, as I held well before its terms of reference were known.

This view is, I think, confirmed by the composition of the Royal Commission just announced, all of whom are

eminent and most respected people. The chairman is an industrialist in a technically advanced industry. Professor Jewkes is an economist who pulls no punches and whose diagnoses delight from their clarity even when they fail to please from their conclusions. Mrs. Baxter can be expected to look on medicine as one of a number of competing employments. Mr. Bonham-Carter, as a former personnel manager, may have a better idea of personnel and public relations than this Government has shown hitherto. Mr. Gunlake, the actuary, will estimate the long-term results of any increase in doctors' remuneration at least as much as the present implications of Spens—and so one might go through the list. The net result seems to be a business committee to assess the financial result of doctors' pay without any bunkum about professional standards or traditions, for, with the exception of Sir David Hughes Parry, a professor of law, members of any profession are strikingly absent from the Royal Commission.

This, I take it, is the situation we have to face, and if we do not realize it our tactics will be wrong, for we shall be attacking the wrong targets. This letter is too long already to suggest what our action should be, though it is clear that to succeed we must present our claims in terms of national and not sectional interest. The example of the shipbuilding dispute warns us that to "strike" simply in defence of Spens is not the way to win popular support or professional success. The world has changed much in recent years, and we must adapt ourselves to it.

I very much fear that the Royal Commission is so constituted as to imply a "technical" report—i.e., that hospital staff should become a sort of elite, like engineers, and general practitioners be looked on as humbler technicians and paid accordingly. This is what Mr. Bevan thought and planned for, and we are accustomed to seeing Conservatives becoming more Socialist than the Socialists. But I think that in the long run this view will be disastrous to the health of the nation, for, though I have profound respect for our academic brethren, life has to be lived and medicine practised in everyday life, and a good G.P. needs at least as much skill and a lot more *nous* than most of those who teach in the wards. Man is still a person, an individual, and the future of medicine lies in the integration and not the fragmentation of those who practise it. The National Health Service ought to work to this end, and it is a thousand pities that the Prime Minister should have decided to review medical and dental remuneration mainly from the technicological angle and not in the wider context of the whole national health, on which, finally, all economic progress depends.

As I said at the beginning, this letter is only an attempt to assess the situation. It does not affect my belief in the moral validity of Spens until some other basis is reached by agreement and not dictation. I think this could only be reached in a full review of the working of the National Health Service, and I am sure that it would pay the Government and the public to undertake this.—I am, etc.,

Winsford, Cheshire.

W. N. LEAK.

Reform of Health Service

SIR,—From the correspondence in your columns it is becoming increasingly clear that the profession is as worried about the structure of the N.H.S. as about the problem of remuneration. It will therefore be of interest to your many readers who advocate reform of the Service to know that the Fellowship for Freedom in Medicine has under consideration an entirely new plan which it intends to publish within the next few weeks. In addition to embodying many of the suggestions made by your correspondents, this plan will greatly reduce the control of the medical profession by the Government, and it will save the Exchequer a very substantial sum. When the plan is published there will probably be criticisms of points of detail, but we hope the principles upon which it is founded will commend themselves to the profession, and will form the basis of a reformed N.H.S. in which we can work contentedly.

The present Service has shown so many glaring defects that it will have to be drastically altered soon—only the almost unlimited good will of the profession has kept it going till now. The appointment of the Royal Commission with such restricted terms of reference can serve no useful purpose. The amount of remuneration is only one of many things that are wrong with the existing Service: this particular item cannot be taken out from the rest, looked at, and reported on, as if it were separated from the structure and the working of the Service in general.

Meanwhile the Fellowship condemns as strongly as anyone the Government's action in breaking a moral and contractual obligation for the sake of financial expediency. We have been shown more clearly than ever before the dangers of a great profession placing itself so firmly in the clutches of the politicians and why it is imperative that the doctors escape from State domination.—I am, etc.,

E. C. WARNER,
Honorary Secretary,
Fellowship for Freedom in Medicine.

London, W.1.

SIR,—As the son of a G.P. I had a glimpse of a noble profession as it should be practised, and my ambition was, from infancy, to enter it. This I achieved in 1950, only to find in the interim the picture had changed. Now that I have attained years of discretion and some experience in several districts, more than one country, and in at least two branches of the Health Service I would like to voice the opinions which I had no opportunity to form or express before my future was ordained for me.

The present undignified wrangle is but a symptom of a disease contracted in 1948, and even the symptom is misinterpreted by the general public and some doctors. To get back to basic essentials, we took an oath on graduation to serve mankind in the form of our patients. There was no mention of a middle man to accept a premium from those who receive the service and then disburse these funds to those who provide it, in the process regulating how, where, and to what extent this service will be rendered. A minority of the profession are paid a salary to preserve the health of the members of an industrial or a governmental community such as the armed Forces, and to that extent they are "employed." But that does not apply to the profession as a whole. The community is in fact its true employers, appointing and paying both ourselves and the Government who have usurped our patients' authority.

I admit the justice of our present claim and we have probably gone too far to change our main goal, but surely everyone can see that a change in government or even a reshuffle will necessitate a repeat performance within the next few years, Spens and Danckwerts notwithstanding. Let the Royal Commission then sit by all means, but make sure that it deals, not primarily with the remuneration issue but with complete reform of the structure of the National Health Service. In fact, the Royal Commission is a step in the right direction in so far as it represents the people of the country rather than the Government. Does a shop-keeper negotiate his prices, his place of business, or his selling methods with anyone but those who buy his wares?

The man in the street will still want his free medical care, and the improvident among us will not take out a voluntary insurance policy to guard against the eventuality of illness. Apart from employers deducting premiums from wages, which is a return to compulsion, the only alternative is a scheme similar to that in operation in Australia with which I have had a fleeting acquaintance. As I understood it the Government paid a subsidy of approximately 45% of the cost of hospitalization, and provided all life-saving drugs free, including insulin, antibiotics, cortisone, etc. This was available to everyone without charge or means test, although these hospitalization costs were calculated on the cost of a bed in a public ward. Intermediate and private bed extras were met by the patient. At least another 45% of in-patient treatment costs could be met by joining a medical insurance organization, one of which was run by the B.M.A., or at least closely connected with the Australian Association.

Private bed extras could be met by paying a slightly higher premium. These ranged from 1s. 6d. to 3s. 6d. per week roughly, and covered a man and his family for almost all medical expenses, including general practitioner, consultant, and ancillary services. In addition the Government chipped in for these latter costs if the patient was a member of such an insurance fund.

Among the advantages of the Australian scheme are the following. The patient passes money direct to the person who renders the service and then claims from the insurance company. He realizes there is a financial obligation on his part and that medical attention is not just something to be turned on like a tap. The insurance company deals with the patient only; there is no one between the patient and his medical attendant. Doctors can raise their fees when necessity arises without reference to any higher authority.

That is an outline of a scheme I saw working with all participants reasonably content. I strongly urge the B.M.A. to approach our antipodean colleagues for full details, and with these in hand ascertain the reaction of the major insurance companies. Let the Royal Commission proceed and make sure that the whole issue and the alternative plans are placed before it as eloquently and forcefully as possible.—I am, etc.,

Edinburgh, 9.

T. F. SANDEMAN.

Woman Consultant for Women's Hospital

SIR,—You kindly published a letter (*Supplement*, February 9, p. 62) from four male practitioners, telling of an appeal by the Southern Hospitals Group Board of Management to the Secretary of State for Scotland against the decision of the Regional Hospital Board to group the vacancies for a consultant physician in four hospitals in Edinburgh into one appointment. The letter gave reasons why it is thought that two of the hospitals should continue to have a woman physician, as this is what the patients obviously want, and pointed out that this not only expressed the view of the Southern Hospitals Group Board of Management but had the support of the regional consultants and specialists committee, the local medical committee (representing the men and women general practitioners of Edinburgh), the Medical Women's Federation, the Edinburgh Association of University Women, the Soroptimist Club, Co-operative Women's Guilds, Townswomen's Guilds, and many other bodies. To ascertain the opinion of the general public a petition to the Secretary of State for Scotland was started and was signed in the course of a few weeks by 28,000 people, representing men and women from all walks of life.

The reply from the Secretary of State for Scotland (*Supplement*, March 16, p. 116) was unsatisfactory, and it implies that those who are pressing for a woman to be appointed at the two women's hospitals are prepared to have a woman at any cost, whether her experience and qualifications were suitable or not. This cannot be contradicted too strongly; the women doctors themselves have always recognized the necessity for holding the highest qualifications and experience.

Having worked for an international women's association, I have had the opportunity of stating with pride that in our country not only do we have equal pay but, on the whole, we have also equal opportunities—more equal, I believe, than in any other country. We cannot but be aware, however, that there are still occasions when the woman has to have definitely higher qualifications to be successful in obtaining an appointment. In this case, if the vacancies in the four hospitals are put together, two of the hospitals will never have had a woman physician on their staff. This fact, together with the knowledge that the male applicants will greatly outnumber the female, makes one feel that the scales will be seriously weighted against a woman being appointed. It is for these reasons that such an enormous and important body of opinion, both professional and lay, is supporting the Southern Hospitals Group Board of Management in the stand it is making.—I am, etc.,

London, N.W.8.

JANET K. AITKEN.

SIR,—I refer to the recent decision of the Secretary of State for Scotland "not to interfere" with the South-eastern Regional Board's proposal to combine the consultant physician charges at the four hospitals of the Southern Hospitals group in Edinburgh into one appointment (*Supplement*, March 16, p. 116): by which proposal the two women's hospitals of the group (Bruntsfield Hospital and Elsie Inglis Maternity Hospital) may lose their traditional character of being women's hospitals staffed entirely by women, the proposed new appointment being open to a consultant of either sex.

When a governmental body makes an unpopular decision and adheres to that decision in the face of popular protest, one usually finds that the desires or needs of one section of the community are sacrificed to satisfy the desires or needs of the country as a whole. There is, however, no such justification for the Secretary of State for Scotland's recent decision to refuse the appeal of the Southern Hospitals Group Board against the Regional Board's proposal. Indeed, in the face of the widespread, vigorous, and unanimous public protest expressed in this region it seems hard to understand what reason could be advanced sufficiently overwhelmingly for this appeal to be refused. Since the Regional Board's announcement was made there has not been a single expression of public opinion in its favour.

I, as a general practitioner, make use of every single hospital in Edinburgh, and I, for one, would be very sorry to see Bruntsfield and Elsie Inglis Hospitals lose their present character, or indeed the other hospitals of the group, the Deaconess and Longmore Hospitals. To me, one of the greatest assets of all four hospitals as at present staffed is that one knows one's patients will really be seen by the consultant to whom one sends them. The combination of all the medical consultant work at the four hospitals into one single charge will, it is said, enable a better service to be offered. In my view this would be both difficult and unlikely. Uniformity leads more often to mediocrity than to the heights of achievement (how many examples of this could one quote), and the chief sufferers would be the public, who, after all, pay for their hospitals and whose voices should not go unheard.—I am, etc.,

Edinburgh, 7.

P. M. M. ORR PATERSON.

Value of Obstetric Lists

SIR,—As the G.P. stands so much at the cross-roads, one is prompted to ask if any real value is placed upon the appointment of a practitioner to an executive council's obstetric list other than financial. My reason for raising this query is that I felt recently that I would like to prepare myself to sit for one of the lesser diplomas in obstetrics, having been on the special obstetric list for some nine years, the object being to stimulate study and keep abreast with modern trends. To my surprise I was informed that my nine years' service on the special obstetric list was of no import and that I was required to have held a resident appointment in obstetrics for six months. Now, as I qualified during the war and went into the Forces almost immediately, I am excluded from sitting for what I take to be a great stimulus to an obstetrician practitioner. But the more important question, beyond my natural disappointment, is the fact that the bodies who make these awards count more reliance on a six months' resident appointment than years of service on an obstetric list with all its many and difficult implications. This being so, one must ask, is there any real need for a special list and if so just where in the academic field must it be placed?—I am, etc.,

Shipley, Yorks.

J. A. FRAIS.

Present Crisis

SIR,—While listening to the views of Mr. Frank Cousins ("Any Questions?", B.B.C.) I wondered if any approach, official or unofficial, had been made to the trade union movement in our present impasse? Even the moral support of such a large organization would, I feel, be of great

benefit to us at the present time, and its views of and support for the alternative scheme would be of value to us in our relationship with the public when such a scheme came into operation.—I am, etc.,

Dalry, Ayrshire.

W. M. WILSON.

Remuneration Claim

SIR,—Dr. R. R. Charlwood (*Supplement*, March 16, p. 119) is, I am sure, quite right in believing that there are many young G.P.s who, thinking along much the same lines as he does, have not the slightest intention of withdrawing from the Health Service on the issue of the 24% pay claim. The Government has, it appears to me, behaved very badly in refusing arbitration, and it is tempting to try to teach it a lesson; the fact remains, however, that there are aspects of the structure of the Health Service which are far more damaging to the practice of good medicine than the lowered incomes of the doctors who work in it. The most serious are, perhaps, the involvement of the Service in day-to-day politics, and the fact that the doctor who puts money into improving the efficiency of his practice suffers for it financially. (The settlement of the present claim would not solve this problem, to which it is irrelevant.) I would be willing to contemplate resignation, and even to see my patients suffer some temporary hardship as a consequence, if there were any question of a better Health Service emerging from the upheaval. But to resign on the narrow issues of the present claim seems to me neither good ethics nor good sense.—I am, etc.,

Biddenden, Kent.

J. E. C. TOWER.

SIR,—In your leading article (*Journal*, March 9, p. 569) you say that "no one is so conscious of the present defects of the N.H.S. as those doctors working in it; and the greatest of all defects is the intervention of the party politician between patient and doctor." I think this statement needs clarification, so that the medical profession and the general public may know what this intervention is and how it acts adversely.

You then go on to say: "Unfortunately there is no other way of bringing home to public and Parliament the present profound distrust of the profession with its employer than by action such as that recommended." As far as one can see, action is contemplated at the present time purely on the request for more remuneration.—I am, etc.,

Margate.

G. L. BROCKLEHURST.

SIR,—It is most devoutly to be hoped that our negotiators will not be put off by Mr. Macmillan's hint of an interim rise of pay. It may well be merely a trick to ensure further delay. I would earnestly suggest that two well-trying sayings be borne in mind, one, perchance influencing the Prime Minister—namely, "Divide and rule"—and the other that will, I hope, influence our own people—"Once bitten, twice shy."—I am, etc.,

Thame, Oxon.

C. H. BARBER.

SIR,—I am a practitioner with a list a little below the average, and the question of increased remuneration is becoming one of urgent necessity. It is, however, of paramount importance that our negotiators should make perfectly clear precisely what they hope to achieve. There has been much talk of Spens and a percentage increase but not one word about how the additional money is to be distributed. If it is an increase in the capitation fee which is envisaged, then I am certainly not prepared to join in a mass resignation. Such an award would be a retrograde step and would merely increase the inequity which is inherent in the present distribution of the pool.

The total amount of the pool includes a sum for practice expenses, and this is distributed as a proportion of the capitation fee. Thus a practitioner with a list of 3,000 receives three times as much as one with a list of 1,000. Since most practice expenses are basic and do not vary

with the size of the list except, perhaps, petrol consumption, it is clear that practices with a large list are overpaid and that those with a small list are underpaid. There would be some relief of hardship if practice expenses were paid direct, even at a flat rate and the balance as capitation fees. This could be done now without any increase in the total remuneration while we await the findings of the Royal Commission.—I am, etc.,

Edinburgh. 10.

D. S. COWNIE.

Acknowledgment of Applications

SIR,—The following cyclostyled circular from the secretary of a group hospital management committee was received by my house-surgeon in acknowledgment of his application for a house-physician job:

"With reference to your application for the post of house-physician I will let you know in due course if you are required for interview."

Such an abrupt circular is becoming all too frequent as the sole response many candidates get for their trouble. Personally I would have expected a more courteous reply, even if the application had been for that of a lavatory attendant, but no doubt such is the status of the profession to-day that doctors can no longer expect even perfunctory thanks for the tendering of their services.—I am, etc.,

Carmarthen.

A. HENRY MILLARD.

Improving Maternity Care

SIR,—The memorandum of evidence of the Royal College of Midwives (*Supplement*, March 2, p. 100) stated sound, but incomplete, views. I am equally certain that to raise the standard of hospital maternity care all hospital practitioners should be required to have periodic postgraduate experience of domiciliary midwifery under the supervision of suitable general-practitioner obstetricians.

From the reports of patients and personal observations it seems that in some maternity hospitals the technical aspect of midwifery may be quite satisfactory. Unfortunately, however, the treatment on the humanitarian side can only too often be described as primitive. I am sure a two-way exchange is a more sensible and satisfactory answer to our mutual desire to improve all aspects of midwifery.—I am, etc.,

Birmingham. 26.

J. D. LACON.

Royal Commission and Public Health Doctors

SIR,—Although public health medical officers are not parties to the present remuneration claim, they are well represented on the Negotiating Committee with a watching brief. Their public announcement of whole-hearted support (*Supplement*, March 2, p. 100) was well received both by the Negotiating Committee and the General Medical Services Committee.

At the meeting with the Minister on February 20 it was made plain to us that the Royal Commission would cover the public health service. Mr. Vosper, the Minister, said: "We hope it will go wider to include doctors in local authority employment and the dental profession." In addressing the G.M.S. Committee (p. 97) next day, Dr. Talbot Rogers referred to this extension of the remit to the Royal Commission. In my own report of the proceedings at the Ministry I said that apart from the offer to junior hospital officers the only satisfactory thing was that public health officers would be considered in the constellation of medicine and not in the constellation of N.A.L.G.O.

While there is no doubt that this extension of the remit would be a delaying factor, nevertheless the later report of the meeting between the Prime Minister and Joint Chairmen shows further evidence of confused thought and indecision on the part of the Government, as public health officers will no longer be the concern of the Commission.—I am, etc.,

Walsall.

A. B. DAVIES.

BRITISH MEDICAL GUILD

Meetings to be Held

KINGSTON-ON-THAMES.—At the Griffin Hotel, Market Place, Kingston-on-Thames, Tuesday, March 26, 8 for 8.30 p.m.

Association Notices

SPECIAL REPRESENTATIVE MEETING

Notice is hereby given that on the requisition of the Council a Special Representative Meeting of the British Medical Association will be held in the Great Hall, B.M.A. House, Tavistock Square, London, W.C.1, on Wednesday, May 1, 1957, at 10 a.m. The business of the meeting is to consider a report and a recommendation of the Council concerning the further action to be taken by the Association in the present dispute with the Government on medical remuneration.

By Order of the Chairman of the Representative Body.

A. MACRAE,
Secretary.

AREAS OF BARNET AND WEST HERTFORDSHIRE DIVISIONS

Notice is hereby given by the Council to all concerned that as from the date of this notice the area of the Civil Parish of Elstree is transferred from the West Hertfordshire Division to the Barnet Division.

A. MACRAE,
Secretary.

Diary of Central Meetings

MARCH

27 Wed. Council, 10 a.m.
29 Fri. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.

APRIL

9 Tues. Conference of Advisory Councils on Occupational Health, 12 noon.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH.—At Royal United Hospital, Bath, Wednesday, March 27, 8.30 p.m., meeting. Dr. H. Yelloweas: "Command Performances."

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, March 29, 8.15 p.m., meeting. Address by Mr. H. J. B. Atkins: "Research into the Virus Aetiology of Cancer."

DARTFORD DIVISION.—At Black Prince Hotel, Bexley, Wednesday, March 27, 8 p.m., annual dance for members, their wives, and guests.

DUNDEE BRANCH.—At Queen's Hotel, Nethergate, Dundee, Friday, March 29, 8.45 p.m., joint meeting with East of Scotland Branch, Pharmaceutical Society. Lecture and films by Dr. J. F. Merry: "Cortisone and Derivatives."

EASTBOURNE DIVISION.—At Princess Alice Memorial Hospital, Eastbourne, Friday, March 29, 8.30 p.m., meeting.

LANCASTER DIVISION.—At King's Arms Hotel, Lancaster, Tuesday, March 26, 8.30 p.m., general meeting.

MID-ESSEX DIVISION.—At Council Chamber, County Hall, Chelmsford, Wednesday, March 27, 8.15 p.m., meeting. Guest speaker, Sir Heneage Ogilvie: "Problem of the Education of the Public on Cancer."

NORTH WALES BRANCH.—At Powis Hall, University College, Bangor, Saturday, March 30, 3 p.m., spring meeting. Symposium on Toxaemia of Pregnancy by the staff of St. David's Hospital, Bangor.

ST. HELENS DIVISION.—At Providence Hospital, Wednesday, March 27, 8.30 p.m., annual general meeting.

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, March 28, 8.30 p.m., annual general meeting.

SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Wednesday, March 27, 8.30 p.m., special meeting.

SOUTH BEDFORDSHIRE DIVISION.—At Warden Tavern, Luton, Friday, March 29, 8 p.m., annual dinner dance.

STOCKPORT DIVISION.—At the Guildhall, Stockport, Friday, March 29, 7.45 for 8.30 p.m., first annual dinner. Guest speakers, Dr. W. J. S. Reid, Dr. E. A. Gerrard, Dr. Miles Parkes, and Mr. W. Rees. Each member is invited to take one guest (medical or non-medical).

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, March 29, 3 p.m., clinical meeting.

WARRINGTON DIVISION.—At New Fir Grove Hotel, Latchford, Without, Wednesday, March 27, 9 p.m., buffet dance.

WOOLWICH DIVISION.—At Woolwich Memorial Hospital, Shooters Hill, S.E., Tuesday, March 26, 8.30 p.m., meeting. Address by Dr. N. R. Mackay: "Radioactive Isotopes."

ANNUAL MEETING—NEWCASTLE UPON TYNE, JULY 10-19, 1957

President-Elect : WELDON WATTS, A.F.C., M.S., F.R.C.S., 21, Lyndhurst Road, Benton, Newcastle upon Tyne, 12.
Local General Secretary : G. W. ANDERSON, M.B., B.S., Department of Pathology, Royal Victoria Infirmary, Newcastle upon Tyne, 1 ; J. I. MUNRO BLACK, M.D., M.S., F.R.C.S., 47, Clayton Road, Jesmond, Newcastle upon Tyne, 2.
Science Secretaries : IAN RANNIE, M.B., Ch.B., M.S., F.R.C.S., 47, Clayton Road, Jesmond, Newcastle upon Tyne, 1 ; J. I. MUNRO BLACK, M.D., M.S., F.R.C.S., 47, Clayton Road, Jesmond, Newcastle upon Tyne, 2.
Executive Clerk : Miss B. E. MIDDLEMISS, B.M.A. House, Tavistock Square, London, W.C.1.

PROVISIONAL PROGRAMME

The 125th Annual Meeting of the British Medical Association will be held in Newcastle upon Tyne from Wednesday, July 10, to Friday, July 19, inclusive.

The Annual Representative Meeting will be held in the City Hall; it will begin on Wednesday, July 10, and will continue on Thursday, Friday, Saturday, and Monday, July 11, 12, 13, and 15.

On the evening of Tuesday, July 9, there will be a Cock-tail Party for Representatives and their Ladies, arranged by the Newcastle upon Tyne Division, with the co-operation of the North of England and the Tees-side Branches. This will be held in the Old Assembly Rooms.

A combined Dinner for Representatives and their Ladies will take place at the Old Assembly Rooms on Thursday, July 11, followed by a Dance.

The Overseas Luncheon has been arranged for Friday, July 12, at 1 p.m. in the Old Assembly Rooms.

On Sunday, July 14, there will be three excursions: (1) All-day excursion to the Roman Wall which will be accompanied by guides from the Department of Roman-British Archaeology, King's College, University of Durham. (2) All-day trip to the Farne Islands. (3) Half-day excursion to Durham Cathedral. In the evening a Symphony Concert, sponsored by Abbott Laboratories Ltd., will be given in the City Hall.

The Adjourned Annual General Meeting and President's Address will take place in the City Hall on the evening of Monday, July 15, and the President's Reception which follows will be held in the Old Assembly Rooms.

The Annual Scientific Meeting and associated functions occupy the period from Monday, July 15, to the evening of Friday, July 19.

The Official Religious Service will be held in St. Nicholas' Cathedral on the afternoon of Tuesday, July 16. The address will be given by the Right Reverend the Lord Bishop of Durham.

There will be a Roman Catholic Service at 11.30 a.m. on Saturday, July 13, at St. Mary's Cathedral.

A Jewish Service will be held on Saturday, July 13, at 10 a.m. at the Leazes Park Road Synagogue.

The Annual Dinner of the Association will be held in the Old Assembly Rooms on Tuesday, July 16.

There is to be a full social programme, including a Civic Reception on Wednesday evening, July 17, and a University Reception on Thursday evening, July 18.

The Annual Breakfast of the Christian Medical Fellowship will be held on Tuesday, July 16, at 8.15 a.m.

Several special visits and excursions are being arranged for ladies accompanying members.

The usual Golf Competitions will take place on July 17 and 18.

The Overseas Conference will be held in the afternoon of Wednesday, July 17.

The Reception Bureau for Registration will be open in the Stephenson Buildings, King's College, on Monday, July 15, at 9 a.m.

From July 15 to 19 there will be a programme of surgical operations and clinical demonstrations in the Royal Victoria Infirmary shown by colour television on a closed circuit. The technical arrangements will be sponsored by Smith, Kline and French Laboratories Ltd. (see p. 138).

Three Plenary Scientific Sessions have been arranged as follows: Wednesday, July 17, at 10 a.m., subject "The Management of Hypertension"; Thursday, July 18, at 2.30 p.m., subject "The Present Status of Prophylactic Immunization"; Friday, July 19, at 9.30 a.m., subject "Care of the Dying."

In addition, three Round-Table Conferences will be held concurrently on Wednesday, July 17, from 9 to 9.45 a.m. The nineteen Scientific Sections will hold meetings, including a special session of the Sections of Obstetrics and

Gynaecology and of General Practice on "Obstetrics and General Practice" to be held on Monday, July 15, at 3 p.m. (Details are given below.)

The Scientific Exhibition will be held in the Stephenson Buildings and will be open daily on July 15 to 19; a wide field of medical interests will be covered. Further details will be published later.

The Annual Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications will also be in the Stephenson Buildings. The Exhibition will be open from 9 a.m. to 6 p.m. on July 15 to 19.

The Ladies' Club will be situated in the Medical School, King's College, and will be open throughout the Meeting.

HOTEL ACCOMMODATION

The following is a preliminary list of hotel accommodation available in Newcastle upon Tyne and district. Members wishing to reserve accommodation are asked to write direct to the hotel, stating that they are attending the B.M.A. Meeting. The Association cannot accept responsibility for any of the prices stated below. These are the tariffs ruling at the moment and are subject to alteration without notice. Applicants should therefore verify the tariffs when making their reservations. Early application for accommodation is recommended. For hostel accommodation all requests should be made to the Executive Clerk, B.M.A. House, London, W.C.1, and not direct to the hostel.

CARAVAN PARK

Arrangements have been made at Newcastle for a special caravan site for members attending the annual meeting with their caravans. The site will be at King's College Athletic Union Ground, Cochrane Park, Newcastle upon Tyne, 6. Apart from a limited amount of hard standing and some on rough grass, there will be facilities for obtaining water and disposing of refuse. Hot and cold washing facilities and showers, with dressing-rooms and drying-rooms, will be available in the pavilion, where there will be a children's playroom and light refreshments can be ordered. The site, which is near Henderson Hall, one of the hostels of the University of Durham, is close to shops and a frequent bus service into the centre of the town.

Applications for space should be made in advance to Dr. W. Hunter, c/o B.M.A., North of England Branch Office, 7, Windsor Terrace, Newcastle upon Tyne, 2, stating name and address, registration number of car, and date of arrival and departure. The charge is 6s. a night, which must be paid at the time of application. Alternative accommodation is available for Caravan Club Members at Whitley Bay Club site on the sea front at Old Hartley, 10 miles from Newcastle.

REGULATIONS REGARDING DRESS

Academic Dress is to be worn at the President's Address, the President's Reception, the Official Religious Service, the Roman Catholic Service, the Civic Reception, and the University Reception.

Robes may be hired from Messrs. Ede & Ravenscroft, Ltd., 93, Chancery Lane, London, W.C.2, or Messrs. Gray & Son (Robemakers), Ltd., Saddler Street, Durham. Early application is advised, as the supply of gowns is limited, and it is suggested that the gowns be sent to the home address of the individual concerned. It is hoped to have a representative of the local robemakers available at the University during the Annual Meeting.

Evening Dress (Tails or Dinner Jacket), with Decorations, is to be worn at the President's Reception, Civic Reception, University Reception, and Annual Dinner. Evening Dress without Decorations should be worn at the Representatives' Dinner and the Representatives' Dance.

TICKETS

No tickets for functions or excursions can be issued in advance, with the exception of the Annual Dinner (details of which are given below).

All tickets for functions up to Sunday, July 14, will be available for Representatives at the A.R.M. Inquiry Office, City Hall Entrance, on July 9, 10, 11, 12, and 13, and for ladies at the Ladies' Club, Medical School, King's College.

Tickets for all other functions after Sunday, July 14, will be available from Monday, July 15, at the Reception Bureau, Stephenson Buildings, or at the Ladies' Club.

ANNUAL DINNER

Special Notice

The Annual Dinner in Newcastle upon Tyne this year will take place on Tuesday, July 16, in the Old Assembly Rooms. This follows the successful innovation made in Brighton last year, when the Dinner was held on the Tuesday instead of the Thursday as had been customary in the past. The maximum number which the room can take is 350. Arrangements for advance booking will be announced in a later issue of the Supplement.

EDINBURGH GRADUATES' DINNER

The Edinburgh Graduates' Dinner will be held in the Royal Station Hotel, Neville Street, Newcastle upon Tyne, on Saturday, July 13, at 7 for 7.30 p.m. All Edinburgh graduates attending the A.R.M., or resident in the area, together with their ladies and guests, will be welcome.

Tickets (25s. each, exclusive of wines) may be had on application, with remittance, to Dr. E. R. C. Walker, 7, Drumsheugh Gardens, Edinburgh, 3.

GLASGOW GRADUATES' DINNER

The Glasgow Graduates' Dinner will be held in the Britannia Rooms, Tilley's Restaurant, Newcastle upon Tyne, on Saturday, July 13, at 7.45 for 8.30 p.m. The dinner is open to Glasgow graduates who are attending the Annual Meeting, their ladies, and guests. Tickets will cost 30s. each, including cocktails, but excluding wines. Numbers are limited to 120, and early application, with appropriate remittance, should be made to Dr. J. T. McCutcheon, British Medical Association, Glasgow Regional Office, 234, St. Vincent Street, Glasgow, C.2. (Dress—Dinner Jackets.)

WELSH DINNER

The Welsh Dinner will be held at the Royal Turk's Head Hotel, Grey Street, Newcastle upon Tyne, at 7.30 p.m. on Friday, July 12. All Welsh Representatives, accompanied by their ladies, will be welcome at this dinner. Tickets, 25s. each (exclusive of wines), may be obtained on application, with remittance, to Dr. I. M. Jones, 3, Parkside, East Herrington, Sunderland.

CHRISTIAN MEDICAL FELLOWSHIP ANNUAL BREAKFAST

The Annual Breakfast of the Christian Medical Fellowship will be held in the Banqueting Hall of the Royal Station Hotel, Newcastle upon Tyne, on Tuesday, July 16, at 8.15 a.m. The Chairman will be Mr. Weldon Watts (President-Elect of the B.M.A.) and the speaker will be Dr. Robert G. Cochrane, Adviser in Leprosy, Ministry of Health; Consulting Leprologist, Tropical Diseases Hospital, St. Thomas's Hospital, and St. John's Hospital; formerly Principal and Director of Christian Medical College, Vellore. The proceedings will terminate at 9.15 a.m. Those intending to be present are asked to notify Dr. W. Condie, Pierremont, 36, Sunderland Road, Heworth, Gateshead, 10, Co. Durham.

GUILD OF SS. LUKE, COSMAS AND DAMIAN

There will be a Mass for Catholic doctors attending the B.M.A. Meeting at St. Mary's Cathedral (opposite the Central Station), Clayton Street, Newcastle, at 11.30 a.m. on Saturday, July 13. An address will be given by the Very Rev. G. P. Dwyer, D.D., Ph.D., Catholic Missionary Society. Academic Dress will be worn, and robing will take place in the County Hotel. Following this there will be a reception and luncheon in the County Hotel (also opposite the Central Station). Members and wives will be welcome. Tickets, price 8s. 6d., may be obtained from the A.R.M. Inquiry Office.

SCIENTIFIC MEETING

PLENARY SESSIONS IN CHEMISTRY LECTURE THEATRE, KING'S COLLEGE

Wednesday, July 17, 10 a.m.: "The Management of Hypertension"

Chairman: Professor MAX L. ROSENHEIM (London).
Speakers: Dr. ROBERT COOPE (Liverpool); Professor JOHN McMICHAEL (London); Mr. E. G. TUCKWELL (London); Dr. JOHN H. HUNT (London).

Thursday, July 18, 2.30 p.m.: "The Present Status of Prophylactic Immunization"

Chairman: Sir JOHN CHARLES (London).
Speakers: Professor R. CRUICKSHANK (London); Dr. J. GRANT (Gateshead); Dr. T. FRANCIS, jun. (Michigan, U.S.A.); Professor C. H. STUART-HARRIS (Sheffield); Dr. P. M. D'ARCY HART (London).

Friday, July 19, 9.30 a.m.: "Care of the Dying"

Chairman: Dr. T. H. BATES (Newcastle upon Tyne).
Speakers: Dr. I. D. GRANT (Glasgow); Professor A. G. R. LOWDON (Newcastle upon Tyne); Mr. C. J. L. THURGAR (Newcastle upon Tyne); Dr. R. BODLEY SCOTT (London); The LORD BISHOP OF DURHAM.

SCIENTIFIC SECTIONS

All sessions will be held in the Stephenson Buildings, King's College. Morning sessions are from 9.30 a.m. to 12 noon, and afternoon sessions from 2.30 to 5 p.m.

MEDICINE

President: Professor F. J. NATTRASS, M.D., F.R.C.P. (Newcastle upon Tyne).

Vice-Presidents: C. N. ARMSTRONG, M.D., F.R.C.P. (Newcastle upon Tyne); H. G. MCGREGOR, M.D., M.R.C.P. (Brighton); J. G. SCADDING, M.D., F.R.C.P. (London).

Hon. Secretaries: GORDON F. EDWARDS, M.B.E., M.B., M.R.C.P., 1, Park Crescent, Roundhay, Leeds, 8; R. B. THOMPSON, M.D., M.R.C.P., The Medical School, King's College, Newcastle upon Tyne, 1.

Tuesday, July 16.—Morning. Combined session with Sections of Surgery, Cardiology, and Radiology, on Arterial Embolism. General introduction, Dr. WILLIAM EVANS (London); Diagnosis of Limb Embolism, Sir JAMES LEARMONTH (Edinburgh); Radiological Aspects (speaker to be announced later); Surgical Treatment, Professor CHARLES ROB (London); Cerebral Embolism, Dr. H. A. DEWAR (Newcastle upon Tyne); Long-term Anticoagulant Therapy, Dr. CATHERINE C. BURT (Edinburgh).

Wednesday, July 17.—Afternoon. Cortisone in General Practice: Speakers will include Professor G. A. SMART (Newcastle upon Tyne) and Dr. R. B. THOMPSON (Newcastle upon Tyne).

SURGERY

President: A. DICKSON WRIGHT, M.S., F.R.C.S. (London).
Vice-Presidents: Professor DIGBY CHAMBERLAIN, Ch.M., F.R.C.S. (Leeds); HAROLD C. EDWARDS, C.B.E., M.S., F.R.C.S. (London); JOHN GILMOUR, M.S., F.R.C.S. (Newcastle upon Tyne); GEORGE A. MASON, V.R.D., F.R.C.S. (Newcastle upon Tyne).

Hon. Secretaries: DAVID TIBBS, M.C., F.R.C.S., River House, Wylam, Northumberland; J. F. R. WITCOMBE, M.Chir., F.R.C.S., 22, Parkside, Cambridge.

Tuesday, July 16.—Morning. Combined session with Sections of Medicine, Cardiology, and Radiology on Arterial Embolism.

Wednesday, July 17.—Afternoon. Combined session with Section of Radiology on Radiological Investigation of the Biliary Tract: Dr. SCOTT PARK (Glasgow), Mr. DUDFIELD ROSE (Newcastle upon Tyne), Dr. J. D. DOW (London), Mr. DICKSON WRIGHT (London).

Thursday, July 18.—Morning. The Diagnosis and Treatment of Carcinoma of Stomach: Clinical Aspects in Diagnosis, Mr. JOHN GILMOUR (Newcastle upon Tyne); Radiology, Dr. G. A. S. LLOYD (London); Gastroscopy, Mr. HERMON TAYLOR (London); Exfoliative Cytology, Dr. R. O. K. SCHADE (Newcastle upon Tyne); Treatment, Professor DIGBY CHAMBERLAIN (Leeds). Late afternoon. Exposure Treatment of Burns in Bagdad: Professor W. E. M. WARDILL (Bagdad).

OBSTETRICS AND GYNAECOLOGY

President: Professor H. HARVEY EVERS, M.S., F.R.C.S., F.R.C.O.G. (Newcastle upon Tyne).

Vice-Presidents: Professor W. I. C. MORRIS, F.R.C.S.Ed., F.R.C.O.G. (Manchester); Professor W. C. W. NIXON, M.D., F.R.C.S., F.R.C.O.G. (London); FRANK STABLER, M.D., F.R.C.S., F.R.C.O.G. (Newcastle upon Tyne); JOHN STALL-WORTHY, F.R.C.S., F.R.C.O.G. (Oxford).

Hon. Secretaries: WILFRID MILLS, T.D., F.R.C.S., M.R.C.O.G., 99, Harborne Road, Edgbaston, Birmingham, 15; LINTON SNAITH, M.D., M.S., F.R.C.S., F.R.C.O.G., 2, Osborne Villas, Newcastle upon Tyne, 2.

Monday, July 15.—Afternoon. Combined session with Section of General Practice. Pre-eclampsia: Mr. O. V. JONES (Bangor), Dr. CATHERINE HARROWER (Glasgow), Dr. JOHN FISHER (Abingdon). General-practitioner Responsibility in Gynaecology: Mr. J. K. RUSSELL (Newcastle upon Tyne), Dr. A. J. GRAY NEWTON (Broomhill, Northumberland), Dr. A. DESMOND STOKER (Winster, Derbyshire).

Tuesday, July 16.—Morning. Placental Insufficiency: Dr. G. T. JOHNSON (Newcastle upon Tyne). Prolonged Labour: Professor W. C. W. NIXON (London), Dr. ALISTAIR GUNN (London), Professor A. S. DUNCAN (Cardiff). Unusual Uses of the Flying Squad: Mr. FRANK STABLER (Newcastle upon Tyne), Dr. ROBERT TENNENT (Glasgow).

Wednesday, July 17.—9 a.m. Round-table Conference: Some Causes of Public Alarm and Anxiety; Irradiation in the Antenatal Period; Rubella and Virus Infections; Rh Interreaction. Chairman, Professor HARVEY EVERS. Afternoon. Combined session with Sections of Child Health and Preventive Medicine on Puberty and Its Problems: Dr. T. N. MACGREGOR (Edinburgh), Professor LESLIE BANKS (Cambridge), Dr. D. V. HUBBLE (Derby).

ANAESTHETICS

President: H. H. PINKERTON, M.B., F.R.F.P.S., F.F.A.R.C.S. (Glasgow).

Vice-Presidents: R. P. HARBORD, M.D., F.F.A.R.C.S., D.A. (Leeds); JOAN MILLAR, M.D., F.F.A.R.C.S., D.A. (Newcastle upon Tyne), Professor E. A. PASK, O.B.E., M.D., F.F.A.R.C.S. (Newcastle upon Tyne).

Hon. Secretaries: J. A. G. HORTON, M.B., D.A., Department of Anaesthesia, Royal Victoria Infirmary, Newcastle upon Tyne, 1; CYRIL F. SCURR, M.V.O., M.B., F.F.A.R.C.S., D.A., Department of Anaesthetics, Westminster Hospital, London, S.W.1.

Wednesday, July 17.—Afternoon. Deaths Related to Anaesthesia: Introduction and General Aspects of the Problem, Dr. JOHN GILLIES (Edinburgh); Anaesthesia for Patients with Intestinal Obstruction, Dr. H. J. V. MORTON (London); Anaesthesia for Emergency Obstetrics, Dr. W. D. WYLIE (London); Anaesthetic Fatalities in Relation to the Use of Relaxant Drugs, Dr. A. R. HUNTER (Manchester).

Thursday, July 18.—Morning. Barbiturate Toxicity and Coma: Treatment of Barbiturate Poisoning without Convulsant Drugs, Dr. ERIC NILSSON (Lund, Sweden); Experimental Evaluation of Bemegride, Dr. T. J. THOMSON (Glasgow); Abnormal Responses to Barbiturates, Dr. J. W. DUNDEE (Liverpool); Clinical Experience with Buthalitone Sodium, Dr. P. H. SIMMONS (London); General discussion opened by Dr. B. R. M. JOHNSON (London).

CARDIOLOGY

President: Professor J. CRIGHTON BRAMWELL, M.D., F.R.C.P. (Manchester).

Vice-Presidents: OSCAR BRENNER, M.D., F.R.C.P. (Birmingham); H. A. DEWAR, M.D., F.R.C.P. (Newcastle upon Tyne); WILLIAM EVANS, D.Sc., M.D., F.R.C.P. (London); W. G. A. SWAN, M.D., F.R.C.P. (Newcastle upon Tyne).

Hon. Secretaries: WALLACE BRIGDEN, M.D., F.R.C.P., 139, Harley Street, London, W.1; FREDERIC JACKSON, M.B., M.R.C.P., 18, North Avenue, Gosforth, Newcastle upon Tyne, 3.

Tuesday, July 16.—Morning. Combined session with Sections of Medicine, Surgery, and Radiology on Arterial Embolism.

Wednesday, July 17.—Afternoon. The Treatment of Resistant Heart Failure, Dr. OSCAR BRENNER (Birmingham); The Use and Abuse of the Electrocardiogram, Dr. CURTIS BAIN (Harrogate); The Role of Quinidine in the Treatment of the Arrhythmias, Dr. PAUL WOOD (London); Rheumatic Carditis in Children To-day, Dr. WALLACE BRIGDEN (London); Prognosis after Cardiac Infarction, Dr. FREDERIC JACKSON (Newcastle upon Tyne); A colour film, "The Jugular Venous Pulse," Dr. PATRICK MOUNSEY (London).

CHILD HEALTH

President: Professor WILFRID GAISFORD, M.Sc., M.D., F.R.C.P. (Manchester).

Vice-Presidents: Professor DONALD COURT, M.D., M.R.C.P., D.C.H. (Newcastle upon Tyne); REGINALD LIGHTWOOD, M.D., F.R.C.P., D.P.H. (London); CHARLES PINCKNEY, M.B., F.R.C.P. (London).

Hon. Secretaries: GEORGE DAVISON, M.D., F.R.C.P., D.C.H., Shincliffe, Station Road, Crumlington, Northumberland; STANLEY D. V. WELLER, M.D., M.R.C.P., D.C.H., 50, Southborough Road, Bickley, Kent.

Wednesday, July 17.—Afternoon. Combined session with Sections of Obstetrics and Gynaecology and Preventive Medicine on Puberty and its Problems.

Thursday, July 18.—Morning. Combined session with Section of General Practice. Acute Chest Disease: Professor DONALD COURT (Newcastle upon Tyne), Dr. J. FRY (Beckenham).

Friday, July 19.—Afternoon. The Collagen Disorders: Speakers will include Dr. BARBARA ANSELL (London), Dr. A. HILL (Stoke Mandeville), Dr. C. CARTER (London). Chairman, Dr. R. LIGHTWOOD (London). Iatrogenic Disease in Paediatrics: speakers will include Dr. A. WHITE FRANKLIN (London), Dr. ALICE STEWART (Oxford), Dr. K. CAMERON (London), Dr. MARY CROSSE (Birmingham). Chairman, Dr. C. PINCKNEY (London).

DERMATOLOGY

President: J. FERGUSON SMITH, M.D., F.R.F.P.S. (Glasgow).

Vice-Presidents: R. MASON BOLAM, M.D. (Newcastle upon Tyne); A. GIRDWOOD FERGUSON, M.D., M.R.C.P.Ed., F.R.F.P.S. (Glasgow); I. B. SNEDDON, M.B., M.R.C.P. (Sheffield).

Hon. Secretaries: R. MASON BOLAM, M.D., The North Cottage, Adderstone Crescent, Jesmond, Newcastle upon Tyne, 2; PETER BORRIE, M.D., M.R.C.P., 115A, Harley Street, London, W.1.

Wednesday, July 17.—Afternoon. Acne Vulgaris. Dr. A. J. ROOK (Cambridge); Vesicular Eruptions of the Hands, Dr. STEPHEN GOLD (London); Neurodermatitis, Dr. A. GIRDWOOD FERGUSON (Glasgow).

GENERAL PRACTICE

President: H. F. WATTSFORD, M.B., B.S. (Newcastle upon Tyne).

Vice-Presidents: JOHN BEYNON, T.D., M.B., B.S. (Brighton); MONA MACNAUGHTON, M.B., Ch.B. (Newcastle upon Tyne); S. WAND, M.B., Ch.B. (Birmingham).

Hon. Secretaries: R. J. F. H. PINSENT, M.D., 1, Mayfield Road, Handsworth, Birmingham; ANDREW SMITH, M.B., B.S., Rose Villa, Whickham, Newcastle upon Tyne.

Monday, July 15.—Afternoon. Combined session with Section of Obstetrics and Gynaecology on Pre-eclampsia and on Gynaecology in General Practice.

Wednesday, July 17.—Afternoon. Combined session with Section of Preventive Medicine on Illness of the School-child. Programme to be announced later.

Thursday, July 18.—Morning. Combined session with Section of Child Health on Acute Chest Disease.

HISTORY OF MEDICINE

President: Sir ZACHARY COPE, M.D., M.S., F.R.C.S. (London).

Vice-Presidents: DOUGLAS GUTHRIE, M.D., F.R.C.S.Ed. (Edinburgh); C. E. KELLETT, M.D., F.R.C.P. (Shotley Bridge); J. DUDFIELD ROSE, M.B., F.R.C.S. (Newcastle upon Tyne).

Hon. Secretaries: N. M. MATHESON, M.R.C.P., F.R.C.S., F.A.C.S., Ashford Hospital, Ashford, Middlesex; ROBERT MOWBRAY, M.D., M.R.C.P., D.C.H., 220, Giles Gate, Durham.

Tuesday, July 16.—Morning. Mark Akenside, Sir JOHN CHARLES (London). Cholera Epidemics in Newcastle, Pro-

fessor JOHN BOYLES (Newcastle); John Snow's Place in History, Dr. M. H. A. DAVISON (Newcastle); The Influence of Leyden upon the Edinburgh Medical School, Dr. D. J. GUTHRIE (Edinburgh); The *De Dissectione* of Charles Etienne, Dr. C. E. KELLETT (Newcastle).

NEUROLOGY

President: HUGH GARLAND, T.D., M.D., F.R.C.P. (Leeds). *Vice-Presidents:* WALPOLE LEWIN, M.S., F.R.C.S. (Oxford); J. W. ALDREN TURNER, D.M., F.R.C.P. (London). *Hon. Secretaries:* R. W. GILLIATT, D.M., M.R.C.P., 51, Harley Street, London, W.1; J. N. WALTON, M.D., M.R.C.P., 5, Dilston Terrace, Gosforth, Newcastle upon Tyne, 3.

Tuesday, July 17.—Afternoon. Symposium on Epilepsy: Modern Views on Classification, Dr. DENIS WILLIAMS (London); Value of the Electroencephalogram in Diagnosis, Dr. DENIS HILL (London); Anticonvulsant Therapy, Dr. HOUSTON MERRITT (New York); Pitfalls and Success in the Surgical Treatment of Focal Epilepsy, Dr. WILDER PENFIELD (Montreal); Epilepsy as a Social Problem—a Summing-up, LORD COHEN OF BIRKENHEAD.

Thursday, July 18.—Morning. Symposium on Cerebral Vascular Disease: Recent Advances in Knowledge of Cerebral Vascular Disease, Dr. RAYMOND D. ADAMS (Boston, Mass.); Medical Management of Subarachnoid Haemorrhage, Dr. J. MACDONALD HOLMES (Stafford); Radiological Investigation in Cases of Cerebral Vascular Disease, Dr. JAMES BULL (London); The Management of "Strokes," Dr. F. A. ELLIOTT (London).

OCCUPATIONAL HEALTH

President: J. J. O'DWYER, C.B.E., M.B., D.P.H. (London).

Vice-Presidents: GEORGE BUCHANAN, B.L., L.R.C.P.&S., D.P.H., D.I.H., D.T.M.&H., D.P.A. (Glasgow); CHARLES CRESDEE, M.R.C.S., L.R.C.P. (Huddersfield); G. E. GRAVES PEIRCE, M.B., F.R.C.S. (London).

Hon. Secretaries: DAVID GULLICK, M.B., B.S., Mount View, Western Road, Stevenage, Herts; R. I. MCCALLUM, M.D., M.R.C.P., Nuffield Department of Industrial Health, the Medical School, King's College, Newcastle upon Tyne, 1.

Thursday, July 18.—Morning. The Management of Pneumoconiosis in General Practice: opening speakers, Dr. A. MEIKLEJOHN (Glasgow), Dr. J. C. GILSON (Llandough), Dr. R. A. TREVEHICK (Sheffield), Dr. FENWICK LISHMAN (Crook, Co. Durham).

OPHTHALMOLOGY

President: J. S. ARKLE, O.B.E., M.B., F.R.C.S.Ed. (Newcastle upon Tyne).

Vice-Presidents: GEORGE BLACK, M.B., F.R.C.S. (Leeds); ALEX G. CROSS, M.D., F.R.C.S. (London); H. VERNON INGRAM, O.B.E., T.D., M.B., D.O.M.S. (Middlesbrough, Tyne); A. E. P. PARKER, M.B., F.R.C.S. (Middlesbrough, Tyne).

Hon. Secretaries: DEREK AINSLIE, M.D., F.R.C.S., D.O.M.S., 87, Harley Street, London, W.1; JAMES M. L. HOWAT, M.B., D.O.M.S., D.O., 3, Tankerville Terrace, Newcastle upon Tyne, 2.

Tuesday, July 16.—Morning. Chiasmal Disease, Professor NORMAN DOTT (Edinburgh), Dr. A. MOONEY (Dublin); Recent Advances in the Diagnosis and Treatment of Glaucoma, Mr. R. J. H. SMITH (London); Ocular Changes in the Leukaemias, Mr. P. D. TREVOR ROPER (London); Cataract Surgery under Chlorpromazine Hydrochloride, Mr. H. VERNON INGRAM (Newcastle upon Tyne).

ORTHOPAEDICS

President: C. GORDON IRWIN, M.B., F.R.C.S.Ed. (Newcastle upon Tyne).

Vice-Presidents: JOHN BASTOW, M.D., F.R.C.S. (Bath); JOHN CHARNLEY, M.B., F.R.C.S. (Manchester); J. KENNETH STANGER, M.B., F.R.C.S. (Newcastle upon Tyne).

Hon. Secretaries: L. W. PLEWES, C.B.E., M.D., F.R.C.S.Ed., Blake Hall, Kensworth, Dunstable, Beds;

JOHN V. TODD, M.Ch.Orth., F.R.C.S., 20, The Grove, Gosforth, Newcastle upon Tyne, 3.

Wednesday, July 17.—9 a.m. Round-table Conference with Section of Physical Medicine on Low Back Pain. Chairman, Dr. HUGH BURT (London). Dr. S. JOSEPHS (Newcastle upon Tyne), Dr. I. N. MACIVER (Newcastle upon Tyne), Mr. N. W. ROBERTS (Liverpool).

Wednesday, July 17.—Afternoon. Pain in the Arm, Mr. ROBERT ROAF (Liverpool), Mr. J. KENNETH STANGER (Newcastle upon Tyne), Dr. MICHAEL KREMER (London); Reconstructive Surgery of the Upper Limb Following Poliomyelitis, Mr. ALEX MILLER (Glasgow).

OTO-RHINO-LARYNGOLOGY

President: W. I. DAGGETT, M.B., F.R.C.S. (London).

Vice-Presidents: R. E. JOWETT, M.D., M.R.C.P., D.L.O. (Sunderland); RONALD MACBETH, D.M., F.R.C.S., F.R.C.S.Ed. (Oxford); FRANCIS MCGUCKIN, M.D., F.R.C.S., F.R.C.S.Ed. (Newcastle upon Tyne).

Hon. Secretaries: J. D. K. DAWES, M.D., F.R.C.S., 40, Bewick Road, Gateshead, Co. Durham; LIONEL TAYLOR, M.B., F.R.C.S., 55, Harley Street, London, W.1.

Thursday, July 18.—Morning. The Scope of Surgery in the Management of Deafness, Mr. I. B. THORBURN (Liverpool), Mr. F. MCGUCKIN (Newcastle upon Tyne).

Friday, July 19.—Afternoon. Epistaxis, Mr. J. P. STEWART (Edinburgh), Dr. H. A. DEWAR (Newcastle); Presenting Symptoms and Signs of Malignant Disease of the Upper Respiratory Tract, Mr. W. A. MILL (London), Mr. R. D. OWEN (Cardiff), Mr. MUNRO BLACK (Newcastle upon Tyne).

PHYSICAL MEDICINE

President: HUGH BURT, M.B., F.R.C.P. (London).

Vice-President: GUY BEAUCHAMP, M.B., Ch.B. (London); JAMES CYRIAX, M.D., M.R.C.P. (London); J. B. STEWART, M.B., D.Phys.Med. (Marlborough); A. ZINOVIEFF, M.R.C.S., L.R.C.P., D.Phys.Med. (Durham).

Hon. Secretaries: A. T. RICHARDSON, M.B., M.R.C.P., D.Phys.Med., the Royal Free Hospital, Gray's Inn Road, London, W.C.1; M. THOMPSON, M.D., M.R.C.P., Department of Physical Medicine, the Royal Victoria Infirmary, Queen Victoria Road, G.P.O. Box No. 141, Newcastle upon Tyne, 1.

Wednesday, July 17.—9 a.m. Round-table Conference with Section of Orthopaedics on Low Back Pain.

Friday, July 19.—Afternoon. The Painful Heel, Dr. A. T. RICHARDSON (London); The Painful Foot, Dr. GUY BEAUCHAMP (London); Results of Rehabilitation of Injured Miners, Dr. A. N. ZINOVIEFF (Durham); Hydrocortisone in Lesions at the Shoulder and the Elbow, Dr. J. CYRIAX (London); Intra-articular Steroid Therapy, Dr. M. THOMPSON (Newcastle upon Tyne).

PLASTIC SURGERY

President: Professor T. POMFRET KILNER, C.B.E., D.M., F.R.C.S. (Oxford).

Vice-Presidents: D. N. MATTHEWS, O.B.E., M.D., M.Ch., F.R.C.S. (London); MORTIMER H. SHAW, M.B., F.R.C.S. (Leeds).

Hon. Secretaries: F. I. HERBERT, M.B., F.R.C.S., 23, Linden Road, Gosforth, Newcastle upon Tyne, 3; W. GROSSMANN, M.D., L.D.S. R.C.S., 79, Harley Street, London, W.1.

Wednesday, July 17.—Afternoon. Programme to be announced later.

PREVENTIVE MEDICINE

President: J. B. TILLEY, M.D., D.P.H. (Newcastle upon Tyne).

Vice-Presidents: Professor E. M. DUNLOP, M.C., M.A., M.D., F.R.S.Ed. (Newcastle upon Tyne); J. F. WARIN, M.D., D.P.H. (Oxford); ELSPETH WARWICK, M.B., D.P.H. (Nottingham).

Hon. Secretaries: J. ALUN EVANS, M.R.C.S., L.R.C.P., D.P.H., 5, Crossfield Avenue, West Winds, Porthcawl, Glam.; R. C. M. PEARSON, M.D., M.R.C.P.Ed., D.P.H., Health Department, Town Hall, Newcastle upon Tyne, 1.

Wednesday, July 17.—Afternoon. Joint session with Sections of Obstetrics and Gynaecology and Child Health on Puberty and its Problems.

Wednesday, July 17.—Afternoon. Joint session with Section of General Practice on Illness of the Schoolchild, programme to be announced later.

PSYCHIATRY

President: Professor ALEXANDER KENNEDY, M.D., F.R.C.P., M.R.C.P.Ed., D.P.M. (Edinburgh).

Vice-Presidents: LOUIS MINSKI, M.D., F.R.C.P., D.P.M. (Sutton, Surrey); Professor MARTIN ROTH, M.D., M.R.C.P., D.P.M. (Newcastle upon Tyne); IAN SKOTTOWE, M.D., M.R.C.P., D.P.M. (Oxford).

Hon. Secretaries: ROBERT ORTON, M.D., M.R.C.P.Ed., D.P.M., Royal Victoria Infirmary and King's College Medical School, Department of Psychological Medicine, Queen Victoria Road, Newcastle upon Tyne, 1; D. A. POND, M.D., M.R.C.P., D.P.M., Yew Trees, Dover House Road, Roehampton, S.W.15.

Tuesday, July 16.—Morning. Symposium on Tranquilizers, Professor J. ELKES (Birmingham), Dr. L. C. COOK (Dartford), Dr. E. H. KITCHING (Manchester).

RADIOLOGY

President: S. WHATELY DAVIDSON, M.D., F.R.C.P., F.F.R. (Newcastle upon Tyne).

Vice-Presidents: PAIGE ARNOLD, M.D. (Sunderland); R. A. KEMP HARPER, M.D., F.R.C.P.Ed., F.R.F.P.S., F.F.R., D.R. (London); W. S. SHEARER, M.B., F.R.C.S.Ed., D.R. (Edinburgh).

Hon. Secretaries: B. D. HOUSTON, M.B., B.S., D.M.R., "Roanhead," Melbury Road, Newcastle upon Tyne, 7; ARTHUR JONES, M.D., M.R.C.P., D.M.R.T., Radiotherapy Department, St. Bartholomew's Hospital, London, E.C.1.

Tuesday, July 16.—Morning. Combined session with Sections of Medicine, Surgery, and Cardiology on Arterial Embolism.

Wednesday, July 17.—Afternoon. Combined session with Section of Surgery on Radiological Investigation of the Biliary Tract.

COLOUR TELEVISION

There will be a daily programme of closed-circuit colour television from the Royal Victoria Infirmary to the Gymnasium, King's College, sponsored and produced by Smith, Kline and French Laboratories Ltd. The programme will consist of clinical demonstrations and surgical operations by members of the staffs of the Medical School, King's College, University of Durham, and the Royal Victoria Infirmary, Newcastle upon Tyne.

Monday, July 15.—12.15–1.15 p.m. Chairman, Mr. J. S. ARKLE. Cases of Corneal Grafts, Mr. H. VERNON INGRAM. Cases of Plastic Lenticular Implants and Contact Lenses, Mr. L. H. LAKE. Cataract Extraction by the Intracapsular Method, Mr. H. VERNON INGRAM, Mr. P. J. L. HUNTER, Dr. M. H. ARMSTRONG DAVISON. 1.15–2.15 p.m. Chairman, Dr. C. N. ARMSTRONG. Some Disorders of Thyroid Function, Dr. F. T. FARMER, Professor G. A. SMART, Mr. C. J. L. THURGAR.

Tuesday, July 16.—12.15–12.45 p.m. Chairman, Professor F. J. NATTRASS. Muscular Dystrophy, Dr. J. N. WALTON, Mr. W. H. STANTON. 12.45–1.15 p.m. Chairman, Professor G. A. SMART. The Treatment of Arthritis, with Special Reference to Intra-articular Injections, Dr. M. THOMPSON, Dr. N. CARDOE. 1.15–2.15 p.m. Chairman, Professor A. G. R. LOWDON. Compression of the Median Nerve in the Carpal Tunnel, Dr. H. G. MILLER, Mr. J. K. STANGER.

Wednesday, July 17.—12.30–12.55 p.m. Chairman, Dr. J.

FERGUSON SMITH (Glasgow). The Treatment of Some Common Skin Disorders, Dr. R. MASON BOLAM, Dr. B. WILSON. 12.55–1.20 p.m. Chairman, Professor S. D. M. COURT. Primary Tuberculosis of Skin and Mucous Membranes, Dr. F. J. W. MILLER, Dr. M. D. TAYLOR. 1.20–1.50 p.m. Peripheral Vascular Disease, Dr. D. J. TIBBS, Mr. D. N. WALDER. 1.50–2.15 p.m. Chairman, Mr. JOHN GILMOUR. Partial Gastrectomy by the Billroth I Method, Professor A. G. R. LOWDON.

Thursday, July 18.—12.15–12.45 p.m. Chairman, Dr. H. G. MILLER. Cleft Lip and Palate, Mr. J. R. G. EDWARDS. Miss M. E. MORLEY. 12.45–1.15 p.m. Chairman, Dr. M. THOMPSON. (1) Early Gait Training in Hemiplegia, Miss N. BOLAM, Miss P. LYTTLETON. (2) Treatment of a Fractured Neck of Humerus, Miss M. JENKINS, Mrs. N. ROBINSON. 1.15–1.50 p.m. Chairman, Professor G. A. SMART. The Diagnosis of Sex, Dr. C. N. ARMSTRONG, Dr. A. R. HORLER. 1.55–2.15 p.m. Chairman, Mr. J. I. MUNRO BLACK. Otosclerotic Deafness, Mr. F. MCGUCKIN.

Friday, July 19.—12.15–1.15 p.m. Chairman, Mr. J. V. TODD. The Diagnosis and Treatment of the Torn Cartilage in the Knee, Mr. C. GORDON IRWIN, Mr. J. K. STANGER, Mr. P. N. ROBSON.

PROVISIONAL TIME-TABLE OF MEETINGS

R.—Events available for members of Representative Body and Ladies accompanying them.
L.—Events primarily arranged for Ladies.
U.—Events for all Members and Ladies accompanying them.
*—Academic Robes should be worn.

Tuesday, July 9

4.30 to 6.30 p.m.—Annual Representative Meeting Inquiry Office open at the City Hall.

2.30 p.m.—Scientific Sections, Stephenson Buildings.

OPHTHALMIC GROUP COMMITTEE

The Ophthalmic Group Committee held an adjourned meeting on March 15, with Mr. O. GAYER MORGAN in the chair, to continue discussion of the agenda of the meeting of February 15.

Ophthalmic Qualifications Committee

The Ophthalmic Qualifications Committee had given preliminary consideration to the recommendation in paragraph 4 of the report of the Joint Subcommittee on the future of the Ophthalmic Services—a recommendation that for applicants who had been medically qualified for at least ten years and who satisfied the criteria in all other respects the Ophthalmic Qualifications Committee be empowered to waive the requirement that they must have served six months in a resident appointment or equivalent whole-time non-resident appointment. This concerned applicants for admission to the central professional list.

On this preliminary consideration the Qualifications Committee had given general approval in principle to the recommendation, but had been doubtful about defining by reference to a period of years the category of practitioners whom it was proposed to bring within the scope of the recommendation. The Committee had thought it more appropriate to specify a date before which practitioners must have obtained their medical qualification in order to be able to

apply for admission to the central list under the proposed new rule. It had also suggested that practitioners who wished to take advantage of the proposed new rule must produce evidence to show that compliance with the requirement of holding a six months' resident appointment or equivalent whole-time non-resident appointment would cause them undue hardship.

The Qualifications Committee are to consider the matter further.

N.O.T.B. Clinics in Industry

The Committee's observations had been sought by the Occupational Health Committee on a letter from the N.O.T.B. Association. This letter stated that before the National Health Service the old N.O.T.B. had arranged with a number of large industrial concerns for clinics to be held on the premises attended by an ophthalmologist and a dispensing optician, the ophthalmologist being selected by the firm and the patient being assured that he had complete freedom of choice to seek attention elsewhere. In some industrial firms to-day ophthalmic medical practitioners and a dispensing optician attended, and the council of the N.O.T.B. Association, which since 1948 had replaced the old Board, felt that it would be valuable to extend this work wherever possible. The council proposed this month (March) to remind its medical members of the valuable work which could be done in this way, and sought the co-operation of the Occupational Health Committee.

The Ophthalmic Group Committee discussed the advantages of the scheme, together with the possibility of its interfering with work outside it, and accepted it on principle, on the understanding that ophthalmologists would have the wider duty of being advisers to the firm, that a full economic rent was charged for the facilities provided, and that the work should be open to any ophthalmologist.

Use of General Practitioner's Surgery

The Central Ethical Committee had received a request for advice from a member. An ophthalmologist visited the member's surgery at regular intervals for the convenience of patients who wished to have refractive tests under the Supplementary Ophthalmic Scheme, and it had been suggested, again for the convenience of the member's patients, that a dispensing optician should be present. The Central Ethical Committee had thereupon expressed the view that it would be ethically undesirable for an ophthalmic medical practitioner to visit regularly a general practitioner's surgery to see patients who required refractive tests and that there was similar objection to the proposed presence of a dispensing optician, as any such arrangement tended to limit the free choice of the patient. It had then sought the views of the Ophthalmic Group Committee.

In its discussion the Committee had in mind the dangers of shepherding inherent in such an arrangement, but recognized the difficulties which arose in outlying districts. Several members of the Committee thought it generally undesirable for an ophthalmologist to consult regularly in the premises of a general practitioner under the S.O.S.; others thought it might be satisfactory if a panel of ophthalmologists were employed; others thought that in remote districts it might be in the interests of the patient if such a practice were permitted.

It was decided that the Chairman should ask if he could attend the next meeting of the Central Ethical Committee, without binding the Group Committee in any way, and should report back.

Blindness Certification

The Committee considered the case of a member who had held a consultant appointment in the N.H.S. immediately prior to departure for the Commonwealth, and who, during his stay in the Commonwealth, had also held a consultant appointment. Back in this country he was anxious to undertake blind certification on behalf of the local authority, but, because he was not regarded as of consultant status, the county medical officer of health was not prepared to make use of his services.

The Ministry's first reply said it was part of the object of using consultants for certification of blindness that this work should be linked with examinations which may lead to appropriate treatment. This would hardly be the case if someone not associated with the hospital department in which treatment could be given was undertaking certification.

In reply it was suggested that the fact that the member could not personally undertake the hospital treatment, where that was necessary, was irrelevant.

In a further reply the Ministry claimed that the phrase "ophthalmologist of consultant status" meant an ophthalmologist who held, or had held, the post of consultant ophthalmologist on the staff of a hospital in the National Health Service.

The Committee felt that the Ministry had decided on this definition without consultation; under it, a retired ophthalmologist, however distinguished, would not be of consultant status. It was decided to take the matter up with the Ministry.

Licensing of Civil Aircraft Pilots

An ophthalmic surgeon who had examined two patients who wished to take out licences as civil aircraft pilots wrote to the Group Committee to express surprise that the Ministry of Transport and Civil Aviation were apparently prepared to accept an optician's report as satisfactory when deciding that a person's visual qualities were adequate for piloting an aircraft; and also that the examination needed to answer the questions on Ministry form C.A. 541 regarding vision was not more exacting.

The Committee decided to seek further information.

Use of Title "Ophthalmologist"

On several occasions the attention of the Association had been called to the use of such titles as "consulting ophthalmologist" by a non-medically qualified person, but it had not been possible to take any action, as there was no special protection for this term in the Medical Acts. The Council had recently appointed a Committee to examine the working of the Medical Act, and it felt that the Group Committee might wish to ask this new Committee to recommend an appropriate amendment of the Act to restrict the term "Ophthalmologist" to medical men.

It was agreed to seek this protection for the term and also to seek protection for the term "Oculist."

Ophthalmic Investigation Committees

The Ministry had confirmed that a doctor on the central professional list for providing Supplementary Ophthalmic Services, but who did not undertake work under those services, was not an "ophthalmic medical practitioner" for the purpose of membership of an Ophthalmic Investigation Committee. When the Regulations were in draft no one had contemplated that an ophthalmic medical practitioner not taking part in those services would have sufficient interest in them to join in their administration, but these circumstances had arisen in one special case. The Ministry had noted the view of the Group Committee that a doctor in this position should be eligible for membership of an Ophthalmic Investigation Committee, and the Department would consider whether the point could be met when the question of amending the Regulations arose. The Regulations could hardly be amended on points of detail at the present time.

Fee for Duplicate Consultation

The Group Committee considered correspondence concerning a case in which a consultant had examined a patient and then had decided, at the same visit, to complete form B.D.8 in order that he might be duly certified. The county council in question had claimed that where a duplicate consultation such as this took place for two separate purposes they were entitled to charge a reduced fee for the examination and completion of form B.D.8. It was stated that the county M.O.H. would take the matter up with the Medical Whitley Council. The Group Committee felt that if a

consultant found that a patient should be on the blind register he should report the fact, in which case a second appointment would be made.

Leaflet for Medical Students

The Group Committee considered the draft of a leaflet which the N.O.T.B. Association suggested should be included with the literature which was issued to medical students on graduation. It advised them on the procedure when they wished to have a patient's eyes examined. The Group Committee decided that the leaflet should be redrafted and considered at the next meeting.

Disposal of Records

The Ministry of Health announced that it contemplated proposing that the period of five years, fixed for the retention of the upper part of form O.S.C.2—after the end of the financial year to which the form related—should be reduced to four years. This was because of storage difficulties. The Group Committee agreed with this proposal.

Pupils at Fee-paying Schools

The N.O.T.B. Association had written to draw attention to the possibility that headmasters at some fee-paying schools might not always be aware of the facilities available for safeguarding the eyesight of their pupils. Its council therefore proposed to raise the matter with the Association of Public School Medical Officers. The Group Committee decided to redraft a letter which it had sent several years ago on the same subject.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held at B.M.A. House on Thursday, March 21, 1957, at 10.30 a.m. Dr. A. TALBOT ROGERS occupied the chair for the first part of the proceedings, the chair subsequently being taken by Dr. A. B. DAVIES.

At the outset of the meeting Dr. B. CARDEW said he would like to see the principle established that, when members of the Committee gave accounts to their various bodies of what took place at meetings, they did not introduce personalities or organizations.

The CHAIRMAN then reported to the Committee on the recent interview that he and Sir Russell Brain had with the Prime Minister.

Cranbrook Committee

The draft Memorandum of Evidence for the Cranbrook Committee was received and adopted with minor drafting amendments. Dr. H. D. CHALKE congratulated those concerned on drawing up such an excellent report.

Assistants and Young Practitioners Subcommittee

Dr. F. GRAY said that the Subcommittee had given very careful consideration to the Constitution Committee's proposal to set up a Young Practitioners Committee of the B.M.A., which would consider all matters affecting medical practitioners who were not fully established in a defined field of practice, including questions referred to other committees, and which could make recommendations thereon with right of direct access to Council. It was resolved finally that:

(1) The Assistants and Young Practitioners Subcommittee should remain in existence as a Subcommittee of the G.M.S. Committee; (2) that the Subcommittee is broadly satisfied with its relationship to the parent Committee; and (3) that the Subcommittee sees no reason to establish the proposed new committee, but if any matter referred to one of the three Sub-

committees at present in existence also concerns one or other of the existing Subcommittees it should be referred to it in the ordinary way.

Expressing his own personal view, Dr. GRAY said that a new subcommittee such as the one proposed would only cause strife amongst the various sections of the profession, particularly between the unestablished and the senior practitioners. It was disastrous in the interests of the profession that such proposals should have been made.

Dr. J. A. PRIDHAM said it was not intended that the Assistants and Young Practitioners Subcommittee should be wound up. The matter had been thrashed out in the Constitution Committee, and feeling in that Committee and in the Council was that the young practitioner, whether established or not established, felt that he was not getting his proper voice in the Association, and was not being looked after.

Dr. B. CARDEW said he could appreciate the general argument, but it was difficult to follow the actual mechanics of having two committees the functions of which would be so similar that they would be considering the same problems month after month.

Dr. F. M. ROSE suggested that the answer was in the machinery of the Association itself.

The resolution of the Subcommittee was accepted.

Other Business

The Committee then considered a large number of items on the agenda dealing with routine matters and completed its business at 5.30 p.m.

CONSULTANT WORK IN S.H.M.O. POSTS

As a result of the announcement (*Supplement*, February 9, p. 60) that Committee B of the Medical Whitley Council had agreed to consider the cases of S.H.M.O.s who claim to be in posts of a consultant nature, some 800 applications have been received. Cases are now being prepared by the B.M.A., and supporting evidence is being sought from medical staff and hospital committees on whether the duties, responsibilities and quality of work of the claimants are of consultant nature. The claim to Committee B will be that individual S.H.M.O.s who can be shown to be doing consultant work should be paid on the consultant scale, although the personal grading of the individual is not necessarily that of consultant. Whatever the outcome of the applications, neither the present hospital establishments nor the personal grading of applicants will be affected.

Questions Answered

Superannuation on Resignation

Q.—Next year I shall be 60 years old, and shall have completed 10 years of service in the N.H.S. If I resign in October in a selected area, what is to prevent the Government from accepting my resignation with gratitude, refunding my superannuation contributions, and saving the money which it would have had to pay me in pension from the following year onwards? It should have little difficulty in replacing me by an unestablished practitioner.

A.—Those doctors in the selected areas who remain on the obstetric list will retain their superannuation rights. In the case of other doctors the position is that, if, during a temporary break in service, a doctor does not accept a refund of contributions and returns to superannuable employment within 12 months, his rights are secure and he continues from where he left off. It can therefore be said that so far as the present plan is concerned doctors' superannuation rights are completely safeguarded.

No settlement with the Government will be agreed to unless it contains a general no-detriment clause safeguarding the interests of those doctors who resigned.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Woman Consultant for Women's Hospital

SIR.—In "Scottish News" under "Woman Consultant for Women's Hospital" (*Supplement*, March 16, p. 116), statements from the Secretary of State's letter to the Southern Hospitals Group Board of Management are given which we think are misleading, and tend to throw the present controversy into wrong perspective. We would be grateful if you would permit us to make a few observations.

While it is true that the physician's work at Bruntsfield and Elsie Inglis Hospitals has heretofore been estimated at three half-days, the Regional Hospital Board had accepted the fact that at least five half-days of clinical work are undertaken in these hospitals. There appears no reason why work estimated erroneously at three half-days in 1948 should continue to be underpaid.

The only argument for changing the *status quo* given by the Regional Hospital Board, against the advice of the Board of Management and against a great weight of medical and lay opinion, is that someone "of the highest calibre" might be attracted to the new consultant position. The representations made by the Board of Management against this argument are of wider import than is implied by the letter from the Department of Health. Not only is a woman consultant desired for the women's hospitals but a woman "of the highest calibre." Further, it is strongly felt that the amount of work in four scattered hospitals would be too much for one person. This point of view is supported by the regional consultants and specialists committee.

The original appeal from the Board of Management to the Regional Hospital Board for the maintenance of the *status quo* did not ask for the post at Bruntsfield and Elsie Inglis Hospitals to be restricted to medical women only. This has arisen as the result of the expressed desire of the people, lay and medical. It is obvious that the only satisfactory solution to the difficulty would appear to be the appointment of a woman consultant to the women's hospitals.—We are, etc.,

E. A. BAXENDINE,
SUSANNE J. PATERSON.

Edinburgh.

General Practitioners and the Hospital Service

SIR.—It would seem, judging from the poor response to appropriate advertisements in the medical press and elsewhere, that insufficient publicity has been accorded a scheme providing for combined training of recently registered graduates in general and hospital practice, and I should be grateful if I may be permitted to repair this omission to some extent through the medium of your correspondence columns.

Some time ago a statement of policy agreed between the Joint Consultants Committee (Scotland), the General Medical Services Subcommittee (Scotland), and the Department of Health for Scotland was issued (see *Supplement*, March 17, 1956, p. 88) urging that (1) a combined training scheme should be developed which offers the practitioner concurrent training and experience in hospital and general practice on completion of his pre-registration year or on completion of National Service if later, and (2) entry into general practice on a part-time basis should be made easier for doctors who have continued in hospital service up to the level of registrar, but who have decided not to devote the whole of their subsequent career to hospital and specialist work.

The basis of this scheme is that a practitioner accepted for training will undertake a two-year programme of work under which he will spend approximately half his time in hospital employment, at the senior house officer or registrar level according to the needs of the particular hospital, and

the other half as a trainee assistant in general practice under the guidance and tuition of an experienced practitioner approved for the purpose by the regional selection committee.

While it was the original intention that as nearly as possible the trainee should carry out both elements of his training concurrently, spending approximately half of each day in hospital and the other half outside, it was anticipated that modification would be necessary to suit local conditions, providing, for example, for the whole-time devotion of alternate periods of up to one year to hospital service and to general practice. After studying ways and means of participating in the scheme the Borders Hospitals Board of Management concluded that in a mainly rural area concurrent training was not a practicable proposition and decided that two trainees should be simultaneously employed, exchanging between general practice and hospital so that there is always one of the two in each field.

The hospital work will involve service in the capacity of senior house officer in the orthopaedic department at Peel Hospital, but during their periods of residence the trainees will have ample opportunity of gaining experience in branches of hospital work other than orthopaedics, as the hospital accepts a wide variety of general surgical and medical cases from four border counties for specialist and emergency treatment in the appropriate wards, while clinics in various specialties, including diseases of ear, nose, and throat, ophthalmology, dietetics, and gynaecology, are conducted at various hospitals within the Group. Experience in general practice will be gained in a large partnership practice in Selkirk, an attractive county town, which offers a considerable variety of medical work, including midwifery and the facilities of a cottage hospital, within a mixed industrial and agricultural community. These proposals have been approved by the higher authorities concerned, and it is hoped that two suitable trainees may shortly be forthcoming to permit their implementation.—I am, etc.,

Galashiels.

G. B. WALKER.

Reform of Health Service

SIR.—Ideas on the reform of the method of payment of general practitioners are attracting more interest, and it was suggested in the *Manchester Guardian* of December 29, 1956, that some alteration was necessary to avoid a "quinquennial earthquake" before pay adjustments could be made. May I with humility, since I have only a short experience of general practice, make some suggestions towards this purpose?

The unemployed people are most in need of the G.P.'s help—i.e., children up to school-leaving age, students, retired people, and the disabled and permanently unemployed. They should be registered with a doctor, who is paid for this by capitation fee. The employed person and his wife can choose to pay into an insurance scheme to reduce their payment to the G.P., or pay for these services as they are received, and they may go, as originally, to whom they please. This insurance scheme could be run privately, as suggested by Dr. J. W. Evans (*Supplement*, March 16, p. 118), or by the Government. The money received would provide an investment income for the insurer which, in the case of the Government, could possibly be offset against the cost of the Health Service. Then the patient and the doctor would suffer less restriction, and, if a reduction in Health Service costs affected taxation, they would be better off for being thrown on to their own resources.—I am, etc.,

Newbury.

L. P. A. NEWBORNE.

Buying and Selling of Practices

SIR.—I think an end should be made to the publishing of letters concerning the remuneration of general practitioners. Surely, after so many months, this problem has been well and truly thrashed out. To continue this never-ending bickering rather cheapens our noble profession in the eyes of the world.

For this reason I think more time should be spent on the question of the buying and selling of practices. Think of the number of present-day doctors who answer vacancy advertisements. Have you thought of the poor doctor not wishing to put forward the same referees again and again as each new vacancy arises? Now there is no scope for improving one's lot apart from increasing an already too large medical list. What of the doctor who has started in a working-class area? He makes a large practice by dint of hard work. Why can't he sell such a practice and buy another practice in some other part of the country should he so wish? However, this is impossible, thanks to a rather silly bargain struck by civilian doctors during the period when the then coming generation of medical men was still in the Services. In other words, the very thing against which we fought—i.e., national socialism—was let in through the medical backdoor.

Therein lies the answer to the huge exodus of doctors from our shores. It is obviously not the temperate British climate but the intemperate workings of a befuddled governmental brain. Therefore I implore you to do something about the goodwill of medical practices which have been made by the efforts and minor sacrifices of individual doctors. What is the future of the said doctor in a busy industrial area? To stay there for the rest of his life? What an ambition. If this is what it means to be a doctor in Britain I, for one, shall leave and start from scratch in a foreign country and make sure that, should I be blessed with children, they will not be looked down upon as being apathetic Britishers.—I am, etc.,

Dagenham, Essex.

SYDNEY HICKS-ROE.

Remuneration Claim

SIR.—From the variety of views expressed in the correspondence reaching the *Journal*, it is apparent that there is no uniformity of opinion on the above. There has indeed been a regrettable lack of clear leadership which might well account for this.

A statement has been issued (*Supplement*, March 23, p. 125) as to the action to be taken by individual doctors when they resign from the Service, but is this really the first thing which must be determined? In withdrawing from the N.H.S. the profession will be taking a step which cannot be repeated. It is the ultimate weapon and must therefore be used to deal fully with all the problems. Consequently, before withdrawing it is essential to be clear as to the reasons for withdrawal and under what conditions service might again be resumed in association with the Government. As far as I know, no clear pronouncement has been given on this. I would suggest that the following might be sufficient as a working platform.

- (1) As far as general practice is concerned, the profession will not agree to work directly under State control, as this inevitably involves political decisions and interferes with the proper doctor-patient relationship. Alternative methods would be matters for discussion and negotiation between the profession and the Government.
- (2) Other branches of the profession may, of necessity, have to rely to a greater extent on direct Government financial payments, but it should be a *sine qua non* that any doctor, whether in general practice or employed in hospital, university, local authority, civil service, or other work, must be dealt with primarily as a member of the medical family.
- (3) In case of any dispute, independent arbitration must be available by right on the request of either side in the dispute, and the arbitration findings must be accepted by both parties.
- (4) Remuneration levels throughout the profession generally must be brought up at once to those envisaged as being appropriate under the Spens Report. The appropriate levels could be decided by an arbiter or arbitration court.

The Government has so far refused to consider arbitration in the present dispute, and the Prime Minister has even been indiscreet enough to announce a 10% increase to junior hospital staff, although there is in existence a Whitley Committee which is supposed to deal as an independent body with these matters by negotiation between the management and staff sides. Such anarchy should not be coun-

tenanced, but if the profession is to be strong in resistance the sections must be united, and if they are to go forward together in action the objectives must be clear. To produce such a statement is the duty surely of the B.M.A. Council. Why is it being delayed?—I am, etc.,

Inveresk, Midlothian.

JOHN RIDDELL.

SIR.—I would like to give you the views of a young general practitioner on the remuneration claim. Although an increase in pay would be nice at any time, I feel it is not justified at the moment to press on the country any further burden. Viewing our situation in society, I do not think we are relatively worse off than our friends in other professions, and reading the analyses of professional incomes and their increases since 1939, as they are published in the *Financial Times*, supports this. The problem of pay differentials is one affecting the whole middle class. If we can live in reasonable circumstances and give our children the best possible education, I am content.

I regret very much the manner and the timing of the B.M.A. effort to force this on the Government. I do not feel their arguments are sufficiently convincing, and I doubt the support that will be received from the profession as a whole. Little effort has been made (certainly none in my area) to determine the reaction of doctors to the pay claim. If I am right, whether the present B.M.A. policy fails or succeeds it cannot help the profession in the long run. We will either encourage all others to put up prices and so force up the cost of living, or we will no longer be regarded as knowing what we are talking about. The success of Britain now, as ever, depends on our ability to adapt our way of life to suit present trends. The absence of large differences in pay between the classes and the provision of first-class educational opportunities for all are, I think, the essentials. I am sure the medical profession will be able to give the country a lead.—I am, etc.,

Welwyn, Herts.

CHARLES DANSIE.

SIR.—The decision, likely to face the individual practitioner, to give or to withhold his support to the application of pressure in support of our pay claim is an anxious one. If he gives his support he is too well aware that the inflationary effect will, coming from an influential profession, be out of proportion to the financial sum involved and capable within a short time of depriving him of any benefit obtained. If he withholds his support he condones a breach of agreement.

May I propose that a compromise proposal be put forward—namely, that, in return for the submission of our claim to arbitration, we agree to accept any reward in the form of non-transferable Government stock redeemable in 10 years or on previous death or in cases where it is agreed that hardship now exists?—I am, etc.,

Basingstoke.

R. GALLIMORE.

SIR.—If a favourable public opinion is necessary to a successful outcome of our remuneration claim we seem bound to lose the day unless something can be done about this mythical "average G.P." who now earns £2,222 per annum free of all practice expenses. This individual has been presented on many fronts. He figured prominently in an article, "Paying the Doctor," in the *Financial Times* of December 29, 1956, which stated that the expenses of which he was relieved included the wages of an assistant and a secretary, as well as the rent and furnishing of his surgery. The same newspaper exhibited him again on February 22, stating categorically that he had an income of "£2,222 (gross after deduction of expenses)." The B.B.C. had him "on the spot" in a programme of that name on February 26 as having a gross income of £3,300, which, after deduction of expenses, left him "a little over £2,200."

What are the facts? Who is this "average G.P."? Are my own circumstances different from those of thousands of my colleagues? There are 2,021 names on my list, which is, I believe, slightly larger than average. I do not

employ an assistant, and the only secretarial work listed among my expenses is that done at cut-price rates by my wife. My earnings from all sources for the past three years, after deduction of expenses allowed by the Inland Revenue, have averaged only three-quarters of that which apparently I should be earning.

So long as the public believes that we have been enjoying an annual income of £2,222 free of all expenses since "Danckwerts," just so long will it be impossible for us to make the man in the street realize that we have any justification in asking for more money. Unfortunately, one finds little evidence that anything is being done to destroy the illusion.—I am, etc.,

Launceston, Cornwall

DONALD M. O'CONNOR.

* * The Spens Committee regarded £1,111 as being the proper average net income from all sources for a general practitioner in a National Health Service. This was in terms of 1938 values of money. The Danckwerts award doubled this figure for 1951 values of money, and stated that the average net remuneration per doctor should be £2,222. The total net remuneration from all sources of N.H.S. general practitioners is therefore a global sum of £2,222 multiplied by the number of principals.—Ed., B.M.J.

SIR.—I should like to offer the B.M.A. my whole-hearted support with respect to the present action in the matter of remuneration, but may I make a plea that wider issues should be considered also by the profession? The administrative interference and Governmental attitude towards the profession has whittled away the last shreds of any independence. Much of the administrative work is carried out by officials who are either unwilling or unable to deal with the medical questions with which they are continually confronted. The old tradition and value of the Hippocratic Oath and the doctors' position in society have disappeared in spite of the assurances of 1948.

I think one ought to remember that—in a recent court case, I believe—it has been argued and established that there exists a "master-servant" relationship between the Ministry and the profession. This, I believe, is the core of our problem, since in the older tradition we were servants only to our patients, to science, and our conscience. This is the outcome of the generally increasing reluctance to assume or reward responsibility. It is after all we who literally and figuratively have to act in the last resort. In that way I believe we are different from many other professions where the action taken affects welfare and life of our fellows less directly.—I am, etc.,

Colchester.

S. L. SHERWOOD.

Those Small Lists

SIR.—I quote a report from the *Daily Telegraph* of February 26. "Some country doctors with small lists of patients, it was pointed out, are as much in need of an increase [of pay] as any of the hospital doctors." This, of course, is true. It would probably be even more cogently true of the town doctors with small lists, since their uncompensated expense ratio is higher. Not only is it true, but this kind of remark has good propaganda value. It appeals to the fair-minded and not-too-analytical British public. To many small-list doctors whose memories are short, it may even sound a note of promise in their grim struggle to make ends meet. This particular hand-out from B.M.A. House may indeed indicate a genuine intention on the part of our present-day leaders to look after their less fortunate colleagues. But to those of us who have been closely linked with B.M.A. politics this is an oft-told tale which has acquired an unsavoury smell. Probably it was told in the fight with Lloyd George in 1911—I don't remember. Certainly it was a spearpoint of our propaganda in the fight with Bevan in 1947-8 and again in securing the Danckwerts arbitration in 1950-1. Yet the small lists remain and there is extensive unemployment in our profession.

The plain fact is that, by force of circumstances, the B.M.A. is run by the doctors with large lists. No one can afford the time-consuming game of medical politics unless he has a substantial income and at least one capable and willing assistant. And so the big committees at B.M.A. House which settle our destinies are composed almost exclusively of the "haves." I am about to retire from the N.H.S. and my view is detached. I feel impelled to sound a warning to the small-list and the unestablished doctors. Presently, if the fight is on, they will be asked to support a policy of collective resignation. Their support will be indispensable. They will be well advised to make their co-operation conditional upon a proper plan for the redistribution of remuneration in general practice. Such a plan should take account of the expense ratio of small practices and should solve the unemployment problem by drastically cutting down the capitation fee payable in relation to the upper ranges of lists above 2,500. Perhaps the G.M.S. Committee has already thought out a plan on these lines and is ready to present it to the special conference. It would be a handsome gesture and would do much to secure that indispensable unity.—I am, etc.,

Orpington Kent.

A. C. E. BREACH.

Saving on Prescribing

SIR.—The suggestion in Dr. Howard English's letter (*Supplement*, February 23, p. 95) that, in effect, doctors should economize by prescribing cheap standard preparations and be rewarded by an increase in their remuneration, is unwise. Especially is this so in the light of the growing volume of evidence of the superior quality of proprietary drugs, both from the pharmaceutical and clinical points of view. The evidence includes: (1) A recent report¹ by eminent analysts that a large proportion of standard barbiturate tablets examined by them were unsatisfactory, whereas all proprietary tablets examined were satisfactory. It is understood that the analysts are extending their survey to other classes of drugs, and have already made a preliminary observation that similar startling differences in quality were apparent in these. (2) A recent review by Dr. J. C. McClure Browne *et al.*² on clinical and laboratory assessments of senna preparations, in which they conclude that "Not only do apparently identical B.P. preparations of syrup of senna differ widely in their therapeutic effect, but, at average doses, the B.P. syrups tested were no better than inert controls. Chemical assay confirmed previous indications of deterioration in aqueous B.P. preparations. A dry granular preparation of senna pod ('senokot'), used in doses usually prescribed, proved to be chemically stable and to have a potent laxative effect." (3) Criticism³ by the Director of Medical Services, Cyprus, of the *National Formulary* on the ground that it was not an authoritative guide to modern therapeutics, but merely a compilation of all these preparations which may still be used by doctors, whether the medicament is still considered efficacious or no.—I am, etc.,

Horsham, Sussex.

Board-and-lodging Charges

SIR.—Since the inception of the National Health Service there has been a continuous process of reducing the reward for the services of whole-time hospital medical staff as compared with (1) the general community; (2) other groups of public service employees; (3) lay hospital officers; (4) general practitioners who, in any case, are largely notoriously under-remunerated for the work they do.

We know that there has been a continuing external relativity decline in regard to full-time hospital medical staff remuneration as compared with each of these other groups, and we know also that the 1951 increase for hospital medical officers (not awarded until 1954, and then not retrospectively) created an upheaval in the internal salary relativities as

between hospital medical staff grades themselves. Now a further disturbance has been caused by the recent unjustifiable residential charges for hospital medical officers. Quite apart from the anger which has been engendered among whole-time resident S.H.M.O.s, the recent board-and-lodging circular has made nonsense of differentials. For example, a fourth-year single resident senior registrar will receive a cheque for a larger amount than a single resident senior hospital medical officer on his starting salary after deduction of income tax and board-and-lodging charges. The senior registrar will receive £40 a year net more than the S.H.M.O. A second-year single resident S.H.M.O. receives £250 gross a year more than a fourth-year single resident senior registrar, but this is whittled down to only £17 a year net more after corresponding deductions have been made in each case. A single consultant in residence on his starting salary earns £14 a year less net than the top level single resident S.H.M.O. after deductions for tax and living in. In other words, the income of the resident medical officer drops on his initial promotion from senior registrar to S.H.M.O. or from S.H.M.O. to consultant.

This situation may or may not be equitable, depending on one's particular point of view about overlapping salaries, but I wonder whether it was the intention of the negotiating bodies so to disturb the balance of pay of the various hospital medical grades that the more "junior" medical officer receives a larger pay cheque than the more "senior." This is one of many illustrations of the host of anomalies that have developed since the old local authority hospital days. The extraordinary thing is that so many of the adjustments which are initiated on the hospital side seem ultimately to be to the disadvantage of the medical officer. Is it that the Treasury agents out-maneuvre their contestants, or that the hospital side negotiating party is forced by ministerial pressure to make unsatisfactory compromises, or is it, as some would contend, that we just haven't a clue?

Stoppages for insurance and superannuation contributions have been ignored in the above calculations, although in point of fact this makes the S.H.M.O.'s position worse relative to the senior registrar. Moreover, if the senior registrar achieves consultant status, the S.H.M.O. pays more in superannuation contributions than the senior registrar in proportion to his ultimate pension at this stage.—I am, etc.,

F. STEEL.

London, N.11.

Retiring Age

SIR.—I wonder if the frustrated senior registrars and others realize that one of the main factors accounting for their plight is the unnecessarily high retiring age imposed on our profession by the N.H. Service Superannuation Division of the Ministry of Health. And, for those who do not know, it is worth repeating that, except for psychiatrists and those fully incapacitated by ill-health, the minimum pensionable retiring age is 60, which seems to me oppressive.

I am quite sure that if the permissible pensionable retiring age could be lowered to 55 it would make for a much greater flexibility in the Service, allow a freer influx and advancement of young doctors, and provide for a natural fall-out of a proportion of less active seniors, with undoubted advantages to the Service as a whole. I suggest that a revision of this ruling on the retiring age would be timely.—I am, etc.,

Bangor.

J. ROBERTS.

Psychiatric Out-patient Departments

SIR.—Are we not proud of our British "bulldog" reputation, characteristic of our nation, and made more pronounced by adversity, emergencies, wars, or privation? In a letter in the *Supplement* of February 9 (p. 62) it was hoped by a correspondent, Dr. J. C. Sawle Thomas, that soon all general hospitals would have their own psycho-logical and psychiatric out-patient departments. To my mind this is a dangerous plan that will increase the number of neurotic people in England. Has not America too much interest in psychiatry, too much personal publicity, less

spiritual vitality, because of this? By all means let there be psychiatric units in some hospitals; but we should make it more difficult for mistakes, graver than imagined by unthinking people, to be made by housemen that will expose the private lives of many completely normal and balanced individuals to scrutiny and recordings.

Individuals may be high-spirited, serious, original, or even shy. If there is some tragedy or deep sorrow in their personal lives they may be temporarily unhappy or morose. Soon the fire and spiritual pride of our nation will be quelled by this "quick summing up" of patients, sent to hospital for other reasons, by a busy or tired physician or surgeon, who may think they are in need of psychological help. Once the label is there, the "rubber stamp" mentioned by Dr. C. Allan Birch (*Supplement*, February 23, p. 93) implies that the patient is below par psychologically—a heavy accusation to make. Too much criticism of our neighbours will remove truth, naturalness, of manner, and happiness of spontaneity. I hope some of my medical colleagues will heed the warning, because, once initiated as in State medicine, whinings and recriminations are too late.—I am, etc.,

M. M. DOBSON.

London, W.1.

Assurance Profits

SIR.—The fiftieth anniversary of the Medical Insurance Agency (long may it prosper) prompts me to ask a question which seems pertinent and well might be the subject of an inquiry by the Agency.

How much unexpected extra profit have the life assurance businesses made in the last 20 years following the introduction of chemotherapy and the antibiotics? The introduction of chemotherapy and the antibiotics must be an astronomical one and should be comparatively easy to calculate. The discomfort caused by the difficulty in investing this windfall is in daily evidence in the financial columns of newspapers, and most of the bigger companies seem to be disposing of a part of it by erecting huge nondescript blocks of offices. This money has been earned by medical science, and it would seem only reasonable that a proportion of it should be returned to source. For instance, were 10% of it applied to the capital re-equipment of hospital services, it might go a long way towards giving the National Health Service the "new look" it so badly needs.—I am, etc.,

Norwich

P. H. SUTTON.

G.P. Refresher Courses

SIR.—We live in an age of broken promises. Recently I applied for a place in two separate refresher courses for G.P.s, within ten days of the advertisement in the *British Medical Journal*. The first advised me to apply for the September course as that of May was already full and had already a "fairly long waiting-list" for withdrawal places. The second advised me to make early application for a course in May, 1958, as that for May, 1957, "has been booked for some considerable time." All this, of course, is long before I attempt to find a locumtenent.

To reassure myself I turned to the *Handbook for General Medical Practitioners* (1955). Paragraph 265 (page 57) runs (my own italics): "The Minister is anxious that general practitioners taking part in the Service should have every opportunity to attend these courses. . . . The only conditions to be satisfied are that the doctor must . . . have at least 500 persons on his list"—no mention of finding a locumtenent. This is one of the issues on which G.P.s stand alone and affects particularly those who are single-handed. Consultants have no leave problems. Some method must be devised and written into any future agreement on pay and conditions. The cost of a holiday is now prohibitive and these refresher courses offer our only hope of respite from door-bell and telephone. It cannot be too much to ask from a Ministry which values our service so highly that special arrangements are made (*sic*) to keep us up to date. There has been a lot of talk recently about the health of medical students. Does the Ministry care

what happens to the single-handed practitioners who cannot afford a holiday? Is there any other person in the civilized world who is "at risk" for 24 hours a day, each and every day?—I am, etc.,

Barrow-in-Furness.

J. H. C. CORR.

Improving Maternity Care

SIR,—Under the heading "Maternity Services Committee" (*Supplement*, March 2, p. 100) you report that the Royal College of Midwives, in its evidence to the committee on the maternity services now sitting under the chairmanship of Lord Cranbrook, has stated that "there should be more careful selection of general-practitioner obstetricians . . . all general practitioners should be required to have post-graduate experience in a maternity hospital or unit and should attend refresher courses at regular intervals."

One could not deny that there may be (I for one would not judge my equal; still less would I judge my senior) some instances where the general-practitioner obstetrician fails to achieve the necessary standard in his work. Nevertheless I fail to see how in any way it is the prerogative of a nursing organization to question the integrity or capabilities of a group of doctors and to cast aspersions on (1) the professorial and consultant staff on whom has fallen the responsibility of training these doctors; (2) the examining bodies who have passed these doctors in their respective subjects; (3) the local medical committee to whom application must be made for inclusion on the obstetrical list and to whom ample evidence must be given of competence; and (4) the local executive committee on whom rests the final responsibility for agreeing to the inclusion of a practitioner's name on the obstetrical list. Note further, please, that in future we general-practitioner obstetricians are to be ordered to go back to school, not on our own initiative or desire to glean further knowledge, but at the express wishes of the College of Midwives.—I am, etc.,

Liverpool, 7.

HUGH W. FORSHAW.

H.M. Forces

The name of Captain J. Parr, R.A.M.C. (Att. 5 K.A.R.), appears in a list of personnel who have been mentioned in dispatches in recognition of distinguished services in Kenya for the period April 21 to October 20, 1956.

A *Supplement* to the *London Gazette* has announced the following awards:

Fourth Clasp to the Territorial Efficiency Decoration.—Major G. D. Thompson, T.D., R.A.M.C.

Second Clasp to the Territorial Efficiency Decoration.—Colonel J. P. J. Jenkins, O.B.E., T.D. (Retired). Lieutenant-Colonel C. S. Nicol, T.D., and Major R. W. Evans, T.D., R.A.M.C.

First Clasp to the Territorial Efficiency Decoration.—Colonel J. P. J. Jenkins, O.B.E., T.D. (Retired).

Territorial Efficiency Decoration.—Major E. R. Smith-Owen (now S.S.R.C.), Captain (Honorary Major) M. C. W. Long (Retired), and Captain D. L. J. Bilbey, R.A.M.C.

ROYAL NAVY

Surgeon Commander G. A. Miller has retired.
Surgeon Lieutenants J. M. Houghton, P. W. Head, and L. J. Evered to be Surgeon Lieutenant-Commanders.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Captain H. M. Willoughby, V.R.D., has retired.
Surgeon Lieutenants K. E. E. Read, N. A. Lewtas, J. P. R. Richardson, and M. M. Brown to be Surgeon Lieutenant-Commanders.

ARMY

Lieutenant-Colonels M. S. W. Bisdee, O.B.E., A. J. Clyne, C.B.E., and J. C. Reed, C.B.E., from R.A.M.C., to be Colonels.

ROYAL ARMY MEDICAL CORPS

Majors C. E. Stuart, F. J. W. Hooper, T.D., T. P. H. McKelvey, and A. B. Dick, T.D., to be Lieutenant-Colonels.

Major E. G. Hardy has retired, receiving a gratuity (Reserve Liability).

Captains E. H. Hillyard and W. O'C. Fitzpatrick to be Majors.
Short Service Commission.—Lieutenant W. E. Tyndall, C.B., C.B.E., M.C., has relinquished his commission, and reverted to retired pay in the rank of Major-General. Major J. B. Spearman has retired, receiving a gratuity (Reserve Liability).

REGULAR ARMY RESERVE OF OFFICERS

Colonel D. C. Bowie, O.B.E.; late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Colonel F. W. A. Warren, O.B.E., T.D., to be Honorary Colonel, 27 General Hospital.

Colonel M. de Lacey, O.B.E., T.D., has retired, retaining the rank of Colonel.

Lieutenant-Colonels (Acting Colonels) G. S. Adams, T.D., and S. T. Anning, T.D., to be Colonels.

Lieutenant-Colonel B. Holden has been granted the acting rank of Colonel.

Majors (Acting Lieutenant-Colonels) O. Walker, W. H. Valentine, O.B.E., E.R.D., J. G. A. Gilruth, T.D., and L. H. Lerman to be Lieutenant-Colonels.

Major W. K. S. Moore has resigned his commission and has been granted the honorary rank of Major.

Major J. H. Dean, T.D., has resigned his commission, retaining the rank of Major.

Captain (Acting Lieutenant-Colonel) R. B. Wilson to be Major.

Captain (Acting Major) C. W. S. F. Manning has been granted the acting rank of Lieutenant-Colonel.

Captain A. M. Wiley, from Regular Army, National Service List, to be Captain, and has been granted the acting rank of Major.

Lieutenant (War Substantive Captain) S. R. T. Headley, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel (Brevet-Colonel (Acting Colonel)) M. J. Lindsey, O.B.E., M.C., T.D., to be Colonel.

Lieutenant-Colonel A. E. K. Price, T.D., has been granted the acting rank of Colonel.

Lieutenant-Colonel G. M. Warrack, D.S.O., O.B.E., T.D., from A.E.R.O., to be Lieutenant-Colonel, and has been granted the acting rank of Colonel.

Majors (Acting Lieutenant-Colonels) J. P. W. Hughes, T.D., I. W. Caldwell, C. O. Carter, R. G. Sykes, E. Grey-Turner, M.C., T.D., J. W. A. Crabtree, and K. C. MacKellvie, T.D., to be Lieutenant-Colonels.

Major E. H. Hanson, T.D., has been granted the acting rank of Colonel.

Majors M. F. Ronayne, O.B.E., and J. S. Binning have been granted the acting rank of Lieutenant-Colonel.

Major J. S. B. Mackay, T.D., has retired, retaining the rank of Major.

Major D. O'Brien has resigned his commission, retaining the rank of Major.

Captain T. W. Barnes to be Major.

Captains N. B. Crisp, T. N. Reynolds, and J. K. Butterfield have been granted the acting rank of Major.

Captain (Acting Major) H. C. Sims, having exceeded the age limit, has retired, and has been granted the honorary rank of Major.

Captain (Acting Major) A. J. Heber to be Major.

Lieutenant (War Substantive Captain) D. A. Stanley, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel C. K. D. Edwards, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Colonel.

Colonels W. Milburn, M.B.E., T.D., R. Passmore, C. K. D. Edwards, T.D., G. Rigby-Jones, M.C., T.D., J. Smith, O.B.E., T.D., and J. B. Mackay, M.B.E., T.D., from Active List, to be Colonels.

Lieutenant-Colonels J. G. Waugh, J. B. Heycock, M.C., T.D., D. T. Rowlands, and C. W. P. Bradfield, T.D., from Active List, to be Lieutenant-Colonels.

Lieutenant-Colonels D. S. Middleton, T.D., B. C. Jennings, T.D., and D. W. E. Lloyd, M.C., T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the rank of Lieutenant-Colonel.

Majors (Honorary Colonels) J. F. Wilde, T.D., R. K. Debenham, O.B.E., and M. Stoddart-Scott, O.B.E., T.D., M.P., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Colonel.

Majors (Honorary Lieutenant-Colonels) H. G. Garland, T.D., W. G. Love, T.D., D. A. Hunt, T.D., and K. McL. Cobban have ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Majors (Honorary Lieutenant-Colonels) C. H. P. Pauli, T.D., A. I. Hunter, P. H. R. Anderson, J. Wright, T.D., T. McK. Robb, and J. D. Finlayson, M.B.E., T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Major (Acting Lieutenant-Colonel) H. J. C. J. L'Etang, from Active List, to be Major, and has been granted the honorary rank of Lieutenant-Colonel.

Major H. B. Trumper, T.D., from Active List, to be Major, and has been granted the honorary rank of Lieutenant-Colonel.

Majors D. MacG. Williamson and S. A. Jenkins have ceased to belong to the T.A.R.O., retaining the rank of Major.

Majors J. C. Fletcher, T.D., D. W. L. Leslie, A. S. Fairbairn, C. Bainbridge, O.B.E., J. D. Bruzard, D. B. McVittie, T.D., P. B. Williams, T.D., W. A. Todd, R. W. J. Naismith, S. R. Gosling, J. E. McClelland, and P. Jacobs, from Active List, to be Majors.

Major G. B. Matthews, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Major.

Major F. W. Newby-Good, T.D., has ceased to belong to the T.A.R.O., on appointment to the Canadian Army (Supplementary Reserve).

Captains (Honorary Majors) F. G. Brown, T.D., and R. M. McGregor, T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captain (Honorary Major) J. A. Dunlop has relinquished his commission, retaining the honorary rank of Major.

Captains (Honorary Majors) F. R. R. Martin, J. H. Bulleid, G. C. Smith, and D. R. Beaton, T.D., have ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captain (Acting Major) D. J. Ellison, from Active List, to be Captain, and has been granted the honorary rank of Major.

Captain (Acting Major) S. Myers, from Active List, to be Captain, relinquishing the acting rank of Major.

Captain B. M. C. Gilsenan, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., and has been granted the honorary rank of Major.

Lieutenant (War Substantive Captain) (Honorary Major) J. J. Mitchell, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

ROYAL AIR FORCE

Air Marshal Sir James MacC. Kilpatrick, K.B.E., C.B., Q.H.P., has retired.

Squadron Leader F. J. Davies has resigned his commission. (Substituted for the notification in a *Supplement* to the *London Gazette* dated February 5.)

Squadron Leader A. M. Cook has been transferred to the Reserve.

Flight Lieutenant A. N. H. Wright has been transferred to the Reserve, retaining the rank of Squadron Leader.

ROYAL AIR FORCE RESERVE OF OFFICERS

Squadron Leaders J. G. Rountree, A. G. Burke, and W. G. Holdsworth have relinquished their commissions, retaining their rank.

Flight Lieutenant C. W. S. Marris has relinquished his commission, retaining the rank of Squadron Leader.

ROYAL AUXILIARY AIR FORCE

Flight Lieutenant R. Mathieson to be Squadron Leader.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squadron Leaders D. B. Matthews, O.B.E., N. E. Stidolph, and C. H. Stewart-Hess have relinquished their commissions, retaining the rank of Wing Commander.

Squadron Leaders T. K. Bryn and T. A. Grimson have relinquished their commissions, retaining their rank, on appointment to the R.A.F.V.R.

Squadron Leaders D. Sheehan, N. Jackson, J. H. McIlraith, G. T. B. Mackinnell-Childs, J. D. Ramsay, T. M. Banham, J. H. Hurst, J. Laurie, E. I. Davis, G. C. W. James, L. M. Rouillard, and R. I. Shier have relinquished their commissions, retaining their rank.

Squadron Leader F. W. Ford has relinquished his commission.

Flight Lieutenants B. G. C. Ackner, H. M. Grant, and H. R. Rolin have relinquished their commissions, retaining the rank of Wing Commander.

Flight Lieutenants, R. C. Browne, C. O. Greer, P. R. K. Bradbury, J. S. Wood, A. T. Hawthorne, H. A. MacLachlan, T. M. Prosser, G. H. Scott, G. G. Lennon, R. W. Parnell, D. C. Russell, J. G. Smith, J. V. Maher, B. G. Parsons-Smith, O.B.E., W. T. Ross, P. H. Davies, A. Shapiro, G. McI. Tucker, D. P. Harris, J. J. O'Dwyer, K. W. B. Rostron, A. B. Rowlands,

J. A. B. Thomas, and M. P. J. Hickey have relinquished their commissions, retaining the rank of Squadron Leader.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: J. M. S. Garrod, M.B., Ch.B., D.T.M.&H., Director, East African Leprosy Research Centre, East Africa High Commission; Fun Yung Khoo, M.B., B.S., D.M.R.D., Senior Radiologist (Diagnostic), Singapore; H. E. Knowles, M.R.C.S., L.R.C.P., D.M.R.D., Radiologist, Fiji; E. H. Madge, M.B., B.S., Surgeon Specialist, Mauritius; A. W. Mearns, M.B., Ch.B., D.P.H., Senior Medical Officer (Health), Jamaica; H. J. McPherson, M.B., Ch.B., D.O., Specialist, Grade A, Ophthalmologist, Selangor, Federation of Malaya; A. J. Walker, M.D., M.R.C.P., D.P.H., D.T.M.&H., Director of Medical Services, Kenya; R. J. Grove-White, M.D., M.R.C.P., Medical Superintendent, Trafalgar Home, Singapore; C. M. Norman-Williams, M.B., Ch.B., D.P.H., D.T.M.&H., Assistant Director of Medical Services, Western Nigeria; Ellen Carey, M.B., B.Ch., D.P.H., Lady Health Officer, British Guiana; W. Dunn, M.B., Ch.B., D.R.C.O.G., and C. M. MacCallum, M.B., Ch.B., Medical Officers, Silicosis Medical Bureau, Northern Rhodesia; Rosemary Hart, M.D., Specialist (Physician), Gold Coast; M. Crkvenac, M.D., Temporary Medical Officer, Northern Nigeria; A. B. Roberts, M.R.C.S., L.R.C.P., and K. Toal, M.B., B.Ch., Medical Officers, South Pacific Health Service, British Solomon Islands Protectorate; C. E. P. Samarasinghe, L.M.S., D.C.H., C.P.H., D.P.H., D.T.M.&H., Medical Officer of Health, Gold Coast; N. P. B. Smyth, L.R.C.P.&S.I., Medical Officer, Kenya; I. D. Smyth, M.B., B.Ch., Medical Officer, St. Vincent, Windward Islands; H. J. Van Der Kaay, M.D., Medical Officer, Western Nigeria; D. A. Westwood, M.B., Ch.B., Medical Officer, Northern Nigeria.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- American College of Surgeons, Committee on Trauma: Early Care of Acute Soft Tissue Injuries. 1954.
- American College of Surgeons, Committee on Trauma: Outline of the Treatment of Fractures. 1956.
- Antoine, A.: Slimming the French Way. 1956.
- Beatty, B.: How to Live with Your Blood Pressure. 1956.
- Beck, A. C.: Obstetrical Practice. Sixth edition. 1955.
- Beck, F.: Ten Patients and an Almoner. 1956.
- Bender, L.: Psychopathology of Children with Organic Brain Disorders. 1956.
- Bisland, E.: True Book About Sister Kenny. 1956.
- Bourne, G.: Heart Disease. 1954.
- British Red Cross Society: Maternal and Child Welfare Manual No. 9. 1956.
- Brocher, J. E. W.: Die Occipito-Cervical-Gegend: eine diagnostisch-pathogenetische Studie. 1955.
- Campbell, W. C.: Operative Orthopaedics. Two volumes. Third edition, edited by J. S. Speed and R. A. Knight. 1956.
- Clegg, D. G.: Pattern for the Listening Eye. 1956.

Branch and Division Meetings to be Held

BROMLEY DIVISION.—At Bull's Head Hotel, Chislehurst, Wednesday, April 3, 6.30 for 7 p.m., dinner; 8.30 p.m., joint meeting with Law Society of Bromley. Address by Dr. J. H. Harley Williams: "Personality in Medicine."

CHESTERFIELD DIVISION.—At Station Hotel, Chesterfield, Friday, April 5, 7.30 to 8 p.m., reception. Presidential Address by Dr. Malcolm Graham: "No Humbug." Members and their ladies are invited.

CITY DIVISION.—Thursday, April 4, 2.30 p.m., visit to Brooke House (The Finsbury Employment Centre for the Elderly). Any B.M.A. members, but especially those of St. Pancras Division, are invited, together with spouses or other guests.

CLEVELAND DIVISION.—At Hinton's Café, Corporation Road, Middlesbrough, Wednesday, April 3, 7.30 p.m., supper meeting. B.M.A. lecture by Dr. E. B. Strauss: "Intractable Pain."

DORSET DIVISION.—At Nurses' Teaching Unit, Dorset County Hospital, Friday, April 5, 8.30 p.m., meeting. B.M.A. Lecture by Dr. M. A. Partridge: "Some Strange Cases."

DUNBARTONSHIRE DIVISION.—At Canniesburn Hospital, Tuesday, April 2, 8.15 p.m., annual general meeting, followed by meeting of all practitioners under contract with Dunbartonshire Executive Council.

EAST DENBIGH AND FLINT DIVISION.—At Blossoms Hotel, Chester, Thursday, April 4, 8.30 p.m., annual general meeting.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, April 4, 8.30 p.m., meeting. Lecture by Dr. E. A. Bennet: "Psychosomatic Disorders."

HASTINGS DIVISION.—At Lecture Room of Nurses' Home, Royal East Sussex Hospital, Hastings, Tuesday, April 2, 8.15 p.m., meeting. Address by Dr. G. E. Beaumont: "Diagnosis of Jaundice."

HOLLAND DIVISION.—At Bridge Hotel, Sutton Bridge, Saturday, April 6, 7.30 for 8 p.m., supper; 9 p.m., B.M.A. Lecture by Professor C. H. Stuart-Harris: "Virus Diseases."

LEICESTERSHIRE AND RUTLAND BRANCH.—At X-ray Department, Leicester Royal Infirmary and Children's Hospital, Wednesday, April 3, 8.30 p.m., meeting. B.M.A. Lecture by Dr. Ffrangcon Roberts: "Health During the Industrial Revolution."

LEWISHAM DIVISION.—At Traumatic Clinic, Lewisham General Hospital, High Street, Lewisham, S.E., Tuesday, April 2, 8.30 p.m., meeting. Address by Mr. J. G. Yates-Bell: "Management of Urological Problems in the Home."

NORTH BEDFORDSHIRE DIVISION.—At South Wing, Bedford General Hospital, Thursday, April 4, 8.30 p.m., meeting. Lecture by Mr. Kenneth Walker: "Problems Associated with Infertility."

NORTH-EAST ESSEX DIVISION.—At Red Lion Hotel, Colchester, Tuesday, April 2, 8.30 p.m., Brains Trust. Subject: Dyspepsia. Panel, Mr. R. D. Reid, Dr. S. A. Propert, Dr. J. B. Penfold, and Dr. R. Sauvan Smith.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, April 2, 8 p.m., supper meeting. Lecture by Dr. E. C. Hutchinson: "Some Observations on Cerebral Vascular Disease."

NUNEATON AND TAMWORTH DIVISION.—At Three Tuns Hotel, Atherstone, Thursday, April 4, 8 p.m., informal supper; 8.45 p.m., general meeting.

SALISBURY DIVISION.—At White Hart Hotel, Salisbury, Saturday, April 6, 7.15 for 7.30 p.m., dinner; 8.30 p.m., meeting. B.M.A. lecture by Dr. Donald Hunter: "Studies of Metabolism in Skeletal Diseases." All medical practitioners in the area of the Division are invited.

SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Sunday, April 7, 10.30 a.m., clinical meeting.

SHEFFIELD DIVISION.—At University Medical Library, Friday, April 5, 8.30 p.m., annual general meeting.

SOUTH BEDFORDSHIRE DIVISION.—At Out-patient Hall, Luton and Dunstable Hospital, Saturday, April 6, 9 p.m., meeting. Lecture by Miss Rose Heilbron, Q.C.: "The Legal Responsibilities of Doctors."

SOUTH-EAST ESSEX DIVISION.—At Overcliff Hotel, Westcliff, Thursday, April 4, 8.30 p.m., meeting. Address by Dr. C. Keith Simpson: "Clues at the Scene." Members of Southend-on-Sea and District Law Society are invited.

SOUTH MIDDLESEX DIVISION.—At Anchor Hotel, Shepperton, Wednesday, April 3, 9 p.m., meeting. Talk by Sir Russell Brail, P.R.C.P.: "Cervical Spondylosis."

TUNBRIDGE WELLS DIVISION.—At Pump Room, Tunbridge Wells, Sunday, April 7, 5 p.m., meeting.

WEST HERTS DIVISION.—At Shrodel's Hospital, Vicarage Road, Watford, Friday, April 5, 8.30 for 9 p.m., joint clinical meeting with West Herts and Watford Medical Society.

WEST SUSSEX DIVISION.—At 2, Longfellow Road, Worthing, Sunday, April 7, 4.30 p.m., general meeting.

Meetings of Branches and Divisions

HAMPSTEAD DIVISION

A dinner was held at the House of Commons on March 7 by invitation of the Rt. Hon. Henry Brooke, M.P., Minister of Housing and Local Government and Minister for Welsh Affairs. Members' wives were among the 54 persons who attended. Dr. L. J. Stoll presided, and the chief guests were the Rt. Hon. Dennis Vosper, M.P., Minister of Health, and Dr. A. Macrae, Secretary of the B.M.A. Mr. Brooke proposed the toast of "the Hampstead Division of the British Medical Association," and Dr. Macrae replied. In responding to the toast of "Our Guests," proposed by the chairman, Mr. Vosper expressed the hope that he would have further opportunities of meeting members of the Association in local Divisions.

KENYA BRANCH

The annual general meeting was held on January 25. The secretary reported that during 1956 membership of the Branch topped the 300 mark for the first time. Monthly meetings were held throughout the year, and among the speakers were Sir Robert McIntosh on anaesthesia, Sir Harold Gillies on plastic surgery, Sir James Learmonth on peripheral nerve compression, and Drs. Harries and Lawes on their work in the Nairobi respiratory unit. Among the Branch Council's activities was the achievement of upgrading of salaries of medical staff following negotiations with the Nairobi City Council. The following officers were elected for 1957:

Vice-president.—Dr. K. V. Adalja.

Honorary Secretary.—Mr. Andrew Hicks.

Honorary Treasurer.—Dr. J. A. Carman.

WEMBLEY DIVISION

A combined meeting of doctors and clergy was held on January 29 at Wembley Hospital. Dr. M. Latner was in the chair. Dr. E. White spoke on possible methods of co-operation between the clergy and medical practitioners. He suggested talks to married and engaged couples, on the lines of those given by the Marriage Guidance Council, to be organized by both doctors and clergy, and the possibility of a centre where a patient could discuss his problems with either a clergyman or a doctor, or both. His talk was followed by a discussion. It was felt that action should be taken to establish co-operation, and a steering committee was provisionally appointed.

WEST SUFFOLK DIVISION

The annual general meeting was held at Everard's Hotel, Bury St. Edmund's on February 19, 1957. Dr. T. C. Kirkpatrick was in the chair, and 26 members attended. The following officers were elected for the ensuing year:

Chairman.—Dr. J. W. E. Cory.

Deputy Vice-chairman.—Dr. T. C. Kirkpatrick.

Honorary Secretary and Treasurer.—Dr. S. Blaxland.

SPECIAL REPRESENTATIVE MEETING
Wednesday, May 1, 1957

REPORT OF THE COUNCIL

THE DISPUTE ON REMUNERATION

The following resolutions were adopted by the A.R.M., 1956:

125. **Resolved** (*nem. con.*): That this Meeting welcomes the proposal for a joint approach by the General Medical Services Committee and the Joint Consultants Committee to the Minister on the question of remuneration of members of the profession.

126. **Resolved**: That this Meeting wholeheartedly welcomes the joint approach by the Consultant and General Practitioner Committees to matters affecting remuneration, warmly congratulates those responsible for this unity of action, and hopes that in any such activities in the future the Public Health Services may be fully represented.

The Council has been kept fully informed of the strenuous but abortive efforts of the Negotiating Committee to secure an opportunity of negotiation or, alternatively, of arbitration on the claim for an adjustment of the remuneration of general medical practitioners and hospital medical staffs in the National Health Service.

The following statement was issued by the Council after an emergency meeting on February 28:

(1) The Council fully supports the decision of its General Medical Services Committee to convene a Special Conference of Representatives of Local Medical Committees and to recommend to that Conference that, unless the Government agrees to an immediate and satisfactory settlement of the profession's claim or to arbitration, general practitioners throughout the country will be advised to send in their resignations from the Service.

(2) The Council has heard a report of the interpretation by the Minister of Health of the Prime Minister's statement that the possibility of an interim adjustment was not precluded. On the evidence before it, the Council can see no fundamental change in the situation which would justify any alteration in the course of action recommended by its General Medical Services Committee.

(3) The Council has noted the statement made by the Prime Minister in Parliament that he is prepared to clarify his statement at the appropriate moment. The Council believes that the present is the appropriate time and is inviting the Negotiating Committee to approach the Prime Minister for immediate clarification.

(4) The Council has noted with great satisfaction the assurances of support given by the Public Health Committee of the Association, representing medical officers in the Public Health Service, and the Joint Consultants Committee, representing hospital medical staffs.

(5) The Council resolves that the convening of a Special Representative Meeting be requisitioned at an appropriate time to consider a report and a recommendation of the Council concerning the further action to be taken by the Association in the present dispute with the Government on medical remuneration.

The long and unhappy story of the dispute with the Government is contained in the Report of the General Medical Services Committee to the Special Conference of Local Medical Committees to be held on April 30. In order to avoid the expense of publishing a separate report for the purpose of the Special Representative Meeting, the Report of the G.M.S. Committee to the Conference is appended to this Report of the Council. An extensive summary of the details of the plan for the organization of general practice in the event of resignation from the National Health Service, appeared in the *Supplement* to the *Journal* of March 23.

The Council fully endorses the proposals of the G.M.S. Committee, and recommends:

Recommendation: That, as there has been no satisfactory settlement of the profession's claim or the submission of that claim to arbitration, (1) the resignations of N.H.S. general practitioners be collected forthwith and held; and (2) the plan for a progressive withdrawal of general practitioners from the National Health Service (as outlined in the Appendix) be put into effect until such time as a satisfactory settlement is achieved or the dispute is referred to arbitration.

The Royal Commission

The Council has considered what should be the attitude of the Association to the Royal Commission on the Remuneration of Doctors and Dentists.

The Council, anxious to put an end to this unfortunate dispute by peaceful methods, regards arbitration as the proper alternative to negotiations, which have been refused. It is clear, however, that the Royal Commission is not an

arbitration tribunal, since its composition and terms of reference have not been agreed upon by the parties to the dispute and since neither party is under any obligation to accept its recommendations.

Moreover, it appears to the Council that the terms of reference of the Royal Commission are such as to preclude it from making just decisions as to the correct levels of medical remuneration in the National Health Service.

The Council considers it to be of fundamental importance that, in the interests of the Health Service and the general community, the profession should hold fast to the principle enunciated in the terms of reference of the Spens Committees—the principle that the incomes of medical practitioners engaged in a publicly organized health service should be fixed with due regard to the financial expectations of medical practice in the past and to the desirability of maintaining in the future the proper social and economic status of medical practice and its power to attract a suitable type of recruit to the profession. To co-operate with the Royal Commission by submitting evidence to the Commission would be to acquiesce in the abandonment of this principle and to accept the view that the economic status achieved by the medical profession in the past is of no account, that the promises of successive Governments to maintain this status should be dismissed from consideration, and that all that matters now is that the incomes of doctors should be adjusted to those received by members of other “professions” and “connected occupations,” such as architects, accountants, bankers, solicitors, surveyors, pharmaceutical chemists, nurses, physiotherapists, chiropodists, laboratory technicians, and dental mechanics.

The Prime Minister has suggested that an exchange of letters regarding the interpretation to be placed by the Royal Commission on its terms of reference might reassure the profession, but the Council is advised that the terms of reference in their present form cannot be so construed as to ensure the observance of the principle referred to above. This could be ensured only by a radical amendment of the terms themselves.

Again, although the claim lodged by the Negotiating Committee was for an adjustment only of the remuneration of general practitioners and hospital medical staffs, the Council is strongly of the opinion that a full review of medical remuneration—the declared purpose for which the Royal Commission was appointed—should include consideration of the incomes of doctors employed by local authorities. It understands, however, that it is not intended that the Commission should pronounce on the remuneration of these members of the profession.

The Council feels sure that the existence of this unhappy dispute, due to the refusal of the Government to allow either negotiation or arbitration, is deplored by the whole profession, and that, if the present claim were satisfactorily settled, the profession would then be entirely willing to engage in discussions with the Government on the machinery for periodical adjustments of remuneration in the future with a view to preventing a recurrence of crises of this kind.

The Council recommends:

Recommendation: (1) That, in the opinion of the Representative Body, in present circumstances it is undesirable that the Association should co-operate in any way with the Royal Commission on the Remuneration of Doctors and Dentists; (2) that, if at a later date circumstances should so alter as to enable the Representative Body to reconsider its attitude to the Royal Commission, any decision to participate be conditional on the inclusion of all public health medical officers within the terms of reference of the Royal Commission.

Health Services in the Future

The record of the Government's treatment of the profession in this and other matters has brought home defects in the relationship between Medicine and the State in the National Health Service as now constituted. The Council has formed the view—which it believes to be shared by many thoughtful members of the Association who have at

heart the maintenance of the best traditions of the profession—that the time has come when the Association should institute a comprehensive review of medical services administered by the State in the light of nine years' experience of the National Health Service. The Council suggests that this review should be undertaken by a Committee fully representative of the interests concerned, medical and lay. The aim would be to eradicate those faults of the present system which cause dissatisfaction to the public and frustration to the profession.

The Council recommends:

Recommendation: That the Council be instructed to institute an inquiry into the whole field of publicly administered medical services in the light of the experience gained of the National Health Service since 1948.

B.M.A. MEMORANDUM TO MEMBERS OF PARLIAMENT

Last week the Association's Public Relations Officer, Mr. John Pringle, sent a memorandum headed "A Crisis of Confidence" to Members of both Houses of Parliament. It is reproduced here in full.

SOME NOTES ON THE DISPUTE WITH THE GOVERNMENT

The medical profession entered the National Health Service in 1948 on a promise by the Minister of Health that the Government accepted—without reservation—the recommendations of the Spens Reports. No responsible person in or out of the Government has ever denied that these pledges were in fact given—and accepted—and that it was on this basis that the profession entered into a completely new relationship with the State.

What has been in dispute from time to time has been the interpretation of the Spens Reports themselves. In 1950 differences developed between the Government and the profession. These differences were, by agreement, referred to an adjudicator, Mr. Justice Danckwerts, who was asked to determine the proper remuneration of general practitioners:

“in order to give effect to the recommendations of the Spens Committee, having regard to the change in the value of money since 1939, to the increases which have taken place in incomes in other professions, and to all other relevant factors.”

The Danckwerts adjudication was accepted both by the Government and the profession.

In the five years following the Danckwerts award the value of money fell by at least 24%. Increases have been given to many other professions, and many groups in the community have enjoyed increases ranging from 30 to 40%. The medical profession has received nothing.

RESTRAINT BY THE PROFESSION

Out of consideration for the country's economic difficulties, and in deference to the Government's appeals for restraint, the profession has year by year refrained from making any fresh claim. What was proper remuneration in 1951 cannot be right in 1957. A claim for an increase of not less than 24% in the remuneration of general practitioners, consultants, and other hospital medical staff was submitted to the Government last year. It was submitted on June 14, 1956. But, in fact, intention to claim had been notified to the Government as far back as February, 1956.

The claim was backed by the highest economic and legal advice. The arguments used in it appear to the profession to be unanswerable. On no single occasion have the Government attempted to answer them. They have refused to consider the claim at all. This is the outstanding fact which disposes of the argument that the doctors are

“unreasonable” people who are asking to be “insulated” for ever and ever against rising prices by their insistence on the Spens Reports.

Apart altogether from Spens, the Government have refused to look at the claim even on its simple merits—that the doctors are at least 24% worse off than they were in 1951.

Representatives of the Negotiating Committee of the profession have met the Minister of Health on three occasions, and the Joint Chairmen met the Prime Minister on March 12, merely to be informed of Government decisions. As at the present date, the following is the situation:

**Refusal to examine the claim.
Refusal to negotiate.
Refusal to arbitrate.**

THE ROYAL COMMISSION

The situation has been worsened by the method which the Government have adopted and which the profession see as an effort to escape alike from their difficulties and their obligations to it.

Without a single word of consultation with the profession the Government have set up a Royal Commission to review medical remuneration. This announcement has been widely and trenchantly criticized as a transparent device for shelving the Government's responsibility.

The B.M.A. Council was determined not to rush into taking a “snap” decision about this Royal Commission. The highest legal advice available to the Council was taken. The question of the profession's attitude to the Commission has been under careful examination for well over a month. After all this consideration the B.M.A. Council yesterday reached a decision to recommend to the doctors that:

it is undesirable in present circumstances that the Association should co-operate in any way with the Royal Commission on the remuneration of doctors and dentists.

This is a very grave decision. It is hoped that Members of Parliament will appreciate that it has not been reached lightly. It scarcely needs saying, we trust, that not the slightest suggestion of disrespect to the chairman and members of the Commission is intended; still less, the least disrespect to the Crown.

Everyone knows the facts regarding the appointment of Royal Commissions. They are set up by the Crown, but on the advice of the Government of the day. The job they have to do is determined by the Government's. If their terms of reference are the Government's, it is appointment and terms of reference are misconceived, it is the Government which must bear the criticism, and nobody else.

The B.M.A. Council has come to its decision because:

(1) The profession has repeatedly made it clear that it would welcome the submission of its pay claim to independent arbitration and would abide by the result. On March 18, referring to industrial disputes, the Prime Minister said: “Surely this is a time when we should accept some form of arbitration rather than have recourse to self-destructive struggles. . . . In the long run, and for the common good, an umpire is better than a duel.”

It will be argued by Government spokesmen that the Royal Commission constitutes “some form of arbitration.” This is not so.

The Royal Commission cannot be regarded as an arbitration tribunal, since its composition and terms of reference have not been agreed by the parties to the dispute and since neither party is under any obligation to accept its recommendations.

(2) The terms of reference of the Royal Commission pre-judge the issue in favour of the Government. This question of the terms of reference is, of course, fundamental. Any ordinary committee, still more a Royal Commission, is bound, throughout its proceedings, to have a continuous regard to the job it is asked to do as set out in its terms of

reference. It must not, and cannot, go outside its terms of reference. The value of its recommendations will be weighed by all concerned according to how strictly it has answered the questions put to it.

Below are the two sets of terms of reference:

- (i) The terms of reference for the (General Practitioner) Spens Committee of 1945;
- (ii) The terms of reference of the Royal Commission, 1957.

Spens

“To consider, after obtaining whatever information and evidence it thinks fit, what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice; to consider this with due regard to what have been the normal financial expectations of general medical practice in the past, and to the desirability of maintaining in the future the proper social and economic status of general medical practice and its power to attract a suitable type of recruit to the profession; and to make recommendations.”

Royal Commission

“To consider:

“(a) How the levels of professional remuneration from all sources now received by doctors and dentists taking any part in the National Health Service compare with the remuneration received by members of other professions, by other members of the medical and dental professions, and by people engaged in connected occupations;

“(b) What, in the light of the foregoing, should be the proper current levels of remuneration of such doctors and dentists by the National Health Service;

“(c) Whether, and if so what, arrangements should be made to keep that remuneration under review.

“And to make recommendations.”

It will be seen at once that (a) and (b) in the Royal Commission's terms of reference are restrictive. The Spens terms of reference were concerned with the medical profession in its relation to the community as a whole—e.g., the references to “the desirability of maintaining in the future the proper social and economic status of general medical practice” and the need to maintain recruitment to the profession.

The B.M.A. considers it to be of fundamental importance that, in the interests of the Health Service and the general community, the profession should hold fast to the principle enunciated in the terms of reference of the Spens Committees—the principle that the incomes of medical practitioners engaged in a publicly organized health service should be fixed with due regard to the financial expectations of medical practice in the past and to the desirability of maintaining in the future the proper social and economic status of medical practice and its power to attract a suitable type of recruit to the profession.

To co-operate with the Royal Commission by submitting evidence to the Commission would be to acquiesce in the abandonment of this principle and to accept the view that the economic status achieved by the medical profession in the past is of no account, that the promises of successive Governments to maintain this status should be dismissed from consideration, and that all that matters now is that the incomes of doctors should be adjusted to those received by members of other “professions” and “connected occupations,” such as architects, accountants, bankers, solicitors, surveyors, pharmaceutical chemists, nurses, physiotherapists, chiropodists, laboratory technicians, and dental mechanics.

PROFESSIONS LOSING GROUND

It is common knowledge that the professional classes have been losing ground in the last 20 years relatively to other sections of the community. The terms of reference of the Royal Commission can only intensify this decline of the professional classes in social and economic status.

To co-operate with a Royal Commission with such terms of reference by submitting evidence to it would, in the view of the Council of the B.M.A., be to acquiesce in the

view that the economic status agreed for the medical profession in the past is of no account.

The Prime Minister has suggested (in his interview with Sir Russell Brain and Dr. Talbot Rogers) that an "exchange of letters" regarding the interpretation to be placed by the Royal Commission on its terms of reference might in some way reassure the profession. The Council is unable to see how this would help. The Royal Commission must be guided by its express terms of reference and nothing else. The Council is advised on the highest legal authority that no exchange of letters can radically alter the plain meaning of these terms.

The Council would like Members of Parliament to be assured on one other matter.

This unhappy dispute need never have happened. It is only due to the refusal of the Government to allow either negotiation or arbitration. Only the Health Service can suffer. This the profession has no wish to see happen, and the Council gives this pledge:

If the present claim can be satisfactorily settled by negotiation or arbitration, the medical profession will then be willing to engage in discussions with the Government on the machinery for periodical adjustments of remuneration in the future, with a view to preventing a recurrence of crises of this kind.

But the Council is convinced that the Royal Commission, with its present terms of reference—however interpreted—can neither deal properly with the present claim nor provide a satisfactory basis for the future.

HEALTH SERVICES IN THE FUTURE

The record of the Government in its dealings with the profession in this and other matters has led to a "crisis of confidence" between Medicine and the State which is now going much deeper than remuneration. The mere fact that it has been possible for the profession to suffer the treatment recently accorded it by the present Government is clear evidence that something is radically wrong in the relationship between Medicine and the State in the National Health Service as now constituted.

The B.M.A. Council decided yesterday that the Association itself should institute a comprehensive review of medical services administered by the State in the light of nine years' experience of the present National Health Service.

The Council intends that this review should be undertaken by a Committee fully representative of the interests concerned, medical and lay. The aim will be to eradicate those faults of the present system which cause dissatisfaction to the public and frustration to the profession.

The B.M.A. is convinced that the time has now arrived for a full examination of present health services, an examination which will continue irrespective of any settlement which may be arrived at of the profession's present remuneration dispute with the Government.

REMUNERATION CLAIM

DIARY OF EVENTS

1946

April.—Report of the Interdepartmental Committee on Remuneration of General Practitioners (G.P. Spens Committee).

1948

May.—Report of the Interdepartmental Committee on the Remuneration of Consultants and Specialists (Consultants and Specialists Spens Committee).

These committees were required not merely to recommend the proper levels of remuneration in the two branches of the profession but also to pay due regard to the desirability of maintaining in the future the appropriate social and

economic status of each section. Committees' recommendations accepted by profession and Government as the basis upon which the profession entered the N.H.S.

1950

May 22.—Letter from Permanent Secretary of Ministry of Health to B.M.A. "The Minister agrees that the Spens Report remains the basis of the remuneration of general medical practitioners until such time as after the usual consultations some other basis is substituted."

1952

March 24.—Adjudication by Mr. Justice Danckwerts on the betterment factor applicable to G.P. remuneration to give effect to Spens Committee recommendations, taking into account change of value of money since 1939. A betterment of 100% awarded as appropriate for 1951 compared with 1939 (*Supplement*, March 29, 1952, p. 113).

June.—Staff Side Committee B, Medical Whitley Council, put in claim for betterment for hospital medical staff in light of Danckwerts award.

July 3.—Statement by Minister of Health in Parliament:

"I want to make it clear that the terms of reference of Mr. Justice Danckwerts's award were confined solely to the question of the remuneration of general practitioners in the N.H.S. and his award has no wider application. In accepting the results of the adjudication, which was of an exceptional nature, the Government have by no means adopted the view that similar adjustments in other fields should follow. In their view, there is no justification for any assumption that the appropriate standard of remuneration for the professional classes is a rate of 100% above that in force in 1939. They consider that remuneration should be determined in the light of all relevant circumstances."

1954

April.—Increases made in remuneration of hospital medical staff; regarded by Staff Side of Whitley Committee B as restoring balance between consultants and specialists and general practitioners as at March, 1951 (*Supplement*, April 10, 1954, p. 145).

1956

February.—Minister of Health and Secretary of State for Scotland notified of consultants and specialists' and general practitioners' intention to make a joint remuneration claim. Joint Negotiating Committee set up; joint chairmen Sir Russell Brain and Dr. A. T. Rogers.

June 14.—Claim based on Spens Reports submitted to Ministers (*Supplement*, July 28, 1956, p. 75).

July 13.—Ministers replied; could not accept premises of claim. Government took view that "the remuneration of the medical profession, like that of others, must be determined from time to time in the light of all relevant circumstances" and "that in present circumstances they would not feel justified in giving consideration to any claim for a general increase in medical remuneration."

August 1.—Representatives of Negotiating Committee met Ministers. Ministers did not accept Committee's contention that Government had contractual obligation to profession. Government's view that Spens Reports merely established a starting point and did not entail automatic and periodic adjustments of remuneration.

September 12.—Supplementary memorandum on legal aspects of contractual obligation (*Supplement*, November 3, 1956, p. 173) submitted to Ministers by Negotiating Committee.

November 21.—Ministers' reply: still of opinion no contractual obligation existed; suggested matter could be tested in courts.

December 19.—Council of B.M.A. decided to overhaul British Medical Guild machinery (*Supplement*, January 5, p. 1).

1957

January 4.—Negotiating Committee's representatives met Ministers. No progress made. Ministers reiterated that

APRIL 6, 1957

REMUNERATION CLAIM

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL 153

PUBLIC HEALTH COMMITTEE ATTITUDE TO ROYAL COMMISSION

A special meeting of the Public Health Committee was held at B.M.A. House on March 22. Dr. J. B. TILLEY occupied the chair. The meeting was convened by the chairman to discuss the Government's intention that the remuneration of public health medical officers should not be considered by the Royal Commission. The Committee had before it a resolution passed by the G.M.S. Committee at its meeting on March 21, in the form of a recommendation to Council, that, in present circumstances, the Council should not co-operate with the Royal Commission.

After a debate held *in camera* the Committee passed unanimously two resolutions:

- (1) That the Council be informed that the Committee pledges its full support for the recommendation of the General Medical Services Committee.
- (2) That, on the assumption that the Council adopts the recommendation of the General Medical Services Committee, if at a later date circumstances should so alter as to enable the Council to reconsider its attitude to the Royal Commission, any decision to participate should be conditional on the inclusion of all public health medical officers within the terms of reference of the Royal Commission.

It was reported that no reply had yet been received from the Ministry to the Council's request for an independent inquiry into the remuneration of public health medical officers.

It agreed that, in the event of an independent inquiry being offered, another meeting of the Public Health Committee would be convened.

JUNIOR HOSPITAL MEDICAL STAFF PAY INCREASES

All hospital authorities have received instructions from the Ministry of Health to increase by 10% from April 1 the salaries of hospital medical and dental staff up to the grade of senior registrar. This follows the statement by the Prime Minister on March 12 that these increases would be made. The new rates per annum for whole-time appointments (with the old in brackets) are as follows:

Senior registrar: £1,210 in first year (£1,100); £1,320 in second year (£1,200); £1,430 in third year (£1,300); £1,540 in fourth year (£1,400). Registrar: £935 in first year and any subsequent year (£965). (£850); £1,061 10s. in second and any subsequent year (£775). Junior hospital medical officer: commencing at £852 10s. (£775) and rising by annual increments of £55 to £1,182 10s. (£1,075). Senior house officer: £819 10s. (£745). House officer: £467 10s. for first post held (£425); £522 10s. for second post held (£475); £577 10s. for third and subsequent post held (£525).

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.

Government had been advised that no legal contractual obligation to profession existed. Ministers stated merits of claim could not be examined in present economic circumstances.

January 17.—Change of Ministers of Health in Government reorganization. Mr. D. Vosper appointed.

February 20.—Negotiating Committee's representatives met Mr. Vosper, who repeated that Government could not consider merits of claim as economic position unchanged. Minister announced that Royal Commission would be set up for full review of medical and dental remuneration. No prior consultation about this with profession. Negotiating Committee requested its joint chairmen to send immediate letter to Prime Minister asking even at that late hour that arbitration might be considered (text of letter and Prime Minister's reply, *Supplement*, March 2, p. 100).

February 21.—G.M.S. Committee decided to recommend resignation of G.P.s from Service if Government did not agree to immediate and satisfactory settlement of claim or, alternatively, arbitration.

February 28.—Joint chairmen of Negotiating Committee met Minister of Health. Minister unable to enlarge on statement in Prime Minister's letter that work of Royal Commission would not preclude some interim adjustment of remuneration. Minister repeated Government's offer of immediate adjustment of remuneration of junior hospital medical staff.

B.M.A. Council endorsed G.M.S. Committee's decision to recommend resignation of G.P.s to special conference. Prime Minister's statement on interim adjustment did not fundamentally alter situation. Assurances of support for G.P. resignation received from Joint Consultants Committee and Public Health Committee. Decision taken to convene special representative meeting. Council invited Negotiating Committee to approach Prime Minister for clarification of statement about interim adjustment.

Terms of reference of Royal Commission announced in Parliament (*Journal*, March 9, p. 569).

March 6.—Negotiating Committee asked its joint chairmen to approach Prime Minister. Results disappointing. Prime Minister suggested exchange of letters might remove doubts about interpretation of terms of reference of Royal Commission. Prime Minister made it clear that Government did not regard arbitration as appropriate.

March 12.—Emergency meeting of G.M.S. Committee. Decision taken to recommend that, in present circumstances, the Council should not co-operate in any way with Royal Commission.

March 22.—Emergency meeting of Public Health Committee. G.M.S. Committee's recommendation to Council that Association should not co-operate with Royal Commission endorsed. Exclusion of public health doctors from terms of reference of Royal Commission should future decision to participate in Royal Commission should be conditional on inclusion of public health medical officers in terms of reference.

March 23.—G.M.S. Committee's recommendation to special conference on April 30 and plan for organization of general practice in event of withdrawal from Service published (*Supplement*, March 23, p. 123).

March 27.—B.M.A. Council met. Endorsed G.M.S. Committee's recommendation that the Association should not under present circumstances co-operate in any way with Royal Commission. Considered that terms of reference precluded Royal Commission from making just decisions on levels of medical remuneration in the N.H.S. Decision taken to recommend to special representative meeting on May 1 that Council be instructed to institute inquiry into whole field of publicly administered medical services.

March 28.—Memorandum on dispute with Government sent by Association's Public Relations Officer to members of both Houses of Parliament (see p. 150 of this *Supplement*).

The Committee set up by the Scottish Health Services Council to review maternity services in Scotland recently held a meeting to begin hearing oral evidence from selected organizations. The Committee's terms of reference are: "To consider, through a professional subcommittee in the first place, the range of provision which should be available in the National Health Service in the interests of the mother and child during pregnancy, confinement, and lying-in; and to advise how best such provision can be secured within the framework of the Service." The chairman of the committee is Professor Montgomery, who is chairman of the Scottish Health Services Council. The medical secretary is Dr. Mabel Mitchell, of the Department of Health.

British Medical Association

PROCEEDINGS OF COUNCIL

The Council of the British Medical Association met at B.M.A. House on March 27, with Dr. S. WAND in the chair.

A great deal of the afternoon session was spent in considering the Council's report to the Special Representative Meeting to be held on May 1. This report and Council's recommendations to the Representative Body are published in the opening pages of this Supplement.

Obituary

The CHAIRMAN reported with regret the deaths of Isaac Jones, a member of Council, and of Robert Walter Dickson Leslie and William Stobie, former members of Council.

Late Mr. Harry Cooper

In paying tribute to the late Mr. Harry Cooper, the CHAIRMAN said it was doubtful whether there had been a more loyal supporter among the Association's own members than Mr. Harry Cooper. He was a man who loved the Association and all members of the Association had loved him. His speech at the Brighton Meeting would never be forgotten.

Member Honoured

The Council received with pleasure a report that Lieutenant-Colonel Keith Fielding Stephens, R.A.M.C., had been appointed an Officer of the Military Division of the Order of the British Empire in recognition of distinguished services in Cyprus.

Reports on A.R.M. Resolutions

Council agreed to recommend to the Representative Body, as an economy measure, that the following resolution of the A.R.M., 1954, be rescinded:

That this Meeting requests that when a resolution is passed at a Representative Meeting, the Division or Divisions concerned in moving the resolution be kept informed of the steps taken to implement the resolution.

It was agreed to recommend instead that Divisions should be informed of the final decision.

Hungarian Medical Refugees

It was reported that contributions to the B.M.A. Hungarian Relief Fund now amounted to £748.

Empire Medical Advisory Bureau

Mr. A. M. A. MOORE, Chairman of Committee of Management, presented the reports of the Empire Medical Advisory Bureau and the International Medical Visitors' Bureau. During 1956, 1,688 new inquirers made use of the Empire Medical Advisory Bureau and the International Medical Visitors' Bureau, and 883 made their first personal calls at the Bureaux. The total number of visitors old and new during the year was 2,692.

The Council recorded grateful appreciation of the services of Mr. L. R. Broster during the five years of his chairmanship, and of the Medical Director and staff of the Bureaux. The reports were adopted.

Organization Committee

Dr. RONALD GIBSON, Chairman of the Organization Committee, presented the report of that committee which contained various recommendations for the revision of standing orders of Council. It also contained a recommendation that in place of the Young Practitioners Committee of the Association, recommended by the Constitution Committee, the Council should approve in principle the convening of an informal conference which should meet once a year for the discussion of problems of particular interest to the junior member of the Association; and that it be referred

to the Organization Committee to submit a detailed recommendation covering the arrangements for such a conference.

If this recommendation were adopted it would mean that once a year representatives of doctors employed in all types of junior appointments—for example, junior commissioned ranks in the regular armed Forces, unestablished general practitioners, junior and senior housemen and registrars in teaching and non-teaching hospitals, and those holding junior appointments in the public health service, etc.—could meet together with their senior colleagues on the respective standing committees to review the work of the Association on behalf of junior members during the year. It would also provide a forum for the discussion of new problems of particular interest to the junior member.

Dr. W. E. DORNAN recalled that the matter was first raised at the Cardiff Meeting in 1955, and since then there had been the feeling among the younger practitioners that a young practitioners committee was needed. This was partly due to the fact that the young people did not believe that a subcommittee which normally met once a year could properly represent them. A second criticism was that a subcommittee could report only to its parent body and had no direct access to the Council. The young practitioners wanted a body which had power to make recommendations direct to the Council.

Pointing out that in January the Constitution Committee's report had the support, in principle, of the Organization Committee, Dr. Dornan complained that it was not until he received the Council agenda that he was made aware of the *volte-face* on the part of the Organization Committee.

Dr. F. GRAY said that the matter was carefully considered by the Assistants and Unestablished Practitioners' Subcommittee of the G.M.S. Committee, and at the conclusion of some hard thinking one young assistant said, "I do not see what this committee will do." Dr. Gray pointed out that there would be absolute chaos if any section of the Association could come directly to Council. "I welcome the change of view of the Organization Committee," he said, "and will support it."

Dr. A. BROWN asked whether the difficulty was not one of appointing delegates to such a conference. It would seem that all the conference would do would be to allow young practitioners to let off steam.

Dr. J. A. PRIDHAM pleaded with Council not to turn down the recommendation out of hand, thus leaving the young practitioners with no adequate representation.

Dr. J. B. W. ROWE expressed the hope that Council would adopt the recommendation if only, he said, for the opportunity it would afford of educating the younger members and of developing those who would succeed present members of Council in the future.

Dr. J. A. L. VAUGHAN JONES said it was absolutely fundamental at the moment that the young practitioners should know that the Council was not unmindful of their wishes and problems. On the motion of Dr. I. D. GRANT, Chairman of the Representative Body, seconded by Mr. A. LAWRENCE ABEL, the question was referred back for further consideration by the Organization Committee. It was stressed that Council wished to give effect to the desire to provide a platform of some kind for the young practitioners, and that in producing a scheme the Organization Committee would go into greater detail, including some financial implications.

Postage on Library Books

A recommendation in the report of the Finance Committee that the temporary suspension of the payment by the Association of outward postage on library books be put into effect forthwith was approved.

General Medical Services Committee

In discussing a recommendation moved by Dr. TALBOT ROGERS, Chairman of the G.M.S. Committee, that at an appropriate time in the future discussions be initiated with officers of the Ministry of Health on the provision of drugs for private patients, Dr. ALEXANDER BROWN said that the G.M.S. Committee did not apparently consider that the present was the right time to initiate discussions. In his view there were several reasons why the Association should go forward with the claim for drugs for private patients. The time to endeavour to get a settlement was now.

Dr. F. GRAY said it would be disastrous if those occupied in the main struggle were forced to devote a great deal of time to a less important issue. The G.M.S. Committee had passed the resolution approving the point in principle and had left it to the good sense of Council to state when the appropriate time would be.

Dr. R. HALE-WHITE said that an added reason why the present was an admirable opportunity to press forward with the matter was that private patients were beginning to wonder whether they could possibly continue being private patients in the circumstances.

Dr. TALBOT ROGERS, in reply, stated that in his view the appropriate time for the action suggested was not the present.

A vote on the recommendation was taken by show of hands, and the recommendation was adopted by 20 votes to 13 votes.

The report was adopted.

Central Consultants and Specialists Committee

Mr. T. HOLMES SELLORS, Chairman of the Committee, presented the report and moved its adoption.

Dr. W. WOOLLEY expressed disappointment at not finding any mention whatever of the remuneration issue in the report. He suggested that the Committee should consider some form of levy to help the general practitioners in their fight, which would go a long way towards holding the two parties together.

Mr. HOLMES SELLORS explained that his Committee had not yet had an opportunity of considering the latest developments in the remuneration dispute.

Journal Committee

Dr. J. G. M. HAMILTON presented the report of the Journal Committee, and informed Council that the figures for the *Journal* up to date were gratifyingly better than those in the budget.

Dr. E. C. DAWSON (Derby) criticized the way the remuneration issue had been presented in the *Journal*, and suggested that the whole of the front page of the *Supplement* should be devoted every week to news on the remuneration issue until it was settled.

Dr. W. WOOLLEY (Bristol), dissenting from this view, said that at a recent meeting he had been asked by over 50 members of the Association, together with two non-members, to congratulate the *Journal* staff on the way in which the case for the Association had been presented. Dr. IAN GRANT, for the Association had been presented, warmly commended the leading article "What is the Case?" which appeared in the *Journal* of March 23.

Dr. HAMILTON, in reply, said it would, of course, be wrong for the Council to start editing the *Journal*, but he assured members that the Editor would consider suggestions and criticisms.

Public Health

The Chairman of the Public Health Committee, Dr. J. B. TILLEY, in presenting the Committee's report, moved a recommendation that the Council should reaffirm to the Ministry of Health its view that a dangerous situation was arising from the arrival in this country of immigrants with communicable diseases, and that Government action should be taken in the matter, including a requirement of compulsory chest x-ray for all immigrants before entry to the country.

Dr. H. D. CHALKE said that the attitude of the Government was exemplified in what happened in the case of the Hungarian refugees. When the first contingent arrived mass x-ray units were made available, but were told to do nothing about it, yet one in six of those refugees had a case history of tuberculosis or of contact with the disease. Many were working in mines all over the country in close contact with other workers. The Government should be urged to do something about it, and Dr. Chalke suggested that the case of the Hungarian refugees should be incorporated in the Public Health Committee's recommendation.

An amendment to a recommendation suggested by Dr. J. B. W. ROWE, that the immigrants should have a compulsory chest x-ray before leaving their own country, was agreed to.

Dr. H. H. D. SUTHERLAND pointed out that tuberculosis was not the only danger. Gonorrhoea presented another great problem. There had never been so many cases in the Paddington area for many years, said Dr. Sutherland, and the country was in great danger from a spread of the disease.

The recommendation was adopted, it being further agreed that it should be treated as a matter of urgency.

Public Relations Committee

The CHAIRMAN congratulated the Public Relations Department on the way in which it had handled public relations in the last few weeks.

Other Committees

In presenting the report of the International Relations Committee, Dr. J. A. PRIDHAM said that the World Medical Association, in co-operation with the International Committee of the Red Cross and the International Committee of Military Medicine and Pharmacy, had designed an identifying emblem for the protection of civilian doctors in time of war. It was described as "a red, straight, vertical stick and a serpent represented by a sinuous line over the stick with two undulations on the left side and one undulation on the right side, displayed on a white field." Two recommendations, that the emblem be approved in respect of doctors in the United Kingdom and that representations of doctors in the United Kingdom and that representations of doctors in the Government with a view to the official adoption of the emblem in the United Kingdom, were adopted.

The Committee had received with dismay a report that the *Confédération des Syndicats Médicaux Français* had decided to withdraw from the World Medical Association owing to inability to pay the increased subscription.

A recommendation that the Memorandum of Evidence prepared by the Maternity Medical Services Committee be approved and submitted to the Cranbrook Committee was adopted.

In presenting the report of the Compensation and Superannuation Committee, Dr. A. N. MATHIAS reminded Council that the A.R.M. in 1955 asked Council to "explore the possibility of superannuation payments being made on sessional fees paid by Government departments to part-time medical officers." Representations were made to the Treasury by the Committee, but, having re-examined the case, the Treasury had reaffirmed its view that it would not be appropriate to grant that concession. It had pointed out that the new income-tax relief made available by section 22 of the Finance Act, 1956, would assist practitioners to make provision for an annuity to supplement the expected benefits from statutory superannuation schemes.

The remaining Committee reports were received without discussion.

The Council elected a number of new Members, and the proceedings terminated at 7 p.m.

BRITISH MEDICAL GUILD

At a meeting of the Trustees of the British Medical Guild, held during the course of the Council meeting on March 27, a draft of a document to be issued to all members of the profession was approved.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Consultants and the Dispute

SIR,—I have not and have never had any personal interest in the financial aspects of the National Health Service as these affect the doctor, since, for reasons that seemed adequate to me, I did not give up my honorary status in 1948, or thereafter while I remained on the active staffs of my two hospitals. Nevertheless, I have watched with interest and with all my initial misgivings the evolution of the Service, and I retain a deep concern for the honour and welfare of the profession to which I still belong. It is therefore in freedom and as a spectator that I venture to express my sense of the confusion that, as in 1948, seems again to have descended upon our scene.

As I understand it, the proposal is that the general practitioner in the Service is, upon a date decided, to resign from it, to continue to treat the sick, at first on the problematic view that they may be willing to pay something directly for this, or even if they do not, and, in addition, to subscribe to a levy to support those who may be hard pressed in this dispute. On the other hand, the consultant or the hospital officer is not to resign, but is to continue the tenor of his way, and to receive his emoluments from the State as heretofore. All he is asked to do is what he should in any case be doing—namely, to refrain from dealing at hospital with patients whose care could be adequately handled by the general practitioner.

This curious appearance of neutrality in the dispute is sought to be justified on the ground that the staffing of hospitals is a service that can in no circumstances be interrupted. Surely we all know that the hospitals must be carried on, but how does this require the total abstention of the consultant from the privilege of participation in the financial sacrifice to be made by his colleague in general practice: for example, in the matter of the levy the latter is ready to impose upon himself at the same time as he is putting his living in peril? Again, as I understand, the two principal negotiators with the Government upon this issue represent, the one, the general practitioner, and the other, the general body of consultants and hospital officers. Yet it appears that a companionship in negotiation does not extend to a companionship in action.

This strange dichotomy in action is perhaps clarified by the letter in your pages (*Journal*, 1956, 1, 857) from the President of the Royal College of Physicians, in which it was stated that "the policy of the College has from the beginning been a firm and consistent one of co-operating with the Government of the day." The two operative words here are "policy" and "co-operating." Surely the policy as here defined is nothing more than a commitment to follow Government policy—that is, someone else's policy—whatever this may happen to be on any "day" in question. It is in fact not a policy, save in the sense of that word associated with the ingenious Vicar of Bray.

I do not question that this statement of its President does faithfully represent the "policy" of the College, and, indeed, I was interested at the time to note that no correspondent wrote to you, Sir, to dispute the prudence or the existence of it, or even to point out that it was certainly not a policy that left the College any freedom of action, save to repudiate it. In short, it appears to me that unless and until the College does repudiate this "firm and consistent" intention there can be no possibility of a companionship in action between consultants and general practitioners should a dispute arise between Government and profession, and no rational role for a representative of the College upon a negotiating body in such a situation.

I do not here express any opinion as to the practical wisdom or propriety of the Association's decision that general

practitioners shall resign from the Service, though I have one. To do this is not my present purpose, but rather to express my bewilderment at the sight of two main divisions of our profession both in negotiation with the Government to the same end; the one free, the other ideologically tied to co-operation with the Government of the day; each, if negotiations finally break down, reacting so differently. The one making all the sacrifices, the other making none at all. What a situation! Illogical in its nature and impractical in action, for in this particular event the "policy" of the College turns out to be "firm and consistent" inaction.

If this be a fair summary of things as they are, I ask how can the profession ever hope to succeed, or to impress, in any corporate action if its several elements do not really stand wholly together, each in its appropriate way prepared to take risks and to make comparable sacrifices in a dispute with the Government, if dispute there must be.—I am, etc..

London, W.1.

F. M. R. WALSHE.

SIR,—Dr. W. N. Leak in his letter (*Supplement*, March 23, p. 129) suggests a diagnosis to account for the Government's present attitude to the medical profession. He may well be correct, but I believe the following alternative one should be considered in order to account for our employers' refusal to honour their moral and contractual obligations—namely, that the resignation of the general practitioners from the Health Service is acceptable to the Government.

It is possible that the Government realizes that the Welfare State in its present form can no longer be financed by the country. One of the modifications which may be envisaged in its structure is that the remuneration of general practitioners should, in part, come directly from their patients, while on the other hand the hospital service should remain fully under the control of the State. If, therefore, the socialistic ideal of a comprehensive medical service is to fail, it is politically expedient that blame should be placed on the medical profession, because of the resignation of the general practitioners, rather than that their employers should be forced to admit that they can no longer afford to pay them an adequate wage.

If the above diagnosis is correct, those of us in the hospital service must, at this stage, give very careful thought as to how best to help our colleagues in general practice at the time of their resignation. It may be that the time will come when we have to negotiate on our own with the Government of the day, and any weakness on our part now can only lead to our further degradation in the future.—I am, etc..

London, E.2.

E. J. M. WEAVER.

What is the Case?

SIR,—As I have received several letters following the one to which you drew attention in your leading article (*Journal*, March 23, p. 690), may I attempt to answer them by explaining the clarification of my own mind which came from listening to Dr. Wand at Crewe and discussing the matter at a Branch Council meeting? While watching the Manchester doctors on I.T.V. on March 29 I felt that some other doctors were almost as hazy as I had been myself.

The first point is about the Government attitude to Spens. This was officially stated—though I had overlooked it—in the *Handbook for General Practitioners* (revised to March 31, 1955) issued by the Ministry of Health and given to all doctors in the Service. This states (para. 179, p. 37): "The Central Pool is now calculated on the basis of the new remuneration appropriate for general practitioners in 1939 (as recommended by the Spens Committee in 1946), together with a betterment factor taking account of changes in the value of money since that time" (italics mine). In view of this categorical statement of less than two years ago the equivocations of Ministers of Health and the Prime Minister seem positively dishonest.

This quotation shows that, in setting up a Royal Commission without any consultation with the doctors and dentists, the intention of the Government is to find

some other basis for the payment of doctors than the Spens agreement to which it has signified its adherence. This is a unilateral repudiation of an agreement to which doctors cannot consent, for if it were allowed to pass it would mean that there would be no likelihood, let alone certainty, that any new agreement would not be equally easily set aside in future.

The setting up of the Royal Commission has the unfortunate, but probably well-calculated, effect that while it is sitting it would be unconstitutional for the Government to enter into any discussions about remuneration. As therefore the Prime Minister stated that the setting up of the Royal Commission did not preclude an interim award, it seems clear that he must be premeditating some announcement such as the 10% rise just given to junior hospital staff without the promised reference to the Whitley Council. I think that every profession will agree that this is not the way in which professional pay should be determined, and every trade unionist will support us in our efforts to insist that claims about remuneration should be settled by negotiation and not dictation.

In my previous letter (*Supplement*, March 23, p. 129) I attempted an analysis of the persons composing this Royal Commission. I believe that members of all professions will support us in the contention that professional remuneration should not be decided, even provisionally, by an almost entirely non-professional committee. Indeed, its peculiar composition looks like a studied insult to the whole professional body, a point of which other bodies should take note.

The conclusion I draw from the foregoing is that doctors have unexpectedly and unwillingly been forced into the forefront of the age-long struggle against arbitrary government, and that, while it is important that doctors should understand what the B.M.A. is proposing to do, it is even more important that the whole population should realize the true significance of what the Government is proposing to do, and the importance of ensuring that the remuneration of doctors, as of others, is settled by negotiation or arbitration and not by arbitrary handouts about which the recipients are allowed no say whatever.

Good government depends on good faith, and a better Health Service depends on the Government giving up its attempt to outwit or double-cross the doctors, so that with full confidence we can get down to the job of correcting the faults of the past and planning a happier and more progressive one for the future.—I am, etc..

Winsford, Cheshire.

W. N. LEAK.

Reform of Health Service

SIR,—I believe that the medical profession in this country is now faced with the opportunity to determine whether it will allow itself to become a slave of the State or to maintain the measure of independence compatible with the ideal of service to humanity. It is not intended to criticize any party or political programme, but I feel most strongly that a change of Government would mean the eventual abolition of private practice and the substitution of a full-time medical service. Such a substitution would involve a change in the proportion of beds allotted to private patients by the various hospital authorities. There would almost certainly be many less private beds—possibly even none. This would mean longer waiting-lists for those nursing-homes which have been able to survive. This would cut deeply at the roots of any income derived from private work by consultants.

I feel no doubt whatever that the National Health Service has come to stay. I believe, also, that the present levels of taxation, the increasing cost of living, the high death duties, and other forms of direct and indirect taxation will eventually reduce the vast majority of the population of this country to one common level, which I firmly believe will not be a high one so far as income is concerned. I believe, also, that this process, accelerating as it is, will be complete in a very few years. I do not believe that there will ever be any reduction in the level of taxation, rather the reverse. I believe, in addition to all the above depressing beliefs, that

the prestige of the general medical practitioner, already on the wane, will be finally extinguished unless we as a profession make a sincere and united effort to maintain it.

I have long wondered why the British Medical Association does not put plainly before the public the two alternatives with which the public is faced: either we are going to have a full-time medical service, or some continuation of the present scheme with all its uncertainties, and eventual extinction of the valued relations between general practitioners and patients. It seems to be imperative to me that the British Medical Association should learn what the public really wants, and only fair that the public should know exactly what the two alternatives would entail.

I am sure that in this country now there are comparatively few who are really private patients. I am convinced that in the future there will be fewer still, and I appreciate the fact that all must pay some form of contribution to the Health Service. But I am equally convinced that there are many who would prefer private medical attention, and that conviction leads me to suggest that the British Medical Association should forthwith institute a contributory scheme which would cover the cost of both general-practitioner and specialist services up to an agreed maximum. I realize that there are many forms of insurance in existence which cover the cost of consultant's fees, nursing-homes, and operations. There are also, I believe, some which cover the cost of attention by the general medical practitioner. So far as I am aware, the British Medical Association does not offer to the public any scheme which covers both general practitioner and specialist services. I want to emphasize that it is a primary point in this scheme that the general-practitioner as well as the consultant should be covered, and that the scheme should be run by the British Medical Association, or, if the constitution of that body would not permit such a scheme, by the Guild. I believe that it should be instituted without delay, and for this purpose I suggest that advertising experts should be employed with the widest powers, including the use of television, radio, and the press. The essential point is to make it widespread, arguing that the present crisis in the doctors' affairs might deprive sick persons of medical services and urging all to join at the first opportunity. The amount of contribution would require the services of statisticians as well as accountants. I would suggest that, as the present contribution under the National Health scheme to purely medical services is approximately one-eighth the cost of the weekly National Insurance stamp, it could be assumed that a yearly contribution of £5 5s. would cover the cost of general-practitioner and specialist services, including nursing-homes and operations. With increasing numbers this payment might be decreased and so attract a number of those in the lower-income groups.

I personally do not believe that at heart the general public would welcome a whole-time medical service, but no one, so far as I know, has taken the trouble to explain to the layman in clear and understandable language what such a service would mean; and, though I am entering into no political discussion on the merits or demerits of such a scheme, I feel that the vast majority of people in this country would prefer to retain a measure of personal contact with their doctors, which has hitherto been the basis of medicine in England. It is to nourish this feeling that I put forward the above suggestion of a contributory scheme, which I feel would weld the profession together, would appeal to those sentiments of private enterprise in the medical practitioner which, after all, are at the basis of all successful medical practices of the past, and if the scheme were successful would place the British Medical Association in a position of greatly increased strength, whatever Government policy might be pursued.—I am, etc..

Barnsey

H. E. McLAUGHLIN.

SIR,—I think there is unprecedented unanimity in the profession in feeling that we are being unfairly treated and that vigorous action is required. But I feel, as Dr. W. N. Leak in his excellent letter (*Supplement*, March 23, p. 129) says, we are in danger of firing at the wrong targets. Rather than

indulge in guerrilla tactics to bring an "obdurate" Minister to heel and lambast a Royal Commission, too late in the field and too hamstrung by its terms of reference to achieve much, let us ignore the Commission and accept the fact that the Minister will not offer us suitable terms of employment, and will not negotiate nor agree to arbitration regarding our pay. Let us regard this not as a catastrophe but as a challenge and an opportunity. We withdraw from an ill-conceived N.H.S. and set up our own alternative scheme (remembering always that we are reasonable folk, and if at the eleventh hour the Minister offers arbitration we will accept).

I had looked forward very keenly to the G.M.S. Committee's alternative scheme. Alas, I was bitterly disappointed in it. It would be fatally easy to reel off a purely destructive panegyric regarding all aspects of our alternative scheme, and/or sit back and await annihilation. But surely all need not be lost if we do but think again. As I see it, the following points are fundamental to achieve a successful British medical service: (1) genuine generalized withdrawal from the N.H.S.; (2) administrative simplicity and uniformity; (3) actuarial soundness; (4) fairness both to doctor and patient; (5) manifest justice; (6) fairness to the Government.

Our withdrawals must be genuine; we must be steadfast, not merely when together in the excitement of a meeting, but equally when alone, in the wee small hours, as our resignations gradually mature. This must be no token gesture to prod, bludgeon, or blackmail the Government into complying with our caprice, but a solemn decision, reluctantly reached, to give due notice to an employer whom we—maybe rightly, maybe wrongly, but certainly sincerely—believe to have been unsatisfactory and indeed untrustworthy; and then to take similar employment with new employers—i.e., both the private patient and the British medical service. We must expect our resignations to be accepted and be "permanent"; we must prepare to work our own B.M.S., if need be for years, if need be for ever.

As well as private practice—which we would prefer (I agree that 7s. 6d. and 5s. are reasonable fees at the inception)—let us offer the public a family doctor service on an insurance basis as from the start of our withdrawal and as a cardinal point. I suggest we call it the British Medical Service—the B.M.S.—sponsored by the B.M.A., implemented by the British Medical Guild. It should be centrally organized with standard rates of contribution and terms of service, but with the local medical committees attending to local administrative affairs as at present (obtaining drugs and dressings being the patient's responsibility). Re contributions, we will of course require actuarial and accountant opinion, but as a rough estimate I would imagine that, as we now have a capitation-cum-loading fee of approximately 22s. per head, varying with the size of list, and as we ask for an increase of 24%, we would be happy to get 27s. 6d. per head per year. If we charged 3s. per month (or 8s. 6d. per quarter, or 34s. per year) that should give an adequate margin for meeting administrative expenses, sundry first charges, initial practice and hardship allowances, and mileage, etc. (once established it should be possible to reduce to 2s. 9d., 8s., and 31s. 6d.). The terms of service could be more or less on the old club lines.

At first sight the patient might complain bitterly of a raw deal, of paying twice for the same thing. On reflection, he would still fare very well indeed. Of the 12s. 9d. weekly insurance stamp, only 10d. now goes into the Health Service, and of that less than 1d. goes to the G.P. pool. So he is being done out of less than 1d. per week (incidentally, half of that is his employer's contribution). If he pressed for the return of that 1d., he might get it. I think the Government is much more likely to reply with justification that, even without the family doctor service, he is still paying less than a quarter of the total cost of the Service.

Our Public Relations Department must get this over to the public, together with the gist of our case: (1) "The Minister agrees that the Spens Report remains the basis of

remuneration of general medical practitioners until such time as, after the usual consultation, some other basis is substituted." (2) Our remuneration was adjusted to March, 1951. (3) Our present claim—that it should be adjusted to 1956 (yes, last year)—has not been considered. Arbitration is refused. (4) Even more important than the actual £ s. d., a vital principle is at stake—that a Government promise freely given must be kept, and that a conscientiously compiled claim should be considered (and if need be disputed) on its merits, not summarily dismissed as a matter of political inexpediency; if agreement be not reached, then arbitration must be conceded. We are willing and anxious, now as always, that our case be referred to arbitration. Failing that, and very reluctantly, we must press on with our own British Medical Service. (5) No patient must suffer medically at all, and they need suffer only slight financial hardship—well, hardship is scarcely the word, for if they join the B.M.S., as suggested above, the cost is approximately that of half a cigarette a day.

But whatever we do, let us do it wholeheartedly. Let us have the courage of our convictions, and if arbitration is still refused and our resignations inevitable, let us act boldly and together, not in penny numbers here and there.—I am, etc.,

Rugby.

R. PRESTON HENDRY.

SIR,—We must support the decision of the G.M.S. Committee to resign from the Health Service or the status of the profession will be lost for ever. Only one conclusion can be drawn from the Government's refusal of arbitration. It wants the doctors to resign and so end the N.H.S. in its present form which has brought the country near to bankruptcy. The Government dares not say this because the public loves its "free" doctoring. It is putting the responsibility (and, in the eyes of the public, the blame) of ending the N.H.S. on the shoulders of the doctors. This Government plan to end the present N.H.S. makes the interim scheme devised by the G.M.S. Committee for the medical care of the public after October 1 appear to be inadequate. It presupposes eventual capitulation on the part of the Government and a re-establishment of the N.H.S. on the old lines with all its faults. A scheme must be produced by the B.M.A.—perhaps in conjunction with the insurance companies—to take the place of the National Health Service.—I am, etc.,

Bromley, Kent.

JOHN C. WISHART.

SIR,—The "scheme" will come as a great disappointment to many practitioners, who were expecting that this opportunity would be taken to rally the whole profession's support, unless it is shortly to be followed by the announcement of a reformed and improved alternative Service.

The profession will not feel happy about withdrawal into the vacuum which will exist unless the alternative is soon published, and the method of withdrawal suggested is one by means of which the Government will feel the gradual twist of the thumbscrew and appears to many to be a political move of half-heartedness rather than the action inspired by love of one's profession and a determination to re-establish its high traditions which have so benefited mankind in the past.

Let everyone sign the form of authorization for special levy at once, for we shall need the funds, but let us pursue the search for a practical and worthy service into which to withdraw—a service which must include the ownership of our own goodwill if the profession is to be kept out of politics, and the intervention of a third party (the State) between us and the patient.—I am, etc.,

Hildenborough, Kent.

C. GLAISHER.

Alternative Scheme

SIR,—I believe that, without resigning from the N.H.S., it is still quite possible to secure our pay adjustment, establish for ourselves substantial control of the G.P. service, eliminate politics, and open the way to good general practice. What the N.H.S. needs is effective competition.

Let the B.M.A. sponsor a national scheme of prepaid medical insurance in order to bring private practice back within the reach of those of the public who appreciate good medicine. I feel sure that the premiums could be quite low (compare the Australian scheme outlined on page 25 of the *Supplement* of January 19), even with the provision of drugs included.

The N.H.S. remains and must always remain a real necessity for those who cannot afford to pay. For the rest there is no reason why an alternative scheme should not be provided. Indeed, it should satisfy everyone. The patient would experience the satisfaction of paying for and getting a doctor with leisure to question deeply, to examine carefully, and to explain fully, and would, at the same time, avoid the heavy bills associated with long illness. For the doctor, quality of practice would be rewarded not by numbers on a list but by increasing numbers of "B.M.A." patients. I feel sure that advertisement and assurance that patients would retain N.H.S. hospital rights would make such a scheme an immediate success and a dignified alternative to the nightmare of mass resignation.—I am, etc.,

Holywell, Flint.

DAVID L. WILLIAMS.

Withdrawal from N.H.S.

SIR,—Following the declaration of our leaders of their intention to advise mass withdrawal, and to publish their own alternative plan for the organization of general practice, many of us eagerly awaited the expected strong lead. The mountains having duly gone into labour, there emerged an emasculated scheme for withdrawal by hire purchase, dragging in its wake the placental ghost of fee-paying private practice. Does anyone think that struggle for a principle can ever be conducted against a strong adversary without some hardship and sacrifice?—I am, etc.,

Taplow, Bucks.

KENNETH SIMON.

SIR,—Your leading article (*Journal*, March 23, p. 692) on withdrawal from the N.H.S. ends thus: "As the Government rejects a reasoned case and a reasonable plea for negotiation or arbitration, action of the kind proposed is all that is left." I write to express my profound disagreement. An alternative more in keeping with the dignity of our profession is that we continue to work at our present rate of pay. While thanking our leaders for their efforts, many doctors will prefer to have nothing to do with a scheme which is scarcely distinguishable from a strike. It is deplorable that our profession should even contemplate embarrassing the Government by action of this sort, especially at a time of national difficulty.—I am, etc.,

Crowthorne, Berks.

E. F. CHAPMAN.

Remuneration Claim

SIR,—Many thanks to Dr. R. R. Charlwood (*Supplement*, March 16, p. 119) and Dr. J. E. C. Tower (*Supplement*, March 23, p. 131) for their most sensible letters in this hour of crisis. As a young G.P. I am proud to serve my patients under the National Health Service, and have not the slightest intention of withdrawing my services. I believe that the plan for progressive withdrawal which I received recently is unwise and doomed to failure. We are asked to resign from the National Health Service in selected areas. The obvious step to be taken by the Government is to advertise the vacancies thus created and appoint another doctor in our place. This newly appointed practitioner will then be given all our medical records (the property of the Ministry of Health) and will continue to provide N.H.S. treatment in our area. Our patients will soon tire of paying our fees (token or otherwise), and a gradual drift will take place. As a dispensing doctor under the N.H.S. I know that I can provide for all my patients, whatever their income, the drugs they need. Yet we are told that if the Government remains obdurate it will be necessary to make a fully economic charge to the patients. What nonsense this is. How can our old people be expected to pay for such expensive drugs as tetracycline and acetazolamide, etc.?

Of course we all would like more money—but what is so very wrong with a Royal Commission? By all means, let us work together to obtain a fair reward for our services, but not at the expense of that splendid achievement, the N.H.S.—I am, etc.,

Maidstone, Kent.

PAUL FINCHAM.

SIR,—We, the undersigned medical practitioners, members of hospital staffs on Merseyside, wish to express our strongest indignation and disapproval of the Government's summary dismissal of the profession's recent case for increased pay. We are wholeheartedly prepared to undertake any action initiated by any responsible medical organization that may be required to press our claim to a more reasonable and just conclusion. We believe that words can no longer be effective, and wish vigorous action to be organized as soon as possible.—We are, etc.,

SIR,—I feel that I must be one of many thousands of general practitioners who are viewing the actions and attitudes of our Negotiating Committee with growing concern. At the present time, when the affairs of the country are in such a parlous state, a claim for a 24% rise by a relatively well-off section of the community has no hope of sympathy from the general public and little hope of complete and enthusiastic support from its own members. We have no financial cause to justify a crusading spirit, and that is what is needed for victory. If we had never started a financial claim but had simply pressed for clearer terms of service, I feel that everyone's conscience would now be clearer and their support more enthusiastic.—I am, etc.,

Glynnceath, Glam.

C. M. E. REES.

Value of Obstetric Lists

SIR,—I am writing to support Dr. J. A. Frai's (*Supplement*, March 23, p. 131). Like him, I discovered two years ago that experience on the obstetric register does not qualify you to sit the D.R.C.O.G. examination. In my case I already held an obstetric appointment, but the hospital in which it was done was not then recognized for this diploma, although it has subsequently been so recognized. At the inception of the diploma, it seems, 10 years in general practice obstetrics qualified one to sit the examination. This was discontinued. Surely the Royal College of Obstetricians and Gynaecologists should recognize service on the obstetric list over so many years to sit the diploma. If not, as Dr. Frai's points out, there would appear to be no need for a special obstetric list. It is time that it was decided what value other than monetary can be attached to being on the obstetric list.—I am, etc.,

Honiton, Devon.

T. GLANVILL.

Association Notices

Diary of Central Meetings

APRIL

9 Tues	Conference of Advisory Councils on Occupational Health, 12 noon.
10 Wed.	Standing Joint Committee of R.M.P.A. and Psychological Medicine Group, 11 a.m.
10 Wed.	Private Practice Committee, 2 p.m.

Branch and Division Meetings to be Held

The following meetings, to which all medical practitioners in the areas are invited, will be held to consider the Reports of Council and the G.M.S. Committee on the remuneration issue.

ALDERSHOT AND FARNHAM DIVISION.—At Northfield Hospital, Aldershot, Thursday, April 11, 8.30 p.m.
 BARNET DIVISION.—At Board Room, Barnet General Hospital, Wednesday, April 10, 8.30 p.m.
 BLACKBURN DIVISION.—At White Bull Hotel, Church Street, Blackburn, Tuesday, April 9, 8.15 p.m. (A.G.M.).
 BUCKINGHAMSHIRE DIVISION.—At Bull's Head Hotel, Aylesbury, Tuesday, April 9, 3.30 p.m.
 BURNLEY DIVISION.—At Concert Hall, Municipal Hospital, Burnley, Saturday, April 6, 4 p.m.
 CHELSEA AND FULHAM DIVISION.—At Fulham Town Hall, S.W., Tuesday, April 9, 8.30 p.m.
 CITY AND TOWER HAMLETS DIVISIONS.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Wednesday, April 10, 8.30 p.m., joint meeting.
 CROYDON DIVISION.—At Out-patient Hall, Croydon General Hospital, Friday, April 12, 8.30 p.m.
 CUMBERLAND DIVISION.—At Globe Hotel, Cockermouth, Sunday, April 7, 3.30 p.m.
 DERBY DIVISION.—At Wilderslowe, Derbyshire Royal Infirmary, Tuesday, April 9, 8.30 p.m.
 DUDLEY DIVISION.—At Nurses' Lecture Theatre, Guest Hospital, Dudley, Tuesday, April 9, 9 p.m.
 DUMFRIES AND GALLOWAY DIVISION.—At Cresswell Maternity Hospital, Dumfries, Sunday, April 14, 3 p.m.
 EAST HERTS DIVISION.—At Council Chamber, County Hall, Hertford, Friday, April 12, 8.30 p.m.
 EAST YORKSHIRE BRANCH.—At Unitarian Church, Park Street, Hull, Thursday, April 11, 8.45 p.m.
 ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Friday, April 12, 8.15 for 8.45 p.m.
 GLASGOW DIVISION.—At Grand Hall, St. Andrew's Halls, Sunday, April 7, 3 p.m. Statement by Dr. Ian D. Grant (Chairman, Representative Body, B.M.A.).
 GUILDFORD DIVISION.—At Mitchell Hall, Royal Surrey County Hospital, Guildford, Thursday, April 11, 8.30 p.m. Address by Dr. D. P. Stevenson (Deputy Secretary, B.M.A.).
 HAMPSHIRE AND ST. PANCRAZ DIVISIONS.—At Great Hall, B.M.A. House, Tavistock Square, London, W.C., Monday, April 8, 8.30 p.m., joint meeting. Dr. Max Sorsby will speak.
 HUDDERSFIELD DIVISION.—At Board Room, Huddersfield Royal Infirmary, Monday, April 8, 8 p.m.
 LAMBETH AND SOUTHWARK DIVISION.—At Nurses' Lecture Hall, Lambeth Hospital, Brook Drive, Kennington Road, S.E., Tuesday, April 9, 8.15 p.m. Dr. Max Sorsby (Member, G.M.S. Committee) will speak.
 LANCASTER DIVISION.—At Royal King's Arms Hotel, Lancaster, Sunday, April 7, 8 p.m.
 LEEDS DIVISION.—At Littlewood Hall, General Infirmary at Leeds, Wednesday, April 10, 8 p.m.
 LINCOLN DIVISION.—At Saracen's Head Hotel, Lincoln, Sunday, April 7, 8 p.m.
 LIVERPOOL DIVISION.—At Y.M.C.A., Mount Pleasant, Liverpool, Sunday, April 14, 3.30 p.m. Dr. D. P. Stevenson (Deputy Secretary, B.M.A.) will speak.
 MACCLESFIELD AND EAST CHESHIRE DIVISION.—At West Park Hospital, Macclesfield, Wednesday, April 10, 8.15 for 8.30 p.m.
 MARYLEBONE DIVISION.—At Medical Society of London, 11, Chandos Street, W., Tuesday, April 9, 8.45 p.m.
 SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Friday, April 12, 8.30 p.m.
 SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Southampton, Thursday, April 11, 8.30 p.m.
 SOUTH-EAST ESSEX DIVISION.—At Queen's Hotel, Westcliff, Thursday, April 11, 8.30 p.m.
 SOUTH MIDDLESEX DIVISION.—At Ball Room, Casino Hotel, Tagg's Island, Hampton Court, Sunday, April 14, 11 a.m.
 SOUTH STAFFS DIVISION.—At Medical Lecture Hut, Royal Hospital, Wolverhampton, Monday, April 8, 8.30 p.m. Dr. A. V. Russell (Member of Council) will report on the present position.
 SOUTH WARWICKSHIRE AND RUGBY DIVISIONS.—At Grand Hotel, Rugby, Wednesday, April 10, 9.30 p.m., joint meeting. (8 for 8.30 p.m., informal supper).
 STRATFORD DIVISION.—At Manor Park Library, Romford Road, Tuesday, April 9, 8.30 p.m. Address by Dr. D. P. Stevenson (Deputy Secretary, B.M.A.).
 WAKEFIELD DIVISION.—At Out-patient Consulting-room, Clayton Hospital, Wakefield, Thursday, April 11, 8 p.m.

WEST HERTS DIVISION.—(1) At Physiotherapy Department, West Herts Hospital, Hemel Hempstead, Wednesday, April 10, 8.30 p.m. (2) At Watford Peace Memorial Hospital, Thursday, April 11, 8.30 p.m.

WEST MIDDLESEX DIVISION.—At Nelson Room, Ealing Town Hall, W., Tuesday, April 9, 8.30 p.m.

WESTMINSTER AND HOLBORN DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Sunday, April 14, 11 a.m.

WEST SUFFOLK DIVISION.—At Everards Hotel, Bury St. Edmunds, Sunday, April 7, 5.30 p.m.

WILLESDEN DIVISION.—At Rehabilitation Department, Willesden General Hospital, Harlesden Road, N.W., Friday, April 12, 9 p.m.

YORK DIVISION.—At York Medical Society's Rooms, 23, Stonegate, York, Saturday, April 13, 8.30 p.m.

ABERYSTWYTH DIVISION.—At Talbot Hotel, Aberystwyth, Saturday, April 13, 7.30 p.m., dinner; talk by Mr. E. Emllyn Lewis: "Modern Treatment of Burns." Wives of members and guests are invited.

BIRKENHEAD AND WIRRAL DIVISION.—At Arrowe Park Hotel, Friday, April 12, 8.30 p.m., meeting. Address by Mr. J. Ralston Paterson: "Medicine in Russia."

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Boscombe, Friday, April 12, 8.15 p.m., meeting.

BRIGHTON AND MID-SUSSEX DIVISION.—At Out-patient Department, Royal Sussex County Hospital, Brighton, Thursday, April 11, 2.30 p.m., general clinical meeting.

BROMLEY DIVISION.—At Royal Bell Hotel, Bromley, Tuesday, April 9, 8.30 p.m., meeting of National Pharmaceutical Union, West Kent Branch, to which B.M.A. members are invited. There will be a quiz on the N.H.S.

CAMBERWELL DIVISION.—At Dulwich Hospital, East Dulwich Grove, S.E., Thursday, April 11, 8.30 p.m., annual general meeting. B.M.A. Lecture by Professor R. Milnes Walker: "Around the World" (with slides and cinematograph film).

CITY OF EDINBURGH DIVISION.—At Lecture Hall, Central Halls, Tollcross, Edinburgh, Thursday, April 11, 8.15 p.m., special meeting.

DEWSBURY DIVISION.—At General Hospital, Dewsbury, Friday, April 12, 8.15 p.m., clinical meeting.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, April 11, 7.30 p.m., dinner; 8.45 p.m., B.M.A. Lecture by Dr. J. H. Cyriax: "Lower Lumbar Disk Lesions."

EAST YORKSHIRE BRANCH.—At Quern House, 68, Park Street, Hull, Wednesday, April 10, 8.30 p.m., meeting. Lecture by Mr. William Gissane: "An Accident Has Occurred."

HAMPSTEAD DIVISION.—At New End Hospital, Hampstead, N.W., Wednesday, April 10, 8.30 p.m., meeting. Talk by Dr. F. E. Camps: "Does Crime Pay?"

KINGSTON-ON-THAMES DIVISION.—At Epsom District Hospital, Dorking Road, Epsom, Tuesday, April 9, 7.45 p.m., clinical meeting.

LEEDS DIVISION.—At Littlewood Hall, General Infirmary at Leeds, Wednesday, April 10, 8 p.m., meeting. Lectures by Dr. D. B. Bradshaw and Dr. J. G. Ollerenshaw on their visits to Russia.

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, April 9, 8.30 p.m., meeting. Consideration of Reports of Council and G.M.S. Committee on remuneration issue. Address by Mr. P. F. Early: "Dupuytren's Contracture" (illustrated by slides).

MAIDSTONE DIVISION.—At Oakwood Hospital, Maidstone, Thursday, April 11, 8 p.m., general meeting.

MANCHESTER DIVISION.—At Large Lecture Theatre, Clinical Sciences Building, York Place, Oxford Road, Manchester, Thursday, April 11, 8.30 p.m., extraordinary general meeting.

REIGATE DIVISION.—At Reigate Hill Hotel, Tuesday, April 9, 8.30 p.m., divisional meeting.

SOUTH STAFFS DIVISION.—Saturday, April 13, visit to Shakespeare Memorial Theatre, Stratford-upon-Avon, for performance of "As You Like It." Bus will leave Don Everall's Bus Station, Bell Street, Wolverhampton, 3.15 p.m. Dinner at Memorial Theatre, 6 p.m.

SOUTH-WEST ESSEX DIVISION.—At Nurses' Home, Wanstead Hospital, E., Wednesday, April 10, 8.30 p.m., special meeting to consider reports of Council and G.M.S. Committee on remuneration issue.

SOUTH-WEST WALES DIVISION.—At Cliff Hotel, Gwbert-on-Sea, Saturday, April 6, 7 p.m., dinner meeting. Dr. E. Howard Kirching: "Hypnosis." Wives of members are invited.

SWANSEA DIVISION.—At Neath General Hospital, Thursday, April 11, 7.30 p.m., clinical meeting.

SWINDON DIVISION.—At Goddard Arms Hotel, Swindon, Wednesday, April 10, 8.15 p.m., combined meeting with Swindon Pharmaceutical Society.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Wednesday, April 10, 8.30 p.m., clinical meeting.

WANDSWORTH DIVISION.—At South London Hospital for Women and Children, South Side, Clapham Common, S.W., Sunday, April 14, 10 a.m. to 12.30 p.m., clinical meeting.

WEST DENBIGH AND FLINT DIVISION.—At Talardy Hotel, St. Asaph, Thursday, April 11, 7 for 7.30 p.m., dinner; 8.30 p.m., annual general meeting, to be followed by discussion on report of G.M.S. Committee. Non-members are invited to take part in the discussion.

PRELIMINARY

Chairman

1. The Council unanimously elected Dr. S. Wand (Birmingham) as its Chairman for a period of three years (1956-9).

The Council has placed on record its deep appreciation of the outstanding services rendered to the Association and the profession by Dr. E. A. Gregg as Chairman of Council for seven years.

Election of Vice-President

2. The Council has much pleasure in recommending:
Recommendation: That Thomas Clarence Routley, C.B.E., LL.D., D.Sc., M.D., F.R.C.P.(C.), of Toronto, be elected a Vice-President of the Association in recognition of his distinguished services to the Association.

Award of Gold Medal to Sir Henry Dale

3. The Council has much pleasure in reporting that it has decided to award the Gold Medal of the Association for Distinguished Merit to Sir Henry Dale, O.M., G.B.E., LL.D.,

M.D., F.R.C.P., F.R.S., in recognition of his distinguished services to medicine in the field of physiology and pharmacology.

Annual Meeting, 1958—Election of President

4. The Council has decided with regret that, owing to doubts as to the adequacy of the accommodation available, it is inadvisable to proceed with arrangements for holding the Annual Meeting of the Association in Margate in 1958. Fortunately, the Midland Branch, which had invited the Association to hold its Annual Meeting in Birmingham in 1960, found it possible to advance the date to 1958, and the Council has gratefully accepted the invitation to visit Birmingham in that year.

The Council has much pleasure in recommending:

Recommendation: That Arthur Peregrine Thomson, M.C., M.D., F.R.C.P. (Birmingham), be elected as President of the Association for 1958-9.

Annual Meetings, 1957, 1960, and 1961

5. The Annual Meeting of the Association will be held this year in Newcastle upon Tyne under the Presidency of

Mr. Weldon P. T. Watts, M.S., F.R.C.S., from July 10 to 19.

The Council has accepted an invitation from the Torquay Division to hold the Annual Meeting in Torquay in 1960, and an invitation from the New Zealand Branch to hold the Annual Meeting in New Zealand in 1961.

Joint Annual Meeting, Edinburgh, 1959

6. The Council, in consultation with the General Secretary of the Canadian Medical Association, has approved preliminary arrangements for the Joint Annual Meeting in Edinburgh from July 18 to 24, 1959, and invitations have been issued to officers of Sections.

The Chairman of Council has sent a letter for publication in the *Canadian Medical Association Journal*, inviting members of the C.M.A. to attend the Joint Meeting. Approximately 1,000 Canadian doctors and their families are expected to be present.

The Late Miss M. E. Gregg

7. In memory of Miss Minnie Elizabeth Gregg, who gave devoted service to the Association as daughter of the Chairman of Council, 1949-56, an electric clock, presented by members of Council, has been installed in the main Committee Room at B.M.A. House.

Representatives of the Association at Conferences of Other Bodies

8. The Council appointed the following to represent the Association at the conferences named:

Conference of Societies registered for Adoption, October, 1956	Dr. Annis Gillie
Annual Congress of Royal Netherlands Medical Association, October, 1956	Dr. S. Wand
British Veterinary Association Conference on "Supplements and Additives in Animal Feeding Stuffs," November, 1956	Dr. F. A. Belam
Brighton Joint Advisory Council on Occupational Health—Conference on Prevention of Occupational Dermatitis, November, 1956	Dr. H. Alexander
Royal Society of Health Congress, April, 1957	Dr. H. D. Chalke
International Hospital Congress, Lisbon, June, 1957	Dr. J. B. Tilley
Canadian Medical Association Annual Meeting, Edmonton, Alberta, June, 1957	Dr. T. Rowland Hill
American Medical Association Annual Meeting, June, 1957	Mr. F. W. Law
Conference of the Church of England Hospital Chaplains Fellowship, July, 1957	Dr. Mary Esslemont
Medical Association of South Africa Annual Meeting, Durban, September, 1957	Dr. E. E. Claxton
	Professor A. A. Moncrieff

Book of Valour

9. The A.R.M. in 1956 (Minute 25) decided on the recommendation of the Council to institute a Book of Valour, to be permanently on view at B.M.A. House, in which there shall be recorded, by decision of the Council, heroic deeds performed by medical practitioners. In each case a copy of the record is to be presented to the medical practitioner concerned or to the next of kin. Arrangements are in hand for the preparation of a suitable Book, and the first entries will be:

Surgeon-Lieutenant Charles Eric Rhodes, M.B., B.S., R.N., who died on June 16, 1955, while attempting to save men trapped in a sunken submarine.

Mark Gregory Baker, M.R.C.S., L.R.C.P., of Ashby-de-la-Zouch, who on August 17, 1955, sacrificed his life while attempting to rescue two men overcome by petrol fumes in a well.

Lieutenant Stanley Graham Sutton, M.B., R.A.M.C., who was awarded the O.B.E. for his bravery during a disastrous forest fire in Cyprus in June, 1956.

Legacies by the Late Sir Henry Brackenbury

10. Legacies under the will of the late Sir Henry Brackenbury which have recently become payable on the death of Lady Brackenbury include £250 for the Charles Hastings Fund and £750 for investment by the Council of the B.M.A., the income of which is to be applied every second or third year as a Prize to be known as "The Brackenbury Prize" to be awarded to a member of the Association at the discretion of the Council "for study essay lecture or other similar contribution on a subject judged by the Council to be of immediate practical importance with regard to public health to some medico-political or medico-sociological problem or to some educational question whether general medical or postgraduate regard being had to literary form as well as to substance."

Petrol Rationing

11. By arrangement with the Ministry of Fuel and Power, the local units of the Association in the areas in which the Regional Petroleum Offices are situated were asked to appoint medical liaison officers whose function would be to advise the Regional Petroleum Officers about claims from doctors for supplementary allowances of petrol for work outside the National Health Service.

British Commonwealth Medical Conference

12. In view of the financial position of the Association and the consequent need for economy, the Council has regretfully decided to postpone the next meeting of the British Commonwealth Medical Conference until 1958.

Study Tour of Denmark

13. The Danish Government (through the Danish Institute) has kindly invited two parties of members of the Association to visit Denmark during August and September, 1957.

Relief for Hungarian Refugees

14. Upwards of 50 refugee doctors from Hungary have been welcomed in the International Medical Visitors Bureau at B.M.A. House, and have been given advice and assistance, financial and other.

The Council sent representatives to a conference at the Ministry of Health at which the position of Hungarian refugee doctors was considered.

The Chairman of Council launched an appeal for contributions in the *British Medical Journal*, partly for the purpose of assisting the Austrian Medical Association in relieving distress among the large number of Hungarian medical refugees in that country.

Consultation with the Profession

15. The Council has noted the following resolution of the A.R.M., 1956:

346. **Resolved:** That this Meeting expresses the earnest hope that, in future, any medical committee or council (or similar body) which advises, or acquiesces in, any major change in medico-political policy, will either take steps to ascertain the views of the profession as a whole, or else to make it clear beyond peradventure that the opinion expressed is solely that of the individuals forming the committee, etc., and by no means necessarily that of the profession as a whole.

Committee on Nuclear and Allied Radiation Hazards

16. At the invitation of the Minister of Health and Secretary of State for Scotland the Council, on behalf of the Association, has suggested the names of medical practitioners who might be invited to serve on a Government Committee to consider the report of the Medical Research Council's Committee on the Hazards to Man of Nuclear and Allied Radiation.

Remuneration Policy

17. The Council has decided not to take any action in connexion with the following resolutions of the A.R.M.,

1956, whilst the present claim for increased remuneration, which has been prepared and presented by a Joint Committee representing hospital medical staffs and general practitioners, is under consideration:

332. **Resolved:** That the Association develop a policy whereby the Council will come to assume fuller responsibility for all future claims submitted by any section of the profession.

334. **Resolved:** That the recommendations of the Council on the subject of remuneration policy be accepted and implemented with the least possible delay and that special emphasis should be placed on the policy outlined in the first recommendation that medical men and women should be remunerated as doctors.

As reported elsewhere in the Council's Report, the Government, through the Ministry of Health, has been urged to set up an independent Committee of Inquiry to consider what should be the range of remuneration of medical officers in the public health service.

Undergraduate Training in General Medical Practice

18. The following resolution of the A.R.M., 1956, has been sent to the General Medical Council:

388. **Resolved:** That this A.R.M. requests the General Medical Council to consider including a period of training and instruction in General Medical Practice in the curriculum of Medical Students.

Reports to Divisions Concerning A.R.M. Resolutions

19. In 1954 the A.R.M. passed the following resolution:

237. **Resolved:** That this Meeting requests that when a resolution is passed at a Representative Meeting, the Division or Divisions concerned in moving the resolution be kept informed of the steps taken to implement the resolution.

Observance of this rule involves not only a considerable burden of work but also considerable expense. As an economy measure, the Council recommends:

Recommendation: (1) That Minute 237 of the A.R.M., 1954, be rescinded. (2) That, when a resolution is passed at a Representative Meeting, the Division or Divisions concerned be informed when a final decision on the subject-matter of the resolution has been reached.

Suggested Summary of Annual Report

20. The Council was asked by the A.R.M., 1956 (Minute 337), to consider the preparation of a short summary of its work, in addition to the Annual Report, for issue to all members. This would involve additional expenditure at a time when the Association can ill afford it. Apart from expense, however, the Council feels that members should be encouraged to read the full report of the Council and not an abridged edition.

A.R.M. Resolutions—Summary of Action Taken

21. The Council submits in Appendix II a summary of action taken in connexion with various resolutions passed at the A.R.M. in 1956. The resolutions in question have been noted in the relevant paragraphs of the Council's Report and it has not been thought necessary to include in the summary nor has it been thought necessary to include in the summary declarations of policy not specifically calling for immediate action by the Council.

The Council has not yet completed its consideration of certain resolutions of the A.R.M., 1956, but hopes to report on these in its Supplementary Report.

GENERAL MEDICAL SERVICES

Remuneration

The Remuneration Claim

22. A full report of the events which have taken place in connexion with the claim for increased remuneration for general practitioners and hospital medical staff will be made to the Special Representative Meeting.

Further developments will be reported in the Supplementary Annual Report.

Size of the Central Pool

Negotiations on the size of the Central Pool have continued and the final settlement for 1954-5, which amounted to £44m., was distributed at the end of last year.

The G.M.S. Committee is doing all it can to expedite the calculation and distribution of the final settlement moneys for subsequent years. Unfortunately, few of the necessary inquiries can be put in train until after the end of the financial year in question.

To illustrate the complexity of these negotiations, the following paragraphs set out the position with regard to the factors which must be taken into account each year:

Number of Doctors in the Service

The figure of the number of N.H.S. principals on the lists of executive councils is factual and is based upon returns from executive councils. The total number thus disclosed is adjusted on the basis of a formula agreed between the G.M.S. Committee and the Ministry to allow for additions and deletions which occur during the year.

Income from Other Sources

With the exception of income from private practice, which remains at the level of £2m. determined by Mr. Justice Danckwerts, the figure of income from other sources is factual and computed from returns made by the various authorities concerned.

The returns from hospitals, local authorities, and Government Departments in recent years indicate that the income from these sources is fairly constant. Factual information will continue to be sought for some years to come, but if there is no change in the situation the G.M.S. Committee, in consultation with the Ministry, will look into the possibility of discontinuing these yearly inquiries and asking the various authorities to make only periodic returns at regular intervals.

So far as private practice is concerned, the Committee has again rejected the suggestion by the Ministry that the last practice expense inquiry undertaken by the Board of Inland Revenue should be used as the basis for calculating the receipts of general practitioners in the N.H.S. from private practice. In consequence, both sides have to date accepted the provisional application of the figure of £2m. decided by Mr. Justice Danckwerts.

In discussing the matter with the Ministry, the G.M.S. Committee, supported by its statistical advisers, maintained that because of the wide diversity of private practice earnings any inquiry into this source of income would have to be on a very large scale to give anything like an accurate picture. Certainly, it is clear that in this sphere a limited sample inquiry, even of the size of that used for practice expense purposes, would be useless and the results misleading.

Practice Expenses

The Ministry has been informed by the Board of Inland Revenue that pressure of work makes an annual inquiry into practice expenses impossible under present conditions. In consequence, although an undertaking was secured that the Board would carry out a further inquiry in 1958, based on accounts for the financial years 1956-7, the practice expense ratio for the years between 1952-3 (the accounting year used for the last official inquiry upon which the 1953-4 Pool was based) and 1957-8 falls to be determined by direct negotiation with the Ministry.

The G.M.S. Committee, on the advice of its experts, agreed to take the results of the 1952-3 inquiry as the baseline, and the total expenses as disclosed by the inquiry for that year were then increased to take account of the increases which were assessed to have taken place in the prices of the various items which go to make up practice expenses as a whole. The Committee is satisfied that the results reflected in the final settlement for 1954-5 have provided a fair valuation of the movement in practice expenses over the period.

Further discussions are now under way on methods of bringing the practice expense ratio up to date for the financial year 1955-6.

Betterment Factor

Pending a settlement of the remuneration dispute, the betterment factor remains at the level of 100% which Mr. Justice Danckwerts held to be applicable some six years ago.

It will be appreciated that the balance due to the profession cannot be computed until the total sum already distributed is known, and for the reasons set out above, it must be some time after the end of the financial year before the final calculation can be made.

Nevertheless, a lapse of some twenty-one months, as occurred in the case of the Pool for 1954-5, is far too long

and the need for dealing more expeditiously with these questions in the future has been impressed upon the Ministry.

Discussions are now proceeding on the size of the Central Pool for 1955-6.

Monthly Payments

Further discussions have taken place with the Ministry on the principle of monthly payments for general practitioners. The A.R.M., 1956, passed the following resolution:

That this A.R.M. urges that negotiations *re* monthly payments to general practitioners be expedited.

The Ministry, whilst not unsympathetic, is reluctant to adopt the suggestion unless it can be certain that the additional work involved will not entail any increase in the staffs of executive councils, but has undertaken to explore the position. It has been pointed out that in some areas where monthly payments are now operating no additional staff has been found necessary and that, in any case, a number of proposals put forward by the G.M.S. Committee—in particular, the abolition of back debits and back credits—should more than compensate for any additional work involved. Discussions are continuing.

Temporary Residents

The amending regulations which came into effect on October 1, 1956, raised the lower temporary resident fee from 5s. to 8s. 6d. The higher fee of 17s. remains unchanged. In addition, the new regulations provided for a right of appeal on the part of any practitioner who is aggrieved by the decision of his Executive Council to classify a particular case as attracting only the lower fee. It is hoped that these new arrangements will obviate some of the difficulties which have previously arisen in connexion with the treatment of temporary residents at holiday camps and institutions.

Supplementary Annual Payments

The A.R.M., 1956, referred the following motion to Council for consideration:

That to obtain Supplementary Annual Payments the qualification of having been in that practice on March 31, 1953, be altered to include all single-handed small-list practitioners who have a static or increasing list irrespective of the date of entry into that practice.

The G.M.S. Committee has examined this suggestion but feels that it is based largely upon a misconception. The scheme of Supplementary Annual Payments was originally devised to prevent any loss to individual small-list practitioners as the result of the introduction of the new scheme for the distribution of the Central Pool in 1953. It is for this reason that the present scheme restricts these payments to those who were in practice at that time.

There seems little justification for extending what is in effect a "no detriment" provision to those who have entered practice subsequently. New entrants setting up in areas where there is a need for more doctors can already receive assistance through the scheme for initial practice allowances. In these circumstances it is felt that no extension of the Supplementary Annual Payments scheme, which was designed to meet a specific need, is warranted.

Machinery for Filling Practice Vacancies

23. The A.R.M., 1956, referred the following motion to Council for consideration:

That this Meeting urges Council to press for the adoption of the Scottish method for filling practice vacancies.

The G.M.S. Committee, with the approval of the Representative Body and the Annual Conference, has already put forward a number of suggestions designed to improve and expedite the filling of practice vacancies in England and Wales. In brief, these proposals were: (1) that the Executive Council should be responsible for appointing a successor; (2) that the decision whether a practice should be dispersed or a vacancy declared should rest with the Executive Council; and (3) that the Medical Practices Committee should act

as an appeals body and, in hearing an appeal, should be required to review all the applications originally submitted.

The matter having been fully discussed with the Ministry, it has been concluded that there may well be good reasons for not disturbing the existing arrangements. The original proposals were prompted mainly by a desire to speed up the selection machinery. Since then it can be said that there has been some general improvement, and it seems that such delays as have occurred are due not so much to any defect in the selection procedure itself but to delays in hearing and announcing the results of appeals against the decision of the Medical Practices Committee. This particular point has been discussed with the Ministry and an assurance obtained that every possible step will be taken to expedite the hearing of appeals and, in particular, to make the results known to all concerned at the earliest possible moment.

On the general issue, apart from the fact that amending legislation would be necessary, the Ministry put forward two grounds of criticism which have some substance. Firstly, the requirement that the Medical Practices Committee as an appeals body should be required to review all the original applications would undoubtedly in practice mean that every case would have to be heard twice. Secondly, the Ministry felt that the proposals did not provide a sufficient counter-balance to local interests.

It was clear from these discussions that early legislation on a matter of this sort was unlikely, and the G.M.S. Committee is satisfied that the Ministry is seized of the importance of doing everything possible to speed up the present selection arrangements. For all these reasons it has been decided to keep the position under review and not to pursue it further for the present.

Medical Practices Committee Certificates

24. At the A.R.M. last year the following motion was referred to the Council for consideration:

That this Meeting recommends that Section 35 (9) of the National Health Service Act, 1946, be more clearly defined even to the extent of amending the Act, so that just as the granting of a Certificate of Valuation protects the practitioner at law, the refusal of such certificates should legally imply that the law has been broken. Furthermore, it recommends that the Medical Practices Committee should be answerable at law for failing to carry out its statutory duties.

The Medical Practices Committee, with whom the matter has now been discussed, takes the view that the particular case which gave rise to the proposals contained in the motion, and which finally ended in the Courts, had a number of unsatisfactory features. In the first place, the certificate had been applied for after the completion of the transaction, and this fact in itself prevented the Committee from issuing a valid certificate since the Act provides that such certificates can be given only in respect of proposed transactions. Secondly, the Valuation Department of the Board of Inland Revenue could not agree with the value placed upon the premises concerned, which in fact were residential and had never substantially been used for practice purposes. The Valuation Department had considered the question more than once but had nevertheless felt unable to increase its own original valuation. Thirdly, the Medical Practices Committee itself, when explaining why a certificate could not be given, had quoted from the letter from the Valuation Department and not restricted itself to the exact terms of the Act. Hence the view expressed by Mr. Justice Vaisey that the Committee had directed its mind to something which was an entirely false point and had nothing to do with Section 35.

Nevertheless, even had it been possible for the M.P.C. to issue a valid certificate, and even if the exact words of the Act had been stated in its letter, that Committee is still not satisfied that it would have been justified in doing so.

It must also be borne in mind that the M.P.C. does not give a legal decision. The refusal of a certificate carries no other implication than that the M.P.C. is not "satisfied" that one can be issued. Thereafter no further action is taken by the M.P.C. but only by the Director of Public Prosecutions in the event of a complaint. In such circumstances, the M.P.C.

may be required to produce its files, but it initiates no steps whatsoever after refusing to grant the certificate. It was pointed out by the M.P.C. that the refusal of a certificate is no bar to the completion of a transaction and undoubtedly the many such transactions may be unexceptionable. The parties, however, are left without the complete protection which a certificate provides.

So far as the M.P.C.'s own procedure is concerned, care is now taken to see that all refusals of certificates are worded in the precise terms of the Act, as indeed the vast majority have been in the past. In those cases where, because of the prior completion of the transaction, it is not possible to give a valid certificate, the M.P.C., in addition to using its standard letter, may add a statement that, were it not so precluded, it would or would not have granted a certificate in respect of that particular transaction.

So far as the latter part of the A.R.M. motion is concerned, the M.P.C. expressed the view that, to the best of its knowledge, the Committee is answerable at law for failure to carry out its statutory duty but that that duty goes no further than to grant or refuse a certificate within the terms of the Act.

To summarize, the following points emerged from the discussion:

1. That the Medical Practices Committee is unable to grant a certificate after any transaction has been completed, and that this fact should be more widely publicized.

2. That there is much to be gained by urging all general practitioners to apply for a certificate when engaged in any transaction which could give rise to a possible transgression of Section 35 of the Act.

3. That the M.P.C. has a standard form of letter which may be helpful to those to whom a certificate is refused because of the prior completion of the transaction.

4. That the agreed form of letter now being issued strictly follows the wording of the Act.

5. That, as far as the latter part of the A.R.M. motion is concerned, the M.P.C. is answerable at law for failure to perform its statutory duty, but that that duty goes no further than to grant or refuse a certificate within the meaning of the Act. It would not be desirable in anybody's interest that the duty of the Committee should be extended, nor that refusal of a certificate by the Committee should "stigmatize" the proposed transactions in the manner suggested in the first part of the A.R.M. motion. All applicants come forward voluntarily, and generally with reasonable proposals.

In view of the explanation given by the Medical Practices Committee it is felt that no action should be taken on the lines suggested in the A.R.M. motion.

Protection of Practices Scheme

25. Some years ago agreement in principle was reached with the Ministry on the steps to be taken to safeguard the practices of general practitioners called up in an emergency. The implementation of this scheme remained subject to a Government decision on the general question of making up the balance of civilian pay in wartime. Largely because of the improvement in the international scene, the matter was not pursued at that time, but with the Suez crisis a small number of general practitioners have been recalled for service with the Forces, and further discussions were initiated with the Ministry on the subject.

In general terms, the arrangements now agreed with the Ministry provide that during an "emergency" recognized by the Minister, after consultation with the profession, a doctor who is absent from his practice will remain on the Medical List and will be expected to make deputizing arrangements to enable his practice to be carried on during his absence.

As far as the Central Pool is concerned, since the absentee doctors will remain on the Medical List, they will continue to be included in the annual calculation, whilst the total remuneration received from the Forces will be deducted from the global pool when the final settlement is calculated at the end of the financial year.

In addition, the expenses of employing a locum or of making other deputizing arrangements is a practice expense

which will be reflected in the overall practice expense ratio when the final settlement is calculated.

From the individual practitioner's point of view, when he joins the Forces his list will be frozen in the sense that for financial purposes the number of patients will, during his absence, be fixed at a number equal to the average during the quarters beginning April 1 and July 1, 1956, or the two quarters immediately preceding that in which he joins the Forces, whichever is the later. During the doctor's absence, transfers of his patients (other than those who have changed their address) to the lists of other doctors will in effect be on a temporary basis. On the absentee doctor's return, Executive Councils will notify all patients (other than those who have changed their place of residence) who were on his list when he joined the Forces but have transferred to another doctor during his absence, that their original doctor has returned to his practice. These patients will be informed that they will be returned to their own doctor's list unless they indicate their wish to continue on the list of the doctor who has been temporarily attending them. If they do not wish to return to their former doctor, the practitioner attending them temporarily will remain responsible for their treatment in all respects but will receive no capitation fees in respect of such patients for a period of twelve months from the date of notification. During this period the fees will be paid to the doctor returning from the Forces.

It is believed that a scheme of this kind will greatly assist the absentee doctor, but it is emphasized that it is only designed for a temporary emergency and any large-scale call-up would call for measures of a different kind.

Practice Accommodation

26. The special Subcommittee of the G.M.S. Committee which is investigating the problem of practice accommodation, particularly in redevelopment areas, has submitted an interim report which will be the subject of exploratory discussions with the Ministry of Health. Particular attention is being paid to the question of the use of local authority accommodation by general practitioners on new housing estates, a problem to which the Representative Body referred in Minute 169 last year—namely:

169. **Resolved:** That the Council be asked to inquire into the unsatisfactory position which obtains in certain local authority areas with regard to tenancy terms for houses and surgeries rented by general practitioners on new housing estates.

Loans for Provision of Surgery Accommodation

27. The A.R.M., 1956, referred the following motion to the Council for consideration:

That the Minister of Health be pressed to increase the scope of interest-free loans for the provision of new surgery accommodation, to include all practitioners, either in single practice or in partnership, where such application is endorsed by the Local Medical Committee and Executive Council.

This proposal has been carefully considered, but it is felt that it would be unwise to seek any extension of the Group Practice Loans Fund at the present time. The aim of the existing scheme is to encourage group practice, and to extend these arrangements to other types of practice could only be effected at the expense of the Central Pool. The yearly contribution of £100,000 to the Group Practice Loans Fund is a first charge on the Central Pool, and any increase in this amount could only reduce the amount remaining in the Pool for distribution in other ways.

Mileage

28. The Government Mileage Committee has now issued an interim report dealing with the "ordinary" portion of the Mileage Fund. The question of special mileage will be the subject of a later report following further investigations to be undertaken by the Mileage Committee.

The interim report has been sent to Local Medical Committees in order that they may have a full opportunity of discussing the matter before the Annual Conference.

No action will be taken to implement the recommendations for altering the present principles of mileage distribution until the final report is available and has been approved by the Conference.

Emergency Call Service

29. Following the introduction of an Emergency Call Service, which, organized on commercial lines, began operating in the London area early last year, the G.M.S. Committee set up a special Subcommittee to examine the whole problem of deputizing arrangements, with particular reference to those organized on a commercial basis. Initially some doubts were felt about the legality of such a service, but after legal advice had been taken, and as a result of the investigations undertaken by the Subcommittee, a statement was published in the *Supplement to the British Medical Journal* of October 6, 1956, to the effect that the G.M.S. Committee was satisfied that such schemes did not necessarily run counter to the National Health Service Act and its regulations.

On the general issue it is felt that the interests of general practice and the public are best observed by providing for proper off-duty and leisure time by means of the more established and proved methods of group partnership and rota schemes. Nevertheless, in certain areas it may not always be possible for the individual doctor to participate in such arrangements, and, in consequence, the statement recognized that in some circumstances an Emergency Call Service might constitute a suitable supplement to the more usual methods of practice.

Clearly, however, such schemes can give rise to abuse, and the G.M.S. Committee takes the view that they should always conform with the customary arrangements in the other forms of practice and that they should not be used as an opportunity to escape a contractual obligation to provide a personal and continuing service or to enable a doctor to avoid all emergency and week-end calls.

Efforts have therefore been made to find some means of preventing abuse in the use of the Service and of bringing it under some form of professional control. After careful consideration, the conclusion has been reached that the most effective way of dealing with the situation would be for the Terms of Service to be amended so that a general practitioner would have to obtain the consent of the Executive Council to any standing deputizing arrangements he proposed to make, instead of merely informing the Council of the arrangements that had been made.

If abuse is to be checked, individual deputizing arrangements must be examined on their merits, and, clearly, such a task can only be undertaken by the Executive Council in close consultation with the Local Medical Committee. Such a measure would also provide a means for dealing with those cases where, without resort to the Emergency Call Service, a doctor persistently contracts out of night and week-end calls. In addition, it would ensure that measure of professional control which is felt to be necessary.

In view of the importance of this proposal no action is being taken until the Annual Conference has had an opportunity of considering the matter.

Elimination of Inflation of Doctors' Lists

30. The G.M.S. Committee is pleased to report that the Ministry has at last agreed to the establishment of an alphabetical index as an adjunct to the numerical register now maintained at Southport. It hopes that this very necessary step will gradually diminish the amount of inflation of doctors' lists, and thus lead to a more equitable distribution of the Pool.

Reinstatement of Ex-Service Men on Doctors' Lists

31. The A.R.M., 1956, referred the following motions to Council for consideration:

That it be arranged with the Ministry of Health that the names of men called up for National Service be left on the list of their doctor and that the men's records remain in the

doctor's care until they change their doctor or move away from the district. The only transaction then necessary would be the deduction of the capitation fee during the two-year period of National Service, with restoration of the fee at the end of that time.

That, alternatively, further representations should be made to the Ministry of Health to ensure that, on leaving the Services, a patient is reinstated automatically on his former doctor's list.

Up till now, the risks of increasing inflation have prevented the Ministry from accepting the suggestion that the names of ex-Service men should automatically be reinstated on the lists of their former doctors. The G.M.S. Committee is, however, glad to report that considerable progress has been made in finding a solution to this small but irritating problem.

At present, when a patient is called up, his medical records are sent to Southport, through the Executive Council. It is now suggested that the Council should retain the record during the two-year call-up period, and, if at the end of that period the ex-Service man returns voluntarily to his doctor's list, the record will be returned to the doctor by the Council. Other records not so dealt with will be reviewed by the Executive Council after a short period following the expiration of the term of National Service, and a letter will be addressed to the Service man at his pre-Service address, inquiring whether he wishes to be reinstated on his former doctor's list. If so, the necessary action will be taken by the Council, but in the absence of a reply the record will be sent to the Central Index at Southport, where the man's present whereabouts can be traced. Whilst this scheme will not cover every case, it should cater adequately for the vast majority and represents a considerable step forward.

Maternity Medical Services

The Cranbrook Committee on the Maternity Services

32. The Minister of Health has set up a Special Committee under the Chairmanship of Lord Cranbrook to inquire into the maternity medical services. The Council has set up a Special Committee to prepare the Association's Memorandum of Evidence, and its attention has been drawn to the views expressed by the Representative Body and the Annual Conference of Local Medical Committees that the Obstetric List should be abolished. Similarly, the Committee has been informed of the view of the Conference that there should be uniformity throughout the country of the criteria laid down for the payment of post-natal fees when the patient fails to attend.

In addition to making strong representations to the Ministry, the attention of the Cranbrook Evidence Committee has been drawn to the following resolutions passed by the A.R.M. last year:

144. **Resolved:** That this Meeting, whilst appreciating the action taken in pursuance of Minute 60 of the A.R.M., 1955, feels that even greater pressure should be brought to bear to get more G.P. obstetric beds as soon as possible.

145. **Resolved:** That this Meeting deplores the shortage of maternity beds, which in turn creates a shortage of general practitioner beds.

150. **Resolved:** That this Meeting reiterates the resolution of 1955 that, in view of the wide variation in different Executive Council areas of criteria for admission to the Obstetric List, any duly qualified registered medical practitioner who applies to go on the Obstetric List should be placed on it without further question.

Portway Maternity Hospital

It will be remembered that the lack of facilities for general practitioner institutional midwifery in the Weymouth area led the G.M.S. Committee to seek a meeting with representatives of the South-west Metropolitan Regional Hospital Board. At these discussions at the end of last year, agreement in principle was reached that ten beds under the overall supervision of the consultant obstetrician should be made available at Portway Hospital to local general practitioners for a period of one year in the first instance.

The G.M.S. Committee has subsequently been disturbed to find that these arrangements have met with substantial

local opposition. Indeed, it has now been informed by the Board that, because of certain practical difficulties, the problem is to be shelved pending the report of the Cranbrook Committee, which is to review the maternity services generally. A further interview with the Board is being sought.

Antenatal Care Related to Toxaemia

A memorandum by the Standing Maternity and Midwifery Advisory Committee of the Central Health Services Council on Antenatal Care Related to Toxaemia has now been issued by the Ministry.

The Chairmen of Boards of Governors and Hospital Management Committees have been asked to arrange meetings of professional representatives from the three branches of the National Health Service to discuss the professional issues raised by the memorandum. It is intended that the views of the three branches of the profession should be conveyed to the administrative bodies concerned in the hospital service, who will then report to the Ministry on the need for any action to be taken centrally. Once this stage is reached the memorandum, which draws attention to the need for the fullest liaison between the hospital, the general practitioner, and the local authority, will be discussed with the Ministry.

Trainee General Practitioner Scheme

33. The report of the Special Subcommittee of the G.M.S. Committee on the Trainee General Practitioner Scheme, which was approved by the Annual Conference last year, has been discussed with the Ministry of Health. The Ministry has accepted the recommendations contained in the report, which has now been sent to Executive Councils with the suggestion that steps should be taken as soon as possible to implement its recommendations.

Local Medical Committees have been advised of the steps which have been taken to establish the Regional Appeals Machinery advocated in the report. Whilst it is believed that the number of cases in which the practitioner will feel it necessary to appeal will be small, it is hoped that Local Medical Committees will take advantage of this new facet of the Scheme.

The Advisory Committee suggested in the report has been constituted. Its personnel includes a medical member of the staff of the Ministry of Health, who acts as an observer.

In view of the considerable increase in motoring costs which has occurred since the appointed day, an increase is being sought in the car allowance made under the Scheme.

The A.R.M., 1956, referred the following motion to the Council for consideration:

That in the case of the sudden illness or death of a single-handed doctor where no locum is immediately available, the Secretary of the Local Selection Committee under the Trainee Scheme should have powers, if requested by the practitioner or his representatives, to permit a trainee in the area to carry on the practice for a period of not exceeding seven days.

Consideration has been given to this suggestion, but, having regard to the fact that the primary object of the scheme is to train new entrants to general practice under the supervision of an experienced practitioner, it is considered that the proposal is neither desirable nor practicable.

Charges for Prescriptions

34. Following the Government's announcement of its intention to extend the charges for prescriptions, a deputation from the G.M.S. Committee protested strongly not only against the charges themselves, but about the complete lack of consultation on the new proposals.

The Association is opposed to charges of any kind, and the Government's present scheme, which extends the existing charges in a manner which must discriminate against certain categories of patients, is particularly unfortunate.

In spite of the Committee's protest, and of representations made to the Minister by the Council, the Government has proceeded with its proposals.

Without prejudice to the major principle involved it was pointed out to the Ministry that certain aspects of the scheme

detailed in official circulars which were seen in draft placed unnecessary burdens upon the dispensing doctor, and the Ministry undertook to take full account of the criticisms which were made. In particular it was suggested that one multiple form of receipt should be made available for the use of dispensing doctors, but the Ministry has now intimated that it is unable to agree to this as it regards a single form as being open to abuse. It is therefore proposing to provide separate pads for charges of 1s., 2s., and 3s. The G.M.S. Committee is protesting strongly to the Ministry about this intolerable imposition which attempts to place an unnecessary additional burden on the dispensing doctor.

Multiple Packs

35. Discussions are to take place with the Ministry of Health on the provision of a number of multiple packs which would count as one item only for the purposes of the prescription charge. It is hoped that by these means it will be possible to alleviate the worst discriminatory features of the present scheme of charges.

Prescribing Costs

36. In its last report the Council referred to the Ministry's anxiety at the continued increase in the cost of the pharmaceutical services and its suggestion that, if the present trends continued, the Minister might be forced to limit the cost which fell upon public funds. The Ministry indicated that it would greatly regret such a step and suggested that an inquiry might be undertaken to see whether there was not some way in which doctors might be able to do still more to eliminate additional costs without detriment to their patients. The G.M.S. Committee agreed to discuss the matter further, but made it clear that any search for economy should not be limited to the general practitioner field. Equally, it was emphasized that it was not prepared to enter into discussions on this subject under duress.

It was felt that there were serious objections to the proposal that such an inquiry should be carried out solely within the profession, and the suggestion was made that a Working Party consisting of representatives from the profession and the Department would be an appropriate body to undertake a task of this nature. The Ministry, however, felt that an inquiry of this nature must be wide in its scope and that it would place officials of the Ministry in an embarrassing position if they were called upon to comment on matters which had political implications. The G.M.S. Committee accepted this point of view and agreed that the inquiry should be undertaken by an independent committee.

It is understood that the inquiry will be concerned with all factors which might influence prescribing, including, for instance, medical education and training, the experience of doctors in hospitals, the influence of hospital practice, the effect of advertising techniques by manufacturers on the medical profession, pharmacists, and the public, and pressure by patients. The Ministry has announced that the personnel of the Prescribing Committee will consist of a Dean of a medical school, two general physicians, a pharmacologist, a pharmacist, a statistician, and five general practitioners.

The G.M.S. Committee has now received an invitation from the Ministry to nominate the five general practitioners to serve on the Prescribing Committee, but in present circumstances the Committee does not feel able to make the suggested nominations.

The following resolution passed by the A.R.M. last year has been noted and appropriate action is being taken:

210. **Resolved:** That this meeting of the B.M.A. wishes to inform H.M. Government that doctors find it impossible to co-operate fully in the medicine economy drive, because most advertisements do not state the price of drugs advertised. It considers all medical advertisements to the profession should give an indication of the basic cost.

Prescribing Statistics

37. The Ministry has for some time been seeking to improve the accuracy of the prescribing data which is

circulated to general practitioners. It had been hoped that this scheme, which enables a doctor to compare his prescribing costs with those for the area, would greatly assist in economy in prescribing, but unfortunately the data prepared by the Ministry contained many anomalies due to the methods by which the figures were compiled.

In the course of revising these methods the Ministry put forward the proposal that prescription forms should be stamped with the name of each individual doctor. This proposal could clearly cause considerable difficulties in partnerships, and it was suggested that it should suffice if the pads of forms for use in partnerships were stamped with the collective name of the firm. Unfortunately it is clear that the whole system of sorting and pricing prescriptions is based upon the name of the individual practitioner, and any modification of the system in the manner envisaged would make it extremely difficult, if not impossible, for the scheme to function satisfactorily.

The G.M.S. Committee, with some reluctance, agreed to the Ministry's proposal for individual stamping. It is, however, watching the position carefully and it will not hesitate to make a further approach to the Ministry should it become clear that general practitioners are suffering any undue burden as a result of these arrangements.

Discussions have now taken place with the Ministry on the following resolution of the A.R.M.:

209. Resolved: That the following motion be referred to the Council for consideration:

That in order to assist practitioners to know the cost of drugs, random selection of E.C.10 forms issued by them should be returned to the doctor as soon as the Pricing Bureau has finished with them.

The Ministry welcomed the principle underlying the suggestion, but pointed out that such a scheme would only be practicable in one-third of the country at any one time—that is, in those areas where prescriptions had already been sorted into doctor order. Equally there would be some delay in that prescriptions had to be kept available for six months after pricing, as a check to chemists' accounts. Subject to these reservations the Ministry is looking into the possibility of putting the scheme into operation.

Discount on Drugs

38. Although the Conference of Local Medical Committees last year accepted an offer by the Association of British Pharmaceutical Industry to increase the rates of discount on proprietary preparations from 10% to 20%, it expressed the view that dispensing doctors' prescriptions for drugs on the Special List should be priced and paid for on the basis of the cost to the practitioner and not on the cost to the pharmacist.

This matter has now been discussed with the Ministry, who take the view that there is some justification for the difference in rates of discount, largely because of the fact that the doctor does not incur some of the overhead expenses which the chemist must face. This answer is regarded as most unsatisfactory and further representations are to be made.

Stock Orders

39. Following discussions with the Ministry of Health a further approach is to be made to the National Pharmaceutical Union with the object of securing the introduction in England and Wales of a scheme for stock orders, similar to that which now operates in Scotland.

Provision of Therapeutic Substances for Use in Emergency

40. The A.R.M., 1956, referred the following motion to Council for consideration:

That this Meeting considers that oxygen, blood, and other therapeutic substances required by a general practitioner in an emergency should be conveyed to the patient at the public expense, and without charge to the doctor.

The G.M.S. Committee has now discussed this matter with the Ministry of Health, and in particular has drawn attention

to the difficulties encountered by many rural practitioners in obtaining urgent supplies of oxygen. It has suggested that oxygen and the equipment associated with it should be transported at the public expense. The Ministry's view is that under present regulations there is no power whereby the N.H.S. can pay charges of this nature, and that the chemists' Terms of Service only require them to supply drugs and appliances, with no obligation to deliver. Negotiations between the Ministry and the Chemist Contractors on the subject of oxygen are still continuing, and the Ministry, having noted the views of the A.R.M., has promised that the question of delivery will not be overlooked.

Replacement of Appliances

41. The A.R.M. last year passed the following resolution:

216. Resolved: That Council be asked to consider the practicability of permitting general practitioners to prescribe on Form E.C.10 replacements of those appliances which are at present available only through the Hospital Service.

At the present time general practitioners are permitted to prescribe replacements of certain appliances which are available in the first instance only to the hospital service.

Consideration is now being given to proposals for extending the list by the addition of a number of replacement appliances. An approach will then be made to the Ministry.

General Practitioner Beds

42. The A.R.M., 1956, passed the following resolution:

183. Resolved: That this Meeting urges that general practitioners should have access to hospital facilities, including beds, throughout the country.

The G.M.S. Committee has now discussed this matter with the Ministry and it is pleased to learn that the figures for 1955 (the latest then available) again show some increase in the total of staffed beds allocated to general practitioners.

There is, however, still room for improvement, and the position will be kept under constant review.

Representation of General Practitioners in Hospital Administration

43. Concern has been felt for some time at the lack of general practitioner representation on the Boards of Governors of teaching hospitals. In the London area, for instance, there is a general practitioner representative on only five of the fourteen Boards concerned. The G.M.S. Committee feels most strongly that this undesirable state of affairs should not be allowed to continue, and further representations have been made to the Ministry. During the course of the discussion, the Ministry was informed of the action which the Association is taking in inviting its Branches and Divisions, in consultation with Local Medical Committees, to send to Headquarters the names of suitable general practitioner representatives for appointment to Boards of Governors, which will then be submitted to the Minister.

The Ministry has undertaken to consider these representations in making future appointments and to do what it can to increase the number of Boards which include a general practitioner member. In doing so, however, the Ministry made the reservation that it is limited by the fixed proportion of nominated members and the need to secure a proper balance between medical and lay membership.

The matter will be reviewed again when the vacancies occurring in the early part of this year have been filled.

As far as Regional Hospital Boards are concerned, the improvement in general practitioner representation secured in recent years has been maintained, but here again the situation will be kept under review.

Antitetanus Serum

44. The Ministry's attention has been drawn to the concern felt in the profession at the problems, both medical and legal, which arise as a result of the widespread use of antitetanus serum, and it has been represented that there is a

clear need for the formulation of a national policy on immunization in infancy.

It is understood, however, that the Medical Research Council will shortly be issuing a report which will have a considerable bearing on this problem, and the matter has therefore been left in abeyance until the Council's report is available.

Combined Diphtheria-Pertussis Immunization

45. The A.R.M. last year passed the following resolution:

193. Resolved: That combined diphtheria-pertussis vaccine and combined diphtheria-pertussis-tetanus vaccine should be available to general practitioners in all local authority areas.

This matter had already been discussed with the Ministry on a previous occasion and the suggestion made that the combined diphtheria-pertussis vaccine should be generally available to the family doctor. At that time, the Ministry was awaiting the results of the Medical Research Council's trials of whooping-cough and combined vaccines, and it thought it was probable that a number of local authorities were using the combined vaccine as part of a research project. In such circumstances, it would not be available to general practitioners. Research apart, where local authorities offered a choice of single or combined immunization, the Act required them to afford general practitioners the opportunity of doing likewise.

The G.M.S. Committee has considerable sympathy with the view advanced by the A.R.M., and it considers that the general practitioner should be able to indent upon the local authorities for the vaccine of his choice. It appears, however, that the wishes of the Representative Body cannot be ever, that the wishes of the Representative Body cannot be implemented until all local authorities adopt the combined vaccines for use in their own vaccination schemes. Further consideration is being given to the matter.

Poliomyelitis Vaccination

46. Following discussions with the Ministry a new circular has been sent to local health authorities setting out the arrangements under which general practitioners will in the future be able to take part in poliomyelitis immunization schemes. This prior consultation has done much to prevent a recurrence of the unfortunate situation which occurred when the vaccine was first introduced and which the A.R.M., 1956, referred to in the following resolution:

189. Resolved: That this Meeting deprecates the action of the Minister of Health in making important medical announcements to the general public before informing the medical profession as a whole.

Post-mortem Examinations

47. The A.R.M. last year passed the following resolutions:

152. Resolved: That the Association should take active steps to establish a system whereby the family doctor, having obtained the consent of the next of kin of the deceased, could call in a consultant pathologist to do a post-mortem examination on any of his patients who had died of natural causes and for whom he could issue a death certificate in the usual way.

153. Resolved: That transport should be available for the removal of corpses for post-mortem examinations at public expense at the request of a general practitioner.

The G.M.S. Committee discussed the question of post-mortem examinations with the Ministry of Health some months ago and secured the Ministry's agreement to a suggestion that, when a general practitioner requires a necropsy, if the pathologist agrees, then the cost of transport from home to hospital should be met from public funds.

The question of extending post-mortem facilities on the lines suggested by the Representative Body in the first resolution quoted above is under consideration by the appropriate committees concerned.

X-ray and Diagnostic Facilities

48. The G.M.S. Committee's attention has been drawn to a number of instances in which general practitioners have

been denied direct access to x-ray and other diagnostic facilities in the hospital service. Although it is appreciated that in many instances this situation is brought about as a result of a shortage of radiographers, the G.M.S. Committee feels strongly that general practitioners alone should not be singled out to suffer a complete withdrawal of these facilities. These views have been brought to the notice of the Ministry of Health on previous occasions and the matter will be pursued further.

Amendment of the N.H.S. (General Medical and Pharmaceutical Services) Regulations

49. Amending regulations to give effect to a number of changes which have recently been agreed between the Committee and the Ministry have now been issued and an explanatory letter has been sent to Executive Councils.

National Insurance Certificates

50. The A.R.M., 1956, passed the following resolution:

218. Resolved: That medical practitioners should, at their discretion, be permitted to issue first or any subsequent National Insurance Certificates for a period of up to four weeks.

This proposal has been examined on a number of occasions in the past and appropriate representations have been made to the Ministry of National Insurance, to whom it was also pointed out that in case of doubt a particular patient could always be referred to the regional medical officer.

The Ministry, however, has been unwilling to agree to any general relaxation of the rule. Hitherto, its principal objection was that the most common indication for selecting a case for reference to the R.M.O. is that incapacity has lasted for longer than would have ordinarily been expected from the diagnosis on the certificate. Such an indication would be altogether absent where the cause stated on the first four-weekly certificate is one which ordinarily covers incapacity for a prolonged period. There would be nothing in these cases, which ordinarily lead the Ministry to suspect mistakes in diagnosis or prognosis, which might not be uncommon if four-weekly certificates could be given at the very outset of incapacity.

It is felt that the Ministry's arguments carry considerable weight, and in view of this practical difficulty it is felt that action should not be taken at the present time.

National Service Medical Boards

51. Arrangements have now been completed with the Ministry of Labour and National Service for the disclosure of National Service Medical Boards' findings to general practitioners in certain cases where the candidate is found unfit for military service. Automatic notification of the general practitioner in all cases when the man is found to be unfit is impracticable, for the difficulties facing the Ministry in disclosing information obtained in the administration of the National Service Acts are substantial. In the first place, it appears that the Ministry has no power under these Acts to disclose such information, nor has it power to instruct Chairmen of Medical Boards to reveal the findings of their Boards for purposes unconnected with the National Service Acts. Moreover, the Ministry points out that the general public has rightly assumed that the records of the Medical Boards will be regarded as highly confidential and will not be disclosed in any way which might be prejudicial to the person concerned. This trust in the confidentiality of Medical Boards' records must be preserved. Nevertheless, the Ministry recognizes that, in certain circumstances, where a man is found unfit for service and is suffering from a condition which requires immediate treatment, it would be in the man's own interest to bring the matter to the notice of the family doctor. Accordingly, the Ministry has agreed to ask Chairmen of Medical Boards to communicate with the general practitioner concerned where a man is found unfit for military service on account of one of the conditions shown

below and where he would benefit from immediate treatment:

Affections of the ear, defective vision, diseases of the eye, cardiac disease, hernia, lung conditions other than tuberculosis, disease of the kidneys, diabetes, peptic ulcer.

Insurance Benefit during Part-time Employment

52. The A.R.M. last year passed the following resolution:

215. **Resolved:** That this Meeting considers that gradual return to full-time work, which is desirable after certain illnesses, would be facilitated if National Insurance Benefit, even at a reduced rate, could be payable for a limited time during part-time employment undertaken as a preliminary to resumption of full employment. This Meeting asks the Council of the B.M.A. to approach the appropriate Government Departments to discuss the matter more fully.

This matter has now been raised with the Ministry of Pensions and National Insurance, and it appears that at present the only circumstances in which a person may receive sickness benefit for a day on which he works are: (1) if the work is undertaken under medical supervision as part of hospital treatment and the earnings do not exceed 20s. per week; and (2) if the work is of such an inconsiderable character that it is classified for National Insurance purposes as work as a non-employed person—for example, if his earnings are less than 20s. per week and if the claimant can show "good cause" for breaking the rule of behaviour which lays down that he should do no work.

If a claimant's doctor certifies that such "work of an inconsiderable character" has his approval and is regarded by him as assisting the claimant's recovery, the statutory authorities would very likely accept this as "good cause," but the amount is still limited to 20s. per week.

The Ministry has pointed out that it would mean a fundamental amendment of the National Insurance Act and its regulations to accept the suggestion that benefit, even at a reduced rate, should be payable during part-time employment, and drew the Committee's attention to the following extract from a report by the Percy Committee on the subject in November, 1956:

The suggestion was put to the Committee that smaller firms would take back their disabled workers earlier on a part-time basis if some inducement were offered in the form of continuing payment of sickness benefit proportionate to the reduced hours of working. For example, a worker employed for three-quarters of his time would get that proportion of his wages and one-quarter of his sickness benefit. Because of the difficulties of assessing the degree of working capacity, and cost of administering such a scheme, the emphasis on the number of hours worked to the disregard of other conditions, and the difficulty of providing adequate medical supervision, the Committee is not able to accept the suggestion, which it understands is not favoured by either side of industry.

The Ministry itself takes the view that the emphasis laid by the Percy Committee on the value of industrial rehabilitation points the way to the best means of remedying the problem of the partially fit patient rather than any amendment of the National Insurance Act on the lines suggested in the A.R.M. resolution. In view of the Ministry's explanation, it seems that little useful purpose would be served by pursuing the matter further.

Prevention of Deafness

53. The G.M.S. Committee has been consulted by the Ministry on a suggestion that a memorandum by the Standing Medical Advisory Committee on the prevention and alleviation of deafness might usefully be circulated to general practitioners. The Committee has suggested that the memorandum should be circulated to all general practitioners through Executive Councils.

R.M.O. Examinations

54. The Annual Representative Meeting, 1956, passed the following resolution:

222. **Resolved:** That in the opinion of this Meeting the local national insurance officer should be required, three week-days

before sending Form R.M.3D to a patient, to notify in writing the practitioner in charge of the case.

The Ministry of Health has been approached, but, having consulted the Ministry of Pensions and National Insurance, feels unable to accept the suggestion because of the considerable increase in sickness benefit which would be involved. At the present time, when the Local Office of the Ministry of Pensions seeks an opinion from the regional medical officer, the R.M.O. informs both the patient and the doctor at the same time. The examination takes place not less than five days after this. If he were required first to inform the general practitioner and then three days later to notify the patient, eight days would elapse between the receipt of the request from the Ministry of Pensions and National Insurance and the actual date of examination. It is understood that some 300,000 insured persons return to work as a result of references to the R.M.O., and if a three-day delay were interposed the effect would be not only a corresponding increase in sickness benefit paid out in respect of the longer period of sickness, but a loss of some 900,000 additional working days.

In present circumstances, and in view of this explanation, the G.M.S. Committee does not feel that it is wise to proceed any further with the proposal.

Service Committees and Tribunal Regulations

55. The following resolution of the A.R.M. has been noted for further consideration when the Service Committees and Tribunal Regulations are next under review:

168. **Resolved:** That amendments to Service Committees Regulations should include: (a) That it be a requirement of the Regulations at Medical Service Committee inquiries that a précis of the evidence given by each witness be prepared and signed by the witness. (b) That it should be a requirement of the Regulations that proceedings against a doctor before a Service Committee should only be in respect of a breach of the Regulations, and the doctor be notified in advance of the inquiry of the regulation of which he is alleged to be in breach.

The regulations have just been amended after a very exhaustive survey, and the G.M.S. Committee does not feel that it is possible to seek further amendments at this stage. In any event, it must be pointed out that the A.R.M. resolution is contrary to a decision taken by the Annual Conference last year, and further consideration must be given to the problem before action is taken.

Interview Expenses of Candidates for Appointment

56. Agreement has now been reached with the Ministry on the reimbursement of travelling and subsistence expenses of candidates for appointments in the National Health Service. The new arrangements bring applicants for general practice vacancies and candidates for hospital posts already in general practice into line with their colleagues in the Hospital Service.

General Practitioner Refresher Courses

57. Representations have been made to the Ministry of Health with a view to increasing the contribution which the Ministry makes towards the expenses incurred by a general practitioner attending a refresher course, including the cost of employing a locum during his absence. Attention has also been called to the inadequacy of the present arrangements for paying subsistence allowances to general practitioners attending these courses.

Education of the Public in Health Matters

58. The Annual Representative Meeting last year referred the following motion to the Council for consideration:

That this Meeting deplores the failure of the Ministry of Health to carry out its proper duty in educating the public in everyday matters of health.

Whilst there is little doubt that the Ministry's efforts in this sphere leave much to be desired, it seems unlikely that, at this period of financial stringency in the N.H.S., the

Ministry will agree to embark upon an extensive propaganda campaign in view of the heavy expenditure involved.

For this reason it has been decided to take no immediate action, although the matter will be kept under review.

COMPENSATION AND SUPERANNUATION

Compensation

59. The Council sought the advice of Sir James Millard Tucker, Q.C., on the best method of presenting a case to the Minister of Health on the following Minutes of the A.R.M., 1956:

156. **Resolved (nem. con.):** That Council should press for payment of compensation adjusted to take into account the fall in the purchasing price of the £ and press for immediate payment; and that until such time as full payment of compensation is made the rate of interest be raised to current levels.

157. **Resolved:** That this Meeting requests the Council to press for the payment of compensation moneys, or alternatively it should be possible to convert compensation moneys into any other Government Stocks.

158. **Resolved:** That in cases of proved hardship, doctors should be allowed to draw out their compensation moneys.

Sir James expressed the opinion that the negotiations for increased remuneration might be prejudiced if the Association were able to convince the Minister that additional money should be made available to general practitioners now, either in the form of increased interest or for immediate payment of the outstanding compensation. Sir James's advice, which the Council has accepted, is that, although the Council has a good case on all points, representations to the Minister should be postponed until the completion of the negotiations on remuneration.

Review of Superannuation Schemes

60. The A.R.M., 1956, approved the following resolution:

161. **Resolved:** That Council be asked to review the Superannuation and Pensions Schemes, with special reference to the responsibilities of the young practitioner with less than 10 years' service.

Both the N.H.S. and local government superannuation schemes make some provision for the young medical practitioner who dies, or who has to retire, with less than 10 years' service. The benefits of both schemes are very similar, and they may be summarized as follows:

(1) Retirement or death following an attributable disease or injury—a pension not exceeding two-thirds of average superannuable remuneration, or a lump sum or annual allowance annuable remuneration, of such amount as may be considered reasonable in all the circumstances. If death or retirement occurs after at least five years' service a gratuity equal to average remuneration is also paid.

(2) Death, or retirement on grounds of ill-health, which is not attributable (a) after less than five years' service, a return of contributions only; (b) after more than five years' service, a lump sum equal to not less than average remuneration.

Thus the minimum benefit, once a contributor has five years' superannuable service, is a lump sum equal to average superannuable remuneration—and at five years he will only have contributed a maximum of 30% of this sum.

The Council is of the opinion that these benefits are not unreasonable in relation to the contributions payable, and that, in any case, no pension scheme can be expected entirely to replace the necessity for some form of life cover if adequate provision is to be made for all contingencies.

Pensions after 20 Years' Service

61. In Minute 163 of the A.R.M., 1956, the following motion was referred to the Council for consideration:

That full pension benefit should be available to practitioners who wish to retire after 20 years' service, even if they have not reached the age of 60 years.

As the Superannuation Scheme must remain actuarially sound, the additional cost of earlier pensions would have

to be met either by increased contributions or by reducing the benefit payable, or both. For instance, to obtain a pension of 1½% of total net remuneration at age 45 after 20 years' service a contribution of about 22.8% per annum would be necessary instead of the present 14%. If the pension is to be the same as if service had continued for 40 years, the contributions would be approximately 45% per annum. Alternatively, if contributions remain the same and a practitioner were able to retire on a pension at 45 after 20 years' service, the pension could not be higher than about 0.9% of his superannuable remuneration. A further alternative would be to increase the contributions of all practitioners to pay for the pensions of those who may wish to retire after 20 years' service.

Having considered the matter carefully, the Council is of the opinion that it should not press for revision of superannuation schemes on the lines indicated in the above motion.

Options under Regulation 76

62. The Ministry of Health has considered the oral and written representations made by the Council, and has again decided that it cannot allow those practitioners who in 1948 elected not to enter the N.H.S. Superannuation Scheme to have an opportunity to enter the scheme at this stage. Convincing reasons have been given why it would be impracticable to allow such a change, and the Council is satisfied that no useful purpose would be served by pursuing the matter further.

Clinical Assistants

63. The Ministry of Health has refused to allow part-time clinical assistants to enter the Superannuation Scheme if there has been a disqualifying break since their last appointment within the Service. The Council will reconsider this question when the report of the Government actuary is available on the valuation of the N.H.S. Superannuation Scheme.

Extension of Pensionable Age

64. The Council is aware of a small number of cases in which a practitioner, through lack of suitable warning, neglected to apply for extension of pensionable age until too late. At the request of the Council the Ministry of Health has arranged through Executive Councils to remind practitioners nearing 65 years of age that unless they apply for an extension of pensionable age they cannot continue to contribute to the Superannuation Scheme and increase their ultimate benefits.

Widows' Pensions

65. The Council has considered the following resolution of the A.R.M., 1956:

162. **Resolved:** That the present ruling, whereby women practitioners may draw widows' pensions in respect of their husbands but women hospital officers may not, is unfortunate and should be retrospectively altered forthwith.

This resolution implies that in no circumstances can a woman hospital officer get a widow's pension. This, however, is not the case. If the husband dies before the wife has earned a retirement pension in her own right a widow's pension is paid. The widow receives this pension even if she continues to work within the N.H.S. and if she later obtains her own retirement pension. It continues until her death or remarriage. Only if the husband dies after the wife has earned a pension in her own right is a widow's pension withheld.

The cost of widows' pensions is met by restricting the lump sum retiring allowance paid to husbands to a sum equal to one year's pension (a single man receives a lump sum equal to three years' pension). When a woman hospital medical officer has qualified for her own pension the husband's retiring allowance is equal to three years' pension, less two-ninths. (This reduction is made because of the cover for a widow's pension which had hitherto existed.) As the retire-

ment pension paid to a whole-time woman hospital medical officer may well be sufficient for her own needs, the Council is of the opinion that, in the majority of cases, both the husband and wife will prefer to retain their freedom of action in the disposal of the higher lump sum, which could be used to purchase an annuity if desired. In all the circumstances the Council has decided not to ask for a change in the present procedure.

Superannuation on Fees from Government Departments

66. The A.R.M., 1955, asked the Council "to explore the possibility of superannuation payments being made on sessional fees paid by Government Departments to part-time medical officers." Representations were made to the Treasury and subsequently the whole question was discussed with officers of the Department. The Treasury has re-examined the case presented by Council but has reaffirmed its view that it would not be appropriate to grant this concession. The Treasury has pointed out that the new income-tax relief made available by section 22 of the Finance Act, 1956, will assist practitioners to make provision for an annuity to supplement, if required, the expected benefits from statutory superannuation schemes.

Estate Duty on Widow's Pension

67. The Council has ascertained that the capital value of the pension payable to a widow under a statutory superannuation scheme is taken into account by the Department of Inland Revenue in assessing the amount of any estate duty payable. The capital value, however, is not aggregated with the remainder of the estate but is assessed separately. In addition, discount is allowed because, under the Regulations, the pension ceases on remarriage. In practice, therefore, no estate duty will be paid on the capital value of a widow's pension unless this amount, less any discount, is more than £3,000.

HOSPITAL AND CONSULTANT SERVICES

Medical Membership of Hospital Boards

68. In June, 1956, the Ministry invited the views of the Royal Colleges and the Association on the recommendation of the Guillebaud Committee that, save in exceptional circumstances, the number of medical members on regional hospital boards and hospital management committees should not exceed 25% of the total membership.

Following consultations with representatives of the General Medical Services and Public Health Committees, the Joint Consultants Committee—with the support of the Council—reminded the Ministry that the profession had long been critical of the method of selection of medical members for appointment to the regional hospital boards, which often resulted in few practitioners being appointed who were in active practice in the region concerned or who were recommended by their professional organizations. The Joint Committee urged that the consultant staffs of hospitals in the region should be allowed to nominate not fewer than five of the members of the board; that a representative of the general practitioners and a representative of the medical officers of health in the area should also be appointed on the nomination of the profession; and that the medical membership of a board should be regarded as consisting of the practitioners so appointed and not as including members of the profession appointed otherwise than on the recommendation of a professional organization.

In December, 1956, the Ministry informed hospital boards that the Minister had accepted the Guillebaud Committee's recommendation, and advised boards to observe the same policy in making appointments to hospital management committees.

The Joint Committee has protested that it is inevitable that the small number of consultant members of regional hospital boards representative of those working in the regions must be still further reduced if the overall number

of medical members is not to exceed 25% of the total membership while still including representatives of the universities and medical schools, and in addition a general practitioner and a medical officer of health.

The attention of the Ministry has also been drawn again to the recommendation of the Bradbeer Committee that hospital boards should be encouraged to appoint up to one-fifth of the members of the hospital management committees from among names submitted by the senior medical and dental staffs of the hospitals in the groups.

The question of medical advisory machinery at regional hospital board level has been reopened with the Ministry in the light of the recommendations of the Guillebaud Committee on the subject.

Hospital Medical Staffing

69. Discussions on the reorganization of the structure of hospital medical staffing have continued between the Joint Consultants Committee and the Ministry, but so far no proposals have emanated from these discussions which the Joint Committee feels can usefully be put to its constituent bodies for consideration.

The Council understands, however, that recently the discussions have centred around the problems associated with the senior registrar grade and the question of a new grade between the senior registrar and the consultant. Both the Ministry and the Joint Committee are anxious to find a satisfactory way of dealing with the excessive numbers of senior registrars in certain branches, which, without blocking recruitment, would facilitate the retention of fully trained senior registrars until vacancies occur in the consultant establishment, particularly in such specialties as neurology, neurosurgery, plastic surgery, and thoracic surgery, where consultant vacancies occur only infrequently.

The Joint Committee is opposed to a new "career" grade which would create another rung on the ladder of promotion to consultant status, and, with the passage of time, diminish and ultimately eliminate the prospects of many "time-expired" senior registrars. In general the Joint Committee favours the temporary expedient of extending the tenure of senior registrars, on a rising salary scale, pending a review, hospital by hospital, of the staffing requirements at all levels from the consultant downwards, which it regards as an essential preliminary to a long-term solution of the present difficulties.

Procedure for the Appointment of Consultants and S.H.M.O.s

70. The Council has considered the following motion referred to it by the A.R.M., 1956:

That it is the policy of the Association that vacancies for hospital consultant appointments of more than one session a week should be advertised in the medical press.

It is required by regulation that, before a consultant or S.H.M.O. is newly appointed to the staff of a hospital, the vacancy shall be advertised. It has always been assumed that this would not preclude the offer, without advertisement, of additional sessions at a hospital to a consultant or S.H.M.O. already on the staff. While it is important that there should be full consultation with the consultant staff before sessions are offered to a consultant without advertisement, the Council considers that it would not necessarily be in the best interests of the Service or of the profession to insist that every consultant appointment of more than one session should be advertised. This would hinder the operation of the moral obligation clause, and would also defeat the efforts sometimes made by hospital boards to improve the position of those members of their consultant staffs who have only a small number of sessions.

Indeed, the Joint Consultants Committee has recently agreed to a proposal by the Ministry that the Regulations should be amended to allow a consultant or S.H.M.O. whose sessions are reduced, or whose contract is terminated, as a result of a local reorganization of hospital services, to be offered an alternative appointment without advertisement.

Discussions have taken place between the Joint Committee and the Ministry with a view to improving the operation of the procedure for the appointment of consultants and S.H.M.O.s, and the Ministry has agreed to advise hospital boards as follows:

(a) That hospital medical staff committees should be allowed to see the applications of the short-listed candidates, so that their views thereon might be available to the advisory appointments committee.

(b) That in addition to the two members (one medical and one lay) of the advisory appointments committee nominated by the H.M.C., the board should be urged to nominate at least one member from the consultant staff of the hospital concerned (or where two or more hospitals are concerned, from the consultant staff of one of the hospitals), preferably in a specialty other than that of the medical member nominated by the H.M.C.

(c) That the member of the advisory appointments committee nominated by the board after consultation with the appropriate Royal College should, wherever practicable, come from outside the area of the region and have no hospital appointment either with the regional board or with the board of governors of any teaching hospital in the region.

Internal Administration of Hospitals

71. The Council has considered the following resolutions of the A.R.M., 1956:

247. **Resolved:** That this Meeting most emphatically takes the point of view that Council has failed to implement the resolution 208 (a) passed at the last A.R.M. and, furthermore, by its comments in paragraph 51 in its Annual Report, has weakened the policy laid down by the Representative Body in 1955.

249. **Resolved:** That this Meeting disapproves of the action of Council in not accepting Resolution 208 as official policy of the Association and that it should be implemented in any discussion of the Bradbeer Report.

(Minute 208 of A.R.M., 1955, reads as follows:

208. **Resolved:** (a) That this Meeting, believing everything concerning the patient must be of importance to the clinician in charge and that, therefore, the lay and ancillary services must be subordinate to the medical, considers that the recommendation of equal tripartite administration by the Bradbeer Committee on Internal Administration of Hospitals is not in the interest of the patient (Bradbeer Report, paras. 20-22); (b) that this Meeting affirms that under no circumstances shall the medical and nursing personnel of hospitals be under the control of lay administrators (para. 25); (c) that this Meeting affirms that it should be obligatory for the hospital management committee to consult with the representatives of the senior medical and dental staff (para. 67); (d) that this Meeting welcomes the recommendation in para. 72 of the Report that, when medical administrators with clinical pointed, they should be of consultant status with clinical responsibility. It considers that paras. 77-78 are unworkable; (e) that this Meeting deplores the suggested downgrading of deputy medical administrators, when such are considered desirable, to a R.M.O./R.S.O. grade (para. 81); (f) that this Meeting reaffirms its belief that it is in the interest of the patient to maintain the close link that at present exists between the medical and nursing professions,

with the proviso that section (d) be referred to the Council for consideration.)

The Council does not consider that the system of tripartite administration should be wholly rejected. This system has worked satisfactorily in a number of the larger hospitals for many years, and experience does not suggest that it necessarily operates to the detriment of the patient. The matter has been carefully reconsidered and the Council sees no reason to disturb such arrangements, so long as the views of the hospital medical staff are dominant in clinical matters. In those hospitals where the tripartite system of administration does not work satisfactorily there should be an investigation to ensure that there is no interference by lay administrators in clinical or nursing matters.

Running Costs of Hospitals

72. The Association was invited by Subcommittee D of the Select Committee on Estimates to submit evidence on the running costs of hospitals, with particular reference to the variation in costs from region to region and from hospital to hospital, and to the control exercised by the Ministry and regional boards over the expenditure of hospital management committees. A memorandum of evidence has been prepared and submitted to Subcommittee D.

Attendance at Hospital Management Committees

73. In order to improve co-operation between hospital management committees and their hospital group medical advisory committees, the Joint Consultants Committee has asked the Ministry that hospital management committees should be encouraged to implement the recommendation of the Bradbeer Committee that the chairman of the group medical advisory committee should be invited to attend meetings of the hospital management committee.

Statutory Registration of Medical Auxiliaries

74. The Council has noted the following resolution of the A.R.M., 1956:

308. **Resolved:** That this A.R.M. welcomes the proposed statutory registration of medical auxiliaries, provided that (1) the medical profession maintains some control of the training standards to be aimed at and general ethical conduct, and (2) that the medical auxiliaries retain their present description and are not given independent status as belonging to professions associated with medicine.

The Ministry has prepared a revised scheme for the registration of medical auxiliaries which differs in a number of respects from the original scheme put forward in 1955. The designation previously proposed—that is, "professions associated with medicine"—has been dropped and "professions supplementary to medicine" substituted, the latter being one of the titles suggested by the Joint Consultants Committee. The proportion of medical auxiliaries on each of the proposed registration boards has been reduced, although they still have a majority of one over the other members. Moreover, the new scheme provides that only medical organizations are to be consulted in connexion with the appointment of medical members of the boards. In one important respect, however, the scheme is unchanged. The proposed council to co-ordinate the functions of the various registration boards is to be given no effective control over the boards, and there is no means of resolving a conflict between one of the boards and the co-ordinating council.

The Joint Consultants Committee has asked the Ministry that the membership of the co-ordinating council should be increased to provide for a member appointed by the Association. In order to reach a settlement, it has also informed the Ministry that it would raise no objection to the revised scheme if the powers of the co-ordinating council are satisfactorily strengthened and the medical members of the registration boards are appointed from names submitted by the appropriate medical organizations and from no other source.

The Central Consultants and Specialists Committee, however, feels that the new draft scheme is unsatisfactory in that it gives the various groups of medical auxiliaries a controlling interest in their own training and ethical conduct, and it has urged the Joint Committee to dissociate itself from the scheme if implemented in its present form.

Shortage of Radiographers and Physiotherapists

75. The Joint Consultants Committee has drawn the attention of the Ministry to the grave shortage of radiographers and physiotherapists in many parts of the country and to its effect on the hospital service, and has asked for an opportunity of discussing the matter.

Remuneration Policy

76. The Council has noted the following resolutions of the A.R.M., 1956:

320. **Resolved:** That the Association affirms its adherence to the principle that medical men and women, in whatever form of medical practice or service they are engaged, should be remunerated as doctors, and that their remuneration should not be determined by relation to that of lay personnel employed in the same sphere.

321. **Resolved:** That where it can be shown that in any particular sphere of practice the levels of remuneration are such as to constitute a deterrent to recruitment, the Association take steps to promote or support negotiations for improvement.

322. **Resolved:** That, since the two Spens Reports have established agreed levels of remuneration for general practitioners and hospital medical staffs, and indirectly for most other sections of the profession, the Association reaffirms its policy to maintain these reports as the basis of professional remuneration.

326. **Resolved:** That, for the time being, it be left to the individual sections of the profession themselves to decide whether to continue negotiations within the Whitley Council system or to withdraw from the system, but that the position be carefully watched and reviewed from time to time, regard being paid to: (a) the experience gained as a result of the present joint negotiations (outside Whitley) on behalf of general practitioners and all grades of hospital medical staff; and (b) the view that it might be preferable to retain the Whitley system for minor questions, leaving matters of major national financial importance to be dealt with by direct negotiation.

332. **Resolved:** That the Association develop a policy whereby the Council will come to assume fuller responsibility for all future claims submitted by any section of the profession.

333. **Resolved:** That the various sections of the profession be informed of the Council's preparedness to negotiate directly at the request of any section.

The Central Consultants and Specialists Committee has been informed of Minutes 332 and 333, and while the Committee finds it difficult to see how the Council could assume a fuller responsibility for any negotiations which are conducted through the Whitley machinery, it has welcomed the Council's offer to undertake negotiations at any time at the Committee's request.

Consideration has been given to the following resolution of the A.R.M., 1956:

328. **Resolved:** That the Association take all possible steps to promote an effective system of negotiation whereby decisions reached upon appropriate salary ranges for medical teachers will be binding upon the universities concerned.

Representations were made to the University Grants Committee in July, 1956, on the remuneration of whole-time university medical teachers, when attention was drawn to the following points:

(a) The discrepancies in remuneration between university medical teachers of clinical subjects and their colleagues of equivalent status in the National Health Service, and the even wider discrepancies in the case of medical teachers in the preclinical departments;

(b) The failure of some universities to increase salaries up to the level authorized by the Chancellor of the Exchequer in 1954;

(c) Problems which arise as a consequence of the inadequate rates of remuneration—for example, the difficulty of recruiting medically qualified candidates both for junior posts and to fill vacancies left by senior members of the staff who transfer to more remunerative posts in the National Health Service and elsewhere;

(d) The increasing tendency to appoint candidates who are not medically qualified and the undesirability of this course in view of the importance of medical students being taught very largely by medically qualified teachers who understand more fully the relevance of preclinical work.

The opportunity was also taken to urge upon the University Grants Committee the desirability of establishing separate negotiating machinery for medical teaching staffs.

In reply the Committee stated that its relationship with the universities made it impossible for it to enter into formal negotiations on matters in which university autonomy was highly valued. It was pointed out that some universities had not fully exercised the power to increase salaries, given by the Chancellor of the Exchequer in 1954, but the University Grants Committee suggested that this was a matter for direct representation to the universities concerned. Further consideration is being given to the matter, both generally and in the light of the recent increases announced by the Chancellor of the Exchequer.

Senior Hospital Medical Officers

77. The Council has considered the following resolutions of the A.R.M., 1956:

247. **Resolved:** That this Meeting most emphatically takes the point of view that Council has failed to implement the resolutions in Minutes 203, 205, and 206 passed at the past A.R.M. and, furthermore, by its comments in paragraph 49 in its Annual Report, has weakened the policy laid down by the Representative Body in 1955.

(Note: Minutes 203, 205, and 206 of the A.R.M., 1955, are as follows:

203. **Resolved:** That this Meeting draws attention to the position of doctors graded as S.H.M.O.s in the hospital service who, despite the fact they are engaged in consultant work, are remunerated at S.H.M.O. rates, and requests the Council to treat this matter as one of urgency and do everything possible to ensure that S.H.M.O.s at present inappropriately graded should be paid at consultant rates.

205. **Resolved:** That this Meeting reiterates the resolution passed last year by the A.R.M. (Min. 121). "That no further S.H.M.O. post be established and that existing posts should be subject to biennial review with a view to upgrading."

206. **Resolved:** That all existing S.H.M.O. posts should be subjected to a review by an independent central committee with a view to upgrading.)

251. **Resolved:** That a review of S.H.M.O.s is now overdue. It should be undertaken by a newly constituted central committee of agreed composition. The criteria should be known and accepted in advance.

256. **Resolved:** That no further S.H.M.O. posts should be established and the present posts be subject to biennial review.

258. **Resolved:** That this Meeting recommends that the salary of the S.H.M.O. grade should be raised to 80% of the consultant salary throughout the whole scale.

261. **Resolved:** That all S.H.M.O.s engaged in consultant work unsupervised should be remunerated at consultant rates.

Representations were made to the Ministry by the Joint Consultants Committee in March, 1956, for a further review of S.H.M.O.s, but this was resisted on the ground that the 1951 review was intended to be a final review of hospital medical staff with a personal grading of S.H.M.O.

During the session, however, the Staff Side of Committee B has renewed its proposal that S.H.M.O.s occupying consultant posts should be remunerated on the consultant salary scale. The Management Side, while not agreeing that every S.H.M.O. occupying a post nominally graded as a consultant post should be paid at consultant rates, has agreed to consider—in consultation with the Staff Side—individual cases on their merits. Arrangements for this review are in hand.

With regard to A.R.M. Minute 256, the Council does not consider that it is practicable at this stage to oppose altogether the creation of new S.H.M.O. posts, bearing in mind the agreement between the Joint Consultants Committee and the Ministry for the proper use of the grade and the possibility of alterations in the near future in the structure of hospital medical staffing. The utmost vigilance is being maintained, however, in scrutinizing S.H.M.O. advertisements to ensure that they are within the scope of the grade in accordance with Circular RHB 50/96. Hospital medical staffs have been reminded of the desirability of bringing to the notice of the Association any cases in which hospital boards propose to advertise S.H.M.O. appointments

which, in the opinion of the local consultants, are wrongly graded. There is already machinery whereby the holder of an S.H.M.O. post may appeal against the grading of the post.

With regard to A.R.M. Minute 258, it was reported to the Representative Body in 1956 that an effort had been made in Committee B to restore the overlap between the maximum point of the S.H.M.O. salary scale and the minimum point of the consultant scale by seeking an increase of £200 in the former. This was resisted by the Management Side and the matter was referred to arbitration by the Industrial Court, which awarded an increase of £75 at all points on the S.H.M.O. scale as from April 26, 1956. In view of this, and of the discussions now proceeding with the Ministry for the reorganization of hospital medical staffing, the Council does not consider the time opportune to initiate negotiations regarding the relative remuneration of S.H.M.O.s. It will, however, keep before it the view expressed by the Representative Body for further consideration should the S.H.M.O. grade, or a grade equivalent thereto, be perpetuated under any new medical staffing structure.

Distinction Awards

78. Lord Moran, Chairman of the Minister's Advisory Committee on Distinction Awards, attended a meeting of the Central Consultants and Specialists Committee and explained the method of selecting consultants for awards and the steps taken to ensure their equitable distribution throughout the country and in the various specialties. The Committee has affirmed its confidence in Lord Moran and his Advisory Committee.

In this connexion the Council has considered the following resolution of the A.R.M., 1956:

239. **Resolved:** That in the opinion of this Meeting, the Council should consider the desirability of abolishing the merit award scheme for members of hospital staffs, unless in very exceptional cases, and replacing it by a system allowing for responsibility payments.

The Council does not consider it desirable, however, to take any action which would result in the abolition of distinction awards.

Remuneration of Hospital Medical Staff

79. The Council has considered the following motion referred to it by the A.R.M., 1956:

That the Joint Negotiating Committee should, in the event of any increase in the betterment factor being granted by the Ministry, consider some means by which members of the hospital and consulting services who retired prior to the granting of the last increase in remuneration should now benefit in their pension.

The Council is in sympathy with the principle that as retired practitioners are affected by changes in the cost of living no less than their colleagues in active practice, their financial position should not be overlooked. It has accordingly drawn the attention of the Negotiating Committee to the motion, suggesting that the position of practitioners retired from the National Health Service on pension should be reviewed from time to time *pari passu* with those still in the Service.

The Staff Side of Committee B of the Medical Whitley Council has been informed of the following resolution of the A.R.M., 1956:

263. **Resolved:** That this Meeting of the Representative Body considers that the house officer grades in hospitals are relatively and absolutely underpaid; and calls upon Council to press for substantial increases in the remuneration to these grades.

All grades of hospital medical staff are included in the joint remuneration claim, but on March 12 the Prime Minister announced an increase of 10% in the remuneration of hospital medical staff up to and including senior registrars to take effect from April 1.

Domiciliary Consultation Arrangements

80. The Council has considered the following resolution of the A.R.M., 1956:

267. **Resolved:** That it should be open to the general practitioner under the Domiciliary Consultation Scheme to call in the services of a specialist anaesthetist, not necessarily a consultant.

It has always been the policy of the Ministry that general practitioners should have free choice in arranging domiciliary consultations, provided the practitioner called in is in contract with a hospital board to undertake such consultations. It is, however, also the policy of the Ministry—and one which the Central Consultants and Specialists Committee and the Joint Consultants Committee support—that so far as practicable the domiciliary service should be a consultant service. Accordingly practitioners not of consultant status are not normally invited by boards to take part in the domiciliary scheme unless there are insufficient consultants practising the specialty available in the area to provide an adequate service. The Ministry has agreed that where a general practitioner considers it necessary on medical grounds he may call upon the services of a consultant anaesthetist under the domiciliary scheme.

The Council has considered the following motion referred to it by the Representative Body:

That the principle by which domiciliary consultation fees are payable to full-time consultants should be extended to include also those honorary consultants employed by regional hospital boards but remunerated by universities.

The Council does not favour the payment of domiciliary consultation fees to whole-time members of university teaching staffs who hold honorary hospital contracts. Moreover, it is probable that in many cases the teacher's conditions of service would preclude him from retaining such fees even if they were payable.

The following motion, also referred to the Council by the Representative Body, has received consideration:

That in a scattered area, where a sole consultant has of necessity to perform a large number of domiciliary consultations, consideration be given to extending the maximum number of visits per quarter for which remuneration is allowed.

Detailed inquiries, made with the helpful co-operation of S.A.M.O.s, have shown that a comparatively small proportion of consultants exceed the number of domiciliary consultations for which payment is made, and these are not only in sparsely populated areas. Consequently the Council does not consider there are grounds for seeking an increase in the maximum domiciliary consultation payment for rural consultants alone. Moreover, it doubts the wisdom of taking separate action in this matter at the present time, since the amount of the domiciliary consultation fee, and hence of the maximum payment, is bound up with the general question of remuneration.

The Council has noted the following resolution of the A.R.M., 1956:

313. **Resolved:** That since patients in maternity nursing-homes are entitled to obstetric domiciliary consultations under the N.H.S., this A.R.M. asks the Minister of Health to allow all patients in nursing-homes full access to the complete range of consultant domiciliary service.

An approach on these lines has been made by the Joint Consultants Committee, but in the Ministry's view the wording of the National Health Service Act, 1946, precludes an extension of the domiciliary service to patients in nursing-homes.

The proposal has been noted for further consideration when amending legislation becomes practicable.

Domiciliary Consultations by Whole-time Consultants

81. The Council has noted the following resolutions of the A.R.M., 1956:

272. **Resolved:** That the Association should press for the payment of domiciliary consultation fees to whole-time specialists up to the permitted maximum.

273. **Resolved:** That the B.M.A. deplores that the Ministry of Health differentiates between domiciliary visits done by whole-time and part-time consultants. The non-payment clause for the first eight visits in each quarter should be abolished and the differential payment for distant visits should be paid to whole-time and part-time consultants.

The Staff Side of Committee B has decided to review the conditions under which whole-time consultants are paid for domiciliary consultations in the light of the first year's experience of the present arrangements.

The Council feels that this is a wise course, and hopes to be in a position to report further in its Supplementary Report.

Domiciliary Consultations by Chest Physicians

82. The Council has noted the following resolution of the A.R.M., 1956:

274. **Resolved:** That a chest physician should receive a fee for domiciliary consultation for a patient on the tuberculosis register of a chest clinic if the circumstances are such that a fee for the visit would be payable to any other physician.

Representations have been made by the Staff Side of Committee B that chest physicians should not be debarred from payment for domiciliary consultations in respect of patients on a clinic tuberculosis register, but entitled to payment for all consultations carried out in the patient's home at the request of a general practitioner, provided the patient is not under active treatment at a chest clinic. The Management Side has shown reluctance to accept this proposal and discussions are continuing.

Legal Liability of the Doctor in the National Health Service

83. The Council has had before it the following motion referred to it by the A.R.M., 1956:

That this Representative Body believes that it is not in the best interests of British medicine and the British people that the hospital doctors in the country should have the legal status of technical servants of the hospital authority.

Although the position regarding the legal liability of hospital authorities for the acts and omissions of members of their medical staffs has until recent years developed differently in England and in Scotland, it now appears to be beyond reasonable doubt that in both countries hospital authorities have a vicarious responsibility for the negligence of their medical staffs.

In England the gradual change in the law regarding the relative liabilities of hospital authorities and their medical staffs has so far evoked little apprehension among hospital staffs, and attention has been directed primarily to the practical difficulties arising between medical staffs and their hospital authorities and to the financial implications of the present trend. Much of these difficulties were overcome by an agreement entered into between the Ministry and the medical defence bodies in 1954 for the apportionment of damages in legal actions of this kind.

In some quarters, however, and particularly in Scotland, there have arisen grave misgivings regarding the position of hospital medical staffs. Hospital boards, while not deliberately setting out to interfere with the clinical freedom of hospital medical staff, might feel themselves compelled, because of their responsibility at law and the financial considerations involved therein, to lay down from time to time the procedures to be undertaken, or not undertaken, by certain grades of medical staff, or in other ways to restrict clinical freedom.

Some steps have already been taken in Scotland to explore ways and means of securing the re-establishment in law of the sole responsibility of doctors engaged in hospital practice for the treatment of the patients in their charge.

The Council is awaiting the result of these deliberations before considering the matter further, but it is hoped that it will be possible to report further in the Supplementary Report.

Complaints Involving Hospital Medical Staff

84. During the past session discussions have taken place with the Ministry to ensure the adoption by hospital authorities of a uniform and satisfactory procedure for investigating complaints involving the professional behaviour or competence of members of hospital medical staffs.

Following these discussions hospital authorities have been advised by the Ministry that where a board or hospital management committee (or the chairman acting on its behalf) is of the opinion that a *prima facie* cause for complaint exists, which if well founded would be sufficiently serious to give rise to the question of disciplinary action, a small investigating committee should be set up to ascertain the facts of the case and report back to the board or hospital management committee. This investigating committee should be composed predominantly of members of the profession, including one or two not associated in any way with the hospital or the case, appointed after consultation with the Joint Consultants Committee. Hospital authorities have also been advised that the practitioner should be given prior warning of the complaint, and allowed to appear personally before the investigating committee, and, in addition, to have legal representation if he so desires.

Board-and-Lodging Charges

85. The Council has noted the following resolutions of the A.R.M., 1956:

284. **Resolved:** That this Meeting recommends that a reasonable standard of accommodation and feeding be provided for hospital residents.

285. **Resolved:** That this Meeting recommends that charges for hospital residents' board and lodging should not be increased until agreement has been reached through "Whitley."

It was reported to the Representative Body in 1956 that Committee B of the Medical Whitley Council was considering the desirability of fixing standard charges for board and lodging for the various grades of resident medical staff above house officer in substitution for the arrangement under para. 17 of the Terms and Conditions of Service whereby individual hospital authorities were obliged to fix the charges at the value of the services provided.

In July, 1956, the Management Side, in order to reach a settlement, accepted the standard charges proposed by the Staff Side—namely, for senior house officers, £150; registrars and junior hospital medical officers, £170; and senior registrars, £200. Charges for resident consultants and S.H.M.O.s were also agreed at £400 and £350 respectively. The Minister has power to vary these standard charges in exceptional circumstances, and the Management Side has intimated that where an application for a reduction of the charge is made the Minister will seek the advice of Committee B before reaching a decision.

These new charges were implemented with effect from August 1, 1956, and the Staff and Management Sides of Committee B are now discussing the possibility of fixing minimum standards of board and accommodation. Detailed proposals have been put forward by the Staff Side with the suggestion that where the food or accommodation falls below an agreed minimum standard the doctor should have a right of appeal, primarily with the object of securing an improvement in the board and lodging rather than a reduction in the charge. Apart from this the new charges have the advantage of being agreed centrally and not subject to unilateral alteration by individual hospital authorities.

Normally consultants or S.H.M.O.s living in hospital accommodation occupy separate houses or flats for which rents are fixed on an individual basis. The new board-and-lodging charges for consultants and S.H.M.O.s were fixed in relation to the higher standard of accommodation that would normally be offered to them as compared with that provided for junior staff. It has been agreed in Committee B that where complaints are received from resident consultants or S.H.M.O.s, or from their hospital authorities, that the new charges are unreasonable in view of the standard

of the board and accommodation provided, they shall be investigated on an *ad hoc* basis by representatives of the two sides.

Whole-time Doctors and Income Tax

86. The following resolutions were adopted by the A.R.M., 1956:

281. **Resolved:** That further representations be made to the Government for the provision of income-tax relief for whole-time members of the hospital service for motor-car costs and depreciation and other essential expenditure.

282. **Resolved:** That it be made a condition of service by regional hospital boards that the use of a car and of a telephone is obligatory.

283. **Resolved:** That the Council be requested to reopen with the income-tax authorities the question of tax relief on subscriptions of membership of learned societies, medical books, and journals for public health medical officers and other full-time medical practitioners.

Consideration has been given by the Central Consultants and Specialists Committee to the possibility of sponsoring a test case on behalf of whole-time hospital medical staff in relation to their entitlement to tax relief in respect of the professional expenses which they normally incur (such as the cost of maintaining a car and a telephone, and subscriptions to professional organizations and learned bodies), which are not reimbursed, or only reimbursed in part, by hospital authorities, but counsel has advised that under the existing legislation there is no prospect of establishing a case for tax relief.

In 1955, however, the Royal Commission on the Taxation of Profits and Income recommended that the present Schedule E rules governing expenses should be amended to permit relief from tax in respect of expenses "reasonably incurred for the appropriate performance of the duties of the employment." If this recommendation were adopted it would go a long way towards meeting the just grievances of doctors in whole-time salaried employment. It is understood that other professional organizations are pressing the Government to implement the recommendation, and the Joint Consultants Committee has been asked to lend its support.

At the same time, as an alternative method of dealing with the matter, the Central Consultants and Specialists Committee has asked the Staff Side of Committee B to make a further effort to secure the payment by hospital authorities of adequate allowances to meet the reasonable professional expenses of their whole-time medical staffs.

With regard to A.R.M. Minute 282, the Central Consultants and Specialists Committee is advised that in the present state of income-tax law no advantage would accrue by making provision of a car or telephone a condition of employment.

Whole-time Hospital Medical Staff and Private Practice

87. The Council has considered the following resolution of the A.R.M., 1956:

318. **Resolved:** That this Meeting recommends that all medical grades of so-called "whole-time" hospital staff should be allowed to pursue the practice of their profession in their off-duty time.

The Council is advised by the Central Consultants and Specialists Committee that it has always pursued the policy that so far as practicable the individual practitioners should have the choice of engaging in hospital work on a whole-time or on a part-time basis. The Committee feels that it is consistent with this policy that whole-time hospital medical staff who wish to engage in private practice should seek an alteration in their contracts. It finds it difficult, therefore, to accept the principle that whole-time medical staff should engage in private practice, because this sphere of professional work is of vital importance to those who, not being in receipt of a whole-time salary, depend to a varying degree upon private fees, and in particular to those who have only a relatively small number of sessions in the hospital service.

Moreover, the Central Consultants and Specialists Committee feels that if the Representative Body's suggestions were adopted it would almost certainly lead to a review of the contracts of whole-time hospital medical staff, with no guarantee that they would be offered new contracts for whole-time or even for maximum part-time service. The Committee also considers that, as the salary scales recommended by the Spens Committee were based on the assumption that the doctor engaged whole-time in the hospital service would not participate in private practice, acceptance of the proposal might lead to a review of the terms of service.

Mileage Rates

88. The agreement reached in the General Whitley Council for a temporary increase in the mileage allowance of $\frac{1}{2}$ d. per mile at all points in the scale applies to hospital medical staffs. This increase will be paid during the continuance of the temporary additional petrol tax with effect from December 5, 1956.

Mileage Allowances of Part-time Hospital Medical Staff

89. A number of problems have arisen in connexion with the payment of mileage allowances to part-time medical staff in respect of home to hospital journeys.

The relevant provision in the terms and conditions of service states that a journey between a part-time officer's home (or consulting-room, if nearer) and hospital shall be regarded as an official journey, and therefore attract mileage allowance. This leaves room for differences of interpretation in certain circumstances; for example, where a consultant has only the limited use of a consulting-room, or where he has more than one consulting-room.

These and related questions are now under discussion between the Staff and Management Sides of Committee B.

Study Leave

90. The Council has had before it the following resolution of the A.R.M., 1956:

279. **Resolved:** That this Meeting again requests Council to approach the Ministry and Department of Health for Scotland on the subject of making study leave available to hospital officers, pointing out that some hospital boards do not supply a locum tenens for an absent officer and require the remaining officers to cover the duties of the absentee. Representations should be made to the Ministry that such conditions cannot be fulfilled in many smaller provincial units, and that there are instances where hospital officers do not have opportunities for study leave.

The Central Consultants and Specialists Committee has obtained from various quarters a considerable amount of information on the subject of study leave and is now making a detailed study of the problem with a view to putting forward specific proposals for improving the present arrangements, including the introduction of a standard code of practice in dealing with applications.

A further report will be included in the Supplementary Annual Report of Council.

Hospital Residents' Hours of Work

91. The Council has considered the following motion referred to it by the A.R.M., 1956:

That this Meeting recommends that sufficient hospital residents should be appointed so that each hospital resident doctor shall work less than 168 hours a week.

The Council is in sympathy with the principle that there should be a sufficient number of resident medical staff to carry out the work of the various hospital departments, allowing for adequate off-duty periods for study and recreation. The burden of excessively long hours of duty which junior medical staff have to bear in many hospitals because of the shortage of staff is one of the primary factors which led to the discussions on hospital medical staffing which are proceeding with the Ministry, and the Central Consultants and Specialists Committee will continue to keep this point in the forefront of its discussions on the subject.

Cremation Certificates

92. Representations have been made to the Ministry by the Joint Consultants Committee in support of the following resolution of the A.R.M., 1956:

311. **Resolved:** That resident hospital staff should not be debarred from receiving a fee for completing Part B of the cremation certificate.

Hospital Private Beds

93. In 1955 the Representative Body urged that private beds should be available in all major hospitals, and in 1956 the Council reported that the Central Consultants and Specialists Committee proposed to review the distribution of private beds with a view to considering what steps should be taken to secure an improvement in the position.

The Committee has now examined the position in the light of the latest available statistics, which show that, taking the country as a whole, hospital private beds are not fully used for the treatment of private patients. Bed occupancy figures, particularly when applied to small groups of beds, do not, of themselves, give a wholly reliable indication of the demand. Moreover, owing to the fact that private beds are not allowed to lie vacant, it frequently happens that a bed is not immediately available when required for a private patient, who consequently has to be admitted to a general ward or to a private nursing-home.

Nevertheless, the Committee feels that any demand for additional private beds must be made on the merits of the case, and supported by evidence that there is a demand for private treatment which cannot be met by the facilities available in the area concerned. Inquiries are accordingly being made of hospital group medical committees and local medical committees as to whether experience has shown that the private beds in each hospital group are adequate and appropriately distributed. Where it is felt that more private beds are needed, these bodies are being asked to furnish sufficiently detailed information to enable a case to be put before the Ministry.

Meanwhile the Joint Consultants Committee has reopened with the Ministry the question of the introduction of a moderately priced private bed, and the abolition of the classification of surgical operations in the Pay-bed Regulations.

Part-time Consultants and Income Tax

94. The Council reported to the Representative Body in 1955 that, on the advice of an eminent tax counsel, steps were being taken to test the validity of the policy of the Inland Revenue in transferring to a Schedule E assessment the hospital income of part-time consultants in cases where this represented the major part of the professional earnings.

Early in 1956 appeals on behalf of five consultants were presented to the Special Commissioners on Income Tax, who decided in favour of the consultants concerned. The Commissioners held that the consultants should have been assessed under Schedule D in respect of the remuneration from their hospital appointments and the fees received for domiciliary consultations.

The Crown appealed against this decision and the appeals are to be heard by a judge of the High Court.

Pending a final decision on the test cases, where the hospital income of a part-time consultant has been transferred to Schedule E, assessment will continue to be made under that Schedule. If the Special Commissioners' decision is upheld, and it is finally decided that part-time consultants should be wholly assessed under Schedule D, all Schedule E assessments in respect of which a notice of appeal has been given by or on behalf of the consultant will be abandoned by the Crown and the tax liability will be dealt with under Schedule D.

The medical defence organizations, the Regional Hospitals Consultants and Specialists Association, and the Hospital Medical Staffs Defence Trust have contributed towards the cost of promoting the test cases.

Conference of Consultants and Specialists

95. The conference of representatives of consultants and specialists from all parts of the United Kingdom held in June, 1956, was welcomed as a valuable opportunity for them to discuss together the many problems confronting the profession working in the hospital service. After consulting with its regional committees, however, the Central Consultants and Specialists Committee does not feel that the time has yet arrived when an annual conference would be justified.

It does not propose, therefore, to arrange a conference in 1957, unless some issue of major importance warrants the holding of a special conference.

Statutory and "Item of Service" Fees

96. In accordance with the view expressed by the Representative Body that all statutory and "item of service" fees should be reviewed in the light of 1956 values of money, all such fees payable for consultant services have been considered by the Central Consultants and Specialists Committee.

The revision of the fees for part-time consultant services carried out on behalf of local authorities is dealt with elsewhere in the Annual Report. The fees for part-time services for Government Departments were largely revised in 1955, but representations have been made to the Treasury that the following fees for services not dealt with at that time should now be increased as indicated:

	Present Fee £ s. d.	Proposed Fee £ s. d.
Medical examination of candidates for the Civil Service, where difficult or lengthy, or where special tests are required	Up to 7 17 6	10 10 0
Pensions appeal tribunals:		
Whole-day ..	6 6 0	10 10 0
Half-day ..	4 4 0	5 5 0

The Treasury is also being urged to agree to a minimum fee of £5 5s. for a visit by a consultant to the inmate of one of H.M. prisons.

The Staff Side of Committee B has been asked to examine all "item of service" fees payable to hospital medical staff under their terms and conditions of service, with a view to their adjustment in line with current values of money.

Future of the Chest Services

97. A memorandum on the future of the chest services has been prepared by a special subcommittee of the Central Consultants and Specialists Committee upon which the General Medical Services and Public Health Committees and the Radiologists and the Tuberculosis and Diseases of the Chest Groups were represented.

The memorandum, set out in Appendix IV, has been forwarded to the Joint Consultants Committee as a basis for discussion with the Ministry.

Constitution of the Central Consultants and Specialists Committee

98. The Council has reviewed the constitution of the Central Consultants and Specialists Committee, with special reference to the many problems affecting senior hospital medical officers and hospital junior medical staff, and makes the following recommendation for changes in the constitution of the Committee:

Recommendation: (1) That the constitution of the Central Consultants and Specialists Committee be amended to provide for the appointment of two members by each of the following: (a) the General Medical Services Committee, (b) the Registrars Group Committee, (c) the S.H.M.O.'s Group Committee; and (2) that the Schedule to the By-laws be amended accordingly.

Review of General Practitioners in 10 (b) Appointments

99. The Council has considered the following motion referred to it by the A.R.M., 1956:

That grading reviews be instituted to consider claims for upgrading by doctors holding 10 (b) appointments in the hospital service.

The Council sympathizes with the view that the personal grading of general practitioners holding 10 (b) appointments should be reviewed, and will press that such practitioners should be included in any future review of hospital medical staff.

Newly Qualified Practitioners: Pre-Registration Posts

100. Consideration has been given to the following motion referred to the Council by the A.R.M., 1956:

That posts in the mental hospital service should be included among approved house appointments for the pre-registration practitioner.

The Council has been advised by the Central Consultants and Specialists Committee that it is opposed to the approval of pre-registration posts in mental hospitals, except where there is sufficient scope in general medicine, with adequate supervision, to justify a house-physician appointment.

The Council will keep under review the question of the average time taken by provisionally registered practitioners to complete their pre-registration service, as suggested in the following motion referred to it by the A.R.M.:

That this Meeting considers that the Council should keep under constant review the question of the time taken to fulfil the pre-registration posts required by the Medical Act, 1950.

X-ray Examination of Recruits to the Royal Ulster Constabulary

101. In 1954 the Northern Ireland Tuberculosis Authority decided that chest physicians in its employment should undertake the chest x-ray examination of recruits to the Royal Ulster Constabulary as part of their duties, and without additional payment, on the ground that the Authority was obliged by statute to provide this service. The chest physicians in Northern Ireland, who had previously received fees for this work, took the view that it was outside the scope of their contractual duties for the Authority, and this scope has been supported by counsel, on whose advice proceedings are being brought under Order 54A of the Supreme Court Rules to have the respective obligations of the chest physicians and of the Northern Ireland Tuberculosis Authority clarified.

Inquiry into the Treatment of Venereal Diseases

102. In recent years there has been a marked fall in the number of patients attending V.D. clinics. It is possible, however, that a significant proportion of cases is now being treated by general practitioners since the discovery and use of penicillin in the treatment of syphilis and gonorrhoea. An inquiry is therefore being made in selected areas into the extent to which venereal disease is being treated outside hospital, in order to obtain a more accurate picture of the prevalence of venereal diseases in Great Britain.

Acute Mental Illness

103. The Council has considered the following resolution of the A.R.M., 1956:

299. **Resolved:** That this A.R.M. is disturbed by the fact that mental welfare officers (laymen, without any recognized training or qualifications) have, in their capacity as duly authorized officers, power to overrule the opinions and advice of general practitioners and consultant psychiatrists regarding emergency admissions under the Lunacy Acts. The meeting deplores the lack of standardized training for mental welfare officers, including duly authorized officers, and instructs the Council to press the Ministry of Health to formulate a national scheme of training for these officers and to put it into operation without further delay.

The importance of ensuring that mental welfare officers receive adequate training was emphasized in the evidence submitted by the Association to the Royal Commission on the law relating to mental illness and mental deficiency. The Council has now made representations to the Ministry of Health that a national scheme for the training of these officers should be formulated and put into operation without delay.

REFORM OF THE NATIONAL HEALTH SERVICE**Code of Conduct for Patients**

104. The Council has considered the following resolution of the A.R.M., 1956:

380. **Resolved:** That this Meeting considers that in view of the fact that savage penalties are inflicted on doctors for infraction of their terms of service, there should be some penalty for patients who abuse it.

As the Representative Body is aware, the Medical Service Committee and Tribunal Regulations have been the subject of close scrutiny recently by a special subcommittee set up for the purpose, and in the opinion of the Council Minute 380 of the A.R.M. does not call for special action at this stage.

Public Education in the Responsible Use of the National Health Service

105. The Council has considered the following resolution of the A.R.M., 1956:

382. **Resolved:** That the attention of the Government be drawn to the need for continuous education of the public, both in youth and in adult life, in the constructive and responsible use of the National Health Service.

It feels that there is a real need for a national campaign for the education of the public in the proper use of the National Health Service. It has drawn the attention of the Ministry of Health to the views of the Representative Body and has requested the Department to receive a small deputation to discuss the possibility of a national campaign and the establishment of a permanent advisory body on the lines of the National Fuel Industrial Committee.

Remuneration Under the National Health Service

106. The Council is engaged in a survey of National Health Service schemes in operation in Dominions overseas, including the methods of remuneration.

OCCUPATIONAL HEALTH**Remuneration of Industrial Medical Officers**

107. The Council has reviewed the recommended rates of remuneration set out below, which were approved by the A.R.M., 1955.

	Range
Assistant medical officers	£1,200 to £1,500
Medical officers ..	£1,400 to £2,300

(A practitioner in this grade who gives satisfactory service would be expected to reach his maximum in his early 40's, but the practitioner giving outstanding service would be expected to receive more rapid advancement.)

Senior medical officers ..	£2,000 to £3,000
Chief medical officers or directors of medical services	From £3,000 according to the size of the undertaking and the responsibilities involved.

The salary in each grade should be reviewed at intervals not exceeding two years.

The Association regards these salary ranges as suitable for pensionable appointments. Where no pension scheme is in operation the salary should be adjusted accordingly.

The Council considers that the rise in the cost of living justifies this revision and that it would be helpful to take this opportunity to include a recommendation that, in each grade, salaries should be reviewed at intervals of not more than

two years, and that practitioners should normally reach the upper limit of their range after approximately ten years.

Recommendation: That the section on the remuneration of whole-time industrial medical officers in the statement on "Remuneration and Terms of Service for Industrial Medical Officers," approved by the Representative Body in 1955, be revised to read as follows:

	Range
Assistant medical officers ..	£1,400 to £1,700
Medical officers ..	£1,600 to £2,500
Senior medical officers ..	£2,250 to £3,250
Chief medical officers or directors of medical services ..	From £3,500, according to the size of the undertaking and the responsibilities involved.

The salary in each grade should be reviewed at intervals not exceeding two years and a practitioner in each grade would normally be expected to reach the upper limit of the range after about ten years of satisfactory service. A practitioner giving outstanding service would be expected to receive more rapid advancement.

The Association regards these salary ranges as suitable for pensionable appointments. Where no pension scheme is in operation the salary should be adjusted accordingly.

The existing recommended salary scale for part-time industrial medical officers is as follows:

Hours per week	Minimum Annual Salary £	Hours per week	Minimum Annual Salary £
Up to 1 hour ..	75	9 to 10 hours ..	600
1 " 2 hours ..	150	10 " 11 " ..	650
2 " 3 " ..	225	11 " 12 " ..	700
3 " 4 " ..	300	12 " 13 " ..	750
4 " 5 " ..	350	13 " 14 " ..	800
5 " 6 " ..	400	14 " 15 " ..	850
6 " 7 " ..	450	15 " 16 " ..	900
7 " 8 " ..	500	16 " 18 " ..	950
8 " 9 " ..	550	18 " 20 " ..	1,000

In reviewing this scale, the Council has borne in mind, *inter alia*, the revised scale agreed in Committee C of the Medical Whitley Council for visiting medical officers to establishments maintained by local authorities.

Recommendation: That the recommended salary scale for part-time industrial medical officers in the statement on "Remuneration and Terms of Service for Industrial Medical Officers," approved by the Representative Body in 1955, be revised to read as follows:

Hours per week	Minimum Annual Salary £	Hours per week	Minimum Annual Salary £
Up to 1 hour ..	100	9 to 10 hours ..	700
1 " 2 hours ..	175	10 " 11 " ..	750
2 " 3 " ..	250	11 " 12 " ..	800
3 " 4 " ..	325	12 " 13 " ..	850
4 " 5 " ..	400	13 " 14 " ..	900
5 " 6 " ..	475	14 " 15 " ..	950
6 " 7 " ..	550	15 " 16 " ..	1,000
7 " 8 " ..	600	16 " 18 " ..	1,050
8 " 9 " ..	650	18 " 20 " ..	1,100

Fees Paid to Appointed Factory Doctors

108. The Council is pressing the Ministry of Labour and National Service to raise the fees paid to Appointed Factory Doctors for examinations under the Factories Acts. These fees (with the exception of those for examinations under the Mule Spinning (Health) Special Regulations, 1953) were fixed in 1947, and an increase is clearly overdue. The Ministry is being urged to raise them to the following:

Examination of Young Persons.—Examination at factory: 10s. 6d. for the first and 6s. for each other person examined at any one visit. Examination not at factory: 6s. for each person examined.

Examination under Dangerous Trades Regulations.—10s. 6d. for the first and 3s. 6d. for each other person examined at any one visit.

Investigation and Report on Cases of Industrial Disease or Accident.—£2 2s. per case with an additional £1 1s. for each other case arising from the same cause and investigated on the same day.

Examinations under the Mule Spinning (Health) Special Regulations.—10s. 6d. for the first and 3s. 6d. for each other person examined at any one visit.

Remuneration for Sessional Work for the Ministry of Labour and National Service

109. Representations are being made to the Ministry of Labour and National Service to increase the sessional fees paid to lecturers at courses for disablement resettlement officers and to members of panels of disablement advisory committees.

Co-ordination in the Field of Occupational Health Research

110. The Council reported last year that it was seeking information from the Lord President of the Council about plans for co-ordinating research in the field of occupational health. One of the functions of the Industrial Health Advisory Committee of the Ministry of Labour and National Service is to consider the problems in industry upon which research is required and to advise on their relative priority. As the work of the I.H.A.C. is limited to establishments covered by the Factories Acts, the Lord President of the Council has recognized the need for further co-ordinating machinery, and two Interdepartmental Committees have been set up—one concerned with the research problems of industrial safety and the other with the broader medical aspects of occupational health research. The form of the machinery is not entirely in accordance with the views of the Council on the subject, and it proposes to keep the matter under review.

Development of the Occupational Health Service for Smaller Factories

111. It is evident that a considerable extension of the occupational health service is desirable and may well be brought about in the relatively near future. It would appear that any expansion of the service, particularly for smaller factories, will have to be provided to a large extent by general practitioners, and in this connexion the Council is giving consideration to such matters as the grouping of factories by area or by industry. Consideration is also being given to the most suitable form of short postgraduate course for general practitioners wishing to undertake part-time industrial appointments or to attend refresher courses in occupational health.

Administration of Morphine by Nurses in Industry

112. The following resolution of the A.R.M., 1956, has been considered by the Council:

356. **Resolved:** That this meeting is astonished at the refusal of the Home Secretary, reported in paragraph 80 of the Annual Report of Council, to legalize the administration of morphine by competent nurses in serious industrial accidents, and instructs Council to press for this essential medical service to industrial workers.

The Home Office has been informed of this resolution as an expression of opinion on behalf of all sections of the profession, and has been urged to reconsider its decision on the matter.

Use of Antibiotics or Chemotherapy by Nurses in Industry

113. The Association of Industrial Medical Officers, the Association of Certifying Factory Surgeons, and the Royal College of Nursing have been informed of the views of the Representative Body contained in the following Minute of the A.R.M., 1956:

359. **Resolved:** That in the opinion of this meeting nursing staff employed in industry should follow hospital practice and never use antibiotics or chemotherapy in any form without the express instructions in writing in each case of a registered medical practitioner.

In the opinion of the Council, the implementation of this resolution could be effected to a large extent by the exercise of special care by doctors who authorize supplies of drugs for nurses working without the supervision of a medical officer.

PUBLIC HEALTH

Negotiating Machinery for Doctors in the Public Health Service

121. In August, 1956, the County Councils Association indicated that representatives of the Local Authority Associations would like to discuss proposals for winding up Committee C of the Medical Whitley Council and for transferring negotiations on remuneration and terms of service for medical officers of health, and probably their deputies, to the Joint Negotiating Committee for Chief Officers, and negotiations for other public health medical officers to the Joint Council for Local Authorities' Administrative, Professional, Technical, and Clerical Services. Having regard to the policy of the Representative Body that medical men and women, in whatever form of medical practice or service, should be remunerated as doctors, and that their remuneration should not be determined by relation to that of non-medical personnel in the same sphere, the Council informed the County Councils Association that no useful purpose could be served by discussing the proposal of the Local Authority Associations.

Remuneration of Public Health Medical Officers

122. Every authority in the United Kingdom has implemented fully Industrial Court Award No. 2565 on the remuneration of public health medical officers from January 1, 1955. By the end of March, 1957, 99% of all local authorities had notified implementation of the subsequent agreement in Committee C on increased remuneration from April 1, 1956 (M.D.C. Circular 27). Advertisements from the other local authorities, which include only two local health authorities, are no longer being accepted for publication in the *British Medical Journal*.

The undermentioned resolution of the A.R.M., 1956, was sent to the Ministry of Health in August last. Despite repeated urgent reminders, no reply (apart from an acknowledgment) has been received:

325. **Resolved:** That the Government be urged to set up forthwith an independent committee of inquiry to consider what should be the range of remuneration of medical officers in the Public Health Service, having regard to the remuneration of other sections of the profession and the desirability of the Public Health Service maintaining its power to attract a suitable type of recruit.

Medical Officer of Health for Middlesbrough—Industrial Court Award

123. The long-standing dispute with regard to the salary of the Medical Officer of Health for Middlesbrough has finally been settled in favour of the medical officer. Since 1953 the town council had refused to implement the findings of Regional Appeals Committees on the matter, and it became necessary to make appointments under the authority the subject of an "Important Notice" in the *British Medical Journal*.

Towards the end of 1956 the authority agreed to refer the dispute to the Minister of Labour and National Service under the Industrial Courts Acts and to accept an award of the Industrial Court, provided that the authority's appointments were withdrawn from the "Important Notice." This was done and the dispute was heard by the Industrial Court on February 13. The award of the court granted a considerable increase in salary for the M.O.H., identical with that recommended by the Regional Appeals Committee in 1955, and with similar retrospection to June, 1955.

Northern Ireland Appeals Machinery

124. An impasse has been reached in the negotiations with the Ministry of Health and Local Government in Northern Ireland on the establishment of Appeals Machinery for the medical profession. The Council agreed to accept for a trial period, without prejudice, two-stage Appeals Machinery which had been suggested by the Ministry. This involved a local appeal to his employer by the aggrieved employee

Advertising Circulars Sent by Drug Firms to Welfare Officers of Industrial Concerns

114. The Council deprecates the practice of some drug firms of addressing promotion material relating to medical products to welfare officers of industrial concerns. It considers it wrong in principle that non-medical persons should be urged to purchase these products and to use them where there may be no proper medical supervision. It understands that some firms have sent representatives to call on welfare officers personally. It has sought the assistance of the Association of British Pharmaceutical Industry and the Industrial Welfare Society in bringing about a discontinuance of these undesirable practices.

Certificates for Short Illnesses

115. The Treasury, the Ministry of Pensions and National Insurance, the nationalized industries, and the British Employers' Confederation have been advised of the view expressed in the following resolution of the A.R.M., 1956, and have been asked for their reactions to it:

72. **Resolved:** That this Meeting requests Council to approach industry in general with a view to abolishing the requirement of medical certificates for short illnesses.

Review of the Schedule of Prescribed Industrial Diseases

116. The Council has forwarded comments to the Industrial Diseases Subcommittee of the Industrial Injuries Advisory Council, which, at the request of the Ministry of Pensions and National Insurance, has been reviewing the terms of prescription of the diseases in the Schedule of Prescribed Diseases for the purposes of the National Insurance (Industrial Injuries) Acts.

Cautionary Notice on Dermatitis Issued by the Ministry of Labour and National Service

117. Suggestions have been submitted to the Factory Department about the style and content of its Cautionary Notice on Dermatitis, new draft lay-outs of which are being considered in that Department.

Medical Standards for Road, Rail, and Air Transport

118. Close liaison has been maintained with the Ministry of Transport and Civil Aviation in connexion with the work of the Bus and Coach Subcommittee of the Ministry's Committee on Road Safety. The subcommittee has had regard to the views on medical standards for public service vehicle drivers contained in the Association's Memorandum on Medical Standards for Road, Rail, and Air Transport.

First-aid Regulations Under the Agriculture (Safety, Health, and Welfare Provisions) Act, 1956

119. At the invitation of the Ministry of Agriculture, Fisheries, and Food, comments were submitted on draft Regulations with regard to first-aid requisites to be provided for workers in agriculture.

Advisory Councils on Occupational Health

120. The Council has received a report of the 1956 Conference of Advisory Councils on Occupational Health, when the principal subject discussed was the "Employment of Older Persons in Industry," and agreed that the Association should act as host for the 1957 Conference, on Tuesday, April 9, at B.M.A. House. The principal subject on this occasion was the "Employment of Disabled Persons in Industry."

The Council has reaffirmed its view that Divisions and Branches should sponsor the establishment of new Advisory Councils in their areas, consisting of representatives of the Association, employers' organizations, and trade unions or trades councils.

and an appeal on his behalf by his professional association or trade union to the National Arbitration Tribunal, suitably extended to include representatives of the professional body or trade union concerned and of the Health Service bodies, for the purpose of hearing and advising on such appeals. Subsequently, however, the Council was informed that the Ministry of Labour in Northern Ireland refused to agree to an alteration of the composition of the Tribunal in this way.

The Council then proposed that the establishment of three-tier Appeals Machinery similar to that in Great Britain should be reconsidered. The Ministry took the view that there was no real hope of progress in reviving discussions along these lines, in view of the earlier difference of opinion on the composition of Appeals Committees at the second level. The Council agrees with this opinion. The Ministry has accepted a suggestion by the Council that independent arbitrators should be appointed to hear the two appeals in Northern Ireland which have been outstanding for some considerable time. The Council has stressed the importance of appointing medical arbitrators acceptable personally to the Ministry, the Association, and the aggrieved parties.

Remuneration for Part-time Work for Local Authorities in England and Wales

125. The Council drew up proposals for a revision of the 1947 and 1951 agreements with the Local Authority Associations on the remuneration of medical practitioners undertaking part-time work for local authorities. The Local Authority Associations were asked to agree to *ad hoc* negotiations on these proposals, but the Council finally agreed that the negotiations might take place in a special Subcommittee of Committee C, on the understanding that the Staff Side would include representatives of the various interests concerned. A revised schedule of fees agreed in this Subcommittee was formally endorsed by Committee C, and the Council expressed its satisfaction with the schedule. The new agreement, which came into effect on January 1, 1957, was published in the *Supplement to the British Medical Journal* of December 29, 1956. By the end of March, 1957, 90% of local health authorities had notified its implementation.

Similar arrangements have been made for negotiating a revision of the corresponding agreement in Scotland.

Representation of the Preventive Medical Service on Regional Hospital Boards

126. Following the expression of opinion by the Joint Consultants Committee that each Regional Hospital Board should include a minimum of five consultants under contract with the Board (nominated by the medical staffs of hospitals in the region), together with a general practitioner and a medical officer of health nominated by the profession, consideration was given to the establishment of machinery for securing nominations for medical officer of health representatives on Regional Hospital Boards. A plan was drawn up in consultation with representatives of the Society of Medical Officers of Health, with a view to ensuring that nominations made by either the Association or the Society were mutually acceptable. This plan was approved by the Council and by the Council of the Society, and Honorary Secretaries of Divisions and Branches of the Association were notified of it on February 21, 1957.

Integration of the Preventive Medical Service with the Hospital Service

127. Consideration has been given to the question of closer liaison between the preventive medical service and the hospital service by the appointment of public health medical officers as honorary consultants on hospital staffs and as members of hospital Medical Advisory Committees. The Council approves of the principle, as being in the interests of all concerned, and would urge that consideration be given to such appointments. It does not accept the view of the Guillebaud Committee that medical officers of health should hold such appointments *as of right*, but it

agrees that, in appropriate circumstances, invitations to public health medical officers to accept appointments of this nature can materially assist the integration of the two services.

Appointment of Medical Officers of Health Without Advertisement

128. Representations are being made to the Ministry of Health against its action in dispensing with the requirement to advertise vacant appointments in certain Metropolitan boroughs. These were mixed appointments as medical officer of health for a borough and L.C.C. divisional medical officer. Applications were invited only from medical officers in certain grades in the employment of the L.C.C.

Milk

129. The Council has considered the following resolution of the A.R.M., 1956:

76. **Resolved:** That this Meeting would welcome next year a report from the Council on the subject of pure milk for the nation.

It believes that the general position throughout the country is not really unsatisfactory, and, having regard to the fact that amendments of the Milk Regulations are in draft, it doubts whether the Association would be justified at the present time in embarking upon a full-scale inquiry into the question of pure milk for the nation. Comments on the draft amendments of the regulations have been submitted to the Ministry of Agriculture, Fisheries, and Food. When the new regulations have come into force the Council will consider again the desirability of undertaking a general review of the subject.

Immigrants and Communicable Diseases

130. The Ministry of Health was notified of the views of the A.R.M., 1956, set out in the following resolution:

80. **Resolved:** That this Meeting expresses its alarm at the continued influx of immigrants found to be suffering from communicable diseases, and instructs Council to explore the problem with a view to necessary action.

The Ministry replied that the problem of the immigrant and his health is recognized and the situation is being kept under review, but there is at present no evidence that the risk to the health of the nation under existing arrangements is such as to justify the very serious step of imposing new controls.

The Council cannot accept this opinion, and is pressing the matter with the Ministry and urging the need for a compulsory chest x-ray examination for all immigrants.

Notification of Infectious Diseases

131. In its Annual Report for 1955-6 the Council stated that it regarded it as important to await the views of the Society of Medical Officers of Health, which was reviewing this subject, before deciding on the appropriate action to be taken on the following resolution of the A.R.M., 1955:

149. **Resolved:** That this Meeting is of the opinion that a review of the legislation concerning the notification of infectious diseases should be carried out by the Association with a view to making recommendations to the Ministry regarding the form of revision, which is long overdue.

The Society has indicated that it still has the matter under active consideration, and that its report will be available shortly.

Air Pollution

132. The following resolution of the A.R.M., 1956, was forwarded to the Ministries of Housing and Local Government, Fuel and Power, and Health:

79. **Resolved:** That this Meeting views with grave concern the continued menace to the health of the people caused by air pollution; welcomes the passage of the Clean Air Bill through Parliament; urges the Government to implement its provisions vigorously; and wishes particularly to impress upon local authorities the urgent need to use to the full the statutory powers given to them to declare smoke-control areas.

The Ministry of Housing and Local Government replied that the Minister intended to fix an appointed day for many of the provisions of the Clean Air Act (including those dealing with smoke-control areas) and to issue a circular and explanatory memorandum to local authorities about the administration of the Act. Subsequently, December 31 was fixed as the appointed day, and on December 28 the regulations, circular letter, and accompanying memorandum were sent to local authorities. The Minister proposes to fix an appointed day early in 1958 for the remaining provisions of the Act.

The other Ministries have explained that they will co-operate with the Ministry of Housing and Local Government, which has the primary responsibility.

Tetanus Immunization

133. The Ministry of Health was notified of the following resolution of the A.R.M., 1956:

82. **Resolved:** That this Meeting urges the Ministry of Health to consider the advisability of encouraging active immunization against tetanus as a public health measure.

It was represented to the Ministry that there is a clear need for the formulation of a national policy on immunization against tetanus in infancy, and the Ministry agreed to consider the representations made. However, as it is expected that a report will shortly be issued by the Medical Research Council having a considerable bearing on this question, the matter has been left in abeyance until this report is available.

"Health Nurses"

134. The Council has noted the view of the Representative Body contained in the following resolution of the A.R.M., 1956, but it does not consider it would be wise to take any action at this stage towards its implementation:

84. **Resolved:** That this Meeting believes that "Health Visitors" should be entitled "Health Nurses."

It is believed that there would be considerable opposition to this in some quarters. The point was not made in connexion with the evidence which the Council submitted in 1954 to the Working Party on the Inquiry into Health Visiting, and the Council considers it undesirable to raise it in isolation.

Married Women Doctors and Public Medical Appointments

135. The Council has decided that advertisements for public medical appointments shall not be accepted for publication in the *British Medical Journal* if they fail to conform with the policy laid down in the following resolution of the A.R.M., 1956:

75. **Resolved:** That it be the policy of the Association that no woman doctor should be disqualified from obtaining a public medical appointment or be dismissed from such an appointment simply by reason of marriage.

The principle has been accepted by Committee C of the Medical Whitley Council and promulgated in a circular to local authorities.

Car Allowances for Public Health Medical Officers

136. In July, 1956, an upward revision of the car allowances for public health medical officers was agreed in Committee C, retrospective to April 1, 1956. This brought the allowances into line with those approved by the National Joint Council for Local Authorities' Administrative, Professional, Technical, and Clerical Services. In view of the introduction of petrol rationing and the accompanying rise in the cost of petrol, a temporary further increase has been agreed from January 1, 1957. These increases apply only in England and Wales, as discussions are still proceeding in Scotland with regard to the introduction of national scales of car allowances for local authorities' chief officers and medical officers.

Annual Leave for Public Health Medical Officers

137. The following resolution of the A.R.M., 1956, was referred to the Staff Side of Committee C, and further information will be available in time for the Supplementary Annual Report of the Council.

78. **Resolved:** That the terms and conditions of service of public health medical officers should be reviewed with the object of relating them more closely to those pertaining in the hospital services in regard to annual leave.

MEDICAL ETHICS

Professional Secrecy

138. In 1952 the policy on professional secrecy was reaffirmed by the Representative Body in the following terms:

It is a practitioner's obligation to observe strictly the rule of professional secrecy by refraining from disclosing voluntarily without the consent of the patient (save with statutory sanction) to any third party information which he has learnt in his professional relationship with the patient.

This policy inevitably forms the basis of advice given to the many who make inquiry. Strong arguments have been put forward in favour of some relaxation of this policy in the public interest.

Advertising

139. The report on indirect methods of advertising which was approved by the Representative Body last year states that "it is generally accepted by the profession that certain customs are so universally practised that it cannot be said that they are for the person's own advantage." Various aspects of advertising, in its broadest sense, have been considered by the Council, and the following are among the decisions taken in regard to practices which are not regarded as customary: (a) Ecclesiastical premises should not be used for doctors' surgeries unless they are made available to all doctors in the area. (b) Where it is considered necessary for an assistant to have his own door-plate, the assistant's name should appear in conjunction with the name of his principal and the normal rules relating to door-plates should apply. It is, however, highly undesirable that a trainee assistant should have his own door-plate.

Lay Organizations

140. Agreement has been reached with the National Marriage Guidance Council on the rewording of an approved memorandum on the Relationship of Medical Practitioners to Marriage Guidance work. Joint committees of the local Marriage Guidance Councils and the appropriate Divisions or Branches of the Association are to be responsible for the compilation of lists of doctors who are willing to render the services required.

Numerous lay organizations exist to promote the interests of sufferers from specific complaints, and difficulties occasionally arise through the compilation of restricted panels of specialists, involving a danger of giving publicity to the specialists concerned. The Council acknowledges the co-operation given by these organizations in overcoming the difficulties which have been experienced.

Ethical Rules

141. As part of the general review of the ethical rules the Council is revising the pamphlet entitled "Ethical Rules Relating to Consultations and Other Matters," and hopes to submit the revised version in its Supplementary Report.

The Council has under consideration the provision of rules of procedure for investigating ethical complaints occurring in overseas Branches. Clarification of the Articles and By-laws of the Association and of the Standing Orders of the Council is being sought in regard to the powers of the Central Ethical Committee.

Nearly all local units of the Association in the United Kingdom have adopted the revised rules governing procedure in ethical matters which were approved by the Representative Body in 1950.

PRIVATE PRACTICE

Drugs for Private Patients

142. The following Minutes of the A.R.M., 1956, have been considered by the Private Practice and General Medical Services Committees:

54. **Resolved:** That the Representative Body notes with satisfaction that a further meeting has been held with the Minister of Health on the question of allowing private patients to obtain drugs, appliances, and dressings through the National Health Pharmaceutical Service. It again emphasizes the importance it attaches to this matter of principle and urges the Council to continue to seek a successful solution to this long-standing grievance.

55. **Resolved:** That this Representative Body instructs the Council to take steps to ensure that any further deputations to the Ministry to secure the right of private patients to obtain drugs and appliances through the N.H.S. should be more closely identified with private practice.

When the deputation from the Council met the Minister of Health on April 18, 1956, the Minister suggested that it would be very useful if there were detailed discussions between the Association and officers of his Department directed particularly towards the following points: (1) working out the size of the problem—that is, the present number of patients in the country receiving private treatment; (2) estimating the likely cost; (3) attempting to devise a suitable disciplinary procedure for controlling this prescribing; and (4) considering what consequent adjustments might have to be made in the remuneration of general practitioners (and in particular in calculating the basis of the Central Pool).

Both Committees were agreed that the Minister's invitation should be accepted, but in view of present circumstances the Council has approved the recommendation of the G.M.S. Committee that the discussions with officers of the Ministry be initiated at an appropriate time in the future.

Fees for Part-time Medical Services for Government Departments

143. Recommendations have been made to the Treasury in accordance with the terms of the following Minute 57 of the A.R.M., 1956:

Resolved: That the fee for reports to Government Departments at present standing at 5s. be increased to one guinea in conformity with the fee paid by insurance companies for reports without examination.

The present fee for an extract from a medical practitioner's record is within the range 5s. to 10s. 6d. The Treasury would not agree to a fee of one guinea but offered to increase the minimum of the range to 7s. 6d. The Council has accepted this offer without prejudice to the reopening of negotiations at a later date.

The Council has accepted a Treasury proposal that the fees payable to a general practitioner acting as locum tenens for a prison doctor be as follows: £3 3s. for half a day, £4 14s. 6d. for a full day, £11 0s. 6d. for fortnightly substitution. Previously the fees were £1 10s., £2 5s., and £5 5s. respectively.

Also accepted, without prejudice to the reopening of negotiations at an early date, was a Treasury offer to increase from £1 5s. to £1 17s. 6d. the fee for a full medical examination and report in a single case by a Treasury Medical Officer.

Medical Examination of Elderly Drivers

144. The following Minute 65 of the A.R.M., 1956, has been discussed with representatives of the Accident Offices Association:

Resolved: That when the medical examination of elderly drivers is requested by insurance companies it should be carried out by an independent doctor for a similar fee to that for life insurance, and this fee should be payable by the insurance company.

The Accident Offices Association refused to accept the suggestions made in the above resolution, and thus reaffirmed the views expressed when similar representations were made in 1954. The A.O.A. made a counter-suggestion that the responsibility for deciding whether an elderly man is fit to drive a car should fall on the Government and should be arranged by amendment of the licensing procedure. The Council is of the opinion that no useful purpose would be served by pursuing this matter further at this stage.

Fees for Payment to Practitioners called in by the Police

145. The Council has considered methods of implementing the revised scale of fees for the payment of practitioners in England and Wales called in by the police, which was approved by the A.R.M., 1956, in the light of the following Minute 67 of the A.R.M., 1956:

Resolved: That this Meeting strongly supports Council's action in making a claim for increased fees for payment to practitioners called in by the police, and urges that Council will pursue its claim with the utmost vigour.

Attempts have been made to secure the adoption of the revised scale by police authorities through the Local Authorities' Associations. These Associations have reaffirmed their view, also expressed at the time of the previous revision, that the adoption of the B.M.A. scale is a matter for discussion between individual local authorities and the profession in the light of local circumstances. The Council has asked Division Secretaries to negotiate directly with the appropriate police authority with a view to the adoption of the revised scale in all cases where practitioners undertaking work for the police consider that the new scale would be advantageous.

Medical Examination for Life Assurance

146. The Council has considered the following Minute 69 of the A.R.M., 1956:

Resolved: That if, after a report on a medical examination for Life Assurance has been received, further medical evidence is considered necessary by the Office's Chief Medical Adviser, then that evidence should be obtained at the Office's expense (not at the expense of the patient).

In previous negotiations with the Life Offices Association on the question of fees for medical reports, it has been accepted that the fee of 15s. or £2 2s., as the case may be, shall cover the giving of subsequent information (whether or not involving a further examination) required by an office in elucidation of, or to remedy omissions in, the original report. It has been agreed, however, that a suitable fee should be forthcoming when information additional to that sought in the original report is required. In these cases the request is made to the doctor by the company concerned, and there is no question of the patient being responsible for the fee.

The cases to which Minute 69 of the A.R.M., 1956, would apply are those which arise out of proposals for a type of policy written at a low rate of premium and which will not bear any additional expense. If the company decides that, in view of the evidence contained in the original report, the proposal cannot be accepted, instead of declining the proposal outright it will often give the proposer an opportunity to produce further medical evidence, provided he does so at his own expense. If the patient then seeks additional evidence from his family doctor, the latter is not precluded from charging a fee, and the amount thereof is a matter for arrangement between the doctor and the patient.

The Council is satisfied that the above Minute is being implemented as far as possible.

Certificates in Respect of Absent Voters

147. Minute 71 of the A.R.M., 1956, called for amendment of form R.P.F. 7 as follows:

Resolved: That the medical certificate at present required on form R.P.F. 7 (application to be treated as an absent voter)

is entirely unsatisfactory. It should be amended to read as follows:

I certify that in my opinion it is undesirable, on medical grounds, that this applicant should go in person to the polling booth, and that this state is likely to continue for.....months.

*indefinitely.

(* complete and/or delete as may be necessary)

Signed.....
Registered Medical Practitioner.

Address.....

Date.....

At present the doctor, in addition to certifying that the voter will be unable to go in person to the polling station by reason of physical incapacity, is also asked to certify that the voter is qualified to be registered as an elector for that area. The Home Office has not accepted the revised medical certificate suggested above, but has agreed to amend the wording to make it clear that the statement referred to in the medical certificate does not relate to the applicant's statement that he is qualified to be registered as an elector.

Accidents—Compensation

148. The Council has sought the advice of the solicitor and an expert on insurance on matters arising out of the following Minute 348 of the A.R.M., 1956:

That the following motion be referred to the Council for consideration:

That this Meeting considers that the Council should discuss with the Government the matter of compensation for doctors injured or who lose their lives in attending accidents.

In an analysis of the circumstances in which a doctor may attend accidents the solicitor showed that there are a number of circumstances in which practitioners of all kinds might not receive compensation under statutory provisions. Even where such provisions apply, such as under the National Health Service Superannuation Scheme, the pension payable to the doctor or his widow may be insufficient to allow a reasonable standard of living. In the solicitor's opinion, however, the Government would take the view that there is no justification for placing medical practitioners in a privileged position over the whole of the rest of the community, and there is no likelihood of the Government agreeing to amend the general law in favour of the profession. The insurance expert advised the Council that insurance through an accident policy would present no difficulties, and that to cover the risk of a fatal accident the premium would be about 17s. 6d. for each £1,000 assured.

The Council has decided to advise practitioners as follows:

(a) Of the financial risks often occasioned by the lack of adequate cover from compensation and superannuation schemes in the event of death or disablement as a result of attending the victim of an accident in the course of medical practice.

(b) That the only way by which these risks can be completely and adequately covered is by an appropriate accident insurance policy.

(c) That it would be advisable for those under contract with an employing authority to ensure that there is a suitable clause in the contract covering the payment of compensation in the event of death or disablement which is attributable to the nature of their duties.

Statutory and "Item of Service" Fees

149. Minute 349 of the A.R.M., 1956, asked "that all statutory and 'item of service' fees should be reviewed in the light of 1956 values of money." The Council is continuously reviewing such fees in an attempt to ensure that they are related to the current value of money, and it will continue to do so.

Examination of Emigrants

150. By agreement with the Governments of Canada and Australia, intending emigrants are informed that they are responsible for the doctor's fee of £1 1s. for each adult and for each child over 16 years of age. In the Council's opinion the appropriate fee for a comprehensive examination and

report (such as is required for intending emigrants) is £2 2s. Many emigrants would be unable to pay this fee, and yet to perpetuate the present agreement would be to differentiate between organizations. This, it is considered, would be very unwise, as it would tend to keep the standard fee for a full examination and report at the lowest level and would make it difficult to justify a claim for the proper fee in circumstances where the patient is not directly responsible for the fee. The Council proposes to ask the Australian and Canadian Governments to delete all reference to the amount of the fee from the papers sent to an intending emigrant, and to state instead that the emigrant is responsible for the doctor's fee. The amount of the fee charged will then be a matter for arrangement between the doctor and the emigrant.

Remuneration of Civilian Medical Practitioners

151. Representations to the Ministry of Defence have resulted in increases in the remuneration of full-time civilian medical practitioners employed by the War Office and of part-time C.M.P.s engaged on a capitation basis. Increases were also obtained in the fees for chairmen and members of War Office and Air Ministry Medical Boards, for the Armies, and for the examination of the families of Army examination of recruits for the Regular and Territorial and R.A.F. personnel proceeding overseas.

"No Waiting" Order—Wolverhampton

152. Arrangements were made by the Council for the profession locally to be represented by counsel at a public inquiry into a proposed "no waiting" order for the centre of Wolverhampton. The Ministry of Transport has since confirmed the order without allowing any exemption to medical practitioners.

Appointment of a Local Authority Employee as Coroner

153. It has come to the notice of the Council that a local authority recently appointed one of its whole-time employees as coroner in a part-time capacity. This, in the opinion of the Council, is most undesirable; the post of coroner should always be held by an independent person and the salary offered should be sufficient to attract applications from suitably qualified persons. The Council has protested to the Home Office about the appointment in question.

Remuneration of Medical Officers of Private and Public Schools

154. The Council considers that the Association's policy on the remuneration of medical officers of private and public schools should now be revised. The present policy, as approved by the A.R.M., 1949, calls for the payment of not less than £1 1s. per scholar per annum for duties outside the National Health Service. After consulting the Medical Officers of Schools Association the Council recommends:

Recommendation: That where practitioners are appointed to undertake special routine medical examination of scholars at private or public boarding schools, and to advise the school authorities generally on matters of health and hygiene, the remuneration should not be less than £1 15s. per scholar per annum for duties outside the National Health Service.

Revision of Fees

155. The following increases of fees have been negotiated. (a) Medical Interviewing Committees of the Ministry of Health: fees for chairmen and members increased as from March 1, 1956, to £3 13s. 6d. and £3 3s. respectively for a session of 2½ hours. (b) Silicosis Medical Bureau, Johannesburg:—fees increased as follows: medical examination and report, from £2 2s. to £3 3s.; report of sputum examination, from 10s. 6d. to £1 11s. 6d.; for x-ray film, from £1 1s. to £3 3s.

"BRITISH MEDICAL JOURNAL"

156. During 1956 the circulation of the *British Medical Journal* for the first time exceeded 80,000 copies. The continued increase in the circulation is partly accounted for

by the Association's rising membership, but the steady upward trend of subscriptions from non-members is a gratifying sign that the *Journal* is found of value by medical men throughout the world.

The year was notably successful for the special journals published by the Association, since all thirteen journals increased their circulation, some by as much as 15% to 20%. Many of these additional copies were sold in the United States, where the promotion campaigns carried out by the American agents have had excellent results.

Abstracts of World Medicine has also done well, with an increase of circulation of about 16%; rather more than half the additional subscribers were in the United States.

The third collection of articles from the Refresher Course for General Practitioners was published in book form towards the end of 1956 and is selling well. During the last few years a substantial financial profit has been made by the sale of books in the *Refresher Course* and *Any Questions?* series. A volume entitled *Emergencies in General Practice* will be published later in 1957. After mutually satisfactory financial arrangements had been made, permission was given to the Argentine medical journal, *Semana médica*, to translate the third volume in the *Any Questions?* series into Spanish, and this book is now on sale in South America.

Rising costs of production again made the year a difficult one for publishers. There were substantial increases in the cost of paper and of printing, and the higher rates for inland postage, which came into operation on June 1, 1956, will add about £7,000 a year to the cost of distributing the *B.M.J.* The rise in the membership also added about £5,000 to the annual expenditure on the *Journal*. Though not entirely offsetting these increased costs, the advertisement revenue showed a useful increase on the previous year, and the sales income was also larger both for the *B.M.J.* and for the special journals. Some saving on production costs was obtained by changing the printers of a number of the special journals, and rates for display advertisements in the *B.M.J.* were increased from January 1, 1957.

There is a limit to the savings that can be made by reducing costs of production, and more attention has been paid to the possibility of increasing revenue by promoting sales of the Association's publications. The success of the campaign carried out by the American agents has already been mentioned, and further improvements are hoped for. The Business Manager visited Scandinavia and Holland, calling on medical booksellers, subscription agents, university libraries, and others. Through these contacts and with the good will evident in Scandinavia towards the Association's publications, a steady increase in subscriptions can be expected, especially when the Business Manager's visit has been followed up by the dispatch to specialists in Scandinavia of descriptive circulars about the journals likely to be of interest to them. The British market has also not been neglected; in particular, a campaign to sell more copies of *Abstracts of World Medicine* to registrars and other hospital staff is being carried out.

Much more material is submitted for publication in the *B.M.J.* than can possibly be printed, and this applies to nearly all sections of the *Journal*. In particular, the dispute with the Government about the remuneration of doctors has increased the pressure on the space available in the *Supplement*, particularly in its correspondence columns.

When considering the motion, referred to the Council by the A.R.M., 1956, "that the *Supplement* to the *British Medical Journal* be published in separate form, as was done several years ago, or that it form the centre pages of the *Journal* and be easily detachable for reference," the Council was informed that the additional cost of publishing the *Supplement* in separate form would be over £6,000 a year. Such additional expenditure was not considered justifiable. To place the *Supplement* in the centre pages of the *Journal* would be likely to be unsatisfactory for several reasons: it would mean extra expenditure and would divide the contents of the *Journal* into two parts, causing annoyance to many

readers. The Council therefore resolved that no action be taken at present on the proposal that the *Supplement* should be published in separate form, but that the matter should be reconsidered if the financial situation improves; and that no action be taken on the proposal that the *Supplement* should form the centre pages of the *Journal*.

"FAMILY DOCTOR"

157. *Family Doctor* has now completed its sixth year of publication, and the year 1956 was a successful one from many points of view. In the course of this year a number of changes were effected, all directed towards broadening the base of *Family Doctor* activities.

On October 26, 1956, the first four *Family Doctor* books were published, and these have been widely welcomed. Earlier in the year a special issue under the title "Getting Married," published at 1s., achieved an extraordinary success, and it seems likely that there will be much the same reception accorded to "Getting Married, 1957." This is a completely new edition at the same price of 1s. and in the same format, but with the whole text entirely rewritten and differently presented. Of this new and completely revised edition there is a print order of a quarter of a million copies, and it seems likely that there will be a complete sell-out in a matter of one or two months.

At an early stage in the development of *Family Doctor* there were numerous requests for individual articles and subjects which could no longer be met by the provision of individual back-numbers of the magazine. It was therefore decided to establish a series of pamphlets and reprints, many of which have continued in demand over a period of years. The logical development of this activity was the creation of a group of 32-page booklets at a uniform price of 1s. Distribution of these booklets has been entirely through chemists' shops, and by the end of 1956 nearly half a million copies of these specially designed booklets had been sold. The intention for the year 1957 is to sell over one million. New titles and new subjects have been developed from material which has already appeared in the magazine. The present range of titles is as follows: *Slim Safely*; *Having a Baby*; *All About Asthma*; *Child Management*; *Nursery Feeding*; *Invalid Cookery*; *Feeding the Family*; *How Your Life Began*; *Infectious Diseases of Childhood*; *The Facts of Life*; *Milestones in the First Four Years*; *First Baby*; *Childless Marriage*.

A more recent development has been the creation of another special 80-page publication entitled "You and Your Baby." This covers antenatal care, infant welfare, and all the problems of infant care and infant feeding in the first few months of life. This particular publication has been distributed free of cost to every general practitioner in this country so that it may be passed on to selected patients. It has also been made available to doctors in terms of additional bulk supplies at a cost of only 9s. per dozen. All these activities, and others which are envisaged, are in line with the policy of providing for the public, through *Family Doctor*, a responsible, reliable, accurate, and authoritative source of information.

It has always been the endeavour of the *Family Doctor* Committee to conduct the magazine at no cost to the general funds of the Association while, at the same time, ploughing back into its development a considerable part of the total revenue. It will be recalled that on the year's working in 1955 there was a surplus of £2,561. Once again all these activities have been conducted at no cost to the general funds of the Association, and once again there is a surplus on the year 1956, this time of £2,362.

The decision to increase the page size of *Family Doctor*, which took effect from the January, 1956, issue, has been widely welcomed by readers and advertisers. So has the decision to bring to an end the Home Supplement special feature which served a useful purpose over an earlier and deliberately limited period.

Distribution has been adversely affected in the early part of this year by petrol difficulties, which led to the temporary

suspension of the *Family Doctor* van service. This covered London and the Home Counties, and had just begun to extend into three or four provincial centres.

Family Doctor is the most widely quoted magazine in this country. In a large measure this reflects the prestige and authority that attaches to its publication by the British Medical Association. *Family Doctor* owes a great deal to the support that is given to it regularly by quotations and comments in all the leading national and provincial newspapers.

Over the year 1956 the magazine has become more firmly established and even more widely accepted. Its ancillary activities have broadened the base of the project and, apart from their immediate practical merits, have extended still further the bounds of health education in its widest sense. All the activities of *Family Doctor* are in line with the original policy decisions of the Annual Representative Meeting. In *Family Doctor* the profession has now a first-class medium for ensuring that accurate and authoritative information is available to an increasing section of the public.

FINANCE

(As the auditing of the Association's accounts has not been completed, the Annual Financial Statement will be published in the Council's Supplementary Report.)

158. An effective control of the expenditure of spending committees and departments has been exercised by the Council throughout the past year. Nevertheless the trend in the financial position of the Association is one which is causing the Council some anxiety.

In the twelve months which ended on December 31 last the revenue from all sources was sufficient to meet steadily increasing expenditure and still leave a small surplus to be carried forward after making provision for the Joint Annual Meeting in Edinburgh in 1959. The prospects for the current year, however, are much less favourable, although it is hoped that the prompt steps taken by Council to effect economies will be successful and a deficit on the year's working avoided.

Income

159. The membership in 1956 reached a new record figure of 70,152, which resulted in an improvement on estimates, the income from subscriptions totalling £265,350, after providing for losses arising from resignations and deaths.

By employing the cash surplus to immediate needs in the purchase of short-dated Treasury Bills the income from investments and deposits was increased by nearly £1,500. This additional revenue offset to a great extent the fall in the net rental income, which resulted from a substantial rise in the cleaning and heating costs for the year. By increasing these charges to tenants in the current year the Council hopes to make good the loss of income. The total income from all sources during the year reached over £288,000, an improvement of some £8,000 on the estimates.

Expenditure

160. In the budget for 1956 provision was made for a total expenditure by the spending Committees and departments, with the exclusion of the Publications departments, of £256,750. During the year, however, the Council gave approval for the payment of a cost-of-living bonus to the official and clerical staffs and immediately following the Annual Representative Meeting in Brighton introduced a subsistence allowance for members attending centrally arranged meetings. These, and other unforeseen expenditure, brought the total up to £272,544.

Publications Account

161. The accounts for the *British Medical Journal*, *Family Doctor*, Special Journals, and Medical Abstracts show a small surplus on the year. Although in sharp contrast to the favourable position of the publications at the close of the previous year it was one that had been anticipated by the Council when preparing the budget for the past year.

Surplus for the Year

162. After providing for taxation and an additional £5,000 to the Reserve for the cost of the Joint Annual Meeting in Edinburgh in 1959 a net surplus of £8,600 was carried to the Accumulated Fund.

Trust Funds and Medical Charities

163. The total sum collected on behalf of the Medical Charities was £12,564, which is slightly less than in the previous year. In view of the increasing needs of the benevolent funds the Council appeals for greater support to the Charities.

Revenue Budget for Twelve Months Ending December 31, 1957

164. The Council has approved a provisional budget for the year 1957.

Based on the early estimates prepared by the spending committees and departments the estimated income for the year exceeds the expenditure by only £3,202. After making provision for an addition of £5,000 to the reserve for the 1959 Joint Annual Meeting in Edinburgh there is a budgeted deficit of £1,800.

The Council has already initiated steps which should lead to considerable economy in the day-to-day expenses of the Association, particularly in connexion with the Committee expenditure. It is unlikely, however, that with the need to incur heavy additional expenditure in connexion with the Remuneration Claim there will be any substantial surplus at the end of the year.

Subsistence Allowance

165. The Annual Representative Meeting, 1956, passed the following resolution:

44. **Resolved:** That the principle having long been approved as the policy of the Association, the time has arrived when subsistence allowances should become payable to members when attending centrally arranged meetings for which they have been elected.

The matter was referred to the Organization Committee and the Finance Committee, and their recommendations embodying the following scale of subsistence allowance for members attending centrally arranged meetings of Committees, Subcommittees, Council, Conferences, and the Annual and Special Representative Meetings were subsequently approved by the Council:

Over 8 hours and under 24 hours away from home 12s. 6d.
Over 24 hours or overnight away from home (less a standard deduction of 25s. if sleeper is claimed) 45s. 0d.

The Council decided that the scale should operate as from the close of the Annual Meeting, 1956, and that it be reviewed at the conclusion of the 1956-7 Session in the light of experience.

ESTATES

Headquarters Building

166. As part of the maintenance programme, redecoration of the whole of the offices in the North and South Wings was carried out in 1956.

A series of windows has been completed in the South Wall of the Garden Court Wing and considerable improvement has been effected in the lighting and redecoration of the ground and first floors of this building.

Regional Offices

167. The Council has accepted a lease of accommodation in a new building to be erected in Belfast near the University. Offices and committee rooms will be provided and the unit will provide an attractive regional centre for the members in Northern Ireland.

SCIENCE

168. This has been a year of intense activity, and a number of investigations have been initiated.

A pilot survey on drug addiction is in progress, and the problem of the control of drugs and the extent of their use by addicts is receiving careful study.

Coal-gas Poisoning

169. The Council has approved a report of a special subcommittee on accidental coal-gas poisoning which contains the recommendations set out in Appendix V. The investigation showed that the number of accidental deaths through coal-gas poisoning in recent years had increased at a greater rate than the number of people aged 65 and over and the total amount of gas consumed. The largest increase in the causes of death was the leaving open of gas-taps. Other contributory factors include the loss of the sense of smell and the increasing tendency of old people to live alone.

Diesel Fumes

170. In compliance with the following resolution of the A.R.M., 1956, representations have been made to the appropriate Government Departments:

118. **Resolved:** That in view of the obnoxiousness of exhaust vapour from road vehicles and the possibility that they may cause very serious disease, this Meeting considers that it is its duty to request the Government to secure obedience to the existing law in respect of such fumes.

It has been ascertained that the Ministry of Transport and Civil Aviation are giving consideration to amending the Motor Vehicles (Construction and Use) Regulations, 1955, which would make it easier for the police to secure the conviction of offenders against the law.

Restraint in the Use of New Drugs

171. The Council has considered the following resolution of the A.R.M., 1956:

117. **Resolved:** That the following motion be referred to the Council for consideration:

That the profession would welcome some degree of restraint in the use of new drugs whilst therapeutic trials were in progress provided that such trials were supervised by some central body.

In the opinion of the Council it is unlikely that new drugs would be made available in the United Kingdom before adequate therapeutic trials had been conducted. The Council is firmly opposed to any curtailment of the freedom of practitioners in prescribing. While being sympathetic towards the terms of the motion contained in Minute 117, the Council regards its implementation as impracticable, unless the Association were to embark on a comprehensive scheme for the co-ordination of clinical trials with the Medical Research Council and the larger pharmaceutical firms.

The Library

172. There has been a continued increase in the number of provincial members using the Library. The construction of windows in the south wall has greatly improved the Library facilities. The Council wishes to express its grateful thanks to the donors of 169 books and periodicals presented during the year.

The Council regrets that on financial grounds it cannot implement the motion contained in the following minute of the A.R.M., 1956:

121. **Resolved:** That the following motion be referred to the Council for consideration:

That this Meeting considers that the postal charges made by the B.M.A. Library should be abolished as a compensation to those members living at a distance from London who are not often able to enjoy the amenities of Headquarters.

The Council is anxious to exercise economy wherever practicable, and an appreciable saving would be effected if the Association reverted to the previous arrangement whereby members paid both outward and inward postage

when borrowing books. The Council understands that this practice has already been adopted by other medical libraries.

Recommendation: That in view of the financial position of the Association, the payment by the Association of outward postage on library books borrowed by members be discontinued as a temporary measure.

Medical Implications of Modern Weapons

173. The motion contained in the following Minute of the A.R.M., 1956, has been under consideration by the Council:

343. **Resolved:** That the following motion be referred to the Council for consideration:

That in view of the fact that any future war is likely to start with little warning, it is essential that members of the medical profession should understand the medical implications of modern weapons. This meeting therefore believes that the Government should arrange courses in these subjects which may be attended by any interested medical practitioner.

Contact has been made with the Civil Defence Section of the Ministry of Health, and lectures are now available for Division meetings. It is hoped that further information on practical aspects of radiation hazards will be published later in the year.

First-aid Handbook

174. After consultation with various experts in first aid, the Council has submitted its comments on a revised *First Aid Textbook* prepared by the St. John Ambulance Association, St. Andrew's Association, and the British Red Cross Society. The consultation envisaged in the following resolution of the A.R.M., 1956, has therefore been achieved:

357. **Resolved:** That this Meeting welcomes the statement that the Association is taking an interest in the preparation of a textbook for first-aid workers, and considers consultation with the Association desirable in the preparation of all books of this nature claiming to be standard teaching manuals.

Foreign Corresponding Members

175. The undermentioned have been invited to become Foreign Corresponding Members in view of their outstanding services to medical science:

Robert Debré, Professor of Paediatrics, Paris.
Constantine Choremis, Professor of Bacteriology, Athens.
Pietro Valdoni, Professor of Surgery, University of Rome.
Carlos Jimenez Diaz, Professor of Internal Medicine, University of Madrid.
Axel Herbert Olivecrona, Professor of Neurosurgery, Stockholm.
Guido Von Fanconi, Professor of Paediatrics, Zurich.
William Bosworth Castle, Professor of Medicine, Harvard.
Robert Frederick Loeb, Professor of Medicine, New York.
George Whipple, Professor of Pathology, Rochester, New York.

Insulin Syringes

176. Last year an approach was made to the British Standards Institution to secure the use of the term "ml." on the insulin syringe and package. Manufacturers indicated that, for a variety of reasons, it would be inadvisable to adopt this suggestion. A proposal has now been submitted to the British Standards Institution that it would be of advantage if insulin syringes were calibrated in twentieths instead of in tenths, as such calibration would equate naturally with the strength of insulin solution in units.

Crash Helmets

177. In accordance with the following resolution of the A.R.M., 1956, the Council sent a deputation to the Ministry of Transport to discuss the compulsory wearing of protective helmets by motor-cyclists:

120. **Resolved:** That the B.M.A. press the Ministry of Transport to enforce the use of crash helmets of approved pattern for those riding motor-cycles, and that a deputation should go to the appropriate Ministry to protest against the sale of dangerous Government surplus.

The second part of this resolution has already been covered by regulations under the Road Traffic Act, 1956. The views presented by the deputation on the compulsory wearing of crash helmets by motor-cyclists were sympathetically received by the Ministry. The Council will continue to keep this matter under careful review.

Dawson Williams Prize

178. The trustees of the Dawson Williams Memorial Fund have decided to award the Dawson Williams Prize of £100 for 1957 to Mr. Denis J. Browne, F.R.C.S., London, in recognition of his pioneer work in the field of paediatrics.

Association Prizes

179. The Council wishes to express its appreciation of the services given by the examiners in the undermentioned competitions.

Sir Charles Hastings and Charles Oliver Hawthorne Clinical Prizes

The Sir Charles Hastings Clinical Prize of £75 has been awarded for 1957 to Dr. E. Ellis Jones, Shrewsbury, for his entry on "Minor Degrees of Nephritis in the Young." The Charles Oliver Hawthorne Prize of £50, given to the author of the second best entry for the competition, has been awarded to Dr. J. E. Davies, Carmarthen, for his entry on "Chronic Brucellosis in General Practice."

Katherine Bishop Harman Prize

The Katherine Bishop Harman Prize of £75 has been awarded for 1957 to Dr. M. June Scudamore, Sidford, Devon, for her entry on "Foetal Distress in Labour."

Occupational Health Prize

The Occupational Health Prize of £50 for 1957 has been awarded to Dr. C. P. Chivers, Sandiway, Northwich, Cheshire, for his entry entitled "Respiratory Function and Disease among Workers in Alkaline Dusts." A second prize of £10 has been awarded to Dr. H. Stott, of the Labour Department, Nairobi, Kenya, for his entry on "Pulmonary Disease amongst Sisal Workers."

Provisionally Registered Practitioners' Prize

A prize of £50 has been awarded in the Provisionally Registered Practitioners' Competition for 1957 to Dr. R. M. Whittington, Sutton, Surrey. The subject set for this competition was "Medicine is an Art as well as a Science."

Medical Students' Prize

The following prizes have been awarded for essays on "The Medical Student and Research—Past Achievements and Present Opportunities" in the 1957 Medical Students' Competition: £25 to Mr. W. I. B. Onuigbo, Glasgow University; £20 to Mr. J. T. Silverstone, St. Bartholomew's Hospital Medical School.

Nurses' Prizes

First and second prizes, of 20 guineas and 10 guineas respectively, have been awarded in the following categories of the Nurses' Competition for 1957:

Category 1.—Student Nurses: Essay subject, "The Patient's Social Background in Relation to His Progress and Happiness in Hospital." First prize, Miss Norma M. G. Smith, Sydney Hospital, N.S.W.; second prize: Miss Grace M. F. Ramsay, Dundee.

Category 2.—State-registered Nurses working in hospital: Essay subject, "Team or Group Care in Nursing." First prize, Mr. Brian V. Watkin, London, S.W.17; second prize, Mr. Robert J. Kelman, Aberdeen.

Category 3.—State-registered Nurses working outside hospital: Essay subject, "The Limitation of the Number of Health, Welfare, and Social Visitors to the Individual Family." First prize not awarded; second prize, Mrs. Joyce St. Claire-Vernan, Cromer.

The Council acknowledges with gratitude the nursing textbooks awarded as consolation prizes in this competition by Messrs. William Heinemann.

Mackenzie Industrial Health Lecture

180. The Mackenzie Industrial Health Lecture was delivered on September 25, 1956, by Dr. R. S. F. Schilling at B.M.A. House in connexion with the Annual Meeting of the Association of Industrial Medical Officers.

Victor Horsley Memorial Lecture

181. The centenary of the birth of Sir Victor Horsley was commemorated by the delivery of the tenth Victor Horsley Memorial Lecture by Professor Sir Geoffrey Jefferson on April 12, 1957, at B.M.A. House. The subject of the lecture was "Sir Victor Horsley—His Life and Work."

B.M.A. Lectures

182. The number of B.M.A. lectures to Branches and Divisions so far arranged during the session is 133. The Council records its grateful thanks to the undermentioned, who have kindly assented to give lectures this session:

Mr. A. Lawrence Abel	Mr. Emlyn Lewis
Mr. R. J. McN. Love	
Professor A. G. R. Lowdon	
Dr. R. A. McCance	
Dr. A. S. McLean	
Professor J. McMichael	
Dr. R. H. Mole	
Mr. A. M. A. Moore	
Mr. C. Naunton Morgan	
Professor W. I. C. Morris	
Dr. W. M. Nichols	
Dr. W. D. Nicol	
Dr. Doris Odum	
Sir Heneage Ogilvie	
Dr. M. A. Partridge	
Dr. J. Ralston Paterson	
Professor Robert Platt	
Dr. Felix Post	
Dr. J. B. Randell	
Mr. Norman Richards	
Professor C. G. Rob	
Dr. Ffrangcon Roberts	
Mr. Alexander Roche	
Dr. A. Talbot Rogers	
Professor H. Scarborough	
Dr. R. Bodley Scott	
Professor H. L. Sheehan	
Dr. Keith Simpson	
Professor E. T. C. Spooner	
Dr. H. Neville Stafford	
Dr. David Stafford-Clark	
Dr. E. B. Strauss	
Professor C. H. Stuart-Harris	
Mr. N. Leigh Taylor	
Mr. J. S. Tough	
Mr. Kenneth Walker	
Professor R. Milnes Walker	
Sir Francis Walshe	
Professor W. Grey Walter	
Mr. Michael Ward	
Professor A. G. Watkins	
Professor E. J. Wayne	
Professor J. M. Webster	
Sir Harold Whittingham	
Dr. Denis Williams	
Mr. A. Dickson Wright	
Mr. R. B. Zachary	

Sir Charles Hastings Festival 1958

183. The Council has agreed in principle to the holding of the second Sir Charles Hastings Memorial Festival at Worcester in 1958, the centenary of the first Medical Act.

PUBLIC RELATIONS

Remuneration Claim

184. In the early days of the profession's Joint Remuneration Claim the Negotiating Committee, which is not an

Association Committee, did not consider it appropriate to embark on widespread publicity while the matter was still under discussion with the Ministers. In these circumstances it was difficult for the Council's public relations machinery to function, and this led to a certain amount of criticism from the profession. Following the rejection of the profession's claim, however, the Negotiating Committee accepted the offer of the services of the Association's Public Relations Department, and great activity has occurred during the past few months. Every effort has been made by press statements and conferences, press advertising, posters, and radio and television programmes to bring the profession's views to the notice of the public. At the main conferences the Joint Chairmen of the Negotiating Committee (Sir Russell Brain and Dr. A. Talbot Rogers), the Chairman of Council (Dr. Wand), and the Acting Chairman of the General Medical Services Committee (Dr. A. B. Davies) have been present to answer questions from the press. Arrangements were made for Sir Russell Brain, Dr. Rogers, Dr. Davies, and Dr. Wand to appear on the television programmes of the B.B.C. and the I.T.A., and on B.B.C. sound radio. The advice and co-operation of the Public Relations Department has been sought in the preparation and production of a very large number of other sound radio and television programmes dealing with the profession's claim. In addition to the great increase in telephone inquiries from the press and others interested, a very large number of personal interviews have taken place.

To coincide with the publication of the alternative plan for medical services in the event of the withdrawal of general practitioners from the National Health Service, advertising space was taken in the national press drawing attention to the Prime Minister's statement advocating arbitration in industrial disputes. Facilities were provided for the television services of the B.B.C. and I.T.A. to record the proceedings of the Press Conference held in connexion with the publication of the alternative plan, at which Honorary Public Relations Secretaries were present as observers.

The profession's case has received very good publicity in the press, and widespread editorial support. The press advertisement on arbitration was reproduced in poster form for display in doctors' waiting-rooms, and a copy was sent to every general practitioner in the National Health Service. Members of both Houses of Parliament were sent a document informing them of the profession's case.

Conference of Honorary Public Relations Secretaries

185. Out of 219 Divisions only five have no provision for public relations work. In 78 Divisions a separate Honorary Public Relations Secretary has been appointed. In 136 Divisions the post is combined with that of Honorary Secretary. Local public relations officers have been kept informed of events in connexion with the remuneration claim, and relevant documents and extracts from the national press giving an indication of press reactions have been sent to them.

Immediately prior to the publication of the alternative plan a Conference of Honorary Public Relations Secretaries was held. Over 180 Secretaries or their deputies were present, and were addressed by Dr. Dain, Dr. Talbot Rogers, the Public Relations Officer, and the Deputy Secretary, who answered questions put to them. The Honorary Public Relations Secretaries later attended the Press Conference as observers.

Fire Dangers in Home and Factory

186. The Council has considered the following resolution of the A.R.M., 1956:

351. **Resolved:** That this Meeting calls attention to the urgent need for much more intensive propaganda to inform all members of the community of the dangers of auto-inflammable materials or any other fire dangers in the home and factory.

In the opinion of the Council no direct action by the Association is indicated, but the attention of the Home Office has been drawn to this matter.

Poliomyelitis Vaccine

187. The Council has considered the following resolution of the A.R.M., 1956:

190. **Resolved:** That the B.M.A. use their influence to secure a more realistic attitude towards poliomyelitis by discouraging undue emphasis in press reports of outbreaks of the disease.

The question of press reports on poliomyelitis outbreaks has been considered on previous occasions, but it is considered that the publicity given has not been unduly alarming and the Council does not consider that any approach to the press is necessary.

The Medical Profession and the Press

188. The Minister of Health finally approved an agreed document submitted by the Conference of Representatives of the medical profession and the press on "Recommended Routine Procedure at Hospitals: Information to the Press about the Condition of Patients," which, together with a short covering memorandum by the Minister, was issued by the Ministry to Regional Hospital Boards, Boards of Governors of Teaching Hospitals, and Hospital Management Committees. The co-operation with the press has proved both constructive and useful, and the Conference is remaining in being to consider any questions which might arise in future.

Sir Charles Hastings Lecture

189. The first Sir Charles Hastings Lecture to be held outside London was delivered to an audience of over 1,000 by Sir Henry Cohen, now Lord Cohen of Birkenhead, at Leeds on April 24, 1956, on "The Conquest of Disease." The lecture, all the arrangements for which were undertaken locally in consultation with Head Office, was an outstanding success.

Increased Charges for Prescriptions

190. Widespread publicity was given to the Association's views of the hardship likely to be caused to patients suffering from chronic conditions, following the decision in October, 1956, to charge a shilling for every item of medicine prescribed for patients.

Public Relations in the Hospital Service

191. A proposal was received from N.A.L.G.O. that the B.M.A. should collaborate with it to develop better public relations in the hospital services. After considering the matter the Council is of opinion that no useful purpose would be served by such co-operation.

ARMED FORCES

Service Pay and Conditions

192. The Council has carefully considered the first report of the Waverley Committee, and has submitted observations upon it to the Ministry of Defence. It has been the consistent policy of the Association that remuneration in the armed Forces should not compare unfavourably with that in other branches of the profession, and the Council considers that the rates of pay proposed by the Waverley Committee are not competitive with medical prospects in civil life. The Ministry of Defence has been strongly urged to give close attention to the proposals on pay contained in the Association's memorandum of evidence to the Waverley Committee.

The Council is in agreement with much of the Waverley Report, but is opposed to the suggested division of the medical branches of the Army and Royal Air Force into two sections, specialist and administrative, as this would restrict the experience of individual medical officers who, in the event of war, might be called upon to perform tasks of a varied nature. The Council understands that the recommendations of the Waverley Committee are at present being studied by the Defence Departments and that specialist pay has already been introduced into the Royal Air Force.

Attention has been given by the Council to numerous other matters affecting the medical branches of the Armed Forces, including (a) the need for reviewing mileage allowances in the light of current conditions and the rates now payable to medical officers in the public health and hospital services, and (b) certain aspects of the Army pensions regulations which appear to bear inequitably upon medical officers.

ORGANIZATION

Association Membership

193. The Council submits the following report upon the membership of the Association for 1956:

New members	3,511	
Resignations withdrawn	148	
Reinstated	3	3,662
Removed in arrears	2,463	
Less paid arrears	1,704	759
Resignations		1,079
Deaths		595
Erased from Register		3
		2,436
		Increase 1,226
		68,926
Membership, December 31, 1955		70,152
Membership, December 31, 1956		

The membership of the Association in the United Kingdom represents 71% of the total profession and 80% of the working profession. The membership on March 27 was 69,544.

The apparent fall is due to the usual temporary adjustment caused by arrears in subscriptions.

It is noted that, for the first time, the membership of the Association has passed 70,000. To mark the occasion the 70,000th member was invited to the Council Dinner on November 6 and was presented with a copy of the *History of the British Medical Association*.

Although the membership position may be regarded as satisfactory, in that the overall figure continues to increase and the percentage figure remains steady, the Council continues to watch the position closely and to encourage recruitment in various ways. Current propaganda material is under review with a view to presenting to the practitioner, in a clear and concise form, the objects of the Association, its many activities, and the benefits to be derived from membership.

Honorary Secretaries

194. The Council, on behalf of the general body of members of the Association, desires again to express its deep appreciation of the services of the honorary secretaries of Divisions and Branches, upon whose loyal co-operation the effective local organization of the Association so largely depends. It has noted with considerable satisfaction a revival of activity and a general widening of the scope of activities in Divisions throughout the country.

The Annual Conference of Honorary Secretaries of Branches and Divisions in the United Kingdom in May, 1956, was a well-attended and successful event. The 1957 Conference will be held at B.M.A. House, London, on May 10. Dr. V. Cotton Cornwall, Honorary Secretary of the Merseyside Branch, will be in the chair.

Date of Annual Representative Meeting

195. The A.R.M., 1956, decided:

338. **Resolved:** That the Council be asked to consider changing the date of the Annual Representative Meeting from early summer to the autumn.

Under By-law 45 the decision as to the time and place of the Annual Representative Meeting in each succeeding year rests with the Representative Body, on the recommendation of the Council. In the event of a decision not being taken by the Representative Body, it is left to the Council itself to determine the date and time of the Meeting. Standing Order 103 of the Council prescribes the third week in July "as the most convenient week for the Annual Meeting and one which is now fixed by custom." Variations in this

date have been necessary in order to meet local convenience, but the A.R.M. has invariably taken place in June or July.

The Council has examined the advantages and disadvantages of continuing the existing procedure. It appreciates the difficulty inherent in holding large meetings at conference towns (especially seaside resorts) during the summer season. It feels, however, that if the Annual Scientific Meeting is to be held in conjunction with the A.R.M. the latter must continue to meet at the accustomed time. Not only would it be difficult to attract speakers to the Annual Scientific Meeting while the medical schools are in session, but it would be difficult in university centres to secure the essential accommodation for the large events connected with the Meeting.

Finally, change of the date of the A.R.M., as suggested, would necessitate drastic alteration in the Association's session and that of the local units without any compensatory advantages. The considered opinion of the Council is that the disadvantages inherent in postponing the A.R.M. for a period of three to four months far outweigh any possible advantages. The Council recommends:

Recommendation: That the existing procedure under which the date of the A.R.M. is determined be retained.

Membership of Council—Vacancies

196. The appointment as Chairman of Council of one of the "13" members of Council elected by the Representative Body has directed attention to the constitutional position in respect of the filling of the vacancy among the "13" members which might be considered under By-law 70 of the Association to have arisen. The opinion of counsel on the situation has been taken, and he has advised that it is within the power of the Council to decide not to fill the vacancy, but that if it desires to fill it, under the By-laws a Special Representative Meeting must be convened to seek guidance as to whether the vacancy is to be filled and by what means. It appears to the Council that any attempt to fill a vacancy so arising would be subject to so many anomalies and difficulties as to make the election a practical impossibility, and that for this reason a vacancy should be deemed not to have occurred. The Council recommends:

Recommendation: That in the event of one of the "13" members of Council elected under By-law 53 (c) by the elected Representatives at the Representative Meeting being appointed to the Chair of the Council, a vacancy among the "13" shall be deemed not to have arisen, and that By-law 70 be amended accordingly.

(The necessary amendment of the By-laws is contained in Appendix VI.)

Roll of Fellows of the Association

197. The A.R.M., 1956, adopted the following recommendations of the Council:

Recommendation: (a) That steps be taken to recognize, by the award of a special distinction, distinguished service given by members of the Association to their Division or Branch. (b) That for this purpose there be established a "Roll of Fellows of the British Medical Association," admission to which shall be governed by Regulations.

The Council has approved the following regulations:

Object of the Roll

To grant a distinctive status, recorded and recognized by the Association, for outstanding services given by members of the Association (whether in active practice or retired) to their Divisions or Branches. Such service to comprise purely local service, or local service combined with service given to the Association as a whole.

Criteria for Admission to the Roll

The criteria governing admission to the Roll are:

- (1) A minimum number of years of uninterrupted membership.
- (2) A minimum number of years as holder of an office, or offices, in a Division or Branch.
- (3) Distinguished service as a member of a quasi independent body such as a Local Medical Committee, Hospital Manage-

ment Committee, Faculty of the College of General Practitioners, Medical Practices Committee, etc.

(4) Outstanding achievement as a leader in negotiations at local level.

(5) Service to the Association as a whole—for example, Representative in the Representative Body, Member of Council, Member of Standing Committees.

Procedure for Admission to the Roll

(1) Admission to the Roll of Gold Medallists and Vice-Presidents of the Association to be automatic.

(2) Approval of the nomination to rest with the Council of the Association on the recommendation of the Organization Committee, with admission to the Roll by the Council.

(3) Admission to the Roll to be accompanied by a scroll setting out the reasons for the award and presented by the appropriate local unit of the Association.

(4) The award to be reported to the Annual Representative Meeting, with a citation at the Annual General Meeting.

(5) The Roll to be preserved in the archives of the Association.

(6) Application for admission of a member to the Roll to be made by a Division or Branch with the support of not less than three-fourths of those present and voting at a meeting of the Division or Branch, due notice of the proposal having been given. The application may be sponsored in the first instance by the Division Executive or Branch Council or by not less than three members of the Division or Branch.

Resident Medical Secretaries to Association Regional Offices

198. At the A.R.M. in 1956 discussion of a motion on this subject was deemed to be out of order under Standing Order 8 as the financial implications had not been considered. In view of further comments the Council has again examined the problem as a whole, including the financial aspect, and with the following motion, forwarded by the Manchester Division for the A.R.M., 1957, before it:

Motion by MANCHESTER: That notwithstanding the decision of Council, and the arguments set forth in Section 163 of the Annual Report, this Meeting requests Council to appoint Resident Medical Secretaries, acceptable to the members of the region concerned, to those areas possessing a Regional Office.

After a comprehensive review the Council reaffirms the views expressed in para. 163 of its Annual Report, 1955-6, namely:

"It appears to the Council that a scheme of resident medical secretaries to Regional Offices would offer advantages and disadvantages which may be summarized as follows:

Advantages

"(1) The main advantage is the personal service given by the resident medical secretary to the individual member—in effect 'bringing the Association to his doorstep.'

"(2) Closer contact between the consultants and the B.M.A. through visits to the Secretary at the Regional Office. The contact of these consultants through the normal regional machinery at the present time is remote.

"(3) Closer liaison with the Honorary Officers of Divisions and Branches and the assistance which could be given to Honorary Secretaries in their work, particularly in helping to revive inactive Divisions, etc.

Disadvantages

"(1) The loss of contact on the part of the regional medical secretaries with the headquarters medical activities, with detriment to the services which could be given to the region, as compared with those under the present arrangement. The position in Scotland is unique in that the Assistant Secretary in charge of the Glasgow Regional Office is within easy access of the Scottish headquarters in Edinburgh, spends a substantial proportion of his time there, and is Secretary of one of the main Scottish Committees—the General Medical Services Subcommittee. His contact with the Scottish headquarters is accordingly close and constant. This would not be possible in England and Wales. The resident medical secretary in the provinces, who would probably be serving a number of centres, would be in a much more isolated position unless he travelled frequently to London, where he would have no particular responsibilities in the way of committees, etc. Such an arrangement would be uneconomic and would entail heavy expenditure in travel. It would appear that the Scottish experiment has led to a drift of correspondence from Edinburgh to Glasgow, with which, because of his intimate contact with Edinburgh, the Assistant Secretary is able quite easily to deal. This would not

be the case in the provinces. With the infrequent contact with London, the regional secretary would have no alternative but to seek advice from headquarters regarding the replies or to forward communications to London, with consequent delay in receipt by the member of the information he sought.

"(2) The danger of divided loyalty where a resident medical secretary was responsible both to the units in his region and to the central Council.

"(3) The possibility that the duties involved would be insufficient to employ the resident medical secretary whole-time unless the area he covered was a very extensive one. This in itself might detract from the usefulness of the secretary.

"(4) The danger of interregional rivalry—one part of the region might make undue demands on his time, with detriment to the attention which he could give to other units in the region.

"(5) Lack of attraction of such a post to a medical man on the ground that it was not sufficiently satisfying or attractive without the headquarters work and responsibility to committees.

"(6) Loss of contact between the headquarters staff and the local units, which would be regrettable.

"(7) Difficulty of communication between the various centres in the region. In many instances it would be easier for a secretary to travel from London direct to a particular centre than across country from the regional headquarters.

"In its discussions the Council has considered possible repercussions of the appointment of medical secretaries resident in the provinces on the central office establishment, and has reached the conclusion that it is unlikely that it would be possible to reduce the headquarters medical staff. The Assistant Secretaries are available at all times to assist Branches and Divisions in their regions, and to travel to the various areas when invited. The arrangement appears to have worked well; there is no evidence of any widespread dissatisfaction with it throughout the country or of a general demand for the appointment of resident secretaries.

"The Council is strongly in favour of the continuation of the existing arrangement, and in expressing this view it would stress the dangers arising from decentralization of the work of the assistant secretaries; the difficulties of intercommunication within the regions; and the great advantage to all concerned of the "two-way traffic" between headquarters and the periphery. The Council feels, however, that in order to get the greatest advantage from this "two-way traffic" the visits of the Assistant Secretaries to their regions should be at regular intervals and made after due notice, in order that there may be opportunities for consultation with individual members.

"To sum up, the Council considers:

"(1) That the existing arrangement, under which assistant secretaries attached to the headquarters staff are responsible for defined regions of the country, and freely available on request for advice and consultations, or visits to a particular unit or units, is preferable to the appointment throughout the United Kingdom of resident medical secretaries on the lines of the Glasgow Regional Office.

"(2) That the assistant secretaries should make regular visits to centres in their regions in order to be available to individual members for the purpose of advice and consultation, after due notice to all concerned. Members of the central Secretariat visiting, by invitation, centres outside their regions would similarly be available for the purpose of advice and consultation."

The Finance Committee has examined carefully the financial aspect of the proposal to be submitted to the forthcoming A.R.M. in the Manchester motion, and, having considered its report, the Council, on purely financial grounds, is unable to recommend its approval at this stage.

Autonomous Bodies

199. In accordance with the provisions of Minute 27 of the A.R.M., 1950, the Council submits the usual recommendation for renewal in respect of the year 1957-8 of the autonomous powers of the General Medical Services and Central Consultants and Specialists Committees.

Recommendation: That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1957-8.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Position of the Newly Qualified Practitioner

200. The position of the newly qualified practitioner *vis-à-vis* the Association has received special attention during the past year. Means by which he may be made to feel that the Association takes a keen interest in his welfare and his particular problems have been discussed together with ways in which he may be encouraged to take an active part in central and local activities. Methods by which Association propaganda in the student and pre-registration stage may be strengthened and extended are also being explored.

The action taken by the Council in a number of matters affecting the provisionally registered practitioner is reported in paragraphs of this report under the heading "Hospital and Consultant Services." The position of the provisionally registered practitioner in the event of the refusal of the certificate of satisfactory service, which is essential for full registration, has been the subject of representations to the General Medical Council and the Licensing Bodies.

Compounded Subscription to Association of Newly Qualified Practitioners

201. The attention of the Council has been drawn to an anomaly in By-law 16 (1). This By-law was amended in 1954 with the intention of providing that a practitioner joining the Association in the year in which he qualified for provisional registration could, if he wished, compound into one lump sum of £10 10s. the Association subscription for the period during which he would normally pay a subscription at a specially reduced rate. As the By-law is now worded, however, the newly qualified member compounds the subscription for the five years commencing in January after the year in which he qualifies. Technically, therefore, he is due to pay either £1 1s. or £2 2s. for the remainder of this year, depending on the date of the final examination. This was not the original intention and the Council feels that the terms of the By-law should be adjusted to remove the anomaly. It recommends:

Recommendation: That By-law 16 (1) be so amended as to remedy the present inconsistency in respect of the compounded subscription payable by newly qualified practitioners. (The necessary amendment of the By-law is contained in Appendix VI.)

Convalescent Homes for Members of the Medical Profession

202. The A.R.M., 1956 (Minute 342), requested the Council to consider "ways and means by which a convalescent home or homes could be established for the use of members of the medical profession and their immediate relations." In doing so, the Council has had before it the opinion of counsel that under its objects the Association cannot "advance the personal interest of individual members of the profession by providing or assisting financially to establish or support a convalescent home"; further, that the funds of the Association could not be "expended in an appeal for funds to establish some organization to provide for, or in connexion with, such a home."

In view of this opinion, the Council has sought to ascertain whether there is in fact any widespread demand for such a project, which would in any event be difficult to organize and staff. It has failed to find any such evidence, and in these circumstances feels that members of the profession in general may safely be left to make their own arrangements. If, however, it is felt that some special arrangements are necessary for sick and needy members of the profession, then it suggests that the best way of meeting the situation would be, as at present, by the provision of monetary grants which would enable these practitioners to take a holiday away from their practices or homes.

The B.M.S.A. and the B.M.A.

203. The B.M.A. continues to maintain its close connexion with the British Medical Students' Association. At its

Annual General Meeting in November, 1956, the B.M.S.A. acknowledged its continued indebtedness to the British Medical Association for its generous help and wished it to be made clear that, though an expression of thanks is made each year, it is by no means a routine acknowledgment, but a genuine expression of appreciation.

Areas of Branches and Divisions

204. Approval has been given to the adjustment of areas in the following Divisions: the Divisions of the Malaya Branch; the Wellington Division of the New Zealand Branch; and the Barnet and West Herts Divisions of the Hertfordshire Branch.

Amendments to By-laws

205. Proposals are made in various paragraphs of this Report which necessitate alterations of the By-laws. The Council recommends:

Recommendation: That the By-laws of the Association be altered in the manner shown in Appendix VI.

CONSTITUTION OF THE ASSOCIATION

206. The special Constitution Committee, established on the instructions of the Representative Body in 1953, has completed its remit. Its Report, which was published in the *Supplement to the British Medical Journal* of February 23, 1957, and forms Appendix I of the Annual Report of Council, is submitted for consideration by the Representative Body.

SCOTLAND

Chairman and Deputy Chairman

207. Dr. W. M. Knox and Dr. G. W. Ireland were appointed Chairman and Deputy Chairman respectively of the Scottish Committee for the session 1956-7.

Conference of Honorary and Public Relations Secretaries of Branches and Divisions in Scotland

208. A conference of Honorary and Public Relations Secretaries of Branches and Divisions in Scotland was held in Edinburgh on October 10, 1956. Dr. J. M. C. Gill (Aberdeen and Kincardine Counties Division) presided in the absence, due to illness, of the appointed Chairman, Dr. J. C. Macarthur (Lanarkshire Division). Twenty-three Secretaries were present at the Conference and in addition the following also attended by invitation: The Chairmen respectively of the Scottish Committee, the General Medical Services Subcommittee (Scotland), and the Central Consultants and Specialists Committee (Scotland), the Scottish and Assistant Scottish Secretaries, Dr. Walter Hedgcock, Assistant Secretary, and the Press Officer to the Association in Scotland. Following an "Any Questions?" item, the Conference discussed the following subjects: (a) the best method of approach to "lapsed" or resigned members of the Association; (b) the work of the Medical Practices Advisory Bureau in Scotland and methods of improving liaison between the Bureau and Branch and Division Secretaries; and (c) facilities which members would like to have at Scottish House when it is reopened following reconstruction.

A recommendation from the conference that a further conference should be held in the autumn of 1957 was considered by the Scottish Committee at its meeting on January 15, 1957. The Committee, whilst appreciating the value of these conferences, felt it necessary to have regard to the present financial difficulties of the Association and resolved to defer a decision on the recommendation until a later date.

Report of Joint Committee on Technical Procedures to be Performed by Nurses

209. The Department of Health for Scotland sought the advice of the Committee in connexion with the advisability of circulating to nurse-employing authorities a report prepared by a Joint Committee of the Scottish Health Services

Council on Technical Procedures to be Performed by Nurses. After consultation with the G.M.S. Subcommittee (Scotland) and the Central C. & S. Committee (Scotland), the Committee informed the Department of Health that, although certain differences of opinion had been expressed by members of the profession in Scotland, the consensus of opinion was in favour of issuing the report to all nurse-employing authorities, provided it was made unequivocally clear to all concerned that the report was to be regarded as a guide and not as a directive, and that the responsibility for deciding what procedures a nurse should or should not undertake rested with the doctors in clinical charge of the patient.

Scottish Health Services Council

210. The Committee has accepted invitations from the Scottish Health Services Council to submit written evidence to two of their special committees, one on Laboratory Services and the other on Maternity Services in Scotland, and have appointed two *ad hoc* subcommittees to prepare their evidence.

Reconstruction of Scottish House

211. There has been some delay in the reconstruction work at Scottish House, but it is anticipated that the work will be completed by the end of March, 1957. This delay has, however, been financially advantageous to the Association as the cost of the reconstruction has been spread over a longer period. It is now estimated that the total cost of the reconstruction will be between £23,000 and £24,000, of which £12,000 has already been paid. In addition, the cost of furnishing the new Members' rooms in Scottish House will probably amount to approximately £3,000. Arrangements are being made for the official reopening of Scottish House on Thursday, May 2, 1957, when Dr. Alexander Hall, President of the Association, will perform the opening ceremony.

Visit of Scottish Doctors to Denmark

212. The Danish Institute has again issued an invitation, through the Committee, to doctors in Scotland to visit Denmark during the early autumn of 1957. Details of the programme are not yet available but will include visits to hospitals and universities. The cost of the trip will be approximately £44.

Medical Subcommittee of the Scottish Advisory Committee of the General Whitley Council for Health Services (G.B.)

213. It has been reported to the Committee that the Medical Subcommittee of the Whitley Scottish Advisory Committee has appointed two *ad hoc* subcommittees to consider (a) travelling and subsistence allowances for local authority medical officers in Scotland, and (b) fees for part-time services rendered by medical practitioners for local authorities in Scotland.

Reorganization of Branches on a Regional Basis

214. At the request of the Constitution Committee, the Scottish Committee gave careful consideration to the proposed reorganization of Branches on a regional basis, with particular reference to the suggested titles for the regional Branches. The Committee finally recommended to the Constitution Committee that the titles of the Branches in Scotland should be as follows: North of Scotland Branch; North-east of Scotland Branch; East of Scotland Branch; South-east of Scotland Branch; West of Scotland Branch.

Press Officer's Report

215. In presenting his annual report to the Committee, Mr. Jarvie, Press Officer to the Association in Scotland, stated that the prestige of the B.M.A. with the Scottish press was good and he had little difficulty in obtaining space in the various Scottish newspapers for news items issued by the Association. More than half the space given by the press

in Scotland to the Association's activities during 1956 had been concerned with matters other than remuneration.

Committees which Report to the Scottish Committee

(a) General Medical Services Subcommittee (Scotland)

216. On receiving the information that the Minister of Health and Secretary of State for Scotland proposed to appoint a committee of inquiry to investigate prescribing costs throughout the country, the Subcommittee informed the Department of Health that in the opinion of the profession in Scotland it would be advantageous to set up a separate committee of inquiry for Scotland to cover prescribing in all fields of the National Health Service. The Scottish Committee and the Central Consultants and Specialists Committee (Scotland) supported this proposal. The Ministers have therefore agreed that a separate committee of inquiry will be appointed in Scotland, and that the scope of the committee's investigations will cover prescribing in the hospital service.

The Emergency Call Service has been informed that the Subcommittee concurred with the views expressed by the General Medical Services Committee in the statement published in the *British Medical Journal* of October 6, 1956.

The Subcommittee considered a memorandum issued by the Department of Health in connexion with arrangements for the treatment of employees of hospital boards who are absent from work for long periods on account of illness. The Subcommittee was of the opinion that the implementation of the proposed arrangements might in some cases undermine the position of the patient's own general practitioner. Attention was drawn to the fact that the memorandum had been issued without prior consultation with the profession, and the Joint Consultants Committee (Scotland) has therefore been asked to discuss this matter with the Department of Health.

(b) Central Consultants and Specialists Committee (Scotland)

The Committee has appointed a special *ad hoc* subcommittee to prepare a report for submission to the Central C. & S. Committee (U.K.) setting out the arguments in favour of reverting to the previous position when hospital authorities were not held in law to be vicariously responsible for the clinical actings of doctors working in the hospital service, and the possible legislative steps by which this object could be achieved. The Subcommittee is awaiting advice from legal advisers expert in parliamentary procedure.

The Committee is concerned at the delay by the Health Ministers and the Joint Consultants Committee (U.K.) in reaching a conclusion on the future structure of hospital medical staffing. They therefore urged the Joint Consultants Committee (Scotland) to reopen discussions with the Department of Health for Scotland on hospital medical staffing, and this recommendation has been accepted by the Scottish Joint Committee.

The Committee has amended their terms of reference to make it clear that these cover matters affecting all members of hospital medical staffs.

WALES

217. The Welsh Committee, which includes representatives of all the Divisions and Branches in Wales and Monmouthshire, has met in Shrewsbury under the chairmanship of Dr. A. Maddock-Jones. It provides opportunities for discussion of all matters of special concern to practitioners in Wales.

Consultations are taking place with the Welsh Association of Local Medical Committees with a view to agreeing upon joint nominations to be submitted for general practitioner representation on hospital management committees.

The Annual Welsh Dinner is to be held in Newcastle upon Tyne on Friday, July 12.

MEDICAL BENEVOLENCE

218. The sum received during 1956 by the Charities Trust Fund of the Association for medical charities was £12,564, which is £324 less than that received during 1955. The

following statement shows the amounts collected and distributed during the 12 months:

	1956	
To Subscriptions and Donations collected for:	£	
(a) Royal Medical Benevolent Fund	3,568	
(b) Royal Medical Foundation of Epsom College	1,112	
(c) Royal Medical Benevolent Fund Society of Ireland	81	
(d) Sir Charles Hastings Fund	112	
(e) Dain Fund:	1,956	
(i) General Account	431	
(ii) Franklin Fund Account	4,425	
(f) Distribution at discretion of B.M.A. Charities Trust Fund	11,685	
	260	
.. Requests received and allocated to Medical Charities	619	
.. Subscriptions and Donations in respect of 1957 received in advance	£12,564	
	1956	
By Amounts distributed to:	£	
(a) Royal Medical Benevolent Fund:		
Earmarked contributions	3,568	
Allocated from Trust Fund	1,550	5,118
(b) Royal Medical Foundation of Epsom College:		
Earmarked contributions	1,112	
Allocated from Trust Fund	1,750	2,862
(c) Royal Medical Benevolent Fund Society of Ireland:		
Earmarked contributions	81	
(d) Sir Charles Hastings and Christine Murrell Funds:		
Earmarked contributions	112	
Allocated from Trust Fund	945	1,057
(e) Dain Fund:		
Earmarked contributions	1,956	
Allocated from Trust Fund	440	
Franklin Fund	431	2,827
	11,945	
.. Receipts in advance carried forward	619	
	£12,564	

The Council draws attention to the continuing need for medical benevolence and urges members of the Association to continue and increase their support of the benevolent funds. Copies of the leaflet "The Charities of the Medical Profession" are available from the Secretary. The Council notes with gratitude that once again the surplus from the Annual Welsh Dinner has been donated to the Charities Trust Fund. The Council appreciates the continued support given to the Dain Fund and the Sir Charles Hastings Fund. The Dain Fund assists in the education of sons and daughters of doctors; the Sir Charles Hastings Fund assists doctors in financial difficulty of a temporary nature.

The Council is exploring the possibility of registering the Charities Trust Fund as a charity in order that it may be authorized to accept seven-year covenants. It is anxious that wider publicity should be given to the name of the British Medical Association Charities Trust Fund in order that the correct description should be used in future wills.

MEDICAL FILMS

219. The Council is glad to report that the Association's film library continues to be well patronized. Copies of the following nine films have been added to the library:

- "My First Baby," copy purchased.
- "Gait" (two copies), presented by Imperial Chemical Industries Ltd.
- "Artificial Respiration," presented by Imperial Chemical Industries Ltd.
- "Examination of the Unconscious Patient," presented by Imperial Chemical Industries Ltd.
- "Removal of Clothing and Treatment of a Fractured Collar-bone," presented by Imperial Chemical Industries Ltd.
- "First Aid for a Patient with a Fractured Spine," presented by Imperial Chemical Industries Ltd.
- "Open Injuries to the Hand" (two copies), presented by Imperial Chemical Industries Ltd.
- "The Motion Picture in Medical Education," copy presented by the American Medical Association.
- "Allergic Diseases in Man," copy presented by C. L. Bencard Ltd.

The Council is greatly indebted to those who have kindly presented films to the Association in the past year.

Although high costs and the difficulties of making copies of films available remain as serious obstacles to the hiring of films to Overseas Branches, five films have been sent to Southern Rhodesia as an experiment and it is understood that they have been much appreciated.

The Council is unable to report progress on the production of the general film on rehabilitation, or the film on dermatology, for which detailed plans have been prepared, owing to financial considerations.

Arrangements are proceeding for the holding of a film competition for 16-mm. medical films in two categories—one for commercial and the other for non-commercial film producers. The closing date for the receipt of entry forms is June 30 and for the receipt of films September 30, 1957.

The Council has undertaken the revision of the catalogue of the film library and it anticipates that it will shortly be available in card index form at a cost of 15s., the subscription to cover the issue of approximately 20 supplementary cards. Cardboard containers for the cards will be sold separately.

In response to a request from the American Medical Association, the Council has submitted details of 10 British medical films for consideration for showing at an International Exhibition of Medical Films in New York in June, 1957.

OVERSEAS

H.M. Overseas Civil Service

220. The Council has noted the proposals of the Government in the "Statement of Policy regarding the Organization of H.M. Overseas Civil Service," published as a White Paper (Cmd. 9768) in May, 1956.

The White Paper, which is framed to take account of developments since the creation of H.M. Overseas Civil Service in October, 1954 (as announced in Colonial No. 306), contains two separate proposals. The first is for the creation of a "central pool" of officers having exceptional administrative or professional qualifications who would, if there were a sufficient demand for their services, be recruited into the regular employment of the United Kingdom Government for service overseas. So far as is known no action has yet been taken to implement this proposal. The second is that where an overseas territory approaching independence desires to retain the services of its existing expatriate staff these officers should be placed on a "Special List," in the service of the United Kingdom Government, and should be seconded to the employing government. Negotiations are in hand for the application of the Special List to Nigeria.

In the Council's view it is necessary for the well-being of the medical branch of the Overseas Civil Service that it should continue to be staffed largely by doctors who are prepared to make it their career. To this end, it is essential that officers already serving, or offering themselves for recruitment, should be assured that they will be given the opportunity of continuing in the Service and will, if necessary, be transferred elsewhere if the territory to which they are posted no longer wishes to retain expatriate officers in pensionable employment. The Council does not consider that financial terms, however generous, can adequately compensate an officer whose chosen career is cut off in its prime, and it is not satisfied that the arrangements so far made, or envisaged, give the individual officer sufficient security of tenure. In particular, it has been suggested that the medical branch of the Overseas Civil Service should be linked to the medical branch of the Home Civil Service. These matters have been discussed with representatives of the Colonial Office and of the Ministry of Health, and the Council will continue to do all in its power to secure the position of the officer holding an appointment in an overseas territory.

The Council is also following with interest various schemes which have been devised by certain universities and other organizations for improving the supply of officers of specialist status to overseas territories on short-term contracts by ensuring, as far as possible, that they will find re-employment in the United Kingdom on their return.

Malta

221. One of the terms of the agreement reached in April, 1956, between the Government of Malta and the Medical Officers' Union was that the Government medical service of Malta should be reviewed by an independent commission. Consequently a commission consisting of three members under the Chairmanship of Mr. L. Farrer-Brown visited Malta. The Council has received the Commission's report and has noted with particular interest the Commission's conclusion that the present system lacks sufficient safeguards against administrative decisions being improperly determined by political partisanship, and the recommendations for decentralizing the administration of the medical services and setting up a Medical Council and an Advisory and Executive Board. The Commission is against the creation of a whole-time salaried district medical service with no right of private practice and considers that staff whose duties are mainly clinical should not be classified as civil servants. In the Council's view, the report entirely vindicates the stand taken by the profession in the recent dispute.

Cyprus

222. The latest salary proposals received from the Government of Cyprus were considered to be satisfactory, and the new rates of pay were introduced, retrospective to January 1, 1956. The Government of Cyprus was removed from the "Important Notice" in the *British Medical Journal* last October.

Caribbean Council

223. The third meeting of the Caribbean Council of the B.M.A. was held in Trinidad in September and was attended by the Chairman of the Representative Body, to whom the Council has offered its congratulations on a most successful tour of certain of the Caribbean Branches. The matters raised in his reports have been taken up in the appropriate quarters.

The Council is also indebted to J. A. Pridham for a visit paid to the Bermuda Branch.

EMPIRE MEDICAL ADVISORY BUREAU

224. The Empire Medical Advisory Bureau, on behalf of the Association, welcomes and provides a personal advisory service to doctors from the Dominions and Colonies visiting the United Kingdom.

The use made of the Bureau continues at the high level of previous years. During 1956, 1,280 new inquirers either wrote to or personally visited the Bureau and a total number of 2,358 persons called at the Bureau seeking advice or assistance in one or more problems. In addition, several hundred old inquirers wrote for further information and advice.

The various aspects of postgraduate medical education are of main concern to the majority of new inquirers and information is given on higher qualifications, courses of instruction, hospital appointments, examinations, medical registration, and defence.

The "Summary of Regulations for Postgraduate Diplomas and Courses of Instruction in Postgraduate Medicine," compiled and produced by the Bureau, has been revised and reprinted as is usual each year. The "Summary" has been dispatched overseas to all Branches of the Association, affiliated associations, deans of medical faculties of Commonwealth universities, postgraduate committees, and editors of medical journals. These copies are intended for reference by overseas inquirers, and many tributes to their usefulness have been received.

Between three and four hundred doctors inquired about junior hospital appointments and advice was given on the types, grades, and availability of these.

Visits to hospitals, clinics, and special centres have been arranged through the co-operation of consultants and hospital authorities. A visit to a hospital was arranged for a group of 45 doctors at the request of the Indian Medical Association.

Many visitors have been met personally by the port health medical officers on arrival and a letter of welcome from the Bureau is sent to every visitor whose place and date of arrival are known. These attentions are much appreciated. Through the kind co-operation of authorities arranging courses of instruction, the Bureau is enabled to contact those overseas visitors, already arrived in the country, who do not know of the Bureau's facilities.

All requests by visitors for accommodation to be arranged in readiness for their arrival in the country have been met. In addition, the Bureau has helped visitors after arrival to secure furnished houses and flats. More than 200 doctors and families have been successfully assisted with the problem of accommodation.

Visitors have been enabled to meet colleagues from all parts of the Commonwealth, including senior members of the profession in the United Kingdom, at social functions arranged by the Bureau. "At homes" were held in London, Edinburgh, Liverpool, and Brighton, and a total of nearly 1,200 overseas doctors and wives were able to attend these. Many expressions of appreciation from guests have been received.

The Council is glad to report that the facilities for our overseas Commonwealth colleagues are so fully used.

INTERNATIONAL MEDICAL VISITORS BUREAU

225. The International Medical Visitors Bureau, established in 1950, provides a personal advisory service for medical practitioners desiring to visit the United Kingdom from countries other than those of the British Commonwealth.

More inquirers made use of the Bureau during the year than formerly, and the 408 new inquirers during 1956 came from 44 countries; among these inquirers were 51 Hungarian refugees.

In addition, requests were received from more than 500 doctors or their families for "holiday exchanges" or *au pair* visits.

Many of the inquirers wanted information concerning postgraduate courses of instruction and diplomas. Others sought information about hospital appointments in order to obtain experience of British medicine, and it is known that a few have been successful in obtaining hospital appointments and temporary registration.

Visits to hospitals, clinics, and other institutions were arranged at the request of some of the more senior visitors, and a visit to a teaching hospital was arranged for a group of 30 German doctors. The Bureau is much indebted for the co-operation of heads of departments, consultants, and other authorities in facilitating these visits.

Suitable accommodation has been found in London and the provinces for all visitors requesting this.

Many inquiries in the field "General Information" have been received and dealt with, and visitors are encouraged to make requests with a view to making their visit successful.

The 534 inquiries about "holiday exchanges" for themselves or their families or children and about *au pair* visits were received from doctors in Europe and in the United Kingdom. With the co-operation of national medical associations, the Bureau endeavoured to put the inquirers in touch with suitable contacts, and it is known that 194 "exchanges" were arranged.

The Hungarian refugee doctors who arrived in the United Kingdom during November and December sought the assistance of the Association, and the majority of them visited the Bureau. About half of them wish to remain in the United Kingdom and the remainder wish to go to other countries.

During the interim period when the doctors are learning English, finding out the necessary steps to obtain registration and the prospects of employment or seeking passages to other countries, the Bureau has been able to help them in various ways. Hungarian doctors and their families have been put in touch with U.K. doctors offering them hospitality. Others have been helped to find temporary hospital appointments or non-medical employment or to attend the hospital practice of U.K. hospitals. Information has been given about registration requirements and prospects in the

U.K. and licensing requirements in other countries. The Hungarian doctors have warmly expressed their appreciation of the help given by the Association in these ways.

The Council has pleasure in reporting the increasing use of the facilities of the International Bureau on behalf of colleagues from foreign countries.

INTERNATIONAL RELATIONS**British Supporting Group for W.M.A.**

226. On January 29, 1957, a British Supporting Group for the World Medical Association was inaugurated on the initiative of the Council. A Steering Committee is undertaking the preliminary organization of the Group and further details will be published in due course.

General Assembly of W.M.A.

227. The tenth General Assembly of the World Medical Association was held in Havana in October, 1956, under the presidency of Dr. J. A. Bustamante, of Cuba. The B.M.A. delegates were Dr. S. Wand and Dr. I. D. Grant, and the alternate delegates Dr. J. A. Pridham and the Secretary. The proceedings included the admission of the New Zealand Branch of the B.M.A. to membership of the W.M.A. and the approval of the appointment of Dr. J. A. L. Vaughan Jones as Chairman of the International Occupational Health Services Committee. Among the subjects discussed by the General Assembly were the design of a medical emblem for the protection of civilian doctors in time of war, the role of the medical profession in plans for medical care, and the organization of the *World Medical Journal*. The meeting also adopted a motion "that in all countries it is particularly important that in the budgets of national Governments the allocation of adequate funds for public health should receive a high degree of priority." On receiving a report of the activities of the International Congress on Medical Ethics and Medical Law the Assembly passed a resolution declaring "that it is primarily the function of the doctors of the world to formulate any Code of International Medical Law and that the W.M.A. is the only organization that can speak for the doctors of the world."

Second World Conference on Medical Education

228. The Programme Committee appointed by the W.M.A. is proceeding with the arrangements for the second World Conference on Medical Education, which is to be held in Chicago in 1959. The theme is to be "Medicine—a Life-long Study." Discussions will be arranged under four general headings—namely, basic clinical training for all doctors; advanced clinical training for general and specialty practice; training for research and teaching; and continuing medical education. The President of the Conference will be Dr. Raymond B. Allen, Chancellor of the University of California.

Protective Emblem for Civilian Doctors

229. The tenth General Assembly of the World Medical Association adopted a medical emblem to be used "in providing complete protection to civilian doctors, their assistants and medical civil defence units which are not and cannot be protected by the Red Cross under the Fourth Geneva Convention." The emblem is a "red straight vertical stick and a serpent represented by a sinuous line over the stick with two undulations on the left side and one undulation on the right side, displayed on a white field." The B.M.A. Council has approved the emblem in respect of doctors in the United Kingdom, and is making representations to the Government with a view to its official adoption.

Geneva Conventions

230. In accordance with Minute 374 of the A.R.M., 1956, the Council has renewed its representations to the Foreign Office concerning the ratification of the Geneva Conventions of 1949. The Foreign Office replied on January 22, 1957, that "it is intended to introduce the legislation necessary to enable Her Majesty's Government to ratify the

Geneva Conventions of 1949 as soon as the present exceptionally heavy legislative programme allows." Subsequently it was announced that the necessary legislation was to be introduced during the current session.

Visit to U.S.S.R.

231. At the invitation of the Ministry of Health of the U.S.S.R. and the President of the Academy of Medical Sciences the Council arranged for a party of British doctors to visit the Soviet Union in August, 1956. It consisted of Dr. Mary Esslemont, Mr. Ian Fraser, Dr. J. G. M. Hamilton, Sir Geoffrey Jefferson, Dr. Ralston Paterson, and Professor G. W. Pickering, with Dr. Alexander Duddington as interpreter. A report on the visit appeared in the *British Medical Journal* of November 3, 1956.

Anglo-American and Anglo-Canadian Exchange Schemes

232. The schemes which enable a small number of British doctors to visit the U.S.A. and Canada in exchange for visits to this country by American and Canadian doctors have been continued. Two British doctors have visited Canada and two the United States, while two Canadian doctors have visited Great Britain.

OTHER ASSOCIATION ACTIVITIES**Medical Practices Advisory Bureau**

233. The work of the Bureau in both the Agency and Advisory Departments has been well maintained during 1956. In the Agency section, in which introductions in the field of general practice are predominant, there are inappreciable fluctuations in the number and type of opening dealt with. This makes comparison with previous periods somewhat unreliable, but it can be stated with some confidence that the position is stable and that there is no marked trend in either direction. The ratio of ordinary assistantships to assistantships with view to partnership remains constant at about 3:1, but there is evidence to suggest that, since more principals are loath to bind themselves by promises even when they are seeking partners, the actual number of introductions which lead to partnerships is increasing.

The second inquiry into unemployment and under-employment showed no significant change. So far as involuntary unemployment is concerned, the figure of 5% to 7% in a selected group of those seeking openings in general practice implies that the amount of actual unemployment in the working profession as a whole is very small and that some of the exaggerated statements made are unjustified. On the other hand, the evidence supports the contention that there are too many young practitioners in appointments which offer no early prospect of establishment in the field of practice of their choice. It is perhaps significant that the number of inquiries about practices and appointments overseas is increasing. The number of openings in the Commonwealth and elsewhere, excluding temporary appointments, remains fairly constant and the Bureau continues to deal with a large variety of practices and appointments in all parts of the world.

The advice of the Bureau is sought on a wide range of personal problems, of which perhaps the majority are concerned with prospective partnerships or the contract between principal and assistant. The Bureau supplies a model form of agreement between principal and assistant (adaptable to traineeships) free of charge to members of the Association. Though no model form is possible in the case of partnerships, advice from the point of view of the doctor rather than of the lawyer is freely available.

"British National Formulary"

234. The work of revising the 1955 edition of the *National Formulary* has continued, and it is expected that the next edition, which will be entitled *British National Formulary* to avoid confusion with the *National Formulary U.S.A.*, will be published on August 1, 1957. An alternative edition, with

the preparations grouped according to their pharmacological action, and a revised *Dental Practitioners' Formulary* will also be published on or about that date.

In the course of this revision it has become clear that a number of difficulties will arise for prescribers and dispensers and the lay public as a result of the change from the apothecaries system to the metric system which is to take place in 1963. In order to smooth out these difficulties in good time the Council has decided to invite the Pharmaceutical Society to join the Association in discussions with other interested bodies with a view to initiating appropriate action.

Medical Act

235. An *ad hoc* committee has been appointed to consider and report on the following Minute 345 of the A.R.M., 1956:

Resolved: That in view of the decision of the General Medical Council to promote a Consolidation Bill for the approval of Parliament, the Council be requested to examine and report on the working of the Medical Acts 1858-1950, with special references to the difficulties attendant upon provisional registration, disciplinary procedure, and elective representation of the profession, and to take any urgent action that appears necessary and desirable.

Now that the "Consolidation Bill" has received the Royal Assent and is the Medical Act, 1956, this resolution is not entirely appropriate. The resolution is therefore being interpreted as referring also to the 1956 Act and as if the words "in view of the decision of the General Medical Council to promote a Consolidation Bill for the approval of Parliament" had been omitted. In addition to the above resolution, attention is being given to the following Minute 387 of the A.R.M., 1956:

Resolved: That the following motion be referred to the Council for consideration:

That this Meeting considers that B.M.A. headquarters should circulate to members the names and a short history of all candidates nominated by Divisions for election to the General Medical Council and that the B.M.A. nominations should not be limited to the number of vacancies on the Council.

Rehabilitation

236. The Council has considered the Report of the Government Committee of Inquiry, under the chairmanship of Lord Piercy, on the Rehabilitation, Training, and Resettlement of Disabled Persons. It is gratified to find that many of the recommendations and opinions which the Council put forward in its Memorandum of Evidence have been accepted by the Piercy Committee. Some of the matters raised in the Committee's Report require, in the Council's view, fuller consideration, and an opportunity is being sought to discuss these with the Ministry of Health. In the meantime the Council has invited postgraduate deans to consider including in the courses arranged for general practitioners a session on the potentialities of aftercare and other facilities for rehabilitation, and including in programmes of meetings for specialist groups papers on rehabilitation as applied to the particular subject under discussion.

Capital Punishment

237. In response to a request from the Home Office the Council offered its views on the proposed introduction into English law of the doctrine of diminished responsibility for murder. This principle, which is now incorporated in the Homicide Act, was recommended by the Council in its Memorandum of Evidence to the Royal Commission on Capital Punishment in 1950.

Control of Medical Manpower

238. The Council has continued to provide secretarial and clerical assistance and other facilities for the two Central Medical Recruitment Committees, and has recovered three-quarters of the cost from the Government. It has also maintained the Emergency Register of the medical profession.

Control of Milk Production

239. In 1949 the Councils of the B.M.A. and the National Veterinary Medical Association (now the British Veterinary Association) approved a report on the Provision of Safe Milk of High Quality which had been prepared by a Joint Committee appointed by the two Associations. Paragraph 54 of the Report stated:

The Committee does not consider that the Health Committee and medical and sanitary officers of the local authorities can adequately be replaced by a new set of persons having an agricultural bias and without the training and experience which alone can give a reasonably sound outlook on the importance of the health aspect.

In May, 1956, the B.V.A. informed the Ministry of Agriculture, Fisheries, and Food that it supported the recommendation of the Arton Wilson Committee that the "Milk Production Officers of the County Agricultural Executive Committee should be transferred to the Veterinary Service," but the B.M.A. was not informed of this unilateral action, which was taken without prior consultation with the B.M.A., until February, 1957. The Council has since reaffirmed the policy laid down in paragraph 54 of the Report on the Provision of Safe Milk of High Quality.

Joint Committee of the B.M.A. and the Magistrates' Association

Attempted Suicide

240. The Council referred to the Committee the following Resolutions of the A.R.M., 1956:

393. **Resolved:** That this Meeting notes with concern the fact that in recent years a considerable number of people have been imprisoned for attempting suicide. It supports the statement of the Joint Committee of the B.M.A. and the Magistrates' Association in their report on Attempted Suicide and the Law (1947) that "There is a strong case for an amendment of the law so that attempted suicide (excluding suicide pacts or incitement of another person to commit suicide) would not be dealt with as a legal offence" and expresses its satisfaction that the Committee is giving further consideration to the matter.

394. **Resolved:** That as a matter of urgency Council should consider the need for further discussion with the Magistrates' Association of the treatment of attempted suicide, particularly as the majority of these cases are in need of psychiatric treatment.

The Committee has considered statistics for the years 1946-55 showing the number of cases of attempted suicide known to the police, the number brought before the courts, and the results of proceedings; and a report of informal inquiries regarding the procedure adopted in hospitals when cases of attempted suicide are received.

The present position, compared with that at the time of the report on the subject in 1947, is not sufficiently altered to warrant further extensive inquiries. The Council thinks, however, that there remains support for the recommendation that the law should be amended so that attempted suicide (excluding attempted "suicide pacts" or incitement of another person to attempt suicide) would not be dealt with as a legal offence.

Whilst it is not at present practicable to press for amendment of the law in this respect, it is agreed that attention should again be drawn to the 1947 report and the more recent statistics, in the hope that persons who have attempted suicide may be dealt with as satisfactorily as the present law permits.

A short statement along these lines is therefore being prepared for submission to the medical press and the journal of the Magistrates' Association.

Problem of the Chronic Alcoholic Patient

The Council has had before it the following resolution of the A.R.M., 1956:

395. **Resolved:** That this Meeting considers that the problem of the chronic alcoholic patient with regard to discharge from treatment and subsequent relapse should be a matter for consideration between the B.M.A. and the Magistrates' Association with a view to alteration of the law.

The Council was informed that the Home Secretary's Advisory Council on the Treatment of Offenders was considering possible alternatives to short sentences of imprisonment, and, in this connexion, would be giving attention to the alcoholism. In view of this, and of the fact that the Council's Committee on Drug Addiction had under consideration the inclusion of alcoholism in its deliberations, it was agreed that discussion of the subject by the Joint Committee of the B.M.A. and the Magistrates' Association should be deferred.

Medical Reports to Courts

The Committee has considered a suggestion that it should prepare a memorandum on medical reports to courts, and it has been agreed that this would be valuable both to doctors and to magistrates. A Subcommittee has been appointed to prepare a draft memorandum on the subject.

Inquiry into Law Relating to Children and Young Persons (Ingleby Committee)

241. The Council has appointed a committee to prepare evidence for submission to the Departmental Committee (under the Chairmanship of Lord Ingleby) appointed by the Home Secretary to inquire into the law relating to children and young persons. The committee is taking as a basis for its discussions the Report on Cruelty to, and Neglect of, Children, prepared by the Joint Committee of the B.M.A. and the Magistrates' Association and published in 1956.

Catering

242. An increasing number of members and their guests are taking advantage of the facilities available in the Hastings Room. The Council has therefore continued the full-time waitress service in this room to enable visitors to B.M.A. House to obtain morning coffee, tea, and alcoholic drinks within the licensed hours.

The luncheon service provided in the members' dining-room continues to attract a large number of regular users and at the same time meets the needs of the fluctuating number of members attending committee meetings. The continued rise in the cost of foodstuffs and increased wage scales have necessitated some small advance in the price of meals served. It is the intention of the Council that this service should operate on a "break even" basis so that members of the Association can continue to obtain meals at prices which compare favourably with those charged in comparable establishments.

S. WAND,
Chairman of Council.

APPENDIX I REPORT OF THE CONSTITUTION COMMITTEE OF THE ASSOCIATION

(See B.M.J. Supplement, February 23, 1957.)

APPENDIX II RESOLUTIONS OF A.R.M., 1956—SUMMARY OF ACTION TAKEN

(The paragraph numbers relate to the main part of the Council's Report)

Subject	General	Action Taken
Book of Valour (Min. 25).		Book now being prepared. (Para. 9.)
Accommodation at 1958 Annual Meeting (Min. 339).		Action unnecessary in view of change in venue. (Para. 4.)
Medal of the Association (Min. 341).		Resolution implemented. (Para. 3.)
Consultation with the profession (Min. 346).		Resolution noted. (Para. 15.)
Summary of Annual Report (Min. 337).		Inadvisable and uneconomical. (Para. 20.)
General Medical Services		
Education of public in health matters (Min. 83).		It is not considered that time is appropriate to pursue this matter. (Para. 58.)
Monthly payments (Min. 129).		Discussions proceeding. Ministry investigating possibilities of introducing monthly payments. (Para. 22.)
Supplementary annual payments (Min. 130).		No action taken. Object of scheme of supplementary annual payments was to protect position of those adversely affected by new distribution scheme in 1953. (Para. 22.)
Reinstatement of ex-Service men on doctors' lists (Mins. 134, 136).		Agreement reached with Ministry of Health on a satisfactory method of dealing with this problem. (Para. 31.)
Machinery for filling practice vacancies (Min. 140).		No further action for the present, following discussions with Ministry. (Para. 23.)
General-practitioner maternity beds (Mins. 144, 145, 150).		Further representations made to Ministry, and need for increasing number of general-practitioner maternity beds emphasized in evidence to Cranbrook Committee. (Para. 32.)
Post-mortem examinations (Mins. 152, 153).		Where pathologist agrees, transport costs will be met by hospital. Extension of post-mortem facilities on lines indicated in R.B. resolution under consideration. (Para. 47.)
Service Committees and Tribunal Regulations (Min. 168).		Position will be reviewed when Regulations are next amended. (Para. 55.)
Practice accommodation (Min. 169).		Considered by special subcommittee which is to discuss the whole problem of accommodation with the Ministry. (Para. 26.)
Employment of general practitioners in hospitals (Mins. 177, 181, 182).		Under consideration; to be dealt with in Supplementary Annual Report.
Employment of general practitioners in hospitals (Min. 183).		Further representations made to Ministry on improvement in number of G.P. beds. (Para. 42.)
Poliomyelitis vaccination (Min. 189).		Discussed with Ministry. General practitioners to participate in present arrangements. (Para. 46.)
Combined diphtheria-pertussis immunization (Min. 193).		Possibilities of implementing suggestion still under consideration. (Para. 45.)
Trainee General Practitioner Scheme (Min. 200).		Proposal considered undesirable and no action taken. (Para. 33.)
Economy in prescribing (Min. 209).		Necessary arrangements made with Ministry of Health. (Para. 37.)
Economy in prescribing (Min. 210).		Will be brought to the notice of Ministry Committee investigating prescribing costs. (Para. 36.)
Loans for provision of surgery accommodation (Min. 213).		Not practicable at present time and in view of insufficiency of funds. (Para. 27.)
Insurance benefit during part-time employment (Min. 215).		Ministry of National Insurance regard as impracticable and no further action to be taken. (Para. 52.)

Subject	Action Taken	Subject	Action Taken
General Medical Services—continued			
Appliances (Min. 216).	List of replacement appliances prescribable by general practitioners is under review with view to extension. (Para. 41.)	Hospital and Consultant Services—continued	
Provision of therapeutic substances for use in emergency (Min. 217).	Brought to notice of the Ministry. (Para. 40.)	Internal administration of hospitals (Mins. 247, 249).	Tripartite system of hospital administration works satisfactorily in many hospitals. Council considers system should not be rejected provided medical staff has dominating voice in clinical matters. (Para. 71.)
National insurance certificates (Min. 218).	Regarded as impracticable by the Ministry of National Insurance. (Para. 50.)	Domiciliary consultation arrangements (Mins. 267, 276, 277, 313).	So far as practicable domiciliary service should be a consultant service. Council does not favour payment of fees to whole-time teachers with honorary hospital contracts. Maximum payment for domiciliary consultations under consideration, but Council considers no special case for rural consultants. N.H.S. Act precludes extension of domiciliary service to nursing-homes. (Para. 80.)
Medical Practices Committee certificates (Min. 220).	Discussed with M.P.C. No further action necessary. (Para. 24.)		Still under consideration (Para. 81.)
R.M.O. examinations (Min. 222).	In practice would extend period of sickness benefit at heavy cost. No further action. (Para. 54.)		Under discussion in Whitley Committee B. (Para. 82.)
Compensation and Superannuation			
Advance payment of compensation and increase of rate of interest (Mins. 156, 157, 158).	On advice of counsel action has been postponed. (Para. 59.)	Domiciliary consultations by whole-time consultants (Mins. 272, 273).	Still under consideration (Para. 90.)
Review of superannuation schemes, with special reference to the responsibilities of the young practitioner (Min. 161).	Council considers benefits are not unreasonable in relation to contributions payable. (Para. 60.)	Domiciliary consultations by chest physicians (Min. 274).	Joint Committee asked to press Government for amendment of Schedule E expense rules. Staff Side of Committee B asked to reopen discussions on payment of allowances. (Para. 86.)
Widows' pensions (Min. 162).	No change recommended. (Para. 65.)	Study leave (Min. 279).	New standard charges agreed. Minimum standards of board and accommodation under discussion. (Para. 85.)
Pensions for practitioners who retire before age 60 after 20 years' service (Min. 163).	Council decided it would be unwise to ask for amendment of Superannuation Scheme in this way. (Para. 61.)	Whole-time doctors and income tax (Mins. 281, 282, 283).	Still under consideration.
Attributable illness (Min. 301).	Under consideration.	Board and lodging (Mins. 284, 285).	
Hospital and Consultant Services			
Employment of general practitioners in hospitals (Min. 184).	Council will press for review of personal grading of general practitioners holding 10 (b) appointment, in any future review of hospital medical staff. (Para. 99.)	Geriatric unit; treatment and rehabilitation of chronic disablement (Mins. 288, 290, 291).	Representations made to Ministry as instructed by R.B. (Para. 103.)
Remuneration of hospital medical staff (Mins. 238, 263).	Council suggested to Negotiating Committee that pensions of retired practitioners should be reviewed <i>pari passu</i> with remuneration of active practitioners. (Para. 79.) Staff Side, Committee B informed of Representative Body's view regarding house officer's remuneration. Fuller report to S.R.M. (Para. 79.)	Acute mental illness (Min. 299).	Pre-registration posts in mental hospitals not approved except where adequate scope and supervision for house-physician's appointment. Time taken for full registration being watched. (Para. 100.)
Distinction awards (Min. 239).	Council does not consider abolition of distinction awards desirable. (Para. 78.)	The newly qualified practitioner: pre-registration posts (Mins. 303, 304).	New draft proposals under consideration. (Para. 74.)
Senior hospital medical officers (Mins. 247, 251, 256, 258, 261).	Representations for further review of S.H.M.O.s resisted by Ministry. S.H.M.O.s occupying consultant posts to be reviewed by Committee B with view to payment on consultant scale in approved cases. Council does not oppose creation of S.H.M.O. posts within scope of grade as agreed with Ministry, pending outcome of discussions on hospital staffing. Salary of S.H.M.O. grade will be reviewed in light of changes in hospital staffing. (Para. 77.)	Statutory registration of medical auxiliaries (Min. 308).	Representations by Joint Committee to Ministry in support of resolution (Para. 92.)
		Cremation certificates (Min. 311).	Legal implications and possible action under consideration. (Para. 83.)
		Legal liability of doctor in the N.H.S. (Min. 315).	Council does not oppose offer of additional sessions, or alternative appointment in cases of redundancy, without advertisement. (Para. 70.)
		Procedure for appointment of consultants and S.H.M.O.s (Min. 316).	Adequate junior staff one of primary factors in hospital medical staffing discussions. (Para. 91.)
		Hospital residents: hours of work (Min. 317).	C.C. and S. Committee's policy that hospital staff should have choice of whole-time service, or part-time service with right to private practice. (Para. 87.)
		Whole-time hospital medical staff and private practice (Min. 318).	

Subject	Action Taken	Subject	Action Taken
Hospital and Consultant Services—continued			
Remuneration policy (Mins. 320, 321, 322, 326, 328, 332, 333).	Representations to University Grants Committee in accordance with Min. 328. (Para. 76.)	Reaffirmation of policy of anonymity in broadcasting (Min. 228).	Policy brought to notice of all inquirers on the subject.
National major casualties service (Min. 344).	Still under consideration.	Drugs for private patients (Mins. 54, 55).	Council has accepted the Minister of Health's suggestion of discussions with his officers. (Para. 142.)
Statutory and "item-of-service" fees (Min. 349).	Staff Side of Committee B asked to review item-of-service fees payable under terms and conditions of service. Other fees largely revised. (Para. 96.)	Fees for part-time medical services for Government Departments (Min. 57).	Minimum fee for extract from medical practitioner's record increased from 5s. to 7s. 6d. (Para. 143.)
Reform of the National Health Service			
Education of public in use of National Health Service (Min. 382).	Representations made to Ministry of Health. (Para. 105.)	Medical examination of elderly drivers (Min. 65).	Proposals unacceptable to Accident Officers Association. (Para. 144.)
Code of conduct for patients (Min. 380).	No action recommended. (Para. 104.)	Fees for police calls (Min. 67).	Divisions in England and Wales requested to negotiate with police authorities locally. (Para. 145.)
Occupational Health			
Certificates for short illnesses (Min. 72).	Reported to Treasury, Ministry of Pensions and National Insurance, nationalized industries, and British Employers' Confederation with a request for their reactions. (Para. 115.)	Medical examination for life assurance (Min. 69).	Council satisfied that resolution is being implemented as far as possible. (Para. 146.)
Administration of morphine by nurses in industry (Min. 356).	Home Office has been urged to reconsider its decision. (Para. 112.)	Certificates for absent voters (Min. 71).	Certificate amended by Home Office. (Para. 147.)
Use of antibiotics or chemotherapy by nurses (Min. 359).	Association of Industrial Medical Officers, Association of Certifying Factory Surgeons, and Royal College of Nursing informed of views of A.R.M. (Para. 113.)	Accidents, compensation (Min. 348).	Practitioners advised of risks and of need for adequate insurance cover. (Para. 148.)
Public Health			
Married women doctors and public medical appointments (Min. 75).	Advertisements not accepted for B.M.J. if they fail to conform with the policy laid down. Principle has been accepted by Committee C. (Para. 135.)	Statutory and "item-of-service" fees (Mins. 349, 350).	Review of such fees is being, and will continue to be, undertaken by the Council. (Para. 149.)
Pure milk (Min. 76).	Council believes the general position is not really unsatisfactory, but will reconsider undertaking a full-scale inquiry after the new Milk Regulations have come into force. (Para. 129.)		Minute 350 under consideration.
Annual leave for public health medical officers (Min. 78).	Referred to Staff Side of Committee C. (Para. 137.)	"British Medical Journal"	
Air pollution (Min. 79).	Reported to the Ministries of Housing and Local Government, Fuel and Power, and Health. December 31, 1956, fixed as appointed day for many of the provisions of the Clean Air Act (including those dealing with smoke-control areas). (Para. 132.)	Publication of Supplement (1) in separate form or (2) in centre of Journal (Min. 39).	(1) Too expensive at present. (2) Not popular with readers. (Para. 156.)
Immigrants and communicable diseases (Min. 80).	Representations still being made to the Ministry of Health. (Para. 130.)	Finance	
Tetanus immunization (Min. 82).	Ministry of Health has agreed to consider the representations made. Report by the Medical Research Council expected shortly. (Para. 133.)	Subsistence allowance (Min. 44).	An allowance for members attending centrally arranged meetings of Committees, Subcommittees, Council, Conferences, and the Annual and Special Representative Meetings has been in operation since the close of the Annual Meeting, 1956. (Para. 165.)
"Health nurses" (Min. 84).	Council does not consider it wise to take any action at this stage. (Para. 134.)	Science	
Remuneration of public health medical officers (Min. 325).	Ministry of Health urged to set up independent committee of inquiry but no decision yet received. (Para. 122.)	Preservation of freedom in prescribing (Min. 20).	Resolution noted. (Para. 171.)
		Condemnation of any Government action which might curtail freedom in prescribing (Min. 21).	Resolution noted. (Para. 171.)
		Restraint in use of new drugs pending therapeutic trials (Min. 117).	Implementation considered impracticable. (Para. 171.)
		Observance of existing law in respect of diesel fumes (Min. 118).	Representations made to Government. (Para. 170.)
		Compulsory use of crash helmets (Min. 120).	Deputation sent to Ministry of Transport. (Para. 177.)
		Abolition of library postal charges (Min. 121).	Implementation impracticable in view of financial position. (Para. 172.)
		Courses on medical implication of modern weapons (Min. 343).	Discussions proceeding with appropriate Government Department. (Para. 173.)
		Consultation with Association in preparation of first-aid manuals (Min. 357).	Suggestions made for improvements in new first-aid handbook. (Para. 174.)

Subject

Action Taken

Public Relations

- Poliomyelitis vaccination (Min. 190). Action considered unnecessary. (Para. 187.)
- Fire dangers in home and factory (Min. 351). Resolution communicated to Home Office. (Para. 186.)

Armed Forces

- Steps to improve remuneration where current levels deter recruitment (Min. 321). Ministry of Defence strongly urged to pay close attention to Association's recommendations to Waverley Committee. (Para. 192.)
- Assumption by Council of fuller responsibility for future remuneration claims (Min. 332). Resolution welcomed by the Armed Forces Committee. (Para. 192.)
- Preparedness of Council to negotiate directly at request of any section of the profession (Min. 333). Resolution welcomed by the Armed Forces Committee. (Para. 192.)

Organization

- Date of A.R.M. (Min. 338). Council recommends continuation of existing procedure for determining date. (Para. 195.)
- Roll of Fellows of Association (Min. 93). Regulations governing admission to Roll framed. (Para. 197.)
- Convalescent homes for members of medical profession (Min. 342). Not considered to be a practicable proposition. (Para. 202.)

International Relations

- Geneva Conventions (Min. 374). Representations made to Foreign Office. Legislation for ratification awaiting Parliamentary time. (Para. 230.)

Arbitration Machinery

- Alternative to Industrial Court (Min. 327). Under consideration.

Other Association Activities

- Review of Medical Acts (Min. 345). Special committee appointed. (Para. 235.)
- Review of procedure for the support of candidates for the G.M.C. (Min. 387). Under consideration by special committee set up to consider and report on working of Medical Acts. (Para. 235.)
- Law in relation to attempted suicide (Mins. 393, 394). Position reviewed, and statement is to be published. (Para. 240.)
- Problem of the chronic alcoholic patient (Min. 395). Consideration deferred pending report of other inquiries on the subject. (Para. 240.)

APPENDIX IV

FUTURE OF THE CHEST SERVICES.—
MEMORANDUM BY THE CHEST SERVICES
SUBCOMMITTEE OF THE CENTRAL CON-
SULTANTS AND SPECIALISTS COMMITTEE

Introduction

In January, 1956, the Central Consultants and Specialists Committee appointed the Chest Services Subcommittee "to consider and report upon special problems affecting the chest services." At its first meeting the Subcommittee agreed that, in addition to dealing with the particular matters referred to it by the Central Consultants and Specialists Committee, it should discuss and prepare a memorandum on the future of the chest services. To assist it in this task it co-opted additional members with particular interest and knowledge of the subject. This memorandum has therefore been prepared by a Subcommittee under the Chairmanship of Dr. Peter Edwards.

The Development of the Chest Service Between
1948 and 1956

1. In 1948 the local authority tuberculosis service formed the foundation of the N.H.S. chest service. This service retains responsibility for the preventive and social aspects

of tuberculosis, and has developed into a clinical specialty dealing with chest diseases of all types.

2. Chest clinics now handle an increased volume of work and, in general, there has been a steady improvement in the staffing, equipment, and siting of these clinics. With outstanding exceptions, the local authorities' premises were not usually well sited or equipped as clinics, but this very fact has often resulted in priority being given to chest services by boards and management committees. Most clinics now have access to full radiological and laboratory diagnostic facilities. In the provinces the separation of clinics and sanatoria is being steadily diminished, but in some areas the system of separate charge of the patient in clinic and sanatorium persists, and must persist for administrative and for geographical reasons.

3. In general the trend has been towards a closer integration or absorption into the general hospital system, and clinically this has been a great improvement. In the absence of any firm general direction, regional boards have developed their own services as they thought fit and the degree of integration has therefore varied from region to region and also from area to area within the regions. Many boards have revised their services piecemeal as their older physicians retire. In some regions the integration has been carried far; the majority of the chest physicians are on the staff and have beds at the general hospitals where also many of the clinics are held.

The Present Position

4. The recent accelerated decline in the mortality from tuberculosis has created in some quarters a sense of complacency as to the future of this disease; this is far from being justified either by the figures of morbidity or of the incidence of infection. Although there is a decline in the mortality, there is as yet no convincing evidence that the incidence of the disease will diminish at the same rate. There is also a decline in the need for beds, but the demand for facilities for the treatment of this disease is difficult to forecast. It is, however, clear that the need for special provision for methods of prevention, diagnosis, and after-care will continue for many years to come. Even if clinical tuberculosis becomes rare, this desirable state of affairs will be secured and maintained only if extensive organization for its prevention is kept in being.

Chest Clinics

5. The view sometimes expressed that the decline in tuberculosis mortality has reduced the amount of work is erroneous; in fact, it has actually increased the amount of work to be undertaken in connexion with the disease. Excluding the cases referred by mass radiography units or discovered by examination of contacts, it is already apparent that the ratio of persons who have to be examined to each case of pulmonary tuberculosis found is increasing. In the case of clinics, the numbers of new patients referred for diagnosis is steadily rising.

6. Extra work has been imposed upon chest clinics because of their increased use as case-finding and diagnostic centres. This has already more than offset the decline in active therapy, such as refill clinics. The standard of assessment of tuberculosis patients has become steadily more critical and has thrown an increasing burden on radiology and pathology departments. This trend is likely to continue until tuberculosis becomes a disease of the past.

Non-Tuberculous Cases

7. The present work of chest clinics is not limited to tuberculosis. The majority, perhaps all, do a greater or lesser amount of non-tuberculous work, depending on the attitude of the individual regional boards towards their chest services, and the facilities available—especially general hospital beds—and to some extent the desires and aptitudes of the individual physicians. There is a variety of chest diseases which have received in the past little concentrated attention while other diseases have become of increasing importance. Examples of

the former are bronchitis, emphysema, asthma, bronchiectasis, pneumoconiosis, which cause much chronic invalidism, and, of the latter, carcinoma of the lung. Diseases of the chest, whether requiring medical or surgical treatment, now call for much more intensive and detailed investigation.

Sanatoria and Chest Hospitals

8. The sanatoria also have undergone improvements since 1948. Before 1948 there were outstanding exceptions where the local authorities had provided excellent buildings and every facility. Since then there has been little new building but much general improvement in radiological and laboratory facilities. The general trend has been for the sanatorium physician to take part in chest clinic work, and for the chest physicians to have beds in the sanatoria. While a diminishing number of sanatoria still deal only with tuberculosis, many have become chest hospitals in the fullest sense of the word. In addition to tuberculosis wards they contain wards for acute and chronic non-tuberculous chest disease, out-patient departments (including E.N.T.), thoracic surgical units, departments for the investigation of respiratory function, physiotherapy, and rehabilitation, and with a full complement of visiting staff from other specialties.

9. The main effects of the recent trends in tuberculosis have been or will be on the sanatoria. In the last three years the position has changed notably; waiting-lists for admission are small or non-existent; the range of cases of tuberculosis admitted to sanatoria has widened; the number of those referred for surgery appears to be diminishing, though the place of surgery has not yet become clearly defined; and in males the age group is higher.

The Future

10. The facts outlined above show that for many years to come the problems of the diagnosis, management, and prevention of tuberculosis will provide a large volume of work requiring the attention of skilled teams throughout the country.

11. As in the past, it is certain that many patients suffering from non-tuberculous chest diseases will be referred to chest clinics. It is important that there should be the fullest facilities for their investigation and care, and each clinic should have its own x-ray department working in close association with that of the general hospital.

12. Ideally it is desirable that the chest service should be an integral part of the general hospital system and should have facilities for the diagnosis, treatment, social welfare, and rehabilitation of tuberculous patients as well as for prevention of the disease. Where practicable, the area clinic should be within the curtilage of the hospital. This would be more convenient for patients; it would make for easier liaison; the physician in charge would have beds in the hospital; and he would be available for mutual consultation with his hospital colleagues. The Radiologists Group has expressed its agreement with this principle; it sees no reason to exclude patients who have thoracic disease from the advantages of a general hospital, and believes that physicians who specialize in diseases of the chest should have the same diagnostic and therapeutic facilities as, say, surgeons who specialize in diseases of the genito-urinary tract.

13. There are, of course, circumstances in which such arrangements would be impracticable; for instance, where a tuberculosis hospital admits patients from many areas, or where it is situated at a distance from the clinics. It is, however, essential that there should be close contact between the hospital and clinics, and, in order that there may be a review of cases, clinic staff should visit the hospital regularly for this purpose.

14. In some regions beds are required for the investigation of tuberculosis and other chest conditions in children. Some of the beds at present vacant or becoming vacant might, where necessary, be equipped and staffed for this purpose.

15. The general practitioner has an important part to play in relation to tuberculosis, not only in its early detection, but also in treatment, aftercare, and rehabilitation of tuberculous

patients. It is therefore essential that every teaching hospital should be associated with a chest service team for the purpose of undergraduate and postgraduate education.

Prevention

16. The chest physician should regard himself not only as a member of the hospital team but also as a member of the public health team of his area. As far as preventive and social work is concerned in non-pulmonary forms of tuberculosis, chest physicians should act as a link between the services provided by local authorities and specialists at the general hospital handling these diseases.

17. Although the care and treatment of chest diseases and tuberculosis should be a part of the work of a general hospital, the handling of tuberculosis should be the responsibility of a special team. Whatever progress is made in the treatment of tuberculosis, the fact remains that it is an infectious disease and consequently there has to be provision for dealing with the epidemiological factors involved.

18. If chest clinics become integral parts of general hospitals, it is essential that the preventive and social aspects of tuberculosis should continue to receive close attention. The physician in charge of the clinic at the general hospital should organize and co-ordinate the preventive and social aspects of the work in consultation with the medical officer of health.

19. Co-operation in the epidemiological field and the social care of the patients would be facilitated if medical officers of health were given honorary appointments on the staffs of hospitals. On the other hand, in some groups a medical liaison committee functions well and this committee includes members of the hospital medical staffs, general practitioners, and medical officers of health.

Mass Radiography Units

20. Mass radiography units should be operated as an integral part of the chest service under the direction of senior and experienced physicians. The present policy of some hospital boards of combining several mass radiography units under a single director rather than attaching them to a chest clinic is considered undesirable both for the service and for the director of the unit, whose field of work becomes very restricted in consequence. The directors of mass radiography units should always be actively engaged in the work of the chest clinics.

21. A consultant radiologist should be available to every mass radiography unit to assist in the interpretation of abnormal films and to advise on radiological techniques and radiation hazards. While it is realized that this may be impossible at the moment, this should be the aim if and when a larger number of radiological staff becomes available.

Medical Staffing

22. In determining the appropriate establishment for each chest clinic, it is recommended that the following should be taken as a guide. Geographical conditions will require that the size of the population served by a chest clinic will vary, but it may be regarded as consisting of one or more units of 100,000 population, each requiring approximately fifty to sixty beds, including those for pulmonary tuberculosis, and the following medical establishment: one physician in charge, one assistant physician, and appropriate junior staff.

23. Where the population is substantially above 100,000 and an additional consultant becomes necessary, there should be not more than one assistant chest physician to each consultant.

24. An examination of the present staffing structure gives cause for concern, and the Committee feels that the matter is of such importance as to warrant special comment. This is set out in the Sub-Appendix.

Summary of Memorandum and Appendix

1. Although there is a decline in the mortality from tuberculosis there is as yet no convincing evidence that the incidence of the disease will diminish at the same rate.

2. It is, and will continue to be, necessary to maintain an organized tuberculosis service based on area clinics.

3. It is certain that many patients suffering from non-tuberculous chest diseases will continue to be referred to chest clinics, and it is important that the fullest facilities for their investigation and care should be available to these clinics.

4. It is desirable that the chest service should be an integral part of the general hospital system; whether or not this can be put into effect, the clinic should have access to facilities for the diagnosis, treatment, social welfare, and rehabilitation of tuberculous patients, as well as for prevention of the disease.

5. The facilities available in chest clinics, and the practicability of providing beds for diagnosis and treatment, vary from one area to another, but wherever possible the following pattern should be established and should be under the control of a single team: (a) the area chest clinic, (b) a small number of beds for non-tuberculous cases arising in the clinic, and (c) beds for the treatment of pulmonary tuberculosis.

6. The clinics should continue to be the centre from which the area tuberculosis service is organized, including work in the epidemiological field, and care and aftercare. Non-respiratory tuberculosis should be dealt with by the appropriate specialist, but the general investigation and care of the patient and his family on the social side should be carried out by the clinic.

7. Every teaching hospital should be associated with a chest service team for the purpose of undergraduate and postgraduate education.

8. Mass radiography units should be operated as an integral part of the chest service, and the directors of such units should always be actively engaged in the work of chest clinics.

9. The appropriate medical establishment for a chest clinic covering a population of 100,000 is as follows: one physician in charge, one assistant physician, and appropriate junior staff.

10. (a) The intake of senior registrars should be reduced to a figure comparable to the expected number of consultant vacancies. (b) There should be an increase of about 40% in the present consultant establishment in order to equate the number of consultants in chest diseases with the number in other specialties; for only so can general practitioners and patients be said to have the advantage of consultant care. (c) There should be a corresponding decrease in the S.H.M.O. establishment.

SUB-APPENDIX

Medical Staffing

1. The most recent figures (*British Medical Journal* of June 30, 1956) show that there are 346 consultant chest physicians, 430 S.H.M.O.s, and 49 senior registrars in the "Training Plan" with 11 "other" senior registrars. The ratio of 0.8 consultant per S.H.M.O. is equalled only in the small specialty of infectious diseases, with only 58 consultants. In all other branches, the consultant/S.H.M.O. ratio is well above unity. Chest diseases, with 4.7 of total consultants, carries 16.5% of total S.H.M.O.s.

2. S.H.M.O.s in chest diseases show wide variations both in qualifications and experience and in the degree of responsibility inherent in their duties. Many who work under full consultant supervision are highly qualified and quite ready for consultant status. Many others, of widely varying ages, qualifications, and calibre are doing work involving full responsibility without supervision or with purely nominal oversight by a consultant.

3. Since 1948 there has been a great improvement in the calibre and qualifications of young doctors entering the specialty. Normally a senior registrar entering the specialty possesses, or acquires within a short time, a higher qualification in general medicine. In the early years of the National Health Service they came in with the belief that promotion would follow the pattern normal in other special-

ties—namely, a direct step from senior registrar to consultant. In fact a high proportion of young S.H.M.O.s have entered this grade from that of senior registrar—for the sake of security—whilst looking for a consultant post.

4. Of the S.H.M.O.s, 180 are aged 40 or under, and a further 92 are aged between 40 and 45. Senior registrars are probably all under 40. Apart from any older men of consultant calibre in these grades, the specialty thus includes 321 doctors of 45 or under in S.H.M.O. or senior registrar grades. At least 200 of these men would be justified in the expecting consultant rank within the next five years. The total number of consultant posts likely to become available by retirement is 22 in the next five years, and 56 in the next ten years.

5. It is therefore clear that no young doctor will take up chest diseases as a career unless his sense of vocation over-rides his foresight. Moreover, the impossibility of filling junior posts has now resulted in a number of these posts being advertised at S.H.M.O. rates in the hope of attracting a pair of hands. The specialty is thus being further diluted with S.H.M.O.s, some of whom are unlikely to be suitable for promotion.

6. The Committee therefore emphasizes the conclusion implicit in its earlier remarks. This is not a specialty without a future. It is a fallacy to assume that the fall in tuberculosis death rates and the reduction of sanatorium waiting-lists means that recruitment can cease. The intake of senior registrars should be reduced to a figure comparable to the expected number of consultant vacancies, and these posts should be held at carefully selected centres. The promotion prospects of trained senior men now waiting for consultant posts should be improved by equating the proportion of consultants in chest diseases with that in other specialties. It is therefore recommended that there should be an increase of about 40% in the present consultant establishment, with a corresponding reduction in the establishment of S.H.M.O.s.

APPENDIX V RECOMMENDATIONS OF COAL-GAS POISONING SUBCOMMITTEE

1. The main stop-cock to the gas supply in a house should always be easily reached and well marked.
2. The precautions needed to promote safety in rescuing cases of coal-gas poisoning should be more widely known.
3. Self-acting artificial respirators should be available at every fire station and ambulance station.
4. Research should continue on the practicability of reducing the carbon monoxide content of coal-gas and the influence of this on the incidence of coal-gas poisoning.
5. The Gas Council should continue its efforts to discover a yet more distinctive or pungent smell to make the presence of coal-gas still more obvious.
6. Communal meters should be replaced by individual ones as quickly as possible.
7. The installation of gas-pipes and appliances by private contractors should conform to the standards laid down by the Gas Council, and the appliances supplied should pass suitable tests for safety in use.
8. Attention should specially be paid to flexible tubing and its connexions and any worn or faulty tubing should be replaced.
9. Gas Boards should cut off the supply of gas when there is any reason to believe leaking fittings or unsafe appliances are being used.
10. Safety gas-taps should be fitted to all appliances, and as soon as possible some convention should be adopted by makers of appliances to denote by colour or some other device the tap for oven, hot-plates, etc.
11. The proper spacing of taps to avoid confusion should also be attended to, and blind or partially blind people should have appliances in which the various taps are distinguishable by touch as well as by position.
12. Automatic ignition and/or safety devices which prevent the escape of unburnt gas if the flames are blown out or the

gas is not ignited should be further developed and popularized. Every effort should be made to sell such appliances at prices competitive with those not so fitted. Special efforts should be made to produce for old people who are accident prone a small oven or cooker fitted with such a device, to be made available on the easiest terms possible.

13. The ventilation of old and converted property should receive careful attention.

14. People should be warned of the dangers of stopping up ventilators, etc., when coal-gas appliances are used (quite apart from the general danger to health of this practice).

15. All over the country steps should be taken to bring the hazards from coal-gas to the attention of statutory and voluntary workers among the aged. This could be done through their central co-ordinating bodies, the Women's Voluntary Services, the National Council of Social Service, etc. Meetings should be arranged with the local officers of the Area Gas Boards so that co-operation and collaboration can be achieved.

16. In the same way, doctors, district nurses, health visitors, and others should be asked to notice the gas appliances used by their patients and be made aware of the willingness of the Gas Board to correct any defect observed.

17. All local authorities should do their utmost to see that the gas appliances of old people are properly suited to their requirements, and more use should be made of statutory powers to achieve this result.

18. Educative but not alarmist publicity should be provided through press, radio, and television to indicate the dangers in the use of coal-gas, particularly to the aged and infirm, and also to explain how easily many of these dangers can be avoided. The public should be induced to demand and suppliers urged to provide safety devices which comply with the standards of established safe practice.

APPENDIX VI

AMENDMENT OF BY-LAWS

Amendment of By-laws

1. By amending By-law 16 (1) by the deletion of the word "further" appearing before the word "payment" in the second proviso thereof.
2. By deleting from By-law 70 the words from and including "and for that period" down to the end thereof and substituting therefor "and cease to be a Member of the Council by virtue of his original appointment and there shall be deemed to be a casual vacancy under By-law 63 except in the case of a person appointed under paragraphs (c) or (e) of By-law 53 in which case the vacancy shall remain unfilled."

Amendment of Schedule to By-laws

By amending the Schedule to the By-laws as follows:

In the fifth column opposite the words "Central Consultants and Specialists" in the first column (a) delete the words "1 by the General Medical Services Committee" and substitute "2 by the General Medical Services Committee"; (b) add at the end thereof "(other than the Registrars Group Committee and the Senior Hospital Medical Officers Group Committee); 2 by the Registrars Group Committee; 2 by the Senior Hospital Medical Officers Group Committee."

REGISTRARS GROUP COUNCIL DINNER

The fifth annual dinner of the Registrars Group Council will be held on Friday, May 10, at Kettners Restaurant, Romilly Street, London, W.1. The guests will be Sir Harry Platt, President of the Royal College of Surgeons, and Dr. S. Wand, Chairman of the Council of the B.M.A. Tickets (price 27s. 6d.) are available to all senior registrars and registrars from the Secretary of the Association.

CENTRAL CONSULTANTS AND SPECIALISTS
COMMITTEE

A meeting of the Central Consultants and Specialists Committee was held at B.M.A. House on Thursday, April 4, with Mr. T. HOLMES SELLORS in the chair.

Royal Commission

The Committee decided by a large majority to endorse the recommendation of the Council of the B.M.A. that in present circumstances the Association should not give evidence to the Royal Commission on the Remuneration of Doctors and Dentists.

S.H.M.O.s in Consultant Posts

It was reported that, following the notice in the *Supplement* (February 9, p. 60), a large number of S.H.M.O.s who occupied consultant posts or who claimed to be engaged in consultant work had applied for their cases to be considered with a view to submission to Committee B of the Medical Whitley Council.

Confidential reports were now being sought from the chairmen of hospital staff committees and from referees named by the applicants.

The Executive Committee had considered the appointment of panels in each of the specialties concerned to review the applications, and had decided to nominate a convener in each specialty, leaving the convener some discretion in selecting the personnel of the panel. It had also been decided to invite the S.H.M.O. Group to nominate a representative to serve on each of the panels, the representative to be in a specialty other than that under consideration by the panel. Applications from S.H.M.O.s in Scotland would be referred in the first place to the Central Consultants and Specialists Committee (Scotland).

Remuneration of Whole-time University Medical
Teachers and Research Workers

It was reported that the Executive Committee had considered a report on remuneration prepared by the Non-professional Medical Teachers and Research Workers Group Committee of the B.M.A., and felt that any comparison between doctors in different spheres, as for instance university teachers and hospital medical staff, must be made on the basis of responsibility and experience. In order to clarify the matter, the Executive was inviting representatives of the Group Committee to discuss the report, and also the effect, if any, of the new scales for university teaching staffs announced by the Chancellor of the Exchequer on March 12, before the report was presented to the Council.

Anaesthetists Fees

A memorandum from the Association of Anaesthetists in Great Britain and Ireland on the question of the maximum fees chargeable by anaesthetists to hospital private patients had been considered by the Executive Committee. It had decided to invite representatives of the Anaesthetists Group Committee to discuss the matter before making any recommendations.

Maternity Medical Services

The Executive Committee had considered the draft memorandum of evidence to be submitted to the Cranbrook Committee on maternity services, and had suggested certain minor changes which it had asked the Chairman to raise when the memorandum was presented to the Council.

Professor G. I. STRACHAN said that although the memorandum was a formidable-looking document it boiled down to an expression of Association policy—namely, that the general practitioner should be the hub of the whole maternity service.

Integration of Medical Officers of Health with
the Hospital Service

On a recommendation from the Liaison Committee it was decided to remind regional committees of the desirability of close co-operation between hospital medical staffs and public

health medical officers, including their appointment, in appropriate instances, to membership of medical staff committees if the members of hospital medical staffs so wish. It was agreed also to forward to regional committees the recommendation of Council on this subject (*Supplement*, February 9, p. 56).

With regard to general practitioners and the hospital service, the Liaison Committee resolved that the General Medical Services Committee be informed that in the view of the Liaison Committee there should be an increase in the number of hospital private beds for the use of consultants and general practitioners whenever it could be shown that the facilities were inadequate to meet the demand for private treatment, but the demand for private beds for the use of general practitioners should be pressed as part of the general case for more general-practitioner beds.

Examination of Immigrants

The Liaison Committee supported the action of the Public Health Committee in recommending to the Council that it should reaffirm to the Ministry its view that a dangerous situation was arising from the arrival in this country of immigrants with communicable diseases, and that Government action should be taken in the matter, including a requirement of compulsory chest x-ray examination for all immigrants before entry into the country.

Annual Report of Central Consultants and Specialists
Committee (Scotland)

Dr. ALEXANDER SMITH presented the report. Professor P. C. P. CLOAKE asked what was proposed in regard to the diagnostic centre in Edinburgh. Dr. E. WALKER (Scottish Secretary) replied that it was an experimental centre set up under the aegis of the Nuffield Trust. It was intended to be a place where practitioners could go to obtain consultants' advice. It was purely experimental.

Hospital Medical Staffing

A report on the discussions between the Joint Consultants Committee and the Ministry on the subject of hospital medical staffing was considered. Dr. I. D. EASTON asked whether there was any prospect of the Joint Consultants Committee having further thought on the question of ratios. The CHAIRMAN, in reply, said that the question of ratios had been accepted. The practical difficulties were great where there was a small specialty. Dr. EASTON pointed out that there was an inadequate number of consultant appointments obtainable in those small specialties.

Dr. T. ROWLAND HILL said that the Joint Committee was determined to resist any attempt to introduce into the structure of the Health Service a permanent career grade of officer between the senior registrar and consultant.

Professor CLOAKE submitted that the committee negotiating the matter would be well advised to urge that the S.H.M.O. problem should be treated entirely separately and dealt with in an independent manner. "I think we should ask the Ministry to agree that the S.H.M.O. grade should be allowed to decrease in numbers and eventually disappear, and that any new grade should be small," he concluded.

Professor G. I. STRACHAN reminded the Committee that the whole object of suggesting a new grade was to improve the hospital service and to save senior registrars from unemployment by forming an intermediate step while they were waiting for consultant appointments.

Mr. LAWRENCE ABEL expressed the view that great strength would be gained at the present time if the Committee stated that it refused all further negotiation until there was a review of consultant establishment, and that review had been completed. It should be pointed out that the time had come when the hospital service should no longer be controlled by the Ministry of Health.

After certain drafting amendments, the following resolution, proposed by Mr. LAWRENCE ABEL and seconded by Dr. G. R. VENNING, was carried:

"That this Committee reiterates its opinion that no recommendation be accepted until an agreed review of consultant establishment has taken place."

Hospital Costing Arrangements

A recommendation from the North-west Metropolitan Regional Consultants and Specialists Committee that a protest be lodged with the Ministry in regard to the request to hospital medical staff for information in connexion with hospital costing arrangements was considered. The CHAIRMAN reported that the Ministry had consulted the Joint Committee, which raised no objection. All that hospital medical staff were asked to provide was an estimate, expressed as a percentage of their contract time as allocated to each hospital, of the amount of their time spent in each of the different departments.

Remuneration of S.H.M.O.s

The Committee agreed to approve in principle that the salaries of S.H.M.O.s should amount to 80% of those of consultants.

The remainder of the items on the agenda were deferred until the next meeting.

HOSPITAL MEDICAL STAFFS DEFENCE
TRUST

MEETING OF TRUSTEES
